Apple IIGS Monitor: Step, Trace, and Search

=====

This article last reviewed: 11 December 1986

Step and Trace are not built into the Apple IIGS Monitor.

The format for the search command is

```
\<search string>\{<bank>/}<addr1>.<addr2>P
```

where <search string> is either a series of hexadecimal values or ASCII text delimited by single or double quotes. In addition, the entire search string is separated from the search range with backslashes. <Bank> is optional (as the braces are meant to indicate) and specifies the memory bank in which you want to search. If you do include a bank number, then you must separate it from <addr1> with a slash. <addr1> and <addr2> are the start and end of the memory range of the search.

For example, to look for the location of the Apple IIgs startup message, type:

```
\ "Apple IIgs" \FF/0000.FFFFFP
```

You should get

```
FF/F914:
```

as the response.
