10 years that shook the world

**Apple celebrates a decade of
achievement with two new Macs**

plus

the COMPLETE range of memory cards

From II+ to GS, from 256K to 8 Megabytes, and from only £99.00

plusRAM—GS

plusRAM—GS2 and **GS8** are the newest additions to the range, giving you up to **EIGHT extra Megabytes** in your GS (the maximum memory possible on the GS). The plusRAM-GS cards plug neatly into the special Memory Expansion slot in your GS for *instant expansion* and are 100% compatible with all GS software as well as ProDOS, DOS3.3, PASCAL and CP/M.

■ 256K to 8 Megabytes

plusRAM—GS2 comes with 256K and is fully socketed so you can easily increase the total RAM up to 2 Megabytes. And if you don't think that's enough, then you need **GS8** — it comes ready with *ONE Megabyte* but you can add extra RAM to the fully socketed card right up to *EIGHT Megabytes* — no other card even comes close!

■ Instant Programs on your GS

Not only do the plusRAM—GS cards give you the most flexible memory expansion for your GS, they've also got a really unique feature — you can add a **PROMdisk Adaptor** to plusRAM—GS, switch on your GS and start-up your favourite programs almost instantly! *Just imagine . . . turn on your GS and your program's there — no disk to load!* The **PROMdisk Adaptor** comes with 64K (expandable to 256K) battery backed-up RAM — *the instant answer!*

■ Appleworks Power

As well as total compatibility with all GS software, plusRAM—GS cards boost AppleWorks beyond all limits, instantly increasing database records, word processor lines and desktop size; even automatically dividing large files to several disks for safe storage.

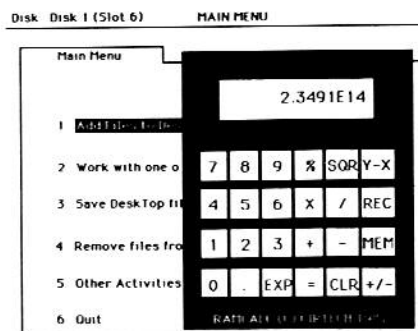

plusRAM—GS — the natural choice for your GS

plusRAM—GS2 — £99.00
 plusRAM—GS8 — £249.00
 256K Upgrade — £20.00

plusRAM for your II, II+ and //e

plusRAM is the *low-cost memory expansion card* for your Apple II or //e. It comes as standard with 256K memory but is fully socketed and can be expanded right up to **1 Megabyte**.

plusRAM plugs into any standard slot in your Apple and instantly operates like a super-fast disk drive with all standard Apple II programs. plusRAM is fully compatible with ProDOS, DOS3.3, Pascal and CP/M; lets you use AppleWorks 1.3 on the II+; your AppleMouse with AppleWorks; expands the AppleWorks desktop, database records and word processor lines, automatically divides large files to several disks and even includes a pop-up, multi-function calculator!

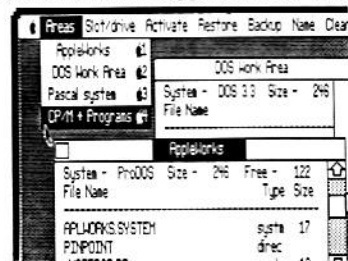

plusRAM — only £99.00
 256K Upgrade — only £20.00

And there's plusRAM-xtra

the ultimate 1 Megabyte memory system for your Apple II, II+ or //e! plusRAM-xtra is a full 1 Megabyte memory expansion card with the same winning features as plusRAM but, as the name suggests, there's more — plusRAM-xtra comes complete with the revolutionary **RamDesk Manager** to give total control.

Use the **RamDesk Manager**, with its MacIntosh-like window environment, to partition the huge plusRAM-xtra memory into several areas for different programs or operating systems and switch between them *instantly!*

(Illustration shows graphics RamDesk Manager on an enhanced Apple //e. A text version of RamDesk Manager is also included for use on other models).

No other RAMcard system provides the power and flexibility of plusRAM-xtra or is supported by more software!

plusRAM-xtra — ONLY £198.00

GS CP/M PLUS SYSTEM — the latest high quality innovation from CIRTECH

NOW you can use the huge range of CP/M programs on your GS too! CIRTECH have released their CP/M Plus System for the Apple II GS. The compact hardware card plugs easily into one of the standard GS expansion slots and incorporates a fast 8MHz Z80 microprocessor to boost the speed of your programs. *The GS also operates in fast mode with the CP/M Plus System for extra speed!* The CIRTECH CP/M Plus Operating System software is the most advanced available for the Apple and has many unique user-friendly features:

- Automatically supports all Apple standard disk drives including 5.25, UniDisk, 3.5 Drive, ProFile, SCSI or RAMcards.
- Inbuilt printer and aux. buffers, with *multiple copy option* which can be used at any time, even during a program.

- **Tool/Key** functions which are **always instantly available**, even in the middle of running a program:
 - disk copying and formatting
 - print 'snapshot' of current screen
 - time and date display
- Automatically uses AppleMouse with any CP/M program.

The very best from CIRTECH

GS CP/M PLUS SYSTEM

ONLY £118.00

SoftStrip Mac

Available now from MCT the new way to send, store, transfer and archive your Macintosh software and data. SoftStrip™ is a revolutionary new technology which gives users the ability to produce computer readable data on plain paper. A typical strip has the storage capacity of approximately 5,500 bytes of information. That's about 4 A4 pages of text. A major advantage of SoftStrip™ is that strips containing unformatted ASCII text produced on say a Macintosh can be easily read into a different computer like an IBM PC. Software, called StripMaker™ to produce strips is available at a cost of only £20.00 and is compatible with the ImageWriter and Epson FX range of Dot Matrix Printers

Long live the revolution!

Wozniak

Jobs

HAPPY Birthday Apple Inc! The company which created the worldwide micro revolution is 10 years old.

To record the milestone, the corporation held simultaneous celebrations in London and at the Universal Studios in Los Angeles.

At these, it was revealed that four million Apple IIs and one million Macintosh computers have been sold to date.

And to ensure that its second decade will be at least as remarkable as its first, Apple announced it is to unveil more new products this year than during all of its previous 10 years.

In fact it chose its transatlantic birthday parties for the mass launch of 24 products, including two new machines.

All in all, a far cry from the humble business which was born in a garage in California.

There a genius by the name of Steve Wozniak perfected the

Apple I and a hustler by the name of Steve Jobs persuaded him to sell it.

Even though events were soon to overtake them, the original intention of the two college dropouts was simply to build PC boards for \$20 and sell them for \$40.

But The Woz was a little nervous. "I worked it out that we would have had to sell about 50 of these to break even", he says, "and I didn't think that many people would buy them".

The rest is history:

1977: Sold in kit form at first, the Apple I is so successful that millionaire entrepreneur Mike Markkula comes on board and devises the business plan to incorporate Apple. The same year sees the launch of the Apple II in the US.

1978: The first Apple personal computer is sold in Europe.

1980: Volume manufacturing begins in Dallas, Texas, and Cork,

Ireland. The Apple III is introduced, and in December, Apple goes public.

1983: An enhanced Apple II, the IIfx, is unveiled and the Dallas plant manufactures its one millionth machine. The Lisa, the personal computer which evolved into the Macintosh, takes its bow. Apple enters the Fortune 500 list of leading American blue chip corporations.

1984: The Macintosh arrives, and with its use of windows, pull-down menus, bit mapped graphics and mouse input device, is heralded as the next industry standard. Enter the IIfx. The two millionth Apple II is produced in Dallas.

1985: Apple goes into a slump as a result of a bruising battle with IBM. The company turns in a loss of \$10 million -- its first -- and lays off 20 per cent of its workforce.

At the same time Apple

introduces the LaserWriter printer, the machine that was soon to help restore the company's prosperity by virtually founding the booming international desktop publishing market.

1986: The launch of the Macintosh Plus is followed by the introduction of the Macintosh 512k/800. A newly-streamlined Apple operation starts to flourish once more on desktop publishing income and goes on to introduce the latest in the Apple II range, the IIgs.

1987: Apple bounces back into financial health. It has gross profit margins over 50 per cent, \$600 million in the bank, no debts and plans to spend \$180 million on R & D this year.

The company's value on Wall Street has soared from \$900 million 20 months ago to \$4.5 billion.

Happy Birthday Apple from the editor, staff, readers and advertisers of *Apple User*.

Where were they then?

Sugar

Sinclair

Hauser

Curry

IN the 10 years since Apple set in motion the personal computer industry, it has grown to be worth a staggering £32 billion worldwide.

Along the way it has spawned numerous companies some now giants in their own right, others that have simply slid back into obscurity.

It has also created a new breed of multi-millionaire from the enormous profits created by the spin-off from manufacturing other best-selling micros.

They are now household names. But what were they doing when Steve Wozniak and Steve

Jobs were founding Apple back in 1977?

Alan Sugar, fresh from enjoying the financial rewards of successfully selling car aerials from his car boot, saw his future in home entertainment through A.M. Sugar Trading. Now known as Amstrad, it means that on paper, as of last month, he is reported to be worth £680 million.

Hermann Hauser and Chris Curry, who were to go on to found Acorn Computers, were both in Cambridge. Hauser was working on his PhD at King's College, while Curry was helping Clive Sinclair to develop the first

pocket television.

With the help of the BBC licence, they were to take computing into British schools, but since have gone their separate ways.

Clive Sinclair meanwhile was fascinated by developments in California. Having already made a name as a pioneer in digital watches and calculators, he was quick to grasp the potential for the personal computer in the UK.

The result? The ZX80 and its successors, millions of pounds in revenue and a knighthood for Clive, then the ensuing slump and the enforced sell-out to

Amstrad.

Yet another close observer of Apple 10 years ago was former concentration camp inmate Jack Tramiel. By 1977, the former typewriter salesman was installed as chief executive of Commodore International.

Established to market typewriters from Eastern Europe, Commodore was to go on to become a billion dollar computer company in its own right.

Ten years is not a long time in the general course of events. But it encompasses the total history of personal computing -- thanks to Apple.

Two new Macs mark the anniversary

APPLE selected its 10th birthday celebrations for the biggest mass launch of products in its history – and the promise of much more to come.

In all, it unveiled some 24 new lines, including two machines, the Macintosh 11 and the Macintosh SE.

Aimed to be the next flagship of the Macintosh range, the six slot open architecture 11 is based on the Motorola 68020 32 bit processor operating at 16MHz.

A floating point unit, the 68881 chip will enable the machine to perform mathematical operations up to 200 times faster than the 68020.

This will make it the most powerful member of the family to date, allowing it to run Macintosh software up to four times faster than the Mac Plus.

It also offers stunning graphics, with a look-up table offering a choice of 16.8 million colours.

Targeted at the high end business and educational markets, the Macintosh 11 offers one megabyte of ram as standard, expandable to eight megabytes on board, and a theoretical 1.5 gigabytes using add-on boards.

Up to two 800k floppy disc drives and one 20, 40 or 80 megabyte hard disc can be accommodated simultaneously by the

machine.

Purchasers will have a choice of mono or colour displays, with both units featuring 640x480 pixel resolution and providing up to 256 colours or grey scales.

The user can also select from a choice of two keyboards, the Apple Keyboard or the Apple Extended Keyboard with 105 keys.

Available in July, the price of a single floppy monochrome system will be in the region of £4,500, while the top of the range internal 40 megabyte SCSI drive system will cost around £5,500.

Meanwhile the new Macintosh SE, an enhanced version of the Macintosh Plus is available now at £2,495. It has a standard 1Mb of memory expandable to 4Mb without the need for additional desk space for disc drives and associated cabling.

"Everyday business needs will continue to be served by the Plus", says Chris Calvert of Apple UK. "but the SE will serve the

needs of those requiring the flexibility of a built-in expansion path".

Third parties are already developing add-in cards for the expansion slot to provide additional facilities such as video, datacomms, networking, storage and co-processors.

Every component in the SE has been redesigned with the exception of the tube.

Overall performance is claimed to be 15 to 20 per cent faster than the Plus. And while there is no route for upgrading Plus hardware to the SE, there is full software and peripheral compatibility between the two systems.

"Both the Macintosh SE and Macintosh 11 are important additions to the Macintosh line", says David Hancock, Apple UK's managing director. "However this is just the start. We'll be offering more new products during 1987 than the total for the previous 10 years".

The Mac SE. The Mac II is pictured on the front cover.

SPECIFICATIONS

MACINTOSH SE:

Processor: MC68000, 32 bit, 7.8 MHz.

Memory: 1Mb ram, expandable to 4Mb, 256k rom, 256 bytes of user-settable parameter memory.

Capacity: 800k per formatted d/s discs, 3.5in hard shell media, 20Mb on optional hard disc.

Screen: 9in hi-res, 512 x 342 pixels, bit-mapped display.

Interface: Apple desktop bus connectors (x2) for communication with keyboard, mouse etc over low-speed bus, RS-232/RS-422 serial ports (x2), 230.4k baud max; external disc interface; system expansion connector; SCSI interface; sound port for external audio amplifier.

Sound: Four-voice sound with 8 bit digital-analog conversion using 22 KHz sample rate

Input: Line voltage 120/240 volts AC,RMS; frequency 47 to 63 Hz single phase; maximum power 100 watts.

Mouse: Mechanical tracking, optical shaft encoding; 3.54 pulse per mm (90 per in) of travel.

Keyboard: Options include Eastwood 81 keyswitch, ADB detachable with 10 key number pad, Saratoga 105 keyswitch, ADB detachable including 15 function keys, T cursor pad and 10 key number pad.

Clock: CMOS custom chip with seven year lithium battery.

Fan: 10 CFM cross flow.

MACINTOSH II

Processor: MC68020, 32 bit at 15.6 MHz.

Co-processor: 68881 floating-point device (IEEE standards).

Memory: 1Mb ram expandable to 8Mb on board; expandable to 2Gb in NuBus slots; 256k rom.

Management: Optional 68851 PMMU.

Disc storage: Options include 800k per formatted d/s disc, 3.5in hard-shell media; 20, 40, 80Mb CSI hard discs, internal and/or external.

Video card: Apple custom frame buffer chip; standard 1-4 bits per pixel up to 256 colours or shades of grey; look-up table with 16.8 million colours.

Monitors: Options include analog 12in mono, 640 x 480 pixels; analog 13-in RGB, 640 x 480 pixels.

Interfaces: Mini-8 serial (RS-232/RS-422) ports (x2); DB-25 SCSI port; Apple desktop bus ports (x2); NuBus internal slots supporting full 32 bit address and data lines (x6).

Sound: Apple custom digital sound chip including four voice wave table synthesis, stereo sampling generator capable of driving stereo headphones.

Input volts: 90-140 VAC; 170-270 VAC, automatically configured; frequency, 48 to 62 Hz; maximum power, 230 watts, not including monitor power.

Mouse: Mechanical tracking, optical shaft encoding 3.54 pulse per mm (90 per in) of travel.

Keyboard: Options include Eastwood 81 keyswitch ADB detachable with 10 key number pad; Saratoga 105 keyswitch ADB detachable including 15 function keys, T cursor pad and 10 key number pad.

IBM TALK

If you can't beat 'em, get 'em to join you, has become the Apple philosophy over data exchange.

The AppleTalk PC Card, one of the company's 10th anniversary batch of support products, is for IBM compatibles. It allows them to share information on an AppleTalk network.

Apple claims this represents a significant step towards smoother communications between Apple hardware and the MS Dos environment.

It is part of the company's policy to achieve greater communication between systems.

The card is a half-sized printed circuit board with a micro-processor and appropriate protocols on its rom. Software is included which converts MS Dos-generated text into PostScript.

A product manager at Apple UK, Richard Bradley explained: "The card will open up for users of MS Dos machines the opportunity to link into a PostScript-based desktop publishing system and with it the advantages of Macintosh-based networks".

Backup

TWO software enhancements for the MacBottom Hard Disc have been released by PCPC; and existing users can get them free.

All MacBottom owners can get these improvements free by sending a C5 sae and a floppy disc to A&M Systems in Bicester.

John Smith with his alarm

Mac alarm is a real winner

ELECTRONICS expert John Smith became so attached to his Apple Macintosh that he invented an alarm to protect it.

And from there has begun a business which could soon be selling around the world.

The MacSentry runs off two batteries and is activated by a printed circuit board. It is housed in a flat steel box finished and shaped to match the computer, which stands on it.

If anyone tries to lift the machine, the alarm lets out an ear-piercing wail.

It is switched on only by using a key and cannot be turned off without it. The siren can apparently sound for seven hours.

"After I invented the alarm I began to wonder how other people would react to it.

"Then I went to a computer show and saw all sorts of exhibitors hopping around worried about the safety of their products. Some actually employed security people to look after the stuff",

said 45-year-old John.

"I thought to myself that my device could have done the job for them. So I went home and got on with developing the idea".

Another feather in his cap is his success in the Business World Inventor of the Year Contest. He was one of the 12 finalists chosen from the 130 original entries.

With the help of a Manpower Services Commission Enterprise Allowance Scheme, he began to expand into other areas.

He has had inquiries from the US for the computer alarm and British interest in his other gadgets.

The first adaptation was to a small platform which fits inside a car boot. Once the alarm is switched on, any shopping or indeed any item placed on top of it is protected.

The alarm has also been reduced to camera-bag size for use by photographers who have to carry about expensive equipment.

Mr Smith's latest adaptation is to fit it to a strong steel chock which can be placed behind the wheel of a caravan or boat trailer.

When a thief tries to make off with the caravan, pulling it away from the chock triggers the alarm.

This design also features a flashing amber warning light for if the vehicle breaks down.

New product deadlines

HERE is Apple's product availability schedule:

Macintosh SE dual floppy – immediate

Macintosh SE single floppy, internal hard disc – immediate

Macintosh II single floppy – later in 1987

Macintosh II single floppy, internal hard disc – late 1987

Monitors and video cards:

Apple HiRes 12in mono – later in 1987

Apple HiRes 13in RGB – later in 1987

1-4 bit video card – later in 1987

8 bit video card expansion kit –

later in 1987

Storage:

Macintosh Internal 800k drive – later in 1987

Macintosh Internal 20SC hard disc – later in 1987

Macintosh Internal 40SC hard disc – later in 1987

Macintosh Internal 80SC hard disc – later in 1987

Apple hard disc 40SC – soon

Apple hard disc 80 SC – later in 1987

Apple tape streamer 40SC – soon

Miscellaneous:

1Mb ram expansion kit – soon

2Mb ram expansion kit – soon

Apple keyboard – immediate

Apple extended keyboard – later in 1987

Alternative operating environments:

A/UX – later in 1987

Apple EtherTalk Interface card – later in 1987

PMMU chip – later in 1987

Communications products:

Appleshare – immediate

AppleTalk PC Card – immediate

5.25in Macintosh II controller card – soon

5.25in Macintosh SE controller card – soon

Apple 5.25in MFM drive (360k) –

Chris leaves his baby behind

APPLE enthusiast Chris Bonington left his favourite technology behind when he set off to conquer yet another Himalayan mountain.

His expedition to Menlungste, the remote Tibetan peak he intends to climb, doesn't require the solar-powered IIc which accompanied him to the top of Everest last year.

To make matters worse, Bonington has had to tear himself away from the latest love of his life, the new IIGS on which he planned this latest expedition.

"I'll miss my micros", he told Apple User just before leaving for

Tibet. "The IIGS is a marvellous machine and I was really enjoying working on it.

"But even though Menlungste is unconquered so far, it's a small trip compared to the Everest expedition, and doesn't require the same degree of monitoring. So we won't need the IIc.

"Instead of sending back dozens of reports like I did from Everest I have to produce only one, so I'm taking my boring old typewriter with me this time.

"But I'm looking forward to getting back to my keyboard when I return to my base in the Lake District".

Where supplies ban hits the hardest

IF British firms stop supplying South Africa with Apple computer support products it could hurt the black population, claims an Apple User reader who lives there.

A voluntary ban on exports of Apple products to South Africa by UK suppliers was called for by DarkStar Systems director Robert Sather in a recent issue of Apple User.

But pharmacist Harold Durrant, who lives in Pretoria, says this would be like "throwing the baby out with the bath water".

He told Apple User: "I work at GaRankuwa Hospital, one of the biggest in Africa, which caters almost exclusively for black patients.

"By an amazing coincidence, the day after reading the Apple User article about banning computer supplies to South Africa, a lecturer here mentioned that the best program on his subject was for an Apple - but that an Apple was not available for his use.

"I would have normally offered to lend him my own, but if it was

damaged it probably could not be mended and the freely available clones are not as good.

"So we shall probably have to accept a not-so-good program for our black patients. And this for our work in total parenteral nutrition - an expensive procedure where the only nourishment a cancer patient receives is by injection.

"When I learned to use a shot-

gun I was taught never to let the fringe of the shot cause injury. Boycotters could, with advantage, remember this.

"I had a cataract operation with a synthetic transplant done at GaRankuwa because there are few better eye departments anywhere in the world.

"I was, of course, admitted to one of the wards for black patients".

Micro Live is facing the axe

TELEVISION'S only regular computer programme, Micro Live, faces the axe. And Database Publications, prompted by hosts of letters from readers, is determined to ensure the axe will not fall.

The last Micro Live in the present series was scheduled for the end of March. Head of Continuing Education (Television) at the BBC David Hargreaves said: "The present season of Micro Live

is its third. We have decided not to plan a fourth for next winter.

"We want to pause, take stock and think about how we ought to be making the best contribution to our understanding of information technology in the future."

Derek Meakin, head of Database Publications, said: "Micro Live has played a leading role in introducing the delights of

Fantasy for the Apple II

AMERICAN publisher Strategic Simulations has released fantasy game Realms of Darkness for the Apple II.

It combines elements of traditional adventure games, using keystrokes or joystick, with graphics/text action using an adventure mode parser where command phrases can be used to guide players in and out of tight spots.

The parser allows players to manipulate objects and talk directly to game characters via the keyboard.

Realms of Darkness is a big game with more than 150 hours of fantasy adventure and role-playing for intermediate-level players. Price \$39.95.

IBM link

DATA communications specialist KMW Systems International has released 3XLink, a device which allows Macintosh users to interface directly into IBM System 34, 36 and 38 computers.

Comprising a KMW Matchbox and special software for the Macintosh, 3XLink allows users to emulate the functions of an IBM 5251/91 terminal with pull-down menus for special keys.

In addition, a printer attached to the Macintosh can appear to System 3X as an IBM5256 printer and can be addressed as a separate device if required.

Also available for use with 3XLink is a file transfer package program which enables bi-directional transfer of files between the Macintosh and System 3X.

computing to an ever-growing audience.

"To kill the series now, when so many exciting developments are taking place in the whole world of microcomputing, is a retrograde step".

So, Apple User readers, it's time to play your part. If you want to help save Micro Live, write to: The Controller, BBC 2, TV Centre, Wood Lane, London W12.

In search of the most amazing word processor

I AGREE, the headline above is some sort of plagiarism and most probably you know the title from somewhere else, but believe it or not, for me it really was some search!

For a better understanding, let me explain what problems can be solved with the Apple II family of computers with appropriate software. Also, I hope that this article will be of some help, not only to non-English speaking Apple users but also for all those wishing to create visually appealing and more attractive documents.

Let me introduce myself. I am a freelance and founder member of the audio visual (or multimedia, or mixed media) creative team SCARS working for clients the whole world over.

A long time ago, we started to program our presentations with an Apple II+ and superb software and hardware from Electrosonic Ltd of London.

Previously we prepared presentations with our own hardware and software, but found that it was much better for us to concentrate our efforts on the purely creative aspects of the presentations, interior and exhibition designs and so on and to choose the best hardware and software on the world market.

Lucky decision

We tested four systems, three from the USA and one from England (remember, this was more than eight years ago, now there are more than 30 main suppliers for such systems, but still Electrosonic is in the first line) and decided, that the English one was the best suited to us.

This was a lucky decision, because it was also our first contact with Apple II computers; other companies used their own specialised computers.

I immediately recognised the big advantage of choosing the Apple II+ for programming, that is the unlimited possibilities it offered not only for our purposes, but also for many other applications as well. Within a short time I was using the Apple II+ for database and spreadsheet applications (do you remember the first versions of VisiCalc and VisiDex?).

However, the choice of word processor was, I was convinced, only temporary. As a matter of fact the solution really was a temporary one, but with the catch that the temporary period took over seven years.

Jaromir Smejic nears the end of a pilgrimage to find his ideal software

However, the target is very near now and attainable.

The problem was that my own language, Czech, has in its alphabet many characters with accents – four different kinds – and for that reason we also have a different keyboard layout. Compared with the English keyboard, we have in place of some numbers, characters with accents and the numbers themselves are shifted (on the same keytops as on the English one, but accessible with the Shift key). There are other changes as well.

However, I was looking not only for a word processor usable for documents in my native language, but for one to write scripts, books, forms and other documents for our customers in their native language.

The problem was that we have customers of many different nationalities and we wanted to have, as part of the word processor's software, several different alphabet sets, if only for drafts.

In the first place there would be the English language, followed by French, Spanish and so on. Although we were working in India, Japan and the Middle East I didn't expect to find a word processor able to comply with all these alphabets. You see how modest my wants were!

I limited my search to word processors with a minimum of 94 characters with custom definable fonts and a suitable font editor with a minimum matrix size of 7 × 12. I was very well aware that it would be necessary to use a hi-res screen display as well as a slower, graphic printing mode.

There were other practicable uses of the Apple II+ with appropriate software within our line of work. Besides creating documents, keeping track of our data and helping us to prepare a budget, I started to use the hi-res graphic pictures for creating covers, title pages and so on for our documents.

The specialty of our creative team is to deliver, not only audio-visual presentations and complete interior solutions, but also all hardware and other material and work, including installation and operation.

Now and then our clients ask for the

famous last minute changes, including changes in some slides with titles. This was OK when we were working in a big city where it was no problem to find a graphic or printer's workshop, to design a new title and make a new slide.

Then with overnight work, developing in a good laboratory (or later with our own small, travelling photo laboratory) everything was OK. But in some countries and cities and on some occasions, like holidays, such a solution was unfortunately out of the question.

And here the old, respected Apple II+ came again to our assistance. We created new titles with the help of some good graphics software, and took shots from the display or in some cases from the printout. We needed software with a wide base of good fonts in at least two sizes and with a font editor enabling us to design non-English characters and symbols.

Since that time I have had a vision that all work connected with preparing various documents with text (in several languages, font sizes, styles and so on) and pictures should be possible with one piece of software – a word processor using a hi-res screen capable of printing documents both in hi-res graphic and text mode.

Temporary solution

My search for such a paragon was long, but I think that now I am getting to the end of my pilgrimage.

However, in the early days when this was still only a vision, no such word processor was available and I naturally chose Apple's own word product, Apple-Writer, as a temporary solution.

It was remarkably easy to get started with, but its many limitations became apparent after some days of use. At that time I was (in)famous among my colleagues for my "telegram" style documents in Czech, because all were without accents, as is normal with telegrams.

In the end they got used to this style, but they were not happy – and frankly speaking, nor was I. Sometimes words without accents have a different meaning and besides it was a solution usable between friends only. I can't use such a document outside our "inner circle".

The next step was adding the Combined Graphic Writer (Computer Stations Inc. USA) ▶

◁ 1981) software that allows flexibility in the printed output. It worked with AppleWriter 1.0 and 1.1 in much the same way as the FontWorks software works today with AppleWorks (naturally without the ability to print sideways), that is you had to embed into your AppleWriter text special Graphic Writer commands (you can freely choose any character for this command).

You could use 10 different character fonts from a total of 21 – all from the famous, in those days, Apple Dos Tool Kit in one document.

After choosing your font(s) and embedding all commands you were able to print your AppleWriter document file via the Combined Graphic Writer. You could also print short notices from an Applesoft program.

This software, though useful in a limited way was no solution to our problems. It was unsuitable for documents, because for non-English letters you had to use symbols only and then you have on the screen mixed letters and symbols in words – try proofreading such a document on the screen!

And there was a second reason: the Apple Dos Tool Kit's font editor matrix (7 × 8) is too small for creating nice looking fonts with special symbols and letters with accents. (Please note, that all notations in this article for matrix or picture sizes are quoted as width × height).

The search continued. For creating headings, title pages, titles for slides, overhead projectors transparencies and so on. I have successively used Higher Text II, the Complete Graphic System, Fontrix, Font and Shape Mechanic, Print Shop and other similar software.

Three Gutenbergs

In the meantime the Gutenberg word processor, named after the German inventor of printing with movable characters (1445) and printer of the famous Gutenberg Bible, was introduced on the market (1981) and advertised as a multi-purpose, multi-lingual word processing and text formatting program written for the Apple II family of micros and allowing up to 21 different printer fonts within a single line; proportionally spaced in 14 different print pitches and micro-justified lines.

What's more, the promise of mixing text and graphics, with hi-res pictures and removing nearly all the restrictions that a user might encounter was added.

Needless to say, I immediately bought this expensive piece of software, because the advertisement promised to fulfil my vision. Please, don't laugh at me, this was in 1981, and I was still a comparatively inexperienced Apple user.

I didn't know that advertisements for software are in one respect exactly the same as for all others – they practically never tell you of the limitations and deficiencies of the advertised programs, nor that some capabilities are strictly hardware dependent, not about the difficult learning curve, and so on. Now I am perhaps better aware of life in the software and hardware jungle I will never, I hope, make this mistake again.

Gutenberg was (and still is in today's reincarnation in two shapes – Gutenberg Sr. and Gutenberg Jr.) a fine piece of software. It has some really exotic features and can solve some very specific problems, but certainly it is neither a general purpose word processor, nor the word processor of my vision, nor a user-friendly and consumer-oriented product.

Editing with Gutenberg is done on a text screen in low resolution (22 lines per screen to display only the normal 94 Ascii characters) or on a hi-res screen in high resolution (11 lines per screen to display in addition up to 115 extra, user-defined characters). The latter is suitable for a custom font size (matrix 7 × 12) and within it you can define specially shaped characters, foreign language characters with accents, mathematical symbols and so on.

The Shift key modification and Gutenberg

AS the first version of Gutenberg worked with a hi-res screen, no lower case adapter for the Apple II+ was necessary, but you had to make the famous Shift key modification all the same.

For Gutenberg it doesn't matter whether you have an Apple II+ or IIe with lower case, it only checks whether this modification of the hardware is made and if not, refuses to cooperate with you.

By the way, do you know that if you get the original version of Gutenberg or another piece of software, which needs this modification it is possible to make it on Apple IIe, too?

The mod on the IIe is not mentioned in any Apple manual, but is very simple.

On the motherboard you will find a jumper X-6 (see also Apple IIe Reference Manual, page 180, Figure 7-14b, schematic diagram, part 2). For the Shift key modification it is necessary to solder together both divided halves of this jumper.

This modification will make no difference to other software, except for the loss of the game connector switch input PB2 (connected to the internal connector pin number 4 and back panel connector pin number 6), because normally only switches PB0 and PB1 are used.

Character sets

Because Gutenberg is able to work with two alternate sets of characters and also with many Control "characters", you have at your disposal up to 209 different characters and (with Gutenberg Sr. only) 10 foreign fonts besides English – they include French, Spanish, German, Italian, Portuguese, Serbian and Hebrew.

Gutenberg's Editing has some peculiarities. In the insert mode, text is parted by an unusual wide gap to make room for the next piece of text, and the overwrite mode always terminates at the end of the line.

The screen doesn't scroll; instead it is re-written and advanced by one line, a sentence or a paragraph at a time, and this is a little annoying. And from the ergonomic point of view it is not too good for your eyes.

On the other hand Gutenberg has a very powerful Search function which is maskable as defined by 10 types of masks. For example, the mask can be such that the character must be in the range 0 to 9.

Another spectacular feature of Gutenberg is the screen, which is divided into two windows. You can not only load a separate file into each window, but can also edit each file separately and move words, sentences or blocks from one file to another.

This feature can be found only in a very limited number of word processors, and is, really powerful and a very useful one.

The ability to create macros and use them directly or execute a whole chain of macros all at once is another efficient feature of Gutenberg. The text buffer is linked to the disc and allows very large disc work files.

The font editor is primitive and clumsy. You can't, for example, transfer to the editing window one character, edit it and after finishing all changes send it to its new Ascii location. There is no way of drawing or altering a character and then deciding where to put it.

For example, if you need to add an accent on the top of e you can't simply add this accent to e and substitute this created character for { (Ascii 125).

No, you have to transfer { to the edit window, clear the edit window and start designing e with accent from scratch. I have not found such a peculiarity in any other font editors. This one also has very limited editing commands.

On the other hand, Gutenberg does have the special PAINT program which can be used to prepare pictures, graphs, diagrams, borders, oversized individual letters and so on.

The images can be cropped, if desired and saved to disc. They can then be printed out by themselves or embedded in text. ▷

Better Looking Electronic Publishing

The Monotype Typographical Conference 1987

*How to improve the visual appeal of
your Electronic Publishing output*

The Monotype residential Typographic Conference is a key event in the calendar for those interested in high quality typography.

In 1987 the 8th annual residential Conference concentrates on achieving better visual performance from Electronic Publishing systems. You have the equipment; but we help you with the sparkle – that special extra that gives your documents professional authority.

The speakers will review management, training, design planning, special techniques, selection of typefaces and sizes, paper grades and offset printing methods to achieve best quality production. In addition, a separate exhibition of Electronic Publishing equipment will offer practical examples.

Come for a stimulating and rewarding conference from 7th to 9th September to improve your Electronic Publishing output and to enjoy the ancient and glorious surroundings of Queens' College, Cambridge.

☆☆☆OVERSEAS ORDERS A SPECIALITY☆☆☆

Pictures can be up to 558 × 190 dots or 278 by 332. That is, a picture may extend across an ordinary page and be about 6cm high, or occupy one column of a two columns format and be about 13cm high. Exact dimensions vary from printer to printer.

Gutenberg does not allow you to use fonts or pictures from any other software, and this makes the use of its rather primitive paint program questionable.

Printer support

Gutenberg supports only a very limited number of printers and only a few more interface cards. Fully supported are Apple's DMP, the Centronic 737 and 739, C.Itoh 8510 and NEC 8023, others, including Epson, are only partially supported. For example, for Epson printers proportional spacing is not supported. The contemporary version (Gutenberg Sr.) also supports the Imagewriter I, C. Itoh Prowriter, Epson MX-100/III compatibles and the Gemini 10-X.

Another version, a stripped-down Gutenberg with very limited features named Gutenberg Jr., is strictly printer-specific and you have to state when buying it which printer you will be using.

As for interface cards, the Apple Super Serial, Grappler, Pkaso and Prometheus are supported. Gutenberg supports only Apple's ImageWriter and DMP when printer font down-loading. Printing in two columns mixing hi-res pictures, created by Gutenberg's own Paint program with the text, is supported.

Gutenberg is neither menu-driven nor has it a Help screen, and in spite of this the number of Gutenberg and Gutenberg Sr.

formatting commands is overwhelming – there are about 120 of them and most are not mnemonic.

Of course this does mean that it has the most complete and sophisticated set of format commands of any Apple word processor based on Dos 3.3, but it also means that it is for dedicated users only. The Gutenberg Jr. provides an assortment of ready-to-run but unchangeable formats including three letter formats and some of them can be modified, but only slightly.

In addition Gutenberg has special conditional format commands which can be used to determine whether additional format commands are to be executed. For example, if the page number reaches a certain value, the program leaves a blank space for an additional paste-up of the picture.

You can't transfer this copy-protected program to hard or ram discs and you can move files in and out of Gutenberg only with a special GLOBAL program which can move data between Gutenberg, Dos 3.3 and CP/M (not Prodos) and which is exclusively in Gutenberg Sr only.

The original version of the Gutenberg documentation was unacceptable. It had no tutorial and was full of extremely detailed technical explanations, unnecessarily so for the average user.

The second version included a tutorial and was still very difficult to understand, but was at least usable. I only browse through the last version of the manual – it has 768 pages and it still is not professionally prepared.

Saving the worst news at the end, Gutenberg is certainly not a WYSIWYG (What You See Is What You Get) word processor. On the contrary, you have to create special files with formatting com-

mands and always use one of them linked with your text file. You never know for sure exactly how your document will be printed before seeing the end product.

Pros and cons

After working for some months with Gutenberg I finally reached the conclusion that it is certainly neither a word processor for most of us nor for normal professional users, regardless of some of its outstanding abilities and the availability of so many special characters.

The program is extremely complex and because of its command structure and quantity will require a great deal of time to master. If you are not working with it for hours each day, you will often have to refer to the manual – and to find out exactly what you need is not so easy.

The program was created by Johann Wagner, whose background was in traditional printing, together with two co-authors, both university professors, in Canada. The trio created Gutenberg to have a word processor suitable for typesetting and printing papers and other documents in different layouts.

Gutenberg is designed to do these things very well. If you are working with documents with complex and unusual formats which are never or seldom changed, if you need to use special characters or symbols and if you don't have a LaserWriter and Apple IIGS, or a Macintosh with PageMaker, and are willing to spend a great deal of time and considerable amount of money and effort, then, perhaps Gutenberg is for you. But it most certainly is not a general purpose package. And it is overpriced.

OK, that's all about Gutenberg. In due course I switched to the Apple IIe, mainly with AppleWriter IIe (later with AppleWorks, but this is another story), as I still sought a solution to my problem.

Of more than 50 word processing programs for the Apple II family about six work in the graphic mode, but not all have a font editor. Some of these word processors using the graphic mode are very old now and not supported any more – Super-Text, SuperScribe, ScreenWriter, Zardax. Finally I came across MultiScribe... more of which next month.

A free 16 page brochure, describing in detail many features of both versions of this product can be obtained from Gutenberg Software, 47 Lewiston Road, Scarborough, Ontario, Canada, M1P 1X8. Tel: 416 757 3320. Price: Gutenberg Sr. CDN \$460, Gutenberg Jr. CDN \$118.

Deadline? Nobody told me anything about a deadline

Kurta makes Apple blossom

Enjoy more productive *Desktop Performance* than ever before with the new Kurta IS/GS™ – the first graphic input system for the Apple IIGS™.

The Kurta IS/GS is the most technologically advanced cordless input system available today. You can have more freedom, versatility, control, and flexibility with such programs as PaintworksPlus™, TopDraw™, Graphicwriter™ and other software packages available for the Apple IIGS. Kurta's products also complement Macintosh, Macintosh Plus, and Apple II using popular software packages like Pagemaker™, Fullpaint™, MacDraw™, MacDraft™, MacCad™, MATC-CAD™ and CadApple™ among others.

Discover all the ways Kurta can make your Apple blossom. Contact Techex today.

TECHEX

The complete range of Kurta tablets for all popular computers (IBM, Amiga, Apple) is available throughout Europe from Techex.

DEALER ENQUIRIES WELCOME.

The strength of the pas

Apple Computer UK Limited, Eastman Way, H
Apple. The Apple Logo. Macintosh an

t, the power of the future.

There are three million Apple II users around the world.

Businesses. Freelancers and entrepreneurs. Teachers and pupils. Artists and scientists.

Individuals who use their computers in three million different ways – which says a great deal about the Apple II's versatility, staying power, and ingeniously flexible design.

So when we set out to create a new generation of Apple II, we knew that we were building on a hugely successful heritage. All we then had to do was use the newest technology to make it fast, powerful, communicative and colourful. As well as compatible with the enormous range of existing software and hardware, and as flexible as ever.

Welcome to the Apple IIgs™

First, meet the 65C816 microprocessor. It has 16-bit performance, making light work of powerful new software, yet it can run virtually every program in the existing Apple II library – up to three times faster.

It does this by working with another chip, the most surprising one of them all. The Mega II: the Apple II on a chip!

This tiny device has the functionality of the Apple II family crystallised into one square inch, which leaves a lot of room for new features.

Take a look at the outstanding graphics combined with 4096 colours of stunning intensity, from electric red to the most delicate violet.

Close your eyes and listen to its 32-oscillator synthesizer, enabling it to reproduce sound as faithfully as it reproduces sight, from natural human speech to jazz compositions and film sound effects.

It has the power to meet the toughest problems that business has to face, yet with the same friendly approach of its famous brother, the Apple Macintosh™. The mouse is free. And so is the software that makes managing your computerised information as easy as selecting papers from a desktop.

So, with almost a decade of success behind it, the new high-performance Apple II looks forward to a new generation of opportunities to show off its new talents. The possibilities are endless.

Now even politics take off in a game

Product: F-15 Strike Eagle
Price: £21.95
Supplier: Microprose, PO Box 24, Cirencester,
Glos. Tel: 0453 886386
Requirements: Apple II, II+, IIe, with joystick

BILLED as America's number one fun combat simulator this is the very latest edition and includes the – wait for it – 'Anti-Terrorist Airstrike to the Shores of Tripoli 1986!'

I am really not so sure that a game should be so overtly political but then this is an American game and perhaps the name of the mission is not terribly important.

Right, let's get strapped into the ejector seat. First select one of the eight combat missions and then one of four levels of expertise (arcade, rookie, pilot or ace).

Before flying there is a real intelligence test – try and find the authentication code (it's printed in tiny letters spread through the instruction manual).

Now you are flying at mach 0.9 at 6,000 feet with an array of sophisticated displays including a 'Heads-Up-Display' projecting target and threat tracking information, navigational cues and status messages directly on to the plane's windscreen. There is also a range selectable radar, a ground map and a weapons status display.

Your job, as pilot, is not only to fly the aircraft but also to select the most appropriate offensive and defensive weapons, the best flight path to and from target and take part in high speed aerial dogfights. The simulation does not include take-off or landing.

If the flight operations manual is to be believed then this program is a faithful simulation of the F-15 attack fighter including all major flight, weapons and information systems.

I would say that a colour monitor and joystick are almost essential. So much of the screen information depends on the colour (blue sky, green land, red warning signals), and there is plenty of keyboard work con-

and there is plenty of keyboard work controlling the weapons system – the pace can be so fast that you hardly dare let go of the joystick.

In comparison with something like Flight Simulator II this is very much easier to fly but there is plenty to think about. All in all a very good game with good graphics: fast moving, well documented and well

presented. But perhaps I should leave you with the words of the Micro-Prose president "...Dedicated to the men and women, who build, maintain and fly one of the world's greatest aircraft at McDonnell Douglas and in the US Air Force. Remember the next time you hear a fighter jet go by – You are hearing the Sound of Freedom".

Bill Hammerton

European battles fought again

Product: Crusade in Europe
Price: £24.95
Supplier: Microprose, PO Box 24, Cirencester,
Glos. Tel: 0453 886386
Requirements: Apple II, II+, IIe, IIc with 64k and joystick

THIS is another one of those excellent strategic simulation games from Microprose. Even for those who have not played strategy games before, Crusade in Europe will provide an excellent introduction.

The accompanying literature is particularly good with a manual of 55 pages including a full-colour map and extensive historical notes to accompany each of the

five campaigns available plus 14 different variations – all of which, according to Microprose, are accurate.

The game puts you in command of either the German or the Allies in the battle for France and the Low Countries during the summer and autumn of 1944.

Scenarios include the battle for Normandy, from the D-Day landings to the liberation of Paris, the Allies' race to the German frontier, Operation Market-Garden, the desperate German counter offensive known as the Battle of the Bulge and a campaign game.

Most of the scenarios include a number of variants that take different amounts of

time to play or, interestingly, explore alternatives to the historical situation.

For example you can play 'what if' Hitler had not believed that the Allies main landing was to be at Pas de Calais. Perhaps there might have been a very different outcome to the war.

The game can be played by one player against the computer, or by two players against each other or even the computer against itself. With the varying degrees of skill, advantage, intelligence and ability that can be set, two players of widely differing abilities can still play a satisfying game.

Once you have decided on the battle and variant and entered the correct code response then battle begins. In contrast to most strategy games *Crusade in Europe* does not proceed by turns. Instead the computer conducts the activities of the units continuously, while a clock ticks away.

However the game can be frozen at any point and the speed can be altered from slow to medium to fast at any time. During the hours of darkness the map display changes from white to black and there are many other nice touches not normally found in simulations, such as multiple map scales, a flashback mode and intelligent units. Games can go on for fairly lengthy

periods and there is a facility for saving up to 15 different game situations.

Another interesting feature is the overview map which will show on one screen the land and sea areas incorporated in the whole game map and the location of all units.

On the reverse of the disc is a 128k version that uses the double hi-res screen of

the IIE and gives other added features such as changing the colour of the text area depending on which side are playing.

All in all this is a superb, complex, historically-accurate wartime strategy game. If you have any interest in the period or war games in general *Crusade in Europe* is a must for your collection.

Bill Hammerton

Program: *Alternate Reality: The City*

Price: £19.99

Supplier: US Gold, Units 2/3, Holford Way, Holford, Birmingham B6 7AX.

Tel: 021-356 3388

Requirements: Any Apple II with 64k

THERE have been many different (and some not so different) role-playing fantasy games on the Apple. *Wizardry* and its sequels are perhaps the best known, and most games follow the *Wizardry* style quite closely.

Alternate Reality does have points in common with the classic – you are wandering around in a maze gaining and losing various hit points and other character statistics. However it would be unfair to dismiss it as just another *Wizardry* clone.

The scenario starts where you have been kidnapped by an alien spaceship and transported to the City of Xebec's Demise. I have no idea who Xebec is (or presumably was) but I don't suppose it matters at the moment. It isn't my choice of a holiday resort.

Your kidnapers can't be all bad because you do have adequate clothing, some food and water, and a small amount of money. The actual amount of cash varies, but it is usually enough for you to purchase a compass (easily available at all shops and very useful) and a basic weapon if you bargain with the Smith. Be careful, however. If you annoy the Smith in your bargaining you can get thrown out and he has a long memory.

The gateway to the city

You start the game in a "room with only one exit". Through a crackling energy screen you can just see a city. Above the screen are constantly changing numbers in boxes labelled HP, WIS, INT and so forth. Any key press freezes the numbers and thus determines the vital statistics of your character.

It is possible to influence the starting vari-

ables a little. Most of the numbers are changing slowly enough for you to aim for a high figure. Hit points in particular don't tax your reaction time too much and I've managed up to a 23 – which, since they go as low as 03 and a single blow can cost you 4 points of damage, can alter your chances quite considerably.

Charisma points are harder to be selec-▷

tive with, but it is interesting to aim for a high skill or intelligence level to see where it gets you. Unfortunately, I found this usually meant I ended up with a low number of hit points, so it never got me very far.

Your displayed characteristics are not the only variables in the game.

If you choose to kill off all the innocent commoners and walk away from nasty muggers your character will be labelled "bad" and this will have consequences for future encounters.

I suspect that other more subtle records of your interactions are also being kept, but Xebec's Demise doesn't have a "freedom of information" arrangement.

The object of the game isn't as straightforward as "kill the princess and rescue the evil sorceror" because *The City* is only the first of a seven-part series. The ultimate scenario is *Destiny*, where you have to decide whether to return to Earth or take revenge on your kidnappers.

In *City* you are aiming to build up one or more characters in order to take part in the next episodes. Apparently you need at least a level 10 character to bother with the second scenario, the *Dungeon*, and I would guess that you had better buy more suitable clothing before you try the elevated social status of the *Palace*.

You enter the *City* with neither experience nor weapons which makes you fairly vulnerable. Fortunately the other inhabitants seem similarly incompetent at first. It is possible to overcome a swordsman wielding a long sword bare-handed, but this is not recommended. Unfortunately their weapons usually vanish on the owner's death, so it's not an easy way to build up an arsenal.

Each blow you land successfully gains you experience points, with an extra bit when your opponent dies. At about 300 points your character progresses to a level 1 status but you have to double your points to get to each successive level. Level 10 is going to take a lot of points!

You can either work with a temporary character or create a new being which can then be saved. A temp is fine to get around with and get the feel of the city, but you can't keep going indefinitely.

Unfortunately I found the save facility annoying. You can save a character on to your prepared disc but that ends that playing session. When you resume playing with the character it is wiped off your character disc.

In order to protect the work of several sessions you need to back-up the character disc. This is not hard, but is an extra bit of disc swapping and messing about which could have been dispensed with.

In some similar games – for example, *Xyphus* – you use the character disc in play, constantly changing the character, so it is understandable that a saved character will be changed. However, *Alternate Reality* does not use the character disc in play so I

Alternate Reality: An encounter in the city

cannot understand why they have to wipe the character when play is resumed.

The *City* is a large maze of streets, alleyways, concealed areas and one-way traps. There are a number of shops, banks, smithies and other vital facilities which you need to be able to find – when night falls you need to know where the nearest inn is, assuming you can afford the board.

The whole *City* needs to be mapped and can be drawn on a 64 x 64 grid. I only found this out when US Gold kindly sent me a copy of the *Alternate Reality* Newsletter which referred to such a grid "provided with your game".

By devious means I got hold of the original Datasoft Atari version. The manual is virtually identical except for the inclusion of the grid, complete with the beginnings of a map. I found this invaluable and was quite annoyed that the review version did not contain it (US Gold please take note). The pretty picture map they sent is very nice, but not a lot of help.

The newsletter also told me that by squinting at the tiny display through which you view the *City* you can just make out vertical lines along the walls, each line corresponding to one square on the grid. It is not easy to spot the lines in the first place, and proved even harder on a 11c screen than the 11e monitor. Colour was no advantage.

Mapping the *City* is not only important in order to find various establishments while building up your experience. Access to future scenarios is via the *City* and you need to find the entrances to them within it. Also you need to use *City* facilities like banks and healers so the game will not be relegated to the back of the shelf once you've built up your version of *Rambo*.

Control is by keyboard only. The main movement keys are IJKL, which I found very convenient. Other keys are used for the various interactions, but you are prompted on-screen at the appropriate time. This was a welcome change from games which

either expect you to memorise 26 or more different commands or spend all your time reading the manual.

On your travels around the *City* you are going to meet various life forms. In fact, the easiest way to meet them is to just stand still and wait. Your interaction is varied by who sees whom first, who saw whom the quickest, and so on.

"Good" forms are heralded by a lively tune and should be left alone if you want to develop a saintly character. Evil forms are heralded by ominous notes and should be exterminated if possible.

Apart from the advantage to your experience level there is the possibility of finding treasure, particularly if you venture out at night.

The music in *Alternate Reality* is described as "original". There are various ways of interpreting that! I hated it, especially when I found myself humming it in Sainsbury's. The other shoppers were only fortunate that I had not learned the words which appear on-screen in time to the music.

The sounds cannot be turned off which can be annoying to non-players in the same room.

The graphics are quite good and the scrolling around the 3D maze is smooth. The hi-res screens inside buildings are very detailed and a welcome change after wandering the streets.

Alternate Reality: The City is a large game. On its own it could keep you playing for some time, but the whole series could be a very long commitment. It is impossible to mention everything in a review, and like all games it has its good and bad aspects.

On the whole, I enjoyed it and will carry on playing it even after writing the review. I also look forward to having a go at the next episodes. Maybe by the time they arrive I'll have a strong enough character to play them.

Program: *Hacker II*
 Price: £24.99
 Supplier: Activision, 23 Pond Street,
 Hampstead, London NW3 2PN.
 Tel: 01-431 1101
 Requirements: *Apple II with 64k and joystick*

HMMM, what's this? "Logon please:". Now what sort of ID is it expecting? Here goes ... hey, I'm in! Who said I couldn't hack my way out of a paper bag?

Well, that bit was easy, now what's on offer on this menu - wow, transmission interrupted.

It seems the CIA has recognised me as the world's leading authority on computer security systems and wants to enlist my help. Unless I succeed, a Russian plan could shift the balance of power and jeopardise the entire free world, not to mention Wigan.

With Big Ronnie in the driving seat, you may feel the balance of power could do with a little shifting, but you didn't get where you are today by entertaining such thoughts.

Fortunately you don't have to go to Siberia where the Doomsday Papers are located, because the CIA will lend you their satellite. That way you can use your com-

Hacking around

The multi-function switching matrix display

puter - obvious, innit?

They've even managed to secrete a few Mobile Remote Unit droids around the place for you to control and have planted a Multi-Function Switching Matrix in the building to help you avoid detection.

It's a pity they didn't manage to get the Doomsday Papers while they were messing about with MRUs and MFSMs, but that's the CIA for you - they've made some pretty enormous real-life mistakes in their time, so why should they be any different in a game?

You are linked to the MFSM via the CIA's computer and satellite, and after a quick training session you can start to use it for real. As far as I can tell, you'll need a joystick. It's a superb display (see screen dump), and looks even better in colour.

The first thing I did was to try the video recorder and was amazed to find all the controls worked. By fast-forwarding the tape I was able to see at what intervals the guards patrolled, and then ... but that would be telling, and I'm sure the CIA wouldn't want me to do that.

The biggest problem I had with *Hacker II* was thinking myself into its scenario. The old "Reds under the bed" threat may well still rouse some Americans, but not any of the ones I know. I also don't think the game would appeal to real hackers - they don't tend to bother with joysticks and they're too busy landing their parents with enormous phone bills - but if you're happy to dream that one day the CIA may interrupt your session on the local bulletin board, you might as well play *Hacker II* while you're waiting.

It pays to increase your word power

DO you use AppleWorks and are you a poor speller? If so, the Pinpoint Pop-up Spelling Checker may be just the thing for you. It checks the spelling of any AppleWorks file while the document is currently on the screen.

The Spelling Checker's dictionary contains about 56,000 words, but you can also create your own dictionary of words that are not in the main file.

With other spelling checkers for Appleworks you have to save your file, quit AppleWorks, boot up the spell checking program, reload the file, search the dictionary, correct the errors, and so on.

With the Pinpoint package all you do is hold down the Closed Apple key, press P, and select the Spelling Checker from the Pinpoint menu. It's as easy as that.

The Pinpoint accessory program (reviewed in *Apple User*, September 1986) offers AppleWorks users the facility to have a notepad, a calculator, an appointments calendar, a communications program, an automatic dialler, a facility for merging graphics with text, an easy way of printing addresses on envelopes or cards and the ability to use your printer like a typewriter.

Any one of these accessories can be selected from a pop-up menu after you press Closed-Apple-P.

Installation

The spelling checker is a separate program from the Pinpoint accessory one, but you need to buy both because the spelling checker must be installed as an accessory within Pinpoint. Although Pinpoint can be installed on other programs, the checker operates only on AppleWorks. The checker comes on two sides of a write-protected disc but it is not copy-protected. First you must copy the discs so that you can configure the program to meet your needs. The 48 page manual gives reasonably clear instructions about installation and operation of the program.

The first step is to boot up the installation disc. (The second disc simply holds the dictionary files). After a graphic demonstration of spelling correction, the screen offers an installation menu similar in appearance to AppleWorks. The first item on this menu asks you to specify your version of AppleWorks. The program works with four

Geoff Wood looks at an AppleWorks accessory that takes the guesswork out of spelling

versions, 1.0, 1.1, 1.2 and 1.3.

Next the installation menu asks you to set default options for the spell checking mode. These can be changed temporarily after the program has been installed, but if you want to change the default options permanently you must reinstall the program.

The first default option checks the spelling of a single word rather than all the words in a complete paragraph or a document. The second default option leaves the sound turned off rather than beeping every time it checks a word. The third default option displays alternative spellings from the dictionary, but this facility can be turned off if you prefer.

The fourth option offers summaries for each paragraph; the default option is off. The fifth default option gives a summary of the whole document, telling you how many words were checked, how many suspect words were found, how many corrections were made and how many words were added to your own dictionary.

The sixth option offers a word count only; the default option is off.

Standard location

Having set the default options, you then revert to the installations menu and choose its third item, which allows you to specify the standard location of the dictionary files. The default is drive 2, but if you have a hard disc or a ram disc you can enter a suitable ProDOS pathname.

The fourth item on the installation menu enables you to install the checker on the Pinpoint installation disc. It copies a file from the checker disc to the Pinpoint disc.

The final step is to install the updated Pinpoint program on your AppleWorks startup disc. Pinpoint is compatible with expanded versions of AppleWorks such as Applied Engineering's RamWorks, Ram-

Factor and Z-Ram and Checkmate Technology's MultiRam, so you can use an AppleWorks startup disc that has already been expanded for a ram drive.

Once the installation is complete you can boot the AppleWorks startup disc, insert the program disc and use AppleWorks in the normal way. When you are ready to check some spelling you invoke the Pinpoint accessories menu with Closed-Apple-P and select the Spelling Checker from the menu.

At this stage, if you are not using a hard disc or a ram drive with the checker files already installed, you should put the checker installation disc in drive 1 and the dictionary disc in drive 2.

Charging defaults

The manual recommends saving your file before you start checking spelling. You may also wish to change some of the default options. If so, press Closed-Apple-M. A pop-up menu appears from which you can temporarily change any of the options. This menu also offers you the opportunity to opt out of the checker.

When you are ready to check some spelling, you simply locate the cursor where you want to start, hold down the Closed Apple key and press P. The word where the cursor is located is highlighted in inverse, and the program refers to the dictionary to check the word. It will either accept the word (if it matches one in the dictionary) or it will display a panel offering various options.

If the program is set to offer alternative spellings, the panel displays a list of up to 10 alternative words and you can select one if you wish. (The program is smart enough to replace upper and lower case letters with the correct case.)

Alternatively, you can edit the suspect word using normal AppleWorks keystrokes for text editing. Or you can add the suspect word to your personal dictionary or simply press the Esc key to proceed without changing the suspect word.

If the program is set to spell check a paragraph or a document, each consecutive word is highlighted as it checks away. When the program comes across a word that does not match, it pauses and displays the panel of options. You must then make a >

◁ choice before it proceeds to the next word.

This means that if you set the program to spell check a long document and then go off to do something else, you may return to find that it has discovered an error on the first page and has paused there awaiting your instruction.

Other spell checking programs such as Sensible Speller can be left to check a whole document and give you a list of suspect words. You can then go through the list of words one at a time and either accept a suggested alternative, edit the word, add it to a dictionary or leave it as it is.

However, Sensible Speller does not operate from within AppleWorks. You have to quit AppleWorks, boot up the spelling program and load the file you wish to check.

With the Pinpoint Spelling Checker in paragraph or document mode, if you have asked for a paragraph or document summary, when it has completed checking a paragraph or document it displays a panel showing the total number of words checked, the number of suspect words found, the number of corrections made and the number of words added to your dictionary.

Journalists and writers may find the word count useful. You can have a word count without the spelling check if you wish.

Trial and error

The manual does not explain that the search mode and the summary mode must match – I discovered this by trial and error. If you want a summary at the end of a document, the program must be set to spell check in document mode and to give a document summary. Similarly, if you want a summary at the end of a paragraph, the program must be set to spell check in paragraph mode and to give a paragraph summary.

If the program is set to spell check in document mode and to give a paragraph summary, it ignores the latter instruction. Similarly, if it is set to spell check in paragraph mode and to give a document summary, it ignores the latter instruction. If it is set to spell check in single word mode, it will not give either a paragraph summary or a document summary, even though one or both of these may have been requested.

Paragraphs are spell checked from the cursor position to the first blank line. If there are no blank lines between your paragraphs it spell checks from the cursor to the end of the document.

While spell checking a document in paragraph or document mode, you can halt the process by pressing the Esc key. You will not then get a paragraph or document summary.

The Pinpoint Spelling Checker is not limited to checking word processor docu-

ments; it can also check words in an AppleWorks spreadsheet or database. According to the manual, these cannot be checked in paragraph or document mode; the program must be in word mode and you must locate the cursor in the cell or field you wish to check.

However, I found that you can print the spreadsheet or database file on to the clipboard, paste it into a word processor document and check it in paragraph or document mode.

Limitations

The program only checks spelling. If you type "their" instead of "there", or "to" instead of "too", or "you" instead of "your", or "it" instead of "is", it will not identify your mistake. If you type "Paris in the the spring", it will accept "the the". Even on spelling, it is not entirely foolproof; it accepted "his's", "her's", "their's", "our's", "mine's" and "your's" and some wrong plurals such as *fun's*.

Also, like many other spelling checkers, the Pinpoint program is American, so its dictionary includes words like *color* and *labor*, but not *colour* and *labour*. The program does not accept words like *recognise*, *organise* and other words ending in "ise" that the Americans spell with "ize". Nor does it accept *defence*, *offence* and *pretence* which the Americans spell with "s" instead of "c".

It thinks that words like *appal*, *fulfil*, *instil* and *skilful* should have double "ll". It doesn't like the "e" in *likeable*, *liveable*, *rateable* and *saleable*. And it suspects words like *calibre*, *centre*, *fibre*, *litre*, *metre*, *spectre* and *theatre* that the Americans spell with "er" instead of "re". However, you can expect to have similar problems with most spelling checkers.

The answer is to put these English words into your own dictionary file. The process of spell checking a word takes slightly longer when it can't find the word in the main dictionary and looks in your own dictionary file. This is created as an Ascii text file so you can inspect it via AppleWorks and delete words if you wish.

The biggest drawback to some spelling checkers is that they tend to be slow. This is certainly true of Pinpoint's checker if you operate it from floppy discs. The program works faster from a 3.5 inch disc or, better still, a hard disc. The fastest way is to load the program and dictionaries into a ram disc. Indeed, the advertisements do say that "Pinpoint and the Spelling Checker are particularly suited for use with extended memory cards".

I used the Spelling Checker to check this article. In document checking mode it took almost 45 minutes with two floppy disc drives and 27 minutes with programs and dictionary in a RamFactor ram card. With a TransWarp accelerator card and the ram card it took only 11 minutes.

The document summary said that there

were 2335 words of which 40 were suspect. More than half of these were in the paragraph about the differences between American and British spelling. It also challenged AppleWorks, Ascii, Exc, MultiRam, Prodos, RamWorks, RamFactor and TransWarp, but it accepted Pinpoint as a word. The other words questioned were clipboard, dialler, etc, notepad, pathname and spreadsheet.

I also used it to get a word count without the spell check. It took 20 minutes with floppy discs and the same time with the program in the ram drive. With the accelerator card it took only eight minutes.

I then checked the article with Sensible Speller. With the program and dictionary on floppy discs it took less than three minutes to collect and check the 2335 words. With the program and dictionaries in the ram card it took only one minute.

However, these times are only for spell checking. The process of editing the suspect words is separate. This took three minutes with floppy discs and two minutes with the program and dictionaries in the ram card.

The combined times are much faster than with the Pinpoint package, but they do not include the time needed to quit AppleWorks and boot up the Sensible Speller program. Even so, Sensible Speller is much faster.

Advantages

One of the advantages of the Pinpoint offering is that it can be so readily adapted to different modes to suit your needs. You might prefer to use it in the single word mode just to check an occasional word when you are not sure of the spelling. With floppy discs, this involves changing discs so if you want to use it this way it is better to have a hard disc or ram disc.

You may prefer to check each paragraph as you go along. However, to save changing floppy discs you really need a 3.5 inch disc or a hard disc or ram disc.

If you are a reasonably good speller, you can turn off the option to suggest alternative spellings. This speeds up the checking process. You can then correct most of the suspect words from your own knowledge and turn the option on temporarily for the occasional word about which you are not sure. Or you might be happy to just have the word count.

Despite a few shortcomings, this is a good program. It is almost a must for AppleWorks users who are poor spellers, and a useful accessory even for good spellers.

The Pinpoint Accessory Program cost £69, as does the Spelling Checker. Both are available from Bidmuthin Technologies, PO Box 264, Harrow, Middlesex HA3 9AY. Tel: 01-907 8516.

BIDMUTHIN TECHNOLOGIES — IMPLEMENTING YOUR IDEAS

Apple computers are renowned for their ingenuity, versatility and reliability. The people who buy them are a reflection of these qualities. But sometimes the requirements of an Apple user out-strip the capabilities of their helpmates. That's where Bidmuthin Technologies come in — helping you to implement your ideas.

Bidmuthin Technologies is a distributor of high-quality peripherals and up-grades for all versions of the Apple, including the new GS.

They are all manufactured to the highest specifications by the market leaders in their fields, names such as Applied Engineering, a watchword in Apple Technology, Pinpoint, manufacturers of high-class software and accessories and VIP Professional, bringing the power of Lotus and Macintosh to the Apple II.

With these products, you can give your Apple a new lease of life, making it faster, more efficient and more productive.

VIP PROFESSIONAL — COMBINING THE WORLDWIDE BEST SELLER LOTUS 1-2-3 AND THE MACINTOSH INTERFACE

VIP Professional is a special piece of software for business users. It is designed specifically for the Apple IIe, IIc and IIGS and combines two heavyweights for use with the Apple. The Lotus 1-2-3 is the most popular, most powerful spreadsheet for IBM and compatibles but Professional allows this industry standard to run on your Apple and adds a Mac-style interface.

Professional has all the features of 1-2-3 and works in exactly the same way, but its additional features make it simpler to use and even more powerful. It uses the same commands and language as 1-2-3 but it has a pull-down menu style format making it extremely easy to learn, particularly as a user sensitive tutorial is included in the package. It outshines the 1-2-3, version 1A, on power with the ability to use 4 megabytes of memory and a giant 8,192 row by 256 column spreadsheet for specific tasks such as accounting and data analysis. It will even transfer spreadsheets from Appleworks. The five different types of graphs have tens of options so that your ideas are even easier to communicate effectively.

Price — IIe/c — £219.00, GS — £279.00 (Ex VAT)

TRANSWARP — THE FASTEST ACCELERATOR BOARD AVAILABLE FOR THE APPLE IIe OR II +

TransWarp takes the Apple IIe and II+ beyond the limit imposed on them by their design.

It will even run your IIe faster than a GS — the figures from Open-Apple Magazine prove it:

IIe — 245 secs; IBM-PC — 191 secs; Macintosh — 125 secs; Mac Plus — 96 secs; IIGS — 96 secs; IBM PC AT (6MHz) — 80 secs; IIe and TransWarp — 80 secs. Results of "sieve" benchmark.

TransWarp recognises no frontiers; it accelerates main memory, ROM and auxiliary. So it zips through work that normally takes a day, in just a morning by running software 3½ times faster than normal. It's totally compatible with all Apple software as, unlike its competitors, it doesn't use caching techniques. It plugs into any slot on the Apple IIe or II+ without the need for additional software to make it work.

Price — £279.00 (Ex VAT)

RAMWORKS — MEMORY FOR THE APPLE IIe, FROM 256k to 3 MEG

Ramworks is the memory card for Appleworks on the IIe. Ramworks is compatible with all IIe hardware and software and it expands all of Appleworks' facilities including the database to over 15,000 records, the word processor to over 15,000 lines and the clipboard to 2,000 lines or records. It even allows you to auto-segment files larger than one disk capacity onto two or more disks, and displays the time and date on Appleworks' screen with any ProDos compatible clock.

Price — £219.00 to £1299.00
(Ex VAT)

New products are being added all the time, particularly for the GS — please phone for details.

All products carry a ten-day no-quibble "money back if not delighted" promise plus a one year guarantee.

Ordering Information Add £1.00 P&P per order. Add VAT at 15%

RAMFACTOR — MEMORY FOR THE II +, IIe AND IIGS

Ramfactor is a powerful memory card with built-in intelligence for the IIe, II+ and IIGS. It has a capacity of up to 1 megabyte on the main board and with RamDisk can run virtually all non-copy protected software at speeds of up to 4 times faster than a hard disk. Because of its instant compatibility, programs can be loaded immediately into Ramfactor for instantaneous access to information. With the optional battery back-up, Ramcharger, data can be stored almost indefinitely and you can even "boot" directly from Ram. Ramfactor also allows you to switch between different programs automatically and it will even allow you to run Appleworks on the II+.

Price — 256K — £239.00, 512K — £289.00,
1 Meg — £369.00 (Ex VAT)

PROP-APP 20 MEGABYTE HARD DISK — THE ONLY HARD DISK THAT WILL RUN ON ALL APPLE COMPUTERS

The Pro-App is the only hard disk that will run safely on the entire range of Apple computers including IIe, IIc, the new GS, Mac and Mac+. It plugs directly into the Smart port of the GS or the external disk drive port of a IIc or the back of a 3.5 inch disk drive, thus saving a valuable slot for further upgrading. It's also ideal for use with the Uni-Share network which links the GS with the IIe and IIc and is available in 10 megabyte, 20 megabyte and 40 megabyte versions.

Price — from £795.00 (Ex VAT)

GS-RAM — THE MOST POWERFUL MEMORY BOARD FOR THE IIGS

GS Ram adds extra memory, up to 1.5 megabytes and expands Appleworks by vastly increasing the size of its database, word processor and clipboard functions. It loads Appleworks automatically for faster operation and has a variable size printer buffer. Therefore your Apple can continue with other work while still printing. Like Ramworks it allows files larger than one disk capacity to be spread over two or more disks and it has an automatic time/date display and entry into the database.

With the 1 meg and 1.5 meg versions of GS Ram, Pinpoint 2.0 is included free.

Price — from
£169.00 to
£379.00
(Ex

AppleUser SPECIAL OFFERS!

Two top adventure trilogies for you to play

Award-winning software house Level 9 has extensively re-written some of their best-selling adventures, and released them in two trilogies: *Jewels of Darkness* and *Silicon Dreams*.

In the *Jewels of Darkness* trilogy you start with *Colossal Adventure*, containing all the treasures, creatures, rooms and puzzles of the mainframe original.

In *Adventure Quest* you must discover the Old Roads to the Dark Tower, Fortress of the Demon Lord. Only there can you defeat him. There's magic in the air in *Dungeon Adventure*. Can you discover the treasure while facing the perils of skeletons, carnivorous jellies and orcs?

The first adventure in the *Silicon Dreams* trilogy is *Snowball*. You awake from suspended animation to find your spaceship on a collision course with Eden. In *Return to Eden* you must prevent the defence robots from destroying your ship. You have lost your memory in the *Worm of Paradise*, and you may have to join the governing party to regain it.

Each features:

- Over 600 illustrations
- New language interpreter
- Huge 1,000 word vocabulary
- Multi-command sentences
- Ultra fast response times
- 64 page novel and 12 page guide

Ram enhancement

DO you use AppleWorks with a ram card such as RamWorks, MultiRam or Z-Ram? If so, the Pinpoint Ram Enhancement Kit may be useful to you. This program allows you to partition the ram card so that AppleWorks does not hog all the ram on the card.

With a 1024k card, or even 512k, you may not need the full size of desktop offered by the expanded version of AppleWorks. Instead, you may prefer to use part of the ram card to store other programs or data.

The kit also enables you to set up an AppleWorks startup disc that creates a ram drive to your specification. It can also automatically load specified files into the ram drive during the process of starting up.

So if you use the same files every day, you do not have to start from scratch with the enhancement kit, you simply boot your adapted AppleWorks startup disc.

In order to use the kit you must have the Pinpoint Desktop Accessories program (reviewed in *Apple User*, September 1986). You can also use it with the Pinpoint Spelling Checker (reviewed in this issue). Pinpoint programs need either an Apple IIc or an enhanced Apple IIe.

The first step in setting up a system is to enhance a copy of your AppleWorks startup and program discs with either Applied Engineering's Super AppleWorks Desktop Expander (version 3.3 or higher) or Checkmate Technology's AppleWorks Expander (version 4.3 or higher).

The next step is to use the Pinpoint installation disc to install the accessories program on the expanded version of AppleWorks.

Five options

The third stage is to boot the ram enhancement kit disc. This produces a menu on the screen, similar in format to the AppleWorks main menu, with five options.

The first option lets you specify which of the Desktop Accessories you want automatically copied to the ram drive at startup. The default for this option is to copy all except the dialler. If you prefer, you can set up AppleWorks without the Pinpoint accessories, but you still need the Pinpoint installation disc in order to set it up this way.

The second option lets you enter the pathnames of up to 16 files that you wish to copy automatically to the ram drive on startup. These could include data files for the Pinpoint Desktop Accessories, the dictionaries for the Pinpoint Spelling Checker, some AppleWorks data files and/or files for other programs such as Apple Writer,

Geoff Wood reviews a kit that gives more flexibility to AppleWorks

SuperCalc 3a or other ProDOS-based programs.

The third option lets you set other characteristics of the ram drive such as its type and size, the location of the startup file and the exit file location.

The kit works not only with RamWorks, MultiRam and Z-Ram but also with the AST Research Sprintdisk and the Apple memory expansion card. However, if you specify the latter, you cannot partition the ram drive.

Although Applied Engineering's RamFactor card (reviewed in *Apple User*, January 1987) is not listed as one of the ram cards, the enhancement kit treats it as an Apple memory expansion card.

The ram drive size can be varied from 128k to 960k in steps of 64k up to 384k and thence in steps of 128k to 768k. Of course, you must not specify a size that is larger than your ram card. The larger you make the ram drive, the smaller will be the AppleWorks desktop.

Default for the startup prefix is /APPLEWORKS and default for the startup path is APLWORKS.SYSTEM. You may wish to change the prefix if you have a suitable version of AppleWorks already on a hard disc or 3.5 inch unidisc.

You can specify the exit prefix and path if you wish. On the enhancement kit disc is a program called Ram Switcher which can be used as a means of switching from AppleWorks to other programs on the ram drive. To use it you would specify a suitable prefix such as /RAM and the pathname RAM.SWITCHER.

If you use the Ram Switcher you should copy the program to your AppleWorks startup disc and include the pathname /APPLEWORKS/RAM.SWITCHER in the list of up to 16 files entered under the second option. This ensures that it is automatically copied on to the ram drive at startup.

If you have only one program on the ram drive, you need not use the Ram Switcher, but simply use an exit pathname such as AW.SYSTEM for AppleWriter or SC3.SYSTEM for SuperCalc.

The fourth option on the menu enables you to create a startup disc. If the type of ram card you have specified is RamWorks, MultiRam or Z-Ram, you will be asked to place the AppleWorks expander disc in drive 1 so that the ram enhancement pro-

gram can access the ram drive software on this disc.

Finally you will be asked to place your AppleWorks startup disc in drive 1 and press any key. This disc will then have a new startup file created by the name PREBOOT.SYSTEM.

For hard disc or unidisc users there is an option to specify a ProDOS path under which this file will be placed. In this case, it will not act as a startup file.

Once you have completed the installation, all that remains is to boot your new AppleWorks startup disc and, when necessary, insert other discs from which it will copy the files you have specified.

You can then use your expanded AppleWorks in the normal way but with a reduced size of desktop. You can also access any AppleWorks data files on the ram drive, amend them, and save them to the ram drive if you wish.

Copies needed

Of course, if you load data files into the ram drive and then use AppleWorks to make alterations to them, you must save or copy them to floppy or hard discs before turning off the computer, otherwise you will lose the revised versions of the files.

When quitting AppleWorks via the main menu, it will automatically follow the prefix and path you have specified, either to the Ram Switcher or direct to another program. The Ram Switcher displays a menu of startup files for the programs in the ram drive. You can use the arrow keys to highlight the startup file you want, then press Return.

Unfortunately, when you have finished using any of the programs in the ram drive, you cannot switch back into AppleWorks from the Ram Switcher; you must reboot the computer and reload the programs. In my view this is a major drawback.

The main advantage of the Pinpoint Ram Enhancement Kit is that it lets you partition the ram card (provided it is in the auxiliary slot) and then use part of the ram card as a ram drive with expanded AppleWorks in the remainder.

There is little point in buying it if you have an Apple Memory Expansion card or a RamFactor card or similar card that fits into one of the main slots, although it does offer an easy way to copy a specified list of files into the ram card.

The Pinpoint Ram Enhancement Kit is available from Bidmuthin Technologies, PO Box 264, Harrow, Middlesex HA3 9AY. Tel: 01-907 8516, price £29.

MicroLink

in association with TELECOM GOLD

Join MicroLink - and use your micro to send and receive electronic mail, telexes, telemessages, go teleshopping, book theatre and rail tickets, read the latest micro news, form your own exclusive closed user group... even go via satellite to the USA to chat in real time to other users with similar interests as yourself. And it's all as easy as making a phone call! All you need to access MicroLink with your micro is a modem, appropriate software and a telephone.

How much does it cost?

● Standing charge of £3 a month. ● Connect charges of 3.5p a minute (between 7pm and 8am weekdays and all Saturday and Sunday), or 11p a minute during office hours. ● Cost of local phone call (London area) or cheap-rate PSS (extra 2.5p a minute).

These are basic charges. Most MicroLink facilities are free, including sending messages to other people on the system. Extras are:

Telex: 5.5p per 100 characters (UK), 11p per 100 (Europe), 18p per 100 (N. America), £1.25 per 400 (rest of the world), £2.75 per 400 (ships at sea). Plus a once-only telex registration fee of £10.

Telemessages: £1.45 for up to 350 words. An illustrated greetings card (for weddings, birthdays, etc) costs an extra 75p. Delivered anywhere in Britain first post the following day.

Overseas mail: 20p (Germany, Denmark), 30p (USA, Canada, Australia, Singapore, Hong Kong, Israel) for first 2,048 characters. For additional 1,024 characters, 10p and 15p.

To join MicroLink simply fill in and return the form below. Within days you will receive your personal mailbox number and password, an easy-to-understand Quick Guide to MicroLink, and the phone number of the Helpline where you can get additional assistance should you require it.

The idiot's guide to desktop publishing

I WISH when I started with my Macintosh that there had been a book bearing the appellation above. Maybe then I would have been able to avoid falling into all the traps and pitfalls that I found on my way to producing my first publication.

Perhaps I should begin by explaining how I came into desktop publishing in the first place.

I work for an educational technology supplies company called Commotion as technical manager. One of my many jobs is to prepare publicity material, technical notes and hand-outs on our products. We also produce our own catalogue, and to keep it up to date it was decided to distribute a quarterly newsletter containing catalogue changes, articles and technical tips.

Up to now all our paperwork was produced by traditional paste up methods, using outside professionals for the major publications, with all the attendant problems of cost and time delays that that brings. So it was decided to try using the Macintosh to produce all our in-house publications.

A Mac Plus was obtained and supplied with MacWrite and MacDraw. After the boss had spent a few days playing with his

Roger Jones learns the rules of a whole new ball game

new toy it was installed on my desk with instructions to "get on with it!"

The first job was to re-write the construction manual for one of our robot arm kits. I already had some experience with micros, and as a reasonably competent two finger typist I thought that I had a few advantages over the complete novice – but I wasn't prepared for the Macintosh.

Throw away all your conceptions about operating a micro, this one is different. I started by taking the guided tour, and the further I got the more impressed I became.

The first and probably most important thing to take on board was the desktop filing system which, after the more familiar filing systems I was used to, was a joy once I had stopped trying to drive the Mac like an ordinary machine.

Emboldened by these first successful steps, I started on the robot arm manual. Writing the words presented no real problems, MacWrite is the easiest word

processor I have ever used, but this also led me into the first trap – not taking enough backups.

Because the Mac is so easy to operate and can take such vast amounts of input in one go, the periods between saving the information to disc and taking backup copies becomes longer and longer. Lulled into a false sense of security by the ease of input and the apparent infallibility of the Mac, I sat bashing away at the keyboard for more than two hours.

There were eight pages of elegantly typed and edited text on the screen when there was a power failure, and with a small strangled cry of despair I watched my work shrink to a tiny spot in the centre of the screen and disappear.

Lesson one had been learnt.

Lesson two was a little longer in finding its way home. The manual was to have a number of thumbnail sketches inserted in the text to illustrate it, and these were constructed in MacDraw. At first I rather laboriously transferred these drawings from drawing program to word processor by copying them to the clipboard and pasting them into the text at the appropriate place.

This worked fine for a while, although it was a very long-winded process, until a friend lent me his copy of Switcher to try out. What an improvement. But another pitfall lay in wait for me. Once again I was trapped by the deceptive ease of operation of the Macintosh into making my files too long and complicated.

Even though I was saving files regularly now, and all the disc operations were going without a hitch, when I came to print them out the system kept crashing. I'm still not sure exactly what I was doing wrong, but after much heartache and splitting of the files into smaller and smaller units I finally managed to get a printout.

The text and pictures were all arranged in single columns and then pasted up by hand to produce two columns to a page for the first rough copy of the manual. This was presented to the other members of the office for criticism and was received with much interest.

I then took the disks up to Cambridge where a friend had a laser printer to get ▶

Ready, Set, Gone!

LETRASET, the instant type giant, has become a major force in desktop publishing by acquiring worldwide rights to Ready, Set, Go!, the latest page design and layout program from Manhattan Graphics.

The package provides a combination of text composition, word processing and page layout functions.

Its block formatting feature allows users to select from eight pre-set grids or to create an unlimited number of customised grid settings.

Ready, Set, Go!'s format allows blocks of text or graphics to be positioned anywhere on the page.

The software includes a Linker tool allowing text to flow automatically to other blocks or pages throughout the entire document.

The user can also create layout templates that can then be reproduced automatically on multiple pages.

Other features include the importing of formatted text from programs like MacWrite and Microsoft Word, realtime hyphenation, kerning, automatic hyphenation, text wraparound, realtime text reflow around graphics, ability to open multiple documents for cutting and pasting, plus PostScript compatibility.

◁ some better quality printouts. There I ran straight into the next set of problems. First the typeface that I had been using on my Imagewriter would not print on the laser-printer, and when I substituted the fonts the page breaks were all out of position. I went back into the files and re-set all the text, only to find that all my sketches now looked awful.

Where lines had joined previously there were now great gaps, and my carefully free-handed curves were all ragged and bent. The resolution of the laser printer is so good that any imperfections in the original drawings will be highlighted and emphasised in the printout. Oh well, back to the drawing board for a bit more editing.

Finally the manual was finished and everyone was very impressed with it. Orders started flooding in for forms and documents for use in the office, and it was decided to write the newsletter for the January High Technology Show on the Macintosh.

To help with this it was decided to buy PageMaker. This is one of the most powerful programs I have ever encountered, and it took some time to get used to it.

The first problem was that, quite natu-

rally, it was aligned for use with the Laser-writer and attempting to make printouts on my Imagewriter gave forth some very strange results indeed. However after a few

phone calls to Logotron, our friendly local Macintosh dealer, this was sorted out and some sample pages started to appear.

Up to now all the work done on the Mac was in the form of text or drawings, and very little was needed in the graphic design area. PageMaker put us into a whole new ball game, and with little or no experience in laying up a newsletter my first efforts were, to say the least, pretty awful.

The biggest trap I fell into was to try to use all of the very considerable number of typefaces and graphic features in the same document, if not all on the same page.

No matter how many times you do it yourself, you can never remove those mistakes you thought were right. (I still think parallel looks better with two r's).

Anyway, I hope that I haven't put you off, because that was definitely not my intention in writing this article. Desktop publishing on the Macintosh is straightforward, relatively simple and very enjoyable. I hope that by recounting my early experiences and blunders I can help you avoid the same mistakes.

Maybe some day I'll even write that book, but it will need a new title. Any suggestions?

Peter Gee leafs through a book that refreshes parts the manual can't reach

THE spread of desktop publishing (DTP) has brought the anticipated flock of books, and one of particular interest to Macintosh owners is Desktop Publishing by Andrew Lucas, which is aimed specifically at the Mac owner intent on entering the new field with the aid of Aldus PageMaker.

Now manuals, even such excellent ones as are provided with PageMaker, are all too often skipped through perfunctorily and consulted when all else fails.

On the other hand, books, the good ones that is, tend to command a more methodical front cover to last word approach. Let's face it, a book is a good

PageMaker techniques

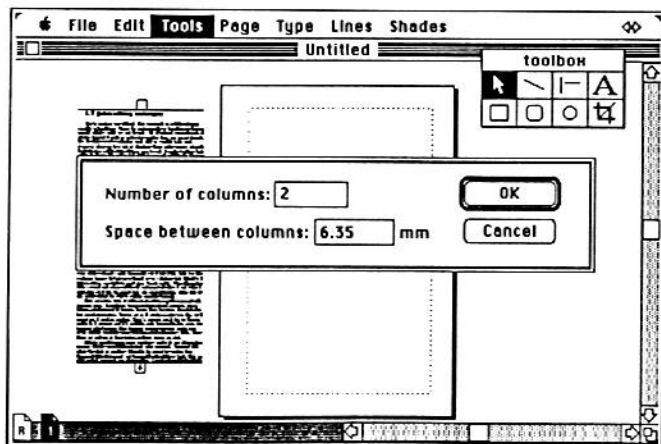

read. And Desktop Publishing is all of that and more.

It presupposes no prior knowledge of either desktop publishing or the equipment used. It starts off with a useful glossary – a workmanlike approach maintained to the end. Who wants to keep trotting to the back of a book for information on a baffling word which should have been explained right at the start?

The opening section takes a fairly cursory

look at the general DTP scene – its economics, uses limitations and future. The actual application of technique, design and style and so forth is left to other authors – Desk Top Publishing. The Book, by Tim Hartnell for instance – as Lucas sets his sights on the primary target of showing how to use the nuts and bolts of PageMaker.

He first has a good look at the hardware required, and here makes the point, which

Plenty of screen dumps illustrate the trickier parts of PageMaker – in this case running text into a page

THE Macintosh has broken new ground in a move which could bring another revolution in the newspaper industry.

The machine forms the heart of Dialtext, an editorial system devised by Talbot Computers of Dorset.

It employs NewsWrite software which allows standard editing from the keyboard and supports multiple windows.

The screen displays the number of characters and lines in the story. It can measure how deep the text would be when set in a variety of types and sizes.

The first paper to install the system was the Poole Advertiser series.

It took just 24 hours to make the switch from typewriter to computer keyboard.

On that first day, the nine journalists responsible for four titles around Poole were split into three groups and given a two-hour training session.

Next morning they sat down to Macintosh terminals to use NewsWrite. The following week a sister system was installed at the company's Southampton office.

At that stage, the journalists were turning out hard copy which was being set in the traditional way by print workers. The aim

Breaking new ground

Alex Cummings with Free Newspaper, Reporter of the Year Jan Fox - and Mac

Aldus fails to dwell on, that you need a hard disc if you are going in for moderately ambitious work. Expensive perhaps, but it would speedily recover its cost in time saved avoiding the frequent disc swapping necessary when using two floppy drives (doubly so if they happen to be of the 400k variety).

The chapter on getting started takes you right through from the moment you unpack and connect together all the gear. And from this point on the book gladly espouses the theory that one picture is worth a thousand words.

We are taken through the whole Pagemaker process with a maximum of screen dumps and only the words necessary to link them into a smooth guided tour.

I find this technique brings the whole operation far more vividly to life than does the Pagemaker manual, although both contain, in general, the same facts. No

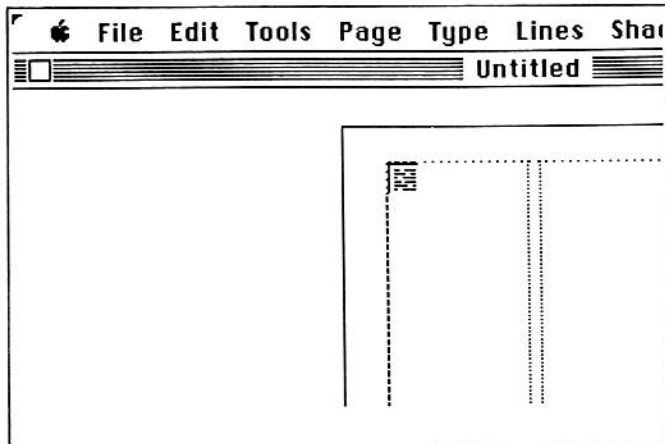

doubt someone will count up the facts in both and prove me resoundingly wrong. But that begs the question, I read a book and only consult a manual.

I picked up a lot of useful tips in the chapter dealing with Pagemaker techniques. One interesting point I hadn't seen mentioned before was the author's discovery that repeated text format changes tend to produce corrupted text files within a document.

Perhaps we are not entirely to blame when things occasionally go haywire.

There are further chapters on MacWrite, MacDraw and MacPaint, plus an intriguing section on FullPaint, something I have yet to see. Finally, a cursory glance at Microsoft Word completes this excellent 200 odd word book.

It will undoubtedly smooth the way wonderfully for anyone completely new to the Macintosh way of desktop publishing.

Columns have been specified... now comes the moment to run it in to the page

◁ was to get reporters used to the equipment before they went "live".

The company began outputting direct to laser printer at the beginning of February. Stories were prepared on screen and checked by journalists before being pasted up.

The Advertiser is in the midst of the next stage, which is to allow completed articles to be printed out ready for paste up in the form they will appear in the paper.

Series managing editor Alex Cummings said: "We are fully satisfied with the progress to date. We are particularly delighted at the ease with which the journalists have taken to it.

"As far as we're concerned, big systems are now dinosaurs.

"We foresee an explosion of personal computer systems in newspapers – particularly for small publishers who cannot afford big systems costing three times the price.

"As the hardware can be supplied off the shelf and the software tailored to individual needs, there is no chance of being held to ransom by manufacturers with their service deals.

"Not only is our new system vastly cheaper, it also offers a lot more. You can

At the signing of the Advertiser-Talbot deal are from left, David Hancock, Apple UK managing director; Tony Tomlinson, director of Southern Newspapers; and Andrew Clunies-Ross of Talbot Computers

even call a calculator up on the screen", said Alex Cummings.

Talbot has also sold Dialtext to Eddie Shah for his Messenger series based in Warrington, Cheshire.

Another part of the package, an automatic copytaking system, is being used by three evening papers.

This also employs a Macintosh, connected to an autoanswer modem. The receiver

is on line 24 hours a day and supports daily directories which automatically change at a pre-set time.

Stories sent in from journalists in district offices or in the field – using either another Macintosh or the Talbot Dialtext 4 portable – are saved on disc and printed out.

The stories are stored by name and number and can be directly accessed by sub editors.

Visual appeal

HOW to improve the visual appeal of your electronic publishing output is the theme of this year's Monotype Corporation Typographical Conference.

The residential event takes place at Queens' College, Cambridge, September 7 to 9. Its aim is to teach users of desktop publishing equipment how to add sparkle and professional authority to their documents.

Speakers will deal with management, training, design planning, special techniques, selection of typefaces and sizes, paper grades and offset printing methods required to achieve top quality publications.

An exhibition of electronic publishing equipment will provide practical examples of the foremost production methods currently available.

Illustrator launch into Europe

THIS month's MacWorld Expo in Rotterdam sees the European launch of Adobe Illustrator, the powerful new Macintosh graphics package for producing high quality line art and illustrations.

It is the latest in a string of major desktop publishing innovations from Adobe Systems, the US firm founded by former Xerox Corporation men Dr John Warnock and Dr Charles Geschke five years ago.

They developed PostScript, the first commercially available page description language for communication between computers and laser printers.

Adobe now employs more than 80 people at its Palo Alto, California, base and licenses PostScript to computer, printer and typesetter manufacturers. It often also designs the hardware needed to run the program.

In addition the company develops fonts – licensing them from industry leaders Mergenthaler Linotype, Letraset and ITC – and builds them into all PostScript output devices.

Adobe has released hundreds of fonts – designed to be stored externally to the printer and downloaded – as part of a continuing long-term effort to develop a professional graphic arts quality library. The

latest crop, launched in the New Year, brings the number of typefaces now available for downloading from the Macintosh into any PostScript-equipped printer or typesetter to 111.

The full range of Adobe Systems fonts is distributed in the UK by McQueen of Edinburgh.

Their new releases include Century Old Style in two weights with italic, ITC Franklin Gothic in three weights with italic, ITC Cheltenham in two weights with italic, Park Avenue, Bodoni in three weights with italic, and Orator in one weight with italic.

Adobe Systems typefaces come as downloadable font family packages on 3.5 in discs, each containing multiple weights with italic versions designed to be used together.

Adobe also provides screen fonts created to correspond with the printer versions and enable WYSIWYG emulation during document production.

"Since we began marketing typefaces our customers have become more and more aware of the importance that type plays in document effectiveness", said Adobe Systems president John Warnock. "That's why we are committed to offering a large library of quality typefaces".

AppleUser SPECIAL OFFERS!

Go wargaming on your Apple — with the ultimate conflict simulation!

Theatre Europe simulates the first 30 days of the war. In addition to being able to command either side, the player can choose the style of his opponent (the computer). The first level is a beginners level, where the computer opponent will not use the nuclear option. If he selects level two, the computer will play a "Rational" game following the accepted strategies of NATO or the Warsaw Pact. In level three it will play a highly unpredictable game.

In the game you command either NATO or Warsaw Pact forces. To help you there is a full colour poster map, together with a detailed instruction booklet.

While the producers of Theatre Europe have taken every care in researching this program to ensure the accuracy of details, we must stress that the events depicted in this conflict simulation are entirely fictitious. They must never be allowed to happen — the danger is that they might!

TWO NEW MACHINTOSHES ANNOUNCED

Two new Macintosh systems were introduced on Monday March 2 - the Macintosh SE, available now, and the high-end Macintosh II which will not get underway until July.

The Macintosh SE offers 15 to 20 per cent increased performance over the Macintosh Plus, and its compact design features two floppy disk drives or one floppy and one 20Mb internal hard disk. Produced in the new Apple platinum colour, it will offer a range of system expansion options via its one slot. The Macintosh II has a modular design and open NuBus architecture of six slots configurable by the user.

Along with the two new macintoshes, Apple is bringing out an extensive range of peripherals to complement the new machines. Hard disk devices include 20 SCSI, 40 SCSI and 80 SCSI Mb internal drives as well as 40 and 80 Mb external drives. A 40 Mb tape streamer is now also offered as a back up system. Two high-res monitors will be available to Macintosh II users; a 12" Mono and a 13" colour display. When matched with the new Apple 5.25 floppy disk drive and appropriate controller, the new systems have the ability to read PC-DOS and MS-DOS files.

Apple IIGS 1Mb

Most of the spectacular programs designed only to run on the GS require at least 512K of Memory. GraphicWriter and PaintWorks are two such programs. As more and more powerful applications are produced for the GS then the need for a large RAM Card grows. The GS uses 800K disks, and it is often desirable to be able to dump the entire contents of a disk on to a RAM Card. The answer to all these problems is to fit a 1MB Ram Card in your GS.

We are offering GS owners a genuine Apple GS RAM Card with a full 1MB on board for just £175.00
This represents a saving of £85.00 !

MacWorld is an open door... in Rotterdam

For those who think the States have cornered the Macintosh market... a European premiere!
MacWorld Expo on April 22, 23 & 24 in Rotterdam, at Holland's state-of-the-art Ahoy Exhibition Centre... Europe's first full-scale Apple Macintosh trade fair, featuring:

MacWorld

expo

- * three full days of hands-on experience with the newest and best in Macintosh software, hardware and peripherals.
- * scores of market-leading exhibitors, including Addison-Wesley, Adobe, Apple Computer, Blyth, Letraset, Microsoft and Symbiotic...
- * hundreds of international dealers, distributors, professionals and user groups:
- * market information and business tips for the Macintosh community...
- * a New Product Show, company sessions and seminars on compatibility, the Mac as executive tool, CAD applications and Desktop Publishing and a special programme for DP professionals on the Mac in the mainframe environment...

all this at your fingertips in lively Rotterdam, with six major European capitals (Brussels, Paris, London, Bonn, Luxemburg and Amsterdam) within a 250-mile radius.

April 22, 23 & 24, 1987 Rotterdam, Holland

For more information

about MacWorld Expo, accommodation, the scores of participants and special events, fill in the coupon and send it to the address listed.

MacWorld Expo

sponsored by Apple Computer and Y-Tech Innovation Centre
Kerkstraat 299, 1017 GZ Amsterdam-C, The Netherlands
Telephone: 31.20.264454 / Telefax: 31.20-254296

I DON'T WANT TO MISS IT!

Yes, I want to know more about MacWorld Expo, April 22-24, 1987. Send me your special brochure. I'm especially interested in: (tick one or more boxes)

- meeting exhibitors
- attending seminars and company sessions
- information on hotel accommodation and travel arrangements to Rotterdam

AT 1

Printer Control Unit in action

IN the past two months we have developed a program to create and edit files which store information about the printer being used by our Printer Control Unit. Now we arrive at the unit itself (Listing I).

To demonstrate the use of regular (as opposed to intrinsic) units, printops is written in such a form. The obvious difference is that the declaration unit printops is NOT followed by the word intrinsic and segment numbers for code and data.

This is because we shall not link the unit into the Library, but keep it in a separate code file and link it into the host program after compilation.

To use a regular unit, compile the host program with the compiled unit (in this case prunit.code) accessible to the compiler and declared with the special (*\$U*) option. This allows the compiler to check that the interface of the unit matches the call made to the unit in the host program.

When the host program has been compiled, the code for the unit's implementation must be linked in, using the Linker. The host file is the program, and the lib file is the compiled unit.

Simpler debugging

As we have noted, using regular rather than intrinsic units means that the code for the unit exists in every program which uses it. While this is wasteful of disc space, it does make debugging simpler.

Once you have checked that the unit is working correctly you may prefer to use the Librarian to build it into the System Library (or other libraries on 128k systems) as an intrinsic unit. At the end of this article we shall look at a very simple demonstration program which uses the unit.

To return to the unit itself, note first the

Part 6 of Stuart Bell's tutorial series covering the unitary approach to program development

two main sections – interface and implementation – each with a declaration of the procedures accessible to host programs.

The first set includes parameter lists; in the implementation the parameters are shown as comments just to make them more comprehensible. If you wish, omit them to save typing.

Most of the procedures simply provide access to the values stored in p_misc without the user having to know the names of the records and sub-records involved.

Two sets of procedures require a little explanation. Firstly, select and newpage. The former selects a new typeface. On a dot matrix printer all it needs to do is to send the appropriate command sequence to the printer.

However on daisywheel machines the print wheel must be changed by the user. Select prompts you to do this via the bottom line of the display. If this display corrupts your screen layout you may prefer to prompt in another way.

After changing the wheel you type a space and the appropriate command sequence is sent – for example to tell the printer about the pitch of the new wheel's typeface.

Similarly, newpage prompts you to either insert a new sheet of paper or advance the continuous stationery if the printer requires it.

The second set of more complex

procedures handle the movement of paper and of the printhead. Advance moves forward the paper (num/denom) of an inch, or as close as possible to that distance.

If the printer can only advance whole lines, it does so, assuming that it is printing at six lines per inch. Backwards does the same thing in reverse, but if the printer cannot reverse-feed the paper, it does nothing.

Finally, space attempts to move the printhead (num/denom) of an inch. It assumes that the printer CAN microspace – the user must check this before invoking the procedure. If it cannot, no action takes place.

Elegant formatting

Space permits just one very small demonstration program (Listing II). This should at least check some of the facilities.

More complex techniques, such as using proportional spacing and microspacing to achieve very elegant text formatting are left as a challenge to the interested reader.

That completes the *Apple User Printer Control Unit*. Once you have taken the effort to type in the unit, I am sure it will save much programming time, if only on simple things like turning underlining on and off.

Its real value will be appreciated when you upgrade your printer, or borrow a friend's when yours needs repair.

No need for any software changes – simply run PRSETUP to create a new PRINT.MISCINFO file. And when your laser printer finally arrives... no problem!

●Next month our third and largest building block; the File Control Unit, which will let us perform all – yes ALL – the activities of the Filer from within Pascal programs.

Neater menus

t Very often a list or menu is presented indented on the screen. Most people use HTAB or TAB functions to achieve this, but it is much simpler to change the left hand side of the window before the table by the required amount.

For example POKE 32.5 ... TABLE ...

POKE 32.0 has the same effect as a series of HTAB's before each part of the table. Make sure that each entry will fit neatly on one line. If you're not sure, first set the window to the appropriate value, e.g. POKE 33.34. [See the Applesoft manual page 129.]

t If you are using Pascal 1.3 whenever the system comes up with an error and asks you to press space try pressing Escape. It goes back to where it came from and tries again.

I have found no reference in the manual to this. I don't know if it works on 1.2 or 1.1 as I haven't got either version.

B.C. Keal

AppleUser SPECIAL OFFERS!

A great price breakthrough in communicating with your Apple

Modem + Software

£86 PLUS VAT **SAVE £63**

Multi-function interface

£48 PLUS VAT **SAVE £32**

The long-awaited price breakthrough in communications with your Apple is here now – thanks to a special deal *Apple User* has negotiated with one of Britain's leading modem manufacturers, Pace Micro Technology.

First, there is a substantial reduction in the price of one of the most reliable modems ever made, together with its associated software.

The modem is the Apple-compatible Pace Nightingale which operates at the two most popular speeds – 1200/75 (for Prestel and other viewdata systems) and 300/300 (for MicroLink, Telecom Gold, remote mainframes, commercial databases, etc).

The software we are offering is the renowned Data Highway, one of the most sophisticated packages ever produced for the Apple.

Apple II+ and IIe owners: You also need a serial interface. If you already have an Apple Super Serial Card, or a

CCS7710, there is no problem. (But tick the appropriate box on the coupon and we will send you the necessary lead free.) If you haven't a serial interface we have a special offer on Mastercard II, which is a combined asynchronous RS232 serial and 8-bit parallel interface card. (The parallel port can also be used to drive parallel printers.)

Apple IIc owners: As you have a built in serial card the only extra you need is a lead. Tick the box when you order the modem package and we'll send you one free.

● Readers taking advantage of either of these offers will also be entitled to free registration to MicroLink, Britain's fastest-growing electronic mail service. With it you can use your Apple to send (and receive) telex, telemessages, down load free Apple telesoftware, and communicate directly with other Apple users all over the USA and other parts of the world.

Please send me:

() Pace Nightingale modem + Data Highway for £98.90 (UK)
Europe £102.90. Overseas £106.90 1090 _____

() Mastercard II multi-function interface for £55.20 (UK)
Europe £57.20. Overseas £60.20 1093 _____

TOTAL _____

Getting facts from figures

IMAGE analysis is the processing of visual information such as an optical image, a photograph, or a video signal in a way which makes it possible to make measurements from it.

Among the sciences in which image analysis has proved useful are geology, physics, crystallography, metallurgy and medicine. The most common applications are the measurement of the size of individual features, that is length, diameter, perimeter and so on, and the measurement of the percentage area within a given observation field which is occupied by a given object or group of objects.

As part of our research at Hull University is to the physiology of diseased skeletal muscle it became necessary to make measurements of both kinds.

The diameters and relative proportions of the various types of fibre which are found in the muscle, and the degree of muscles by collagenous connective tissue (similar in nature to the material from which tendons are made), are important parameters which

P.A. Marshall finds a host of applications for image analysis techniques

we wished to measure in both diseased and normal muscles.

In order to make these measurements a low cost image analyser base around the Apple II was built. The hardware used is illustrated in Figure 1 and Plate 1.

The optical image to be analysed was provided by an Hitachi high resolution video camera which was attached directly to a microscope. In principle, however, it is also possible to use the camera with a normal lens to provide images of larger objects.

The composite video image was fed into a digitising interface (Computech Diplomat) installed in one of the Apple's periph-

eral slots. This converts the continuously-varying analogue video signal into a digital form and breaks the image down into a series of values equivalent to the pixels of the computer video graphics screen.

Before each pixel is plotted its value is compared with a user-selected threshold. If the value is greater than the threshold the pixel is plotted as black, and if lower as white.

In actuality two thresholds were used to select upper and lower limits for the digitised image. These were set by 150 Kohm potentiometers attached to the Apple's games port.

Resolution

The raw video, displayed on a high resolution black and white monitor, enabled comparison between the two images. Although some loss of resolution was inevitable, by careful adjustment of the threshold and the intensity of the micro-

Plate 1: The image analyser

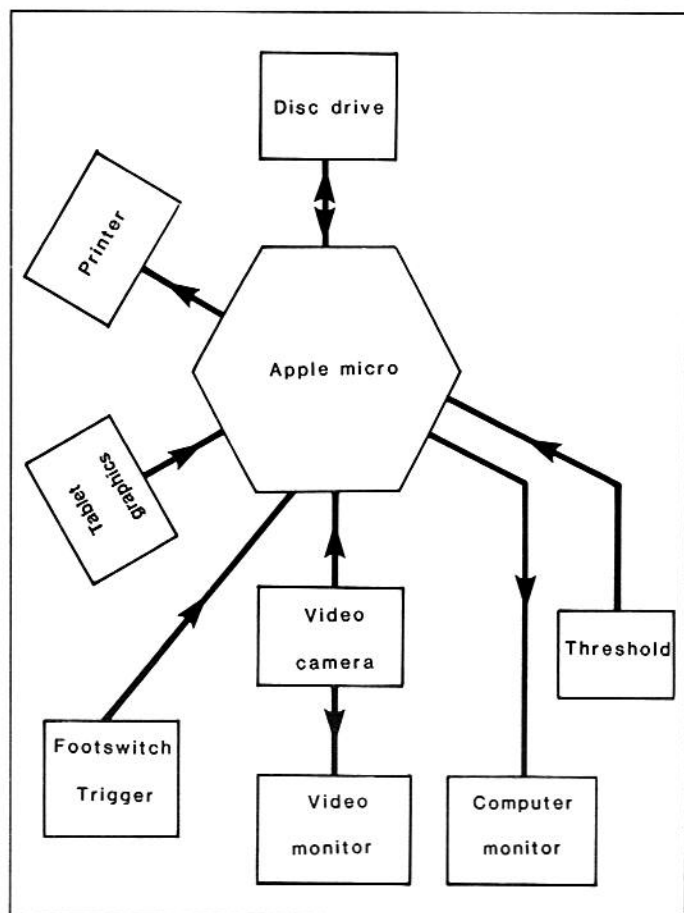

Figure 1: The hardware setup

Plate II: Comparison of video and digital images

scope illumination, good agreement between the digitised image and the video image was obtained (Plate II).

When this was applied to sections stained with a red dye to highlight the connective tissue in the muscle, a green filter was introduced into the light path to increase contrast.

By counting the number of black pixels in the computer image a measure of the degree of connective tissue infiltration in a given muscle could be made. This was done by a machine code utility called up by the controlling software.

Graphics tablet

An external footswitch was added to allow the capture of a digitised frame independently of software control.

Measurement of the diameter of the individual muscle fibres was made possible by the addition of a graphics tablet. Since the video camera was capable of accepting an external synchronisation pulse it was possible to synchronise the camera to the computer.

Having done this, it was a simple matter to overlay the raw video signal with a computer graphic image, thus making it possible to make measurements of any features by drawing on the graphics table with the stylus.

Routines were written which made it

possible to measure areas, perimeters or the diameter of the muscle fibres.

The software owes much to the original Tablet-code Applesoft written by B. Ehlers for Apple as a demonstration of the capabilities of the graphics tablet.

Alterations

As many of the routines used in this program were obviously of immediate use to us, there seemed little point in re-inventing the wheel. It has become necessary however, to make major alterations in the original program to get it to perform all of the functions we required.

Once run, the software transferred con-

trol of the system to the graphics tablet. The various functions performed by the hardware were selectable from the menu panel of the graphics tablet.

Alternatives include resetting the video or tablet hardware, calibrating the tablet surface for length measurements, drawing straight lines between two specified points (used to measure diameters), cataloguing data files, blanking off a border to cut off any unwanted detail, measuring areas and perimeters, as well as counting the number of black pixels to estimate the amount of connective tissue.

These latter functions could be applied to either a single microscope field or a series of fields and the data stored on floppy disc for later analysis. □

Appletalk

THINK big, Apple is telling single-minded personal computer users. The company believes its newly-released AppleShare workgroup fileserver will extend the single user's thinking towards networking.

The product is a software package that will allow up to 25 users to access documents, folders, applications or whole discs of information from anywhere on an AppleTalk network as if it were resident on each user's Mac. It needs a dedicated Macintosh Plus,

SE or II and at least one hard disc, along with appropriate AppleTalk personal network cables and connections for each workstation which must have 512k of memory.

"Apple UK communications manager, Chris Jones said: "We recognised the need for our own fileserver as part of our long term communications plans for Macintosh users".

He said nearly all existing Macintosh application software would run, unmodified, on AppleShare.

Bigger, brighter and better

THE September 1986 issue of *Apple User* featured an article titled Expanding the capabilities of Print Shop, written by Henry Kong. Both the article and the program are of immense value in the handling of Print Shop's graphics, but as the programs did not function quite as expected I took the opportunity to revise them slightly.

I left file DO unchanged and extended X4 and X9 to handle image enlargement more effectively. Print Shop's graphics are designed in such a way that all eight bits of each byte are used and sent to the printer, but when you try to send them to the hi-res screen only seven of the bits are shown: The eighth one is used to select the colours of the dots in that byte.

This meant that some image pixels were lost, and with this in mind I wrote a program which translates the 11 eight-bit bytes in each Print Shop graphic line into 13 seven-bit bytes that the hi-res screen will accept without image degradation.

Factorised code

Each of these new lines is 91 pixels long, but the extra three bits don't show up on the screen as they match the background area.

This translator, located at \$7000-\$70EF, is simple and repetitive (Figure 1 shows a graphic representation) and the subroutines at \$70D3 and \$70E1 are simply "factorisations" of the overall code – they are not

Den James offers a revised program that makes more of Print Shop's graphics

truly self-contained modules.

Changes to X4 and X9 perform the similar repetitive task of shifting bits around byte boundaries (see Figure 11) and the subroutines at \$71FC, \$7208, \$7212 and \$721F are also factorisations.

The Basic program has been revised too, the format following Henry Kong's original, but slightly adapted toward my personal preferences. (Deleting all the REMs will reduce on-disc length by five sectors to 15 and are included here for clarification.)

Options are now presented on-screen and their scope is extended to include what I think Henry Kong originally intended (judging by the superfluous lines in his listing on Page 31 of his article). These are <P>rint, <S>ave to disc, magnify 1x, 4x and 9x, <M>irror image, toggle the ackground colour (to match or contrast with the image) and <I>nvert the image.

Examples of the resultant images are shown in Figure 111 – (a) as printed from Print Shop's own graphic editor, (b) at normal size from this program, followed by

(c) at 4x and (d) at 9x.

They are a little extended in appearance, but still lend themselves well to further manipulation with Paul Sinnet's excellent Hi-Res Screen Editor, also featured in recent issues of *Apple User*.

A further refinement can be made by replacing the 4x magnification code with 6x in order to produce a better proportioned enlargement. If this is preferred you need binary file X6X9TR instead of X4X9TR – only the X6 section is changed (see listing) – and alter the Basic as follows:

- Change memory location 29248 to 29242 in line 90.
- Change the 52 to 54 in line 430.
- Change the value of TM from 96 to 116 in line 730.

Reductions

- Change the value of HT from 104 to 156 in line 770.
- Change all references to X4 and T=4 to X6 and T=6 in lines 90, 190, 430, 530, 580, 640, 670, 730, 770, 880 and 1140.
- Change the value of LOC from 29450 to 24576 in line 70.

Finally, a word on Henry Kong's graphic reducer. If this is incorporated in Paul Sinnet's editor you can easily move the area you want to reduce so that it occupies the top left corner of the screen. (The reducer will only accept data from a window 176 pixels wide by 156 deep, ranged top left.)

Figure 1: Graphic representation of translator

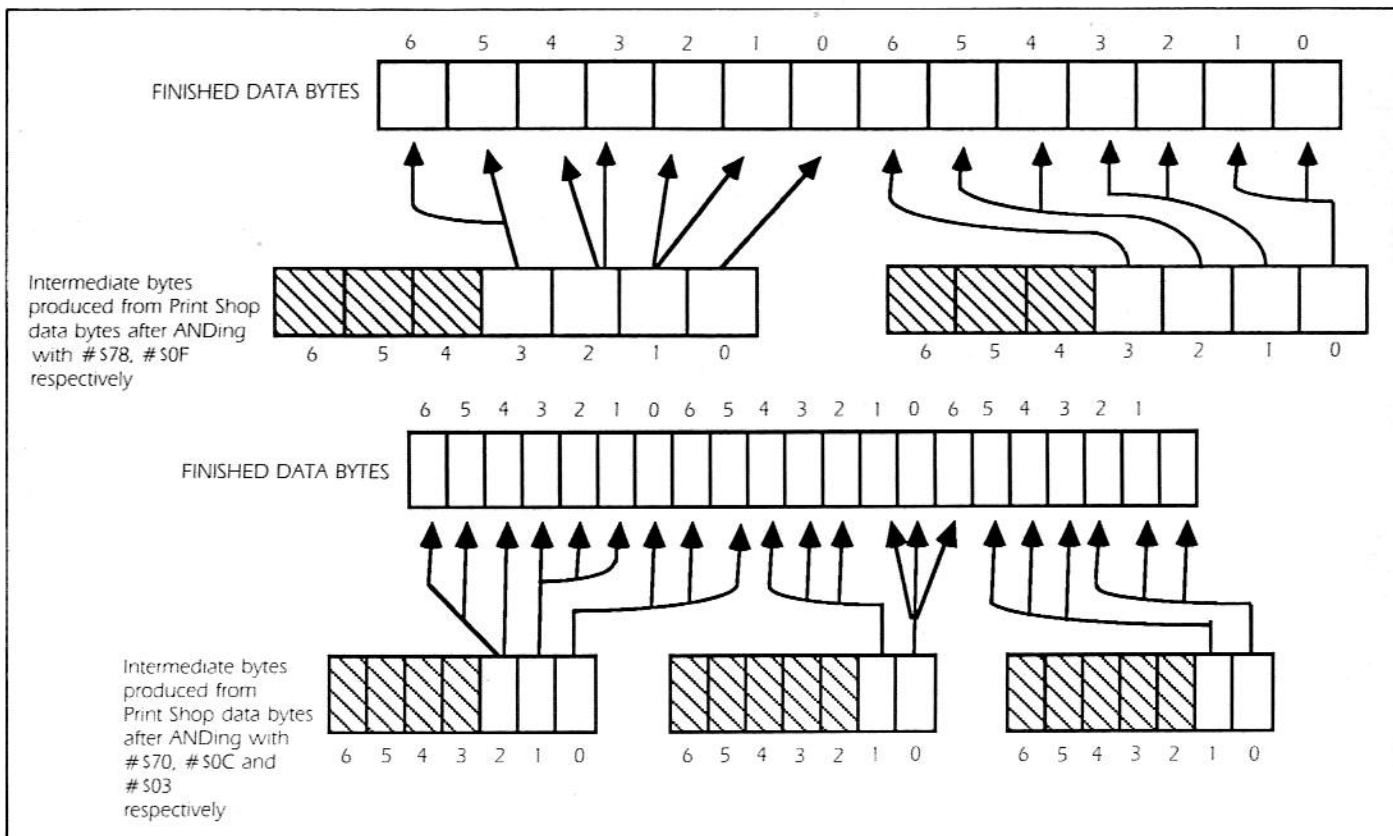

Figure II: Graphic representation of X4 and X9 The Basic program

Figure III: The images are extended as magnification increases

Dynamic debugging using DDT

ONE 8080 utility supplied with CP/M 2 which is useful if only in the absence of anything better, is DDT.COM which stands for dynamic debugging tool. This is a CP/M debugger which allows us to load files from disc and control program execution as well as examine and change memory.

The best way to learn about DDT is to load and use it, so with a copy of your system disc in the logged drive issue the command DDT.

DDT will sign on with a - (minus sign) as prompt.

There are 12 commands known to DDT (see Figure 1). Generally each is a single character, upper or lower case, which may be followed by hexadecimal numbers signifying addresses or values.

Try the command d0 at the - prompt. You will see 192 bytes of memory displayed from address 0000h onwards. The first number in each line is the address of the first byte displayed; 16 bytes are then displayed in the line from that address.

At the end of the line are the Ascii characters which the values in memory might represent. If the value is not a printable character a dot is printed instead.

This Ascii field makes it easier to spot and read blocks of text. You can examine a disc file by loading it into memory either from within DDT by using the I and R commands or by giving the disc file name when invoking DDT.

For example, to examine STAT.COM; from within DDT issue two commands:

```
istat.com
```

(which initialises the FCB) and :

```
r
```

(which reads the file specified in the FCB) Then, from the command level issue the command:

```
ddt stat.com
```

The file is loaded into the TPA as if it were

Colin Foster and Robert Neale show how to use DDT.COM, the dynamic debugging tool

the program about to execute, and DDT displays status information of the form:

```
NEXT PC
1580 0100
```

NEXT tells us the first free memory location above the loaded program and PC tells us the address pointed to by the program counter. The address of 0100h is the default which is used by commands such as D if you enter them without specifying an address.

If you wish to change a program with DDT carefully note the value of NEXT: you will need it to calculate the number of programming pages (256 bytes each) in which the program sits if you intend to save the changed version to disc.

To exit DDT just type ^C and if you wish to save a changed version use the CCP SAVE command to write it to disc. The number of pages to save from our example above would be 21.

This is calculated as follows: The next address is 1580h and the start address is 0100h, therefore there are 1480h bytes to save.

That is 15h pages (each page is 256 or 100h bytes) and 15h is 21 decimal. Remember that SAVE expects the number of pages to be expressed in decimal, but DDT works in hexadecimal.

We have seen DDT load a binary file (COM file) but it will also take a .HEX file such as the output from assemblers like

ASM, and convert it to binary as it loads.

The G command will execute code in memory. You can specify the entry address and one or two breakpoints. For example, typing g will execute the code starting at whatever the current value of the program counter is while g100,124,3c00 will execute code starting at address 0100h, but will first insert a breakpoint (code RST 6) at addresses 124h and 3C00h.

DDT keeps track of the contents of the processor registers being used by the program being debugged so that you can examine and change any one of them with the X command.

For example, typing:

```
x
```

will display the current contents of all the registers.

Typing:

```
xp
```

will display the current value of the program counter. If you follow the xp command with a press of the Return key the program counter will not be changed, but if you first enter a hexadecimal number the program counter will be changed to reflect the new value.

Similarly, xa will let you alter the accumulator, xb, xd, and xh will let you alter the double registers BC, DE and HL and xs lets you alter the stack pointer.

The T command will trace through the program, displaying the contents of the registers after each instruction.

Typing:

```
t
```

will trace a single instruction, typing t20 will trace 32 instructions.

The associated command u will execute the specified number of instructions, but will only display the register contents once, at the end of the last instruction

This is useful for tracing a piece of code

A	Assemble, enter assembler code.
D	Dump, display the contents of memory in hexadecimal and Ascii.
F	Fill memory, with specified constant.
G	Go, start a program executing from given address.
H	hex, display hex.
I	Input, set the FCB ready for the read command.
L	List, disassembled contents of memory.
M	Move, move a block of memory.
R	Read, the file specified by I is read into memory.
S	Substitute, put new contents into an address.
T	Trace, execute program with registers list at each.
U	Untrace, execute program with register list after last.
X	Examine, list or alter register value.

Figure 1: The DDT commands

such as a subroutine, and checking the registers only on entry and exit without cluttering the screen with all the intermediate results.

Unfortunately there is an important limitation to the usefulness of the trace commands – DDT is an 8080 utility and so only understands the subset of the Z80's instruction set which the older 8080 is able to execute.

This means that if we try to trace a program written specifically for a Z80, DDT will almost certainly meet an instruction which it does not understand.

When tracing, the consequences of this are unpredictable but tend to be brief, spectacular and fatal. (When listing you will merely be presented with a question mark, implying that DDT does not understand the instruction).

Remember, if you intend to debug a program using DDT you must either write in 8080 assembly language and use ASM, or if you have a Z80 assembler, restrict yourself to using the instruction for which there are 8080 equivalents (see the table in last month's article).

Assembler mode

The same restriction applies to another useful facility, DDT's line assembler. Typing:

```
a100
```

will put you into the assembler mode and redisplay the address – 100h in this example – at which you wish to start your code.

You can then type in a sequence of 8080 assembler instructions (pressing Return after each) such as:

```
mvi c,2
mvi e,23
call 5
jmp 0
```

and DDT will insert the appropriate machine code into memory. Pressing Return on its own will exit the assembler.

L does the opposite of assemble; typing I100 will display the program in 8080 mnemonics. Z80 instructions will not be recognised. For example, if you have just invoked DDT and entered the assemble language program given above, then given the command I100 the likely result is:

```
0100 MVI C,02
0102 MVI E,23
0104 CALL 0005
0107 JMP 0000
010A MOV D,D
010B MOV C,C
010C MOV B,B
010D MOV C,B
010E MOV D,H
010F ??=20
0110 ??=28
```

if using Microsoft's CP/M. The first part is our program, that from 010Ah onwards, is part of the copyright notice left in memory.

The S command allows you to step through memory altering bytes if you wish. Typing s100 will redisplay the address and

show you the value of the byte at that address. Pressing Return will step on to the next byte without changing the first one.

However typing a hexadecimal number will substitute it for the value already in memory and then step to the next location. This continues until you enter a fullstop.

To move a block of memory use a command such as:

```
m100,2ff,2d00
```

This will copy the block starting at 100h and ending at 2FFh inclusive to the area of memory starting at 2D00h. The original memory is not altered.

To fill an area of memory with a value, say 0FFh, type:

```
f1000,1fff,ff
```

which will fill the area starting at 1000h and ending at 1FFFh inclusively.

DDT can perform simple hexadecimal

arithmetic. Typing:

```
hx,y (x and y are hexadecimal numbers)
```

will display the sum and the difference of the two numbers.

Use DDT to examine the SPA before and after loading a file and identify the information it contains. Look at any programs you have written and practice tracing and executing the code using breakpoints.

You'll be making a lot of use of DDT or something very similar if you start writing programs to run under CP/M, so it is well worth learning how to use it properly.

There are other debuggers around, CP/M3 for example has a more powerful one called SID (Figure II), but all work in very similar ways to DDT. Frequently even the commands are the same – some can just do more than DDT.

There is a trade-off however. The more powerful a debugger, the bigger it is. when you run a debugger the first thing it does is to relocate itself up into high memory just

A ssss	Assemble starting at address ssss.
C ssss	Call subroutine at ssss.
C ssss,v1,v2	Call subroutine with v1 in BC and v2 in DE.
D	Dump memory as with DDT.
D wssss,eeee	Dump from ssss to eeee with 16 bit word format.
E file1	Load file with name file1.
E file1,file2	Load file1 and file2 as symbol table to be used.
F ssss,eeee,c	Fill memory from ssss to eeee with cs.
G	Go as with DDT.
H	Hexadecimal values as with DDT.
I file1	Input filename file1 to FCB as with DDT.
L	List as with DDT.
M	Move memory as with DDT.
P ssss	Sets location ssss as a passpoint for counting.
P ssss,i	Sets location and initialises value of counter to i.
R	Read in the file given in FCB.
R o	Read file in FCB to 100h plus the offset o.
S	Substitute as with DDT.
S Wssss	Substitute but with 16 bit words.
T	Trace.
U	Trace with last register info only.
V	Display current SID values
W file,sss,eeefile	Write the contents of memory from sss to eee using filename.
X	Examine registers as with DDT.

Figure II: The SID commands

No.	Function	Input parameters	Output parameters
0	System reset	None	None
1	Console input	None	A=char
2	Console output	E=char	None
3	Reader input	None	A=char
4	Punch output	E=char	None
5	List output	E=char	None
6	Direct console I/O	E=OFF else	A=00h (no char ready) A=char (if char ready)
7	Get IOBYTE	None	A=IOBYTE
8	Set IOBYTE	E=IOBYTE	None
9	Print string	DE=address of string	None
10	Read console buffer	DE=address of buffer	buffer has char
11	Get console status	None	A=00 (no char ready) A=0FF (char ready)
12	Return version number	None	HL=version number

Figure III: The non-disc BDOS function calls

◁ below the BDOS. When you load other programs, it fools them into thinking that it is part of the BDOS and so is not overwritten by them.

However this does mean that the TPA is reduced in size by the length of the debugger. It also means that it is difficult to look at the CCP and BDOS.

Last April an Appletip from Peter Wilson showed a way round this problem, and it is worth repeating here. Load DDT as normal and then enter L160. You will see the instruction MOV A,M.

Alter this to MVI A,3D with the A command. Exit DDT with a ^C and save the new version with the command:

```
SAVE 20 A:BUG.COM
```

This file, BUG.COM, will be our non-relocating DDT, useful for looking at BDOS.

Last month we introduced the concept of BDOS function calls, which are routines within the BDOS which we can use to carry out particular functions for us by calling them in a standard way.

They fall into two groups, those concerned with disc functions and those which are not.

We will start with the latter group, as they are simpler to understand. Figure III lists the 12 non-disc function calls with any parameters which they expect to receive and which will be returned.

Figure IV:
Z80 assembly
language form.

```

; Program to demonstrate the use of BDOS
; function 2 – CONOUT – by printing
; a '#' on the screen.
;
;          org    100h          ;start at base of TPA
;
conout    equ    2              ;function number for conout
warm     equ    0000h          ;warm boot entry at start of TPA
bdos     equ    0005h          ;BDOS entry point
;
start:    ld      c,conout      ;function number into C
          ld      e,'#'        ;character into E
          call   bdos          ;go do it
;
          jp     warm          ;finish by restarting CCP via
                               ;warm boot
end

```

We will examine them individually next month. For the moment we'll look at how they are evoked.

As an example, we'll use function 2, the console output, often abbreviated to CONOUT. This will print a character on the screen. From Figure III you will see that the BDOS expects the character which we want to print to be in register E and it will return nothing. In other words, we will not get any error messages back, as can happen if things go wrong with more complex

functions.

In register C we put the function number and then we CALL 5 to execute the program. This is demonstrated in the short assembly language program given above as an assemble example.

It will put a # on the screen and then perform a warm boot by jumping to address 0000h in the SPA. This contains another jump into the BIOS to perform the warm boot and return us to the CCP prompt.

User unfriendly

THE Macroworks utility from Beagle Brothers (Ver 1-0) is OK for the AppleWorks word processor, but nowhere in the manual do you find a warning about how unfriendly the built-in macros can be to your database files, especially if you are working in multiple records layout.

In the single records layout their behaviour is more annoying – adding characters to the field and a jumping cursor – than dangerous.

The most annoying and sometimes deadly commands (to your database file, naturally not to you) are the following (all beginning with SA – Solid Apple command) in multiple records layout:

X: Adds to six records in succession in the same categories (under the cursor) two characters to each. You cannot Undo this.
.,: Adds four characters to the right of the cursor. You cannot Undo this.

Jaromir Smejic finds room for improvement in a Macroworks utility

All others you can Undo with the SA-U command (please keep this command always in the macro file) if you use Undo immediately after the improper SA command:

D: Delete complete record under cursor.

W: Delete complete record under cursor.

Y: If cursor is, for example, on record 5, this command deletes completely records 2 and 3.

Z: Zap complete file to end. Only the last record remains.

Space: Deletes character under cursor.

These commands write two characters to the right of the cursor and then invoke the main menu: C, I, J, K, L, M, O, Return.

They invoke the Find function, looking for two characters, and after that invoke the main menu: G, Q, Cursor down.

The remaining commands either fulfil their function (for example S: Save and Remove file from Desktop) or behave only erratically (for example Tab: cursor jumps four records down and two categories to the right).

In spreadsheet files: D, Y, Z delete one row, but that can be Undone. Other SA commands are more annoying rather than dangerous.

Finally one golden rule: Never use these macros outside the word processor files.

Do look with me for another, not so hazardous, utility – and let us all know if you find one!

Now's the time to link your Apple to the big wide world!

Join the communications revolution and use your Apple (plus the telephone) to roam the world... logging on to MicroLink, Telecom Gold, Prestel, Micronet and the ever-growing number of bulletin boards, both in the UK and USA. Help yourself to hundreds of free telesoftware programs – and much, much more!

TeleLink

Linking the PC to the world

TeleLink Guide to PSS

You'll be able to read all about it in Britain's No. 1 communications magazine TeleLink. Each issue contains an up-to-the minute guide to all the modems and comms software now available for the Apple range.

● Here's a special offer for readers of Apple User. For every subscription ordered using the form below, we will give you free registration to MicroLink, worth £5. If you would like to take advantage of this offer, don't forget to tick the box!

ORDER FORM

Valid to March 31, 1987

	UK & Eire	Europe	O'seas Airmail	(✓)	£	p
One copy of the Nov/Dec issue of TeleLink	£1.75	£2	£2.50	<input type="checkbox"/>	5021

ORIENTAL
STRATEGY GAME**

**AppleUser
SPECIAL
OFFERS!**

**SAVE
UP TO £10**

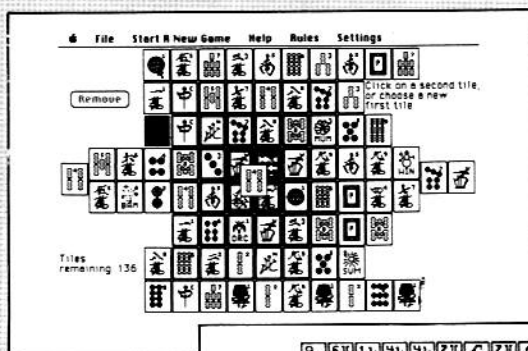

SHANGHAI is based around the 3,000-year-old Chinese game Mah Jongg which took the US by storm during prohibition in the 1920s – and promptly got banned when it turned many unsuspecting gamers into ivory tile addicts.

The game consists of 144 tiles depicting flowers, seasons, dragons, the wind and more. These are stacked up to five tiles high in the Dragon formation.

Your task is deceptively simple: Snap off matching pairs from the top of the piles until you run out of tiles.

You can play against the clock, in a team, or against your friends – as well as take back moves, peek under tiles and call up the Help screens.

This delightful, challenging game will keep you and your friends engrossed for hours.

AppleUser SPECIAL OFFERS!

The first Apple User Games Disc was one of the most popular packages we've ever offered our readers. Now comes Apple User Games Disc No. 2 – more great games that we thought were ideal but which were just too long to be printed in the magazine. And the price is still £5.95 for 7 games – that's just 85p a game!

AppleUser GAMES

DISCS No. 2

ALIEN ZAP – Good, old-fashioned machine code arcade game by Peter Ibbotson. Clever Apple graphics, and plenty of action.

SATELLITE CONTROL – A game of skill on the hi-res screen by Edwin Long. You're challenged to change the shape of a shuttle's orbit.

LIFE – This ubiquitous game has seen many forms. This latest, by Gerrard Manning, uses the hi-res screen to create new challenges.

TYPING TEST – A nice, simple game from Lawrence Tan, but one that will help improve your typing and keyboard skills. Ideal for beginners.

CARD TRICK – The computer is an excellent medium for performing feats of sleight of hand. Play tricks with cards with J. Taylor.

NOUGHTS & CROSSES – The graphics may not be sensational, but Frank Lewis shows how to play a fast game using only the lo-res screen.

THE PERILS OF PRINCESS EMMELINE – Denise McKnight invites you to face unknown foes as you immerse yourself in this adventure.

MURDER – Can you deduce who the murderer was? Roger the Lodger, maybe? And what weapon did he use – an exploding cigar?

BOMBER – Flatten the deserted city to provide a landing strip for your plane. If you're in a destructive mood you'll have a field day!

PELMAN – A two-player game of memory. Pit your wits against another human for a change – and let your Apple be the referee.

DINGHY SAILOR – We've all seen flight simulators. Now for something completely different. See how you can handle this sailing dinghy.

NIM – It may look like a straightforward game. In fact, nothing could be simpler. But YOU try beating this challenging program.

MASTERMIND – No, not the black leather chair version, but the much older, brain-bending code-breaker. It's just as compulsive!

WORD SEARCH – Hook up your printer and use this program to create your own word square puzzles to try out on your friends.

3D ENERGY FIELD – A superb three dimensional maze game. Can you escape from the labyrinth or will the energy field catch you?

The best of MacPaint and MacDraw:

SuperPaint is the most advanced graphics creation tool available for the **Macintosh**. It has two layers; one for editing dots like MacPaint, and one for manipulating objects like MacDraw. The features read like a Christmas wishlist. Full-screen editing. Multiple windows. 3 levels of magnification. Reduced view. Creates shapes bigger than the screen. Draws circles and squares from the centre. Text can be edited. LaserWriter Fonts. Open and save MacDraw PICT and MacPaint files. Print multiple copies. Colour printing on ImageWriter II. Makes full use of big screens.

Best of all, there's LaserBits™, dot-by-dot editing at 300dots-per-inch resolution. The results printed on a LaserWriter are stunning! Paste these graphics into other programs and they retain their 300dpi resolution! In fact, the Superpaint file format has just been adopted as the standard by all seven major US scanner manufacturers for 300dpi graphics editing.

Here's what the US reviewers have been saying about it :

"**SuperPaint** is the best paint program available on the Macintosh today" - Adrian Mello, MacWorld, Jan '87

"I can really review **SuperPaint** in two words: Get it!" - Sharon Aker, MacUser (US), Feb '87

"**SuperPaint** is the hottest graphics package currently available." - CJ Weigand, MACazine, Jan '87

When all you want is a masterpiece **SUPERPAINT** £95.00

WriteNow

- Document size only limited by disk space
- Number of documents open only limited by memory
- Instant repagination
- Visible on-screen columns: 1 to 4
- 50,000-word built-in spelling checker
- Imports MacWrite™, MS Word™ and text files
- Visible pagebreaks
- Headers & footers with even/odd page specification
- Visible footnotes with auto page overflow
- Visible lines from 4 to 127 points
- Graphic output embeddable in text
- Forward, backward, & wild card Find and Replace
- Sub- and Super- script in point increments
- Soft hyphenation
- Automatic backup file copies
- Alternating binding margins
- Tab indent left, indent right
- Left centre, right, and arbitrary tabs
- *Keep on same Page! paragraphs
- Extended or condensed style options
- Date, time, and page no. anywhere on page
- Selective Font, size, and style changes
- *Identical paragraph* format changes
- Moveable ruler
- Fast, flicker-free, horizontal & vertical scrolling
- Cancel long operations mid-event
- Option to show non-printing characters
- Undo for ALL editing changes
- Not copy protected

... and it costs £165.00
Did we forget anything?

Introducing **WriteNow For Macintosh**, the next step in word processing for your Mac. **WriteNow For Macintosh** combines the power you would expect from a dedicated word processing system with the ease of operation that you're used to with **MacWrite™**. Word processing on the Mac will never be the same. Here's what Steve Jobs, creator of the Macintosh says about **WriteNow**: "This is the word processor we designed and built the Macintosh for." The wait is over. Right now.

The MacSerious Promise

We're dedicated to helping the serious - or not too serious - Mac user get hold of the software he or she needs ... and which no-one else supplies this side of the Atlantic. If you can't find it elsewhere, try MacSerious. If we don't have it in stock, we'll get it for you if it exists.

The MacSerious Programmers Toolbox

LightSpeed Pascal £115
An interactive compiler and development environment for the Mac. You'll find all the convenient debugging features of Macintosh Pascal (also from Think Tech) but the interactive program is seamlessly integrated with a high-performance compiler, ultra-fast linker, and automatic project management. **Lightspeed Pascal** offers both the beginner and professional developer speed and ease of use in creating stand-alone double-clickable applications. Features include a High-Level Symbolic Debugger, Toolbox-level Debugger, numerous utilities, excellent documentation

LightSpeed C £160
A complete high-performance C programming environment providing in a single integrated Macintosh-style application, a multi-file text editor, high performance native code compiler, ultra-fast linker, and automatic make facility, as well as full Toolbox and Unix-compatibility library support. Complete implementation of the C language as defined by Kernighan & Ritchie's *The C Programming Language* plus more recent features. **Lightspeed C** compiles more than 10 times faster than any other Mac C compiler. Generated code is between 70% & 90% of the size produced by other compilers, and execution time varies between 65% and 95%. Call for full details.

MacSerious & the Apple //GS

Yes, we now have software for the GS. Available today:

Visualizer //GS (£95.00) Superb business graphics package taking full advantage of advanced features of the GS. Utilises **AppleWorks** data.

GraphicWriter (£140.00) Full powered WYSIWIG word-processor with built-in paint tools

PaintWorks Plus (£75.00) 'Colour MacPaint' for the GS - and then some. With **PaintWorks Plus**, you can make graphics come alive in animated sequences.

TML Pascal (APW) (£115.00, £140.00 w/ Source Code Library) Complete access to GS Tools; create stand alone applications.

Please Note: These products will not work on other Apple II machines. This is just the beginning. At MacSerious we look forward to bringing you many more exciting new products for this superb reincarnation of the classic Apple II computer.

MORE

The First Integrated Idea Processor/Idea Presenter
More is a third generation idea processing software product from **Living Videotext**, the company that invented Macintosh idea processing with **Thinktank**. Software Product of the Year 1986, MacUser Magazine (USA)

- **MORE Intelligent Idea Processing**
 - Hoisting
 - Cloning
 - Automated Reorganization
 - Pattern Matching
 - Visual Levels
- **MORE Desktop Presentations**
 - Bullet Charts
 - Tree Charts
 - Direct Transfer to DTP Programs
- **MORE Desktop Productivity**
 - Outline Templates
 - Smart Calendars and Time Stamping
 - Auto Phone Dialer
 - Outline Maths
 - Text and Graphics Windows
- **MORE Macintosh Power**
 - Standard editing
 - Up To Six Windows Open
 - Window Tiling
 - Transfer Outlines to Text and PICT

£295.00

Trapeze

The Spreadsheet without limits

Trapeze is a revolutionary program that frees you from the limitations of row and column spreadsheets. It was designed specifically for the Mac and takes full advantage of its speed, power and simplicity. Here's what **Trapeze** does...

Trapeze stores information in blocks; it does not lock you into a row & block prison. And you can move them freely around wherever you want, retaining the relationship between blocks. And it does it Fast...

Complex worksheets can be set up in minutes. **Trapeze** has fast, superior calculation speed, and it directly supports **Levco's Prodigy 4™** and other 68881 maths coprocessors.

Power on Demand...
Up to 32 worksheets open at once. Over 100 built-in functions. Create charts with 1000's of plots. And model size is limited only by memory.

Plus Things No Other Spreadsheet Can Do...
Advanced operations, such as desktop engineering functions ranging from matrix operations to simultaneous equations. Multiple databases for efficient organization, analysis and presentation. Import graphics and text from paint, draw and word processing programs.

Trapeze costs £295.00

From Jasik Designs

The interactive disassembler.
When you've got **MacNosy**, there are no more secrets.
£80.00
The Debugger beyond Discipline... the ultimate one
£150.00

TML Pascal £90
We could be selling it for 2 or 3 times the price. This amazing system will compile BOTH Lisa & Macintosh Pascal, permitting the creation of stand-alone, double-clickable applications, and DA's. And to go with it there's **TML Systems' Development Tools...**
TML Source Code Library for only £70.00. A collection of 18 example Pascal applications representing over 1 Mb of source code.
MacLanguage Database Toolkit for £85.00 - a complete library of Pascal procedures.
MacExpress for Pascal from AISoft for £175.00 is a complete library of Pascal procedures.

Mystery card

I WOULD be very grateful if you could offer some advice which might help with a hardware problem I have. My][Europlus contains an 80 column card which apparently cannot be identified (it is the type with a trailing lead for video output, rather than the pukka Apple version which I use on a IIe, which takes input/output through the slot) and the two main problems present are:

- The text output starts right over at the left hand side of the screen, instead of being nicely centralised.

- Despite a lack of any instructions, I have found most of the soft switches, but I cannot find how to revert to 40 column output from software (Control-Reset works in direct mode) and another peculiarity is that PR#3 and Control-Reset do not clear the screen; only chr\$(12) and HOME respectively do.

I am wondering if it is possible that I have got a card designed for a IIe? If not, is there any way of adjusting the firmware on the card to give a centralised video output?

If this should present difficulties, could you advise me on the cheapest, but effective way to upgrade the Apple II to the same standard as that of a non-extended 80 column IIe? (I already know about the Flipper or similar, but £300 or thereabouts is not peanuts!).

One other item of information which would assist me is the publisher of Beneath Apple DOS as I feel ready to attack it. The price would also be an advantage. – **J.L. Risdon, York.**

- It is probably best to alter the horizontal adjustments on your monitor to move the text to the right. PR#0 will revert to 40 column text, but you may have to move the monitor lead back to the 40 column output.

There may be commands such as Esc4 or ↑ x to effect the same.

The keyboard needs to be adjusted to give lower case to come up to IIe standards. Some 80 column cards give software or hardware lower case, and revision 7. Apple pluses can have the keyboard board adapted to return lower case.

CP/M colour

I AM interested in obtaining colour with CP/M and wonder how to do it. I have an Apple IIe with DMS30 colour card and Microvitec 1451 monitor.

In Applesoft the POKE 50944,69 brings green on black, POKE 50944,65, light blue on black, and so on.

However I do not know how to do this with CP/M, and would prefer to use the green on black to the white on black I now have.

Would you or a reader please let me know, in terms a novice would understand. – **John Cliffe, Chester.**

- I have not been able to test this program because I do not have the equipment, but if you try it out and let me know if it does not work I shall try to find out why.

I am assuming that you have a version of CP/M from Microsoft and that your card is a Microsoft one, or at least one which is compatible with Microsoft's.

I also assume that you have a file named DDT.COM on a CP/M disc – it is distributed with the system master disc.

First, boot up CP/M as normal and invoke the file DDT.COM with the command DDT.

You will see a sign on message and a dash. Type A100 Return. You will see 0100 and the cursor, type MVI A,45 followed by Return, and you will see 0102. Type STA E700 (Return), you will see 0105, Type RST 0, (Return) you will see 0106. Press Return

alone. Now type L100 (Return), and you will see the program disassembled as:

```
0100 MVI A,45
0102 STA E700
0105 RST 00
0106
```

From here you should see some MOV instructions. Ignore them, as they are not part of our program.

Press Control-C to exit the program DDT and you should be greeted with the usual CP/M prompt. Now type SAVE 1 FILENAME.COM where FILENAME is the name of the file which you want to save your program under.

It can include a disc drive specifier if you want.

If you now do a DIR on the disc you will see the COM file FILENAME. If you execute this file when starting your CP/M session you should, with any luck, set your monitor into green on black.

Light blue on black would have been initiated by using the instruction MVI A,41 at the address 100h.

The program is quite simple – it merely loads the Z80 accumulator with the value desired to be poked in, and then stores the accumulator at the address E700h.

This address is the CP/M equivalent of the 6502 address SC700 which is where you normally poke your setup value (50944).

If you do not have Microsoft CP/M there is a chance that the 6502 address of SC700 is not the Z80 address E700h. If this is the case you will have to consult your manuals to find out the real equivalent (it may even be the same). – **Max Parrott.**

Loose lead

I RECENTLY ordered an 80 column text card for my Apple II+. The card came with no instructions on how to set it up. I placed it in slot three. There was a wire dangling down from the card. Since I don't know where to connect it, I feared that if I turned on the computer the card might break down.

The wire had a type of clip at the end of it. Can you please tell me where to connect the clip. – **Bertrand Lee, Winthrop, Australia.**

- Without knowing the manufacturer it is impossible to say. Is it a clip – in which case it could connect anywhere – or is it a video socket for your monitor lead?

User clubs

PLEASE could you tell me if there are such things as Apple User Clubs. I am particularly interested if there is a local one where one can obtain any help and advice. I use an Apple IIe with 128k and CP/M.

Over the years I have obtained a library of software from overseas, much of which is unobtainable in the UK and I am looking to ▷

◁ exchange any copies of my existing software with any that might interest me. — **P. Huish, Bristol.**

● Yes, there is a loose network of Apple User Clubs. Your nearest is Bristol Apple Users & Dabblers. Contact Michael Farmer, 77 Moorlands Road, Fishponds, Bristol BS16 2LG.

Prototype IIc

I HAVE been offered an Apple IIc which has, underneath it a label bearing the words "UK prototype". I would be grateful if you could let me know the difference between this model and the current production model of the IIc.

The operating system I.D. displayed on the screen on boot-up is *PRODOS 1.0.1* and the prom I.D. is *APPLE IIc REV A NOV 30-83*.

If there are any great differences, could this IIc be upgraded and at what cost? I have contacted Apple but they could not help.

One problem that I have noticed is that the display on a normal colour TV via the modulator supplied is very difficult to read.

I have tried trimming the modulator using the control provided but am unable to improve the quality. Also I am unable to obtain a colour display on the screen.

When used with a black and white monitor, via the composite video output socket, the display is fine.

Finally, do you know where I might obtain a replacement case for a IIc, as the one on this particular model is badly damaged. — **M.C. Awbery, Beds.**

● It is difficult to know what differences there are, if any, as we have not seen a IIc such as you describe. The operating system you have is old but is loaded from disc and is not in the machine, so you can update to ProDos 1.1.1.

As far as we know all IIc modulators are pretty awful!

Subscript errors

SINCE I bought my Apple IIc several years ago I have used it very successfully with software like AppleWriter, Quickfile and Superbase.

On the few occasions that I wanted to save datafiles, I have always had trouble. I use the Dos 3.3 and follow the manual — the Dos Manual, Disk Operating System, Apple product #A2L0036 (030-0115B)

If I create a simple datafile via a basic program, like:

```
100 DIM PIM(100)
110 Z=25
120 FOR X=0 TO 100
130 PIM(X)=Z
140 Z=Z+3
150 NEXT X
160 END
```

This works all right, and all the data can be retrieved by typing:

```
PRINT PIM(..)
```

When trying to save it on to disc, I use the BSAVE command (manual p.92), for example:

```
BSAVE PIM,AS000,LS100
```

According to the CATALOG of the disc (after switching off and rebooting Dos 3.3) there is a B file called PIM on the disc.

When trying to BLOAD this file by typing:

```
BLOAD PIM, or BLOAD PIM, AS000
```

the machine makes all the appropriate noises, but when trying to retrieve data as before by typing PRINT PIM(...) I do not get a File not found, or File type mismatch error message, but a subscript error message.

Obviously I am doing something fundamentally wrong.

Similarly, when I am trying to save and retrieve a shape table, using the instructions from the Applesoft Basic programmer's reference manual, p.150ff (which seems to me a rather roundabout way of creating shapes anyway) my time is wasted and no shape is retrieved.

I find that the Apple manuals give me all the necessary details on loading a file from a disc, but very little on creating such a file in the first place.

I do hope that you can put me on the right track. Unfortunately my local friendly dealer seems to have disappeared from the scene, so I am unable to get any help on this rather fundamental problem. — **P.A. Harthoorn, Canterbury, Kent.**

● Your example program temporarily saves in memory the value you have assigned to each of the elements of the array PIM. This you have proved by being able to print out the values of PIM as you describe.

You now wish to save these values to disc so that you have a permanent record.

Your example of saving (from page 92) of the Dos manual), namely BSAVE PIM,AS000,LS100, saves an image of the area of memory running from \$000 to \$100, which in decimal numbers is 0 to 256

As you have seen, you have saved this area of memory and you can reload it. However, don't worry — the worst you can do is lose your program.)

(Incidentally, this area of memory you have BSAVED is "special" to the 6502 processor and Basic and you shouldn't use it until you have more experience. However, don't worry the worse you can do is lose your program.)

There is a way of saving your Basic variables to disc as an image of memory, but until you know more of the inner workings of Basic and of the 6502 it is best left alone.

The recommended way of saving these variable is in sequential file as described in the chapter starting on page 47 of your Dos manual.

Your example program could be extended to save the variable by the addi-

tion of the lines:

```
160 DS=CHRS(4)
170 PRINT DS;"OPEN PIM EXAMPLE"
180 PRINT DS;"DELETE PIM EXAMPLE"
190 PRINT DS;"OPEN PIM EXAMPLE"
200 PRINT DS;"WRITE PIM EXAMPLE"
210 FOR X=0 TO 100
220 PRINT PIM (X)
230 NEXT X
240 PRINT DS;"CLOSE PIM EXAMPLE"
```

After running this program you will discover on the disc a file named PIM EXAMPLE. This contains the values of PIM. These values could be retrieved back into memory by the following program part:

```
300 PRINT DS;"OPEN PIM EXAMPLE"
310 PRINT DS;"READ PIM EXAMPLE"
320 FOR X=0 TO 100
330 INPUT PIM(X)
340 NEXT X
350 PRINT DS;"CLOSE PIM EXAMPLE"
360 END
```

Note that DS is already set to the value of CHRS(4) by the first part of the example program. Normally these program parts would be put together into a bigger program which lets you jump to whichever part is needed at the time.

Under Dos there is no easy way of saving all the variables of a Basic program to disc. However, under the newer operating system, ProDos, you can save all your variables with one command and retrieve them with another, and I would recommend that you change operating systems.

Your problem with shape tables is almost certainly that after loading the shape table back from disc you are not informing Basic where it resides.

This is done by calculating the address of the start of the table and POKEing this address into the two bytes at 232 and 233.

To do this you need to understand a little on memory organisation and addressing.

Briefly, if the address is A then you have to calculate two values H and L as follows: H=INT (A/256) and L=A - H * 256. Then POKE 232,L and POKE 233,H

Max Parrott

Apple User Classifieds

Has upgrading your computer given you hardware you no longer need? Or have changing interests left you with unwanted software? Then THIS is the place to advertise your surplus items. Apple User readers are always on the lookout for a bargain and this is the first place they look!

An added bonus!

Your advert will also be automatically displayed on MicroLink, the electronic mail service operated in association with Telecom Gold. This means it will be seen by thousands of computer enthusiasts who can send an instant response.

Classified advertisements will be accepted under the following conditions:

- This service is EXCLUSIVELY for the use of private readers. No trade ads will be allowed.
- To avoid encouraging software piracy, all ads will be carefully vetted before they are accepted.
- Ads can only be accepted on this form (or a photocopy of it).
- There is no maximum to the number of words you include in your ad. If there is insufficient room on the form, continue on a separate sheet of paper.
- The cost is 20p per word, with a minimum of 10 words.
- We GUARANTEE your ad will appear in the May issue (on sale April 29) providing it is received by April 1.

Snapshot and the Art of Apple II Switching

The Snapshot card unleashes your Apple's hidden power to interrupt-and-resume any running program. When you load up Snapshot's on-board RAM with one of Dark Star Systems' growing family of easy-to-use, menu-driven software packs, you get awesome switching power at the press of a button....

Switch 1 The Snapshot Shuttle lets you keep ANY four programs in your RAMcard and switch back and forth among them – instantly!

Switch 2 The Snapshot Printer-rupt lets you interrupt ANY running program, print its display using a galaxy of great menu options, and resume running it as though nothing happened.

Switch 3 The Snapshot Copykit lets you make archival backups of your copy-protected software in less than 25 seconds.

Switch 4 The Shell is the memory-manager and mini operating system which allows Snapshot software to work within an interrupted program.

PRICES (ex VAT)
Snapshot version IIe card (requires software) £ 95.00
Each software pack (requires card)..... £ 20.00
All 4 software packs..... £ 55.00

MEMORY EXPANSION CARDS
The Shuttle will let you load 2 x 64K programs into a 128K Apple. Naturally, the more memory you have, the more programs you will be able to load. The Shuttle works with all the popular RAM cards.

Cirtech 64 extended IIe 80-column card £ 42.00
Cirtech PlusRAM 256K RAMcard..... £ 90.00
Cirtech PlusRAM 1 Meg RAMcard..... £144.00

If ordering direct, please enclose cheque or quote details of your Visa, MasterCard or American Express account.

SHIPPING
First Class postage & packing free of charge in U.K.
