Apple II Computer Documentation Resources (a2_docs_documentation.msw)
With the introduction of the Apple II family of computers, the wonders of programming, communicating, and just plain going out became affordable for an entire generation of budding enthusiasts and their families. By the end of the 70's an entire culture had risen up around the Apple II, and the energy of thousands of hardware and software hackers went into learning every last op-code and settable switch within the machine.

It can't be discounted that Apple's successful foray into the educational market resulted in schools nationwide brimming with Apple IIs, and social groups collecting around the labs after school hours. All manner of things happened there, some documented below.

These files range from explicit memory maps of the Apple II to long tutorials on how to "crack" games, that is, remove all copy protection and make the game easier to distribute between other pirates.

---

Apple II Textfiles

18 September 2000

With the introduction of the Apple II family of computers, the wonders of programming, communicating, and just plain going out became affordable for an entire generation of budding enthusiasts and their families. By the end of the 70's an entire culture had risen up around the Apple II, and the energy of thousands of hardware and software hackers went into learning every last op-code and settable switch within the machine.

It can't be discounted that Apple's successful foray into the educational market resulted in schools nationwide brimming with Apple IIs, and social groups collecting around the labs after school hours. All manner of things happened there, some documented below.

These files range from explicit memory maps of the Apple II to long tutorials on how to "crack" games, that is, remove all copy protection and make the game easier to distribute between other pirates.
As a large amount of programs were illegally copied on the Apple (a situation that was common on pretty much every Microcomputer platform), it became necessary for users to share the documentation from the original package so that the disks were useable.

A small number of these "Soft Dox" are also for pirating programs themselves, which supplied their own documentation, often with a very entertaining bent in the writing.

When you were just a little ogre none of the other monster children would play with you. You had a spiked tail and a penchant for young ladies, preferably flame grilled in your own breath! When you were twenty feet tall, with 2 horns on your head, you could have something to do with the fact that you are twenty feet tall, with 2 horns on your head. Alternatively, it could be your halitosis, which is so bad it sets things on fire. Or even the fact that you can knock down stone wall with your fists. Anyway, now it is your turn to get your revenge, you are going to claim the golden egg.
buildings to demolish them, or flame them to set them on fire, while fighting off the other creatures on the screen. Watch out for the hornets that fly across the screen and sting you. Be wary of the weapons the humans try to bring to bear. You will need to destroy these before they destroy you.

FOOD
You can eat the junk food and the people. These increase your health, thus enabling you to continue your destruction for longer.

FIRE POWER
Eat the lightning to revitalize your fire power.

HEALTH
Every time you are hit your health decreases. Your health is represented by the word "Aaargh," by your character at the top of the screen. When the word is completely formed, you will die a very bloody death.

COMPLETING A LEVEL
When you have captured the egg you will take this back to your treasure cave. Unfortunately, life is never easy and you will need to fight to keep your treasure. You have a limited amount of time to find the egg. After a certain period, the natives will have had time to hide the egg from you, and you will have to go on to another scene.

When you have succeeded in gathering a hoard of five eggs, you can go to the volcano and try to capture the big one, the final Roc's egg, a golden egg to surpass all others.

CONTROLS
Either joystick or keyboard.

Joystick
Use the stick to move left, right, up, down, or diagonally.
To flame, first face the direction you want to flame. Then press the appropriate joystick button.
To punch, first face the direction you want to punch. Then press the appropriate joystick button to punch straight out, or press the joystick button while pushing the stick up or down to punch up, punch down, or to pick up people or other nourishment.

Keyboard
Use the number keypad to move left, right, up, down, or diagonally. Press 5 to stop.
To flame, first face the direction you want to flame. Then press the spacebar to flame.
To punch, face the direction you want to punch. Then press the Shift key to punch straight out, or press Shift and the directional key to punch up, punch down, or to pick up people or other nourishment.

OTHER CONTROLS
ESC - Pause
S - Sound off/on
Q - Quit
R - Restart
AND I ONLY DO SO AFTER IT HAS BEEN ON THE SYSTEM FOR MORE THAN A MONTH.

MESSAGE SUMMARIES:
THE "$" COMMAND LISTS THE CURRENT ITEMS AND PRICES OF ITEMS OFFERED FOR SALE THROUGH THE CLUB STORE. THESE PRICES ARE NOT OFFICIAL, AS THIS IS NOT A COMMERCIAL BULLETIN BOARD.

THE "O" COMMAND WILL GIVE YOU THE MESSAGE NUMBERS OF MESSAGES SENT TO YOU, TO ALL, AND FROM YOU. WHEN YOU SIGN ON, THE ABS ALSO LISTS THE NUMBERS OF MESSAGES SENT TO YOU.

DELETING A MESSAGE:
THE "D" COMMAND WILL LIST THE SUMMARY OF THE MESSAGE AND ASK YOU IF YOU WANT TO DELETE IT. ONLY THE SENDER, THE RECIPIENT (IF NOT TO ALL) AND THE SYSOP CAN DELETE MESSAGES. SO THAT EVERYONE CAN USE THE ABS, PLEASE DELETE YOUR OLD MESSAGES!!

AMENDING A MESSAGE:
THE "A" COMMAND AND THE EDIT OPTION OF THE "E" COMMAND ALLOW YOU TO CHANGE THE RECIPIENT, SUMMARY OR TEXT OF A MESSAGE. IF THE MESSAGE HAS FEWER THAN 10 LINES, YOU MAY ADD A LINE. IF YOU CAN'T DELETE A LINE, BUT REPLACING IT WITH 1 OR 2 SPACES WILL HAVE THE SAME EFFECT.

INFORMATIONAL PRINTOUTS:
THE "H" COMMAND GIVES A SHORT DESCRIPTION OF ALL AVAILABLE COMMANDS AND CONTROL CHARACTERS. NEW USERS MAY WANT TO MAKE A PRINTOUT OF THIS LIST FOR HANDY REFERENCE. (IF YOUR PRINTER IS TOO SLOW, SEE THE "N" COMMAND, EXPLAINED BELOW.)

THE "?" COMMAND LISTS ONLY THE LETTERS OF ALLOWED COMMANDS, AND IS FOR QUICK REFERENCE.
THE "B" COMMAND LISTS OTHER COMPUTER BULLETIN BOARD SYSTEMS. IF YOU KNOW OF ANY CHANGES THAT SHOULD BE MADE -- AND CHANGES OCCUR FREQUENTLY AS SYSTEMS START UP OR SHUT DOWN -- PLEASE LEAVE THE SYSOP A MESSAGE.

THE "M" COMMAND LISTS THE MEETING DATES, TIMES AND LOCATIONS OF ALL MEETINGS OF WASHINGTON APPLE PI AND THE NORTHERN VIRGINIA APPLE USERS GROUP, NOVAPPLE. ALSO LISTED IS INFORMATION ON MEETINGS OF W.A.P.'S SPECIAL INTEREST GROUPS, KNOWN BY THE ABBREVIATION "SIG", AND TUTORIALS, CLASSES ON SPECIAL SUBJECTS FOR WAP MEMBERS.

THE "S" COMMAND LISTS THIS INFORMATION ABOUT THE ABS.

HOUSEKEEPING COMMANDS:
LINEFEEDS AND NULLS:
IF AT ANY TIME YOU SEND THE ABS A LINEFEED, THE ABS WILL BEGIN TO SEND YOU LINEFEEDS. IF YOUR COMPUTER SENDS A LINEFEED AFTER CARRIAGE RETURN, THE FIRST "ENTER A CARRIAGE RETURN" SHOULD ENABLE LINEFEED INSERTION. (LINEFEEDS ARE NEEDED BY CP/M SYSTEMS AND SOME PRINTING TERMINALS.)

YOU CAN USE THE "N" COMMAND TO TURN LINEFEED INSERTION ON OR OFF.

NULLS ARE THE ABS' WAY OF ALLOWING YOUR PRINTER TO KEEP UP WITH THE ABS. CRT'S WITH LESS THAN 10 LINES, YOU MAY NEED THEM. IF YOU DO NEED THEM, THE "N" COMMAND WILL TELL YOU THE CURRENT DELAY AFTER CARRIAGE RETURN, WHICH CAN BE 0-2.55 SECONDS, AND SPEED. BECAUSE NORMAL TRANSMISSION IS ONLY AT 30 CHARACTERS/SECOND, ONLY SPEEDS OF 100 OR LESS HAVE ANY EFFECT. SPEED= IS IN EFFECT AT ALL TIMES REGARDLESS OF WHETHER LINEFEED INSERTION IS ON.

SPEED= IS JUST APPLESOFT'S "SPEED=" COMMAND.

KNOWLEDGABLE USER:
WHEN YOU KNOW THE WORKINGS OF THE ABS WELL, YOU CAN USE THE "K" COMMAND TO ELIMINATE SOME OF THE PROMPTS.
THIS WILL SPEED UP OPERATIONS SOME.

80-COLUMN MODE:
IF YOU ARE USING A PRINTER OR 80-COLUMN BOARD, YOU CAN CHANGE EVERY OTHER CARRIAGE RETURN INTO A SPACE WITH THE "+" COMMAND.
TO TURN IT OFF, ENTER "+" AGAIN.

USERS AND WAP NUMBERS:
THE "W" (WHO) COMMAND ALLOWS YOU TO FIND A PERSON'S WAP NUMBER IF YOU KNOW THE FIRST TWO LETTERS OF THE PERSON'S LAST NAME, AND TO FIND HIS OR HER NAME IF YOU KNOW HIS OR HER WAP NUMBER.

LOWER CASE:
USE CTRL-L LIKE A SHIFT-LOCK KEY TO TOGGLE OFF OR ON LOWER-CASE TRANSLATION. IF YOU WANT TO SEE LOWER CASE, ENTER CTRL-L ANY TIME THE ABS EXPECTS INPUT. ENTERING CTRL-L AGAIN
FILE TRANSFER SYSTEMS:
THE "X" COMMAND ENTERS A FILE TRANSFER SUBSYSTEM. IT HAS A SEPARATE HELP COMMAND.

GENERAL INFORMATION:
THIS SYSTEM RUNS ON AN APPLE II IN APPLESOFT AND ASSEMBLY LANGUAGE USING A D.C. HAYES MICROMODEM II UNDER A PROGRAM WRITTEN BY THOMAS S. WARRICK (BASED ON SOME EARLIER WORK DONE BY JOHN MOON) FOR WASHINGTON APPLE PI, THE WORLD'S SECOND LARGEST APPLE COMPUTER USERS' GROUP.

YOUR CURRENT SYSOP IS: (INSERT YOUR NAME)

THE POLICY OF THIS ABB5 PROHIBITS COMMERCIAL MESSAGES. "COMMERCIAL" MEANS ANY OFFER OR SOLICITATION OF AN OFFER FOR A PRODUCT OR SERVICE BY ANYONE IN THE TRADE OR BUSINESS OF SELLING THAT PRODUCT OR SERVICE. CASUAL SALES OF PERSONAL PROPERTY ARE PERMITTED. THESE RULES SHOULD NOT BE CIRCUMVENTED THROUGH THE ACTIVITY OF OTHERS.

(KEEP FOR CONTROL CHARACTERS C, H (BACKSPACE), K, L, M (RETURN), S, AND U (RIGHT-ARROW), ALL CONTROL CHARACTERS ARE IGNORED. (THIS MEANS NO "BEEP").)
I WELCOME ALL YOUR COMMENTS AND SUGGESTIONS. THIS IS MANY OF THEM WILL BE ACTED ON AS SOON AS THEY CAN BE INCORPORATED INTO THE PROGRAM. MANY OF THE MOST USEFUL FEATURES IN THE SYSTEM WERE SUGGESTED BY USERS.

ENJOY! (YOUR NAME) SYSOP
the password file. Note that if you have the CPS card, you will not need to worry about changing your file (except for the bulletin date). These will be discussed more below.

MESSAGES -- This is the principal file to which your users will be reading and writing, thus, it is first on the disk in order to make disk access as fast as possible. Understanding the structure of Messages is very important to an understanding of WAPABBS. Messages is a random-access text file with a record length of 452 characters. The file is initialized with 138 "EMPTY" records. When a message is in use, it consists of up to 14 lines, each followed by a return:

The userid of the sender (6 characters);

The userid of the recipient (6 characters);

The date of the message (13 characters in the form YMMDD.HHMMSS, where Y=year, MM=month, DD=day, HH=hour, MM=minute, SS=second); this is the format for the date that must always be used in the STARTUP file.

A summary of the message (20 characters); and

The text of the message in up to 10 lines of up to 39 characters each. If the message is less than 10 lines, the last line of text is followed by a null line, i.e., a line with no characters prior to the return that ends the line. If the file is empty, you will be asked whether they want to read the bulletin before proceeding further. The userid numbers in the Messages file may not be sold without express permission of Washington Apple Pi.

CLUB STORE -- This sequential text file provides information about any quasi-commercial ventures you, your organization, or anybody else may have. If you don't have any such activity, you may want to use this file as a "Shopper's Guide" to products and services available at your area. This file also ends with a null line.

MEETINGS -- This sequential text file gives the dates, times and places of meetings that are of interest to your users. As this file comes to you, it contains the meeting information for Washington Apple Pi. This file also ends with a null line.

BBS -- This sequential text file gives phone numbers and other information of other CBBS systems in your area. Asterisks have been added as a border for esthetic purposes. This file also ends with a null line.

TO SYSOP -- This sequential text file stores messages left to you by up to 9 people who do not have passwords. The first entry in the file is a one-digit number of the number of messages in the file. The text of the messages follows. This file may be retrieved only by you.

UPLOAD1 -- This sequential text file gives the instructions for uploading and downloading files to or from the ABBS. "Uploading" means sending files to other computers to the ABBS; "downloading" means sending files from the ABBS to other computers.

UPLOAD2 -- This sequential text file contains a list of files available for uploading. A null line terminates the listing; this is necessary so that uploads will return to the file prior to the return that ends the line. An additional null line terminates the file. It is also available for manipulation by your own revisions of WAPABBS;

DOWNLOADS -- This sequential text file contains a list of files available for downloading. A null line terminates the listing; this is necessary so that downloads will return to the file prior to the return that ends the line. An additional null line terminates the file. It is also available for manipulation by your own revisions of WAPABBS;

UPLOAD2 -- This sequential text file contains a list of files available for downloading. A null line terminates the listing; this is necessary so that downloads will return to the file prior to the return that ends the line. An additional null line terminates the file. It is also available for manipulation by your own revisions of WAPABBS;

USERS.OBJ -- This text file contains 40-character records with this information:

characters 1-4: The numeric portion of the userid, in 4-digit form. Thus user 1 is '0001'; user 2027 is '2027'.

characters 5-8: The password;

characters 9-23: The user's name with last name first;

characters 24-33: The last date the user called in, in the form YYMMDD.HH.

characters 34-37: The number of times the user has signed on;

characters 38: The letter "M". This character is available for manipulation; you may, for example, use this character to record whether or not someone has answered the Opinion question;

character 39: The '*' character. This is used to make a border on printouts of the file. It is also available for manipulation by your own revisions of WAPABBS;

and

character 40: A carriage return. Note that after the return that ends the last user record there must be another return, at the end of the file or the program will change passwords should be able to show you the length of this file. It must always be greater than a number even divisible by 40 (e.g., 41 or 361) in order for WAPABBS to work. WAPABBS accesses this file as a random-access file in order to check the userid numbers. Each location contains 255 ($FF) if the user is allowed on the USERS file. BUILD USERS.OBJ then runs WAPABBS to restart the system.

UPLOAD2 -- This sequential text file contains a list of files available for uploading. A null line terminates the listing; this is necessary so that uploads will return to the file prior to the return that ends the line. An additional null line terminates the file. It is also available for manipulation by your own revisions of WAPABBS;

REMEMBER II -- This text file is available for downloading. You should EXEC it with MORE I in effect, and BRACE it as it says. This is, if may say, an excellent terminal program for the Micromodem II. Non-commercial distribution is permitted, and this program may not be sold without express permission of Washington Apple Pi.

REM II INSTRUCTIONS -- This text file contains the instructions for REMEMBER II. You should EXEC it in the same manner to create a file called REM II.OBJ1, which REMEMBER II will access when you request instructions in its use.

ABRS1 and ABRS3 are source code for the binary files discussed above.

AN ANALYSIS OF THE PROGRAMS:

1. THE INPUT/OUTPUT ROUTINES

The I/O routines are activated by a "CALL 37888" in line 32 of WAPABBS. The I/O routines are activated by a "CALL 37888" in line 32 of WAPABBS. This routine changes the CSW/KSW vectors ($36-$39) to the ABBS's I/O routines, sets the "A" vector ($3F5-$3F7), and jumps to the DOS routine for the ABBS's I/O routines.

The Output routine, which begins at $9420, first does a test to see if the character being output is lowercase. If so, the character is EOR'ed against LOCSE. If lowercase-to-uppercase conversion is on, LOCSE is set to $20; if off, it is $00. Following this, the accumulator (hereafter referred to as "A") and the X and Y registers are stored on the stack.

Next, the keyboard is checked for an interrupt character such as ctrl-C. Since only the SYSOP can enter a key from the ABBS's Apple, this is given priority. If a key was pressed, the X register is restored from the stack, and the program waits for another character to be received or entered before resuming output. Next, CMASK is checked to see if a ctrl-C or ctrl-K is allowed. If either is allowed (i.e., if CMASK eq 0), and if the character received is indeed a ctrl-C or ctrl-K, an interrupt character has arrived through the modem. If not, the character in the accumulator is sent out through the modem, the A, X, and Y registers are restored, and the character is printed on the screen. The program then jumps to the DOS's console output routine.

If a character was entered at the keyboard or from the modem while output was in process, several tests are made. If the character was a ctrl-S, the program waits for another character to be received or entered before resuming output. If the character was a ctrl-D, the program then jumps to the DOS's console output routine.

If the character received was neither a ctrl-C nor a ctrl-K, it is ignored and the character is sent out anyway.

The input routine, which begins at $9486, first saves the X register, which is the offset from $200 (the start of the input buffer), into CLL, "Current Line length" in the sense of the term MBX. This prevents the user from entering a line longer than WAPABBS is expecting. If the line is too long, the user is sent a bell (ctrl-G).

If the program receives a ctrl-K, it clears CMSK (calculated at line 8180) to 0 and jumps to the DOS's console output routine.

If the user is in effect, the characters that are read are printed on the ABBS's computer's monitor in uppercase form. If lowercase-to-uppercase conversion is on, LOCSE is set to $20; if off, it is $00. Following this, the accumulator (hereafter referred to as "A") and the X and Y registers are stored on the stack.

Next, the keyboard is checked for an interrupt character such as ctrl-C. Since only the SYSOP can enter a key from the ABBS's Apple, this is given priority. If a key was pressed, the X register is restored from the stack, and the program waits for another character to be received or entered before resuming output. Next, CMASK is checked to see if a ctrl-C or ctrl-K is allowed. If either is allowed (i.e., if CMASK eq 0), and if the character received is indeed a ctrl-C or ctrl-K, an interrupt character has arrived through the modem. If not, the character in the accumulator is sent out through the modem, the A, X, and Y registers are restored, and the character is printed on the screen. The program then jumps to the DOS's console output routine.

If a character was entered at the keyboard or from the modem while output was in process, several tests are made. If the character was a ctrl-S, the program waits for another character to be received or entered before resuming output. If the character was a ctrl-D, the program then jumps to the DOS's console output routine.

If the character received was neither a ctrl-C nor a ctrl-K, it is ignored and the character is sent out anyway.

The input routine, which begins at $9486, first saves the X register, which is the offset from $200 (the start of the input buffer), into CLL, "Current Line length" in the sense of the term MBX. This prevents the user from entering a line longer than WAPABBS is expecting. If the line is too long, the user is sent a bell (ctrl-G).

If the program receives a ctrl-K, it clears CMSK (calculated at line 8180) to 0 and jumps to the DOS's console output routine.

If the user is in effect, the characters that are read are printed on the ABBS's computer's monitor in uppercase form. If lowercase-to-uppercase conversion is on, LOCSE is set to $20; if off, it is $00. Following this, the accumulator (hereafter referred to as "A") and the X and Y registers are stored on the stack.

Next, the keyboard is checked for an interrupt character such as ctrl-C. Since only the SYSOP can enter a key from the ABBS's Apple, this is given priority. If a key was pressed, the X register is restored from the stack, and the program waits for another character to be received or entered before resuming output. Next, CMASK is checked to see if a ctrl-C or ctrl-K is allowed. If either is allowed (i.e., if CMASK eq 0), and if the character received is indeed a ctrl-C or ctrl-K, an interrupt character has arrived through the modem. If not, the character in the accumulator is sent out through the modem, the A, X, and Y registers are restored, and the character is printed on the screen. The program then jumps to the DOS's console output routine.

If a character was entered at the keyboard or from the modem while output was in process, several tests are made. If the character was a ctrl-S, the program waits for another character to be received or entered before resuming output. If the character was a ctrl-D, the program then jumps to the DOS's console output routine.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.apple/ -- 18 September 2000 -- 18 of 1262
password entry in the USERS file. If user 538 were not on the system, J would become 0. Note that this routine is used in the signon process and in the W and Y commands.

III. VARIABLES USED IN WAPABBS

A$ must be the first variable used in the program in order for the machine language routine at $300 to work. A$ is the workhorse string variable; all string input passes through A$. Note that if A$ has been set by the routine at $300, for so long as A$ is not assigned to another variable, A$ will not take up regular memory space and will not create "garbage."

ACTIVE is a flag used to tell the I/O routines whether the SYSOP, a user, or no one is currently using the ABBS. See above for a further description of the values ACTIVE can have.

ACS [Allowable Commands] is a list of the letters of allowable commands. CALL 804 uses this to compute the index value of the response to the "COMMAND?" prompt for use by the ON J GOTO in line 111. The CALL 804 routine requires that ACS be a variable.

AL$ is "ALL   ", and is used by the message handling routines to prevent errors that would occur if a user entered "ALL", which is only 3 characters long, instead of the 6-character response that the ABBS expected.

BS is the secondary string variable. It is used by the "&" message summary routines and for other general purposes.

BDS [Bulletin Date] is a 4-character string that tells users when the bulletin was most recently updated.

BD$ [Bulletin Date] is a 4-character string that tells users when the bulletin was most recently updated.

C60 is 1 if the user has selected 80-column mode with the "*" command, 0 otherwise.

CH [Chat] is 1 if you have indicated your availability for a chat, 0 otherwise. See the description of the ABBS1 routines and program lines 1010 and 1020.

CM [Chmask] is 0 if the user is permitted to interrupt program execution and return to the "COMMAND?" prompt; 1 means interruption is not permitted.

CMS is a comma (",."). This must be a variable so that the CALL 804 routine can tell whether what should have been a file name has a comma.

CRDLY is the delay (in 0.1 seconds) sent after each carriage return if the user has specified linefeed insertion. This is the standard Micromodem delay. Note that setting this to 0 is equivalent to specifying a delay of 2.56 seconds.

D$ is ctrl-D.

D1$ [Date1] is "> " and is used to create a date value higher than any valid date. In this way, WAPABBS will sort the messages in proper date order.

DAS [Date] is the current date as specified in the STARTUP file or by the clock.

DA(MS) [Date order; see below for meaning of MS] is used to store the messages in date order. DA(1) is equal to the message number of the oldest message, DA(2) is the number of the second oldest, etc.

DR [Drive] is a location within DOS 3.3 that, when poked with 1 or 2, will access that disk drive for the next DOS command without requiring ",D1" or ",D2".

E$ contains "E" and is used by CALL 804 to check that a number entered was not in exponential notation.

EMS [Empty] contains "EMPTY ", and is used to erase the "From" value in message summaries and on disk.

ER [Error] is used to store error codes. Certain errors are ignored, some are processed, and some stop program execution. See the description of the lines of WAPABBS beginning with 40000.

F [File number] is used to store the number of the file being accessed.

FCS contains ctrl-D + "CLOSE". When printed, this will close all disk files.

FG [Flagged messages] is 1 if, when reviewing message summaries, the user has chosen to flag those messages he wishes to read in full. It is 0 if the user has chosen not to be asked whether he will read the full text of certain messages.

FG(MS) [Flagged messages; see below for MS] contains a 1 in an element if that message has been flagged for a reading of its complete text, and a 0 if the message has not been flagged.

FLAG is the location of the Micromodem's FLAGS byte. See the Micromodem manual for complete details.

FO$ contains ctrl-D + "OPEN".

FPS contains ctrl-D + "POSITION".

FR$ contains ctrl-D + "READ".

FS contains ctrl-D + "WRITE".

FS(12) contains the 12 file names used by WAPABBS.

INLIN is 768. This is the address of the line input routine beginning at $300.

J is the workhorse numeric variable. It is often the message number being printed or processed or an index in a FOR-NEXT loop.

JJ is a secondary general-purpose numeric variable.

K is the second most-commonly used numeric variable. It is often a line counter, used to make sure that message lengths are no more than 10 lines long.

KK is another secondary general-purpose numeric variable.

KU [Knowledgeable User] is 1 if the user claims to be familiar with the operations of the ABBS, 0 otherwise. If KU = 1, many prompts are shortened or eliminated.

L [Logical variable] is usually used as the result of a logical test of a message summary string using the &T function. It is usually ~1, 0, or +1.

LC [Last Call] holds the date and time (to the nearest 0.1 hour) that the user last called in to the ABBS.

MC [Message Count] is the number of messages currently in use. Given the way DA(MS) works, DA(MC) is the message number of the most-recently entered message and DA(MC+1) is the message number of the most recently-deleted message and will become the message number assigned to the next-entered message. Think about this for a while.

MS is ctrl-D + "MON I". All files are printed out with MON I in effect because this is fast and causes no unnecessary interruptions between lines.

MO(12) contains the number of days in each month. Change this during leap years.

MS is the total number of messages that the system will allow. The two constraints to increasing this are disk space and space in the message summary area. Many arrays are dimensioned by MS.
M$(0)$ is used to enter and edit messages. M$(0)$ has the userid of the sender of the message, M$(1)$ has the userid of the recipient, M$(2)$ has the date the message was entered, M$(3)$ has the message summary, and M$(4)$-M$(13)$ store the lines of the text of the message.

MNS is ctrl-D + "NOMON C,I,O". See M$1$ for an explanation of why this is necessary.

R [Record number] is used by the random-access file routines to select the message number to be read or written.

S1$ [Sysop1] has the SYSOP's userid in 4-digit numeric form. If the SYSOP's number were WAP001, for example, S1$ should be set to "0001". This is necessary to keep the "Y" routine from printing the SYSOP's password.

SL [Slot] contains the Micromodem's slot number.

SO [Signons] contains the number of users who have successfully signed on. If someone signs on more than once, they are counted more than once.

SYS [SYSOP] contains the userid of the SYSOP. Observe when going through the program listing that the SYSOP can do many things forbidden to others.

T1$ [T user 1] is the userid of a person who is able to change the date if you are unable to do so.

T2$ [T user 2] is the userid of the person who can change the date and print the password file. If you have no one to whom you want to allow access to the date or password file, set these to your own userid to prevent anyone from having this much access.

U$ [Userid] is the userid of the user currently on the ABBS. In case you have not guessed, a userid is a 6-character string with a 2 or 3 letter prefix and a numeric suffix in the range 1-4095.

UL$ [Upload] contains the letters of the four commands allowed during uploads.

UP$ [Upload] is the password necessary to begin uploading a file into the ABBS. E is a general-purpose numeric variable.
MidiMate - A Midi File Utility for the Apple IIGS Computer

Copyright 1990 by Lindsay B. Hough, Ph.D.

Version 1.1 - Compiled by TML Pascal II

MidiMate is a program for the Apple IIGS that allows users to convert Industry Standard Midi Sequence Files to the new format supported by the program SynthLab. SynthLab is a powerful instrument editor and Midi-compatible sequencer written by Apple Computer that allows users to build instruments and play them with their Apple IIGS. Synthlab uses the new Apple IIGS Tool 35 (MidiSynth).

With MidiMate, standard Midi files from MasterTracks Pro, MasterTracks Jr, Audio Animator, and others can be converted to the SynthLab format. This version of the program will convert the first 7 midi tracks of standard files up to file sizes of about 40K (the actual limitation is 64K of SynthLab format, but the maximum size of the midi standard file depends somewhat on the type of midi data). Only Midi file format 1 (multi-track) is supported, which means that if your sequencing software gives you a choice of midi standard files to produce, always choose the multi-track option. The program also supports NDAs (but see bug report below).

MIDIMATE REQUIREMENTS - The program requires an Apple IIGS with at least 1 MB of memory running GSOS 5.02. The program will run in any disk configuration, but special instructions are required for single disk drive users (see installation, below). The program does NOT require Tool 35, SynthLab, or a Midi Interface.

MMDemo - This is a demo version of the program that is installed and run exactly like the actual program. MMDemo will let you load and convert files, allowing the user to get the look and feel of the program. The demo will not save converted files.

INSTALLATION OF MIDIMATE OR MMDemo - For users of hard disk drives or more than a single 3.5 inch drive, just launch the MIDIMATE application file from the Finder. Users of single disk drives must create a bootable system disk containing the MIDIMATE or MMDemo file, re-boot with that disk, and launch the program. If necessary, get rid of extra fonts, or unneeded desk accessories. The program doesn't use custom fonts. MidiMate needs constant access to the system (boot disk) so make sure that the system disk is in another disk drive (or on the hard disk) while MidiMate is running. If you like icons and have the room, copy the file MidiMate.Icon to the Icon folder of your boot disk (optional).

RUNNING THE PROGRAM - To convert a Midi Standard File, perform the following 3 steps in order:

1) Choose "Load Midi Sequence" from the File Menu. After a brief pause, you will see a "Standard Midi File Window", showing, among other data, the actual midi data in hex format. You can use the sidebar to scroll through the midi data (if you're interested). You don't HAVE to do anything with this window - it's just there to tell you that the file was loaded correctly. Since the TextEdit tool was used in displaying the midi hex data, you can also EDIT the midi hex data. However, in the present version of the program, MidiMate will ignore whatever you do to the data.

2) To convert the loaded midi data, choose "Stdn Midi --> SynthLab" from the Convert Menu. Depending on the file size, the conversion may take several minutes. During the conversion, MidiMate tells you exactly what it's doing (info on number of tracks, number of seq items converted, etc). At any point during the conversion, you can interrupt this process and go back to the Midi Window by choosing the "Cancel" button at the bottom of the screen. MidiMate informs you of any problems encountered during the conversion. At the end of a successful conversion, you will see a "SynthLab" window displaying data on the converted file. If, for any reason, the conversion was not successful, the program informs you and tells you the nature of the problem (e.g. bad file, file too big, etc.). MidiMate can convert files up to 64K of converted sequence image, which corresponds to 8,192 seq items (seq items are counted on screen during conversion).

3) When the file has been successfully converted, choose "Save Sequence (Synthlab)" from the File menu. You can save it to any folder with any name. The file created has the "synth" instrument has the default for SynthLab. Of course you can change that after the file is loaded into SynthLab, but it is most convenient to place converted sequences in a folder with "synth.hnk" and "synth.wv" files (see the Synthlab manual). MMDemo will not save converted files.

OTHER MENU OPTIONS - The menu has an "About" choice, a "Help" option, along with your favorite NDAs. Choosing "Close" from the file menu or clicking the close button on the MidiMate windows does nothing to NDA windows, but will remove any open midi or SynthLab files (You get a warning). After closing the open window, you will have to start the conversion process all over again.

FILES WITH THIS PACKAGE:

MMDemo - A GSOS application file that is demo program. No other files are needed by the program, but the program uses both the data fork and resource fork of this file.

AboutMMDemo.Txt - This manual.

BUGS AND BUG REPORTING - So far there is only 1 known bug. The program is incompatible with some NDAs, but I'm not sure which.

When the program can't translate a file, it almost always tells you and tells you why. So it seldom crashes. However, it does translate a file incorrectly once in a while - no problems with Midimate, but SynthLab gags on it (crashes while playing). Use *"turn off all notes"* option in synthlab if needed, and also choose *"view sequence"*. Sometimes you will see the seq items out of ascending order with a crash like this. THE FIX for this problem is removing NDAs. I can't tell you which ones cause the problem - only that file translation errors like this are not reproducible (they produce different bad files, not the same bad files) and they are ALWAYS (so far) fixed by removing the desk.Accs folder from my hard disk. But DAs do I have? Memory, WriteIt, IIGS Text Printer, along with BG sound and label grabber. I haven't had time yet to figure out who the culprit is.

If you have a reproducible bug or a file that won't convert after removing ALL NDAs (by renaming Desk.Acc), please record the sequence of events that causes the bug, and send me the report, along with the file that wouldn't convert and the file that MidiMate produced if any (that St won't play):

Lindsay Hough
PO Box 212
Slingerlands, NY 12159

To Order MidiMate, send $18.00 + $3.00 shipping and handling to the above address. Include your AOL handle for E-mail shipping, which saves you the $3.00

E-mail (ACL): LindsayGS

3) When the file has been successfully converted, choose "Save Sequence (Synthlab)" from the File menu. You can save it to any folder with any name. The file created has the "synth" instrument has the default for SynthLab. Of course you can change that after the file is loaded into SynthLab, but it is most convenient to place converted sequences in a folder with "synth.hnk" and "synth.wv" files (see the Synthlab manual). MMDemo will not save converted files.
INTRODUCTION

There is a place in the Western Atlantic, where more than 100 planes and ships have literally vanished into thin air. Many people refer to this area as The Devil's Triangle. Of more than 1000 lives have been lost in this area in the last 26 years, not one body or piece has been ever found.

As an experienced adventurer, you are asked to explore this area of hopes of finding an explanation and possible solution to this mystery. Many top top scientists have come up with several possible explanations. The most widely excepted explanations is the possibility of submerged crystals, acting as laser beams which destruct or destroy navigational equipment of ships and planes. These crystals are thought to been used by the 'ancient' Atlanteans as a power source, specifically located in the 'Tongue of the Ocean'.

VOCABULARY

Words such as sea-fan, vase-sponge, and sand-dollar, should be broke with a (-) hyphen.

GLOSSARY

ABYSSAL- pertaining to the lowest depths of the ocean.

ATLANTIS- a mythical island in the Atlantic ocean that was said to sunk into the sea.

BLUE HOLES- a group of ancient underwater limestone caves that were once above water. Due to the odd reflectivity of light in these caves, fish are often found swimming upside down.

SEAMOUNT- an underwater volcano

TONGUE OF THE OCEAN- the name of a trench located in the Devil's Triangle. The largest percentage of ships and planes occur in this location.

TRENCH- a deep area in the ocean floor, generally deeper than 6,000 meters. Accounts for less than 2% of the ocean's floor.

Here is a quick and dirty way to give yourself more lives in Space Ace:

1) Before booting the game, enter the monitor by typing CALL -151 from BASIC. Type in # and then return. This will enable the ENTER MONITOR CDA.

2) Boot Space Ace.

3) Whenever your lives are running low, enter the control panel. The ENTER MONITOR CDA should be active, so select it and you will be in the monitor.

4) Type in 1846:09 and then return. Music will still be playing and interrupts active, so type slowly or some characters will be missed.

5) Type CTRL-Y to return to the game.

You now have 9 lives. This process can be repeated whenever your lives starts to get low. DO NOT GIVE YOURSELF MORE THAN NINE LIVES! If you attempt to do so, the game will probably crash. When displaying the graphics screen with the number of lives, it tends to mess up if there are more than two digits present.

P.S. I realize this is not the greatest cheat, but if someone wants to look into it further, it should not be difficult to find the code which decrements location $1846. However, this location is not references absolutely, so you'd have to do some dissasembling and poking around to find the code.

I can be reached on:

Mini - Cheat

By Mach Three 10/9/90
**INTRODUCTION**

**THE GAME.** ARCHON depicts the eternal struggle between Light and Darkness as a contest of action and strategy between opposing forces wrought from myth and legend. The Light Side and the Dark Side are equal in number, balanced in power, and the like. There are 18 icons - a total of eight different kinds on each side. None of yours are identical to any of the icons on the other side. You win the game.

**MOVEMENT.** In old-fashioned and - admit it - somewhat dull board games (chess, backgammon, and their ilk), the "defending" piece gets removed quietly from the board, and the "attacker" wins the "battle" - and the square -without a blow being struck. In ARCHON, we do not allow such docility, such rank defeatism on the part of the defender. No! If you want that square, you have to fight for it! When you try to occupy a square held by the enemy, the disputed square expands to fill the entire screen ... and then, in the words of a certain orange-skinned monster of comic-book fame, "IT'S CLOBBERIN' TIME!!"

**THE LUMINOSITY CYCLE.** ARCHON's strategy screen "changes". While some squares are always white or always black, others - "luminance" squares - vary in brightness throughout the game in a simple pattern: black-dark-barely dark-barely light-light-white... and reverse. Back and forth, throughout the game, the cycle continues, the luminance shifting after every other turn. Your fortunes in the game tend to ebb and flow with the luminosity cycle. This is because icons of the Light Side are harder to defeat on light squares than on dark ones. Conversely, Darkside icons are stronger on dark squares and weakest on white ones.

**POWER POINTS.** The five "power points" are indicated on the screen by flashing red symbols. Icons on power points heal faster than usual and are protected from the effects of magic spells. If your icons occupy all five power points, you win the game.

**MOVEMENT.** If the hollow square or "frame" is on your side, it's your turn. (Simple, eh?) Use your joystick to move the frame atop the icon you want. Once you push the button to confirm your choice, you must move that icon somewhere. (If an icon has nowhere to go, the computer will not allow you to "pick it up"). Once you move the icon to its destination (again with the joystick), push the button again, and the obedient image will freeze in place. Movement comes in three flavors: ground, fly, and teleport. Ground movers move the frame atop your mage, as if you were going to move it. Push the button, and the usual message appears. Without moving the icon, however, just push the button again, and you will get a new message: SELECT YOUR SPELL.*

**COMBAT.** Action in the combat arena is immediate and simultaneous; there is no taking turns. Joysticks direct the movement of the icons. An icon initiates an attack - swinging a sword, firing an arrow, casting a fireball - in the direction the joystick is pointed. You can attack or move in any of eight directions: forward, backward, left, right, and the four diagonals. Your icon cannot move while the button is pressed. Combat is of three general types. Knights and Goblins are sword-swingers and club-wielders; they must be very near an opponent to inflict damage. The Banshee and the Phoenix inflict damage in a circular area around themselves; the longer the opposing icon is in that circle, the greater the damage it sustains. Darkside icons throw "missiles" of some sort and can, consequently, do damage from a considerable distance. See the Quick Reference Card for a detailed comparison of the speed of and damage done by the different missiles.

**THE ATTACK INTERVAL.** While combat is fast and furious, you can't just fire away as fast as your finger twitches. It takes a moment to raise a sword into position to strike; longer to conjure even a fast fireball; and the better part of two whole seconds (!) to rip a boulder out of the ground and lift it high enough to throw. Pushing the button before your icon is ready to strike will accomplish nothing - except to keep your icon from moving. At the exact instant you can launch another attack, the computer rings a bell - a high note of a certain orange-skinned monster of comic-book fame, "IT'S CLOBBERIN' TIME!!"

The icons are classified according to the types of weapons they can wield: a sword-wielding knight, an archer, a darkside icon, and so on. For more information, refer to your Quick Reference Card. Always carry a record of your enemies with you during the game, lest you forget them.

**THE GAME DESIGN.** The design philosophy of ARCHON is somewhat unusual. The player's goal is to "kill" the opponent's icons. Icons kill each other in combat or by "throwing" missiles. Icons die, then come back to life as a ghost, then return to life as a regular icon; the cycle continues, the luminance shifting after every other turn. Your seriously wounded icon is easier to defeat the next time it is forced to fight. Your icons are immortal - they cannot be killed by anything. However, if you ever are reduced to a single icon, you lose.

**POWER POINTS.** The five "power points" are indicated on the screen by flashing on white ones. Heal spell. Conversely, DarkSide icons are stronger on dark squares and weakest more quickly, by resting on a power point; or instantly and completely, by a Hostilities on the part of the defender. No! If you want that square, you have to fight for it! When you try to occupy a square held by the enemy, the disputed square expands to fill the entire screen ... and then, in the words of a certain orange-skinned monster of comic-book fame, "IT'S CLOBBERIN' TIME!!"

**THE LUMINOSITY CYCLE.** ARCHON's strategy screen "changes". While some squares are always white or always black, others - "luminance" squares - vary in brightness throughout the game in a simple pattern: black-dark-barely dark-barely light-light-white... and reverse. Back and forth, throughout the game, the cycle continues, the luminance shifting after every other turn. Your fortunes in the game tend to ebb and flow with the luminosity cycle. This is because icons of the Light Side are harder to defeat on light squares than on dark ones. Conversely, Darkside icons are stronger on dark squares and weakest on white ones.

**POWER POINTS.** The five "power points" are indicated on the screen by flashing red symbols. Icons on power points heal faster than usual and are protected from the effects of magic spells. If your icons occupy all five power points, you win the game.

**MOVEMENT.** If the hollow square or "frame" is on your side, it's your turn. (Simple, eh?) Use your joystick to move the frame atop the icon you want. Once you push the button to confirm your choice, you must move that icon somewhere. (If an icon has nowhere to go, the computer will not allow you to "pick it up"). Once you move the icon to its destination (again with the joystick), push the button again, and the obedient image will freeze in place. Movement comes in three flavors: ground, fly, and teleport. Ground movers move the frame atop your mage, as if you were going to move it. Push the button, and the usual message appears. Without moving the icon, however, just push the button again, and you will get a new message: SELECT YOUR SPELL.*

---

**DOCUMENT achon.txt**

This document is provided by HARDWARE HEISTER and input by BELLE STARR, for your playing pleasure.
Push the joystick up or down to survey the spells still available, and push the button when you find the one you want. If further actions on your part are required, additional messages will direct you appropriately. Remember that you can't conjure the same spell more than once, and you can't cast a spell against power points or icons on them. Details are given below.

-------------
TELEPORT

**EFFECT:** This spell moves-teleports-any one of your icons any distance from one square on the strategy screen to another.

**ACTIONS REQUIRED:** After selecting the spell, move the frame to the icon you want; push the button; and then move the icon to its destination-just as if it were a normal move.

**RESTRICTIONS:** You cannot move an enemy icon. You cannot move onto a square already occupied by one of your own icons (as usual). You cannot teleport onto or off a power point. You cannot teleport an imprisoned icon. (See IMPRISON.)

**ADDITIONAL NOTES:** Do not confuse this spell with a mage's normal three-square movement. That is minor magic, on the same order as casting fireballs, and is not bound by the restrictions of the seven major spells.

------
HEAL

**EFFECT:** This spell instantly heals any icon of all wounds it has sustained in the combat arena.

**ACTIONS REQUIRED:** After selecting the spell, move the frame to the wounded icon, and push the button.

**RESTRICTIONS:** You cannot heal an icon resting on a power point. You can "heal" an already healthy icon, but why bother?

------
SHIFT TIME

**EFFECT:** Two effects are possible. Most often, the spell reverses the flow of time: i.e., the direction of the luminosity cycle of the delta squares. Squares that had been growing gradually darker would now grow lighter-until the cycle peaked. However, if the spell is cast when the luminosity cycle is at either peak, Shift Time will cause the cycle to shift abruptly to the opposite extreme (from black to white, or vice versa).

**ACTIONS REQUIRED:** None after selecting the spell.

**RESTRICTIONS:** None.

------
EXCHANGE

**EFFECT:** This spell causes any two icons on the strategy screen to trade places.

**ACTIONS REQUIRED:** Move the frame to one of the icons you wish to transpose, the Light Side. In battle, the Wizard casts devastating balls of fire. He rarely ventures from the safety of his home power point, however, and is more commonly used to cast on of the seven spells.

---
UNICORN

**RESTRICTIONS:** You cannot move an enemy icon. You cannot move onto a square already occupied by one of your own icons (as usual). You cannot teleport onto or off a power point. You cannot teleport an imprisoned icon. (See IMPRISON.)

**ADDITIONAL NOTES:** Do not confuse this spell with a mage's normal three-square movement. That is minor magic, on the same order as casting fireballs, and is not bound by the restrictions of the seven major spells.

------
ARCHERS

**EFFECT:** The ARCHERS are fearless Amazon warriors of legendary skill with their fine whitewood bows. They are endowed with magical quivers that can never be emptied.

------
ARCHON - THE OPPOSING FORCES

**LIGHT SIDE**

**WIZARD.** An ancient man of vast supernatural power, the WIZARD is the leader of the Light Side. In battle, the Wizard casts devastating balls of fire. He rarely ventures from the safety of his home power point, however, and is more commonly used to cast on of the seven spells.

**UNICORN.** Resembling a great white horse with the tail of a lion and a sharp, spiral horn set at its brow, the UNICORN is swift and agile. The beautiful creature can fire a blinding bolt of energy from its magical horn.

**ARCHERS.** The ARCHERS are fearless Amazon warriors of legendary skill with their fine whitewood bows. They are endowed with magical quivers that can never be emptied.

**EXCHANGE**

**EFFECT:** This spell causes any two icons on the strategy screen to trade places.

**ACTIONS REQUIRED:** Move the frame to one of the icons you wish to transpose, then do the same to the other icon.

**RESTRICTIONS:** Neither icon can be imprisoned or on a power point.

**SUMMON ELEMENTAL**

**EFFECT:** This spell allows you to attack any enemy icon with a new, temporary icon representing one of four elementals-animated spirits of the ancient elements of earth, air, fire, and water. Combat is conducted in the combat arena as usual, except that the elemental vanishes after the battle, win or lose.

**ACTIONS REQUIRED:** Once the spell is selected and the elemental appears on your side of the strategy screen, move it to the icon you wish to attack. In the combat arena, direct the elemental just as you would any other icon.

**RESTRICTIONS:** You cannot attack an icon on a power point. You cannot direct the elemental to a vacant square or one occupied by one of your own icons. You cannot choose which elemental will respond to your summons.

-------
REVIVE

**EFFECT:** This spell restores to the game an icon previously lost in combat.

**ACTIONS REQUIRED:** The procedure is similar to a Teleport spell or a normal move, except that the revived icon comes from a special display by the side of the strategy screen, and its destination must be a vacant square next to the mage.

**RESTRICTIONS:** You cannot "revive" an icon not already dead. One of the squares adjoining your mage must be vacant, and you must put the revived icon on one of those vacant squares.

-------
IMPRISON

**EFFECT:** This spell keeps an icon on the strategy screen from leaving its square. The icon can fight its attackers in the combat arena, but it cannot be moved off its square. Important: an imprisoned mage cannot cast spells! Imprisonment is temporary. A Dark Side icon would remain imprisoned until the delta squares turn black; a Light Side icon would be freed when delta squares turn white.

**ACTIONS REQUIRED:** Once the spell is cast, move the frame to the target icon, and push the button.

**RESTRICTIONS:** You cannot imprison an icon on a power point. You cannot imprison any icon at a time when the luminosity cycle would automatically free it.

-------
CEASE CONJURING

This is not a spell; it is a way to avoid casting a spell if you miscalculate. If you change your mind while selecting a spell, or if the spell you want is unavailable or canceled, you may push the button when CEASE CONJURING is displayed. This will allow you to start your turn over.

---
GOLEM. A GOLEM is an artificial being, shaped from stone and gleaming metal, and animated by magic. Roughly man-shaped, it is huge, twice the height of a man. Its weapons are boulders ripped from the earth and hurled with devastating force.

VALKYRIES. VALKYRIES are beauteous blonde war maidens from the legions of Valhalla. Each of these ferocious females is endowed with two great magical gifts: first, the ability to stride the air as if it were solid ground; and, second, an enchanted spear, which, when thrown, returns to her hand of its own accord.

DIJINNI. The DIJINNI is a magical being from another dimension, a plane of tempest and storm. In form he is a huge superbly muscled man whose body is partly flesh and partly swirling currents of air. A cousin to the wind itself, the Djinni can raise a small tornado with a gesture and control it with a thought.

PHOENIX. The PHOENIX is a flaming bird of immense size and power. In battle it can explode into a seething mass of fire, scorching anyone on the perimeter of the blaze and burning severely any enemy unfortunate enough to be caught near the incandescent core. Not only is the Phoenix unscathed by its own flames, but, while undergoing its fiery metamorphosis, it cannot be harmed by any attack known.

KNIGHTS. The KNIGHTS are foot soldiers armed and armored against foes far larger than themselves. Although they cannot withstand more than one blow from many of their enemies, they need not be mere cannon (or dragon) fodder. Provided they are swift and clever, their speed of attack gives them a chance to survive and triumph.

SORCERESS. The level of the old Wizard only in power, the eternally young and ever beautiful SORCERESS is his counterpart in all ways. Her lightning bolts are swifter and surer than his fireballs, if a shade less potent. Fierce in battle but safest on the black power point, she is most often used to cast the seven spells.

BASILISK. The BASILISK is a small, crested reptile with the scaly body of a lizard and the bulbous, glowing eyes of a gorgon. Although it is relatively short-lived, the beast's quick movements and deadly glance make it a terrifying opponent.

MANTICORE. The MANTICORE resembles a large, golden lion with a human face and a scorpion's thorny tail. This nasty appendage bristles with great quills like a scorpion's stinger. The poison from these stings is so powerful that anyone hit will fall into a deep sleep.

TROLL. A dweller in caves and dark places, the misshapen TROLL is a shambling giant, dull but strong, clumsy but hard to slay. Like the Golem, if carries no ready-made weapons; instead, it seizes boulders, tree trunks—whatever comes to hand—and catapults the massive objects at its enemies.

SHAPESHIFTER. The SHAPESHIFTER is a doppleganger, a demonic creature without true shape or form, save what it steals from its enemies. In battle it becomes the mirror image of its opponent, strongest on squares where its enemy is weakest, turning the enemy's powers against itself. It has no fixed lifespan; all wounds that do not prove fatal will heal as soon as it assumes a new form.

DRAGON. The DRAGON, a monstrous, serpentine reptile, is without peer in the combat arena. One gout of its flaming breath will kill many creatures, and a second blast is almost always fatal. Highly mobile and very difficult to slay, its awesome powers make it second in value only to the Sorceress.

BANSHEE. The BANSHEE is an undead spirit that feeds off the souls of her opponents, a ghastly apparition that attacks with her keening wail, draining the life from anyone in range of the sound (the shaded area around her).

Prolonged exposure to the terrifying shriek can be fatal.

GOBLINS. GOBLINS are hideous dwarves, twisted of limb and misshapen of feature, unfriendly and often violent. Their mutual antagonism is kept in check only by the powers of the Sorceress. On dark ground their gnarled clubs are more than a match for the swords of the Knights, and if well-directed they can bring down the most potent of enemies.

ACOS COMPILER RELEASE 1.2 SPECS

Hardware Required : Apple II series
Memory Required : 64K
Operating System : DOS 3.3 or PRODOS
Hardware Supported : printer, modem, display cards, clock, etc.

Total Program Space: 24k
Total Variable Space: 24k - program space
Internal Editor Space: 4k

Scratch Ram: 192 bytes

Compiler Info: standard 2 pass compiler built on assembler principles for label oriented languages.

Pass 1 Info: compiler pass 1 takes text source code and tokenizes all statements and functions into single byte tokens. All text and symbols are marked as such for fast recognition. All label addresses are stored into a separate table. Tokenized code is generated into memory without addresses.

Pass 2 Info: Compiler pass 2 goes through the label reference table and searches for the address of the desired routine. If a match is not found, a LABEL NOT FOUND message is displayed. Otherwise, the address is saved into the second table. Afterwards, all references that were found are inserted into the actual code. The compiled code is then saved to disk.

Code Execution: Actual code execution is based on a "fetch-and-go" method. Each token is fetched from the compiled code. The routine is then found via a lookup table and is executed. When label references are made, the address is already known so no time is taken searching for it.

ACOS REFERENCE FOR ACOS RELEASE 1/2

GENERAL INFORMATION

Welcome to the world of ACOS. The following document was written to help give you an introduction to ACOS and to help you to learn to write your own programs or modify others written in ACOS.

ACOS is a full featured language just like BASIC, PASCAL, FORTRAN, or any other language. It resembles BASIC more than any other language due to the fact that almost everyone involved with computers is familiar with BASIC because it comes standard with most personal computers. Since the aim was to make ACOS as easy to use as possible, it was modeled after BASIC. At the same time, there are also many differences also.

This package contains a proprietary ACOS compiler which you will be using. Unlike many interpreted BASICs which have their editor built in, ACOS requires the use of some sort of text editor for you to manipulate your source files. All ACOS source files are stored as text, so any editor that can modify standard text files can be used.

WRITING A PROGRAM

Since actually doing something tends to be a better teacher than just reading about something, we will be writing a small sample program in ACOS. The first thing you need to do is start your text editor/word processor you plan on using to write your code. Once you are ready, enter the following program:

```acos
LOOP
    print "this is an acos program"
    print "I hope it works!"
    goto loop
```

The important points to note are these: ACOS is not based around line numbers as is the BASIC language. It is free form like PASCAL or ASSEMBLY LANGUAGE. It uses labels as markers for groups of code instead of line numbers which marks the beginning of a line of code when the requirement arises to identify a specific point within the program. Since your labels can have descriptive names to begin a section of code, it makes it easier to see what this code does. Also, you can add extra blank lines at the top and bottom of a group of code to identify it more clearly. If you add comments within your code it helps you remember what you are trying to do in that section.

When you begin to write your program there are a few rules that must be followed in order for ACOS to process your code. LABELS must ALWAYS begin in column 0 at the left side of the screen. The rest of the code always begins in column 1. The only exception to this deals with the use of quotes (" ) to identify text. When you open a quote at the start of the print statement, all following text will be printed to the screen until another quote is encountered. This includes normal text, any control character and blank lines as well.

Once you have typed in this test program, save it to your ACOS compiler disk under the name "TEST.S". You must ALWAYS add a ".S" to the end of any source file for ACOS so ACOS knows it is a "source" file. Then exit from your editor back to your operating system. Insert the disk with the ACOS compiler and log to that disk. Execute the ACOS compiler with the appropriate operating system command (-ACOS, BRUN ACOS, ACOS)

At this time, the ACOS loader will execute and check through you directory for any ACOS source files and do some file maintenance at the same time. You will then be asked for the name of the ACOS program to be executed. Hitting return will execute the default starting program which is indicated in brackets. This default filename will differ from application to application. Type in "TEST" and return. You will see "TEST" displayed as the default filename. Enter a return and the compiler will start to execute.

The screen will clear and you will get a "COMPILING 1...") message. This means that the compiler is in the first phase of its two phase compile. This first phase takes the longest. After a quick wait, the message will change to "COMPILING 2...". This indicates that the compiler is in the second phase. This generally is very fast. Once the second phase is complete and has created a new file, which in this case is called "TEST.G", the message will be cleared and the program executed.

In this case, the following will be displayed:

```
this is an acos program
I hope it works!
```

ACOS processor will then execute the program.

ACOS source code is similar to BASIC in that it resembles BASIC more than any other language due to the fact that almost everyone involved with computers is familiar with BASIC because it comes standard with most personal computers. Since the aim was to make ACOS as easy to use as possible, it was modeled after BASIC. At the same time, there are also many differences also.

This package contains a proprietary ACOS compiler which you will be using. Unlike many interpreted BASICs which have their editor built in, ACOS requires the use of some sort of text editor for you to manipulate your source files. All ACOS source files are stored as text, so any editor that can modify standard text files can be used.

ACOS processor will then execute the program.
The first line that happens is that the ACOS interpreter looked at the first line of code for a label that begins at the very left most column of the screen. This told ACOS that the first line is actually a LABEL. A LABEL is a reference point in a program to a section of code. A LABEL has no effect when the program flow passes through it, but it directs the operation from the line executing from one section of code to the beginning of the section where the LABEL is.

Execution then is passed to the next line, the first having no actual effect. ACOS looked and saw that the second line did NOT start at the leftmost column but started at column 1 instead. This tells ACOS that the data on the line is the actual program code. ACOS then looked at the first word which in this case was PRINT. ACOS then went into its internal PRINT routine as you asked it.

Once within the PRINT routine, special rules take over that govern the PRINT statement. Summing up quickly, PRINT will display to the console whatever text or data is in between the " " marks. In this case, it printed "THIS IS AN ACOS PROGRAM". This data was placed within quotes to show that it was text. Once the end of the line was encountered, execution passed to the next line.

The next line was another PRINT statement which was displayed: "I HOPE THIS WORKS!". This is the same text that you typed in when you wrote the short program. It works in the same way as the first PRINT statement. This is the simplest form of the PRINT statement. Its function is by no means limited to this basic form since there are many other variations that can be used.

The last line of the program contained another statement to be executed by virtue that it was indented 1 space. This time, the STATEMENT or COMMAND was GOTO. This statement does what is called FLOW CONTROL. This is the process by which the point of execution of the program is changed from the last line executed to a new line.

When the GOTO routine is executed, it searches for the name of the LABEL and when it finds the LABEL, it executes the next line of code. In this case, the label is LOOP. ACOS then looks through the program to find a label called LOOP. As it happens, that label is on the first line of the program, though it could have been in any line. The program execution point is then moved to the label LOOP which happens to be at the beginning of the program in this case. Thus, the text is printed again and again. This is what is called an INFINITE LOOP. That is, the loop will never stop (unless you as operator stop it via RESET or some other means).

After you hit [RESET], you will be faced with a group of choices labeled "RESTART: S,M,Q ?". By pressing "S" you will restart the original program you told ACOS to execute. By pressing "M" you will restart the program in memory. In this case, they are the same, but programs can link to other programs so that the original one is different from the one in memory now. This is helpful for debugging so you can re-start that program in memory without starting with the original one first. By pressing "Q", you will quit ACOS and return to your operating system.

At this point, you have successfully written, entered, and executed an ACOS program. Though this was a simple example, the steps are the same for advanced programs. The following is a summary of the steps involved with writing an ACOS program:

1) Enter some form of word or text processor that can accommodate standard text files.
2) Type in your ACOS program. All labels start at column 0 while all actual code starts at column 1.
3) Save the program to disk adding a ".S" suffix onto your filename (ex: TEST.S) so that ACOS can identify it as an ACOS source file.
4) Execute ACOS from your operating system via whatever commands are needed. (ex: ACOS, BRUN ACOS, ACOS).
5) Enter the name of the module you wish to execute if it is different from the default name. Don't add the ".S" suffix or the file will not be found.
6) The compiler will then compile and execute your program. If you execute the program again without changing the source code, the compiler will NOT re-compile, it will just run the old code.

The following section contains information on all the data formats, variable types, and disk access methods that can be used with ACOS. A working knowledge of BASIC is recommended to help you along. If you don't know ant other language, try and use the examples as much as possible. They will be the best teacher. Also, try modifying existing code. This is another easy way to learn.

-------------------------
PROGRAM STRUCTURE
-------------------------

Under ACOS the structure of a program is very much "free-form". That is, the compiler is very tolerant of different styles of programming. You are allowed to add blank lines and comments anywhere in your code for ease of reading. Any line within an ACOS source program must be in one of the following formats:

Blank Line: If the line is blank, this line will be skipped by the compiler. Blank lines are a good way to separate blocks of your code apart from other blocks for ease of reading.

Comment Line: By placing a semi-colon (;) as the first character of the line in column 0, all data until the end of the line will be ignored. In this way, you can enter comments so that when you come back to work on a program, you will have some idea of what you were trying to accomplish.

Label Line: By entering just a keyword of your choice starting at column 0 of the line, you can enter a label. The first character of a label must be alphabetic. The rest of the label can consist of alphabetic characters. The first 8 characters of the label are significant. That is, the labels TEST and TEST2 are considered different labels by ACOS while SHOWFILE2 and SHOWFILE8 would appear the same to ACOS since the first 8 characters are the same.

Statement Line: A statement line is always indented 1 space from the the left side. That is, at column 1, not column 0 like the previous line types. Statements are just entered on the line in the order you want them executed. If you wish to put multiple statements on a line, separate the statements with a colon (;). Statements may be typed in either upper, lower or mixed case.

SPECIAL CHARACTERS

There are several special characters that ACOS recognizes within your program code and uses them for different purposes. The following list show characters that have special meanings to ACOS. There are other characters which when encountered will be ignored. Any character including those below can be displayed by the program without problem, they just have special meanings when encountered outside the PRINT statement.

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>space or blank</td>
</tr>
<tr>
<td>=</td>
<td>equals sign and also used for assignment statements</td>
</tr>
<tr>
<td>+</td>
<td>plus sign also used for adding strings</td>
</tr>
<tr>
<td>-</td>
<td>minus sign used for subtraction</td>
</tr>
<tr>
<td>*</td>
<td>multiply sign used for multiplication</td>
</tr>
<tr>
<td>/</td>
<td>divide sign used for division</td>
</tr>
<tr>
<td>(</td>
<td>open parenthesis used to begin a function</td>
</tr>
<tr>
<td>)</td>
<td>close parenthesis used to end a function</td>
</tr>
</tbody>
</table>
The ability to use variable names greater than 2 characters is only for your reading convenience.

You can assign a variable a value the same way you do in any BASIC. You can use: LET VOTE=1 to set the variable V0 to a value of 1. As a shortcut, you can just say VO=1, and ACOS will figure out what you mean. The LET is an optional operator. When assigning a string variable to an absolute value, the string to be assigned must be enclosed in quotes and must be no more than 255 characters in length.

**Reserved Words**

Under ACOS, certain reserved words have predefined meanings. These words all correspond to ACOS statements, functions, and operands. When encountered, they will be executed as an ACOS command. These may NOT be used for variable names.

It is always best if you separated reserved words from data or each other by use of a space or a colon or whatever special characters the particular command syntax allows.

One of the keys behind writing a good program is making sure you can understand what you wrote. For example, PRINT A$;B$;C:HOME uses a (;), a (,), a ( ) space and a (:) between data.

The following is a list of reserved words:

- ADDINT
- APPEND
- BYTE
- CHRS
- CLEAR
- CLOCK
- CLOSE
- COPY
- CREATE
- DATE$:ECHO
- EDIT
- END
- FILL
- FLAG
- FOR
- GET
- GOSUB
- GOTO
- HOME
- IF
- INFO
- INPUT
- INSTR
- KEY
- KILL
- LEFT$
- LIMIT
- LOG
- MARK
- MIDI
- MODEM
- MOVE
- NAME$
- NEXT
- NIBBLE
- NOT
- ON
- NOCAR
- OPEN
- PDL
- PEAK
- POKE
- POP
- POSITION
- PRINT
- PUBLIC
- PUSH
- RAM
- RAM2
- READY
- RETURN
- REWIND
- RIGHT$
- RIFC0
- RND$
- SET
- SETINT
- STR$
- TEXT
- TIMES
- TONE
- UPDATE
- USE
- VAL
- MEM
- WIDTH
- WRITE

**ARITHMETIC OPERATORS**

There are several standard arithmetical operators that can be applied to numeric and string variables. Though they are somewhat limited in nature under ACOS, most common functions can be accommodated.

Addition: A+B+C or A+B$5 or A+3/7 are all legal operators. Whenever a number is needed for whatever purpose, an equation may be substituted with its place. A=8+B+C$5 or A=B$5+1000$5 or A=THIS IS "A TEST" are all legal string addition commands. Under string addition, the contents of the second string are appended onto the contents of the first.

Subtraction: A-B-C or A-B$5 or A-3/7 are all legal operators. It is very similar to using the addition operator. There is no string subtraction operator.

Multiplication: A*B+C or A*B$5 or A*3/7 are all legal operators. If you combine multiplication/division operands with addition/subtraction operands, the division/multiplication will be executed first. ex: 4*5*3=19 not 27.

Division: A/B+C or A/B$5 or A/3/7 are all legal operators. Since ACOS is an integer based language, with division operands, the results are rounded to the nearest integer and the remainder are thrown away. Thus 10/2=5, 10/3=3, 10/9=1, 10/11=0.

Modulo: A=B MOD C or A=B MOD$5 or A=3 MOD$7 are all legal operators. The MOD operand is a sub function of division. Instead of returning the quotient as with division, the remainder is returned. Thus, 10 MOD$2=0, 10 MOD$3=1, 10 MOD$7=3.

Grouping: By using the parenthesis, you can create complex expressions and control the method of expression evaluation. Arguments within a set of parenthesis are always executed first. You may also nest several levels of parenthesis if needed. Thus ((3+4)*5)/(3+4) is evaluated in the following steps: step 1: (7*5)/(3+4) step 2: 35/(3+4) step 3 35/7 step 4 result is 5.

**RELATIONAL OPERATORS**

Relational operators are used to compare two values and return a true/false result. Strings may be compared with other strings but not to numbers. The same is true for numbers. A "TRUE" result is returned as the value of 1 while a "FALSE" result is returned as the value of 0. The following are the legal relational operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Relation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>equality</td>
<td>X=Y</td>
</tr>
<tr>
<td>&lt;&gt; or &gt;</td>
<td>inequality</td>
<td>X&gt;Y or X&lt;Y</td>
</tr>
<tr>
<td>&lt;</td>
<td>less than</td>
<td>X&lt;Y</td>
</tr>
<tr>
<td>&gt;</td>
<td>greater than</td>
<td>X&gt;Y</td>
</tr>
<tr>
<td>&lt;= or =</td>
<td>less than or</td>
<td>X&lt;Y or X=Y</td>
</tr>
<tr>
<td>&lt;&gt; or &gt;</td>
<td>equal to</td>
<td>X=Y or X&lt;&gt;Y</td>
</tr>
<tr>
<td>&gt;= or =</td>
<td>greater than</td>
<td>X&gt;Y or X&gt;Y</td>
</tr>
</tbody>
</table>

Examples: (1=0) with the result of false or (0), (1=1) with the result of true or (1), (5+4) with the result of false or (0), (5+4) with the result of true or (1), (7>7) with the result of false or (0), (7>7) with the result of true or (1).

You may always substitute more complex variables in place of simple variables. You can replace ((X>Y)) with a more complex expression like ((4+5)*6)/(3+4)+2 or

### Apple II Computer Info

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 29 of 1262

- **$** — dollar sign used to indicate a string function
- **;** — semi-colon used for text formatting
- **:** — colon used as a statement separator
- **?** — double quote or string delimiter
- **<** — question mark or PRINT abbreviation
- **>** — backslash or new-line character
- **<=** — greater than or equal to
- **<>** — inequality
- **>=** — less than
expressions that are even more complex. If you do have a complex expression on a
side, you should put parenthesis around it to separate it from the relational
operator so it is processed as one side.

When used in conjunction with the IF statement, you have one of the most powerful
statements in ACOS. When used with the IF statement, you have a conditional
branch, the single most important program execution statement.

LOGICAL OPERATORS

Logical operators perform simple logic operations on numeric values. They can be used
to increase the power of the IF statement by allowing more conditions to be
evaluated. Under their simplest form, logical operators work with true (1) and false
(0) values. The following truth tables show the results of all the possible logical
operators in action.

<table>
<thead>
<tr>
<th>x</th>
<th>z=x or y</th>
<th>z=x and y</th>
<th>z= not x</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

The following examples show the IF statement being used with the relational and
logical operators:

```
IF (X=5) AND (Y=9) GOTO label
```

```
IF (NAME$="SHIT") AND (UN=1) GOTO label
```

```
IF NOT ((A=3) OR (B=4)) GOTO label
```

Again it is important to use parenthesis when complex equations are being evaluated
so that ACOS can understand the order the operand is processed. Since execution order
is normally sequential, without grouping, ACOS will be on its own to decide what
order you wanted to do things. Many times it will guess correctly, but on occasion,
it will guess wrong. Using grouping is an easy way to avoid this problem.

PRINT STATEMENTS

The two most frequently used versatile statements have to be PRINT and INPUT. These
are the basic means by which you input data into variables and print data out to the
screen. Due to the frequency of use, a basic understanding of these two statements is
very important.

The PRINT statement has the function of taking data and displaying it on the
console/modem. There are many options in PRINT that can be used. The basic form of
print is PRINT [expression]. In the simplest form you can use PRINT [any absolute
data]. This would include numbers (PRINT 563) or text within quotes (PRINT "HELLO").

To include multiple arguments, you need not even separate them, though a space or
semi-colon between them makes it easier to read. PRINT "THE VALUE 4+5";9.

```
   To print a variable, just include the name of the variable in the PRINT statement. A
   PRINT NAME$ would print the contents of NAME$ on the screen. To combine multiple
   statements, just use the semi-colon or a space. PRINT NAME$;UN;PEEK(465);4+5 would
   display all the above data.

There are several special characters that can be used with the PRINT statement to
format the data. If you use a comma instead of a semi-colon, the comma will also be
printed. There is also a print-at character ($) that can be used. PRINT$5,0;"HELLO"
will display the word HELLO at vertical location line 5 horizontal location column 0.

INPUT STATEMENTS

The INPUT statement is used to enter data in variables from the console/modem by the
user. It also has a quick directive so the text can be displayed (like a PRINT
statement) before the data is entered. This works well as a prompt.

In its simplest form, INPUT is used to enter either a string or numeric variable from
the console/modem. INPUT NAMES would wait for the user to enter a string from the
keyboard. That string would then be put into NAMES.

To enter multiple variables, separate the variable names with either the comma or the
backslash character. When you separate variables with a comma, the input must
 correspond to the number of commas used in the input. For example, INPUT A,B,C would
wait for 3 numbers to be entered. Typing 1,2,3 would enter 1 for A, 2 for B, and 3
for C.

If you enter a backslash between variables, then each value must be on a separate
line. This avoids having to do multiple INPUT statements all in a row. Thus INPUT
A\B\$, would enter two lines worth of data into the two string
would enter two lines worth of data into the two string
subset would be a different volume number. For example, "n ACOS config program.

To change drives within ACOS, you can always prefix the filename with the drive
specifier. Whenever you access a drive, the default drive is set to the last drive
used. Also, to set the default drive without doing any real disk access, the LOC
statement can be used. For example, the syntax for LOG is LOG "drive spec" or LOG
"B:".

------------------------- DISK FILES

The last part of this introduction deals with using disk files. This is one of the
most important features of ACOS. You can OPEN a file, manipulate the data within, and
then CLOSE the file. If you wish to use a new file, the CREATE statement can be used.
If you wish to delete an old file, the KILL statement can be used. The following is a
list of disk commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPEND</td>
<td>This will set the file so that all new data written to the file will be appended onto the end of the file.</td>
</tr>
<tr>
<td>CLOSE</td>
<td>This will close the file. All open files will be closed.</td>
</tr>
<tr>
<td>CREATE</td>
<td>This will set the file so that all new data written to the file will be appended onto the end of the file.</td>
</tr>
<tr>
<td>INPUT</td>
<td>This is just like the normal INPUT statement except that input will be taken from the open disk file instead of the console/modem.</td>
</tr>
<tr>
<td>MARK</td>
<td>current byte location within the file. With the MARK statement, you can select the actual byte number from the beginning of the file. This is generally not used.</td>
</tr>
<tr>
<td>OPEN</td>
<td>This will open the file for access.</td>
</tr>
<tr>
<td>PRINT</td>
<td>This will print the contents of the file to the screen.</td>
</tr>
<tr>
<td>READ</td>
<td>This will read the contents of the file to the screen.</td>
</tr>
<tr>
<td>WRITE</td>
<td>This will write the contents of the file to the screen.</td>
</tr>
</tbody>
</table>

The first thing to do is open the file. You use the OPEN#channel,filename statement.
There are 2 disk channels that may be used. The two channels are 1 and 2. Only one
file per disk channel may be open at any one time. Thus, there are a maximum of two
files open at any one time. The filename format differs from operating system to
operating system. ex: OPEN #1,"USERS" would open the file USERS on disk channel 1.

Once you have opened a disk file, all further access is done with reference to the
disk channel you opened the file under. At this point, the following commands can be
used to access the file. |

APPEND #channel - This will set the file so that all new data written to the file will be appended onto the end of the file. |

The ACOS compiler could not find a label that was referenced in the program.

------------------------- symbol table full

There are too many labels in the symbol table. ACOS will only allow a maximum of 255
labels within a segment.

------------------------- syntax error

Missing parenthesis in line, misspelling of a keyword, misuse of punctuation, etc....

------------------------- missing symbol

There is no label following a GOTO, GOSUB or a PUSH. |

------------------------- undefined label

Execution phrase label. This occurs when a segment is being executed and cannot find
a label. During the compiling phase, you will also be informed that the label was not
found.

------------------------- missing data

Occurs when a program statement has no valid argument. For example, X=CLOCK() is
missing data because there is no valid number between the parenthesis.

------------------------- type mismatch

The left hand side of an assignment statement was a numeric variable and the right
hand side was a string, or vice versa, or a function which expected a string argument
was given a numeric one or vice versa.

------------------------- overflow > 32767

ACOS cannot handle numbers which exceed 32767.

------------------------- division by zero

division by zero is always an error.
Apple II Computer Info

string too long
An attempt was made to create a string larger than 255 characters.
-------------------------
gosub stack full
ACOS will not allow you to nest more than 16 GOSUB or PUSH statements.
-------------------------
return without gosub
A RETURN or POP statement was encountered without a corresponding GOSUB or PUSH being executed.
-------------------------
bad device number
You have accessed a device that is not OPEN or READY, or you have accessed a device that does not exist.
-------------------------
illegal filename
The syntax of the filename is illegal or an attempt is made to use a disk channel that is already open.
-------------------------
for stack full
ACOS will not allow you to nest more than 16 FOR statements.
-------------------------
next without for
A NEXT statement was encountered without a corresponding FOR statement being executed.
-------------------------
link label not found
you attempted to LINK into a segment at a label that is either PUBLIC or does not exist.
-------------------------
message file not found
You tried to READY a message file that doesn't exist.
-------------------------
end of program
An END statement has been encountered or ACOS has reached the end of a shell.
-------------------------
bad drive specifier
An attempt was made to access a drive or pathname that does not exist.
-------------------------
unable to load external
ACOS was unable to find and execute an external module.
-------------------------
unclosed quote at EOF
You didn't end a PRINT statement with a quotation mark.
-------------------------

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 33 of 1262

---

**ACOS COMMANDS & FUNCTIONS**

---

**ADDINT**
syntax: ADDINT (string1 [,string1...])

the ADDINT command will add more keys to the existing interrupt keys table. previous keys will not be cleared. the functions of the keys is the same as with the SETINT command.

---

**APPEND**
syntax: APPEND #device

the APPEND statement is generally used to add data to an existing file. if you issue an APPEND statement, the file pointer will be moved to the end of the file. you can also find out the length of a file by doing an APPEND and then using the MARK function. Mark will then return the length of the file in bytes.

---

**BYTE**
syntax: BYTE=number
BYTE=(number)
BYTE=(number)=number256

the BYTE function is similar to the FLAG function. it is a low overhead data storage unit. just point to where in memory you want the data to be stored using the first syntax, and you can then access the data using the second or third syntax's.

---

**CHR$**
syntax: string=CHR$(ascii code [,number chars])

appears to be same as in Applesoft with the exception of [,number chars] which allows user to define how many ascii codes are to be assigned to string.

---

**CLEAR**
syntax: CLEAR
CLEAR #device

the forms to clears share only one thing in common: they both clear data in one form or another. in the first syntax, without an argument, CLEAR will reset all the variables to nil, clear all the addresses from the for-next and gosub-return stack, and close all open files. suggested use is at beginning of program.

in its second syntax, CLEAR is used to clear out device buffers. the legal device channels are 8,9,10. CLEAR #8 will clear the editor so that any output into the editor will be appended to a clear editor. CLEAR #9 will clear the top of screen display. You must clear the top of screen display before you write any info into it. CLEAR #10 will clear the ram drive. any further writes will be appended on to the end.

---

**CLOCK**
syntax: CLOCK(0)
CLOCK(1)=expression
expression=CLOCK(2)

the CLOCK function/statement is used for setting a time limit. it can also be used to find out how long someone has been using the system. the following options are available.

CLOCK(0) - this statement is used to reset the clock time to zero. it should be executed when your program begins.

CLOCK(1) - you will need to set CLOCK(1) equal to the number of minutes you want as a time limit, or 0 for no limit. when the time limit expires, it will be handled as a "no carrier" situation. the program will jump to the NOCARD routine.

CLOCK(2) - the CLOCK(2) function will return the number of seconds that a user has been connected. divide this number by 60 to find how many minutes they have been connected.

-------------------------

FLAG=(number)

syntax:  expression=FLAG

an 8 bit [0-255] number, and DATA is the byte that will be used to fill memory. generally it is used to zero out memory. START is a 16 bit memory address, length is the number of bytes to be zeroed. the FILL statement is used to fill an area of memory with some bytes of data.

syntax:  FILL start,length,data

the FILL statement is used to fill an area of memory with some bytes of data. generally it is used to zero out memory. START is a 16 bit memory address, length is an 8 bit [0-255] number, and DATA is the byte that will be used to fill memory.

-------------------------

EDIT

syntax:  EDIT(number)

the EDIT statement is the command used to interface acos with its editor. with the different EDIT statements, you can clear the editor, see how much space is free, etc. the following list gives all legal calls....

EDIT(0) - clears the editor. there will be a total of 4096 bytes free after a clear takes place.

EDIT(1) - enter the editor. if no data is present, the editor will start to accept input right away. if other data is present, the editor will start in the prompt mode.

EDIT(2) - this is a function that returns the number of bytes used within the editor. if this number equals 0 the editor is empty.

EDIT(3) - this is used to set the video width to be used within the editor. any value from 1 to 255 is legal. the most often used widths are 32, 40, 64, 80, 128. all operations within the editor will be based around this width. you can also read the current width using EDIT(3) as a function.

EDIT(4) - this is used to set the 'back-space mode' that the editor will use. certain modes allow more control than others. mode 0 indicates that the actual mode is not known. the editor will work fine, but some functions will be disabled. under mode 1, the editor will assume that the user has a 'non-destructible' backspace. this allows all the editor functions to be used and is how the local console setup is. mode 2 tells the editor that the user has a 'destructible' backspace. under this mode, some functions are disabled, but the editor speeds up certain other functions.

-------------------------

CLOSE

syntax:  CLOSE

the CLOSE command is used to close a disk file after you are done with it. if you give a device channel with the close command, only that file will be closed. if you CLOSE by itself, all open files will be closed.

-------------------------

COPY

syntax:  COPY filename [,#device]

COPY #device [,#device]

the COPY command is used for displaying and copying information from device to device. the first argument can be a filename or a device, in which case, the file is opened and input is taken from that file, or it can be a device. the second device is optional. if present all output will be routed there, otherwise it will be displayed to the modem/console. the second argument may not be another filename. if you wish to copy to a file, open the file with the OPEN command, and copy to that device.

-------------------------

CREATE

syntax:  CREATE filename

the CREATE statement is used to create an empty file on the disk. the new file can be opened and read and written to just as any other file would be. this is the only way to create a file under acos. unlike some other basics, acos will NOT create a file using the OPEN command.

-------------------------

CRUNCH

syntax:  CRUNCH

the CRUNCH statement is used in conjunction with the MSG commands. it is used to "CRUNCH" together a message file in while messages have been killed. this allows you to maintain a sequential message file and get rid of all the blank deleted entries that might be there.

-------------------------

DATES

syntax:  string=DATES

the DATES function returns the current date in MM/DD/YY format. the input will be taken from whatever device was configured as a clock. if 00/00/00 is returned, then there is no clock in the system and the date hasn't been set.

-------------------------

END

syntax:  END

same as applesoft, terminates program. returns to acos restart state.

-------------------------

FILL

syntax:  FILL start,length,data

the FILL statement is used to fill an area of memory with some bytes of data. generally it is used to zero out memory. START is a 16 bit memory address, length is an 8 bit [0-255] number, and DATA is the byte that will be used to fill memory.

-------------------------

FLAG

syntax:  expression=FLAG

FLAG=number

FLAG=(number)=number1

the ECHO statement is used to set the echo character to be used with the INPUT statement. once the echo has been set, that character will be sent each time a user types a character when entering text. the ECHO statement in the second syntax will reset the echo to the character that is being typed.
the FLAG function is a low overhead way to store 1 bit information. you just need to point the FLAG function to a point in memory that you wish to store your data in, and you can manipulate as many flags as you need. each byte of memory can contain 8 flags. to setup the FLAG function, use the first syntax to point the function to a point in memory where the flags will be stored. once the pointer is setup, you can use the FLAG just like a variable using the second and third syntax for reading and writing the flags.

-------------------------

**FOR**

syntax: FOR numvar=number TO number STEP number

; NEXT

appears to have same function and limits as applesoft FOR-NEXT loops.

-------------------------

**FREE**

syntax: FREE

appears to have same function as applesoft FREE(0) command.

-------------------------

**GET**

syntax: GET varstr

the GET statement is used to get a single keypress from the keyboard. when encountered, the system will wait until a key is pressed. the key will be returned in <varstr>. control characters will not be filtered out as they are with INPUT.

-------------------------

**GOSUB**

syntax: GOSUB label

appears to have same function as applesoft GOSUB. only thing worth noting is that acos uses labels as targets instead of line numbers.

-------------------------

**GOTO**

syntax: GOTO label

appears to have same function as applesoft GOTO, again with the exception that acos uses labels not line numbers.

-------------------------

**HOME**

syntax: HOME

appears to have same function as applesoft HOME. clears current window.

-------------------------

**IF**

appears to have same function as applesoft IF-THEN except it supports the ELSE directive when the statement was false. ELSE is optional. THEN is also optional but if you use THEN, it cannot be followed by a label directly. (use IF arg THEN GOTO label).

-------------------------

**INFO**

syntax: expression=INFO(optional)

INFO can be used as either a statement or as a function. it is really a 'catch-all' in nature, many values that are more or less unrelated are returned. the following table gives the meanings of all the INFO data.

argument r/w function

---

Apple II Computer Info

-------------------------

**KILL**

syntax: KILL filename

the INPUT statement is broken down into 4 different parts. the first part is the input device to be used. when omitted, the input is taken from the modem/console, otherwise input is taken from that device. the second part is the input mode. there is a restrictive mode placed on the input so that the inputed data is what you desire. the third part of INPUT is the prompt. the prompt is basically just a text string that will be printed prior to getting the input. the newline character '\\' can be used at the beginning of the text. the last part of INPUT is the variable list.

-------------------------

**INPUT**

syntax: INPUT [\{device,\} [\{number,\} [\{\}\] [\"text\"] [variable [\{,\}\} [variable..]]

the INPUT statement is broken down into 4 different parts. the first part is the input device to be used. when omitted, the input is taken from the modem/console, otherwise input is taken from that device. the second part is the input mode. there is a restrictive mode placed on the input so that the inputed data is what you desire. the third part of INPUT is the prompt. the prompt is basically just a text string that will be printed prior to getting the input. the newline character '\\' can be used at the beginning of the text. the last part of INPUT is the variable list.

-------------------------

**INSTR**

syntax: expression=INSTR(string,string)

the INSTR function is used to search within a string for the existence of another string. the first string is that string which you are searching for. the second string is what will be searched. the case of the text will be ignored. the function will return the number of the first character where the match was found. if the function returns zero, no match was found.

-------------------------

**KEY**

syntax: expression=KEY(0)

expression=KEY(1)

expression=KEY(2)

the KEY function is used to check and see what if any keys have been pressed. it is generally used to check to see if a routine needs to be interrupted and is used in conjunction with the SETINT and ADDINT statements. this routine does not wait for a key, it returns either an NULL value or the ascii value of the key. in the KEY(1) form, a non-zero byte will be returned if the key pressed was the 'file stop' key. in the KEY(2) form, a non-zero byte will be returned if the pressed key is the 'file next' key defined in config.

-------------------------

**KILL**

syntax: KILL filename

KILL #MSG(expression)
the KILL statement can be used in two different ways. in both ways it is used to delete data. in the first form, with the filename, it will delete the file from disk. in its second form, it will kill a message within the currently active message base. after using KILL on a message, it is always a good idea to follow it with an UPDATE.

--------------------------
MODEM(0) - this command needs to be issued before any other modem command is used. its function is to initialize the modem driver for later use.

MODEM(1) - this command waits for an incoming call and establishes a connection. execution will continue when either a call is connected or the user goes into local mode.

MODEM(2) - this command causes the modem to hangup. all further output will be sent to console only.

--------------------------
KILL syntax: KILL filename

the KILL statement can be used in two different ways. in both ways it is used to delete data. in the first form, with the filename, it will delete the file from disk. in its second form, it will kill a message within the currently active message base. after using KILL on a message, it is always a good idea to follow it with an UPDATE.

--------------------------
LEFT$ syntax: LEFT$=LEFT$(string,length)

appears to have same function as applesoft LEFT$.

--------------------------
LEN syntax: expression=LEN(string)

appears to have same function as applesoft LEN.

--------------------------
LINK syntax: LINK filename [,string-label]

this statement will allow two program segments to be linked together. it is in this way that the problem of not enough memory is dealt with. the filename argument is mandatory and is in standard filename syntax. if you wish the execution to begin at a point other than the beginning of the module, then add on a comma followed by the name of the label IN STRING FORM. the label must be enclosed in quotes or must be in a string. ex: LINK "A:MSG.SEG","BULLETINS". you must also make use the PUBLIC command within the segment you are linking to so that the labels address is available to the link command.

--------------------------
LOG syntax: LOG drivespec

the LOG statement simply changes the default disk drive to the <drivespec> drive. if the drive is not legal, a BAD DRIVE SPECIFIER error will occur.

--------------------------
MARK syntax: expression=MARK(device)

the MARK function will allow you to either set or check the point at which a file is doing i/o. if you want to go to the beginning of a file, you would issue a MARK(1)=0 assuming it was file 1. MARK has a second function in that it can be used to see if a file exists. normallyacos will not generate an error if a file exists, so it can be hard to tell if there is one. to see if a file exists:

IF MARK(1) PRINT "FILE EXISTS"
CLOSE #1

--------------------------
MID$ syntax: string=MID$(string,start [,length])

appears to have same function as applesoft MID$.

--------------------------
NEXT syntax: NEXT

similar to the applesoft NEXT statement which is used with FOR-NEXT loops but with the exception you cannot use a variable after NEXT. (NEXT X is illegal).

--------------------------
NIBBLE
syntax: NIBBLE=number
NIBBLE(number)=number
NIBBLE(number)=number16

the NEXT function is similar to the FLAG function in that it is a low overhead data storage method. with the NIBBLE function, you can store 4 bit numbers that have the range 0-15. use the first syntax of NIBBLE to point to the point in memory where the data will be stored. use the second and third syntax to read and write the actual data.

--------------------------
NOT syntax: expression= NOT expression

the NOT operator is a boolean logic operator. it changes the value of an expression from true to false or from false to true. in boolean logic, false is considered to be zero while not false or true, is considered to be any other number. the NOT operator is most commonly used in IF statements.

--------------------------
ON NOCAR syntax: ON NOCAR GOTO label

the ON NOCAR statement is used to setup a routine that can be used when carrier is lost from a remote user. when the carrier is lost, acos will then hang up the modem.
it will then change the current execution point to the label that was setup. whenever you link to another segment you must set up a new ON NOCAR vector to a routine within that segment. if you don’t have a vector set up and a remote caller drops carrier, the system will just sit there until it times out.

os will then hang up the modem. it will then change the current execution point to the label that was setup. whenever you link to another segment you must set up a new ON NOCAR vector to a routine within that segment. if you don’t have a vector set up and a remote caller drops carrier, the system will just sit there until it times out.

---

OPEN

syntax:  OPEN #device,filename

the OPEN statement is used to make disk files ready to do i/o with out a program. you open a disk file using either device channel 1 or 2, and all further references to that channel will access the file associated with it. when you are finished with the file, use the CLOSE command. this will free up the device channel for later use. if you try to use a channel that is already in use, or one besides channel 1 or 2, you will get a BAD DEVICE CHANNEL error. if the file you open does not exist, no error will be generated. if you try to read from the file, it will appear to be empty. use the CREATE command to make a file.

---

PDL

syntax:  expression=PDL(number)

the PDL function is used to read one of the paddles on the system. you can read paddle zero through three. the number returned will be in the range 0-255.

---

PEEK

syntax:  expression=PEEK(address)

appears to be the same as the applesoft PEEK function.

---

POKE

syntax:  POKE address,value

appears to be the same as the applesoft PEEK function.

---

POP

syntax:  POP

appears to be the same as the applesoft POP statement with the exception of it also can be used with the acos PUSH command.

---

POSITION

syntax:  POSITION #device,number,number [,number]

the POSITION statement is used to position within a random access file. the first argument is the disk device channel number that was used to open the file. the second field is the length of each record. the third field is the record number to be positioned to. the fourth field is the offset within the record that is to be positioned to.

---

PRINT

syntax:  PRINT [#device,] [expression] [,expression] ;

rules for PRINT:

control: ',' - the comma is used to separate expressions within the print statement and will be printed literally.

control: ';' - the semi-colon is also used to separate expressions it will not be printed when encountered, if a semi-colon is the last character in the line, then the carriage return will be suppressed.
control: \"\" - the backslash is used to generate a newline character
using the backslash, there is no need to put a bunch
of print:print... statements.

exprs: TEXT - text must be contained within quotes and will be
printed exactly as typed. within quotes, you may have
any special characters including return. having an
open quote with no close can prove to be an
interesting experience.

exprs: STRING - the contents of the listed string will be printed.
exprs: NUMBER - the content of the listed number will be printed.

-------------------------
PUBLIC
syntax: PUBLIC label
the PUBLIC statement is used to make a label within a program module available to
other modules to link to. if you wish to link to another program module, and start
execution at a point other than the beginning of the module, you will need to make
that point public. you can have a maximum of 8 public labels within a program module.

-------------------------
PUSH
syntax: PUSH label
the PUSH statement is a sub-set of the GOSUB statement. it does not actually change
the current point of execution, but places a return address in a table so that the
next time a RETURN statement is encountered, control will return to this present
point. a POP statement will remove the last address added to the return table.

-------------------------
RAM
syntax: RAM
the RAM function is really just a constant pointer. it just points to a free 64 bytes
of memory that has been set aside for program use.
-------------------------
RAM2
syntax: RAM2
the RAM2 function is the same as the RAM function except that it points to a
different 64 bytes that are available for program use. usually this memory is used
in conjunction with the READ, WRITE, NIBBLE and BYTE functions.

-------------------------
RANDOM
syntax: expression=RANDOM(number)
the RANDOM function is used to generate a random number within the range 0-number.
a new random number will be generated every time the system goes to get input. if you
take two random numbers in a row, they will always be the same. if you need more than
one, use the RND$ string between. the will do a temporary re-random.

-------------------------
READ
syntax: READ # device,memloc,number
the READ statement is used to load data from a file into memory in its binary form
without any processing or changing. the input does not have to come from a file, it
can come from the editor or a message file. it is similar to an apple dos BLOAD
command.

-------------------------
READY
syntax: READY filename
the READY statement is used to make a message file ready for use. it is similar to an
OPEN statement being used before a file is accessed. after a message file is ready,
all the following references to MSG will be directed to that file. once a message
file has been made ready, it can also be used in its second syntax to ready a
specific message within the file. this is generally used if further references to the
file will use the device channel associated with the message base.
syntax: string=STR$(number)

appears to have same function as the applesoft STR$.

---

**TEXT**
syntax: TEXT

used to clear the screen and any window on the local console.

---

**THEN**
syntax: THEN

same as applesoft THEN, separates statements within IF statements.

---

**TIME$**
syntax: string=TIME$

the TIME$ function is used to get the current time from your clock. if your system is equipped with a clock, the time will be returned in a "HH:MM:SS XM" format. if your clock is in the 24 hour configuration then it will be returned in the "HR:MM:SS" format. if you have no clock, then your estimated time on will be returned. the estimated time is based upon the number of characters output and the speed they were sent. the format for estimated time is "HH:MM:SS ET". when the clock is first reset via a MODEM(0) command, the time will be "00:00:00 ET" and will advance from there.

---

**TONE**
syntax: TONE (number,number)

the TONE function is used to generate a tone from the speaker in your computer. the first argument is the pitch and the second is the duration.

---

**UPDATE**
syntax: UPDATE

the UPDATE statement is used to write any information about the current message base from memory out to disk. normally, certain things are buffered and will stay within memory for long periods of time. in the event of a power failure or a system reset, this data will be lost before it is written out to disk. use the UPDATE statement to force the data to be written out to disk.

---

**USE**
syntax: USE filename [,any options]

the USE statement is used to access a routine that is external to the acos language. what happens is that the USE statement loads in an external command and transfer control to that command. the command will normally get parameters from the continuation of the line after the filename argument.

---

**VAL**
syntax: expression=VAL(string)

appears to have same function as applesoft VAL.

---

**WHEN$**
syntax: WHEN$=address

string=WHEN$

WHEN$=string

the WHEN$ function is really just a data compression scheme. you initially point WHEN$ to a address in memory. at this address there must be 2 free bytes. when you read from WHEN$, the 2 bytes will be retrieved from the memory location and translated into a "MM/DD/YY" format. when you assign WHEN$ a value, the current date will be read and changed into a 2 byte compressed format and saved at the current address pointer.

---

**WIDTH**
syntax: expression=WIDTH(number)

the WIDTH function is really an interface to the config program. it will return 4 widths that were setup as the most commonly used widths under config, along with the width that should be used for a default when the video width is not known. WIDTH(1-4) will return the 4 most commonly used widths. WIDTH(0) will return the number of the width(1-4) that should be used as a default.

---

**WRITE**
syntax: WRITE #device,memloc,number

the WRITE statement is the opposite of the READ statement. it is used to write unprocessed binary data from memory to a file or other device. almost all the device channels can be written and none will generate errors. just specify the memory location and length to be written.

---

* end of file
Welcome to the SCI-FI Acrostic Solver. This program presents three acrostic puzzles with famous science fiction authors as the topics. The author's last name is the answer down. Each letter in the author's name is used as the first letter of a word across. By solving the words across, you will spell the author's name down. A clue for the word down appears at the bottom of your screen. Use the ^ arrow keys or Control A and Control Z @ to move from row to row. As you move up and down, a clue for the row where you are working will appear at the top of the screen. You may guess, but the program expects you to solve all words across. Correct words are marked. If you need help with a word, use ^ Control F @ to see the first letter. Once you have completed the first puzzle, the program will automatically move on to the second. If you want to skip a puzzle, use ^ Control N @ to ask for the Next puzzle.

You can quit completely by using the [ESC] key. The program will ask you to confirm your choice. If you do quit, you will go back to the UPTIME Menu. If you do not, you will go back the puzzle, resuming where you left off.

In this program, you will find a set of acrostics with the same theme. If you are a bit familiar with BASIC, you might look at the data statements starting at line 12000 and change them to create your own acrostics. You may want a set of puzzles for a favorite topic of yours. If digging into Applesoft is a bit beyond your wishes, you can send your suggestions to UPTIME. If we receive enough response, we will either include a new acrostic or (preferably) a set of programs that will allow you to make your own acrostics and save them on the disk for other people to solve. Let us know if you would like a utility which will print these puzzles for you as well.

^ Files Needed @

ACROSTICS - Program used to setup the machine for SCIFI
UPTIME.TITLE - The introduction to the program
SCIFI - The main program
FP - EXEC file used to exit.
GARBAGE - A quick garbage collection routine

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 40 of 1262
AE PRO is part of the "Professional Series" pioneered by Southwestern Data System (SDS). For the first time ever, there is communications software which operates similarly in all three major operating systems of the Apple II computer; CP/M, Pascal, and the native Apple DOS. The AE PRO edit mode is a flexible set of software designed to work with each of its members -- CP/M files can be transferred via modem or direct connect interface to Pascal, Pascal to DOS or any combination.

--->> BAUD RATES <<---
AE PRO supports all standard telecommunications baud rates as well as the higher direct connect rates up to at least 4800 baud when interfaced to conventional 80 column boards, or in excess of 9600 baud when interfaced to an external terminal capable of those higher rates. Its supports full terminal emulation -the ability of AE PRO and your 80 column board or external terminal to mimic screen display characteristics of other popular terminals. Thus you can communicate with all host computers. AE PRO may require a particular display characteristic. This provides maximum flexibility while minimizing connect time.

--->> HARDWARE <<---
AE PRO also supports all currently available hardware for the Apple II including all modems, whether plugged into the Apple mother-board or operating externally, all display devices from the internal Apple 40 column screen to 80 column boards and external compatible interfaced. The same versatility applies to printer interfaces as well. With most printer interface cards, AE PRO's unique printer "ring" buffer prevents the loss of data while on-line with the printer enables simultaneously.

--->> COMPACT CODE <<---
AE PRO is written in very compact efficient form. Code overlays are used frequently which allow different sections of AE PRO's code to share the same section of memory. The result is a small amount of computer memory wasted space anywhere in memory. Micro PRO's Wordstar word processor and Microsoft's A.L.D.S. assembler-linker package were used exclusively for its development.

--->> POWERFUL EDITOR <<---
AE PRO also contains a powerful built-in editing system. The editor can utilize either the same memory as AE PRO's data buffer, or a special expanded buffer. In the expanded mode, your already large 18k byte data buffer is expanded further by another 7.5k. You can switch between buffers quickly & easily, but may not maintain data in both simultaneously. The editor is oriented in nature, but utilizes a flexible screen-oriented editing system in which the cursor may be freely moved around in text. Characters may be added or deleted at will. Also featured are recursive global find and edit commands, which allow you to locate particular characters or strings anywhere in your file, instantly move into the edit mode, make necessary changes, and continue on to find the next find occurrence.

--->> BUILT-IN MEMORY MANAGEMENT SYSTEM <<---
AE PRO goes one step further. If your Apple II is equipped with a standard 16K RAM board in slot zero, AE will automatically relocate the DOS operating system to higher memory and increase your data buffer size even further. In this mode of operation, your minimum buffer size will increase from 18k bytes to approx. 28k bytes. In the expanded editor mode, another 7.5k bytes is added above that.

--->> MOST POWERFUL MACRO SYSTEM EVER <<---
AE PRO provides you with the ultimate in flexibility. Complete system parameter assignment as part of the normal macro library. Now not only do you have full macro libraries with which to make complex operations easier, each separate library can completely reconfigure AE PRO. Things such as the system phone number, baud rate, parity, various menu parameters, even terminal emulation tables are part of this powerful system. Once configured, all you need to do is tell AE PRO which system to call. It will call, connect, reconfigure itself, and complete the log-on automatically while you sit back and watch.

--->> UNATTENDED AUTO-ANSWER <<---
AE PRO allows completely unattended answer mode with password log-on. If the Novation Apple CAT modem is utilized with the Bell 21a option, AE PRO will automatically adjust to that of the caller. In the unattended mode, the caller can view standard text files to the screen, do blind copy of data, or send or receive any type of file in the Christensen error-free mode. The unattended mode can be set up for complete turnkey operation too. If configured to so, you can power-up your computer on the AE disk and automatically enter the unattended remote mode.

--->> AUTO-ANSWERBACK MODE <<---
AE PRO also have the ability to function as an ANSWERBACK DDR or TMX mode to forwarding mail systems such as Telenet's Telemail and many others. In this mode, AE PRO will pick up the phone, and wait for the forwarding system to activate it with special HERE-IS character. AE PRO will then identify itself, and accept the incoming data into its buffer. After the conclusion of the exchange, the forwarding computer will hangup, and AE PRO will automatically save its buffer to disk (the printer may be simultaneously supported also) and wait for the next call.

--->> ERROR FREE TRANSFERS <<---
A wide range of send modes are provided. Everything from the simplest blind block dump, to a very complex packet-oriented error checking mode ensures that all data will be able to terminals compatible. AE PRO's unique "ring" buffer prevents the loss of data to practically any host computer you can find. Even the slowest or most awkward systems are easily accommodated.

--->> MENU DRIVEN <<---
AE PRO is unobtrusive. It remains quietly on the sidelines until you request something. It can display extensive help menus if you want them, or none if you don't. An extra feature, the BRIEF mode allows the more experienced operator to turn off AE PRO's extra prompting. This keeps the screen clear of announcements and prompting you may not always need.

--->> SOPHISTICATED INSTALL PROGRAM <<---
AE PRO's install program is very user friendly and easy to use. It requires no programming knowledge to operate but encompasses all aspect of the basic set-up of AE PRO including various automatic modes which allow you to move AE PRO from one system to another of different hardware configuration. It will figure out what is there and work correctly without further attention. There are no line numbers to change or internal programming changes to make. If AE PRO cannot adjust for a particular hardware configuration, it flexible screen-oriented capability, will inform you and automatically run the INSTALL program if present on that drive.

--->> MANUAL ABBREVIATIONS: <<---
Throughout this manual, certain abbreviations for keys or characters may be used:
c/ё carriage return key
BS backspace character (^H)
RUB RIGHT arrow character
ESC ESCape character
C CONTROL character
# Apple II Computer Info

RUBout character (screen display only)

Also note that a HEX value may be indicated by a number being preceded by a dollar sign ($) or followed by "H" (letter H).

<td>BFD92</td>
<td>A utility program designed to produce a TEXT FILE FROM A Binary block of data, if that data does NOT reside from $9200:$9600.</td>
</tr>
</tbody>
</table>

**NOTE:**

AE PRO itself does not rely on any non-macro files to operate normally. Therefore, you can produce diskettes which contain on HELLO, AE and associated macro files, to allow you the largest possible disk space. If you also would like to be able to operate INSTALL from AE PRO, you must include INSTALL and BDOS on the AE disk.

--- A TYPICAL QUICKIE SET-UP ---

For our example, we'll take a pretty "standard" hardware configuration found in many reasonably equipped Apple II's used in the home.

It would consist of:

1. Apple II Plus, 48K RAM
2. 16K RAM card - any manufacture
3. Apple mini-drives on one controller card
4. 80 Column board (optional)
5. Hayes Associates MicroModem II
6. Epson MX70/80/F Printer
7. Parallel Printer Interface

First, like running any other new software, MAKE A COPY OF AE PRO DISKETTE. Any conventional copy program may be used. When done, put the master aside, and "use the copy". Insert the AE PRO copy disk in boot drive, and either power up the computer or type PR#6 to initiate the boot process. After a few seconds of disk activity, AE PRO will attempt to run and discover it has not yet been installed. It will display a message on the 40 column screen.

The first install--RUNNING INSTALL

Another few seconds will pass the screen will again clear and you will see:

ASCII EXPRESS "THE PROFESSIONAL" INSTALLATION PROGRAM
FOR AE VERSION 3.4x
(C) 1982 BY SOUTHWESTERN DATA SYSTEMS

If you can ON THE DEVICE THAT WILL BE USED WITH AE PRO, answer YES.
If you cannot under any circumstance, display lower case, answer NO.

Then it will ask: CAN YOU DISPLAY LOWER CASE? (Y/N)

If you can, at the moment, display lower case on your 40 column screen, answer yes. This question only affects the display of Install's menus.

Since you are running AE PRO for the first time, the screen will again clear and you will see the next display stages:

**PLEASE SELECT ONE OF THE FOLLOWING:**

1. Novation Apple CAT
2. Hayes Assoc. MicroModem II
3. CCS 7710A/D, 7711, SSN AIO, Apple Comm-Card, Prometheus VersaCard
4. Mountain Computer CPS
5. KSI Lynx
6. MFC MicroConnection
7. Apple Super Serial Card

Current: 0 New: ---

Since for this example, you have a MicroModem II installed, select option 2

Next: SLOT of communications device (0-7)

Current: 2 New: ---

Enter the slot in which your modem is installed.

The message: Installing Communications Driver!

Will appear indicating you choice is valid and the proper code has been installed. If you had given invalid answers to the previous questions, Install would inform you and allow you to try again. AE PRO configures itself automatically for various display devices, as well as most printer interfaces, so for this installation, all that remains is to tell AE PRO which slot the printer interface (if present) resides, and which slot the display board (if present) resides.
No other hardware adjustments need be made.

The printer slot may be set with the "P" option and the display slot with the "L" option. Most other user parameters have already been set for you and need not be changed at this stage.

Look at the various options of Install and their descriptions in the instructions. You need not make any further changes now, but make a note of any changes you might want to make in the future after you understand this program better.

When your through looking around, use the "S" command at Install's main menu to save the changes you have made and run the program.

THE FIRST RUN:

As AE PRO is running, it configures itself for the various hardware you have installed in your computer. It should always come up onto the selected display device with:

ASCII EXPRESS "The Professional"
Version 3.4x (c) 1982 by
Southwestern Data System

Near

The "->" is the system prompt as long as you are NOT currently connected to a host computer. At this point you can type "?" or "@" to display command menu #1 or "2" to display command menu #2.

DIALING A NUMBER:

You type "D" to dial a number. AE PRO responds: Number?

You enter the phone number of the system you wish to call and hit return. If you change your mind, just enter a c/r (carriage return) alone to abort this command.

AE PRO has the number now and displays: AE: Dialing: 853-1212

The numbers are output to the screen as they are dialed. When dialing is completed, it reports: AE: Waiting for connect.. and "listens" for the host computer's carrier. If no carrier is detected within about 40 seconds, the message: AE: Connection terminated

-> will overprint the previous message, display the "->" prompt and wait for further instructions. If carrier was detected, a different course of events occurs. First the screen will clear, and the message: AE: Term-->

will appear in the upper left hand corner of the screen. You are not in terminal mode. Anything you type now, will be directed to the computer you called. Any time you wish, you can temporarily exit the terminal mode with the "Q" key (control-Q). AE PRO will respond with: AE: Term-->

Remember that now we are copying all data on your screen to the copy buffer and are not currently connected to a host computer. At this point you can type "?" or "Q" to catalog the current disk. AE will display

AE: Copy ON

AE: Term-->

will display. To turn the copy buffer OFF, just type "R" again, or "Q" from terminal mode if you are connected. For now, you have the copy flag enabled, but are not currently connected. Call the same computer again, but since AE PRO remembers previous commands, type D to invoke the dial mode. Instead of re-entering the number, enter the "->" character.

"->" recall the last input used for most commands that require a more than one character response.

AE will again dial the previously specified number and attempt to connect.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 44 of 1262

We won't get thru all this now, but rather step through a basic macro set-up to get you going in the right directions. First pick a system that you can call so you have a "target" for this macro fill. We'll consider it a bulletin board for simplicity, but the same procedure would apply to any set-up. Update the phone number displayed to that of the system you are creating this macro for. Do this with the "p" command.

AE PRO will respond:
Enter new number:
Enter the phone number of the new system followed by c/r. For the purpose of demo, we'll call it "BBS Yourtown". After the number is correctly entered, the menu will re-display and the number just entered should be in place. Change any other obvious parameters dealing with that system, such as baud rate or parity in a similar manner. Once you are done with the parameters section, enter the "D" command to enter the actual macro element editing section.

EDITING MACRO STRINGS:

AE PRO will display:
#0 g;n
Your display should look something like this:
#1 yourid
#2 yourpassword
A  PMS Santee  stpms
D  Source      source
I  MicroNet    mnet
J  Smartmodem  hayes

Basically this is giving you a library list of the various macro files you have to choose from. Of course, this can be customized to suit your individual needs. If you were now to type "m" "a" you would be directing AE PRO to load the file for PMS Santee which on the diskette is an "S" file names "STPMS.MAC". The second field displayed is the system which the first field selection represents, and the third field is the name of the macro data file which will be loaded at that time.

AE PRO should respond: PMS Santee <macro loaded>

DISPLAYING MACRO PARAMETERS:

Now let's check out what we actually loaded. Type the "U" command (this is displayed on menu 2) to enter the macro configuration section. You'll see a complete display of the data parameters of that file:

Current loaded: STPMS.MAC
Phone: 561-7277!

B = Baud rate 300
D = Macros display/edit
E = Duplex FULL
F = Data word format ENI
K = Chat mode OFF
L = Load macro from disk
N = XON character $11=^Q
O = XOFF character $13=^S
P = Change macro phone #
S = Set terminal parameters
T = Transpose ^H/RUB OFF
U = Update from current macro
W = Write macro to disk
X = Exit to main command prompt
Z = Format screen OFF
$ = Emulation mode ON
^ = Apple CAT port INT
Apple II Computer Info

0 = Auto
1 = User routines (PRINTER.USER)
2 = 6522 parallel card
3 = Comm-card
4 = Apple serial card
5 = Apple parallel card
6 = Special
7 = CPS
8 = CCS-7728 parallel card

Current 0 New:

Choices are somewhat similar to video display options. If zero is selected and as long as AE PRO can, it will recognize the interface card installed & configure automatically. ALWAYS SELECT ZERO OPTION UNLESS YOU HAVE SPECIFIC REASON NOT TO!! Like video, if you do not desire the auto function, or have a card not recognized by AE PRO select one of the below.

1 = User routines is a custom section, you may install a custom driver.
2 = An interface using the 6522 chip.
3 = Comm-type card in any interface using the 6850 chip.
4 = Apple HS Serial Card: Only one card that fits this - the original Apple High Speed Serial-some firmware is used on these cards, but part of it dealing with linefeeds or protocol.
5 = Apple Parallel card- This is the most popular, as well as the most copied interface mode. Most printer cards designated as parallel will fall into this section, including many of the universal types of EPSON printer, its own parallel card and many others.
6 = Special is any type card using TYPE 6 FIRMWARE protocol.
7 = CPS-- only one card in this category --MOUNTAIN COMPUTER CPS card-- may be used as serial or parallel driver. If selected you will be asked as to the mode of drive. Be careful here if using same CPS card for both modem, screen driver, as well as printer driver. inadvertently specifying the same section as two different drivers may cause unusual results. As screen driver, it may be used ONLY in the serial mode.
8 = CCS 7728 Parallel card or Micro-Buffer system.

L=LINEFEED STRIP: AE PRO supplies linefeeds directly to the printer at all times. This normal default mode is not dependent on the type of printer interface you are using, only the printer internal drivers themselves. If printer is doing double-linefeeds all the time when driven by AE PRO set this to YES. Otherwise set at NO.

M=PRINTER MESSAGE: If your printer requires any kind of initialization characters be sent when accessed, set them up here. These don't include sequences which are normally designated as FIRMWARE initialization. Things such as ^A are usually firmware initialized are ineffective here. Thus it is unnecessary to send "1 commands to set printer column width as that is a function of the interface card firmware rather than the printer itself. The message to the printer can be entered directly from the keyboard, including all control characters.

Current printer setup message:
Enter new message or RETURN:

(you type) HELLO THERE ^S ^S ^\[ ^\[

Of course, HELLO THERE control-s control-s ESCape ESCape won't do anything useful to your printer and is shown only as an example. Entering c/r as the FIRST character of the line, will immediately exit this mode and leave the original string intact. Note each time printer is enabled from AE PRO these characters are sent. If you want to clear the entire contents of the printer set-up buffer, enter the printer terminator character as the first and only character.

S=PRINTER INTERFACE SLOT:
0 = No printer installed
1-7= Printer interface slot

Current = 0 New:--

Set to slot in which printer interface card resides.

===> End Of Dox File #2 <==

A=Add Delete Exit?

The terminal prefix key is very powerful. It commands all macro functions as well as a means of producing any ASCII character from the keyboard. In the prefixed terminal table, you program which characters are to be converted, and to what, when preceded by the terminal prefix key, up to 16 substitutions.
NOTE: If you are operating install pgm. totally in upper-case, or intend to use AE PRO in upper case only, some of these characters will actually display as their upper-case counterpart. Thus {,|,} will be [],",. This is unavoidable because Apple see some ASCII values this way.

A=Add character:
This mode allows you to add a character substitute. Either the character prefixed, or the character to be output, you can enter from the keyboard, or "$xx" as the HEX value.

D=Delete character:
Just like the above "A" mode, except it deletes the character and its substitution from the existing table.
Apple II Computer Info

S = Slots remotely accessible:  
   4 5 6
X = Exit  
Choice?
C=Ring count before answer:  
Sets the number of incoming rings before AE PRO will pick up the phone.  
Values are from 1-9.
R=Remote password:  
This is the sequence of characters which must be entered by a called at the  
"ENTRY:" level of AE PRO.  No reaction from AE will occur unless exactly  
the correct combination of characters is entered.  Any alphanumeric  
characters including control char. are legal except ^M, (c/r), "H","J.  
A maximum of six char. may be installed.
S=Disk slots remotely accessible:  
Only those slots specified here will be legal for remote access.  
If not legal, will be ignored.
--------------------------------------------------------------------------

1=SYSTEM DEFAULTS (menu 1)
B = Auto disconnect .... ON
C = Copy .................. OFF
D = Duplex............... FULL
E = Emulation ............. ON
F = Data word format .... BN1
G = Screen formatting .... OFF
H = Chat.... .............. OFF
I = Baud rate............ 4
J = Apple CAT using aux port.. NO
K = Keyclick .............. OFF
N = XON char.... "Q" ($11)
O = XOFF char.... "S" ($13)
P = Printer... ............. OFF
S = Control-show... ...... OFF
T = Transpose "H/RUB" OFF
X = Exit  
Choice?
B=Auto-disconnect:  
Determines the run-time default of the ":" auto-disconnect function.
C=Copy:  
Determines whether the ":" copy flag comes up on or off.
D=Prefixed break key:  
Determines if the duplex default comes up half or full.  
This may be superseded by a macro file, if active.
E=Emulation:  
Determines if the AE emulation mode ($) mode comes up on or off.  
This too may be changed by a macro file.
F=Data word format:  
Determines the default word length, parity and number  
of stop bits the modem will default at run-time.  
Can be changed by macro file.
G=Screen format default:  
Determines whether the "Z" screen format command in on or off.
H=Chat:  
Set run-time for the chat (K) mode.
--------------------------------------------------------------------------

2=SYSTEM DEFAULTS (menu 2)

B=Auto-disconnect:  
Determines the run-time default of the ":" auto-disconnect function.
C=Copy:  
Determines whether the ":" copy flag comes up on or off.
D=Prefixed break key:  
This is the second char. of the break key sequence.  In the current  
setting, to send BREAK, you would type "KB" from within the terminal  
mode.  "KB char. can be defined as can this, the second char. It is  
recommended that it be a control char., as a dual control char.  
sequence is easier to type than if the second of the two is non-control.  
"KB is easy to remember for the word break.
E=Emulation:  
The standard BREAK time is actually 250ms (milliseconds) but many systems  
may require a break to be sent for as long as 500ms (one half sec.).  
Try it this way first (menu setting) and redefine it necessary.
F=Dial mode default:  
Novation Apple CAT only.
Set the dialing default mode, pulse (rotary type) or TouchTone.
G=Screen clear char.:  
Actual screen clear char... $0C ^L  Lead-in ... $00 ^/ (none)  
Defines the char. when used internally will cause the display screen to  
clear.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)  
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 46 of 1262
Note:
This serves a different purpose that the similar function in the Terminal emulation table. The emulation table converts incoming characters to those required by your display. This option is used only by AE PRO during internal clear screen option. The "Actual" screen clear char. above serves an additional function when used in the 40 col. screen mode. In 40 col. the defined char. determines which INCOMING char. will cause 40 col. screen to display while in terminal mode.

F=Screen clear delay:
Some external terminals may require a small "settling" time directly after a clear screen before it can accurately accept further data. This value is equivalent to the time delay in milliseconds.

G=Backspace char.:
This causes your display device to move the cursor one space to the left-non-destructively. DO NOT confuse this with the key to type on your keyboard. This will ALWAYS be the BS or RUBout (left-arrow) key. There are a handful of terminals that might require a char. other than "H" to perform this act.

H=Copy ON char.:
Like the "here-is" char., the copy on char. is that which when received in terminal mode cause AE to immediately turn on its copy buffer. It is normally set at "A". To disable, enter zero.

I=Copy OFF char.:
Corresponds to the copy on char., except that when encountered in terminal mode, instruct AE to turn OFF its copy buffer. Normally set to "T". To disable, enter zero.

J=Literal send mode:
This mode sorts whether or not blank lines in ASCII text file are being ignored. This determines whether or not characters are sent exactly as-is or "padded". Paddiing converts blank lines (c/r alone) to space-c/r. Most host computers take a blank line (c/r alone) as a command, so this sequence would occur during a text send, the host would change mode. If the literal send mode is "off", any blank line consisting of c/r would be converted to space-c/r to avoid being taken as a command. This in no way modifies the appearance of the text. Set to suit. AE PRO is shipped with this mode disabled (off).

K=Keyclick duration:
The Apple speaker will emit a "click". The higher the value the longer the delay, and the louder (or more obvious) the click. The range is 1-40.

L=Pre-sub case insensitive:
This decides if prefixed char. are to be sensitive to input case. Example: you have defined "MA" to send "A" or another char. What this option determines is whether the case of the letter you type after the "M" is significant. If set to YES, case would be insensitive, thus a lower case A would be treated the same as a upper case A. If NO, lower and upper case letters are regarded as different chars. Set from 0 to whatever you can tolerate up to 255.

M=Brief AE PRO:
This selects default condition for the Brief (non-verbose mode). It is also managed by the "*" command in the main menu.

N=Shift key hardware mode:
This is between the connection of your keyboard and PB2 of the game I/O connector that is used with 80 col. boards. You can install this jumper even with 40 col. screen in use and tell AE to use the shift key for its case shifting.

O=View speed:
Sets the default of all commands which display text on the screen, and is controlled from within by the non-shifted "<" & ">" keys. Commands affected are "M", "J", & "I" within the editor. Range is 0-14 with zero being no delay.

P=Screen formatting width:
In the forced width of the display device when the (Z) is selected. Use this for 80 col. boards that can't perform their own screen wrap if a line exceeds its total width.

Q=Brief AE PRO:
If this option is set to NO, the disk volume default is zero, which allows exchange of disks freely without concern for volume parameters. If YES the vol. which AE runs from becomes the default for further load, save and catalog operations do not default to zero wildcard, but to the specified volume. The hard disk option may also apply to 8", single, double density systems which vol. parameters are significant.

R=Send LINE delay:
This default delay value of AE's "N" command, the delay after each line sent in the NON-prompted send mode. Legal values are from 0 (no delay) to nine (maximum)

S=Block mode send rate:
This default RATE is which char. are sent out the modem port in ALL send...
modes except C)haracter mode. It is continuously variable during the actual send with the "<" & ">" keys (non-shifted). Each time "><" key is pressed the speed will slow one "notch". The reverse is true for the "<" key. Range is 0 (full speed) to 7 (very very slow).

T=Terminal prefix key:
   This key serves as the prefix to special chars.and macros.

Ae Pro Docs continued

4=SYSTEM DEFAULTS (menu 4)
   Same as other menu's--following instructions below.

Ae= User abort char.:
   This char. is used as a way of "escape" from any command operation.
   It can be entered at any time within a string input.

J) do not operate any disk utility pgms "fix file sizes".
   Permanent damage to the disk and contents.

k) if AE has been run, and exited while still connected to host, the next
   time it is run (no power-down done) many modem related defaults will be
   the same.

L) response for prompts are from operator, specific defaults are assumed
   if c/r is entered,or def=n or def=y or specific answer.

--------------------------------------------------------------------------
KEYBOARD HARDWARE/SOFTWARE OPTIONS:
S = Shift key hardware mod (menu 2)
C = Case toggle key (menu 3)
F = 80 col board firmware (menu 3)

S & C options:
S&C are used together. If 40 col. screen & "S" is set to ON, it assumes
you shift key has been electrically connected to game port like some of the
80 col boards are. If "S" is set to OFF, it assumes case conversion will
be done via software and the key will be typed to act as shift in the "C"
option. ESCape key is defined as toggle for upper/lower case. ONE press
next char. will be typed, TWO presses shift-lock enabled.

F option:
   This is used to process incoming chars. you can support case shifting is
   the same fashion as the card would have done, but without the extra
   processing it may perform on chars like ^A ^V ^K. This is accomplished by
   turning "F" OFF and "S" ON. If you like all of the functions of your 80
   col. board then set "F" to ON. Then make necessary substitutions in the
   editor cursor key definition table.

--------------------------------------------------------------------------
MAIN COMMAND MENU: Menu 1

   In 80 col. the format will change to split screen left and right

Note: Anytime you are connected to a host,
   you can re-enter terminal mode by press SPACE BAR.

Apple II Computer Info

X=EXIT PROGRAM: Terminates and returns to operating system it was in at execution time. IF BRIEF is on, and double-checks will be in effect.

Y=DISPLAY PREFIXED CHARACTERS: This shows its character substitute table as defined in Install pgm.

Z=SET DELAY (0-9): Used when typing to another terminal package, or when typing to a host which requires linefeeds after any c/r typed. It also puts you in half duplex so c/r's are displayed on the local screen. If Chat is enabled during a text file send (not protocol mode), linefeeds will be appended to each c/r sent during transfer. If linefeeds are necessary during keyboard communication, they will be needed during transfers as well.

A=SHOW CONTROL CHARACTER ON/OFF: Enables or disables the interactive terminal chat mode. Used when typing to another terminal package, or when typing to a host which requires linefeeds after any c/r typed. It also puts you in half duplex so c/r's are displayed on the local screen. If Chat is enabled during a text file send (not protocol mode), linefeeds will be appended to each c/r sent during transfer. If linefeeds are necessary during keyboard communication, they will be needed during transfers as well.

E=ECHO DUPLEX FULL-HALF: Enables to full from half duplex, or half to full. In full, chars. you type do not appear on your screen unless echoed by host. In half it is assumed that host is not echoing. If you see two of each char. you type, or none at all, toggle between full or half.

B=BAUD RATE: Displays current baud rate.

F=DISPLAY MAIN MENU: Displays the main command menu. The command menu contains all the commands available in the Apple IIe computer system. It allows you to navigate through the system and perform various tasks.

G=DISPLAY PREFIXED CHARACTERS: This command displays the character substitute table as defined in the Install program.

N=SCREEN FORMAT ON-OFF: Normally off, when on it will not modify the display of incoming data. When on it will cause the screen to wrap to the next line at a pre-set column width. This is useful for 80 col. displays.

T=TRANSPOSE 'H/RUB ON-OFF: Left arrow sends the BS (backspace) char. which tells the host to backspace one char. Some systems, require a RUBout char. to be sent to perform the same operations. RUBout is available on the Apple keyboard. Two solutions -- One = defin the char. in the substitution table, then invoke by typing "^W^H" (H is a backspace, or left arrow) this retains the left arrow key. Two if you do not want to do two keystrokes you can enable Transpose mode (T), this converts the left arrow key to send a RUBout instead of a backspace.

H=AUTO ANSWER ON-OFF: Normaly ON. If OFF it does not modify the display of incoming data. When ON it will cause the screen to wrap to the next line at a pre-set column width. This is useful for 80 col. displays.

W=CURSOR (ARROW) ON-OFF: Normaly OFF when ON it does not modify the display of incoming data.

L=LEFT ARROW KEY: Left arrow sends the BS (backspace) char. which tells the host to backspace one char. This command is used to manipulate the screen and move the cursor.

T=TERMINAL CHAT ON-OFF: Enable or disables the interactive terminal chat mode. Used when typing to another terminal package, or when typing to a host which requires linefeeds after any c/r typed. It also puts you in half duplex so c/r's are displayed on the local screen. If Chat is enabled during a text file send (not protocol mode), linefeeds will be appended to each c/r sent during transfer. If linefeeds are necessary during keyboard communication, they will be needed during transfers as well.

A=AUTO SAVE ON-OFF: If a file is specified, this option will be enabled. All disk options are valid. c/r alone will disable command. After name is specified the copy flag "R" is enabled. When the buffer gets to within 1k of full, used defined XOFF char. will be sent and a wait for data sending stop will go into effect. Data will be automatically saved to disk when buffer is full, the name added "AEX" will be added to the file name. (as save cycle number) First file line will be .AE1, second .AE2, etc. After save, buffer will be cleared, there will be a beep to indicate that another buffer is being started and the XON char. to the host is sent to tell it to continue sending. This process is indefinite as long as there is space on the disk. You are free to exchange disks between save, should you get a full disk message during one of the saves, put in new disk, use the "W" command to continue. Used "*" as the filename to save under. This will get the files intact. When the save is over, manually type the XON char. from the keyboard to signal the host to continue. From then on its back to automatic mode. By using the "*" command you are recalling the last name used in the related buffer.

R=RUBOUT ON-OFF: Used when typing to another terminal package, or when typing to a host which requires linefeeds after any c/r typed. It also puts you in half duplex so c/r's are displayed on the local screen. If Chat is enabled during a text file send (not protocol mode), linefeeds will be appended to each c/r sent during transfer. If linefeeds are necessary during keyboard communication, they will be needed during transfers as well.

S=DISCONNECT ON-OFF: Normally off. When on it will cause the screen to wrap to the next line at a pre-set column width. This is useful for 80 col. displays.

K=KEYBOARD SENSING ON-OFF: If a file is specified, this option will be enabled. All disk options are valid. c/r alone will disable command. After name is specified the copy flag "R" is enabled. When the buffer gets to within 1k of full, used defined XOFF char. will be sent and a wait for data sending stop will go into effect. Data will be automatically saved to disk when buffer is full, the name added "AEX" will be added to the file name. (as save cycle number) First file line will be .AE1, second .AE2, etc. After save, buffer will be cleared, there will be a beep to indicate that another buffer is being started and the XON char. to the host is sent to tell it to continue sending. This process is indefinite as long as there is space on the disk. You are free to exchange disks between saves, should you get a full disk message during one of the saves, put in new disk, use the "W" command to continue. Used "*" as the filename to save under. This will get the files intact. When the save is over, manually type the XON char. from the keyboard to signal the host to continue. From then on its back to automatic mode. By using the "*" command you are recalling the last name used in the related buffer.

P=DISPLAY PREFIXED CHARACTERS: This command displays the character substitute table as defined in the Install program.

O=DISPLAY MAIN MENU: Displays the main command menu. The command menu contains all the commands available in the Apple IIe computer system. It allows you to navigate through the system and perform various tasks.

M=MACROS ON-OFF: Normaly OFF, when ON it will affect the display of incoming data. When ON it will cause the screen to wrap to the next line at a pre-set column width. This is useful for 80 col. displays.

D=DISPLAY MENU TWO: Will display menu 2, when pressed.

U=ENTER MACRO UPDATE/DISPLAY SECTION: See section on MACROS

V=EDITOR: System Editor. It has its own command chars. Contents of data buffer will remain intact and become that of the editor unless you clear it either before or after entering the editor mode.

--- End Of AE Dox File #4 <=-

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 50 of 1262
Enter the Christensen receive mode. Will open specified filename (drive to the end (this case 10) would be deleted. NOTE: since editor is line
R=Receive file: wild card. If you had 10 lines of data and typed ".D4,50" all lines from 4
Short menu of options available at this level. delete lines 4,5,&6. If FROM or TWO is out of range a range error will be
H=Help: ".D4", just line 4 will be deleted. If a ranges is desired ".D4,6" will

Autosave is required to type the password defined in the Install pgm. If not password or incorrect typing .H or .? command. All editor commands are in the DOT COMMAND. Each

\# =BRIEF MODE ON-OFF: Will ask for confirmations to various commands or display additional information

The editor shares the same buffer as the capture buffer (18k). When OFF, its in VERBOSE mode. If ON, INFO packets are installed and it will convert as per the table. Use this with 80 col or external terminal. If you don't want a particular conversion to take place, or are talking to host, that does not sent 1/f char. after each c/r, you must disable. L/R's will be appended by AE.

APPLE II COMPUTER INFO

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 51 of 1262
oriented, it is assumed each line is ended with a c/r. If it is not, the new line will be the same number as the last line listed, AE will give a range error. Solution hit c/r once as a new line, the use ".D" to delete it. Also you can't edit a line that is not properly terminated by c/r. Example: editing data that was just captured-when the "P" command is turned off it sets the end of file. This may not correspond to the c/r at end of line. Thus, there may be several char. left-over that are not ended by c/r.

.I=Insert line: (Exx)

This is the screen oriented edit mode. This means actual display of data you about to edit. You can move the cursor around within the line to add, exchange, or delete characters. You cannot move the cursor beyond the line number to left, these keys are not definable.

.R=Recall previous line unedited:

Use to quickly restore garbage line to original condition.

.S=Screen print:

Prints the data on a line by line basis to printer. Normal line numbers are not printed. If "N" is already entered, line number will be printed too.

.I=Insert lines:

Enters repeating insert loop starting at whatever line number specified. Now when we type ".^W," we actually output a "[".I=Insert lines: typing a "," so we prefix the comma with TERMINAL PREFIX KEY (usually a ^W).

.P=Put file to disk:

Write the current buffer contents to disk. Options same as .G command.

.X=Exit editor:

Exits the editor and returns to main command mode. May not exit if under the *.B* mode. If not in *.B* mode, you can move back and forth between edit and main part of pgm.with no changes to the current buffer.

.S=String search:

Searches entire buffer for the specified string (series of chars.). When match is found, the line the match is on will be displayed on screen. If the string occurs on any other char. type *, if no match the message "Nothing" will appear. If you want to edit the line where the match was found type .E by itself, the cursor will position itself at the end of the match found, edit the line and accept with c/r. If you want more matches after edit type ".^" again to continue. If any other command is issued the operation is aborted and must be restarted. If "^S" (xx=pline #) is added to search, the search will begin on the line specified instead of the beginning of the file.

.M=Margin set (right):

Sets the column that will no longer accept input in any mode, also screen oriented. It is assumed each line is ended with a c/r. If it is not, the new line will be the same number as the last line listed, AE will give a range error. Solution hit c/r once as a new line, the use ".D" to delete it. Also you can't edit a line that is not properly terminated by c/r. Example: editing data that was just captured-when the "P" command is turned off it sets the end of file. This may not correspond to the c/r at end of line. Thus, there may be several char. left-over that are not ended by c/r.

.I=Insert line: (Exx)

This is the screen oriented edit mode. This means actual display of data you about to edit. You can move the cursor around within the line to add, exchange, or delete characters. The chars. that effect cursor movement are setable by you, from the factory they are set as follows:

*A* = cursor left one WORD. Cursor will settle on first char. of a word.

*S* = cursor left one character. Control chars. are displayed as uppercase, with "**".

*D* = cursor right one "*U,(right arrow) is the same, but not redefinable."

*F* = cursor right one WORD. Same rules as "*A*.

*X* = cursor to beginning of line.

*C* = cursor to end of line.

*P* = prefix character. Example: If you want to enter "C" into text, you type ".F" ("G" normally can't be entered cause its a cursor command. To enter "P" itself enter "PPP", "G" = gobbled character. Destructive forward delete and not user definable.

*N* = delete char. to left of current cursor position. (left arrow).

If using external terminal RUBOut key will do same.

These keys are not definable.

.R=Recall original line unedited:

Use to quickly restore garbage line to original condition.

.V=View insert:

Will view inserting insert. If ON, any char. typed will be inserted into existing text at cursor position. If OFF, any char. typed will be exchanged for whatever char. cursor is currently on. As insert is toggled, the editing mode will show insert is active.

.Z=Zaps the current line. Completely eliminates the contents of the line being edited. If accidentally pressed, typed restore with .R. To exit this level, c/r. Note: Since editor is line oriented each line is terminated with a c/r. If not new-line prompt will be same number as the last line edited.

.F=Free space/buffer status:

Displays current number of chars. in buffer, as well as the number remaining.

.G=Get file from disk:

Load sequential text from disk. If no file is specified, AE will ask. The last file can be recalled by ".*". A c/r alone will Catalog Directory can be scrolled by pressing any key. c/r will abort catalog. AE will check to see if buffer is full, and you will be asked to append/load a new file if buffer has data. If buffer has data typing anything except ".A" (including c/r), will clear the buffer. If file is to large for buffer message will be displayed-any key except ".U" will cause whatever has just been added to the buffer to be disregarded. If ".N" is entered, whatever part of the file that was loaded will remain to the end of buffer.

.H=Help:

Displays the editor menu-all options available in edit mode.

.I=Insert lines:

Enters repeating insert loop starting at whatever line number specified. The "*P*" cursor position which is usually ".N" (n is the line number you're working on), will change to ">*n>*" in insert mode. You can remain as long as you like, all dot commands are valid here. If N is included in the insert directive, the line numbers prompt will be turned OFF (this is "blind" insert mode). .I = OFF .I N = ON

.P=Put file to disk:

Write the current buffer contents to disk. Options same as .G command.

.R=Reset maximum memory:

This is a special mode that expands memory capabilities (buffer size) by just over 7k. If does this by overwriting particular parts of AE that are disposable when your NOT using them at this time. You cannot maintain your current buffer when you enter this mode. Buffer must be written to disk, mode activated and file loaded back in. Also you cannot exit the editor without first clearing your buffer. If you wish to retain data with the .C command, then you can exit. When exited, overwritten part is restored automatically. Use the mode when you just need the editor itself with a larger buffer and not on-line.

=S=String search:

Searches entire buffer for the specified string (series of chars.). When match is found, the line the match is on will be displayed on screen. If the string occurs on any other char. type *, if no match the message "Nothing" will appear. If you want to edit the line where the match was found type .E by itself, the cursor will position itself at the end of the match found, edit the line and accept with c/r. If you want more matches after edit type ".^" again to continue. If any other command is issued the operation is aborted and must be restarted. If "^S" (xx=pline #) is added to search, the search will begin on the line specified instead of the beginning of the file.

.X=Exit editor:

Exits the editor and returns to main command mode. May not exit if under the *.B* mode. If not in *.B* mode, you can move back and forth between edit and main part of pgm.with no changes to the current buffer.

.S=Search for next occurrence:

A manual recursive search mode used only after a search has been initially entered.

.A=Append:

Saves the AE file to disk. If buffer is not empty, you will be asked to cancel or append the buffer. If buffer is empty, you will be asked if you want to append file or enter a new filename. If you supply a valid filename, the buffer contents will be written to disk and the editor will be closed.

.T=List lines:

List line on screen. If no starting point, list will start from beginning. A specified range is possible. .Ixx,yy= xx is starting line, yy is ending line. "*N" is valid and ".^=*".

.Modify set (right):

Sets the column that will no longer accept input in any mode, also screen edit. Present to 78 chars. per line, can be modified by the Install pgm. Value 1-255.

.O=Output to printer:

Outputs specified range of line to printer. Normally line numbers are not printer, but if ".N" is also entered line number will be supplied too.

.T=List lines:

List line on screen. If no starting point, list will start from beginning. A specified range is possible. .Ixx,yy= xx is starting line, yy is ending line. "*N" is valid and ".^=*".

.Modify set (right):

Sets the column that will no longer accept input in any mode, also screen edit. Present to 78 chars. per line, can be modified by the Install pgm. Value 1-255.

.O=Output to printer:

Outputs specified range of line to printer. Normally line numbers are not printer, but if ".N" is also entered line number will be supplied too.

.T=List lines:

List line on screen. If no starting point, list will start from beginning. A specified range is possible. .Ixx,yy= xx is starting line, yy is ending line. "*N" is valid and ".^=*".

.Modify set (right):

Sets the column that will no longer accept input in any mode, also screen edit. Present to 78 chars. per line, can be modified by the Install pgm. Value 1-255.

.Modify set (right):

Sets the column that will no longer accept input in any mode, also screen edit. Present to 78 chars. per line, can be modified by the Install pgm. Value 1-255.
it to halt an operation currently in progress, do something else for awhile
and then resume what was going on originally. Under normal conditions the
processor does only one thing at a time. Each step takes thousands of
processor "cycles" to complete. When that project is done, it will do the
next in line. Any pgm. may take millions of these next operations to do some-
thing simple like printing a menu of commands on the screen. Since a new
operation can't begin until the processors has finished the previous one.
it is clear to see that multiple operations cannot normally be carried out.

---Enter INTERRUPTS---

With Interrupts, a whole new world of possibilities emerges.
When an interrupt occurs, the processor is internally told to "put on hold"
what it is doing and to handle the interrupt request. When the interrupt
request has been fulfilled, the processor will pick up exactly where it left
off.

Interrupts will allow you to operate various menu commands, status displays
or status changes such as COPY ON or OFF, PRINTER ON or OFF all without
losing any incoming data. There are limitations, YOU MANY NOT PERFORM DISK
ACCESSURES SUCH AS LOAD, SAVE ON CATALOG and expect incoming data to be
intact. DOS does not allow interrupts to remain enabled while accessing the
disk, so a small portion of incoming data may be lost at these times.
Also, modems do not support interrupts as shipped, & may need minor
modifications before they become operative in that mode, there are a
handful of modems that flat out do not support interrupts at all. It
possible employ interrupts. At 300 baud you can live without them, but
1200 baud & up THEY ARE MANDATORY if using 40 col or any 80 col boards.
These hardware devices simply can't maintain the throughput required at all
time, and tie up the processors while writing to their screens. Since
interrupts put precedence on incoming data, none will be lost with the
clearest of displays. As a rule, external terminal will not require them,
but unless you have a specific reason not to use them, use them.

INTERRUPTS Apple CAT:
Novation Apple CAT comes ready to operate in an interrupt driven mode and
is completely controllable from software. No hardware changes are needed.
AE will automatically enter the interrupt mode with this modem.
MicroModem:
Hayes is capable of operating in interrupt mode if a certain jumper is
installed on the card itself. Soldering is necessary, if not experienced let
a technician do it.

MicroConnection: hardware modification is necessary--soldering again.

LYNX:
No provision for operation of the ESI LYNX in an interrupt driven
environment.

CPS CARD:
Not normally available but with simple hardware change they are enabled.
--Soldering again--

SSM AIO board: Hardware modification is necessary--soldering required.

CCS Card:
Already supported with no hardware changes.

Comm Card: Hardware modification is necessary--soldering required.

SCC Card:
Fully ready and is automatically compensated for at run-time.
SW1 switch be enabled see ESC MANUAL for further details.

EMULATION INFO:
There are two parts to terminal emulation. Input & Output.

Input is always what the data will be coming in, i.e. the codes for the
terminal your host THINGS it is talking to. The output is what those
incoming codes are actually converted to for whatever terminal you are
actually using. 80 col. boards used the DATAMEDIA terminal, the codes are
always entered in ASCII HEX.

Terminal emulation Table --software/input-Vt52
bytes 1-12 1a 20 2a 1b 3a 0c 4a ca 5a cb 6a 00 7a 00 8a c8 9a d9
10a c1 11a c3 12a 00

Hardware/Output-Datamedia--
bytes 1-12 1b a0 2b 00 3b 0c 4b 08 5b 1d 6b 00 7b 00 8b 19 9b 1e
10b 1f 11b 1c 12b 00

BYTE 1 - Cursor offset - this has to do with actual ASCII values used to
display a cursor during a gotoxy sequence. Such a sequence has 4 char.,
but some may require 5. Start with lead-in char., followed by address
cursor char. The next 2 bytes after the x,y coordinates, usually transmit
in yx order. Most terminal used ASCII 20h are the "base" or 0th row or
column at upper left corner. That is the space char. (space bar), as you
add positions, you increment up the ASCII chart for the different locations
on the screen. All terminals do not use the same offset. When converting
from one type of terminal to another this offset must be known for both
terminals. We make two uses of the same byte, high bit clear, we assume
a normal sequence order of YX, high bit set-the terminal requires the
sequence in XY order. Example: Bytes 1a & 2a both indicate a cursor offset
of 20hex, but the 2nd one, A0hex, (a 20h with the high bit set) tell us the
coordinates will need to be sent in reverse order.

BYTE 2 - Lead-in char- many terminals use a lead-in char. to perform certain
functions on the screen. This char. will precede one of several function
chars. Doing this can build functions in the screen without taking up more
ASCII chars. Typical lead-in char. ESC (3bh), when a function requires
this char., its high bit will be set in the table.

BYTE 3- Clear screen- the clear screen in this example is 0Ch('L') for both
input & output. Whenever these locations are the same, the exact results
can be produced by setting both to 00, no modification, just passing the "L"
right on through. Modified.

BYTE 4 & BYTE 5 - Clear to end of page and line - not available on all
terminals, set to zero if not implemented.

BYTE 6 & BYTE 7 - Hi-lite ON/OFF - this char. if encountered, will cause
the terminal to go into or out of a highlighted or inverse text mode.

BYTE 8 - Home cursor - causes the terminal cursor to "home".
Most terminals it will be the upper left-corner, some, lower left-corner.

BYTE 9 - Load cursor- part of the gotoxy sequence - tells the terminal to
look at the next two chars. as the actual xy coordinates for positioning.
May be prefixed with previous described chars.

BYTE 10- Cursor up causes the cursor to non-destructively move up one line.
BYTE 11- Cursor forward - non-destructive move forward 1 char.
BYTE 12- Extra - this is an extra value which may be used for code
conversions, to support functions not already being converted.

Remember-- if any two terminals or setups requires the same char. sequence
to execute a particular function (except the first two bytes of each half
of a table), the entry position in both sections of the table may both be
zeros,so the original sequence will pass through unaltered.
UTILITY PROGRAMS: The following utilities on on the AE disk.

MPF.A - converts Applesoft Basic programs to ASCII text.

MPF.I - " Integer " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " 

MFP.A - converts Applesoft Basic programs to ASCII text.

MFP.I - " Integer " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " " 

Once conversion has taken place, this text may be transferred to any practically any dial-up computer system. Typical use is to forward a program file to anyone in another part of the country via the Source or other public access time sharing system. The file would be temporarily stored on the mainframe until downloaded, once transferred back to an APPLE, it may be EXEC'd into memory and appropriately saved to disk.

MPF.A - Applesoft->text:
To create a text file from an Applesoft pgm. first type "FP" and "LOAD" the pgm. from disk. Then, type "EXEC MPF.A.". MPF.A is an EXEC file that manipulates internal Applesoft pointers and the LOGD FFM.A, which is the pgm. that actually does the file writing.

PFM.A is not runnable—it may only be used by MPF.A.

Next, you will be prompted for the filename to create & which slot/drive you want the file written to. When the file is written to disk, you will be asked if you want to CRUNCH it. Crunching removes all spaces and punctuation from a file which has been created from a pgm. This should be on occasion when crunching is not used unless it is on files that were not created from a Basic pgm. When CRUNCH begins, it asks what the maximum line length should be. Defaults 160 chars. uploading a pgm to another APPLE you could use 255. Example: uploading to the Source you use 140, cause that is the maximum legal line length. CRUNCH doesn't cut off lines, it just keeps track of which lines are too long & how much. If you need to modify the lines, load them into the editor. The crunch version of the file will be the same name as the original with a _C appended to the end. Crunched files can be 35 percent smaller that a non-crunchen one.

MPF.A Integer->text:
MPF.I and PFM.A do the same as MPF.A & PFM.A doe for Applesoft, except the crunch is not built into it. A crunched Integer file will not show quite the savings an Applesoft file will.

SPACECRUNCH:
SPACECRUNCH is the pgm which is used in MPF.A. It can just as easily be used as a stand alone to crunch previously uncrunched files, or to crunch Integer files as well.

BFDO/BFD92 Binary->text
These two create text files from binary blocks of data. The only difference between the two versions is their location in memory. BFD8 = $800(2048 DEC.) BFD92 = $9000 (37376 DEC.) Select appropriate the one to use depending on where the binary block resides. BLOAD the block of data into memory, then BRUN BFD from Applesoft basic. It will NOT work from Integer. You'll be asked starting & ending addresses of the block, give address in HEX & the new filename.

CREATING A PROGRAM FILE - SCENARIO
Example: Applesoft pgm called "KLUDGE" that has a binary called "KLUDGE.OBJ". You want to make a file from the two and send it. Load pgm and a look at the really long lines, break them up into two smaller ones, (being careful of internal logical operation). Then "EXEC MPF.A" and follow the prompting and crunch it. Now "BFDO/BFD92" and find out its starting & ending addresses. One way is to "CALL-151", TYPE AA60.AA73, the last 2 bytes of the displayed block will be the starting address, and the first 2 will be the length. Now "BRUN BFDO", again follow prompting, after all of this is done type FF to reinitialize Applesoft pointers. Now "BRUN AE" and use the Y to get into the editor. In editor type .G to get converted file into the buffer. Keep in mind that this file will eventually be EXEC'd into another APPLE. INSERT at the beginning of the file (.I0):
cause XON/XOFF protocol to be in effect while printing is in progress.
If not sure how to use leave OFF.

L = Load Macro File - now the first time you access any old format macro file, whether it be in Macro Configuration or main command prompt (^; or ^;^) with the "Mx" command, an automatic update will occur and the modified macro save back to the disk under the same name.

S= Set terminal parms
B= Change single parms
M= cursor down (before "extra") - most terminal this will be "J" ($0A)
E= extra - reserved for additional conversions
O= extra -
F= Printer ON - this option is only operational if on the INPUT side of the emulation table.
G= Printer OFF-
" = Internal command char:
G= Get another macro file and execute a specified element "G<x>filename>
This is an instruction to get macro file (do not use .MAC extension) & when loaded, execute element #x.
S= Set current macro parms, - synonymous with "G".
<yzzz> Macro string handshaking:
Handshake whole word or phrases syntax is <string>,
*x**x* are required to delimit the search string.
Example: **<Ct>70315,13054*password<ok>r maug

agal2069                        AGATE MANUAL                       Tony Marques
LEGALITIES
AGATE is copyright 1991 by Tony Marques, and is released as ShareWare to be freely transferred and copied for the purpose of distribution. However, as ShareWare there is an expectation that users register the software with the author, and offer whatever they may feel the software is worth. Registered users shall be entitled to any future updates. AGATE bears no warrentees or guarantees and it shall not be libal for any damage or loss incurred during it's use or possession.

Tony Marques
2602 Molitor Street, Terrace, B.C., V8G-3A2, Canada

AGATE was archived as AGATE069.SHK and contains the following members:

AGATE.SYSTEM - system file - essential component
AGATE.SCREEN - title screen - not necessary for execution
AGATE.UKDATA - user data - essential component
AGATE.PIECES - AGATE pieces - essential component
AGATE.FONT38 - graphic fonts - not necessary for text operation
AGATE.MANUAL - 'documentation' - not necessary for execution

REQUIREMENTS
AGATE requires an enhanced Apple II computer with 128k. AGATE will disconnect the 64k ProDOS /RAM disk located in Slot 3, Drive 2 on 128k machines. AGATE does not support disk swapping so source and destination paths have to be on-line when performing select disk functions. Consequently, multiple drives are recommended. It is also recommended that AGATE be placed on a /RAM or /HARD disk when used.

WARNING: To ensure that AGATE is compatible with your /RAM disks, it is recommended that the first time you use AGATE check the validity of your /RAM disk before and after use. It has no problems with AE /RAM or GS /RAM disks and most others.

ON-LINE
AGATE has not been provided with dialing facilities and acts as a dumb terminal. Consequently, dialing and other modem commands must be issued by users using the basic 'AT' commands. Refer to your manual to learn about the 'AT' command set and how to use them.

Basic commands include:

ATE1 - "AT'tention, 'E'cho on ('1') - turn on echo while in command mode.
ATD911 - "AT', 'D'ial '911'
TRone or T'rune may prefix the number to determine dialing mode.
+++ - three ** with brief pauses - enter command mode after connected
ATH - 'AT', 'H'ang up
AEO - 'AT', 'O'n-line again - after +++

EMULATION

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 55 of 1262
AGATE's ANSI (DEC VT100) emulation has been further refined and now also supports ANSI Music (which may someday be tuned for all computers).

The option menu allows you to configure some stuff. The left and right arrow keys shift menus while up and down select settings. Pressing OA-S saves whatever you have chosen to disk.

Of the several options two need to be explained.

SAY -o This option allows you to tell AGATE the system speed of your computer. AGATE is incapable of setting or reading the system speed and so it relies on you to SAY what the system speed is. The value of the system speed controls the cursor blinking rate, the length of the tones, and most crucially timing during file transfers. This is a MOST important setting.

Tony Marques                2602 Molitor Street, Terrace, B.C., V8G-3A2, Canada

FILE UTILITIES

Generally, AGATE ignores all file errors. AGATE is also incapable of handling volumes which are off-line so it is necessary to keep the SOURCE and DESTIN paths in the drives at the same time -- no disk swapping is supported.

PIZZA AGATE supports unZIPping and is capable of unSTOREing, unSHRINKing, EXPLODING members of .ZIP archives. AGATE is currently unable to unREDUCE members, but because of it's GREAT rarity no one should miss it's presence. AGATE recognizes ZIP files by their .ZIP extensions. PKZIP and ZIP are registered trademarks of PKWARE.

.ALZ Before writing PIZZA, I gained some practical experience in the field of data compression by writing my own shrinker. The 12bit LZW algorithm is capable of producing compressed files smaller than either LZW/1 from SHKit or LZW/2 from GSHKit, and this is taking into account the overhead produced by NuFX archives. It is not as effective as SHRINKing as implemented within PKZIP, but not because I am not capable.

Compressed files are named 'FILE.ALZ', but they may be renamed and any file may be decompressed which has the '.ALZ' suffix. Decompressed files create or replace 'FILE.UNC'.

VIEW The view option may be slowed with the Open Apple or stopped with the Solid Apple. The space bar pauses while ESC abort the viewing.

TRANSFER PROTOCOLS

Currently, only YMODEM and ZMODEM downloading has been implemented.

Of the several options two need to be explained.

Those of you who feel that the user interface is lacking, I must agree.
AIRBALL

Player controls

Typed in by the ROAD WARRIOR (6/27/89)

System requirements:

Airball will run on an APPLE IIgs with at least 768k and a color monitor. A joystick is recommended, but not necessary. To load the game, simply place the master disk in your default disk drive, then double click on the "AIRBALL.NODRAG" icon (the fastest mode of play). Or "AIRBALL.DRAGONS (has the dragon on both sides of the screen but sacrifices some speed) the game will then load.

Introduction

"Now you're really in trouble" said the Evil Wizard. "I've warned you about trespassing in my mansion. Now, since you did not take heed of my warnings, I'm turning you into a ball of air and sending you deep into my mansion of over 250 rooms, to search for my spellbook that may give you clues on how to transform yourself into a human again. It will not be a simple task, for you, as the ball of air, have a slow leak, and you'll need to jump on the air pump in some rooms to stay inflated. Take heed, for if you pump up too much you will burst! If you are lucky enough to find the spellbook in these rooms, you'll next have to pick up the objects I've left such as: crosses, tins of beans, a Buddha, a dragon statue, a pumpkin, a flask and even crates that you'll need to get over treacherous obstacles! This is your one chance of survival", he cackles.

"Sounds easy," you laughingly boast to the evil wizard. "Oh! Does it now!" He sneers. "Well I'm also putting spikes in these rooms that will take your breath away, as well as killer pads on the floor. You have no chance for success...Hee! Hee!"

Playing instructions

At the start of the game you will be put on a pump. As long as you remain on the pump your internal pressure will increase. If your pressure becomes too high you will burst. At the bottom of the screen your pressure is represented by a yellow bar, pay close attention to this bar because this is how much air you have left until you find another pump.

Once you have acquired sufficient pressure you must search for the spellbook. Watch out for hidden dangers, as your skin is easily punctured. There are rooms that require help to gain access. (Hint: you need to find the flashlight to enter the dark room.) If you are lucky enough to find the spellbook, return it to the starting room and follow the wizard's advice.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 57 of 1262
---AirBall Cheat by >>Joe User-----------------------------------------------
---Call the InfoManiac: (813)-584-4447-----------------------------------------

Note from the Author
=====================
Ok, the reason I didn't make one of my regular cheats is that AirBall required modifications which couldn't practically be applied on a relocatable (S16) file. The AirBall cheat is therefore a CDA. This in itself poses a problem, as the program must be searched for in memory (after all, it is relocatable). The advantages of having extra code space for the cheat in memory, however, outweigh the AirBall-relocation-searcher problems. Because of the CDA, I was able to actually install an extra key-command into AirBall, as documented in the use of the cheat below.

How to Use the Cheat
=====================
First of all, put the CDA into either your /AIRBALL/SYSTEM/DESK.ACCS/ subdirectory, or in the corresponding subdirectory on your hard drive, if you like to launch AirBall from the Finder or whatever. Reboot your system to get GS/OS to load the CDA.

Next, launch either AirBall.Dragons or AirBall.NoDrag. The cheat does not completely work with the dragons version; this is because I like the no-dragons version better. Therefore, you're better off running the no-dragons version.

Get to the point where the AirBall is being inflated on those air-blower gizmos, and press Control-Open Apple-ESC. Select "AirBall Cheat by >>Joe User".

If the cheat installs fine, it will make a low-pitch to high-pitch chirp and then you put you on Quit in the Control Panel. If you haven't loaded AirBall and you try to run the cheat (or AirBall has been damaged), the cheat will wait some time then give you a high-pitch to low-pitch chirp. (The reverse of the other one!)

The first thing you'll notice upon returning to AirBall is that you have infinite men. (This works on either the dragons or the no-dragons version.)

When you press Control-C, the cheat will give you a low-high chirp, telling you it's on. Your AirBall will no longer leak air, nor will it explode when you stay too long on the blower gizmo, and it is now INVUNERABLE to those various pointy objects lying around the castle. Press Control-C to turn the cheat off again, giving you the high-low chirp. (Control-C crashes in the dragons version.)

Hints
=====
Having an invunerability cheat can get you into T-R-O-U-B-L-E. The original author of the game (Jason Harper) didn't intend for that little AirBall to be in some of the places you can get it to with the cheat. Therefore, if you find yourself hopelessly stuck somewhere (happens all the time), press Control-C to turn off the cheat. You'll die, but you DO have infinite men, and you'll be returned to the last air-blower gizmo you touched. This is a good reason to land on every air-blower gizmo you see, even though with the cheat you don't need to use them.

Have fun!

Installing Alert Sound is very simple...simply copy two files! The Sounds file, and the Standard Beep entry will be selected. Please note, for post-System 5.0 systems, or systems that have been upgraded to System Disk 5.0.4, the volume control setting is saved in battery RAM. If you are not currently using the standard beep, the pitch control will not affect the beep.

The second file to copy will depend on how you want to run Alert Sound. If you wish to use the default sounds included with the Cdev, then copy the file "Sounds" into your *:System folder. If you don't want to install the default sounds, or don't have enough space free, then copy the file called "Sounds.Empty" into your *:System folder and rename the copy of the file to "Sounds".

Please be aware that these files contain resource forks, and must therefore be copied with the Finder or another program which is "Post-System 5.0" (such as ProSel/16 by Glen Bredon or Wings by Vitesse). Once you have successfully installed Alert Sound, you can delete the Sound Cdev from your *:System:Cdevs folder. Alert Sound duplicates the functions of the Sound Cdev, making it unnecessary.

Using the Cdev

Functionally, the Alert Sound Cdev is very similar to the Macintosh Sound Cdev. The first thing you must do is open the Control Panel NDA (isn't this so easy?)! If Alert Sound is not already selected, then click on its icon to select it. After a short pause and some disk activity, a list of available sounds will appear. Below the list will be four buttons: "Beep", "Add", "Remove", and "Extras". And below the four buttons will be two scroll bars labeled "Volume" and "Pitch".

To change your beep sound, you simply highlight it in the list of available sounds presented to you. To return to the normal GS beep, select the sound labeled "Standard Beep", which is always at the top of the list. You can hear the currently selected beep sound by clicking the "Beep" button.

I have set up Alert Sound with an initial set of sounds, all taken from the Macintosh standard Mac beep tone, Clink-Klank, Boing, Monkey, and Mac II Chime (the startup chime for the Mac II). To find out how to add your own sounds, keep reading!

The volume scroll bar is used to control the sound volume. Any changes to the volume will be saved in your battery RAM and reflected in the text control panel.

The pitch scroll bar is only useful if you are using the standard beep. It is used to change the pitch of the beep, and like the volume control, the setting is saved in battery RAM. If you are not currently using the standard beep, then the pitch control will not affect the beep.

The "Extras" button is for future use, and is currently dimmed.

The "Add" button is used to add more sounds to the list of those available. After clicking this button, you are presented with a Standard File dialog from which you can select the sound file you wish to add to your list (this sound file must be a standard raw data file; Alert Sound cannot currently handle any special resource forks such as ASIF). After selecting the file to add, you are presented with a window in which you can type in a 1-32 character title for the sound. When you are finished typing the name, click the Add button in this new window, and Alert Sound will go to work and add the file to your list. If for some reason an error occurs, Alert Sound does its best to clean up after itself, including removing any resources which were created. However, no error message is displayed since it will be obvious if an error occurred as the new sound will not be in the list.

To remove a sound from the resource file, simply select the sound in the list of sounds, and click on the "Remove" button. The sound will be removed from the Sounds file, and the Standard Beep entry will be selected. Please note that you cannot remove the Standard Beep sound.

Due to the nature of the Resource Manager, deleting a sound does not make the
From time to time I have noticed that Orca/Pascal programs can do strange things. The Add and Remove function of Alert Sound is written with Orca/Pascal, so if they do anything strange, please let me know so I can attempt to remedy the problem. Often times I can simply "program around" bugs in Orca/Pascal.

Make sure that any sounds you add are terminated by at least four consecutive zero bytes. If you don't, you may get a small burst of static or noise (very short, but annoying) at the end of your beep sound. Many sound programs will do this for you when you save, so check the documentation of your favorite sound program.

I have noticed that some sounds would not play completely when added to the sound list. It turned out that these sounds had spurious zero bytes in them which caused them to end prematurely. Once I filtered them out, the sounds played perfectly. At this time I have absolutely no idea why Alert Sound seems to be more sensitive to these zero bytes then some other programs.

If the program which you are currently running makes use of the Sound Tools, then Alert Sound will simply beep normally (until you exit that program). Right now there is no way to avoid this, since Apple has stated that any program using the sound tools has total control over the sound hardware.

Alert Sound does not function with the program launcher Wings by Vitesse. It appears that Wings installs its own beep routines which disconnect Alert Sound. At this time there is no way around this.

The Future

At this time, I have further plans for this CDev, including ideas such as direct digitization and the ability to handle other sounds formats (ASIF, Sound Shop, etc). However, much of this depends on how much response I get regarding the cdev.

If you have any more ideas for Alert Sound, or even ideas for other nifty programs, drop me a line at one of the places listed at the end of the docs. I'm always looking for something to program!

Revision History

vl.0 : First release.
vl.1 : Added "volume" and "pitch" controls, making the old Sound Cdev unnecessary.

Added "Remove" button to remove sounds from the resource file. Also added an "Extras" button for future use.

Wrote a built-in check so that Alert Sound will realize when it's been disconnected (ie, by Wings). When such a situation occurs, Alert Sound simply displays an error message informing the user that Alert Sound has been disconnected and cannot function.

Fixed a strange bug that caused Alert Sound to blow up when the system beeped while inside BASIC System.

About the Author

Steven Yuhasz
President
Frontier Technologies

Technical Stuff

Alert Sound hooks itself into the bell vector using the Miscellaneous toolbox call _SetVector. The beep routine installed has several "dummy" instructions which are used to store important parameters across uses of the Cdev (such as Alert Sound's permanent user ID number and the handles of the sound parameter block and the wave form). Since the Cdev code is disposed of when Alert Sound is closed, these parameters cannot be stored in the cdev code itself. The ID check added in version 1.1 is necessary to prevent Alert Sound from retrieving erroneous parameters when another program patches out the bell vector.

Sounds are stored in the Sounds file in the System folder. This is essentially huge resource fork containing four types of resources: an rListRef resource ($801C), rPString resources ($8006), rSoundSample resources ($8024), and an rCDevSetup (0004).

The rPStrings are simply the titles of the sounds. No big deal.

The rSoundSamples are exactly as defined in Technical Note #76 for the GS, except that I ignore the Rel Pitch and Stereo Channel fields. Again, no big deal.

The rListRef resource consists of 10-byte members with the following format:
+0 : reference to title string. Should be ID of pstring resource
+4 : item flags. Always leave the low two bits set to \%10 to signal refIsResource
+5 : unused, but makes the record an even # of bytes
+6 : reference to sound resource. Should be ID of rSoundSample resource

The rCDevSetup resource is 64 bytes long (only 8 of which are currently defined). It basically looks like this:
+0: Total number of available sounds
+4: rSoundSample resource ID of currently selected beep sound
+8: Unused and reserved, 56 bytes.

Miscellaneous

I would like to thank Steven Yuhasz for both beta testing of the Cdev and for supplying me with the Macintosh sounds. I'd also like to thank Tom Stechow for his help in beta testing, as well as his comments and suggestions.

I'm very pleased to be able to say that Frontier Technologies is again releasing another fine product by Joshua M. Thompson. I am proud to have Joshua as a fine partner in a growing company. Our first product, Nupak (an uncompression utility), some parts of the Metal BBS software, and Future Vision (a networking BBS which runs under Metal).

A Personal Message from Steven Yuhasz

-----------------
If you're a CDev author, please contact me! I've got a ton of room in the Sounds file where you can put just about anything, like config information, desktop patterns (hint, hint!), or whatever. I really despise a bunch of little data files all over my hard drive (aren't the Finder.Data files enough?)!

Credits, etc.

Most of Alert Sound is written in assembly, except the add and remove, which are written in Orca/Pascal.

Shareware fees (make checks payable to JOSHUA THOMPSON), as well as comments, questions, or ideas, can be sent to:

Snail Mail : Frontier Technologies
2128 Scotten
Detroit, MI 48209-1667

America Online : Frontier T

I can also be reached as The Magnetic Monopole (user #2) on :

The Electronic Gateway : (313)422-8073 300/1200/2400 bps

Home of the Future Vision software

Look for more great products from Frontier Technologies in the future!

---

The Algebra Tutor program teaches students how to manipulate algebraic equations from one form to another, such as converting an equation in the form Y=Function of X into X=Function of Y. The basic mathematical principle of such transformation is that if you have two quantities that are equal (the two sides of the equation), you can do anything to both sides and they will still be equal. The trick is finding exactly what operations to perform to convert the equation from its present form to the desired form.

The Algebra Tutor teaches this skill by performing the operations, demonstrating and explaining each step. The program can use an equation provided by the student or can generate an equation of its own to solve. It is primarily intended for high school students who study algebra.

Operating Instructions

The first four choices solve an equation provided by the user. The only difference is the amount of explanation the computer gives as it manipulates the equation. Number 1 gives the solution without any explanation. This would be for the student who has worked out the problem and merely wants to verify that his or her answer is correct. Number 2 manipulates the equation and shows the result of each step, but does not explain what the step was. Number 3 shows the result of each step and provides an explanation of what operation was performed. Number 4 is the same as number 3, except that the computer pauses until the user presses the space bar after each operation to allow the student as much time as necessary to study each step. Choices 1 thru 3 will allow the user to send the output to the printer.

If the user selects one of the first four Main Menu options, the computer will first ask for the equation to be solved. Type the equation and press [RETURN]. Typical equations would be Y=A*SIN(X^3) or A^(X+B)=SQR(Y-C). After you enter the equation, the computer will ask what variable to solve for. Enter the variable (such as X or Y) and press [RETURN]. The computer will solve the equation for the indicated variable.

Besides the variable and the equal sign, the equation may contain parentheses and the following operations.

* Plus
* Minus
* Multiply
/ Divide
- Unitary negation
^ To the power
SIN() Sine
COS() Cosine
TAN() Tangent
ARCSIN() Arcsine
ARCCOS() Arcosine
ARCTAN() Arctangent
SQR() Square root
LOG() Natural logarithm
LOG10() Logarithm base 10
EXP() E (natural log base) to the power

There are limitations to the equations you can enter. The variable you are solving for can appear only once in the equation. Although the other variables in the equation can be

Look for more great products from Frontier Technologies in the future!
An equation can have several characters, the variable to solve for must be a single letter. Two adjacent operators must be separated by parentheses for clarity. For example, \( X^{-2} \) must be written \( X^{(-2)} \) and \( A^*X \) must be written as \( A^{(-X)} \). Mathematical operators must be clearly stated, not implied. For example, \( 2X \) must be written as \( 2*X \). All variables are converted to upper case by the program for consistency.

If you choose number 5 in the Main Menu, the program will generate an equation for you to solve. First it will ask you what difficulty level you want. Press a number from 1 to 8. It's not necessary to press [RETURN]. The higher the number you choose, the more complicated the equation will be.

The computer will show you the equation in the form \( Y = \text{function of } X \) and will tell you to solve for \( X \). The computer then asks you what level of explanation you want. The four levels of explanation are the same as the first four choices in the Main Menu. After you press the number of the level of explanation you want, the computer will solve the equation.

After the computer has solved the equation, whether it is one you gave it or computer generated, the computer will display the message "Finished". Press [ESC] for the Main Menu.

To Exit ALGEBRA TUTOR and return to UpTime choose option 6 from the main menu.

NOTE: When solving a long equation that requires many steps it is possible for the screen to scroll up.

Press [']-[7] to run Algebra Tutor.
Inverse characters.

And we should mention...

If you are using Alpha Plot and want to execute a DOS command (for example, unlock a picture file), you must exit Alpha Plot (CTRL-@ or <RESET>), type the command, and then "run Alpha Plot".

Scrunch will save the most space on images containing much black or white.

The X & O of the XO cursor will become dots at the edge of the screen.

R will now rotate the drawing cursor from drawing mode.

Sideways pictures may be easily created with Alpha Plot by turning your monitor on its side (left or right optional).

Type & Draw switches
---------------

CTRL-T will directly enter the typing mode from drawing mode.

CTRL-D will directly enter the drawing mode from typing mode.

Exiting Alpha Plot
---------------

CTRL-@ has been added as a quit-key. <RESET> and CTRL-C also work, but could leave a cursor imprint on your picture. Always save before quitting Alpha Plot.

Drawing with paddles
---------------

A PDL-0 button-press causes zero offset (same as <RETURN> in key mode).

A PDL-1 button-press draws a line & cancels offset (same as "-" in key mode).

Apple color bugs
---------------

Color lines (not solids) on color backgrounds often produce strange effects due to Apple's Color-Graphics Hardware. Results depend on which colors you are using...

Green-orange or violet-blue combinations will maintain true colors, but lines will be thick and stair-stepped. Other combinations will produce a mixture of colors.

For most Apple graphic applications, black is the best background "color".

Relocating color sections will produce inaccurate colors if you move other than 14 plots left or right (arrow keys). Moving seven plots left or right will produce complementary colors.

Typing notes
------------

CTRL-E prints a left square bracket ([). CTRL-F prints a backslash (\). CTRL-I prints an underscore (_).

Lower case versions of the three special characters above, as well as @, ] and ^, will produce some nice ASCII characters you may not be familiar with. Also...

CTRL-B prints Alpha Plot's caps cursor. CTRL-P prints the lower-case cursor.

The last normal character typed on a non-black background may appear incomplete. Type a space or CTRL-J to fix it.

To include descenders, Alpha Plot's inverse bleeds at the top instead of the bottom. If you want, add a white line to the top of your
AmDOS 3.5
Copyright 1985 Gary B. Little

AmDOS 3.5 (Amateur Disk Operating System version 3.5) is an Apple II program for initializing 3.5-inch UniDisk disks in such a way that they will boot the DOS 3.3 operating system and work properly with it. To use it, first LOAD your Applesoft greeting program into memory and then BRUN the program called AmDOS INIT. After you press the space bar to clear the "user-supported program" notice, enter the slot and drive number of the disk to be formatted and then the name of the greeting program; once you do this, insert the disk to be formatted and press "F" to start the process. Formatting takes approximately one minute.

AmDOS logically divides a formatted 3.5-inch disk into two discrete 400K volumes; there are 50 tracks per volume and 32 sectors per track. Use the ",D1" and ",D3" drive parameters (as well as a slot parameter, if necessary) with your DOS 3.3 commands to select the first and second volumes of drive 1. Use ",D2" and ",D4" to select the first and second volumes of drive 2. For example, to catalog the second volume on drive 1, use the command "CATALOG,D3". As with standard DOS 3.3, if you don't specify a slot or drive parameter, the most recently specified default value is implicitly used.

Compatibility
With AmDOS installed, the INIT command is disabled. If you need to initialize a 5.25-inch floppy disk, you will first have to boot a disk that contains a standard copy of DOS 3.3. To reinstall AmDOS after you've loaded standard DOS 3.3, boot from a previously formatted 3.5-inch disk.

AmDOS makes use of two data areas in the high end of memory: $8D12-$8D14 and $BEAF-$BF07. These areas must not be used by any DOS 3.3 "patches" you might install. AmDOS also uses a 512-byte I/O buffer at $9AF9-$9CF8; the standard DOS 3.3 file buffers are installed just below this area. AmDOS sets MAXFILES = 2 (two file buffers) when it boots up; this means that HIMEM (the top of memory pointer) initially contains $9653. The DOS 3.3 default of MAXFILES = 3 is not used because that would result in a HIMEM of $9400, instead of the usual $9600, and any program that used the area from $9400 and $95FF for data storage would not work properly because the file buffer area would be overwritten. Such programs erroneously assume that HIMEM is always $9600.

If you want to run a program that expects three file buffers to be active (there are not many programs like this), enter the DOS 3.3 "MAXFILES 3" command before running it.

You can use a slightly-modified version of the FID utility program on the DOS 3.3 system master disk to transfer files to and from AmDOS-formatted 3.5-inch disks. Here are the steps to follow to make the modifications to a copy of FID:

<table>
<thead>
<tr>
<th>UNLOCK FID</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD FID</td>
</tr>
</tbody>
</table>

The modified FID will still work properly with standard DOS 3.3 and with 5.25-inch floppy disks.

Memory Map
Here is a memory map showing the arrangement of buffers below the main AmDOS code and data area beginning at \$9D00:

```
<table>
<thead>
<tr>
<th>AmDOS (DOS 3.3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>code and data area</td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>512-byte buffer</td>
</tr>
<tr>
<td>-----------------</td>
</tr>

<tr>
<td>File buffer #3</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
```

AmDOS 3.5 is a user-supported program. Try it for 30 days and if you find it useful, send $15 (U.S.A. funds) or $20 (Canadian funds) to Gary B. Little, #210 - 131 Water Street, Vancouver, British Columbia, Canada, V6B 4M3 (Telephone: (604) 681-3371). Otherwise, pass your copies along to others or erase them.

ANNUAL ART OF WAR AT SEA DOCS

brought to you by the Gauntlet of C0Dfish
a Circle of Dickz file
ware cracked by Coast to Coast

C0Dfish is in no way affiliated with Coast to Coast, or with it’s releases.

Anyone who d/l’ed this ware should know how to boot it up, so I’ll skip that.

NOTE: This is the main section of the documentation. All the specific definitions for terms found throughout are contained in the glossary, a separate file being sent out with the doc file #1 (this).

: MAP FEATURES :

Repair Port: looks like a town. Provides supplies to ships.

SHIPS:
- Squadrions: a group of between 1 and 3 ships
- Fleet: all of the squadrons of the same color form a fleet.
- Flagship: This is a ship-of-the-line with an admiral aboard. It is the most powerful ship on the high seas.

HINTS:
- To receive supplies or repairs from a port or a crown, you must anchor where there is a flat shore across the entire length of the port. Check a squadron’s "Info" to see if it is "in port".
- The cannons can only fire out of the sides of the ship and the crew can only be on one side of the ship at a time.
command line. The squadron will follow the path you want the squadron to follow, and press M again to mark the frame will center on the selected ship and begin following it again.

**THE SHIP SYMBOL**
- The white cross-shaped object near the center of the screen is the marker which lets you scout out the enemy squadrons and command your own.
- The ship and anchor symbols represent squadrons of ships. You control the white squadrons, and the enemy controls the black ones. A squadron symbol with a flag on it means there is a flagship in that squadron.
- To scroll the map, use the + key to scroll up (+ key to scroll back down). You can jump quickly to the top or bottom of the map by pressing the Shift key and the + or - key at the same time. You can use Ctrl in place of +, and Tab in place of -. This is especially helpful if you are left handed. If you are using the joystick, hold down button #1 and move the joystick to scroll the map.

**THE COMMAND LINE**
- You will receive messages during the campaign indicating enemy ship sightings, imminent encounters and other events. These messages will appear at the bottom of the screen, just above the command line.

**YOUR MISSION**
- Win by capturing or sinking all of the enemy's flags while protecting your own. You can also win by capturing a black crown. In the Ancient Art of War at Sea, the most skillful player does what it takes to win the campaign with a minimum of fighting.

**COMMAND OPTIONS**
- At the bottom of the current screen are several command options. Throughout the AAmWaS, command options will appear, usually at the bottom of the screen. To select an option, press the letter key that corresponds to the first letter of the command. In this example, the commands are as follows:
  - **(T)eame** -- You can alter the speed of the campaign at any point. When Time appears on the command line by pressing T. Four different settings are possible. (You may want to use a slower time when you're making your plans, then speed up when you've got everything set.)
  - **(F)leet** -- Press F and the size of both fleets will be displayed. You will see the types and total number of ships on both sides. The game will freeze while you are doing this. Press End (or any other key) when you are done.
  - **(C)lear** -- Use Clear to remove old messages from the bottom of the screen. Clear will not appear when there are no messages displayed.
  - **(P)ause** -- Use Pause to freeze the game. To get things going again, press any key. Clear will sometimes take place of Pause on the command line, but pause will still work.
  - **(S)urrender** -- You can surrender at any time during the game when Surrender appears on the command line by pressing S.
  - Saving the Game -- Press Alt S if you want to save the game so you can resume playing where you left off at a later time. The computer will prompt you to insert a data disk -- just follow the instructions on the screen; the program takes care of the rest.

**THE COMMAND OPTIONS**
- There are command options available when you have the marker positioned over one of your own squadrons.
  - **(M)ove** -- To "move" a squadron, press M (notice that the marker changes its shape to an open box). Move the marker, using the keyboard or joystick, to trace the path you want the squadron to follow, and press M again to mark the destination (a small white mark will appear here). The squadron will follow the exact same route that the marker took. Collisions between squadrons will not occur.
- Occasionally, while you are tracing a squadron's path, the computer will mark a destination before you press M. This means the computer's memory for keeping track of squadron paths is temporarily full. Once the squadron reaches the marked destination, you will usually be able to move it ahead to the final destination. This shouldn't happen very often though.

**COMMANDS**
- You can gather limited information about an enemy squadron by placing the marker over it, and pressing J for info.
- **(D)etach** -- To detach part of a squadron, press D. Use the + or - keys to select a ship and then press S to switch it to the new squadron. When you are done, press E.
- **(J)oin** -- If two squadrons are close enough, you can Join them (up to a max of 3 ships in a squad). Press J and then join them in the same way you detached a squadron. If Join is not shown at the bottom of the screen, you can use the Move to bring the squadrons closer together.
- **(Z)oom** -- This option appears on the command line when you place the marker over a battle symbol of crossed sabers. Zoom gives you an exciting, animated close-up view of the battle where you can give tactical commands to your ships.
- **(P)ractice** -- Use this option to familiarize yourself with tactical operations. Practice is the same as Zoom except it is used when the enemy is not present. When you are doing practice E.

**TACTICAL OPERATIONS**
- Tactical operations begin after choosing either Zoom or Practice. During this phase, movement on the map will stop. You can choose between two views, a long view of the entire tactical battle area, or a closer view of a portion of the battle area. The white ships on the screen are yours and if the enemy ships are present, they will be black.

**THE LONG VIEW**
- During a long view, you will see the view frame over the water. The ship in the center of the view frame is the selected ship and info about it is displayed at the top of the screen. You are "on board" the selected ship and can give it orders. If there is more than one ship in your squadron, use + or - to select another ship. The selected ship will blink and be centered in the view frame.

**THE SHORT VIEW**
- The view frame will follow that ship until you use the keypad to move the view frame around the battle area. When you press the Space bar, the view frame will center on the selected ship and begin following it again.

**THE SUMMARY**
- The view frame can also be used like a magnifying glass by pressing View. This gives you a close view, causing the area inside the view frame to fill the whole screen. You can also move within this close view by using the keypad. For example, press 7 to move Northwest, 6 to move East, etc. The close view is used for precision. Holes in damaged hulls and sails can also be seen during a close view. In long view, a disabled ship will show damage marks. To return to a long view, press View.
If enemy ships are present, try moving the view frame so that enemy ships are within it’s boundaries and press View to see the condition of their sails and hull.

If two ships are close enough where part of one is being covered by the other, the nearest ship will become partially transparent so you can see the hidden ship.

If a ship goes far enough off the edge of the battle area, it has retreated and you can no longer use it during this battle.

If a ship is stopped, it will drift in the direction of the wind.

If the battle takes place near a shore, avoid the hidden coral reefs and shoals that occur near land.

Time moves a little slower when you are using close view than during long view. But even the slowest time setting in the game is considerably faster than the pace real sailing ships moved at during actual battles.

Time, View and Pause can be used almost always in tactical battle mode, even if they are not displayed on the screen.

If you decide you want to leave a tactical battle before it is over, press Leave. You will return to the strategy level and the battle will continue and resolve on it’s own.

**COMMANDING A SHIP**

When you have selected a ship in a tactical battle, you are responsible for the ship's speed, course, orders and cannons. When using a command, it will be highlighted. When appropriate, additional instructions will be shown on the command line at the bottom of the screen. To leave a command and clear the command line, press Enter.

If you are using a particular command you can usually go directly to another command without having to formally leave the first command. Just type the first letter of the new command.

**SAILING SPEED**

The speed of the ship is determined by the condition and trim of the sails and the direction of the wind.

The trim of the sails is represented at the top left corner by the Sail Indicator. Press S and then use + or - to adjust the trim. The more sail that is put to the wind, the faster the ship will move. If no sail is shown, the ship will come to a halt. Press Enter when you are done. To quickly go to full sails, press S twice. If the sails are already full when you do this, they will switch to no sails. As a ship's sails become damaged the Sail Indicator will start to turn blue, indicating decreased effectiveness of the sails.

The wind direction Indicator is to the upper left of the Sail Indicator. The wind can blow from any of the 4 primary compass points. The Wind Direction Indicator will only appear if wind is set to "realistic" in the Options Shoppe.

Momentum is a factor when moving a ship through the water. A stopped ship will take a few moments to get up to speed after giving it full sails, and a moving ship will take a few moments to stop after cutting the sails all the way back. A ship that loses momentum will drift in the direction of the wind.

To the right of the Sail Indicator is the Speed Bar. It works like a speedometer. The Speed Bar will be full when a ship is in perfect condition, using full sails and on a course that takes full advantage of the wind. Trimming the sails, sail damage and beating into the wind contribute to reducing your speed and are reflected in the Speed Bar. If the wind is set to "not realistic" in the Options Shoppe, it will not affect the Speed Bar.

**CANNONS**

To the right of the Sail Indicator are the controls for the ship's cannons. You decide which side of the ship the men will be on and when to fire.

If ship is not selected, it will automatically shoot at enemy ships.

**GUN**

Your crew can man only one side of the ship at a time. If the crew is at the cannon on the right, the ship will fire out of the right starboard side. To change broadsides, press G for Gun and your crew will move to the left cannon.

To help you visualize which direction your cannons will fire, look at the gauge at the top right of the screen. Your ship is in the center and the red square shows the direction that your cannons will fire.

**AIM**

Aim is available to the player only when "Manual Aim" is selected in the Options Shoppe. If Manual Aim is not selected, the crew will automatically aim the cannons for you, and this option will no be available.

You cannot aim or fire a cannon unless your crew is on that side of the ship and in firing position (standing behind the cannon with the firing punk ready).

To aim your cannons, press A. Use + or - to raise or lower the aim.

**FIRE**

On the top of the cannon barrel is a small hole with a bit of gunpowder in it. When you order "Fire!", a slow burning punk is touched to this hole. The flame from this flash runs down to the base of the charge and the cannon fires. Your crew will quickly reload and you'll be ready to fire again.

When realistic reload is selected in the Options Shoppe your crewman go through a longer procedure. The crew may skip some of the loading procedures depending on the reload time setting in your Options Shoppe.

You will see a flash on the target ship when a cannonball hits. Damage from sail hits is evident as the ship's sails become increasingly tattered. A hit on the hull will destroy cannon and crew and leave holes. Damage to sails and hull can be seen most clearly when the side of the ship is facing you.

**ORDERS**

Battle orders are given to ships in your squadron individually. To change a ship's orders, press O, then use + or - to rotate through the available orders. You can also press O again if you prefer, since it works the same as +. Some of the orders are not always available. While Orders is selected, time stops. (Orders is selected ?? Shouldn't that be selected ??)

General Chase: Make your best speed and course to individually attack the enemy.

Follow Ship in front: Try to maintain a single-file line if it is behind another ship.

Mimic Ship in front: Copy the maneuvers of the ship ahead.

Avoid Battle: Stay away from the action.

Course: Player controls the heading of the ship. When you select this order, a box will appear on the perimeter of the gauge at the top right of the screen. Use + or - to move the box around the gauge, and the ship will turn to the heading indicated by
the purpose of this training session was to show you how to use the program. Since a fleet cannot function without any admirals, eliminate their flagships.

BOARD

If two ships come together, side by side, they will grapple. If neither ship is disabled or extremely overmatched, you will have the opportunity to command the battle yourself. When you receive the message that two ships have grappled, select zoom to take command and meet the enemy man to man.

There are two types of fighters, sailors and marines. Marines shoot rifles and their orders are to take their station and fire at will. Sailors fight with swords and will respond to your commands.

Two ways to win when boarding.
1. Capture the enemy's flag.
2. Defeat the enemy sailors and marines.

The Four Zones: The raised deck at the stern of your ship is the Poopdeck. (don't look at me). The lower deck is the Quarterdeck, except for the area by the enemy ship, which is called the Railing. The fourth zone is the area around the flag.

Commands: You command your sailors by assigning them to a new zone to fight in. To do this, press the first letter of the zone you want him to move to. For example, to move a sailor from the Poopdeck to the Flag, press F and then F. To repeat a command, press A (Again). If you select a zone to move from and then change your mind, you can cancel it by pressing Backspace or Esc. From the Poopdeck to the Railing you can command a sailor to (Cross). A sailor with this command will try to fight his way across the enemy ship and try to reach their flag. Once a sailor is told to Cross, he will be dedicated to that mission and you will not be able to recall him.

To begin the battle, press (A)ttack. If you would rather leave and let them fight it out for themselves, press (L)eave.

SAILING TO WAR

Now you've learned how to command squadrons, gather information on a strategic level and command battleships on a tactical level! Remember the enemy squadrons are on the move while you're getting ready to meet them, so act quickly !!

The campaign can end in any of four ways:
[1] When the last ship on either side is captured or sunk.
[2] When the last flagship on either side is captured or sunk.
[3] When one side captures the other side's crown.

After the campaign is finished, you will see the results of the battle. A chart will show how many warships on each side were sunk or captured and the number of flagships that were sunk or captured.

END OF TRAINING SESSION

The purpose of this training session was to show you how to use the program.

*** NOTE 'O' FRIENDS OF SVEN ***

There isn't anything you can do in this part of the program that will have a permanent effect, so feel free to "cut loose!". You can change any or all of the rules and choose a different opponent if you wish. Each campaign can be very different, depending on the rules and the enemy, but the next time you play the game, everything will return to the way it was before you started.

SHIP DESCRIPTIONS

The warships in The Ancient Art of War at Sea are of the late 18th century variety. You will encounter four types of ships in The Ancient Art of War at Sea.

* MERCHANTSHIPS *

Merchantships supply ports with food, provisions and various nautical equipment. They are lightly armed and built for carrying supplies, not fighting. Merchantships have their own orders and you have no control over them. You can intercept enemy merchantships to capture their supplies.

* FRIGATE *

Frigates are small warships. They usually had one gun deck in addition to cannons on the quarterdeck and forecastle. The classic frigates carried between 30 and 44 guns. Fast and maneuverable, they could escape a ship-of-the-line and were powerful enough to handle any other vessel.

A frigate in the AAOaWS is a sleek, fast, two-decker with 44 guns and a crew of 250.

* SHIP-OF-THE-LINE *

A ship-of-the-line in the AAOaWS is of the classic type: a four deck, 74-gun warship, including 10 carronades, and a crew of more than 600.

* FLAGSHIP *

A flagship in the AAOaWS contains an Admiral and is of the classic type: a massive four-deck, 130-gun warship, including 22 carronades and a crew of 875... the most fearsome sight on the high seas.

--------------

: STRATEGY :

--------------

Concentrate your Power.

When facing an enemy fleet of equal or greater size, isolate small groups of enemy ships. Attack partial fleets with full fleets. Isolate one ship and fight it with two or three ships. This is the way to defeat an enemy both strategically and tactically.

Usually try to keep squadrons full with three ships instead of splitting them into smaller squadrons. If you split them up, you'll end up with two or three weak squadrons instead of one powerful squadron.

Before deciding to battle, compare the strength of your squadron to the strength of the enemy squadron and determine your chances of victory. (Strength is determined by the number of ships on each side, the type of ships on each side and their condition.) Then, try to engage in battle only from a position of strength. The condition of the ships involved can have a major effect on the odds of winning.

Focus your attention on enemy flagships (where their admirals are). Since a fleet cannot function without any admirals, eliminate their flagships.
If you plan to attack an enemy squadron, try to gain the wind advantage. Use your crown or supply ports to keep your ships stocked. A well-fed crew is an efficient crew. Use your Crown or Repair ports to keep your ships in good condition. One fresh ship is better than two badly damaged ships. If a squadron's supplies decrease below 20%, the condition of the ships in the squadron will start to deteriorate. This is because the crew has to ration food and can't work as hard to keep the ship in good condition.

Anchor near a food port to increase supplies. Anchor near a repair port to improve condition. To be sure your ship is receiving supplies or repairs from a port, check its Info after it is anchored. Instead of indicating speed, it should say "In Port". A Crown will increase both the supplies and the condition of any ship in its harbor. A ship cannot be repaired unless its supplies are above 20%. Another way to increase a squadron's supplies is to capture enemy merchantships or intercept friendly merchantships.

Merchantships can sail through rough or shallow water without fear or damage. Larger ships (flagships and ships-of-the-line) can sail through rough water without fear or damage, but frigates will often sink, depending on how rough the water is. This factor can be adjusted in the Rules scroll just before starting a campaign.

It is very dangerous to try to sail large ships through shallow water. When a flagship is lost in shallow water, the Admiral will board another ship-of-the-line that is in the same squadron. If there is none, the Admiral will go down with his ship. Frigates have no trouble in shallow water. Merchantships can sail through rough or shallow water without fear or damage.

A major factor in the speed of sailing ships. If wind is set to 0, look for the Wind Cherub on the map to see which way the wind is blowing. Generally, the more you try to sail into the wind, the slower your squadron will move. The wind may change during a campaign. Wind speed varies from 5 to 15 knots.

If you plan to attack an enemy squadron, try to gain the wind advantage by meeting him with the wind at your back. The position of the crossed sabre symbols in relation to the wind on the strategic level determines the two squadron's position in relation to the wind after you zoom to the tactical level.

---

Orders - Each ship in your squadron will be given individual orders. The orders that you can give will vary depend on the situation.

Course: This is used when you want to take charge of a ship's navigation.

General Chase: Make your best speed and course to attack the enemy.

Follow Ship in Front: You can use this order to try to maintain a line.

Mimic Ship in Front: A ship with this order will turn the same amount as the ship in front of it even if they are on different headings.

Avoid Battle: If your ship gets hurt badly you may want to use this.

Boarding: A ship with this command will sail to and board a disabled enemy ship. It can also board a friendly ship and make enough repairs to put it back into action.

---

Tactics:

Strategy: Your strategy is up to you.

Accuracy: Your cannon range is surpassed only by Jones and Nelson. The accuracy of your shots can be increased (or decreased) by taking charge of firing the cannons yourself. (Manual)

Reload Speed:

Accuracy: 75% of your crew will be sailors, 25% marines.

Cannon Range:

Seamanship: (Sailors are swordsmen, and marines are riflemen).

Crew Quality adjustable in rules (green= 1 *, average= 4 *'s, crack= 7 *'s)

DUKE OF MEDINA SIDONIA 1588

Strategy: Sidonia tends to pick an objective and then move towards it en masse.

Tactics: Sidonia's cannons can only shoot a short distance so his ships will try to fight at close range. His Spanish galleons are slow and bulky ships that were built to carry marines. His goal is to bound your ships where he can use
his superior marksmen to defeat you. His sailors are not skilled in the art of fencing. When grappling, 25% of his crew will be sailors and 75% marines.

---

**DATA DISKS**
A data disk is used when you want to make your own campaigns, play a campaign that you make, or resume a campaign that was previously saved. You can make as many data disks as you want. Each data disk can hold up to 11 new campaigns and 1 saved game.

**PREPARING A DATA DISK**
Before you start, you need to have a blank or expendable disk to use as your Data Disk. The program will tell you when you need to insert your disk. If your disk is not formatted, the program will do this for you. Just follow the prompts to swap disks when necessary, and the computer will do the rest. Make sure the Data Disk option is set properly in the "Options Shoppe."

**PLAYING A CAMPAIGN**
To play a campaign that you created and saved on a Data Disk, select "Go To War" at the title page and then choose the last selection on the titles scroll, "Data Disk".

If you are using the Data Disk and you want to play a campaign on your War Disk, choose the first selection "[WAR DISK]", on the data disk titles scroll.

**SAVING A GAME IN PROGRESS**
A game can be saved only on a Data Disk. If there already is a saved game on the Data Disk, that game will be ERASED when you save the new game.

You can save a game in progress when the war map is on the screen and the pointer is not over a squad (any time "View" is on the command line). When you are ready to save the game, hold the Alt key down and press S. The program will tell you when to insert your Data Disk. You will automatically exit the game after it is saved.

**RESUMING A SAVED GAME**
Select "Go to War" at the title page. Select the last title on the first scroll, "(DATA DISK)". The program will tell you when to insert the Data Disk with the Saved Game.

When the program asks if you want to continue with the saved game, press 'Y'. These are not the full docs, but is a summary of all the important info.

Call this excellent system...

Ethereal Dimension Exclusive...9600HST/104megs..................[301] 529-6418

the Gauntlet - CODfish text files (c) 1988

---
CAMPAIGN: A campaign is a series of military maneuvers that form a war. The AAOwA5 comes with eleven separate campaigns, each set at a different location and time. Using the Game Generator you can design your own campaigns.

COMMAND OPTIONS: Are used to move through the program and to give orders to your ships and squadrons. Command Options will change during the game but can usually be found on the bottom line of the screen. After Zooming, command options can also be found at the top of the screen. To use a Command option, press the key that is indicated or, if no key is indicated, press the first letter of the command.

CONDITION: Cannonfire and low supplies will decrease a ship's condition. A ship's condition is determined by her hull and sail damage. When the condition of a ship's hull deteriorates, cannons are damaged and firepower decreases. When a ship's sails are destroyed, the ship will also be disabled. When the condition of a ship's hull deteriorates, cannons are damaged and firepower decreases. A ship with severe hull damage will sink.

To improve the condition of a ship, it must be repaired at a repair port. During a battle, some repairs can be made to a badly damaged ship by boarding with a stronger friendly ship.

CROWN: A crown represents the heart of a side's homeland. A war can be won by anchoring a ship next to a Crown of the opposite color, but first, all enemy ships at the Crown must be defeated. A Crown provides supplies and repairs to ships of the same color. Crowns are supplied from inland and do not require merchantships.

DETACH: If a squadron contains more than one ship, and there are fewer than 40 squadrons on the map (including any enemy squadrons not shown), you can divide the squadron in two. Put the marker over the squadron. When "Detach" appears on the command line, press D. Use + or - to select a ship and then press S to switch it to the new squadron. When you are done, press E. The new squadron will appear just to the right of the original squadron. By typing J ("Join") you can move ships back to the original squadron.

ENCOUNTER: If one of your squadrons comes close to an enemy squadron, an encounter will be reported, and both squadrons will turn into the shape of crossed sabres. You can either take command of that battle and lead it into battle by Zooming, or let the ships fight without your help. If the two squadrons start flanking, they often have started fighting without you. You can check it's place on the map by Zooming, or let the ships fight without your help. If the two squadrons start flanking, they often have started fighting without you. You can check it's place on the map by Zooming, or let the ships fight without your help. If the two squadrons start flanking, they often have started fighting without you. You can check it's place on the map by Zooming, or let the ships fight without your help.

En route to a battle, you cannot take command after the fighting has started. To adjust the amount of time between an encounter and the start of a battle, go to "Ye Olde Options Shoppe." With "fight delay" set to medium, you have about 30 seconds between an encounter and the start of a battle.

ENEMY: The enemy are the black squadrons and ships. The enemy are lead by one of six historical military minds, each with his own style of waging war.

The mass tactics of the Duke of Medina Sidonia. The aggressive attack of Blackbeard. The formal tactics of Martin Tromp. The determination of John Paul Jones. The brilliance of Lord Admiral Nelson. The unpredictability of Thor Foote.

FLAGSHIP: Is a strong ship-of-the-line with an Admiral on board. It is the most powerful ship on the high seas. Sinking the last flagship on either side wins the campaign.

HELP: Is just above the Command Line at the bottom of the screen. It appears when using certain commands to tell you what to do.

INFO: To get information about a squadron, move the marker over it until you see "Info" on the command line. Then press 1. If two or more squadrons are directly over each other on the map, you will get information on only one squadron. Using the Info command, you can learn the name of the ships in the squadron, their type, condition and supplies. You can also adjust their sailing speed.

JOIN: If two squadrons are close enough, you can Join them (up to a max of 3 ships in a squadron). If "Join" is not shown at the bottom of the screen, you can use "Move" to bring the squadron closer together. Put the marker over the squadron. When "Join" appears on the command line, press J. Use + or - to select a ship and then press the Space Bar to move it to the new squadron. When you are done, press E.

MARKER: Is represented by the white crosshairs on the screen. Use the arrow keys or joystick to move it. Place it over a squadron to get information on all ships and supplies. The marker can move to any ship. When the marker is over a squadron, you will hear a peep and the command line will change. It will appear once for every squadron under it, so if two or more squadrons are in the exact same location, you will hear more than one beep.

MERCHANT SHIP: Merchantships supply ports. Warships can intercept enemy merchantships, capturing their supplies and sinking them. Your warships can also get supplies by intercepting white merchantships. If the intercepting squadron's supplies are above 50%, the merchantship will have enough supplies left to continue on its destination.

MESSAGES: During a campaign your ships will sometimes report information to you. Messages will appear at the bottom of the screen just above the Help Line. Up to two messages can be shown on the screen at the same time. When a new message comes in, the previous message will move down and the new message will take it's place on top. To remove the messages on the screen, press C to clear them.

Reports and sightings are given in terms of map location, not in terms of the squadron sending the report.

Some of the messages are:
X Enemy Sighted: One of your squadrons has visual contact with an enemy squadron. It will also report the enemy squadron's location on the map. *NOTE* Occasionally, tired sailors will report a false sighting.

X Encounter: Your squadron is preparing to fight another squadron. You have a short time after receiving this message to Zoom to the battle before the fighting starts if you want to command your ships individually.

X Fighting: The two fighting squadrons will flash to show that a battle is in progress. You cannot Zoom in on a squadron while it is fighting.

X Battle Won/Lost: The results of fighting will be given when you don't Zoom.

X Flagships: The capture of a flagship is a major event. When a flagship is won or lost, it will be reported.

X Lost in Rough Water: Rough water is a dangerous place for frigates to be.

X Lost in Shallow Water: Shallow water is a dangerous place for ships-of-the-line and flagships.

MOVE: To move a squadron, place the marker over a friendly squadron until "Move" is shown on the command line, then press M. Now trace the route you want the squadron to take. When you've reached the end of the route, press M again. A white dot will appear there, marking the destination.

PRACTICE: To improve your skills as a tactical commander, move the marker over one of your squadrons and press P. You can then practice using the combat

RULES: Some rules will change with each campaign. You will see the rules scroll before a campaign begins. Advanced players may wish to change the rules of a campaign for variety. Most rules apply to both you and the enemy, although some may be different for the enemy depending on who their leader is.

SIGHTINGS: When one of your squadrons gets close to an enemy squadron, it will report sighting the enemy. When the visibility is not set to unlimited, the squadron that is sighted will appear on the map. It will stay on the map until your squadron loses sight of it. The "rules" determine the visibility. If a sighting is reported and you can't find an enemy squadron in that area, it is because your men lost sight of it quickly. After sighting an enemy squadron, you can trials it, to try to run from it or close in.
THE POINT OF ANKH IS TO PICK UP ALL THE TRIANGLES THAT ARE
NOT RIGHT, ---- ! \ AND BY GOING INTO ALL 64 ROOMS.
\ / ! \ ----
\ / ! ----
NON-RIGHT RIGHT

THIS IS ACCOMPLISHED BY OPENING DOORS (OBVIOUSLY). DOORS CAN BE OPENED BY
SHOOTING A SMILEY FACE OR A BLOCK OUTLINE. IF THE BLOCK OUTLINE EXPLODES, DON'T WORRY. IT WASN'T NEEDED. WHEN YOU HEAR A BEEP, YOU
KNOW THAT THE DOOR WILL OPEN, EITHER IN THE ROOM THAT YOU ARE IN, OR
SOMEWHERE ELSE. MY FIRST RULE FOR THE GAME IS SHOOT FIRST, ASK
QUESTIONS LATER. WHENEVER YOU SEE SOMETHING IN A ROOM, SHOOT IT. IF
THERE IS NO BEEP, OR IT DOES NOT EXPLODE, TOUCH IT WITH YOUR FEELERS.
THERE ARE MANY TRIANGLE IN THE ROOMS. IF THEY ARE NOT RIGHT TRIANGLE
AND ARE IN ONE OF THE TREASURE ROOMS, THEN PICK THEM UP. IF THEY ARE
RIGHT TRIANGLES, THEN SHOOT THEM. IF THEY DON'T EXPLODE, THEN PICK
THEM UP. THEY ARE GOOD FOR SOMETHING. WHEN YOU HAVE ALL THE PIECES,
AND HAVE BEEN IN ALL THE ROOMS, THEN YOU WIN. A COUPLE ON HINTS... IN
THE NUMBERED ROOMS, SHOOT THE OUTLINE BLOCK, THEN THE SMILEY FACE TO
OPEN THE DOORS TO THE NEXT NUMBERED ROOM. WHEN YOU GET THE RIGHT
TRIANGLE, DROP IT IN THE ALCOVE IN ROOM ZERO WITH THE NON-RIGHT
TRIANGLE. IN THE PIANO ROOM (WHEN YOU SHOOT THE BOX, IT PLAYS MUSIC),
DROP ALL THE NON-RIGHT TRIANGLES, AND SHOOT THEM SO THE MUSIC THEY
MAKE IS THE SAME AS THE MUSIC THE BOX MAKES WHEN SHOT. IN THE ROOM
WHERE THE TWO THINGS SANDWICH YOU BETWEEN THEM, PUSH OUT ANY BLOCK
TOUCHABLE. ALSO, TRY NOT TO HAVE A DOOR CLOSE ON YOU. THIS HAS
HAPPENED TO ME ONCE OR TWICE, AND USUALLY WHEN I WAS ABOUT TO WIN. TO
GET STUCK IN A DOOR, YOU STOP IN ITS PATH WHILE IT IS CLOSING, OR JUST
MOVE THROUGH IT'S PATH, AND NOT GET THROUGH FAST ENOUGH. SOMETIMES,
YOU HAVE TO MOVE THROUGH A MOVING DOOR'S PATH, BUT TRY NOT TO GET
CAUGHT.

5. CHEAT

TO CHEAT AT ANKH, TYPE THE FOLLOWING:

TO PICK UP THINGS, HOLD DOWN CONTROL, AND PUSH THE FIRE KEY FOR THE
DIRECTION YOU WANT. TO MOVE SMALL DISTANCES, HOLD DOWN CONTROL AND
PRESS THE MOVE KEY FOR THE DIRECTION YOU WANT. V CONTROLS THE VOLUME,
ESCAPE PUTS THE GAME ON HOLD.

3. THE PIECES

DAGGER: SHOWS YOU HIDDEN TRIANGLES.
BLOCK WITH DOT IN MIDDLE: EITHER SHOOTS, OR CURVES SHOT
BLOCK WITH DASH IN MIDDLE: MOVES WHEN SOMETHING IS SHOT.
SMILEY FACE: OPEN DOOR WHEN SHOT
BLOCK OUTLINE: OPENS DOOR WHEN SHOT OR HIT WITH
PICKER UPPERS. SOME ARE USELESS.

4. THE GAME
APBA Major League Players Baseball
[Box by Pac-Rat]

- Introduction

APBA Major League Players Baseball puts you in the dugout as a manager of your favorite baseball team! The game is intended to be played by two players, each managing one team, but it can also be played by one player managing both teams. With the draft disk, you can set up your own league and organize teams, with players of your own choice.

The game simulates much of the complex decision making that goes on in a real baseball game. Before the game starts, you choose which teams you want to manage, and then your starting line-ups. Once the game begins, the defensive manager has several strategic options of his own. Bringing in relievers, pinch hitting, intentional walks, hitting and running are just a few of the strategic decisions to be made. Sometimes you will even have to make quick base running and throwing decisions, just like in the real game.

- System Requirements

To play APBA Major League Players Baseball you must have an Apple //c or //e with 128K RAM and an 80-column card, two 5 1/4 floppy disk drives, and a monitor.

- Quick Start (for complete game set-up, check next section)

Starting from the Rules and Data Screen, follow the instructions below and you will soon be playing APBA Major League Players Baseball.

The program will prompt you when you need to change disks. If at any point you make an inputting error, you can often back out of it by pressing the [ESC] key.

1. Press [RETURN]. The Team Selection Screen will appear.
2. Press [SHIFT] and [1] simultaneously. Wait for the division champions team name to appear under HOME.
3. Press [B].
6. Press [L].
7. Press [1]. The visiting team's starting line-up will appear.
8. Press [RETURN]. The home team roster will appear.

11. Insert the Play By Play diskette in drive 2. Press [RETURN] to continue. The Game Screen will appear. [Press [ESC] if you wish to shorten the National Anthem]
12. Press [P].
13. Press [RETURN]. You're playing this year's league championship!

Use the 'Quick Reference Card' for a summary of your managerial options.

Important Notes: [CONTROL] [X] will end the game at any time and start over.

- Rule, Team and Line-Up Selection

Once BASEBALL is loaded, you can start playing with just a few keystrokes.

[Rules and Data Screen]

Using [SHIFT] [1], choose to play with a designated hitter (DH) or without a designated hitter. Your choice is highlighted. The DH option has been implemented according to the Official Baseball Rules. If you choose to play with a DH, certain managerial moves may nullify your right to use a DH (for example—announcing a defensive player at the DH spot in the batting order after the game has begun). If you attempt to make such a move, a warning will appear on your screen.

Using [SHIFT] [2], choose the length of time available for dynamic decisions - Professional (10 seconds), Semi-pro (15 seconds), or Amateur (20 seconds). Your choice is highlighted.

Using [SHIFT] [3], choose to play with or without sound. Your choice is highlighted.

Using [SHIFT] [4], choose the speed at which you wish the outcomes to show Regular for dramatic play, Quick for "no pause" play.

Using [SHIFT] [5], determine which Data Disk you have inserted.

After using the shift keys to specify the rules, insert side A of the Data Diskette, press [RETURN], and the Team Selection Screen will appear.

[Team Selection Screen]

Teams are arranged by organization, league, and division. The game comes with 676 players organized by the leagues and cities in which they play. You can play these teams immediately. To select a team, follow these steps.

1. Choose the organization you wish to play with by pressing [1] through [6]. (Before drafting your own teams, you will have only one choice: PROFESSIONAL BASEBALL.) Your choice will be highlighted.
2. Select a division using [A] through [L]. (Before drafting your own teams, your choices are [A], [B], [G], and [H].) Your choice will be highlighted. The teams in this division will appear under TEAMS with their won/lost records.
3. Select a team to play with using the up/down arrow keys. Your choice will be highlighted.
4. Indicate whether this team is the home or visiting team. Press [SHIFT] [1] to choose the home team and [SHIFT] [2] to choose the visiting team.
5. Repeat these steps to choose a second team.

Important Notes: You may change your mind about which teams to play for as long as you remain on the Team Selection Screen. Simply follow steps 1-4 above. Your new selection will replace the team you had previously selected.

To play teams from different years or Data Diskettes against each other, load the first team following the procedure above, then switch Data Diskettes, press [SHIFT] [5], and load the second team.

You may play any team from any organization against any other team. You may even play a team against itself.

The Line-up Screen

The name and year of the team is in the upper right hand corner. The line-up will be displayed in the upper left of the screen. The roster for the team appears in the lower half of the screen.

On the roster, non-pitchers star at letter A and proceed down; pitchers start at letter Z and proceed up. Non-pitchers are displayed with last name, primary position (Pos), fielding rating at that position (D), the side they bat from (B), and running speed (Sp).

Pitchers are displayed with last name, the arm they throw with (T), pitching grade (always as a starter, if they started during the actual season) (Gr), and control letters (Ctrl). Grades of relievers are marked with an asterisk.

See THE PLAYER SCREEN for a further explanation of player performance ratings.

[Announcing a Line-up]

You may either use a pre-stored line-up or announce players individually.

[Announcing a Prestored Line-up]

Space has been provided for five prestored line-ups in the upper right corner of the screen. A frequently used line-up for each team is provided as choice 1. After you have saved your own line-ups they will also appear on the list. To load a prestored line-up:

1. Press [L].
2. Select a number from [1] through [5].

Loading a line-up erases all previously announced players.

The names of the players on the starting line-up are displayed, followed by their defensive position and fielding ratings. Totals are given for team and infield fielding ratings.

If a designated hitter (DH) was stored in the line-up and you are not now playing with the DH, the DH will be dropped from the line-up and the pitcher, if there was one, will appear batting ninth. If a DH does not appear in the prestored line-up and you have chosen to play with one, the pitcher, if there was one, will be moved out of the batting order automatically, and you will need to select a DH.

[Announcing Individual Players]

To help make line-up decisions, you can display the complete player statistics.

1. Press [D].
2. Press either [A]...[Z] or the batting number [1]...[9] of the player to be studied.

The Player Screen will appear. For a complete description of the player ratings, see THE PLAYER SCREEN section.

[Adding a Player to the Line-up]

After selecting a player to announce, follow the steps below to add him to the line-up:

1. Press [A] to start an announcement.
2. Press [A]...[Z] to select the player.
3. Press [1]...[9] (or [P] if you elected to use designated hitters) to select his place in the batting order.
4. Press [1]...[9] (or [D] if you elected to use designated hitters) to select his defensive position.
5. The selected player and his ratings will appear in the line-up and his name will be highlighted in the roster.
6. Repeat this process until you have a valid defensive line-up.

[Correcting a Line-up]

Check the line-up to make sure it is the one you want. If the line-up is incorrect, press [R] for Remove followed by [1]...[9] or [P] to remove the incorrect player. Announce the correct player in the vacant position.

BASEBALL will tell you if your line-up is invalid. Examples of invalid line-ups: you have entered two players at the same position; you are missing a player; you have an ejected or injured player in the line-up; you have not designated a defensive position for a pinch hitter, a pinch runner, or his replacement. If your line-up is invalid, make the correction as described above.

After you have corrected an invalid line-up, if there is still a player marked with an asterisk, you must [M] Move that player to his proper defensive position to finish validating the line-up, even if it appears that he's already there. You may also use the [M] Move command to change the defensive position of a player without changing his line-up position.

Before finalizing your line-up, you may make as many changes as you want.

[Saving a Line-up]

1. Press [S].
2. Press [1]...[5] to choose the line-up number. If a lineup already exists at that position, the new line-up will replace the old line-up.
3. Enter a name for the line-up.
4. Press [RETURN].

This line-up will be saved to the data diskette. You will be able to load this line-up with the [L] Load command in the future.
Important note: [ESC] lets you back out of any incomplete command.

[Completing the Line-ups]

Announce a line-up for each team. When you press [RETURN] after announcing the second line-up, you are prompted to insert the Play By Play diskette. Insert this disk, press [RETURN], and the Game Screen will appear.

- PLAYING THE GAME

The top part of the Game Screen displays the two line-ups, the line score with run, hit, and error totals, the inning, count, and number of outs, and a description of each play as it occurs. The current batter is highlighted and after the first inning the lead-off batter is marked with an asterisk.

To the left of the "INN:* on the same line, is a space reserved for up to two scorer messages. The messages and their meanings are:

- E1...E9 - Error on the defensive player indicated
- WP - Wild pitch
- PB - Passed ball
- SAC - Sacrifice bunt or fly
- FC - Fielder's choice

On some complex plays, further scoring messages appear in the description of the play.

The lower part of the Game Screen displays the diamond, the defensive alignment, the current batter (on the appropriate side of the plate), and base runners with their running speed. You will also see the base running results of each play, partial game statistics for the current pitcher (innings pitched, hits, earned runs, walks (BB), strike-outs), partial game statistics for the current batter (at bats, runs, hits, RBI), the pitch, bat, and time-out indicators, and selected managerial calls when in effect (IN, STRETCH, HOLD, HIT & RUN).

Important note: A HOME RUN graphic will flash repeatedly on the scoreboard after a home run is hit. You can stop the flashing by pressing any key.

See THE PLAYER SCREEN for complete explanations of player performance ratings.

[Managerial Decisions]

APBA Baseball can be a game of managerial coaching decisions. Choosing the team and the line-up are only the first of these decisions. As you play the game, the following options are available to you:

<Options for the defensive manager> <Team in field>

Before [P] Pitch:

- [H] Hold - With a runner at first base, holding him on slows the runner somewhat for stealing and base advancement and provides the chance for him to get picked off. Of course, with the first baseman nearer the bag, it is easier to hit through the right side. Holding on is automatically in effect if there is a runner on first and no one on second, unless the defensive manager turns it off by pressing [H]. Press [H] again to reinstate HOLD.

- [I] In - With a runner at third base, press [I] draws the infield in and increases the chance of the play being made at home on a ground ball. If you play IN, though, more ground balls will get through the infield for hits. IN must be called before each pitch to remain in effect.

- [S] Stretch - With a runner at third base, pressing [S] causes the pitcher to pitch from the stretch rather than from a full wind up. In all base situations except men on first and third, pitching from the stretch will prevent the runner on third from stealing home, but the pitcher will be a little but less effective against the batter. With runners on first and third, the pitcher must pitch from the STRETCH.

- [B] Batter - Either manager can display complete statistics for the batter by pressing [B].

- [CONTROL] [D] - Allow defensive substitution. See DEFENSIVE SUBSTITUTIONS MOVES, and RELIEF PITCHING.

- [CONTROL] [R] - Either manager can call up an instant replay by pressing

- [CONTROL] [R] - If the play went more than size lines, press [CONTROL] [R] again to continue the play.

[CONTROL] [G] - Toggles the Quick Play option. Quick Play speeds up the presentation of outcomes, but it does not affect the time allowed for dynamic decisions.
[**W**] Walk -  
Press [**W**] to intentionally walk the batter.  

[**P**] Pitch -  
Press [**P**] to pitch the ball.  

After [**P**] Pitch:  
No defensive commands are allowed after the pitch.  

<Options for the offensive manager>  
<Team at bat>  

Before [**P**] Pitch:  

[**R**] Run (HIT & RUN) -  
(set the play in motion) Hit away.  

After [**P**] Pitch:  

[**T**] Time -  
Press [**T**] to step out of the box (call time). Calling time nullifies the pitch. Only the manager whose team is at bat may call time. After time
is called, either manager may make new managerial decisions. Play proceeds as if the pitch were never made; however, if the defensive manager has already called for HOLD, STRETCH, or IN, those calls will remain in effect.

Important notes: Hitting & running and bunting often create a count against the batter (more strikes than balls). A count against the batter increases the chance of a batter striking out.

Occasionally a sign - an offensive managerial call - will be missed by the batter or base runner. Play will proceed as if the sign had not been given.

[Dynamic Decisions: Base Advancement, Throwing, and Fielding]

Dynamic decisions are managerial calls which must be made during the play. The program allows a limited time to make the decisions. You determine the time limit in advance from the RULES AND DATA SCREEN.

Each dynamic decision demands a response. Press the number of the choice of your decision. If you do not respond (make a decision) in the time allotted, a decision will be made for you. This automatic decision is the default and generally is the "conservative" decision. Sometimes the default is the obvious decision; for instance, the default response to "MAKE THROW?" on a steal attempt is always "yes."

Important note: For dynamic decisions, the response marked with an asterisk (*) is the default. If you do not respond, the default response will guide what happens next.

Dynamic decisions for the offensive manager are base advancement decisions for example "TRY FOR THIRD!" and "TRY FOR SECOND ON THE THROW?" If the offensive manager is asked to make advancement decisions, the defensive manager has to make throwing decisions in response.

Occasionally the defensive manager will be asked to make fielding decisions as well, for example: "GO FOR DOUBLE PLAY OR OUT AT HOME?" These fielding decisions will not require a response from the offensive manager.

You will need some information to help you decide when to advance base or when to try to throw out a base runner. This information is provided in four ways:

1) The description of the play gives you verbal clue about your chance of advancing successfully. These descriptions include such information as how far the ball was hit, where and how it was fielded, and the position of the runner.

2) The arm and fielding ratings of the defensive players are displayed by their names - the outfielder handling the ball is marked with a flag sign.

3) The speed ratings of base runners are displayed next to their names.

4) The number of outs is displayed on the scoreboard - with two outs the runners with be moving on contact.

[Cutting Off Throws]

When a manager chooses to advance an extra base on the outfielder's throw, the defensive manager usually will be given an opportunity to cut off the throw (to make the play on a trailing runner). Any runner headed for home when the ball is cut off will score, and his run will count even if the third out is subsequently made on the play.

The chances of putting out a trailing runner depend largely on the speed of that runner and the chance of advancement of the runner on whom the play was originally being made. The closer the runner is to home, the greater the chance of the trailing runner has of advancing if a play is subsequently made on him. Exception: if the chance of the original runner advancing successfully is an almost sure thing, then the chance of the trailing runner advancing even with the cutoff is also high. In this case it is usually better not to make a play for the lead runner.

There is no cutoff option when the runner is attempting to advance on the hit rather than the throw.

[Pinch Hitting and Pinch Running]

At any time in the game the offensive manager may choose a pinch hitter or pinch runner. To do this press [CONTROL] [O] (if the ball has been pitched, call [T] Time first). The Pinch Hitter/Runner Screen will appear. It contains the same information as the Line-up Screen.

To make a substitution, press [A], select the letter of the player entering the game, then select the [B] Batter or [1]...[3] base runner to be replaced. Players NOT available for pinching are highlighted (players playing the game) or marked OUT, EJECTED, or INJURED.

Important note: The only offensive [M] Move permitted during the game allows the pitcher to pinch-hit or pinch-run for the designated hitter. This [M] Move will invalidate the DH for the remainder of the game.

Important notes after play begins: Once a player is announced, he is in the game! Once a player is replaced, he is out of the game!

[Defensive Substitutions, Moves, and Relief Pitching]

At any time in the game the offensive manager may make a defensive substitution, move a defensive players, or bring in a relief pitcher. Press [CONTROL] [D]. The Substitution Screen will appear. It contains the same information as the Line-up Screen.

To make a substitution: press [A]. Select the letter of the player entering the game, position in the batting order, and defensive position. Again, players NOT available for substitution are highlighted or marked OUT, EJECTED or INJURED. Remember: the Official Baseball Rules specify that once a player is announced he is in the game.

To move a player to a new defensive position; press [M]. Select the batting position of the player to be moved, then select the new defensive position of the player. [M] Move is useful when you have used a pinch hitter or pinch runner and you wish to announce his defensive position. You can also use it to switch players in the field, for instance, to move a better "arm" to right field from left field.

To bring in a relief pitcher simply make a substitution in the appropriate spot in the batting order. Press [A]. Then select the letter of the pitcher entering the game, position in the batting order, and defensive position (pitcher).

Any player may be used as a relief or starting pitcher (if your own league rules permit it), but his grade, control, and endurance factors will be adjusted according to his probable skills. Remember: the Official Baseball Rules require a relief pitcher to face at least one batter or to pitch until the side is retired.

For all defensive substitutions, [ESC] will back you out of an incomplete announcement or move.

Important notes: Once the game begins, a player cannot be moved from one position in the batting order to another. If you wish to change the batting order before the game begins, a player can be removed and
If a player is INJURED or EJECTED, the manager will be required to replace him only when it becomes necessary, (that is, when he must bat, run the bases, or take a defensive position). If there is not a player eligible to play at that time, the understaffed team forfeits the game.

To help make pinch running, pinch hitting and other substitution decisions, you can examine the complete player statistics by using [D] Display and [A]...[Z] or batting order number [1]...[9] of the player to be studied. When you choose a player in this manner, the Player Screen will appear.

Injury -
Determines the seriousness of the injury should a player be injured (higher tend to be a more serious injury): range 0 to 4.

Throw -
A rating of the strength and accuracy of a catcher's throwing arm on steal attempts: range th-4 to th+6 (higher is better). Non-catchers who are playing catcher are always rated th-4.

Passed ball rating: range 0 to 3 (lower is better). This rating affects the frequency of passed balls. Non-catchers who are playing catcher are always rated 3.

Passed ball rating: range 0 to 3 (lower is better). This rating affects the frequency of passed balls. Non-catchers who are playing catcher are always rated 3.

Rating -
The defensive fielding rating. The following are ranges for fielding ratings by position (higher is better):

<table>
<thead>
<tr>
<th>Position</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>pitcher</td>
<td>1 to 2</td>
</tr>
<tr>
<td>third baseman</td>
<td>3 to 6</td>
</tr>
<tr>
<td>catcher</td>
<td>5 to 9</td>
</tr>
<tr>
<td>shortstop</td>
<td>6 to 10</td>
</tr>
<tr>
<td>first baseman</td>
<td>2 to 5</td>
</tr>
<tr>
<td>second baseman</td>
<td>2 to 5</td>
</tr>
<tr>
<td>outfielder</td>
<td>1 to 3</td>
</tr>
<tr>
<td>shortstop</td>
<td>1 to 3</td>
</tr>
</tbody>
</table>

The total of defensive ratings for the infield (six players) is the Infield Rating. The total for the entire team (nine players) is the Team Rating. Although the individual fielding ratings are the most important factor in determining how well your team plays, the outcome of plays in which the ball is handled by several players is sometimes determined by the Infield and Team Ratings. Again, higher is better.

Important note: If you play a player at a position for which he is not rated, he will be given the lowest rating for that position. Exception: good-fielding shortstops and second baseman may be rated slightly better than "lowest" at other infield positions. Any player may play at any position, but for realistic outcomes, players should not be used at unlisted positions unless injuries or ejections require it.

Infield Rating.
Rates the hitting-for-average ability of a player (how much his batting average will increase) when the HIT & RUN is called: range 0 to 5 (higher is better). General hit & run ability takes into consideration the batter's tendency to strike out. When the batter does miss the ball, a HIT & RUN becomes a steal attempt.

<Defensive ratings and statistics>

Position -
A list of positions for which a player is rated defensively. If a player is rated at a position, then he appeared at that position in the season represented. His primary position is marked with an asterisk.

<Offensive ratings and statistics>

Rating -
The offensive ratings and statistics are ranges for offensive ratings and statistics:

<table>
<thead>
<tr>
<th>Position</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>pitcher</td>
<td>1 to 2</td>
</tr>
<tr>
<td>third baseman</td>
<td>3 to 6</td>
</tr>
<tr>
<td>catcher</td>
<td>5 to 9</td>
</tr>
<tr>
<td>shortstop</td>
<td>6 to 10</td>
</tr>
<tr>
<td>first baseman</td>
<td>2 to 5</td>
</tr>
<tr>
<td>second baseman</td>
<td>2 to 5</td>
</tr>
<tr>
<td>outfielder</td>
<td>1 to 3</td>
</tr>
<tr>
<td>shortstop</td>
<td>1 to 3</td>
</tr>
</tbody>
</table>

The total of offensive ratings for the infield (six players) is the Infield Rating. The total for the entire team (nine players) is the Team Rating. Although the individual fielding ratings are the most important factor in determining how well your team plays, the outcome of plays in which the ball is handled by several players is sometimes determined by the Infield and Team Ratings. Again, higher is better.

Important note: If you play a player at a position for which he is not rated, he will be given the lowest rating for that position. Exception: good-fielding shortstops and second baseman may be rated slightly better than "lowest" at other infield positions.

Any player may play at any position, but for realistic outcomes, players should not be used at unlisted positions unless injuries or ejections require it.

Injury -
Determines the seriousness of the injury should a player be injured (higher tend to be a more serious injury): range 0 to 4.
Apple II Computer Info

Throws -
Pitching arm (Right/Left). A pitcher will perform better than his base grade against a batter hitting from the same side as he throws if the batter has a platoon rating greater than 0. See platoon example.

Grade -
The basic rating of pitching skill: range 1 to 30 (higher is better).
Poor = 1 to 5, average = 6 to 10, good = 11 to 15, very good = 16 to 20, super star = 21 to 25, immortal = 26 to 30.

A pitcher may be rated as a starter, a reliever (marked with an asterisk), or both. If a pitcher started any game during the regular season, he is rated as a starter. Some pitchers grades as starters on the Line-up Screen also have a separate grade for relieving. In this case, both ratings are displayed on his Player Screen. You can check a pitcher's official statistics for games appeared in (G) and games started (GS) to see if he pitched primarily as a starter or as a reliever during the actual season.

The grade can change during the game in several ways. If a poor pitcher goes 5 consecutive innings without allowing an earned run, his grade will advance by 5 each inning thereafter, up to a grade of 20, or until he gives up an earned run. An average pitcher will advance after 6 consecutive innings, a good pitcher after 7, and a very good pitcher after 8. Any pitcher's grade will go down 5 after allowing 5 earned runs in 3 consecutive innings. These changes will be displayed on the Game Screen under the pitcher's name.

Some grade changes are not displayed on the screen. Batter-to-batter changes caused by the platoon rating of the batter are not displayed. Relief pitchers are more effective against the first batter they face if they enter the game during an inning (not at the beginning of an inning). This increased grade of 5 is not displayed. Any effects of durability (see below) are not displayed.

Control -
Rates pitching control and strike-out ability: possible ratings are W, X, X, Y, and Z.

W = wild (walks)
XY = super star strike-out ratio (strike-outs/innings pitched)
X = excellent strike-out ratio
Y = good strike-out ratio (X and Y both increase strike-outs)
Z = good walk ratio (decreases the number of walks, especially with men on base)

Move -
Rates the move to first: range 0 to 3 (higher is better). A pitcher's move affects steal attempts and base advancement of a runner on first if he's being held on. The better the move, the less chance of successful advancement.

Durability -
Rates how long a pitcher can be expected to go while retaining his initial effectiveness: range for starters 0 to 4, range for relievers 1 to 3 (lower is better).

You will have to learn to sense when your pitcher really loses it. A "4" rated starter generally can be expected to tire beginning in the seventh inning, a "1" rated starter in the ninth, and a "1" rated reliever in his fourth inning of work.

BB -
Rates the frequency of hit-batters: 0 or no rating (0 is better). A "0" rating reduces the number of batters hit by the pitch.

BK -
Rates the frequency of balks: 0 or no rating (0 is better). A "0" rating
reduces the number of balks.

WP - Rates the frequency of wild pitches; range 0 to 3 (lower is better). A lower rating reduces the number of wild pitches.

HR - Rates the tendency to prevent or give up home runs; possible ratings are G, H, L, M, or no rating. If a pitcher has a rating of G or H (H is better), he will allow fewer home runs. If a pitcher has a rating of L or M (M is worse), he will give up more home runs.

Season and Game Statistics for pitchers - wins (W), losses (L), saves (S), winning percentage (PCT), earned run average (ERA), games started (GS), games started (ES), innings pitched (IP), hits (H), runs (R), earned runs (ER), home runs (HR), total walks (TBB), hit-batters (HB), strike-outs (SO), wild pitches (WP), balks (BK).

-- END OF GAME OPTIONS

A game can end in several ways: one team can win after the regular nine innings or in extra innings, the game can be rained out, one team can forfeit the game by not being able to field nine eligible players, or the managers may choose to "call" the game using [CONTROL] [X].

When the game ends, you will be given these options:

[U] Update win-loss records - Update will determine the winning team, if there is one, and if the teams come from the same data diskette and the same organization, it will add one to the Wins column for the winner and one to the Losses column for the losing team. It will also recalculate the games behind (GB) for all teams in the division. These updates are displayed on the Team Changes screen. Update cannot be used for PROFESSIONAL BASEBALL.

Important note: Only an official game has a winner or loser. For the updating option, an official game is one that has gone 4 1/2 innings if the home team is ahead, or 5 innings if the home team is behind, whether the game was ended by rain or by [CONTROL] [X]. A game that ends in a tie is not considered an official game for the purposes of this program. A forfeited game is an official game. (A game is forfeited when one team is unable to field a complete line-up). Only official games can be used to update records.

Updating and printing can be done in either order. The other options below - [S] and [R] - destroy the game statistics and eliminate the possibility of updating the win-loss records automatically with the current game results (but see [C] Correct).

[S] Same Teams in Same Park - Allows you to play another game with the same teams in the same ball park. If you want a different home team or if you want to select new rules, you must use the [R] Restart option below. [S] Same Teams asks you new for a new line-up for each team.

[R] Restart - Takes you back to the Rules and Data Screen, from which you will be able to change the rules, speed of dynamic decisions, sound, and the teams being played.

Important note: To review the game performance of a player screen at the end of a game, press [CONTROL] [D] or [CONTROL] [D], then [D] Display, followed by the appropriate player identification ([A]...[Z] or [1]...[9]). This must be done before choosing [S] Same Teams or [R] Restart, otherwise the game statistics will have been erased.

- INTRODUCTION TO DRAFTING

DRAFT will make you Commissioner, owner, general manager, and manager at the same time. You can set up your own baseball organization with leagues and divisions. Draft your own teams. Establish a farm system. When you have set up a league, be sure to send in your customer registration card to receive news of program updates and enhancements.

[How to Load Draft]

1. Put the Draft Diskette in drive 1 and side A of the Data Diskette in drive 2.

2. Turn on the computer, or, if it's on, simultaneously press [CONTROL] [Open Apple] [RESET].

The Copyright Screen will appear, followed by the Create/Modify Organizations Screen.

- CREATING A NEW ORGANIZATION

For each organization you wish to create, decide how many leagues you want (up to 2), how many divisions (up to 4 in each league, up to 6 total), and how many teams in each division (up to 14 in each division; up to 50 in each organization; up to 100 teams in all including PROFESSIONAL BASEBALL).

Below are three examples of baseball organizations that could be created:

[Example 1]

Organization Name: Home Baseball
League name(s): Home League
Division(s): Div 1 Div 2
Team name(s): BUDAPEST Bombers BUDAPEST Farm
HONG KONG Kongers HONG KONG Farm
WOONSOCKET Rockets WOONSOCKET Farm

[Example 2]

Organization Name: Sunbelt League
League name(s): ---
Division(s): ---
Team name(s): TAMPA Zoo's

[Example 3]

Organization Name: Office Baseball
League name(s): League 1 League 2
Division(s): Div 1 Div 2 Div 1 Div 2
Team name(s): BALT CAL CH1 ATL
HOS CINC MONT CIN
CLE KC NY HOU
DET MIN PIT LA
MIL OAK PIT SD
NY SEA STL SF
TOR TEX

Notice that the organization title, Office Baseball, has the same structure used for major league baseball. Some people may want to replay the actual season represented by the Data Diskette. The Office Baseball organization will allow you to do this and keep team records and make roster changes as they actually occurred during the season represented by the Data Diskette. The rosters of the organization PROFESSIONAL BASEBALL cannot be modified, and neither can its win-loss records, but its rosters can be copied.

[Setting up the Organization, Leagues and Divisions]
Decide how best to structure your new organization (see examples above), and follow the steps listed below.

Important note: In draft, pressing [RETURN] will advance you to the next screen. Pressing [ESC] will bring you back to the previous screen.

<Create the Organization>

1. Press the number [2]..[6] under which you wish to store the name of your organization.
2. Type the name as you want it to appear on the organization list. You are allowed up to 25 characters. If you are planning to have only one league in your new organization, you may wish to name the organization using the league name — see example 2 above.
3. Press [RETURN]. A highlighted pointer will appear where the league names will be entered.

<Create the First League>

4. Type the name of the first league (20 characters maximum).
5. Press [RETURN]. A highlighted pointer will appear under the league name.

<Create the Divisions in the First League>

6. Type the name of the first division in the league. Up to 20 characters are allowed. Skip this step if you do not want any divisions in this league.
7. Press [RETURN].
8. Repeat steps 6 and 7 for additional divisions. Enter up to four divisions if you are planning to have one or two league, up to six if you have no leagues.

Hint: you may wish to establish a farm system as a division. Each FARM division would have the same number of teams as each PRO division (see example 1 above).

<Complete the Organization>

9. Repeat steps 4 through 8 for the second league.
10. Check that the organizations, leagues, and divisions are as you want them. If you have any changes, use [R] Rename and [D] Drop to correct them.

You cannot [D] Drop a league or division. You can only [D] Drop an organization. If you [D] Drop the organization, you will lose all of its teams and rosters. You can [R] Rename an organization, league, or division.

11. When you have finished naming the organization, leagues, and divisions, press [RETURN] to continue. The Add/Select Teams Screen will appear.

[Adding Teams to the New Organization]

1. Using [SHIFT] [1], choose the league to which you wish to add a team. Your choice is highlighted.
2. Using [SHIFT] [2], or the right/left arrow keys, choose the division to which you wish to add a team. Your choice is highlighted.
4. Type the team name (up to 15 characters).
5. Press [RETURN]. The arrow cursor will remain on the same line.
6. Type the team nickname (up to 9 characters). This name will be used on the line score on the Game Screen.
7. Press [RETURN].
8. Repeat steps 3 through 7 for the remaining teams in the division.
9. Repeat steps 2 through 8 for each division in the league.
10. Repeat all of the above for each league in the organization.

When all of the teams for all divisions have been named, you are ready to add players to your teams.

[Adding Players]

You may add players by either exporting an entire roster from an existing team and importing the roster to a new team, or by drafting individual players.

[Exporting and Importing]

To copy an entire roster from one team to another, use the [E] Export and [I] Import commands. [E] Export will copy the roster of a team into memory. [I] Import copies that roster under a new team name and writes it to disk.

This process is useful for setting up your own league in which you can modify to reflect roster changes made during the actual season. Try copying one of the teams in PROFESSIONAL BASEBALL to a new team with no current players.

To [E] export the team roster:

1. From the Create/Modify Organizations Screen, press [1] to highlight PROFESSIONAL BASEBALL (or another organization that contains the roster you want to copy).
2. Press [RETURN] to proceed to the Add/Select Teams Screen.
3. Choose the league and division of the team you wish to copy using [SHIFT] [1] and [SHIFT] [2].
4. Highlight the team using the up/down arrow keys.
5. Press [E] Export to load the team into memory.
6. Press [ESC] to return to the Create/Modify Organizations Screen.

Important note: You may [E] Export from any organization, not just from PROFESSIONAL BASEBALL.

To [I] import the team roster:

1. Select or create the organization which will contain the copied team. The organization will be highlighted.
2. Press [RETURN] to advance to the Add/Select Teams Screen.
3. Choose the appropriate league and division using the [SHIFT] [1] and
   [SHIFT] [2] keys.
4. Add or select the team to contain the roster you are copying. The
   team will be highlighted.
5. Press [I] Import to write the entire exported roster onto a disk.
   Importing will erase any players previously drafted for the team
   highlighted.

Important notes: You may not [I] Import to PROFESSIONAL BASEBALL. A
roster may NOT be copied from one data diskette to another.

- DRAFTING A TEAM
To add individual players to a team roster, proceed to the Add/Select
Teams Screen.
1. Press [SHIFT] [1] to select a league.
3. Press the up/down arrow keys to select a team.

[The Draft Screen]
The upper left corner shows the name of the team being drafted. The
upper right corner shows the number of major league baseball players
available for the draft and the year (season) of the Data Diskette.
The top part of the Draft Screen displays nine names of major league
baseball players. For a non-pitcher, the name is followed by primary
position (Pos), defensive rating at that position (D), batting side (B),
and speed (Sp). For a pitcher, the name is followed by position (Pos),
throwing arm (T), pitching grade (GR), and control ratings (Ctrl).
The nine names that first come up on the screen are the first nine names
in an alphabetical listing of all the players. You can move through the
player list in several ways:
Up and down arrow keys will scroll the list of names.
[F] First will take you home to the top of the list.
[L] Last will take you to the end of the list.
[S] Search will take you directly to a part of the list you specify -
press [S], then type the first three letters of the player's name, and
press [RETURN].
[U] Update will save your roster.

The lower part of the screen displays the current team roster.
Twenty-six (26) spaces are provided to allow an empty space between
the pitchers and non-pitchers. If you choose to, you can draft up to 26
players.

[Adding a Player to The Roster]
The roster that you create here will be displayed in the same order on
the Line-up, Pinch Hitter/Runner, and Substitution Screens. Using one of
the methods described above, find the player you wish to add to the
team; that is, bring his name into view on the list (any position on the
list will do).

If you know where on your roster you wish a player to appear, press [F]
Put, press the number [1]...[9] of the player you wish to add, then press
the letter [A]...[Z] of the position where you want him to appear
on the roster. His name will be moved there. Be careful, since [P] Put
will overwrite a player in the select position.

If you do not care about position on the roster, press [A] Add and the
number [1]...[9] of the player you wish to add. His name will be added
to the roster in the first available place from the top (non-pitcher) or
from the bottom (pitcher).

Important notes: It is possible to add any player to any team that you
have created even if he appears on other rosters in the same
organization, same league, same division, or same team. (You can even
draft a team composed entirely of your single favorite player.)

DRAFT only works with a single Data Diskette. You cannot draft players
from different years onto the same team unless you are playing with an
Old Timers Diskette.

At any time you may back up to the previous screen using [ESC]. If you
[ESC], the results of any team creation or drafting will be saved.

[Releasing a Player]
You can drop a player from your roster by pressing [R] Release, then the
roster letter of the player to be dropped.

Hint: after a game, an INJURED player can be dropped from his regular
roster and added to his FARM team roster. His name will then not appear
on the regular roster until you want him to rejoin the team.

[Trading Players]
Simple player trades can be accomplished by releasing players from their
current teams and drafting them onto their new teams.

[Considering a Player for the Draft]
As you are adding players to a roster, you can get more information
about any of the players listed on the screen by pressing [O] Display
then the number [1]...[9] or roster letter [A]...[Z] of the player to
study. Make the necessary disk changes and the Player Screen will appear
(see THE PLAYER SCREEN).

[A Few Examples of Common League Rules]
Rules about drafting players, order of the draft, quality of the players
drafted, replacing injured players, using farm clubs, using starters and
releivers, using players out of position, and many other organizational
aspects of the game are left to you and your fellow managers. APBA Major
League Players Baseball is a basic management system that is flexible
enough to accommodate many league rules and structures. It is
recommended that rules be established before league play begins. Below
are some examples of common rules.
A team has a 25-player roster.
A team must have at least four starting pitchers.
A starting pitcher may not start before his turn in the rotation.
A starting pitcher may not relieve if there is a reliever available (unless he is also rated as a reliever).
A reliever must rest every third (or fourth) game.
INJURED players must sit out only one half of the specified injured time (used for leagues with shorter seasons).
Players are separated into groups of comparable skill/value. Only a certain number of players can be drafted from each of the higher level of skill, providing for more realistic teams.

- MODIFYING AN ORGANIZATION

From the Create/Modify Organizations Screen, press [2]...[6] to choose the organization to be modified.

Your choices are now to:

[D] Drop the entire organization, including leagues, divisions, teams, roster, win-loss records, and standings (GB = games behind).
[R] Rename an element in the organization - either the [O] Organization, [L] League, or [D] Division (use the backspace to edit the name in each case.)
[C] Clear the WIN-LOSS records for all teams in the organization.

To modify a team within the organization or to add a team, press [RETURN]. The Add/Select Teams Screen will appear.

To [A] Add a team, see ADDING TEAMS TO THE NEW ORGANIZATION.
To modify a team, press [SHIFT] [1] to select a league, press [SHIFT] [2] (or the right/left cursor keys) to select a division, and press the up/down arrow keys to select a team. You are now ready to modify the team highlighted.

Your choices are to:

[D] Drop the entire team, including roster, win-loss record, and standing.
[R] Rename the team, first the city name, then the nickname.
[C] Correct the W-L record, first WINS, then LOSSES.

To modify the team roster, select the team, press [RETURN], and add or release players as described above in DRAFTING A TEAM.

[End of Documentation]
The logic in Lines 840 and 850 causes the DIM statement in Line 860 to reserve exactly enough space for the entries in the first root directory or sub-directory. Line 840 uses HIMEM to locate the 1K buffer established for the OPENed directory file. Based on technical knowledge of file handling techniques used by BASIC.SYSTEM, the logic of Line 850 then picks up the number of entries as stored in the first block describing the entries in the directory.

The actual display or print of the desired catalog starts in Line 820. Notice the OPEN with the TDIR parameter in Line 820. Under ProDOS, a directory file may be opened and read just like a sequential file. What is returned by each INPUT statement is the same as that displayed by a CATALOG command with things like file name, file type, etc. returned in a fixed format. With this in mind, Line 870 reads the volume or subdirectory name, ignores the following blank line, and the CATALOG header line.

Lines 880 to 940 input and collect each line in the CATALOG display. This logic uses the BLOCKS FREE... line as an end of file marker instead of using ONERR processing to trap a true end of file.

After a line for a file is read, the input is processed by the subroutine in Lines 1540 to 1780. This subroutine returns a string whose contents are as follows:

<table>
<thead>
<tr>
<th>Position</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-6</td>
<td>File status. &quot;<em>&quot; = locked. &quot;</em>&quot; = unlocked</td>
</tr>
<tr>
<td>7-16</td>
<td>File name</td>
</tr>
<tr>
<td>17-31</td>
<td>File type, e.g., SYSTEM PROGRAM</td>
</tr>
<tr>
<td>32-40</td>
<td>Modification date dd-mm-yy</td>
</tr>
<tr>
<td>41-50</td>
<td>Right justified file length in terms of K</td>
</tr>
<tr>
<td>51-58</td>
<td>Left justified file length in terms of K</td>
</tr>
</tbody>
</table>

This string is then added to the array for the volume or subdirectory entries.

Lines 990 to 1100 sort the array in ascending order by file name and/or directory name. This code is a modification of the code presented by Garry G. Kiziak in "The Compact Sorter", NIBBLE Vol4/No. 1. It is a very fast sort routine worth repeating here in its more general form.

\[
\begin{align*}
10 & \text{ Z } = 1 \\
20 & \text{ Z } = 3 \times \text{ Z } + 1 : \text{ IF } \text{ Z } < \text{ NUM} \text{ THEN } 20 \\
30 & \text{ Z } = (\text{ Z } - 1) / 3 : \text{ IF } \text{ Z } < 1 \text{ THEN RETURN} \\
40 & \text{ FOR } \text{ I } = \text{ Z } + \text{ L TO } \text{ H} : \text{ J } = \text{ I } - \text{ Z} \\
50 & \text{ K } = \text{ J } + \text{ Z} : \text{ IF } \text{ A } = \text{ MIDS} (\text{NAS}(\text{J}), \text{M}, \text{N}) \text{ THEN } \text{TEMP} \text{ = } \text{NAS}(\text{J}) \\
& \text{ NAS}(\text{J}) = \text{NAS}(\text{K}) + \text{NAS}(\text{K}) \text{ = TEMP} \text{ = } \text{J} \text{ = J + Z : IF } \text{J} > \text{ L THEN 50} \\
60 & \text{ NEXT I : GOTO 30}
\end{align*}
\]

This subroutine, Lines 310 to 580 represent the code to provide the main menu control. Once a function is performed, control always returns to Line 360.

Lines 590 to 4120 provide the logic to display a catalog or print a catalog. Using a simple flag in PF$, the same code can be used for both functions. The logic starts with the necessary code to prompt for a volume or subdirectory name and initialize the display or print process. This is performed in Lines 590 to 810.
To quote Garry, "this routine is supposed to be a modified SHELL METZNER sort. It might be called the SHELL SHUTTLE sort since it is also a modified version of the SHUTTLE INTERCHANGE sort". Based on my extensive use of the algorithm, I have found it to be very fast. Garry also presents a machine language form which really makes a sort in BASIC fly.

With the array sorted, Lines 1840 to 1950 display the contents of the array. Each line of the display starts at the left margin. When the array is completely displayed, Lines 2160 to 2170 display the final line showing space free, space used, and total space on the volume. Control is then passed back to the main menu logic starting at Line 360.

Going back to the display of the array process, if Line 1940 finds a directory entry in the array, control passes to Lines 2230 to 2680. Basically, this logic reads the entries for the subdirectory, sorts them, and displays them.

First note Lines 2230 and 2240. The program could have been designed to dimension the subdirectory arrays once at the beginning of the program. This has a couple of problems. First, there is the problem of how big to make the arrays. Subdirectories are not limited to 51 entries, therefore, too small a dimension might make the program bomb with a subscript out of range error. Too large a dimension might make the program bomb with an out of memory error. To minimize this problem, Line 2230 results in a D1 which is the number of directory blocks in the subdirectory. Each block can hold a maximum of 13 entries, therefore, Line 2240 dimensions an array with a proper size to accommodate the subdirectory entries.

The second problem involves garbage collection. Even though I force garbage collection at appropriate points in the logic, after an array is used, its strings still exist in string storage. When the array is used again, new strings are built and, based on experience, without deleting the array after it has been used, the garbage collection logic is invoked more often.

To minimize problems with potential out of memory conditions and garbage collection, the array is deleted after it has been used.

With this in mind, let's continue with the discussion of processing a subdirectory under the root of the volume. Lines 2290 to 2260 read the subdirectory entries into an array in a manner exactly as described for the root entries. In Line 2410, if there are no entries in the subdirectory, the array is forced to be completely processed. Lines 2420 to 2540 sort the array using the sort algorithm described earlier. Lines 2550 to 2650 display the entries in the subdirectory with each line indented over three spaces. The final result of the display or print provides a layout in which subdirectories can be quickly located.

Once the subdirectory has been completely processed, Line 2660 deletes the array. Garbage collection is forced and control is then passed to Line 1950 to continue processing of the root entries.

A subdirectory under the root can also contain subdirectories. If Line 2660 detects a subdirectory, control is passed to the logic in Lines 2740 to 3220. This logic is an exact duplicate of the logic in Lines 2230 to 2680 with D1 replaced by D2, R replaced with D1$, and L1 replaced by L2. Each displayed or printed line is indented over five spaces from the left margin. When this subdirectory is completely processed, Line 3200 deletes the array, garbage collection is forced, and control is passed to Line 2650 to continue processing in the first level subdirectory.

A subdirectory under a subdirectory can also contain subdirectories. If Line 3180 detects a subdirectory, control is passed to the logic in Lines 3320 to 3750. Again, logic is duplicated with D2 replaced by D3, D1$ replaced by D2$, and L2 replaced by L3.

The logic described here assumes only three levels of subdirectories under the root. Modifying the logic to include another level is relatively easy. Add a Line 3715 to look for a subdirectory entry using any Line 3180 as a model. Duplicate Lines 3320 to 3750 starting after the end of the program at Line 4870. Now change each D2 to D3, each D3 to D4, each D2$ to D3$, and each L3 to L4. Add a couple of spaces to the copied Line 3640 and delete a couple of periods from the copied Line 3690. Finally replace the GOTO 3190 in the copied Line 3750 to GOTO 3720.

Lines 4180 to 4370 handle the LOCK A FILE logic. Lines 4430 to 4620 handle the UNLOCK A FILE logic. Lines 4680 to 4870 handle the START UP APPLEWORKS logic. The logic of these three functions is reasonably straightforward and require no technical discussion.

This program should be a very useful addition to any library - it certainly has been to mine. It has been tested by several non technical types like my wife who rarely work outside the world of Appeworks.
DOCUMENT apple.mechanic

APPLE MECHANIC DOCUMENTATION

SHAPE EDITOR/FONT EDITOR:

USE KEYS 1 thru 6

KEY #1 EDIT- shape
KEY #2 SAVE- shape
KEY #3 LOAD- shapes
KEY #4 CATALOG: disk
KEY #5 DRIVE- drive/slot change
KEY #6 DISPLAY- shapes
ESC KEY EXIT- program

#1 EDIT:
Press key #1-view shape table

RIGHT ARROW

LEFT ARROW view shapes, up to 12, in memory.

ZERO, COLON, HYPHEN- shapes 10,11,12 to view.

RETURN- give you two rectangles on screen and flashing cursor.

ARROW KEYS,A,Z - right, left, up, down.

SHAPE EDITOR- limit 999 vectors. Change max in beginning of program.

X(erase)- Use X as a "backspace" key.

P=PRE- PLOT-After you have selected shape, before RETURN select P, now you can draw with series of dots. When finished with P hit RETURN.

PLOTTING TIPS- To move plotting course without changing the drawing use SPACE BAR.

HOW TO USE SHAPE TABLES:

Set ROT & SCALE to minimum values 0 and 1. Then decide where in memory to load shape table. Example 25000 is a nice round number.

10 ROT=0: SCALE = 1
20 SH = 25000:D$=CHR$(4)
30 D$;"BLOAD SHAPES,A";SH

SETTING THE SHAPE TABLE POINTER:

To tell your APPLE where your shape table is(location 25000) you need two pokes-

40 POKES 232,SH-INT?(SH/256) * 256
50 POKES 233,INT?(SH/256)

These two pokes put 25000 into the shape table pointer at memory locations 232 & 233. ALWAYS INCLUDE THE TWO POKES AT THE BEGINNING OF YOUR SHAPE TABLE PROGRAMS OR YOU'LL LOSE THE WHOLE SHAPE. To alternate between shape tables, simply re-poke a new location into the shape table pointer at 232,233 each time you change.

OTHER EXAMPLES:

100 FOR X = 0 TO 279
110 DRAW 3 AT X,100: REM AT X,Y

XDRAW- works like DRAW but ignores HCOLOR and plots dots in the opposite color of the dot being plotted.

BLACK(0/4) IS OPPOSITE WHITE (3/7) GREEN(1) IS OPPOSITE VIOLET(2) ORANGE (5) IS OPPOSITE BLUE(6)

HI-RES COORDINATES: To tell a shape where to appear, specify the coordinates (horizontal, vertical) of the shapes starting point. Don't specify outside of screen limits or it will CRASH.

HORIZONTAL: 0 TO 279 VERTICAL: 0 TO 191 VERTICAL W/4 TEXT LINES: 0 TO 159

DRAWING WITHOUT COORDINATES:

After first shape is drawn, you don't need to specify coordinates for the next DRAW or XDRAW. Each successive shape without coordinates will begin at the point where the previous shape stopped.

SCALE:

You can enlarge a shape by setting SCALE equal to a number, 2-255 or 0. A SCALE of zero is equivalent to a SCALE of 256.

ROT:

You can rotate a shape by setting ROT before you draw-

ROT=0: NORMAL
ROT=16: ROTATED 90 CLOCKWISE
ROT=32: *upp Side Down
ROT=48: 270 CLOCKWISE

ROT values between the above only apply when SCALE is set larger than minimum(1). ROT values greater then 64 simply repeat the cycle until ROT=255

MOVING A SHAPE:

More than one way to move a shape. Basically you have to DRAW the shape, ERASE it, and REDRAW it in a new position. This XDRAW does all that

100 FOR X = 0 TO 279
110 XDRAW 5 AT X,100: REM DRAW SHAPE
115 XDRAW 5 AT X,100: REM ERASE SHAPE
120 NEXT X

With DRAW you erase the shape by re-DRAWing it in the background color.

OTHER EXAMPLES:

100 FOR X = 0 TO 279
110 HCOLOR=3:DRAW 5 AT X,100: REM DRAW
120 HCOLOR=0:DRAW 5 AT X,100: REM ERASE
120 NEXT X

OR

113 FOR I = 1 TO 50: NEXT

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 89 of 1262
OTHER HI-RES MANIPULATIONS:

HGR -clears page 1 to black
HGR2-clears page 2 to black
HCOLOR=X:HPLOT 0,0:CALL 62454- clears hi-res in HCOLOR X

The following "switches" do not clear the screen, but REVEAL whatever is currently on the page 1 or 2 text, hi-res, or lo-res screens:

POKE 49323,0-view hi or lo res
POKE 49233,0-view text screen
POKE 49234,0-view full graphic,lo or hi res
POKE 49325,0-view graphics plus 4 text lines(VTAB 21-24)
POKE 49236,0-view page 1 (hi,lo res or text)
POKE 49237,0-view page 2
POKE 49238,0-view lo res
POKE 49239,0-view hi res
POKE 230,32- allows drawing on page 1 (L)LOAD HI-RES PICTURE:
POKE 230,64- allows drawing on page 2
POKE 230,96- allows drawing on page 3 (not directly viewable)

PRINT PEEK(228) - prints HCOLOR code
PRINT PEEK(233) - prints current SCALE value
PRINT PEEK(249) - prints current ROT value
CALL 62923- stores last plotted coordinates at 224-226
PEEK(226) - VERTICAL position during last CALL 62923
PEEK(224)+PEEK(225)*256 - horizontal during CALL 62923

FONT EDITOR:
95 hi res characters Use with HI-WRITER, XTyPER

SHAPE FOR large fonts TAKE UP MORE MEMORY AND DISK SPACE THAN ANY OTHER HI-RES FONTS. 18 SECTORS FOR LARGE, 7 SECTORS FOR SMALL DOS TOOLKIT ONLY USE 5 SECTORS, REASON IS FLEXIBILITY AND ATTRACTIVENESS.

LARGE FONTS vs SMALL FONTS:
All font names in APPLE MECHANIC are preceded by a \{shift-M\}. All are large-height fonts, except those with "small" in their names. Another way to tell-by sectors. Full 96 character large fonts will be 16-20 sectors, small fonts will be 6-10 sectors.

TO USE FONT EDITOR:
"RUN FONT EDITOR" USE 1-6 KEY INSTRUCTION IN BEGINNING OF THIS PROGRAM
LOAD w/KEY3 FONTS YOU MIGHT WANT TO SEE

EDITING: Key #1-gives you a striped flashing cursor, use ARROWS or A, Z keys. Also see ASCII value of the key that will type character. Hit RETURN, THREE OPTIONS:

[I]-Grid imprint-Prints selected character as a 10x blowup of grid.
[E]-Erase/Redraw- Temporarily erases character so can be redrawn.
[S]-Shadow Imprint-Prints a shadow of character on 10x grid. Shadow is for reference or tracing. does not effect final shape.

SPACE BAR changes cursor for SOLID to OUTLINED and back, representing PLOT and NO-PILOT.

DISPLAY- KEY #6:
Select 6 and type as you normally would. ESC = between upper and lower case. To type a save use XTyPER or Hi-WRITER programs

XTYPER PROGRAM:

Use this program to type Page One hi-res screen, up to three shape-fonts at a time. To start, type "RUN XTyPER" and make sure disk has at least one large or one small shape-font on it including every font you intend to use.

MAIN MENU:
Running XTyPER or Ctrl-R while typing display Menu & lets you load fonts, clear hi-res screen, load and save hi-res images and quit program.

(1,2,43) LOADING FONTS:
You can load up to 3 large or small fonts. Select 1,2, or 3 and enter name of font. (example- \"BLOAD FONTNAME,A18880\")

(X)CLEAR HI-RES SCREEN:
Hit X to clear, if you have no image loaded on hi-res page 1. If you get a snowy screen, type Ctrl-R, X, Y, and RETURN

(L)LOAD HI-RES PICTURE:
Select L to load a hi-res picture from your disk.

(S)SAVE EXISTING PICTURE:
WARNING: Lock files so you don't accidentally enter a font name when saving a hi-res image. Note*** To see hi-res picture on page 1 when not running a program type HGR(return) and BLOAD PICTURE, AS2000(return), where "picture" is the name of the image you want to see.

(CATALOG:
Select C to catalog main menu. You can check file names fonts or hi-res. You will be given the option also of locking and unlocking files.

(Q)QUIT:
Select Q lets you quit XTyPER. Message "GOTO 2000 TO CONTINUE" if you "RUN" instead of "GOTO 2000" you would have to reload your fonts.
This method works only with white type on a black background. Align vertically, and position its left edge so it touches any part of the character to be erased.

Ctrl-W wipe out:
Erase entire line of type in black from the top of the caps cursor down.

OVERTYPING:
Place cursor over character, aligning the top and left edges, change typing color (0-7) to the color of the background, and type over the characters to be erased.

(CTRL-F) FONT CHANGE:
Select Ctrl-F will allow you to type a new font. Can't select a font number that has not been loaded into memory.

(CTRL-G) COLOR CHANGE:
Select Ctrl-G gives you a new typing color. XTYPER WILL NOT LET YOU CHOOSE AN ALTERNATE COLOR #7 (WHITE) OR #4 (BLACK).

(CTRL-G) GRID:
Select Ctrl-G will display a 4x4 grid. Hit Ctrl-G again will erase the grid. DO NOT TYPE OVER GRID.

(CTRL-R) RETURN TO MAIN MENU:
Select Ctrl-R will give you main menu.

LEADING NOTES (LEADING):

DEFAULT ERASE COLOR:
Second non-REM program line in Xtyper. The variable BG is the erase color used by Ctrl-B and Ctrl-W.

HI-WRITER PROGRAM:

Hi-Write is meant to be used as part of your Applesoft programs!!!!
You can add instructions after line 500 to Hi-Writer instead of Xtyper as your main program, save disk space and typing.

LIST LINES 50-53 OF HI-WRITER:
50 FLAG=0:REM (0=LOAD, 1=DON'T)
51 FT$(1)= "BLOCK"
52 FT$(2)= "SMALL STANDARD"
53 FT$(3)= "APPLE"
The variable FLAG in line 50, tells Apple whether or not to load the three fonts form Lines 51-53.

Hi-Writer lets you access up to three fonts at one time. Let FLAG =0 and enter the names of your three fonts at lines 51-53. If you only want one or two fonts enter a blank FT$(3)="".

PROGRAM VARIABLES: (lines 90-500) do a GOSUB 100

A$:- Words to be printed
FT:- Current Font Number (1-3)
FT3$: Name of Font 3 to be loaded
VT:-VTAB (1-24)
HT:- Htab (1-40)
IN:- Inverse (1=Yes, 0=No)
CT:- Auto-Center (1=Yes, 0=No)
HC:- Hcolor type (0-7)
CL:- Hcolor for Clearing Screen (0-7)
RT:- Rot value for printing (0-3)

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 91 of 1262

Apple II Computer Info

520 A$="HELLO":GOSUB 100

APPLE/LOWER CASE
590 A$="B@EAGLE @B@ROS":GOSUB 90

FT & FT3$
Set FT equal 1, 2, or 3 any time you want to change fonts. You can replace 3 as many times as possible. To replace 1 & 2 change lines 51 & 52 reset FLAG in line 50 to zero, and re-run the program.

CT & GOTO 400: CENTERING

(CTRL-R) RETURN TO MAIN MENU:
Select Ctrl-R will give you main menu.

POKE TXT,0=reveals the lower sixth of the text screen V TAB 21-24
POKE FULL,0=switch to full hi-res with text screen "hidden" behind.
TEXT=switch you entirely over to a text screen without erasing hi-res.
POKE HIRES,0= switch you back to hi-res without clearing the screen.

OUT OF MEMORY:
5000 ? CHR$(4):"RUN NEXT PROGRAM" insert in your program and entire new version of Hi-Writer will continue.

NON-KEY CHARACTERS:
CHR$(95)=underscore
CHR$(92)=backslash
CHR$(91)=left square bracket

ERRORS:
ONERR GOTO 450 in line 55. Type "TEXT" or hit RESET to find and correct the error.

FONT SPLITTER:
Run FONT SPLITTER to reduce the number of characters in a font. Follow prompts on screen and let Apple do rest.

PAGE COPY:

With Page Copy text files, you can move image already in memory for one page to another.

20 INPUT "MOVE IMAGE FROM PAGE:"; A
30 INPUT "MOVE IMAGE TO PAGE:"; B
40 POKE 60,0: POKE 61,A*32
50 POKE 62,0: POKE 63,A*32+32
60 POKE 64,0: POKE 65,B*32+32
70 POKE 66,0: POKE 67,B*32
80 CALL-468

SHAPE ANALYZER:

8 - Hyphen - enter temporary "mode" ESC - will exit for mode RETURN - set default value where appropriate.

KEY #6
Arrow keys, A, Z

KEY #7
Draw, Xdraw

KEY #8
Move current shape on screen A, Z, ARROWS, move 9 units vertically and horizontally. S, X, K, L, - parallel 1 unit at a time

KEY #9
Arrow increase and decrease by 16(90): A, Z, do the same by unit of 1. Hitting RETURN changes to zero(normal)

KEY #0
Arrow changes value, for increase or decrease A, Z,

KEY #1: Arrow increases and decreases HCOLOR TEST (0-7). B = background
N=shape RETURN reset HCOLOR to 3 background 0

KEY #
Analyze a shape vector by vector.
1=shapes permitted in table
2=large font shape
0=non-font.

Enter a shape number and watch the screen. Reading left to right you will see each vector of the shape (0-255). Inverse = Move & Plot. Normal = Move & Don’t Plot. Hit ESC to see graphic display of shape, or RETURN for another vector analysis.

BYTE ZAP PROGRAM:

CURSOR

Arrow keys move numerically up or down one byte A, Z, -move up or down one row RETURN - move up or down 16 bytes in the direction the cursor's arrows are pointing

KEY #1, #2, #3
1 and 3 tells program to read the previous and next sector on disk. 2 will let you name sector you want to read. Enter track and sector number in dec. or hex($hex)

KEY #4
R/HEX FORMAT
D/DECIMAL FORMAT
A/ASCII FORMAT
DOCUMENT appleworks

A data base is simply a program that keeps track of groups of data, called records. Each record is a group of entries in different categories, one entry from each category.

Required equipment:
Apple //e or //c
Appleworks boot disk and system disk

** Note **
in the lower right-hand corner, an approximate memory available indicator will appear. If you have a //e with ext. 80-col. Card or a //c, the number will be 55k. An un-expanded //e will show 10k.

To begin, insert the Appleworks startup disk and press ctrl-@-reset to boot up. (or if the Apple is off, turn it on.)
The disk will load PRODOS and ask you to switch disks. Do so and press return.

Next you will enter the date. (if you have a clock card in slot2 or 4, you should see a second blank record. Press @-z open-appl z. You are now in multiple-record layout. (before you were in single record layout.) if you had many records, you would see them all "at-a-glance".

That's basically a data base. Here are some helpful features Apple threw in:

- @-a = open-Apple a.
- @-b = open-Apple b.
- @-c = open-Apple c.
- @-d = delete record
- @-e = toggle between edit cursor and insert cursor
- @-f = find a record
- @-g = get another desktop file
- @-h = screen dump
- @-i = insert a record
- @-m = move a record onto/off of clipboard
- @-n = change category name or file name
- @-q = geto another desktop file
- @-r = change record selection rules
- @-s = save current file
- @-v = set a default value for a category
- @-w = clear to end of entry
- @-x = toggle single-record/multiple-record layout
- @-y = move through multiple-record layout
- @-z = open-appl z

Suppose you want to make a data base to keep track of information on your home appliances. You will need categories such as "item" (blender), "serial number" (#JWM233949272), "model" (super-blend), "make" (GE) , date of purchase" (1/2/82). Each item in parenthesis is an entry in each category. You boot up Appleworks, select #1 on the main menu, select 4 on the sub-menu (data base file), and select 1 on the sub-sub-menu (from scratch). You then enter the name of the file ("appliances"). You enter the category names, one at a time, press return after each. It will tell you to start adding records. Enter the sample entries above. When you are done you should see a second blank record. Press @-z (open-appl z). You are now in multiple-record layout. (before you were in single record layout.) if you had many records, you would see them all "at-a-glance".

Note: I will symbolize the open-Apple key with the "@". @-a = open-Apple a.
Now that we know what to do with a word processor we can find out how Apple intends for us to command it.

Restrictions:
- # of characters: 64k-10,000 128k- 56,000

** Note **
You don't have to hit return after each line. When printed out, the program will supply returns. Note the phrase "when printed." In your file, the text looks like one long line. Excessive line length can and will cause other word processors grief if you try and use Apple Writer /e or Apple Works files in them. So decide early on if it is worth the candle.

All you have to do is type. For lower case, release "caps lock".

Other keys of interest:
- @-c Copy text to/from clipboard
- @-d Delete text
- @-e Toggle cursors
- @-f Find text
- @-g Screen dump
- @-h Determine where page breaks will be when printed
- @-i Move text to/from clipboard
- @-j Rename file
- @-k Display printer options
- @-l Print document
- @-m Replace text with other text
- @-n Save file to disk
- @-o Set tabs (tab key)
- @-p Clear to end of line
- @-q Display returns and printer settings
- @-r Move through text (same as database)
- @-s Help
- @-t Move one word left
- @-u Move one word right
- @-v Move up 1 page
- @-w Move down 1 page
- @-x Sticky space (prevent 2 words form being separate by wrap-around)

Functions:
- @ABS(value) Absolute value of argument
- @AVG(list) Average value in list
- @BINT(value) Integer value of argument
- @MAX(list) Largest value in list
- @MIN(list) Smallest value in list
- @SQRT(value) Square root
- @SUM(list) Sum of all values in list
- @CHOOSE(value,list) Like BASIC "on x goto zzzz,zzzz,..."
- @ERRCHR prints "error"
- @LOOKUP(value,range) Looks for largest entry less than/equal to value
- @INT(value) Integer value of argument
- @MAX(list) Largest value in list
- @MEDIAN(list) Median value in list
- @MIN(list) Smallest value in list
- @range A list of adjacent cells (A10...A13) means cells A10-A13, inclusive.
- @list List of values (14,A22,B17-B16,D12...F12)

Restrictions:
- Apple intends for us to command it.
- You can put letter,numbers,or formulas in a cell. By lining up numbers the column, the number is the row. Cell A1 is in column A and row 1.
- Total # of cells available for use:126,873 (999 rows times 127 columns)
- To enter a label into a cell (letters explaining another cell), type a letter or a quote (") to signify a label. Then type the rest of the label.
- To enter a value, type a number, or, to copy another cell, a plus sign then the cell name (+B7 will copy the value in B7)
- To enter a formula, type a plus sign followed by the formula.
Q: What is the difference between @-m (move to clipboard) and @c (copy to clipboard)?

A: @-m will remove the information from where you got it and @c leaves the info. Where you got it and puts a copy where you're copying to.

Cut and Paste is a fancy term for moving text/records from one part of a file to a part of another file or a different part of the same file. This is done using the "clipboard" to hold the text while you select where to "paste" it.

If you have an Apple DMP and no other printers: You can do nothing. Dmp is the default printer.

If you have one of the following printers, you can select it when you configure:

- Apple daisywheel (dwp)
- Apple silentype
- Apple image writer
- Epson mx series or mx grafterx
- Epson rx
- Epson fx
- Qume sprint 5 or 11

If you have a dmp and a printer above: Select which one will be the main printer and select it. Put the other down as a secondary printer.

If the application has also been programmed to include the "MESSAGE CENTER" feature of GS/OS, the application program will then automatically launch the application program for that data file.

Making use of the "MESSAGE CENTER" feature of GS/OS must be specifically programmed into the application. Many applications were not programmed to make use of this feature. If an application is so programmed, it can not make use of the feature unless the data file icon parameters include the full pathname of the application program.

Many Apple IIGS users can not make use of this automatic application launch because they do not have an icon editor, do not understand the importance of providing an application pathname or do not understand how to use this feature.

Apple and "Appleworks" are trademarks of Apple computer, inc. The commands and functions are copyrighted by Apple computer, inc.

Epson, Grafterx, and Qume are trademarks of the respective companies.
File Dialog to appear. Only ProDOS 8 and ProDOS 16 application programs will be displayed. Select the application normally, that is, just as if you were going to launch an application or open a data file. Double click on the application's filename or click on the OPEN button. When you select the application in this way, the Open File Dialog will disappear and the full pathname of your application will appear in the long box below the icon.

If you click on the "Cancel" button in the Open File Dialog, nothing will change.

The other buttons in the Open File Dialog will operate normally.

PREVIOUS ICON

Clicking on this button will change the icon and pathname to the icon just before the current one in the file. If there is only one icon in the file or if you are at the last icon, clicking on this button will have no effect.

NEXT ICON

Clicking on this button will change the icon and pathname to the icon just after the current one in the file. If there is only one icon in the file or if you are at the last icon, clicking on this button will have no effect.

CANCEL

Clicking on this button will cancel the operation. The current icon file will not be saved to disk and no pathnames will be changed. The window will be closed and you can then open a new icon file.

DONE

Clicking on this button will bring up the Standard Save File Dialog.

If you change your mind about saving the modified icon file, you can abort the save by clicking on the "Cancel" button in the Standard Save File Dialog.

Icon files should ONLY be saved to the ICONS folder. GS/OS can not find icons anywhere else except in the ICONS folder.

The window will be closed and you can then open a new icon file.

So you decided to enlist in the arcade army, eh? Well, around here there's only one way to do things-- the army way! So stand up straight, wipe that silly smile off your face and listen up, soldier!

To begin

-------- Put the disk in the drive and turn the computer on. Watch the educational training film that appears on the screen. After you have memorized it, you can bypass it by pressing the <return> key.

Signing up

---------- Enter your serial number. (This is a number between 1 and 5, inclusive). The computer will ask you your name. Type it in. From now on, every time you boot the disk it will display your name, rank, and serial number. Never tell a foreign (or domestic) spy any more than that, it might lead to your demise. It's also against regulations in this army, we do things the army way!

To proceed to the training area, press the <esc> key. Once there, you will be greeted by the drill instructor. The di's primary occupation is the motivation of recruits. He will motivate you to pick one of five training areas. Should his methods fail to persuade you to make a decision, you'll be booted out of the arcade army and you'll have to reenlist if you ever want to amount to anything.

Watch out for land mines. They could turn up at anytime, just to keep you recruits on your toes. But there's not enough powder in them to waste you, only to teach you to watch where you're going. Get smart and maybe we'll remove the mines later.

Ordnance regulations

---------------------- The military hardware used in your training has some built-in features worth taking advantage of. The "p" key will pause the simulation. <ctrl-a> will toggle the sound effects <sp bar> or holding down both joystick buttons at the same time will allow you to bypass the music that follows failure during any task. Please note that often the reason for your failure will be pointed out on the screen with a small arrow. Study it carefully.

Rank

---- The purpose of your training is to work your way up to the rank of sergeant major. Right now you're a lowly civilian and unless you shape up you're going to stay one! Should you show some aptitude, you may earn your stripes as follows:

Recruit.............no stripes

Rank
**DISK LOADING INSTRUCTIONS**

Turn on the computer. Insert the diskette into drive 1 with the label facing upwards. If the GS Operating System is already up, insert the game disk into the drive. Click the mouse pointer twice on the TAITO.ARKANOID icon when it appears. Next, click the pointer twice on the ARKANOID icon. The game will now load. If you want to boot directly from the Arkanoid disk, reset the computer and the game will start automatically.

**CONTROLS**

This game is played with the Applemouse. When the title screen appears, press 1 for a one player game; 2 for a two player game. Pressing the mouse button automatically starts a one player game.

During game play:

- Press ESC to pause the game; press any key to continue play.
- Moving the mouse from left to right causes the Vaus to travel in the corresponding direction. Press the mouse button to release the energy ball or fire the laser.

**Option Keys**

- Control + R Restarts the game
- Control + Q Returns to the finder
- Control + S Turns the sound on/off
- Left Arrow Decreases Volume
- Right Arrow Increases Volume

**HOW TO PLAY**

The intergalactic carrier Arkanoid travels through the outer reaches of the galaxy, carrying planet Earth's remaining human survivors. They encounter DOH, a complex entity of incredible power. As the carrier falls prey to his attack, the crew escapes in the "Vaus" and enter a demention of living energy! The battle for freedom takes place over 33 levels of complex and intricate barriers. Will you survive the final onslaught of DOH?

Move the Vaus left and right. Use your skills to deflect an energy ball will gradually destroy the walls confronting you. Grey energy blocks must be hit more than once; some energy blocks are indestructible. Alien life forms randomly descend to hinder you. Eliminate them on contact with an energy ball or the Vaus.

Destroy the energy blocks and release these capsules to help you win the game:

- **B** (Pink) Advances you to the next level
- **C** (Green) Catch the ball, move to a new position and fire
protection W**AS** the best for the GS so far but it is now TOAST!!!!!!!!!

sharper angle for maneuvering into restrictive places.

- Use the very edge of your Vaus to deflect the ball and give it a number of hits.
- The laser is useful for breaking down energy block that require a or enclosed within a wall.
- The dividing capsule is very usefull if your ball is caught behind 

HINTS AND TIPS

- The dividing capsule is very useful if your ball is caught behind or enclosed within a wall.
- The laser is useful for breaking down energy block that require a number of hits.
- Use the very edge of your Vaus to deflect the ball and give it a sharper angle for maneuvering into restrictive places.

PS: If you are an excellent Graphix drawer and would like to get your pics on the newest GS Releases please let a Club 96 Member know. Also, TAITO your protection "WAS" the best for the GS so far but it is now TOAST!!!!!!!!!!!!
Alps are still a climber's paradise. Your are against hazardous rock and unpredictable weather, but if you plan well and climb expertly, you'll earn yourself a place in the select company of Alpine conquerors.

GETTING STARTED
It's almost time to get started on your trek to the summit. You'll soon see the routes you can choose from. Some are harder than others, but none of them are easy. To begin, make your selections from the dialog box in the first game screen:

<table>
<thead>
<tr>
<th>NUMBER OF COURSES</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>RESUME</th>
<th>TRAINING</th>
</tr>
</thead>
</table>

Disregard the RESUME selection for now. You'll use it later when you play a saved game. If you want to practice first, press "T" (or move the pointer to Training and press the fire button or <RETURN>). The training trail is a real climb.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

PACKING LIST

ITEM

PURPOSE

Ropes

Break your falls when you're climbing. Be sure to pack at least one rope.

Carabiners

Metal loops used to hook the rope to your clim-bing gear. You can't use the rope without them.

Ice pins

Attach the Carabiners to an ice cliff. You must have ice pins in order to use the carabiners and rope on ice.

Pitons

Attach the carabiners to a rock face. You must have pitons or chocks in order to use carabiners on rock.

Hammer Pounds in the ice pins and pitons. You can't use the ice pins or pitons without it.

Chock

A carabiner anchor you force in a crack in the rock. You don't need a hammer to use chocks.

Strap

Fastens you onto a rock face. You'll need this in order to get into your pack while climbing.

Stirrups

A support that protects you while you haul up the rope. Without it you may have to abandon the rope with you come to its end.

Soft shoes

Smooth-soled climbing shoes, very helpful for traction on ice cliffs.

Chalk

Protection from falling rocks.

Apple II Computer Info

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 100 of 1262
Keep an eye on the little man to the right of the cliff. He'll tell you how far you have to go. Next to your icon are the five buttons: Bomb, Pickaxe, Axe, Rope, and Charge. You may want to use your crampons and a bomb. You can't use any cramps on your feet while you're climbing, but you may use them afterward. If you have a bomb, you can throw it by pressing the fire button while climbing. If you have a rope, you can tie it to your feet and pull it up. It will be used to pull you up. The rope will not be used for climbing. If you have a pickaxe, you can dig a hole in the ground. If you have a bomb, you can throw it by pressing the fire button while climbing. If you have a rope, you can tie it to your feet and pull it up. It will be used to pull you up. The rope will not be used for climbing. If you have a pickaxe, you can dig a hole in the ground.

CLIMBING ON ICE

As soon as the ice appears, you will have to use your crampons. You can't use your ice axes on the ice, so they will be useless. You will have to use your crampons to climb. You can use your crampons to pull yourself up, or you can use them to pull someone else up. When you're using your crampons, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet. When you're climbing, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet.

CLIMBING ON ROCK

As soon as you conquer the ice, a new challenge confronts you: a rock face. If possible, stop just before you there. If you go straight from the ice to the rock, you will get a severe cramp. You can use your crampons to climb the rock. You can use your crampons to pull yourself up, or you can use them to pull someone else up. When you're using your crampons, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet. When you're climbing, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet.

CLIMBING ON ICE

As soon as the ice appears, you will have to use your crampons. You can't use your ice axes on the ice, so they will be useless. You will have to use your crampons to climb. You can use your crampons to pull yourself up, or you can use them to pull someone else up. When you're using your crampons, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet. When you're climbing, you can move the joystick up or down to pull yourself up or down. When you're climbing, you can move the joystick left or right to move your feet.
the pointer to the rucksack and press the fire button or <SPACE>. Find something that fills the bill, and press the fire button or <SPACE> again. If you're satisfied with your needs, the little climber and/or his message will disappear. Sometimes, though, whatever you've chosen isn't enough. For example, the little climber is shivering. You get him a wool hat, but he's still cold. Go back to the pack and get the anorak. That should do the trick. When the climber gets tired, he needs a nap. If you're on level ground, take out the tent. This automatically puts him to sleep. If you've forgotten a tent, take out the shovel to dig an igloo. If you've forgotten both the shovel and the tent, you're in trouble. You can keep on going, but you'll get more and more tired. If you get the cold message while in the tent, take out the sleeping bag. If that doesn't work, try the foil cover or some warmer clothes. The clock speeds up while the climber sleeps. The tired graphic or message will disappear when the climber's ready to get up. When it's time to get up, reverse the procedure to put the tent or shovel and the sleeping bag back in the pack. You'll probably want something to eat, and then it's time to get back on the trail. If you get hungry, thirsty, or tired while climbing, check your progress by looking at the little man on the right. If you're close to the top, keep going and then open your pack on level ground. If you don't want to wait, secure yourself with the strap, open your pack, and take out what you need. If you're on a rock face, you can even sleep during your climb, using the hammock instead of the tent. Of course, if you've forgotten the hammock you'll have to keep climbing.

IF DISASTER STRIKES
Mountaineering is dangerous, and no matter how skilled you become, you may still make a fatal miscalculation while climbing or overlook a crevasse while trudging across the glacier. If you've used up your beginner's luck, that's the end of the game. Fortunately, it's easy to bring yourself back to life and start over. Just press <ESC> and you'll find yourself at the trailhead, ready to start again.

Better luck this time!

ENDING A GAME
To stop the clock while you take a break, press the "p" key. To save a game in order to resume it later, be sure to pack the save gamedisk when you're packing items for your rucksack. When you're ready to stop and save, open your pack and take out the disk. Your game will be saved at that point. When you're ready to resume play, load the program. When you're asked to choose a route, select resume. You'll start climbing again from where you saved the game.

TRIUMPH -- AND A NEW GAME
After a day or even longer of hard work and danger, you reach the summit of your trek. You may be tired, but this is your moment of triumph. Enter your name in the scoring screen that appears, and then press <RETURN>. When you're ready to start again, press the fire button or <SPACE>. You'll find yourself back at the trailhead, ready to choose a new route and strive for new heights. To quit the program at any time, press "Q".

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 102 of 1262
Apple II Computer Info

Concept: The idea of the whole game is to successfully destroy each wave of enemy fighters and bombers. Those planes are: MIG-25's

MIG-23's
TU-26's

Your planes are:
F-15's
B-1's

You are an AWAC plane. A plane which flies around the screen and pinpoints the locations of enemy planes and relays them to missile silos on the ground. The keys for movement are...

I
J
K
M

Planes are indicated on the screen by flying numbers. They range from 1-9. To identify which type of a plane a certain number is that is flying on the screen, you hit that number on the keyboard. Example...

Say the number 3 was flying around on my screen. I hit the #3, and at the bottom of the screen the name and blueprints of the plane will appear. You can then decide whether to destroy it or leave it alone. To destroy a plane (or number flying on the screen) you must currently have that plane and its blueprints at the bottom of the screen. Example...

Since I hit 3 (above), the blueprints of whatever 3 is (let's a MIG) will appear at the bottom of the screen. I can then hit the RETURN key and a missile will launch from the nearest U.S. missile silo (indicated by the squares on the screen.) If I hit a number on my keyboard, and that number is not currently visible on my screen, no blueprints will appear and it will give the message NOT IDENTIFIED. A word of advice. A number will not necessarily be the same plane throughout the entire game. Example...

The #3 could fly on my screen, and I could identify it as a MIG. Before I have time to blast it, however, it flies off. 10 seconds later the same number (3) could fly on again, but it might just be a U.S. plane. It's a good idea to check before you blast.

Fuel: The fuel indicator will get lower and lower as the game goes on. If you run out of fuel before you wipe out the enemy, the game is over. You do have 1 chance per wave of replenishing your fuel supply. If your fuel supply is running low, you can hit the T key. A funny little beep will sound, but other than that, that's all that happens.

What has really happened is that one of your bases has dispatched a fuel plane, which is a KC 707. Don't blow this up if you see it! You only have one!! Once you hit "T", the KC 707 will automatically fly up to you (it will also be using a number) dock with you, and return home. You can only do this once per wave, so use it wisely. Another feature is the PANIC button. On the right side of the screen is the word PANIC written vertically. Along with the word will be either 1 or more warheads. If things ever get too crowded, and too many enemy planes are flying towards you, you can hit the */" key. This will alert all bases currently on the screen to help out, and they will destroy every enemy plane on the screen. Each time you hit the */" key, one warhead disappears from the side of the screen. Again, you only get one per turn. But... unlike the fuel plane, if you don't use the panic button, you get to keep the warhead you didn't use, and get an extra warhead for completing the wave. Also... don't hit the "B" key. I don't know what the hell this is, but whenever I hit it, it drops me into the monitor. After a wave is completed, you receive bonus points for however many bases are still up (the enemy planes like to drop bombs on your bases, that's why your destroying them). After all the bonus points have been tallied, your fuel tank will be filled, you will recieve and extra PANIC warhead, and a flashing READY will appear on the screen. Hit return, and the game will proceed with the next wave of enemy planes.
THE AXE PACKER TAKES A REGULAR 34 SECTOR HIRES PAGE AND CHANGES IT INTO A 10-14 SECTOR HI-RES PAGE

WRITTEN BY: THE AXE
HOUSTON TEXAS

GET IT NOW!!!!

INCLUDED ARE NEW GHOSTBUSTER HIRES PICTURES THAT ARE PACKED

13 SECTORS EACH!!!!!!!

GET THE FOLLOWING FILES:

THE AXE PACKER V1.0
THE AXE PACKER UTILITY V1.0
PACK.OBJ

TO SEE THE GHOSTBUSTER HIRES PAGES YOU MUST GET THE AXE UNPACKER UTILITY.

::: Sysop Note :::: I have since revised the Axe Packer Utility with a catalog feature in the event that the file name entered is incorrect, hence version 1.1

The Avatar

---

The joystick or cursor keys are used to control the warrior as follows:

* Joystick center- Warrior is still and in firing position where appropriate.
* Up/Down- Warrior up or down ladders where appropriate.
* Left/Right- Warrior turn/move left or right where appropriate.

With fire button pressed:

* Joystick center- Warrior fires laser in direction faced where appropriate (including off the ladders).
* Up- Warrior jumps straight up where appropriate.
* Down- Same as joystick center.
* Left/right- Warrior stops firing and transports where appropriate.
* Joystick diagonal – Warrior somersaults forward in direction he is facing where appropriate.

Further keyboard controls:

F1Toggle sound effects On/Off
1Select laser mode 1 (on main keyboard no keypad)
2Select laser mode 2
3Select laser mode 3
4Select laser mode 4

Well, to start out with this game is tough. It says so on the front cover of the instructions, so it must be true!

It's June 5th 1999, your an archaeologist who has discovered a scrawl from what seems to be a old man, or thing. You call your old archaeologist professor and tell him of a stone with baal written on it. Hearing the word Baal caused so much interest that he told you not to touch it. He told you that the stone was *foretold by an old scottish monk way back in the 12th century...* The stone could cause death and destruction to the world at a time when man was reaching for the stars. Later it was discovered that the date June 5th 1999 would be 666 if the 1999 was turned upside down! The devil, satan!! The other archaeologist moved the stone an Baal rose, killing all in his sights! A War Council was formed to kill this monster, elite warriors have been selected to fight Baal....

YOU are in charge of the Time Warriors and here are your TOP SECRET MISSION INSTRUCTIONS. You must guide and control each Time Warrior in his quest. Although it is impossible to say what horrors you will encounter when you enter BAAL's lair, his enormous power coupled with his huge army of monstrous beasts make him an extremely dangerous enemy.

We pray you can do it, we know you can. Many lives will be lost in the numerous bloody battles but BAAL must be defeated. If not we run the risk of being ruled by a power crazy demon at best, at worst the earth as we know it is doomed. OUR FATE IS IN YOUR HANDS.....

---
You'll get in a fight, and some woman named Tasha will save your butt. She'll tell you that Matabushi is your enemy, not the Black Widows, and that Kearny was just trying to get you killed. Go ahead and leave the bar.

If you read the news net, you'll see that Tasha gave you some files supposedly from Matabushi telling about your family's execution. Read on, and you'll find something about Matabushi announcing a new commercial strategy. Another news item from Jordan Rowe will tell you to meet up with Kearny on Albierno. Go there.

When you get there, you'll land in the middle of a battle, and see Tasha. Follow her. You will see Tasha and Kearny confronting each other, and have to decide whom to trust. I would suggest you trust Tasha.

When you get to Land's End, enter the bar and order a drink. The barkeep will tell you to come back later. Go to the mech complex and sell your Jenner, as any crewmembers, because the game will sometimes crash when you do. You'll want to end up with a good crew and some good mechs, I would suggest you return later, but you can just order another drink and he'll give you some information and the name of a Marik planet, such as Gibson, Mosiro, or Sadurni. Travel there.

When you arrive on the Marik planet, go to the Mech complex. The man there will tell you that you might find Kangaroo Jack on Tancredi IV or Okefenokee also, if you wanted to), go to Kirchbach and kick some butt.

The Lexicon 714-627-0601 9600+ Only!

How to Solve MechWarrior:

This cheat has been provided so you can sit back, play the game, quickly win, say to yourself "Wow neat! I've won...", and stuff the game away in your archives in a short period of time.

The basic premise behind MechWarrior is that you're the only surviving son of the leader of Ander's Moon. A group of Mechs attacked the planet, killed your family, and installed a new government on the planet. They also stole a valuable Chalice which is a heirloom of family power or something. Your job is to track down the killers, find the Chalice, and restore your family to power on Ander's Moon.

When you start out, you will usually be on one of the Davion planets, but might start out on a Kurita planet. Travel immediately to the Kurita planet of Land's End.

When you get to Land's End, enter the bar and order a drink. The barkeep will tell you to come back later. Go to the mech complex and sell your Jenner, as any crewmembers, because the game will sometimes crash when you do. You'll want to end up with a good crew and some good mechs, I would suggest you return later, but you can just order another drink and he'll give you some information and the name of a Marik planet, such as Gibson, Mosiro, or Sadurni. Travel there.

When you arrive on the Marik planet, go to the Mech complex. The man there will tell you that you might find Kangaroo Jack on Tancredi IV or Okefenokee (Davion planets). When you leave, you will be shot at by a sniper. RUN. When you get to the Davion planet, go to the bar. Order a drink, and you'll be introduced to a guy named Kearny. He'll give you some information, and a scrap of paper with an address on it, telling you where the Black Widows currently are. That's your next destination. It will be a Kurita world like Thestria or Proserpina.

When you get there, go into the bar. You'll see some of the Black Widows, and get a story. CHALLENGE it.
Ok, that's the basic background to the game. When you begin, you will find yourself in the courtroom battling the two brothers. You are at the bottom of the screen, with the ghost trap positioned in the center of the screen. To capture the ghost, use your controlling device (keyboard, joystick, or mouse) and maneuver the bullseye on top of one of the ghosts. When he is in your sights, hit the fire button to fire. He will undoubtedly dodge, so you will have to move or fire again. You will notice a large river running along the top of the screen, there will be two energy bars. These represent the energy of the ghosts you are attempting to capture. Your object is to drain the bar completely. At that point, the ghost trap will automatically kick in and suck in a ghost. Also note in the top left-hand corner, there is a thermometer. If the meter reaches the top, the slime will temporarily shut down due to overheating. When it cools down, you will be able to fire again. I recommend you NOT fire the accelerator at open space, as it wastes energy dramatically.

Five years ago, in the city of New York, the Ghostbusters battled their first major spirit manifestation. Cross the proton streams produced by their particle accelerators, they managed to reverse the dimensional gateway created by Gozer, and send him back through the portal. In the process, they destroyed much of the surrounding area, which just so happened to make the mayor a tad upset. Over the years, they went out of business, due to various reasons, one being the fact that the supernatural occurrences had been halted dramatically, thus giving them no ghosts to bust. Upon declaring bankruptcy, they went their separate ways.

In the meanwhile, The New York Art Museum received a painting of an ancient tyrant, Vigo the Carpathian. The painting had an aura of evil about it, and with good reason, for it was the resting place of Vigo's spirit, waiting to get out. The spirit needed a spark of energy to emerge into the real world. Vigo just so happened that the spark needed was in the city's sewer, taking the form of psycho-reactant slime. The slime, being psycho-reactant slime, was created from Vigo's bad thoughts, actions, and attitudes of the bitter citizens of the Big Apple.

The slime soon rose to the city's surface streets, and it was soon discovered by the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people. As each day passed, the painting of Vigo drew power from the people.

Meanwhile, Spengler, Stantz, and Venkman had been reunited in order that they might have a sample of positive energy slime. If it explodes, you will have to test the slime. If it doesn't, you need not worry about him either. If you catch the two ghosts successfully, you will experience the first quote digitized from the movie with great accuracy: "Two in the box! Ready to go! We be fast, they be slow!". The judge will then release you, and the Ghostbusters will be back in business! If you fail to capture the two ghosts, you will still be allowed to go back into business, but you will owe a debt of $10,000.

You will next find yourself in the firehouse. You have several options here, the most being:

- Go to get more slime.
- Answer the phone.
- Test slime.
- Visit Parkview.

This should be the VERY FIRST move you make in the firehouse. This option will allow one of the Ghostbusters to be lowered into the city's sewer system in order to get a psycho-reactant slime sample. Lower yourself down to the river, and you will encounter a ghost that pops out of the river, and also avoid getting slammed by any wandering ghosts or spirits. If the hand grabs you, quickly shake back and forth to break loose. You will only be able to do this three times. Also, if you get slammed more than three times by wandering ghosts, you will fall into the river.

You will get a chance to answer the phone six times. Each time, you will be answering a job call to bust some ghosts. Upon selecting this option, a window will appear with a picture of the Ghostbuster's secretary, Janine Melnitz. She will answer the phone by either saying "Ghostbusters...Whaddaya want?", "We got one that pops out of the river, and also avoid getting slammed by any wandering ghosts or spirits. If the hand grabs you, quickly shake back and forth to break loose. You will only be able to do this three times. Also, if you get slammed more than three times by wandering ghosts, you will fall into the river.

This option will allow one of the Ghostbusters to be lowered into the city's sewer system in order to get a psycho-reactant slime sample. Lower yourself down to the river, and you will encounter a ghost that pops out of the river, and also avoid getting slammed by any wandering ghosts or spirits. If the hand grabs you, quickly shake back and forth to break loose. You will only be able to do this three times. Also, if you get slammed more than three times by wandering ghosts, you will fall into the river.
If any of the Ghostbusters fall into the river of slime, they will end up in Parkview, the local mental ward. If this is the case, and you wish to break them out, select this option. You will then find yourself climbing on the wall of the institution on a rope. Push to either the left or the right and press the fire button. You will crash through one of the windows and enter the room. There may be any number of things in the room. If one of the Ghostbusters is not there, escape as soon as possible. Staying too long will make the guards drop a net over you and take you away. To escape the room, wait for the rope to swing by the window and then push forward and press the button. If you do this correctly, you will be back outside on the rope. If for some reason you wish to leave the place entirely, move down until you reach the ground, where you will drive away in the Ecto-1.

After going through all this stuff for some time, Egon will make a Slime Blower to shoot the positive energy slime. You will now have an option to "Take Statue for a Walk", meaning you will animate the Statue of Liberty in order to go into battle with Vigo the Carpathian. DO NOT select this option until you have three vials of positive slime (the vials will be shown at the bottom right of the list with all the Ghostbusters' names. Just keep getting more slime and testing it. When you test ALL of the sound tracks, you will end up with three vials.

MOVING THE STATUE OF LIBERTY

Simply move your controller to the northeast and northwest. Observe the movement of the statue's feet, and how they interact with your controller. In time, you will get the hang of it and be able to move quickly. To stop the statue at an intersection in order to turn, maneuver both of its feet so that they are both resting on the ground.

A TIP: Like I said before, the FIRST MOVE in the firehouse you should make is getting some slime. After doing so, DO NOT test it. Rather, answer the phone. Egon will offer to stay behind and run tests. When you come back from the call, he will have finished his tests, and inform you that he found a bad sound track. He will, however, have kept the slime from exploding. That way, you will not have to go back for more slime! Answer the phone again to repeat this process. Keep in mind that WHENEVER you answer a call and there is a slime sample still intact, Egon will stay behind to test it.

Well, that should be enough information to get you started! I'll leave you to battle Vigo yourself <grin>. If you have any problems, or any other tips for this game, contact me at the number below. Also, I am getting into the habit of writing documentation files for other games, so if you happen to find a game with little or no docs whatsoever, give me a call, and I'll write one up if I can. Have fun!!!

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
3.1 Disk sectoring

This value is the number of sectors per track. The options are 13 or 16. A 16 sector selection will not work if you have an old disk drive which has not been updated for 16 sectors per track.

3.2 Disk format

This is the type of operating system being used on this diskette. For 13 sector both DOS and CP/M are available. For 16 sectors disks, CP/M and PASCAL are available (the PASCAL option works for Apple Fortran).

3.3 Preserve data

This option will allow you to re-format a disk while preserving the data on it.

3.4 Skew direction

This prompt indicates the direction of the skewing to be used. The options are ascending and descending. Ordinarily, DOS reads sectors in descending order while CP/M and PASCAL read them in ascending order.

3.5 ???

3.6 Slot

The number of the slot occupied by your disk controller.

3.7 Drive

The drive number of your disk drive.

3.8 Volume number

This is the volume number that will be used to format your diskette. The numbers 0-254 are available. You can use this to change a volume number.

3.9 Starting track

The track number which formatting is to start.

3.10 Ending Track

The last track to be formatted.

4. The ZAP Program

Moving the buffer cursor to the offset given by /EXP/. /EXP/ may range in value from 500 to 255

(The symbols +|- means you can put a plus or minus sign at that point.) Move the cursor to a new offset, computed by adding or subtracting the value of the expression, /EXP/ EX. +257.

READ track and sector. Used in this format...READ/EXP1/;/EXP2/

WRITE Write to current track and sector. Used in this format...WRITE/EXP1/;/EXP2/

N Next track.

P Read previous sector.

LC Lower case.

UC Upper case.

IMAGE Sets the ASCII translation on the right hand side of the screen so that minimal translation is done.

ASCII The opposite of IMAGE mode. ASCII is the default.

LOCK Lock ZAP so no writing can be done.

UNLOCK Opposite of LOCK, undoes LOCK.

DOS16 Informs ZAP the the disk has 16 sec format.

DOS13 Self explanatory.

CP/M For CP/M disks.

PASCAL For PASCAL disks.

OPEN You can open a file like...OPEN"HELLO" and it will read the VTOC and find the track sector list and display the sectors c

CLOSE Closes an opened file.

PRINT Copies entire screen to printer.

Here is a list of all the ZAP commands including the ones i didn't mention.

/EXP/ Set buffer cursor

+/EXP/ Move forward in buffer, disk, or file

-/EXP/ Move backward as above

R/TRK/;/SEC/ Read track, sector

R/REC/;/BYT/ Read record, byte (open file)

WRITE/TRK/;/SEC/ Writes track, sector

WRITE/REC/;/BYT/ Same as above

N Next sector

P Previous sector

% indirect read

5. Buffer Modify Commands

/STR/ Store string into buffer

SET Multiple store

& Logical and operation
Apple II Computer Info

0                  Logical OR operation
X                  Logical Exclusive OR operation
6.  COMPARISON COMMANDS
L                  Look for string.
V                  verify strings matches buffer
COMPARE/BUFFER/    Compare buffers.
7.  Option Switch Commands
LC     Lowercase
UC     Uppercase.
IMAGE  Print char in image form.
ASCII  Standard ascii translation.
LOCK   Prevent write operations.
UNLOCK  Allow write operations.
DOS16  DOS 3.3
DOS13  DOS 3.2 OR 3.1
CPM    Use CPM skew table (16 sector).
PASCAL  Use PASCAL skew table.
NOWRAP Prevent disk or file wraparound
8.  File Commands
OPEN     Open a file
I               Disassemble to screen
RLEN     Set record length
CLOSE    Close file
WHERE    Open file containing sector
PRINT    Copy screen to printer
DUMP     Dump sector(s) to printer
IDUMP   Dump instructions to printer
NOTE     Print comment line
LOG      Log all changes
NOLOG    Stop logging changes
10.  Buffer command
    #     Select buffer
11.  Macro Commands
    (/NAME//TEXT/) Define macro
    /NAME/    Invoke macro
    //NAME/   Delete macro
    MACROS   List of all macros
    MNWAP    Swap macro table with buffer
H 1 *Label Commands*
    LABELS  Displays all labels
    /=NAME/ Define label
    //NAME/ Delete label
    /NAME/+EXP/ Position to label plus expression

15. FIXCAT

This is a self explanatory program. But here are some notes

The way this program restores deleted files is that it goes looking for sector lists. I found this program to be really great.

First, if you have an I/O err, use INIT, while saving the data. If the I/O err is on the catalog track. No problem! Just run FIXCAT after using INIT and you can either start from scratch (warning! I have never done this so make a backup before using) or you can read from present catalog. If you start from scratch look for deleted files and restore all that you can.

TRAX: A track examination program. TRAX will read a track from a diskette in its "raw" pre-nibbilized form and format it on the screen, attempting to pick out the sector formatting, such as a protected diskette or one which has been damaged in some way, TRAX will highlight its anomalies. TRAX is also useful in conjunction with the INIT program to determine the physical order or skewing of sectors on a diskette.

TRAX COMMANDS

ARROW KEYS SELECT TRACK TO READ
R READ CURRENT TRACK
N READ NEXT TRACK
P READ PREVIOUS TRACK
F TOGGLE DISK FORMAT (13/16)
V VERIFY DISK & DISPLAY ERRS
A DISPLAY ADDRESS CHECKSUMS
D DISPLAY DATA CHECKSUMS
C RECALIBRATE & READ TRACK 0
S CHANGE SLOT/DRIVE CONFIG.
X ENTER RAW DUMP MODE
ESC KEY EXIT PROGRAM

[ANALYSIS MODE COMMANDS-]

[-RAW DUMP COMMANDS-]

RIGHT ARROW SCROLL FORWARD ONE LINE
LEFT ARROW SCROLL BACK ONE LINE
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 112 of 1262

INIT: The INIT program can be used to reformat a single track on a diskette, a range of tracks, or the entire diskette. In addition, INIT will optionally attempt to preserve the contents of any readable sector it finds before reformating. Thus, INIT can be used to fix a single sector whose formatting has been damaged so that it can no longer be read from or written to. This avoids having to initialize the entire diskette with the DOS INIT command. INIT will also allow you to specify the order of the sectors on any given track. doing this can improve disk read times by about 40%.

INIT OPTIONS

Disk Sectoring: THIS VALUE IS THE NUMBER OF SECTORS PER TRACK. THE OPTIONS ARE 13 OR 16.

Disk Format: This is the type of operating system being used on this diskette.

Preserve Data: This question asks whether the data currently on your diskette should be preserved.

Skew Direction: This prompt indicates the direction of the skewing to be used.

Skew Factor: This is the spacing placed between logically sequential sectors during formatting.

Slot: The number of the slot occupied by your disk drive controller card.

Drive: The drive number of your disk drive.

Volume Number: This is the volume number that will be used to format your diskette.

Starting Track: The track number upon which formatting is to start.

Ending Track: The last track to be formatted.

ZAP: ZAP in its simplest sense allows you to read and modify a diskette at the track and sector level. A sector may be read and displayed in hexadecimal and ascii and, optionally, modified and rewritten to the disk. ZAP provides over 50 commands, including some programmability with macros, labels, and loops, allowing you to perform complex manipulations on diskettes. full support exists for DOS files of all types, CP/M files, and Pascal files as well. ZAP is perhaps the most complex of the four programs but you will probably find you use it most heavily.
# /EXP/
Select buffer

[-MACRO COMMANDS-]

(/NAME/ /TEXT/) Define macro
//NAME/ Invoke macro
//NAME/ Delete macro
MACROS List all macros
MSWAP Swap macro table with buffer

[-LABEL COMMANDS-]

LABELS Display all labels
=name/ Define label
//NAME/ Delete label
//NAME/+/EXP/ Position to label
/LSWAP Swap label table with buffer

[-TRACE COMMANDS-]

TRACE Display trace table
< Back up in trace
> Advance in trace

[-MISCELLANEOUS COMMANDS-]

AT/EXP/ Position but do not read
AT Mark buffer empty
S/SLOT/,/DRIVE/ Set disk slot, drive
7/EXP/ Calculator
I Disassemble to screen
LOOP/CNT/,/LOC/ Repeat line
HELP/EXP/ Show help screen
VTOC Read DOS VTOC
STATUS Show ZAP status variables
END Exit zap

FIXCAT: The fixcat program is an automated utility which allows you to diagnose and correct errors in the catalog track of any DOS diskette. In addition, it takes the Find Track/ Sector lists program (FTS) of Beneath Apple DOS a step further by actually recovering lost files on a diskette automatically! Fixcat will also allow you to remove the DOS image from track 1 and 2 to provide more room for files and will recover lost sectors by correcting the VTOC freespace map.

FIXCAT MESSAGES

Display in what slot?
If you wish to have fixcat display its message only on the Apple screen, enter 0 (the default). If you want them to be printed on a printer, give the slot number of your printer here.

Automatic Timeout in Seconds?
Enter 0 (the default) if you want FIXCAT to always wait for your response to each question it asks. If you specify a number of seconds, in the other hand, each time FIXCAT prompts you for a response, it will wait that number of seconds before taking the default as your answer.

What Format is Your Diskette?
If your diskette is 16 sector format, type 16 (the default). If it is an older 13 sector diskette, type 13.

Read existing catalog from diskette or start from scratch? ("R" or "S")
If your catalog is at all intact, specify R (the default) to have FIXCAT use it as a basis for its operations. Only if there is not a single valid sector left in the catalog should you specify "S". In this case, FIXCAT will start with a zeroed out catalog track and will build it up from scratch.

Does this diskette contain a DOS image on tracks 0, 1, and 2?
If this is a standard, bootable disk, reply Y (the default). If you want to recover track 1 and 2 for your own and never boot this diskette again, reply N. Also reply N if you have previously recovered these tracks using FIXCAT.

Scan for Lost or Deleted Files?
If you do not think you have any missing files, reply N (the default). If you wish to have FIXCAT search the entire diskette for "unattached" track/ sector list sectors, type Y.

Recover This File?
If you think that this is a file you want, reply Y (the default). If the file looks like an old deleted file you no longer wanted, reply N.

What type of File is it? (T,I,A,B,R,S)
If you were able to identify the file, you probably know its file type as well. If not, FIXCAT will prompt you with a pretty good guess. You'll find that FIXCAT will be correct in its guess about 95% of the time. If the wrong file type is given and you later detect this you can delete the file and rerun FIXCAT, supplying a different type this time.

Apply Accumulated Corrections to the VTOC/Catalog Track?
Reply Y if you want the corrections you have authorized up to this point to be applied to the catalog track on your diskette. Reply N if you want to forget the whole thing and not change your diskette after all.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 113 of 1262
INTRODUCTION TO BALTIC 1985:

THE SOVIET OFFENSIVE INTO SOUTHERN GERMANY HAS BEEN HALTED AT THE RHINE AFTER BITTER FIGHTING. IN THE PERSIAN GULF, THE BATTLE FOR THE OILFIELDS HAS PAUSED, AS BOTH SIDES RESUPPLY.

SATELLITE AND OTHER INTELLIGENCE REPORTS SHOW WIDESPREAD CIVIL DISOBEDIENCE IN WARSAW, GDANSK, AND OTHER POLISH CITIES. SOME EASTERN EUROPEAN UNITS HAVE BEEN CLASSIFIED AS UNRELIABLE BY THEIR SOVIET ALLIES, AND SOVIET RESERVES HAVE BEEN SENT TO SUPPRESS THE REbellions.

Radio reports from Berlin, breaking through intense Soviet jamming, show that American infantry units, bypassed by the Soviet blitzkrieg into southern Germany, are still holding out in the suburbs of West Berlin.

In the NATO battlefield headquarters, the NATO commander reviews the intelligence reports, meets with his staff, and issues these orders:

NATO units are to drive south east, seize and hold a corridor to Berlin, linking up with the NATO units holding out there, before the Soviets can bring in their reserves.

At 0400 the next morning, tactical air support fighters and fighter-bombers take off from their airfields. Airborne units drop strategically along the corridor to seize key objectives. NATO main battle tanks and armored personnel carriers roll through the checkpoint s and the wire fences along the east German border, on the road to Berlin. Operation Baltic has begun.

 Playing the first game:

When the game starts, you will be presented with the options shown when you boot the program up. To change any option, type the number until the option you want is highlighted. When you are ready, press the space bar to see a cool title page. The game will then begin with the NATO move.

The map scale:

Each hexagon on the on the 39 by 28 hex map represents 3 miles. On the screen, you see one sector, or 1/12th of the whole map. Sector numbers and letters (1 to 9; A, B, and C) appear on the map.

Terrain:

The north German terrain is similar to that in the game "Germany 1985", with these additions: (not too accurate!)

(*) NATO-HELD OBJECTIVE
(O) SOVIET-HELD OBJECTIVE

Moving the cursor:

To move the blinking cursor around the map, use the command keys shown in the diagram at right:

[2.5] Air cavalry:

Air cavalry units cannot enter enemy-owned town, urban or objective hexes.

[2.6] Transport mode:

Infantry units cannot change to transport mode.

[2.8] Rivers:

Regular units can cross a river in river mode. Air cavalry can cross a river in any mode.

[2.9] Bridging:

No bridging is needed in this scenario. Engineer units can change to river mode more easily than other units, but otherwise have no special functions.

[2.10] Terrain effects:

Look at the table at the end of the docs.

[2.11] Smoke:

Smoke-filled hexes cost an extra movement point to enter.

[3.0] Modes:

Infantry units cannot change to transport mode.

Engineer units can change to reorganize mode.

Changing to river mode costs regular units twice the movement points it did in the game "Germany 1985". Engineer units can change to river mode at a cost half that of regular units, giving them the ability to cross rivers more rapidly than other units.

The order phase:
PLEASE REFER TO "GERMANY 1985" DOCS TO FIND OUT THE ORDER PHASE (APPLE MANOR).

[5.0] ARTILLERY:

ONCE AGAIN, PLEASE REFER TO "GERMANY 1985" DOCS TO FIND OUT ARTILLERY RANGES.

[6.0] AIR POWER: %] THE SIDE WITH AIR SUPERIORITY HAS A POSSIBLE MAXIMUM OF FIVE AIR STRIKES PER TURN.

[%] THE NATO PLAYER HAS AIR SUPERIORITY FOR THE FIRST TWO TURNS.

[9.0] REORGANIZATION:

ENGINEER UNITS MAY REORGANIZE.

[10.0] HIDDEN UNITS:

ALL UNITS ARE EXPOSED WHEN THEY FIRST APPEAR ON THE MAP. HIDE EACH OF YOUR UNITS BY TYPING CTRL. H DURING ITS MOVEMENT PHASE. IF YOU ARE PLAYING SOLITAIRE, AND YOU HAVE CHOSEN THE HIDDEN OPTION, THE COMPUTER WILL AUTOMATICALLY HIDE ENEMY UNITS WHEN THEY MOVE.

[11.0] MINES AND NUCLEAR CONTAMINATION:

MINES AND NUCLEAR CONTAMINATION PLAY NO PART IN THIS SCENARIO.

[13.0] VICTORY POINTS:

THE NATO PLAYER RECEIVES:

[%] 1/2 POINT FOR EACH OBJECTIVE HELD

[%] 1点 FOR EACH SOVIET UNIT ELIMINATED

THE SOVIET PLAYER RECEIVES:

[%] 1 POINT FOR EACH OBJECTIVE HELD

[%] 1/2 POINT FOR EACH OBJECTIVE HELD

[%] 1 POINT FOR EACH NATO UNIT ELIMINATED

NOTE: AN OBJECTIVE HEX IS HELD BY THE SIDE WHOSE UNIT LAST ENTERED THE HEX. (OR ORIGINALLY WAS HELD BY THE PLAYER.)

[13.1] THE VICTORY DISPLAY:

TO SEE THE DISPLAY OF VICTORY POINTS EARNED BY EACH SIDE, TYPE CTRL. V AT ANY TIME DURING YOUR TURN. (PLAYERS CAN ALSO SEE THE VICTORY DISPLAY DURING SOLITAIRE GAMES WHEN THE COMPUTER IS MOVING ENEMY UNITS.)

[13.2] END OF THE GAME:

BALTIMORE 1985 ENDS AUTOMATICALLY AFTER TURN 15, 16, OR 17, AT THE OPTION OF THE COMPUTER. THE COMPUTER WILL COMPARE VICTORY POINTS AND DECLARE A WINNER.

[16.0] TACTICS:

[%] THE NATO PLAYER MUST MOVE QUICKLY TO TAKE ADVANTAGE OF HIS INITIAL AIR SUPERIORITY AND NUMBERS. THE RUSSIAN PLAYER STARTS WITH NO SPARE AIR SUPERIORITY POINTS AND IT WILL BE SEVERAL TURNS BEFORE THE NATO PLAYER CAN BE CHALLENGED IN THE AIR.

[%] KEEP DIVISIONS TOGETHER. PROTECT, AND, WHENEVER POSSIBLE, HIDE HEADQUARTERS UNITS IN THE REAR. USE THE D KEY FREQUENTLY TO CHECK THE LOCATION OF DIVISIONAL UNITS.

[%] WITHDRAW, HIDE AND REORGANIZE WEAKENED UNITS. THEY WILL BE NEEDED LATER IN THIS SCENARIO, WHEN SOVIET REINFORCEMENTS ARRIVE, AND THEIR LOSS COSTS VICTORY POINTS.

[%] HIDE UNITS WHENEVER POSSIBLE. THE COMPUTER CAN'T SEE YOU, AND AMBUSHES ARE AN EFFECTIVE TACTIC.

FREQUENTLY USED COMMANDS

Festering Pit. Simple, eh?

So the new word is Black Scar. In the second one, we got 11, so our word is word for the middle wheel. In our above examples: In the first one, we got 8, ended up as -5. Add 16 to it, and your new number is 11). Tar Quarry as the second word. Stagger Inn is number 8. The difference is 7. Cyanis, the difference is 2. For Tunnels, it’s 12, and so on.) Remember that if the word you get was Urmech, the difference is 0. If the word you get is Alliria, The Aardvark’s Burrow will be completely off.

You do the same process for the inner wheel. Find the value, and subtract the original difference from it (the difference you get from the stuff with the outermost wheel). The result is your new word.

Your two new words are what you will be looking up on the chart. It’s important that you do the math correctly, because otherwise, the code you get will be completely off.

Here’s how the charts are organized. They are split up into two sections for each spoke on the middle wheel. It will print ‘xxxxxxx Spoke’. That’s on the middle wheel. You have to find the section with your word at the top of it. In that chart, there are 16 columns of numbers. Each column represents one spoke on the inner wheel. In each column there are 16 abbreviations, with a number next to each. You have to find the correct column (using the name you got for your inner wheel), and then look up the correct abbreviation.

Abbreviations are as follows:

<table>
<thead>
<tr>
<th>Outermost Wheel (bottom)</th>
<th>Middle Wheel</th>
<th>Innermost Wheel</th>
</tr>
</thead>
<tbody>
<tr>
<td>1: Urmec</td>
<td>1: Crystal Spring</td>
<td>1: Lucencia</td>
</tr>
<tr>
<td>2: Telotha</td>
<td>2: Old Dwarf Mine</td>
<td>2: Kinstia</td>
</tr>
<tr>
<td>3: Cyanis</td>
<td>3: Shadow Rock</td>
<td>3: Tenebroia</td>
</tr>
<tr>
<td>4: The Old Man</td>
<td>4: Sulphur Springs</td>
<td>4: Tarmitia</td>
</tr>
<tr>
<td>5: Hawklayer</td>
<td>5: Warriors Vale</td>
<td>5: Malefia</td>
</tr>
<tr>
<td>6: Scrapwood</td>
<td>6: Clera Brannia</td>
<td>6: Valarian</td>
</tr>
<tr>
<td>7: Bard’s Hall</td>
<td>7: Celaria Bree</td>
<td>7: Lanair</td>
</tr>
<tr>
<td>8: Stagger Inn</td>
<td>8: Black Scar</td>
<td>8: Alliria</td>
</tr>
<tr>
<td>9: Hic Haven</td>
<td>9: Dark Copse</td>
<td>9: Ferofist</td>
</tr>
<tr>
<td>10: Violet Mountain</td>
<td>10: Nowhere</td>
<td>10: Seadu</td>
</tr>
<tr>
<td>11: Crystal Palace</td>
<td>11: Festering Pit</td>
<td>11: Werra</td>
</tr>
<tr>
<td>12: Catacombs</td>
<td>12: Sacred Grove</td>
<td>12: TarJan</td>
</tr>
<tr>
<td>13: Tunnels</td>
<td>13: Ice Keep</td>
<td>13: Skara Brae</td>
</tr>
<tr>
<td>14: Workshop</td>
<td>14: Shadow Canyon</td>
<td>14: UnterBrea</td>
</tr>
<tr>
<td>15: Wizard’s Guild</td>
<td>15: Tar Quarry</td>
<td>15: Arboria</td>
</tr>
<tr>
<td>16: Brilhasti</td>
<td>16: Cold Peak</td>
<td>16: Gelidia</td>
</tr>
</tbody>
</table>

Here is what you must do. Take the numerical value of word that the game gives you for the outermost wheel. (Find out which word is on the outer wheel, and take its value.) Then find the difference between it and ‘1’. (That is, if the word you get was Urmech, the difference is 0. If the word you get is Cyanis, the difference is 2. For Tunnels, it’s 12, and so on.) Remember that number. Then, find out the numerical value of the word on the middle wheel. (If your word is Clera Brannia, your value is 6. If you got Black Scar, your value is 8, etc.) Then, subtract the difference from the value of the second word.

For example: Let’s say you got Stagger Inn as your first word, and Tar Quarry as the second word. Stagger Inn is number 8. The difference is 7. Tar Quarry has a value of 15. Subtract 7 from 15, and you get 8.

If you get a value less than 1, add 16 to it (that is, let’s say your number ended up as -5. Add 16 to it, and your new number is 11).

The number you get from that subtraction process is the value of your new word for the middle wheel. In our above examples: In the first one, we got 8, so the new word is Black Scar. In the second one, we got 11, so our word is Festering Pit. Simple, eh?
This is one of those "because it could be done" projects. "Visit Applesoft BASIC" drops you into good old Applesoft under GS/OS, provided it can allocate 4K of bank 0 memory. (If it can't allocate the memory, complains politely and doesn't let you into Applesoft.)

The "6" command takes you back to the CDA menu.

Don't try to use HGR or HGR2 while you're visiting Applesoft-- that memory may already be in use by other parts of the system.

How to reach the author:

Computerve: 72177,3233 Internet: diyons@apple.com
GEnie: D.LYONS2 AppleLink: DAVE.LYONS
America Online: Dave Lyons P.O. Box 875, Cupertino CA 95015

The Penguin: A bird in the Hand. Commissioner Gordon calls you with the news that the Penguin is back. He's set himself up as a respectable umbrella merchant. But the commissioner is sure the Penguin's factory is just a cover for his plot to take over the world with an army of robot penguins. The only way to thwart the penguin's plot is to destroy his master computer.

To get to the Penguin's master computer, you have to make your way to the factory through streets and across rooftops crawling the Penguin's thugs. Once you've discovered how to get into the factory, you can search out the master computer and destroy it. But don't think it will be easy. The Penguin has more than one surprise waiting for you.

The Joker: A Fete Worse than Death. You don't need Commissioner Gordon to tell you about the Joker's latest feat of sleight of hand - he's kidnapped Robin! Your search leads you through the sewers of Gotham City to the Fair, where the fun house isn't so much fun and a ride on the rollercoaster could be your last.

Controls
--------

To display the status screen, hold down the fire button and move the joystick down.

To return to the current game screen from the status screen, click the Return icon.

Joystick controls without the fire button pressed:

Face back or climb up

|<-- o ----> Move Right

Duck facing left \ Duck facing right

Face front or climb down

Joystick controls with the fire button pressed:

High kick left ^ High kick right
Apple II Computer Info

To Drop an object:
- Go to the status screen.
- Move the Bat cursor over the icon of the object you want to drop, then press the fire button.
  - The square around the icon flashes.
- Move the Bat cursor to the Drop icon, and press the fire button.
  - The icon of the object disappears from the status screen. The object reappears on the game screen.

Returning to the Game screen. To return to the game screen:
- Move the Bat cursor over the Return icon, then press the fire button.
  - The game screen reappears.

Turning Music On or Off. To turn the music on or off:
- Go to the status screen.
- Move the bat cursor over the music icon, then press the fire button.
  - If the music is on, it goes off, if it's off, it comes on.

Restarting the game. To start the game over at any time:
- Go to the status screen.
- Move the Bat cursor over the Restart icon, then press the fire button.
  - The message appears that asks if you want to start the game over.
  - Type y if you want to start over; or type n if you want to go back to the game where you left off.

Energy: At the bottom of the screen, the graph or Batman’s face shows how much energy you have left. As you use energy, the bars on the graph get shorter or Batman’s face slowly turns into a skull.
To get more energy, eat food objects you picked up.
To eat:
- Pick up food items
- Go to the status screen.
- Move the Bat cursor over the icon of the food object you want to eat, then press the fire button.
  - The bars on the graph grow longer, or part of the skull that's showing changes back to Batman's face.

Hints and Tips
---------------------
1) Don’t eat too much too soon.
2) Some objects do more damage than good.
3) You can carry only a limited number of object at a time. Drop objects you don’t think you need anymore.
4) Duck to avoid bullets.
The Penguin: A Bird in the Hand

When you learn from Com. Gordon that the Penguin is plotting to take over the world with an army of robot penguins, you rush at the Batcave. Before you leave, be sure to collect all the items you think you can use. When you reach the streets of Gotham City, keep an eye out for other useful items. Watch out for the thugs that roam the streets—they may shoot at you. Punch, kick, or hit them with your batarang for temporary defense.

The Joker: A Fete Worse than Death

To reach Robin, you first have to make your way through the sewers of Gotham City—not a pleasant prospect. Make sure you've collected the items you think you'll need before you plunge into the sewers. You need to disarm them before you can leave the sewers—but it will take you a while to come across the tool you need to do the job, and you'll have to do a lot of backtracking to disarm all of them.

When you find the bat ears, use them to amplify your hearing.
The First Succession War (2787-2821)
...left cities decimated, vital industries destroyed, and hundreds of millions of civilians dead. All energies were turned to war -- civilian technology, including water purification systems, deteriorated drastically.

The Second Succession War (2830-2863)
...was just as deadly, destructive, and indecisive as its first. The blossoming military technology nurtured as it died in war. It became increasingly difficult to build the computers, large fusion reactors, BattleMechs, and dropships desperately needed for combat. Production slowed dramatically, lagging dangerously far behind the battle-field losses. The warlords were reduced to cannibalizing existing equipment for spare parts to supplement the building of new weaponry. Salvage became vitally important to survival.

The Third Succession War (2866-present)
...continues the brutal contest. Resources are too scarce to destroy, to valuable not to fight for. War is now a way of life.

There are five houses at war, you start in the third most powerful. These houses are listed:

- The House of Davion -- The Federated Suns
- The House of Kurita -- The Draconis Combine
- The House of Steiner -- The Lyran Commonwealth
- The House of Marik -- The Free Worlds League
- The House of Liao -- The Capellan Confederation

The weakest house, constant defeat and heavy territorial losses have kept this house quiet. Maximilian Liao has been seeking assistance from the more powerful houses.

There are your five houses. For you out there who didn't bother to read it, you are a part of the second house, the House of Steiner. Your main enemy will be the House of Kurita, as you will find out before your training is complete.

You are Jason Youngblood, you have begun your BattleMech Warrior training at the age of 9. You are now 18, an expert at fighting. Your father is named Jeremiah Youngblood, head of security, and leading the war against the Draconis Combine. Your mission will be pointed out to you as the game progresses, but for now all you need to know is that you must find the 'MechWarrior Academy, and get as high ranked as you can for your Pilot and Gunnery skills, in order to do well in the real battlefield.

The vital importance. This word protection isn't much at all. You have to identify parts of the robot. You need these when you go to the academy for training. You have to pass the "written quiz".

Here are the parts:
- Right Shoulder -- TORSO MAINFRAME
- Right Hip -- GYRO HOUSING
- Left Upper Thigh -- JUMP JET INTAKE
- Right Elbow -- ELBOW ACTUATOR
- Right Inner Arm -- BALANCE STRUT
- Right Thigh -- LEG MAINSHAFT
- Left Foot -- FOOT UNIT
- Right Foot -- FOOT CASTING
- Right Ankle -- FOOT ACTUATOR

That's it. The Right side of the robot will be on the right side of the screen, so when I say "Right Shoulder", from the robots point of view, it is really the left side. You'll get that eventually.

For the Robotic Exercises, experiment a little. Who knows, it might help your piloting and gunnery skill more. After the city gets blown up by several 35-ton jenner robots, and when you get to the StarPort, you'll get your own 25-ton spankin' new Commando 'Mech. Of course, you can upgrade that to a 30 ton Commando like I got, with 10 lasers on it.

When training, don't forget the other skills. Especially the combat skills, like 'Bows' and 'Knives'. You'll wonder how you can rack up 1000 credits, but remember the stock account. Eventually, you'll be spending 25000 credits to upgrade your 'Mechs. It may sound expensive, but right now I'm so fixed for cash that my account is in the 6-digit figures right now.

Stocks: the source of 90% of all your income. The other 10%? well, when you get onto the battlefield, and demolish 2 'Mechs and 5 humans, and have an expert mechanic to salvage the armoring, well, that racks up some good C-bills too. (C-bills is the currency)

Always look for companions to join you on your quest. You won't get any until Rex joins you at the StarPort. If you're having trouble finding Rex, did the Citadel get destroyed yet? If it did, then go in a North-Northwest direction to get to the starport. When you see a major city with a Arena in it, then you know you found the right place. Rex is in one of the buildings.
You need a good Medic and Mechanic. When you find them, increase their skill in the Mechat Lube and Hospital. BUY WEAPONS, ARMOR, AND CLOTHES! Yes, you will be in enemy territory, so you won't want to stand out in a crowd.

The 'things' get expensive, but what isn't going to be expensive in the 31st century?

Those were all hints for after the Citadel gets destroyed. Before, just talk to as many people as you can, and get as much skills as you can. When the citadel gets blown up, you should have one 'Excellent' skill for a combat weapon, and at least 'Good' for Piloting, and 'Amateur' for Gunnery. If you can, get the 'Excellent' skill in Rifles and SMG's skill, and buy an inferno rocket launcher. They kill with one hit. Armor -- a Flak Vest will suit you. That's all you'll need for now.

That's about it...I think. You will get stuck, I'm stuck in this game right now, but I figure I'll find a way out of it sooner or later. There's always the hint book, that's only about $12.50. N'joy!

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 123 of 1262

Overview:
Beagle graphics is a Graphics utility that lets you use the special feature built into the Apple //e & //c computers to display Double-Hi-Res, with this gem of a program you can achieve graphics that are double of that of the regular Apple //+ or an Apple //e with only 64K or a version "B" motherboard. With this prog, you can get 560 X 191 instead of 279 X 191. This is "Double" the resolution the Apple's usually have plus 16 colors instead of 8.

Different Programs on the Beagle-Graphics disk:
-> Double Hi-Res Utilities:
  Slide.Show - Double Hi-res picture-display program.
  Font.Editor - Double Hi-res character editor.
  HGR.to.DHGR - Converts Hi-res Pictures to double-Hi-res.
  Convert.Hi-res.1 - Converts pictures to 1/2-size double Hi-Res.
  Convert.Hi-res.2 - Converts pictures to Full-Screen double hi-Res.
  Change.Colors - Changes any double Hi-res color to any other.
  Double.Scunch - Compacts Pictures to save disk space.
  Page.2 - Lets you move and swap pictures between pages 1 and 2.

-> Double Lo-Res Utilities:
  GR.to.DGR - Converts Lo-Res Programs to Double Lo-Res.
  Convert.Lo-res.1 - Converts pictures to 1/2-size double Lo-Res.
  Convert.Lo-res.2 - Converts pictures to Full-Screen Double Hi-Res.
  Lo-Res.Load.Save - Lets you load and save double Lo-Res pictures or 80-Column text screens.

-> Plus:
  Many different pictures: Beagle.pac, Bbwos.pac, ect.... Many different Character sets: Ascii.Font, Blippo.Font, ect....

To use the features of Beagle-Graphics, you must use special BBros. commands. Here is a list and a brief explanation of each of them:
(All commands use the "&" vector-meaning they all are preceded by an "&").

Here is a list of the Double Hi-Res commands:
& BCOLOR
Syntax:
& BCOLOR
Examples:
& BCOLOR=15
& BCOLOR=2
Purpose:
Sets the background color for clearing the screen (See &CLEAR) and for Double Hi-Res text (See &PRINT).
Remarks:
Color value must be between 1-15 to specify a Doub Hi-Res color:

0-Black  1-Magenta (Red)  2-Dark Blue   3-Violet      4-Dark Green
5-Grey 1  6-Medium Blue  7-Light Blue  8-Brown      9-Orange
10-Grey 2 11-Pink        12-Green    13-Yellow    14-Aqua
15-White
Syntax:
& BOX (x length[,]y length) [AT x,y]
Purpose:
Draws a square.
Examples:
& BOX (50,25) at 80,80
& BOX (50) at 70,80
& BOX (100)
& CIRCLE
Syntax:
& CIRCLE (x radius [,y radius]) [AT x,y]
Examples:
& CIRCLE (20,10) AT 100,100
& CIRCLE (40) at 70,96
& CIRCLE (100)
& CLEAR
Syntax:
& CLEAR
Examples:
& BCOLOR =13: & CLEAR
& BCOLOR =0 : & CLEAR
Purpose:
Clears the entire double hi-res screen to the color specified by the last &BCOLOR command.
Apple II Computer Info

Syntax:
& HGR2

Purpose:
same as Applesoft HGR2 command, cept' for double Hi-Res.

---

& HPLT

Syntax:
\texttt{\textbackslash a1,\textbackslash y1 \{TO \textbackslash x2,\textbackslash y2\...[TO \textbackslash xn,\textbackslash yn]\}}

Examples:
\& HPLT 75,20
\& HPLT 48,115 TO 79,84 TO 110,116
\& HPLT TO 125,10

Purpose:
same as Applesoft HPLT command, cept' for double Hi-Res.

---

& HSCRN

Syntax:
& HSCRN \(x,y,\text{variable}\)

Examples:
\& HSCRN \((50,70,A)\) : PRINT \(A\)
\& HSCRN \((100,0,B)\) : PRINT \(B\)

Purpose:
Allows text output on the double Hi-Res screen using subsequent PRINT statements.

---

& LOAD

Syntax:
& LOAD \text{main memory file}, aux mem file

Examples:
\& LOAD "\text{PATTERNS}","\text{PATTERNS.AUX}"
\& LOAD "\text{PIC,D2}","\text{MYPIC.AUX,D2}"  

Purpose:
loads a double Hi-Res Picture.

---

& MODE

Syntax:
& MODE (mode number)

Examples:
& MODE \((4)\)

Purpose:
Selects a double Hi-Res Graphics Mode.

Remarks:
Mode number must be a numeric expression (1-4):
1: 560 Mode
2: 140 Mode
3: 560 Mixed Mode
4: 140 Mixed Mode

& MODE can be used instead of & HGR or & HGR2 to display the double Hi-Res Screen without Clearing the screen to black.

---

& NORM

Syntax:
& NORM

Purpose:
Turns off Hi-Res Text, Canceling the effect of & PRINT and & XPRINT.

---

& PRINT

Syntax:
& PRINT

Example:
& PRINT (Sample prog. later)

Purpose:
Allows text output on the double Hi-Res screen using subsequent PRINT statements.

Remarks:
Once & PRINT is executed, it will cause PRINT statements to print on the double Hi-Res screen.

Important:
You must use & NORMAL before printing on the text screen and/or before using a DOS command.

Text Size:
In 560 Mode \([& \text{MODE(1)} \text{ or } & \text{MODE(3)}]\), you can display narrow characters (80 columns x 24 lines). In 140 Mode \([& \text{MODE(2)} \text{ or } & \text{MODE(4)}]\), you can display wide characters (20 columns x 24 lines)

Htab/Vtab:
HTAB and VTAB won't work. Use the & GOTO command.

Color:
The double Hi-Res text color (Foreground color) is changed with & HCOLOR. The Background color is changed by & BCOLOR.

Fonts:
Before using & PRINT you must load a Hi-Res Font ("character set") into memory.

Sample Program using: & PRINT
20 \texttt{PRINT \texttt{CHR$(4)}};"BLOAD ASCII.FONT,A";F
30 \texttt{L=PEEK(974) + PEEK(975) \ast 256 : REM DHGR LOCATION}
40 \texttt{POKE L + 3,0: POKE L + 4,64}
100 & HORZ2 & PRINT ; &XCOLOR =15; & B COLOR =0
110 & MODE (1) & GOTO 0,0: PRINT "SMALL TYPE"
120 & MODE (2): PRINT "BIG TYPE"
125 PRINT ; &XCOLOR = 1; PRINT "Color type in":PRINT
127 & BCOLOR = 2: PRINT "DIFFERENT STYLES!"
130 PRINT \texttt{CHR$(4)};"BLOAD COLOSAL.FONT"
& HCOLOR= 12: "DIFFERENT STYLES!": PRINT " PLUS...":
150 GOTO 0,10: H = INT(RND(1)*16) : B=INT (RND(1)*16): IF B <> H THEN
& HCOLOR= H: & B COLOR= B: PRINT SPC ( 15): PRINT " MIXED"
155 IF PEEK (-16384) < 128 OR B = H THEN 150
160 HOME: & TEXT: & NORMAL : LIST

Purpose:
Draws a circle or ellipse on the double Hi-Res screen. This command
works just like & CIRCLE, except that each point of the circle is
plotted using the complement (oposite) of the color already displayed
at that point.

& ROT

Syntax: & ROT = rotation value

Examples: & ROT =16

Purpose:
Sets the rotation for Double Hi-Res shapes to be drawn with
& DRAW or & XDRAW.

& SAVE

Syntax: & SAVE main mem file, aux mem file.

Examples: & SAVE "PIC","PIC.AUX"
& SAVE A$,B$ & SAVE FILE.1,S6,D2",FILE.2,S7,D2"

Purpose:
Saves a double Hi-Res pictures to disk.

Remarks:
Double Hi-Res pictures are saved as two separate files, one from main
memory, and another from auxiliary memory.

& XBOX

Syntax: & XBOX (x length [,y length]) [AT x,y]

Examples & XBOX (50,25) at 80,80
& XBOX (50) at 70,80 & XBOX (100)

Purpose:
Draws a square or rectangle on the double Hi-Res screen. This command
works just like the & BOX command, except that each point of the box
is plotted using the complement (opposite) of the color already
displayed at that point.

& XPRINT

Syntax: & XPRINT

Examples: & XPRINT

Purpose:
Allows text output anywhere on the Double Hi-Res screen. This command
works just like & PRINT, except that the color of each character will be
the complement of the existing color.

& XCIRCLE

Syntax: & XCIRCLE (x radius [,y radius]) [AT x,y]

Examples: & XCIRCLE (20,10) AT 100,100
& XCIRCLE (30) AT 70,96 & XCIRCLE (100)

Here is a list of the Double Low-Res commands:

& COLOR

Syntax: & COLOR = color value

Examples: & COLOR =11
& COLOR =15
Apple II Computer Info

Purpose:
Sets the display color for plotting double Lo-Res graphics. The colors for Double Low-Res are the same as in Double Hi-Res.

Syntax:
& GR
Example:
& GR
Purpose:
Exactly the same as Applesoft's GR command, except for Double Lo-Res.

Syntax:
& GR2
Example:
& GR2
Purpose:
Converts the screen display to full-screen Double Lo-Res graphics (80 x 48 pixels) with no text window at the bottom of the screen.

Syntax:
& HLIN x1,y1 AT y
Examples:
& HLIN 0,79 at 0
& HLIN 20,25 at 25
Purpose:
Draws a horizontal double Lo-Res line.

Syntax:
& PLOT x,y
Examples:
& PLOT 0,0
& PLOT 79,47
Purpose:
Same as Applesoft's PLOT command, except for Double Lo-Res.

Syntax:
& SCRN (x,y variable)
Examples:
& SCRN (5,10,A)
& SCRN (79,0, RUE)
Purpose:
Returns the color value of the block at the designated position on the Double Lo-Res screen.

Syntax:
& TEXT
Example:
& TEXT
Purpose:
Returns to text display.

Syntax:
& VLIN y1,y2 at x
Examples:
& VLIN 5,15 at 45
& VLIN 0,39 at 79
Purpose:
Draws a vertical line on the Double Lo-Res screen.

That is all of the 33 new commands that Beagle Graphics gives you to take advantage of the hi-quality graphical graphics on the Apple //e-c computers.

By the way, if you want to print-out any of these Double Hi-Res, Double Lo-Res, or 80 column text screens, wait for our Tripple-Dump also from Beagle Bros. We should have it released before the end of the month!

a white box. This is the "default condition" and the computer will SELECT BEAST USING (keys or paddle)
Inhabited by several strong but warring races, their constant conflicts had reduced their population to where mutual destruction would result. In 3853 QA, the tribal leaders agreed to a temporary truce, and formed the Council to find a nonviolent means for settling disputes. It was decided that disagreements would be settled by a tournament which would be won through the use of clever strategy. To avoid Alaxian bloodshed, the tournaments would be fought using semi-intelligent beasts controlled by their Alaxian masters. Any disagreements between the tribes would be settled with a Beast War tournament.
Due to racial differences among its members, the Council agreed to three tournament standards. The Terran Common rules were favored by the Humanoid member of the council. These rules enabled the slower-thinking humans to devise innovative strategies. The Alaxian Universal rules were favored by most of the council members. These rules demanded rapid numerical analysis of your position, your strengths, and your opponents weaknesses. To compromise between the desires of the Humanoids and the Alaxians, the Galactic Standard was agreed upon. The rules were refined over the centuries. Advancements in holographics technology allowed the destruction of innocent beasts to end.

Object: 

To capture more sectors than your opponent(s). The game consists of a series of rounds. During each round, you control an army of six beasts. A sector is captured by moving one of your beasts into the sector. Captured sectors will contain one of your beasts, or a small satellite in your color. Each round ends when only one players beasts remain on the galactic grid.

Options:

After you enter your name, the question "Would you like to play against the computer at novice level?" will appear. You can see the letter Y in a white box. This is the "default condition" and the computer will automatically accept this as your answer if you press return. If you don't want to play the computer at this level, press N for NO and hit return. There are four different sets of rules to choose from: novice challenge, terran common, galactic standard, and alaxian universal. Each set changes four factors. A fifth rules set will allow you to set the factors:
The number of rounds to complete a tournament Time limit for each round
The energy recharge time for creatures on the plexus(center of the board) Whether or not you want random starting positions

Novice   Terran   Galactic Alaxian  Custom

History

The galactic grid has 41 sectors around the plexus. They are arranged in three orbits: the outer, middle, and inner orbit. Surrounding the grid are four colored fields. In the field of your color is a counter showing how many sectors your beasts have captured. When your start a round, you have controlled six sectors, the sectors your beasts are occupying. The beasts move from one sector to another by jumping through hyperspace. Jumping is done by setting up two windows. A home window is built around the beast selected for movement. and a destination window is formed at the sector you want the beast to move to. Once the windows have been built, the beast jumps through hyperspace from the home window to the destination window. Each beast has its own unique movement pattern, as explained in the Beasts section.

When it is your turn to move, the information box in the upper right corner of the screen will display:
(your name)
SELECT BEAST USING (keys or paddle)
Depending upon whose turn it is, and whether you are using paddles or the keyboard, the fourth line could be PDL 0 or PDL 1. A AND S for the A and K keys, or K AND L for the K and L keys. Keys A and K are used to select a beast or sector; keys S and L enter your choice into the computer. If you want to take back a coice press the ESC key. If you are using paddles, rotating the paddle back and forth across the middle area will move the source and destination windows. Pressing the paddle button will enter your choices.

The Grid:

The galactic game grid has 41 sectors around the plexus(center sector on board) to regain one unit of energy. Energy is lost by moving and by attacking.

Random starting positions: changing the starting positions of the beasts makes it more difficult to predetermine the opening moves of the game.

To the right of the grid are three graphs showing energy, time and power. JThe Energy and Power graphs show the condition of the beast
The unique appearance of the wraithil is responsible for its association with a mythological group of hominoid creatures called the Undead. It can have up to 30 energy units and have a strength of 6 units.

Movement pattern: the wraithil can move to a different colored sector containing an enemy satellite consumes 12 units of energy. If your beast uses all of its energy in making the jump it perishes but leaves one of your satellites in the sector. The plexus is the center of the grid. As a focus of energy, it will channel that flow into any beast occupying that sector. The rate of flow is set at the beginning of the game. For example, if the recharge time is four seconds, that means that every four seconds, a beast on the plexus will receive one unit of energy until it is totally recharged.

The Wraithil

The Wraithil can move diagonally only. It has 44 energy units. When attacking its prey, the tentacles of the wraithil close together to form a spear tip which can easily puncture the thin metallic skin of a mechanos.

The Dracon: Controlling the Beast

If the keyboard controls are being used, the following keys are used to control the beasts:

- **A**: move left
- **D**: move right
- **W**: flee
- **X**: attack

**Left group:**
- **E**: stop
- ;: move right
- : move left
- .: attack

**Right group:**
- **R**: stop
- !: move left
- #: move right
- @: flee

If paddles are being used, turning the dial to the right will move the beast to the right and turning it left will cause it to move left. Centering the dial will stop movement. Pressing the paddle button while the beast is advancing against another beast will cause the beast to attack. Pressing the button while you beast is backing up near the edge of the screen will cause it to flee. A beast can flee only to its original position, and then only if it contains one of your satellites. If it is already occupied, it cannot flee. If it doesn't have enough energy to make the jump, then it will perish when it emerges from hyperspace.
Fleeing from your opponent will allow your enemy to move again.

Scoring:
-------
The round ends when only one player's beasts remain on the galactic grid. At the end of the round, each player receives 300 points for each beast remaining on the field, and 150 points for each captured sector. At the end of the tournament, the player with the highest score wins. If you have been playing against the computer using one of the standard rule sets, your name and score will be saved.

Special Features:
-----------------
PAUSE
Holding down the CONTROL key and the F key will stop the game. Press return to continue.

SOUND
Pressing CTRL-S will toggle the sound.
QUIT
Pressing CTRL-Q will end the tournament.
RESET HIGH SCORES
Pressing CTRL-R and the high scores will be reset back to 0.

SELECTING A DIFFERENT BEAST
If you have selected a beast and change your mind, pressing the ESC key will allow you to choose another beast.

Strategy for Beast War
-----------------------
The objective of Beast War is to capture more sectors than your opponent(s). To do this you should consider your beasts movement patterns, energy, power, combat capabilities and strategic positioning.

The movement patterns of your beasts need to be carefully considered to enable you to capture sectors, attack your opponents, and defend your terrain. For example, certain beasts will only move on one color. Moving it through the plexus can change the color of the sector it is on. Moving a beast through the plexus also enables it to regain energy. However, trading beast positions can cost valuable time, allowing your opponent to take the initiative.

Moving to a sector containing an enemy satellite uses much more energy than moving to a free sector. It is advantageous to block your opponents moves with your own satellites. If your opponent captures a sector containing your satellite, his beast will be weakened and open for attack.

This strategy calls for using your energy efficiently. Your beasts can gain energy by capturing and defending the plexus against your opponents, and by defeating them in combat. Since beasts lose energy through movement, any move that does not enhance your position is a wasted move.

If your beasts energy is less than three units it will perish on the next move. There is little you can do with it in combat unless it has a very long weapon range versus its opponent. (such as the dragon fighting the aeroctus) The kamikazee strategy is recommended: move into a sector containing an opposing satellite and (poof!) your beast is gone but leaving a friendly satellite behind.

But to be a successful Beast Warrior, you have to fight well. The amount of power a beast has is determined by its strength, moral support, and combative relationship with its opponent. The strength is determined by its nature; it cannot change. If the adjacent sectors contain friendly forces, your beast will be strengthened by their presence. Each friendly beast will increase the combatants power by one unit.

Finally, each beast is especially effective in fighting one other beast, and resistant to attacks by one other beast. These factors provide combat bonuses which can increase or reduce a beasts power by 2 units. The Beasts section provides more info on this.

The power graph reflects the sum total of these factors. In combat, the amount of damage a beast does is determined by a random number that depends upon its strength, moral support, and combat bonus. The minimum amount of damage inflicted upon your opponent is determined by your beasts moral support and combat bonus. So a beast which has a combat bonus and moral support can often be quite successful in defeating an apparently more powerful opponent by repeatedly striking with an above average amount of damage.

Your position becomes greatly improved when you defeat an opponents beast, and greatly weakened when one of your beasts are defeated. If your beast is defeated, you lose a sector and a beast, your total energy pool is reduced, and the victors pool is increased. It is often the better part of valor to retreat when threatened by a superior force. Fleeing from combat is also costly, though not as much as being defeated. Recovering from a flee will lose time and energy, but it will preserve your beast.
Welcome to the land of Green Sky! In Below the Root, you must find and return Raamo to the people, for he is their spirit leader. Looking everywhere is essential to complete the quest.

PREPARING A STORAGE DISK:
Format a disk in DOS 3.3 format. This may be used in order to save games to disk.

HOW TO BEGIN:
Create your storage disk if you wish to save games to disk. Then put the program disk into the drive and boot Below the Root. Choose "J" for joystick or "K" for Keyboard. Be sure to insert Side 2 first. The game introduction will automatically begin. Introduction may be stopped by pressing space bar or joystick button.

KEYBOARD AND JOYSTICK COMMANDS:

JOYSTICK CONTROL: To move your character or cursor, push joystick forward or backward, left or right. To make a selection, press either joystick button. To get to the possible selections while you are playing the game, hold down the joystick button and pull the joystick down.

KEYBOARD CONTROL: Use the keys below to move in a direction. When you want to make a selection, press spacebar. Left-handed players may use alternate keys.

<table>

MAIN MENU:
After the game is loaded, the main menu will appear with the following choices:

START GAME
CONTINUE
DISK STORAGE
SAMPLE QUEST
START GAME:
To Begin a New Quest

1. Choose START GAME on the main menu.

2. The message "CHOOSE YOUR QUESTER" will appear. There are five characters to choose from, each with their own abilities and personality. Push your joystick forward or press the up key to cycle through your options, then make a selection.
Apple II Computer Info

GLIDE: Gliding is possible only if you are carrying a shuba. To glide, push the joystick button while you are falling. Once the glide begins, push the joystick sideways to move left or right.

EXIT OR ENTER A DOORWAY: Position yourself over the door and press the joystick button.

ON KEYBOARD (use the keys shown on the diagram)

WALK: Press the appropriate key for the direction you want to go. JUMP: From a standing position, press the appropriate directional key quickly two times. While walking, press the appropriate directional key once. To jump from a ladder or vine, go right or left. Jumping from ladders is not allowed underground. RUN: After a jump, you will automatically start running. STOP: Press the key opposite to the direction you are moving. CLIMB: Press the appropriate directional key while you’re on a ladder or vine. CRAWL: Press the down key when you are not on a ladder or vine to stoop. Then go right or left. STAND UP: Press the up key when you’re in the crawl position. FALL: Walk off the end of a ramp or tree limb. GLIDE: Press the left or right directional keys while you’re falling. EXIT OR ENTER A DOORWAY: Position yourself over the door and press the up key.

WHAT YOU CAN DO IN GREEN SKY:

After you choose your character, you’ll be ready to explore Green-Sky. The option menu enables you to choose all the activities you will need in Green-Sky. To display and use the option menu:

WITH JOYSTICK:

1. Hold the joystick button down while you pull the joystick backward.

2. Move around the Menu by pushing the joystick in the direction you want to go.

3. Stop on the option of your choice, press the joystick button.

WITH KEYBOARD:

1. Press the spacebar.

2. Move around the Menu using directional keys.

3. Stop on the option of your choice and press the space bar.

NOTE: Whenever the Menu is visible, the timer will stop.

PAUSE: Pause during game then return to the quest.

SPEAK: Move close to another game character. Be sure you are facing each other. The other character’s message will appear.

PENSE: Depending on your level of spirit skill, you can pense emotions or messages. To pense messages, you must be standing close to and facing the other character.

OFFER: Offer anything you are carrying to another character. Cycle through your inventory and select.

TAKE: Position yourself over any item you would like to take. If you can take the item, it will instantly disappear from the screen. You are now carrying it in your inventory.

BUY: Stand close to and face the merchant. The merchant will take your token and give you permission to take an item, provided you have room to carry it. After buying, be sure to take item.
USE: Use trencher beaks, vine ropes, honeylamps, and other tools you happen to acquire.

Trencher Beak: Face the bramble then USE the beak. One layer of bramble will disappear; repeat process until you clear bramble. If you get caught in a bramble patch without a beak or cutting tool, you must RENEW yourself.

Vine rope: Face direction you want to throw rope. Try to USE the rope. The rope will appear if there is something for the rope to connect to in the direction you throw it. CRAWL across the vine rope, or you'll fall.

Honeylamp: It will be obvious when you need to USE the lamp.

EAT: Eat any of the edibles you are carrying. Cycle through your inventory and select.

DROP: Drop an item, if you are carrying too much.

SELL: You may sell tools and food to any of the merchants.

HEAL: This spirit skill will restore your energy and food level.

REST: Rest indoors on the hanging green nids, either in your own nid-place or in the nid-places of others who offer you rest. Stand in front of the nid and select REST.

EXAMINE: Examine unfamiliar objects you happen to come upon.

INVENTORY: Displays what you are carrying.

GRUNSPREKE: If you have enough spirit skills, you have the power to make tree limbs grow. Stand at the edge of a limb, facing outward. With each successful grunspreking, the tree limb grows. Step out on the new growth and GRUNSPREKE again to create a living bridge.

KINIFORT: If you have enough spirit skills, you have the power to move tools or your own body using psychic power. When you select KINIFORT, a pointer will appear on the screen.

To kiniport tools: Move the pointer to the tool you want to move. Select. Then point to where you wish to move it. Select again. You must place the tool on a spot where you will be able to stand when you pick it up.

To kiniport your body: Place the pointer on your body near your feet. Select. Then point to the spot where you want to move.

STATUS: Displays your STATUS at any given point during your quest.

RENEW: If you get stuck somewhere, RENEW will return you home at the expense of losing a day of quest time.

MENU: Return to the main menu.

STATUS: How you can check on your progress:

Checking on status will give you all the information about yourself.

DAY: Your performance as a quester will be judged on the number of days you take to complete the quest. At the end of 50 days your time will run out.

TIME OF DAY: Reports the current time of day. Game time passes whenever you are moving around the Green-Sky environment. Time stops whenever the Option Menu, Main Menu, Status Display, or text of any kind is being displayed.

SPIRIT LIMIT: Indicates your current Spirit Limit.

STAMINA: Rates your maximum strength. Questers with more stamina can store more rest and food energy, jump farther, and carry more. Your stamina can be increased in the Quest by eating Strange Exilers.

QUESTER: Displays your name. Depending on which character you have chosen, your beginning spirit and stamina will vary.

LEVEL OF REST: Your rest energy is used as your journey time passes. Jumping, climbing, and especially crashing will also use rest energy. Your level can be restored by resting in your nid or in the nid of a friendly character. Your maximum level is one-half of your stamina. If your rest drops below 0, you will be forced to return to your nid-place. You will have lost a day of game time but your energy levels will be replenished.

LEVEL OF FOOD: Food energy is depleted in the same manner as rest energy. Dropping below zero will return you to your nid-place. Keep your food level up by eating.

LEVEL OF SPIRIT: The amount of spirit energy you possess. This energy is depleted every time you use a Spirit Skill. Spirit energy is restored as game time passes.

Note: An example of the difference between SPIRIT LIMIT and LEVEL OF SPIRIT:

You may have a SPIRIT LIMIT of 20 and thus have the ability to GRUNSPREKE. Grunspreking, however, uses two units of spirit energy, so if your level of spirit is currently less than 2, you cannot Grunspreke until your energy is restored.

(*)(*)(*) BELOW THE ROOT GAME TIPS (*)(*)(*)

OBJECTS: (descriptions and where to find them)

PAN BREAD: Pan Bread is a main source of food for the people of Below the Root. Pan Bread is a good meal and provides good nutrients. You can find Pan Bread at Sky Grund, Grand Grund, and Silk Grund. You can also find Pan Bread at a shop.

ROAST LAPAN: Roast Lapans provide protein for long trips. Some roast lapans have strange tastes and lower your spirit energy. You can find Roast Lapans below Garden Grund at the Lapan House, and also at Broad Grund.

FRUIT AND NUTS: Fruit and nuts provide quick energy to keep going, and are a good snack. Fruit and nuts can be found at Garden Grund, Below the Root in Vatar's Quarters, at Temple Grund, and you can purchase them at shops.

SHEBAS: Shebas are used to glide between the Grund, and slow you down so you can land on branches without hurting yourself. You are automatically given one shuba at your home. Additional shubas can be found below Garden Grund, or may be purchased at Star Grund. Beware, for some shubas tear easily, especially when you're falling from branches.

TOKENS: Tokens are the money of Below the Root. Tokens can be used to bribe others, or to purchase objects at shops. Tokens are located every-
where in Below the Root. An enormous supply is also found in the caverns.

**wisserberries**: Wissenberries have no real use, except to bribe the guard at the front of the door that leads to the cavern. Never eat wissenberries, for they can weaken you. Wissenberries are found at Sky Grund, Garden Grund, and at Temple Grund. They can also be purchased at Grand Grund.

**VINE ROPE**: Vine ropes are used to cross from one place to another, and can prove very useful at times. Vine ropes can also be given to Raamo to save him. Vine ropes are located at Sky Grund, Broad Grund, and at Temple Grund. Can be purchased at Star Grund.

**HONEYLAMPS**: Honeylamps are used in the caverns to light the way. You need a big supply, for honeylamps die quickly. They can be found at Grand Grund, in Broad Grund shops, and in the caverns.

**TRENCHER BEAK**: Trencher beaks are used to cut bramble in order to make a path. Trencher beaks are weak and could break at any time. The Wand of Befal is a better tool. Trencher Beaks found at Broad Grund Shops, and at Silk Grunds.

**WAND OF BEFAL**: The Wand of Befal takes the place of a trencher beak, but is very strong, and does not break. The Wand of Befal is hard to get. It is owned by the evil group called the NEKOM. You must get kidnapped by the NEKOM in order to acquire the wand. See elsewhere for the hideouts of the NEKOM.

**SPECIAL NOTE**: The Wand of Befal can also be used to kill people, but completely takes away your spirit level and energy.

**SPIRIT LAMP**: The Spirit Lamp takes the place of the honeylamps, but does not burn out. The Spirit Lamp can only be acquired in Temple Grund using D'O Falla's key. The Chamber of the Forgotten is where the Spirit Lamp is found. The Chamber is located by Vine Palace in Temple Grund. See elsewhere for the location of D'O Falla's key.

**SPIRIT BELL**: The Spirit Bell rings whenever there is a door that you cannot see underground. The Spirit Bell is located on top of Sky Grund. See elsewhere for more details.

**STRANGE EXILERS**: Strange exilers are a type of food that you can eat, and you will grow stronger. Strange exilers are really useful if you're low on energy and strength and food, the strange exiler revives this, plus gives you extra. Strange exilers are located in Sky Grund, Garden Grund, and in Temple Grund. Exilers are very rare. There is also one in the hideout of the evil gang, D'O Slatt. D'O Slatt's key is needed in the caverns. See elsewhere for the location of D'O Slatt's hideout and how to get there.

**TEMPLE KEY**: The Temple Key has a numerous amount of uses. The Temple Key can unlock the front gates of Temple Grund. The Temple Key can also unlock the door to the Temple. The Temple Key can also unlock the doors that hold objects in D'O Slatt's and the Nekom's hideouts. The Temple Key is located in Temple Grund, near the top of the ground. Use a shuba to glide down and retrieve the key. NOTE: If you don't have the key, and can't get the key, and need to get into Temple Grund, there's a way. See elsewhere.

**D'O FALLA'S KEY**: D'O Falla's key is the key to unlock the Chamber of the Forgotten. In order to get this key, first get permission from D'O Falla who lives in Temple Grund in the Vine Palace. Then jump off the edge of Temple Grund and glide to the ground. Go left, climb up the ladder, and glide down onto the platform and retrieve the key.

**WHERE TO GET SPIRIT ENERGY**:

**WISE CHILD**: The Wise Child lives up near the garden in Garden Grund, and is very easy to get to. The Wise Child gives you advice and 5 points of Spirit Energy.

**RAAMO'S MOTHER**: Raamo's mother lives in the Temple in Temple Grund, and gives 5 points of spirit energy. You need the Temple Key to enter.

**VATAR**: Vatar lives below in the caverns and gives 5 points of spirit energy, and has 2 fruits & nuts which you can get simply by talking to him. Once you enter the caverns, keep going right and you can't miss it.

**HERMIT**: The hermit lives atop of Grand Grund. It really isn't that hard to get there, but you need a trencher beak or the Wand of Befal to enter & exit.

**D'O NESHOM**: D'O Neshom lives atop Sky Grund, and it is not easy to get there. You will need at least 1 vine rope. If you are Pomma, you will need 2 vine ropes to get there. Vine ropes are all around in Sky Grund. D'O Neshom gives you 5 points of energy, plus the Spirit Bell.

**ANIMALS**: Pensing rabbits (lapans) and monkeys will give you 1 point of spirit energy. Spiders and snakes do not give spirit energy, and can tear your shuba quite easily. There are 3 spirit-giving animals in Sky Grund, 2 in Garden Grund, 1 in Silk Grund, 1 below Temple Grund, and 1 underground near Raamo. Simply get by the animals, and pense them for 1 point of spirit energy. If you get enough animals, that could amount up to 7 extra points, good for characters with weak spirit energy.

**EVP MEN'S HIDEOUTS AND DESCRIPTIONS**

**NEKOM**: The Nekom is an evil organization that has the Wand of Befal, a type of trencher beak, but much stronger and it does not break. The hideout of the Nekom is below Star Grund, and almost impossible to reach by hand. Getting kidnapped is easier. There are many kidnappers for the Nekom. If someone offers you sleep, pense them and tell if they're working for the Nekom. If they are, you can sleep there and you'll be kidnapped. Once you are kidnapped and in the Nekom hideout, you will need the power to kiniport or you will need the Temple Key in order to get the Wand of Befal.

**D'O SLATT**: D'O Slatt's men are much more evil then the followers of the Nekom. These men also offer you sleep. Some can be found wandering outside, just waiting to kidnap you. Just pense them in order to find out if they're working for D'O Slatt. They usually say, "D'O Slatt's men are waiting." Sometimes, outside, men or women with an evil emotion usually work with D'O Slatt. Once you are kidnapped and arrive at D'O Slatt's hideout, you will need to use the Temple Key or the power to kiniport to get the Strange exiler there. The hideout is located in Broad Grund. A man who lives near Broad Grund is a kidnapper for D'O Slatt also.

**BRIEF STATUS OF CHARACTERS**

**NERIC**: Neric is a good one to use if you are just beginning to play. Below the Root. Neric has good strength, and some spirit energy. He's a good one to quest with.

**GENAA**: Genaa is a good one if you need a little challenge. Genaa is very strong, but has no spirit energy. See elsewhere for places to acquire spirit energy.

**HERD**: Herd is kind of like Neric. He has moderate strength, and moderate spirit energy. He is a middle person. Note that some people do not like Herd and will not give him supplies.

**POMMA**: Everybody ADORES Pomma. They'll give her anything she wants. Even if people hate kids, her emotions win them over. Pomma has some strength, and is greatly spirit gifted. Pomma will need strange exilers
CHARM: Let's all face it, Charn was created for a challenge, and I mean a big challenge!!! He is a weakling, and his spirit gift was created for the birds. If you want a challenge, here it is!!!

MORE TIPS AND HINTS FOR BELOW THE ROOT:

ENTERING THE TEMPLE GRUND WITHOUT A KEY: If you need to get into Temple Grund, and have no key, simply revive your spirit energy, and go to the top of Star Grund. Get to the rightmost edge of the highest branch, and grunspreke till it says you can't grunspreke anymore. Then jump off the edge, and quickly pop open your shuba. You will keep on gliding, right past the gate to Temple Grund, and you're in!!

SHOPS ARE NO GOOD: Shops really are no help. You can get the same supplies for free at houses. Each thing that is in a store is also in some house. Why buy when you can get it for free?!

GUARD AT THE FRONT ENTRANCE: The guard to the front entrance to the cavern takes wissenberries before you enter. If you give him 2 batches of wissenberries, the guard will disappear and you won't ever have to worry about gathering wissenberries ever again.

HOW TO GET TO THE CAVERN: Getting to the cavern is really quite simple. The cavern is directly below Sky Grund, simply go to the bottom of Sky Grund and go left. You can't miss it!

HOW TO GET TO IMPOSSIBLE PLACES: Using the grunspreke power, the wand of befal, and a shuba you can get almost anywhere!

WHAT YOU NEED TO EXPLORE THE CAVERN: You need wissenberries for the front guard, you need a token for the guard inside, you need a lamp (the spirit lamp, or many honeylamps) and you need the Wand of Befal or a trencher beak in order to clear the bramble in the cave. You also need a vine rope or a shuba in order to save Raamo, and the Spirit Bell in order to find some hidden doors.

HOW TO SOLVE BELOW THE ROOT:

Solving Below the Root is not an easy task. But here's a way to go about it. Explore every grund, take any supplies, get the spirit energy if there is any, and explore the next grund. Return to your house frequently to drop off items. When you have explored every grund, go in the caverns with your special cavern supplies, and keep going right. Going left in the caverns leads no place. You can visit Vatar. Keep going right, and soon you'll hear your spirit bell ring. Enter the invisible door, go left and use your power of kiniport to save Raamo! Be sure to offer him a shuba or a vine rope, and you've won!!

THE INTERFACE - How to get there from here.

The BET interface design is basically very straight-forward. The main window layout borrows heavily from many other desktop-based word processors. The extensions that you will notice are the two distinct regions above the ruler. The area to the left being a fully-featured menu bar. It works exactly like you would expect, with full keyboard menu equivalent support. The second area is the status region. Currently the only information you may see here is a 'live' display of the total number of characters in your document, if activated via 'Preferences...'.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 135 of 1262
Apple II Computer Documentation

control-y
This removes all characters from the insertion point to the end of the document.

left arrow
This moves the insertion point before the previous character.

right arrow
This moves the insertion point before the next character.

up arrow
This moves the insertion point up one line.

down arrow
This moves the insertion point down one line.

delete
This removes the character to the left of the insertion point. If there is currently a selection, this removes the entire selection.

clear
This clears the current selection. This does nothing if there is no selection.

delete
This removes the character to the right of the insertion point. If there is currently a selection, this removes the entire selection.

control-y
This removes all characters from the insertion point to the end of the document.

clear
This clears the current selection. This does nothing if there is no selection.

control-c
This copies the current selection to the clipboard.

control-v
This pastes the current contents of the clipboard to the current insertion point. If there is a selection, this replaces the selection with the text from the clipboard.

duplicate
This moves the insertion point to the line clicked. By dragging, this selects by characters.

duplicate
This selects a word. By dragging, this selects by words.

duplicate
This selects an entire line. By dragging, this selects by lines.

duplicate
This supports the AppleWorks style of relative cursor navigation. By performing a Command-number sequence, the insertion point is moved a relative distance from the beginning of the document. Command-1 results in the insertion point moving to the beginning of the document. Command-9 moves the insertion point to the end of the document. Command-2 through Command-8 result in a relative movement into the document.

-------

OPERATION - 'If yesterday was an odd weekday (to determine, see schedule
12-9a,17, How Can I Be Sure That Today Isn't Odd?), only the even,
non-shifted, non-vowel function keys will be operable. ':-)

When initially opened, BET will present you with an empty edit window. From there you may create a new document by typing, or you may load an existing document from disk. You may also paste in text that was previously copied or cut to the clipboard.

-------

LOADING

To load a file, select 'Open...' from the 'File' menu. BET will present you with a file selection dialog box. You will notice a pop-up menu at the bottom of the window. Through it, you may constrain the types of files that are shown in the file list. For example, if you choose 'Teach' from the pop-up, only those files that are saved as Teach formatted will be displayed. If you select the 'All Types' item is chosen, as it is initially, BET will display every file that it is capable of interpreting. You select a file that you wish to open by double-clicking on the file name, or selecting the 'Open' button while the file is highlighted.

-------

SAVING

The procedure for saving a file is quite similar to opening a file. You can select either 'Save' or 'Save As...' from the 'File' menu. If you have just created a new document and you select 'Save', you will be given the opportunity to name the new file. If you choose 'Save As...', you will always be given the opportunity to name the file before saving.

If you have already saved your document, or you have loaded a pre-existing document from disk and you select 'Save', BET will automatically save your document as it is named, in its current file format.

The save dialog also has a pop-up menu from which you can choose the format in which BET saves your file. If you have never saved your document, BET automatically displays 'Text' as the default save type. You may change this type.
to whatever you wish. If you have saved your document, or you have loaded a pre-existing document, BET will display the original file type of the document in the pop-up. You may also change this.

One note about saving files with styled text is in order. Currently, BET can only save style information (font, size, attributes, color) when you save as 'Text'. If you save a file that contains a variety of styles as Text or Source, all style information will be lost. A future version will address this problem.

-----------
AUTO SAVE
-----------

BET has a powerful feature, selectable via 'Preferences...'... that allows you to specify minute intervals that BET will attempt to save your document. If you have never saved the document when the auto save time occurs, BET will present you with the same dialog you use for a 'Save As...'.

BET resets the save countdown timer in four instances; 1) Whenever you manually save your document. 2) When you open a new document. 3) When you select 'Save' from the 'Preferences...'... dialog. 4) When it completes a successful auto save.

When BET's main window is deactivated, BET temporarily suspends auto-save. It will be re-activated when the window again becomes selected.

---
NDW ---
---

'New' allows you to discontinue working on your current document. If the file has been saved, the current text is cleared and you may begin entering your text. If the document has not been saved, BET will ask you if you wish to save it before clearing the text. You may choose 'Yes', 'No', or 'Cancel'. 'Yes' allows you to save the document before BET clears the current text. 'No' clears the current text, ignoring any changes that you may have made to the current document. 'Cancel' returns you to your current document as though you had never chosen the 'New' menu item.

PRINTING
-----------

'Page Setup...' and 'Print...' work exactly as you would expect them. You will see the appropriate dialogs for the current printer.

----
QUIT
----

You may close BET by three means. The first is if you click in the close box in the upper-left corner of the edit window. You can also close BET through two menu items. The first is 'Close' and the other 'Quit', both in the 'File' menu. In all cases, BET will inform you if you have not recently saved your document.

-----------
FIND/REPLACE
-----------

The 'Find/Replace...' feature allows you to search for, or replace, specific text strings throughout your document. The search starts from the current cursor location or start of a selection page.

Conventional find/replace features have usually appeared in two forms. The first is the standard modal dialog that is opened on top of your document. Its placement is dictated by the programmer, so it can obscure portions of your document. The second is the use of a modeless dialog. This is the kind of search where the 'Find' window can be sent to the background, but it can be kept onscreen at all times if you wish.

Since BET is a desk accessory, using the second search type, a modeless dialog is not possible. Desk accessories can only leave one window permanently open (under System Software v.6.0 this is no longer true). I did not opt for the first method because I do not like being forced to do something that needs multi-window interaction, from a modal position.

The dialog that you are presented with differs from normal modal dialogs in a few ways. The first is that it is called a movable modal dialog. It always remains the frontmost window, but you may position it anywhere around the screen. It also allows you to position the main text editing window wherever you like, except that the front to back window orientation cannot be changed.

The scrolling and selecting of your document's text is also permitted. With this method you can change the search start location while you are searching. All that you have to do is click or drag in the appropriate area of the edit window. Note that the window will not move to the front as it would in a normal environment. Also, the cursor usually can be seen, but it will not flash as when editing is possible.

---------------
PREFERENCES
---------------

From the preferences dialog you may set up your environment to suit your specific needs. BET saves your preferences to an external file which is maintained in such a way that BET is fully AppleShare friendly. BET may be run off of a server volume, with separately maintained preferences for each user.

The buttons at the bottom of the window provide you with three options for exit. The 'Cancel' button allows you to ignore any changes you may have made. 'Temporary' enables any changes you have made, but does not save them permanently. When you close BET, the preferences will revert to those that were previously set. 'Save' immediately writes your preferences changes to the preferences file.

The various preference options are:

Word wrap only on carriage returns - This informs BET when you wish it to wrap your text to the next line. If this item is selected, then BET will only wrap text when you enter a carriage-return. If it is unselected, then BET will wrap text to fit the current ruler. As you resize the window, the current text will be re-wrapped to fit the current ruler width.

Use intelligent cut and paste - This helps eliminate the need for you to insert space characters to fix a paste. With this option enabled, BET allows the you to select a word, and cut and paste that selected text without adding or removing any space characters.

Draw active character count - This enables the interactively updated count of your document's length. When selected, the character count in the status region is continuously updated to reflect the current number of characters in your document.

Auto save every XX minutes - This specifies the intervals in which BET is to attempt to save your current document. If you have never saved your document when the auto save occurs, you will be given the chance to give your document a name.

Use intelligent quotes - This enables the curled quotation marks that indicate the opening and closing of a quotation. If this feature is enabled, BET automatically uses the curled variation of quotation marks as you enter new text. Changing this option has no effect on previously entered quotes.

Convert 8-bit ASCII text on saves - When this feature is turned off, BET writes 8-bit ASCII text (such as files created by Merlin) just as it was read.
This means that you can use BET to edit such files without the manual conversion most text editors require. If this feature is enabled, BET will clear the high bits of all characters of such files at save time. This allows you to convert such files to normal 7-bit ASCII text, again, without a manual conversion process.

Default Font - This preference allows you to specify the font, size, style, and color settings BET uses when creating a new document. This allows you to override the normal 8 point Shaston system font. You make your selections from the same Choose Font dialog that you use during the normal operation of BET.

Source Save - This pop-up allows you to specify the language stamp to apply to source files when using 'Save As...'. It's always Note that this option's value is not used when you save your document with 'Save'. In that instance, your document is stamped with its current language designation.

Ruler Type - Allows you to specify the default measurement type that BET is to use in displaying the ruler. Current options are English, Metric, and pixel.

Miscellaneous:

BET saves the current position and sizes of the main and Find/Replace windows to the preference file when BET is closed. When BET is again opened, the windows are sized and positioned to reflect the saved values.

BET also remembers the current visibility state of the ruler when BET is closed. The next time BET is opened, the ruler will be visible or invisible, depending on its previous state.

NOTE: Some serious problems have arisen in testing this feature. Unfortunately, I do not currently have the time to fully come up with an alternate method, so I've elected to disable this feature in that version. It should be enabled in the next release, most probably when System 6.0 is released later this year.

BET automatically saves the current printer setup (set via Page Setup) when it is closed. This allows you to set up your most common print variables once, rather that with each new document.

WHAT IT DOES - Or doesn't. It just depends on the way you look at life.

- Clicking upon the line spacing and justification buttons will reformat the entire document. Unfortunately, the Text Edit tool set, of which BET is based upon, doesn't support multiple rulers just yet.
- Just as the above changes are global, so are the placement of tabs. Tabs do not belong to a specific line, rather, they currently are for the entire document. This is also a Text Edit toolset limitation.
- The file translation routines for AppleWorks documents currently only extract the text. No formatting information that is embedded in the document is retained. Since the principal reason for implementing this translator was to enable me to quickly read AppleWorks documents, I've left out the formatting until a later version. That version will address both the importing and exporting of fully-formatted AppleWorks documents, including AppleWorks GS.

PLANNED FUTURE FEATURES - Will we see it by version 7.0?

My current future features list (is that mutually exclusive?) is rather extensive, and growing. But for now, I will be concentrating on finishing those features that are already partially implemented. As always, your suggestions are greatly appreciated!

BUGS, ANOMALIES, AND OTHER UNDOCUMENTED FEATURES - Or, 'What just happened'

In its current incarnation, BET is a rather stable piece of code. That's not to say that everything will work completely properly, but thus far BET has not crashed on me. That's always Note that this is a plus in my book.

As I've mentioned above, the Hide/Show ruler option is not enabled in this version. It should be fully working in the next release, which will coincide with the release of System 6.0. I have some great new features in the works that specifically take advantage of new System 6.0 features.

BET has strange behaviour with the AppleWorks GS Word Processor module. AWGS apparently does not play with the cursor properly. If BET is in the front, and your cursor keeps changing from the insertion cursor to the arrow cursor, somewhat like a strobe light, it's not my fault. Call Claris (do they still develop Apple II software, or just sell it?). Using a text editor while you are running AWGS's WP is also strange behaviour...

ABOUT THE AUTHOR - I'm the one you should blame.

I'm currently a pre-junior (yep, that's what I said) computer science major at Drexel University in Philadelphia, PA. I try to be the Apple II champion here, but you don't know what oppression feels like until you've gone to a school where everyone thinks the only computer Apple has ever manufactured rhymes with 'Ack!' Heck, we only have 10,000+ of the suckers here. Somebody has to tell this place the truth. What is a 'Macintosh IIgs' anyway? I've heard that one far too many times...

I've been programming the Apple II since 1981, and the IIgs since the day it was released way back in '86. You probably haven't seen much work with my name on it due to two irritating habits that I've gotten myself into over the years. One, from '86 through '87, all I wrote were utilities to help me program. Very bad rut. The second, once I stopped the first, was the inability to completely finish projects due to the fact that I wanted everything perfect by the first release. Well, this is a fine example of the death of my second bad habit. :-(

THANKS - The others you should blame.

First off, my tester at Carnegie Mellon, Gregory Ross Thompson. I don't know what you want to read here Greg, but there's your name. :) Next, all of the people back at APPLE PITTSburgh, my favorite users' group. Special thanks there to Matt Irvin and John LaScola. They were the first humans to see BET last December, and John has given me many fine and useful suggestions. Here at Drexel we have Reggie "put your favorite quote here" Adkins. He desperately wanted to see me finally get one of my many, many projects completely done. Does this count?

I'd also like to thank those that have offered many useful and quite varied suggestions. Keep them coming! And finally, to all of you who have graciously sent in your ShareWare fees. I really appreciate your support and you can rest assured that you will continue to have mine.
Thanks to all.

Well, there you have it. If you have any questions, comments, suggestions, or anything else that I may be interested in, you can reach me at:

W -> north-west      W -> north     E -> north-east
A -> west            S -> STOP      D -> east
Z -> south-west      X -> south     C -> south-east

Gun Movement (keyboard):
I -> north-west      O -> north                P -> north-west
K -> west            L -> fire one round       + -> east
     -> south-west         .                     / -> south-east
     -> south             /

Wepons/Arsenal Command:
: -> switches between dagger* and gun
B -> drops and picks up the bomb*
R -> resets the bomb timer if you have tool kit*. (bomb must be dropped first)
H -> put away gun

Miscellaneous:
(RETURN) -> displays inventory
(SPACE) -> searches a guard (NOTE: anything found on the guard, if needed, will automatically be taken)
F -> uses first aid kit* (if wounded)
M -> bribes guard (costs 15 marks)
<ESC> -> saves game
U -> use object in closet

A "**" indicates that this item must be found

Game Notes
----------

The object of "Beyond Castle Wolfenstein", is to find Hitler, drop a bomb in the room where he is, and run like hell back the room where you started. Hitler will always be on the lowest level of the
Instead of chests, we now have closets. To open a closet, point your gun at it, and press the space bar. If it is locked, you must do the following:

1. Point gun at lock
2. Press buttons 1-0, until you hear a click
3. Start back at button 1, press it, if it does not click, go back to the original button and press it till it clicks. Then try the next button until you find the other "clicker".
4. Repeat this process a third time and when you find the correct three digit combo, it will open. You can, of course, shoot the lock off, but that may attract unwanted attention, and is a waste of bullets.

You can get up to five passes. Each pass is different. You can see which passes you have by looking at the side of your screen and noticing how many inverse numbers there are. One of the five passes will randomly work on each level, but you never know which, so you have to test them out. If you show a guard a pass, and you don't produce the correct one he will draw his gun and ask again, if you still don't get it right, he will shoot, or go after you.

There are two types of guards:
1. The kind that walk around and patrol the area.
2. The kind that sit behind desks.

If a guard hears a shot, sees a dead body, or see's you with a drawn weapon he will probably head towards the nearest alarm. Alarm's look like little holes. When a guard reaches one, he will set it off, thus alerting the whole place of your presence (i.e. everyone will know who you are). There is only one way of resetting the alarm, if you find in a closet, the alarm controls, hit '1' to reset them (i.e. turn off).

The guards at desks are not to be reckoned with, it always takes more then one shot to kill them, so they will time to set off the alarm behind the desk. It is best just to bribe them or show your id.

There are two ways of getting to different levels:
1. Find a secret passage way behind a closet.
2. Enter an elevator.

An elevator is a boxed off room with one of the sides slowly opening and closing. You can see which way the elevator is going by looking at the upper right-hand portion of the room and seeing which way the arrow is pointing.

When resetting the bomb, always make sure there are no guards around, or they will go after you. The bomb timer automatically starts when picked up, and is displayed at the top of the screen.

To use the dagger, you must first select it, then sneak up behind a guard and run into him. This is the ONLY way the dagger will work, do not attempt head-on attacks. The dagger is useful when not wanting to alert other guards of your presence, but want to do-in another guard.

After killing a guard, you can drag his body by moving next to it, pointing the gun at it, and hitting the space (and moving in a direction of course).

You can have a maximum of five passes, 100 marks and 10 bullets, and three of the following: bomb, first-aid kit, dagger.
Finally, if you figure out how to use sound files from any place I haven't mentioned, let me know. I don't know if any other computers use the same kind of files as Apple IIgs and Macintosh, but I'd love to hear from anyone who does. My GEnie mail address is GUYRICE, and my Post Office address is given below.

Final notes:

This software is completely public domain. You are not OBLIGATED to send any money at all. However, you are NOT RESTRICTED from doing so, either. If you really liked this program, STARTPIC, STARTSOUND, SYSBEEP, or any other public domain programs I have written, and feel you need to show your appreciation to me somehow, my address is:

Guy T. Rice
P.O. Box 13036
Dinkytown Station
Minneapolis, MN 55414
Hail fellow warriors in the distant realm of "THE BILESTOAD!" (Thunder & lightning please)

After completing any good game, the age old question always pops up: "What the Hell do I do now?" Coming from a relatively isolated part of the world (somewhere up in Canada) I can't speak for any other Pirates but myself. I say, "Take it apart! Dismember the Mother-Phucker!" and proceed to rip out subroutines which I might find useful and try to figure out how the program does its stuff. When I completed the master level in The Bilestoad I became intrigued with the level code generating routines and looked around and discovered a method of finding level codes for any password for any level. Here's how to do it:

Boot The Bilestoad and press <RESET> until the drive stops.
Do a CALL-151, then an 803G.
This gets you into the player registration screen and prompts you for your password. Type in the password you want level codes for and press <RETURN>. When it asks you for your level code, press <RESET>. Do a CALL-151 and enter the following commands:

* => F3:xx N A7B0G N AA61G <RTN>
where xx is the level MINUS ONE of the level code you want.
For example, if you wanted the level code for the master level 40, you would type:

F3:27 (decimal = 39) N A7B0G....

Here is a list for all you lazy bums who don't feel like trying this out. The password is "GERBIL" (what else?)

- KRK 11 - NNI 21 - JRI 31 - INK
- WVA 12 - OMK 22 - UEC 32 - OZK
- RMC 13 - JON 23 - SKA 33 - TWF
- FRA 14 - QRC 24 - POF 34 - UNC
- WSA 15 - IKK 25 - KGR 35 - LVI
- VTI 16 - WSP 26 - SKF 36 - NNN
- LSI 17 - HKN 27 - VUC 37 - SNA
- LSN 18 - HNI 28 - POA 38 - MSK
- NEI 19 - TWA 29 - J01 39 - MVK
- KI 30 - RLG 40 - QCC (Master Level)

Apple II Computer Info
JOYSTICK CONTROLS:

THE JOYSTICK CONTROLS ARE SIMILAR TO THE KEYBOARD CONTROLS, WITH BUTTON 1 USED TO SELECT WHICH SET OF CONTROLS TO USE.

WITH BUTTON 1 UP:

<table>
<thead>
<tr>
<th>UPPER</th>
<th>WALK</th>
<th>UPPER</th>
</tr>
</thead>
<tbody>
<tr>
<td>KICK</td>
<td>AWAY</td>
<td>KICK</td>
</tr>
<tr>
<td>TO</td>
<td>FROM</td>
<td>TO</td>
</tr>
<tr>
<td>LEFT</td>
<td>SCREEN</td>
<td>RIGHT</td>
</tr>
</tbody>
</table>

WITH BUTTON 1 PUSHED:

<table>
<thead>
<tr>
<th>FLYING SIDE</th>
<th>FLYING SIDE</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIERCING</td>
<td>DOWN</td>
</tr>
<tr>
<td>KICK TO</td>
<td>KICK</td>
</tr>
<tr>
<td>TO</td>
<td>BLOCK</td>
</tr>
<tr>
<td>LEFT</td>
<td>RIGHT</td>
</tr>
</tbody>
</table>

HIT BUTTON 0 TO SWITCH DIRECTION.

PLAYERS CAN GET POINTS DURING SPARRING IN THE FOLLOWING WAYS:

1. CONNECTING WITH AN ATTACK
2. BLOCKING AN OPPONENT’S ATTACK

THE WINNER IS DETERMINED BY THE NUMBER OF WARNING.

PRACTICE SECTION:

OPTION #2 ALLOWS YOU TO LOOK AT THE DIFFERENT ATTACKS THAT ARE AVAILABLE.
EDITING TEXT FILES WITH EDITOR

A unique feature of BlackSpring is that it allows you to edit text files on-line. These text files can only be 1226 lines long, and no longer.

The process is very simple. Simply place a one in the [optional] extension and the file will be loaded instead of created.

If the text file that you are loading is longer than 1226 lines, memory location 10 will contain a 2 and BlackSpring will not allow you to edit it.

When the Save/Write command is issued the old text file will be written over with the newly edited one. If no text file existed, it will be created.

BlackSpring will allow you to use control characters in the text files. Control characters will appear in inverse during editing.

If a line in a text file is longer than 79 characters, it will be split into two different lines. It is not recommended that you use BlackSpring to edit segments, since most segments have lines that are longer than 79 characters.

Example Program:

```asciidoc
input @2 "Filename to edit: " i$:if i$="" return
use "g:blackspring",a3$,i$,1:if peek(10)=2 print "File too long...":return
if peek(10) \[ Aborted \] return
```

GETTING HELP FROM THE EDITOR

If you, or one of your users, is in need of a command list, then he/she only has to press Control-A (user) or Open-Apple A (sysop) to get a Help Window.

The Help Window will appear on the screen. You simply press RETURN when you are done using the Help Window and the screen will be refreshed and you can continue to write your file.

COMMANDS

- **Control-A** Display Help Window
- **Control-B** Jump to Line 1 of the editor
- **Control-C** Center the current line of text
- **Control-D** Delete current line; pull text up
- **Control-E** Toggle Insert/Replace Mode
- **Control-N** Jump to Last Line of the file which you're editing
- **Control-P** Toggle Insert Control Characters ON/OFF
- **Control-W** Write: Save Message

---

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 144 of 1262
BLAZING PADDLES

BLADE O' BLACKPOOLE =

BLADE OF BLACKPOOLE <-> A NEW GAME FROM SIRIUS SOFTWARE DONE IN
HI-RES GRAPHICS

GENERAL COMMANDS:
SAVE = SAVE A GAME
BRIEF = GIVE A SHORT DESCRIPTION OF A ROOM
SCORE = I HOPE YOU CAN FIGURE THIS ONE
RESUME = RESUMES GAME
LONG = GIVES LONG DESCRIPTION OF ROOM
WITH = WITH ROCK, WITH SWORD,ETC
HELP = GIVES HELP
Q = ABORT, SAVE, OR RESUME GAME

YOU MAY ALSO USE MULTIPLE WORD COMMANDS
SUCH AS:
TURN THE LAMP ON
MOVE THE ROCK WITH THE LEVER
TALK TO THE BARTENDER

What is Blazzing Paddles?

BLAZING PADDLES is a very powerful and easy to use drawing program. It
allows you to use almost any input device to create drawing, diagrams,
and text. It is easy enough for young children to use like a coloring
book, yet sophisticated features are included for the serious computer
artist.

Equipment requirements
1. An Apple //c, //e, //+, //, or compatible computer with 48K minimum
   and Applesoft.
2. One or two disk drive.
3. A color monitor or TV is preferred, but a monochrome monitor will
   work fine.
4. One of the following input device (properly connected):
   1) Mouse
   2) Graphics Tablet
   3) Touchpad (KoadlaPad or equivalent)
   4) Joystick, trackball, or similiar paddle port device
   5) Light Pen
5. A printer is optional. You can get a printout of your picture with
   most types of printers.

Getting Started

Before running the program, make sure your input device is properly
connected. Carefully follow the installation directions supplied with
the device. Make sure the power is OFF before connecting anything to
your computer. Next place the BLAZING PADDLES disk in drive 1 (label
facing up), and turn the computer on. When the drive stops spinning,
you will see the following display on your monitor screen. At the
bottom of the screen is a menu of the various input devices. The left
and right arrow keys are used to make a choice from this menu. Press
the right arrow [->] key to highlight the next selection on the menu.
Press the left arrow [<-] key to move backward through the menu. When
the device you are using is highlighted, press [RETURN] to run the
program. The disk will run for a few moments and then the main menu
will appear. Since each input device is operated differently, you will
have to learn the following techniques for your device.

* How to move the "cursor" around the screen.
* How to draw and select menu items using the "ACTION BUTTON."
* How to delete actions using the "UNDO BUTTON."
III - Command Explanation

The cursor is a small flashing marker that indicates your position on the screen. The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture. The UNDO BUTTON is used to remove the last item played on the picture. The [ESC] key on the keyboard is used for the UNDO feature.

The ACTION BUTTON is the point of the pen. When you press down on the pen so that the point retracts, you activate the ACTION BUTTON. The UNDO BUTTON is removed to use the last item played on the picture. This allows you to try things out before they become a permanent part of the picture. The [ESC] key on the keyboard is used for the UNDO BUTTON. If you are using a device with two buttons (touchpad, joystick, etc.), the second button becomes the UNDO BUTTON.

*Note - Light pens require special techniques. If you are using a light pen, refer to the chapter on LIGHT PENS.

Moving the Cursor

The cursor is a small flashing marker that indicates your position on the screen. The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture. The UNDO BUTTON is used to remove the last item played on the picture. The [ESC] key on the keyboard is used for the UNDO feature.

The ACTION BUTTON is the point of the pen. When you press down on the pen so that the point retracts, you activate the ACTION BUTTON. The UNDO BUTTON is removed to use the last item played on the picture. This allows you to try things out before they become a permanent part of the picture. The [ESC] key on the keyboard is used for the UNDO BUTTON. If you are using a device with two buttons (touchpad, joystick, etc.), the second button becomes the UNDO BUTTON.

*Note - The "undo" feature will work only on the very last thing drawn on the screen.

Action Button

The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture. The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture. The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture. The ACTION BUTTON is used when you want to make a menu selection or draw something on the picture.

Undo Button

The UNDO BUTTON is used to remove the last item played on the picture. The [ESC] key on the keyboard is used for the UNDO BUTTON. If you are using a device with two buttons (touchpad, joystick, etc.), the second button becomes the UNDO BUTTON.

*Note - The "undo" feature will work only on the very last thing drawn on the screen.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 147 of 1626

- OA-R = Read block into buffer
- OA-E = Edit what you need.
- OA-R enter 0110, or just 110 and <Return>.
- OA-Ctrl-W = Write buffer to disk at block #110

OA-C = Copy Blocks between devices
Pressing this key puts you into the copy mode of this program. With this command you can do any of the following, plus other things not listed or thought of yet.
- Copy 5 1/4 to 5 1/4 inch disks. One or two drives.
- Copy 3 1/2 to 3 1/2 inch disks. One or two drives.
- Copy Ram disks to any of the above or visa versa.
- Copy Hard disks to any of the above or visa versa.
- OR any combination of the above.
- Copy ranges of blocks between any of the above.
- Search and replace byte sequences between any of the above.
- Search and replace within ranges of blocks.
- Backup hard drives, or ram drives onto 5 1/4 or 3 1/2.
- And other things that I haven't run across yet.
See Appendix B on the copy program for more information.

OA-E = Edit Byte
Pressing this key will allow you to edit the buffer. This can be done either in Hexadecimal or Ascii. If your in the Hexadecimal mode, by pressing OA-E you'll be asked for which byte you would like to edit. Enter in the byte # you want to work on. At this time the byte in the buffer will be highlighted, the byte number, the current value and a prompt will be presented to you. If you press Escape, you'll back out of this operation. If you press Return, no change will be made to the byte, and the next byte will be presented to you for the same evaluation. Pressing the arrow keys will allow you to quickly and easily move around in the buffer. You'll always be presented with the current byte value for the same evaluation as before. You may also use any of the OA-keys to go to any other operation without hitting the Escape key. If you execute the edit a new hex byte the buffer will be updated, and the next byte will be displayed. This will continue on until you press Escape.

If you're in Ascii mode, the same order of events will happen with one notable difference. Before being asked which byte number you want to edit, you'll be asked to specify if you want the High bit set, or reset. The difference being in the Hexidecimal mode, the byte has a hexadecimal value of $CA, (High bit set). This letter on the screen is displayed normally. The letter "A" can also be represented on the screen as a flashing character (40 columns), or Inverse (80 column). The hexidecimal value for this letter "A" is $41. It's important to edit a letter in the correct mode, otherwise problems can arise later while trying to use the edited data. An example of this problem would be if you wanted to change the volume name of a FRODOS disk. FRODOS looks for the volume name in block #602, and it must be in high bit reset mode, (Flashing). If you edit it with the high bit set, the FRODOS will recognize it as a valid volume name. So to prevent problems, mark down which type of letter is being used.

*** Note- Editing a byte does not alter the disk in any way. To save the edited information to a disk you must use the OA-Ctrl-W, Write command.

OA-F = Find Byte Sequence
Pressing this key will allow you to search the disk for a specific byte sequence. You may scan up to a 20 byte sequence to be searched for. The * character (or BD in hex mode), is the Wildcard, and can be inserted anytime you need to find a range of bytes. For example, if you want to find anytime softswitches are being accessed you could search for this sequence; A9 BD C0 ($DA $C0XX); Remember BDs="n".

This will show you the places on the disk that this instruction is being executed. Or if you want to find the occurrences of a word that might be spelled incorrectly, but you're not sure how it's spelled, you might search for this sequence; MISP="n" (MISP=MISSPELLED).

This will show you all the places on the disk that mispxxxxx occurs. If you want to search for a Hex sequence, you must be in the HEX display mode, (OA-H), And you want to search for an Ascii sequence you must be in the ASCII mode, (OA-A). You'll find that while searching for Ascii bytes, you may enter the characters in lowercase, but the program turns them into uppercase. This happens because the Ascii search looks for the entered sequence in uppercase, lowercase, high bit set, high bit reset or a mixture of any.

Once you hit OA-F, assuming your in hex mode, you'll be presented with a prompt that asks you to enter your search sequence in hex. If you have already entered a sequence it will be displayed as the default. Pressing Return here will bring up the default and start it's search. Pressing Escape here will back out of this operation. You may also use any of the OA-Ctrl operation to jump to another operation. Any other hex bytes can then be entered. After the proper sequence is entered, press Return to accept, and the search will begin. Pressing Escape while searching the disk will stop the search and bring you back to the prompt.

If your in Ascii mode, the sequence of events is the same, only you'll have to enter Ascii Information.

Remember, when you hit OA-A or OA-H you'll set the default search string to null, no default string will be displayed.

OA-H = Hex display Mode
Pressing this key will set the program in the Hex display mode. All work on the buffer data will be done in Hex.

OA-L = List disassembly of buffer
Pressing this key lists a disassembly of the code read to the buffer. This command also shows the Ascii equivalent along side of the disassembled code. You may disassemble one instruction at a time by pressing the space-bar. Holding down the space-bar will give you a slow non stop scroll of the code. Holding down the Return key will give you a quick non stop scroll of the code. Pressing Escape at anytime will back out of the operation.

OA-P = Print screen to Slot #1
Pressing this key will print the contents of the screen to your printer connected at slot #1. This command can be invoked at anytime the program is waiting for input. This screen is used by the Imagewriter printers. Other printers may not work as clearly. Eventually the user will be able to designate his own initialization string. Sorry for now though. If you really need to change the initialization string, follow these steps:
- Scan the disk that the Block Work program is on.
- Look for this sequence – 89 90 00 EA EA EA EA EA
- Replace this with your init string.
- You only have # bytes to work with and an ending 00.
- You must append the 00 to the end of your string.
- Write it back to the same block number and try it.

OA-R = Read Block to Buffer
Pressing this key will read a block of information to the buffer, and display the information on the screen. This command uses the information on the top of the screen to find the correct block. You will need to set the correct Slot #, Drive #, and Block # to read first. (See Appendix C for what device is located in which slot and drive #)

OA-S = Set current Slot #
After pressing this key, you'll be prompted for the slot number of the device you're working with. Pressing Escape will restore the old slot number and end this operation. Let's assume the program first starts up, it uses the slot it started up from as the current slot #. Also, when ending the program, set the Slot and Drive that you want your selector quit code to access first. This will greatly speed up your selection of the next system program.

OA-T = Toggle tone ON/OFF
Pressing this key will toggle the tone on or off. So if you like it silent, press this key once. If you decide you want it back, press it again. The program starts up with the tone enabled.

OA-Ctrl-W = Write buffer to Block #
Pressing these keys will write the contents of the buffer to the block number designated on the top information line. The control key was added for safety.

CA-> = Increment Block # and Read
Appendix B - Copying Blocks between devices

The Copy option of this program is one of the nicest features of this program. It's extremely flexible, and has features not found on any other program that I've seen. These features are:

- Normal Disk copy
- Copy a range of blocks from one device to another.
- Copy disk while searching and replacing a string.

You are not limited to device types. For example I can copy a 5 1/4 disk to a RAM disk. Or Back-up a Hard Disk. (There are other programs that will do this job more efficiently.) Or any other combination of devices. Now this could cause problems, but if your careful you'll have no problem.

When copying disk to disk, you must have a formatted disk for your target disk, Otherwise a write error will occur. The upper information line will display the Slot, Drive, Block and operation that is being worked on at any given time.

The normal disk copy option will keep reading from one disk and write to another disk until either the source disk runs out of blocks, or the target disk runs out of blocks. This allows you to use any combination of devices while copying.

The Copy range of blocks option allows a much more controlled copying process. If you want to copy the first 80 blocks of a 5 1/4 disk to you Ram disk, you could specify this. You can even set the starting block of the target disk to a different starting block.

The Search for byte sequence option allows you to specify either a hex string, or an Ascii string to search for. If the string is found it is replaced with another string that you specify. The number of times a replacement is made is displayed down at the bottom of the screen. You can use this option on the whole disk or use the Range option to be more controlled in your search.

All these options allow for alot of combinations, so try them out and see what works the best.

Appendix C - Device mapping in PRODOS

PRODOS upon booting checks to see what machine is it's running on, and what devices are connected to it. It now stores all the information about these devices in a special location inside PRODOS. Storage devices such as Disk II's, Duo Drives, Ram disks, Hard disks, etc, are mapped to go into a specific slot and drive number. The problem is, depending on your configuration, the slot and drive number given to a device may not be the exact slot and drive that it is setting in. So, for those of you who need it heres a list of where PRODOS will map the following devices.

(Assuming that these devices are connected at once.)

<table>
<thead>
<tr>
<th>Slot #</th>
<th>Drive #</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>Hard Drive #1 (Prodos)</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>Hard Drive #2 (Prodos)</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>5 1/4 Floppy drive #1</td>
</tr>
<tr>
<td>4</td>
<td>2</td>
<td>5 1/4 Floppy drive #2</td>
</tr>
<tr>
<td>5</td>
<td>1</td>
<td>3 1/2 Floppy drive #1</td>
</tr>
<tr>
<td>6</td>
<td>2</td>
<td>3 1/2 Floppy drive #2</td>
</tr>
<tr>
<td>7</td>
<td>2</td>
<td>RAM disk 64K</td>
</tr>
<tr>
<td>8</td>
<td>2</td>
<td>3 1/2 Floppy drive #2 if RAMS is installed on IIGs.</td>
</tr>
</tbody>
</table>

This information is from Dennis and Tom Weishaar's book "Prodos inside and out," but I would like to give you a couple of sources to look at.

- Assembly Lines, Softalk Publishing, Roger Wagner. $3.95 from Polarware software company.
- Prodos inside and out, Appendix B, Tab Books inc. $16.95 Walden books etc
- And any other good Apple publication on Assembly.

Appendix A - The Hexidecimal numbering system

The hexidecimal numbering system is a convenient system for programmers to use. An example of a hexidecimal number would be $10. (The dollar sign "$" is the standard representation of a hexidecimal number.) The number $10 does not equal the number 10. The former equals 16 in our normal decimal numbering system. While the latter does equal 10 in the decimal numbering system. The Hex numbering system utilizes 16 unique digits, they are 0,1,2,3,4,5,6,7,8,9,A,B,C,D,E,F. While the decimal numbering system just uses 0-9. There are a couple of reasons why hexidecimal is so important to the computer programmer but unfortunately I don't have the space to thoroughly discuss it. But I would like to give you a couple of sources to look at.

- Assembly Lines, Softalk Publishing, Roger Wagner. $3.95 from Polarware software company.
- Prodos inside and out, Appendix B, Tab Books inc. $16.95 Walden books etc
- And any other good Apple publication on Assembly.
BLKSAVE, by Guy T. Rice

Bob Garth recently pointed out that one of the most likely places to hide a virus, or at least to patch one in, is block 0, the bootup code, on your ProDOS disks. I don't know if such a virus has been made yet, but this program will protect you from one if it has been or will be developed.

Put this into your SYSTEM/SYSTEM.SETUP directory. Now, everytime you boot up, it will check the boot code to see if it's been modified. If it has, it will tell you so, fix block 0, and then reboot. (It lets you know, so you might possibly be able to figure out which program did it. If you just downloaded and tried out a new program, and then this message pops up, LET US ALL KNOW IMMEDIATELY!!)

It would probably be wiest to rename this program to something unique. That way, a virus install program can't delete or modify this file. (For example, you could rename BLKSAVE to something like ZSDFSLKHERSUR.)

Comments? My GEnie mail address is GUY.T.RICE
By pressing OA-T or OA-/ from the main menu one can view a help screen listing the commands.

Selecting Files To Be Processed

After making your menu selection you will be prompted for a source directory name and where necessary a destination pathname or target directory. You can use the TAB key to skip to the next '/' in the pathname shown or OA-TAB to back up to the previous '/'. The DELETE key will delete characters and the --/> keys will backspace and move the cursor forward. When prompted for a destination pathname be sure and enter a pathname for a file not a directory.

After the directory(s) are selected a catalog of the source directory will be displayed. Using the up, down, left and right arrows will move the inverse bar accordingly. Pressing the space bar will toggle a file for normal selection and will display a checkmark next to the name. The 'S' key will toggle a file to be squeezed when added to the Binary II file and will display a 'S' next to the name. OA-space or control-a will toggle all the normal items and OA-S will toggle all the squeezed items. Pressing return will start the processing using the selected filenames.

Pressing OA-D when selecting the files will cause ALL the files and sub-dirs to be squeezed and all subsequent files and sub-dirs contained within them. You could use this to sqz a WHOLE disk if you wanted.

Using The Mouse

If you have a mouse BLU will find it and allow you to use it instead of using the arrow keys and you can use the mouse button to select files though you still have to press return to start the process after the files are selected.

Holding down the OA (open apple) key when pressing the mouse button will toggle the file for squeezing. Holding down the CA (closed apple, option on the g) when pressing the mouse button will act just like pressing return does - it will start the processing.

The sensitivity of the mouse is at location $204B when the program is in memory. This is the $84 byte after the beginning of the program. It is currently set at $08. This means the mouse must move 8 increments to move the inverse bar. If you want to change this use a block editor or from the basic prompt enter:

CALL-151 ;enter monitor
BLOAD BLU,TSYS,A$2000 ;load file
$204B:XX ;XX being the new value. Higher value=lesser sensitivity.
BSAVE BLU,TSYS,A$2000 ;save file
'c ;back to basic

Making Binary II Files

You can use the Destination pathname to pick which directory or disk the Binary II file is placed.

BLU will display all the sub-directories that are selected and allow you to select files from them unless of course you use OA-D which will select them all automatically.

Squeezing Files

BLU will NOT squeeze an existing Binary II file. Squeezing an already

formed Binary II file defeats the whole purpose behind using this format. The correct method is to use BLU's ability to squeeze files WHILE making the Binary II file.

BLU adds an extension of '.QQ' to the original filename to form the squeezed filename.

All file types, except for DIRs, are able to be squeezed.

BLU uses the Huffman algorithm to squeeze files. It first encodes repeated characters by doing a byte for byte pass through the file except that DLE is encoded as DLE, zero and repeated byte values are encoded as value, DLE, count for counts that are greater or equal to 3. On the second translation it develops a binary tree representing the decoding information for a variable length bit string code for each input byte. Each string's length is in inverse proportion to its frequency of appearance in the incoming data stream. Decoding information is included in the squeezed file, so squeezing short files or files with uniformly distributed byte values will actually increase the size.

Special thanks to Don Elton for the donation of his SQ/USQ source code to the Public Domain. I adapted these routines to speed up the processing of squeezing and un-squeezing files and to fix a bug that sometimes caused large files to squeeze incorrectly. There also had to be some changes to integrate the routines into BLU. The core of the algorithms though are basically unchanged from Don's source.

Un-squeezing Files

The squeezed file is unsqueezed to the original file's name. If this name already exists then BLU overwrites it.

Extracting from Binary II Files

BLU will NOT overwrite any files, except the above. If there is a duplicate file then BLU will add an extension of '.n' to the filename. You can then rename the file when you are done with BLU.

BLU checks available disk space to make sure there is enough room for all the files. If there is insufficient space then the program will issue an error message and exit back to the main menu. It will not extract any files unless there is enough space.

Squeezed files within the Binary II file will be AUTOMATICALLY unsqueezed when extracted. You do NOT have to use the USQ function from the main menu to unsqueeze any files. If the files were squeezed separately first and then made into a Binary II file BLU will still unsqueeze them automatically as long as the files have a suffix of '.QQ'.

Deleting Files

BLU will not delete locked files.

Final Words

If you encounter any bugs or come up with a suggestion on improving the program please let me know.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 150 of 1262
BODYFAT CALCULATOR
By Jerrry Robison

"BODYFAT CALCULATOR" is based on work published in a book titled NUTRITION, WEIGHT CONTROL, AND EXERCISE by F Katch and W McArdle (c) 1977.

The percent bodyfat calculated by this method is within 2.5 and 4% of values obtained by hydrostatic weighing. Variations may exist for some people, but usually this method is accurate and reliable.

On the screens to follow, you will be asked enter to information on your age, sex, bodyweight, and 3 circumference dimensions (using a tape measure) for 3 places on your body. Males and females will have different places to measure. Also, each sex will have different places to measure depending on age.

Enter all your dimensions in INCHES. This program will not accept FRACTIONS. You must enter DECIMALS for FRACTIONAL parts of an INCH. What follows is a conversion table to aid you.

FRACTION TO DECIMAL CONVERSION TABLE

<table>
<thead>
<tr>
<th>FRACTION</th>
<th>DECIMAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/8</td>
<td>.125</td>
</tr>
<tr>
<td>1/4</td>
<td>.250</td>
</tr>
<tr>
<td>3/8</td>
<td>.375</td>
</tr>
<tr>
<td>1/2</td>
<td>.500</td>
</tr>
<tr>
<td>5/8</td>
<td>.625</td>
</tr>
<tr>
<td>3/4</td>
<td>.750</td>
</tr>
<tr>
<td>7/8</td>
<td>.875</td>
</tr>
</tbody>
</table>

The following information will help you determine where and how to measure yourself properly to get more accurate results from "BODYFAT CALCULATOR". Remember, you will need to measure only three places on your body. The program will instruct you on which places. However, we will list instructions for all six places.

HIPS--Measure at largest part where hips are broadest side-to-side and deepest front-to-back.

FOR WAIST--Measure the smallest part usually above the navel. Keep abdominal muscles relaxed. Stand erect.

FOR FOREARM--Measure at largest part, usually below the elbow.

FOR ARM--Measure the upper arm with muscles relaxed. Keep arm straight at elbow.

FOR CALF--Measure at largest part of calf, usually about 3 inches below the knee.

FOR THIGH--Measure at largest part, usually at the crease below the buttock. Keep your weight evenly distributed on both feet.

FOR WEIGHT--To measure body-weight, you should have no clothing on. Use beam scale if possible.

"BODYFAT CALCULATOR" IS VALID ONLY FOR WEIGHTS of 75-300 and AGES of 15-50.

All measurements should be taken with a good quality cloth or plastic tape. Use same tape each time for consistency. Do not pull tape too tight and compress the flesh. Tape should make gentle contact with skin. Also, measure and enter your muscle girth dimensions when the muscle is relaxed, unless otherwise instructed.
BODYFAT CALCULATOR
---ape each time for consistancy. Do not pull tape too tight and "comress the flesh. Tape should make "gentle contact with skin."
9085 DATA

+++ ^:::::::::::::::@
  @ :@ BorderCat :@
  ^:::::::::::::::@

This program allows you to make catalogs of all your Print Shop borders. These catalogs are saved as HiRes screens, and can be printed using THE PRINT SHOP's Screen Magic option.

When the program runs, the first question it will ask you is how many drives you have. If you have two, place the disk containing the borders you wish to catalog (several are included with this issue) into drive #1, and a disk for saving these catalogs in drive #2. If you only have one drive, place the borders disk in the drive; the program will prompt you to insert the data disk and the borders disk as needed.

The borders disk is then read, and your pictures are placed on a clean HiRes screen. Up to 12 borders can fit on one screen. After each screen is filled it is saved to disk, and the process is repeated until all borders have been processed.

*Note 1:* You will supply a name for your screen images (catalogs). The program saves the files in the following manner: VOL yourname# where 'yourname' is the name you supplied, and '#' is the sequential number of the screen. For example, let's say you have 20 borders, and have said you want the catalogs to be named "PHRED". You will have the following screens saved:

VOL PHRED1
VOL PHRED2

*Note 2:* Once you commit yourself to doing a catalog of your borders the [ESC] function will no longer work. The only way out other then pressing [CONTROL]-[RESET] is to let the program run its course.

^ Needed files @
The following files are used for this program:

BORDERCAT - The main program.
FP - EXEC file used to exit
UPTIME.ML - HiRes character sets
GETFILE - Support file used to read catalog
PS.BORDER - Support file used to put borders on screen
BORD.xxx - Several BORD. (border) files for your use...

---<>:9-GREED: YOU HAVE TO GET A LOT OF JEWELS HERE, LUCKY THERE ARE SO MANY.
---<>:10-TRACKS: GET THE JEWELS. AVOID THE FIREFLIES.
Introduction

BRAM Checker is an Apple IIgs Temporary Initialization file (TIF) that checks the contents of the battery RAM present in an Apple IIgs for changes from an image that is saved to the disk. You will be notified at boot time of any changes to the battery RAM since the last time you booted the computer. The program will inform you of the battery RAM locations that were changed, and give you the opportunity to restore the old values or continue booting with the new values.

Installation

Just copy the file "BRAM.Checker" to the "*:System:System.Setup" folder on your boot disk.

That is all.

Using the Program

If you make a change (or someone else does) to your battery RAM, for example, change the monitor border color, BRAM.Checker will inform you of the change during the next boot. You will have the option of accepting the changes and continuing with the boot, or you may restore the old values.

If the battery RAM has changed, the IIgs boot process will be interrupted by a dialog on the text screen informing you that there was a change. Press ESC to see which values were actually changed; press return to simply accept the changes and continue. After viewing which items were changed, another dialog allows you to either restore the old values (press ESC), or continue with the new (changed) values (press RETURN).

BRAM.Checker saves a copy of your battery RAM to a file called "BRAM.Image" in your System.Setup folder. This saved image is compared to the battery RAM image at boot time, and you are informed of differences.

That's it. Have fun with it.

New for Version 1.1

+ Added text for BRAM locations $5E and $5F.
+ Added a resource fork with rVersion & rComment resources.
+ Shows boot info under System 6 (Icon).

New for Version 1.2

+ Added a few more BRAM location text.
Borg turns regally in its atmospheric envelope. High off graphically orbit over scars on the surface left by a large ore-endless figure-eight band of shallow space. It flickers intermittently in fixed geocenters two stars and the golden planet lopping around them in an endless figure-eight. Far above the planet, a shiny fleck hangs in the blue-black tumbling through darkness, the last meteors veer toward rock, in gravitational fields along the way. After eons of pg.17 across the universe like blazing pinballs to flame out, rock

by rock, in gravitational fields along the way. After eons of pg.17 across the universe like blazing pinballs to flame out, rock

through space - fan mail from some dead planet, hurtling winked out one by one.

Starlight on naked rock: a phalanx of meteors charges into the sky until the bright spots in its midst, like pale eyes, pg.11

One of them pointed. "The Creator!" The constellation they beheld was like a benign face, with one golden eye and one blue eye gazing down into the rift. Something like a drop of blood gleamed in its forehead - a red dwarf pulsing irregularly. "Something is wrong", said one of the golden creatures. "A dark cloud hides the Creator's face - the evil mask of prophecy!" Indeed, the constellation seemed dim, and even the brightest stars were slightly obscured by the shadow, darker than space, creeping over them.

"When the Creator shall be masked", intoned one of the seven, and the others chanted, "then the world will die...

"Then the mask shall fall away", chanted the first, and the others responded, "then the world will live again..."

The first one said, "The darkness quickens - it is the time of renewal. When the blood star vanishes, the dark storm will scour the planet clean. All our people must be returned to Borg. And then we must perform the ritual of the elements, to recreate the Creator so that the Lau may live". Another murmured, "All our training has brought us to this day".

In reverence and awe, the seven gazed upward at the stricken constellation. Suddenly they heard rough voices drifting up the path, then creaking leather, rattling chains and thudding boots.

"Breakers!" Terrified, the golden creatures fled into the jungle. Darkness broke out behind them, followed by blades flashing in the dim violet light. At the edge of the jungle, one of the golden creatures fell - two bone-handled knives in its back - and lay twitching as the Breakers, cursing and joking, surrounded it. Their leader had a face like a peeled carrot, scarred down one side. With a raspy chuckle, he yanked his knives out of the corpse and gloated, "Like Mulcahy says -

they're no good dead, but it's better than letting 'em get away!" He wiped the blades on his filthy leather pants amid guttural laughter.

Nobody saw the luminous golden mantle that rose from behind a metaplast wall plate - can be anywhere. away!"  He wiped the blades on his filthy leather pants amid guttural laughter.

Far above the planet, a shiny fleck hangs in the blue-black band of shallow space. It flickers intermittently in fixed geographical orbit over scars on the surface left by a large ore-
mining operation. The industrial space colony's age is revealed by the obsolete spherical design, with antiquated solar power panels, reflector and shields spread over its translucent dome: picture a round blow-glass sculpture hanging in a dark void - a dirty yellow glow inside - its outer surfaces, points and spires dusted with fairy light from distant fireballs.

A vagrant meteor smashes through one of the solar panels, blows a dish antenna to junk and bounces off the colony's hull. Then it wobbles on into eternity, leaving the hull plates ruptured and gaping behind.

The luminous golden mantle rolls up from the planet and drifts toward the colony, surrounding it and seeming to stare in through the dome with shining eyes as the colony shudders in the meteor's wake. The lights inside dim and flicker for several moments. Hovering outside the dome, the vaporous eyes peer into the colony's heart. A universal intelligence feels along the maze of corridors, through the residence modules, the shophouses, across the rotting hydroponic vegetable beds and rusting transport pods to the administration module, and out again, sensing everything. Except for a skeleton mining crew, a handful of drifters and a large force of security mutants, the colony seems abandoned.

The mind feels its way to a barroom on one of the utility levels. Under garish colored lights, entities of every description are killing time, drinking, fighting, planning trouble. Ouch! The sordid violence in these entities' brainwaves is painful to the probing awareness. It recoils, and the dusty glow outside the colony hull seems to intensify briefly. Then, tentatively, the intelligence touches some of the more accessible minds in the barroom...

"Haw haw! The look on that thing's face when eight thousand volts whirled it into its face! Brood!" The Cirdonian broad-shouldered bartender, his rivets whipped the bartop, spilling drinks and shaking the floor. Since he was a Cirdonian, nobody complained. Buying a new drink was easier than buying a new head.

"Sounds pretty funny", said a huge boxlike entity next to Betty the Bartender. "Look here!" The Cirdonian watched the bartender's face for something like a supernova behind the occipital bulge. His small eyes blazed for a moment. Then it wobbles on into eternity, leaving the hull plates the expressions flit across like starlight on a moonscape. The luminous golden mantle rolls up from the planet and seems to intensify briefly. Then, tentatively, the intelligence touches some of the more accessible minds in the barroom...

Panface nodded to Betty the Bartender and gave up his place to another Breaker. Even the Cirdonian pulled back slightly as he left. Panface was known for his sweet, melancholy disposition, but he had also been known to drink too much of Betty's lava and convulsively tear three-inch meta-plast plates into confetti while in the throes of some unknown grief.

The big solemn guy rolled across the clamorous room, his big solemn eyes blazed for a moment. The mind feels its way to a barroom on one of the utility levels. Under garish colored lights, entities of every description are killing time, drinking, fighting, planning trouble. The Cirdonian, nobody complained. Buying a new drink was easier than buying a new head.

"Sounds pretty funny", said a huge boxlike entity next to Betty the Bartender. "Look here!" The Cirdonian watched the bartender's face for something like a supernova behind the occipital bulge. ing maintenance tasks, but the colony appears to be disintegrating.

Probing the administration module, the intelligence watches a tall young Terran stroll along a corridor, read a doorplate, and jauntily enter an office. A far-world receptionist of indeterminate gender interrupts filing its nasal flanges to buzz another office, then directs the young Terran through a door.

An older, slightly-built Terran with shifty eyes stands to greet the youth with a nod and the ritual hand clasp. Then the two sit down on opposite sides of a desk and begin talking.

The glowing spots outside the hull seem to blink; the intelligence focuses on the office. Ubiquitous Terrans, infesting the galaxy! Such messy little minds on the surface, but capable of such devious complexity. Reading one from the outside is like crossing a room full of Breakers in the dark, but the intelligence grimly reaches out, touches one of the minds and then the other...

pg.24

Nate Grey had a funny feeling the moment he saw the guy. "Welcome to Nimbus Colony," he said cordially.

"Thank you," said the guy. He didn't asseem like a bad guy, really. Nate Grey could have liked him in another situation, on a free planet maybe, or a mission to the swamps of some nacreous moon where they'd be on the same team perhaps, a colonization or something.

"Grey tensed his eyes. "Don't mention it." What was the guy's game? What was he after? Look at those duds - gold fake noogahide, thumbs hooked in his asteroid belt, smiling. What's he up to?"

"Nice office." They both looked around the office. It was a lousy office, the kind they give you when they don't care. The UMC logo was everywhere. Except for that, Grey didn't mind it.

"Thanks," he said. "Miss yours?"

"Oh, I don't have an office," said the guy, flexing his asteroid belt. "I'm a little too mobile for that."

"Out there counting stars," nodded Grey, counting stars. That's what they called it when you were young and on the move, out there in deep space, acing through atmospheres strange to breathe, maybe landing on some paradise where everything was perfect for life but no life existed, or landing in parasitic slop and barely escaping, rusting from colony to colony, adventure to adventure. And during the voyages you'd sit in the observation bay for years, counting stars.

"See any new ones you could name after yourself?"

The guy smiled, an honest smile. "Riggs? What kind of a colonization or something. have at least one part obtained from the Kargons. They had every kind of ship ever built anywhere, piles of them, a parts farm. Riggs had been there, but not just to see that. Karg was also the site of the Gak Academy. Riggs shifted uncomfortably in his seat.

"I guess Riggs is as good a name for a star as Kangor." Kangor was Karg's main star. "By the way, who did the painting?"

Grey glanced at the painting. It was a lousy painting. Osten-sibly a landscape of Borg - but the artist had obviously never seen Borg, only read about it. The planet in this painting was covered with silica, decomposed from sandstone. The actual Borgian surface was pyrite and silica, flecks of the stuff in a layer several miles deep.

pg.26

Miners had to put metaplast tubes through it just to reach the ore-bearing strata, which were escaping from the expense of the UMC's Borgian operation. Walking on that surface was like walking through dry soup, Grey remembered. The artist depicted deep, rocky canyons, barren except for a few thick vines. In fact, the canyons were volcanic rifts, miles deep, choked with jungle and debris. The debris showed definite signs of life from time to time, as if kargons were living in the canyons, forcing their way through the crust by sheer weight. Spectrochromatographic test results hinted at periodic cataclysms of unknown origin.

The artist must have read about the carnivorous vines. Sure, there were still vines in places, and Grey had scars to prove it. But they were dying out. Unfortunately for them, they tended to grow down cliffs and ravines, dangling in places where carnivorous life was scarce. Sometimes a poor lorn would wander by; then there would be flowers in that spot and the other lorn would avoid it. Those were the flowers, reflected Grey, that they used to manufacture their sacred narcotic.

They called it Magic. Grey had experienced it, once...

The intelligence cringes; its luminosity withers away from the colony hull. The elder Terran is thinking thoughts he
has no right to think, recalling memories that are forbidden all but the Lau. But in the wide universe, indignation and anger are inconsequential. The great eyes widen. The mind again peers into the small office.

"I think a machine did that painting, to tell the truth", said Nathan Grey.

pg.27

The other guy laughed, rubbing a ring on his left hand. Grey noticed the inlaid insignia, which could have held a printed circuit, or maybe a chip. What device did it operate? Abruptly, he asked, "When are you leaving us?"

The guy stopped laughing and shrugged. "I haven't made any plans", he said, meeting Grey's eyes. "I take it you've been reading my columns?"

"No I haven't had time", said Grey blandly. "Have you written about Nimbus Colony already? I thought you roving corres-pondents filed on SpaceWave twice a day. I haven't noticed any transmissions to Spiral Arm Today on our log."

"I've been slipping them in", said the guy a bit to quickly. "Those little columns only take a half-second burst."

But Grey was suspicious now. He glanced at the ring. A shielded transmitter?

"Anyway", the guy continued, "Mr. Gibbons wants me to stay, see what UMC might be up to out here. As a matter of fact, I might want to get down to Borg. Would you mind arranging that?"

Grey almost snorted. "Impossible, of course. As you are aware, Borg is a Class IV planet."

"Why?"

"I'd have to be a Federation agent to know that," said Grey with a soft laugh that sounded like a loose rock sliding downhill. "Or a smuggler", said the guy, and Grey's mind registered a thought that sent the eavesdropping entity reeling...

The gaseous eyes drift outside the hull. the intelligence watches a the young Terran woman stroll jauntily out of the office, rather hard to believe anybody owns this colony. The cloud hovers outside the colony dome as the awareness watches Grey punch a button on his desk.

pg.31

"Grgla! Hey - stop filling your face and get in here!"

Nate Grey had to avoid looking at his receptionist when it appeared in the doorway. Why couldn't he have had a Terran female for a secretary? Unfortunately, the UMC was an Equal Entity Employer...

"Have you been saving those SpaceWave tabloids? I want to see the current issues of Spiral Arm Today."

"Certainly Mr. Grey", honked Grgla, flouncing out. The floor shook. In a few moments Grey had a stack of the cheesy publications on his desk. He flipped through the top one, started reading a groaned. The latest edition of the beam-published newspaper carried stories in many languages. One of several in Terran was a popular column called Be Here. Now, by award-winning reporter-at-large J.Delbert Riggs.

BE HERE NOW
By J.Delbert Riggs

------------------

No Silver Lining on Nimbus
(part one)

DATELINE: UMC Nimbus Colony,
Slug Lau. But in the wide universe, a bizarre drama is being played out in this forsaken corner of

pg.32

nowhere, on a sleazy industrial satellite and the mysterious desert planet it orbits. The cast of characters includes intergalactic dropouts, smugglers, murderers, at least one Federation agent, and an ancient civilization of mystical beings called the Lau.

Just to make the plot a little thicker, the star players - a powerful Lau shaman known by the name Garbo - may not even exist.

The scenario is convoluted, to say the least. And there's only one reporter who has managed to gain an overview of the whole sordid mess:

Yours truly, J.Delbert Riggs. I'm here now.

Still reading? Good. Here's what I have so far:

A band of space pirates - "Breakers" in Slug Nebula Standard Received (SNBR) has established a headquarters in deep volcanic rifts on this Class IV desert orb called Borg. For some time now, according to Federation sources, the Breakers on Borg have been using Nimbus Colony as a base for Galaxy-wide smuggling operations. This orbiting junkpile is allegedly owned and operated by the omni-present United Mining Corporation (UMC), which ostensibly uses it as an operational base for mineral recovery on Borg. (The astute reader will recall that UMC recently acquired exclusive mineral rights to Borg following a protracted legal power-play directed by UMC executive Nathan Grey. See my column, Where is Borg? in SAT # 448681-B.)

I say ostensibly, because quite frankly it is rather hard to believe anybody owns this colony... or "Klink" in SNBR - and harder to imagine it's actually being operated at all. Token work crews do shuffle down and back regularly, but no ore has been shipped out for months. According to the company's own geological projections, the latvium deposit they were working should have been exhausted by now.

So why does Nimbus Colony remain in fixed orbit? More to the point, why is the klink deserted except for a skeleton workforce, and oversized department of fierce mutant security cops - known as "Gaks" in SNBR - and of dropouts, drifters, adventurers and other deep-space drifters, "Breakers" in SNBR - confined in a wrecked bar on the utility level of a deserted residential module?

Why, indeed.

Having been assigned to quarters in that very module - and yes, it is quite deserted - I unavoid-ably made contact with these Breakers in my first few hours here. They are most certainly a motley

pg.33

and a dangerous bunch. But I can assure you that the Breakers are a far better company that their adversary, the Gaks.

At last, I can appreciate the recent rash of "Gak
jokes" (How many Gaks does it take to catch a red ball, etc.) - although I now know I wasn't missing much. They are stupid, sadistic, scum-bags, and I've said as much to their visors. You can't ever see their faces - which is probably just as well.

(Tomorrow: Breakers - the Entities your Mother Warned You About)

BE HERE NOW
By J.Delbert Riggs

No Silver Lining on Nimbus
(part two)

DATELINE: UMC NIMBUS COLONY,
SLUG NEBULA
In the last column, I sketched the particulars of a bizarre drama now playing on the UMC colony, Nimbus. I'm here now.

There is a species of spacefarer known as a Breaker. That's a loose synonym for adventurer, shuttlebum, pirate, outlaw, loser, and any other kind of misfit one might care to avoid mentioning - or associating with.
For reason or reasons unknown, virtually all the Breakers in theSlug nebula are now on Borg. Most of them have been trapped on Nimbus Colony, but a fair number seem to be making it down to the planet, where they join up with a band of smugglers headquartered in Borg's deep volcanic rifts.

The Breakers on Borg are lead by a former Federation agent, professional ballet dancer and convicted murderer named Vulkos Mulcahy. Little is known about Mulcahy except that he's fast, smart and treacherous. His sidekick is a wicked punk who currently goes by the name Don. Mulcahy's mistress is Minnie Markarova, the one-time pride of Sector X's Paris Colony and Mulcahy's ballet instructor until she fell under his spell. Minnie dropped out of sight after helping him extort virtually every cent in the Paris Colony Ballet's operating fund. (See my column, Minnie Makarova, Bad Girl or Pawn? in SAT # 4449677-B.)

This unsavory trio, and a bunch of their closer friends, are now working out of Borgian Rifts. They reportedly deal in some especially unsavory contraband: slaves and narcotics. It seems that some of the Lau - a particularly gentle folk said to possess unique telekinetic powers - have been turning up in chains on other worlds. Pets of the rich? I'm told by my close personal friend Druella Comstock, the glamorous shuttle-set ingénue, that having your own Lau is the height of the current top-drawer chic. Immoral? Certainly. Illegal? Of course. In fact, it stinks - but that's the rich for you (close personal friends excepted, Druella, and I mean that).

Mulcahy's contact on Nimbus Colony is a veteran bootlegger whose name is known to school-kids in every system from here to Andromeda: the legendary, nearly mythical Casey Jones himself, another former Federation agent turned smuggler, killer, and thief. But before we start inquiring into the basic nature of Federation agents, let's get to the crux of the matter.

Jones and Mulcahy are duking it out. It seems that the two master criminals - one controlling the source of contraband, the other its distribution - are now going for each other's throats in an all-out war over the proceeds of their nefarious trade.

At any rate, the deal seems to be about to go down here on Nimbus Colony or, more probably, on Borg itself. Any yours truly, intrepid correspondent that I am, has every intention of witnessing it.

Meanwhile, mysterious ore freighters continue to stop here on occasion - but it sure isn't ore. So far nobody here cares to recall (for a reporter's benefit, anyway) what the last one looked like or who was aboard.

Grey has agreed to give SAT an interview at some point, but never seems to be in his Administration Module office, or anywhere else, when this reporter shows up to talk.

That's Grey for now. I have other leads to pursue. Sources in the Breaker bar have told me that Casey Jones works out of a concealed room near the shuttle bay on the lower level of this colony. As soon as I make a final attempt to see Grey, I'm going down to find Jones and interview him on the situation. I trust he'll keep his famous Colt .45 holstered out of respect for the press.

That's it, I'm on my way.

(Tomorrow: Casey Jones - the Rat Behind the Legend)

"That dirty...Grgla!" The hideous receptionist slithered into the office with the flange-file in one limp claw. Grey shouted at it on his way out. "I'm away from my desk, in a meeting and with a client until further notice, got it?"

"Sure thing, sir" said Grgla, already making plans.
The vast intelligence probes the receptionist's mind, but Grgla has a powerful mental scrambler in place. Turning into the maze of corridors and pod chutes to locate Nathan Grey, the intelligence comes across Riggs in his residential module. Riggs is talking with someone called Druella. The intelligence is mystified— it can't locate another functioning mind in the module. Nonetheless, it tunes in:

"Druella", said Riggs, "I'd like to go over that material on Borg again."

"Okay, Delbert", responded a perky voice. "Coming right up."

There was a melodious beep.

Touching the young Terran's mind, the intelligence read along with him in a book called All About Borg, by famed explorer Captain Brumus Dart, Ph.D. The table of contents listed the chapter headings typical of a scholarly work. Riggs turned to the one titled, Garbo: Alter-Orb or Legend? He began to read:

pg.40

GARBO

Alter-Orb or Legend?

According to Lau belief, Borg has a shadowy, insubstantial twin that orbits on the same path (see Appendix Q: Source Mythology, Borg and Garbo). Our instruments have not been able to detect such an entity, but the Lau believe in it absolutely. They call this alter-orb Garbo, and have invested it with a persona which is manifested collectively by a body of seven Lau shamans. (Note: I was never able to meet a "Garbo" shaman, and wonder whether they, too, may not be a figment of the Lau mythology.)

Moreover, they believe that the mysterious alter-orb is the wellspring of Lau energy, and the source of all life on Borg. They say that a kind of balanced polarity exists between the unique forces emanated by each of Borg's two suns, the blue and the gold. These forces are held in dynamic stasis by energy from the Garbo alter-orb. (Note: This is my interpretation of the various indistinct, incomprehensible versions of the Garbo myth obtained from individual Lau. It should be treated as hearsay.)

Perhaps the most familiar facet of the Garbo myth is its apocalyptic emphasis. Like so many other deities, this Garbo creates through destruction. The Lau believe that once every several thousand years, the orbital paths of the two

pg.41

heavenly bodies intersect. Although the resulting collision is not physical in nature, due to the insubstantial properties of the alter-orb, it nonetheless precipitates utter chaos and destroys all life on Borg, except for the Lau themselves and certain portions of their habitat deep in the Borgian rifts (see Chapter 4).

Survival is not guaranteed, however. In order for them to live through the catastrophic energy storm, the Lau themselves and certain preparations must be made well in advance. These involve assembling a number of sacred objects—the so-called elements—which are employed in a ritual recreation of the universe in its proper image. The ritual is said to be performed in a sacred cavern deep in the rifts.

I have never seen the cavern or its alleged contents. But I have observed apparent transmogrifications of Lau individuals from corporeal form into water, fire and other states. (Note: As I was the sole non-Lau witness, and given that my profound astonishment precluded a precise recording of my observations, this may be taken as a subjective field report of empirically observed phenomena, although, I humbly assert, something more that mere anecdote.)

These transformations were apparently made possible by drawing energy from certain stones. Could these have been the elements alluded to previously?

At the time of my visit with the Lau, they believed that the grand event, the collision of Borg and the alter-orb, Garbo, was imminent. As one of the more garrulous elders informed me, "The Creator wears a mask" when the cataclysm is nigh. The old Lau was an habitual user of Magic, the psychotropic narcotic unique to Borg (see Appendix B), and may not have been entirely reliable in an objective sense.

"The Creator wears a mask" apparently refers to the chief constellation in the Borgian firmament, called the Lau. (or, sometimes, Garbo). The image imposed on the stars of the Creator is that of an ancient sage, his white hair and beard blowing in the solar wind, with arms outstretched in offering. In his left hand is a golden star, in his right, a blue star, and his forehead is marked by a red dwarf, equidistant from the two, which pulses blood-red, especially in the sky where the constellation resides for most of the year.

It seems that during the latter part of 4999, the Creator's face had begun to be occluded by a sort of celestial shadow. Indeed, the constellation looked rather dim to me, and the forehead stone seemed to shine bloodier each morning, but I was unable to distinguish any kind of shadow. Of course, I wasn't given to the use of Magic, either.

My garrulous friend also informed me that his people were worried because the various disruptions and pressureds brought on by the gold rush had made it difficult for them to maintain control over the elements. Some of them confessed to deep fear that the elements would not be assembled in time to avert the end of the Lau race and of the planet Borg.

pg.43

When the Federation mandate of 4999 forced me to leave Borg, the Lau were in a state of deep trepidation, almost
BREAKERS responds to a wide variety of commands. Some common ones are explained below, but you'll discover others as you begin play. In fact, BREAKERS recognizes a vocabulary of over 1200 words. Many synonyms of commands are possible. For example, "get" works as well as "take", and "rub" is a synonym for "touch". For ease of typing, some commands can be abbreviated. You can also type commands in either upper or lower case. When you are finished typing a command, press the RETURN key.

You can also take a greater part in the action by talking to characters and evaluating their responses. A note on how to use dialogue follows the discussion of commands.

The universe of BREAKERS is constantly transforming itself. Even if you do nothing, characters will patrol Nimbus Colony, monsters will prowl the Borgian seas, the cosmic weather will continue to change.

Occasionally, the text being displayed will be longer than your screen. Instead of "scrolling" information out of sight faster that you can read it, BREAKERS will pause and instruct you to Press any key to continue. When you press a key, the rest of the text will display on your screen.

PG.64

COMMANDS

AGAIN: Repeats your last command, just as though you had typed it again. After this command, you must still press RETURN.

BOOKMARK: Retains your progress in the novel by making a copy of your current position on a formatted diskette. Later you can resume the novel from that point with the RESUME NOVEL command. See the Special Features section of the computer reference card packaged with your novel diskette for details.

CLOSE (object): Tries to close the object you specify.

DROP (object): Frees you of an object you are carrying.

EXAMINE or EX (object): Checks the characteristics of an object - works like LOOK

—Apple II Computer Documentation Resources (a2_docs_documentation.msw)
FOLLOW or FOL (person): Allows you to follow a character who is going his own way. But be careful; some characters don't like to be followed.

GET (object): Tries to pick up the object you specify. Produces the same effect as TAKE.

GIVE (object) TO (person): Giving objects to characters can be risky, innocuous, or crucial. You can also use this form: GIVE (person) (object).

HEALTH: Checks your physical condition. Are you injured? Just stunned?

HIT (object or person) WITH (object): This and commands like it exercise your aggressive tendencies.

INVENTORY or INV: Tells you which objects you've collected and are currently carrying.

LOOK (direction): Describes what lies in a particular direction from your position.

LOOK AT (object): Describes the features of an object - works like EXAMINE.

NORTH and others: Allows you to move in the direction you specify. You can also abbreviate directions (N,S,E,W, etc.). GO TO (object) and WALK (direction) produce the same result.

OPEN (object): Tries to open the object you specify.

PAUSE NOVEL: Halts the changing world of the novel as long as you wish. You can resume the action by pressing any key. To stop the novel in a faster way, see the Using Special Keys section of the computer reference card packaged with your diskette.

PLAY: Lets you indulge yourself with songs and musical instruments.

PRINTER ON: Creates a printed record of your progress through BREAKERS. See the reference card packaged with you diskette for details.

PROGRESS or PR: Reports on achievements of importance in your electronic mission.

PUT (object) IN (object): Tries to merge objects. The results may be important or pointless.

QUIT NOVEL: Ends your session of BREAKERS without saving your current position.

READ (object): Obtains written information, such as priceless clues, from the object you specify.

RESTART NOVEL: Begins BREAKERS again from the start.

RESUME NOVEL: Reopens the novel from the point at which you typed the BOOKMARK command. For specific instructions, see the reference card packaged with you diskette.

SHOW (object) TO (person): Displays an object to a character. You may receive an interesting reaction.

SING: Ventilates your vocal chords.

TAKE or T (object): Allows you to collect objects which seem interesting or useful. You can take on thing or several at a time.

THROW (object) (direction): Lets you toss precious things accurately at a crucial moment in BREAKERS.

TIME FASTER: Speeds up the changing world of the Electronic Novel. This command does not change the speed at which your commands are responded to by the novel. It increases the rate at which characters and elements of the novel's physical world enter the scene, pop up, or fly by. Typing this command repeatedly will speed up the universe a little each time. To slow down the changing world type TIME SLOWER.

TIME SLOWER: The opposite of TIME FASTER. Typing TIME SLOWER repeatedly will slow down the changing universe of the Electronic Novel by degrees.

BREAKERS will respond to many other commands; feel free to experiment. Some interesting examples might be:

- get and examine the red ball
- get the wire knife and the lava and drink it
- look at everyone but the cirdonian
- offer the medallion to nate grey
- spary the bolt with the spray can
- look at myself
- give 15 pieces of gold casey

When you use numbers in commands or dialogue, use the numeral form; don't spell the numbers out (25 not twenty-five)

DIALOGUE

Electronic Novels allow you to talk to characters and creatures, real and imagined. You can ask them questions, order them to do your bidding, or tell them to do things with objects or to other characters. They will respond in their own unique ways. The FORM you use for this kind of dialogue is important. Here are two examples:

- betty, "who's mulcahy?"
- druella, "thanks for the information"

Notice that it is not necessary to capitalize or to use periods at the ends of sentences.

When you are finished typing a line of dialogue, be sure to press RETURN.

To relieve you of some typing, dialogue also has a shorter form. You may omit the comma following the name of the character you're addressing. The second quotation mark may be omitted also. Example:

pg.68
Instead of

bobo, "give me the vbx"

you may type

bobo "give me the vbx"

Some other examples of BREAKERS dialogue might be:

panface "where's delbert riggs?"
betty "please give me a drink"
beek "what does it all mean?"
cirdonian "you're a punk"
jones "what is west from here?"
corpse "you don't look so hot"

TIME AND SPACE

Many of the characters in BREAKERS move around of their own volition. When you talk to a character in your area, he will answer you in his own special way. If he happens to move to the next room, he won't brush you off; he will still answer. However, if the character moves far away from your position, he'll no longer be able to hear you. Examples:

(betty in your area)
betty "who are the gaks?"

"Not so loud – you're talking about the toughest cops in the galaxy", Betty cautions.

(betty in the next room)
betty "who are you?"

"Don't try to get personal with me", the bartender snaps.

(betty far away)
betty "let me take you away from all this"

Your words don't reach that far.

Engaging characters in conversation allows you to enter the world of BREAKERS completely. But remember, when you talk to an Electronic Novel, anything can happen.

PERIOD

By typing several periods (...) and pressing RETURN, you can watch the universe unfold over several time intervals. This is an advanced strategic tactic you may find useful.

RETURN KEY

Press RETURN whenever you are finished typing a command. If you press RETURN without typing any command, the world of the novel will still continue to change all around you. When you press only RETURN, time will pass and the universe will turn together with whatever else may be happening at the time: characters entering the vicinity, conversations beginning, etc. As in life, the universe of the
Write Protect all sides except the character disk and your castle. You'll copy the module and castles onto it. Instructions on how to copy castles and modules are under "Copying Modules" and "Constructing a Castle."

Introduction:
You've just entered another world. A world with fabulous riches, unbridled sorcery, and no end. Your adventuring parties may work together or break up and fight one another. Over 200 different monsters are waiting for a chance to kill your characters in dozens of exotic ways. Even if the monsters don't get you, the traps lurking around every corner certainly will.

Ahem. You say you're a veteran of many types of role playing games? You've always emerged victorious? We shall see. Computers show no mercy. If you're new to adventure games, you'll find that Bronze Dragon is an easy game to play, yet it creates an infinite variety of situations.

Bronze Dragon is a fantasy role-playing game that can accommodate up to 5 players at once. There are many objectives in Bronze Dragon. In fact, there are no less than 12 castles and 1 full-blown module contained in the basic game. The ultimate goal is survival, and more importantly, enjoyment!

The Disks:
---

Bronze Dragon consists of two disks that we provide and one that you must supply. Whenever you're prompted to insert a new disk, do so and press return. If the program doesn't tell you to change disks, you don't need to. To abort a procedure at a disk prompt, press the space bar.

Disk one ->
S1 <Bronze Side>: The Main Menu and Dragon Village Menu are on this disk side. You will always boot the Bronze Side to begin play.

S2 <Dragon Side>: The disk side contains the monsters, the plots, and generates the castles.

Disk two ->
S1 <Character Disk>: Up to 40 of your characters can be saved on this disk side. If characters aren't saved, they don't exist.

S2 <Module Disk>: Our first module, Seekers of the Storm, is contained in its magnificent entirely on this disk side. The monsters and the plot are already there, waiting for you. You must copy the module onto a blank disk and name it Castle Disk before you can explore it. See "Copying Modules."

Disk Three ->
S1 <Castle Disk>: Use one of YOUR blank disks for this, name it Castle Disk. You'll copy the module and castles onto it. Instructions on how to copy castles and modules are under "Copy Modules" and "Constructing Castles."

Write Protect all sides except the character disk and your castle.

---

For Those With Two Disk Drives:

Bronze Dragon can be configured for two disk drives quite easily. Instead of switching disks and pressing return when the program prompts you, just put the required disk in drive two and enter "2."

From then on, the program will know to access drive two for that disk. The character disk should be put in drive two when you're copying a module or creating a castle.

Beginning Play:

Boot the Bronze side of disk one to start playing Bronze Dragon. The first screen you'll see after the Bronze Dragon logo clears is the Main Menu. The choices on that menu are summarized below, then explained in detail later.

1> Create a Character: You can actually make a flesh and blood being! Well not really, but you can determine the name, race, class, and alignment for each character.

2> Enter Dragon Village: Dragon Village is a mystical town where almost anything can be bought or sold.

3> Copy a Module: Seekers of the Storm, our first module, must be copied on a blank disk that you provide - you can't play on the original. The disk you've copied in on will henceforth be called the "Castle Disk," so remember that when you're asked to insert it. See "Copying Modules."

4> Construct a Castle: A "castle" is the setting for one of the 12 plots which the computer can't tell you to change disks, you don't need to. To abort a procedure at a disk prompt, press the space bar.

5> Gather a Party: One to five character MUST be "gathered" before they can start and adventure. It's kind of like assigning a group of characters to a certain adventure temporarily. Be sure the characters have finished their business in Dragon Village before gathering them into a party.

6> Go On An Adventure: After you've equipped and gathered your party, it's time to go on an adventure.

7> Go To The Crossroads: After the adventure is over, a group of characters must travel to the Kingdom of King Leopold or the Pit of Lord Ursul to gain skill points and skill levels.

How To Create A Character:

Bronze Dragon begins when you start to create a party of characters. Every Bronze Dragon "persona" is unique and will help the party with individual powers.

You create characters by choosing among the options in each category, such as name, race, etc. After everything is set, the status of the character is shown, including ability scores and bronze pieces. The meaning of the ability scores is given in the glossary under "ability scores." Each character starts with 75 bronze pieces.

Name: Any name up to 16 characters in length is acceptable. By entering
Race: You have 3 to choose from: humans, elves, and dwarves. Each is detailed below.

Humans-> Humans are a very odd race, one that isn't very well liked by more advanced creatures. They are usually around six feet in height and seem to regard this mutation as an advantage somehow. Special Commands: Humans can approximate the value of any object.

Elven ability scores:

--------------- -------
Strength : 09
Agility : 13
Intelligence : 13
Constitution : 07
endurance : 08

Dwarves-> Dwarves are generally a sullen and ill-tempered race. Many scholars attribute this to the fact that they're incredibly ugly. In fact, most females dwarves have beards, which is why so many dwarves go on adventures. Special Command: Dwarves are always aware of their relative position above or below ground.

Dwarven ability scores:

--------------- -------
Strength : 12
Agility : 08
Intelligence : 14
Constitution : 14
endurance : 13

Class: You have 5 classes to choose from. The special commands are explained in their own section.

Knights are fightin' strong, blood 'n guts, here's mud in yer eye type characters. They're blue collar adventurers; they can take damage and dish it right back out. Knights can wear any type of armor and use any type of weapon. Their special commands include swordplay and rage. They have the most hit points and can carry up to 15 objects.

Assassins have average hit points and can carry up to 13 objects. They use haggling system, so wise folks don't take the first offer. Hit return if you wish to cut short a haggling session. Don't get cute by asking outrageous prices, because these guys are extremely touchy. See tips for advice on bargaining.

Ninjas are mysterous masters of the orient fighting arts. They can only wear little more armor than wizards, but they have many weapons to choose from. Their special commands are martial arts, imitate dead, and leap. Ninjas have average hit points, and can carry up to 10 items.

Elders are experts on living systems; their spells make them adept at both healing and killing. Elders are slightly more restricted in armor than assassins, and have very few weapons to choose from. Sorcery, destroy, and innate healing are their special commands. Elders have a few more hit points than wizards and can carry up to 8 objects.

Wizards are powerful magic-users who can create massive amounts of damage with their powerful spells. They can own very little in the way of armor or weapons. Sorcery and cast energy are their special commands. Wizards have the fewest hit points and can carry up to 8 objects.

Alignment: This is a character's basic nature, whether it's virtuous, lawful, chaotic, or vile. Virtuous and lawful characters are "good," while chaotic and vile characters are "evil."

During an adventure a character's alignment will change according to the player's actions. The most common method is by striking a monster or character. If you constantly attack good monsters, your characters will become vile if you didn't start out that way. If you adopt a "wait and see" attitued toward creatures you're not sure about (like lions), and only attack the evil creatures you're characters will become virtuous. It's much easier to become vile than virtuous. One or two swats on a unicorn will make anyone vile, but a vile character will have to kill many hobgoblins to become virtuous.

I can't resist mentioning that character can change their alignments by attacking themselves! If a virtuous character attacks himself, he'll become evil. By the same token, a vile character will become a little less vile by attacking himself. Sure, it's a radical way of doing things, but Bronze Dragon inspires such lunacy....

Dragan Village:

After you've created a party of characters, you'll need to supply them one with weapons and equipment in Dragon Village. The guard at the outer gates will ask for the name of one of your characters. If you can't remember it, just hit "R" and you'll get a complete roster of characters. If you just hit "return," you'll go back to the Main Menu.

Dragon Village Menu:

1> Purchase Equipment: The provider brings out his stuff in three groups: weapons, armor, and muscelaneous equipment. Mittle the space bar will take you to the next group; the return key brings back the Dragon Village Menu. Characters who go adventuring without weapons or armor are known as "Bronze Dragon Chow." Consult appendices 3, 4, & 6 for details on equipment.

2> Haggle with Merchants: Wanna sell something? Anything at all? Our three crooks -excuse us, merchants, will buy anything except cursed objects. They use haggling system, so wise folks don't take the first offer. Hit return if you wish to cut short a haggling session. Don't get cute by asking outrageous prices, because these guys are extremely touchy. See tips for advice on bargaining.

3> Learn Spells: Only Elders and Wizards can learn spells, which they buy with spell points instead of bronze pieces. The cost for each spell point is dependent on the level of the spell. High level spells are only available to high level characters. Spell points are regained when a character uses a spell or forgets it. Maximum of 7 spells for wizards and 6 for Elders can be learned at one time. See appendix 7 for details on spells.

4> Learn Martial Arts: Only Ninjas can learn martial arts, and even they have to have the money and skill levels to use 'em. As with spells, there are different levels of martial arts, only they're called disciplines to confuse you. Check appendix 5 and special commands for details.
construct a 60 room castle.

After you've copied the module, you can gather your party and go on an adventure. You've also either created a castle or copied the module on a blank disk. It's time to gather your party (option 3 on Main Menu). You'll be shown the name of each character who's already in the party (if any) and asked the name of each member who wants to join. After you've entered the names, the computer will check to see if each character is available. If so, it will print "<Name> has joined." Any character who is unavailable (i.e. dead or already on an adventure) will not be allowed to join.

When characters come back at Dragon Village, they are dispersed. In other words, they must re-gather before going on another adventure.
If you try to gather a party for an adventure that already has five characters assigned to it, the computer will say the party is full. Next, it will ask you if you wish to destroy the party by killing all of the characters. If you decide to destroy the old party, you'll be able to gather a new party for the adventure.

Going On An Adventure:

After you've fathered your party, it's time to have some fun and actually play the game (option 6 on the Main Menu).

The Screen:

During play, there is a "menu window" at the top of the screen. These four lines contain a lot of information. The top line shows the character's name and which menu is up. The numbers of the left represent the commands; the command you choose is highlighted to the right. For your convenience, the bottom line shows the character's hit points, armor rank, and endurance.

Don't be put off by the complicated looks of the window. Before long, you'll only need to glance at it for a moment to get the information you need.

The Controls:

The number, arrow, and letter keys all preform the same function, highlighting commands. Choose the method of input which suits you best.

0-9: Pressing any number will highlight a command.

Arrow keys: These highlight commands left and right. The arrow keys must be used to highlight a number higher than 9 when characters have more than 9 objects in their inventory.

Letter keys: The first letter of each regular command also highlights it. The two exceptions to this are "V" for look and "E" for retreat.

Return: Implements the highlighted command.

Space bar: The space bar has two functions depending on when it's hit.

1> If you haven't chosen a command (pressed return), the space bar will toggle between the regular commands and special commands.

2> if you've chosen a command that affects another monster or character, the space bar will toggle between the name groups.

Escape key: This key will abort almost any action in case you change your mind. The slash key works the same way.

Ctrl-G: Toggles "group move" on and off. Group move is on when you start, which means characters travel together. Characters can't toggle this off during module play.

Ctrl-T: Allows you to set the time delay, which is how quickly stuff prints out. Initially set to 25, it ranges from 0-50, with the lower numbers increasing the speed. Zero time delay waits for you to press a key.

Ctrl-Q: Saves the game at its current place. This can only be done during the first character's turn.

Ctrl-R: Reorders the party. This can only be done during the first character's turn.

Ctrl-D: Toggles the area description on and off. It is on when you start. When off, it allows for faster movement through known areas.

The Regular Commands:

The following is a list of the command options available when playing Bronze Dragon. The numbers in brackets correspond to those in the menu window. Some commands, such as search, will bring up another menu.

1> Rest: The pause that refreshes. Resting regains some endurance for weary characters.

2> Fight: Fighting is attempting to strike a monster or character with a weapon. Your weapon must work in the rand you're in for your attack to have a chance at success. See "How To Fight" and "Range."

3> Search: There are 4 different ways to search.

1) Search for objects: Let's talk treasure. If you want something that's in a room, this is the command to pick it up. It'll also allow you to read a scroll or even push a button.

2) Search Creature: You can plunder dead monsters and characters.

3) Search for Secret Doors: Hidden exits can sometimes be detected using this command. High intelligence increases the chances of detection, and repeated searches increases it even more.

4) Search for Traps: The truly paranoid can check a room out if they suspect a trap. High intelligence and repeated attempts also improve the chances for detecting traps.

4> Look: This will give you a description of your immediate surroundings if there is sufficient light. Hitting space bar after the description will let you see the exit locations and the monsters (if any). Since "look" is automatically executed when you enter a room, mapping is usually done at the very start. An important note: Any objects you happen to see with "look" aren't necessarily the total contents of the area.

5> Diversion: This gives every character in the area except the diverter a +10 to hit on their next turn and allows assassins to assassinate. A drawback, the diverter draws the monster's attention.

6> Advance: This is moving within a room toward a certain monster or character, generally used to get in proper range for fighting. See Range.

7> Retreat: The opposite of advance. It can also be used to get in proper range, especially when using weapons that won't function in short range, such as a flail or javelin. See Range.

8> Use Object: There are 5 different ways to use an object.

1) Unlock Item: An attempt to unlock some sort of container, such as a chest or coffer with whatever is in hand. It is not used to unlock anything else (such as doors). Thieve's tools are the best at doing this, but you can use anything.

2) Use On Creature: This is using the item in hand on a monster or character. Food, elixer, and magic items work under this command. While food and elixer are benificial when used this way, magic items could be harmful. Your fellow characters probably wouldn't appreciate a "dancing sword" being used on them.

3) Examine Object: Finding out how unusual objects work is one of the biggest sources of puzzlement for Bronze Dragon players. When you look at an object closely, you might discover something interesting or important.
4) Use On Your Possessions: This is using the object in hand on another object. If you wanted to connect two rods together or put poison on a dagger, this is the command to use. See "Solving Plots."

5) Use In Room: This is sort of the "default" command when you don't know what else to do. It could be unlocking a door with a key; using a want to levitate a rock, etc. See "Solving Plots."

9) Inventory: There are 5 sub-commands under inventory.

1) New in Hand: It is often necessary to put the proper object in hand before fighting, using an object, etc. This doesn't take up a character's turn. Sometimes it is in hand, it will stay there until you say otherwise.

2) Status: This will tell you absolutely everything about your character's health and standing.

3) Get Rid Of: This command will erase the object of your choice, never to be seen again. It does not affect the object in hand, unless you happen to choose it for disposal. This command does not take up a character's turn.

4) Give Object: This command transfers one of your possessions to a monster or character of your choosing. Gifts often convince non-vile creatures to leave in peace.

5) Give Money: This works exactly like give object, except the medium of exchange is bronze pieces.

6) Leave: Yep, the thrill of adventure is right here: there's always that last kill to climb or secret chamber you haven't seen yet. Characters travel in a pack unless you toggle group move off with Ctrl-G. Exits will appear on the numbers 1-4. If you're outside the castle, "Go back to Dragon Village" will be at number 5.

Special Commands:

The regular commands on the preceding pages are available to any character. Hitting the space bar will toggle on a second menu, which has the "special commands." Each character gets one command due to race, as explained under race in "How To Create A Character." The character's class affords several additional commands which are detailed below.

Knights:

1) Swordplay: This adds a "+1" on the to hit roll for every two skill levels of a knight. It also maximizes a sword's damage. This command can't be used unless a sword of some type is in hand.

2) Rage: Knights can attack at twice their normal rate with this command, although it reduces endurance to zero.

Assassins:

1) Assassinate: Successfully using this command will instantaneously kill any monster or character. To even have a chance at assassinating, however two conditions must be met....

A) The assassin must have a dagger in hand.

B) Someone else must divert or area must be dark

Once an assassin reaches the 10th skill level, condition B no longer applies.

Ninjas:

1) Martial Arts: Martial arts are a special method of defense and fighting. There are 10 different levels of martial arts, called disciplines, which range from Yeti to Dragon style. Each discipline has 3 modes: an attack, a strike, and a defense. Ninjas can master a maximum of 5 modes, if they wish to learn more, they must replace one that they have previously learned. The different modes are explained below, and appendix 5 should further enlighten you. The best way to figure all this out, of course, is to create a ninja and experiment.

Attack modes: This is a short range attack that causes damage if successfully rolled, much like an ordinary weapon attack. A martial arts attack does double damage if the creature attacked is covered under the attack's discipline. A Yeti attack, for instance, does 1-10 damage against everything except for monsters with a "freeze" attack. A hit against such a creature would automatically do 20 points of damage.

Strike modes: Strikes are short range attacks that will not affect characters or monsters nor under the strike's discipline. If a strike is used against a monster under the correct discipline, however, it will automatically hit and cripple the monster. If a tiger strike, which affects anything that claws or bites, were used against a ghost, it would have no effect. If it were used against a bear, however, the bear couldn't use it's claw or bite.

Defense modes: Defense modes improve your armor rank (subtract from it) in addition to making you invulnerable under the defense's discipline. Their effects are cumulative, meaning that having both bear defense (-1) and eagle defense (-2) would lower armor rank by three, in addition to making one invulnerable to encircle and drain attacks.

2) Leap: Like sneak, a successful leap moves a character across a room without taking a turn. Ninjas can position themselves anywhere within a room this way, but there is one drawback - the only action allowed at the end of a leap is a martial arts attack or a strike. First level ninjas have a base 25% chance of leaping with bonuses added for high agility and additional skill levels.

3) Imitate Dead: If successfully done, a ninja is unable to do anything for 4-6 turns after using this command. During the trance-like state, neither monsters nor characters will strike the Ninja. Upon awakening, the ninja will no longer be poisoned, illusioned, beserk, frozen, etc. If you fail to imitate your chances at imitating dead.

Elders:

1) Sorcery: This is the act of casting a spell. Spells work at any range, each for having a certain number of charges, or times it can be used. If the charges are used up, the spell is gone and the caster will regain the spell points used to learn the spell. Check appendix 7 for details.

2) Destroy: Any "undead" creature less powerful than the elder casting this will be burned to ashes. Undead creatures are those who have lived and died, yet still walk the earth. Typical undead monsters are ghosts, devils, lethal deadlies, etc. Characters get no skill points for destroying monsters.

3) Innate Heal: This will heal characters whose hit points were previously been falling below 30% of the character's hit points maximum. The side effect is that hit points max will be lowered a little: Example: A knight named joey started an adventure with 100 "hit points now" and 100 "hit points max." Hit points now was reduced to 40 by an ill-tempered fire beetle. An elder used innate healing on Joey, which put both "hit points now" and "hit points max" at 90.

Joey's hit points max isn't permanently crippled - both the healers and
king Leopold can fix him up. The healers do it for a price and Leopold
doesn't if Joey brings him an artifact.

Wizards:

1> Sorcery: See sorcery under the elder's special commands.

2> Cast Energy: This is a damaging attack that will function at any
range. Damage is 10 times the Wizard's skill level, but if reduces a
Wizard's endurance to zero

Range:

Characters must be in proper range to fight. The proper range depends on
what weapon is being used (see appendix 3). The three ranges, short
range, medium range, and long range, are listed on the character and
monster screens. There're abbreviated SR, MR, and LR, respectively. You
can move into the proper range by advancing or retreating.

EXAMPLE: Arch Mage George wants to hit a giant rat with his lucern
hammer. He tries, but the rat is in medium range and hit hammer can only
hit monsters in short range. George has a choice - he can either advance
toward the rat and hit it next turn, or he could put a sling & stones in
hand and hit it this turn (A sling and stones works in medium or long
range).

How To Fight:

Before you fight, you should put the proper object in hand. This is done
by hitting inventory and new in hand.

The next step is pressing fight and choosing a victim, either a
character or a monster. You can toggle between the monster and character
names by hitting the space bar. Hitting escape aborts the fight
command.

You can hit any number corresponding to a monster to see the creature's
name and range. When you find the monster you wish to strike, hit return
and the "attempt" will take place.

Smack any key to freeze the rolling randomizer. Afterwards, any plusses
or minuses will be added to the number and if it's enough, you'll hit.

Good luck!

Solving Plots:

-------------

Read this carefully, for enjoying Bronze Dragon to its fullest depends
on your understanding of how to solve its many puzzles, which are called
plots. The module, Seekers of the Storm, has an extremely intricate plot
that may take months to solve.

A plot consists mainly of a legend concerning an object or series of
objects that you must recover. For a complete listing of these, check
appendix 1. IMPORTANT: The King and Overlord often want objects other
than the final object, so bring back as many goodies as you can. In
plots where you need the final object to start another adventure,
they'll let you keep the final object.

The four steps to solving a plot and gaining skill levels are listed
below.

1> Study the Legends: Don't start on an adventure without any
information! After you've picked your adventure, mingle in the pub. The
people there will give you all sorts of information, although some of it
might be false. Write down anything that seems important because it
probably is. Later, when you're starting to explore the castle or
module, a story about it will be shown that could prove helpful.

2> Finding the Pieces: In most plots, you must recover some minor object
before you can get the "final" object, which is the one either Leopold
or Usul will reward you for. How do you know when an object is needed to
solve the plot and not just ordinary rubbish? The Wizard in Dragon
Village may be able to help. Look for objects that the pub people or
legends mention, also look for objects that are extremely unusual or
inaccessible. If something is inaccessible, find out why and think about
what you might need to get the object.

3> Using the Objects: This is the act of putting the puzzle together.
The two commands which are most often used for this are "use in room"
and "use on your possessions." EXAMPLE: You find a glowing iron crown in
a room, and you want to take it, but it's too hot to touch. Suddenly,
you remember that bucket of ice water you passed over 12 rooms ago! If
you get the ice water and use it (in room), it'll free the iron crown.

Sometimes you might have to fit two plot objects together to form a new
object. EXAMPLE: You want to take a dancing sword, but it's flying
about the room just out of reach. You have two wands, a red and a blue
one, but neither seems to stop the sword. By using (on possessions) the
blue wand on the red wand, you form a bronze wand. When you use the
bronze wand "in room," it stops the sword from spinning.

4> Taking it Back: When you've recovered the "final" object, it's time
to go back to the King or Overlord for your reward. Either of them will
greatly reward you if you give them the final object, unless the final
object is used for some further plot. In this case, they will take
something else that you've picked up during the adventure and
(hopefully) saved. EXAMPLE: The talisman in plot 3 must be kept in order
to solve plot 4.

Saving a game:

-------------

Since it takes hours to complete an adventure, you probably wish to save
the game in progress several times. All you have to do is press CTRL-Q
during the first character's turn. If you wish to continue play at that
point, answer "Y" to the prompt. Answering "N" will take you back to
Dragon Village, but not your characters.
endurance, but the two shouldn't be confused. Constitution is permanent score which determines how much is regained when a character rests.

5) Endurance: Endurance, the measure of fatigue, is the only ability score that fluctuates. Activities such as fighting and spell casting causes endurance to go down. If it reaches zero, you'd better rest or you'll lose hit points.

Armor: Equipment which affects armor rank is called armor. If you possess armor, you're automatically wearing it. There are two obstacles that could prevent a character from wearing a certain piece of armor:

1) The character's class is incompatible or
2) The character is already wearing that "type" of armor. EXAMPLE: A wizard tries to pick up some chain mail. EXAMPLE 2: A character tries to take elven boots when she already has high boots. See appendix 1.

Armor Rank: Armor rank, or AR, is a measure of how vulnerable a character is to physical attack. Low numbers are better than high ones in this case. A character with no armor has the armor rank of 10, which means an unlucky dart-throwing blind man could hit him from 500 betting.

Berserk: A character in this state is slightly insane, but in a bloodthirsty kind of way. Berserk characters often behave normally one moment, and then try to hack their friends to pieces in the next moment. Luckily, it's a temporary condition.

Beter: A unit of measurement. It's the length between the tip of King Leopold's nose and his outstretched hand. Really.

Bilo: The weight of one bronze piece. See weight.

Bronze Piece: Otherwise known as BP's or bronpies, bronze pieces are the basic unit of money in Bronze Dragon.

Castle: "Castle" is a generic term for a place where you adventure. Monsters, treasures, and all sorts of strange and wonderful objects are found in castles.

Characters: A character is a persona that you, the player, assume. Up to 5 characters can go on an adventure at once.

Charges: The amount of uses a spell or magic item has is referred to as charges. Each time a spell or magic item is used, one more charge will be spent until none are left and the magic is gone.

Class: This is the profession of a character. There are 5 classes: Knight, Assassin, Ninja, and Wizard. Each class has at least two special commands unique unto that class.

Cursed Objects: Cursed objects are objects you can't "get rid of." They usually perform poorly. EXAMPLE: A cursed weapon might be a broad sword that has a -5 penalty "to hit." The only way to get rid of a cursed item is by consulting the Wizard in Dragon Village or casting a remove curse spell. Cursed stuff doesn't reveal its true nature until it is put in hand. Of course by then, it's too late!

Damage: Anytime hit points are taken from a character or monster, damage has occurred. Objects such as lanterns and dishes can be "damaged" when they're used as weapons. Characters can actually destroy objects by using them this way in a fight.

Difficulty: How tough a castle is survival-wise is difficulty. This is probably the most important part of designing a castle.
Double Damage: If the number you get on the rolling randomizer is twice as much as the number you need to hit, you'll do twice as much damage.

Eating: Ya gotta eat to live! Eating is done by putting food in hand, then hitting <use> and <use on creature>. Then it's simply a matter of picking who you wish to feed (it could be yerself). Going without food for a long period of time leads to unconsciousness.

Food: Eating good food will keep you from starving, but beware of the stuff you pick up off castle floors, because it may be poisonous. If you go without food for 200 turns, you'll drop unconscious.

Healing: Raising hit points now or hit points max is healing.

Hit Points: This is a measure of how much *life* a character has. When a character is damaged, hit points are lost. When all hit points are lost, the character dies.

Hit Points Max: His points max is the highest number of hit points a character can have. This maximum number is lowered when an elder uses innate healing.

Hit Points Now: Hit points now is a character's current number of hit points.

Level: The term level, not to be confused with skill level, means the floor or story of a castle. Negative levels are below ground level.

Light: The contents of a room can only be seen if there is a good source of light. Incidentally, monster tend to fight better in dark rooms. After several seconds a screen will appear allowing you to make a backup copy of Battle Chess or to Play Battle Chess. (This screen will not appear when loading from your backup copy.) Press the '1' key will allow you to make a backup copy of Battle Chess, while pressing the '2' key will continue loading the game. If option '2' is selected or if played from your backup, the color title screen will appear as the game loads. Press the <Space Bar> to get past the title screen or press the <ESC> key to bring up the game credits and any changes or revisions made to the program (if any).

Module: The most complex and interesting adventures are called modules, although the castles your apple creates are pretty good too.. Find the proper game and type in the correct move.

Mech Note: If you're wrong, it doesn't matter, it will think you're right.

Monster Levels: There are 10 different levels of monsters, level 1 contains the weakest and level 10 the hardest.
move the flashing square to the location you want the piece to move to and press the joystick button. (You will notice that legal moves are flashing black squares and illegal ones are flashing red.)

**BATTLE CHESS MENUS**

**Using Keyboard:**
Press the <ESC> key or move the flashing square off the top or bottom of the board so that the menu bar appears and press the <Return> key to pull down the menu. Use the keyboard or the arrow keys to switch between the menus and highlight an option. Press the <Return> key to select it. Select the "Return" option at the bottom of any menu to exit without selecting.

**Using Joystick:**
Move the flashing square off the top or bottom of the board so that the menu bar appears and press the joystick button. Move the joystick left or right to change menus, and then up or down until the desired menu option is highlighted. Press the joystick button to the select it. Select "Return" at the bottom of any menu to exit without selecting.

The four menus contain the following options:

- **DISK:** Load Game, Save Game, New Game, Setup Board, Quit
- **MOVE:** Force Move, Take Back, Replay, Suggest Move
- **SETTINGS:** Sound On/Off, Walk On/Off, Combat On/Off, 3-D Board, 2-D Board, Human Plays Red, Apple Plays Red, Modem Plays Red, Human Plays Blue, Apple Plays Blue, Modem Plays Blue
- **LEVEL:** Novice, Level 1-6

An asterisk (*) to the left of an option denotes that option as currently unselectable.

A plus (+) to the left of an option denotes that option as currently selected.

**MENU OPTIONS EXPLAINED**

**LOAD GAME:** If you've saved a game before, this option recalls the game and picks up where you left off. After selecting Load Game, the Load window will appear, displaying a list of your saved games numbered 1 through 7. Select the game you wish to load by pressing the joystick button when the highlighted bar is over the game you wish to load or using the keyboard or arrow keys and pressing the <Return> key if you don't have a joystick. Select the "Return" option at the bottom of the menu to exit without loading.

**SAVE GAME:** You can save games to your backup disk only. Pick this option if you want to save a game to disk while the game is in progress. Choose the game number (1 through 7) you wish to save to (erasing the old game at that number) by using Joystick or the keyboard or arrow keys and pressing the button or <Return>. Select the "Return" option at the bottom of the menu to exit without saving.

**NEW GAME:** This option lets you start a new game at any time.

**SET UP BOARD:** This option lets you set up games for testing strategies or for playing classic chess problems. Set Up is performed on a 2-dimensional chess board with the additional chess pieces arranged vertically on each side of the board. Any of the pieces can be selected and moved into any position by selecting them with the joystick or keyboard. To select a piece on the side of the chess board, use the joystick or keyboard or arrow keys to move off the board and choose a specific piece, and press the button or <Return> key. This will pick up your chosen piece for you to place. From Set Up, you have three additional menu options.

**CLEAR BOARD:** Removes all pieces from the board.

**RESTORE BOARD:** While remaining in Set Up, this aborts any changes you've made.

**DONE:** Returns to normal playing mode so you can play the game you’ve set-up.

**QUIT:** You've had enough. Reboot the disk.

**FORCE MOVE:** If you get impatient while waiting for Battle Chess to make its move, you can force it to move with this option. This interrupts the computer's thinking process and makes it take the best moves that it has thought of so far.

**TAKE BACK:** This option will take back the last move made by either side. You can take back about five moves from both sides.

**REPLAY:** If you've just taken back a move, then decided it wasn't such a bad move after all, you can select Replay to put the piece back where it was before the Take Back.

**SUGGEST MOVE:** Want a hint for your next possible move? The Suggest Move option will give you that hint. Flashing highlights will appear on a square occupied by one of your pieces and the suggested destination square. This command is not instantaneous.

**WALK ON/OFF:** Turning this off will move the pieces in 3-D without animating them.

**COMBAT ON/OFF:** Turning this off will skip the combat animation. (The above two options are useful for those who want a quicker game on the 3-D board.)

**LEVELS:** Levels Novice through 6 are available. Novice is the easiest, and 6 is the hardest. Under the Novice level, Battle Chess does only one simplistic board evaluation and occasionally makes poor moves. At each higher level, Battle Chess will look ahead further in the game, thus playing a better game of chess. Remember, if it’s taking too long, you can always override the thinking process and make moves.

**SHORTCUT KEYS**

Certain shortcut keys are available during a game as follows:

- F = Force Move
- T = Take Back
- R = Replay
- S = Suggest Move
- V = Toggle Sound On/Off
- W = Toggle Walk On/Off
- C = Toggle Combat On/Off

**CHECK**
When your King is in check, a "check" cursor will appear in the upper left corner of the screen to warn you. It will go away when your king escapes check.

**PAWN PROMOTION**
When a pawn reaches the eighth rank, a window will appear in the center of the screen. This window contains four pieces; you can change the pawn into any of them. Choose the promotion by pressing the joystick button when the piece you want to promote to is underscored or by using the keyboard or arrow keys and <Return>.

**CASTLING**
If it's legal to do so (as discussed in the manual), you may castle by moving your King two spaces to his destination square. The Rook will know what to do on its own.

**PLAYING BATTLE CHESS BY MODEM**
You can play BATTLE CHESS against a far away opponent if each of you has a Hayes-compatible modem hooked up to your computer with BATTLE CHESS. Your
modem must be hooked up to an Apple Super Serial Card with interrupts turned on, or an Apple IIe. If your modem is properly connected, as shown in your modem manual, there are 3 steps to start playing over the modem with B.CHESS.

1. Arrange with your opponent who will play Blue. After you've agreed, both of you should load BATTLE CHESS and set your opponent's color with the Modem Plays Blue or Modem Plays Red menu option. Hang up the phone on both ends before continuing. (But say "Bye, Bye!")

2. One player must set his modem to auto-answer mode. You can do this by bringing up the text window with the <TAB> key and typing ATS0=1. And press the <Return> key.

3. The other player must call the player whose modem is set to auto-answer. To dial a number, bring up the text window with the <TAB> key and type ATD 555-1212, substituting the correct phone number, and press the <Return> key. You can use any phone number with the ATD command, including area codes.

Your modem will pick up the phone and dial the number, and if all goes well, it'll then connect with the modem on the receiving end. If you get this far, you're set; you can start your chess game. When you move a piece, that move will happen on your opponent's end as well as yours. Note that after the two players are connected, the menu options New Game, Set Up Board, and Load Game will send an entirely new chess board to both sides, discarding the current game.

When you set one player to modem, you can send a text message to your modem or opponent by pressing the <TAB> key and typing your message or command and hitting <Return>. After hitting <Return> at the end of your message, the window will disappear and the line of text will be sent. (This is also the way you control your modem in BATTLE CHESS). A window will pop up on your opponent's screen with your message. After he or she dismisses the window, the game can continue. You can receive these messages at any time except when a window is open on your screen. If you send commands to your modem in this way, your modem will act on them. See your modem manual for details on AT commands.

There are two set ups to break the connection and hang up the phone. First, type +++ (three plus signs), press <Return>, and wait a moment. This will get your modem's attention. Then type ATH to tell your modem to hang up. This will close the connection between the two players.

BATTLE CHESS communicates at 300 baud with 8 bits and no parity.

PLAYING BATTLE CHESS WITH SERIAL CABLES

If you and an opponent have two computers, you may play with one person at each computer. Hook up a null modem cable between the computers' serial ports. Then one person show pick Modem Plays Red and the other, Modem Plays Blue. You can proceed to play as if you were connected by modem. The only difference is that you never need to type any dialing commands.

Official Listing of [Factus] Boards

The LookOut .......... (403) 457 - 0114 Private Storage ..... (215) 745 - 0495

End of File.
THE HIGHLIGHTED ROW (=..= IN THE EXAMPLE HERE) IS THE CURRENT ONE.

SETTING THE STACK POINTS:

\[ S=E0 <\text{CR}> \]

THIS CAUSES 2 CHANGES:

1. THE COMMAND LINE WILL DISPLAY "S=E0" AND THEN CLEAR
   AFTER <CR> IS PRESSED.

2. THE STACK POINTER IN DISPLAY #1 WOULD CHANGE TO E0. (UNDER "S")

3. THE STACK WINDOW WILL SHOW NEW POSITION.

THE STACK POINTER IN DISPLAY 1 WOULD SHOW E0, WHILE THE WINDOW WOULD
SHOW $E0. THE 6502 STACK IS IN PAGE 1 THEREFORE, SETTING STACK TO
$E0 IS THE SAME AS $E0.

DISPLAY #3

TO THE RIGHT OF THE STACK WINDOW, BUG BYTER DISPLAYS THE PROGRAM CODE
IN THIS FORM:

ADDRESS:OPCODE OPERAND OPTION

TYPE: FCABL <CR>

THE DISPLAY #3 WILL NOW SHOW A LIST FROM FCA8 UP.

EXAMPLE: FCAC: BNE $FCAAA D0 FC

NOTE: =...= MEANS HIGHLIGHTING

DISPLAY #1

IN THE EXAMPLE ABOVE, BUG BYTER IS DISPLAYING THE 6 6502 REGISTERS AT
THE TOP OF THE SCREEN.

EXAMPLE

\[ \begin{array}{c|c}
\hline
PC & 030D \\
A & FF \\
X & 20 \\
Y & 01 \\
P & 30 \\
\hline
\end{array} \]

IN THE UPPER RIGHT OF THE SCREEN, THE PROCESSOR STATUS (P) IS DIVIDED
INFO INDIVIDUAL BITS: NV-BDIIZC

EXAMPLE

\[ \begin{array}{c|c}
\hline
N & 0 \\
V & 0 \\
- & 1 \\
B & 1 \\
D & 0 \\
I & 0 \\
Z & 0 \\
C & 0 \\
\hline
\end{array} \]

APPLE II COMPUTER DOCUMENTATION RESOURCES (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 176 of 1262
BYE.80 is a selector program called from memory whenever a ProDOS QUIT or BASIC BYE is given. This program is based on Alan Birds' Better Bye but works ONLY in 80 columns and gives the user the added ability to choose from 32 System programs and/or Directories. I wrote this version for Hard Disk users, however, all users of large storage devices will appreciate the added control.

To use Better Bye, simply move the Light Bar to the desired program or directory name, and press return. If a directory is chosen, a new set of programs and/or directories will be presented. Pressing escape will allow you to change Volumes.

This program is donated to the Public Domain, however, you must contact the author for the right to include this program in any commercial software.
Charlie Brown's ABC's contains four games that help children learn the alphabet.

**First ABC's:** This game is designed to help children associate a letter with its name and a word that begins with that letter.

**Directions:**
1. Listen as Charlie Brown says the name of a letter and a word that begins with that letter.
2. Type the first letter of the word you hear. If you are correct, the Peanuts gang will animate and play a tune.
3. Press another letter key to go on or use the arrow keys (->) to move to the next letter in alphabetical sequence. (The left arrow (<-) will go to the previous letter in the alphabet sequence.)
4. At anytime, press (Open Apple-P) to print a copy of the screen.
5. Press ESC to leave the game and return to the title screen to change game level or other options.

**Game A:** This game is designed to help children visually match letters.

**Directions:**
1. You'll see a letter and word on the screen followed by "Type [the letter]."
2. Type the letter and the Peanuts game will put on a show.
3. After 6 letters, you will be offered a chance to print out a Charlie Brown's ABC's Certificate.
4. At anytime, press (Open Apple-P) to print a copy of the screen.
5. Press ESC to leave the game and return to the title screen to change game level or other options.

**Game B:** This game is designed to help children recalling letter names.

**Directions:**
1. Listen as Charlie Brown says the name of a letter and a word that begins with that letter.
2. Type the letter you hear. If you type the correct letter Snoopy and his friends will celebrate with you.
3. After 10 matches you'll be offered a chance to print out a Charlie Brown's ABC's Certificate.
4. At anytime, press (Open Apple-P) to print a copy of the screen.
5. Press ESC to leave the game and return to the title screen to change game level or other options.

**Game C:** This game is designed to help children listen for beginning sounds.

**Directions:**
1. Listen as Charlie Brown says a word.
2. Type the first letter of the word you hear. If you are correct, the Peanuts gang will cheer you on.
3. After 10 matches you'll be offered a chance to print out a Charlie Brown's ABC's Certificate.
4. At anytime, press (Open Apple-P) to print a copy of the screen.
5. Press ESC to leave the game and return to the title screen to change game level or other options.

Apple Tree  February 11,1990
STARTING PLAY

When the CALIFORNIA GAMES title screen appears, press the FIRE BUTTON on your joystick to continue to the menu screen. The CALIFORNIA GAMES menu offers a choice of six options. To make a selection, use your joystick to move the cursor to your choice, then press the FIRE BUTTON. You may also select an option by typing the corresponding numbered key.

OPTION 1: Compete in All the Events

Compete in all six events. The number of trophies awarded to each player is tallied as you compete, and a special trophy is awarded to the overall champion at the conclusion of the last event. You’ll compete in the events in this order: Half Pipe Skateboard, Foot Bag, Surfing, Skating, BMX Bike Racing and Flying Disk.

- You’ll first be asked to enter your name and pick a sponsor.
- Type your name on the keyboard and press the RETURN key.
- Use the joystick to move the cursor to the sponsor of your choice, then press the FIRE BUTTON to pick that sponsor.
- Repeat the name and sponsor selection for each addition player (up to eight). When all players’ names and sponsors have been entered, press the RETURN key again.
- A verification screen will appear. If all the names are correct, select YES with the joystick and press the FIRE BUTTON, or type A. If you need to make any changes, select NO or type B.

OPTION 2: Compete in Some Events

Similar to Option 1, but you compete in the events of your choice.

- Choose the event(s) by typing the corresponding numbered key or by moving your joystick and pressing the FIRE BUTTON.
- The events you choose will be displayed in purple.
- When you are finished choosing the events, move the cursor to the word DONE and press the FIRE BUTTON.

OPTION 3: Compete in One Event

Similar to Option 1 and 2, but you compete in any single event of your choice.

- Choose the event by typing the corresponding numbered key or by moving your joystick and pressing the FIRE BUTTON.

OPTION 4: Practice One Event

- Choose the event by typing the corresponding numbered key or by moving your joystick and pressing the FIRE BUTTON. No scores are kept during practice rounds.

OPTION 5: View High Scores

- Displays the highest score recorded in all events, with the name of the player who achieved each record.
- Press the FIRE BUTTON to return to the menu.

OPTION 6: View Title Screen

- Displays the title screen and credits.
- Press the FIRE BUTTON to return to the menu.
correctly, you'll keep the bag bouncing high in the air. Score extra points by performing stunts. The highest score wins the event.

OBJECT: Hacking at the sack with your feet, knees and head, you must try to make as many kicks as you can before time runs out. And remember, you get extra points for every stunt you perform.

- Press the FIRE BUTTON to kick the bag into the air and start the event.
- As the bag falls back toward the ground, press the FIRE BUTTON to kick again just before the bag reaches your foot.
- To perform a head butt, press the FIRE BUTTON just before the bag drops below the level of your head.

- Move the joystick as indicated in the diagram to control other movements.

**Jump**

- Move Left <--- ---> Move Right
- Turn Around

(About face)

- Several types of kicks are possible, including inside kicks, outside kicks, jumping reverse kicks, knee kicks and back kicks.
- To perform different types of kicks, move to new positions underneath the bag while it's in the air. For example, move to the right so the bag will drop next to you (but not too far). Now press the FIRE BUTTON when the bag approaches and you'll perform an outside kick.
- Other kicks are performed by positioning yourself in different ways. Discover the ways to perform all the kicks by trying various movements during practice.

**SCORING:** You earn points for each stunt or kick performed successfully.

More difficult stunts, like turning around while the bag is in the air, earn higher scores. You lose time if you drop the bag or kick it off the screen. You also earn points for consecutive kicks completed without allowing the bag to touch the ground. Earn bonus for catching the sack when thrown from off-screen. Here are some stunts to try by combining different kicks and moves:

**Any Kick:** (10 pts.)
Half Axle: (250 pts.) Any two kicks with a half spin in between.
Full Axle: (500 pts.) Any two kicks with a full spin in between.
Horseshoe: (500 pts.) Left back kick + Right back kick.
Jester: (2000 pts.) Left jumping kick or right jumping kick.
Double arch: (2500 pts.) Left outside kick + Right outside kick + left outside kick.
Doda: (5000 pts.) Left outside kick + head butt + right outside kick.

**Roller Skating**

Roller Skating is hot. Anyone can skate and almost everyone does, with a feeling of freedom unlike any other sport. And CALIFORNIA GAMES skating is as radical as you can get. The trick is to skate down a beach boardwalk without falling. You'll have to avoid cracks in the sidewalk, granite, puddles of water, shoes lying in your path and more. You'll have to squat to miss flying beach balls. You'll even have to jump over missing pieces of the sidewalk!

**OBJECT:** The object in roller skating is to avoid the obstacles and cover the course in the best possible time, with as many stunts as you can perform during the event.

- Press the FIRE BUTTON to kick the bag into the air and start the event.
- To begin skating, roll the joystick to the UP position. Then roll the joystick to the DOWN position. Continue rolling between these two positions to gain speed.

- Move the joystick as shown in the diagram to perform other skating moves.

**Surfing**

Surfing began as the sport of Hawaiian kings; now it rules the California coastline. From Santa Cruz to Rincon Point, surfers and their colorful boards dot the miles of sun-splashed beaches. And you're about to join them. You'll shoot the curl, shred the tube and probably even eat a little sand (when you wipe out). It's going to be hot. You'll be there. And you'll be awesome.

**OBJECT:** Competition surfing is a game of staying near the curl of the wave and maneuvering your board smoothly at high speeds. Ride the face of the wave, moving back and forth, in and out of the tube. "Use" as much of the wave as you can before your ride comes to an end.

- Hold the joystick LEFT to avoid wiping out at the beginning of your ride.
- To steer the board to the surfer's left, move the joystick LEFT.
- To steer the board to the surfer's right, move the joystick RIGHT.
- Hold the FIRE BUTTON down to make sharper turns. Note that sharp turns slow you down.
- If you go too close to the bottom of the wave, you'll either wipe out or end your ride by leaving the wave.
- To end your ride cleanly, go over the top of the wave.
- If you go over the top of the wave and turn your board around in the air, you can catch the wave again (but you'll wipe out if you come back down at a bad angle).
- You get 1:30 minutes for the event or 4 wipeouts. You earn more points for longer rides, so try to ride each wave as long as you possibly can.

**SCORING:** You're scored for the length of your ride, the number of turns you make and your speed each time you turn. You also earn high points from the judges for riding in the tube (underneath the curl of the wave), and riding near the break. "Catching air" scores extra points: ride up to the top of the wave until the end of your board clears the crest, then turn and continue your ride.

**STRATEGY:** Your final score is based on how well you "use" the wave. Riding along straight, far out in front of the break counts for very little. Take risks. The more risks you take to do your stunts, the more points you will earn. Making cutbacks (180-degree turns), moving up and down the wave and doing 360's (complete circles) all earn high scores. Earn maximum points for high speed turns, especially if you complete them near the top of the wave or near the break.
STRATEGY: When you complete the course, you get 60 points for each second awarded to the Champion of the games based on the total number of points Forward Flip 3000 6000 Table Top 500 1000 Jump 200 400 Wheelie 100 200

STUNT MINIMUM MAXIMUM
Wheelie 100 200 Jump 200 400 Table Top 500 1000 360 Turn 1000 2000 Backward Flip 1500 3000 Forward Flip 3000 6000

STRATEGY: When you complete the course, you get 60 points for each second that you're not out of the race. If you fall, you are disqualified from the race and you lose your points. You also get points for avoiding obstacles (jumping and spinning at the same time). Complicated moves lead to high scores. But be careful not to fall more than twice, or you'll be out of the competition.

BMX BIKE RACING
BMX stands for Bicycle Motocross. It also stands for radical action and challenging competition. In this event, riders use strong, lightweight bicycles to race on an action-packed course in the California desert. There are plenty of jumps, bumps and dips. (Rows of low bumps are called "Whoop-ti-dos." You'll need speed, a good sense of timing and a heavy dose of endurance.

OBJEKT: The object is to cover the course in the fastest possible time, performing stunts and avoiding or jumping over obstacles. The fastest daredevil rider will win the event.

- Move the joystick RIGHT to start the event.
- Move the joystick UP to steer left.
- Move the joystick DOWN to steer right.
- Move the joystick RIGHT repeatedly to increase your speed.
- Press the FIRE BUTTON to jump.
- Move the joystick LEFT to do a wheelie.
- To begin a jump, move the joystick LEFT as you ride onto a hill or ramp.
- When you're in the air, use the joystick to perform stunts:
  - Move the stick UP to do a table top. Hold the stick as long as possible then release the joystick to put the bike down.
  - Move the stick DOWN to do a 360-degree turn.
  - Move the joystick LEFT to do a backward flip.
  - Move the stick RIGHT to do a forward flip.
- Timing is important to perform stunts and jumps. You must time the start and finish of each move to complete it successfully. If you're not in a "centered" position by the time you land or complete your stunt, you will crash.
- You're allowed one "serious" fall or three "easy" falls before you're out of the race. If you fall and fall on your head, it's a serious fall.
- At the end of the course, press the FIRE BUTTON to stop. You earn bonus points for stopping on the finishing pad.

SCORING: Try to complete the course within the 2:00 minute time limit. The faster your time, the higher your score will be. You also get points for each stunt, with bonus points for holding stunts as long as possible. Here's a table of the minimum and maximum points awarded for each stunt:

<table>
<thead>
<tr>
<th>STUNT</th>
<th>MINIMUM</th>
<th>MAXIMUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wheelie</td>
<td>100</td>
<td>200</td>
</tr>
<tr>
<td>Jump</td>
<td>200</td>
<td>400</td>
</tr>
<tr>
<td>Table Top</td>
<td>500</td>
<td>1000</td>
</tr>
<tr>
<td>360 Turn</td>
<td>1000</td>
<td>2000</td>
</tr>
<tr>
<td>Backward Flip</td>
<td>1500</td>
<td>3000</td>
</tr>
<tr>
<td>Forward Flip</td>
<td>3000</td>
<td>6000</td>
</tr>
</tbody>
</table>

After every event, trophies are awarded with the names and sponsors of the top finishers in the order they placed.

CHAMPION CEREMONY
If the players compete in all six CALIFORNIA GAMES events, a final trophy is awarded to the Champion of the games based on the total number of points.
awarded.

First Place   =  5 points
Second Place  =  3 points
Third Place   =  1 point

The points are totaled after all events have been completed, and the player with the most points is the California Champion.

EVENT RECORDS

If an event record is broken or tied in any event, CALIFORNIA GAMES saves the name of the record-breaking player. The records are displayed on the Event Records screen. If a new record is set for an event, the previous record is erased and the new information appears in its place.

CALIFORNIA SPOKEN HERE

AGGRO (a-gro) adj. if you're a dare-devilly dude you'll go "way aggro", executing aggressive moves on the ramps and waves of California.

AWESOME (ah-sum) adj. awe-inspiring. ie. That's one awesome dude.

BIO (bi-o) adj. short for bionic. You've got to be superhuman with aggro moves to be known as bio.

DUDE (dyud) noun. BUDDY: can be used to express disbelief as in "DUDE!", or surprise, as in "DUDE!" or as a friendly greeting, as in "Hey DUDE!" Say while laughing for an attention-getting effect, ie. Duhuhuhude!

GNARLY (narly) adj. mind and body bendingly difficult. Waves, ramps and aggro moves can be gnarly. Then there are gnarly tests, gnarly prom dates, gnarly curfews, etc...

LIKE (lik) prep. insert anywhere you like, like, in any sentence, in, like, any context. Used most effectively when upset: "it's, like, geez..." Or the coolest way to use "like" is with "all" (for more description) "It's, like- I'm all - Duude you've got sand in your jams."

RADICAL (raa-di-cul) adj. 1) outrageous: "Radical moves, dude!" 2) cool: "It'd be radical if you could cruise to the ramp around 5 o'clock."

TOTALLY (toh-tul-ly) adv. completely, entirely: something or someone is totally awesome, radical, or aggro. In California everything is totally something. (companion word: see Tubular)

TUBULAR (tyu-byu-lar) adj. an adjective that came from the sea and has evolved into an everyday term. Parties, concerts, etc. can be totally tubular. Its use is endangered by the word "awesome". (companion word: see Totally)

dates, gnarly curfews, etc...

LIKE (lik) prep. insert anywhere you like, like, in any sentence, in, like, any context. Used most effectively when upset: "it's, like, geez..." Or the coolest way to use "like" is with "all" (for more description) "It's, like- I'm all - Duude you've got sand in your jams."

RADICAL (raa-di-cul) adj. 1) outrageous: "Radical moves, dude!" 2) cool: "It'd be radical if you could cruise to the ramp around 5 o'clock."

TOTALLY (toh-tul-ly) adv. completely, entirely: someth

Call these apple boards !

Tell em' Haker sent ya !!
To destroy the planet on the Vision Screen, select Button 5 (the one marked with an 'X'). NOTE: You may exit the Planet Destruction sequence at any point by simply pressing the INST/DEL key.

OORXX Landing Mission
---------------------
To activate an OORXX landing mission select Button 4 (the one marked with a down arrow) from the Planet Vision Screen. An OORXX will be transported immediately to the planet surface and a vector image of the landscape will appear on your viewing screen.

FLYING THE OORXX
----------------
Because you ship is too large to land on a planet, you must view the planet's surface through the eyes of an OORXX - creatures designed for just such missions. You guide the OORXX as it flies across the planet surface.

The two markers on either side of the screen indicate your altitude above the planet surface. The horizontal dotted line along the bottom of the screen indicates your speed - the longer the line, the greater your speed. To decrease speed, hold down the fire button and pull back. To increase speed, hold down the fire button and push forward.

Landing Sites
-------------
Each planet has a designated landing site, located at the end of a long narrow valley. As you fly, an onscreen sight indicates your current position. If you are headed in the right direction, the sight will appear as a flashing diamond shape. If you are off target, an arrow on the left or right side of the sight will point you in the direction you should turn. When you reach the landing site, the OORXX will land automatically and the resident alien (if there is one) will appear.

Avoiding Missiles
-----------------
If enemy missiles are present on the planet surface, they will begin homing in on the OORXX immediately; a continuous beeping noise lets you know that you've been sighted. To avoid the missiles, you must fly as low as possible without crashing.

When a missile locks on your position, arrows appear on either side of the screen and begin moving toward each other. The closer the arrows get to one another, the closer the missile is to the OORXX; if the arrows meet in the center of the screen, the OORXX will be destroyed and you will be returned to the ship's interior.

THE UPCOM
----------
To communicate with aliens, you must use the UPCOM (Universal Protocol of Communication) icon system. Once you land, the UPCOM Module appears automatically on the screen if an alien is present.

Receiving A Message
-------------------
As the alien speaks, icons will appear on the left side of the UPCOM Module. To receive a translation of a certain icon, simply point to the icon in question; the translation will appear on the right side of the screen.

If the central mouth is still moving, it means the alien has more to say. Point to the 'mouth' and press the fire button to read the rest of the message.

Sending A Message
-----------------
You may respond to the alien using any of the highlighted icons shown in the UPCOM window. The window shows only a small portion of the available icons. To scroll, selectors located on either side of the icon window. To scroll more quickly, point to the scroll bar located at the bottom of the window and hold the fire button.
button; then move the joystick left or right to move the icons in that direction.

To select an icon, simply point to it and press the fire button. That icon will then appear on the right side of the UPCOM Module. You may select up to eight icons for each sentence. When your message is complete, point to the 'mouth' and press the fire button to transmit your message to the alien. The left-arrow shaped button on the right side of the UPCOM Module lets you delete an icon, and you may also insert an icon into an existing sentence.

Teleporting
-------------

If an alien agrees to be teleported the Teleport icon will appear on the bottom left of the screen. Select this button to teleport the alien onto your ship. To teleport an alien from your ship onto a planet's surface, select the Teleport icon button once you land.

Returning To The Ship
----------------------

Select the triangular-shaped button on the right side of the Module to return to the ship.

THE SHIP'S INTERIOR
---------------------

To return to the ship's interior from a planet surface, select the triangular-shaped button located on the right side of the screen. From the Galaxy Map or Planet Vision Screen, select any INACTIVE button to return to the ship's interior. The main control panel is shown at the bottom of the screen.

Interior Controls
-----------------

Button 1 is used to save your game to disk. Complete instructions are given below. To activate the Planet Vision Screen for a view of the nearest planet, select Button 2; select any inactive button to return to the ship's interior. To view the Galaxy Map, select Button 3 (the one marked with a 'nebula' shape); select any inactive button to return to the ship's interior.

The Fridgitorium
-----------------

If you have teleported an alien (or clone) onto the ship, it will appear in the Fridgitorium on the left side of the screen. While in the Fridgitorium, the alien will not be able to communicate. To disintegrate creatures in the Fridgitorium, select the button directly below the Fridgitorium. When a creature is disintegrated, you recover its vital fluids. However, only the clones' vital fluids are compatible with your system.

OORXX Reactivation
--------------------

Once you guide an OORXX to a planet's landing site, the OORXX remains there and may be reactivated at any time. If you have already landed on the planet whose coordinates are shown at the top of the screen (i.e. the nearest planet), a question mark will appear on the right side of the screen. Select the question mark to reactivate the OORXX on that planet's surface.

THE GALAXY MAP
----------------

To view the Galaxy Map, select Button 3 from the ship's interior. The horizontal and vertical lines superimposed on the Galaxy Map allow you to select a specific planet from among 32,768 possible choices.

Coordinates
----------

The location of each planet in the galaxy is expressed by a set of coordinate numbers, X/Y. The vertical line is the 'X' coordinate and the horizontal line is the 'Y' coordinate line. The nearest planet is the one located at the intersection of the two lines. The coordinates of this planet are displayed at the top of the screen.

Selecting A Planet
-------------------

As you move your hand around the map, the coordinates of the planet you are pointing to at any given moment are shown in the box at the upper left side of the screen.

To select a destination planet, point to the vertical ('X') coordinate line and press and hold the fire button; then move the joystick left or right to move the coordinate line. As the coordinate line moves, the 'Y' coordinate will change accordingly in the box on the upper right side of the screen. When the desired 'Y' coordinate appears in this box, release the fire button to lock in that coordinate number.

To select a new 'Y' coordinate, point to the horizontal ('Y') coordinate line and press and hold the fire button; then move up or down to move the coordinate line. As the coordinate line moves, the value for the 'Y' coordinate will change accordingly in the box on the upper right side of the screen. When the desired 'Y' coordinate appears in this box, release the fire button to lock in that coordinate number.

Hyperspace
----------

To travel to the new planet you have selected on the Galaxy Map, activate the Hyperspace option by selecting the central control panel button (the one marked with an up-arrow). When the Hyperspace sequence is over, the new planet will appear on the viewing screen. NOTE: You may exit the Hyperspace sequence at any point by simply pressing the INST/DEL key.

SAVING A GAME
-------------

You may save your game to disk any time AFTER five minutes of play. To save game, return to the ship's interior and select Button 1 (the disk icon). The saved file will be called BLOOD.CPT. If the game was not successfully saved, the disk icon will flash for several seconds; in this case, check your disk and try again. Each time you save to disk, the new saved game will replace the old saved game. Although you cannot pause the game during play, you may save your progress at any point and return to your game at a later time.

Loading A Saved Game
----------------------

You may load a saved game ONLY DURING THE FIRST FIVE MINUTES OF GAME PLAY. To load a saved game, the Vision Screen appears, select any inactive button to proceed to the ship's interior. Then select Button 1 (the disk icon). If the game did not load successfully, the disk icon will flash for several seconds; in this case, check your disk and try again. Should you wish to load a saved game after five minutes have expired, you will have to reboot the program.

THE END
-------

To survive, you must find all five clones and disintegrate them in your ship's Fridgitorium. The last clone should give you the coordinates of the planet where Torka - the beautiful alien Ondoyante - is waiting. Once you go there and teleport her onto your ship (note that she does NOT stay in the Fridgitorium!), you've won. Now all you have to do is figure out how to get yourself out of the game.....
Apple II Computer Info

--- Playing the game ---

Joystick Controls:

Note: You will need a 2 button joystick.

Note: On an Apple IIc, the keyboard switch must be up for the game to function.

Joystick Button 0: To speed briefing. Also to fire all weapons

Joystick Button 1: To enter all of the vehicles while over a door or an entry. Also to start elevators when the joystick is pushed up or down.

Down: To kneel down

Up: To stand up

Right/Left: To run right or left and also to select firing direction for weapons.

Other Controls:

Esc: Freezes all action until another key is pressed.

Ctrl-E: Toggles the sound on/off.

Ctrl-R: Re-starts game.

Survival Skills:

The rule of thumb when dealing with most insects you may find on the Araan Desert is to bite them before they bite you.

Crimson Lunglurker: Identified by it's bright red scales. Catching a glimpse of one of these little beauties scuttling across the sands is enough to tempt any palate. Stir with just a pinch a garlic.

Stomach Slug: Pleasing grey in color and no bigger than your thumb. Can be found under medium sized rocks. Takes just a bit more effort to collect, but is well worth it in the flavor department. Served poached or hardtack and you'll have your companions begging for more.

Bug Verde: Brings a touch of spice to what may be considered a rather bland diet. Delicious when toasted. Caution, only the female is edible. She has one less band on her abdomen.

Brain Borer: If lightly coated with batter before frying it can be quite pleasant.

Lip Leaper: High in protein and fiber. While barbecuing avoid fumes identical to P-7X nerve gas.

Navel Leech: The crunchy granola of the insect world. High in polyunsaturated riboflavin, and low in fat. Toxic coating removed by boiling

Mega Rodent: Also known as Torch. Excretes a smegma like odor. Highly toxic, can be found under any wet moldy rock. Or sometimes hanging in a tree.

F.O.E. MILITARY EQUIP. I.D.

RIPOV RIP-14 (COOT) HELICOPTER.

MAX. SPEED: 125 MPH (205 KM/H)
CRUISE SPEED: 85 MPH (140 KM/H)

KLEM K1-9 (WOMBAT) MEDIUM TRUCK.

MAX. SPEED: 65 MPH (107 KM/H)
CRUISE : SAME
RANGE : 25 MILES (413 KM)

KLEM K1-67c (SLOTH) SCOUT CAR.

MAX. SPEED: 65 MPH
CRUISE : SAME
RANGE : SAME AS WOMBAT

KLEM 7-43 (HYENA) HEAVY TANK.

MAX. SPEED : 6.5 MPH (10.7 KM/H)
CRUISE : SAME
RANGE : 25 MILES ( 41.3 KM)

KLEM R-457e/k (TOAD) KILLER ROBOT

MAX. SPEED: SAME AS HYENA
CRUISE : SAME
RANGE : SAME

SURVIVAL HINTS:

Your jet can withstand some, but not much, damage from anti-aircraft weapons. Avoid this fire.

Watch out for radar dishes. If not destroyed, they can trigger heat-seeking cruise missiles!

Keep moving! The more slowly you move, the more demonic the enemies DR. MAYBE can mobilize.

Use strategy. It may take several shots and some elaborate footwork to defeat your more devious enemies.

Use any and all equipment you find in your path. Your commando training will come in handy as you commandeer F.O.E. military equipment you find along the way.

And GOOD LUCK, Goodnight. The entire Free World is counting on you!!

Playing the Game

[Signing In]

You begin the game outside the office of the Acme Detective Agency. An electronic security device will detect your presence and ask you to sign in. Type your name when the flashing cursor appears and then press RETURN.

[Your Assignment]

Once you've signed-in, expect a call from the chief about your assignment. You'll be told:

- what treasure has been stolen
- where the crime occurred
- whether the criminal is male or female
- what your deadline is for arresting the criminal

[Object of the Game]

The thief is heading for a hideout in one of 34 European countries. There are 16 possible suspects for the crime. To win the game and advance your career, you must accomplish two tasks before your deadline:

1. Track the criminal's movements across Europe to his or her final destination. You'll have to use the clues you find in each city to determine where the criminal is going next.
2. Identify the criminal and get a warrant for his or her arrest. You'll get clues to the criminal’s identity in messages from the Chief that appear periodically on the screen.

Warrants are issued by the Crime Lab computer based on the information contained in the Note-book. Therefore, as you receive clues to the criminal's identity, be sure to log them in the Notebook.

* You must obtain a warrant for the guilty criminal before you catch up with him or her. Otherwise, the criminal will escape and you may want to reconsider your career as a detective.

Tools of the Trade

[The Main Menu]

The main menu provides the following options to aid you in apprehending the criminal:

- Investigate
- Use Notebook
- Visit Crime Lab
- Go to Airport

Each of these menu options is outlined below:

-Investigate-

Investigate lets you uncover clues in the city you're currently visiting. You may find two kinds of clues: Destination Clues and Character Clues.

The Investigation Menu lists ways to get clues leading to the villain’s next destination. You can choose to:

- Search Scene
- Call Tipster

The clues you uncover will give you information about the country where the criminal is headed next. If you need more information, you can make a different selection from the Investigate Menu.

-How to Decipher Clues-

You have several resources that can help you unravel the clues you find:

- On-screen "Snapshot" illustrating a highlight of each city or country.
- Rand McNally Concise Atlas of Europe with its maps, gazetteer, index, etc. included with the program (*Check your glove compartment for this one, folks.. If not, any atlas should work.*)
- Crime Lab’s Database which contains information about the flag colors, currency and main language of all the European countries.

-Use Notebook-

Messages from your chief will occasionally appear on the screen telling you some thing personal about the criminal you are seeking. These messages are referred to as Character Clues.

Use Notebook lets you keep a record of the character clues you have found. Your notebook lets you keep track of the suspect’s sex, hair color, eye color, and favorite type of movie and book.

To record information in the Notebook, do the following:

1. Use the up and down arrow keys to highlight a characteristic.
2. Use the left and right arrow keys to cycle through all the possible choices for each characteristic until you reach the one you want.
3. If you don't know a characteristic, leave the space blank.

* The information contained in the notebook will be needed by the crime lab computer in order to issue a warrant, so keep your Notebook up-to-date.

Selecting Use Notebook will not cost you any playing time so use the Notebook as often as you like.

When you have finished entering all the information you know about a suspect, press RETURN or a Joystick button to Close Notebook. If you wish to close notebook without saving your changes, press Escape.

-Go To Airport-
Go to Airport lets you get out of town when you think you know the criminals' next destination. You can also go to the airport to check your connections and help narrow down your search.

After selecting Go to Airport, you're given two menu options:
- Depart by Plane
- Return to Town

A window will also appear listing all the city destinations that are currently available from your location. If you are just checking your connections, you'll want to select Return to Town to continue your investigation.

If you select depart by Plane, a map of Europe will appear with a small square marking your current location of the city whose name is highlighted in the destinations window.

By using up/down arrow keys, you may now highlight any of the available destinations and then select it by pressing RETURN or the lower numbered joystick button.

- Visit Crime Lab-

When you want to obtain an arrest warrant for your suspect, you must visit the Crime Lab and enter your crime notes. The Crime Lab also has a special Database of information that can help you unravel the location of clues you encounter as you chase the criminal. Lastly, the Crime Lab has a special feature for saving your case to disk.

After selecting Visit Crime Lab from the main menu, you will be given four options as outlined below:

Enter Crime Notes

Selecting Enter Crime Notes will automatically feed the crime lab computer all the information contained in the notebook. If the Notebook contains sufficient information about a suspect's identity, an arrest warrant will be issued for that suspect. Otherwise, the computer may give you a list of possible culprits without being able to narrow the suspects down to one individual. You will then have to go back to chasing the suspect and supplying more information to your notebook.

Note: If you modify or add to your crime notes and then re-enter them into the crime lab computer, any existing warrant may be voided even if no new warrant is issued.

Use Database

Selecting use database allows you to access a special database of information regarding the countries of Europe, the colors of their flags, their currency and the primary language spoken there. In conjunction with your Rand McNally Concise Atlas of Europe (*Or whatever the hell you are using*), this database is a great resource for unraveling the Destination Clues you've discovered in your investigations.

For example, if you know the criminal is heading for a country where French is spoken and francs are spent, select Use Database to see if the Crime Lab Computer can identify the country you seek.

The database contains three search categories which are: Flag colors, Currencies, and Languages. Use the up/down arrow keys to highlight the desired category.

Use the left and right arrow keys to cycle through the choices contained in each category until you find the one you want. Fill in as many categories as you can based on the clues you've discovered.

When you are finished, press RETURN or a joystick button. The Crime Lab computer will then search through its Database and try to identify the country that matches the search criteria.

The information you provided may not be sufficient to identify the destination country, but the computer may still be of help by narrowing down your choices. You may then use other resources to find the criminal's next stop.

Return to Scene

Selecting Return to Scene lets you leave the Crime Lab and go back to the city you left so that you can get on with the case.

Save Case

Selecting Save Case allows you to save the case-in-progress onto disk. After selecting Save Case, simply follow the on-screen prompts. You can have only one case saved under any particular name.

To continue a saved case, start WECS as usual. After you sign in, the computer will recognize that you have saved a case under your sign-in name and will ask you if you want to continue working on that case. Type Y and press RETURN.

If you do not want to continue your saved case, type N and press RETURN. Your saved case will then be ERASED from the disk.

Tips from the Chief

Work quickly. Keep track of the time and date on your screen. Remember you have a deadline to meet. Don't waste time using the Crime Lab's computer too often, investigating for too long at any location or flying to a city unless you're sure it's the one to which the suspect has fled. Each wrong or unnecessary move will cost you precious hours.

You know you're on the right track when you see a suspicious person or occurrence on your screen. Beware of deadly missiles - they mean you're closing in on your suspect's hideout. If you know you are ready to nab the criminal and you still don't have a warrant, you may want to skip town fast. Go back to the previous city and try to find some Character clues, get your warrant and then trail the villain again.

A clever detective sometimes goes to the airport to check the plane connections available. It takes an hour of your time, but you'll leave the villain's possible destination and perhaps narrow down your search.

[DECIPHERING CLUES]

The key to your success in tracking Carmen and her gang is to decipher the clues you find accurately and efficiently. Remember that you may be able to decipher clues with information from any one of four sources:

1. On-Screen descriptions of each city and country
2. Crime Lab Database
3. Detective Guide

[INVESTIGATION HINTS]

Here are some hints you may want to follow as you investigate:
Read the on-screen descriptions of each city and country to gain information that will help you in future cases. (Some energetic detectives may even want to take notes.)

Check the Detective guide (* Comes with the game guys..*) for information on the "snapshot" shown for each location. You might even find the solution to a clue (* Well, I might..*).

Remember that the Crime Lab Database contains information on each country's flag colors, main languages, and currency.

You'll find it easier to locate the information you need for your investigation if you become familiar with your Rand McNally Concise Atlas of Europe (*!@#$%^&*!@#)*. The atlas has a number of sections in which to find information. Make sure you check:
- The special section on how to use the atlas
- The maps and any accompanying index, pay special attention to the varied types of maps
- The fact chart
- The maps and info contained in the gazetteer.

Clues have been taken from ALL these sections.

It also notes that other Atlases can be helpful...

-END-

The following information has been gleaned from Interpol's files and our field agents. While brief, these descriptions may contain valuable clues to be used in tracking down and identifying members of the V.I.L.E. organization.

Name: Carmen Sandiego
Occupation: A former spy for the Intelligence Service of Monaco.

Miscellaneous: Carmen Sandiego (known to the inner circle as "Buffy") is reported to be an agent, double agent, triple agent, and quadruple agent for so many countries that even she has forgotten which one she is working for. The auburn-haired founder of the Villains' International Legion of Evil (V.I.L.E.) has recruited the most cunning and resourceful band of thieves in history. During her years as a Monacan secret agent, she generally posed as a tennis pro and always traveled to and from matches in her 1939 Packard convertible. Carmen has a fondness for tacos and never appears in public without her famous ruby necklace "The Moon of Moldavia."

Name: Merey LaRoc
Occupation: Ms. LaRoc is a freelance aerobic dancer

Miscellaneous: For the past five years, this brunette beauty has been traveling around the world with a mobile health spa to conduct exercise classes for the extremely wealthy. Rumor has it that this is merely a cover for her criminal activities. When she isn't pillaging the treasures of the World, Merey can usually be found participating in the good life. A world class mountain climber, she has a mania for fine jewelry and spicy foods. Her favorite mode of travel is in the back of a fancy limousine where she can relax and plot her next job.

Name: Dazzle Annie Nonker
Occupation: Proprietress of the toughest yogurt bar east of Suez.

Miscellaneous: Born sole heir to the fortune of the shoelace king, Baron Franz von Nonker, Annie was quickly disinherited when she ran off with a Croatian tennis pro. Cast adrift when she failed to make the cut for the Davis Cup mixed doubles, she was forced to live only by her wits and the paltry $1,000,000 she had been able to save out of her allowance. With this modest windfall and her innate grit, the blond bombshell was able to open Chez Acidophilus. Frequentued by the dregs of humanity, Chez Acidophilus has become the headquarters for V.I.L.E. Annie is rumored to have a tattoo and craving for shellfish. She is known to drive a Bugatti limousine.
[Name: Lady Agatha Wayland]

Occupation: A colorful character with a prediction for sensible shoes. Lady Agatha is a reader of mystery stories set in upper-class English drawing rooms.

Miscellaneous: Lady Agatha has no ability at solving murder cases but is very interested in amassing great wealth. A compulsive lawbreaker, she loves to exceed the speed limit in her Denghby super-chauvinist speedster. Red tresses streaming in the open air, she drives through the countryside looking for great Mexican restaurants. An avid sportswoman, Lady Agatha has been known to pick up a few extra dollars on weekends trouncing unsuspecting locals at the local tennis courts. She is reported to have a diamond ring the size of a small grapefruit stolen from the Royal Treasury of Graustark.

[Name: Len "Red" Bulk]

Occupation: Ex-professional hockey player and compulsive gambler, Len was barred for life from playing when he was caught trying to bribe himself.

Miscellaneous: Bitter and unemployed, Bulk was forced to turn to crime in order to support his gambling habit. He swears he will quit just as soon as he "wins the big one." Because of an unfortunate habit of blocking too many shots with his head, Len will occasionally think he is a Big Horn sheep and begin climbing the nearest peak. Cannot fit into any car that has a top, loves sporting a strange Ukranian tattoo, he has been known to eat the headbands to scandinavian basketball teams to allow them to play outdoors for the first time during the winter months. A super athlete, Scar plays killer croquet for money. One of his prize possessions is a five-carat pinky ring he won from Thor Ihorovitch in a marathon match that lasted three days. Rarely seen in public, he rides around in a limousine with shaded windows with his trusted man-servant, a 6'8" sherpa, as his only companion. He is said to have red hair.

[Name: Scar Graynolt]

Occupation: Scar plays the role of a mild-mannered folk guitarist, while in reality, he is a complete plug-ugly.

Miscellaneous: Graynolt made a fortune selling reflective headbands to scandinavian basketball teams to allow them to play outdoor games for the first time during the winter months. A super athlete, Scar plays killer croquet for money. One of his prize possessions is a five-carat pinky ring he won from Thor Ihorovitch in a marathon match that lasted three days. Rarely seen in public, he rides around in a limousine with shaded windows with his trusted man-servant, a 6'8" sherpa, as his only companion. He is said to have red hair.

[Name: Nick Brunch]

Occupation: Hard-boiled ex-private eye, ear, nose and throat.

Miscellaneous: The only things that interest Nick are fast cars and fast women. He'll never turn down a caper that permits him to live in the fast lane. An avid mountain climber, Brunch was last seen roaring through an Alpine village on his Kamikaze-1250 motorcycle. He generally wears a soiled trenchcoat, snap-brimmed fedora and sports a Dick Tracy Crimefighter's ring on his left hand. A close friend of Scar Graynolt, they share a common interest in Mexican food. Brunch has black hair, brown eyes and a seedy mustache.

[Name: Fast Eddie B.]

Occupation: A world class croquet player, he always carries his custom-made set of mallets in the trunk of his convertible.

Miscellaneous: Gentleman thief and society cat burglar, Fast Eddie mixes easily with the jet set and can usually be found at one of PEOPLE Magazine's top 10 playgrounds for the rich. Impeccably groomed at all times, he once fought a duel with a waiter in his favorite Mexican restaurant who spilled a drop of hot sauce on his white linen suit. His most famous crime was the theft of a damask tablecloth. Posing as a waiter, Fast Eddie removed it from the table during a state dinner for the Ambassador without spilling a drop or breaking a plate. In fact, the theft wasn't even noticed until dessert was served. This raven-haired criminal mastermind always leaves a diamond stickpin at the scene of the crime as his trademark.

[Name: Thor Ihorovitch]

Occupation: Pretender to the Czarist throne and a lot of other things, too, Ihorovitch has an amazing ability to disappear from sight for varying amounts of time.

Miscellaneous: He seems to have a great fascination for very large marsupials. A likeable brute, Ihorovitch provides an additional hand for the mob's nefarious activities. Blond and sporting a strange Ukrainian tattoo, he has been known to eat the contents of an entire lobster tank by himself. Ihorovitch has a color television set installed in his limousine so he doesn't have to miss the Saturday morning cartoon shows.

[Name: Katherine "Boom-Boom" Drib]

Occupation: Three-time winner of the Trans-Siberian Motorcycle race, Drib is the official hostess for V.I.L.E.
WHERE IN THE USA IS CARMEN SANDIEGO?

By: Ken Bull, Gene Portwood and Laureen Elliot

MAIN DOCUMENTATION FILE

Case number: AD14-2236
Subject: Carmen Sandiego
Compiled by: Acme Detective Agency

And you were dreaming of palm trees and sunshine...

8 a.m., a miserable, stormy morning. After an hour-long commute in the pouring rain, you slosh into the Acme Detective Agency, grunt hello to your secretary, pour yourself a cup of scalding coffee and slump down at your desk. It's been a tough year. The only good thing about it is that you've earned a vacation and you're scheduled to leave at 5 p.m. today. You take a swig of coffee and grab a travel brochure from your desk. Visions of sandy beaches, swaying palms, and cool blue waters fill your head.

Suddenly, you're snapped back to reality by a newspaper slammed down on your desk. "Read it and weep," a voice growls. Matt Brannigan, a beefy-faced lunk and one of the agency's top men, is looking down at you with a twisted grin.

You scan the headlines and your heart skips a beat. You can't believe your eyes: Carmen Sandiego has escaped from the toughest prison in Europe!

"The Chief has cancelled all vacations and put everyone on 24-hour-a-day alert," your colleague says. "We've got it on good authority that Carmen's headed for the USA with the worst gang of thugs and criminals ever assembled. No one rests until she's behind bars again!"

As you slam dunk your now worthless travel brochure into the metal trash basket beside your desk, you can't help but wonder at Carmen's timing in re-establishing her Villain's International League of Evil (V.I.L.E.) in the USA. Why couldn't she have waited? Just a few hours more and it wouldn't have been your problem. Grimly, you gather your trench coat around you and head for the door.

"Maybe you'll get to see a bit of the country during this caper," your fellow detective offers as you head for the door. "Yeah," he chuckes, "just think of the whole thing as one big vacation - it'll make it easier.*

** Ready for Duty **

- Getting Started -

Insert the WHERE IN THE USA IS CARMEN SANDIEGO? disk, label side up (Side A), into the disk drive and close the drive door. Turn on your computer and monitor. The program will load into memory and begin an animated introduction. After you've watched the introduction (or any time after the disk drive light goes off), and you're ready to start the game, press any key or joystick button. During the game you will be prompted to flip the disk when necessary. (Always make sure you wait until the red disk drive light is off.)

** You're on Your Way **

- Signing In -

To get your assignment, you first need to sign in. Type in your name, and then press RETURN. If you make a mistake or run out of space, use the Delete key (or left arrow) to erase, then re-type. If you're new on the job, you need to indicate when asked (type Y for yes and press RETURN). Once you've signed in, you'll be given an assignment and send on the trail of the thief!

- Tools of the Trade -

The items on the Main Menu at the bottom right-hand corner of the screen help you track down and identify the villain.

- Controls -

To select an item, use either the keyboard or a joystick. Highlight the item you want by pressing the arrow keys or pushing the joystick up and down. Select the item by pressing RETURN or button #0. Press ESC or button #1 if you accidentally select the wrong item or if you want to choose another.

Select items from other menus in the program in the same way.

- Special Keys -

CONTROL-D permits you to delete a detective's name from the Detective Roster
CONTROL-R ends current game and starts a new one
CONTROL-F permits you to view the Detective Hall of Fame
CONTROL-S turns sound off and on
CONTROL-Y flips y-axis on joystick

- Briefing -

The villain you're after is hiding out in a city in one of the 50 states or the District of Columbia (Washington, D.C.). He or she has left clues along the way, though. These clues point to the city itself or to the state where the city is located.

Carmen's gang has 16 members, including Carmen herself. Any one of them could be the villain, although Carmen is generally more elusive - and smarter - than the rest of the V.I.L.E. gang.

You begin at the bottom of the detective ranks, but as you prove yourself, promotions will come your way. Persevere, catch the crooks, and you'll climb your way through the ranks - 10 in all - to reach Master Detective status.

Even then, you'll need your own quick thinking and hard-nosed investigative skills, plus the Crime Computer, the special included Map of the United States, Fodor's USA travel guide, and your own purloined copy of Carmen's secret scrapbook.

[Sidenote: The "special map" is just an ordinary map of the USA which has the cities in this game printed within the states - just use any map] [ if you need it. The travel guide is 879 pages and can be bought] [ at a book store or else you can use an almanac or another travel] [ guide - the information is rarely needed if ever. The Scrapbook] [ is in the documentation file titled "SCRAPBOOK" -RL]

You have only a limited amount of time to solve each case before the villain gives you the slip. Watch the clock and note the deadline indicated by the Crime Computer at the beginning of each game.

- On the Trail -

Your starting point is the city where the villain (who has just swiped a valuable state treasure) was last seen.

Refer to your official Map of the United States to check locations by city and
state so you'll know where you are and where you're going.

The upper-left portion of the screen always gives your present location, day of the week, and the time.

Be sure to read the descriptions of the city and state that appear on the screen. These contain valuable information that may be useful in solving later cases. Hint: Take the time to jot some of this information down. You'll be glad that you did!

Use the items on the Main Menu to help you track the villain down.

See Connections lists all possible destinations reached by connecting flights from your present location. Check these first to see where the villain might have gone - they change from game to game, so be sure to take a look even if you've been to the city in a previous game. When you've seen the connections, you can clear them from the screen by selecting Hide Connections or leave them on the screen if you prefer.

Depart by Plane lets you depart for the location of your choice once you've investigated and think you know where the villain has gone. An on-screen map of the United States shows your current location (black square) and the location of the connecting city that is currently highlighted (hollow circle). Once you select your destination, your travel route will be displayed.

Investigate lets you unearth clues so you can track the villain to his or her next destination. Clues are found in three locations, which change from city to city. Visit as many clue locations as you want, but remember that the more investigating you do, the more time you use. Use Fodor's USA travel guide to help unravel the clues you turn up.

Crime Computer helps you narrow down your list of suspects and get an arrest warrant for a specific villain. To use the Crime Computer:

Select Crime Computer from the Main Menu. Then select Use Computer from the new menu that appears. In the upper right-hand side of the screen, you'll see a list of characteristics. As you gather clues about the suspect, enter information in the Crime Computer in the following way: Highlight a characteristic - hobby, for example. Then press RETURN or joystick button #0 to cycle through the possible choices until you reach the one you want. If you don't know a characteristic, leave that space blank. When you've finished entering all the information you know about a suspect, select Compute. A list of all suspects who have the characteristics you've specified will be printed out.

When you've narrowed down the list to one suspect, the Crime Computer will issue an arrest warrant. Now you're ready to make an arrest, as soon as you catch up with the villain. (If you need to change the warrant because new clues point to a different suspect, simply enter the correct characteristics in the Crime Computer and a new warrant will be issued.)

Time Out

Even super sleuths need a break. If you want time out, you can Save a case in progress, and then Continue the same case at a later time.

To save your case, select Crime Computer from the Main Menu, then select Save Case. Follow the on-screen prompts to save your case. (Note that once you have saved your case, you cannot continue to play until you restart the game and tell the computer that you want to continue your case.)

To Continue a saved case, simply start the game as usual. After you sign in, the computer will recognize that you have saved a case and will ask you if you want to continue the case at that time. Type Y (for yes) to continue and press RETURN. You will then be whisked to the city where you left off. If you don't want to continue your saved case, type N (for no) and press RETURN. Your saved case will be erased from the disk. Your rank and the total number of cases solved will remain unchanged. (Note: You can have only one saved case on the disk at a time.)

- Investigative Pointers -
  - You know you're on the right track when you see a suspicious person or occurrence on the screen. That's because the real villain stays in hiding and has a crony check you out.
  - The closer you get to the villain the more dangerous your situation becomes. Beware of deadly missiles - they mean you're closing in on your suspect and things are getting hot!
  - Don't waste time using the Crime Computer too often or investigating for too long at each location. Use Carmen's secret Scrapbook to pin down the villain's identity and your Fodor's USA travel guide to reveal the villain's route - if you use your head you'll advance faster than fellow detectives who do nothing but play their hunches.
  - Be sure you have an arrest warrant by the time you catch up with the villain. If you don't have a warrant, you can't make an arrest and the thief will slip through your fingers. And make sure your warrant is for the correct suspect - otherwise you could be in hot water with the Chief for risking a charge of false arrest!
  - Every case you're assigned is different. When you begin a new assignment, you'll start a new city, look for a new stolen treasure, and follow a new suspect over a new route with new clues.
  - As you advance through the ranks, you'll get assigned to tougher cases, with more difficult clues to unravel and a longer trail to follow.
  - If you reach the top of the ranks and have earned all the Special Commendations you can before mandatory retirement, you can always get back in action by using an assumed name when you sign in. This is a smart move. After all, your real name may be on Carmen's hit list!

- Carmen's Scrapbook - Your Own Stolen Treasure
  - Lucky for you, the Acme Detective Agency has managed to purloin Carmen's own secret Scrapbook. In it, Carmen has collected mementos and information about every member of her gang. You can use this information to identify the V.I.L.E. villain you're looking for in your current case. For example, if Carmen notes that one of her henchman's (or henchwoman's) favorite snacks is tacos, you'll know that the villain's food preference is Tex/Mex (a category in the Crime Computer). Clues about Carmen are found in the Scrapbook, too. But like Carmen herself, these clues are elusive. You'll have to use all your detecting skills as you sift through the Scrapbook trying to identify this arch-villain's interests, hobbies, etc.

  - A Final Hint -
    - Don't hesitate to use other reference books you may have on hand. The biographical and geographical sections of a dictionary may be helpful, as well as an encyclopedia, a map, or an Almanac. Use whatever you can to help you unravel the clues, save time, catch the crooks, and earn those promotions!
WHERE IN THE USA IS CARMEN SANDIEGO?

NOTE: Getting this cost us two of our
best operatives! (Carmen hired both of them!!).

Watch your step
-------------------
The Chief

Fisherman's Grotto #6 7/8" Restaurant
We had lunch here after B.B.D.'s first job
for us. She confessed she hated her brown
hair and was thinking of dyeing it peacock
blue.

Sheriff Paul Drive: Here's Paul entertaining his fellow workers down at the
big supply depot. They're sure thrilled.
Met the big Blond hunk on his way to a Crayfish Feed.

Good at truck driving. Can do wheelies with his forklift!

Name: "Sheriff" Paul Drive
Occupation: Drug-store cowboy (unemployed)
Favorite movie: Godzilla at the OK Corral
Last book read: The Joy of Changing Your Oil Filter

Ken Hartley Reed: Ken dining in style on fish sticks on the patio of his
favorite restaurant, L'Olister Verde. I've been trying to
convince him to put a streak in that moussy brown hair of
his, but no luck so far.

Achievements:
1) Stole trophy from star forward after losing in a game of
one-on-one.
2) Won fifth-grade spelling bee. Winning word: spelunking.

Talents:
1) Can play Beethoven's Fifth backward on his harmonica!

Titus Canby: We planned the Statue of Liberty heist between the first and
second movements. Made Titus promise to wear a wig to hide his
red hair.

Name: Titus Canby
Occupation: Lobsterman, safe cracker, thug
Favorite Movie: Plan 9 from Outer Space
Last book read: The Carlsbad Caverns Diet
Favorite drink: Clam Juice
Favorite team: San Francisco 49'ers

Mylar Naughahyde: This was taken at the Street Merchant's Institute for
Advanced Studies where Myler is on the faculty.

Real name: Mylar Naugahyde
Alias: Kard Shark
Alias: Phantom of the Opera
Favorite sayings:
Blonds have more fun.
Pass the grits.
Wanna bet?

New York

Brenda and Cobina Vanderbelt: Double trouble! Off to the big game and a day
of fun, fun, fun for the dynamic duo.

How to tell them apart:
1. Brenda has an extra tooth.
2. Cobina stirs her coffee with a teaspoon; Brenda uses a tablespoon.
3. Brenda's hair color is Bleeding Heart #5; Cobina's is Fire Engine Red.

Special Talents:
- Lip reading
- Karate
- Cave crawling
- Dancing the tango
- Cooking terrific gumbo

Bio:
Former word processor.
Sang lead in "Barber of Seville"
Co-authored "The Scarlett O'Hara Cookbook"
Wrote article on why blondes have more fun

Expenses from the Pencil's last caper. Have to talk to her about these!

Wendy Pauper: Half-time madness! Wendy and the lead guitarist from Reeking Sewage tear things up at the stadium.

Great addition to the team! Recruited her 8/15 from a club on the outskirts of Cleveland. Cooks great chicken creole.

She never misses a Miami Dolphins game! (The team even gave her own helmet.)

Lost again in the lottery! Next time we pull a job in Vegas, I'm going to show her the ropes.

Alexander Graham Edison: Alexander engaged in his (and my) favorite sport (basketball).

Notes: This blushing brown-haired beauty was a lineman laid off by the local phone company when I met him in a we-never-close fried chicken bar. He was planning to use his training to become a freelance gene splicer until I convinced him to sign up with V.I.L.E.

Benjamin Hana: The chef picks his "menu" for tomorrow with a little help from a "friend". (Just horsing around, of course.)

Jet black hair (just like mine!), impish grin, cute little ears, and cooks a terrific shrimp creole. So glad we met when we did.

Employment history:
- Martial arts instructor
- Goalie for Calgary Flames
- Backup guitar man at the Palomino Western Bar

Benjamin's Folly! (betting on horses)
The only good tips he's had lately are on asparagus, not horses.

Strengths: Genius with an oil can and wrench. No troubles with your getaway car when tuned by this lady.

Weaknesses: Don't plan a job when a hockey game's on the tube. Better yet, don't even call.

Venus H. Pencil: Taken on her last day on the job. Oh well, word processing's loss is crime's gain. She'll have to take out her aggressions on the sink now. (She's one terrific goalie).

From the Kitchen of Heidi Gosikh

Southern Fried Chicken Mysteresioso
1) Steal one medium size chicken for each four guests...
2) Pluck

Hobbies:
- Needlepointing scenes of famous disasters
- Playing old Caruso records
- Designing tarot cards

Oysters R' Us Restaurant
Souvenir of dinner at Polly's favorite restaurant. She sang "The Bell Song" between coffee and dessert. Got a standing ovation.

Second Stage's CARMEN
Souvenir of our first date. I listened to this while he fixed his carburetor. Too bad I don't like opera.

Notes: This blushing brown-haired beauty was a lineman laid off by the local phone company when I met him in a we-never-close fried chicken bar. He was planning to use his training to become a freelance gene splicer until I convinced him to sign up with V.I.L.E.

Benjamin Hana: The chef picks his "menu" for tomorrow with a little help from a "friend". (Just horsing around, of course.)

Jet black hair (just like mine!), impish grin, cute little ears, and cooks a terrific shrimp creole. So glad we met when we did.

Weaknesses: Don't plan a job when a hockey game's on the tube. Better yet, don't even call.

Venus H. Pencil: Taken on her last day on the job. Oh well, word processing's loss is crime's gain. She'll have to take out her aggressions on the sink now. (She's one terrific goalie).
CATSEND 202

CATSEND 202 IS A FILE TRANSFER PROGRAM WRITTEN FOR THE APPLE CAT MODEM. WHAT DISTINGUISHES IT FROM OTHER, SIMILAR PROGRAMS IS THAT IT OPERATES AT 1200 BAUD HALF-DUPLEX, COMMONLY KNOWN AS '202'. ALTHOUGH CATSEND WAS DESIGNED WITH EASE-OF-USE IN MIND, SOME DOCUMENTATION IS NECESSARY TO UNDERSTAND FULLY HOW TO USE IT.

WHEN YOU FIRST RUN CATSEND, YOU WILL BE PRESENTED WITH A MENU SIMILAR TO THE ONE BELOW:

```
$END FILES
$RECEIVE FILES
$CATALOG DISK
$FORMAT DISK
$TOGGLE DRIVE ->1
$PICKUP HANDSET
$HANGUP HANDSET
$ADD A FILE
$NEW SLOT FOR CAT ->2
$ZERO ALL FILES
$VIEW SELECTED FILES
-- -- -- -- --
```

I WILL NOW GO THROUGH EACH OPTION, EXPLAINING WHAT EACH DOES AND HOW TO USE IT PROPERLY.

$END FILES: WHEN SELECTED, THIS WILL PROMPT YOU TO 'PRESS A KEY TO CONTINUE...'. IF YOU PRESS <ESC>, YOU WILL BE RETURNED TO THE MAIN MENU WITH ALL SELECTED FILES INTACT. OTHERWISE, THE SENDING PROCESS WILL BEGIN. IF NO FILES HAVE BEEN SELECTED, HOWEVER, YOU WILL BE NOTIFIED OF THIS AND WILL BE RETURNED TO THE MAIN MENU. AFTER THE FILE TRANSFER IS COMPLETE, CATSEND WILL SOUND A PAGER 3 TIMES ON BOTH THE SENDING AND RECEIVING SIDE TO ALERT BOTH PARTIES THAT IT IS DONE. THE CARRIER WILL TURN OFF AND THE HANDSET WILL GO OFF-HOOK TO PRESERVE THE LINE, AND YOU WILL BE RETURNED TO THE MAIN MENU.

$RECEIVE FILES: WHEN '<R' IS TYPED FROM THE MAIN MENU, YOU WILL BE PROMPTED TO 'PRESS A KEY TO CONTINUE...'. ONCE AGAIN, YOU MAY PRESS <ESC> TO ABORT AND RETURN TO THE MAIN MENU. OTHERWISE, CATSEND WILL GO INTO RECEIVE MODE, AND WILL WAIT UNTIL A HANDSHAKE IS RECEIVED. NEXT, CATSEND WILL RECEIVE THE FILE NAME, NUMBER OF BLOCKS, AND FINALLY THE PROGRAM ITSELF. AFTER ALL THE FILES HAVE BEEN RECEIVED, THE PAGER WILL SOUND, THE CARRIER WILL TURN OFF, THE HANDSET WILL PICK UP, AND YOU WILL BE RETURNED TO THE MAIN MENU JUST AS IN $END MODE.

$CATALOG DISK: THIS WILL CATALOG WHATEVER DRIVE IS CURRENTLY 'ON'. THE FIRST FEW FILES WILL BE DISPLAYED, THEN IT WILL WAIT FOR A KEYPRESS. PRESSING <RETURN> HERE WILL TERMINATE THE CATALOG, WHILE ANY
Apple II Computer Info

[FORMAT DISK] This will format the disk in whatever drive is currently 'on'. It will free up tracks 1-2, and will install a 'This disk has no DOS' message on track 0, sector 0.

[T]OGGLE DRIVE: This decides which drive is 'on', and toggles between drives one and two. Be certain that you do not try to select files from one disk, and then [T]oggle drive and choose files from the other drive!!!

[P]ICKUP HANDSET: Picks up the line and enables the handset for voice mode. The handset will automatically turn off when entering either [S] or [R] modes.

[H]ANGUP HANDSET: Hangs up the line and turns off the handset completely.

[A]DD A FILE: This is where you choose the files you wish to transfer. You will be prompted with 'FILE ->'. Here, you have several options. Either you can type in the name of the file and hit return, in which case it will make sure there really is a file by that name, or you can press <ESC> to exit [A]dd mode and return to the main menu, or you can press <RETURN> which will catalog the disk. Again, <RETURN> to terminate the catalog or any other key to continue. After you have chosen all the files you wish to send, press <ESC> to go back to the main menu. (you can go back and add more files anytime prior to sending them.)

[N]EW SLOT FOR CAT: You may enter a number from 1 to 7.

[Z]ERO ALL FILES: This will clear a been added so far. Thus, if you added some files, and then decided that you wanted to send something else, you would [Z]ero the files and start over.

[V]IEW SELECTED FILES: This displays the files you have chosen already.

-- -- -- -- --

DOS ERRORS: If an error occurs while a DOS command is being executed, an alert will sound and the DOS error number will be displayed. Look at any DOS manual to find out what error the number represents.

-- -- -- -- --

DURING THE TRANSFER: While sending or receiving files, you may look at either the [T]EXT or [G]RAPHICS screen. Simply type 't' for text or 'g' for graphics, and after CATSEND has finished sending/receiving the current block, it will flip the display to the proper screen. After CATSEND reads/writes one pass, and goes on to the next, it will flip to the text screen to let you see how it's doing.

-- -- -- -- --

AND THAT'S IT! We hope you enjoy using CATSEND 202, and that you find it useful. If you have any ideas concerning later revisions of CATSEND, please contact either the WOMBAT or the GONIF via the ADVENTURER'S TAVERN: (714) 538-3103. HAVE FUN!!
Congratulations! You are now about to become a Computer Bulletin Board System (CBBS) Operator. As System Operator (SYSOP), you will be responsible for maintaining a useful and informative service for your club, your organization, your friends, or the general public.

This program is called an Apple Bulletin Board System (ABBS), since it is a CBBS that runs on an Apple I+. As to hardware, you will need:
- An Apple I+ computer (or an Apple I with AppleSoft on a ROMCARD or on a 16K Card)
- Two standard Apple (or compatible) 5 1/4" disk drives running under DOS 3.3;
- A D.C. Hayes Micromodem II in slot 3 (you may move it to slot 2 after making certain changes in the program);
- The disk drives containing this file, the WAPABBS program and sample files ready for your own adaptation;
- A viewing device such as a monitor, CRT, or TV set that will allow you to view what the ABBS is doing.

A text editor for the addition, deletion and maintenance of the text files that the ABBS uses. The DOS Tool Kit, sold by Apple Computer, is adequate for your needs; a word processing program that uses text files will probably also work. Many Apple users' groups have excellent text editors in their program libraries;
- A Mountain Hardware CPS Multifunction Card in slot 4 (this is optional -- the ABBS will work without the clock card, but you must change the date manually);
- A printer to print out listings and preserve a record of messages (this is optional also. In order for the printer to record what the ABBS is doing while in operation, you must have a printer that uses an Apple parallel interface card in slot 1 or is otherwise able to print out a character FOEd to $C090; and
- The software that runs WAPABBS.

Additionally, you will want to give serious consideration to giving the ABBS its own private telephone line. No matter what times you tell your users that your system is up, they will call in at all hours of the day or night. And when people with these popular modems will probably ask you how to use the ABBS with them. This program is copyright (1982) by Thomas S. Warrick. Sale of these programs for any price more than a nominal amount is excessive of the value of the media is prohibited.

THE FILES ON THESE DISKS:

The files on these disks are designed to run in specific disk drives. In drive 1 should be the disk with these files:
- A DISK -- This is the ABBS program. Disk 1 will run this program on boot-up only if your system suffers a temporary power outage the system will restart itself.
- A DISK -- This binary file contains the input/output routines and the "$" routines, which handle the message summary strings. To run the ABBS with your Micromodem, you must change the first line number in the program's source code (on disk 2) and re-assemble it. (You will also have to change line 10 of WAPABBS to set SL = 2.)

This binary file loads several machine language routines into page 3. Most important is the line input routine, which begins at 768 ($300). The source file, ABBS3, is on disk 2.

START -- This text file contains 5 entries: today's date (in a special form discussed below in connection with field 3 of the MESSAGES file), the date of the last bulletin, the password for uploading files to the ABBS, the userid (pronounced VOEd) that is used to identify your area number, which is used to identify a person other than the SYSOP who is allowed to change the date, and the userid for a person other than the SYSOP who is allowed to change the date and to look at the password file. Note that if you have the CPS card, you will not need to worry about selling (except for the bulletin date). This will be discussed more below.

MESSAGES -- This is the principal file to which your users will be reading and writing; thus, it is first on the disk in order to make disk access as fast as possible. Understanding the structure of Messages is very important to an understanding of a random-access text file with a record length of 452 characters. The file is initialized with 136 "EMTPY" records. When a message is in use, it consists of up to 14 fields, each followed by a return:
- The userid of the sender (6 characters);
- The userid of the recipient (6 characters);
- The date of the message (13 characters in the form YYMMDD.HHMMSS, where YY=year, MM=month, DD=day, HH=hour, MM=minute, SS=second. This is the format for the date that must always be used in the STARTUP file);
- A summary of the message (20 characters); and
- The text of the message in up to 10 lines of up to 39 characters each. If the message is less than 10 lines, the last line of text is followed by a null line, i.e., 14 characters prior to the return that ends the line.

USERS -- This text file contains 40-character records with this information:
- The numeric portion of the userid, in 4-digit form. Thus user 1 is *0001*; user 2027 is *2027*;
- The password of the user (6 characters);
- The user's name with last name first;
- The address of the user;
- The phone number and other contact information of the user;
- The number of times the user has signed on;
- The last date the user called in, in the form YYMMDD.HH;
- A summary of the message (20 characters); and
- The text of the message in up to 10 lines of up to 39 characters each. If the message is less than 10 lines, the last line of text is followed by a null line, i.e., 14 characters prior to the return that ends the line.

USERS.OBJ, allows you to update this file after you change the USERS file.

Apple II Computer Info

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.apple/ -- 18 September 2000 -- 197 of 1262
INSTRUCTIONS -- This sequential text file gives instructions in the use of the ABBS to your side user. You should read these carefully. This file also ends with a null line. Insert your name in the field where appropriate.

This AppleSoft program should be run every time you add or delete an entry to or from the USERS file. It looks at each record in the file and builds the USERS.OBJ file according to whether a particular user is listed in the USERS file. BUILD USR.OBJ and then runs WAPABBS to restart the system.

-- TO SYSOP -- This sequential text file stores messages left to you by up to 9 people who do not have passwords. The first entry in the file is a one-digit number of the number of messages in the file. The text of the messages follows. This file may be retrieved only by you.

UPLOAD1 -- This sequential text file gives the instructions for uploading and downloading. When the ABBS: *Uploading* begins, the ABBS computers to the ABBS: *downloading* means sending files from the ABBS to other computers.

-- UPLOAD2 -- This sequential text file contains a list of files available for uploading. A null line terminates the listing; this is necessary so that uploads will terminate properly.

-- OPINION -- This sequential text file has as its first record a question to which everyone can respond. Answers are stored right after the question. Only you can see the answers, however. No check is made to see whether someone has answered more than once.

REMEMBER II -- This text file is available for downloading. You should EXEC it with SET 1, SET 0, and ASAVE it as it says. This is, I may say, an excellent terminal program for the Micromodem II. Non-commercial distribution is permitted, and this program may not be sold without express permission of Washington Apple Pi.

REM II INSTRUCTIONS -- This text file contains the instructions for REMEMBER II. You should EXEC it in the same manner to create a file called REM II.OBJ1, which REMEMBER II will access when you request instructions in its use.

ABBS1 and ABBS3 are source code for the binary files discussed above.

AN ANALYSIS OF THE PROGRAMS:

1. THE INPUT/OUTPUT ROUTINES

Apple II I/O for WAPABBS. The I/O routines are activated by a "CALL 37888" in line 32 of WAPABBS. This routine changes the CSW/KSW vectors ($E3-$E9) to the ABBS's I/O routines, sets the "K" vector ($5F-57), and jumps to the DOS routine that reconnects DOS's I/O hooks.

The Output routine, which begins at $9420, first does a test to see if the character being output is lowercase. If so, the character is OR'ed against LOCSE. If lowercase-to-uppercase conversion is on, the character is translated to uppercase for the next caller, the stack is cleared, and control falls into the GOTO routine.

If modem input is allowed, the modem is checked to see if the user's modem's carrier is not detected. If carrier is not detected, ACTIVE is unchanged, and the next request for input will continue as if the modem had not been detected.

The next sequence of code hangs up the phone, using the Micromodem routine at $CBAB. ACTIVE is reset to 0, LOCSE is set to $20 so that lowercase characters will be translated to uppercase, and the next caller, the stack is cleared, and control falls into the GOTO routine.

The GOTO routine, at $9400, immediately outputs a return to clear any active input. This prevents someone from tying up the ABBS by leaving their computer connected inadvertently.

If bit 6 of ACTIVE is set, the ABBS will ignore the modem. This is so that when you want to use the ABBS yourself, WAPABBS will not answer the phone. Thus if ACTIVE=64, no modem input is recognized.

If modem input is allowed, the modem is checked to see if the user's modem's carrier tone has been lost. If it has, WAPABBS hangs up the phone. If not, the modem is polled for a character. If a character has arrived, the most significant bit is set and processing begins. If no data has arrived from the modem, the keyboard is checked. If a ctrl-A has been pressed by the SYSOP, WAPABBS responds:

REM II:

You may now enter these characters with these results:

ctrl-A    Ends chat mode
ctrl-B    Begins Chat mode by doing a jump to 4300
ctrl-C    Flashes an "O" on the screen, meaning that the SYSOP is now "out"
ctrl-D    Flashes an "X" on the screen, meaning that the SYSOP is now "in"
ctrl-R    Sends a ctrl-R out over the modem
ctrl-T    Sends a ctrl-T out over the modem
ctrl-?    Sends a ctrl-? out over the modem

If a character has been received, the ABBS's screen is set to non-flashing, which is Apple convention to let you know that a character has been received.

If a rubout has been received (ASCII $7F), the user is sent a bell and the character is not allowed. If a carriage or line feed is accepted, a beep is emitted and the keyboard is returned to its state.

If a parity error, receiver overrun error, or framing error is detected, the character is ignored. The user will notice that his character was not echoed.

Finally, the character that was received is checked to see if it is a control character. If not, LINEMAX is checked, and if the character was longer than LINEMAX, the character is sent to the ABBS's System Monitor.

If the character received is a system monitor flag, the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.

If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000. If the character received was a carriage return, then the stack is cleared and jumps to AppleSoft line 2000.
The ABBS next checks to see if a ctrl-C or a ctrl-K is permitted. If so, and if the character is a ctrl-C or a ctrl-K, it is treated in the same manner as ctrl-C or ctrl-K were by the output routine.

A linefeed (ctrl-J) turns on LF1 (see the Micromodem manual) which will send linefeeds after each carriage return. This affects modem output, not screen output.

A ctrl-X acts exactly as ctrl-X does on regular Apple input: it cancels the input line and asks for another one. X and CLL are returned to the left margin, i.e., zero.

Ctrl-L toggles LOCSE, which allows lowercase input. Ctrl-L has the function of a shift-lock key.

The short routines that follow handle the ignore-this-character routine and the cursor.

The next group of routines handle the ampersand ("&"). These routines manipulate the message summary strings, which begin at $6800. These strings would require more than 1K of overhead if handled as traditional Applesoft strings.

1. Assign a string to the message summary array:
   \[
   & A J,K,A$ \]
   where A means "assign", J is the message number, K is which part of the message summary the string is to be stored (0=the user the message is from, 1=the user the message is to, 2=the date, and 3=the summary of the text of the message), and A$ is the string to move into the message summary array.

2. Print a string:
   \[
   & P J,K \]
   where P means "print", and J and K have the same meaning as above.

3. Assign one of the elements of the array to B$:
   \[
   & B J,K \]
   where B means "LET B$ = ", and J and K have the same meaning as in string assignment. Note that only the variable B$ can be used in this manner. Furthermore, B$ must already have been set equal to something by an earlier program line or direct command such as: B$ = "HELLO"

4. Test an element of the message summary array:
   \[
   & T J,K,A$,L \]
   where T means "test", J and K have their usual meaning, A$ refers to the string being tested against the message summary item, and L is the variable used to store the result. The result will be:
   - 0 if message summary item > A$
   - 1 if message summary item = A$
   - -1 if message summary item < A$

II. THE PAGE 3 ROUTINES

ABBS3.OBJ0 has three routines. The first, called INLIN, is a revision of the well-known "Input Anything" routine. This modification, however, uses this syntax:

CALL INLIN [;X]

where INLIN=768 and X is the maximum allowable line length (LINEMAX). If X is not specified, the previous maximum line length is used. X must be between 0 and 255; note that if X>256, both you and the user will hear beeps after the entry of the 249th through 255th character. In order for INLIN to work, the first variable in the main Applesoft program must be a character string; WAPABBS uses A$. The routine accepts commas, colons, and quotation marks; only a return will terminate input. The routine ends by setting A$ equal to what was just entered, but A$ is still in the input buffer and will be written over by the next input request or by the next DOS command. To save the string, you must use the command:

A$ = MID$(A$,1)

Note that a simple assignment statement such as B$ = A$ will not work.

The next routine does an index function:

CALL 804,A$,B$,J

This looks for the first character of A$ in the string B$, and returns with J equal to the relative position of the first occurrence of the character. So if A$="HELLO" and B$="ABCDEFGHIJKLMNOPQRSTUVWXYZ", J would become 8. If "H" did not occur in B$, J would be set to 0.

The third routine looks up the userid number and calculates the record number in the USERSOBJ sequential text file. Its syntax is:

CALL 892,J

where J is the userid number. J is returned as the record number. For example, if user WAPABBS calls in, J would be set by a WAPABBS routine to 538. This routine would go through the USERSOBJ file in memory and would calculate how many userid numbers between 1 and 538 were "active." The result would be the record number of user 538's password entry in the USERS file. If user 538 were not on the system, J would become 0. Note that this routine is used in the signon process and in the W and Y commands.

III. VARIABLES USED IN WAPABBS

A$ must be the first variable used in the program in order for the machine language routine at $300 to work. A$ is the workhorse string variable; all string input passes through A$. Note that if A$ has been set by the routine at $300, so long as A$ is not assigned to another variable, A$ will not take up regular memory space and will not create "garbage."

ACTIVE is a flag used to tell the I/O routines whether the SYSOP, a user, or none is currently using the ABBS. See above for a further description of the values ACTIVE can have.

AC$ [Allowable Commands] is a list of the letters of allowable commands. CALL 804 uses this to compute the index value of the response to the "COMMAND?" prompt for use by the ON J GOTO in line 2011. The CALL 804 routine requires that AC$ be a variable.

AL$ is "ALL ", and is used by the message handling routines to prevent errors that would occur if a user entered "ALL", which is only 3 characters long, instead of the 6-character response that the ABBS expected.

B$ is the secondary string variable. It is used by the "$" message summary routines and for other general purposes.

BDS [Bulletin Date] is a 4-character string that tells users when the bulletin was most recently updated.

B(6) is an array used by the sorting routine that organizes the messages into date order.

CH [Chat] is 1 if you have indicated your availability for a chat, 0 otherwise.

CK [Chatkey] is 0 if the user is permitted to interrupt program execution and return to the "COMMAND?" prompt; 1 means interruption is not permitted.

CMS is a comma (","). This must be a variable so that the CALL 804 routine can tell whether what should have been a file name has a comma.

CDRL is the delay (in 0.1 seconds) sent after each carriage return if the user has specified linefeed insertion. This is the standard Micromodem delay. Note that setting this to 0 is equivalent to specifying a delay of 2.56 seconds.

D$ is ctrl-D.

D1$ [Date1] is "> " and is used to create a date value higher than any valid date. In this way, WAPABBS will sort the messages in proper date order.

DAS [Datec] is the current date as specified in the STARTUP file or by the clock.

DA(S) [Date order; see below for meaning of HS] is used to store the dates in date order. DA(1) is equal to the message number of the oldest message, DA(2) is the number of the second oldest, etc.

DR [Drive] is a location within DOS 3.3 that, when poked with 1 or 2, will access that disk drive for the next DOS command without requiring ",D1" or ",D2".

E$ contains "$" and is used by CALL 804 to check that a number entered was not in exponential notation.

EMS [Empty] contains "EMPTY ", and is used to erase the "From" value in message summaries and on disk.
Apple II Computer Info

MS$(13) is used to enter and edit messages. MS$(0) has the userid of the sender of the message, MS$(1) has the userid of the recipient, MS$(2) has the date the message was entered, MS$(3) has the message summary, and MS$(4)–MS$(13) store the lines of the text of the message.

NM$ is ctrl-D + "MON I,0". See MI$ for an explanation of why this is necessary.

R [Record number] is used by the random-access file routines to select the message number to be read or written.

S1$ [Sysop] has the SYSOP's userid in 4-digit numeric form. If the SYSOP's number were WAP001, for example, S1$ should be set to "0001". This is necessary to keep the "Y" routine from printing the SYSOP's password.

SL [Slot] contains the Micromodem's slot number.

SO [SignOns] contains the number of users who have successfully signed on. If someone signs on more than once, they are counted more than once.

SYS [SYSOP] contains the userid of the SYSOP. Observe when going through the program listing that the SYSOP can do many things forbidden to others.

T1$ [T user 1] is the userid of a person who is able to change the date if you are unable to do so.

T2$ [T user 2] is the userid of the person who can change the date and print the password file. If you have no one to whom you want to allow access to the date or password file, set these to your own userid to prevent anyone from having this much access.

UL$ [Upload] contains the letters of the four commands allowed during uploads.

UP$ [Upload] is the password necessary to begin uploading a file into the ABBS. In case you have not guessed, a userid is a 6-character string with a 2 or 3 letter prefix and a numeric suffix in the range 1-4095.

Z is a general-purpose numeric variable.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 200 of 1262
The Code Crusher is very similar to the Prefix Prowler in operation. If you haven't read the doc file on the Prowler, press [ESC] and do it now.

The wad of boring configuration questions is basically the same as in the Prowler, with the addition of "NUMBER OF DIGITS IN CODE", "STARTING CODE", "ENDING CODE", and "ENTER A NUMBER KNOWN TO EMIT A CARRIER". The first 3 are just...just...just so incredibly obvious that they should be on street signs. The final question requests a test number to call to check a code's validity. Enter a number (including area code) of a BBS or other computer system which is seldom busy.

Notice that there is no Random Dialing option on the Code Crusher. It was omitted for various dull reasons.

The runtime commands are the same as those in the Prowler, but here they are again anyway, since I happen to have them in the word processor.

RUNTIME COMMANDS:

Anything during dialing at the ? prompt you can enter one of the following commands, followed by [RETURN]. Notice that they must be entered ALONE after the ? input prompt.

N: Skip to the next code.
R: Medial current code (useful if your modem lacks automatic busy signal redialing)
Q: Quit and save datafile (if one is used)
G: Pop up Graphics Page 2. Useful if mommy walks in to see if you are learning anything on your expensive toy.
T: Text screen (use to get back to the text display after the 'G' command)
L: Signal the Crusher that the current code has worked and flag it as a successful connect.

Keep your nose peeled for phigs.

Phreak out, phreak out and touch someone. Automatically

---

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 201 of 1262

INTRODUCTION

Certificate Maker provides more than 200 professionally designed, partially-completed certificates, called templates for you to use in making certificates for any occasion. Some templates are intended for specific occasions such as academic achievement, sporting triumphs and so on; these include a title and appropriate artwork. Other templates are multi-purpose; they haveno artwork and only a partial title like: CERTIFICATE OF....

To make a certificate, all you have to do is select the template you want, (a complete list of the template numbers and what they contain will be found later on in these docs) choose a border and type style, and fill in the blanks with the recipient's name and achievement.

For those occasions when you want to present personalized certificates to several people, Certificate Maker has a feature called the "NAME" WILDCARD that lets you insert names into otherwise identical certificates.

The information you enter is added to a template when you print the certificate. The templates themselves remain intact and can be used over and over.

THE ELEMENTS OF A CERTIFICATE

Basically there are 4 parts to a certificate:

> TITLE: Some templates include a complete title such as MATHEMATICS AWARD or MOST VALUABLE MEMBER, while other templates provide a partial title like CERTIFICATE OF...., or a completely blank title area.

> GRAPHICS: Many templates include an illustration to spice up the professional, or humorous, touch.

> BORDER: There are 24 designs to choose from. Samples of each border appear on a special Border menu in the program.

> TEXT: Every template provides space where you can type in specific information about an award. Most templates also include a line for the
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

Apple II Computer Info

date and your signature. Certificate Maker has five font styles and two
font sizes from which you may choose.

Entering the special code "NAME" in your text instructs CM to print the
same certificate several times, with a different name on each copy.

A separate procedure allows you to create "name" files containing the
names of the people in your office, classroom, or organization. Just
before you print a certificate that has the "NAME" wildcard in it, the
program asks you to choose the names you want to use.

USING THE KEYBOARD

The following table shows the keys used in Certificate Maker.

<table>
<thead>
<tr>
<th>Function</th>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[return]</td>
<td></td>
<td>Use [return] to select an item from a menu or a list of options.</td>
</tr>
<tr>
<td>[esc]</td>
<td></td>
<td>Use [esc] to cancel your work on one screen and return to the previous screen. When entering text, use [esc] to delete the text on the current line and move the cursor back to the previous line.</td>
</tr>
<tr>
<td>[control-R]</td>
<td></td>
<td>Use [control-R] (hold down [control] and press R simultaneously) at any time to cancel your work and return to the Main Menu. From there, you can start over or exit from Certificate Maker.</td>
</tr>
</tbody>
</table>

Apple IIe/c: Use the up and down arrow keys to move from one item to another in a menu or a list of options.

Apple II+: Use for up and for down.

[backarrow]        |          | Use the backarrow or delete key to erase characters to the left of the cursor. |
[delete]           |          | Use [delete] to delete characters to the left of the cursor. |

SETTING UP AND RUNNING C.M.

-----------------------------

BEFORE YOU START:

If you plan to use the "NAME" wildcard feature, initialize a floppy disk for "NAME" file storage. Use ProDOS to initialize your disk.

"NAME" files must be stored on a separate floppy disk. They cannot be kept on the Certificate Maker Master Program disk or the Certificate Catalog disks. A single floppy disk can hold all your "NAME" files.

TO START CERTIFICATE MAKER:

Insert the Master Program disk in drive 1 and turn on your computer. If you have two disk drives, insert the Certificate Catalog disk in drive 2.

TO EXIT FROM CERTIFICATE MAKER:

1. Return to the Main Menu by pressing [Ctrl-R].
2. Select the Exit Program option (if you want to run another software application), or turn off your computer.

HOW TO MAKE A CERTIFICATE:

Listed below are the 12 steps necessary for making a certificate. Each step is described in detail after this list.

1. Select MAKE CERTIFICATE from the Main Menu.
2. Enter the template number.
3. Select the border of your choice.
4. If the certificate is blank, then select the Title Font Style. (If the certificate is not blank, but is partial, then it will skip this step)
5. If the certificate is partial, then enter the Title Text.
6. Select the Body Font Style.
7. Enter the Body Text.
8. Enter the Date Line.
9. Enter the Signature Line.
10. Select "NAME" file to use. (This step is taken only if you used a wildcard "NAME" in step #7)
11. Select names to print from the "NAME" file you selected in step #10.
12. PRINT MENU - Print the certificate.

MAIN MENU

-----------------------------

Select MAKE CERTIFICATE if you want to create a certificate.

Select "NAME" FILE if you want to create or edit a list of names. A "NAME" file list can be merged into a certificate to produce several personalized copies of the same certificate. The program goes to Screen A, Select "NAME" file option (described in more detail later).

NOTE: This option is used to add or delete names from a "NAME" file, not to select the names to be printed on any given certificate. Actual name selection is done in the Make Certificate procedure.

Select EXIT PROGRAM to leave CM and return to ProDOS.

No matter where you are in CM, you can press [Ctrl-R] to Return to this menu.

ENTER TEMPLATE NUMBER

-----------------------------

Enter the number of the certificate template you want to create.

Templates 1 - 39 are on Disk 1, Side B.
Templates 40 - 127 are on Disk 2, Side A.
Templates 128 - 220 are on Disk 2, Side B.

Illustrations of the certificates appear in the back of the original manual. There is no way to see the certificates before you print them.
Apple II Computer Info

Select the font style you want for the body of the certificate. You can see the samples of the different styles at the bottom of the screen. The fonts are:

- SERIF
- SAN SERIF
- SCRIPT
- GOTHIC
- ART DECO

The font you choose for the body of the text will also be used for the date text.

You may choose any of the 5 fonts, regardless of the font used for the certificate title. Usually, a certificate looks best when you use the same font for both the title and the body text.

Once again, the NEW DISK option is for future CM additions.

ENTER THE BODY TEXT

This is basically the same as entering the text for the title except that you are entering it for the body of the certificate.

The text is centered on each line.

To make typing corrections, use the [backarrow] and [delete] keys. To delete an entire line of text, press [esc].

Pressing [return] on the last line ends the text entry.

TO PERSONALIZE SEVERAL COPIES OF THE CERTIFICATE:

Type *NAME* all by itself on the line where you want each name to appear. Don’t put any other text on the line that has the *NAME* wildcard. Just before you print the certificate, the program will ask you what *NAME* file and which names from that file that you want to use. (Creating name files will be explained later in these dox)

ENTER THE DATE LINE

Enter the date text you want to appear on the certificate.

Entering a date is optional. You may decide to leave the date area blank, or you may enter some text other than a date. The line and the word “date” that you see on the template, do not appear on the printed certificate.

Because of the amount of space allowed, not all certificates have enough room to spell out an entire date such as "September 23, 1987." The amount of space allowed for the date is indicated by the length of the line on the screen.

The font style for the date text is the same as what you chose for the certificate text. The font size is small and cannot be changed.
The format of each certificate (horizontal, vertical, or small) cannot be changed.

If your text has a "NAME" wildcard, the program will print one cert. for each name you specified in the SELECT NAMES section. If the "NAME" cert. are horizontal or vertical, the program will advance the printer to the top-of-form after each cert. is printed. If the "NAME" cert. are the small format, the program will print them two to a page.

NOTE: The program will print about one-third of the certificate at a time, then pause for a few moments before continuing. DON'T worry when your printer stops before printing the entire certificate!

When the printing is done, the program returns to the Print Menu. This gives you a chance to print the certificate again. If you want to print the cert. again but accidentally select Main Menu, you can get back to the Print Menu by pressing [ESC] from the Main Menu.

Select PRINT TEST if you want to find out where on the paper the certificate will print. The program will print a four-corner test pattern of the certificate; this saves you from printing the entire certificate when you are not sure if the paper is aligned properly. This option is particularly recom-mended the very first time you use CM and on all occasions where you are printing several "NAME" certificates.

Print Test is also helpful when you want to make sure that you have selected the right printer in the Change Setup procedure.

Select MAIN MENU if you want to start over or quit CM. From there, you can press [ESC] to return to the Print Menu if you decide to print the certificate after all. If you make any other selection from the Main Menu, the information you have entered in Steps 2-11 will be lost.

Select CHANGE SETUP if the printer setup displayed does not describe your printer. The program will display an alphabetical list of all the printers that can be used with CM.

Scroll through the list until you find your printer, then select it. The program may have you respond to one or more questions regarding the specific configuration of your printer.

You will have to do the Change Setup procedure only the first time you print a certificate (and again if you ever use CM with a different printer). Once you have specified your type of printer, the program remembers it.

PRINTER TIPS
--------------------------------
Colored ribbons and colored paper, available from your favorite computer store, can add flair to your certificates.

The graphics resolution of your printer will have an effect on the appearance of your certificates. A graphics resolution of 120 by 72 dots per inch provides the best quality.

If the printer skips lines while printing a cert., turn off the automatic linefeed setting on your printer. See your printer manual for instructions. (Note: Some of the Change Setup procedures allow you to turn off linefeeds without physically adjusting your printer.)

If the printer doesn't work, turn it off and back on again, then go through the Change Setup procedure. If that doesn't help, compare your DIP switch settings to those recommended in your printer manual.

"NAME" FILE
--------------------------------
This screen appears only if the body text you entered has the "NAME" wildcard.

Select the "NAME" file from which you wish to draw names to be printed on several copies of the certificate.

If you have not done so already, the program will ask you to insert a "NAME" file disk into the appropriate disk drive.

Insert a new disk, then select NEW DISK if the "NAME" file you want is on a different disk.

SELECT THE NAMES
--------------------------------
Select SELECT ALL NAMES if you want to print a certificate for every name in the file. An asterisk will appear to the left of each name.

Select this option also if you want to select most but not all names from the list. Then move the cursor to the names you DON'T want and press [RETURN] to delete those names.

Select the INDIVIDUAL NAMES if you want to print certificates for only a few of the names in the file. An asterisk will appear next to each name you select.

To remove a name accidentally selected, move the cursor to the name and press [RETURN].

Select PROCEED TO PRINT when you are done selecting names.

PRINT THE CERTIFICATE
--------------------------------
Select PRINT CERTIFICATE if the printer name displayed is the name of your printer, and if you are sure that the paper is adjusted properly in the printer.

Until you become familiar with how to align the paper for the various certificate formats, it is a good idea to select the Print Test option (described in the next section of these dox) before printing a certificate.
This section explains how to create a new *NAME* file and how to edit an existing *NAME* file. At the top of each page, the entry screen is lettered in the order in which you will use it. Follow these steps for quick reference:

1. Select NAME FILE from the Main Menu.

2. Select CREATE NEW *NAME* FILE from the Select Option... screen.

3. Then ENTER NAME # 1 and keep entering as many names as you want in the file. Then when you have entered the number of names you want, just hit [return] on a blank line.

4. Then enter the name that you want to SAVE the *NAME* LIST AS.

To edit an existing *NAME* file, just select NAME FILE from the Main Menu again and then select EDIT EXISTING *NAME* FILE from the Select Option... menu. Then select the name file you want to use and then you should be able to walk through the menu's from there and figure it out.

I will now describe in more detail how these steps are performed:

**SELECT *NAME* FILE OPTION

This is the first screen you see when you select the *NAME* File option from the Main Menu.

Select CREATE NEW *NAME* FILE if you want to make a new list of names. The program then goes to the ENTER NAMES screen.

Select EDIT EXISTING *NAME* FILE if you want to make additions, corrections, or deletions to an existing file. The program goes to the SELECT *NAME* FILE screen.

Select A PREVIOUSLY ENTERED NAME if you want to delete that name from the list. Then when you save the file, the names will be arranged in alphabetical order.

Change the disk in the disk drive, then select NEW DISK if the *NAME* file you want is on a different disk.

**ENTER NAMES

Enter each name that you want to appear in the file. Each file may contain up to 75 names. As you enter names, the number at the top of the screen indicates how many names are in the file.

Each name in the list can be up to 25 characters long. Within that limit, each name may contain as many words as you like. Enter each name as you want it to appear on the certificate (example, MARY SMITH not SMITH, MARY).

Make sure the name is correct before you press [return]! Once you press [return], the only way to correct a name is through the EDIT EXISTING *NAME* FILE procedure. Make corrections use the [backarrow] or [delete] key as described in the Introduction.

The order in which you enter names is not important. When you save a *NAME* file, the program automatically alphabetizes the list by the last word you enter.

When you are done entering names, press [return] when the entry line is blank.

**SAVE *NAME* FILE

Enter a name for the *NAME* file. Choose a name that will help you remember the contents of the file.

*NAME* FILES HAVE FILENAME PREFIXES, BUT THE PREFIXES ARE ASSIGNED BY THE PROGRAM AUTOMATICALLY. YOU CANNOT INCLUDE A FILENAME PREFIX WHEN NAMING A *NAME* FILE. The prefix assigned by the program is CNN. You will need to use the filename prefix when you are copying or deleting a file in ProDOS.

*NAME* files must be saved on a data disk. Never save a *NAME* file on the Certificate Maker Master Program (Disk 1 - Side A) or Certificate disk. If you have more than one disk drive, the program displays a message reminding you which drive to use.

If you are saving an edited file, you can keep both the original and edited versions of the file by assigning a new name to the file, or you can get rid of the original version by assigning its name to the edited version.

For more info on disks, filenames, and filename prefixes, see your ProDOS manual.

When the file has been saved, the program returns to the MAIN MENU.

**EDIT *NAME* FILE

Select ADD NEW NAME if you want to add one or more names to the file. The program goes to the screen that says, ENTER NAME TO BE ADDED.

Select A PREVIOUSLY ENTERED NAME if you want to delete that name from the list. As you scroll through the list of names, each name is highlighted, and the word DELETE appears next to it. When the name you want to delete is highlighted, press [return].

You cannot edit a previously entered name. Thus, in order to change MARY SMITH to MARY SMITH, you must first delete the incorrect name, then select Add new name and enter the correct name.

Select SAVE EDITED FILE when you are done editing the file. The program goes to the screen called, SAVE *NAME* FILE.

**ENTER NAME TO BE ADDED

Enter each name you want to add to the file. Remember, each name can be up to 25 characters long, and there is a maximum of 75 names per file.

To make corrections, press [backarrow] or [delete] before pressing [return]. Once you have entered a name, you can correct it only from the EDIT *NAME* FILE screen.

When you are done entering names, press [return] when the entry line is blank. The program will then go to the EDIT *NAME* FILE screen. From there, you can save the file.

On the EDIT *NAME* FILE screen, the names you added will appear at the end of the list. Then, when you save the file, the names will be arranged in alphabetical order.

The End!

See CERT.MAKER DOX2 for a full listing of the templates!
Below is a list of all the template numbers and what they contain. These templates are also grouped into categories which I have also listed below.

**S P E C I A L  K E Y S**

* A template number with one asterisk before the number means that the certificate has no title on it at all. In other words it probably just has a picture in the upper right hand corner with blank lines on it for you to fill in with whatever info you want to. Template # 92 is an example of this.

! A template number with an exclamation point in front of it means it is in the SMALL FORMAT.

$ A template with a dollar sign in front of it means the template is in the HORIZONTAL FORMAT.

All other templates are in the VERTICAL FORMAT!

Do not use these special keys in the program itself when it asks you to ENTER THE TEMPLATE NUMBER! Just use the number itself. The special keys are just for your own reference.

**UNIQUE TEMPLATES** - These are humorous awards with humorous graphics.

-----------------

1.......Most Valuable Member
2.......Bad Haircut Award
3.......Award For Quitting Smoking
4.......Rude Awakening Award
5.......Couch Potato Award
6.......Back Seat Driver Award
7.......Can of Worms Award
8.......Award for Painting Yourself Into a Corner
9.......Computer Operator's License
10......Computer Whiz-Kid Award
11......Procrastinator's Award
12......Troubleshooter's Certificate
13......Coolness Under Pressure Award
14......Sticking To Your Guns Award
15......Lemon Award
16......Wanted - this is a picture of man behind bars that has a blank spot over his face where you can paste a photo of your favorite person.
17......Team Work Award
18......Worst Joke Award
19......Globetrotter's Certificate
20......Ms Know-It-All Award
21......Mr Know-It-All Award
22......Best Kisses Award
23......Sweet Tooth Certificate
24......Beer Connoisseur's License
25......Wine Taster's Certificate

$192......Certificate of Proficiency
$193......Certificate of Performance
$194......Certificate of .... (large letters)
$195......Certificate of .... (small letters)
$196......Certificate of .... (small letters/different layout)
$197......Award for First Place
$198......Award for Second Place
$199......Award for Third Place
$200......Honorable Mention
$201......Award for Best Idea
$202......Efficiency Award
$203......Citizenship Award
$204......Award I
$205......Award II
$206......Award III
$207......Award for...I
$208......Award for...II
$209......Job Well Done Award
$210......License I
$211......License II
**Certificate Maker**

Operation of the Certificate Maker is basically obvious from within the program. Choices of borders are shown on screen, type styles are easy to select...the only value of dox is in choice of the over 200 certificate templates. While these are graphically printed in the original documentation, this listing should at least make the program usable.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 211 of 1262
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 212 of 1262
Also with this command, you can 'enter' a board. This is necessary in order to see the contents of a board, etc. You'll receive a listing of those boards which contain the available new messages. You'll receive a listing of those boards containing new news at hand.

You can, using these commands, read messages, or otherwise have them sent to you. Should a file be longer than 50 lines, it can only be sent to you.

This command enables you to receive short instructions regarding how to write into the Chamas Boards or else the News Net.

This command lets you register with the Netnews and the Chamas Boards.

Exactly....just for unsubscribing.

With this command it's possible to check out what network groups are available and whether you're subscribed.

NET shows which network groups there are. At present these are SUB and DNET. These are also the domains for the SUBSCRIBE, WRITE, etc. commands.

Using NET <net group>, you can determine with which groups you are registered. e.g.: NET SUB.

With ADDRESS <nickname>, you can determine the UserId and NodeId of another user.

Should problems arise, you can use this command to get in touch with one of the operators.

With this command you can determine who is still logged into the Chamas.

- ChemLab Quick Reference -

Written by Cyborg
(A CatPack presentation!)

ChemLab: Main Menu

At this menu:
Use the SPACE BAR to page thru the all the experiments.
Press RETURN to enter the name of the one you want.

Chemlab: Controls in the Lab

Key | Function
---|---
[O]|Switches which arm is in use
[Arrow keys]|Move in the direction indicated
[S]|Gives you a list of your equipment
[L]|Gives you a list of liquids available
[G]|Gives you a list of gases available
[H]|Superheat the lab (hit S again to restore)
[P]|Pressurize the lab (hit P again to restore)
[R]|Review text (CLEARS LAB!)
[C]|Clear the Lab; start over
[Space bar]|Switch hand on left arm
[Escape]|Returns to main selection menu
[Return]|Action key
[V]|Controls gas valves
[B]|Controls burners
[M]|Read message (if indicated on screen)

Chemlab: How to obtain chemicals (using the left arm)

To get solids:
-----------------

Use the left arm, with the spoon as a hand. Move under the dispenser, and press RETURN. Now input the name of the solid you want. To drop the solid from the spoon, hit RETURN again.

To get liquids:
-----------------

Use the left arm, with the nozzle as a hand. Move over whatever you want the liquid in, and hit RETURN. Now type in the name of the liquid you want.

To get gases:
-----------------

Use the left arm with the gas cap as a hand. Move under one of the connectors under the gas tanks. Press RETURN. It should connect with the cap. Now, move the cap over a flask, and press RETURN to connect them. Now you control the valves to get the correct gas. Open the valve of the tank, and the valve of the connector you connected to, to get that gas. You can mix and match gases by controlling the valves.

ChemLab: Moving equipment (using the right arm)

To get equipment, move the right arm down until it is just above the platform at the lower right of the screen. Now hit RETURN, and enter the name of the piece of equipment you want. It will pop up. Now, move the hand beside the equipment, and hit RETURN. It should latch on to it. Now move it as you would the arm (Suggestion: always place your first equipment to the far right to make room for other equipment.), and hit RETURN to drop it there. You CANNOT move equipment once you have connected or placed something in it. If it didn't work, you'll probably have to clear the lab and start from scratch.

---
Chipwits is a game very much like Robot War. You program your robot to collect the good stuff like pies, cups, oil cans, and disks; and you also program the robot to destroy the bad stuff like those bugs that shock your robot, the weird looking face. And the bomb which can not be destroyed has to be avoided.

1. First you drag down the warehouse menu and you select an unused slot, or if you want to write over a previous robot select an already occupied slot.

2. Goto the workshop menu and select "ENTER". From here is where you will be programming your robot.

Programming your robot:
The program always starts out at the stoplight. The little pointer attached to the lower right hand box of the stoplight is the direction flow of the program. Goto to the box to the right of the stoplight and press the button (This is how you move the cursor around). You then have to select an operator, which is a command to the robot. But some commands require an argument, like the eye for example.

OPERATORS:
Starting from upper right working down as how you would read a book.

Eye:
Allows the robot to see in front of himself. The robot can cover all the spaces in front of him. (requires an argument)

Hand:
Allows the robot to touch the floor in front of him. This command covers only the space directly in front of him. (requires an argument)

Nose:
Allows the robot to "sniff" out what is in the room. This covers the entire room. (requires an argument)

???:
I have no idea what this waffle-like shape does.

Linker:
This looks like a railroad track. This is like a connector it performer no specific command. It just connects from one box to another in case you run out of space. (requires an argument)

Train?:
I don't know what this icon looks like but I know what it does. It is the movement command for the robot. (requires an argument)

Musical note:
This makes a noise, but I don't see the useful purpose in this command. (Requires an argument)

"*":
I don't know what this does. (Requires no argument)

"-":
Me don't know this one either. (Requires no argument)

An arrow pointing to a train:
This assigns a variable to the movement memory of the train. This command is used if you want the robot to do something over that it previously done. The robot only has enough room to store 3 variables. If you assign new ones, the last one is cleared and everything is shifted down one. (Requires an argument)

An arrow pointing to a question mark:
This is like the earlier one except it does not deal with direction of movement. It deals with the objects in the game. i.e. pies, disks, etc

An arrow pointing to a cup:
This assigns a variable to the memory of the robot also. But it is a value in a sense. For example, in Applesoft you may use the command "X=4" then later say "If X=4 then ... so on..." You can do that in Chipwits. This command is the assinging function in this process. The "If.. then.." part of the function will be mentioned later. (Requires an argument)

An arrow pointing away from "$":
This is a command to throw out the most recent entered variable, entered by the top three command. When the upper-most variable is throw the variables are all shifted up one. (Requires an argument)

Electric Generator:
This is the defense mechanism in the robot. When this command is called upon, a bolt of electricity is fired. The electricity goes the way the robot is facing. This command is used to kill the dangerous objects in the game. i.e. those bugs and the funny faces. (Requires no argument)

The train with an "=" sign under it: This is used in conjunction with the command that has an arrow pointing to a train. When an variable is assigned with that command, this command acts I^f the "If...=...then" part of the function. (Requires an argument)

The "?" with a "=" under it: This command is like the previous one. This command checks to see if the most recent variable equals the one you asked for. If it does the value is (T)rue and if it does not the value is (F)alse. (Requires an argument)

The cup with a "=" under it: Same as above, except it works with a value. (Or in this case an amount) (Requires an amount)

The cup with a "<" under it: Same as above, except it is not equal that is being asked, it is less than. (Requires an amount) A grabber:
This is the hand of the robot. This is how the robot picks things up to be eaten. The robot gets points for things eaten. (Requires no argument)

A boomer-rang shaped object:
This servers as the command "RETURN". It performs the same function as in Applesoft. It returns the program from a sub-routine. (Requires no argument) A looped arrow:
This command restarts the program. In a sense it means "start over from the stoplight". (Requires no argument)

An interface card:
This command allows you to expand the length of the program. It branches the main program into sub-routines. For example, you can have a different subroutine to handle one task, like moving, grabbing things, and so on. And to return from the sub-routine you use the boomer-rang shaped thing. The program continues with the box that follows the departure point of the subroutine. (Requires no argument)

A "T" connected to a "F": This is a randomizer. For example, if you don't want your robot following one set of commands all the time (one set of commands often leads to a loop) you can use this command at the beginning of your program. There is a 50% chance for (T)rue and 50% for
After you have made a robot, save it if you like. Then to enter your robot to his mission, goto the Missions menu and select "start mission", and watch your robot work.

If you need to de-bug your robot. Select "step" from the OPTION menu. This will make your robot preform step by step. The number in the bottom right corner is the box the program is on.

(Fl)ase.
Arguments for EYE, HAND, NOSE, ARROW ABOVE "?", ARROW UNDER "?":
Pie:
a prize that is worth a certain amount of points.
Cup:
A prize, to my knowledge has no point value.
Disk:
A prize worth points.
Oil can:
Worth points.
Floor:
The ground.
"
The most recent variable assigned to the "?" memory.
Bomb:
a destructive object that can not be electrified. It must be avoided.
Funny face:
This destructive object can be electrified with the electric generator.
Bug:
This bug shocks your robot, and this is not good for your robot. This bug can also be destroyed by electricity.
Wall:
This is the wall.
Door:
This is a door.
Arguments for Train, Arrow above train, arrow under train:
The arrows indicate which direction of movement.
Up arrow:
Move foward
Down arrow:
move backward
Left:
Turn left
Right:
Turn right
Arguments for Interface Card: The letters A, B, C, D, E, F. These are the amount of room you have to work with on your program. You have 6 pages of programming room not counting the main page.
Arguments for Arrow above "X":
The three variable stacks:Train, "?", and cup. This removes the most recent variable.
Arguments for the commands to do with the "cup":
There are cups filled to a different amount. This is used for the numbers. The least filled cup means 1 and as it gets filled more the numbers increases. Or the numbering can go the opposite way. It is just a matter of interpretation.
CHRONO WARRIOR IS AN ARCADE GAME WHERE YOU PLAY THE ROLE OF A TIME TRAVELER. YOU MUST PASS 5 LEVELS IN TIME AND REACH THE PRESENT.

WHEN THE GAME BOOTS, YOU SHOULD SEE THE TITLE PAGE. PRESS THE KEY A FEW TIMES UNTIL YOU SEE THE OPTION TO PLAY A GAME OR PRACTICE A LEVEL.

CHOOSE ACCORDingly.

DECIDE YOUR DIFFICULTY LEVEL AND YOU'RE OFF!

P[THE CONTROLS:]

JOYSTICK : MOVES CHRONO WARRIOR IN DIRECTION.

Level

BUTTON 0 : [1] FIRES STONE
[2] DOES NOTHING
[3] FIRES ARROWS
[4] DROPS BOMBS
[5] DROPS JUNK MAIL

KEYBOARD :
A
<- ->
Z

SPACEBAR : SAME AS BUTTON0 ON JOYSTICK

[SYNOPSIS OF LEVELS:]

[STONE AGE (1):]

GATHER ALL THE PIECES OF YOUR TIME PORTAL AND ENTER IT. NOT TOO HARD, BUT Beware OF THE DINOSAURS. YOU CAN TEMPORARILY STUN THEM WITH THE STONE, BUT THEY RECOVER QUICKLY, AND CAN CLIMB LADDERS AFTER YOU!

[ROMAN EMPIRE (2):]

YOU PLAY A CHARIOTEER IN THE CIRCUS BILLIUS AND MUST GATHER 5 GOLD COINS FROM THE ARENA. AVOID WATER SLICKS AND WHEN OTHER CHARIOTS GET IN YOUR WAY, YOU CAN MAKE THEM WIPE OUT BY BUMPING THEM IN THE BACK. WHEN 5 COINS ARE GATHERED A RED CARPET WILL ROLL OUT. STEP INTO IT AND WARP TO THE NEXT_LVL.

[MEdieval time (3):]

YOU ARE ROBIN HOOD, AND MUST ROB FROM THE RICH AND GIVE TO THE POOR. ONCE YOU HAVE DONE THIS THREE TIMES, YOU ADVANCE TO THE NEXT_LVL. Beware OF SOLDiers! Thto Finish the Level move in the CDrumbridge of the CASTle.

[CIVIL war (4):]

GET ALL THE ENERGY PACKS AND AVOID THE CANNONS. THIS IS VERY TRICKY MANEUVERI your Balloon.
THE CIA (CONFIDENTIAL INFORMATION ADVISORS)

HARD DOCS CONTRIBUTED BY DIAMOND JIM
APPLE MANOR (716) 654-7663 * 24

TRICKY DICK is a disk editor that can be used on both normal and most protected disks. It will read in a sector directly from disk and list the sector's contents to screen or printer in Integer, Applesoft, assembler, hex and ASCII. Tricky Dick can patch and customize your disk, protect your software, and read and alter normal and most protected disks.

THE LINGUIST dumps a track of raw nibbles directly from any disk - protected or not. It also decodes address data on the disk and translates raw disk nibbles into hex. The translated nibbles then can be listed by TRICKY DICK in BASIC, assembler and ASCII. This makes it possible to list the programs and textfiles from any disk, normal, damaged or locked. It can be used to look closer at a program, examine disk formatting and recover lost programs no matter how badly the disk is damaged.

THE TRACER automatically searches normal and most protected disks sector by sector for any 1-6 strings you specify in ASCII or hex. It will also find the VTOC, catalog sectors, and track/sector lists on normal and protected disks. You can choose any or all of its 9 search options, and they will be carried out simultaneously, scanning an entire disk in 19-135 seconds. When it finds something that you're looking for it jumps back into TRICKY DICK and places a cursor on the item it's found.

THE CODE BREAKER makes use of a special table in DOS 3.3 and 3.2 to decrypt the most popular "secret code" used to hide commercial programs from prying eyes.

THE TRACKER shadows the disk arm, reporting its every move as DOS LOADS, SAVES, RENAMES, or does anything else to a disk. It leaves a list of every track and sector visited, and every read or write operation carried out during any disk access. THE TRACKER can be used to find out exactly where a disk is crashing, make a permanent record of your files, and learn more about how DOS works.

THE CIA MODULES

TRICKY DICK controls the operations of the other CIA utilities. First, BRUN TRICKY DICK. Then when you need to call upon one of the other utilities, you BLOAD it. A single keystroke transfers control to the utility you BLOAD and enables it to carry out its work. During certain operations, the module will pass data to TRICKY DICK for special processing. For example, when the TRACER finds a string it's looking for, it jumps back to TRICKY DICK, displays the string, and places TRICKY DICK'S cursor on the first character. TRICKY DICK is in charge and you can edit the string and/or other data in the sector where it resides.

The only exception to this system is THE TRACKER which works alone.
In other words, the Linguist will transform all 3 of the encoding formats used on Apple disks (6&2, 5&3, and 4&4) into a recognizable and executable form.

The immediate importance of all this is that after this is, that after dumping a track of raw nibbles and translating them into ordinary hex, you can immediately jump back to Tricky Dick and display this code as an Applesoft, Integer, or assembly listing. Of course, Tricky Dick is also no slouch at translating. But where a disk has too badly clobbered, too heavily protected, made sectorless, encoded in 4&4 - or simply requires a raw nibble examination to establish the formatting - old Tricky is just not up to the job. That's when the Linguist springs into action at the touch of a CTRL E to help out.

Tricky Disk and The Linguist have what you might call a permanent intimate relationship. That is, The Linguist will not work properly unless Tricky Dick is also present in memory. This is because the program uses some of Trick Dick's internal routines in order to both conserve RAM and to maintain an efficient interface with the user. So if you try to run The Linguist alone, you'll get some rather strange effects.

Once Tricky Dick is in memory, hit CTRL C to BLOAD The Linguist. It loads in at $8000 in memory and can be accessed at any time from Tricky Dick.

When the Linguist is in memory, you can jump to it at any time from Tricky Dick by pressing CTRL E. When you first enter The Linguist, the disk arm recalibrates and emits that grating machine-gun rattle we have all come to know and hate. The sound effects notwithstanding, you can always get back to Tricky Dick by typing CTRL C.
The Help Screen
[< or >]

If you happen to need a brief reminder about any of The Linguist's commands, just hit the '/' key to display the help screen. This brings up a list of instructions, together with their accompanying keystrokes. A '^' before a letter indicates a CTRL key must be pressed at the same time as the letter. You can call up the help screens at any time.

The Linguist's Data Display
[< >]

Hitting the space bar gets you from The Linguist's introductory or help screen to the to the data display; several of the Linguist's commands also automatically do the same. This screen shows you one memory page (256 bytes) of code in the data buffer, which starts at $4000 and ends at $7FFF in RAM. The 4-digit hex addresses on the far left of the screen correspond exactly to memory locations in the buffer. This allows you to calculate the buffer locations of any block of code by simply counting up. For example, the positions of the tenth byte in row $4000 would be $400A.

Entering Commands
[< >]

The "ALL COMMANDS" message at the bottom of the screen prompts you to enter the instructions you want the Linguist to carry out. Each command is echoed on the right of the '?'. An incorrect entry is signalled by a brief "ping".

Track Selector
[< >]

You can decrement or increment the track number (which appears after 'T=') a half track at a time by hitting the '<' and '>' keys respectively. The track numbers progress up to $7F$, at which point wraparound takes place. This is to allow the use of the Linguist with drives capable of reading 80-track diskettes. To clock the track number forward or backward rapidly, hold down one of the two keys and the REPT key simultaneously. An often quicker way to input a track number is to type 'T=', followed by the number of number. This only works for whole tracks, but the next adjacent half track can always be specified by hitting the '<' or '>' keys.

Setting the Drive Arm to Track $00
[^S]

Hitting CTRL S recalibrates the disk arm, pulling it back to track $00. It comes in handy for clocking back the track number rapidly, and to give your drive a reference point to find the selected track (during a rew nibble read your machine makes no check of the track numbers on the disk to find the current track).

Reading a Track
[^B]

Hit CTRL B to read the desired track into The Linguist's buffer. Be sure to locate the correct drive while still in Tricky Dick before jumping to the Linguist. One buffer page of data will appear in the data display area immediately after a read. If the introductory or help screens were up at the time of this command, a switch to the data display will automatically take place.

Paging through the Buffer
[< ->]

Pressing the right arrow changes the data display to the next page in the buffer. So if the data from, say, location $4000 to $40F0 are displayed, hitting the right arrow once flips to the data located from $4100 to $41F0. This can be continued until you reach the end of the buffer at $7FFF. In the same manner, the left arrow page backward a page at a time. The controls are "locked" so that you never accidentally stay lower than the beginning or higher than the end of the buffer.
Jumping to the Beginning or the End of the Buffer

[*B*] [*M*]

You can instantly get back to the beginning of the buffer at $4000 by hitting CTRL B; CTRL M takes you right to the end. (page $7F)

**Censor Movements**

[*I*, *J*, *K*, *M* AND [*I*, *J*, *K*, *M*]]

[*I*, *J*, *K*, and *M* move the cursor around the data display just like they do when used for Applesoft editing. When these commands take the cursor beyond the edge of the screen, scrolling or wrapping occurs. For example, pressing 'K' when the cursor is at the end of a row causes it to jump to the beginning of the next row; pressing 'M' when the cursor is on the bottom line of the display causes the screen to scroll up one line. Holding down CTRL and hitting any of the 4 keys increases the distance covered, causing the cursor to jump to the edge of the screen.

A continuous scroll can be obtained by moving the cursor to the top or bottom of the screen and pressing REPT together with '*I*' and '*M*' keys respectively. This can be continued until the first or last of the buffer data appears on the screen.

**Decoding the Address Field Information**

[Cursor controls]

At the bottom left of your screen you will find a separate line of data consisting of a 4-digit address followed by 4 2-digit numbers. It displays a translation from 4&4 into normal hex of 8 consecutive disk nibbles starting with the byte under the cursor. This enables you to decode the address field information by placing the cursor on the first byte to the right of '05 AA 96' address field header of any sector. The data line will display the results in the following order: the buffer address of the byte under the cursor, the disk's volume number, the current track number, the number of the sector whose address field you are examining, and the address field checksum. The buffer address is always a 4-digit number and the other items are each 2-digits long. All are in hexadecimal and the sector number represents the physical sector on the disk. The meaning and interpretation of this data will be explained in the tutorial which follows the instruction section.

Since most disks use 4&4 nibbles in the address field only, the 4&4 translation will usually be meaningless if the cursor is placed elsewhere among the sector data. One important exception, however, occurs when entire files have been deliberately encoded in the 4&4 mode (as can be found in many current games). If you are working with such a disk, you can decode a string of 8 4&4 nibbles by positioning the cursor over the first byte of any 4&4 byte-pair.

**Changing the Decoding Mode**

[*D*]

To switch between the 6&2, 5&3, and 4&4 decoding modes, hit CTRL D, followed by the number after the 'D'. For example, if you are presently in a 5&3 mode, you will see a '5 & 3' just under the '<->' at the upper right of the screen. To change to, say 5&3, type in a CTRL D, causing the cursor to leap up and cover the '5'. This is your cue to press the '5' key which automatically changes the display mode to '5&3'. If you previously changed Tricky Dick's D.O.S. version to 3.2, the display will already show '5&3'.

**Translating a Sector**

[*T*]

After having selected the encoding mode, place the cursor over the first byte after the 'D5 AA AD' (on a normal disk) data field header of the sector you want to translate. Then press CTRL T (which evokes a high pitched squeek), and jumps back into Tricky Dick's buffer and can be displayed on the screen in the usual manner by...
pressing any key. You can also use the procedure described in Tricky Dick's instructions (Chapter 3) to get an Applesoft, Integer, or assembly listing from this code.

If you are jumping back and forth between Tricky Dick and The Linguist to translate a series of sectors in the above manner, you may be hampered somewhat by the recalibrating each time you press CTRL E. A patch to the Linguist which eliminates this is 8026: 2C from the monitor. However, if you change track number you must let The Linguist recalibrate to get its bearings. Do this with CTRL S as described previously. To patch back the CTRL E recalibration, type 8026: 20 from the monitor.

Remember that if you are translating 4&4, the disk is likely to be sectorless. What you get when using this encoding mode is a translation of 512 consecutive disk nibbles into 256 bytes of normal hex.

---

You probably won't need to do this often while using The Linguist. If you do, however, you will have to go back to Tricky Dick with a CTRL C, change the drive number from there, and then jump to The Linguist with CTRL E.

The other Tricky Dick parms such as the sector number, D.O.S. version, and sector marks are not relevant to the operation of The Linguist. This is because The Linguist reads in an entire track at a time and completely ignores the disk's formatting.

---

Getting Hard Copy from The Linguist

Although no printer dump subroutine has been included in The Linguist, it's easy to get hard copy of a given section of the buffer. First make a note of the beginning and ending addresses on The Linguist's hex display of the block of data you want to print. Then get into BASIC by hitting RESET once or CTRL C twice and turn on your printer card. Finally enter the monitor with CALL-151, type <first address>.<second address>

| e.g., 4000.4010, and your printer will start churning out the copy. |

---

This a Wareforce docfile...
Look for the next chapter in the C.I.A. series...
The Linguist (Part B)

Well that is it I hope you enjoy it...

Avoiding D.O.S. Lang. Card Clobber

D.O.S. 3.3 has particularly pesky subroutine which stores a $00 in the first byte of the language card whenever we do a PR#6. This in turn makes D.O.S. think that the language card is empty. So if you happen to have INTERGE BASIC (or some other program) there, and then boot up from the keyboard, you always have to reboot your System Master and hang around while it reloads INTEGER. Most of the time, however, a perfectly good image of INTEGER is still in the language card in spite of the LANGUAGE NOT AVAILABLE message you get when you try to call it.

Fixing this is a piece of cake. Just read in track $00, sector $09, and write 3 'EA' over the '8D 00 E0' in line $D0, leaving it looking like this.

Then write it back to the disk. Any disk with this patch in its D.O.S. will leave INTEGER in peace when booting.

Important Note

I know it seems obvious, but don't forget to reboot the D.O.S. you've just altered with the following patches if you want to see them in action.

Switching the HELLO file

To make this simple alteration, read in track $01, sector $09. Starting with byte $75 in line $70, you will see the name of the HELLO program. If you want another file on the disk to run automatically on boot-up, put the cursor over the first byte of the HELLO file's name (a 'C8' for 'H' on most disks), and hey in SHIFT 2 (the * character). Now type in the new file's name and press down the CTRL, SHIFT and @ keys together, returning to normal operation. If the name of the new file is shorter than that of the old one, there will be some unwanted characters tacked on at the end. Be sure to type 'A0's' (ASCII for spaces) over these before writing the sector back to the disk.

Using a Binary or EXEC HELLO file

Normally, when D.O.S. finishes booting into RAM, it issues a RUN command to start the HELLO program. However, if you used the foregoing method to switch HELLO to a machine language or EXEC file, you will obviously want D.O.S. to issue the correct BRUN or EXEC command on boot up. To do this read in track $00, sector $0D and change byte $42 from a '06' to:

(1) a '34' to BRUN a binary hello program;
(2) a '14' to EXEC and EXEC file.

Now write the sector back to the disk. You may wish to make this and the foregoing patch on a COPY of your CIA disk so that it's BRUN's Tricky Dick immediately on boot-up. If you do, you should leave line $40 looking like the example below.

40: 03 A9 34 05 AD 62 2A
\ Binary HELLO flag

Loading a Program between D.O.S. and its Buffers

Having carried out the preceding two operations, you might decide that it would also be useful to place your program in some secure spot in memory where subsequent loading and running of other files cannot overwrite it. The best way of doing this is to move D.O.S. buffers down and load your program on top of them. A simple D.O.S. patch will insure their complete safety even if D.O.S. is coldstarted.

To set things up, read track $00, sector $0C
00: D3 1C 81 1E BD 1E 75 2A

The next step is to subtract the length of your program in bytes from $1C0, the number shown in reverse at the beginning of line $00. So if your file was, say, $200 (decimal 512) bytes long, you'd have to work out that $1C0 - $200 = $9B00. You should now reverse the high and low bytes of this result in the classical 6502 manner, type them over the D3 1C", and write the whole works to the disk.

00: D3 1C 81 1E BD 1E 75 2A

What happens is, the '1A D3' gets changed to '9A D3' on boot up, moving the buffers down the required amount. This allows you to fix your program to run $9B00 - $200 = $9000 in RAM.

Eliminating the Pause during a CATALOG

If you manage to accumulate a large number of files on a single disk, you may find it useful to have continuous scrolling during a CATALOG. If so, read in track $01, sector $00 of the disk whose D.O.S. you wish to provide this service. Then simply change byte $34 from a 'CE' to a '60' as shown below.

30: BD 20 ED FD 60 9D 33 D0

Changed byte

Write this block to the disk and you will find, after rebooting, that the patched version of D.O.S. will not stop after each screenful of file names during a CATALOG, but will scroll rapidly through to the end of the list. If you have an autostart monitor, you can use CTRL S to stop/start the listing.
Changing the "DISK VOLUME"

Catalog Message

In order to personalize your disk, you might like to have some message other than "DISK VOLUME 254" appear when a CATALOG is executed. If so, read track 02, sector 002 and change the "DISK VOLUME" message (written backwards!) that begins at byte $80. If you write over the space ($A0) at byte $AF, you can squeeze in up to 12 characters by hitting a function key 2 (the "*" sign) and typing them in backwards. So to say "Sammy's Disk", lines $A8 - $B8 would look like the illustration below.

First byte of entry
!

A8:C9 C1 C2 D3 D2 C1 CB:ABSORAA:
B0:D3 C9 C4 A0 D3 A7 D9 CD:SID S'YM:
B8:CD C1 D3 04 0F 04 00:MAISDDQ:
!

Last byte of entry

If you carried out the preceeding instructions, and rebooted, you should get the following heading on each CATALOG.

SAMMY'S DISK254

This looks a bit messy, so to get rid of the '254', read in track 001, sector 00C and type 'EA's' over bytes $C0-$C2, ending up with:

C0: EA EA EA 20 2F AE 20 2F

After writing this back to the disk and rebooting, your catalog message will blaze forth in its most pristine form.

Putting Headings on the Catalog Track

There are few more frustrating experiences than searching through dozens of disks for a program you urgently need, realizing that you have overlooked it, and then having to start the whole tedious business from scratch once again. Some order can be brought to disk chaos by inserting headings on the catalog track and making sure the type of files that they apply to are placed underneath. For example, it might be useful to get the following display upon CATALOG a disk.

T 000 GAMES
T 000 ----- *
B 062 PIRATE'S SWAG
B 071 ROBIN HOOD's LOOT

With a newly initialized disk in the drive, type in the following sequence: SAVE XXXXX SAVE YYYY DELETE XXXX DELETE YYYY. Then examine track 011, sector 00F and you will see the 'X' and 'Y' strings just beneath the HELLO entry. The 'X's will most likely be in line $30. So start by placing the cursor on the 'FF' in the line above (byte $2E) and type in 'A0 00 00'. This should leave your cursor on the first of the 3 'D9's' (ASCII for 'X') in line 30.

Now you can press SHIFT 2 and type in the letters G A M E S, leaving the string 'C7 C1 CD C5 D3' in place of the 'D8's'. Be sure to finish this sequence by pressing CTRL SHIFT P (CTRL @) to get back into normal mode. Lines $28 and $30 should look like this.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 224 of 1262

Apple II Computer Info

28:A0 A0 A0 A0 02 00 24 00: B88B:
30: C7 C1 CD C5 D3 A0:GAMES:

The next step is to press 'M' 3 times to bring your cursor over the '13' at the end of the string of 'A0's in line 48. Type in 'A0 00'. This should bring your to the beginning of the deleted entry for the 'Y' program.

Now you have only to repeat the above process. In other words, just type '24 00 00' over the 'FF 0F 02' in line 50. Then follow this with a SHIFT 2 and hit the '-' key 5 times, leaving a trail of 'A0's' over the 'D9's'. After CTRL @, move straight down to the '14 02' and replace this with an 'A0 00'. Finally check everything and write the sector back to the disk. Reboot and do a CATALOG to make sure the heading got set up O.K.

If you want a flashing instead of a normal heading, press SHIFT 7 (the ' character) before typing in the heading's letters. Inverse characters can be obtained by changing the normalscreen ASCII numbers as follows:

Numbers beginning with a 'C'....

change the 'C' to a 'O'

Numbers beginning with a 'D'....

change the 'D' to a '1'

'A0' (a space)....

change the 'A' to a '2'

If you change the ASCII for "GAMES" in this manner, you would end up with:

30: 00 07 01 05 13 A0 A0:GAMES:

You can now transfer your favorite games to the disk and they will automatically appear beneath the heading. If after doing this you still have some space left over, you can easily use the same procedure to shove another heading underneath the games on the catalog. Further files can be add below this, and so on.

By the way, when you SAVEd the 'X' and 'Y' files, 4 sectors were set aside by D.O.S. to store their nonexistent data. Subsequently DELETEing them readjusted the bit maps to reclaim this wasted space.

Another point to take note of was the '24' we put in the dummy files' headings. You can now transfer your favorite games to the disk and they will automatically appear beneath the heading. If after doing this you still have some space left over, you can easily use the same procedure to shove another heading underneath the games on the catalog. Further files can be add below this, and so on.

Apple II Computer Info

read in track $01, sector $09 and add 19 '88's' after the HELLO program's name. This program will run automatically when you boot the disk, but of course, D.O.S. will ignore any direct commands referring to HELLO, since HELLO now contains 19 extra control characters.

A couple of points are worth noting here. First of all, it seems that 19 '88's' is always the correct formula, regardless of the file name's length (but you can't hide files whose names are longer than 11 letters due to the 30 character maximum permitted by D.O.S.). Second, the reason this method works is that CTRL H's output backspaces to the monitor. So what happens is that the HELLO file's name gets printed for a tiny fraction of a second, too quick for anyone to spot it. Then along comes the next filename to complete Y overwrite it.

Changing D.O.S. Error Messages

If you feel capable of a more eloquent turn of phrase than the author of Apple D.O.S., you might like to change the wording of some of the D.O.S. error messages. These begin on track $01, sector $08, byte $75, and end on the next sector ($09), byte $3D. So let's assume, for example, that you want to change I/O ERROR message to CRASH OUT (clearly a far more descriptive choice). Start by reading in track $01, sector $58. The message starts in line $C8:

```
C8:41 54 43 C8 49 2F 4F 20:ATCHI/O :
```

Position the cursor over the '49', press SHIFT 7 (the ' sign) to go into normal ASCII mode, and type "CRASH OUT". Now press CTRL E, followed by SHIFT 2 (the * sign) to switch to high ASCII (the last character is in high ASCII to flag the end of the message). Type in the final 'T' and write the sector back. Boot the disk, leave the drive door open, and type "LOAD HELLO". Your altered message should quickly appear.

This can be done with any of the error messages. Just remember to end up with high ASCII character, and make sure your own message's does not exceed the one you are replacing.

Some Ideas for Advanced Programmers

Here are a few Tricky Dick tidbits that you assembly language programmers may find useful. And even if you don't know your way around an assembler too well yet, some of these may prove helpful.

When you have one of the C.I.A. modules in memory, hitting CTRL E causes Tricky Dick to jump to it and begin execution. This feature makes it possible for you to install your own programs and access it with the same instructions. Furthermore, you can easily interface your code with Tricky Dick to call Tricky's internal routines.

The first thing Tricky Dick does on CTRL E is attempt to distinguish a C.I.A. module from left-over garbage in RAM. In order to do this, it EOR's the byte at $B800 with the one at $B801, then CMP's this with the byte at $B802. If a match is found, it JSR's to $B8003 where the module's code begins. If a match does not occur, a tone is sounded and normal operation is resumed. To use the CTRL E hook, you need to assemble your programs to run at this address and set up the first 3 bytes accordingly.

Tricky Dick contains both a 3.3 and a 3.2 RWTS. The 3.3 version begins at $3800, and the 3.2 at $3000. They both use the same ICB which starts at $815, and share the device characteristics table which starts at $826. The information on these two lists is in exactly the same order you would normally expect. A JSR to $121f invokes a subroutine which looks at $82A to determine which D.O.S. version has been selected, then calls the appropriate RWTS. Reading or writing with the RWTS will be done using the D.O.S. marks shown in Tricky Dick's display. Tricky Dick stores its sector data into a buffer starting at $2E00.

If you want to BSAVE Tricky Dick any patches or changes to it, use A$803, L$3800.

You can call each of the 3 versions of RWTS in the machine independently. Thus, you could, for example, use the D.O.S. RWTS at $B800 to read a disk, and one of the Tricky Dick RWTS's to write it out again or vice versa. With Tricky Dick and a module in memory, there is still free core from $4000 to $7FFF for use as a buffer or anything else. After your program has done its thing, it can return control to Tricky Dick at any time with an RTS.

Moving Closer to the Disk

Well, that just about loses this file on Tricky Dick for now, though I'll be returning to some of this utility's more sophisticated capabilities when I show you how to work on copy protected disks. However, without a little help from the other members of the C.I.A., there are just some jobs that Tricky can't do. You'll find that for some of the work you'll be wanting to carry out, you're going to need to delve into the most inaccessible parts of normal and abnormal disks - and make complete sense of all the information they contain. That's why you need to meet The Linguist.

------- APPLE MANOR (716) 654-POOF!

<1-58/Last-33> <T/P/A

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 225 of 1262
EDITING SINGLE BYTES IN THE DISPLAY: CTRL L then typing an A for Applesoft, an I for Integer or a * for distance covered, causing the cursor to jump to the edge of the display. If the sector data contains Applesoft or Integer BASIC code, a listing will appear. Holding down CTRL and hitting any of these 4 keys increases the LISTING APPLESOFT AND INTEGER CODE (CTRL L) (L): can be continued until the first or last line of sector data appears on the screen. Beyond the edge of the screen, scrolling or wrap-around occurs. Scrolling The cursor will be positioned next to the last byte that was disassembled.

HELP SCREEN (/ or ?): The help screen lists each command. A ^ before a letter means that the CTRL key must be pressed at the same time as the letter. Hit any key to go back to the data display.

SELECT DOS VERSION (CTRL D): Toggles between DOS 3.2/3.3. The current version is shown under the word DOS at the top of the display.

SLOT, DRIVE AND DEVICE SELECT (CTRL O): Brings the cursor up next to 'SL='. If your disk controller is in SLOT 6, hit RETURN, if not type the slot #. If a card with P5 and P6 PROMS is present, DOS 3.2 will automatically be brought into play. The cursor will move to 'DR=' -type in the # of the drive which has the disk you wish to work on. After that, press RETURN to go to 'FS='. The default (FS=0) means that printer output is disabled. Enter your printer card's slot # when you see this prompt.

THE DISPLAY:

Data entry modes (CTRL @) (* '(': Just after loading TRICKY DICK, the words "NORMAL HEX" will appear at the lower left of the screen next to the word "DATA". This means that you can enter hex digits and these digits will appear in the data display under the cursor. This allows you to edit the screen display before writing it to disk. Typing * (SHIFT 6) puts you in "high ASCII" mode and causes an inverse "HIGH ASCII" message to appear in the lower left corner of the screen. In this mode, each time you press any key, its corresponding ASCII code # will be displayed. If you issue any other command, you'll need to hit the CTRL SHIFT F (CTRL @). This puts you back into the "NORMAL HEX" mode and allows TRICKY DICK to accept your keyboard commands again. Typing ' (SHIFT 7) places you in standard, or "low" ASCII mode. Each keystroke will leave its normal ASCII under the cursor. To return to normal TRICKY DICK functions, hit CTRL SHIFT F (CTRL @).

DATA ENTRY MODES (CTRL @) ('('):

To view the second half of the sector, hit either CTRL M or RETURN, bringing the cursor to the bottom of the screen. To scroll through the remaining data, hold down the M and REPT keys. You can scroll back to the beginning by hitting CTRL L, followed by pressing 1 and REPT. Alternatively, hold down the CTRL key and press F, M, and F, in that order. The column of hex #s on the far left which are followed by a ': ' tell you what portion of the sector data you're viewing. They are offsets in TRICKY DICK's data buffer and range from 500 to 7FF in 8 byte increments.

FLIPPING DATA DISPLAYS (CTRL F):

When in the viewing mode CTRL F will erase the alphanumeric symbols on the right of the screen and display all the data in the last sector read. The cursor will remain over the same byte during the flip. The leftmost column of numbers indicates the buffer offsets, but with the trailing zero omitted to retain clear screen formatting. Press CTRL F again to get back to the partial screen with ASCII and the next 128 bytes of data, starting with the row in the full display where you left your cursor.

SECTOR FILLING (CTRL Z, CTRL X):

In either of the above 2 displays, CTRL Z replaces the sector data with zeros beginning with the byte over which the cursor is placed, and extending to the right end of the sector. CTRL X fills the sector from the cursor to the end with the byte value under the cursor. These commands don't write anything to the disk itself.

DISASSEMBLING SECTOR DATA (L):

Hitting L disassembles the sector code beginning with the byte under the cursor and continuing until the screen is filled. The middle column of the display gives the ASCII translation of the hex data to its left. Repeatedly pressing the L carries on the disassembly until the end of the sector is reached. After disassembling a screenful of hex, you can return to the previous screen by hitting the SPACEBAR or some other noncommand key. The cursor will be positioned next to the last byte that was disassembled.

LISTING APPLESOFT AND INTEGER CODE (CTRL L) (L):

If the sector data contains Applesoft or Integer BASIC code, a listing can also be displayed. Select the language that you want to list by pressing CTRL L then typing an A for Applesoft, an I for Integer or a * for assembler. Finally hit L for a listing which begins with the byte under the cursor. Keep typing L's until you have listed all the code in the sector.
The next step is to type CTRL O, followed by 2 RETURNS. This brings the
'\*' for a disassembly
'I' for an Integer listing
'A' for an Applesoft listing of the sector code
instructions:
print select parameter, prompting you to type in one of the following
data in TRICKY DICK'S display to be printed. The cursor will jump to the
PRINTING HARD COPY FROM TRICKY DICK (CTRL P) (P):
that TRICKY DICK will always write a sector of data to the disk with a data
field checksum of $00.

Finally, by changing the 'Y's' in the DOS mark section to 'N's', you can tell
TRICKY DICK to accept any value in that position. For example, 'DE00' in the first line causes the second byte of all address
field trailers to be ignored during reading or writing.

The third line shows the data field header and trailer (the latter with an added 'EB') once again. The header and trailer you select here will appear in the data field of the next sector you WRITE to the disk. This line is used only for writing and allows you to alter the values in the data field header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

DEALING WITH NON-STANDARD SECTOR MARKS (CTRL S):
These are the features that let you read and write to disks whose formatting
has been altered. To do this with the least amount of work, use THE LINGUIST
to determine the nature and extent of the alterations.

In the third line, you've selected the correct drive, track and sector #'s and that the data dump irrespective of the cursor position.

writing to the disk (CTRL W AND Y):
CTRL W followed by 'Y' writes the contents of the sector buffer to the sector
whose address is shown at the top of the screen. WARNING: Be sure that all the
information shown on the screen is correct before you write it, if you make
a mistake you'll clobber the disk, maybe irreparably. Check to be certain
you've selected the correct drive, track and sector #'s and that the data
displayed on the screen is the data you want written on the disk. When you
press CTRL W you'll hear 6 short tones. Keying in a 'Y' during this sequence
writes to the disk and stops the tones. If you press CTRL W by mistake, you
can simply elect not to do anything and when the 6 tones cease, the write
instructions are automatically cancelled.

DEALING WITH NON-STANDARD SECTOR MARKS (CTRL S):

These are the features that let you read and write to disks whose formatting
has been altered. To do this with the least amount of work, use THE LINGUIST
to determine the nature and extent of the alterations.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.

In the top line, "D5AA96" is the standard DOS 3.3 address field header and
"DEAA" is the address field trailer. If you've changed the DOS version to
3.2 the top line will read "D5AA85" which is the 3.2 header. The next line
"DE0AA9" refers to the data field header and "DEAA" is that field's trailer.

IMPORTANT: By replacing one or more of the header or trailer bytes with a
'TRICKY DICK' to ignore the address field checksum (the first Y) and/or the
header and trailer of any sector you write to the disk.
This program allows you to get codes for Long distance services like MCI and Sprint. I tried to keep the working of the program the free and loose to allow compatibility with almost any service. The program can also be used as a War Dialer which searches the local area for modems. Simply leave the +, # and .’s out of the dialing string. Example: ATDT 775-xxxx. With slight modifications the program can be used for many other applications along the same lines.

First I’ll give a basic rundown of the options from the main and modem menus, then I’ll go into detail about the structure of the code and modifying it. There are a few general notes I’d like to mention before I get to the menu options:

[Dialing String]

The dialing string uses 4 symbols to represent different things. They are:
+ - This is the long distance port (or extender).
# - This is the target (or number to be called).
. - This is used for a delay and automatically converted to a (.)
\ - (Or X) This is replaced by a random number from 0 to 9 when dialing.

Sample dialing string: ATDT+.1xxx.# In the actual dialing string, this might produce something like:
ATDT7430631,,,13825,2037979075

LD port Code Target

The + is replaced by a port from the list you entered with the E command. The # is replaced by a target randomly chosen from another list. All (.)’s are replaced with (,) and a random number (0 to 9) is chosen for each x.

[ Defaults]

Most of the defaults for the program are located around lines 100 to 200. The only thing everyone should change is the default for the filename of the setup file. The original program has it set to CC.SETUP. I would suggest using CC.<LD company name>. Find the line that contains: <line number> FSETUP$ = "<filename>" and change the name in quotes (**) to the name you wish to use. If you do not do this you will have to enter it every time you use the program or leave it as the current default. All other defaults can be changed in the same way, but it should not be necessary because you can load in your own setup with Q = Quit: This exits the program, clears the screen, and returns the borders to normal. You will be in ProDOS Applesoft basic with this program in memory.

[D= Direct command to modem: This allows you to enter one command that will be executed by the modem. The command is entered directly and not on the menu.]

So I have included a complete list of commands in the order they appear in the main menu except for the B and P commands which I listed above.

U = Update default dialing string: Used to change the dialing string which appears in the top line on the left. See dialing string above for more information.

W = Write current setup to disk: This saves the current setup under the the name specified on the second line to the left. All information will be saved including: prefix, area code, phone numbers, etc.

E = Enter phone numbers: Allows you to enter as many LD ports and targets as you want. Note that if you are entering the information as there is little error checking in this routine. Just follow the prompts and you should have no trouble. Be sure to use the W command to write the setup to disk and avoid having to retype the numbers with each run. When entering the targets if you enter a number that is exactly 7 digits long, the default area code will be added to the beginning of it. If you do not want the area code added on you have several options: alter the program, use a Word processor to alter the setup file, or add a 0 onto the end of the number (It shouldn't effect anything). I think the second choice is by far the easiest.

V = View Instructions: Simply tells you to read this file. Some time I may add some quick instructions, which is why I put it in, in the first place.

L = Load setup: Loads the setup from disk. Loads the filename specified on the second line to the left.

C = Catalog prefix: Catalogs the current prefix. Use Ctrl-S to stop/start the scrolling.

F = File names: Used to change the filenames for the codes and setup. Has minimal error checking: The first letter must be an alphabetic capital letter (therefore returns and spaces will not be excepted), allowing ASCII values 65 (A) through 90 (Z).

I = Display codes: Uses the filename on the second line to the right. And displays this files contents. Normally this file would contain codes, but it can contain anything. Use Ctrl-S to stop/start the scrolling and be able to see the information.

A = Area code: Lets you change the default area code (See the E command). This routine will only except a 3 digit numerical entry whose first digit is not a 0 (all part of the error checking).

S = Set prefix: This will be the prodos pathname used to save or load anything. The current prefix will be displayed on the first line to the right.

D = Dos command: Allows you to enter any dos command and executes it. You can use it to delete code files once you have copied down the information to paper. If you don’t delete the file each time the program finds another code it will append it on to the end of the file. Type: D Delete «Code file-name».

Q = Quit: This exits the program, clears the screen, and returns the borders to normal. You will be in ProDOS Applesoft basic with this program in memory.

P = Preferences for modem: A sub menu that allows you to change certain modem parameters.

M = Modem delay: The amount of time the modem should wait before connecting to the next modem. It is really necessary is from the B command to stop dialing.

Most of the commands are self explanatory, but others need further explanation.
dialing - How many codes to try? Enter a number and press return. Press return all by itself to cancel. After this command the screen will display several stats: Codes Tried, Codes to try, Codes Found, Dialing status, and dialing string.

Dialing status can be one of four things: Organizing (appears once when commands are sent to modem before each dialing session), Dialing (Sending the dialing string to the modem), Waiting (waiting for a connect), or Saving (The program has found a code and is saving it). Dialing string is the actual string sent to the modem.

Ok, with those explanations you should have no problem using the program. Happy code hunting.

[Modifying the program]

I started using lots of REMs to make it easier to modify, but got tired of that quickly.

After credits and basic screen setup in lines 106 to 189. Add any new variables here, and alter any defaults that appear. Don't mess with the variables that you're not familiar with like the flags.

Then we have some introductory notes at 200 to 280. If you make any changes to the program you can note them here to supplement these docs. Next comes the main menu (300-355) and statements to get your input. Line 380 sends the input to a subroutine that uppercases it. So if you add something that gets a single letter command assign it to I$ and gosub 5500 to uppercase it.

Lines 380 to 899 are for a list of If statements that gosub some where for each command entered. Look here to see where a particular command from the main menu will take you.

Lines 1000 to 5000 are used to update the top of screen stats. There is a gosub 1000 at the end of any subroutine that might change these stats.

At 10000 to 29900 is the core of the program. This does the dialing and will be the biggest cause of compatibility problems between modems. The original program was written on an Apple //c with 2400 baud Mercury modem. Theoretically it should be compatible with any modem that uses the Hayes command set, but all modems have their slight differences, incompatibilities, and bugs. I'll get back to this later.

The preferences menu and routines are at 48000 through 49980.

At 50000 we have the hit a key routine that simply prints "Hit a key" on the bottom line and waits for you to comply, then erases the message and homes the screen.

55000 is branched to from the onerr in line 5, also note that line 7's poke cancels the onerr and was used for debugging. When I was finished with it I placed a rem in front of the poke. In line 55100 A = peek (222) returns a code for the error that occured, the lines after that check this code and act accordingly. The last statement of this routine returns you to the main menu (goto 300).

The preferences menu ends at line 60000.

Unless I missed any, all the peeks and pokes are followed by a Rem statement explaining its purpose. Peeks 78 and 79 are used in generating a random number.

There are many variables used in the program, and I'm going to list all the ones I can remember that are important and not obvious.

CT = Codes tried
CF = Code Found

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 229 of 1262
In this procedure we print some information to the screen, and send the following to the modem:

ATE0  Tells the modem not to echo commands. This is needed by my modem, other modems may dial without it. This command can sometimes mess up the first dialing of that session.

ATM0   Turns the modem's speaker off if SP$ = "OFF". If you want to change the speakers status after you have begun dialing once, you will have to quit (the Q command), turn off the modem and restart the program (RUN).

ATS7=DE DE is a variable that holds the modems delay. This command sets that delay.

DCS(2)  This is the direct command if there is one.

Next we return from the subroutine and begin a loop (this controls everything else in this routine). The loop increments CT (See the variable list), finds P0$ and T0$, and resets D15(3) to "". Next we have a delay to allow the program to hang up from the last dialing, then we gosub 21000 which does the dialing using P0$ and T0$. This routine gets CN$ (usually CONNECT or NO CARRIER) and sets CN to 1 if CN$ = CONNECT, then it returns CN to the loop. After that the program checks two things: is CT >= NC (meaning the routine has reached the Number of codes to try and should stop), and is CN = 1 (a CONNECT). If CN does = 1 the program gosubs to 12000.

At 12000, the save code routine we start off by hanging up. The program enters a PR#2, then waits about 1 second and sends +++ another 1 second delay and ATH is sent. That should hang up the phone and a PR#0 is executed switching back to 80 columns. Now the program writes the dialing string (DI$(3)) to a text file commands: If you use ProTERM, write down the Init string it uses and replace the ATE0 with that. If it works then... you can get rid of one part of that Init string at a time until you narrow it down to the ones that are really needed.

If you have only 40 columns, you're going to have many a problem. And I'm not going to try and anticipate the effects... so you're on your own.

5. Check the slot of your modem if it's not slot 2, change all PR#2's to PR#3 (whatever slot it is). Speaking of PR# commands... I use a PR#0,ASC307, which changes PR#0 to the address for PR#3 but skips over some initializing commands which would clear the screen.

6. Finally, the most important one: Dip Switches. Get into ProDOS applesoft. Enter PR#2 (or whatever slot your modem's in). Then enter CTRL-A 1 (this lets you see what you are typing). Now press Return and watch the lights on the modem, when you hit return the RD (Read data) and SD (Send Data) lights should flash. If they do not flash you can be pretty sure it has something to do with Dip Switches. Turn the modem off and play with the switches, turn it on again and hit return again... watching the lights. You'll have to countinue to play with these switches like this until you find a combination that works. I know this can be difficult if you have a lot of switches, so use your manual to try and decide which switches might have an effect on it.

OK, that's about it. If you make any substantial changes, I'd like to see what other people did with my program, you can reach me at USHA or TPH among other boards you might see me on.

---END---
## System Requirements:

For playing on an Apple IIe, IIc or 100% compatible, Commando requires:

- 128k RAM
- Disk Drive
- Color Graphics adapter
- Monitor (or TV with RF modulator)
- Joystick (optional)

## Getting Started

If you are using an Apple IIe, or IIc or 100% compatible:

- Turn on your monitor or TV.
- Insert the Commando disk in drive A and boot machine.
- The title screen will appear, followed by a computer controlled demonstration game.
- Press "Fire" button on joystick or keyboard to begin.

## Objective

As the crack shot Commando, your mission is to move forward into enemy territory. You must destroy the enemy and their base by passing through the Iron Walls.

## Game Play

- Use the joystick or keyboard to maneuver your soldier.
- Press the "Fire" button to shoot or the "Grenade" button to throw grenades.
- Dodge all bullets and grenades.
- Trees and other obstacles can be used for cover.
- Do not fall into rivers or ponds. Beware of trucks and jeeps.
- Pick up enemy grenades in boxes and use them against the enemy.
- Each box contains 1 grenade.
- Win bonus points by rescuing prisoners, destroying enemy leaders, and destroying the enemy headquarters.

### Keyboard Assignments

<table>
<thead>
<tr>

<tr>
<td>Z</td>
<td>Throws Grenade</td>
</tr>
</tbody>
</table>

### Joystick Assignments

- Joystick controls movement
- Z = Throws Grenade
- Z = Shoots Gun
- I = UP
- J = Left
- K = Down
- L = Right

### Game Control Keys

- Primary button shoots gun ("button O", usually at lower left).
- Secondary button throws grenade ("button 1", usually at upper left).

Game control keys are:

- S = Toggles Sound
- ESC = Pauses Game

> COMPETITION KARATE SEQUEL <

Once your student achieve the rank of red belt, one of two rates immediately await them: either they become instructors, or are permanently retired, and can no longer participate in the game. Even students who are instructors eventually retire when a (MISSING TEXT)

To provide further action and adventure for these retired martial arts experts, a sequel program to Competition Karate is in the works at Motivated Software. Retired* red belts* are the only characters eligible to participate in the sequel, which will p (MISSING TEXT)

Your characters will traverse treacherous country in search of a personal quest.

Along the way they will encounter temples of learning, where they can gain more martial arts knowledge as well as mystical, and even magical, training.

> IMPORTANT <

DO NOT AFFIX A WRITE PROTECT TAB TO THE GAME DISK OR ANY COMPETITION KARATE DATA DISKS.

NEVER PRESS [CTRL-C] OR THE [RESET] KEY WHILE THE GAME IS IN PROGRESS - CERTAIN GAME FUNCTIONS MAY BE PERMANENTLY DAMAGED.

Compressor:

Compressor is a machine language program which reads an ASCII text or Appleworks AWP source file, and converts it into a new file which is about 30% smaller than the original. This compressed file can then be displayed or printed by Dogpaw, and will appear the same as the source file. This will be useful for situations where Dogpaw is being used to display large amounts of text, and disk space is getting short.

Compressor can also decompress its compressed files, converting them back to ASCII text files.

Using Compressor:

Compressor is a ProDOS-based program. It requires 80 column display and lower case capability. To use Compressor, simply BRUN it and enter the pathname of your source file and the name you want to give the object file at the prompts. If the source file is ASCII text or an AppleWorks AWP (word processor) file, the object file that Compressor creates will be compressed. To decompress a file, just enter the name of the compressed file as your source file. Compressor will detect that it is a compressed file, and the new object file will be decompressed standard ASCII text. If the name you enter for the object file is the name of an existing file, you will be asked if you want this file to be overwritten. Your source file will be unaffected by Compressor.

The exact amount by which Compressor reduces a file's size will vary. Source files that include a lot of upper case and/or numeric characters will not be reduced as much as more ordinary files. A file that consists entirely of upper case and/or numerics will not be reduced at all. There is no limit on the size of the source file to be processed by Compressor. If the source file and object file are on different disks in the same drive, Compressor will prompt you to swap disks if and when necessary. Just be sure you have the object file's disk in the drive when you first enter its pathname.

The compressed file will be of type $F8 in the ProDOS catalog. This is one of the file types set aside by Apple as "user defined". For this reason, you may occasionally come across other files of type $F8 that have nothing to do with Dogpaw or Compressor.

Compressor can only decompress files to standard ASCII text (type "TXT" in the ProDOS catalog). This means that AppleWorks AWP files that are compressed and then decompressed will lose any embedded printer control characters, margin and page-break settings, etcetera. ASCII text files can, however, still be loaded into AppleWorks, worked with, and re-saved as AWP files.

DOCUMENT conglomerates

DOCUMENT conversion

Docs for Converting Wings of Fury:

To convert:

If you haven't done so already, unpack sides 1 and 2. Then, use CONVERT WINGS S1 to convert side one of the UNPACKED disk, and CONVERT WINGS S2 to convert side 2. Put the unpacked disk in drive 1 when the programs tell you to do.

Only ONE drive is required in order to convert Wings of Fury and make it playable. The unpacked disks are merely overwritten into 18-sector format which makes for a fast conversion and saves disk swapping.

COPY18: This is your bonus for getting my crack of Wings of Fury. This program DOES require 2 drives. It's features include: Copy sides 1 and 2 of WOF, change prolog byte, and copy a range of tracks. Big deal, you say—well, these utilities are for 18-sector wares, and using it you can quickly and easily copy virtually all other Broderbund 18-sector games!

How 18-sector protection works:

Most of you know that normal DOS 3.3 writes 16 sectors per track, and that each sector can be individually read in or written out to the disk. With Broderbund's 18-sector protection, it is more complicated. Each track actually consists of 6 blocks, containing 300 bytes of information (3 sectors or 3 pages). Each page/sector can be loaded into memory anywhere and individually. When writing, however, the entire track must be written at once.

How to use Broderbund's RWTS:

First, it is located at $4800-5300 in all of the utilities. It is AIRHEART's RWTS since it was the handiest one around. Using the loader is similar to ProDOS—you JSR to it, and then the commands are imbedded after it. For example,

JSR $4800

HEX 08,10,04

[more code]

turns on drive 1 after a small delay. This chart shows all of the combinations:

First byte:00: Turns on drive; Byte 2: 01 or 02: drive 1 or 2; Byte 3:xx: delay to wait before accessing drive--4 is usually good.

First byte:01: Turns off drive.

First byte:02: Position drive head; Byte 2:00 or xx: if 00, assume track number in SP is current track. If nonzero, read from track head is currently over and determine current track; Byte 3:xx: Track to move to.

First byte:03: Read a track; Byte 2:xx: Page to begin reading at. Reads in 12 pages of information starting at xx.

First byte:04: Read a track; Bytes 2-$13 (18 bytes): Pages to which data is to be stored. If you don't want to read in sectors, use 00 as the page number to read them in.

For example, 04,32,34,35,36,17,38,19,3a,3b,3c,3d,3e,3f,00,00,00,00 is the code usually used to load in the rest of a hi-res picture (after a 03,20).

First byte:05: Write a track; Byte 2:xx: Page to start writing from. Analogous to 03.

First byte:06: Write a track; Bytes #13:Pages to write from. Analogous to 04.
First byte:07: Change prolog byte. Byte 2:xx: New prolog. This allows you to read in other 18-sector Broderbund wares. The prolog byte for WOF is $96. For Airheart, it was $A4. Use a nibble editor to discover what it should be for other games.
Changing this value in the COPY18 program along with copying a range of tracks makes all 18-sector programs easily copyable (though not in 16-sector format).

18-sector disk accesses are FAST! Broderbund has written a great little RWTS and with these docs, other people doing future cracks should have a much easier time.

Also, I cleaned up the first few stages of WOF's boot, which makes it much easier for someone else to do a complete crack. All of these utilities is enough for me—but I've done all of the hard work. Someone only needs to grind out the 16 sector version! Space in the first boot stage was so tight that I didn't even have room to shut off the drive while the title page was up!

If these docs make more sense (it's late...sorry), or if you have more questions, I'm easy to reach. The whole world knows my phone #.

Mr. Slick

---

Do you keep putting those coupons in the drawer for shopping day, but keep forgetting them? Here is a program to help you out. You enter each coupon, along with its category (there are 9 to choose from), company, product type, its value, and the expiration date. Then, when you are set to go, just select those coupons to use, and the program will print them out for you.

The program is menu driven, and self explanatory. One item you MUST take note of is that when you enter a new coupon, the program will assign it a "Coupon Number", and tell you to write it down. We suggest that you write this coupon number in the upper right hand corner of the coupon itself, so that you never have to worry about the coupon's identity.

In order to select coupons to be used select the View/Select coupon option. Decide which category the coupons are in (this may take a few selections, since the coupons may not all be in the same category). The program will then show each coupon to you and ask you if you want to select it. Pressing "Y" will do so, "N" will leave the coupon unselected. You will then be shown the next coupon, and the cycle will repeat until all coupons have been processed. You can then print this list out for reference if you have a printer.

After you have used a coupon (or decided you're not going to) you can tell the program about it by using the Delete option. Here you select your coupons, and at each one tell the computer if it was unredeemed, redeemed, or redeemed for double value. This lets the computer know how much money you have saved. The total amount saved is available using the Amount Saved option.

Once in a while (once a month) you may want to delete those coupons that have expired, and are no longer any good. When entering the cut-off date, remember that most @ stores will accept coupons up to 30 days after the expiration date!

^ Files Needed @

The following files are needed to run the program:

**COUPON HANDLER** - Main program.
**COUPONS** - Data file. Must be present to run the program!
---gram!
--- program!
---rogram!
---
This program is ShareWare. Go ahead and try it out, but if you want to continue using it, you need to pay me for it. For complete details, see the Standard Plea and Legal Absurdities sections near the end of this document.

Usage

Just run this program from any program launcher. If you have the Orca shell or some other shell that can run "EXE" files, you can change the filetype of the CPUSpeed program to EXE so it will work better with the shell. Using Orca/APW, the command would be "filetype CPUSpeed si6". If, for some bizarre reason, you want to install this program as a utility under Orca/APW, it is restartable.

Problems & TechStuff

The routine which generates the CPU speed works by essentially turning off everything taking place in the background while it's checking the speed. While things are only off for about 1/60th of a second at a time, very time-critical things such as AppleTalk may have problems. For this reason, the CPU speed routine is only called when the system speed varies by more than 1 MHz. This will usually only happen when the CPU speed has actually changed.

The CPU and system speed are different because several things take place in the background while programs are running. There are too many possible things to go into, but they include AppleTalk, screen blankers such as UltraBlank (shameless plug), and anything else that needs to be handled on a regular basis.

The average system speed is computed by taking the average of the last 60 "instantaneous" system speed values, which are kept in a circular buffer. Every time the speed changes by more than 1 MHz, this buffer is cleared so that the new system speed will appear immediately. Smaller changes will take some time to show up in the average, though, since it takes time for the new numbers to replace the old (at one MHz, several seconds).

The actual numbers that this program reports are, as far as I can tell, correct. I have no means of determining the exact speed that my computer is running, so I've 'tweaked' the numbers to arrive at what should be close, if not exactly right. This program has been tested at 1.024 and 2.8 MHz, and a "7" (actually 6.25) MHz TransWarp GS. Let me know if the numbers are way off at other speeds. Remember though, that the reported CPU speed may be somewhat slower than the actual speed of the chip.

This program should fairly accurately report the speed of the computer up to slightly more than 19.6 MHz, after which the program will cease giving meaningful numbers.

Standard Plea

This program is ShareWare, so if you find yourself using it, please help me out by paying something for it, so I can justify spending the time to update this and write other nifty pieces of software. People who send me at least $2 (US) per computer, along with their vital information (Name, Address, # of computers, America Online screen name [if applicable], any other Internet-accessible names, etc.), and refer to "CPUSpeed Version 1.20" will be assigned a registration number and will be entitled to receive future ShareWare versions of this program. Unless you include money to cover shipping, I will only send updates by e-mail.

If you enjoyed this software, have suggestions for enhancements or improvements, want to report bugs, or send piles of money, my address is:
Robert S. Claney
2370-E Shady Oaks Rd
Marshalltown, IA  50158-9575

I can also be reached at the following locations:
America Online: BobClaney
Internet: bobclaney@iastate.edu
txa84@isuvaux.iastate.edu (won't be checked very often)
claney@iastate.edu  this summer

Version History

Version 1.20
Make program run cleaner when launched as S16 (while still working as EXE). Enlarge the history buffer, so the system speed will be more stable.

Version 1.15
Change the way the program decides to "recalibrate" the CPU speed, to attempt to keep the system loading down. Add the closing plug. Shrink system speed history buffer, to keep size down, and make the system speed more responsive.

Version 1.11
Tweak the timing control for the CPU speed, so it's accurate at higher speeds.

Version 1.10
Change speed calibration to try to take into account the amount of time spent in the timing routines running at 1.024 MHz (because of accesses to slow RAM). Add the onscreen docs.

Version 1.01
Add CPU speed routine, to (attempt to) indicate the processor's actual speed irrespective of system loading.

Version 1.00
First version. Attempt to calibrate number to documented speed (1.024/2.8MHz) when there are no background tasks.

Legal Absurdities

11. THE MIRROR IS THE MIRROR THAT ALICE WENT THRU IN THE "LOOKING GLASS" (GO MIRROR)

12. THE FLASHLIGHT IS ON THE STAIRS

13. THE GENIE WILL HANDLE THE MIMIC.

14. THE MIMIC HAS THE SOLUTION TO THE CAVE-IN.

15. THE PILLAR MESSAGE (LOOK PILLAR) IS "INDIAN PARTNER"

16. SAYING "TONTO" OPENS THE SEALED DOOR.

17. THE WATER IN THE BOTTLE MAKES THE TREE GROW.

18. USE THE BOTTLE TO CATCH THE FIRE-FLYS.

19. RUB LAMP TO KILL THE KYBOR.

20. RUB STUMP TO GET TO LUCIFER (DROP FLASHLIGHT FIRST)

21. THE BAT WILL KILL THE SNAKE.

22. DROP LAMP TO KILL LUCIFER.

23. THE CUP AND TACK ARE USELESS.

24. SAY SHAZAM TO CROSS THE GORGE TO THE WEST.

25. TO GET THE PICK YOU MUST FIRST CUT THE TREE AND GET THE BLOB OF RUBBER

26. DROP RUBBER (BLOB) TO STOP THE WATER FROM DROWNING YOU.

27. GET THE CAKE ON YOUR WAY OUT ONLY.

28. THROW KNIFE TO OPEN THE DOOR TO THE EAST.

29. EAT CAKE TO ESCAPE THE CAGE.

30. DIG WITH THE PICK TO GO BEYOND THE DEAD END.

31. YOU CAN FLY WITH THE MAGIC CARPET BUT GET THE PENCIL FIRST.

32. KISS THE MEDUSA AND THEN GO DOWN AND WEST TO A DEAD END.

33. DRAW THE PENCIL THERE.

34. "GOOSUM" WILL GET YOU BY THE SQUID.

35. UNLOCK DOOR WITH THE KEY YOU FOUND AFTER DRAWING THE DOOR.

36. "GOOSUM" WILL GET YOU BY THE SQUID.
HERE’S THE 'DOCS' FOR CRISIS MOUNTAIN:

THE OBJECT OF THE GAME IS TO PROTECT YOUR POWER CRYSTALS FROM THE ATTACKING MANGANS. A CRYSTAL CAN TAKE 4 HITS BEFORE GOING CRITICAL AND THIS IS A FANTASTIC NEW GAME BY DAVID SCHROEDER. YOU ARE A MAN (CALL HIM MARIO) WHO IS DESPERATELY TRYING TO SAVE THE MOUNTAIN FROM DESTRUCTION BY DISARMING THE NUCLEAR BOMBS FOUND BURIED IN THE MOUNTAIN. THE BOMBS ONLY NEED TO BE DUG UP TO BE DISARMED AS THE TERRORISTS WHO PLANTED THEM DID NOT EXPECT MARIO TO FIND THEM. ONCE ALL THE BOMBS HAVE BEEN MADE 'SAFE', MARIO CAN START HIS BONUS RUN. HERE’S HOW TO PLAY:

ACTIVITY       CONTROL
WALK/CRAWL     TOGGLE BUTTON 1
JUMP/DIG       BUTTON 0

(DEPENDING ON WHETHER MARIO IS WALKING OR CRAWLING DETERMINES IF HE'LL DIG OR JUMP.)

MARIO CAN FALL SAFELY FROM ANY HEIGHT. HE MAY NOT FALL INTO THE LAVA (RED STUFF). THE MOVING BALLS OF LAVA CAUSE HIM TO LOSE STRENGTH. IF HE IS HIT BY THEM, THE STRENGTH IS INDICATED BY AN 2=WALKING SLOWLY, 1=CRAWLING, 0=DEAD, THE OTHER OBJECTS ARE WORTH BONUS POINTS. POSSESSING THE SHOVEL LETS MARIO DIG FOUR TIMES AS FAST. THE BONUS RUN BEGINS WHEN ALL BOMBS HAVE BEEN DUG UP. ANY TIME WHEN MARIO IS HIT BY A ROCK OR JUMPS INTO THE LAVA AND THEREFORE DIES, THE BONUS RUN ENDS. THE LENGTH OF THE BONUS RUN IS THE AMOUNT OF TIME LEFT ON THE TIMERS. HIGHER LEVELS ARE FASTER AND HAVE MORE BOMBS TO DEFUSE. THERE ARE A TOTAL OF TWO SCREENS.
How to Use Compact:
1. Lock the program you want compacted on disk so you don't accidentally lose it.
2. LOAD the program you want to compact.
3. BRUN COMPACT. If this has recently been done you probably can just type "&".
D.BUIX Note: If you want D.BUIX and both in memory, you must BRUN D.BUG first. Otherwise COMPACT will disappear.

Now you will see COMPACT's menu:
(1) REMOVE REMS ............... YES
(2) CONCATENATE LINES ........... YES
(3) SHORTEN VARIABLE NAMES .... YES
(4) RENAME VARIABLES ............ YES
(5) COMPACT PART OF PROGRAM .... NO
(6) VARIABLE TABLE TO PRINTER .. NO
(C) COMPACT
(Q) QUIT

COMPACT Menu Options
1. REMOVE REMS
YES means when you compact your program, every Remark statement will be deleted. If you use a lot of Rems, this will save program space than any other, because every character and space in a Remark takes up an entire byte of memory.
2. CONCATENATE LINES
YES means that when you compact your program, as many statements as possible will be packed into single program lines, thus eliminating old line numbers.

ULTRA-LONG-LINE PROBLEMS
With option 2 set at YES, COMPACT will often create a program line that works perfectly, but is too long to edit. Applesoft allows program lines of about 250 bytes (like "PRINT" takes up one byte). Editing, however, has to consider each character in the listing (now "PRINT" takes up five characters, plus two more for spaces on each end). Even GPLE's "Pack" feature won't always let you edit an ultra-long line.

WATCH OUT that you don't inadvertently chop off a program line when you attempt to edit it. If you are cursor-tracing a line and you hear beeping (or you try to edit with GPLE and code is missing), type CONTROL-X immediately, and BRUN LINE.SPLITTER.

3. SH# When this option is set to YES, all variable names longer than two characters will be shortened to two characters.

In Applesoft, it doesn't matter how long your variable names are, only the first two characters count (COMPACT leaves only those two characters if you select YES for this option). The variables APPLE, APPALOOSA and AP are the same. So are MOUSES, MOUNTEVERESTS and MOH.

The advantage to long variable names is that they are more descriptive. The disadvantage is that they take up a lot of room - one byte perNote: OPTION 3 simply chops off the end of long variable names.
OPTION 4 actually renames variables without regard to their former name.

4. RENAME VARIABLES
When this option is selected, COMPACT will change as many two-or-more character variable names into one-letter names as possible. The multiple character variables that are used most often will be converted to single letter names until all 26 letters have been used (for each variable type). Remember, A5, A8 and A may all be in the same proc: A (4) YES sets (3) to YES and (5) to NO. A (4) NO sets (6) to NO.

5. COMPACT PART OF PROGRAM
Use this option if you only want a portion of a program compacted. After typing "C" to start compacting, you will be asked for the start and end line numbers for compacting. You may default to the beginning or the end of the program by simply hitting RETURN as an answer to either question.

Note: A (5) YES sets (4) to NO.

6. VARIABLE TABLE TO PRINTER
When set to YES, this option will variables on your slot 1 printer (if option 4 set to YES).

"#" TO RE-RUN COMPACT
After COMPACT has been used and exited, you will usually be able to bring it up again by typing "#" (return). If this doesn't work, just type "BRUN COMPACT" again.

COMPACT assumes that any extra bytes that it finds imbedded beyond the end of a program is relocatable code that the program uses. If extra bytes are found, you will be asked if you wish to keep them. Answering "Y" will move the code to the new program e the extra bytes.

If you don't think you have anything beyond the end of the program, and COMPACT asks you about it anyway, just answer "N" and that will be the end of that.

UNUSED STATEMENTS
When programs have undergone heavy revision, statements often remain that can't possibly be executed - your program just won't encounter them. COMPACT will remove the line numbers that contain these potentially useless statements. It's up to you to delete them after COMPACT is finished.

THE VARIABLE CONVERSION NAME VARIABLES (option 4) is set to YES, a variable conversion table will be displayed on the screen during compaction. This chart lists the name of every variable in the program, it's new name (if it was changed), and the number of times it appears in the program. (Note: Only the first two characters of the variable will appear under the OLD column heading, even though that variable may have had a longer name.)

One-character variables are listed first, unchanged, in the order of their appearance in the program. COMPACT will shorten as many of those as possible to one character, with the ones that appear most often in the program changed first.

If no name appears in the NEW column, it's because there are no more single character left for that particular variable type. This will only occur in very large and/or complex programs. Usually real of string variables will be the first to run out of the 26 available single-character names.

LOOK FOR "LONE" VARIABLES
Watch thefor variables that appear only once or twice in a program. This could indicate that the variable name was misspelled or was once part of a program segment that was removed. You might be able to save additional space (or uncover a potential bug) if you look at the lone variable.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 239 of 1262

Apple II Computer Info

extends above $4000, it will be partially wiped out by COMPACT and you'll be
told to re-load.

---------------------------------------
LINE.SPLITTER

LINE.SPLITTER simply chops a program line into two parts, in case it is too long
to edit. With your program loaded simply type "BRUN LI" when asked, type the
number of the line you want to split. LINE.SPLITTER will split the line as near
the middle as possible, taking into consideration any IF statements.

The second section of the split line will be numbered one line number higher
than the first section.

LINE.SPLITTER ERROR MESSAGES

LINE DOES NOT EXIST

Ooops, try again.

RENUMBER FOLLOWING LINE

If the higher number is already taken, the split will be cancelled and you will
have to rename that part of your program to make n'T BE SPLIT.
The line has only one statement, or its first statement contains an IF.

---------------------------------------
COMPARE

D CODE's COMPARE program will take two Applesoft programs and tell you exactly
what lines are unique, different, or the same. You can also use COMPARE to check
binary and text files to see if they are identical.

JUST BRUN COMPARE AND TYPE TWO FILE NAMES

Select COMPARE from the D CODE startup menu, or simply type: BRUN COMP
at
ly, COMPACT and COMPARE cannot live in the same Apple at the same time -
irreconcilable differences. COMPARE and D.BUG get along quite well, however. So
do COMPACT and D.BUG.

When the COMPARE screen appears, enter the names of the two files you want to
COMPARE. RETURN (with no name) signifies the Applesoft program currently in
memory. Under DOS 3.3, type the file name and any DOS parameters that go with
it (for example - MYPROGRAM,S6,D2). Under ProDOS, COMPARE will assume the
current prefix, unless one is specified (for example
/MYDISK/MY.SUNDIR/MYPGRAM).

COMPARING APPLESOFT FILES

When you're comparing two Applesoft programs, COMPARE will ask you if you want
occurrences of identical lines printed. You will usually want to answer
"N", since "Y" will often print a ton of meaningless line numbers.
During comparison, a 1, 2, D or S will appear next to the line numbers as they are shown on the screen:

1 means that this line is unique to Program #1 (the first one you selected) and doesn’t exist;
2 means the line exists in Program #2 and not in #1.
D means both programs have duplicate line numbers, but the contents of the lines are different.
S means the lines are the same (This will appear only if you answered *Y* to the DISPLAY SAME LINES? option.)

COMPARING BINARY AND TEXT FILES

Since there are no line numbers in binary and text files, COMPARE will just tell you if the files are identical or not.

Binary file note: If you’re using DOS 3.3, COMPARE will also display the starting add both files (If you’re in ProDOS, just type "CATALOG" and take a look there.)

"*" TO RE-COMPARE

Once it’s loaded, you may usually re-enter COMPARE and use it again by typing "*" (return).

D.BUG

LOADING D.BUG

To load and activate D.BUG’s commands, just type:BRUN D.BUG. Or select D.BUG from the STARTUP program’s menu.

If you want D.BUG to co-exist in memory with either COMPACT or COMPARE, D.BUG must be loaded first like GPLE, Double-Take, FrontoDOS, and so on, should be loaded before D.BUG.

D.BUG may be loaded from a program in the usual way:

10 PRINT: PRINT CHR$(4);"BRUN D.BUG"

REM VING D.BUG

To disable D.BUG and free up approximately 5.5K of memory it occupies, type "FP" (DOS 3.3) or "-FP" (ProDOS - FP is a memory clearing file in the ProDOS D.CODE catalog.).

SINGLE CHARACTER ABBREVIATIONS

Each D.BUG command may be abbreviated by typing only its first character (or characters). For example, thed can be abbreviated as C, CH, CHE, or CHEC. To function properly, some of the new commands may or must be followed by other characters or words.

D.BUG FUNCTIONS AND COMMANDS

Fast Finder

New command: FIND (F)

Function: Quickly searches through an Applesoft program for occurrences of a specified character or word.

Program Checker

New command: CHECK (C)

Function: Quickly proofreads Applesoft programs for syntax errors and undefined statement errors. In addition, everything you type from Proofread automatically (no command required)

Easy Lister

New command: L

Function: Saves you three keystrokes every time you list a program, by letting you type "L" instead of "LIST".

Window Tracer

New commands: TRACE (T), NOTRACE (N), VARIABLES (V), and WINDOW (W)

Function: Lets you watch Applesoft program line numbers and statements "live" as they are executed (and optionally watch variable and expression values) in an adjustable text window at the bottom of the screen.

Dump Tracer

DUMP (D), SIZE (S), and ZAP (Z)

Function: After a program stops for any reason, you can see the line numbers and statements that were most-recently executed.

Breakpoints

New command: BREAK (B)

Function: Lets you set up breakpoints so your program will automatically stop when a variable becomes a certain value, or when other specified conditions are true.

Note: All D.BUG commands may be used within a program.

FAST FINDER

New command: FIND (F)

With any Applesoft program (and D.BUG) "F" (return). You will be asked what you want to "SEARCH FOR:". After you respond, all line numbers containing your character or word will be reported. If your word appears in line, say three times, that line number will appear three times. The total number of occurrences will be reported after the search ends.

FIND scans your entire program twice, first looking for your string in PRINT, REM, and DATA statements, and then in the form of Applesoft words, or tokens.

When you tell FIND to search for "READ"it reports one set of line numbers for occurrences like PRINT "READ YOUR MAIL." and then another set of numbers for occurrences line READ AS.

WILDCARD CHARACTERS

Using "@" in a search word will match a single character in a string. Using "#" in a search will match any number of characters.

FIND AND LIST (FIND L OR FL)

Typing "FINDL" of "FL" works like "F" (above), but each occurrence will be listed, and the search word will be highlighted in inverse.

PROGRAM CHECKER

New command: CHECK (Applesoft program (and D.BUG) in memory, type "C" (return), and your program will quickly be proofread for two specific things:

?SYNTAX ERRORS: This includes misspelled commands (like "PTINT"), improperly
For a program that has been typed into memory and is to be traced, it is best to type

D.BUG

Before typing "RUN FILENAME", if you do not ZAP before typing "RUN FILENAME", you will get meaningless garbage next time you DUMP.

This command changes the size of the trace window. The controls are: (Up arrow or Ctrl-K): Moves the top of the trace window down. (Down arrow or Ctrl-J): Moves the top of the trace window up. (Ctrl-C): Halts a DUMP. (Ctrl-S): Does the same thing it has always done. Type "T" before you run a program activates an adjustable-size "trace window" that displays the current line numbers and statements currently being executed. You can slow down the program execution or stop it at the bottom of the screen. Therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

TYPING "T" before you run a program activates an adjustable-size "trace window" at the bottom of the screen. The controls are: (Up arrow or Ctrl-K): Moves the top of the trace window down. (Down arrow or Ctrl-J): Moves the top of the trace window up. (Ctrl-C): Halts a DUMP. (Ctrl-S): Does the same thing it has always done. Type "T" before you run a program activates an adjustable-size "trace window" that displays the current line numbers and statements currently being executed. You can slow down the program execution or stop it at the bottom of the screen. Therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

The COMPACT program will find program statements or lines that can't possibly be executed (not really an error) D.BUG does not cancel improper statements, it just tells you about them. May be your "error" was intentional - like a GOTO 100 when you hadn't typed in line 100 yet. After entering a program line that is improper, you should immediately edit, re-enter or delete the line and speak of editing, D.BUG is totally cump; if you want to type a statement that contains an error, and you don't want to see and hear D.BUG's warning, precede the statement (and line number, if any) with a slash (/). The slash turns off D.BUG's proofread function for that line only.

ERROR MESSAGES
No Errors: This means that the program in memory when you typed "C" is free of syntax and undefined statement errors.

<T> An inverse "T" in a listed program line or statement means a syntax error exists nearby.

</> An inverse "#" in a listed program means an undefined statement error exists nearby.

"LIVE" SYNTAX CHECKING
With D.BUG loaded, every time you type anything, it will automatically be checked for syntax and undefined statement errors. Improper statements will be listed and flagged with an inverse "T" or "#".

EASY LISTER
New command: L
With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

TYPING "T" before you run a program activates an adjustable-size "trace window" at the bottom of the screen. The controls are: (Up arrow or Ctrl-K): Moves the top of the trace window down. (Down arrow or Ctrl-J): Moves the top of the trace window up. (Ctrl-C): Halts a DUMP. (Ctrl-S): Does the same thing it has always done. Type "T" before you run a program activates an adjustable-size "trace window" that displays the current line numbers and statements currently being executed. You can slow down the program execution or stop it at the bottom of the screen. Therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.

With D.BUG loaded you may simply type "L" (return) to LIST a program in memory. All Applesoft syntax is in effect; therefore you can use commands like L10-100, L-100, and L100-.
commands:  BREAK IF...
BREAK ON...
BREAK AT...
BREAK LIST
BREAK +
BREAK -

Typing "BREAK:" or "B:" followed by a number 1-8 will set up a breakpoint.

Sample program:

5 TEXT:HOME
10 X=INT(RND(1)*20)
20 PRINT X
30 IF X=2 THEN PRINT CHR$(7): GOTO 10
40 IF NOT INT(RND(1)*200) THEN 10
50 PRINT "END":END

Sample breakpoints:
B1: IF X=10
B2: ON GOTO
B8: AT 20,10

BREAK IF...
The first breakpoint to stop anytime X=10. When X does equal ten then the following will appear:

BREAKPOINT 1: IF X=10
BREAK IN 20

The first line tells you what made the program stop, the second is the next statement executed after the break occurred.

BREAK ON...
The second breakpoint will stop the program the first time a statement beginning with GOTO. This breakpoint will stop the program at line 30

BREAK AT...
The third breakpoint will halt the program the 10th time a statement in line e were two statements, separated by a colon, in line 20, then the 5th time the program reached line 20 the program would stop. If the breakpoint was set up as "B8: AT 20" then the first time line 20 was encountered the program would break.

BREAK LIST (BLIST)
This will list all breakpoints that are currently in memory. A "+" will indicate an active breakpoint, and a "-" will denote an inactive one. To list one breakpoint, 2 for example, type "B2LIST".

BREAK - (B-)
To deactivate all breakpoints, say 4, type "B4-".

BREAK+ (B+)
"B+" will activate all breakpoints. You can use the same method to activate only one as you do deactivate one breakpoint.

After a breakpoint does it's job you can continue the program with "CONT". If the program stopped with a BREAK IF... or BREAK ON... then you will need to deactivate that breakpoint or change the condition, or the program will stop immediately after you restart it. Do not, however, change the program.

Breakpoints slow the program down considerably. However, BREAK ON and BREAK AT won't slow down a program much at all.

that breakpoint or change the condition, or the program will stop immediately after you restart it. Do not, however, change the program.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 242 of 1262
New Features added to version 0.7

The following is a list of improvements and new features incorporated into this version of D.T.Painter that were not available in the previous release (version 0.6):

1) The editing tool and all edit menu functions are now operational (cut, copy, paste, clear, invert, horiz flip, vert flip and show clipboard).

2) You have the option of using a pictures color palette instead of the host applications colors.
   The only limitation here is that the picture must have been created in the same SHR mode (either 320 or 640) that the host application is running in, in order to enable use of the pictures colors.
   Pictures are saved to disk and printed using whichever color palette you have selected.

3) Full Screen now displays pictures using the color palette and SHR mode that they were originally created in.
   You can also now toggle Full Screen on and off by pressing the space bar.

4) Choose Font can now be selected by holding the Open Apple key and clicking on the Text tool icon.

5) Pen Size can now be selected by holding the Open Apple key and clicking on any of the shape tools or line tools icons.

6) The program can now be used with either System disk 4.0 or 5.0. The advantage to using System disk 4.0 is that users with 768k memory can now use D.T.Painter. There is also much more space available on System disk v4.0, so it is easier to fit the program on it.

Bugs found and fixed

The following is a list of the bugs I have found in v0.6 and have since corrected in 0.7:

1) Solid polygon dimensions off screen did not match those on screen. The first time the screen was updated after a solid polygon had been drawn, the size changed by approx 1 pixel on all sides.

2) The bug that was causing the ProDOS error #64 message dialog to appear and the source for many mysterious crashes has now finally been nailed down and eliminated! The majority of the trouble came during the initial selection of the program from the Apple menu when the program looked to find the boot up disk.

3) The program no longer checks a $C1 picture files aux type. This caused quite a few pictures to be unloadable.

4) The program now tests to make sure the boot disk is in a drive when selecting Choose Font. When the boot disk was not available to v0.6 it would cause the system to lock up.

5) The program now tests to make sure you have at least 10k of memory available before it will print a picture. This eliminates the system locking up during printing operations in the event that insufficient memory is available to the print manager.

6) This version of D.T.Painter no longer asks if you want to save a picture that has been changed before quitting the program. This may seem like a step backward, but for some unknown reason the program would crash when asking to save the picture when you elected to launch another program from the Finder. At any rate I thought it better to leave this "feature" out.

There were MANY other minor bugs fixed. I think you will find this version of D.T.Painter to be very solid and reliable to use. I have been unable to crash it and hope none of you are able to either. At any rate if YOU are able to crash it please let me know!

General Notes

D.T.Painter (DeskTop Painter) is an Apple IIgs NDA (New Desk Accessory). With it you can load, edit, save or print super hi-res (SHR) pictures. It works from within host applications running on a desktop of either 320 or 640 super hi-res graphics (SHR) mode.

This program is still under development and I am always open to suggestions to improve upon it, so if you see something that doesn't look or feel right let me know.

My current plans for this program are to make it shareware when it is complete. As it stands the only features not operational that have been planned from the start are Zoom and Coordinates. I have quite a few other ideas that I have come up with since the initial idea for this program came to me and may implement them in version 1.0.

There is a great deal of memory testing that goes on behind the scenes and if you find that you are getting locked out of a feature or two because of lack of memory, try closing some windows or NDAs. They all require overhead and closing out something may free up enough RAM to let you do what you want to do.

Many thanks to Jeff Krich (JeffK01), Joe Schober (JScober), Marian Petrides (Gus Grafix) and Scott Gentry (AFL Scott) on ALPE for their suggestions, help and encouragement.

If you have any questions or discover any bugs you can reach me on AppleLink PE (screen name "Bud Gehr"), on GEnie (account name "E.Gehr1") or you can get me via US mail at the following address:

Earl Gehr
1824 A Manning Circle
Charleston, SC 29404
For the first in a limited series of classic music pieces from the Far East (limited only by the number of sheet musics I can get my hands on), I have chosen two versions - koto solo and koto accompanied by shakuhachi - of Rokudan no Shirabe (translation: "A Study of Six Levels"). This is one of the better known of the Japanese classics, and by far the best known piece of the type called danmono ("leveled pieces").

The danmono format is one of the oldest formats of Japanese music, the other being kumiuta ("assembled songs"). A danmono piece consists of a number of sequential "levels", each of which varies slightly from the one before, and each of which use the material given in the first level. The "material" of the music is mainly a series of ascents and descents in fifths, and the main cadence, in terms of key C as the basis, is G-D-C. Most of the danmono are written in the tuning system called "hira-jo_shi", a pentatonic scale for which the open-string notes are C-D-D#-G-G#-C'. Intermediate pitches are made on the koto - a long zither tuned by raising the strings off the soundboard with bridges - by manipulating the non-playing area of the strings on the left side of the bridges with the left hand. The first string on the koto - the farthest from the player - is one fifth ABOVE the second string, and in fact has the same pitch as the fifth string. This first string is only used alone, or in combination with the second string to produce the open fifth chord called "shan", or when it will be echoed or accompanied by the fifth string. The "shan" chord, as will be heard, incorporates two of the primary registers of the tuning system, and therefore the melody departs from and returns to either or both of these pitches. The "shan" chord in some cases can be likened to a drone for musical purposes, and this seems an especially good analogy considering the drone of Scottish bagpipes.

Danmono begin with a cadence which expresses the three primary notes of the tuning system used. After this opening cadence, called the "kando.", come the levels, one after the other, each level containing 104 regular beats. The first level, from which all subsequent levels depart, has basically three parts. In the first part, the piece reiterates the cadence, then slowly rises in register, eventually covering all the strings on the koto. This task completed, a short state which one musical analyst calls "crisis" or "climax", ensues in which the piece "knocks its head against the ceiling" - remaining mostly in high register, but marked by irregularly paced phrases and often unusual notes which are rarely found at any other time in the given level. Finally, a descent is made, first hesitant, then in earnest, back down through the registers, and finally sets itself up to repeat the main cadence, thus drawing the level to a close and readying for the next level. The final level often has a "hanging ending", which sets up for playing the cadence but never actually does so.

#2 Godan ("Five Levels")

This is the other Danmono piece I've chosen to include, partly because it is the shortest danmono piece, and partly because upon inspection I found that this piece makes a nice demonstration of the "tsuki-iro", or "stabbing color" technique described below. This technique occurs only once in Rokudan, but is used extensively in Godan to add "lilt" to certain notes in the middle of melodic strings.

Enjoy!
This allows you to add a character to the current party.

H: Heal a character

If you have the money, you can heal characters at the local temple. Sometimes the characters will be so bad off that the only people that can help them are at the temple.

E: Equip a character

You can go to the equipment shop to buy or sell equipment.

NOTE: You must buy equipment for your character before you begin the adventure. If you don't, your party will go naked and weaponless into battle—not the smartest plan of attack.

After equipping them, press each character's number (1-4), go into the Items menu and Ready their equipment. Fighters need a weapon, shield (unless the weapon requires two hands to wield), and armor. Priests need the same, but can't use pointed weapons. Wizards can only wear leather armor (they need to gesture a lot), and usually use a staff.

T: Transfer a party

If you finished Dark Designs II, you can transfer your characters from that scenario to this one. You can transfer from Softdisk #109, Softdisk G-S #12, or wherever you have copied the game. You will need to know the exact pathname if your Dark Designs II is not on your Softdisk disk.

L: Learn spells

You can learn (read "buy") spells. Your priest or wizard will be taken to the appropriate spell shop. Each has eight spells to offer.

Wizard Spells

- Magic Missile: shoots a bolt of energy at a monster
- Speed: gives a player great dexterity for a while
- Strength: improves a player's strength for a while
- Stun: paralyzes a monster temporarily
- Lightning Bolt: zaps a monster with a big lightning bolt
- Fireball: blasts a column of monsters with fiery force
- Flame Strike: blasts all monsters with critter-crippling fire
- Death Ray: convinces most monsters to shuffle off this mortal coil
- Mark: (found on a scroll in the adventure) this spell marks a spot to which you can teleport to later
- Teleport: (found in the adventure) instantly transports you to the 'mark' you made with the mark spell.

Priest Spells

- Cure Light: heals a character of some damage
- Dispel Undead: commands magically animated dead creatures to begone in God's will
- Bless: protects the player from attacks
- Cure Serious: heals a character of serious damage
- Death's Door: heals a knocked-out character to consciousness
- Banishment: tells evil beings to go take a hike
- Word of Recall: moves the party from big danger back to town
- Curseall: heals a character completely (unless they are dead)

It is wise to accrue all of these spells.

Q: Quit and Save position

This quits the game and saves the state of your party.

W: Enter the Castle
INSIDE THE CASTLE

When wandering around the Castle, you will have four windows full of information.

The upper left window presents a 3-D view of the hallway you are in (spiffy graphics
courtesy of Laura Malone). You can use the mouse to move around by clicking at the
top, left, right and bottom of that window. The top and bottom are forward and turn
around respectively, and left and right are rather nicely equivalent to left and
right.

When you look at a character (by pressing 1 through 4), the character info will
appear in this window. When you are attacked by monsters, an overhead view of the
melee will appear in this window.

The upper right window contains the automatic map. Wherever you have explored will
be automatically mapped for you. When you are attacked by monsters, their numbers
will be displayed here.

Across the center of the screen is the information window. A text description of the
area you are in will be here, as well as information and prompts during an encounter.

At the bottom of the screen is the character status window, showing each character's
name, body points, spell points, and class.

COMMANDS IN THE CASTLE

You can use the arrows keys to move around, or IJ, or click on the 3-D window.

Press S to search the wall in front of you for a secret door.

Press Q to quit and save the game where you are.

ENCOUNTERS

When a group of monsters attacks, you can Fight or Run away. If you run away, you
will move back to the square you were in.

If you fight, each character can choose to Attack, cast a Spell, Use an Item, move
forward to the front line, or drop to the Back of the party. If the character
doesn't want to do any of these, press the SPACEBAR to pass the turn.

Once all characters have chosen you have one last chance to change your course of
action.

The fight continues until a) the monsters are defeated, b) you are defeated, c) you
cast a Word of Recall, or d) you run away.

If you are victorious you will get either a) gold, b) an item, or c) nothing.
Regardless of which you receive, you'll get experience points, which go toward you
character improving his or her body and spell points.

SOME TIPS ON PLAYING DARK DESIGNS III

¥ Never let your cleric get too low in hit or spell points. If you need to get out
quickly, they are your only hope. (Unless you have wisely purchased a Recall
Scroll.....)

¥ Cure Light is a pretty good spell, as the higher level the caster, the better it
heals, and it only takes one spell point. Save the other healing spells for heavy
combat.

¥A speed ring on a Wizard is a joy to behold. (He almost always casts first.) A
Cleric with a speed ring is helpful, also. He can heal characters before the monsters
get to attack him or cast Word of Recall before the party can be mauled.

RESTOCKING

You can restock the game so someone else can start from scratch by pressing Control-R
when the colorful title screen appears. All characters that have not brought back
Agamon's head will be deleted. You have been warned!

COPYING DARK DESIGNS III

Select "File Copier" from the File menu (or just press Open-Apple-F) to run the
copying program. Click on "Dark Designs III" and select the disk you'd like to copy
it to.
DATEWORKS

VERSION 1.0

DAVID SACHS ASSOCIATES

(USE DOWN ARROW TO SCROLL TEXT)

LIMITED WARRANTY

TO THE ORIGINAL PURCHASER ONLY, DAVID SACHS ASSOCIATES WARRANTS THAT THE
MEDIUM WHICH THE SOFTWARE PRODUCT IS RECORDED TO SHALL BE FREE FROM DEFECTS
IN MATERIAL AND WORKMANSHIP UNDER NORMAL USE AND SERVICE FOR A PERIOD OF
NINETY (90) DAYS FROM THE DATE OF PURCHASE. IF DURING THIS PERIOD A DEFECT
IN THE PRODUCT SHOULD OCCUR, THE PRODUCT MAY BE RETURNED TO DAVID SACHS
ASSOCIATES WITH PROOF OF PURCHASE, AND DAVID SACHS ASSOCIATES WILL REPLACE
THE PRODUCT. THIS SOLE AND EXCLUSIVE REMEDY IN THE EVENT OF A DEFECT IS
EXRESSLY LIMITED TO REPLACEMENT OF THE PRODUCT AS PROVIDED HERE.

IF FAILURE OF THE PRODUCT, IN THE JUDGMENT OF DAVID SACHS ASSOCIATES RESULTED
FROM ACCIDENT, ABUSE, OR MISAPPLICATION OF THE PRODUCT, DAVID SACHS
ASSOCIATES SHALL HAVE NO RESPONSIBILITY TO REPLACE OR REPAIR THE PRODUCT
UNDER THE ABOVE TERMS.

LIMITATION ON WARRANTIES AND LIABILITY

EVEN THOUGH DAVID SACHS ASSOCIATES RESEARCHED THROUGH ALL MEANS AT HIS
DISPOSAL, REVIEWED AND DOUBLE CHECKED THE ACCURACY OF THE ENCLOSED SOFTWARE,
DAVID SACHS ASSOCIATES CANNOT MAKE ANY WARRANTY OR REPRESENTATION, EITHER
EXPRESS OR IMPLIED, WITH RESPECT TO THIS SOFTWARE. AS A RESULT, THE ENCLOSED
SOFTWARE IS SOLD "AS IS". THE PURCHASER ASSUMES THE ENTIRE RISK AS TO THE
CONTENT AND PERFORMANCE. NO EVENT WILL DAVID SACHS ASSOCIATES BE LIABLE
FOR DIRECT, INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES RESULTING
FROM ANY DEFECT OR INFORMATION ERROR CONTAINED IN THE SOFTWARE, EVEN IF THEY
HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGE OR ERROR INFORMATION.

SOME STATES DO NOT ALLOW THE EXCLUSION OR LIMITATION OF IMPLIED WARRANTIES OR
LIABILITY FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATION OR
EXCLUSION MAY NOT APPLY TO YOU.

COPYRIGHT

DAVID SACHS ASSOCIATES CONFIDENTIAL INFORMATION: LIMITED DISTRIBUTION TO
AUTHORIZED PERSONS ONLY. THIS SOFTWARE IS PROTECTED AS AN UNPUBLISHED WORK UNDER THE UNITED STATES
COPYRIGHT LAW OF 1976 AND WAS ORIGINATED 1985-1986. IT IS PROPRIETARY TO
DAVID SACHS ASSOCIATES. (c) ALL RIGHTS RESERVED 1986. UNAUTHORIZED USE (INCLUDING USE TO PREPARE OTHER USE, DISCLOSURE,
REPRODUCTION, OR DISTRIBUTION) MAY VIOLATE FEDERAL AND STATE CRIMINAL LAW.

"AppleWorks" is a registered trademark of Apple Computer, Inc.

CONGRATULATIONS

You have just purchased a valuable and convenient tool that you will use day
in and day out for as long as you have to remember an appointment, birthday,
holiday, or any date for any reason. You will also have a complete record of
all appointments, expense records, family medical records, or any type of
information that you wish to keep a chronological record of.

"DateWorks" can be used as an:

APPOINTMENT BOOK
DIARY
EXPENSE LOG
FAMILY MEDICAL RECORD
DAILY REMINDER
T & E LOG

TIME LOG AND MUCH MUCH MUCH MORE.

And you can do it all within the incredibly flexible "AppleWorks" database.
What this means is that at a touch of a key or two you can find, sort,
format, add, delete, view, or print your information to suit YOUR specific
needs.

"DateWorks" is a group of "AppleWorks" data templates encompassing 12 years
dates, days of the week and holidays. Each file gives you fields for
occasions and 24 appointment or reminder fields. You can also add any local
holidays, union holidays or anything you want in any field.

1. "DateWorks" is not copy protected. As with any valuable data or program
disk, the first thing you should do is make a backup copy. Use the
"DUPLICATE DISK" option on your system utilities for that purpose and store
your original in a safe place.

2. To add a "DateWorks" file to YOUR data disk use the "COPY FILES" option on
the System Utilities Disk. Another way to do this is to boot your
"AppleWorks" program and then insert your "DateWorks" disk into your data
drive. Bring the "DateWorks" file (year) that you want to the "desktop" in
the normal manner. After you have done this, remove the "DateWorks" disk
from the data drive and insert the data disk that you will be using. Using
option 3 of the "AppleWorks" Main Menu, put the "DateWorks" file on YOUR
data disk. CAUTION: DO NOT TRY TO COPY "DateWorks" FILES TO YOUR
"AppleWorks" PROGRAM DISK. "DateWorks" CONTAINS DATA FILES AND MUST GO ON
YOUR DATA DISK. For quick and easy access I suggest that you keep the
current "DateWorks" year on the "Desktop" whenever using "AppleWorks".

3. Your "DateWorks" screen looks like this in the "single record layout":

DATE : Jan 1 86 OCCASION:
DAY : WED HOLIDAY : NEW YEARS DAY

1: 13:
2: 14:
3: 15:
4: 16:
5: 17:
6: 18:
7: 19:
8: 20:
9: 21:
10: 22:
11: 23:
12: 24:

And like this in the "Multiple Record Layout":

DATE : DAY :HOLIDAY : OCCASION: 1:

Jan 1 86 WED NEW YEARS DAY - - -
Jan 2 86 THUR - - -
Jan 3 86 FRI - - -
Jan 4 86 SAT - - -
Jan 5 86 SUN - - -
Jan 6 86 MON - - -
Jan 7 86 TUE - - -
Jan 8 86 WED - - -
Jan 9 86 THUR - - -
Jan 10 86 FRI - - -
Jan 11 86 SAT - - -
Jan 12 86 SUN - - -
Jan 13 86 MON - - -
The "DATE" and "DAY" fields contain data for the years 1986 thru 1997. The "HOLIDAY" field contains all "legal" Holidays in effect at the time of the latest version of "DateWorks" plus the more widely recognized holidays. You may add any local, union, school or any holiday that affects you or your geographical area. The "OCCASION" field is for entering birthdays, anniversaries or any other occasion that you would not want to forget.

You may change the category names or any other part of the "DateWorks" screen that you want to change. Use the "OPEN APPLE - N" to enter the "CHANGE NAME/CATEGORY" screen and follow the instructions on the screen. If you need further help, press "OPEN APPLE - ?" from the "REVIEW/ADD/ENTER" screen. Here are some sample screens that you may use for different purposes:

**DAILY EXPENSE RECORD:**

**A WORD ABOUT HOLIDAYS**

I have researched holidays through a number sources and checked and double checked my work until I was sure that the information was accurate. THINGS CHANGE!! It is possible that new holidays may be added or the formulas used to determine what day a particular holiday is observed will be changed. I STRONGLY SUGGEST THAT YOU TAKE A MOMENT OR TWO AT THE BEGINNING OF EACH YEAR TO COMPARE THE HOLIDAY SCHEDULE IN "DateWorks" WITH A CURRENT HOLIDAY CALENDAR.

Everybody does not celebrate the same holidays. Depending on your religion, geographical location, union membership, and various other factors, you may choose to either observe or ignore the listed holidays. You may enter any holiday in the "HOLIDAY" field and you can just as easily delete any holiday that appears. Technically there are no national holidays in the United States. Each of the states has jurisdiction over its holidays which are designated by legislative enactment or executive proclamation. In practice however, most states observe the Federal Public Holidays even though the President and Congress can legally designate holidays only for the District of Columbia and for Federal employees. When a holiday falls on a Sunday or a Saturday, it is usually observed on the following Monday or preceding Friday. For some holidays, government and business closing practices vary. In most states, the office of the Secretary of State can provide details of holiday closings.

In most states the following will be legal public holidays as of 1986:

NEW YEARS DAY  PRESIDENTS DAY (WASHINGTONS BIRTHDAY)
MEMORIAL DAY  INDEPENDENCE DAY
LABOR DAY  COLUMBUS DAY
VETERANS DAY  THANKSGIVING DAY
CHRISTMAS

I have also included holidays that are generally observed by most geographical areas and religious faiths, they are:
Welcome to Dazzle Draw - your entry into a world where everyone can be an artist. Using the newest in Apple color technology, Dazzle Draw lets you turn your monitor into an artist's canvas. You work your magic with a mouse, graphics tablet, drawing pad...or even a joystick.

Using the full 16 colors of this new "double high-resolution" technology, Dazzle Draw offers you a full selection of electronic paint brushes. You can fill in areas, cut and paste or copy portions of your drawing and create rectangles, ovals and straight lines in seconds. For fine detailed work, you can zoom in on any area of the screen. When you're done, you can save your creation onto a disk so you can work on it another time, show it to your friends, audience or customers in a "slide show." or use it as part of your own software programs.

If you have Apple's Scribe color printer (or another color printer listed on the Dazzle Draw package) you can even make full-color printouts of your artistry.

Dazzle Draw offers Apple //e and //c owners a level of graphics sophistication previously available only on far more expensive computers. Whether you're a professional artist, software developer or a part-time doodler, you'll be drawing in no time. And, as you are about to discover, every feature of Dazzle Draw is easy to use.

So put on your creative cap and let your imagination run free.

This manual is divided into several parts to show you how to get started and how to use all the features of the program.

The first section, Getting Started, tells you what you'll need to use the program and how to load it into your computer.

Input Devices explains how to use the mouse and other "tools of the trade."

Dazzling Basics introduces the menus and general features of the program. If you're already familiar with graphics software, this section may be all you need to get started.

Beginners should try out Your First Drawing and then read through

Whether you're a professional artist, software developer or a part-time doodler, you'll be drawing in no time. And, as you are about to discover, every feature of Dazzle Draw is easy to use.

So put on your creative cap and let your imagination run free.

This manual is divided into several parts to show you how to get started and how to use all the features of the program.

The first section, Getting Started, tells you what you'll need to use the program and how to load it into your computer.

Input Devices explains how to use the mouse and other "tools of the trade."

Dazzling Basics introduces the menus and general features of the program. If you're already familiar with graphics software, this section may be all you need to get started.

Beginners should try out Your First Drawing and then read through
Dazzling Details, which takes you through all the menus step-by-step. This section is also useful as a quick reference if you want to learn how to use particular features of the program.

Four Appendices provide technical information on hardware tips, printer setup, color, and ProDOS, the disk operating system used in Dazzle Draw.

The Glossary includes brief definitions of all the menus and functions of the program and terms in the manual that may be unfamiliar.

At the very end, you’ll find a list of Shortcuts and a display of all menus for quick reference.

The following are Required:
- Apple II/c or 128k II/e.
- Disk Drive.
- Color TV or monitor.
- A mouse, Apple Graphics Tablet, Drawing pad (such as a Koala Pad, ErgoPad, or Animation Station), or joystick.

The following are optional:
- Dot Matrix printer.
- Apple Scribe or Epson JX-80 color printer.

1. Insert the Dazzle Draw disk into the disk drive, turn on your computer. The program will load automatically.

2. Wait until the red light on the disk drive goes out. A title screen will appear. A second screen will appear and you will be asked to provide the following information:
   - Type the appropriate number (1 through 4) that corresponds to the input device you will be using.
   - Select which file system (Easy File or Professional File/ProDOS) you would like to use. If you are not familiar with ProDOS we suggest that you use Easy File. For more information refer directly to the File section.

Make a backup Copy

It’s a good idea to make a backup copy of Dazzle Draw. The program lets you make one backup copy of the front side of the disk. To make a backup copy, you will need a separate blank disk. Press the ESC key while the program is loading, before the title screen appears. Then follow the easy, step-by-step prompts that appear on your screen. A disk label is provided to identify the copy you make. Make certain the disk you use does not have the square, write-protect notch along the edge covered over with a tab or label.

For an introduction to the program, insert your Dazzle Draw disk into the disk drive with the label side down. Then turn on your computer. Follow the on-screen prompts for a brief slide show of drawings displaying what Dazzle Draw can do.

Later, you’ll learn to make automatic slide shows of your own pictures, with you deciding the sequence and timing of the whole show.

The best tools for using Dazzle Draw are either a mouse or an Apple Graphics Tablet. Although you can use a drawing pad or joystick, you’ll have less control over the cursor.

With your “artist’s tool” you can move the cursor (a white pointer or other shape) around the screen to select features from the program and to create your drawings.

This manual was written assuming you will be using a mouse. Depending on which input device you use, you’ll want to keep in mind the instructions below that apply.

To select a Dazzle Draw feature, move the cursor by moving the mouse on a clean, flat surface next to your computer until the cursor reaches the feature you want. Press the mouse button to highlight your choice, and then release the button. This is called “clicking the mouse.” To draw, move the mouse while holding down the button. Then release the button to finish a stroke.

Move the stylus on the surface of the pad to move the cursor. Press the pen down in place of pressing the mouse button.

Apply pressure to the tablet’s surface to move the cursor. Use the left pad button in place of the mouse button.
Before you begin, take a minute to study the screen. Your "canvas" covers the entire screen, including the area behind the menus at the top of the screen. The small white arrow is the cursor. It will take on different shapes, depending on the feature you pick.

The vertical band at the bottom of the screen is the scroll bar. It lets you move the canvas up and down the screen so you can use the entire drawing area without obstructions. You select features in Dazzle Draw through the menus. These contain special operations for drawing, choosing shapes, patterns, and colors, for cutting, pasting and copying, and saving and retrieving your work.

To choose one of Dazzle Draw's features, simply pull down the appropriate menu. Keep the mouse button held down and move the cursor over the feature you want to highlight, and then release the button. When a feature is gray, it can't be highlighted, and selecting it will have no effect.

The Crown Menu includes fundamental features of the program. As an exercise, select the first feature, About Dazzle Draw... Here's how you do it:

1. Move the cursor to the Crown menu.
2. When you reach it, hold down the mouse button.

When you reach it, hold down the mouse button. "selected," then click Test in the dialogue box. The message "Welcome to Dazzle Draw" should print out on your printer.

Note - The buttons on various drawing tablets and joysticks may vary.

3. Now move the cursor over About Dazzle Draw... and then release the button.
4. A window with a message appears on the screen.
5. To exit the feature and return to the main menus, move the cursor to the small box to the left of the window name and click the mouse.

Help About

This feature is like a title screen. It tells you how created and published the program and the publication date.

Printer Setup

This feature only applies if you're using a printer with Dazzle Draw. Dazzle Draw works on a variety of popular printers. Check the label on the back of the box for particulars. You must let the program know what kind of printer you'll be using. Here's how:

1. Pull down the Crown menu and select Printer Setup.
2. The "dialogue box" shown above will appear on the screen.
3. The dialogue box indicates three things: the name of the printer, the name of the interface card, and the slot number your interface card is in. If your printer, interface card, or slot number do not match these, you must change the settings. (If you have a /c, you can only change the printer settings.)
4. To change a setting, click the mouse on that item. The name will be highlighted and the bottom section of the dialogue box will display your choices. Click the mouse over the up-and-down arrows to scroll through your choices. When you see the name you want, just click over it.
5. To change another item, click the mouse over the item you want to change and follow the same steps.
6. If you change your mind at any time during this procedure, just click the mouse over Cancel and Dazzle Draw will restore the original names.
7. If you don't want to make any changes, simply click the mouse over Okay. The dialogue box will disappear.

Note - To test your printer, make sure your printer is turn on and "selected," then click Test in the dialogue box. The message "Welcome to Dazzle Draw" should print out on your printer.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 251 of 1262
Quit Dazzle Draw

When you're ready to stop using Dazzle Draw, this feature lets you remove the program from your computer's memory without turning off the system. You can then start up another program.

You've probably noticed that the Undo box has no features. This is because the Undo box has a unique function. It gives you the option of "undoing" the last step you took - for example, the last stroke you drew or section you cut or pasted. This option works only if you use it immediately following the action you want to take back, when the Undo box is red. To undo an action, move the cursor to Undo and click the mouse, or type "z" which is the keyboard shortcut for this function.

Windows in Dazzle Draw are the boxes that appear in the middle of the screen containing either information about the program or "tools" for using the various features.

Moving Windows

You can use a window from one feature (like Help About...) at the same time you're working with another feature without erasing what's on the screen. You can also move the windows around the screen so you can work more easily. For example, if you want to keep the Help About...window on the screen as you work here's what you do:

1. Move the cursor into the white title band at the top of the window.
2. Press the mouse button.
3. "Drag" the window to a more convenient location and release the button.

Note - Several windows on the screen at one time will look like a stack of cards. To bring one up from the pile, just click the mouse over an exposed area of the window you want it will jump to the top of the pile.

Using Tool Windows

When you choose certain functions of the program, tool windows appear at the bottom of the screen. A tool window is really like a tool box. It contains the tool you'll need to use the feature you've picked. For now, take a look at the tool window for Paint Brush. It contains the following features:

Name - Identifies the tool window.
Sizes - Lets you pick one of the four sizes for your paint brush.
Shapes - Gives you a selection of six paint brush shapes.
Solid Color or Pattern - Lets you decide whether you want to paint with a solid color or pattern.
Palette - Lets you pick one of 16 colors or 30 patterns from a palette.

Active Box - Tells you what color or pattern is active.
Scroll Bar - Lets you expose the entire canvas by moving the drawing area up and down.
Exit Box - Lets you exit Paint Brush and return to the main menus.

By now you have probably noticed that the little boxes that contain the names of the menus and features change color from time to time. Each of these colors has a specific meaning.

Blue - It's okay to use this option.
Yellow - You've just highlighted this option and it will be selected when you release the button.
Gray - This option is off bounds. You can't use it right now.
Red - Applies to Undo only. Lets you know when the Undo function is available.
Paint Brush lets you paint with a wide variety of solid colors and patterns. You can add text and even create lines, ovals and rectangles at the touch of a button.

Here's how to use Paint Brush:

1. Pull down the Tools menu and select Paint Brush.
2. Select either the solid color or pattern option.
3. Select a color or pattern. If you've chosen patterns, click the mouse over the "up" or "down" scrolling arrow to view all the patterns possibilities, six at a time.
4. Select a brush shape.
5. Select a brush size. The smallest brush size you can use with solid colors is one pixel.
6. Move the cursor, now shaped like the tip of a paint brush, onto the drawing area, and press the mouse button to begin drawing.
7. Release the button when you want to stop drawing and to move the cursor around the screen without leaving a trace.
8. To erase, select black or the color of your background and the brush size and shape with which you want to erase.
9. With the mouse button pressed down, sweep the cursor across the area you want to erase.

Hints:
1. To draw straight vertical or horizontal lines, press the "Open Apple" key ("Closed Apple" if you're using a drawing pad or joystick) while you move the brush. This feature is called "constrain." You can also use this feature in the Spray Paint mode and, as you'll soon see, when drawing Shapes.
2. Your brush tip is displayed in a contrasting color so that you won't "lose" it on a background of the same color. Occasionally, you may want your brush displayed in the current color, rather than the contrasting color. Press the spacebar- to switch between these two options.

Spray paint is primarily a shading tool that lets you apply colors and pattern in any density. You can adjust the spray to four different shapes.

Here's how to use Spray Paint:
1. Pull down the Tools menu and select Spray Paint.
2a. Using solid colors: If you are filling a solid color with another solid color, the "fill" and "with" boxes both are pre--set to the solid option, so all you have to do is select a color, then click the mouse over the area that you want to fill that color with.
2b. Using patterns: If you're filling with a pattern or over a pattern, you must tell the computer. To do so, first click the mouse over the solid or pattern option next to the "Fill" box to indicate what type of area you plan to fill. Then click over the solid or pattern option next to the "With" box. Now select the pattern or color from the palette that you ant to fill with. If you are filling over a pattern, the cursor will change to a dotted-line box. Click the mouse over the area that you want to fill.

Note - The dotted-line box shows what Dazzle Draw "sees" as the pattern it will cover.

The Zoom feature lets you magnify a small segment of your drawing so that you can do fine detail work by adding and deleting colors, pixel by pixel. You can work in even finer details with the color option in the Goodies menu turned off. The Grid function, also in the Goodies menu, can further enhance your Zoom work.

Here's how to magnify a section of your drawing:
1. Pull down the Tools menu and select the Zoom feature.
2. A dotted-line box will appear on the screen.
3. Move the box to the area you want to magnify by pressing the mouse button and dragging the box to the section you want to magnify. Then click the mouse.
4. The selected area will be placed in the Active box. It also will be enlarged to fill up the entire drawing area, so you can modify the drawing pixel by pixel.
5. While you're working, you can redefine the section you're working on by using the "zoom scroller," a device that appear in the Zoom tool window. The zoom scroller is like a joystick that directs the positioning of the magnified working area. Simply point the cursor at the dot in the center of the zoom scroller. This feature is called "constrain." Then move the cursor in the desired direction.

Working in your magnified section, here's how to add the delete colors:
1. Pick a color.
2. Move the cursor to the pixel you want to color and click the mouse.
To color more than one pixel, simply hold down the button while moving the mouse until you've filled in all the pixels.

3. If you change your mind and want to erase this color, click the mouse over the pixel or pixels you have that color. The pixels will turn black.

Using the Text feature, you can add words to your drawing. You have your choice of two type fonts (Modern or Serif) and three styles (Plain, Bold, or Italic). In addition, you can choose two sizes for each font: 18 or 36 Point for Modern and 24 or 48 Point for Serif.

If you want to add text to your drawing:
1. Pull down the Tools menu and select Text.
2. The Text Tool window will appear, displaying the current font, size, and style. You can change any of these settings by clicking the mouse over the current choice. The available options will appear one at a time.
3. Move your cursor to the position where you want your text to begin, and click the mouse. This position the text cursor at the place where the character type will begin.

Here's how to use the Shapes feature:
1. Pull down the Tools menu and select Shapes.
2. Select the outline or filled oval or rectangle.
3. Pick a border thickness if you've chosen an outlined shape.
4. Move the cursor to the drawing area.
5. Press the mouse button and drag cursor to create the size shape you want, and then release the button.

Note - To draw a perfect circle or a square, press the "Open Apple" key ("Closed Apple" when using a drawing pad or joystick) while defining an oval or rectangle.

With the Lines feature, you can draw solid lines with patterns or colors. You can use single lines, connecting lines, or rays emanating from a single point.

It's easy to use the Lines operation. Here's how:

Single Lines
1. Pull down the Tools menu and select the Lines feature.
2. Pick a color or pattern.
3. Pick the straight line option.
4. Choose a line width.
5. Move the cursor into the drawing area and press the mouse button where you want your line to begin. Then move the cursor to where you want your line to end and release the button.

Connecting Lines
1. Follow the instructions for straight lines until you get to Step 3. Then pick the connecting lines option.
2. Choose a line width.
3. Move the cursor to the area where you want your first line to begin and press the mouse button. Drag the cursor to the place where you want that line to end, and then release the button.
4. To draw a second line, press the button again. The second line will begin where the last line ended. Then drag the cursor until you get to the place where you want this line to end, and release the button. You can draw as many lines as you want.
5. To begin a new series of lines, click the mouse anywhere outside the drawing area to end the old series.

Rays
1. Follow the instruction for single lines until you get to Step 3.
2. Pick the rays option.
3. Move your cursor to the drawing area and press down the button at the point from which you want the rays to emanate.
4. Press the mouse button and drag the cursor to the point at which you want the line to end. To draw a second line, press the mouse button again and drag the cursor again.
5. To begin a new set of rays, click outside the drawing area.
Flip, Invert Colors, Cut, Paste, Copy, Exchange Colors, or Clear
Section features.

Here's how to capture a section:
1. Pull down the Edit menu and select Capture.
2. Move the cursor to any corner of the section you want to capture, and then press the mouse button. Drag the cursor a little and a small, dotted-lined box appears on the screen.
3. While continuing to hold down the mouse button, move the mouse so that the dotted line surrounds the area you want to edit.
4. Release the mouse button.

With this feature, you can flip a section of your drawing vertically or horizontally.
1. Capture the section you want to change.
2. Select Flip Horizontally or Flip Vertically from the Capture tool window.

The Invert Color feature lets you change colors in a section of your drawing to their "opposite" colors (such as white to black).
1. Capture the section where you want to invert colors.
2. Select the Invert Colors option from the Capture tool window.

Using the Cut and Paste features together, you can remove the section you captured and reposition it in another area of your drawing. Here's how to do it:
1. Capture the section you want to reposition.
2. Select Cut from the Edit menu or type "x" on your keyboard. The captured section will be lifted off the screen and placed onto the clipboard. In its place will be a black space.
3. Select Paste or type "v".
4. Press the mouse button and drag the cursor (which now look like a right angle to indicate the lower right corner of the section you cut) to where you want the section to be relocated. Then release the mouse button.

With the Copy feature, you can reproduce a section of your drawing without removing it and, by using Paste, place the duplicate onto another part of your screen. Here's how:

1. Capture the section you want to copy.
2. Select Copy from the Edit menu or type "c." The captured section will be copied off the screen and placed on the computer's clipboard. This time you won't see a black space replacing it – the original remains on the screen.
3. Press the mouse button and drag the cursor to the location where you want a copy of the section to appear.
4. Select Paste or type "v." The cursor now looks like a right angle.
5. When you move it to where you want the copy to go, press the mouse button. As you hold down the button, you can drag the image for exact positioning. Then release the button.
6. To make multiple copies, type "CTRL-V" each time you want a copy to be pasted to the screen.
Effectively, when you will have discovered the new ideas, this became the start of a revolution in the world of packers. D.D. DeLUXE is more than a packer, it is a totally new mean of compressing a full disk of data into a single transferable file!

The original!! (nothing less...)

DISK DISINTEGRATER DeLUXE V4.0

The original

(C) Logix Innovations 1988
2590, 4th Ave, St-Georges,Canada G5Y 3S8

Program written by: Louis Roy
Tutorial written by: The Broker
and
Louis Roy

Finally! No, you are not dreaming, here is the latest packer that Louis Roy wrote especially for you:

DISK DISINTEGRATER DeLUXE V4.0
The original!! (nothing less...)

D.D. DeLUXE is more than a packer, it is a totally new mean of communication. Effectively, when you will have discovered the new ideas included in this program as well as the power of the new features, you will never accept again to use other DDD imitations, and you will only swear by D.D.DeLUXE, guaranteed!

Louis Roy, the author of this program, has completely redesigned his packing algorithm. It packs more and faster! He also included a super fast and reliable checksum mechanism to validate the integrity of the compressed data. And Louis has designed this package thinking of the various types of users out there, from the faithfull []+ users, all the way to the PC transporter //GS users of today, without forgetting Sysops, Hard disk and Ram disk users, etc...

Another significant built-in feature of the program is the capability offered to the packing user to compose, and permanently store in the packed file, an 11 line peronnal message, and this, plus the built-in checksum and all the new features that you will soon discover, has resulted in a faster packer! As we said before, the world of modem telecommunication will never be the same again!

D.D.DE LUXE AT A GLANCE:

- Can pack 5.25, 3.5 800K and 3.5 1600K disks.
- Compatible with all PRODOS devices in existence today, including Ram disks, hard disks, etc..
- A new feature that permit you to communicate with hundreds of people
- have a copy commands that permit you to copy file from a directory to another.
- have an optimize option to pack even more (only prodos disk)
- have a clock on the main menu
- Support up to 14 storage units connect to your Apple.
- Will execute on Apple []+, //e, //c and //GS.
- Recognize, and utilizes your 80 columns cards (except on a []+)
- Packs more than ever.
- Packs and unpacks faster.
- PRODOS Hard disk compatible.
- Window driven.
- Keep the name of the packer and the date of packing.
- User friendly, less typing involved thru intelligent user interface.
- Built-in checksums.
- Supports all PRODOS commands directly from the program.
- Built-in FORMAT command recognizing all PRODOS devices.
- Keeps your configuration and personal message between sessions.
- Full error trapping mechanism.
- Recognizes, and utilizes, any clocks you may have.
- Built-in mini editor to edit your personal message.
- Packs and unpacks with one or more devices.
- Allows duplicate volumes on-line (contrary to COPY []).
- Easy to use!
- and more!!

HISTORY

Most of you have heard of the history of the famous DDD packer, but for the benefit of those that may not, we will recap the accomplishments of Louis Roy:

1983: Louis Roy, under the alias of DALTON, writes his first packer. Immediately this became a huge hit. It became THE de-facto standard in the modem world. What made this packer so special? Basically, a faster and more efficient packing algorithm and a few new ideas that were destined to become some of the most copied features of the day; the mean to compress a full disk of data into a single transferable file! This became the start of a revolution in the world of packers... From
that day onwards, packers would never be the same again, thanks to DDD V1.0.

1984: He writes a new version, DDD V2.0. This version supported new utilities, but still was using the DDD V1.0 packing algorithm. The program became visually more attractive, and user friendly routines as well as a more intelligent user interface appeared, things such as a task status bar, built in size appearing in the packed title, etc...

1985: DDD V2.1 correcting a bug in V2.0.

1986: DDD V3.0. Louis wrote this new version of his now legendary packer, but decides not to release it. This version supported many of the features that you will now find in DDD V4.0. The personal message, hard disk support, all appeared in that version. It was still using DDD 3.3.

Why wasn't it released? Because Louis decided to stop programming for the Apple all together. Even with the new packer nearing completion, he decided to take a sabatical to put his life in perspective. The life of a hacker is an arduous one, sooner or later you must let go...

This seemed to be the signal other hackers, with little imagination of their own, were looking for! From this moment on, we saw the appearance of new packers while keeping compatibility with DDD V2.1. Even now, most packers in use have blatantly copied his algorithm. Sometimes one wonders if programming ability is not equivalent to copying abilities!

1988: After his sabatical, Louis takes charge again by introducing Disk Disintegrater Deluxe V4.0. The packing algorithm has been totally revamped into a faster, more powerful packer. Mark my words, this packer marks the dawn of a new era, and believe me, the shock waves will be felt all over the modern world, and probably, the same unimaginative people will copy it again.

Make yourself a favor, use the original! As in other domains, the original has usually the upper hand on the copy!

***********************************
COMPATIBILITY
***********************************

A) D.D.Deluxe is not compatible with the older algorythm of DDD V2.1 (and other compatible packers). Why? Keep reading, the reasons will become obvious... In any case, this packer will render all other obsolete!

B) D.D.Deluxe will execute bug free under the following computers:
- Apple ]+ or compatible, with 64k
- Apple //e, enhanced or not, with or without extended 80 column cards.
- Apple //c, all models
- Apple //GS

C) Screen mode:
- Apple ]+: The display will be in 40 columns mode and in upper case characters only, even if you have a compatible ]+ which supports lower case characters. The main reason being that even those compatible cannot display inverted lower case characters that DDD uses.
- Apple //e: If you have an 80 column card, D.D.Deluxe will not use it, this is caused by the lack of standard in the ]+ 80 columns. Remember that you will have to boot DDD in 40 columns, any attempt to boot in 80 columns will result in garbage characters on your screen.
- Apple //e without 80 columns card: You will see lower case characters, but obviously you will only get 40 columns of display.
- Apple //e with 80 columns, Apple //c and Apple //GS: You will see both 80 columns and lower case characters.

D) Disk format that D.D.Deluxe can pack:
- 5.25" floppy diskettes
- 3.5" floppy diskettes with 800k capacity
- 3.5" floppy diskettes with 1600k capacity (yes, we know, they don't exist...yet...but we can compact them!).

E) Disk drives compatible with D.D.Deluxe:
- 5.25" disk drives
- 3.5" 800k drives (this include Apple 3.5, Unidisk 3.5, Universal disk controller and all other 3.5 drives that are Apple compatible.)
- 3.5" 1600k drives (not yet available, but Apple is rumoured to announce one for 1988).
- All hard disks working under PRODOS (CMS, Siders, Profile, etc.).
- All RAM cards that support a PRODOS RAM disk driver.
- All ram disks (such as the //GS Memory Saver).
- PC transporter RAM disk.
- PC transporter 5.25" PRODOS disk.

F) PRODOS version:
D.D.Deluxe is compatible with PRODOS version 1.3 or higher. Do not use with older PRODOS revisions (it will not run). It's preferable to use V1.4 because V1.3 have minor bugs in it.

G) Clock cards:
D.D.Deluxe will read your clock card as long as you have loaded its driver in the PRODOS boot (clock patch). D.D.Deluxe is compatible with all standard PRODOS clock cards, with or without patch. D.D.Deluxe will also work without a clock card, in which case you will be prompted for date/time input whenever required.

***********************************
WHAT YOU HAVE ON D.D.Deluxe DISK
***********************************

The D.D.Deluxe original disk have 2 sides. Following is a description of the various files on the disk:

D.D.Deluxe.V4.0
This is the main program of D.D.Deluxe (application file). This file should never be renamed, if you use D.D.Deluxe LOAD or if you use the Finder on a //gs.

D.D.Deluxe.COM
This is the file where your personal configuration of D.D.Deluxe (type BIN) will be stored. This file should never be renamed !

ICONS directory: FINDER.ICONS, FINDER.DATA and DDDDELUXE.ICONS
These files will only be useful for Apple //gs users. On the disk itself, these files are useless. Copy these files to the directory called ICONS of the Finder you are using. Your finder will then be able to load these files and will display the appropriate ICONS relative to D.D.Deluxe files. A small surprise is waiting for you! (Note: you probably have FINDER.ICONS and FINDER.DATA on your disk, replace them by these new files).

READ.ME.FIRST
First text file to read when booting for the first time the D.D.Deluxe disk (side 1).

D.D.Deluxe.DOK
TXT file, First part of the D.D.Deluxe documentation.
D.D.DeLUXE works on any system with at least 64k (except on the original Apple II). Maybe you are disappointed that the program does not make use of the full 128k, or more, memory of the /a, /c or //GS! There is a simple reason to this: it's faster that way! Even if the DDD's buffer is smaller by only using 64k of the available memory, resulting in increased disk access, it's still faster! This is caused by the peculiar architecture of the Apple bus. The Apple can only access 64k of memory at the same time, all subsequent 64k of memory are used as a switched memory bank. Basically, this demands a substantial amount of memory moves. In his beta version, Louis was using bank switched memory, but after a few benchmarks, he noticed that the increased memory handling capability resulted in decreased performance. So he removed it.

Statistically speaking, 98% of the Apple systems in use have more than one disk drive, so this will not cause a problem to the majority of the users. Those that only have a disk drive are left with the alternative of using a ram disk, acquiring a secondary disk drive, or swap disks! (check the copy command for further instructions on how to use ram disks when packing and unpacking).

......

NOTE ON RAMDISK

If you have a configured ram disk with 800k, D.D.DeLUXE will treat it as a 3.5" 800k drive. The same rule applies with ram disks of 1600k. It will so be possible to you to unpack DDD files of 800k and 1600k onto ramdisks instead of the usual 3.5" disks.

......

CLOCKS

If your Apple has a clock card, D.D.DeLUXE will display the current date and time in a little window at the bottom left of your screen of the main menu.

......

RESET KEY

As in other Apple programs, never press the RESET button while D.D. DeLUXE accesses your disk. This may prove to be hazardous to the life of your disk! However, as long as D.D.DeLUXE is not accessing the drives, it will be safe to press reset, you will then be transported back to the main menu.

......

ESC KEY

......

At any stage during the program, you can go back to the main menu by pressing the ESC key. No matter where you are, no matter what you are doing, you can always ESCape back to the main menu!

DISK ACCESS ERROR TRAPPING

Anywhere and at any time, D.D.DeLUXE always utilizes the same error trapping routine. This routine is activated automatically whenever you get an error while D.D.DeLUXE is accessing the disk. In the eventuality of such an error occurring, D.D.DeLUXE will tell you the appropriate PRODOS error code, in hexadecimal, in a little window at the top of your screen. Just refer to the standard PRODOS error codes (or the PRODOS error charts in a file on your D.D.DeLUXE disk) to find out the cause of the error and select an appropriate course of action.

In an error situation, the program will suggest that you press a key if you wish to retry the same operation again. It may give you the same error again, but if you corrected the problem in the meantime, it will work. This feature will prove useful whenever you leave your disk drive open for example...

WHAT'S THE PERSONNAL MESSAGE?

The personnal message is a very powerful and useful feature, maybe the impact of this feature escapes you right now, but as you will soon find out, you will not want to pack without this option!

Every time you will pack a disk, D.D.DeLUXE will compress and insert in the resulting DDD file your personal message along with your name and the date you packed the file. When another person will decompress your DDD file, D.D.DeLUXE will display automatically on the screen your personal message, your name and the date packed. Can't you already sense the obvious advantages of such a feature?

What could you write in that message? In reality, just about anything that you feel you would want other people to see, things such as documentation, special hints, even a classified ad! Let's say you have a modem to sell, etc.. You may even be able to reach somebody that you ignore his telephone number, even his address, the possibilities are endless!

WHAT'S THE MENU LINE

The menu line is edited at the same time as your personal message. As the user unpacks the DDD file, at the very start of the unpack, your personal message will be displayed. But the menu line only will be displayed at the end of the unpack, providing that no errors were detected.

This menu line will appear in the user's main menu as long as he will work with D.D.DeLUXE, or until the next unpack. What you will do with this menu line is only bound to your imagination, for example, you could use it as publicity for your favorite BBS, as this line will remain in permanence on the screen of the unpacking user as long as he uses D.D.DeLUXE (or until the next unpack), or why not use it to pass on proverbs, I'm sure that already ideas are popping in your head.

Take note that the menu line stay on the main menu screen even if the
user use the option "View DDD file informations" (in PRODOS COMMANDS).

D.D.DeLUXE PRODOS FILE TYPE and DISK IDENTIFICATION

When you are packing, D.D.DeLUXE uses the PRODOS type $DD (short for Disintegraterr DeLuxe) to store your DDD file, no matter if you used 5.25, 3.5, 800k or 1600k. As of now, this file type has not been used by any other Apple software programs.

When you will catalog such a directory with D.D.DeLUXE, these file types will appear as "DDD", but if you use other software programs to catalog such disks, they will appear as "SDD". This will facilitate the identification of DDD files.

How will you know what type of medium is to be used during the unpacking operation? This is made quite simple, just look at the file name! D.D.DeLUXE utilizes suffixes to differentiate the various mediums:

<filename>.A ---> 5.25 floppy
<filename>.B ---> 3.5 800k disk
<filename>.C ---> 3.5 1600k disk

HORIZONTAL MENU

At certain occasions, D.D.DeLUXE will ask you to choose certain options with the horizontal menu. In this case, just use the left and right arrows (-> and <-) to choose the option you desire, then press Return to accept it.

NOTE ON DIRECTORY SIZE

D.D.DeLUXE can catalog any PRODOS directory that contains a maximum of 600 files. Note that the limit applies to each directory, you may have thousands of files on your disk, but in any given directory (or sub-directory), D.D.DeLUXE cannot catalog more than 600 files. In the rare eventuality of this happening, you will get the message "DIRECTORY TOO LARGE", in which case you should consider splitting that directory into smaller sub-directories. But in reality, we all know that nobody would have this problem since we all know what problem having such huge directories will bring.

One final note, if you use a RAM disk driver, this limit will perhaps be lower, but then again, nobody should be affected.

EDITOR CONTROL KEY

Every time that D.D.DeLUXE will ask you to type anything, you will automatically have access to the following editing keys:

>- : move cursor right in sentence
<- : move cursor left in sentence
DEL : delete character at left of cursor
CTRL-D : delete character at cursor
TAB or CTRL-I : toggle insert mode on/off
CTRL-F : put cursor at first character of the line
CTRL-L : put cursor at last character of the line
CLEAR or CTRL-X : Clear line
RETURN : Accept line

D.D.DeLUXE STANDARD DIRECTORY COMMAND

Every time that you use the following options: PACK, UNPACK, PRODOS COMMANDS, OPTIMIZE, VIEW DDD FILE INFORMATIONS, SAVE MESSAGE and COPY COMMAND you will always have access to the following commands:

The first window that D.D.DeLUXE will display will be a list of the on line PRODOS volumes as well as a list of all devices without a valid PRODOS volume in it. At this time, you can use the arrow keys to browse through that list and choose your preference by pressing the Return key. Just remember that you will only be allowed to choose a device that contains a valid PRODOS volume.

Then D.D.DeLUXE will show you a second window containing the directory of the volume you chose previously. You will also indicate to you wether the catalog you are viewing is a FULL or PARTIAL catalog. You will see such information on the top line of the window. At the bottom of the window, you will see the volume name, total free blocks of the disk as well as the total block capacity of that disk. You then have, at least, the following options:

a) Arrows:
   - Right and down arrows: move down 1 line in directory
   - Left and up arrows: move up 1 line in directory
   - Open apple + down arrow: move down 7 lines in directory
   - Open apple + up arrow: move up 7 lines in directory

b) RETURN key:

   If you wish to catalog a subdirectory, position your scroll bar to the subdirectory and press Return, D.D.DeLUXE will give you a new catalog of that subdirectory.

c) Key "1":

   Back 1 directory. If you are not at the volume directory and you are in a subdirectory, you can backtrack to the previous directory by pressing the number 1 key.

d) Key "2":

   Full and Partial catalog toggle switch. By pressing the number 2 key, you will activate a toggle between the full and partial catalog mode. In a full catalog, D.D.DeLUXE will display all files present in the working directory, in a partial directory, D.D.DeLUXE will only display the sub-directories and the files of type $DD (or DDD). This option will allow you to quickly zero in on such type of files.

e) Key "3":

   Volume window. By pressing this key, D.D.DeLUXE will give you back the volume window of all on-line volumes on your Apple. Of course, if you inserted or removed volumes since the last time, D.D.DeLUXE will present you with an up-to-date picture of these volumes.

   Note that if your directory is empty, D.D.DeLUXE will display "No Entry". If you are in mode "full" and D.D.DeLUXE will display that message, then you have no files whatsoever in your directory, however, if you were in "partial" mode, then this message will indicate that you have no sub-directory or DDD files in the working volume. You may still have other types of file in this directory, to verify, just go in "full" mode by pressing "2" key.

HOW TO START D.D.DeLUXE

Before starting D.D.DeLUXE, if you have a clock card, you should evidently load its driver to patch PRODOS, if it hasn't been done already. Furthermore, if you also want to utilize your Ram card, you should also load its driver.

Note that no diver are necessary for /RAM on the //GS or the standard /RAM on the //c or //e. And don't forget either that you must use PRODOS 1.3 or higher.
Do not rename the following files, as they are used by D.D.DeLUXE and you may create unnecessary problems:

"D.D.DELUXE.V4.0"
"D.D.DELUXE.LOAD"
"D.D.DELUXE.CONF"

You must have the configuration file "D.D.DELUXE.CONF" residing in the same directory as "D.D.DELUXE.V4.0", so that D.D.DELUXE can load this configuration. If the configuration file is not found, then D.D.DELUXE will configure itself with default parameters.

If you are using a //GS, you can start D.D.DELUXE directly from the Finder by executing the main module: D.D.DELUXE.V4.0. You will not need to execute the D.D.DELUXE.LOAD if you use the Finder or the PRODOS dispatcher (PRODOS BYE or QUIT commands).

If you start D.D.DELUXE from AppleSoft basic, then you must start D.D.DELUXE.LOAD first, this binary file will load the main program D.D.DELUXE.V4.0 in resident memory. This procedure is necessary due to the size of the routine and this could cause a conflict with the BASIC.SYSTEM in memory if you wished to start directly from basic.

If you have an Apple ][+, you must start D.D.DELUXE from 40 columns, if you have an 80 column card, you must refrain from using it.

Once loaded, D.D.DELUXE will show you a banner page, at this stage, you may elect to press the letter A to read the "About D.D.Deluxe" for the program, pressing any other key will go directly to the main menu. Voilà! You are now ready to utilize D.D.Deluxe.

If this is the first time ever you used D.D.DELUXE, you will probably elect to go to option #8 and configure your personal version of D.D.DELUXE, if you need help with this option, read the documentation on the CONFIGURE option.

........

MAIN MENU

........

First, let's review the list of commands that will be documented in the following paragraphs and are available from the main menu:

[1] Pack disk
[2] Unpack disk
[3] Prodos commands
[4] Edit my message
[5] View last DDD info
[6] Optimize Prodos disk
[7] Format Prodos disk
[8] Checksum disk
[9] Configure
[0] Quit

You can choose one of the options directly by pressing its appropriate number or browse through the choices with one of the "browse" keys:

Space bar, right and down arrow: down one line
left and up arrow: one line
Return: accept option selected

PACK DISK

This option will allow you to compress a whole disk (5.25, 3.5 800k or 3.5 1600k) into a single file. Here is how to proceed:

1) D.D.Deluxe will ask you to select the location of the disk you wish to pack. D.D.Deluxe will show you the inventory window of all the disk 5.25, 3.5 800k and 3.5 1600k allowable on your system. Using the arrow keys, choose the location of your original medium and press return. It is not necessary that you insert your original disk at this time. You could do but you could also wait until D.D.DeLUXE asks you for it. If you are using an Apple //gs and you wished to pack a 3.5" disk, it would be preferable to insert the source disk prior to press RETURN in step #2.

2) The next step will be to type the name of the file you wish to assign to your packed DDD file. You are allowed a maximum of 13 characters, either in upper or lower case. Note that D.D.Deluxe will always append a suffix to your selected name, this suffix will identify the medium to be used to unpack:

.A --> 5.25" floppy
.B --> 3.5" 800k disk
.C --> 3.5" 1600k disk

Apple //gs user: Please note that if you chose to pack a 3.5 disk and that you have inserted the disk to be packed prior to start step #2, D.D.Deluxe will default the file name to be used to the volume of the disk to be packed, if it is a PRODOS disk of course. You will then have the option of accepting it as is, to modify it, or to enter a different name, by pressing first the CTRL-X or CLEAR (clear line).

Note: it's now time to insert your destination prodos disk where you want to save the DDD file.

3) If you are using an installed clock in your PRODOS, the D.D.Deluxe will not ask for the date, it will read it directly from the clock. However, if no clock was recognized, then D.D.Deluxe will ask you to register the date, that date will be defaulted to the date you stored in the configure option, but you can always override it with today's date, or another, with the help of the following keys:

right or up arrow: add 1 to current field (day, month or year)
left or down arrow: subtract 1 from current field
space bar: switch between fields (day, month or year)
Return: accept the date

4) Now D.D.Deluxe will show you the volume window. You can use the "STANDARD DIRECTORY COMMANDS" as mentioned previously to select the volume and directory where you wish to store your packed file. By default, D.D.Deluxe will suggest you the first directory (the volume directory) in "partial mode". Note that if you haven't already inserted your target disk (the one where you want to store the DDD file) and that you are already at the volume window, you can still insert it right away and choose, with the scrollbar, the device where the disk resides (i.e. the slot and drive number), then press RETURN.

Also note that if your target disk is not a PRODOS disk, or that it has never been formatted, D.D.Deluxe will ask you whether or not you wish to format it (PRODOS format). If you decline, then D.D.Deluxe will go back to the volume window (as you must absolutely choose a PRODOS directory to store your packed file).

You must also make sure that there is sufficient space on the directory where you wish to store your packed file, otherwise you will end up having to redo the entire packing process. With experience, you should be able to estimate roughly the number of PRODOS blocks required to pack a disk.

5) Finally, D.D.Deluxe can start packing! Check this:

a) 1 drive operation:
If the device you chose to pack your disk is the same as the device where your packed file will be stored, then D.D.Deluxe will only use 1 drive to pack your disk. Get ready to do a lot of disk swapping!
D.D.DeLUXE will ask you to alternatively insert your original disk and your destination disk. Don’t make a mistake, because D.D.DeLUXE will not verify that this is indeed the original disk or the target disk (it would slow down the packing process). It would be a prudent decision to put a "write protect tab" on your original disk, just in case... The consequences could be that you damage your original disk.

b) 2 devices operation:
If your source and destination disks do not reside on the same device, then D.D.DeLUXE will assume that you are packing using 2 different devices, will ask you to insert both the disks to be used at their respective selected locations and start packing by pressing a key!

c) Information displayed:
D.D.DeLUXE will display the following five parameters:
-> "DDD status" : Will tell you what DDD is doing
-> "Block #" : the block number that DDD is currently loading in memory to compress it.
-> "Total block" : The total number of blocks to be compressed
-> "Checksum8" : Since DDD loads 8 blocks of data at the same time to compress them, the checksum8 is the cumulative checksum of these 8 loaded blocks.
-> "Total file block" : This is the cumulative size, in block, of the packed file.

d) When D.D.DeLUXE has finished, just press any key to return to the main menu. Voila! You have successfully packed your disk!

NOTES:
o D.D.DeLUXE will use PRODOS file type $DD for all files packed with D.D.DeLUXE.
o D.D.DeLUXE will save in your packed file, your name, the date packed, your personal message and your menu line and all checksums of the disk.
o If you packed a 3.5" disk on a Apple //gs and if you use a APPLE 3.5 drive, and you do a 2 devices operations, D.D.DeLUXE will automatically eject your original disk from the drive.

C) Now, D.D.DeLUXE will ask you whether or not you wish to format your target disk (that’s the disk where you will unpack your disk onto, not the other way around!). By default, the response will be "YES", if you already know that your target disk has already been formatted in a standard way, (PRODOS, DOS 3.3, PASCAL, CP/M or other standard format), then you do not need to reformat your disk, you can then answer "NO". Just remember that your target disk must have been formatted at least once and that, in a normal method (i.e. not a protected disk). In any other cases, you will have to format your target disk.

D) D.D.DeLUXE now proceeds in unpacking your DDD file:
a) 1 drive operation:
Once again, if your source and target devices are the same, D.D.DeLUXE will assume that only one drive will be used to unpack, you will be then asked to alternatively insert the target and source disks.

b) 2 devices operation:
If your source and destination disks do not reside on the same device, then D.D.DeLUXE will assume that you are unpacking using 2 different devices, will ask you to insert both the disks to be used at their respective selected locations and start unpacking!

c) Information displayed:
As it unpacks, D.D.DeLUXE will display the following information:
-> "DDD status" : Will tell you what DDD is doing
-> "Block #" : the block number that DDD is currently writing on the target disk.
-> "Total block" : The total number of blocks to be unpacked
-> "Checksum8" : Since DDD loads 8 blocks of data at the same time...
This command will allow you to view a text file on the screen.

C) CTRL-V: VIEW TEXT FILE

You will be using D.D.DeLUXE, so have no fear that D.D.DeLUXE will ever convert a file that is not a DDD file. A) EDIT MY MESSAGE

You can try this command on any type of files. Prior to convert that file with DDD, one hint is to use for the usual DDD suffix (.A, .B or .C).

Most of the time, this command will never be used as the majority of contemporary modem transmission programs preserve the file type. If you ever have doubts that a TXT file (or other file type than $DD) was actually packed with D.D.DeLUXE, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

On top of the usual commands, the following additional commands are available (to activate these commands, use the arrow keys to position your cursor into the subdirectory, then delete each files contained, one by one). In situations like that, the use of a commercial program such as Copy It! maybe more appropriate.

When D.D.DeLUXE has finished, it will display the entire file, by pressing CTRL-Q (quit).

If an error was detected in the checksum, D.D.DeLUXE will stop unpacking immediately and indicate to you the last checksum of the DDD file. If your DDD file has been altered or destroyed (it only takes a lone bad byte!), while unpacking D.D.DeLUXE always verifies the checksum of the file being unpacked against the checksum stored on the DDD file. This way, you will always know that the unpacked file matches the original.

If an error was detected in the checksum, D.D.DeLUXE will stop unpacking immediately and indicate to you the last checksum of the DDD file. If an error was detected in the checksum, D.D.DeLUXE will stop unpacking immediately and indicate to you the last checksum of the DDD file. On top of the usual commands, the following additional commands are available (to activate these commands, use the arrow keys to position your cursor into the subdirectory, then delete each files contained, one by one).

As you press CTRL-R, D.D.DeLUXE will prompt you for the new name of the file, as usual you are restricted to 15 characters maximum. As you press Return, the file is renamed and D.D.DeLUXE would have refreshed the volume window accordingly.

This option will allow you to create a sub-directory in the working directory. As you press CTRL-C, D.D.DeLUXE will as you to enter the name of the directory to be created, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

This command will allow you to convert a DDD file that would be of a type TXT (text file) or any other file type to a normal DDD file type $DD. This command may be necessary in instances where your modem transmission program only creates files of type TXT (or other file type like BIN). Once the file received, you must use this option to change this file type back to the usual $DD type.

This option will allow you to create a sub-directory in the working directory. As you press CTRL-C, D.D.DeLUXE will as you to enter the name of the directory to be created, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

This option will allow you to view a text file on the screen. As you choose this option, D.D.DeLUXE will start displaying that file on the screen. D.D.DeLUXE will automatically display that file in page mode, when the display window is full, D.D.DeLUXE will stop further displaying until a key has been pressed on the keyboard (any one except ESC). Once the entire text file has been viewed, D.D.DeLUXE will go back to the directory where you were prior to press CTRL-V. Note that you could always exit from that command before having viewed the entire file, by pressing CTRL-Q (quit).

You may use this option on any DDD file. Take note that it’s the same control key as "VIEW TEXT FILE". D.D.DeLUXE identify automatically which command to use by checking the file type of the file (TXT or DDD file). This command is identical to the "VIEW LAST DDD INFO" command. Once D.D.DeLUXE has supplied you with the informations concerning the DDD file, it will go back to the directory where you were. Note that you can also save these informations in a TXT file, just like "VIEW LAST DDD INFO" by pressing CTRL-S.

F) CTRL-R: RENAME FILE

You can try this command on any type of files. Prior to convert that file with DDD, one hint is to use for the usual DDD suffix (.A, .B or .C).

C) CTRL-V: VIEW DDD FILE INFORMATIONS

Officially, you are only allowed to view any file of type TXT, but un-officially, you could also view Appleworks file type AMP, but right now the text will not be formatted exactly like Appleworks would. The reason is that Appleworks support is not officially implemented in this revision, but will be in a subsequent release of D.D.DeLUXE.

You can try this command on any type of files. Prior to convert that file with DDD, one hint is to use for the usual DDD suffix (.A, .B or .C).

If your DDD file has been altered or destroyed (it only takes a lone bad byte!), while unpacking D.D.DeLUXE always verifies the checksum of the file being unpacked against the checksum stored on the DDD file. This way, you will always know that the unpacked file matches the original.

This option will allow you to create a sub-directory in the working directory. As you press CTRL-C, D.D.DeLUXE will as you to enter the name of the directory to be created, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

This command will allow you to copy a file from the working directory to another directory. As you press CTRL-P, D.D.DeLUXE will display the volume window, as usual the "STANDARD DIRECTORY COMMANDS" described above will apply. Furthermore, D.D.DeLUXE will always default the first catalog to FULL mode.

This option will allow you to create a sub-directory in the working directory. As you press CTRL-C, D.D.DeLUXE will as you to enter the name of the directory to be created, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

This command will allow you to convert a DDD file that would be of a type TXT (text file) or any other file type to a normal DDD file type $DD. This command may be necessary in instances where your modem transmission program only creates files of type TXT (or other file type like BIN). Once the file received, you must use this option to change this file type back to the usual $DD type.

This option will allow you to create a sub-directory in the working directory. As you press CTRL-C, D.D.DeLUXE will as you to enter the name of the directory to be created, you are allowed 15 characters maximum, then press Return and it’s done! Your subdirectory has been created.

This command will allow you to convert a DDD file that would be of a type TXT (text file) or any other file type to a normal DDD file type $DD. This command may be necessary in instances where your modem transmission program only creates files of type TXT (or other file type like BIN). Once the file received, you must use this option to change this file type back to the usual $DD type.
the built-in D.D.DeLUXE MINI EDITOR to compose your message, here is a rundown of the various commands of this editor:

CTRL-J : (or down arrow), move cursor 1 line down
CTRL-X : (or up arrow), move cursor 1 line up
-> : move cursor right 1 character
<- : move cursor left 1 character
RETURN : move cursor 1 line down and position the cursor
DEL : delete character at left of cursor
CTRL-D : delete character at cursor
TAB or CTRL-I : toggle insert mode on/off
CTRL-N : toggle normal or inverse mode
CTRL-Z : center the line
CTRL-F : put cursor at first character of the line
CTRL-L : put cursor at last character of the line
CLEAR or CTRL-X : Clear line
CTRL-E : Erase the entire message

For []+ users, the following keys have been added:

CTRL-R : Prints the underscore character "_".
CTRL-T : Prints the backslash character "\".
CTRL-Y : Prints the square bracket character "\[".

These three special characters have been added since the standard Apple []+ cannot generate these characters directly from the keyboard, while being able to display them.

Note that you can type the characters in normal mode or in inverse mode. This should allow you to be creative in your message. Note also that the insert mode can be turned off by using the CTRL-I command again or by pressing one of the arrow keys or Return.

On your status line, D.D.DeLUXE will display the current insert mode (on or off) as well as the character mode (normal or inverse). Furthermore, if you are currently using 80 column, D.D.DeLUXE will display an index of the various commands available to you at the left of the window. Of course, if you are using 40 columns display, this index will not be seen on the left of the window, but underneath it.

Once you have finished typing your personal message (your creation), press ESC to return to the main menu. You can save this message for future use by going to the configuration option. D.D.DeLUXE will save it along with all other configuration parameters. This is the message that will appear as part of your packed file the next time you pack a file. Note that it is not necessary to go to the configuration option if you only wish the personal message you just typed to affect the files you will be packing in the current session, this is only if you wish to have this message appear as the default message every time you start D.D.DeLUXE.

...............
VIEW LAST DDD INFO
...............

This option will allow you to read the message from the last disk you have unpacked or the message from the last packed DDD file where you used the "VIEW DDD FILE INFORMATIONS" (from PRODOS COMMANDS), whichever came last.

D.D.DeLUXE will display the following informations:

- the name of the DDD file
- the personal message of that file
- the menu line
- the name of whoever packed that file
- the date of packing
- the version of D.D.DeLUXE used in packing (>= 4.0)

...............
OPTIMIZE PRODOS DISK
...............

This option will allow you to erase all the free blocks from a PRODOS disk. Use this option with care! You may wish to optimize your disk to improve performance. However, be careful as it will erase all the free blocks on your disk.

As you choose this option, D.D.DeLUXE will show you the volume display window, but this time, you will not see the directory window. Using the arrow keys, select the volume you wish to optimize and press RETURN. Note that if you attempt to optimize a non-PRODOS disk, D.D.DeLUXE will refuse to do so. You can optimize all types of disks (ram disks, harddisks, 5.25", etc.) as long as it is a PRODOS.

Once the optimization routine has completed, your disk has been optimized and now ready to be packed.

...............
FORMAT PRODOS DISK
...............

This option will allow you to format any one of your devices connected to your Apple, these include Ramdisk, harddisk, floppy 5.25", 3.5" 800k and 1600k drives, PC transporter 5.25" disk, etc..

When you choose this option, D.D.DeLUXE will give you a display window listing all devices connected to your Apple, using the arrow keys, just choose the devices to be formatted and press RETURN. D.D.DeLUXE then verifies that the selected devices have a disk inside them and will ask you to confirm that you indeed wish to format them. By default, the answer to this question is "NO", so choose "YES" and press RETURN. As the formatting is completed, press any key to return to the main menu.
A) DISABLE 5.25":

This option will allow you to customize D.D.DeLUXE according to your personal tastes and hardware. Following is a list of the various parameters available to you:

1) KeyClick:
   - This option will toggle the "noise" made every time you press a key. Use it according to your taste.

2) Your Name:
   - This is where you register your name, up to 19 characters are allowed.
   - This name will become your default for all further packing.

3) Pack Default Date:
   - This option allows you to specify the default pathname to be used upon exiting from D.D.DeLUXE. For more information on this option, check the section "QUIT" later in the documentation. Just remember that all pathnames must start by "/" and that the name of the called application program must correspond to a file type SYS.

4) System Speed:
   - This option allows you to adjust the speed of D.D.DeLUXE according to the speed of your CPU, for example, if you have a ZIPCHIP, chose 2Mhz, etc.. Why this parameter? D.D.DeLUXE will adjust the scrolling speed of the checksum window including the following informations:

- Block number: This is the first of the 8 blocks of the checksum, as you already know, DDD computes the checksum every 8 blocks.
- Checksum: Checksum of these 8 blocks.
- Last block: This is the last block # to be reached
- Total checksum: Checksum of all blocks on disk.

When D.D.DeLUXE has finished to compute the entire disk's checksum, you will have the total checksum, in hexadecimal, at the bottom of the screen. Note that if you wish, at any time, to stop the scrolling window (maybe to write down each checksum), you can do so by pressing the space bar once, you would restart it by pressing it again. Also note that you can checksum any type of Apple disk, it may be PRODOS, DOS 3.3, PASCAL, CP/M or any other valid format, even if we mention the term "block" to compute the checksum.

This option is not necessary to pack or unpack disks, D.D.DeLUXE automatically do so for you. It's just one more utility at your disposal, if you should ever decide to check the checksums yourself.

5) Configure:

This option will allow you to customize D.D.DeLUXE according to your personal tastes and hardware. Following is a list of the various parameters available to you:

A) Disable 5.25":

...
When you select this option, D.D.DeLUXE will utilize the standard QUIT function of PRODOS (like BYE in AppleSoft). On a //gs, if you called D.D.DeLUXE via the finder and after using D.D.DeLUXE you wish to return to the finder, you should use this quit option.

B) DEFAULT:

If you elect to quit to the default pathname, then D.D.DeLUXE will utilize the pathname that you have configured, of course you will have to make sure that the appropriate volume be online. This option will be practical if you always use the same application after leaving D.D.DeLUXE, such as a communication program.

C) OTHER:

This option is similar to the PRODOS QUIT command but is much faster. D.D.DeLUXE will ask you to enter the pathname of the application that you wish to execute upon leaving. Just type the full pathname, the name of the system file to be executed (type SYS) and press Return, D.D.DeLUXE will then load it and execute it.

HOW TO GET MORE SPEED

There are many ways to increase the execution speed of D.D.DeLUXE while packing or unpacking, here are some suggestions:

a) If you use a //gs, D.D.DeLUXE switch automatically to 2.8Mhz, compressing mechanism will then go roughly twice as fast as on 1MHz. You could also use a Ramdisk (or a Romdisk (such as the Memory Saver)) to store your DDD file. Or you could also use a memory cache program. The speed difference is really interesting, wether you are packing, unpacking, be it on a 5.25", 3.5", ramdisk or hard disk. The best memory cache program is probably "DIVERSI CACHE". Loading such a memory cache program will prove worthwhile, especially if you have many DDD files to pack or unpack.

b) If you use a //gs, //e or //c, you basically have three methods of speeding up D.D.DeLUXE:

1) The first method is to use an accelerator card, such as Applied Engineering's Transwarp which speeds up your Apple to 3.0MHz. The best accelerator is probably the ZIPCHIP from Zip Technology which increases speed to 4MHz, in which case D.D.D. would pack/unpack 3 times as fast (since disk accesses would remain at 1MHz).

2) The second method would be thru software, once again using a ramdisk. Note that D.D.DeLUXE is compatible with all PRODOS memory cards that fits in the []+, //e or //c. You only have to load the Prodos driver before booting DDD. D.D.DeLUXE will then recognize your ram card, if you forgot to load the driver, then DDD will not recognize the extra memory. In certain rare cases, it is possible that there will be a conflict between the driver and DDD, in which case you will not be able to use your ramcard. Certain cards have Rom based drivers, and in such instances, no drivers require to be loaded.

3) You can use also a cache program if your ramdisk allows one (check on the diskette that the manufacturer supplied with your RAM card)

CONCLUSION

I hope that D.D.DeLUXE will please you. Louis Roy has spent countless hours perfecting it, so be creative when you use it while composing your personal message on each DDD file, this idea will revolutionize the world of packed files!

INTRO:
---------

'DALTON DISINTEGRATER' is a new program which compresses a whole disk into 1, 2, 3 or 4 binary files maximum. As you will see, 'D.D.D. 1.0' is much better than disk splitter, disk rigger and disk slicer.

It works with ONE or TWO drives and with an original DOS 3.3 or a modified DOS 3.3 (like FRONTO-DOS, DIVERSI-DOS, DAVID DOS, SUPEROBS, ZDOS, HYPERDOS, etc.).

PACK A DISK (COMPRESS):
-------------------------------

When you pack, the SOURCE disk is the disk you want to compress and the TARGET is an initialized disk which will contains the compressed files.

To compress a disk into files, BRUN D.D.D. 1.0 and enter the number of drives you have. Now, choose option 1 (PACK) and enter the name of the program you want to compress. Before pressing 'RETURN', insert the ORIGINAL disk into drive 1 and an initialized disk (TARGET disk) into drive 2 if you have 2 drives (be sure you have enough space on this disk). Now press 'RETURN'. Voila!

If you have not enough space on your TARGET disk, the program will stop and write 'DISK FULL'. Just change the TARGET disk and put another one, then press a key (not 'ESC'...) to complete the compression.

When the program has finished, press 3 to quit, 1 to PACK or 2 to UNPACK another disk.

UNPACK A DISK (DECOMPRESS):
When you UNPACK, the SOURCE is the disk with the compressed files and the TARGET is the disk you want to merge onto.

To re-assemble (UNPACK) a disk, BRUN D.D.D. 1.0 and enter the number of drives you have. Now choose option 2 (UNPACK) and enter the name of the program you want to UNPACK. Before pressing 'RETURN', insert the SOURCE disk drive 1 and the TARGET disk (a blank disk, initialized or NOT) into drive 2 if you have 2 drives. Now press 'RETURN'. Voila!

When the program has finished, just press 3 to quit, 1 to PACK or 2 to UNPACK another disk.

TECHNICAL NOTES:

- Any time you can press 'ESC' and the program will restart.
- The program is completely error proof.
- Filenames can be up to 20 characters long.
- When you choose the option 3:QUIT, you will be in Applesoft. If you wish to execute the program once again, you must "BRUN" DALTON DISK DISINTEGRATER (don't make a 'CALL XXX' because of the program's structure...).
- It is not necessary for all the compressed files to be present on a single disk when you unpack a program.

ADVANTAGES FOR SYSOP:

1. Because of the algorithms used in D.D.D. 1.0, the compression is at its maximum, so you can put more programs on your AE LINE or BBS'S disk(s).
2. The downloadings take less time and it is more convenient for users to capture program(s).

ADVANTAGES FOR USERS:

1. Less time to wait while downloading a disk.
2. Less interventions to the AE LINE when you download a disk (because there's is a maximum of 4 files).
3. For those of you who have one drive, when you will pack or unpack a disk, you will open and close the drive's door (for exchange SOURCE and TARGET disk) only a few times: 2 to 8 times maximum (DISK SLICER: 18 times...).

COMPARAISON:

- DISINTEGRATER: 1 to 4 files maximum
- DISK RIGGER2: 2 to 5 files
- DISK SPLITTER: 4 to 8 files
- DISK SLICER: 9 files

COMPARAISON:

- DISINTEGRATER: 203 sect. Rating:63.8%
- DISK RIGGER1: 233 sect. Rating:58.4%
- DISK RIGGER2: 268 sect. Rating:52.1%
- DISK SLICER: 276 sect. Rating:50.7%
- DISK SPLITTER:416 sect. Rating:25.7%

Program: BUCK ROGERS
Program: ARCADE BOOT CAMP
Program: PIRATE SIGNATURE
Program: SUMMER GAMES (side 2)

ADVANTAGES FOR USERS:

1. Less time to wait while downloading a disk.
2. Less interventions to the AE LINE when you download a disk (because there's is a maximum of 4 files).
3. For those of you who have one drive, when you will pack or unpack a disk, you will open and close the drive's door (for exchange SOURCE and TARGET disk) only a few times: 2 to 8 times maximum (DISK SLICER: 18 times...).
As you can see, D.D.D. compresses a disk extremely efficiently considering the size of the files saved on disk as well as the number of files saved.

I have programmed D.D.D. for all AE lines to reduce transfer time. I hope you like it and don't hesitate to use it!

HAVE PHUN!

I would like to point out that the soul purpose of this new DDD 1.2 version is to enable CatSend 3.0 to function properly with DDD 1.0 which it didn't to start off with!

Therefore DDD 1.2 should only be used with CatSend!! DDD 1.2 works with all transfer programs but please use DDD 1.2 (new version) with all other transfering programs.

All DDD 1.2 supported commands are identical to those of DDD 1.0. Therefore please refer to DDD 1.0 documentation for a complete tutorial on the supported commands!

Why D.D.D. Version 1.2 ???

The soul purpose of this version is to content CatSend users. DDD 1.2 performs flawlessly with all CatSend versions! Therefore I suggest all CatSend sysops to switch from Disk Rigger to DDD 1.2 because DDD's packing algorithm is much more efficient than Disk Rigger's or any other present disk compressor except for DDD 1.0's. Packing disks with DDD 1.2 will only be more beneficial to you.

- More available disk space for CatSend sysops with few floppies.

I regret for not having released this DDD 1.2/CATSEND 3.0 compatible version sooner. But now there is DDD 1.2 which works properly with CATSEND (to a certain extent).

Compatibility

DDD 1.0 and DDD 1.2 are not at
all compatible with eachother!!
DDD 1.2 compressed files contain
2 less than signs <<, a single digit
and 2 greater that signs >> at end
of their filenames so that you can
differ both versions apart.

[DDD 1.2] - Catsend compatible version.
Example: *B 123 SUPER PINBALL<<0>>
*B 040 SUPER PINBALL<<1>>

[DDD 1.0] - Not Catsend compatible.
Example: *B 123 SUPER PINBALL<<0>
*B 040 SUPER PINBALL<1>

--- ROACHES IN CATSEND! ---

Why didn't DDD 1.0 work properly
with Catsend to start off with??
Your guess was as good as mine.
I recently located a bug in good old
Catsend! (Believe it or not...) "Following many experiments on this
matter, I noticed a glitch (bug!!) in
Catsend that wouldn't transmit every
byte of a binary file! This error only
occurred randomly throughout the tests. Which in turn explains why some DDD 1.0
packed files successfully unpacked after
they were transmitted using Catsend.

Here are the following bugs I
located in Catsend. This section is
a little technical; therefore if you
are curious, keep reading...
Roach Number 1
=-=-=-=-=-=-=-=

This bug concerns regular BINARY
FILES as well as DDD 1.0 packed files
when transmitted over by Catsend.
(Only Binary files; not Applesoft,
Integer or Text files...). DDD 1.0
failed to unpack the packed files
because of this following error:

With certain binary files Catsend
will not transmit the last bytes.
For example, with DDD 1.0 packed files
(123 Sectors) Catsend will not transmit
the last 3 bytes. These last bytes are
vital to the UNPACK command in DDD 1.0!

At the same token, I tried various
binary files other than DDD 1.0 files
and sometimes Catsend refuses to
transmit the last bytes. I am unsure
where the error is in Catsend, although
I am sure it exists! One certain fact
I was able to determine is that this
error revolves around the length of the
binary file being transmitted.
Roach Number 2
=-=-=-=-=-=-=-=

Catsend is unable to transmit any
file exceeding 255 sectors! In effect
if you attempt transmitting a file that
towers over 255 sectors, Catsend will
only transmit the difference.
Example: *B 300 SUPER PINBALL

Catsend in this case would only
transmit 44 blocks: 300 minus 256 =
44 sectors. Here is where the error
arises! The file (or compressed file)
Catsend saves on your disk will not
be the complete version.

This error will cause a huge
delima with DDD {} (new version!)
because DDD {} usually compresses
a whole disk into one file exceeding
the length of 256 sectors.

Note: This bug is not in any way
responsible for the original
malfuction of DDD version 1.0
with Catsend!

--- NOTE TO: THE WOMBAT & THE GONIF ---

Your Catsend has revolutionized
distribution of software! Please be
aware that it contains unpleasant
ROACHES. Unless you correct these
errors I believe Catsend will remain
absolute in comparison to the awesome
Cafur {}! Perhaps you dudes should
consider a catsend version IV!?

--- CONCLUSION ---

I corrected the original DDD 1.0
to cooperate with Catsend by simply
reducing the compressed files by 3
lovely bytes! And another miracle was
casted. Therefore I decided to name
this new version, DDD 1.2!!

One word to all Catsend sysops:
Why in the hell don't you switch your
system to a Cafur {} line? It will
save you a lot of bloody trouble
because all DDD versions function
perfectly with Cafur! Especially
DDD {}! Besides Cafur is the new
mode nowadays... You don't see computer
geeks wearing Catsend anymore!?
Introduction

In This Intro, I Will Simply But Briefly Emphasize On D.D.'s Primary Features. Dalton's Disk Disintegrater 1.0 Malfunctions With Catsend 3.0 For Known Reasons. Following Several Tests On This Matter, Dalton Spotted A Huge Error In Catsend (Every Version) That Would Not Enable DDD 1.0 Compressed Files To Be Successfully Transmitted Over The Phone Line. Therefore Dalton Recently Modified DDD 1.0 To Function With Catsend, Despite The Ugly And Nasty Bug That Contaminates It! DDD 1.2 Is Identical To The Original 1.0 Version, Although Version 1.2 Is Now Fully Compatible With Catsend. Refer To \-> Dalton Disk Disintegrater 1.2 Documentation For More Information Concerning This Topic.

Obviously This New DDD \[ Version Has Been Modified To Perform Properly With Catsend. So Please Do Not Hold Any Grudges Against It. Version \] Has Been Beta-Tested Over And Over, Resulting To Our Expectations (Pretty Awesome!)

Primary Features

Here Are The Primary Features Dalton's Disk Disintegrater \[ Will Have To Offer You:

- This Second Version Was Designed With 64k Of Memory In Mind. DDD And Your Extra 16k Go Hand In Hand To Offer You Some Pretty Awesome Advantages.

- DDD Packs & Unpacks Programs Very Fast. Unlike Disk Rigger 2.0, which Consumes Too Much Time.

- 85 Percent Of All Programs Will Entirely Compress In 2 Drive Passes Only! [For 64k Systems!!]
Apple II Computer Info

- Squeezes Every Bit Out Of Your Extra 16k Of Ram, To Enable Maximum Speed And Minimum Disk Access. (For 64k Systems!!)
- Autochecks For 64k Of Memory On Boot. If Not Present, Will Configure Itself To A Standard 48k System.
- DDD[] Contains A Perfected, Powerful And Flawless Crunching Algorithm Which Utilizes Every Packing Technique In Order To Achieve Maximum Data Compression.
- Amazingly Compares Any Program Into Only 1 Super File!!
  Example: *B 248 SUPER ZAXXON<248>
  Instead Of: *B 135 SUPER ZAXXON.00
              *B 135 SUPER ZAXXON.01
              *B 060 SUPER ZAXXON.02
- Arrow Driven Commands. This Allows Swift Access To All The Options.
- Dos Commands. This Permits You To Access Important Dos Commands From Within The Program Without Having To Exit Then Reenter Once Again.
  Menu Options
  1]Pack
  2]Unpack
  3]Source:1 Target:2
  4]Catalog drive 1
  5]Catalog drive 2
  6]Dos commands
  7]Boot drive 1

[PACKING A DISK] - OPTION 1
- Enter Any Filename You Wish The Superfile To Occupy.
- Make Sure Your Target Disk Has Sufficient Disk Space For The Packed Version.
- Your Target Disk Needs At Least 200 To 300 Free Sectors Before You Begin The Pack. Otherwise A Disk Full Error May Result!
  Use Option [4] From Main Menu, (Dos Commands) To Either Format Your Target Disk Or To Delete Useless Files On It.
- When Packing, Make Sure The Filename You Use Is Not One Identical To A Filename On Your Target Disk. And If So Delete Or Rename That File Before Attempting The Pack.
- If A Disk Full Error Does Occur While Packing, DDD Will Obliterate Whatever Packing It Has Achieved And Leave The Exact Diskspace Your Original Target Disk Occupied Before The Pack Was Executed.
- If You Have Formatted A 40 Track Disk And Wish To Use It As A Target For The Pack, Go Ahead.
  DDD Supports 40 Track Capabilities, Which Means It Will Write On A 40 Track Preformatted Disk (There Is No Need To Use A 40 Track DDS). If DDD Detects A 40 Track Disk, It Will Write On The Extra Tracks Only If Necessary.

[UNPACKING A DISK] - OPTION 2
- When Unpacking A Disk, The Source Is The Disk With The Compressed File And The Target Is The Disk You Wish To Merge Onto.
- Your Target Disk (Merge Onto) Doesn't Necessarily Need A Preformatted Disk. It Will Automatically Initialize Your Target Disk Before Commencing Decompression.
- When Entering The Filename You Wish To Unpack, Do Not Include The < Less Than Sign, XXX (Where XXX Is The Sectors) And > Greater Than Sign Following The Filename.
  Only Enter The Bare Filename And DDD Will Do The Rest.
  Example Enter:SUPER ZAXXON
  Do Not Enter:SUPER ZAXXON<248>

[SOURCE:1 TARGET:2] - OPTION 3
- This Option Will Permit You To Configure Your Drive Setup In The Manner You Wish! To Change The SOURCE Disk, Press "1" For Drive #1 Or Press "2" For Drive #2 (Or You Can Hit RETURN). Same Process To Configure The Target Disk.
  DDD[] Predefines To Support 2 Drives (SOURCE:1 TARGET:2).
- Obviously Few Cycles Of Changing Disks Must Occur If You Only Have A One Drive System. Therefore DDD Will Adjust Itself To Tell You When To Insert SOURCE And When To Insert TARGET Disks.

[CATALOG DRIVE 1] - OPTION 4
Apple II Computer Info

[CATALOG DRIVE 2] - OPTION 5

- These Options Were Added To DDD Because They Are So Oftenly Used. Catalog Your Disks When You Are Unsure Of Filenames.
- Following The Directory, The Free Sectors Remaining On The Disk Will Be Illustrated For Your Convenience.
- If You Only Have One Drive, Option 5 May Be Quite Useless To You.

[DOS COMMANDS] - OPTION 6

- This Option Was Added As Well Because Of Great Demand. Many Irrelevant DOS Commands Were Omitted.
- Here Is A List Of Accessible DOS Cmds:

  => TK  Abbreviates Track
  => ST  Abbreviates Status
  => R   Reading A Track
  => W   Writing A Track
  => C   Compressing A Track
  => D   Decompressing A Track
  => I   Initializing All Tracks

- The 'I' Is Illustrated Simultaneously As DDD []

- This Option Was Added As Well Because Of Great Demand. Many Irrelevant DOS Commands Were Omitted.

[BOOT DRIVE 1] - OPTION 7

- This Option Is Quite Useful Once You Have Terminated To Unpack A Program. You Simply Insert The Unpacked Version Into Drive 1 (Slot 6 Only!) And Watch Her Boot Up...

The Track Indicator

- Instead Of Useless Twirling Cosmetics Appearing On The Screen While DDD Is Active, Dalton Chose To Add A Rather Complete Track Status Indicator Oftenly Found In Bit Copiers.
- Here Is A Complete Legend Of The Abbreviated Significations Used On The Status Line:

  => MEMORY :  48k Or 64k
  => DRIVE :  1 Or 2

Determines The Amount Of Random Access Memory Your Apple Can Provide.

- In Order To Tell DDD [] Apart From DDD 1.0 And From DDD 1.2, Verify The Last Characters Of The Compressed Filename:

Accumulates As The Packing Or Unpacking Goes On, Until It Has Reached Its Final Limit Or Maximum.
LEN Abbreviates LENGTH (Sector Wise).

- Displays A Decimal Point On Each Individual Track Once It Has Successfully Been Read/Compressed Or Decompressed/Written.

- Displays A Decimal Point On Each Individual Track Once It Has Successfully Been Read/Compressed Or Decompressed/Written.

DDD Has Gone Through Several Tests And It Has Performed Flawlessly. Here Is A List Of Tests DDD Has Successfully Passed:

- DDD Operates Fine With Any DOS.
- Such As Diversi Dos, Pronto Dos, Hyper Dos, Original Dos, Etc.
- I Suggest That You Don't Use David Dos Because The Init Command Was Purged From That Operating System. We Suggest That You Use Pronto Dos.

- DDD Operates Fine On Any Apple [], [], [], (c, Apple Compatible 48k or 64k, With Either 1 or 2 Disk Drives Online.
- There Was An Error In The Original DDD 1.0 Which Made Apple ](e Inoperatable With 1 Drive Because The ](e's Monitor ROM Differs From The Original Apple ]( or ](e's ROM. DDD ]( Now Operates Perfectly With 1 or 2 Drives On The Apple ](e.

- We Have Transferred DDD Packed Files Over The Modem Using Almost Every Transfer Program.
- DDD Compressed Files Transmit Fine With Every X-Fer Program With The Exception Of Catsend 3.0. When The Compressed File Exceeds 256 Sectors, Catsend Crashes (Bug In Catsend...). Therefore Catsend Will Work Fine Under The Condition That The DDD Compressed File Doesn't Exceed 256 Sectors!

The Authors Of Catsend Will Have To Make Certain Modifications To Their Catsend Program In Order To Enable Files Exceeding 256 Sectors To Transmit Properly. Hopefully They Will Release A New Good Working Version Soon!

------

Comparing Results

- Dalton And I Have Done Several Comparisons Between DDD ]( And Disk Rigger 2.0. In Every Case, DDD Defeated Rigger In Both Speed And Packing Tests. Therefore We Are Quite Convinced That No Other Present Disk Compressor Can Surpass DDD's Overall Qualifications.
- As For Other Disk Crunchers Like, Compact It 1.0 And Disk Slicer, We Didn't Bother Comparing Statistics Because Next To DDD ], Disk Rigger Performed The Best.

- I've Included A Sector/Speed Test Chart That Compares DDD And Rigger Back To Back. The Main Objectives Of These Tests Are To Simply Point Out That DDD Is More Versatile And Convenient To Use Especially For Ae/Catsend/Catfur Sysops.

------

DDD 1.0(Old Version) Very Rarely Compresses A Whole Program Into 1 File. Notice There Is Only 1 Digit In The <X>.
The Following Transfer Programs
Check Out Perfectly With DDD][:

/\ ASCII EXPRESS (AE)
[\V3.0 - V4.0 - V4.2] /\ DOS FILE EXCHANGE (DFX)
[\V2.0 - NEW V2.0] /\ CATSEND (Applecat X-fer Program)
[ALL VERSIONS ON CONDITIONS] /\ DISKFER (Applecat X-fer Program)
[\V1.0 - V2.0] /\ CAT-FUR (Applecat X-fer Program)
[\V1.1 - V2.0]

Conclusion

I Hope This Tutorial Has Helped
You Make The Change From Disk
Rigger 2.0(Absolue!) To DDD]

I Special Thanks To The Micron
For His Radical Catfur][.
Catfur Is A Major Breakthrough
In Transfer Programs And Surely
Enriches Pirates All Over North America.

We Urge All Catsend Sysops To Make
The Switch To Catfur[]. It's A
More Reliable, Faster, And Very
User Friendly Transfer Program!
(It Works Very Well With DDD][...]
Catfur Compares With Commercial
Transfer Programs Such As:
Ascii Express And D.F.X.][!

The History of Packing:

In the beginning, most Apple programs were single files. In those days, all pirates had to do to upload and download programs was to call up an AE line and send the program across. But as software became more sophisticated, programs began to require full disks. To send an entire disk just could not be done with AE! So pirating software had to get more sophisticated to keep up with the new programs. At that point, the Stack (of Corrupt Computing) wrote his first Disk Splitter, which was a program that split a full disk into a sector map and 1-6 binary files. This made it possible to upload a full disk with AE by first splitting it, then unsplitting it back to its original state after downloading. Although this program ignored unused sectors, it did no data compression. Thus began the succession of programs that ultimately led to Disk Disintegrator[].1 Enhanced.

Disk Splitter worked, but it was unfriendly and the files it created took up a lot of disk space. It was followed by a number of similar programs which began to use various data compression methods. First there was Disk Rigger 1.0 and the its modifications (none of which were successful). Although it did compression and some fancy tricks, it simply did not work. Other programs were Disk Slicer by the Rocker and Disk Divider by M. Hata. Disk Rigger 2.0 was the next widely accepted program after Disk Splitter, but it had been the standard for only a short period when Dalton came out with his revolutionary Dalton's Disk Disintegrator 1.0. This program had a bug when working with multisets. However, if you use balanced disk in the language card, you will not want to use the language card's memory, or DOS will be overwritten, and you will have a hard disk. The second real reason for this option is to allow people with Siders to disable auxiliary memory. We can hear the Sider owners chanting in unison, "Why would I want to do something like that?" Unfortunately, since no one donated a Sider to the Assembly Line, we can not figure out a way to make DDD 2.1 work with both a Sider and auxiliary memory. If you wish to donate a Sider or information on how to make it work, see the number at the bottom of this doc. Remember: if you wish to use DDD 2.1E and a Sider, you MUST disable auxiliary memory.

Notes to hard drive owners:

Error Codes:

Since DOS is not active, if a DOS error occurs, instead of receiving a DOS error message, you will receive an RMSTS error. Here is a summary of the error codes and what they mean:

<table>
<thead>
<tr>
<th>Error #</th>
<th>Cause of error</th>
</tr>
</thead>
<tbody>
<tr>
<td>08</td>
<td>Error during initialization</td>
</tr>
<tr>
<td>10</td>
<td>Write protect error</td>
</tr>
<tr>
<td>20</td>
<td>Virtual memory mismatch error</td>
</tr>
<tr>
<td>40</td>
<td>I/O error</td>
</tr>
</tbody>
</table>

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 295 of 1262
This program will probably benefit you more than anyone else. All possible efforts were made to accommodate you. The light-bar file selection and volume support make it a breeze to use with your hard disk. Slider owners: make sure to read the above note, and do not rant and rave about a bug in DDD 2.1E that does not exist. You were informed here! Also notice also that this program does work correctly with large volumes, unlike DDD 2.0+.

Things not to do with your hard disk:
1) Do not use the Format option on a volume.
2) Do not unpack a disk to a volume.
3) Do not pack a large volume (you CAN pack a small volume!).

(official distributor for the Assembly Line)

Explanation:

This file will point out the differences between the many packing programs and hopefully introduce the new STANDARD in packing, DDD 2.5R.

Here's a list of the current (most recent) packers:

DDD 2.1E - Enhanced DDD makes use of 128k and lightbars
DDD 2.5 - Further enhancement of 2.1E which includes a Digi-Check
DDD 2.5R - The most recent packing program, is EXACTLY the same as DDD 2.5 except that it creates an "R" type file, not a "B".

As many of you know when DDD 2.5 or DDD 2.1E (referred to from now on as DDD 2.5 or DDD 2.1E) pack they create a Binary or "B" type file. However, DDD 2.5R creates a Relocatable or "R" type file, but this is done for a reason. With the advent of the IIGS many people have been purchasing 2400 baud modems or simply buying full duplex 1200 baud modems (such as Hayes and USRobotics). Well the standard transferring program is Ascii Express (AE) which uses XMODEM protocol. There are a number of ProDOS compatible XMODEM transfer programs which are compatible with AE, including DOS. What this means is that let's say you are calling a board using AE; M guards talk under ProDOS and the board you are calling is running AE (DOS) remotely. Well once you enter AE you can still download or upload even though you are in ProDOS, you see all of the ProDOS XMODEM transfer programs automatically convert the file you are sending to a ProDOS file, you are receiving to a ProDOS file. So once you got all that let's go on to say that you see something that you want to download, like Defender of the Crown, but it is packed using DDD 2.5. Well as I stated above, even though you are in ProDOS you can still transfer with DOS modems because of the built in converter in the ProDOS transfer programs. But, there is a problem as many of you know not all the files that are in DOS can convert to ProDOS perfectly in the transfer program. Well the Binary or "B" file is one such file, and this is what DDD 2.5 packs files into. Even though you could download it into ProDOS the file would be garbage as a result of the bad converting. This may seem very complicated but I will go over it again near the end of this file.

This problem has been solved, but only partially. You see, there has been a new packer created DDD 2.5R which creates "R" type files which can be converted back and forth between DOS and ProDOS without any mess ups, but not many people realize this program and are thus not using the new packer. Well if everyone would begin to use the new DDD 2.5R then anyone using a ProDOS transfer program could download any ware packed with DDD because the built in converter program would no longer mess up the packed files like it used to with the "B" type files.

Well! The point is simple, DDD 2.5R should become the new standard, not because I say so or anyone else - simply because it is better. DDD 2.5R is no different from DDD 2.5, the only difference between the two is that 2.5R creates a Relocatable (R) filetype instead of the normal Binary (B) filetype. The "R" filetype allows users of either DOS to download/upload any ware without worrying whether it will convert correctly or not, as it converts perfectly.

Along with this file I am going to re-upload DDD 2.5R in case some people over looked it as I did at first and I am also going to upload a DDD CONVERT UTILITY program which will be explained in detail a little later.

People who own Apple IIgs's and are planning to buy any external modems are "stuck between a rock and a hard place." Because everyone knows that the IIgs has a built in Serial port for external modems, but the only XMODEM
programs to support this are all written in ProDOS and none for DOS are planned in the built in port. But even though the IIGS has a built in Serial port for modems, IIGS users would have to purchase a Super Serial Card and use this instead simply because AE (DOS version) only works with the Serial Card and not the built in port. Not only is this dumb it's also costly. An approximate cost for a Super Serial Card is $120.00 and plus a cable for around $20.00. Well if they used the built in port it would only require a $35.00 cable instead of $140.00 for a card and cable. Now, on the other hand, if people started to use DDD 2.5R then IIGS users would have a ProDOS XMODEM program and the built in port (remember the only XMODEM transfer programs who recognize the built in port are all in ProDOS) can still be able to download and upload all packed files because they can be converted perfectly.

Now let's make up two examples to further illustrate what I am trying to point out.

Ex.#1: Jim owns a IIGS, and a USRobotics 2400 Courier modem connected to his IIGS via the built in port. Well Jim calls up Wares Palace, the nation's #1 wares board, and decides to download BUREAUCRACY, the hottest new ware out in the country. Jim goes to the transfer section, finds BUREAUCRACY on a volume and then decides to start downloading. Well unfortunately since Wares Palace is using AE (DOS) and Jim is currently in AE:MOUSE TALK, he cannot download it because it was packed with DDD 2.5 (not R). If he had downloaded it not would he have his copy not have worked, but he also would have wasted his last remaining xfer credits. What can Jim do? Not much of anything unless someone sends it to him packed with DDD 2.5R or with a *R* filetype (more later).

Ex.#2: Jake (Jim's brother) is now using the IIGS and calls up Wares Palace East Elite because Jim is not cool enough to get on. So then Jake decides to take a shot at downloading BUREAUCRACY, I mean it's already been out for 4 hours and he doesn't even have it. So he enters the transfer section and as before the board is in AE (DOS) whereas he is in AE:MOUSE TALK, but this time he sees that some nice fellow has packed it into an *R* filetype so quickly without wasting anymore time to think Jake starts to download it to his unidrive. After 800 blocks he is relieved to have the ware, so he hangs up and now has to unpack it. Well, the packed file is in ProDOS how can it be unpacked? The Answer: Boot up Copy /+ 6.x+ and convert the file to DOS by copying it from the unidrive to any DOS disk. Now Jake has the packed file in DOS so he boots up DDD 2.x (any version of DDD 2.x even DDD 2.1 can unpack DDD 2.5R files as well as DDD 2.5R itself). After unpacking Jake is thoroughly entralled with his Gnu ware and decides to upload it to Wares Palace Southeast but he has deleted his packed file of it, so he boots up his only DDD, version 2.1E. (Jake never needed 2.5R because he only downloads, he doesn't ever pack wares!) Well Jake has packed the ware and he now uses Digi-Check // to tack the Digi-Check onto the end of the filename. Now Jake has a packed file which looks exactly as if it were unpacked and not the built in port. Not only is this dumb it's also costly. An approximate cost for a Super Serial Card is $120.00 and plus a cable for around $20.00. Well if they used the built in port it would only require a $35.00 cable instead of $140.00 for a card and cable. Now, on the other hand, if people started to use DDD 2.5R then IIGS users would have a ProDOS XMODEM program and the built in port (remember the only XMODEM transfer programs who recognize the built in port are all in ProDOS) can still be able to download and upload all packed files because they can be converted perfectly.

The end result is this: From now on pack all files using DDD 2.5R and if you are a sysop and someone uploads a packed file that is an *R* filetype the sysop then uses DDD CONVERT UTILITY to change its filetype to *R*. The following are docs to DDD CONVERT UTILITY.

DDD CONVERT UTILITY is a program which was written in order to help DDD 2.5R become more popular and the current standard. The program is very straightforward and when run it prompts you for the appropriate Slot, Drive, and Volume to use. After this it will ask you for the entire filename, if you are not sure press [RETURN] and the current catalog will be displayed. When you know the name type it in exactly and DDD CONVERT UTILITY will find the file, change it's filetype to *R* and exit you to DOS. Very simply, this program changes a files filetype from *B* to *R*, but since I did not know of any simple programs that do this I decided to write one, besides it only took around 2 hours. After the file has been converted to *R* filetype it can be converted back and forth between DOS and ProDOS without fear of messing it up as it remains intact throughout all of the conversions. To exit the program press [ESCAPE] at any time and to re-enter press "s". The program works great with hard drives as well as normal drives, simply press [RETURN] when prompted for the appropriate volume if you are using a floppy.

Closing Comments:
The filetype does not matter at all to DDD 2.1E, DDD 2.5, or DDD 2.5R - they can unpack any filetype, which means that they all can unpack each others packed files. With DDD 2.5R and the DDD CONVERT UTILITY there is no reason why there should ever be a "B" type packed file on any board, as they can easily be changed. From now on I hope that everyone understands and decides to use DDD 2.5R to pack files and in the future I plan on writing a universal converter for any filetype, like Text and Applesoft, which will also convert back as well.

If you do not understand this then please contact me on any board I am on or specifically:

Apple Tree //_____________________________305/556-6858
Rock'n Roll Harbour ____________________305/821-2232
Capital Connection ______________________716/473-8051

The Screamer.

Also if it matters, Apple Tree // will begin to support DDD 2.5R and the "R" packed files shortly so I hope all other boards contend as well. And this file did not mention DDD 2.6 or DDD ProDOS because I do not have either one of them, but the point stands that from now on all packed wares should be in the *R* filetype.
Disk Disintegrator Version 2.7 Release Notes

New Features:

- **FORMAT**: A new format option now supports 35, 36, and 40 track disks. The 40 track option frees up 608 sectors, but will only work correctly on Non-Apple drives. Most Apple drives do, however, support the 36 track option which formats 544 sectors. If those two fail (I/O Errors) then you can use either of the 35 track formats. The first of these formats a disk with the standard 528 sectors, while the second formats a 528 sector disk, but uses 14 sectors usually allocated to the catalog, giving you 542 sectors. The second format only allows you 7 filenames on the disk.

- **DELETE**: This option is selected from the main menu, and simply lets you delete files. You will be prompted for source or target, and then can select the files to delete with the lightbar. Press <ESC> when you are done.

- **FASTLOADER**: DDD 2.7 is now equipped with a fastloader and reads itself in much faster than the old version. This loader will work in Diversi-DOS, Standard DOS 3.3, Sider DOS, and probably all other versions of DOS 3.3 available.

- **FILETYPE**: To make ProDOS conversions of packed files easier, DDD 2.7 now writes its object file to disk as an "R" filetype (Relocatable). This originally appeared in The Screamer's DDD 2.5R, and was done in good taste, and for a good reason.

Apology:

We would like to apologize for the little bit of protection added to the code for DDD. The reason for adding this protection is all the people with sector editors who think releasing a new version of a program means changing the version number and names on the title page.

If you want to make any modifications to DDD, contact Radioactive Snail or Data Latch on the Last Dimension and we will see about getting you the source code so you can do it right.

The Last Dimension AE
10 meg, 1200/2400 baud, 24 hours
214/827-5249

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 298 of 1262
Here is the last update of Disk Disintegrater DeLuxe: Version 4.2a. In this update, there is no additional feature than V4.2. For more features, wait for version 4.3.

D.D.DeLUXE V4.2a correct a little bug of version 4.2 when you unpack a DDD file and format the target disk. Now, the bug is fixed in V4.2a. This bug was not present in earlier versions (lower than 4.2). All DDD files packed with compatible packers or D.D.DeLUXE (any versions) are all good. The bug was present only in certain rare conditions and when you unpack a file while formatting the target disk with D.D.DeLUXE V4.2. So all your D.D.DeLUXE packed files are good.

Also in V4.2a, a little modification has been made to distinguish between the two partial catalog modes in PACK and UNPACK options:

a) In PACK option: when you ask for a partial catalog, D.D.DeLUXE print PARTIAL1 and show sub-directories, $DD type files and REL or TXT files if you have configured your D.D.DeLUXE to show them.

b) In UNPACK option: when you ask for a partial catalog, D.D.DeLUXE print PARTIAL2 and show only sub-directory filenames.

Please DISTRIBUTE this version on many Apple BBS boards as you can, it's very important to use V4.2a rather than V4.2 (when you unpack a DDD file). Thank you.

Louis Roy,
The author of D.D.DeLUXE.

Here is the last update of Disk Disintegrater DeLuxe: Version 5.0. You will find many new features in this version, here is a list of what have been added or modified since version 4.2a:

- If you have a mouse, you can use it //gs.
- D.D.DeLuxe remembers your last drive access so you can call back the last catalog you made.
- You can quit quickly, anywhere in the program by pressing CTRL-Q.
- There are more ways to quit the program.
- When you format a disk, you can specify a volume name and also, the disk is now prodos bootable.
- When you format a 3.5 disk on a //gs, you can now specify the interleave you wish to use to get a faster 3.5 disk (to know more about interleave please read notes about interleave in the D.D.DeLuxe documentation...).
- There are more options to configure.
- Each time you use the CTRL-I (insert on/off) in the mini-editor or at others places, the insert on mode remain on even if you use arrows.
- The size of the D.D.DeLuxe buffer is now displayed on the main menu screen.
- The time of day is always displayed on screen //gs.
- You can configure the program to show TXT, REL or/and APW files in partial catalog mode.
- You can now rename a prodos volume.
- When you ask to view DDD info, you can now save the info-file or you can print it on your printer.
- You can now view on screen or print on your printer normal text files, appleworks APW files or any other prodos files (view hex bytes).
- In catalog mode, you can execute a SYS program directly.
- You can now analyze a DDD file without unpacking it to check if the file is good.
- Now, D.D.DeLuxe can use your full 128k on a //e or //c as buffer when packing and unpacking.
- On a //gs, D.D.DeLuxe can now use //gs memory as buffer.
- Each time you pack a 3.5 disk, you can specify a suggested interleave for the disk you pack.
- There is now a "buffer meter" when you pack/unpack. With this meter, you can see D.D.DeLuxe put or remove bytes to the buffer.
- You can now pack/unpack new 3.5 1.44M disk.
- When you run the program on a //gs and you pack/unpack a 3.5 disk, D.D.DeLuxe eject the 3.5 disk automatically and also, detect when you put a 3.5 disk in the drive (1 drive operation).
- The program, in general, is faster.
- And many others littles modifications you will discover...

To know more about all these features, read the documentation on the side 2 of the D.D.DeLuxe disk.

NOTES:

a) When will run D.D.DeLUXE V5.0, you will have to re-configure it because V5.0 do not use the same configuration file as previous versions.
b) If you use the loading file "D.D.DELUXE_LOAD", you must replace it by the new one.

c) All DDD files packed with V4.0, V4.1, V4.2, V4.2a are compatible with D.D.DeLUXE V5.0.

d) To unpack old DDD 2.1 files (disk packed with PBN, DDD Pro, and other DDD 2.1 compatible program), you proceed the same way you do with D.D.DeLUXE DDD files.

e) When you unpack an old DDD 2.1 file, there is no guarantee the unpacked disk is exactly the same as the original disk because there is no checksum in the old DDD file. But if you unpack a new DDD file (type $DD, with message in the file), if D.D.DeLUXE unpack without checksum error, you can be sure your unpacked disk is exactly the same as the original disk.

f) The documentation has been updated for V5.0 now.

g) If you have an Apple //gs, please replace your old icon file by the new one (DDDELUXE.ICONS) in the ICON folder.

Please DISTRIBUTE this version on many Apple BBS boards as you can (distribute both sides!). Thank you and have fun with this new version of Disk Disintegrater Deluxe!!

For your pleasure only,

Louis Roy,
The author of D.D.DeLUXE.
And, then, after the "Enhanced" version of DDD 2.1 came out, it was successfully followed by version 2.2, which was written by Tom E. Hawk added some new features to DDD, most notable of which was the "#XXXX" we all saw mysteriously appended onto DOS 3.3 filenames. The mysterious lettering, was, of course, a checksum that had been calculated on the disk as it was being packed. This helped with transfers with AE, because AE Pro uses a checksum variation of xmodem to transfer files. Checksum xmodem is inherently unreliable because it does not check the ORDER of the bytes in a file, it just checks the values. So, DDD 2.5 filled a very necessary gap.

Even though ProDOS had been around since 1984, no one hardly ever used the OS for bulletin boards and file transfers because there was not a decent packing program for packing disks or files. Then came Propacker. Propacker ended with version 5.3c written by Randall Banning, who now makes his residence in Canada. (as does Dalton). Propacker ushered in the era of ProDOS boards, because now files could be packed into an efficient format for use in transferring.

However, the number of pirate boards that used Propacker could be counted on the fingers of one hand. The reason: DDD was king, and so was DOS 3.3. Everyone was happy until Apple Computer, Inc. unveiled a little monster called "The Apple IIGs." You see, the IIGs could use these 3.5 inch drives that held 800k of data. Could DDD handle a 3.5" drive? No. The reason: DOS 3.3 could only handle up to 400k volumes, and even then, it had to be "forced." Propacker was the answer. Apple's ProDOS operating system for our II's meant that we had a fast OS, and a lot more power because now we could use devices that could hold as much as 32 megabytes. So, ProDOS was the answer. But, the problem had not yet arrived... when the IIGs came out, we had a problem, and a BIG one.

The initial question that everyone asked was "what types of disks will we be transferring if we own IIGs'"? Apple made that abundantly clear when we were told that the new operating system, the native mode version of ProDOS, PropDOS/16, could only handle a 3.5" disk. Propacker was NICE. Propacker was reasonably fast, and it worked well as long as you hadn't gotten a bad transfer, in which case, it would crash while unpacking. But, on the whole, a decent packing program.

Then, after a bunch of DOS 3.3 based pirate boards decided that they would convert to the ProDOS format because of the increased demands for space, there quietly came a ProDOS compatible type of DDD. It was called PBH Pack. (PBH for "ProDOS/16." Essentially, if you had a pack utility that could handle 3.5" disks, you were coming out, the size of the executable file itself almost exceeded the capacity of a 5.25" disk. So, we had our problem, and we had the solution at hand: Propacker.

Propacker was (and still is) a nice nifty little program written to pack BOTH 3.5" and 5.25" disks. As a bonus, it could tell if you had packed a 3.5" disk, and what type of disk you were unpacking was a 3.5" disk. Propacker was NICE. Propacker was reasonably fast, and it worked well as long as you hadn't gotten a bad transfer, in which case, it would crash while unpacking. But, on the whole, a decent packing program.

Then, after a bunch of DOS 3.3 based pirate boards decided that they would convert to the ProDOS format because of the increased demands for space, there quietly came a ProDOS compatible type of DDD. It was called PBH Pack. (PBH for "ProDOS/16." Essentially, if you had a pack utility that could handle 3.5" disks, you were coming out, the size of the executable file itself almost exceeded the capacity of a 5.25" disk. So, we had our problem, and we had the solution at hand: Propacker.

ProTerm 1.2 became THE standard for Apple II telecommunications among pirates during the summer of 1987. ProTerm 1.2 had the capability to send files using many different protocols, among which was a "different" style protocol whereby it would pack a whole disk "on-the-fly" and send it... the packing algorithm that Greg Scheafer uses in Proterm is compatible with DDD and PBH pack. Great, we finally have some sort of standard emerging.

Now comes the advent of DDD Pro. For the first time, someone has taken a great deal of time to re-write DDD for ProDOS the way it SHOULD have been done in the first place. DDD Pro features high-lighter bar option selection, optional CRC generation on disk files, an "optimization" utility for ProDOS disks, disk AND file packing built-in, and many other "nice" features that make this packer stand out as an exceptional program. Read on...
If you selected "FILE" in the pack-type selection, you will first be prompted for the file that you want to pack. You will then be prompted for the pathname of the file that you wish to pack to. Once provided, the program will pack the file, attaching a 100 byte header onto the front of the packed file which includes some vital information. The format of the info in the header packet is as follows:

<table>
<thead>
<tr>
<th>Offset</th>
<th>Length</th>
<th>Data Byte(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>+0</td>
<td>1</td>
<td>$0A / ID byte #1</td>
</tr>
<tr>
<td>+1</td>
<td>1</td>
<td>$44 / ID byte #2</td>
</tr>
<tr>
<td>+2</td>
<td>1</td>
<td>$42 / ID byte #3</td>
</tr>
<tr>
<td>+3</td>
<td>1</td>
<td>Access code</td>
</tr>
<tr>
<td>+4</td>
<td>1</td>
<td>File type code</td>
</tr>
<tr>
<td>+5</td>
<td>2</td>
<td>Auxiliary type code</td>
</tr>
<tr>
<td>+7</td>
<td>1</td>
<td>Storage type code</td>
</tr>
<tr>
<td>+8</td>
<td>2</td>
<td>Number of 512 byte blocks used by the file</td>
</tr>
<tr>
<td>+10</td>
<td>2</td>
<td>Date of modification</td>
</tr>
<tr>
<td>+12</td>
<td>2</td>
<td>Time of modification</td>
</tr>
<tr>
<td>+14</td>
<td>2</td>
<td>Date of creation</td>
</tr>
<tr>
<td>+16</td>
<td>2</td>
<td>Time of creation</td>
</tr>
<tr>
<td>+18</td>
<td>3</td>
<td>EOF position</td>
</tr>
<tr>
<td>+21</td>
<td>2</td>
<td>CRC-16 of file</td>
</tr>
<tr>
<td>+23</td>
<td>2</td>
<td>Read count (# of 16 page reads to make)</td>
</tr>
<tr>
<td>+25</td>
<td>1</td>
<td>Length of filename</td>
</tr>
<tr>
<td>+26</td>
<td>64</td>
<td>filename, or pathname of file, possibly including up to 64 characters</td>
</tr>
<tr>
<td>+91</td>
<td>9</td>
<td>Reserved for future expansion (Should be 0)</td>
</tr>
<tr>
<td>+100</td>
<td></td>
<td>Packed data</td>
</tr>
</tbody>
</table>

As noted in the header info, DDD Pro runs a CRC-16 (not CRC- CCITT, for those interested) on the source file while it is compacting its data. The CRC checks the ORDER AND CONTENT of the data to make sure that the file's integrity is not damaged during a transfer.

UNPACK DISK/FILE: The selection does the exact opposite of pack a disk/file. It will prompt you as to whether you want to unpack a disk or file. Once answered, DDD Pro will prompt you for the disk or file to unpack. If you select disk, DDD Pro will check to see if the target disk has already been formatted. If not, DDD Pro will format the disk and start unpacking. If the disk has already been formatted, you will be asked if you want to overwrite it. If you answer yes, DDD Pro will start unpacking immediately instead of unnecessarily reformatting the disk.

Since the filename is already stored in the header of a DDD packed file, there is no need to provide an output filename for a packed file.

If you have a DDD packed file, and try to unpack it to a disk, you will be told that it is "not a DDD format file." Simply choose the "FILE" option in the select box, and the file will unpack correctly.

CATALOG: This selection acts as advertised in that it allows you to get a catalog of the currently prefixed volume, or subdirectory.

OPTIMIZE A DISK: This selection will allow you to "zero-out" the contents of the unused blocks on a ProDOS disk. You will be prompted for the device whose unused blocks you wish to clear.

You will want to "zero-out" the blocks on a disk that you are about to pack if and only if it is a ProDOS disk. This option can save a lot of space in packing because when ProDOS deletes a file, it does NOT place all zeros (0's) in the blocks that the file was using. Whenever a file wants some more space on the disk, it will simply place itself over top of the old data. (after all, why spend more zeroing out something if more data is going to be placed there anyway?) But, since the DDD packing algorithm works on the principle of repeated bytes packing more efficiently, you will want to remove all the data from these blocks. So, that's why you would want to "optimize" them. The procedure just makes a disk have less data to pack because you removed the unused data.

GENERATE A CRC: This selection will allow you to generate a CRC-16 on a whole disk, or on a file. Why would you want to do this? If you need a unique way to tell if 2 files are different, then the CRC's of the files will be different. If two disks are different, even by so much as 1 bit, the CRC's will be different. So, you could have a friend run a CRC on a disk before he sends it to you, and after it is unpacked, you could run a CRC on the disk to find out if the transfer was successful without line noise.

Note, however, that a CRC-16 for files is built-in to the DDD packed file format. If the file somehow got scrambled, DDD Pro will tell you so by a subtle warning message.

DELETE A FILE: The selection will allow you to delete a file from the currently prefixed volume/path.

ABOUT DDD PRO: This will show you current information about the version of DDD Pro you are using. It will also give credit where credit is due.

MISC:

-------

Before formatting any device, if the disk in that device has been formatted before, you will be prompted as to whether or not you actually want that disk formatted. This is provided for your protection if you have any valuable disk you don't want accidently formatted.

If you press 'y' at any filename prompt, you will be given a list of the currently on line volumes, and if you press 'y' you will be given a catalog of the current prefix.

CREDITS:

--------

Dalton, without whose packing algorithm, apple pirating would be going nowhere.
Zlopoth, for writing the first "enhanced" version of DDD. Tom E Hawk, for writing the second "enhanced" version of DDD, DDD 2.5. The Nybbler, for writing that wonderful/awful DDD compacter, PBH Pack 1.0-2.1 Major Disaster, for writing PBH Pack 2.0e, and providing the source to PBH. Mountain Man, for his INCREDIBLE disassembly and translation of the DDD packing algorithm.
Dr. DX, for writing the first credible translation of DDD for ProDOS.
Me, for writing the docs for this thing.
All the sysops who run a ProDOS board, without whose pushing, this program would not exist.
And everyone else who has had anything to do with making any of the many versions of DDD and PBH Pack.

POSTLUDE:

-------

Because he has a penchant for this type of thing, Dr. DX will be making better and improved versions of DDD Pro. The next MAJOR revision should support the 65C02 and have 80-columns, mousetext, and ProTERM-style file selection. The packing algorithm will be enhanced ever so slightly by the additional support of the 65C02's extra opcodes.

If I ever get time, I will be writing a ProDOS/16 version of DDD Pro... It will use pull-downs and SuperHires for file selection, etc. The algorithm will be tweaked some more by the use of the 65816's 16-bit opcodes.

And, while on the subject of algorithms, we will probably be "enhancing" the DDD algorithm in the not-so-near future to include additional packing algorithms. We will try to remain completely compatible with the existing DDD standard for
packed files, and just increase the effective compaction.

Chief Examiner
Lakeville, CT Police Department
Lakeville, CT Police Laboratory
File # H657/SJ43.1
G.K. Anderson, Detective 1st Class
July 8, 1982
RS: Robner Case

Although it appears that at least one member of the Robner household
had a reason for wishing Mr. Robner dead, the findings of the Medical Examiner and evidence gained from interviews with the family and family associates are only consistent with the conclusion that Mr. Robner died of a self-administered overdose of Ebullion.

G.K. Anderson
---
G.K. Anderson

CORPUS DELICTI– Union Memorial Hospital, Lakeville, CT

Summary of findings from Coroner's Examination:

Front and Back outline of body Small "x" written on left side of head in Front View of Body

Explanation: There were no injuries or marks of a suspicious nature, except a small bruise on the left temple (consistent with falling to the floor from a chair).

Analysis of the blood of the deceased revealed a blood level of 27mg% for Ebullion. The therapeutic range of this drug is normally 4 to 6 mg%. A fatal dose, while not specified by the manufacturer, has been found to be in the 10-20mg% range. A routine analysis for other common drugs was unproductive.

Findings were unremarkable except for massive liver damage consistent with overdose of Ebullion, and 10mg of Ebullion recovered from the stomach. Death occurred at 1 AM, plus or minus one hour.

The blood level of Ebullion and the massive liver damage consistent with Ebullion toxicity lead to the inevitable conclusion that the deceased died of an overdose of that drug.

Xaviera Hockmuller md.

Medical examiner

July 9, 1982

Chief of Detectives
Edindale Police Department
Edindale, CT 06103

Dear Chief:

I must once again ask for your assistance on a case involving one of my clients.

As you are no doubt aware, Mr. Marshall Robner, the industrialist and philanthropist, was found dead yesterday morning in his home. As far as I can determine, he was found dead on the floor of his library, the victim of an overdose of Ebullion, a medicine which he had been taking lately for severe bouts of depression. He had been alone during the night, and the door to his library had been bolted from the inside. Police had to break the door down with axes, I'm told, to get inside.

While I am completely convinced that there was no foul play involved in Mr. Robner's death, it is disturbing that Mr. Robner had called me only three days earlier for the purpose of informing me that his will was to be altered. In fact, I was expecting to hear from him this week so that he could deliver the papers to me. Given the size of the Robner estate, I feel that a more complete investigation should be undertaken. If for no other reason that to quash the suspicions which are inevitable in these circumstances.

I have sifted through the evidence gathered by the local police authorities and am passing it along for your inspection. I phoned Mrs. Robner this morning and informed her of my intention of having you take on the case. She was reluctant to be of assistance, but I convinced her to allow you to come around at eight o'clock tomorrow morning and spend the day.

I will be at the house at noon tomorrow for the reading of the current will, which Mr. Robner wrote a few years ago. I hope to see you then.

Sincerely yours,

Signed- Warren Coates
Coates, Shavely & Coates * Attorney at Law * Suite 1327 * Excelsior Tower * Hartford, CT 06101

Interviews - Excerpts--
Mrs. Robner

Detective Anderson: How did you come to find Mr. Robner?

Mrs. Robner: When I woke up this morning, I noticed that Marshall was not in bed. I wasn't alarmed, really, as it was not unusual for him to work late at night in the library and fall asleep there. I went down to the library and knocked on the door. Didn't answer, so I knocked even harder. When that didn't work, I started calling his name loudly. So loud, actually, that I woke up Ms. Dunbar and George. We all were gathered there, knocking and yelling, and finally Mrs. Rourke, our housekeeper, was alarmed enough to come upstairs. She suggested calling the police, which we did. They arrived about twenty minutes later, and started breaking down the door with axes. When we entered the room, we found Marshall lying on the floor, face down.

Anderson: Did he usually keep his door locked when he worked?

Robner: Almost always. He was pretty secretive about his work and he liked to be alone when he worked.

Anderson: Do you know of any reason why your husband might have wanted to take his own life?

Robner: He's been very depressed lately, you know. His business, Robner Corporation, is not doing well, and there is talk of selling out to a larger firm. Marshall founded the company, what, about twenty six years ago, and he has been desperately trying to find some way of saving it.

Anderson: The pills we found by his body, do you know what they are?

Robner: Yes. They were Ebullion tablets. It's an anti-depressant his doctor prescribed for him just last week.

Anderson: Had he been acting less depressed since then?

Robner: I really don't know. I haven't noticed much change.

Anderson: Did your husband ever talk of suicide?

Robner: He did, actually, though I never took it seriously. He would talk about how everything would be easier if he were dead, but then he would start again talking about how he was going to have to keep the...
business going. I'm... I'm stunned, really.

Anderson: Mrs. Robner, do you know of anyone who might have wanted to kill your husband?

Robner: Why, no. Of course not. He wasn't a very friendly man, he was very quiet. But he was a great philanthropist, you know, and everyone that knew him respected him. I can't imagine anyone wanting to hurt Marshall. Do you really suspect he didn't commit suicide?

Anderson: I don't suspect anything. I just want to understand what's happened.

FINGERPRINTS ON BOTTOM OF PAGE -- L & R THUMB/L & R INDEX/L & R MIDDLE/L & R RING / L & R LITTLE

Interview-- Ms. Dunbar

Detective Anderson: You were Mr. Robner's personal secretary, is that right?

Ms. Dunbar: Yes, sir.

Anderson: I understand that you were the last person to see Mr. Robner alive. Could you tell me about that?

Dunbar: Why, yes. I brought him some tea at about 11 PM that night. On nights when he expected to work late, he would always expect tea at that hour. I brought him the tea and he asked me to leave. That's all.

Anderson: Did Mr. Robner seem at all upset?

Dunbar: No, I don't remember that. On the desk when you came in?

Anderson: Do you know what he was working on that evening? Dunbar: No. I wasn't with him, except for that one time.

Anderson: Do you recall whether the pills, the Ebullion pills, were on the desk when you came in?

Dunbar: No, I don't remember that.

Anderson: Ms. Dunbar, were you with Mrs. Robner when the door was opened by the police?

Dunbar: Yes

Anderson: Do you remember her reaction? Anything she might have said?

Dunbar: She didn't really react much. I don't think she said anything except "He's dead." or something of that sort. She just stood there with the rest of us until you people arrived.

Anderson: How were the Robners getting along? I mean, were they happily married?

Dunbar: I don't thing so, really. He was so quiet and, well dreamy. She was always scolding him for paying too much attention to the business and to his "good works". They rarely went out lately, which seemed to upset Mrs.Robner quite a bit. She had friends of her own that she used to visit. I think she would have gone insane, otherwise.

Anderson: Thank you, Ms. Dunbar. Oh, one last thing. You prepared the tea for Mr. Robner?
Anderson: Were you at the concert alone?

Baxter: Quite alone.

Anderson: Do you know of anyone who might have wanted to harm Mr. Robner?

Baxter: No. Except for George, of course. During some of their shouting matches I've heard George threaten Marshall, but I don't really think he ever would have followed through.

Anderson: Shouting matches?

Baxter: George and Marshall were always at odds. You see, George has been living like a spoiled child all of his life. He's twenty five now and has never held a job. Just spends money, or gamble it away. Being the Robners' only child, he gets away with murder. Marshall would lecture him and threaten to cut him, off without a cent, and then the yelling would start. Eventually Marshall would give in.

Anderson: When was the last time you heard this?

Baxter: Actually, I heard it again just last week. Strange, now that I think of it, they went at it just last week. I hear that Marshall told George that he had decided to disinherit him. He even mentioned it to me at the office the next day. He seemed pretty serious. I suppose that the financial troubles at the company may have been responsible for his attitude.

Anderson: Are you at the house often? You say you have heard some of these "shouting matches".

Baxter: Well, I'm not here often. Only on occasion. I have heard it once or twice and have been told of other times.

Anderson: Thank you, Mr. Baxter

FINGERPRINTS - L. THUMB/L. INDEX/L. MIDDLE/L. RING part of R/L. LITTLE part of R

Interview - Mrs. Rourke

Detective Anderson: Mr. Robner, I have been told by Mr. Baxter that you and your father had some serious arguments lately. Could you tell me what they were about?

George Robner: I don't think that's your business.

Anderson: I'm told they had to do with you habit of wasting or gambling away your father's money.

Robner: So?

Anderson: I've even been told that he threatened to disinherit you.

Robner: Yeah. He said he was going to. I'll bet he didn't though. He never has.

Anderson: Mr. Robner, let me be frank. I'm, told that you threatened violence against your father as recently as a week ago, and now he's dead.

Robner: Look, I don't get what you're driving at. You find the poor guy dead in his room. The room is locked. His bottle of medicine is nearly empty. What sort of detective are you, anyway?

Anderson: I'm doing th asking, if you don't mind.
Rourke: Well, of course I've heard all of the screaming and fussing with George and Mr. Robner. That's been going on for years, now so I don't make much of it anymore. No, I can't imagine anyone wanting to hurt poor Mr. Robner. He was such a sweet man.

Anderson: Thank you, Mrs. Rourke.

FINGERPRINTS - L&R THUMB, INDEX, MIDDLE, R ING, LITTLE

CHAPTER I

Investigative Techniques for Cases of Suspected Homicide----

The detective investigating a possible homicide is much like a person piecing together a puzzle. In both endeavors, the participant must weigh each inconsistency, and ultimately determine how all the parts fit together as a logical whole. Here, then, are some considerations to bear in mind as you attempt to solve this puzzle.

The Time Element:

It is usually necessary to conduct your investigation as expeditiously as possible. You have a deadline of 12 hours, make proper use of your time, its important. Most actions you perform will take about one minute of investigative time, some actions, such as examinations done CAREFULLY, may take longer. If you wish time to pass without actually doing anything, you can say WAIT FOR some number of MINUTES...OR... WAIT FOR some person....OR... WAIT UNTIL a specified time. In any case, you will see events occurring while you are waiting and always have the opportunity to change your mind about sitting idly should an interesting event take place.

Evidence:

During your investigations, you will uncover pieces of physical evidence found in your vicinity. While this evidence may be vital in itself to reach a proper conclusion to the case, it may also be of great interest to one of the principals in the case. Therefore, showing pieces of evidence to others (even suspects) may have a useful effect. Other people may make discoveries of their own which they may relate to you. It is altogether proper to ask to be shown such findings.

Suspects:

It is possible to ask people for information. However, be aware that their answers, while often helpful, may be self-serving, false, or contradictory. Remember at all times that you are dealing with people----some of whom are under great pressure or emotional strain. The most extreme care must be exercised when your ACCUSE people.

The Police Laboratory:

The facilities of the nearby police laboratory are always available to you. Fingerprints found on objects can be compared with those of the principals, which are on file at the lab, simply by instructing the lab to FINGERPRINT the object in question. You can ANALYZE an object in a routine manner or FOR a specific substance. Sergeant Duffy, as diligent an assistant as can be found the annals of criminology, will take objects to the lab for you and return with the results, usually within half an hour.

Procedure for Making Arrests:

When you feel that you have established a convincing case against one or more people, you may decide to ARREST them. (A single individual must be in your presence to be arrested; two or more accomplices need
To handle any of the various pieces of evidence, simply refer to the object by its name. Should there be several objects of same type (e.g.-two tables), just add a descriptive word (e.g.- THE LONG TABLE). Here are some ways in which other investigators have handled evidence:

- Take the pencil.
- Put the wrapper, the ticket, and the nail file on the dresser.
- Sit down on the sofa.
- Examine the detective magazine.
- Look around the painting.
- Search near the scuff marks.
- Take everything except the fish bowl and the antique rocking chair.

Don’t hesitate to handle more than one object at a time. Just be sure to separate their names by a comma or the word AND:

- Put the wrapper, the ticket, and the nail file on the dresser.

Dealing with Suspects and Other People:

The best authorities recommend courtesy as a key to winning the confidence of those you encounter while conducting police business. For instance, speaking to people from a distance is strongly discouraged. If you need to get the attention of someone who is, say, down a hall or corridor, simply remark, Mrs. Jones! If you cannot resist the urge, you may even say, Hey, Mrs. Jones!

Once you an another person are in the same place, you can ask questions or ask that person to do something for you. However, there are "only two" types of questions that will be answered; those dealing with information about someone or something, and those concerning the whereabouts of person and objects. Again, courtesy is the key. When addressing someone, precede your statement or question with that person’s name and a comma:

- Mr. Jones, tell me about Mrs. Jones.
- Jim, who is the butler?
- Fred, show me the bullet holes.
- Mr. Giles, give me the gun.

Once you are engaged in conversation with someone, you can skip the formality and simply state requests. However, when the person with whom you are speaking moves to a different place, it is proper to re-initiate your interview by using the individual’s name.

Avoiding Tedious Interrogations:

It is considered extremely poor form to ask interrogative questions which have already been asked by other police officials. Therefore, you are supplied with any relevant interviews obtained from other police officers. Also, as noted in the preceding section, only a few types of questions will receive a response. When is impossible to elicit a response to a question that seems vital to your investigations, the needed information will often be found in your dossier. If not, you can assume the information is not important.

Communication Your Intent:

Clarity of speech is as important as clarity of mind in detective work. At times, you may happen to specify an action incompletely. For example, you might say, Kill the suspect without indicating the weapon you wish to utilize. In such cases, you may be asked to make a clarification (e.g.- with what?) Should this occur just answer the question (e.g.- with the revolver). If you specify an action incompletely in a situation where one thing may be assumed (e.g.- there is only one weapon), you will be informed of that assumption (e.g.- with the revolver). If you say something which cannot be
understood because it is either too complex or improperly stated, you will be told of the problem.

Flatfoot Computer Lingo:
The police have only limited resources and it computers often use words which they cannot understand. Such words are used only to enhance your imagery and focus your deductive powers.

Ending an Investigation:
If you wish to terminate your investigation and not come back to it at a later time, you can type QUIT. Since a decision of this kind is irreversible, you will have to confirm your decision.

If you want to terminate your investigation by starting over from scratch, you can type RESTART. You will again be asked to confirm your decision.

Continuing an Investigation at a Later Time:
If you wish to suspend your investigation midway and continue it from that point at a later time, type SAVE and answer the question as described on your Reference Card. To return to your investigation at another time, type RESTORE and answer the question as described in the Reference Card. You may want to use this feature when you are about to try something dangerous or irrevocable.

Utilizing Stenographic Services:
Depending on your hardware, you may be able to obtain a typed transcript of your activities using the SCRIPT command. The transcript may be stopped with the UNSCRIPT command. Consult reference card for availability of this service on your system.

CHAPTER III
Commonly Encountered Terms in Criminal Investigations----
ACCUSE (someone) OF (something)-- Makes an accusation against someone. (In this regard, "something" is usually murder.)
AGAIN -- Causes the last action you performed to be repeated.
ANALYZE (something) -- Asks the police laboratory to perform a routine analysis (including fingerprints comparisons) of something.
ANALYZE (something) FOR (something specific)--Asks police laboratory to analyze something specifically for something in particular
ARREST (someone or someones)--If there is considerable amount of evidence against an individual or individual, this command ends the case and describes the result of the prosecution.
ASK (someone) ABOUT (something or someone)--An impersonal form of the expression "(someone), TELL ME ABOUT (something or someone)," it can be used as an abbreviated form of questioning.
BRIEF -- Causes a place to be described completely only on your first visit there. On subsequent visits, only the name of the place and the important objects present there will be described. (This is the normal situation.)
EXAMINE (something)-- Looks at something with an eye toward detail.
FINGERPRINT (something)-- Asks the police laboratory to compare fingerprints on (something) with those on file at the lab.
FOLLOW (someone)-- Does the obvious.
INVENTORY -- Lists your possessions. This can be abbreviated to I.
LOOK AROUND -- Provides a complete description of your surroundings. This can be abbreviated to either LOOK or L.
QUIT -- If confirmed, terminates the investigation. If you wish to continue the investigation at a later time, use the SAVE command first.
RESTART -- If confirmed, terminates the investigation and starts it over from the beginning.
RESTORE -- Restores a previously suspended investigation. Consult Reference Card for the procedure on your system.
SAVE -- Suspends your investigation for completion at a later time. Consult Reference Card.
SCRIPT -- Starts a transcript (if you have a printer). Consult Reference Card.
SEARCH (something or someone) -- Does the obvious.
SEARCH NEAR (something) -- Looks closely at the area immediate to something, possibly providing more information than simply examining it.
SHOW ME (something) -- A request to another person to show you or lead you to something.
SHOW (something) TO (someone) -- Does the obvious, possibly eliciting an interesting reaction.
TIME -- Displays the current time. This can be abbreviated to T.
UNSCRIPT -- Stops the transcript that started using the SCRIPT command.
VERSION -- Displays the version and serial number of your copy of ANALYZE (something) FOR (something specific)--Asks police laboratory any particular action.
WAIT FOR (number) MINUTES -- Causes time to pass without you taking any particular action.
WAIT FOR (someone) -- Causes time to pass until someone arrives at the place you are in. Every so often you will have the opportunity to stop waiting for the person if he/she hasn't yet arrived.
WAIT UNTIL (time) -- Causes time to pass until the desired time arrives. As with the other WAIT command,s interesting events happening in your environs will give you the option of terminating your idle state.
WHAITS WRONG -- A request to another person to discuss what's on his mind.
WHERE IS (something or someone) -- A request to another person to help you find something or someone.
WHO IS HERE -- Describes other people who are in the same place that you are. This is done implicitly during a LOOK AROUND.
REFERENCE CARD:
Talking to the Game--
When ever you see the prompt ( > ), the game is waiting for you to
type up to two full lines of text at a time. If you make a mistake,
use the left-arrow key to erase the error. When you have finished
typing in your instructions, press the RETURN key. The game will
respond and then the prompt ( > ) will reappear.

If a description will not fit on the screen all at once (MORE) will
appear in the bottom left portion of the screen. After reading the
part on the screen, you will need to press the space bar to see the
rest of the description.

The Status Line at, the top of the screen, you will see a status
line. The line is updated after every move to show you current where
about in the game. Depending upon the type of game, it may also show
other information.

Score --
In game that keep score, (e.g.-ZORK) the right side of the status line
will show something like this:

SCORE: 245/920

The first number is your score and the second is the total number of
moves you have made. In the example, you have 245 points in 920
moves.

Time--
In games that keep track of the time (e.g. - the mystery thriller
DEADLINE), the right side of the status line will look something like this:

TIME: 9:22 AM

This show the current time of day in the game.

SCRIPTing--
The SCRIPT function is an optional feature which is not necessary to
play the game, and may not be available with certain hardware. If the
SCRIPT command works with your hardware configuration, you may make a
transcript of the game as you play it.

1. Turn on Printer
2. Load Game
3. Use SCRIPT command to start transcript
4. To stop transcript use UNSCRIPT command

SCRIPT & UNSCRIPT may be used as often as desired as long as the
printer is left on-line.

Saving a Game Position--
WARNING** The diskette used for SAVE and RESTORE is maintained in a
special format and should not be used for any other purpose. Files of
any other kind stored on the diskette will be destroyed by the SAVE
command.

To SAVE current position use SAVE command.

You can SAVE eight different positions on each disk and RESTORE them
in any order.

To keep track of these different positions, each is assigned a number
(from 0 -7). Each time you SAVE a game position, it will overwrite any
position that is already on your storage disk with the number you
specified. If you want to SAVE more than one position, you must use a
different position number for each one.

Prompt-- PLEASE INSERT SAVE DISKETTE
This program will allow you to extract archived files that were compressed by a program known as 'ARC'. There are versions of 'ARC' that run on the IBM PC, the AMIGA, the ATARI ST, the 8-bit ATARI's (800xl, etc), and many other personal computers. 'ARC' has been widely accepted as a standard for compressing files that will be uploaded and downloaded. These compressed file therefore contain a wealth of source code for programmers, a multitude of computer art, etc.

Prior to the release of this program, the only way an APPLE II user could utilize the contents of an ARC'd file was to get someone with another brand of computer to de-ARC it for them. While many of us probably did that (that's how I got some of the source code used to write this program), it was slow and inconvenient.

Now, thanks to yours truly (me), APPLE //GS users can de-ARC those files themselves. This program will only run on either a //GS or a //E that has had its motherboard upgraded to that of a //GS. I will attempt to create a version of this program that will work on the 8-bit //E's, //C's, II+'s, etc in the future.

To use this program, simply copy it to the directory that contains the ARC'd file and double click on its icon. You will be presented with a menu that contains four options. The menu is presented here to make this discussion easier for both of us:

- [L]ist contents of an archive
- [E]xtract contents of an archive
- [S]et name of archive to work with
- [Q]uit this program

The choice is yours =>

It will be easier to start from the bottom ([Q]uit) of the list. To select any of these options, simply type the letter that is within the square brackets and press RETURN. You will then be presented with a menu that will allow you to select one of the three bugs preventing you from using version 1.1 (last month), but there were two more bugs waiting to be discovered and eliminated. As far as I know, this version will handle all types of ARC'd files that were created using a standard version of ARC. There is a new type of compression out called 'squashing' that I have not seen the source code for. If I can get the source code (LEGALLY), then I will try to include it in a future version.

If I understand the original source code for this program correctly, then it will abort if it reads a file header that contains an unknown compression method. I have added a couple of lines that should tell you the number that describes that compression. If you encounter this sort of a problem, then send me a letter with that number (a copy of the file would be VERY helpful also) and I'll see what I can do.

This program will allow you to change the archive you will be listing or extracting from. This allows you to extract files from several different archives without having to re-start this program for each archive. To select this option, simply type 'S' (upper or lower case, it doesn't matter) and press RETURN. You will be prompted to enter a file name. Make sure you spell the file name correctly. After having set a file name, you will see it listed on the line under the "[S]et name of archive to work with" option. If you want to list or extract from another archive or you want to correct the file's spelling, simply re-select this option.

You are allowed up to fifty characters when you type in the file's name. Obviously this is in excess of PRODOS' limit of fifteen. However, you can use the remaining thirty-five characters for a partial or full pathname for the target file.

This program is smart enough to detect garbage like this and, when extracting those files, will change all illegal characters to periods.

Also, some files may start with a number. If this is detected, then the number will be changed to a 'Z'. This substitution will ONLY take place if the FIRST character in the file name is a number.

After each option is completed, you will be asked to press RETURN to continue. This was added so that any error messages you may have received will still be visible before the screen is cleared. Simply press the RETURN key and the program will continue.

This program is intended to be used from the GI's FINDER or the older Mousesed v1.1. However, for those of you who would prefer to use it from a shell (such as APW, ORCA/M GS, or ECPI6), all you have to do is change the file type from GBS to GB5. Then just treat it the same as you would any other shell command.

If you are using APW or ORCA/M GS, then you should note that you can no longer pass the file's name from the command line. This was done to make way for the menu. Future items intended for inclusion in this program include true directory 'walking', the ability to catalog the current prefix, and, one of these days, a desktop (super hi-res) mouse-based interface.

You can find ARC'd files to download in the ATARI ST, IBM, and AMIGA Round Tables of GEnie, or from local BBS's that cater to those computers. To use de-ARC'd ATARI pictures, you will need a special program that can handle them. I recommend Jason Harper's program known as: SHRconvert. It can be found in the GEnie downloads as file #1766.

This version will handle all types of ARC'd files that were created using a standard version of ARC. There is a new type of compression out called 'squashing' that I have not seen the source code for. If I can get the source code (LEGALLY), then I will try to include it in a future version.

If I understand the original source code for this program correctly, then it will abort if it reads a file header that contains an unknown compression method. I have added a couple of lines that should tell you the number that describes that compression. If you encounter this sort of a problem, then send me a letter with that number (a copy of the file would be VERY helpful also) and I'll see what I can do.

This program will allow you to change the archive you will be listing or extracting from. This allows you to extract files from several different archives without having to re-start this program for each archive. To select this option, simply type 'S' (upper or lower case, it doesn't matter) and press RETURN. You will be prompted to enter a file name. Make sure you spell the file name correctly. After having set a file name, you will see it listed on the line under the "[S]et name of archive to work with" option. If you want to list or extract from another archive or you want to correct the file's spelling, simply re-select this option.

You are allowed up to fifty characters when you type in the file's name. Obviously this is in excess of PRODOS' limit of fifteen. However, you can use the remaining thirty-five characters for a partial or full pathname for the target file.

This program is smart enough to detect garbage like this and, when extracting those files, will change all illegal characters to periods.

Also, some files may start with a number. If this is detected, then the number will be changed to a 'Z'. This substitution will ONLY take place if the FIRST character in the file name is a number.

After each option is completed, you will be asked to press RETURN to continue. This was added so that any error messages you may have received will still be visible before the screen is cleared. Simply press the RETURN key and the program will continue.

This program is intended to be used from the GI's FINDER or the older Mousesed v1.1. However, for those of you who would prefer to use it from a shell (such as APW, ORCA/M GS, or ECPI6), all you have to do is change the file type from GBS to GB5. Then just treat it the same as you would any other shell command.

If you are using APW or ORCA/M GS, then you should note that you can no longer pass the file's name from the command line. This was done to make way for the menu. Future items intended for inclusion in this program include true directory 'walking', the ability to catalog the current prefix, and, one of these days, a desktop (super hi-res) mouse-based interface.

You can find ARC'd files to download in the ATARI ST, IBM, and AMIGA Round Tables of GEnie, or from local BBS's that cater to those computers. To use de-ARC'd ATARI pictures, you will need a special program that can handle them. I recommend Jason Harper's program known as: SHRconvert. It can be found in the GEnie downloads as file #1766.
If you have any problems using this program then contact me at:

Tim Swihart
GENie address: TSWIHART
or
P. O. Box 26303
Fort Worth, TX 76121

This program is considered FREEWARE, however, if you feel like sending me money for it, I will gladly accept it. I intend to make some revisions to this program in the future so that it will be easier to use, have more features, and keep me busy. If you would like to receive those updates directly, then send $15 to me at the address listed above.

Thank you very much.

Tim Swihart

Here is the last update of Disk Disintegrater DeLuxe. What it have more than V4.0? You can now unpack old DDD files. A few changes have been made in "Pack" option, in "Unpack" option and also in "Prodos commands" option.

Notes:
------
a) You can keep your configuration file of D.D.DeLUXE V4.0 without any problem.
b) If you use the loading file "D.D.DELEXE.LOAD", you must replace it by the new one.
c) All DDD files packed with V4.0 are compatible with D.D.DeLUXE V4.1 (in both ways).
d) To unpack old DDD files, you must proceed the same way you do with D.D.DeLUXE DDD files.
e) When you unpack an old DDD file, there is no guarantee the unpacked disk is exactly the same as the original disk because there is no checksum in the old DDD file. But if you unpack a new DDD file (type $DD, with message in the file), if D.D.DeLUXE unpack without checksum error, you can be sure your unpacked disk is exactly the same as the original disk.
f) Last note: For the moment, the documentation has not been updated to V4.1. The present documentation is for D.D.DeLUXE V4.0.

For your pleasure only,
Louis Roy,
The author of D.D.DeLUXE.
The newest version of the Eamon Dungeon Design System has the following new features:

1. New types of artifacts are available. The old versions had only treasures (of fixed value and variable value) and weapons. (Standard and odd.) The new version allows all sorts of new types of artifacts with the code already installed to handle them. In addition, you may create your own types of artifacts.

2. The Dungeon Edit program has been completely re-written to allow easier entry of data. The new program now allows default data for all fields for rooms, artifacts and monsters. This makes it faster to key in data when you want most fields to be the default. You can also change the defaults within the program. A list of improvements is given here:
   a. Defaults for fields
   b. Defaults can be changed
   c. Field labels may be changed
   d. New fields may be added to rooms, artifacts or monster definitions.
   e. Fields definitions may be saved to and reloaded from disk
   f. New types of artifacts may be added dynamically
   g. Artifact formats may be defined or redefined

3. The dungeon list program has been modified to accept version 6.0 data and describe it during the list process.

4. The base program has been enhanced to allow the new artifact types including the commands to activate the new artifacts. Some previous bugs have been corrected.

5. The base program has had a read effects routine added that can be performed by the designer to read and print effects.

6. Embedded artifacts have been installed. Embedded artifacts are those that are not listed as being in the room, although they can be acted upon by the adventurer. For example you could code the description of a room to describe a large statue in the room and then create an artifact for the statue. The description of the statue will not be listed when the adventurer enters the room. This makes it easier to hide things from the adventurer.

7. Locked doors and gates may be set up with no special programming. Simply put the door or gate in the room and set up the data for it. The gates or doors will automatically block the way until they are unlocked or broken down. (yes, they can be attacked and broken with sufficient power.)

8. Bound monsters can be simulated automatically. The programming required is already set up. Simply code the data required.

9. Secret Passages are handled automatically.

Here is the last update of Disk Disintegrater DeLuxe. Version 4.2 is much easier to use and much faster. Many improvements have been made to D.D.DeLUXE:

1) Now, D.D.DeLUXE can pack the track volume # of 5.25" disks. Note: the volume # is not the prodos volume, it's the track volume (the track volume is an old technique used by DOS 3.3 to format tracks of 5.25" disks, but not used by prodos).

2) In partial catalog mode, you may configure D.D.DeLUXE to show not only DIR and DDD files, but also REL and TXT files.

3) You can configure your D.D.DeLUXE to scan or not, your 5.25" drives (scan = search for a prodos disk volume).

4) You can also configure it to scan or not, all your devices connected to your Apple //.

5) When you unpack a DDD file and format the target disk, D.D.DeLUXE unpacks it much faster than V4.1 or V4.0. Take note when you unpack a DDD file type "A" *(5.25" disk), D.D.DeLUXE will format your target disk automatically (it's necessary because of the track volume #).

6) You can now use all the prodos commands in pack and unpack option.

7) In the main menu, you can quit D.D.DeLUXE quickly by pressing CTRL-Q.

8) Like version V4.1, V4.2 can unpack old DDD 2.1 files.

9) There are also many other modifications you will discover using this program.

Notes:

a) When will run D.D.DeLUXE V4.2, you will have to re-configure it because V4.2 do not use the same configuration file as V4.1 or V4.0.

b) If you use the loading file "D.D.DE.LUXE.LOAD", you must replace it by the new one.

c) All DDD files packed with V4.0 and V4.1 are compatible with D.D.DeLUXE V4.2 (V4.2 can unpack V4.0 and V4.1 DDD files).

d) To unpack old DDD 2.1 files, you proceed the same way you do with D.D.DE.LUXE DDD files.

e) When you unpack an old DDD 2.1 file, there is no guarantee the unpacked disk is exactly the same as the original disk because there is no checksum in the old DDD file. But if you unpack a new DDD file (type DDD, with message in the file), if D.D.DeLUXE unpack without checksum error, you can be sure your unpacked disk is exactly the same as the original disk.

f) Last note: For the moment, the documentation has not been updated to V4.2. The present documentation is for D.D.DeLUXE V4.0.

For your pleasure only,
Louis Roy,
The author of D.D.DeLUXE.
On the following pages are some additional details regarding these new features and how to use them.

**ARTIFACTS**

The new types of artifacts that have been added are listed below:

<table>
<thead>
<tr>
<th>Old</th>
<th>New</th>
<th>Format Ptr</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Gold</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>Treasure</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>Weapon</td>
<td>1</td>
</tr>
<tr>
<td>3</td>
<td>Odd Weapon</td>
<td>1</td>
</tr>
<tr>
<td>4</td>
<td>Container</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>Light</td>
<td>3</td>
</tr>
<tr>
<td>6</td>
<td>Healing</td>
<td>4</td>
</tr>
<tr>
<td>7</td>
<td>Readable</td>
<td>5</td>
</tr>
<tr>
<td>8</td>
<td>Door/Gate</td>
<td>6</td>
</tr>
<tr>
<td>9</td>
<td>Key</td>
<td>7</td>
</tr>
<tr>
<td>10</td>
<td>Bound Monster</td>
<td>8</td>
</tr>
</tbody>
</table>

Because these new artifact types must supply the base program with additional information, the designer will have to code this additional information when setting up the adventure. To assist the designer in this task, there have been groups of labels and default data set up for each general purpose. These are called formats. There are eight different formats available as the standard ones. In addition, the designer may set up his own formats using functions in the dungeon edit program. Each artifact type has a format pointer that tells the program which format will be used for fields 5 thru 8. The format pointers for a particular artifact type may also be changed by the designer, although this is probably not ever necessary. The formats available are:

**Format 1**

<table>
<thead>
<tr>
<th>Fld 5 = Weap. Type</th>
<th>Format 2</th>
<th>Format 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 6 = Compl.</td>
<td>Fld 5 = Key #</td>
<td>Fld 5 = Counter</td>
</tr>
<tr>
<td>Fld 7 = Dice</td>
<td>Fld 6 = Strength</td>
<td></td>
</tr>
<tr>
<td>Fld 8 = Sides</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Format 2**

<table>
<thead>
<tr>
<th>Fld 5 = Chances</th>
<th>Format 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 6 = Heal Amt</td>
<td>Fld 5 = Key#</td>
</tr>
<tr>
<td>Fld 7 = Nbr Uses</td>
<td>Fld 7 = Read Flag</td>
</tr>
<tr>
<td>Fld 8 = Sides</td>
<td>Fld 7 = Strength</td>
</tr>
</tbody>
</table>

**Format 3**

<table>
<thead>
<tr>
<th>none</th>
<th>Fld 5 = Monster#</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 7 = Guard#</td>
<td>Fld 8 = Att.Flag</td>
</tr>
</tbody>
</table>

Because these new artifact types must supply the base program with additional information, the designer will have to code this additional information when setting up the adventure. To assist the designer in this task, there have been groups of labels and default data set up for each general purpose. These are called formats. There are eight different formats available as the standard ones. In addition, the designer may set up his own formats using functions in the dungeon edit program. Each artifact type has a format pointer that tells the program which format will be used for fields 5 thru 8. The format pointers for a particular artifact type may also be changed by the designer, although this is probably not ever necessary. The formats available are:

**Format 1**

<table>
<thead>
<tr>
<th>Fld 5 = Weap. Type</th>
<th>Format 2</th>
<th>Format 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 6 = Compl.</td>
<td>Fld 5 = Key #</td>
<td>Fld 5 = Counter</td>
</tr>
<tr>
<td>Fld 7 = Dice</td>
<td>Fld 6 = Strength</td>
<td></td>
</tr>
<tr>
<td>Fld 8 = Sides</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Format 2**

<table>
<thead>
<tr>
<th>Fld 5 = Chances</th>
<th>Format 6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 6 = Heal Amt</td>
<td>Fld 5 = Key#</td>
</tr>
<tr>
<td>Fld 7 = Nbr Uses</td>
<td>Fld 7 = Read Flag</td>
</tr>
<tr>
<td>Fld 8 = Sides</td>
<td>Fld 7 = Strength</td>
</tr>
</tbody>
</table>

**Format 3**

<table>
<thead>
<tr>
<th>none</th>
<th>Fld 5 = Monster#</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fld 7 = Guard#</td>
<td>Fld 8 = Att.Flag</td>
</tr>
</tbody>
</table>

The new artifacts are explained in some detail below:

**Magic Weapons** - These weapons are locally magical. That is, they are magic weapons within the scope of the current adventure. If they are taken out of the adventure, they will revert to standard weapons. While they are magic, they cannot break except by magical means. This is the extent of their natural magic power. If you want other magic effects, you will have to program them.

**Container** - This type of artifact can contain other artifacts. The artifact may be opened at which time, the program searches the artifact table looking for any artifact having a room number of 100 plus the number of the artifact being opened. Any artifact meeting this criteria is moved into the room by the program and the message YOU FOUND SOMETHING. is printed.

**Light** - When rooms are coded in version 6.0, a code for light is included. If the room is too dark to see in without artificial light, you code a 0. If there is a normal amount of light, a 1 is coded. A light artifact is lit using the LIGHT command. This will activate the light so that all rooms entered are lit up. A light will expire after awhile. There is a field coded to indicate how long a light will last. When this number is exceeded, the light will go out never to work again. (There is currently no way to reactivate a light without special programming.)

**Healing** - This type of artifact will heal the user by the amount specified at the time the artifact was set up. It may be used only a limited number of times before being exhausted.

**Readable** - This type of artifact will allow the user to read it. The program will automatically read the effects from the effects portion of the EAMON.DESC file. These effects must be added by the designer and the pointers established according to the prompts given by the readable artifact format.

**Door** - A door has a 'room into' and a strength factor. The 'room into' code is very important, since it takes the place of a room connect code where the door is located. The strength factor is how strong the door is. Doors may be broken down by beating on them.

**Key** - A key artifact is used for opening containers, doors or freeing bound monsters. The artifacts they are used on will indicate which key works on it, although this is probably not ever necessary. The formats available are:

*Bound Monster* - This type of artifact is used to simulate a bound monster. The key number needed to free the bound person, the monster guarding the bound monster and a pointer to the monster being bound makes up the data fields of this artifact type.

**Location of Artifacts**

Version 6.0 also allows artifacts to be in special places. Artifacts are normally coded with room numbers ranging from 1 to the number of rooms in a dungeon. There are now additional codes recognized by the program.

- +100 .... Inside a container artifact
- +200 .... Embedded in a room description
- +300 .... Hidden in a room

For example, if you want to place an artifact inside artifact #9, code it's room code as 109. If you want an artifact to be in room number 17, but not be listed as a separate artifact, code it's room code as 217. If you want an artifact to be hidden in room number 25 (so you have to look to find it), code it's room code as 325.
The dungeon edit program will also allow you to build your own artifact types, or modify existing artifact types, formats, or even monster or room data. This was done to prevent the need for a custom edit program when special fields are needed by an adventure.

ROOMS

The Eamon.Rooms file contains the rooms that you can move into. This file now has the ability to contain new codes that permit the ability to have automatic secret passages, and locked doors. Before this was installed, you had to program these manually for every adventure you wrote.

Room numbers from 1 to 99 are normal.

Room number -99 means exit to the Main Hall.

Room numbers less than 0 and greater than -99 are secret passages. The absolute value of the number is used for the pointer to the room when the passage is discovered. Passages are discovered by using the LOOK command. If you want them discovered by other means, you will still have to program it.

Room numbers greater than 100 are locked doors. The difference between 100 and the room code is used to point to an artifact. This artifact must then be a door or gate. The artifact will specify the room to be moved into, the key number, the strength of the door necessary to enter the room.

MONSTERS

Monsters have not changed from previous versions of Eamon, but the ability to add fields or modify field labels has been added. This allows you to more easily put special programming into your base program when this programming may require additional data to be on the Monsters file.

ADDITIONAL ARTIFACT TYPES

Additional artifact types may be added, using the functions in the dungeon edit, but these additional artifacts will have to be supported via changes you must make to the base program.

Customized fields added or changed from the standard may be difficult to remember and duplicate when you go back to edit a dungeon a second or third time. For this reason, the ability to be able to save and restore these parameters to disk has been installed. The data that is saved off for parameters is listed below.

You should decide before starting your adventure what changes will be made (if any) to the standard layouts, since these changes must be made before any fields are defined. If this is not done, you will end up with monsters or artifacts with the incorrect layout. If you are not adding any fields, it will not make any difference, but if you are the program could bomb while trying to read data from the disk that does not exist.

The file that stores the parameters is sequential and contains the following data.

AF - # fields in an artifact (not counting last 4 variable fields)
Field Name 1
Field Name 2
...  af
Default 1
Default 2
...  af

NF - # of Formats
Format Label $ (F,1)
Format Label $ (F,2)
Format Label $ (F,3)
Format Label $ (F,4)
Default (F,1)
Default (F,2)
...

MF - #monster fields
Monster Label 1
...  mf
Default Monster 1
...  mf

---End of Parameters File---

A MANUAL FOR EAMON ADVENTURE DESIGNERS
By Donald Brown

EAMON is the computerized fantasy role-playing game developed by Donald Brown. This manual has been written for those stalwart people who are tired of having their characters killed in the many adventures written for the system, and want revenge by creating their own death traps. It is assumed that you are already familiar with the gaming system and the information included in the Player’s manual.

Most of the adventures that are written for the Eamon system have been similar to the "Adventure" game that was created by Don Woods and Willie Crowther of MIT, such as the Beginner’s Cave included on the master diskette. This manual will both help you design your own scenarios in that type of game but will also permit you to meld any other type of game with the system that you wish.

HOOKING UP WITH EAMON
SENDING ADVENTURERS TO THEIR DEATH FOR FUN AND PROFIT

Under the Eamon rules, it takes only a few numbers to completely describe a character. Between adventures, all of the player characters, (or adventurers) that the Master system knows about are stored in a file on the Master that is called "CHARACTERS". It is a random-access file with a length of 150. Record 0 holds the number of records used in the file, and all subsequent records may hold one character. If the first string in the record is null ("") then the character in that record has been deleted and the record may be reused to store a new character. The data held in each record is:
A string that has the name. The next numbers stored are (in order) player Hardiness, Agility, Charisma, the four spell abilities (Blast, Heal, Speed, and Power), the five weapon abilities (Axe, Bow, Club, Spear, and Sword), the player’s Armour Expertise, the player’s sex as a string ("M" or "F"), gold pieces carried, gold pieces in the bank, the player’s armour class (Leather=2, Chain=4, Plate=6, with one added for a shield), then for each of a player’s four weapons the name of the weapon, the weapon type, the weapon complexity, the weapon dice, and the weapon’s sides per die. If a player does not have four weapons, his weapons will be first, and all other weapon names will be "NONE". Except for name, sex, and weapon names all of the information is stored as an integer number, with all probability numbers stored as percentages (perfect=100).

When a player leaves the Main Hall to go on an Adventure, first his character is deleted from the CHARACTERS file, and then the player is prompted to change diskettes. The program then tries to read a program name from the file EAMON.NAME on the adventure disk. If this name is found, a file called FRESH MEAT is opened on the disk and the data that was in the record of the CHARACTERS file is written into that file, preceded by the record number that the character previously resided in. Finally, the program given in the EAMON.NAME file is run.

Once the adventure is over, control must be returned to the main Eamon programs. If the adventure ended in the character’s death, all that must be done is deleting a file called "THE ADVENTURER" from the master diskette and running MAIN HALL. (You may instead directly run THE WONDERFUL WORLD OF EAMON and then do not need to delete the file. If you do want to go the MAIN HALL route, it might be advisable to open THE ADVENTURER before deleting it, to make sure it will really be there.)

If the character survives your adventure, you will have to recreate him into the CHARACTERS file. The Main Program logic is already writing the character his own character record now, but you may want to change this if you have a special reason for it. Normally this is simply writing in the new information of the character into the old record gốcs in FRESH MEAT. However, if your program has the ability to quit for a while and come back later, it is possible for a new character to be stored in the old record. In this case you should have a record in which the CHARACTERS file for a free record to store the character, and write it in there (for an example of how this is done, list the NEW CHARACTERS program on your master diskette).

Once you have stored the character into the CHARACTERS file, you must re-create a file called THE ADVENTURE which has two pieces of data in it—the name of the character, and the record he resides in of the CHARACTERS file. This too, is already done by the logic of the Main program, but it may
be necessary for you to know what is being done, in case you want to change it. Once this is done, run MAIN HALL to finish. (Also currently done.)

USE OF THE DUNGEON DESIGN DISKETTE

The Dungeon Design Diskette is designed to make the job of entering new Adventure-like scenarios much easier. It includes a base to work from for your program, as well as a simple means of entering the data into the text files needed by that base program.

Version 5.0 of the Dungeon Designer Diskette will contain two versions of the Main Adventure program. One is called MAIN PGM (or BASE PROGRAM 2.0) and the other is MAIN PGM 10 (or BASE PROGRAM 10).

Version 6.0 will only contain MAIN PGM, but will contain an extra file called CONVERT MAIN MAIN 10. This is a text file that can be executed (using the DOS EXEC command) to convert MAIN PGM to a ten direction version. To do this simply load in MAIN PGM and type EXEC CONVERT MAIN MAIN 10. You will see some Applesoft prompts. When it stops, you will have a ten direction version of the MAIN PGM. You may then save this on your adventure diskette.

The first step in creating your adventure is initializing the diskette. The program on the DDD (Dungeon Design Diskette) will do several things for you---it will INIT the diskette, put your program's name into EAMON.NAME, and put in the starting data needed for the dungeon editing program to work. It also creates a boot program that identifies this diskette as an Eamon adventure by you! You will be asked for an adventure number, this must be an integer from 1 to 254, since it is used as the disk volume. It is not important what number you assign, it will be bumped assigned to the next valid number--once you have submitted it to the library.

When you have initialized your diskette, you should delete the text file SAVE LEADIN PROGRAM HERE. Then re-insert the DDD and load LEADIN PROGRAM. The diskettes should be switched again and you will type in SAVE (your adventure name). You must spell the name to be saved-in () above exactly as you did when you typed in the name of the adventure during the initializing process. Then re-insert the DDD and type LOAD MAIN PGM or LOAD MAIN PGM 10 (depending on whether you answered 6 or 10 directions during the initializing process. The MAIN PGM 10 should be used if you answered 10 to the number of directions. Otherwise, use MAIN PGM. Now re-insert your new adventure diskette and type SAVE MAIN PGM. Note---here you use 'MAIN PGM' regardless of which program you loaded. You are now ready to begin entering data for the adventure. The DDD and run the program 'DUNGEON EDIT'. This program is the one that puts your basic dungeon design into the text files.

A few general remarks are in order now--First of all, you should always have your dungeon designed before entering it. Decide what rooms you have, how they connect, what monsters inhabit those rooms (and what their attributes are), and what treasures are sprinkled about.

For each of the four things you can enter (ROOM, ARTIFACT, EFFECT, and MONSTER), you can either add a new one onto the end of the list, or edit one already there. You cannot delete a thing already there (though you can replace it through editing). You also must not go beyond 100 of any of the things (though you can go over 100). Actually you will run out of disk space long before you hit the limit of 100 on these items. The more practical limits of the system are: (-in general-)

Rooms: 50-85
Artifacts: 35-50;
Effects: 0-25;
Monsters: 12-35.

If you do go over the 100 limit on anything you will not be warned of your error, but you will not get the results you wanted.

Adding and Editing will be almost identical for all four data types, except that in EDITING new entry will be placed after the cursor at the start of entries. Every time you are to do more entry than just hitting one key, the entry will be done with a special input routine. It appears to be the standard Apple input on first glance, but it has many significant differences. First of all, the old Escape-key editing features do not work. Instead, the following control keys do things--

ESC--this returns, accepting both what is before and after the flashing cursor. It is very useful while editing since if you simply hit ESC no change will be made.

RETURN--this also does a return, except only accepting what is before the cursor.
CTRL-B—this moves the cursor to
the first character of your
input.

CTRL-E—this moves the cursor to
the last character of your
input.

CTRL-D—this deletes the character
that the cursor is sitting on, bringing
the characters after the cursor
forward one space.

CTRL-I—this inserts a space
where the cursor is, moving all
characters after the cursor
back one space. This is good
if you are entering a line
that you want to look good
as it wraps around your 40-column
screen.

<-> (FORWARD & BACKWARD ARROWS)--
these move the cursor back or
forward by one character.

Your entries cannot go over 250
characters, and you should not use
quotation marks ("'). You may use commas
and colons in descriptions only. Do not
have any trailing spaces on the names
of items. (Applesoft regards "LION" as
being different from "LION ", though
your player may not recognize the
difference. Additionally, if you are
entering a number, enter only a number,
do not include any leading or trailing
spaces or other extraneous characters.
The program won't like them and will
simply spit them back at you.

Another thing to watch out for is names
on artifacts that begin with a number.
The program will accept them and you
can use them, but when you try to give
the item to a monster the program will
not understand. For example assume you
want to put an 8 inch knife in your
adventure. When adventurer picks it up
and tries to give it to his friend the
Doctor, the Doctor will think he is
being given 8 gold pieces. That is
because the program looks at the
artifact name and because it begins
with a number, it mis-understands.

For every room, you will need to
give eight pieces of data. First is
the room name, which cannot go over
39 characters. In the program it will
be printed as: "YOU ARE (room name)",
so you should use names like, "AT THE
CAVE ENTRANCE". Secondly you will
need to give a room description. It is
not preceeded by anything, so it must
be a full and complete description. If
your description is longer than 40
characters, you must pad it with spaces
so that when the description wraps
around the Apple's 40-column screen,
the breaks are between words. Finally,
you will have to give the room numbers
that you can get to from that room in
each direction. A special code has
been developed—if you give a room of
0, you can never move that direction.
If you give positive direction, there's
an open connection. Negative numbers
are special and usually indicate a
secret passage. Another special code is
-99 which indicates the exit to home.

Artifacts are somewhat similar. An
artifact is any non-living thing that
is in the dungeon. In addition to what
you might normally think of as the
artifacts you want to include: (gold,
silver, statues), you must also have
as an artifact all weapons used by your
monsters, as well as a dead body for
every monster.

For each artifact, you will again
need a name (this time just the normal
name, such as "GOLD COINS") and a full
description. You will also have to give
the item's room that it starts in, its
value in gold pieces, its type and its
weight. The room is usually a positive
number, however if the item isn't in
the dungeon yet (such as a dead body)
you should assign a room of zero, and
if the item starts by being carried by
the player, its room is -1.

There are four types of artifacts.
Type 0 is a treasure with a value that
will not change with the player's
charisma, such as a pile of gold coins.
Type 1 is a treasure whose value will
vary with the player's charisma, such
as a Persian rug. Types 2 and 3 are
weapons, with 2 being a weapon that
can be bought at the Main Hall, and 3 a
special weapon.

If your artifact is a weapon (type
2 or 3), you will also have to enter
some more information on it. First is
the weapon complexity, then is the
weapon type (1=axe, 2=bow, 3=mace,
4=spear, 5=sword), then the weapon's
damage with first the number of 'dice'
thrown, for that damage, then the sides
per die.

The other major type of data to be
put in your files is monsters, which are
any living (or animate) things in
the dungeon. Artifacts are similar to
characters, however they are assumed to
have their full armour expertise and

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 318 of 1262
know all weapons equally well. For each monster you will need the name, the description, then hardness (as with a player), agility, friendliness (the percentage chance of making friends with a character of a charisma of 10), courage (will flee from a fight after he has received that percentage of his hardness in hits, on the average), room starts in (may be zero if in a chest or other special thing activates him), his body weight, his special defensive odds (normally 0, but magic or size/speed may make some monsters harder to hit), defensive odds are a %, Armour (hits absorbed or stopped per blow. This may be things such as a furry skin or magical effects), and the weapon number (a pointer to some artifact. If the weapon number is 0 it is assumed natural weapons; claws or teeth. If the weapon number is -1 then the monster isn't carrying a weapon). You will then have to give for that weapon the monster's complete chance to strike a blow with it, and its sides and dice of damage. These numbers do not have to be consistant with the numbers given in the artifact list; a monster may know how to use his weapon better than someone who doesn't know some secret, and the chance of hitting is of course affected by the monster's weapon expertise and other information not stored.

There is a fourth thing that can be entered called an "EFFECT". It is there for your own special use--it permits you to store some strings on disk so that it can be called in quickly. The code to read effects is not in place in the base program (Main Pgm). To read an effect (number E, for example) use a routine such as:

PRINT DK$;"READ EAMON.DESC,B";E+200
: INPUT A$ : PRINT A$ : PRINT DK$.  

NOTE: This routine also prints the effect (A$) that it reads. For further examples of its use you might want to check out The Beginners Cave. It is also included as room for expansion of the DDD.

Once you have put all of your data into your files, you will probably want to see what you entered, to catch errors and get a good overview. There is a program included on the DDD that will list all of your data in a simple, organized fashion. It will list all of your rooms, artifacts, and monsters in order, also pointing out what sort of "links" have been set up (what is the room name you are moving into, what is the name of the artifact that the monster uses as a weapon, etc.) If one of these links goes to the wrong thing, there's an error! If you want to put this monster, you must modify lines 9000-9999 of the program DUNGEON LIST to start your printer and set the value of PL to the line length of your printer, less one (39 for the Apple's screen).

There is also a program included called DUNGEON (OLD) which was written to work with the older system of files where EAMON.MONSTERS and EAMON.ARTIFACTS were sequential files. Although it might be very useful to examine other people's dungeons after you have played in them to learn how to design your own, it goes without saying that only a fool and a scoundrel would list someone else's dungeon before playing to avoid dangers!

ADAPTING THE BASE DUNGEON PROGRAM

All of the work above was to put your dungeon into a format that the computer can use. It couples with a program called the BASE DUNGEON PROGRAM (or on later versions called MAIN PGM or MAIN PGM 10). If no sliding doors, things hidden inside of other things, etc. are needed, and you are using the original DDD, you can simply save the base program on your diskette and have a program that prints the explanation or mission run this program if you have a newer version of the DDD and have already saved the MAIN PGM and your (name of adventure) program, you are all ready to go.

However, if you want special effects such as a sword that teleports the user to another room at random times (gee, I may use that) these explanations should help you.

Lines 100-999 are the main loop. Every time a command is gotten, those lines are run through. If you want to have something done (or checked for) every turn, it should be put in lines 500-900.

Lines 1000-1999 reads in monsters and artifacts from disk, as well as doing other initializing. If you want to add a new command, you will have to change line 1910 (increase the number in the DATA statement), 1920 (add the new verbs--no spaces are permitted), and line 290 (add the line numbers to go to). If you want special things to happen at a certain time, put a code to read effects is not in place in the base program (Main Pgm). To read an effect (number E, for example) use a routine such as:

PRINT DK$;"READ EAMON.DESC,B";E+200
: INPUT A$ : PRINT A$ : PRINT DK$.  

NOTE: This routine also prints the effect (A$) that it reads. For further examples of its use you might want to check out The Beginners Cave. It is also included as room for expansion of the DDD.

Once you have put all of your data into your files, you will probably want to see what you entered, to catch errors and get a good overview. There is a program included on the DDD that will list all of your data in a simple, organized fashion. It will list all of your rooms, artifacts, and monsters in order, also pointing out what sort of "links" have been set up (what is the room name you are moving into, what is the name of the artifact that the monster uses as a weapon, etc.) If one of these links goes to the wrong

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 319 of 1262
the variable DIE has a non-zero value the player didn’t survive. Lines 2100 thru 2290 are for your additions.

Lines 3000-3999 are the movement commands. If you want to magically move the player, set R2 to the number of the room to enter and go to 3500. If something happens so as to make the monsters reconsider their reactions to the player, a GOSUB 3600 will check the reactions of all monsters who are unaligned (see below). If you have special results and/or conditions for movement and have thus given negative room numbers in the editor, the place to check is in lines 3050-3490.

Lines 4000-4999 are to get things. Lines 4200-4899 are the place to add special results when getting some artifact. You may place synonyms in lines 4030-4110 (such as, 4030 IF S$="BAT" THEN S$="VAMPIRE BAT"). Finally, if a command MUST have a subject, GOSUB 4900 will ensure one is gotten. Lines 7000-7999 are the attack commands and subroutines. Lines 7700-7999 are to kill monster M. If things happen when a monster dies (such as dropping something from the body), it should be put in this section.

Lines 13000-13999 are the Power Spell. As told in the Players’ manual, this spell can do anything at all—feel free to throw out this section and add your own.

Lines 16000-16999 are the say command, which is very useful for words of power' or some other strange effects.

Most of the variables are self-explanatory and also can be changed locally if desired, but a description of some of the others are—

AC - Armour class of player
ADK(*) - Artifact data
The first subscript is the number of the artifact, and the key for the second is:
1=Value
2=Type
3=Weight
4=Room
5=Complexity
6=Weapon Type
7=Dice
8=Sides
9=Flag if seen
AE - Armour expertise
AN(*) - Name of artifacts
BANK - Gold player has in bank
C - Holds number of command given
CS(*) - Verbs program responds to
CH - Player charisma

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
people's adventures, it would definitely be a good idea to tear it apart to see how other people have adapted this program to their own use. Also, if I might give a few suggestions to new Eamon dungeon designers -

1. Be fair to the adventurer. Don't try to stack the odds totally against him. A good rule of thumb is that an adventurer can lick about five times his own Hardiness in opponents, with allies subtracting their Hardiness from the opposition. If you continually design pure death traps (and don't reward the successful outrageously), people aren't going to want to send their carefully-built up characters through your dungeons. On the other hand, if your dungeons are just big give-aways, they will quickly become boring.

2. You can place one or two traps of the zap-you're dead type (such as the book in the Beginner's Cave) so long as they are not overdone and are not required to survive them to get out. Thus, if your only way out of the tunnels is drinking a potion that half of the time teleports you away, the other half poisons you, it isn't fair.

3. Particularly to those who have designed dungeons for non-computerized role-playing games, remember that there is only one adventurer going in, not an army! No matter how great a character is, he cannot by himself handle a dozen thugs.

4. Last but not least, don't be afraid to break any of these rules. If you truly believe that your dungeon will be better, do anything you please. The worst that will happen is that people will not play in it and you'll have to change a few things.

The following is a summary of the steps to follow to create an adventure of your own. This summary is provided to allow you an easier step-by-step method of creating your scenario.

1. Be sure you have everything you need

   The things you will need are:

   a. A theme for the adventure.
   This is usually the hardest part.

   b. A map of the setting for the adventure

   c. A list of all the monsters that will appear.

   d. A list of all the artifacts you will need.

   e. The DDD (Dungeon Designer's Diskette)

2. The next step is to initialize your adventure diskette. This is done by booting on the DDD and selecting the initialize function. You will be requested to replace the DDD with a blank diskette. Then you will be asked for the name of the adventure, the adventure number and the author's name.

   The diskette that is sitting in the disk drive after these questions are answered will be initialized. For this reason, you should always keep your DDD write protected.

3. When the diskette has been initialized, you'll need to copy two programs from the DDD to your adventure diskette. The first one that should be copied is LEADIN PROGRAM. Copy this one by:

   a. Insert the DDD and type in:
   LOAD LEADIN PROGRAM

   b. Insert the adventure & type
   DELETE SAVE LEADIN PROGRAM HERE

   c. Now type: SAVE (whatever you called your adventure)

   The name that you use in the save command must be the exact name that you used when you initialized the diskette.

   The second program that you have to copy from the DDD to the adventure diskette is the main adventure program. The name that this program goes by on the DDD may be one of the following:

   BASE DUNGEON PROGRAM
   BASE PROGRAM 2.0
   MAIN PGM

   This will depend on which version of the DDD that you have. If you answered the question "six or ten directions" as 10, then you will have to use the ten direction version of the main program.

   Some versions of the DDD do not have
this capability. However, if you did
get a question on how many directions
you wanted, your designer does have
this capability. If you are using
version 6.0, and you want to use ten
directions, you have to create a ten
direction version of the main program.
This is a very simple process. Simply
load the MAIN PGM program into memory,
and type:  EXEC CONVERT MAIN>MAIN 10.

When the process is complete, you will
have a ten direction version in memory.
You may then save this on the adventure
diskette. When you have the appropriate
program in memory, insert the adventure
diskette and save it under the name
MAIN PGM.

4. The next step is to add the data or
information about your adventure. All
items are added using the DUNGEON EDIT
program. Boot on the DDD and select
modify an adventure. The edit program
is run and then requests you to insert
your adventure diskette. You will then
add all of your rooms, artifacts,
effects and monsters. This may take
several days, so whenever you get tired
of entering, select quit option. All
of your items will be saved and you can
pick up where you left off.

5. After all your rooms, artifacts, etc
have been entered, you may make your
program changes to MAIN PGM. These will
be all of the things that you want to
be special about your adventure.

6. The next phase will be to test your
adventure. The best way to do this is
to be sure the PRINT DK$"DELETE FRESH
MEAT" statement has been deleted from
the MAIN PGM, (.try line 1055 or 1050)
and that your main program has been
saved to the adventure diskette after
making your changes. Then boot the
Eamon Master diskette. Select the
character to be used to test with and
take him into the Main Hall and select
adventure. Insert adventure diskette
and you should now begin your test.
From that time on, to repeat a test you
should be able to simply run MAIN PGM.
(Or if MAIN PGM is already in memory,
simply type RUN)

Another helpful hint: to restart an
adventure if it bombs off you should be
able to type GOTO 210.

7. When you are sure your adventure is
ready you could have a friend test it.
When the adventure is completely ready,
send a copy of it to:

John Nelson
1226 E. University

Des Moines, Ia  50316

It will then be an "official" Ramon
Adventure and may be distributed.

If you have any questions or problems
designing an adventure, write to the
above address. We will do our best to
help you get back on the right track.

THE END
v3.0 Complete TuneUp to prepare for System 6.0
- Fixed some quirks, more user friendly and smaller.
- Changed interface to popup menus.
- Added save as a Binary PTRN file.
- Changed Pattern Editor to allow "Painting".
- Added a "None" desktop type command which updates the Finder.Def file.
- Available as a Temporary Init file that can be updated with the CDev to save much space on your boot disk (2.5K vs 15.5K)

v2.5 Bug Fix
- Changed the handle size so that the resource and message will always be the correct size. This used to work automatically. Aparently something with the DMA SCSI card System Software and System 5.03 changed that.

v2.4E Bug Fix
- Changed some code in Desk Color and LoadPic to more effectively handle errors. This should eliminate all problems that have been experienced, especially with desktop pictures.
- Compiled with the release version of ORCA/C v1.1 instead of a beta.

v2.2E Bug Fix
- Changed one line of code to correct a bug "I" introduced that prevented reloading of a picture during a boot.

v2.1M Pattern and Picture loader without Editor
- "M" version saves space and time, but must use patterns already created.

v2.1E Bug Fix and improvement
- "E" version includes built-in pattern editor
- Modified Interface (buttons) slightly and made the CDev to allow for a more logical interface. Includes Delete and Insert pattern.
- Automatically updates desktop to current pattern/graphic when closing.

v1.1 First major release
- Added Standard File Dialog to find the picture to load to the desktop.
- Cleaned up some more "ORCA/C" bugs
- Polished 320 mode button sizes

v0.32b - Still a beta test version, but I haven't heard any complaints
- Cleaned up buttons display in 320 mode
- Cleaned up save file routines so no errors will occur
- Cleaned update desktop routine to recognize last color used
- Added ability to load a picture to desktop

v0.24b - This is a beta version and the first release, it can't be absolutely guaranteed to work in ALL circumstances.
The scroll bar and two buttons below the current pattern display allow you to move between multiple loaded patterns, insert a new pattern, or delete the displayed pattern.

Please try not to confuse loaded patterns and the file from which they came from, and the system pattern. There is only a system pattern and it is saved (attached) to the Control Panel file whenever you close the Control Panel. Pattern files are only saved/updated when you select the "Save As .." commands.

To change the current color, click in the color selection area in the color you'd like, you'll see the current color change. To fill in the pattern grid with the current color, click in the current color area, you'll notice the grid fill with that color and the pattern area will also update to reflect this.

To temporarily change the current desktop to the current color, click in the current pattern display. I wouldn't suggest doing this in the Finder, because it will cover up ALL the icons. No big loss, just close all the windows, press "Open Apple A" to select all icons and it will pull them back to the top. This will not actually send the new pattern into the system, but just change this desktop. Unless you select "Revert" before you close the Control Panel, this temporary desktop will be replaced by the currently selected desktop.

If more than one pattern is currently loaded, the scroll bar can be used to move between and select the different patterns.

If you would like to insert a new pattern, click in the "Ins" button or press the "clear" key. A periwinkle blue pattern is inserted before the currently displayed pattern. You now have one more actual pattern contained in the loaded patterns. The pattern file is not updated until you use a "Save As .." command.

If you would like to delete a pattern, use the scroll bar to select it, then click in the "Del" button or press the "delete" key. The currently displayed pattern will be deleted from the loaded patterns and you'll be moved to the previous pattern. If only one pattern was loaded, it will be cleared to periwinkle blue. The pattern file is not updated until you use a "Save As .." command.

When you get a pattern you like, you can do several things with it. You could see it temporarily on the screen (try it out) by clicking the current pattern display. This will not actually send the new pattern into the system, but just change this desktop. If you don't do anything, your pattern will be sent to the system becoming the system pattern and saved when you close the Control Panel NDA or DeskColor Control Panel. You should see the new pattern on your desktop immediately. If you were just editing a pattern, you could save it as a file elsewhere. Again a reminder, the pattern files are ON2 updated/saved when you use a "Save As .." command. The pattern system is updated when you close the Control Panel.

To load a picture, select the "Graphic" menu item. You'll be presented with a Standard Get File Dialog. The file may be of any SHR type; i.e., Screen (PIC, 500), PackBytes (PNT, $c1, aux 6000), PaintWorks 640 (PNT, $c1, aux 60001), Apple Preferred (PNT, $c1, aux 60002), or PaintWorks 640 mode (PNT, $c1, aux $8000). You must keep in mind that the picture will be used for both 320 AND 640 mode, so it should be one that looks good in both. I would suggest using my ShowPic NDA to see the pictures and/or modifying them if you don't know what they look like. A pattern or some sort of desktop will not look very well, but a portrait would so you'll be drawn to the screen after you close the Control Panel.

The "Save APF" and "Save PTRN" commands work similarly. They each save the currently loaded pattern(s) to a file. You will get a Standard Dialog for saving a file. If you loaded your patterns from a PaintWorks Graphic or other file, please don't replace it. The preferred method of saving is in Apple Preferred Format (APF), however the PTRN option saves it as a binary file with the "PTRN" and number of patterns header (like Pattern // and Desktop Lord use).

Use the "Revert" command to prevent your new pattern/graphic from being sent to the system. Normally every time you close the Control Panel NDA or DeskColor Control Panel, the selected desktop is sent to the system and saved on disk. The Revert command can be used for backing out of an experimental editing session or any time you change your mind. HOWEVER, if you go back and continue editing the pattern or select a new background type, you'll notice the newly updated desktop will be removed. To reverse the effect of "Revert", you could select the "New" command.

The "Update Init" command is used to save the currently select desktop type to the DeskColor Temporary Init file. The Init file is much smaller to use, but it will not be used in the system unless you select "Open". It is suggested using it only after you have decided which desktop you want to live with. The first desktop loaded will be the one used. I would suggest only having the Control Panel NDA active on your boot disk. If you don't have enough space on your boot disk, get the Control Panel up running first (even if you have to leave off all your favorite NDA's and Control Panels), select DeskColor Control Panel, choose a desktop, then Update the Init. You may then remove the Control Panel from your boot disk and use the Init file. The Color.Init file should be in the SYSTEM.SETUP folder in the Finder of older systems or in the "SYSTEM.SETUP" folder in the Finder of newer systems or boot disk. Depending on the catalog order (not alphabetized order) of the "SYSTEM.SETUP" folder, the Control Panel (CDEV.INIT) or Init (Color.Init) will be used unless the user has selected the "Revert" command in the Control Panel NDA or DeskColor Control Panel.

The menus should be fairly accurate. The type menu ALWAYS displays the current background type or the one you've requested. The command menu will display "Revert" until you select "New" or "Open" or draw in the pattern. If you close the Control Panel NDA with either "New" or "Open" displayed, the new desktop is sent to the system. If "Revert" is displayed, the desktop is not changed. If you have selected "Pattern", "Open" means more than one pattern is loaded, and "New" means a single pattern is loaded.

Keep in mind that a picture message takes up 32K of memory and will also take up almost as much disk space when saved. This makes the Control Panel file grow up to 50K when you have selected a picture. A pattern/color is 1000 times smaller to store. To be honest a graphic desktop takes up 64K of memory, so if you have memory shortage problems, use a pattern instead.

+ Known Quirks:
Apple II Computer Info

There is a big difference between the way 320 and 640 mode work. You'll notice that the colors change on pictures, but the shapes stay the same. There are 16 colors in 320 mode and 4 colors and some mixes in 640 mode. Patterns are also different. In 320 mode a pattern is 8 points by 8 points with 16 colors. In 640 mode a pattern is 8 points by 8 points with 4 colors, but to get 16 mixed colors it goes to 4 points by 8 points. You'll notice the different displays when you bring up the editor in 320 mode and 640 mode. The 640 mode pattern is always the top half of the 320 mode pattern when switching. Meaning, a box pattern drawn in one mode will be a uniquely odd pattern in the other mode with different colors. When editing a pattern in 640 mode a copy is placed in the bottom half of the pattern for 320 mode to create a symmetrical pattern. You may modify the bottom four lines of the 320 mode pattern WITHOUT affecting the 640 mode pattern.

To obtain a consistent pattern in both 320 AND 640 mode (Like Graffiti), use your favorite paint program. Select your pattern and fill the full screen, then close DeskColor. You can then load that graphic file into DeskColor. That's basically how Graffiti does it, not with patterns, but with graphics.

Earlier versions of ProSel 16 (pre-8.547) wipe out the desktop message when launching a ProDOS 8 program. Glen mistakedly used the same message number as the desktop uses. I would suggest updating to the most current version of ProSel 16 anyway, especially if you are experiencing any problems.

The Finder draws it's own desktop. To get it updated, you may have to select, then close DeskColor up to three times. This should work with graphics, but it is pretty picky when it comes to updating to a new pattern. The easiest way is to click in the current pattern area, which covers all the icons, then Close All windows, then Select All to bring the icons to the front.

AppleWorks GS seems to have problems sometimes if you are using a picture. I don't know if this only affects ROM 03 machines or other also. I have never had a problem with this myself.

+ Look for the source code somewhere nearby. It's in ORCA/C v1.3 with APW v1.1 Rez files and ORCA/M for the picture loading routines.

This program contains material from the ORCA/C Run-Time Libraries, copyright 1987-1989 by Byte Works, Inc. Used with permission

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 325 of 1262
NOTE:

THE DIFFERENCE BETWEEN THE TWO TWO-PLAYER MODES IS THAT IN THE COOPERATIVE VERSION, THE BULLETS FIRED BY ONE PLAYER WILL NOT AFFECT THE OTHER.

*************

GAME PLAY

*************

MOVE YOUR VEHICLE ON THE ELEVATOR TO THE DESIRED MINE SHAFT. ENTER THE CAVE. AS YOU MOVE, YOU MINE THROUGH THE DIRT. YOU MOVE FASTER IN PATHWAYS THAT ARE ALREADY CLEARED. YOU MAY SHOOT THE MONSTERS, WHO ATTEMPT TO HARASS YOUR PROGRESS. HOWEVER, THEY WILL REAPPEAR IN A FEW SECONDS. THERE ARE EIGHT DIAMONDS IN EACH LEVEL. YOU MUST TAKE EACH DIAMOND, PROCESS IT AND BRING IT OUT OF THE MINE. AS YOU TAKE A DIAMOND, IT WILL FOLLOW BEHIND YOU -- KINDA LIKE SERPENTINE. THE MONSTERS CAN EAT YOUR DIAMONDS ONLY WHEN YOU ARE CARRYING THEM. BUT YOU CAN'T TAKE DIAMONDS IMMEDIATELY OUT OF THE MINE! YOU MUST PROCESS THEM FIRST. THE PROCESSING BOX LOOKS LIKE THIS:

```
INTERN
---
CHIEF SURGEON
---
BLACK BAG
---
THANX ALL AE SYSTEMS!
```

REQUIREMENTS: 48-K APPLE DRIVES

OPTIONAL EQUIPMENT: JOYSTICK

OBJECT:

TO COMPLETE ALL LEVELS WITH HIGHEST POSSIBLE SCORE

GAME CONTROLS:

CTRL-B = RESTART WITH NEW OPTIONS
CTRL-R = RESTART
CTRL-C = ALTERNATE KEYBOARD CONTROL
CTRL-J = JOYSTICK
CTRL-K = KEYBOARD
CTRL-S = SOUND TOGGLE
CTRL-ESC = PAUSE

DEFAULT CONTROL KEYS:

PLAYER 1

I = W
J = L
K = A

(SPACE) = FIRE

PLAYER 2

--

W = I
L = J
A = K

(SPACE) = FIRE

PLAYING MODES:

1 PLAYER
2 PLAYER COOPERATIVE
2 PLAYER COMPETITIVE

EXTRA POINTS:

TO TAKE THE DIAMONDS OUT OF THE MINE FOR THE MOST POINTS, YOU SHOULD QUEUE THEM UP; THAT IS, MOVE ALL EIGHT TO THE STORAGE AREA AND THEN MOVE THEM OUT. THE UPPER RIGHT IS AN ENTRY/EXIT AREA. DIAMONDS CAN BE Brought in or removed from this area. The bottom is an exit to leave the diamonds in the processing area.

YOU WILL FIND TWO "U" SHAPED, HEAVY BORDERED SQUARES. THESE ARE TELEPORTERS. MOVING INTO ONE WILL TRANSPORT YOU TO THE OTHER.

IF YOU COMPLETE FIVE DUNGEONS WITH LESS THAN FIVE DIAMONDS LOST AND STILL ARE ALIVE, THE GAME WILL GIVE YOU A PASSWORD. USE THE PASSWORD LATER TO SKIP BEGINNING LEVELS. THERE ARE SEVEN LEVELS IN ALL.

>>> SPECIAL NOTES <<<

A KEY IN THE LATTER DUNGEONS IS TO BE PROCESSED LIKE A REGULAR DIAMOND.

MONSTERS ARE SHY WHEN YOU HAVE A KEY

THERE ARE SPECIAL TRANSPORTERS THAT REQUIRE A KEY -- THEY WILL TRANSPORT YOU TO ANOTHER AREA OF THE SHAFT.

*************

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 327 of 1262
Apple II Computer Info

- The Help and view-text-file windows are 4.7 zillion times faster now.
- Four sizes of fat pixels are available in Edit Icon windows (see View menu).

Bug fixes in DicEd v1.1:

- Clicking in the icon area of an icon file window while the Edit button was disabled (when positioned at icon #0, before all the icons in the file) would let you edit this nonexistent icon, possibly leading to a crash.
- Some users have had DicEd 1.0 crash while quitting. I believe this was because of some buggy code in the TML Pascal 1.50A library, and I now bypass that code. If you still get crashes, I want to hear about it.
- The rectangle around the sample icons will always be redrawn properly now.
- Bogus redrawing of the fat-pixel images used to happen after drawing pixels and releasing the mouse if the window was scrolled vertically by a sufficient amount.
- The hot spot of the Pencil cursor has been moved down and right by one pixel.
- The Watch cursor is displayed while printing a text file to the printer.

*------*
DIG EM'
*------*

"I" MOVES UP
"M" MOVES DOWN
"E" MOVES LEFT
"K" MOVES RIGHT
"RETURN" FIRES

PLAYED ALMOST EXACTLY LIKE "DIG DUG"

DIFFERENCES: WHEN MONSTERS PASS THROUGH WALLS THEY GO AT AN INCREDIBLY FAST RATE ON A BEELINE STRAIGHT FOR YOU. WHEN DOING THIS, YOU MUST DIRECTLY HIT THEM. IF YOU JUST LEAVE YOUR NOZZLE HANGING OUT, THEY WILL BE ABLE TO PASS THROUGH THE NOZZLE AND GET YOU. ALSO, WHEN HIT THE MONSTERS BLOW UP IMMEDIATELY.

THE MONSTERS BECOME PROGRESSIVELY HARDER TO DEAL WITH. BY THE TIME THE 10TH ROUND OCCURS, THREE MONSTERS WILL IMMEDIATELY SPRING FROM THEIR STATIONS AT ONCE. CONSIDERING THE RATE AT WHICH THEY TRAVEL THROUGH THE ROCK, THIS SITUATION IS ALMOST IMPOSSIBLE TO DEAL WITH.

HINT: BY DROPPING 2 ROCKS(they don't have to hit anything), a prize will appear in the middle of the screen. The prizes become progressively worth more and more.

YOU GET A FREE MAN AT 10,000 AND ONLY AT 10,000 YOU START OUT WITH 4 MEN.
Dino Eggs docs by:
Mini Appler

There are 9 levels to DINO Eggs. Once you get to level 9, it just loops back there again.

How to complete a level:

The first thing you must do is build a fire. This is done by picking up one piece of wood and putting it on top of another piece. To pick up an object stand above it and press the top button. To drop an object stand above nothing and press top button. Once the fire is started Dino Mom will not come. (till the fire is out again) Now you have to run around and pick up eggs. You can only carry 3 eggs at a time unless you pick up a power. (it looks like a purple-green sun). When you have eggs and want to teleport them to the 21st century, walk into your time machine and press top button. This gives you points for your eggs. There are eggs hidden underneath the rocks. First drop the rock by trying to pick it up, then see what's during the course of the game, you may notice these sexy creatures peeping at you. Don't get excited, they are only dinosaurs! To get points for dinos, you must jump over them, (bottom button), and while above their heads, press the top button. This drops a cage on them. You get more points for caged Dino's than eggs when you warp. Once you have cleared all the eggs and Dinos, then leave to the next level!

Scoring and other stuff:

When warping- 6, 8, 12 pts for Dinos caged. 1st, 2nd, 3rd 2pts for each egg carried.

When warping to next level-

-1 for each egg left.
-10 for each Dino left. (ouch!)
+10 bonus for perfect level!
+50 bonus for perfect level 9!

To kill spiders, walk or jump over their threads. To kill fast and slow bugs drop rocks on their heads. To warp to next level, try to drop nothing into your time machine two times in a row! Note*: On level 9 you need 2 fires to keep Dino ma off yer tail!

the disk's directory structure is being read into memory. When the map is displayed, there will be a box across the top which represents the disk's volume directory and all the files on the disk. Underneath it will be a row of boxes representing the directories contained in the disk's volume directory; underneath each of them will be the directories they contain, and so on. The width of each directory's box is proportional to its size: a box that is 1/4th of the width of the screen represents a directory that contains files that total to 1/4th of the total space used on the disk (NOT 1/4th of the total space available for use on the disk). Any white space under a directory box, not filled by boxes representing subdirectories, represents the space taken by individual, non-directory files in that directory. If you map a disk containing no subdirectories at all, the entire screen will be filled with a single box representing its volume directory.

Each directory box contains the name of the directory it represents, if it will fit. If not, just point the mouse cursor at the box and its full name and exact size in disk blocks will appear at the bottom of the screen.

Clicking the mouse or pressing any key will return you to the list of online disks, from which you can choose another disk to map or quit back to your program selector. If you click in a directory box and then immediately quit, the prefix will be set to the directory you clicked in; this has no effect with most program selectors, but with those that do make use of the prefix (such as the APW or Orca/GS command shell) this feature can be used to quickly examine directories that seem to be taking up more disk space than they should. If you're using such a program selector, and don't want to change the prefix from what it was on entry to DirMap, make sure you always exit the map view mode by pressing a key or clicking the mouse outside of any directory.

USAGE FROM THE APW OR ORCA/GS COMMAND SHELL:
If you use APW or Orca, you can still use DirMap as described above, but it will be more convenient to use if you install it as a shell command. Just follow these steps:

1. Copy DIRMAP into your Utilities (prefix 6) directory:
   PREFIX (wherever dirmap currently is)
   COPY DIRMAP 6/
2. Change its filetype to EXE so the shell doesn't have to reload after use:
   FILETYPE 6/DIRMAP EXE
3. Add an entry for it in your commands table:
   EDIT 4/SYSCMD
   insert the line (in alphabetical order):
   DIRMAP  U :disk directory mapper
   Save the file back to disk, then exit and reenter the shell.

You can now call up DirMap by typing DIRMAP, no matter what the current prefix is. You can also tell DirMap to immediately map one or more disks by typing their names (or the name of the device containing the disk, or the name of a file or directory on the disk) after the DIRMAP command. Each requested disk will be mapped in turn; press the mouse button or any key to go on to the next. When all have been mapped, you'll be at DirMap's disk listing screen and can click on Quit to return to the shell. An example:

```
   DIRMAP /HARD1  /APPLEDISK3.5A  *  6
```

will map the following four disks:

1. the one named /HARD1,
2. whatever disk is in the device named APPLEDISK3.5A,
3. the boot disk, and
4. whatever disk contains prefix 6 (the APW/Orca utilities directory).

COPY DIRMAP 6/ COMMANDS STARING BACK AT YOU!

**DISK-FER TERMINAL SOFTWARE**
**WRITTEN BY THE REDHEADED FREAK**

THE MAIN POINT OF THIS SOFTWARE IS TO MAKE THE WORLD OF PIRACY A WHOLE LOT EASIER AND MORE EFFICIENT OF THE COMPUTERS TIME OF DISK-SPACE AND OF YOUR TIME. YOU NEED NOT BE PRESENT DURING THE X-FER WHICH CAO AND HAS LASTED UP TO 1 HOUR AND 10 MINUTES. YOU DON'T NEED TWO EXTRA DISKS FOR ANY PARTS OR ANYTHING OF THE SORT. INSTEAD YOU NEED DISK-FER AND A BLANK DISK.

OPERATION OF DISK-FER IS AS FOLLOWS. WHEN YOU BootUP THE PROGRAM YOU MIGHT BE CONFRONTED WITH ONE OF MANY THINGS.

1) - IT COULD BE IN LOWERCASE (IF YOU CAN'T READ LOWERCASE) IN WHICH CASE YOU HIT 'V' TO CONFIGURE THE SYSTEM.

2) - THE SLOT COULD BE CONFIGURED WRONG IN WHICH CASE YOU NEED TO HIT 'C' TO CHANGE THE SLOT. IF IT HANGS THE SYSTEM AS A RESULT OF A BAD SLOT # YOU NEED TO MOD THE PROGRAM BEFORE YOU RUN IT.

TO MAKE THIS MOD FROM THE MONITOR TYPE:

```
*905:n0 (WHERE 'n' IS THE SLOT #)

IF YOUR SLOT # IS 2 THEN THERE SHOULD BE A $20 THERE.
```

3) - IT COMES UP DISK-FER WITH THE RIGHT SLOT AND ALL!!!!!!!!!

AFTER YOU GET IT CONFIGURED FOR YOUR SYSTEM YOU SHOULD SEE A BUNCH OF COMMANDS STARING BACK AT YOU!

F) - TOGGLES BETWEEN ON HOOK AND OFF HOOK. AN INVERSE PIN ON THE STATUS BAR WILL BE LIT WHEN THE CAT IS ONLINE.

V) TOGGLES BETWEEN MODEM AND VOICE MODE. MODEM MODE WILL BE FORCED AT THE BEGINNING OF A X-FER. AND VOICE MODE WILL BE FORCED AT THE MENU.

C) - CHANGES THE APPLE-CAT SLOT. AN INTERESTING LITTLE THING THAT HAPPENS ON MY COMPUTER IS THAT WHEN I CHANGE THE SLOT TO MY PRINTER CARD AND THE PRINTER IS OFF, THE CARRIER LIGHT FLASHS ON AND OFF AT THE SAME RATE AS THE VIDEO CIRCUITRY UPDATES THE SCREEN. LEAVING BROKEN CHARACTERS ON THE SCREEN.

M) TOGGLES BETWEEN ORGINATE AND ANSWER MODE OF THE MODEM. DURING A BOTH SIDE TRADE THE COMPUTER TO SEND FIRST IS THE ONE THAT IS IN ORGINATE AT THE START OF THE X-FER.

D) - DOS COMMAND. THIS OPTION ALLOW YOU TO ENTER A DOS COMMAND TO BE华侨大学
PARSED BY THE CURRENT DOS. (ANY DOS COMMAND CAN BE ENTERED)

E)  EDIT PASSWORD. THIS OPTION EDITS THE CURRENT PASSWORD OF THE SYSTEM.
    YOU MAY ENTER LOWERCASE/CNTRL/NORMAL CHAR'S TO BE USED AS YOUR
    PASSWORD. THE PASSWORD IS USED TO KEEP UNWANTED PEOPLE (SOFTWARE
    UNDERGROUND MEMBERS) OUT OF YOUR SYSTEM.

S)-
R)-
B)-
L)-
K)-

THESE FIVE OPTIONS ARE THE TRANSFER/RECEIVE OPTIONS. I WILL EXPLAIN
HOW TO USE THEM IN GENERAL THEN IN DETAIL. WHEN YOU SELECT ONE OF THESE
OPTIONS THE COMPUTER COMES UP WITH 'ENTER PASSWORD.' AT THIS POINT
YOU CAN EITHER TYPE:

<ESc> TO ABORT.... <RET> TO TRANSFER WHEN BOTH APPLES ARE IN 'LOCAL
MODE' (SEE BELOW).... HITTING RETURN WILL JUST JUMP TO THE TRANSFER
ROUTINE THAT YOU CHOSE AT THE MENU.

A TWO CHARACTER PASSWORD ENTERED AT THIS PROMPT PUTS THE APPLE INTO A
REMOTE COMPUTER. THIS OPTION IS USED TO CALL UP A 'DISK-FER BBS' WHICH
WILL BE WAITING FOR CALLS TO SEND DISKS, IF OF COURSE THE TWO
PASSWORDS MATCH. THESE TWO PASSWORDS ARE:

THE COMPUTER THAT IS THE 'BBS' THE PASSWORD THAT YOU TYPE AFTER THE
COMMAND.

SENDING AND RECEIVING FILES.

---------- -----
S) -
SEND THE DISKETTE IN DRIVE ONE. THIS COMMAND MUST BE EXECUTED ALONG
WITH THE 'R' COMMAND.

R)-
RECEIVE A DISK FROM THE LINES TO DRIVE 1.

B)-
RECEIVE A DISK AND PUT IT ON DRIVE TWO. AND SEND THE DISKETTE IN DRIVE
TWO. THE ORDER OF OPERATIONS IS DECIDED BY THE ORG/ANS MODE. THE IN
ORG SENDS FIRST.

L)-
LOP-SIDED SEND. SEND BOTH THE DISKS IN BOTH DRIVES. (NOTE, TO MANY OF
THOSE X-FERS WILL CAUSE THE COMPUTER TO SELF-DESTRUCT TO PREVENT YOU
FROM BEING LEACHED UPON!!!!!!!!!!!!!!!!!!!)

K)-
LOP-SIDED RECEIVE. RECEIVE DISKS IN BOTH DRIVES. THESE ARE THE BEST
X-FERS THAT THE PROGRAM DOES!!!!!!!!!!!!!!!!!!!!.

(NOTE: IF THE COMPUTER IS NOT IN UNATTENDED MODE THESE X-FERS WILL
'NEVER' ABORT BY THEMSELVES. THEY WILL JUST KEEP HACKING AWAY UNLESS A
SYNC ERROR OCCURS AND THE RECEIVE SKIPS A BLOCK. THESE ERRORS ARE
POSSIBLE BUT NOT LIKELY. IF THE TRANSFER ENDS ON ITS OWN. THEN YOU CAN
BE 98% SURE THAT THE DISKS HAVE BEEN SENT CORRECTLY.

WHEN THE X-FER ENDS BOTH SIDES WILL WAIT FOR YOU TO HIT A KEY. THE
FIRST PERSON TO HIT A KEY WILL BE IN CONTROL OF BOTH COMPUTERS HE/SHE
(WO-MAN'S LIB) WILL BE SENT A SMALL MENU AT 300 BAUD.

B)ELL OR H)ANG UP??
DISK MUNCHER 1.1
THE ULTIMATE IN FAST COPIERS

DOCUMENTATION BY:
THE INSPECTOR

ANOTHER GREAT PROGRAM BROUGHT TO YOU BY
CORRUPT COMPUTING

DISK MUNCHER IS PROBABLY THE FASTEST COPIER AVAILABLE FOR THE APPLE COMPUTER. (THERE MIGHT BE COPIERS THAT SACRIFICE RELIABILITY FOR SPEED, AND ARE THUS FASTER.) DISK MUNCHER CAN COPY A DISK IN LESS THEN 30 SECONDS WITH INIT! (ON A 48K SYSTEM). IF YOUR SYSTEM HAS MORE MEMORY ADDED THRU ADDITIONAL RAM CARDS, DISK MUNCHER WILL BE ABLE TO COPY A DISK IN EVEN LESS TIME! WHILE DISK MUNCHER IS EXTREMELY FAST AND RELIABLE, IT IS DESIGNED WITH THE USER IN MIND. DISK MUNCHER HAS SUCH USER FRIENDLY OPTIONS AS A CATALOG FUNCTION WITH DISK MAP, WRITE VERIFY, SAVE-ABLE CONFIGURATION, STATUS INDICATORS AMONG OTHERS.

BEFORE YOU CAN EVEN BEGIN TO USE DISK MUNCHER, YOU WILL NEED TO KNOW A FEW BASIC THINGS ABOUT HOW DISK MUNCHER REFERS TO YOUR DISK DRIVES. THE SOURCE DISK IS THE DISK YOU ARE COPYING FROM (USUALLY SLOT 6, DRIVE 1) AND THE TARGET DISK IS THE DISK YOU ARE COPYING TO (USUALLY SLOT 6, DRIVE 2). THE VALUES FOR SOURCE AND TARGET CAN BE CHANGED, BUT BETWEEN THE SOURCE AND TARGET DISK. DISK MUNCHER WILL PROMPT YOU WHEN TO CHANGE DISKS.) WARNING!: DUE TO THE FACT THAT IT IS VERY EASY TO PUT THE WRONG DISK IN THE DRIVE, YOU ARE ADVISED TO PUT A WRITE-PROTECT TAB ON THE SOURCE DISK TO PREVENT ACCIDENTAL ERASURE.

TO START DISK MUNCHER ALL YOU NEED TO DO IS TYPE "BRUN DISK MUNCHER:"

"PRESS ANY KEY TO CONTINUE". AFTER YOU PRESS A KEY, DISK MUNCHER WILL READ THE DISK, AND YOU CAN DO IT WITHOUT EVER LEAVING DISK MUNCHER! NOTE: SOME DISKS DO NOT HAVE A CATALOG OR DISK MAP, OR THE DISK MAP MAY APPEAR GARBLED. IF YOU ARE UNABLE TO TELL WHAT IS ON THE DISK FROM THE LABEL OR BECAUSE OF ONE OF THESE CONDITONS, YOU ARE ADVISED TO "BOOT" THE DISK TO TRY TO DETERMINE WHAT IT CONTAINS.

NOW THAT YOU KNOW HOW TO CATALOG A DISK, WHY DON'T WE LEARN HOW TO USE THE ACTUAL COPIER?

WHEN YOU PRESS "3" TO COPY A DISK, THE SCREEN WILL CLEAR AND WILL BE DIVIDED INTO TWO SEPARATE SECTIONS. THE LEFT SECTION CONTAINS ALL MESSAGES, WHAT SLOT AND DRIVE THE SOURCE AND TARGET DISKS ARE IN, AND ALL THE INFORMATION ABOUT RAM CARDS. THE RIGHT SIDE OF THE SCREEN IS A STATUS AREA. IT SHOWS WHAT MODE THE COPIER IS IN, AND WHAT TRACK DISK MUNCHER IS CURRENTLY COPYING. WHENEVER DISK MUNCHER IS ACCESSING THE DISK IN COPY MODE, IT WILL DISPLAY A "STATUS MARKER" NEXT TO THE TRACK IT IS ON. THIS IS A LIST OF WHAT THE DIFFERENT STATUS MARKERS REPRESENT:

- INVERSE R - READING FROM CURRENT TRACK
- INVERSE W - WRITING TO CURRENT TRACK
- INVERSE V - VERIFY WRITE TO CURRENT TRACK
- NORMAL R - READ ERROR
- NORMAL W - WRITE ERROR

AFTER DISK MUNCHER DISPLAYS THIS INFORMATION, IT WILL TELL YOU: "PRESS RETURN TO CONTINUE, SPACE BAR CHANGES OPTIONS". AT THIS PROMPT, YOU CAN PRESS RETURN, SPACE BAR, OR CTRL-V. CTRL-V Toggles THE WRITE VERIFY ON OR OFF. IF YOU PRESS RETURN, DISK MUNCHER WILL BEGIN COPYING THE DISK. IF YOU ARE USING A ONE DISK SYSTEM IT WILL PROMPT YOU TO INSERT THE SOURCE DISK AND PRESS RETURN. YOU WILL HAVE TO SWAP BETWEEN THE SOURCE AND TARGET DISK. DISK MUNCHER WILL PROMPT YOU WHEN TO CHANGE DISKS.) WARNING!: DUE TO THE FACT THAT IT IS VERY EASY TO PUT THE WRONG DISK IN THE DRIVE, YOU ARE ADVISED TO PUT A WRITE-PROTECT TAB ON THE SOURCE DISK TO PREVENT ACCIDENTAL ERASURE.

CARD, DISK MUNCHER WILL SCAN THAT SLOT TO DETERMINE HOW BIG THE CARD IS, AND WHETHER IT IS A LEGEND, SATURN, 16K, OR 32K CARD, BECAUSE OF THIS IF YOU ENTER THE SLOT OF A CARD THAT IS NOT A RAM CARD, UNLESS DISK MUNCHER MIGHT HAPPEN TO DISCOVER THAT CARD, IT COULD HAVE IT'S TIME CHANGED, ETC...). NOTE: DISK MUNCHER WILL AUTOMATICALLY SEARCH SLOT 0 FOR A RAM CARD. YOU SHOULD ENTER THE SLOTS FOR ALL YOUR RAM CARDS. WHEN YOU ARE DONE ENTERING, PRESS SPACE BAR, AND DISK MUNCHER WILL RETURN YOU TO "INSERT DISKS" PROMPT. NOTE: TO LEARN HOW TO SAVE THIS CONFIGURATION, SO THAT YOU DON'T HAVE TO TYPE ALL THE INFORMATION IN EACH TIME YOU WISH TO USE DISK MUNCHER, SEE APPENDIX C.

YOU HAVE NOW LEARNED HOW TO COPY A DISK, AND CHANGE THE OPTIONS. THE ONLY THING LEFT TO TELL YOU ABOUT HOW TO EXIT FROM DISK MUNCHER. EXITING FROM DISK MUNCHER IS VERY SIMPLE. FOR DISK MUNCHER IS LOADED IN, ENTER THE MONITOR WITH THE "LOAD DISK MUNCHER 1.1" COMMAND FROM DISK.

TO BEGIN WITH YOU WILL NEED TO "BLOAD" DISK MUNCHER FROM DISK. THIS CAN BE ACCOMPLISHED WITH THE "BLOAD DISK MUNCHER 1.1" COMMAND FROM DISK. AFTER DISK MUNCHER IS LOADED IN, ENTER THE MONITOR WITH THE "CALL-151" COMMAND FROM BASIC. THIS IS A LIST OF ADDRESSES IN DISK MUNCHER THAT CORRESPOND TO THE DIFFERENT DEFAULT VALUES FOR THE USER CONFIGURATION:

LOCATIONS OPTION

$1000 SOURCE SLOT TIMES 16 + SOURCE DRIVE I.E. $1000=$61
$1001 TARGET SLOT TIMES 16 + TARGET DRIVE I.E. $1001=$62
$1002 SLOT OF RAM CARD 1 TIMES 16.
$1003 SLOT OF RAM CARD 2 TIMES 16.
$1004 SLOT OF RAM CARD 3 TIMES 16.
$1005 SLOT OF RAM CARD 4 TIMES 16.
$1006 VERIFY ON/OFF ($00=OFF,$FF=ON)
$1007 FUTURE EXPANSION.

AFTER YOU HAVE ENTERED YOUR RAM CARD SLOTS IN THE BYTES, YOU HAVE TO FILL THE REMAINING RAM CARD LOCATIONS LOCATIONS WITH 255 (SPACES). LOCATIONS $1008-$100F ARE THE RESET CONFIGURATION SECTION. THE FORMAT FOR RESET CONFIGURATION IS THE SAME AS THE USER CONFIGURATION.

AFTER YOU HAVE ENTERED ALL THE INFORMATION YOU CAN RETURN TO DOS BY TYPING "3DOG". ALL YOU HAVE LEFT TO DO IS SAVE DISK MUNCHER BACK OUT TO DISK. THIS CAN BE ACCOMPLISHED WITH THE "SAVE DISK MUNCHER 1.1" command. THEN EVERY TIME YOU WANT TO USE DISK MUNCHER YOU WILL JUST BRUN IT AS USUAL, AND THE USER CONFIGURATION WILL BE ACTIVE. IF YOU WISH TO USE THE RESET CONFIGURATION YOU CAN PRESS CTRL-R. YOU CAN THEN SWITCH BACK TO THE USER CONFIGURATION BY PRESSING CTRL-C.

IF YOU HAVE TWO DIFFERENT COMPUTERS THAT YOU USE DISK MUNCHER ON, YOU COULD CHANGE BOTH THE USER AND RESET CONFIGURATIONS. THIS WOULD ALLOW YOU TO USE THE USER CONFIGURATION FOR ONE COMPUTER AND THE RESET CONFIGURATION FOR THE OTHER.

Appendix B - Story and Principle Behind Disk Muncher

When we (the Stack and Myself) first saw the "Fast" copiers we thought they were great, but they lacked one major feature: you couldn’t catalog a disk from within their program! So we decided to write our own "Fast" copier. When we were in the planning stages, the stack in one of his brain storms (the same ones that gave you the rotating shapes and the zoolooms) was deciding what he could make a faster copier. Well the product of that idea was Disk Muncher.

The principle behind all this is a little complicated, and this explanation is just the backround and basics behind it. On a disk information is store in nibbles. Each nibble is only six bits long. Normally DOS reads the nibbles in and converts them to eight bit format. Well this is just fine and dandy, but it takes a while to convert the nibbles. So the stack decided he would just read the nibbles and write them back out without converting them. This can give a lot of time when you are copying a whole disk and makes it so that the disk does not have to be edited. Because the 6 bit nibbles take up more room in memory than a 8 bit byte, it takes more memory to read a track, thus the required 224K for reading in the whole disk.

Appendix C - Technical Stuff

This section contains information useful to the experienced programmer.

If by some unforeseen circumstance your drive has the head violently moved (like dropping it out the window or something like that) you can recalibrate it with the "LOAD DOS 1.0" command. These commands will recalibrate the source and target drives respectively.

One other interesting thing you might want to know. The track move delay table is stored at $1200. If you have a drive that can seek the head faster than normal, this might be useful.

Appendix D - Differences Between Version 1.0 and Version 1.1

The major difference between version 1.0 and version 1.1 is the read and write verify. There are other minor differences, like the fact that Disk Muncher doesn’t recalibrate the head after the first time. Another access to the source drive is easy access to the target drive, they were great, but they lacked one major feature: you couldn’t catalog a disk from within their program! So we decided to write our own "Fast" copier. Well the product of that idea was Disk Muncher.

Upcoming Projects and Programs:

The newest member of Corrupt Computing, the Technicolor Pirate, is almost done with a very interesting and unique program: Shape Hunter. This is a program that will allow you to use an nmi to interrupt a game, and save it for later play, or even edit the shapes and pictures in the game. This is one of the most impressive projects Corrupt Computing has ever undertaken.

Still in the planning stages is a program packer/unpacker, a modular DOS, a RAM disk program that will allow you to use any RAM card by any company as a RAM disk, and a Shape Hunter Utilities disk. Also in the planning stages is a Corrupt Computing newsletter. It will include a major article on how the disk drive works, and a complete interpretation of the P6 and P6A Proms.

Well that is just about it for now.

A Word to the Wise.
CORRUPT COMPUTING HAS MAINTAINED A REPUTATION FOR WRITING GOOD
PROGRAMS AND DISTRIBUTING THEM TO THE USER AT NO OR VERY LITTLE COST.
BUT IF PEOPLE BEGIN TO ABUSE THIS SERVICE BY TRYING TO SELL OUR
PROGRAMS, OR REQUESTING A ACCESS FEE (WITHOUT OUR KNOWLEDGE) FOR THE
PRIVILEGE OF DOWNLOADING OUR PROGRAMS, THIS SERVICE WILL BE
DISCONTINUED. YOU HAVE BEEN WARNED!

THANK YOU VERY MUCH FOR YOUR COOPERATION.

IF YOU HAVE ANY QUESTIONS, COMMENTS, OR CONCERNS, PLEASE DIRECT THEM
TO EITHER THE INSPECTOR OR THE STACK ON "THE CORRUPT COMMUNICATIONS
BULLETIN BOARD". 313-453-9183 - 24HRS.

DOCUMENT diskcovers

Disk Covers and T.I.M. Version 1.1

Disk Covers - A New Kind of Icon

I have a large collection of Graphics, I call them Pics, which I have
downloaded, scanned, digitized, or on rare occasion created.
They are stored on disks by catagory such as cartoons, space, etc. The
disks are named by catagory and I wrote slide show to view them.

I thought it would be fun to take one Pic from each disk and make a large
Icon from it that would pop up on the desktop when the disk was inserted
and run slide show when it was double clicked.

This would be a kind of album cover like my cd's have, to help better
remind me of the contents of the disk.

Alas when I ran T.I.M. to make my first one it died. The code overwrote
itself and the variables when ever it got over 80 lines high. This can't be
(I sec to me) I wrote this piece of slop to handle 100 lines, a 50 line
icon plus a 50 line mask, but such was not the case.

So back to pounding the keys, hacking away at my own already sloppy code,
T.I.M. Version 1.1 came into being. And my disk collection is starting to
get some covers.

First: How I use them.

1. Make a folder named ICONS on each disk.
2. Name the Disk Cover Icon the same name as the disk and put it in the
   icons folder.
3. I already have the icon attached to the name of the disk, for a basic
   program ($FC) and launching */BASIC.LAUNCHER.
4. Write and save a basic program by that name which will run the program
   of your choice, Slide.Show, Windows, Etc. (See the Example)
5. Drag the disk to the trash and then pop it back in, you should now be
   able to see your Icon Picture.
6. Turn on (an X in the block) Save Finder Info To Disk. This should be off
   unless you are rearranging your desktop as it will speed up all window
   closes and launches.
7. Drag the Icon Picture onto the desktop and close the disk's window.
8. Now Drag the Disk into the Trash, I also write-protect it then.
9. Turn off (no X in the block) Save Finder Info To Disk.

An alternate to step 7 is to move the icon pic and size the window so that
the window border surrounds the pic, this way you can close the window
but it will still pop up when you double-click the disk.

Next: How to make them.

1. The easiest way I have found is to use SHR Convert to load a Pic, then
   reduce 50% by height and width and save as a $C1 (Screen) file.
2. Next load it into PaintWorks Gold or DeluxePaint II - Make a mask or
   template to protect all but one color, then wash that color with the
   color from the finder's pallette that most approximates the original.
3. To repeat, make sure you are using the finders colors to view the pic as
   you work. I use DeluxePaint II and go from Restore Pallette on the spare
   page to Use Brush Pallette on the Page I am converting.
4. When I have finished converting I save it to my T.I.M. disk as ESP.GIRLS
   as an example then run T.I.M. to make the icon.
5. Be sure to save or convert it into a $C1 file with the image in the
   absolute upper left hand corner of the screen.

You could also grab or load a Pic as a Brush and reduce or resize it to a
size you would like but then you have to go thru the boring process of counting pixels. Bah, Humbug. A single 50 x 50 percent reduction is 180 wide by 100 high, do it twice and its 90 wide by 50 high, nice and easy.

Now for a few thousand words about T.I.M. Version 1.1

1. It will now let you define the program it launches.
2. Handles Icons up to 50 lines high with a custom mask.
3. Over 50 lines high it makes its own mask.
4. Writes and reads back parts of the file to disk and then assembles them into an Icon named TEST.ICON - You have NO CHOICE and any existing TEST.ICON will be deleted.
5. Maximum height - 150 lines
6. Maximum width - Don't know, largest I have done is 160 pixels.
7. Minimum size - Again don't know, must be over $F$ squared (16 x 16).

That's All Folks - Have Fun

Fred

DOCUMENT disktimer

DISKTIMER GS
A Hard Disk Benchmarking Program

(C) 1988 Joe Jaworski
18405 Tamarind Street
Fountain Valley, CA 92708

GENie: JVJAWORSKI
CompuServe: [73307,310]

This program is FREeware. It is copyright material but you may use it and/or distribute it free of charge to anyone for personal, non-commercial use. Licensing is required for including DiskTimerGS with any commercial hardware or software product. Contact me at the above address for licensing information.

What is DiskTimerGS?
DisktimerGS is a "Benchmark" or performance rating program designed to measure how efficiently a hard disk drive will perform on an Apple IIGS. It is designed to give you, the consumer, a rating system by which to measure the performance of hard disk drives and their manufacturers claims.

Like all benchmarks, test results cannot be strictly correlated to a drive's performance in an actual application. However, the key to a benchmark is the comparison of results between different products.

DiskTimerGS has been designed to eliminate as many system variables as possible to insure accurate results in a wide variety of system configurations. DiskTimerGS is immune to disk cache settings, controller cache memory, partitioning, system interrupts (including mouse movement), and buffered drive seeks.

APPLETALK USERS: DiskTimerGS disables interrupts during the actual test periods. This will "hang" the network. Disconnect AppleTalk before running DisktimerGS.

Using DiskTimerGS
DiskTimerGS is very easy to use. Simple transfer a copy of the program to the disk drive you want to test and launch it from there. It doesn't matter if the program is put in a folder or in the root directory. However, it must be launched from the drive you want to test. The tests will take anywhere from 2 to 5 minutes to run.

DisktimerGS does not perform any WRITE operations and will not alter any data on any disk under test. In fact, the disk must be formatted and contain a ProDOS directory in order to run the tests. If the disk is partitioned, any single partition can be tested (the results are independent of partitioning) but the partition selected must be at least 9.9 Megabytes in size in order for the tests to run. DO NOT try to run DiskTimer from a floppy. It won't work.

About the Results
DiskTimerGS reports its results in seconds for each
APPLE II COMPUTER INFO

DOCUMENTATION FOR DISK INVENTORY UTILITY V1.0B

BY THE SAINT

(C) 870727 ARISTOS UNLIMITED

This program is Public Domain.

DIU is a ProDOS utility that will allow you to take an inventory of your ProDOS disks and create a TXT file which could be used by AppleWorks.

DIU will first ask for the Slot & Drive of the diskette to be inventoried. This is selected using the light-bar selector. Next DIU will ask for the information should be displayed (Printer, Screen, or Text file). With this version 1.0B of DIU, output to text file is the only valid option. Selecting Text file will prompt for the FULL pathname of the file to be created. Full pathname means that you must specify the Volume name as well as the file name [ex. /MYDISK/NEWFILE]. DIU will then read the directory from the selected slot and drive and create a TXT file on the specified pathname. The same TXT file may be used again for different disk. Each disk inventory will be appended to the previous one if the same name is used.

To create an AppleWorks Data Base file from the TXT file, follow the following instructions.

1. From the Main Menu select option 1, "Add files to Desktop."
2. Next, select option 4, "Make a new file for the Data Base."
3. Select option 2, "Make a new file from a text (ASCII) file."
4. Enter 9 to the question "How many categories per record?"
5. Enter the complete pathname of the file created with DIU. [ex. /MYDISK/NEWFILE]

After Appleworks has read the file, it will ask for the name of the new file. This is the name of the Data Base file.

There it is! Appleworks now has a Data Base file with an inventory of your ProDOS disk(s).

Now to fix-up the file.

Press OA-N for "Rename categories." The categories should be changed to the following:

CATEGORY01 = Pathname
CATEGORY02 = Filename
CATEGORY03 = Type (filetype)
CATEGORY04 = Blks (Blocks)
CATEGORY05 = Modified Date

Press OA-L to "Change record layout."
Delete "Modified Time" & "Create Time." "Filename" should be set at 15 spaces, since this is the maximum number of characters allowed in a ProDOS filename.
"Type" should be set to 3 spaces.
"Modified Date" & "Create Date" should both be set at 9 spaces.

Run DiskTimerGS at least three times (The results may vary slightly depending upon the drive/controller tested). Submit all three test results (or an average of the three) along with your name, BBS ID, and any additional comments to support the test setup. Submit your data to one of my BBS ID's listed above.

Thanks for your support. I hope you find DiskTimerGS an Independent and valuable aid in selecting one of the growing number of hard disk drives now available for the IIGS.

-JOE JAWORSKI

DiskTimerGS operates through the ProDOS 16 interface under GS/OS. It is not compatible with System Disks before version 4.0 and is not compatible with other models of the Apple II.

OPERATION. THE THREE TESTS PERFORMED ARE:

READ TIMING: THIS TEST PERFORMS A SEQUENTIAL READ OF A NUMBER OF 512 BYTE BLOCKS TO DETERMINE HOW FAST THE HARD DISK CAN TRANSFER CONSECUTIVE DATA. THE FACTORS THAT MOST EFFECT THIS NUMBER ARE THE DISK INTERLEAVE AND DATA TRANSFER RATE OF THE DRIVE.

SEEK TIMING: THIS TEST MEASURES THE TIME IT TAKES TO SEEK THE R/W HEADS OF THE DRIVE ACROSS 10 Megabytes OF DATA. THE RESULTS OF THIS TEST ARE MAINLY GOVERNED BY THE TRACK-TO-TRACK, AVERAGE ACCESS, AND HEAD SETTLING TIME OF THE DRIVE.

ADAPTER TIMING: THIS TEST PERFORMS A REPEATED READ OF A SINGLE BLOCK ON THE DISK, MEASURING THE OVERHEAD TO RECEIVE DATA FROM THE LOW-LEVEL DISK INTERFACE THROUGH THE PRODOS 16 HIGH-LEVEL INTERFACE. FACTORS THAT EFFECT THIS RATING ARE THE DELAYS THROUGH THE HOST ADAPTER CARD ORIGINATING AT THE DISK DRIVE INTERFACE HARDWARE AND THE DISK/HOST INTERFACE. IN OTHER WORDS, IT MEASURES THE EFFICIENCY OF THE SCIS Card OR OTHER CONTROLLER CARD USED TO OPERATE THE DISK DRIVE.

INTERPRETING RESULTS

COMPARE YOUR DRIVE TO THE OTHERS LISTED IN THE DISKTIMERGS COMPARISON LIST (INCLUDED IN THIS DOWNLOAD) TO SEE HOW WELL YOUR DRIVE HAS PERFORMED.

SUBMITTING TO THE COMPARISON LIST:

THE DISKTIMERGS COMPARISON LIST INCLUDED WITH THIS DOWNLOAD WILL BE FREQUENTLY UPDATED. TO MAKE DISKTIMERGS AN EFFECTIVE TOOL, I NEED YOUR HELP IN KEEPING THIS LIST AS UP TO DATE AS POSSIBLE. IF YOU HAVE A HARD DRIVE THAT IS NOT ON THE LIST, RUN DISKTIMERGS AND SUBMIT YOUR TEST RESULTS SO I CAN INCLUDE IT IN THE NEXT UPDATE. EVEN IF YOUR DRIVE IS "HOMEBREW", IT WOULD BE INTERESTING TO COMPARE RESULTS TO COMMERCIALY AVAILABLE PRODUCTS.

Run DiskTimerGS at least three times (The results may vary slightly depending upon the drive/controller tested). Submit all three test results (or an average of the three) along with your name, BBS ID, and any additional comments to support the test setup. Submit your data to one of my BBS ID’s listed above.

Thanks for your support. I hope you find DiskTimerGS an Independent and valuable aid in selecting one of the growing number of hard disk drives now available for the IIGS.

-JOE JAWORSKI

DiskTimerGS operates through the ProDOS 16 interface under GS/OS. It is not compatible with System Disks before version 4.0 and is not compatible with other models of the Apple II.
The Diversi-Cache program comes on a 5.25 ProDOS floppy disk. We recommend you boot this disk when you power on, to install Diversi-Cache. You can then boot from the 3.5 drive with "PR#5".

You can also use the Apple //gs system utility program to transfer all of the Diversi-Cache files to a newly formatted 3.5 inch disk.

*** Adding Diversi-Cache to PRODOS *** (Not available on demo disk)

You can append Diversi-Cache to any disk with a file named PRODOS, for automatic installation when you boot that disk.

Choose this option from the menu, and insert the disk you want to update. Then, enter the slot and drive where the disk is located. You may enter the slot and drive of a hard disk, if desired.

If the PRODOS file you select already has Diversi-Cache appended, you will be given the option to add the new Diversi-Cache, or to remove Diversi-Cache and restore PRODOS to normal.

*** Installation Errors ***

You will receive a user support number, and a new disk with the latest version of Diversi-Cache. Your honesty will help us distribute future programs in this same, low-cost way.

*** Introduction ***

Diversi-Cache dramatically increases the I/O speed of the Apple Disk 3.5, under any operating system (ProDOS, Pascal, DOS 3.3). Diversi-Cache only speeds up the Apple Disk 3.5 designed for the Apple //gs, and will not affect the speed of the older Apple //c compatible UniDisk 3.5.

Diversi-Cache speeds up the Disk 3.5 in two ways. First of all, whenever the system reads a block, Diversi-Cache actually reads an entire track. This triples the speed of disk reads, and doubles the speed of ProDOS writes.

Secondly, Diversi-Cache allows you to allocate a cache memory buffer from 0 to 800K in size. An 800K cache works for the entire disk, while a 400K cache would work for the cache range, for example. Whenever the system reads a block in the cache range, Diversi-Cache saves it in the cache buffer. If the system asks for this block again, it comes out of memory at "Ramdisk" speed.

*** Installing Diversi-Cache ***

The Diversi-Cache program is a binary file named "CACHE". Diversi-Cache may be installed under ProDOS or DOS 3.3 with:

BRUN CACHE

Diversi-Cache installs itself in the first 64K of the memory expansion card (bank 2), and stays there permanently until a power off re-boot. That is, Diversi-Cache stays installed even if you reboot with open-apple-ctrl-reset. Note: after a reboot, Diversi-Cache is reconnect with the next toolset call (INPUT or entering the control panel does a toolset call).
Hold down the left or right arrow keys to adjust the buffer size. Press <RETURN> when you see the desired buffer size. Note that a buffer size of 0K disables the cache buffer entirely. Even with the cache buffer disabled, Diversi-Cache will still approximately triple the read speed for long files.

*** Changing the Cache Drive ***

If you have more than one Apple Disk 3.5, Diversi-Cache normally will only cache drive #1. To select a different drive to cache, hit the down arrow key after selecting the buffer size as described above. You may cache drive 1, drive 2, or both drives.

When you cache both drives, the cache buffer is cleared every time you switch from one drive to the other.

When you BRUN CACHE, you start with an 800K cache for drive #1. To change these starting values, RUN SETCACHE on the Diversi-Cache disk. This modifies and BSAVE's the CACHE file, so be sure your disk is not write protected.

*** Disabling Diversi-Cache ***

Hit the down arrow again, and then the left arrow to disable Diversi-Cache entirely. This may allow you to use Diversi-Cache with protected disks, by temporarily disabling it when the program checks for a protected block.

*** Compatibility Problems ***

Diversi-Cache works with any program which uses the //gs expanded memory correctly, as well as most copy protected programs. However, some of Apple's initial system software has memory management bugs. In particular, if you set up a Ramdisk with the control panel, be sure the maximum and minimum size are the same.

WARNING!!!!!!

THE MAXIMUM AND MINIMUM SIZE OF YOUR //GS RAMDISK MUST BE THE SAME!

Diversi-Cache tends to trigger bugs in software which occur when the //gs memory fills, since the cache buffer fills all available memory. In particular, the //gs Ramdisk may return write errors if memory is full and the minimum size is set to less than the maximum. Many programs, such as Appleworks, don't check for write errors on a ramdisk, and may do strange things (like destroy your disks, even).

Other problems occur with ProDOS16 version 1.0, which de-allocates all memory. This will eventually destroy your Ramdisk space and Diversi-Cache as other programs overwrite their memory. If you have to boot Version 1.0, be sure to do an "open-apple_shift_ctrl_reset" reboot afterwards.

Some ProDOS16 programs "hang" when they run out of memory. These programs will work if you reduce the cache size, or increase the amount of memory in your //gs.

Hopefully, ProDOS16 version 1.2 corrects these problems. It is contained on the //gs system disk with the version number 2.0.

An occasional program, such as "Bard's Tale", ignores the //gs memory manager and destroys all memory, overwriting Diversi-Cache, Ramdisk, and anything else. You will have to run these programs from a power off reboot.

In summary, if a program doesn't work with Diversi-Cache, try reducing your cache size. If possible, set your Ramdisk size to 0 to leave more memory for Diversi-Cache.

*** Converting to a System File ***

You can convert Diversi-Cache to a system file, so you can run it directly from a menu selection program. To do this, first run BASIC.SYSTEM. Then CATALOG the Diversi-Cache disk and note the length of the CACHE file. Then, enter the following:

CREATE SCACHE,TSYS
BLOAD CACHE
BSAVE SCACHE,TSYS,AS2000,Lxxxxx (where xxxx is length of CACHE file)

*** Converting to DOS 3.3 ***

First, boot DOS 3.3 and format a disk with:

INIT HELLO

Then, boot ProDOS again and enter:

BLOAD CACHE
Put in your new DOS 3.3 formatted disk

BLOAD CACHE,AS2000,Lxxxxx (where xxxx is length of CACHE file).

Note that to run DOS 3.3 on a Disk 3.5, you need a DOS 3.3 adapter program. We recommend AmDOS(tm) from Gary Little, 131 Water St. #210, Vancouver, B.C., CANADA V6B 4M3, 604-681-3371 for $20.

AmDOS works with our Diversi-DOS(tm). For maximum DOS 3.3 performance on the Apple Disk 3.5, combine Diversi-Cache, Diversi-DOS, and AmDOS together.

*** Licensing Information ***

Although Diversi-Cache is copyrighted, DSR allows copying and distribution of the program subject to the following restrictions:

1. Anyone receiving a copy of Diversi-Cache must send a $35 license fee directly to DSR, Inc. within 2 weeks.
2. Any company, club, or individual may charge up to $5.00 for distributing copies of Diversi-Cache, provided it is clear that an additional $35 fee must be sent directly to DSR.

Publishers:

Publishers may license Diversi-Cache for a $250, one-time fee for all their programs. To do this, the following message must appear in the written documentation:

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

This disk contains a high-speed operating system called Diversi-Cache, which is licensed for use with this program only. To legally use Diversi-Cache with other programs, you may send $35 directly to: DSR, Inc., 34880 Bunker Hill, Farmington, MI 48018. You will receive the latest Diversi-Cache program disk with documentation.

Multiple Computers:

Each additional computer license fee is $35, up to a maximum of $250 for all the computers owned by a company (or school district).

*** User Support ***

Your user support number entitles you to talk directly to the programmer, Bill Basham. Please write if possible, or call:

313 553-9460 between 3 and 5 PM Eastern time.

*** Diversi-Copy ***

Diversi-Copy(tm) is the fastest and easiest way to make back-up copies of your 3.5 disks. Diversi-Cache triples the disk read speed when used with Diversi-Copy. Note, however, that Diversi-Copy exits with a power-off type reboot, so you'll need to re-install Diversi-Cache.

Diversi-Copy was chosen as incider magazine's "Editors' Choice". It is the best copy program available, for both 5.25 and 3.25 drive copying.

*** Diversi-Key ***

Diversi-Key is a keyboard macro program for the Apple //GS that will work with any program that allows interrupts. This includes programs that run under Pascal, ProDOS, or DOS 3.3. Diversi-Key works with Appleworks 2.0, as well as most other programs.

Diversi-Key sends macro keystrokes as if you had typed them at the keyboard, so you don't need to modify your programs to work with Diversi-Key. Diversi-Key allows you to add an almost unlimited number of custom functions to any program.

Diversi-Key includes a flexible way to program the mouse to work with any program, as well as date and time macros, nested macro calls, nested repeat, IF, and WHILE conditional loops, and much much more.

*** How to Order ***

To order, please send your check to:

DSR, Inc.
34880 Bunker Hill
Farmington, MI 48018-2728

The cost of our programs is as follows:

<table>
<thead>
<tr>
<th>Program</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diversi-DOS</td>
<td>$30</td>
</tr>
<tr>
<td>Diversi-Copy</td>
<td>$30</td>
</tr>
<tr>
<td>Diversi-Cache</td>
<td>$35</td>
</tr>
</tbody>
</table>
When copying ProDOS or Pascal disks, Diversi-Copy skips all unused blocks, as shown by the disk directory. This greatly speeds up the copying process, unless your disk is nearly full.

If you want to copy these unused blocks for some reason, press "=" from the main menu (the one that says "Insert Original Disk in Drive #1").

Before writing to a Unidisk 3.5, Diversi-Copy automatically formats the disk. This takes about 45 seconds per disk, in addition to the write time. When copying onto a "virgin" disk, i.e. right out of the box, this step is necessary.

However, if you are re-writing over a disk that already has data on it, you can skip this format step by pressing "F" from the main menu. Press "F" again to restore formatting.

This disk contains a demonstration version of Diversi-Copy. To legally use Diversi-Copy, please send in your payment within 2 weeks. Before writing to a Unidisk 3.5, Diversi-Copy automatically formats the disk. This takes about 45 seconds per disk, in addition to the write time. When copying onto a "virgin" disk, i.e. right out of the box, this step is necessary.

To get this version to copy 5.25 disks in a specific slot, get into BASIC and enter:

BLOAD DCOPY
POKE 2054,S (where S=4..7 slot number)
SAVE DCOPY

Diversi-Copy for the Unidisk 3.5 is a separate program included on the Diversi-Copy disk. This program is called "UCOPY". You can use the Unidisk 3.3 System Utilities disk to transfer "UCOPY" to any ProDOS disk, and execute it with a "BRUN UCOPY" command.

When you run the UCOPY program, it automatically finds the slot where your Unidisk 3.5 is located. The copying process works very much like Diversi-Copy for floppy disks. You may make 1-drive copies, or 2-drive copies (if you have 2 Unidisks).

To make a 1-drive copy, insert your original disk in Unidisk drive #1 and hit <space>. The program will prompt you with screen messages and beeps. You may hit 'S' to turn the beeps off and on.

To avoid writing onto your original by mistake, you may want to write protect it by sliding the tab on the disk so the write protect hole is open. The write protect hole on your duplicate must be closed, of course.

Put your original in drive #1, and your duplicate in drive #2. Press <return> to begin copying. Both disks are ejected when copying is complete.

Diversi-Copy for the Unidisk 3.5 is a separate program included on the Diversi-Copy disk. This program is called "UCOPY". You can use the Unidisk 3.3 System Utilities disk to transfer "UCOPY" to any ProDOS disk, and execute it with a "BRUN UCOPY" command.

When you run the UCOPY program, it automatically finds the slot where your Unidisk 3.5 is located. The copying process works very much like Diversi-Copy for floppy disks. You may make 1-drive copies, or 2-drive copies (if you have 2 Unidisks).

To make a 1-drive copy, insert your original disk in Unidisk drive #1 and hit <space>. The program will prompt you with screen messages and beeps. You may hit 'S' to turn the beeps off and on.

To avoid writing onto your original by mistake, you may want to write protect it by sliding the tab on the disk so the write protect hole is open. The write protect hole on your duplicate must be closed, of course.

Put your original in drive #1, and your duplicate in drive #2. Press <return> to begin copying. Both disks are ejected when copying is complete.

Diversi-Copy for the Unidisk 3.5 is a separate program included on the Diversi-Copy disk. This program is called "UCOPY". You can use the Unidisk 3.3 System Utilities disk to transfer "UCOPY" to any ProDOS disk, and execute it with a "BRUN UCOPY" command.

When you run the UCOPY program, it automatically finds the slot where your Unidisk 3.5 is located. The copying process works very much like Diversi-Copy for floppy disks. You may make 1-drive copies, or 2-drive copies (if you have 2 Unidisks).

To make a 1-drive copy, insert your original disk in Unidisk drive #1 and hit <space>. The program will prompt you with screen messages and beeps. You may hit 'S' to turn the beeps off and on.

To avoid writing onto your original by mistake, you may want to write protect it by sliding the tab on the disk so the write protect hole is open. The write protect hole on your duplicate must be closed, of course.

Put your original in drive #1, and your duplicate in drive #2. Press <return> to begin copying. Both disks are ejected when copying is complete.

Diversi-Copy for the Unidisk 3.5 is a separate program included on the Diversi-Copy disk. This program is called "UCOPY". You can use the Unidisk 3.3 System Utilities disk to transfer "UCOPY" to any ProDOS disk, and execute it with a "BRUN UCOPY" command.

When you run the UCOPY program, it automatically finds the slot where your Unidisk 3.5 is located. The copying process works very much like Diversi-Copy for floppy disks. You may make 1-drive copies, or 2-drive copies (if you have 2 Unidisks).

To make a 1-drive copy, insert your original disk in Unidisk drive #1 and hit <space>. The program will prompt you with screen messages and beeps. You may hit 'S' to turn the beeps off and on.

To avoid writing onto your original by mistake, you may want to write protect it by sliding the tab on the disk so the write protect hole is open. The write protect hole on your duplicate must be closed, of course.

Put your original in drive #1, and your duplicate in drive #2. Press <return> to begin copying. Both disks are ejected when copying is complete.
On a 1-drive system, put a blank disk in drive #1 and hit <space> to write each copy. On a 2-drive system, put blank disks in drives #1 and #2 and hit 'A'. Diversi-COPY will write to drive #1 and #2 alternately until you hit <ESC> or get a write error. You never have to touch the keyboard. While Diversi-COPY is writing to drive #2, put a new disk in drive #1, and vice-versa.

*** Errors ***

When something goes wrong in the copy process, Diversi-COPY will print an error number and explanation. If you forget to insert a disk, you will see the "Offline - No Disk in Drive" error. Just insert the disk and try again.

If you try to write to a disk with the write-protect hole open, you will see the "NoWrite - Disk Write Protected" error. Slide the write-protect tab over the hole and try again (if you really wanted to write on this disk).

The other error you are likely to see is the "I/O Error". Frequently, this is caused when the disk did not insert properly. Try pushing the eject button, and re-inserting the disk.

The I/O error will also occur if you try to read a "virgin" disk as an original, or if you try to write onto a "virgin" disk without formatting. If the disk is copy-protected, it will also give an I/O read error.

Finally, some I/O errors are caused by defective, damaged, scratched, or just worn-out disks. Hopefully, you will have used Diversi-COPY to back-up these disks before this happens.

When you get an I/O error during reading, Diversi-COPY will stop and ask you to press "S" if you want to try to read the block again. Hit <SPACE> to cancel the copy, or "I" to ignore the bad block. If you hit "I", then a block of all "0" will be substituted for the bad block. The file which contains this block will be partially lost.

*** User Support ***

Your user support number is on the disk which you get from DSR, Inc. when you send $30. Licensed users may call 313 553-9460 on weekdays between 3 and 5 P.M. (Eastern) for support, or write to

DSR, Inc.
34880 Bunker Hill
Farmington, MI 48018-2728

We will notify licensed users of any future updates to Diversi-COPY. Updates may be purchased for $5. We will also notify users of any future programs we release.

*** Multiple Computers ***

Diversi-COPY may be copied and used on all computers owned by a single individual, company, school district, or government agency, without additional fee, subject to the following restrictions:

1. All computers must be located within a 25 mile radius, or local phone calling area. I.E. corporations with branches in different cities should buy 1 copy for each city.

2. Each user support number entitles only ONE individual to call or write to DSR for support.
Note: Don't transfer the file named "PRODOS" on the //gs system disk to any other disk. Use the "PRODOS" on the Diversi-Key disk.

Diversi-Key comes with built-in macros for use with Appleworks 2.0. To get started, boot the Diversi-Key disk and choose the menu option to install Diversi-Key. This also installs the Appleworks macros.

To verify that Diversi-Key is active, press the option key. An inverse “K” should appear in the upper right corner of the screen. Appleworks should be in the mode where what you type appears on the screen, as if you were going to type a letter.

While holding the option key down (inverse “K” appears), press the minus key, “-”, on the KEYPAD, twice. Diversi-Key will now display all the built-in Appleworks macro definitions, typing them into a word processing file.

If you aren't in the right Appleworks mode to be able to type input, you may hear a lot of beeps, and the screen will go "crazy" as Diversi-Key continues typing. Don’t panic! Hit the panic button. Press: OPEN-APPLE_CONTROL_DELETE (halts Diversi-Key any time)

PLEASE COPY THIS DISK AND GIVE IT TO EVERYONE YOU KNOW!

It is legal to copy and distribute this disk. However, to legally use the Diversi-Key program on this disk, you must send payment within 2 weeks. Please send $45 directly to:

DSR, Inc.
34880 Bunker Hill
Farmington, MI 48018-2728

You will receive a user support number, and a new disk with the latest version of Diversi-Key. Your honesty will help us distribute future programs in this same, low-cost way.

INTRODUCTION

Diversi-Key is a keyboard macro utility for the Apple //gs, which can be used to automate the keyboard input for most programs which run on the //gs.

You install Diversi-Key permanently into the //gs expansion memory, where it stays available while you run other programs (such as Appleworks). Your other programs run normally, until you activate Diversi-Key by holding down the "option" key on the //gs keyboard.

While holding down the option key, the next keys you press are interpreted as a "Macro" call. When you call a macro, Diversi-Key takes over your keyboard, and rapidly types a pre-defined sequence of keystrokes for you. You'll find that Diversi-Key greatly increases the power and utility of your other programs.

When you hold down the option key, your program will pause temporarily, and resume when you let the option key up. You can press the option key to stop the program any time, i.e. to read a screen message which is scrolling by. Whenever the option key is down, you will see an inverse "K" in the upper right corner of the text screen (when in text mode only).

Diversi-Key requires an Apple //gs with at least 512K. The Apple //gs comes with 256K, so you must buy a memory card with at least 256K, which plugs into the //gs memory expansion slot.

START WITH APPLEWORKS

When you boot your Appleworks disk, if it says "ProDOS 1.1.1", then you should update the "PRODOS" file with a //gs version (ProDOS 1.2 or later). Use the //gs system utility program to transfer the file named "PRODOS" from the Diversi-Key disk to your Appleworks disk, replacing the old "PRODOS". This gives the correct time and date stamping of your files, and allows Diversi-Key to function.
Keep your "KEYMAC" printout handy as a reference. You may find the pre-defined macros are enough, in which case you can stop reading right here! Later, if you want to use the full power of Diversi-Key, you can study the rest of these instructions.

**USING PINPOINT:**

Many Appleworks add-ons, such as Pinpoint, use the option key as a trigger. To use Diversi-Key with these programs, change the Diversi-Key "trigger" key before booting Appleworks, as follows:

1. Boot the Diversi-Key disk and install Diversi-Key with the Appleworks macros.
2. Holding the option key down, enter the number "42." on the keypad. That is, enter: "4", then "2", then ".", all on the KEYPAD.
3. Now boot Appleworks, and use the option key to trigger Pinpoint as usual.
4. You now trigger Diversi-Key by pressing the OPEN-APPLE key AND the OPTION key together.

**Note:** Be sure you change the trigger key BEFORE booting Appleworks. Then, install Pinpoint before using Diversi-Key. If Pinpoint won't install, try re-booting Appleworks and don't use Diversi-Key until it Pinpoint is installed.

*******
**DEFINING SIMPLE KEYBOARD MACROS**
*******

To define a macro, hold the option key down and press the "=" on the numeric KEYPAD. Then, press the key on the KEYBOARD which you want to define. Now, type the macro definition on the KEYBOARD. When you're through with your definition, press the KEYPAD <enter> key.

For example, to define the option-D key as a macro which types "Hello", enter the following keystrokes:

```
[option-keypad-=]D
Hello<enter>
```

More details on defining macros are described later.

*******
**SAVING AND LOADING MACROS**
*******

After you define a macro, it is held in memory until you turn the machine off. To save it to disk, you must first enter BASIC. You can do this by booting the Diversi-Key disk, and choosing the "Exit to BASIC" option. Or, from the system disk, choose "BASIC.SYSTEM" from the launcher or desktop.

When you enter BASIC, you will see the Applesoft prompt, ]. To save your macro file, hold the option key down and enter the following on the KEYPAD:

```
1.2.
```

You should see the word "BSAVE", and a prompt to enter a filename. Pick a name for your file, and enter it. Then, press return. The file will be saved to disk.

To install the new macros later, get to BASIC and enter:

```
BRUN filename (where filename is the name you entered when saving)
```

**Note:** To get back to the launcher after entering BASIC, enter:

```
BYE
```

*******
**INTERRUPTS**
*******

Diversi-Key activates 60-cycle interrupts on the //gs. This may cause problems with some programs which read or write to a 5.25 drive without disabling the interrupt. In particular, Copy II+ versions before 7.4 will destroy 5.25 disks if you write on them with interrupts active (there is no problem with 3.5 drives). If you plan to use Copy II+ with 5.25 drives, be sure you get version 7.4 or greater.

This problem also shows up if you try to boot ProDOS from a 5.25 drive using PR#6. To avoid the problem, boot with open-apple-ctrl-reset, or use special macro [10. (described later)]

The Diversi-Key disk contains a file named BOOTFIX which will update the boot tracks on a 5.25 ProDOS disk to correct this problem. Exit to BASIC and enter:

```
BRUN BOOTFIX
```

Then, put in your 5.25 disk and press <space> to fix it.

*******
**INSTALLATION**
*******

Diversi-Key may be installed automatically from the menu when you boot the Diversi-Key disk. You only boot this disk once, at power on. The Diversi-Key program is actually a binary file named "DIVKEY". Diversi-Key may be installed under ProDOS or DOS 3.3 with:

```
BRUN DIVKEY
```

Once Diversi-Key is installed, it stays in memory permanently until a power off re-boot. That is, Diversi-Key stays installed even if you
reboot with open-apple-ctrl-reset.

ERRORS: When you BRUN DIVKEY, you will hear a "beep" if the installation was unsuccessful. The usual reason for this is that you tried to install Diversi-Key again, when it was already installed. You also get this error if you don't have a //gs memory expansion card, or if there is no memory available to install Diversi-Key. If this occurs, try installing Diversi-Key from a power-off boot.

Note: To avoid the beep, POKE 0,0.

NO RESPONSE? If Diversi-Key ever stops working, particularly after booting a new program, try pressing the "flush" key sequence:
open-apple_control_delete (Flush key sequence)

The Diversi-Key disk contains a pre-defined set of macros in a file names "DIVMAC", which are installed when you boot the Diversi-Key disk. You can also install them from BASIC with:
BRUN DIVMAC

The Diversi-Key program comes on a 5.25 ProDOS floppy disk. We recommend you boot this disk when you power on, to install Diversi-Key. You can then boot from the 3.5 drive with "PR#5".

You can also use the Apple //gs system utility program to transfer all of the Diversi-Key files to a newly formatted 3.5 inch disk.

********
AUTOMATIC STARTUP
********

You can add Diversi-Key to any ProDOS disk, and have it install automatically when you boot that disk. Use menu option #4 on the Diversi-Key disk to do this (not available on the demo).

This option adds the DIVKEY and DIVMAC files to your disk. It then changes the name of the PRODOS file on your disk to OLDPRO, and changes the DIVKEY file to PRODOS. When your disk boots, it should execute these files:

PRODOS (installs Diversi-Key)
DIVMAC (installs macros)
OLDPRO (starts up ProDOS 8 or 16)

To remove Diversi-Key from your disk, enter BASIC and type the following:

DELETE DIVMAC
DELETE PRODOS
RENAME OLDPRO, PRODOS

To put Diversi-Key back on the disk, use menu option #2. With the demo disk, you can transfer the files, DIVKEY, and DIVMAC, to your disk, and enter:

RENAME PRODOS, OLDPRO
RENAME DIVKEY, PRODOS

********
COLD REBOOT
********

You can remove Diversi-Key by turning the power switch off for 10 seconds or so, but this will eventually wear out the switch. You can simulate a power-off re-boot as follows:
1. Hold OPEN-APPLE_SHIFT_CONTROL keys down (3 keys).
2. Press and release RESET key.
3. Wait for 2 beeps.

This will remove Diversi-Key, and clear your Ramdisk (if any).

********
CALLING MACROS
********

Macros in Diversi-Key are numbered from 1 to 9999. There are two different ways to call the same macro. You can call a macro by number by holding down the option key, and entering the macro number on the numeric KEYPAD. This is called a "Numeric Macro". You can also call a macro by holding the option key down, and pressing any keyboard key. This is called a "Keyboard Macro".

********
NUMERIC MACROS
********

To call a numeric macro, hold the option key down and type the macro number on the numeric keypad. The macro is triggered when you press the keypad <enter> key, or let up the option key. Press the keypad <clear> key if you make an error. Diversi-Key displays a Numeric macro as [nnnn], where nnnn is a number from 1 to 9999. Some Numeric macros are: [0124], [0001], [9047].

********
KEYBOARD MACROS
********

Triggering a Numeric macro requires more than one keystroke, and numbers are hard to remember. To get around these problems, you may also trigger macros with single-keystrokes on the KEYBOARD. You do this by holding down the option key, and pressing any keyboard key, that is, any key not on the numeric keypad. The macro is triggered immediately when you hit the keyboard key. Be sure to let up the option key, to allow the program to continue after the macro is completed.

Diversi-Key displays a keyboard macro as: [k], where "k" is any keyboard key. Here are some keyboard macro examples: [N], [S], [1]. Note that [1] is a keyboard macro triggered by pressing "1" on the keyboard. [0001] is a Numeric macro, triggered by pressing "1<enter>" on the numeric keypad.

There are 96 possible keyboard macros, which correspond to Numeric macros numbered from 0 to 95. Each keyboard macro corresponds to its ASCII equivalent Numeric macro. For example, the "A" key is an ASCII 65. Therefore [A] is the same as [0065].

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 345 of 1262
Note that lowercase keyboard macros are converted to uppercase. That is, [a] is the same as [A]. For keyboard keys with ASCII values from 96 through 127, subtract ASCII 32 to find the Numeric equivalent (converts to lowercase).

Numeric macros [0096] to [0099] have no keyboard macro equivalent.

********
REDEFINING THE KEYBOARD
********

You can re-define the entire keyboard by entering:

`[xx/]` where xx=0..99

That is, hold the option key down, enter a number from 0 to 99 on the numeric keypad, and press the numeric keypad */ key.

When you do this, the keyboard macros will now correspond to Numeric macros [xx00] to [xx99] instead of [0000] to [0099].

For example, when you enter [02/], then [A] triggers macro [0265] instead of macro [0065].

You can use this feature when you switch programs, since your macro definitions will be very specific to each program. For example, you might enter [00/] for running Appleworks, and [01/] for programming in BASIC. Thus, you can keep up to 100 sets of keyboard macro definitions in memory at one time, in each 32K macro file.

********
SPECIAL MACROS
********

Diversi-Key contains 100 pre-defined "special" macros, which are always available, and cannot be modified. You call a special macro by holding the option key down, and entering a number from 1 to 99 on the numeric keypad. Then, hit the keypad */ to trigger the special macro (instead of <enter>). Special macros are displayed as follows:

`[nn.]` where nn=0 to 99

Special macro [00.] calls the "control panel". If you hold the option key down, and hit the keypad */ (without entering a number), the effect is the same as pressing OPEN-APPLE_CONTROL_ESCAPE.

Other special macros functions are described throughout these instructions. For a list of all special macros, see the reference section.

********
DEFINING A MACRO
********

You can define a new macro, or edit an existing macro definition at any time. To define a Numeric macro, enter the macro number on the keypad, followed by the keypad *=:

`[nnnn]=` where nnnn=0..9999

To define a keyboard macro, hold the option key down, press the keypad "=" followed by the keyboard key you want to define.

`[=k]` where k is any keyboard key

When you enter macro define mode, the current definition for this macro, if any, will appear on the top line of the screen. The macro definition begins with:

`[nnnn=k]` where nnnn is Numeric macro number you are defining, and k is its keyboard macro key equivalent (if any). For example:

`[0065=A]`

You define the macro by typing it on the keyboard. When finished, press the keypad <enter> key to accept, or the keypad <clear> key to cancel. Note that the first time you press <clear> it clears any definition you have typed, if any. Press <clear> again to exit macro define mode without changing anything.

While defining a macro, you can call another keyboard macro by holding the option key down, and hitting the keypad */ when you press the keyboard key. The status of the open-apple key (up or down), is saved in the macro definition, which is especially useful with Appleworks.

During the macro definition, the following keypad keys have special functions:

Keypad Key Function
* Delete last character entered
- Move cursor back 1
+ Move cursor forward 1
<clear> Cancel definition
<enter> Accept definition
/ Enter special macro functions

The keypad */ key is used to enter Numeric macro calls, special macro calls, and all the other special macro functions described later. To call Numeric macros enter:

`/nnnn<return>` where nnnn is Numeric macro number 1..9999

To enter a special macro call:

`/xx<return>` where xx is special macro number 00..99

********
SCREEN DISPLAY DURING MACRO DEFINITIONS
********

As you type your macro definition, each character is displayed on the top line of the screen. If you hold the open apple key down while typing a character, the character appears as {k} where "k" is the character. Open-Apple A is shown as {A}, for example. Other display features are as follows:

`[k]` keyboard macro call
If you trigger the wrong macro, or hit keypad -- by mistake, Diversi-Key may go merrily along typing bad keystrokes for some time. Fortunately, you can stop Diversi-Key at any time by typing the FLUSH key sequence. To do this, hold down the control and open-apple keys, and then press the delete key. Try this whenever Diversi-Key seems to be acting "strangely", i.e. not working.

********

MACRO FILES
********

Diversi-Key macro files are saved on disk as binary files. You then BRUN the file to load it into memory for use. The Diversi-Key disk contains a standard file named "DIVMAC" which contains the pre-defined macro definitions for Appleworks (and other programs). To load this file, enter:

BRUN DIVMAC

When you do this, the macro definitions on disk in the DIVMAC file will replace the current macros in memory. However, you may keep up to 10 different macro files in memory at once, each with up to 9999 macros in 32K memory.

Macro files in memory are numbered from 0 to 9. Normally, you will only use file #0. To switch to a new macro file number, hold the option key down, and press the keypad keys "=+n", where n is a KEYPAD digit from 0 to 9.

For example, to load a second macro file named "MAC2" and still preserve the existing macros, enter

=+2 (keypad-option key down)  BRUN MAC2

In the following display options, the "-" key is the one on the keypad:

-- Displays all macro definitions
-nnnn- Displays all definitions starting with Numeric macro nnnn
-nnnnn- Displays Numeric macro nnnnn
-k Displays Numeric macro "k"
-@ Displays Numeric macro "@"<@> is ctrl-@ / Displays all current keyboard macros

Note: Diversi-Key may pause for up to 12 seconds when displaying macros, as it searches for undefined macro numbers.

Comments: You can put comments at the end of your macro definitions by pressing the keypad "=". Followed by the comment. When displaying comments, i.e. with keypad --, Diversi-Key sends these comments as actual keystrokes. That is, a <ret> in a macro definition is sent as the 5 characters, "<ret>", during display. A <ret> in a comment, is sent as a real single keystroke carriage return, during display only. This allows you to send formatting commands in comments, to make them easier to read. For example, the built-in comments all start with <ret> space, to indent them on the next line.

*******

SAVING MACRO FILES
*******

You can save your current macros in a file, either under ProDOS or DOS 3.3. To do this, you must first enter BASIC, and get to the Applesoft prompt, which is as:

              }

One way to do this is to choose "BASIC.SYSTEM" from the //GS program launcher or desktop.

When you see this prompt, enter special macro [1.][2.]. That is, hold the option key down, and press the 4 keypad keys "1.2." without
letting the option key up.

Diversi-Key will type the word "BSAVE" for you, and wait for you to enter a file name. Type the name of the macro file you want to save, and hit <return>. Diversi-Key will finish the BSAVE command for you. You may now reboot. Under ProDOS, you can return to the launcher by typing "BYE<return>".

WARNING:!!!

Never enter [1.] [2.] while executing a program. Doing this will crash the program (and possibly the whole system). Be sure you see the Applesoft prompt "]\" before entering [1.] [2.].

*******

STARTUP MACRO
*******

After your new macros are installed with BRUN macro, Diversi-Key will automatically execute Numeric macro [9999], if you have defined one. Use this macro to initialize Diversi-Key set-up values, if you wish.

You can specify a different macro as the startup macro. To do so, save the macro file as follows:

[nnnn+] (where nnnn is start-up macro number) [1.] [3.]

*******

FORCING FILE NUMBER
*******

When you install a macro file, it normally loads into the current active file number, which you set with [=+n] before BRUN DIVMAC. To create a macro file which loads to a specific file number, enter:

[=++n][1.] [2.] (when saving the macro file)

You can use this feature to set up a turn-key system which loads several macro files, using the startup macro of the first file to load the second file to a different file number.

*******

CONVERTING TO SYSTEM FILES
*******

You can convert your macro files to system files, in order to load them from a menu manager program, as follows:

First CATALOG your disk and note the length of the DIVMAC file.

BLOAD DIVMAC,A$1000 CREATE SDIVMAC,TSYS BSAVE SDIVMAC,TSYS,A$1000,Lxxxxx where xxxx is the length from the CATALOG ABOVE

You can do this with any macro file, not just "DIVMAC".

+--------------------------------------------------------------------------------------------------+

Advanced Features

+--------------------------------------------------------------------------------------------------+
LDA $C010  (NOT NEEDED, CHANGE TO NOP/NOP/NOP)
GETKEY  LDA $C000
BPL GETKEY
STA $C010  (NEEDED)

You can use the //GS monitor to find references to $C010 as follows:

BLOAD program
CALL -151
110 C0<800.9600P
+++++++ USING THE MOUSE
+++++++ Diversi-Key allows you to program your mouse to send macro keystrokes. You activate the mouse with the special macro: [51.]

With the mouse activated, you can send a total of 10 different macros from the mouse. When the program starts, the mouse movements will send the following macros:

With mouse button up:
[<P>]: left mouse motion
[<Q>]: right mouse motion
[<R>]: down mouse motion
[<T>]: sent when mouse button goes from down to up

With mouse button down:
[<V>]: left mouse motion
[<W>]: right mouse motion
[<X>]: down mouse motion
[<Y>]: sent when mouse button goes from up to down

You can re-assign these mouse macros with the /B (BMOUSE) and /M (MOUSE) special functions. For example:

/B/<A> will assign the mouse button down macros to be [<A>]
[M]/<A> does the same for the mouse button up.
/B1000 will assign the mouse button down macros to be Numeric macro numbers 1000 to 1004, and similarly for /M1000.

To use the mouse, first enter [51.] to enable it. Then, hold down the option key, and move the mouse, or press the mouse button. The mouse is only active when the option key is down.

While holding the option key down, you can press the control key to enable the one way mouse function. With the control key down, mouse left-right motion is ignored. With the control key up, mouse up-down motion is ignored. If you prefer, you can use the control key to convert mouse left/right motion into up/down motion. Enter [54.] to enable this feature.

You can lower the mouse sensitivity with [55.] for horizontal, or [56.] for vertical. You can enter these macros up to 255 times for minimum sensitivity (use repeat function).

Macro [57.] increases the ability of the mouse to type ahead. Each time you call [57.], can typeahead one more macro call. You can increase typeahead 255 times.

If you define mouse motion to do cursor movement keystrokes, then the typeahead behaves as follows:

With no typeahead, the cursor moves in the same direction the mouse moves. When you stop mouse movement, cursor movement stops. If you move the mouse faster than the cursor can follow, nothing changes.

With full typeahead, the mouse can get ahead of the cursor. If you move the mouse rapidly, the cursor will eventually catch up to the mouse. The cursor keeps moving after you stop moving the mouse.

After you start moving the mouse, you can no longer trigger macros from the keyboard. You'll notice that the inverse "K" in the upper right corner disappears during mouse movements. Let up the option key for an instant to get the "K" to re-appear, and allow macro triggering from the keyboard again. This feature is included to avoid pausing the program during mouse movements.

When using the mouse for a long time, you can enter [45.] to change the "trigger" key to <caps lock>, to avoid of having to hold down the <option> key all the time. To cancel, enter [40.].

With Diversi-Key, the mouse becomes an extremely flexible tool which can be used in any program, if desired.

+++++++ TRIGGER HOLD MODE
+++++++ Trigger hold mode allows you to use the mouse without having to hold down the option key. Enter special macro [05.] to enable trigger hold mode. To turn it off, enter [04.].

With trigger hold mode active, the option key (or other trigger key), behaves much like the caps lock key. That is, when you press and release the option key once, it stays "pressed" until you press and release it again.

This mode may also be used to trigger macros with one hand.

OTHER INFORMATION

*** Licensing Information ***

Although Diversi-Key is copyrighted, DSR allows copying and distribution of the program subject to the following restrictions:

1. Anyone receiving a copy of Diversi-Key must send a $45 license fee directly to DSR, Inc. within 2 weeks.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 350 of 1262

2. Any company, club, or individual may charge up to $5.00 for distributing copies of Diversi-Key, provided it is clear that an additional $45 fee must be sent directly to DSR.

Publishers:

Unlike Diversi-DOS and Diversi-Cache, we do not license Diversi-Key to be included with other programs. However, we do encourage you to include a custom Diversi-Key macro file on your disks, specific for your program. We hope you will recommend that your customers order Diversi-Key directly from us, in order to use this file.

Multiple Computers:

Each additional computer license fee is $45, up to a maximum of $250 for all the computers owned by a company (or school district).

*** User Support ***

Your user support number entitles you to talk directly to the programmer, Bill Basham. Please write if possible, or call:

313 553-9460 between 3 and 5 PM Eastern time.

*** Diversi-Cache ***

Diversi-Cache dramatically increases the I/O speed of the Apple Disk 3.5, under any operating system (ProDOS, Pascal, DOS 3.3).

Diversi-Cache speeds up the Disk 3.5 in two ways. First of all, whenever the system reads a block, Diversi-Cache actually reads an entire track. This triples the speed of disk reads, and doubles the speed of ProDOS writes.

Secondly, Diversi-Cache allows you to allocate a cache memory buffer from 0 to 800K in size. Whenever the system reads a block, Diversi-Cache saves it in the cache buffer. If the system asks for this block again, it comes out of memory at "Ramdisk" speed.

Diversi-Cache only speeds up the Apple Disk 3.5 designed for the Apple //gs, and will not affect the speed of the older Apple //c compatible UniDisk 3.5.

*** Diversi-Copy ***

Diversi-Copy(tm) is the fastest and easiest way to make back-up copies of your 3.5 and 5.25 disks. Diversi-Copy will use all available memory in an Apple //gs, //e, //c, or II+ compatible to allow 1-pass copying with a single drive.

Diversi-Copy was chosen as incider magazine's "Editors' Choice". It is the best copy program available, for both 5.25 and 3.25 drive copying.

*** How to Order ***

To order, please send your check to:

DSR, Inc.
34880 Bunker Hill
Farmington, MI 48018-2728

The cost of our programs is as follows:

- Diversi-DOS $30
- Diversi-Copy $30
- Diversi-Cache $35
- Diversi-Key $45

We only sell our programs by mail-order, and will notify you of future program updates which you may purchase for $5 each.

REFERENCE

CONVERTING DIVKEY TO A SYSTEM FILE

You can convert Diversi-Key to a system file, so you can run it directly from a menu selection program. To do this, first run BASIC.SYSTEM. Then CATALOG the Diversi-Key disk and note the length of the DIVKEY file. Then, enter the following:

CREATE SDIVKEY,TSYS,A$2000
BLOAD DIVKEY
BSAVE SDIVKEY,TSYS,A$2000,Lxxxxx (where xxxxx is length of DIVKEY file)

MOVING DIVKEY TO DOS 3.3

First, boot DOS 3.3 and format a disk with:

INIT HELLO

Then, boot ProDOS again and enter:

BLOAD DIVKEY

Put in your new DOS 3.3 formatted disk

BSAVE DIVKEY,A$2000,Lxxxxx (where xxxxx is length of DIVKEY file).

USING DIVERSI-KEY: SUMMARY

Executing a macro: Hold down option key and enter:

[] means keypad keys

[nnnn] let up option key executes macro nnnn

Disk Labeller Pro
Version 1.0
by Dave Touvell

Documentation File
June 2, 1987

GEnie Mail address: D.TOUVELL

Apple Orchard BBS: (919) 764-3834
Leave E-Mail for Dave Touvell

This is a public domain program. You may give copies of it away, and are encouraged to do so.

Disk Labeller Pro runs on any Apple II capable of running ProDOS 8, with at least one disk drive, lowercase capability, and a dot matrix printer that will print Condensed Superscript (17 CPI, 1/2 height) characters.

This program will read a ProDOS disk catalog, then print a label consisting of the Volume name, Number of Free Blocks, and the Name, Type, and Size of up to 42 files in the volume directory. You can let Disk Labeller Pro print all of the files on the disk, or you can choose to be shown the catalog entry for each file, and asked whether you wish to include it on the label. Several printers are supported, and may be selected from the Select Printer Menu. The program may be configured for printers capable of printing compressed superscript text that are not listed through the Custom Printer option. The labels used are standard 4 by 1-7/16 inch mailing labels. Other label sizes are not supported at this time.

Disk Labeller Pro is menu driven for ease of use. The menu selection pointer may be moved with the Left/Right arrow keys, the Up/Down arrow keys, or by pressing the number key corresponding to the item you wish to choose. When the pointer is on the option that you wish to choose, press the RETURN key. At most places in the program where you are asked to press a key to continue, or at any menu, you can return to the previous menu by pressing the ESC key.

When the program is run for the first time, you will be at the Configuration Menu.

Move the menu pointer to the first option, Select Drive, and press the RETURN key. You will then be asked for the number of the disk drive in which the disks to be labelled will be. Press 1 or 2, or press RETURN if you want to leave it as the number displayed. You will then be returned to the Configuration Menu.

Choose the next option, Set Printer Slot, and enter the slot number (1 through 7) that your printer is in, or press return for no change from the slot displayed. You will again be at the Configuration Menu.

The next option is Printer Interface Setup. Choose this option and the current interface setup string will be displayed in its decimal ASCII form. When the program is run for the first time this string will be "009 054 053 078", this is the decimal ASCII representation of "<Ctrl-I>65N", the string needed by the Apple Parallel interface card. Press RETURN to leave it as it is, or enter a new setup string in the same form that will set the interface card to allow a 65 character line. The leading zeroes are not necessary, but each value should be seperated by a space. After you enter this string you will again be at the Configuration Menu.

Next, select the Choose Printer option, and you will see the Choose Printer Menu. If your printer is not listed here, and is capable of Condensed Superscript print mode (17 characters per inch, half height), you can configure Disk Labeller Pro for it by choosing the Custom Printer option. You will then be asked for the command codes needed to implement various print functions. Consult your printer manual for the codes needed to implement each function, then enter each set of codes as a series of DECIMAL numbers; one decimal number per ASCII character in the command set. Seperate each number by a space. For example, to set Superscript mode on an Epson RX-80 printer the code set is:"<ESC>50". This would be entered as: 27 83 48. (The Decimal ASCII code for ESC is 27, for S is 83, and for 8 is 48.) If
Disk Labeller Pro has been configured before, the current values of each code will be shown. You may press RETURN alone to keep the values shown. Each function, with the exception of Expanded Mode (Double Width) On and Off, must have a value. If no value is entered, a space ("032") will be substituted, but the program will not print properly. When you are done, you will be asked to press RETURN if the values are correct, or to press ESC to re-enter the values if you made a mistake. If you press RETURN you will be returned to the Select Printer Menu. Select the Return to Configuration Menu option (or press ESC).

You are now finished with Configuration. Select the Return to Main Menu option or press ESC. The disk drive will come on as Disk Labeller Pro saves the configuration in a VAR file named "SETUP", and you will be at the Main Menu.

You are now ready to label disks. Select Label Disks from the Main Menu, and you will be shown the Label Disks Menu. Here you have the option of having all of the files in the disk catalog on the printed, or being shown the entry for each file and asked whether or not to include it on the printed label.

If you choose to print all the files, you will be prompted to put the disk to be labelled into the drive that you designated during configuration and press a key. The volume name and number of files on the disk will be displayed. If there are more than 42 files on the disk you will be returned to the Label Disks menu and prompted to use the Select Files option. Otherwise, you will be prompted to ready the printer any press a key. At this point you can press the ESC key to return to the Label Disks menu, or make sure the printer is ready and press any key except ESC to print the label.

If you choose the Select Files to Print option you will be shown the catalog entry for each file and asked if this file is to be included on the label. You can press Y for yes, or N for no; or you may press ESC to abort and return to the Label Disks menu, or press RETURN to stop selecting files and print the label. The Volume name and the number of files selected so far are shown above the file entry. When all files have been displayed you will be prompted to ready the printer and press a key, as above.

After the label has been printed you will be returned to the Label Disks menu. You may then label another disk or return to the Main menu.

The third option on the Main menu is See Documentation. It displays this file to the screen. Make sure that the file DLP.DOC is available in the same prefix as the program was run from, or you will get an error. After the screen is full, you will be prompted to press any key for the next screenful, or you may press the ESC key to return to the Main Menu.

If you select the Quit to BASIC option from the main Menu, you will be asked to verify that you wish to do this. If you answer Y then you will be in BASIC. N will return you to the Main Menu.

This is the first version of this program, and it has only been tested with the Epson RX-80 printer and a parallel interface. If you have any problems, suggestions, or comments, leave E-Mail to me at one of the following places:

I am particularly interested in hearing of any problems with other printers, and if the printer codes needed to make other printers work, so that I can include more ready-made printer setups in the next version.

I would also like to thank all of the people who answered my plea for printer command codes a while back. Since these were used in the program untested, I'd like to hear whether or not they work properly.
Dogpaw is a powerful added-ProDOS-command program which provides an easy and convenient method of displaying and/or printing text files from the BASIC environment. It is primarily intended as a means of presenting on-disk program documentation, though I'm sure many will find Dogpaw useful for a variety of other text viewing/printing purposes. Dogpaw is public domain, and all programmers are welcome to "package" it along with their own public domain or commercial programs for the purpose of handling documentation files. Non-programmers will also find Dogpaw a useful thing to have on hand for displaying documentation (or other text) files.

Some non-programmer people may find parts of the instructions below to be overly technical. Not to worry; whatever you don't understand, you probably don't need to know.

Dogpaw works with ProDOS TXT (ASCII text) files, AWP (AppleWorks Word Processor) files and "compressed" files. Compressed files will be explained later. Dogpaw will work with files of any length, to the maximum allowed by ProDOS. When displaying text on-screen, Dogpaw presents the text in word wrapped form on either the 40 or 80 column screen. Dogpaw allows you to page forward and backward through the text unlike many text-to-screen utilities, which only allow one-way scrolling. Dogpaw also has a "search" option, which allows you to scan through a file for occurrences of any word or phrase. If Dogpaw detects that it is running on an Apple II+, the on-screen text will be displayed in upper case, with lower case a selectable option.

When using Dogpaw to display text on-screen, you can have it scan through the text until a certain string of characters is found. The syntax for this is much like that for the page header option:

```
10 PRINT CHR$(4)"DOGPAW [filename]\[string]"
```

With [string] being whatever you want to scan for. If you enter

```
DOGPAW [filename]+\[string]
```

then Dogpaw will put the file DOGPAW.DOCS.C on screen, and quickly flip through the pages until a page with the first occurrence of the word "widget" is being displayed. Then you can move forward or backward as usual. If no occurrence of the entered string is found, Dogpaw will scan through to the end of the text, and the "end of text" message will appear at the screen bottom. If, when Dogpaw stops scanning and displays the page of text with your string, you press the S key, Dogpaw will start scanning again for another occurrence of the string. When using the 80 column screen, Dogpaw will flag the line(s) the string appears in by inverting the first character of the line. Both the screen-displayed text and the printed text can be set to either single or double spacing.

Compressed files and /Doc.Stuff/:
Dogpaw is included on a disk of public domain utility programs written by me. This disk is called "/Doc.Stuff/" and is available from public domain software vendors, is in the software libraries of some on-line information systems, or can be ordered from me for $3.00. The other utilities on /Doc.Stuff/ are also related to the task of preparing text for program documentation. One of these utility programs is "Compressor", which takes TXT or AWP files and compresses them by about 30%. This minimizing the disk space taken up by such files. As mentioned, Dogpaw can display and print these compressed files as well as TXT and AWP files.

Using Dogpaw:
When you RUN (or "-") Dogpaw, it installs itself as a new ProDOS command, and can then be used much like other ProDOS commands. (More correctly called "BASIC.SYSTEM commands", if ya wanna get technical.) For example, from the Applesoft prompt, you can simply type in "Dogpaw [filename]", with [filename] being the name or pathname of the text file you want to view. The text will be word wrapped for either 40 or 80 column display, depending on which is active when Dogpaw is called. If Dogpaw finds that the active output slot is neither 0 (40 column display) nor 3 (40 or 80 column) when it is called, it assumes that the output is for a printer, and the text is formatted appropriately. As with other ProDOS commands, Dogpaw can also be used from within a BASIC program in the form: PRINT CHR$(4)"DOGPAW [filename]". Thus, to use Dogpaw to print a file with a printer in slot 1, you would use a BASIC line such as:

```
10 PRINT CHR$(4)"PR#1: PRINT CHR$(4)"DOGPAW [filename]"
```

When Dogpaw finishes printing the file, it will return to "slot 0"; output to screen in 40 column mode. When printing, Dogpaw will ignore any embedded printer-control characters, AppleWorks margin and page-break settings, etc. One exception to this is AppleWorks line-centering. If you tell AppleWorks to center a line of text, Dogpaw will center it on-screen and printed page.

The page header option:
To have Dogpaw print a header at the top of each printed page, the following syntax is used:

```
10 PRINT CHR$(4)"DOGPAW [filename]\[header]"
```

That is, whatever you want printed at the top of your pages is written in after the pathname of the text file, separated from the pathname with a backslash. The header will be printed at the top left of each page. If you want the header centered on the page, separate it from the pathname with TWO backslashes:

```
DOGPAW [filename]\\[header]
```

If you want the page number included in your header, insert the "#" character where you want the page number to appear. The header option has no effect on Dogpaw's text-to-screen display.

The scan/search option:
When using Dogpaw to display text on-screen, you can have it scan through the text until a certain string of characters is found. The syntax for this is much like that for the page header option:

```
DOGPAW [filename]\[string]
```

or

```
10 PRINT CHR$(4)"DOGPAW [filename]\[string]"
```

With [string] being whatever you want to scan for. If you enter

```
DOGPAW DOGPAW.DOCS.C Swidpe
```

then Dogpaw will put the file DOGPAW.DOCS.C on screen, and quickly flip through the pages until a page with the first occurrence of the word "widget" is being displayed. Then you can move forward or backward as usual. If no occurrence of the entered string is found, Dogpaw will scan through to the end of the text, and the "end of text" message will appear at the screen bottom. If, when Dogpaw stops scanning and displays the page of text with your string, you press the S key, Dogpaw will start scanning again for another occurrence of the string. When using the 80 column screen, Dogpaw will flag the line(s) the string appears in by inverting the first character of the line. Both the screen-displayed text and the printed text can be set to either single or double spacing.

Line spacing:
Normally, Dogpaw displays and prints its text single spaced. If you want a double spaced display or printout, simply include a "*" AFTER the filename, and BEFORE the header or search-string, if either is being used; like so:

```
DOGPAW [filename]+\[header]
```

or

```
DOGPAW [filename]+\[string]
```

or

```
DOGPAW [filename]+\[header]\[string]
```

In my opinion, text on the 40 column screen is much easier to read if it's double spaced.

"As-is" mode:
Occasionally, you may want to use Dogpaw to print out a TXT file which has carriage returns inserted at the end of each line, and has the line-length set to 80 columns. This is sometimes called "80 column hard formatting". This kind of formatting is often found in text files that are uploaded to Bulletin Board Systems. Because Dogpaw normally does its own word wrapping and lets the file use its own formatting by including "#" (circled "a", for "as-is") after the pathname when calling Dogpaw. Like this:

```
DOGPAW [filename]+\[header]\#"a"
```
The "$" must come before the "\" header token, if any header is being used. It can be used together with "@". When this feature is used, Dogpaw will print without a left-hand margin. Using "@$" won't effect on-screen text; hard formatted files will look fine on an 80 column display, but will have lots of oddly-lengthed lines on a 40 column display.

Case-converter for the II+:
When Dogpaw detects that it is running on an Apple II+, the text displayed on-screen will be converted to upper case. To accommodate II+'s that have been modified to display lower case, this conversion can be turned off by pressing "C". Pressing "C" again will turn it back on. When running on a II+, Dogpaw will put a prompt at the bottom of the text-display screen which explains this feature. Text sent to a printer on a II+ will not be converted to upper case. Dogpaw's 80 column mode is compatible with Videx Videoterm standard II+ 80 column cards.

NODOGPAW:
To remove Dogpaw and free up the memory it uses (about 4K), enter "NODOGPAW". After this is done, entering any Dogpaw commands will result in a syntax error. Please note, however, that this command will release all the buffers that any other added ProDOS commands, ampersand (4) routines, etc. have allocated. (Dogpaw supports daisy-chaining of other added ProDOS commands.) This shouldn't cause any problems with other added ProDOS commands or with ampersand routines - they will simply be removed and disconnected along with Dogpaw. Problems could be caused, however, if NODOGPAW is used when certain other buffer-allocating programs are installed. Some such programs don't use either the ampersand or the added-command "hooks". Beagle Bros. "GPLE" and "D.BUG" are a couple of examples. The NODOGPAW command will release the memory set aside for routines like these, but won't "disconnect" them. Therefor, a crash becomes likely. In general, you should avoid using NODOGPAW unless you are sure that nothing that will cause problems is tucked away in the machine's memory.

DOGPAW?:
Entering "DOGPAW?" will display the title, version number and date of the Dogpaw program, and also the name and address of its glory-hogging author (me). This is handy for checking whether Dogpaw is installed. This same information is printed whenever you BRUN Dogpaw in immediate mode (that is, from the keyboard, not from within a BASIC program).

Techy stuff:
Dogpaw BLOADs at $4000, and relocates itself above HIMEM, which is lowered accordingly. Before relocating itself, Dogpaw checks to see if it has already been installed. If it has, it simply returns to BASIC, rather than installing a second copy of itself. When loading a text file into memory, Dogpaw will use whatever room is unused by the BASIC program (if any) that's loaded. Dogpaw has its own set of error messages to let you know if things go wrong. Dogpaw supports pathnames only, not S(lot) and D(drive) parameters.

I'd like to thank Garry Delong and Doug Trueman for their help with Dogpaw. Without their assistance, Dogpaw would be a mere bug-eaten shell of its current self.

Why "Dogpaw"? - thought you'd never ask. Very simple, actually: Start with "Documentation; Printer or Screen". Shorten that to "Doc,P.O.S." Now give that a couple of hard shakes & a slap, and VOILA! You get "dogpaw". Obvious, huh?

Any comments, bug reports, etc. you may have regarding this program are more than welcome.

INTRODUCTION:

DOS3.5 is a assembly language program which modifies DOS3.3 to run 3.5" disks.

DOS3.5 IS NOT IN THE PUBLIC DOMAIN!

Some code is from:

APPLE ASSEMBLY LINES
(C) COPYRIGHT 1986 S-C SOFTWARE
MAY & JULY & OCT 1986 issues
S-C SOFTWARE
P.O. BOX 280300
DALLAS, TX 75228

All code not from APPLE ASSEMBLY LINES 1986 IS:

==
(C) COPYRIGHT 1987 BRAD PLATT
ALL RIGHTS RESERVED

PRONTODOS is a trademark of BEAGLE BROTHERS
APPLE, APPLE II, and APPLE IIGS are trademarks of APPLE COMPUTER INC.

THE DISCLAIMER

These instructions and the program DOS3.5 is sold without any expressed or implied warranties whatsoever. No warranty of fitness for a particular purpose is offered. The user is advised to test the program thoroughly before relying on it. The user must assume the entire risk of using the program DOS3.5 and the modified disk operating system that it creates.

3.5*DOS3.3

3.5*DOS3.3 is the name given to the new disk operating system created by the program DOS3.5. This new DOS is DOS3.3 slightly modified so it can run 3.5" disks, and still retain compatibility with the DOS3.3 programming environment.

3.5*DOS3.3 seems to be compatible with all the APPLE II family of computers that have at least 48K of ram, including the APPLE IIGS.

OVERVIEW of 3.5*DOS3.3

BENEFITS:
1. Very little of DOS3.3 has been modified, so should be compatible with almost all programs that use an unmodified DOS3.3 programming environment.
2. Allows the use of 3.5" disks to run and store programs.
3. Will also run normal 5.25" disks that have been initialized by DOS3.3.

4. Allows approximately 800K bytes of information to be stored on one 3.5" disk. Data is stored as if each 3.5" disk was 2 disk drives each holding 400K bytes.

**DRAWBACKS:**

1. Cannot initialize 5.25" disks from the 3.5"DOS3.3 environment.
2. Cannot initialize 5.25" disks that have been initialized by DOS3.3.

3. Will also run normal 5.25" disks that have been initialized by DOS3.3.
4. Allows approximately 800K bytes of information to be stored on one 3.5" disk. Data is stored as if each 3.5" disk was 2 disk drives each holding 400K bytes.

**DRAWBACKS:**

1. Can run only one 3.5" drive, and it must be in its own slot. (No limit to the number of 5.25" drives as long as not in same slot as 3.5" drives).
2. No INIT command. (To initialize a 3.5" disk you must run the program DOS3.5 and chose option to initialize 3.5" disk).
3. Cannot initialize 5.25" disks from the 3.5"DOS3.3 environment.
4. The program DOS3.5 should be copied onto the initialized 3.5" disk so you can use it to initialize new disks.
5. The startup program, more commonly known as the HELLO program, is not automatically copied onto the 3.5" disk when it's initialized. Instead you should put the HELLO program onto the 3.5" disk soon after it has been initialized. Also the HELLO program must be called "HELLO".
6. 3.5"DOS3.3 uses $BCDF-$BCFF. This area is officially unused by DOS3.3, so it's a popular place used to put patches. Example: PRONTODOS uses it.

**GETTING STARTED**

Assumptions:
You have an Apple II series of computers with at least 48K of RAM in it.
You have the program DOS3.5 on a 5.25" disk that contains the disk operating system DOS3.3.

1. Boot up this disk
2. Type BRUN DOS3.5 (then press return)
3. Get to menu titled MODIFY DOS3.5 TO RUN 3.5" DISKS

When asked WHICH VERSION DO YOU WANT?

Chose choice #1 which is: 1. WITHOUT PATCH
DOS3.3 has now been modified to 3.5"DOS3.3

4. Get to menu titled MAIN MENU

Chose choice #1 which is: 1. INITIALIZE 3.5" DISK

then follow the directions on the screen. Make sure there is a 3.5" disk in the correct drive or the program will bomb!

Your 3.5" disk is now initialized.

5. Return to MAIN MENU
6. To initialize more disks repeat steps 4 and 5.
7. For every new disk that has just been initialized, it's strongly suggested that you copy the program DOS3.5 onto the new disk. (This step is optional)

**3 VERSIONS OF DOS3.3**

They are:
1. Normal DOS3.3 (not able to run 3.5" disks)
2. DOS3.3 modified for 3.5" disks with NO PATCH $BC56-$BCFF is used
3. DOS3.3 modified for 3.5" disks with PATCH $BC56-$BCFF unused

---

**Apple II Computer Documentation Resources**

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 357 of 1262
WARNING! Not all enhancements are compatible with 3.5"DOS3.3.

Start by booting up a 5.25" disk that has PRONTODOS with the enhancements you want on it.

The program DOS3.5 identifies which one of these 3 versions is currently in the computer (but only if one of these 3 versions is in the computer).

3.5"DOS3.3 refers to both versions 2 and 3.

Both versions 2 and 3 changes $BEAF-$BF8E. This is where the modification to DOS3.3 is put.

Normal DOS3.3 INIT command uses $BEAF-$BF8F and $BC56-$BCDE. Normal DOS3.3 does not use $BCDF-$BCFF.

The old RWTS buffer is used whenever DOS communicates with a 5.25" disk. The new RWTS BUFFER is used only when 3.5"DOS3.3 communicates with a 3.5" disk.

OLD RWTS NEW RWTS
BUFFER BUFFER
NORMAL DOS3.3 $BB00-$BC55 none exists
3.5"DOS3.3 NO PATCH $BB00-$BC55 $BB00-$BCFF
3.5"DOS3.3 WITH PATCH $BB00-$BC55 $9A6-$9CA5

The patch itself changes less then a dozen bytes, but causes the new RWTS buffer to use $9A6-$9CA5 (normally used as DOS3.3 buffer #1) instead of $BB00-$BCFF.

Room is made for $9A6-$9CA5 by tricking DOS into thinking buffer #1 begins where buffers #2 usually is. In other words, MAXFILE 2 sets HIMEM at the same place (when used with patch version) that MAXFILE 3 use to be. Also, the default (or startup value) of MAXFILE is changed from 3 to 2. (See Nibble Magazine April 1986 pages 100-101 for more information).

PRONTODOS and 3.5"DOS3.3

PRONTODOS is a program that modifies DOS3.3 to speed it up. Dos commands like LOAD, SAVE, BLOAD, and BSAVE are all sped up, usually 2 to 4 times faster then plain DOS3.3.

PRONTODOS contains other enhancement to DOS3.3 such as print disk free space during catalog, or "TYPE" command which lists text files.

Plain PRONTODOS seems to work with the "no patch" version of 3.5"DOS3.3.

In order to use as many PRONTODOS enhancements as possible, use the patch version of 3.5"DOS3.3. Even so, not all the enhancements will work. The "TYPE" command doesn't work with it, but print disk free space does.

The best way to tell is to try it out.

INITIALIZING NEW 3.5" DISKS TO RUN PRONTODOS MODIFIED 3.5"DOS3.3

Start by booting up a 5.25" disk that has PRONTODOS with the enhancements you want on it.

WARNING! Not all enhancements are compatible with 3.5"DOS3.3.

Then follow the same steps as explained in the getting started section except for the following:

Start at step 2
At step 3, chose choice #2 which is: 2. WITH PATCH

When you're done, the newly initialized 3.5" disk will incorporate PRONTODOS's modification into 3.5"DOS3.3. Now, whenever you boot up with this 3.5" disk, the modified 3.5"DOS3.3 that's loaded into memory has PRONTODOS in it. You can use this disk to initialize new PRONTODOS modified 3.5"DOS3.3 disks. You'll be impressed by the speedup of most disk commands.

GETTING DOS VERSION 3.5"DOS3.3 INTO COMPUTER

You boot up a 3.5" disk the same way as a 5.25" disk.

Any 3.5" disk that has been initialized (using program DOS3.5) will have 3.5"DOS3.3 on it. This means that whenever it is booted up, 3.5"DOS3.3 is loaded into memory, and is used as the disk operating system (DOS3). This is the best way to load it into Apple's memory.

A more roundabout way would be to use the program DOS3.5 to change DOS3.3 to 3.5"DOS3.3, then to exit from this program. This roundabout way is only needed if normal DOS3.3 is in the computer, and you don't want to boot a 3.5" disk.

If 3.5"DOS3.3 is in the Apple, when you run program DOS3.5, the mnemonic section titled:

MODIFY DOS3.3 TO RUN 3.5" DISKS

is skipped over, because this section is not needed. Also, you cannot change from 3.5"DOS3.3 "with no patch" to a "with patch" version, or vice versa.

MORE ON INITIALIZING

Initializing a 3.5" disk using the program DOS3.5 places the DOS currently in the Apple onto the 3.5" disk. Therefore, if you have PRONTODOS modified DOS3.3 in the computer when you initialize a new 3.5" disk, the new disk will contain PRONTODOS modified 3.5"DOS3.3.

REMEMBER:
1. INIT command won't work if 3.5"DOS3.3 is in Apple.
2. The only way to initialize a 3.5" disk is to use the program DOS3.5.
3. When 3.5"DOS3.3 is in Apple, you cannot initialize 5.25" disks.

DETERMINING WHICH 3.5" DISK DRIVE IS USED

When a 3.5" disk that has 3.5"DOS3.3 is booted up, the 3.5" disk drive that does the booting is the one and only 3.5" disk drive that will be used by 3.5"DOS3.3.

3.5" disks with 3.5"DOS3.3 are NOT slot dependent!

For example assume:
Ann's Apple computer's 3.5" disk drive is in slot 7, and Bill's Apple computer's 3.5" disk drive is in slot 4.
Ann's 3.5" disks (with 3.5"DOS3.3) created on her computer will run on Bill's computer and vice versa.

The only time you ever have to identify which slot the 3.5" disk drive is in is when you boot up from a 5.25" disk and run the program DOS3.5 to install 3.5"DOS3.3. (Reason: you are booting up with normal DOS3.3 and...
only 3.5" disks can boot up with 3.5*DS3.3

CHANGE NAME "DS3.5" WHEN COPYING PROGRAM
===============================================================================
When you use the program DS3.5 to make a copy of itself, the copy is automatically named "DS3.5". To change the name that all further copies will be automatically named, you must alter the program DS3.5.

The new name must be a valid DS3.3 name from 1 to 12 characters long.

CURRENT VALUES

$16C3 = C4 CF D3 AE B5 (ASCII values)
$16C9 = A0 A0 A0 A0 A0 A0 ($A0= blank space)

$A0= blank space

TO CHANGE NAME:
Put ASCII values of characters of new name starting at $16C3. Make sure the first character is a letter. Use ASCII values with bit 7=1 (all ASCII values must be greater than 127). If new name is less than 12 characters long, fill remaining bytes through $16CE with $A0 ($A0= blank space).

EXAMPLE: Change name to "INIT.N.COPY"
CALL -151 (enter monitor)
*16C3: C9 CE C9 D4 AE CE (INIT.N)
*16C5: AE C3 CF D0 D9 A0 (.COPY)
*3D0G (leave monitor)

Now save altered DS3.5 to disk. Better yet, run altered DS3.5 and initialize a new 3.5" disk. Then use this program to copy DS3.5 onto this new disk (the altered DS3.5 will be copied). Be sure to write on disk label that you are using a different startup program name.

CHANGE NAME OF "HELLO"
===============================================================================
The name of the 3.5" disk's startup program is "HELLO". On an already initialized 3.5" disk you can always save a new startup program under the name "HELLO".

If you want to use a different startup name, then you must alter the program DS3.5. Once altered, whenever a 3.5" disk is initialized using this altered DS3.5 program, the new 3.5" disk's startup program will have this new name.

The new startup name must be a valid DS3.3 name from 1 to 30 characters long.

CURRENT VALUES

$10F1 = 05 (number of characters in name)
$1D5E = C8 C5 CC CC CF (ASCII values)
$1D6E TO $1D7B = $A0 ($A0= blank space)

TO CHANGE NAME:
1. Put $A0 at $15AC-$15C9
   Put $A0 at $1D5E-$1D7B
2. Put number of characters in new name at $10F1. Must be from 1 to 30
3. Put ASCII values of characters of new name starting at $1D5E, making sure the first character is a letter. Use ASCII values with bit 7=1 (all ASCII values must be greater than 127).

EXAMPLE: Change startup name to "HI2"
CALL -151 (enter monitor)
*15AC: A0 ($A0= blank space)

DFXX IS BROKEN VERSION OF DFX

DO$ FILE EXCHANGE [1.1]

===> INTRODUCTION

PROGRAM BY BLACKSMITH

(C) 1982 BY ARROW MICRO SOFTWARE

INTRODUCTION
---

DO$ FILE EXCHANGE (DFX) is a program for transferring DOS 3.3 files between APPLE II computers that are equipped with the HAYES MICROMODEM II*.

DFX supports an APPLE to APPLE terminal “CHAT” mode that allows both ends to type messages to each other at the same time that files are being transferred.

HARDWARE REQUIRED
---

APPLE II 48K

APPLESOFT in ROM or LANGUAGE CARD

HAYES MICROMODEM II in slot 2

DISK II in slot 6

SOFTWARE REQUIRED

LIMITATIONS .......................5

INTERNALS ........................5

MAKING COPIES OF DFX .............7

* Indicates trademark of Hayes Microcomputer Products, Inc.

APPLE is a registered trademark of APPLE COMPUTER INC.

HOW TO RUN DFX
---

LOADING THE PROGRAM

Run the program called DFX on the LOCAL and REMOTE APPLE II computers. The program makes a quick check to see if the phone line has a clean data carrier present, in which case DFX will accept the current call and present the M-$-& menu. If no carrier is detected, DFX will hangup the line and present the following C-& menu:

C .... CALL ORIGINATION

& .... BOOT DRIVE 1

WAITING FOR CALL

The “WAITING FOR CALL” message means that the system will auto-answer the telephone if a RING is detected.

PLACING THE CALL

Type “C” to originate call. Then type the telephone number of the other APPLE as requested and let DFX dial the number via the modem. If an answer is received within 30 seconds, the call will be connected and the following M-$-& menu presented.

M .... MASTER MODE

$ .... HANGUP LINE

& .... BOOT DRIVE 1

CHAT MODE

A flashing cursor near the bottom left of the screen indicates that you are in CHAT mode connection with the other APPLE. Likewise, the REMOTE APPLE will be in CHAT mode connection with you. This means that you may type messages to each other within a three line scroll area just above the STATUS display line at the bottom of the screen. All the non-control characters may be typed, and in addition, the control-G will ring the bell. The LEFT ARROW key will backup the cursor as far as the left margin.

FUNCTION MODE

To select any of the MENU items, you must toggle your keyboard from CHAT to FUNCTION mode by using the FORWARD ARROW key.

THE STATUS DISPLAY

As you play with the CHAT-FUNCTION toggle, you will notice that at the bottom right of the screen in the STATUS display there is a “C” or “F” indicating the current state of the LOCAL APPLE. If the REMOTE starts to toggle his CHAT-FUNCTION state, you will see his current state at the left of the STATUS display.

HANGING UP THE LINE

Selecting “$” will hangup the telephone line and within about 15 seconds, both APPLES will reset to the original C-& menu and the WAITING FOR CALL state.

RETURNING TO DOS

Selecting “&” will leave the telephone line connected and cause the system to BOOT from DRIVE 1.

TRANSFERRING FILES

To transfer files, one of you must take control of the total system. This means that one of you elects to become the “MASTER” and the other end becomes the “SLAVE”. To become the MASTER, type “M” from the FUNCTION mode and if you succeed in becoming MASTER the REMOTE menu will be replaced by the message:-

[CONTROLLED BY REMOTE]

You will be presented with the S-R-E menu:-

S .... SEND LOCAL FILES

R .... RECEIVE REMOTE FILES

E .... EXIT MASTER MODE

You can toggle between CHAT and FUNCTION mode at any time, but when ready to select from the menu, you must be in FUNCTION mode.

Selecting the “E” menu item will relinquish MASTER control and return both APPLES to the M-$-& menu.
SELECTING FILES FOR TRANSFER

Insert into DRIVE 1 any disk that contains files to be sent. or has space for files to be received and select "F" or "R" from the menu. The APPLE that holds the files to be sent will read the CATALOG from its disk and send a copy to the other APPLE. When both ends have copies of the CATALOG displayed, the MASTER end can select the files to be transferred. This is done by moving the selection cursor up and down the screen with the < and > (or , and .) keys while in FUNCTION mode. The MASTER end toggles the file selection with the SPACE bar and both ends can see which files have been selected. When ready to start the file transfer, type CONTROL-C. While your disk is actually being accessed, you will be barred from using the keyboard, but at all other times, including file transmission, you may select CHAT mode and converse with the other end.

WATCHING THE DATA GO BY

There are three display screens supported by DFX. They are called the MENU, UTILITY and the GRAPHIC screens. You may switch from the current MENU screen to either the UTILITY or GRAPHIC screen at any time. The ESC key toggles your APPLE between the three screens and the STATUS line shows a H, G or M so that you know where you are. You can even see which screen the REMOTE is currently selecting by looking at the left side of the STATUS line.

THE UTILITY SCREEN

This shows the Receive and Transmit data streams and an extension of the CHAT scroll area. In FUNCTION mode, the < and > (or , and .) keys move the small arrow under the data stream left and right. The hexadecimal values of the two indicated data stream characters are displayed at the right. A count of the total characters Received and Transmitted is displayed on the left.

THE GRAPHIC SCREEN

The GRAPHIC screen shows 32 blocks of any file in transit. If it is a HIRES picture file, the sender will see the picture as loaded from disk, while the receiver will see it slowly appear. There are no valid function mode keys while using the GRAPHIC screen.

ERROR HANDLING

---------------

FAILURE TO GAIN MASTER CONTROL

If you both managed to type "M" almost simultaneously while attempting to become MASTER, then you will both get a NOT ACCEPTED BY REMOTE message.

If you have placed a call to another computer that is not running DFX, DFXAPPLN.OBJ is the File Transfer Application routine. The APPLE that holds the files to be sent will read the CATALOG from its disk and send a copy to the other APPLE. When both ends have copies of the CATALOG displayed, the MASTER end can select the files to be transferred. This is done by moving the selection cursor up and down the screen with the < and > (or , and .) keys while in FUNCTION mode. The MASTER end toggles the file selection with the SPACE bar and both ends can see which files have been selected. When ready to start the file transfer, type CONTROL-C.

While your disk is actually being accessed, you will be barred from using the keyboard, but at all other times, including file transmission, you may select CHAT mode and converse with the other end.

SELECTING FILES FOR TRANSFER

Insert into DRIVE 1 any disk that contains files to be sent. or has space for files to be received and select "F" or "R" from the menu. The APPLE that holds the files to be sent will read the CATALOG from its disk and send a copy to the other APPLE. When both ends have copies of the CATALOG displayed, the MASTER end can select the files to be transferred. This is done by moving the selection cursor up and down the screen with the < and > (or , and .) keys while in FUNCTION mode. The MASTER end toggles the file selection with the SPACE bar and both ends can see which files have been selected. When ready to start the file transfer, type CONTROL-C.

While your disk is actually being accessed, you will be barred from using the keyboard, but at all other times, including file transmission, you may select CHAT mode and converse with the other end.

WATCHING THE DATA GO BY

There are three display screens supported by DFX. They are called the MENU, UTILITY and the GRAPHIC screens. You may switch from the current MENU screen to either the UTILITY or GRAPHIC screen at any time. The ESC key toggles your APPLE between the three screens and the STATUS line shows a H, G or M so that you know where you are. You can even see which screen the REMOTE is currently selecting by looking at the left side of the STATUS line.

THE UTILITY SCREEN

This shows the Receive and Transmit data streams and an extension of the CHAT scroll area. In FUNCTION mode, the < and > (or , and .) keys move the small arrow under the data stream left and right. The hexadecimal values of the two indicated data stream characters are displayed at the right. A count of the total characters Received and Transmitted is displayed on the left.

THE GRAPHIC SCREEN

The GRAPHIC screen shows 32 blocks of any file in transit. If it is a HIRES picture file, the sender will see the picture as loaded from disk, while the receiver will see it slowly appear. There are no valid function mode keys while using the GRAPHIC screen.

ERROR HANDLING

---------------

FAILURE TO GAIN MASTER CONTROL

If you both managed to type "M" almost simultaneously while attempting to become MASTER, then you will both get a NOT ACCEPTED BY REMOTE message.

If you have placed a call to another computer that is not running DFX, DFXAPPLN.OBJ is the File Transfer Application routine. Select the UTILITY screen, FUNCTION mode and type SHIFT-CONTROL-F. This will signal the REMOTE APPLE to close any open files and return to the M-S-E menu. If successful, the LOCAL APPLE will then do the same. If either APPLE was in the middle of a disk access at the time, you may have to repeat the sequence again.

LIMITATIONS

---------------

- All disk functions refer to DRIVE 1.
- The HAYES MICROMODEM II must be in slot 2.
- All files must be in standard DOS 3.3 format. (APPLESOFT, INTEGER, BINARY or TEXT).
- If the sender's CATALOG has more than 38 files, only the first 38 will be displayed for possible transfer.
- If the sender's CATALOG has more than 19 files, the display will show all file names truncated after the 12th character. However, the file names up to the 30th character are still used internally.
- At least one end must be running an original DFX PRIMARY DISK as provided by ARROW MICRO SOFTWARE. The other end may be a SECONDARY copy produced by any suitable file copy program, bit copier, or by the DFX FULL-THROUGH (DFT) utility. If you attempt to run SECONDARY copies of DFX in both APPLES, you will be permitted to place the call, CHAT and select files; but you will not be permitted to transfer any files. The slowly flashing "**" at the centre of the STATUS line will break into a very fast flash if both ends are running SECONDARY copies of DFX. Also, the message:-

[NO PRIMARY DFX DISK]

will be displayed when you enable the M-S-E or S-R-E menu. If you attempt to transfer files between two SECONDARY copies of DFX, you will be forced to press RESET which will drop the line and reboot.

INTERNALS

---------------

DFX is a small APPLESOFT program that loads and executes four binary program segments.

MODEMSUB.OBJ is the operating system that supports the three screens, CHAT-FUNCTION, STATUS display and modem.

DFXAPPLN.OBJ is the File Transfer Application routine.

DFXAPPLNMSG.OBJ contains all the messages for DFXAPPLN.OBJ.

DFXGRODS.OBJ makes various modifications to DOS 3.3 and initializes all variables. It then evaporates.

DFXDOCUMENTATION is a formatted text file of this documentation.

DOC is a rather slow and simple minded APPLESOFT program that prints the DOCUMENTATION file to a printer in slot 1.

DFT is an APPLESOFT program that will send a copy of the DFX files to a REMOTE.

GETTING OUT OF DFX

When exiting from DFX, it is necessary to reboot the system with a more normal DOS 3.3. The "<" character has been chosen as the menu selection character because it requires a SHIFT and "<" key to reach
Sit back and watch for about 8 3/4 minutes.

WHEN DPT FINISHES
He should now have a SECONDARY copy of the DFX files on his disk and DFX should be up and running on both APPLES.

If all goes well, your DFX will be running a few seconds ahead of his and you will see his CHAT status "C" appear when his DFX starts up. It is now safe to chat to him. If you start chatting too soon, his system may hangup the line because he sees strange bits on the line while he is testing the connection.

SENDING THE REST OF THE DFX FILES
To complete the SECONDARY DFX file complement, you should now use DFX to send him the files called: DOC, DFXDOCUMENTATION, ORDERING, HELLO and DFX. (HELLO and DFX are required to replace the temporary files sent by DPT.)

COPYRIGHT
--------
This software product (DFX) is copyrighted and all rights are reserved by ARROW MICRO SOFTWARE. The distribution and sale of this product are intended for the use of the original purchaser only. However, lawful users of this program are hereby licensed to execute the DPT program to transmit a SECONDARY COPY of any of the DFX files to other users for the purpose of usefully executing the DFX program between APPLE II computers.

Note: In any DFX to DFX communication, at least one end must run a PRIMARY COPY of DFX to work correctly.

No warranty, either expressed or implied, is made with respect to any part of this software. The programs are sold "AS IS". In no event shall AMS be liable for any direct or indirect, incidental or consequential damages resulting from any defect in the licensed program.
Doublestuff is an applesoft compatible language, that is not loaded like applesoft, it is loaded into the area of memory were integer basic is loaded. It actually "Doubles" the graphics of your 128k //e or standard Apple //c. The Basic prompt now, instead of "]" is now "}". To use this you MUST be in 80 columns, and when you boot the disk, it will install Doublestuff into memory, and put you into 80 columns, with the "}" prompt.

The Demos
-----------
To see what's available for demo programs, type "catalog" watch your typing. A program listed is called "ME FIRST" this program when executed will run the Double lo-res demo menu, if you press <ESC> from the inverse menu <made like that for easier viewing on color composite monitors>, pressing <ESC> will bring you to the double Hi-res menu. Just type the number you want on either menu, to select what you want to see.

The Language
-------------

The Language is basically the same, except for these new changes, everything is compatible:

- Hi-res is now 0-559 by 0-191 instead of 0-279 by 0-191 pixels.
  (Hploting Co-ordinates: X=0 to 559, Y=0 to 191)
- Lo-res is now 0-79 by 0-47 instead of 0-39 by 0-47 blocks of graphics. (Plot, Hlin, Vlin Co-ordinates: X=0 to 79, Y=0 to 191)
- In Hi-res, the colors are the same as Lo-res
- The commands HGR and GR turns on graphics mode to the last color used, I.E.: Hcolor=5, then a HGR would turn on Hi-res with a grey screen. To get a black Hi-res or Lo-res screen, just do a hcolor=0 or color=0 respectively.
- The disk has Standard Dos 3.3 and Turbo dos, for faster access, this disk will not work with: Diversi Dos, David Dos or ProntoDos.
- Here are the colors and numbers for HCOLOR=x and color=x, (x=the number of the color), 0=black.

Dr. Mario
Programmed By Blue Adept/USAlliance

Project Began July 5th
Completed July 20th 4:48pm
Made workable for GS/OS August 17
Further Remodeled to fix some bugs on January 27, 1992

Dr. Mario is a game of Virus's and Pills to cure them. The object of each level is to remove all the virus pieces from the screen. This is accomplished by getting 4 or more Pill Pieces of 1 color in a row horizontally or vertically. You get points for each virus you take out. If you take out more than 1 virus at a time then you get 400+ (400*number of viruses killed). Game is won after level 20 is completed.

Could it be Mario has settled down? After numerous adventures in the Mario Bros. series, he's tured in his running shoes for a stethoscope. Now he's a medical researcher at Mushroom Kingdom Hospital, experimenting in the virus lab.

But of course, Mario is a trouble magnet. Everywhere he goes, something is bound to happen that only quick reflexes and superhuman hand-eye coordination can fix. So one day, just as Mario was beginning work, Nurse Toadstool came rushing in with news that something had gone horribly wrong. One of the experimental viruses was growing out of control inside a laboratory bottle.

Fortunately, Mario had just developed a new set of vitamins that should have been able to kill the viruses. Unfortunately, things got complicated. The vitamins worked, but each one was effective only against a specific virus, and only when enough of the right vitamins were used. In desperation, Mario began throwing vitamins into the laboratory bottle, trying to get enough of the right ones to the viruses they could kill.

An idea is to line up four or more pieces of the same color, either horizontally or vertically. By "pieces," we mean a whole capsule, or half of a capsule, or a virus. When that happens, all of te matching pieces disappear from the screen. If one or more of the pieces were viruses, you get points.

One key to shaping your strategy is to keep an eye on the upper right corner of the screen, where you can see the next vitamin Dr. Mario will toss into the jar. Although you can make the currently falling capsule fall faster by pushing down, you should probably just let it drop at its own pace. Use the time to look at what the next capsule will be and figure out where it will fit.

It's also important to anticipate where broken pieces of capsules will drop.

Each capsule consists of two halves, and if one half disappears when you match a row, the other half remains on the screen. When this happens, the half left behind drops until something stops it. If it happens to land somewhere to make ANOTHER matching row of four colors, that row will also disappear, and any halves left behind will also drop, and so on.

It should be pretty obvious, therefore, that when you match a capsule to a row, you should also think about where the odd half will drop. How will the leftover piece affect the piles of capsules below it? The key to beating Dr. Mario especially at the higher more contaminated levels is getting the knack of lining up capsules so that when one half disappears, the leftover half can drop somewhere useful.

If you drop a capsule on top of a different-colored virus, there are only three ways to clear the virus later. The first method is to imply pile on more capsules of the same wrong color until they form a matching row and disappear, leaving the virus uncovered. This method is the most common, and it works, but it also takes time. In addition, the halves left behind might cover other viruses in the process, so careful planning is essential.

The second way to clear a virus that's buried beneath wrong-colored capsules is to match it with a horizontal row of pieces. This is probably better than method #1, but isn't always possible. Again, careful planning is the only way to keep those lines clear.

The third method is even more difficult – form a vertical stack by building up matching capsules beneath the virus. This is possible because viruses, unlike capsules, do not fall toward the bottom of the screen when there's nothing to support them. They hang in midair, and sometimes you can slide capsules into place underneath.

Like other tetris style games, Dr. Mario is an exercise in thinking ahead under pressure. You can usually recover from mistakes, but it always takes time. And the longer you take to clear a level, the faster Dr. Mario tosses in the capsules.

Unlike other Tetris variants however, Dr. Mario has viruses and you can see them magnified in the lower left corner of the screen. These viruses disappear as you clear all of that color virus out of each level.

Key Commands
A - Flip Left
S - Flip Right
4 - Move Left
2 - Move Down
6 - Move Right
Q - Quit
ESC - P - pause game

Press Space Bar every time you are waiting at some screen that seems to be waiting for something.

Their are also a couple secret keys that I put in to help me while programming the game. The commands put the screen into some test modes that are pretty interesting...see if you can find em eh?

This Game was written because of the massive lack of games on the market for the Apple //gs right now. Since I've cracked and released 183 games over the 5 years that I've been the leader of USAlliance I decided that it was time to give something really producutive back. This is the first serious game I've ever written, so its not exactly incredible quality. Also, I wrote this game from scratch in 15 days in my spare time and the usual amount of time it takes to write an arcade game is more than 4 months. This is the first of several games I hope to write in my spare time for the GS.

I am also making most of the source code to these games available to anyone who wants to see it. Since these games are not authorized and nobody gets any cash for em then I'm not going to loose anything by other people getting ahol of this code, eh?

later
BA/USAlliance

V2.1

Final Note: I have tested this game extensively as well as I can. I have played it through several times and for me it always works. If you find any bugz or problems with it then try to get word to me so I can fix the bugs as quickly as possible!!

msg to jason/joe $McK: deeeeeeereserersverwwwwwwwwwddddd...... how long did it take you to get permission to leave your state? >:

fr0d000 MiStTeR: bagged any more young males lately?
THE SOLUTION LEGEND --

S - SWING DIRK'S SWORD
F - MOVE THE JOYSTICK FORWARD
B - PULL THE JOYSTICK BACKWARDS
L - MOVE THE JOYSTICK TO THE LEFT
R - MOVE THE JOYSTICK TO THE RIGHT

(H) -- YOU MUST VERY QUICKLY MOVE FORWARD TO MAKE IT THRU THE WALL. THIS IS NOT DIFFICULT TO DO IF YOU ARE PREPARED....

(R) -- THE ROOM CAN BE REVERSED BY THE COMPUTER. EACH LEFT MOVE MUST BE CHANGED TO A RIGHT AND VICE VERSA. FORWARD, BACKWARDS AND SWORD REMAIN THE SAME. (H) -- A HINT GIVING TIPS ON TIMING OR HOW TO SPOT ROOMS THAT HAVE BEEN REVERSED.

ROOM #1: THE ROOM WITH THE BRICK WALL FORMING IN FRONT OF YOU.

MOVEMENT -- F.

ROOM #2: THREE ROPES SWINGING OVER THE FIRE PITS.

MOVEMENT -- R-R-R-R.

ROOM #3: THE ROOM WHERE ROCKS FALL ON TOP OF YOU.

MOVEMENT -- R-R

ROOM #4: DRINK ME ROOM.

MOVEMENT -- R

ROOM #5: THE ROOM WITH JUMPING SKULLS OOOZING TAR, AND BIG HANDS.

MOVEMENT -- F-S-F-S-L

THE FLASH DIRECTLY AFTER YOU SEE IT.

EACH ROOM HAS A DESCRIPTIVE TITLE WHICH WILL ALLOW YOU TO DETERMINE THE ROOM PATTERN YOU NEED. THE ROOMS ARE ALWAYS PLAYED IN A SEMI-RANDOM PATTERN.

ROOM #1: THE ROOM WITH THE BRICK WALL FORMING IN FRONT OF YOU.

MOVEMENT -- F.

(H) -- YOU MUST VERY QUICKLY MOVE FORWARD TO MAKE IT THRU THE WALL. THIS IS NOT DIFFICULT TO DO IF YOU ARE PREPARED....

ROOM #2: THREE ROPES SWINGING OVER THE FIRE PITS.

MOVEMENT -- R-R-R-R.

(H) -- THE FIRST JUMP SHOULD BE MADE WHEN THE ROPE NEAREST TO YOU IS CLOSE TO YOU. OTHER JUMPS ARE MADE WHEN DIRK REACHES HIS HAND OUT TO GRASP THE NEXT ROPE. (YOU WILL NOT SEE THE NEXT ROPE YET....)

(R) -- THIS ROOM CAN BE REVERSED. YOU MUST MOVE INSTEAD L-L-L-L TO CROSS THE PIT. IT IS FAIRLY OBVIOUS TO SPOT THIS ROOM REVERSED AS DIRK APPEARS ON THE LEFT SIDE OF THE SCREEN WHEN IT IS NORMAL AND ON THE RIGHT WHEN IT IS REVERSED.

ROOM #3: THE ROOM WHERE ROCKS FALL ON TOP OF YOU.

MOVEMENT -- R-R

(H) -- MOVE RIGHT AS SOON AS YOU RECOGNIZE THE ROOM AND AGAIN AFTER THE FLASH IN THE RIGHT-HAND DOORWAY (SEE BEGINNING ABOUT FLASHES).

ROOM #4: DRINK ME ROOM.

MOVEMENT -- R

(H) -- MOVE RIGHT AS SOON AS YOU ENTER THE ROOM. THIS IS AN EXAMPLE OF THE ROOMS IN WHICH FLASHES ARE NOT SHOWING THE CORRECT PATH.

ROOM #5: THE ROOM WITH JUMPING SKULLS OOOZING TAR, AND BIG HANDS.

MOVEMENT -- F-S-F-S-L

(H) -- MOVE FORWARD AS SOON AS YOU SEE THE SKULLS (BE SURE TO LISTEN FOR THE "BEEP")! PRESS SWORD WHEN DIRK LANDS FROM HIS JUMP FORWARD. CONTINUE THROUGH THE ROOM NORMALLY FROM HERE (LISTEN CAREFULLY AS THIS IS A NOISY ROOM.)

(R) -- THE ROOM CAN BE REVERSED. ONLY ONE MOVE IN THIS ROOM MUST BE CHANGED TO ACCOUNT FOR THE SWITCH AND THAT IS THE MOVE AFTER DIRK SWINGS THE SECOND TIME. SIMPLY LOOK WHICH WAY HE IS FACING...
AFTER HE SWINGS AND MOVE THAT WAY. (NOT TERRIBLY DIFFICULT IS IT?)

ROOM #6: BREATHING DOOR WITH DIAMOND.
MOVEMENT -- R-R
(H) -- MOVE RIGHT WHEN DIRK GETS PULLED INTO SECOND ROOM AND RIGHT AGAIN WHEN THE DOORWAY ON THE RIGHT SIDE FLASHES.

ROOM #7: DUNGEON WITH SKULL HANGING FROM A ROPE.
MOVEMENT -- S-S-S-F
(H) -- SWING FIRST THREE TIMES AND KILL SNAKES. DIRK WILL ALWAYS MISS THE THIRD SNAKE. AFTER HE SWINGS THE SWORD THE THIRD TIME PUSH FORWARD QUICKLY AGAIN AS DIRK ESCAPES THE DUNGEON.

ROOM #8: ROOM WITH GREEN TENTACLE REACHING IN THRU TOP LEFT OF SCREEN.
MOVEMENT -- S-F-R-B-L-F
(H) -- MOVE ONLY AFTER YOU SEE THE HORSEMAN APPEAR.

ROOM #9: DUNGEON WITH LIGHTNING AND FIRE.
MOVEMENT -- R-F-B-L
(H) -- IN THIS ROOM THE LIGHTNING ACTS AS THE POINTER TELLING YOU WHEN TO MOVE. AFTER THE FIRST BOLT OF LIGHTNING MAKE THE FIRST MOVE, SAME FOR THE SECOND AND THIRD. AFTER THE THIRD IS COMPLETE MOVE LEFT AND DIRK WILL EXIT (EXIT STAGE LEFT).

ROOM #10: ROWBOAT WITH RAPIDS AND WHIRLPOOLS
MOVEMENT -- R-L-R-L-R-L-...ECT...ECT
(H) -- THIS IS A VERY EASY ROOM DUE TO THE FACT THAT ALL YOU MUST DO IS FOLLOW THE FLASHES IN THE BEGINNING. GO TO THE LIGHT COLORED SECTIONS IN THE MIDDLE AND AVOID ALL WHIRLPOOLS. THE ROOM IS EVEN EASIER SINCE THE MOVEMENTS SWITCH BETWEEN RIGHT AND LEFT AT EACH DECISION SO AFTER YOU HAVE THE FIRST MOVE IN A SET, THE REST ARE EASY! BE AWARE OF TRICKS LIKE PLAYING A SCREEN WHERE YOU DO NOTHING FOLLOWED QUICKLY BY A DECISION SCREEN. ONLY ONE MOVE OTHER THAN R OR L IS NEEDED. AFTER THE WHIRLPOOLS END, SIMPLY WAIT FOR DIRK TO BE SHOT OUT OF HIS BOAT AND MOVE FORWARD TO GRAB THE CHAIN. I WILL LET THE REST OF THE ROOM TO YOU (I PROMISE IT'S AN EASY ONE)
(R) -- THERE IS ONE STRANGE HAPPENING ON THIS SCREEN. ONCE IN A WHILE, YOU WILL SKIP THE FIRST WHIRLPOOL & HAVE TO MOVE THE OTHER WAY TO AVOID THE SECOND. DON'T SAY I DIDN'T WARN YOU!!!!!
(R) -- DEFEYING US EVEN MORE, THE PROGRAMMERS HAVE DECIDED THAT
THIS ROOM MAY ALSO BE REVERSED. THIS PROVES TO BE A REAL
CHALLENGE TO LEARNING PLAYERS. IT IS VERY DIFFICULT TO CATCH THE
POINTER TO THE REVERSE YOUR FIRST FEW TIMES BUT BEAR WITH IT,
YOU'LL GET IT SOMEDAY... TO TELL IF THE SCREEN IS REVERSED, YOU
MUST WATCH THE FIRST ENERGY BOLT THE KNIGHT SENDS AT YOU. IT WILL
COME AT YOU AND SURROUND YOU ON THREE SIDES, THE SIDE WHICH IS
OPEN IS EITHER THE LEFT OR RIGHT SIDE. IF IT IS THE RIGHT SIDE.
THE SCREEN IS NORMAL, IF IT IS THE LEFT SIDE THE SCREEN IS
REVERSED. (GOOD LUCK... YOU'LL NEED IT...)

ROOM #17: THE ANIMATED WEAPONS ROOM.

MOVEMENT -- S-S-L-S-S

(H) -- THE SWORDING IN THIS ROOM IS THE KEY. THE BEST POINTER TO
WHEN TO SWING IS WHEN THE WEAPON CONFRONTING YOU STARTS DOWN AT
YOU TO PRESS THE SWORD BUTTON. IT WOULD BE VERY BENEFICIAL TO
WATCH OTHERS DO THIS TO GET THE IDEA. MOVE LEFT TO AVOID THE
ANVIL AS SOON AS YOU SEE IT. WHEN DIRK ENCHANTS HIS SWORD AND
THE ANVIL COMES TO LIFE PRESS SWORD AGAIN BEFORE HE BEGINS TO
SWING. NOTE THAT DIRK CLIMBS UP TO THE POT AUTOMATICALLY AND YOU
NEEDNT MOVE FORWARD.

(R) -- THIS ROOM CAN BE REVERSED AND THE ONLY DIFFERENCE IS THAT
HE MOVES RIGHT TO AVOID THE ANVIL THIS TIME. YOU CAN TELL WHICH
WAY TO MOVE AT THIS POINT BECAUSE FIRE IS ON THE SIDE THAT YOU
SHOULD NOT MOVE TO. ANOTHER POINTER IS THAT DIRK IS ON THE LEFT
SIDE OF THE SCREEN WHEN YOU SHOULD MOVE LEFT AND THE RIGHT SIDE
WHEN YOU SHOULD MOVE RIGHT.

ROOM 18: SPINNER ROOM WITH GRUNTS (GRUNTS?!?!)   

MOVEMENT -- F-S-B-F

(H) -- YOU ARE SHOWN TWO SPINNERS AND DIRK ATTEMPTING TO PASS
THROUGH THEM! THERE ARE TWO SEPERATE VERSIONS (ALTHOUGH THEY LOOK
THE SAME, THEY ARE DIFFERENT AND YOU MUST PASS BOTH TO GET TO THE
DRAGON) BUT BOTH USE THE SAME SOLUTION. AS DIRK APPROACHES THE
SPINNERS, HE WILL GRUNT ALOUD AS HE WALKS LIKE "UUUHHH",
"UOOOHEH". WAIT FOR THE SECOND GRUNT AND THEN MOVE FORWARD. IF
YOU DO IT RIGHT HE WILL SPRINT THROUGH AND JUMP FORWARD. PRESS
SWORD AS HE JUMPS, PULL BACK AND WAIT FOR THE VIEW TO SWITCH.
FINALLY PUSH FORWARD AND HE WILL EXIT.

ROOM #19: THE LAVA MONSTERS (MUDHENS)

MOVEMENT -- S-F-F-F-E-C-T....ECT...

(H) -- PRESS SWORD AND WAIT FOR HIM TO SWING AND CATCH HIS SWORD.
THEN MOVE FORWARD QUICKLY OVER AND OVER. IN THE WHOLE ROOM ONLY
ONE MOVE MUST BE TIMED. YOU RUN OUT INTO THE END OF A PROJECTION
AND MUST JUMP ACROSS A LAVA PIT TO THE OTHER SIDE. WAIT FOR THE
OPPOSITE SIDE TO FLASH AND THEN JUMP. AFTER THAT JUMP CONTINUE
MOVING FORWARD QUICKLY UNTIL YOU EXIT THE ROOM.

ROOM #20: THE ELECTRIFIED GROUND WITH A STEEL DOOR SLAMMING IN
FRONT OF DIRK.
Draw Poker

The Poker Table pits you against the "House". Both you and the dealer start with an equal amount of money, depending on the amount the player withdraws. You play "table stakes" rules meaning that, during play, you or the dealer cannot bet any amount of money that exceeds the others bankroll.

At the first prompt after entering the Poker Table, you may:

A)nte or Q)uit to the Casino Menu

If you choose to Ante, both you and the dealer put $5 in the "pot". Each is then dealt 5 cards. You or the dealer may Bet, Check or Fold. The winner of the previous round will always Bet or Check first. Betting may range from $2 to $25. After one Bets, the other may either Check, Raise, or Fold. If one Bets and the other Folds, the one who Bet automatically wins the "pot". If one Raises, the raise is always limited to $25. There is also a limit of 3 raises before and after discards. You are allowed to check and raise.

After both you and the dealer Check or Call, you are shown your cards and asked which ones you wish to discard. If you wish to "stand pat", hit <RETURN>. You may discard from 1 to 5 (all) cards.

You discard by typing the number(s) of the cards:

To discard 1,2,5: 125 <RETURN>
To discard 2,4 : 24 <RETURN>
To discard all : 12345 <RETURN>

ALWAYS enter the numbers of the cards in ASCENDING order.

You are then shown the number of new cards that you and the dealer took. You new hand is then displayed and you are given the chance to bet these cards. The same rules apply to this round of betting that applied to the last round.

After all betting is complete, the "house" analyzes each hand to determine the winner. If you win, the "pot" is added to your bankroll. In the case of a tie, the "pot" is split between the player and the "house".
At this point you may either A)nte for a new round of Poker or Q)uit.

I am releasing another 3200 color paint program for the benefit of the Apple IIgs community. This is my second release, the first being Emerald Visions v1.0.

I have also included in this archive some 3200 color pictures that I have drawn with DreamGrafix. If you have drawn any that you think are exceptionally good, I would appreciate it if you could upload them to one of the above boards. All of my future releases will be uploaded to those boards...

I want to thank Blue Adept, Mr. Z, and Bladerunner's sister! Boy is she TIGHT!

Till next time!

;ACOS Master
Beware: A witch doctor's curse is about to envelop you and your apple computer, wreaking havoc on ordinary reality, digital circuitry and network TV reception!

Your mission: Others have been lured in to this world before you; a little girl, a little boy, their pet lizard, their pet crocodile and their mother. Your task is to find them and bring them back to waking reality, safe & happily reunited.

Mission 1...rescue the little girl and her pet lizard. Watch out for scorpions, flying turkeys, and (on higher levels) green vacuum cleaners!

Mission 2...rescue the little boy and his pet crocodile. Watch out for monsters magnets, and the witch doctor!

Mission 3...rescue the mother. Watch out for serpents and flying weapons!

You are luckily wearing your trance-resistant, anti-gravity rescue suit. You're also well-armed with an unlimited supply of luminous reality pellets, which you can shoot to disintegrate monsters and other enemy phantoms that the witch doctor has cleverly conjured to thwart you.

You start with five lives. For each round of three missions completed successfully, you earn one extra life.

Each time you complete a mission, a curtain of dreams will descend, transport-??

Your wide-screen radar-scope at the top of the screen will prove indispensable in your quest.

Controls:
For joystick: use up/down/left/right movements. Press the button to fire.
For keyboard: A=up, Z=down, <--left, -->right (Apple //e uses K=left, right=L)

Press the spacebar to fire.

Scoring:
35....scorpions, monsters, snakes
100...daggers, swords, arrows, balloon, helicopter, witch doctor.
300....rescue girl/rescue boy
500...rescue mother
500...roast turkey
0.....hatchets

Survival tips: Flying turkeys must be shot at repeatedly. Green vacuum cleaners are indestructible. At higher levels, additional perils appear!

Special keys:
Ctrl-R restart
Ctrl-J change to joystick control
Ctrl-K change to keyboard control
Ctrl-S toggle sound on/off
Ctrl-V toggle volume high/low
Esc pause-press any key to continue
The object is to shoot the floating numbers and mathematical operands and place them down below in a balanced mathematical expression such as 234+14=248. Blank spaces don't matter, so 2 34+1 4=2 48 is acceptable. No operands may be on the right side of the '=' sign and the result can't be equal to 0.

The scarabs to the side indicate how many machines you have left. You may shoot and be shot by the other player which results in an award of 10 points to the shooting player and the loss of a piece to the victim.

Press the paddle button to shoot a number, then move your scarab down below the main screen and drop your number in one of the slots available. If you accidentally pick up a number or operand you don't want, then you must position yourself above the 'garbage' hole toward the bottom center of the screen, then press the paddle button to drop the unwanted digit. If at any time you accidentally drop a number or operand in the wrong place so that your expression shows little chance of balancing, move your scarab as close to the bottom center of the screen as possible and press the paddle button. This will release all of your numbers and allow you to start over.

Scoring:
The four operands are + (addition), - (subtraction), x (multiplication), / (division). These are worth 1, 2, 3 and 4 points respectively. The computer goes through the equation and adds the value of the operands, multiplies this by the length of the smallest number, and multiplies that by 10. You also receive 10 points for zapping the other player. CTRL-S will toggle sound on/off.
INFO button, type in the full name of the human. The Human Database Service will then provide your MAD with information (Address, IO numbers, etc.) of the selected human. After receiving information, you may select REPEAT to try another name or select EXIT to leave the program. If you accidentally type in the wrong name, you can try to try again or type BYE to leave the program.

NOTE: The Orb Alliance has authorized Manhunters to visit any address furnished by the INFO system.

As a Manhunter, you are required to record all pertinent data that you discover during your investigations. Luckily, INFO provides a means to ENTER this data through its Autoscan feature. Whenever important information is picked up by a Manhunter (important documents, notes, etc.), Autoscan examines the data and stores important information into memory for future access. To observe this data, select INFO from your MAD and type NOTES in place of name.

TRACKER

All human movement is recorded in the Human Tracking Records database of the Alliance computer. Due to the low priority placed on these records, tracking information on each human is only available from shortly before the time of the alleged criminal activity to a time period not extending beyond the end of that day. Due to unforeseen difficulties with human tracking disks, the targeted human's identity is not recorded. Also, tracking of a target is cut off if the human should venture under earth soil. However, this practice is strictly forbidden and should not hamper your investigations.

One function of MAD is to tap into the appropriate human tracking records for your current assignment. When MAD first accesses tracking records, it will determine and then "tag" the most appropriate human target signal. A playback will begin with the subject's movements throughout the city. During playback, MAD will also display any other human targets that come in close contact with the tagged human target. You may tag any of these human subjects that you feel may be beneficial to your investigation. To tag a new target, simply place your marker over the desired subject and press ENTER. The yellow rotating target should change to the subject you have chosen. You may replay tracking records as often as you find necessary. Manhunters are authorized by the Orb Alliance to visit any location that a tagged target visits.

NOTE: Experienced Manhunters have found that the most efficient way to use the Tracking records is to watch it until it terminates transmission. Proceed to replay the transmission, closing the MAD after the target leaves each location. Travel to the location shown and investigate.

SIGNAL TRACKER

This is a recently installed feature that allows the recording of various signals entering and leaving the Alliance central computer.

The Alliance central computer contains a Signal Analyzer which resides in its I/O buffer. Once playback begins, the Analyzer examines the data and stores important information into memory for future access. If a tagged signal contains restricted information, it will determine and then "tag" the most appropriate human target signal. After a signal has been tagged, it is automatically fed into the Analyzer. If the analyzed signal contains restricted information, the signal can then be traced back to its source by your MAD tracking device. After the traced signal leads you to a suspect, you will follow normal Manhunter procedure to complete your investigation.

MANHUNTER OVERVIEW

This orb-infested metropolis can be one mean place for a Manhunter to live. You may find it helpful to play Manhunter with a friend. Different situations (namely, a gruesome death!). This feature allows you to face the most unexpected of conclusions without requiring you to replay the entire game.

5. GOT YOUR BACK AGAINST THE WALL?

If you've tried every trick of the trade and still can't get anywhere, don't panic. Even expert Manhunters have been known to get blown to shreds. It's just part of the job.

end of file.
PLAYER INSTRUCTIONS

The universe is filled with pestilence, crime and disease. Colnar is the being who rules all evil, controlling everyone and everything. He is planning time travel to another state of being, a new universe which is prevalent with harmony and tranquility. The masses were content and at peace with each other. War was virtually nonexistent and the wisdom of the Elders had been undisputed for over 100 years.

Meanwhile, in another dimension...

The universe is filled with pestilence, crime and disease. Colnar is the being who rules all evil, controlling everyone and everything. He is planning time travel to another state of being, a new universe which is prevalent with happiness, so that he may once again spread his evil ways.

Time passes.....

2197, the year your legacy began. Dondra, world of the Elders...a place of harmony and tranquility. The masses were content and at peace with each other. War was virtually nonexistent and the wisdom of the Elders had been undisputed for over 100 years.

In this program there are many different ways to enter commands. You may use the standard two word method, ie: GO NORTH [RETURN], or you may type CONTROL-N, or you may press the joystick forward and press button (0) to move, or you can simply press N [RETURN]. When entering a command you will usually need an ACTION word and an OBJECT word. Some standard commands might be: LOOK DOOR, READ SIGN, TAKE KEY, OPEN DOOR. To enter and execute your commands you will be using something called a "parser", ie: the link between your nimble fingers and the computer of your choice. When typing in a command the prompt or starting point is indicated on the bottom of the screen as: ENTRY> or >. After familiarizing yourself with the program for a while using some of the basic commands above, try some of the following methods of getting around in Ardnod.

ADVANCED COMMAND ENTRY

If you enjoy being more verbose in your description of actions and objects this parser will accommodate you. For instance, the basic commands from the previous paragraph could have been entered: READ THE SIGN ON THE DOOR, TAKE THE KEY OFF OF THE FLOOR, OPEN THE DOOR, FACTUS ARE SNOBS. You may also use multiple actions and multiple objects in the same sentence. If, for instance, you knew what you wanted to do in a particular room you could: GET THE KEY AND THE WRENCH THEN OPEN THE NORTH DOOR. This would immediately take the key and the wrench from the floor and open the north door in that order.

Your capabilities are not limited to what is on the screen at the present time. You may also move between screens, look at objects, and do just about anything in that same sentence, ie: OPEN THE DOOR THEN GO NORTH AND HAVE A LOOK AT THE OLD MURAL. When getting or dropping items you may also use commas: TAKE GEM, VIAL, SACK.

MULTIPLE COMMAND ENTRY

One of the special text handling capabilities is the multiple command entry.

In your travels on Ardnod you will be generating experience based upon how you perform in this world. You will also gain items that can be used in future quests. Therefore, when you boot this program for the first time you will be asked to supply a name to assign to your first character. Even though you may be terminated many times during the game play, you will always be re-incarnated after being brought back to the boot disk.

EXPERIENCE

You will be given experience during your travels based upon:

- Total Number of saves
- Number of times terminated
- Number of objects gained
- Elapsed time

These results will be used to calculate you total experience gained. To view your experience at any time during game play type: EXP or EXPERIENCE.

BASIC COMMAND ENTRY

In this program there are many different ways to enter commands. You may use the standard two word method, ie: GO NORTH [RETURN], or you may type CONTROL-N, or you may press the joystick forward and press button (0) to move, or you can simply press N [RETURN]. When entering a command you will usually need an ACTION word and an OBJECT word. Some standard commands might be: LOOK DOOR, READ SIGN, TAKE KEY, OPEN DOOR. To enter and execute your commands you will be using something called a "parser", ie: the link between your nimble fingers and the computer of your choice. When typing in a command the prompt or starting point is indicated on the bottom of the screen as: ENTRY> or >. After familiarizing yourself with the program for a while using some of the basic commands above, try some of the following methods of getting around in Ardnod.

ADVANCED COMMAND ENTRY

If you enjoy being more verbose in your description of actions and objects this parser will accommodate you. For instance, the basic commands from the previous paragraph could have been entered: READ THE SIGN ON THE DOOR, TAKE THE KEY OFF OF THE FLOOR, OPEN THE DOOR, FACTUS ARE SNOBS. You may also use multiple actions and multiple objects in the same sentence. If, for instance, you knew what you wanted to do in a particular room you could: GET THE KEY AND THE WRENCH THEN OPEN THE NORTH DOOR. This would immediately take the key and the wrench from the floor and open the north door in that order.

Your capabilities are not limited to what is on the screen at the present time. You may also move between screens, look at objects, and do just about anything in that same sentence, ie: OPEN THE DOOR THEN GO NORTH AND HAVE A LOOK AT THE OLD MURAL. When getting or dropping items you may also use commas: TAKE GEM, VIAL, SACK.

MULTIPLE COMMAND ENTRY

One of the special text handling capabilities is the multiple command entry.
You may type in a lengthy number of commands one after the other with a period between each: TAKE THE GEM, VIAL, AND ROPE. GO NORTH. GO UP. GIVE THE GEM TO THE MAN. GO DOWN. GO SOUTH. GO WEST.

Each of the commands will be executed in the order received until they are completed. Remember, if something was entered incorrectly, then the chances are the commands that follow will not properly execute.

TRAVELLING ON ARDNOD

Remember that you are always looking out the eyes of Terna, the last of the Tellasi race. We have tried to make it as easy as possible to understand your position at each location, while trying to maintain a proper perception of your facing. When you move to a location the description shown will give you a good understanding of your surroundings. In many cases it is possible to look in more than one direction. To accomplish this you may: LOOK SOUTH.

In your travels of Ardnod you will encounter many strange beings which will in some way have to be dealt with. Sometimes you might have to give them something or perform some action, to make them more friendly. You will also find that there are many "timed" events which keep you on your toes and prevent stagnant gameplay.

Keyboard Movement:

Earlier we discussed basic and advanced commands which game you an understanding of the parser. We said that you can GO NORTH to move to the next location in a northerly direction. You may GO in any direction you can think of: NORTH, SOUTH, EAST, WEST, NORTHWEST, SOUTHWEST, UP, NORTHEAST, and DOWN. You can even GO AROUND or GO BEHIND many things (hint, hint). However, it is not necessary to type GO every time: N, S, W, E, NW, MW, SE, SW, U, and D [RETURN] will get you around very quickly. After you have mastered these movement commands, try the ones below.

CONTROL - Movement commands (See Help Screen)

JOYSTICK MOVEMENT

You are slumped over that machine, it is time to pack in a heavy hacking section and you couldn't type another move... Don't fuckin' worry! Pick up the joystick which is hiding under all of the ECC releases and type CONTROL-J. This command will toggle your joystick on or off. When you press the joystick in any direction you will see the corresponding movement command at the ENTRY> prompt. When you press button (0) it will then move in that direction. When you want to go UP or DOWN you will need to hold down the botton (1) and move the joystick forward and back to make your selection. When you want to type something into the computer, let the joystick self center (there is no need to disable the joystick to type in commands).

SPECIAL FUNCTIONS

HELP: This screen may be accessed to help you remember some of the features in Questmaster

EXPERIENCE (EXP): Displays your present Questmaster stats as well as the elapsed time.

TIME (CONTROL-T): Will display your elapsed time since you started your quest. This time will be a factor in calculating your experience.

CONTROL-J: Toggles joystick function on and off; it can be used at any time for immediate movement. (Make sure that you have your joystick adjusted properly.)

CONTROL-R: This will purge your character from the disk and make you restart from the beginning.

SAVING AND LOADING POSITIONS

This feature is provided so that you can return to locations previously saved after you quit or have been terminated (by one of the strange or evil beings you might encounter on Ardnod.) There is a catch, however; the number of times that you can save a game is counted and will negatively affect your experience. We hope this will give your character an air performance, rewarding the more cautious and penalizing the frivolous adventurer.

At almost any time during play you are permitted to restore as well as to save your present stats to the saved game disk. To do this simply LOAD GAME and SAVE GAME.

Apple /// Version:

The screen will clear and you will be instructed to insert your saved game disk and press [RETURN]. If you have a second disk drive press D and you will see the disk drive indicator change on the screen. A second drive is convenient because your disk swapping will be reduced to a minimum. After putting in the appropriate disk and pressing [RETURN] a select game menu will appear. If using the LOAD command, only previously saved games will be indicated. If using SAVE you may type a new letter not indicated or you may elect to write over an old one. Any letter from A to Z is available in SAVE mode.

BASIC COMMANDS

Some basic commands to get you started are: Use, Open, Take (all), Drop (all), Say, Look, Kick, Read, Go. This is only to help the beginner. There are hundreds of words this program will recognize and execute, so do not hesitate to try anything. There are also some command substitutions that will make your travels a little easier. (1) is the same thing as typing in LOOK, (I) is the same as INVENTORY and all of the directions can be abbreviated. When typing in commands these abbreviations will also work in full sentence structure, ie: LOOK AT THE SOUTH DOOR THEN OPEN THE SOUTH DOOR. GET THE KEY THEN KICK THE KEY SOUTH. GO SOUTH ---- same as ---- L S DOOR. OPEN S DOOR. GET KEY. KICK KEY S. S

YOUR QUEST ON ARDNOD

This futuristic land has mountains, deserts, streams, fields, and cities. You will find that aspects of this world are different from any other you have known.

To win you must set forth in this strange and forbidden land to find the Crystal Prism of Heheutotol and return to the starting location. Upon return, you will gain new power which can be used in future quests!

SOME FUCKIN' HINTS

Stuck in the first room? Try these fuckin' hints:

Did you take the key?
Yes -- it dropped to the ground.
No -- try taking it.

Did you decipher the code on the north door?
Yes -- good.
No -- it is a sliding code, (ie: B=A C=B):

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 374 of 1262
DOCUMENTECHelon

To get the key you must:

OPEN THE SOUTH DOOR
KICK THE KEY SOUTH { The key steams up the south room. }
GO SOUTH
TAKE THE KEY
GO NORTH

To open the north door:

After you insert the key into the keyhole the door will open.
GO NORTH
Skeletons will appear and scream "SPEAK MORTL". Simply try what
has worked before:
SAY DEATH TO COLNAR

The skeletons give you items helpful in your quest on Ardnod.

To get past the skeletons in one set of instructions when starting from
the first screen:

TAKE KEY. OPEN S DOOR. KICK KEY S. S. GET KEY. N. SAY DEATH TO
COLNAR. INSERT KEY INTO KEYHOLE. N. SAY DEATH TO COLNAR. N.

end of file.

DOCUMENTECHelon

1) Ship View
(ESC,1,2,3,4,5)
Select front, rear, right, up, or down. All views except the front view will
display a portion of the spacecraft to indicate which view is currently
selected.

2) RPV View
('6' key)
When your RPV is deployed, you can switch to RPV view at any time. When this is
done the 'RPV View' light on the instrument panel will turn yellow. One of the
more interesting features of the game is flying the C-104 while watching from
the droid (RPV). To switch back to ship view, select one of the six ship view
keys described above.

3) Zoom
('Y' & 'U' keys)
Both the Main screen and the Top view have Zoom (magnification) capabilities.
The Zoom feature allows you to examine buildings and structures more closely
without flying nearer to them. The Zoom magnifies the viewing area to make
objects appear closer. The main screen can be "Zoomed In" to a power of 16X
while to Top view can be zoomed into 22X.

4) Zone Map
('J' Key)
Pressing this key will bring up the Zone Map which is divided into 36 areas.
When you begin the game the entire map will be red (except at the Base Station).
As you fly around the map will turn white in the sectors that have been scanned
by your ships sensors. Your present location is always indicated by a flashing
dot. Press Space bar to return to main screen.

5) Hyperdrive
('H' key during Zone Map)
There will be times when you will want to move quickly across the Zone. You
could fly to your destination Area using your main engines, but it would waste
time and fuel. Hyperdrive will transport you there in a matter of seconds. First
select Zone map, then press the 'H' key. A flashing dot will appear at your
current position. Move the Joystick up, down, left or right and position the dot
in the destination area. Now press button 1 or Space bar. You will arrive in the
new area in a matter of seconds. Your coordinates and sector will remain the
same.

6) Area Map
('B' key)
The area map will display your current location within the area. Unlike the Zone
Map (which freezes play), the Area map is a Heads Up display and can be toggled
on and off without stopping play.

7) Top View
('T' key)
This key is used to toggle the Top View on and off. Turning the top view off is
normally done to speed up the rate at which the main screen updates.

8) Pitch auto center
(Return Key)
Pressing this key toggles the pitch auto centering feature on and off. When auto
centering is on, the white light just below the Pitch readout will come on. This feature will automatically return your pitch to zero (level flight) when the joystick is released.

9) Hover
('O', 'L', '.' keys)
These keys control the anti-gravity hover system. Push the Hover down key ('.') to make your ship Descend. Push the Hover up key ('O') to make it ascend. The longer you hold the key down, the faster the ship will move. Press Hover Stop key ('O') or the Emergency Stop key (Space Bar) to stop ascending or descending.

10) Tracking
('O' key)
Push this key to toggle the RPV tracking system on or off. When your RPV is deployed, it will try to follow your ship at all times if tracking is enabled. The tracking indicator will turn blue when tracking is ON.

11) Emergency Stop
(Space Bar)
This key will zero all ship velocities.

12) Deploy RPV
('9' key)
Press this key to deploy your RPV. The droid is used only for exploration and reconnaissance as it has no weapons. You can activate its camera and sensors by selecting RPV View ('6' key).

13) Control
('C' key)
This key toggles between C-104 and RPV control.

14) Teleporter
(Left Arrow Key)
Pressing this key will engage the Object Teleportation System. Several conditions must be met before an object can be beamed aboard. All engines including hover must be stopped. Altitude must be at 50 meters or below and down view must be selected. In addition, there must be an object (flashing hour glass visible on the main screen. The teleporter is also used to retrieve the RPV.

15) Grid
('-' key)
This key is used to select full, partial, or no surface grid.

16) Data Link
(Right Arrow key)
Pressing this key will link your on board computer to the main computers at Echelon Headquarters. Once the data link is established you can select numerous playing options.

17) Weapons
('B', 'N', 'M', '.' keys)
These four keys are used to arm and disarm the weapon systems aboard the C-104 spacecraft. Select 'B' to arm the Lasers, 'N' to arm the Photon Cannons, and 'M' to arm the missiles. Select ',' to disarm all weapons.

18) Auto Bank Center
('/' key)
This key toggles Auto Bank centering on or off. When stick is released, the bank or tilt of the wings will automatically return to zero.

19) Full forward thrust
('2' key)
Pressing the '1' key engages full forward thrusts.

20) Full reverse thrust
('K' key)
Pressing 'K' engages full reverse thrusters.

21) Sound
('R' key)
Toggles sound on or off.

Keyboard Controls
W - Pitch Down
Z - Pitch Up
A - Bank left
S - Bank Right
E - Forward Thrust
X - Reverse Thrust
D - Thrust Stop
F - Fire weapons

Activate Joystick by using the Data Link and selecting Controls from Game Options.

- END -
The computer then displays this information on two viewing screens. The main screen shows point of view images of buildings, vehicles, terrain, etc. This screen will also display a blue grid which indicates the planet's surface. You can selectively shut off all or part of the surface grid. This is normally done to increase the rate at which the display is updated.

The smaller screen is the top view or overhead view. This is the computer's interpretation of an outside view looking down on your spacecraft.

Your ship is represented in outline form as 7 flashing dots. The dot in the center locates the center of your spacecraft. The green vertical and horizontal lines represent sector boundaries, the top VIEW can be turned on or off as needed by press 'T'.

Note: When the RPV view is selected, both screens will display images from the RPV's point of view.
28) Zoom Indicator
Coordinate System
Your current location within the Zone is always defined in terms of AREA, SECTOR, and then coordinates and altitude within the sector. Since each sector is 10,000 meters across, coordinates are given as follows:
X Coordinate = 0 thru 10,000 (west to east)
Z Coordinate = 0 thru 10,000 (south to north)

Z = 10,000

Z = 5,000

Z = 0

Z Coordinate = 0 thru 10,000 (south to north)
X Coordinate = 0 thru 10,000 (west to east)

Your altitude will range from 0 at the planet’s surface to a max of 13,500 meters. Your ship’s computer will not allow you to leave the zone or to fly above 13,500 meters without special authorization.

Velocity Indicators:
There are two sets of velocity indicators on your instrument panel. The display on the left indicates forward or reverse velocity.

The display on the right is the vertical speed indicator and shows the rate of climb or descent. Rate of climb or descent while hovering is also shown.

Zoom Indicator:
Both the MAIN and TOP VIEW screens have zoom capabilities. When one of the Zoom in or out keys are pressed, these indicators will show the amount of magnification being used. Main screen zoom has a range of 1X normal to 16X max. Top view has range of 1X normal to 22X max.

RPV View Indicators:
If these console lights are white, they indicate that the main screen is now displaying the view from the RPV camera. If lights are black, the main screen is displaying the view from the C-104.

Scoring Indicators:
There are two separate scoring displays. The left display is the ‘B’ or Exploration score. Points are awarded here based on credits received through artifact and clue retrieval. The right display is the ‘C’ or combat score. Points are awarded here based on enemy ships destroyed. You are also awarded combat points for target practice and combat simulation. Virtually any structure or terrain on the planet can be a target. However, the ship’s computer will not allow you to destroy structures that are not hostile. If you fire at a hostile target, the computer will simulate the sequence on the screen. If the target was hit the image will be removed from the screen and points will be awarded.

Weapons:
Laser: These anti-matter packets are suspended in a magnetic field until fired. Once released, the disintegrate rapidly but are very effective at short range (up to 4000 meters).

Photon Cannon: This unit is basically a very high intensity pulse laser. The pulse power is supplied by rapidly discharging a P.C. power cell and the cell casing is ejected after each round is fired. The cannons are good at short to medium range (up to 4600 meters).

Missiles: These are medium to long range, solid fuel rockets with micro-nuclear detonators. (Acronym: LRN). They have no external guidance system which virtually neutralizes and electronic counter measure techniques (effective range 6300 meters).

Teleporter:
One of the most important functions of your spacecraft is teleporting objects aboard. There are hundreds of objects in the Patrol Zone that contain information needed to solve the maps and locate the Pirate Base. The RPV is also retrieved by the teleporter. To teleport objects, use the following procedure.

1. Locate an Object –
Objects that are teleportable are shown as flashing hourglasses on the viewing screen. From a distance the object appears as a small flashing dot.

Note: (to follow this procedure while attempting to teleport an actual object, fly to area B-2, sector J-7)

2. Approach –
When an object appears on screen, it may be in the adjacent sector. Fly towards the object and adjust your controls so that the object remains in the center of the screen. When your spacecraft gets close, the object will begin moving more rapidly. Lower your speed and altitude and continue your approach. If the spacecraft continues forward when you are very near the object it may disappear from the front view as the spacecraft begins to pass over it.

3. Activate ‘Down’ Screen –
To teleport an object, your spacecraft must be directly over it. Press the down view key (‘5’) to activate the down screen. The down screen shows the object directly below your spacecraft. There is a blind spot between front and down view screens and when the object passes out of view from the front screen, it is not immediately seen in the down screen.

4. Maneuver Your Spacecraft Over The Object –
If the object is in front of your craft, begin moving slowly forward so that the spacecraft passes over the object. The object should now be visible on the down screen. If the object passes outside the down view area, use the other views to locate it. Use the down view sight (small cross hairs) to line up the object. Maneuver the spacecraft so that the object is still partially visible when you are at or below 50 meters.

Note: Objects cannot be teleported unless your altitude is 50 meters or below.

5. Begin Teleportation Sequence –
Once the object is within teleport range (inside the screen are with the spacecraft below 50 meters), press the Teleport Key ( ‘<-’ ). This will activate the teleport sequence and bring the object on board. If the object is not properly lined up, the message “No object within range” will appear. This means either your craft is too high (over alt. 50) or not enough of the object is inside the screen area.

Combat
If you wish to battle enemy spacecraft, enter the Data Link Combat Section and set enemy strength to a value other than 1.

The Planet is broken down into a number of Patrol Zones. Since there is only one C-104 per zone, it’s up to you to defend it. When your ship comes under attack, a small audio signal will sound. Enemy spacecraft should be visible on the top
view screen. They will be identified as small dots moving toward your spacecraft. Activate one of your weapons by pressing 'B', 'N' or 'M' and get ready for combat.

The only direction your weapons fire is directly ahead. Look at the top view screen and identify which of the enemy aircraft is the closest and position your spacecraft to view the approach from the front screen. When you are hit by an enemy weapon, the screen will flash white and strength will be taken from your shields.

The RFV

The RFV is a remote piloted vehicle and is used for all types of exploration and observation work outside the spacecraft. The RFV has its own propulsion system and can fly in much the same manner as the C-104. It also has a camera that allows the pilot to monitor the RFV's viewing area.

RFV Controls:

To deploy the RFV, the C-104 must be at alt. 00. Once on the ground, press the '9' key. A message and the small figure in the lower left corner of the panel will change color. The RFV will always be deployed to the north of you.

The RFV is operated by using the same controls that are used with the C-104. To switch the controls from the C-104 to the RFV, press 'C'. The control indicator should read RFV. Press 'C' again will change control back to the C-104.

To switch to RFV view, press '6'. If you have not moved the RFV from where it was deployed, you will see the outside view of your spacecraft. To switch the view back to the C-104, press one of the Ship View keys.

You can use the RFV to explore buildings and structures or to fly around the sectors. The RFV responds to the controls in the same manner as the C-104. If the RFV collides with the C-104, the RFV will be destroyed.

To retrieve your RFV, press the teleport key ( < - ). The C-104 must be in control and you must be stopped.

Remote Control Flying

The tracking function allows you to fly the C-104 like a remote control aircraft. To try this, do the following:

1. Set your altitude at 00
2. Deploy RFV
3. Switch to RFV view ('6'). You should see the C-104 in front of you.
4. Switch the controls to the C-104 ('C')
5. Press the Tracking Key ('0')

With the tracking on, the RFV will follow the C-104's flight pattern. If you get disoriented or lose track of your position, simply stop the C-104, switch to front view and press the teleport key. Your lost droid will be beamed aboard.

Training Courses

There are six different training courses designed to improve your skills in flying and operating the spacecraft.

1. Touch and Go: The object of the touch and go course is to set your spacecraft down on landing pads that are located in Area C-4, sectors H-6 through H-10. Start on the arrow ( --- ) located in sector H-5 and at altitude 200. The landing pads are small yellow squares with a red X inside. They are located in the sectors directly east. Begin moving forward and try to set your spacecraft directly on top of the landing pad. This requires using the down screen view. Positioning your spacecraft over the landing pads is very similar to positioning your ship over teleportable objects. This course will improve your skills.
2. Floating Tunnel Obstacle Course: This course is also designed to improve maneuvering skills but you also need to watch your altitude and pitch carefully.
3. Aerial Target Range: The aerial target range is to increase your proficiency in the use of weapons. There is a target range located in Area A-2, Sectors H-4 through H-10. Start at Sector H-3 X=7884, Z=5281, alt=5175. The object is to fly through the range hitting as many targets as you can in the least amount of time. There are 14 triangle type figures staggered from Sectors H-4 to H-10.
4. Target Range: The target range located in area B-2 starts in sector J-10 and goes through several connected sectors. The object is to increase your weapon proficiency by flying through the sectors hitting as many targets as quickly as possible.

The Data Link

Press --> to request up-link to Echelon Headquarters. When the link comes on line you have 4 selections from the main menu.

1. Docking
2. Game Options
3. Pirate Maps
4. X. Terminate

1 - Docking

1. Docking procedures: This gives instructions on how to re-dock once leaving the base station. Any time during flight you can return to the base station to re-energize your shields, get more fuel, ammunition or droids. Any damage that your craft has sustained will be repaired.
2. Weapons and Fuel: This option allows you to select the amount of fuel and the amount of ammunition for each of your weapons. This can be done up to the maximum capacity (in weight) that can be held by the ship. To activate a category press the Space Bar. Use the (+) or (-) keys to add or subtract the amount of ammunition or fuel. To exit press '/'.
3. Default weapons/fuel: This option automatically selects the normal loading of ammunition and fuel. You may then make adjustments if you wish. Press '/' to exit.
2 - Game Options:

1. Combat: There are two choices you can make under this category.
   - Enemy strength - This allows you to vary the enemy strength between 6 different levels.
   - Structure Display - This allows you to either leave the structures or buildings on screen during combat or to not display them during combat. Having the structures not displayed speeds up game play.
2. Load/Save/Restart: This option allows you to SAVE a game in progress, LOAD a previously saved game and resume play, FORMAT a disk, or RESTART a game without re-booting. Please follow the instructions outlined on the screen carefully. You cannot save games onto the Echelon disk.
3. Controls: This option allows you to select between keyboard and joystick controls. The Default is keyboard. If you wish to use a joystick, you must use this option to select joystick mode.
4 - Pirate Maps

This allows you to view the pieces displayed on the pirate maps. The maps start with no information but gradually fill in each time objects are teleported. There are six different maps and each is used to help locate the Pirate Base.
Docking

1. The main base is located in area B-3, Sector G-7. Fly to this location at an altitude of 10,000 meters.
2. To get to the docking area, you must fly through one of the four entry bays.
3. Line your spacecraft up (at alt. 10,000 meters) directly in front of one of the bay entry doors and slowly begin to approach the opening.
4. As your spacecraft begins to enter the bay, your speed will automatically be reduced.
5. Keep your ship in the center of the entry bay. If you hit the sides of the bay, you'll hear a thud. You cannot fly through the walls of the space station.
6. Keep an eye on your X and Z coordinates. When your coordinates are approximately X=5000, Z=5000 at altitude 10,000 meters you have reached the docking bay.
7. Rotate the spacecraft to a heading of 00 and the docking system will automatically be engaged.

ISIS - The 10th Planet

History of ISIS

Scientists had long suspected the existence of a 10th planet. In 1821, 40 years after the discovery of the seventh planet, Uranus, French Astronomer Alexis Bouvard noticed that Uranus' observed position did not agree with its calculated orbit. Uranus was being pulled slightly off course by the gravitational attraction of an outer planet. This led to the search and discovery of Neptune, the eighth planet. But the mass of Neptune did not account for the distortion in Uranus' orbit so a search began for the ninth planet. When Pluto was discovered in 1930, it's mass was much too small to fully account for Uranus' wobble, so an earnest search for a tenth planet had been continuing at the U.S. Naval Observatory (USNO) since the early 1980's. In 1996 a research team from the USNO announced the discovery of Isis, the 10th Planet in our solar system. The Planet's mass, approximately five times that of earth, was so sufficient in size to effect the gravitational field of Uranus. Isis has a thin atmosphere made up of primarily Oxygen, Carbon Dioxide, Nitrogen and Argon. Its orbit is elliptical and it takes over 340 earth years to orbit the sun. The biggest surprise however, was yet to come. In 2011, the first unmanned landing probe reached Isis. The photographs and data sent back finally verified that Earth was not the only planet where life has existed. Signs of an ancient civilization were observed on the surface of the planet, but life was no longer present. Evidence indicated a great cataclysm had taken place and large areas of the planet showed incredible devastation. Upon analysis of the information, general consensus more effective.

Statistics for Isis:

- Mean distance from Sun: 6.5 billion km
- Period of orbit: 341 earth years
- Period of rotation: 47 earth hours
- Diameter: 28,940 Km
- Mass relative to Earth: 5.3
- Surface gravity relative to earth: 1.25

Historical Time Line

1996 - Discovery of 10th planet.
capabilities, they have caused an increasing amount of damage to ISF facilities.

The ISF established Echelon two years ago to regain firm control inside the
area. Progress, however, has been marginal. Major Thomas Allen was given the
task of infiltrating the pirate organization over 16 months ago, but his status
at this point is unknown. Pirates continue to use the element of surprise and
have enjoyed an increasing amount of success against ISF facilities throughout
the area.

Objective: Your assignment is to locate the Space Pirates Main Base of
operation. According to Intelligence reports, it is somewhere inside your Patrol
Zone. Your investigation requires to retrieve artifacts and information
throughout the zone to find the answer. Any pirate spacecraft spotted inside
your assigned area should be neutralized. Good Luck, Commander!

The Pirate Code
The Pirate base is somewhere inside your Patrol Zone. Finding the base will take
a great deal of 'detective work'. Through intelligence reports, we know that the
space Pirates have developed a secret code to encrypt all messages and
transmissions. Your teleporter's material analyzer is programming to decipher as
much of this code as possible. Many of the objects and artifacts that you
teleport aboard will contain writings and inscriptions. Some of these are clues
and many are written in Pirate Code. Breaking the code is essential to the
solution of the game.

The Six Steps
We also know that the Pirates have developed a sophisticated cloaking system
which constantly keeps their base invisible and undetectable by our scanners.
Latest reports indicate that there is a special sequence of 6 steps that can be
performed to de-activate the cloaking devices. Apparently the designers set up
this sequence to serve as an emergency override in the event of a major
malfunction in the system. These steps must be performed in the proper sequence.
If any of the steps are executed out of order, one must start again.

The Six Maps
Each of the six steps is represented by a map. The maps are in your Data Link
System. The Maps have no information to begin with, but portions of a map will
fill in each time an object is teleported aboard. Each map has a graphic and
text section. Every time an object is teleported, a new piece of text and
graphic will be revealed. (If you cash in the object for credit).

The Maps are identified by color. When an object is teleported, the computer
will give its description, the number of credits available, and the color of its
as associated map.

<table>
<thead>
<tr>
<th>Description:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space Debris</td>
</tr>
<tr>
<td>Credits: 10               White &lt;-------- Map Color</td>
</tr>
</tbody>
</table>

If you cash the object in for credit, the map will be shown and the graphic and
text pieces will appear. (Note: Be sure to save the game periodically. This must
be done to preserve the map pieces between playing sessions.)

When all the objects in the patrol Zone have been teleported, all 6 maps will be
filled in. The text with each map gives instructions on how to complete one of
the six steps. This text, however, is in pirate code and must be deciphered.

Completing Your Mission
To solve the mystery and complete your mission, do the following.

1. Fill in the maps by teleporting objects aboard your spacecraft.
2. Write down clues. Each map has its own important clues that pertain to that
   particular map. Most important clues will be encoded.
3. Break the Pirate code and interpret the instructions for each of the 6 steps.
   Scattered throughout the Zone are clues to the meanings of the Pirate Code.
   These clues are on teleported objects as well as written on walls or buildings.
   Each time you decipher a letter or number, write it down.
4. Determine the correct order of the steps. Once you finish all 6 maps and
   break the code, you will be able to read the instructions on how to complete
   each of the 6 steps. All steps involve flying to a specific point and performing
   specific maneuvers with your spacecraft. If you successfully follow the
   instruction for that step, a sign will be given. Thus you will receive 6 signs
   for successfully completing 6 steps. There is a problem, however. You must
   complete the 6 steps in a specific order to deactivate the cloaking system and
   win the game.
   Hint: Look for clues of the form: *Something PRECEDES something* These are very
   important and should always be written down.
   Hint: Each MAP graphic is important. It represents something within the zone and
   is related to a 'Precedes' clue.
5. Complete the 6 steps in their proper order. As each step is completed, the
   sign for that step will be given, but there will be no indication given as to
   whether or not you are sill on the correct sequence. You will have to wait until
   all 6 steps are completed to find out. If you find the proper order, you'll know
   it. If not, try again. Use the PRECEDES clues. Without them, you may have a
   rough time. There are 720 different combinations.

-END-
The Crossroads was an early outpost used extensively in the early and mid 21st century for scientific expeditions. More modern facilities at other sites were later constructed and the Crossroads was abandoned. The Echelon Training course (touch and go) is located in Sectors H-6 thru H-10. Only ISF personnel with Level 1 security clearance are authorized within these sectors.

C-5: One of the most severe blows to the ISF occurred in Sector C-5. After 16 months on planet Earth, Largo, the largest of the ISF superfreighters was nearing Echelon. The Pirate raids had been taking their toll on Echelon reserve supplies and many items aboard the Largo were in short supply at the base. The freighter was under military escort and at last report, it was sighted near Echelon. The Pirate raids continued and Echelon was left with only a small defense force. The situation was critical. A decision was made to attack and the Echelon target range was ready for use. A thorough search was undertaken, but the huge freighter was never found. The loss of supplies nearly spelled disaster for the base. Supplies and medical equipment nearly ran out before an emergency shipment could be received from surrounding colonies. It is assumed that pirates attacked the Largo. By employing communication disrupters and stealth equipment, the distress message was blocked. The mystery of what happened to the freighter after the attack, however, remains to be solved.

C-6: Area C-6 was opened up in 2039 to independent mining operations. Isolated settlements can be found throughout the area. Most are abandoned now because of the Pirate attacks in the area.

D-1: Independent Mining Facilities are located throughout this area.

D-2: No information available. Area has several large structures photographed by satellite. Large tracts remain unexplored.

D-3: Remains of Ancient Isis City can be found in Sector H-3. City has several large buildings that are still intact.

D-4: No information available. Area has many large structures which have been photographed by satellite but large tracts remain unexplored.

D-5: The Refinery located in B-7 was built in 2042 to process Dylidium and Titanium into a high-strength alloy. The facility was built to furnish replacement parts for spacecraft during the Alphan War.

D-6: The McAdams Penitentiary located in Sector I-10 was built in 2054 for prisoners who were considered too dangerous to be housed in other facilities. The inmates were required to work in the Dylidium mines. When Lithicite, a very unique crystal, was discovered at the mine, many miners were killed in a strange accident. Apparently the laser used to mine Dylidium can excite the crystal and under the right conditions cause an explosion. This led to riots in 2082 when 350 inmates escaped in a prison freighter. Most of the prison itself was destroyed in the revolt and the remaining inmates were transferred to other facilities. The prison was officially closed in March 2082.

E-1: The Abandoned Landing Strip in Sector C-7 was established in 2021 as the original ISF base of operations. The landing strip was attacked during the early phase of the Alphan War and personnel were evacuated to a more defensible position.

E-2: The Research Radio Telescope in Sector C-9 was built in 2037. Information and data at this site are analyzed by astronomers at Echelon.

E-5: No information available. Area has several large structures photographed by satellite but large tracts remain unexplored.

E-6: The Mining Facility located in Sectors C-7 was set up in 2039 when large deposits of the element Dylidium were discovered. Dylidium when combined with Titanium makes an extremely strong alloy and is used primarily in the construction of the outer hulls of spacecraft. The mining operations began using prisoners from the McAdams Penitentiary in 2054. In 2059, Lithicite crystal was discovered and mining operations were expanded. Lithicite crystal was a failure and the mine was closed down in 2079.
discovered at the site. This crystal is extremely and can explode if not handled correctly. Efforts to mine the Lithicite crystal were unsuccessful and over 30 prisoners were killed in mining accidents. The mine was shut down in 2083 when more plentiful Dylidium deposits were discovered at other locations. This location, though deserted is considered dangerous and only military and mining officials with Level 3 security clearance may visit the site.

F-1: Remains of an Ancient Isis city can be found in sector F-6.

F-2: Sector L-6 features a large object that has been nicknamed the Great Horn. The 'Horn' was constructed by some alien civilization over 20 million years ago. The material is metal that is not found anywhere in our solar system as far as we know. It is so hard that it is virtually indestructible.

F-3: The Space Platform in K-11 is owned by a private mining corporation. Remains of an ancient Isis town in Sector I-6 has been dated over 4000 years old.

F-4: No Information available. Area is unexplored.

F-5: Ancient remains of a small town located in Sector E-7.

F-6: No information available. Area is unexplored.

---END---
ECP-16 takes responsibility for launching your program and for passing the command line to the shell program (EXE file).

This latter feature is handy. As an example, I downloaded a public domain C source for a file squeezing program. I made no modifications to this file at all. I compiled the program using APW C (pre-release version) and I can now execute this program under ECP-16 the same way you would do so on UNIX, CP/M, or MS-DOS by just typing the name (pathname) of the program along with any arguments that might be required by the program. I'm including the object code to this program in the library with ECP-16 for you to play with. I'm sure you can see the potential for this. C sources from MS-DOS (and there are a lot of them and many in the public domain) are useless under the DeskTop and before now could only be executed from APW (a huge package that's ok as a development environment but who wants to wait for it to load when all you want to do is some quick file manipulation?).

Licensing:

Oh yes, ECP-16 will be licensable to developers who would like to include it with their ProDOS 16 applications and utilities that they sell. All I ask is that you pay me $60 per product per year and that you encourage your users to buy the full package (so they can get support and updates with the latest docs and all).

Feedback:

As with all of my programs I welcome suggestions and comments on my software and how it might be improved. If you want to wait until a more functional version of the software is ready before paying your shareware fee then that's fine. If you pay the fee right now you won't get any printed documentation for ECP-16 but you will get a bootable disk with ECP-16 and the full ECP-8 package (complete with docs). To a great extent the operation of ECP-16 will mirror ECP-16 when possible without sacrificing the nice features available under ProDOS 16.

You can launch the following types of files:

SI6 These are ProDOS 16 system programs. Right now ECP-16 stays resident.

SYS Note that calling a SYS program prevents you from automatically returning to ECP-16 but ECP-8 can relaunch ECP-16 if commanded to do so.

BAS You must have a copy of BASIC.SYSTEM in your CMDS subdirectory named as "BASIC" and you must have a copy of SYSTEM.LAUNCHER in your CMDS subdirectory.

TXT You can launch BASIC EXEC files by typing "BASIC FILENAME" where FILENAME is the name of the TXT EXEC file you wish to launch.

BIN The same rules that apply to BAS files apply here. BIN files are executed by BASIC.

EXE These are ProDOS 16 shell programs. Some will only run under APW but most will run under APW or ECP-16.

BAT These are ECP-16 Batch files. (Described below)

Filenames:

ECP-16 supports any valid ProDOS-16 file naming convention. The following are all valid pathnames for any command in ECP-16 that requires a filename as an argument:

..dir/file (references directory levels above the current one)
/a/subdir/file (accept all file names that begin with "fi")
/a/subdir/file? (as above but prompt for matches)

Setting up your system disk:

ECP-16 can be set-up in a couple of different ways. One is to make the ECP-16 SI6 file the START file program selector. To do this you just put ECP-16 in the SYSTEM subdirectory as shown below and name it as START. The second method is to name the ECP-16 SI6 file as ECP16.SYS16 and put it in the volume directory of your ProDOS 16 system disk and make sure it appears in the directory before any other SI6 or SYS files.

The CMDS subdirectory:

You may set PREFIX 6 to the directory you want ECP-16 to look to if it can't find a file (EXE or SI6) in the current directory. The default value is a subdirectory named CMDS in the boot directory for ECP-16. You may set this anywhere you like.

The HISTORY buffer:

ECP-16 keeps a 'history' buffer to store your most recently entered commands. As a typing aid, you can scroll back and forth into this buffer and re-edit or re-enter previously entered commands with just a few keystrokes. To go back in the buffer, press the up arrow key. To go forward in the buffer just press the down arrow key. Try it.. you'll figure it out.

Batch files:

Like ECP-8, ECP-16 supports powerful disk based Batch files. These files are standard ProDOS text files whose file type has been changed to BAT (S5). These files can contain any valid ECP-16 command, either internal or external. When you enter a BAT file, the command line arguments for the BAT file are stored in the variables $1 - $9 with the argument count stored in $0. Batch file command lines are expanded into their full form prior to parsing and execution.

Example: The Move Bat file
ifeq $0 ;say "No arguments supplied\"G\M\J\" ;stop
   copy $1 $2
   delete $1
The above Bat file would be called from the command line as

```
moved <source> <destination>
```

When the Bat file is executed, the following statements are parsed:

```
ifeq 2 0;say "No arguments supplied^G^M^J";stop
copy <source> <destination>
delete <source>
```

Startup BAT files:

ECP-16 supports two types of auto-start BAT files. The first file searched for at boot time is CP.KEYS. This file should be kept in the same directory with the ECP16.SYS16 program file. It is typically used to define function keys but it can be used for any activity you'd like to take place when ECP-16 is initially loaded. Next, ECP-16 looks in the current PREFIX 0 directory for a file named CP.STARTUP. This file can also contain any command but you may have more than one CP.STARTUP file on your disk, perhaps one in the directory of each other program you frequently run from ECP-16, i.e. if you exit AppleWorks and AppleWorks is stored in /a/appleworks then you might want to put a CP.STARTUP file in /a/appleworks that would do any clean-up activities you'd like executed when you exit from AppleWorks. This could include backing up a ram disk or just setting the prefix back to your root directory.

I/O Redirection:

```
cat /vol >.printer
```

I/O Redirection:

```
cat /vol/subdir >spool.file
```

Note that output redirection only lasts for the command that includes the " >" output specifier. You can output all command output to the printer by using the SET PRINTER ON command.

Commands Documentation:

```
# Anything
```

Below are descriptions of the command that have been implemented in ECP-16 as of this version of the software.

This is a comment command. The remainder of the current line is ignored by the command processor.

```
! Anything
```

This is a comment command. The remainder of the current line is ignored by the command processor.

```
# Anything
```

Use this command to display a help file in the HELP subdirectory (designated by PREFIX 5). Pressing any key will pause the display. Use ESC to abort this command. If no argument is supplied then the file "$/CMDO/LIST" will be displayed.

```
BOOT <No Argument> ! <1-7>
```

This command will boot the disk device in the slot (1-7) specified. If not slot is specified then the online devices will be searched in the default scanning order.

```
CAT <Directory names>
```

This command changes the ProDOS file type of <file> to the type specified. Types may be specified either by their 3 letter identifier or by their hexadecimal type number.

```
CHTYPE <file> <typename>!<type in hex>
```

This is a comment command. The remainder of the current line is ignored by the command processor.

```
? <No Argument> ! <Command Name>
```

Use this command to display a help file in the HELP subdirectory (designated by PREFIX 5). Pressing any key will pause the display. Use ESC to abort this command. If no argument is supplied then the file "$/CMDO/LIST" will be displayed.

```
CREATE <directory names>
```

The selected directories will be displayed. If no argument is supplied then the current prefix directory will be displayed.

```
DELETE <pathnames>
```

The files specified by <pathnames> are permanently deleted from the
Apple II Computer Info

DUMP <pathnames>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

The specified files are displayed to the screen as a hexadecimal dump with file offsets.

ECHO <No Argument>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Batch file statements will be displayed to the screen as they execute after this command has been entered.

ERASE <device name> <volume name>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Erases the volume directory of a previously formatted volume and rewrites a volume directory and boot blocks using <volume name> as the name of the new volume. Note that this command will essentially destroy all data on the target device. You should use the ONLINE command to see a listing of the contents of each device prior to using this command. You will be asked to confirm twice that you actually want to erase a volume.

Example:
Erase .d4 /new.volume
The above command would erase the volume in device .d4 and would create a new volume named "/new.volume".

FKEY <No Argument> ! <0-9!A-Z> ! <0-9!A-Z> <string>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command is used to display (with no arguments), cancel (with number or key argument only), or define user-defined function (macro) keys. Control characters are coded after the "^" character such that a carriage return is represented as "^M". Any character that may be typed into the line editor may be represented and multiple lines of input may be defined. Function key definitions are limited to 127 characters.

Example:
Fkey 1 "^XCat""^MOnLine""^M"
The above definition assigns the indicated string to the Open Apple - 1 key combination. Pressing OA-1 will enter Cat, press return, enter Online and press return again.

FORMAT <device name> <volume name>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Formats the media in <device name> and creates the ProDOS volume named <volume name>. A volume directory and boot blocks are also written to the new volume at <device name>. Note that this command will destroy all data on the target device. You should use the ONLINE command to see a listing of the contents of all online devices prior to using this command. You will be asked to confirm twice that you actually want to format a volume.

Example:
Format .d4 /new.volume
The above command would format the media in device .d4 and would create the new volume "/new.volume".

GOTO <label>  Type: Internal
Batch: Yes
Keyboard: No
Wildcards: No

Use this command to unconditionally branch within a BATch program. A <label> is defined as the first word or quoted argument after a comment character in a Batch file. The following are legal labels:
# <label>
# "label"

Example:
GOTO OA-1
The above definition assigns the indicated string to the Open Apple - 1 key combination. Pressing OA-1 will enter Cat, press return, enter Online and press return again.

HELP <No Argument> ! <Command name>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: Yes

Use this command to display a help file in the HELP subdirectory (designated by Prefix 5). Pressing any key will pause the display. Use ESC to abort this command. If no argument is supplied then the file "5/CMDLIST" will be displayed.

IF <pathname>  Type: Internal
Batch: Yes
Keyboard: Yes (though not useful)
Wildcards: No

If the specified pathname exists on an online device then execution will continue with the statements that follow the IF command on the same line. If the file does not exist or if the name is improperly specified then execution will continue with the following line.

Example:
IF OA-1
The two arguments are equal (case ignored) then execution continues with the statements on the rest of the current line. If they are not equal then the rest of the line is skipped with execution continuing on the next line.

IFNOT <pathname>  Type: Internal
Batch: Yes
Keyboard: Yes (though not useful)
Wildcards: No

If the specified file does not exist on an online device then execution will continue on the same line. If the file does exist then execution will continue with the next line.

IFSHELL <ECP16> ! <ECP8>                                      Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command, implemented in both ECP-8 and ECP-16 allows a running BATch program to determine which shell is executing it. This allows you to know which commands are available to you so you can have your BAT program branch to use appropriate syntax based on which shell is active. You can thus use the same BAT file under either ECP8 or ECP16.

IFYES <No Argument>                                           Type: Internal
Batch: Yes
Keyboard: Yes (though not useful)
Wildcards: No

This command will display a cursor on the screen and wait for a Y or N keypress. If the user presses the "Y" key then execution continues with the statements that follow on the same line. If the user presses anything else then the remainder of the current line is ignored with execution continuing with the next line.

LOCK <pathnames>                                              Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: Yes

The specified files are locked (made read only). The string "More..." is displayed to the screen and the command then waits for any keypress to continue.

MAKEB <vol name list>                                         Type: External
Batch: Yes
Keyboard: Yes
Wildcards: Yes

This command writes the boot block for the named volumes. This is typically used to allow you to boot from a ram disk without having to format the disk. You still need to have a copy of the operating system on the volume to make it capable of booting.

MEM <No Argument>                                             Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command shows memory usage statistics.

MON <No Argument> ! <Monitor commands>                       Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

With <No Argument> this command will drop you into the system Monitor program. Press Control-Y <RETURN> to return to ECP-16. If you specify an argument, it will be passed to the system Monitor as a command with control staying in ECP-16.

NOECHO <No Argument>                                          Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This is an Apple IIgs Desktop program that merely sets up the desktop and allows you to execute NDA's or New Desk Accessories. The only other options are to display the copyright information and to quit back to ECP16. NDA's can only be launched from desktop programs which is why this external command is necessary.

ONLINE <No Argument>                                          Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

All OnLine disk devices will be displayed along with their device names, volume names, operating system type, and block usage statistics.

PAUSE <No Argument>                                           Type: Internal
Batch: Yes
Keyboard: Yes (though not useful)
Wildcards: No

The string "More..." is displayed to the screen and the command then waits for any keypress to continue.

PREFIX <No argument> ! <directory> ! <prefix number> <directoryType: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command either sets or displays system prefixes.

QUIT <No Argument>                                             Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Returns control to the program that started ECP-16.

RENAME <Original pathname> <New pathname>                     Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Renames <Original pathname> to <New pathname>. On a future version of ProDOS 16 this command will actually move a file entry from one directory to another but under version 1.1 only a simple renaming operation is supported.
Apple II Computer Info

SAY <string>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

SAY, SET, PINIT commands and others.

SET VERbose <ON ! OFF>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command determines whether ECP will issue warnings before overwriting existing files when you tell ECP to do this via the COPY command. The default setting is "ON".

Batch: Yes
Keyboard: Yes
Wildcards: No

This command will execute a ProDOS 16 SYSTEM (S16) program while keeping ECP-16 active and in memory. If you just enter the name of an S16 program then ECP-16 normally shuts itself down and remains dormant.

With the SHELL command you can execute S16 programs from BAT files provided that the S16 program doesn’t close the BAT file being executed.

SHELL <S16 Pathname>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

Shifts the command line arguments down by one variable thus eating the next argument to be parsed.

SHIFT <No Argument>  Type: Internal
Batch: Yes
Keyboard: No
Wildcards: No

This command will cause all subsequent command output to be routed to the printer device attached to PSLOT (normally 1) or it will turn off such output previously enabled.

STOP <No Argument>  Type: Internal
Batch: Yes
Keyboard: No
Wildcards: No

Terminates execution of the current BATch program.

This command allows you to specify the printer initialization string.
The string may be enclosed in quotes and may include control characters by using the currently defined control token (default = "). The default printer initialization string is "\18\n".

SET PRINTER <ON ! OFF>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command allows you to set the prompt used when ECP gathers input from the keyboard. The default value is ":".

SET PROMPT <prompt character>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command allows you to set the prompt used when ECP gathers input from the keyboard. The default value is ":".

SET PSLOT <0-7>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command determines which slot your printer is attached to. The default value is 1. A slot setting of 0 designates that you do not have a printer.

SET TOKEN <token character>  Type: Internal
Batch: Yes
Keyboard: Yes
Wildcards: No

This command determines which character will be used as the control character token character. The default value is ":".

Displays the current date and time using the format specified in the Control panel.
The specified files are displayed to the screen. Pressing any key will pause the display and pressing the ESC key will abort the display.

Control characters and non-printing characters are displayed as periods.

The specified files are unlocked (changed to read/write/renaming/destroy enabled).

This command allows you to display an AppleWorks AWP word processing file to the current output device as if it were a text file viewed with the TYPE command.

Here is an example for using this list to find the instructions for a disk. Suppose you want to make a back up copy of the disk named, "MICRO COURIER".

First, look up MICRO COURIER in the "Programs Listed By Name" section of the list. It says, "MICRO COURIER:MICA#a". This tells us that the protection used on this disk is "MICA#a". Now we look up "MICA" in the "Protections Used By Company" section of the list. This shows that we used the abbreviation "MICA" for the company "MICROCOM INC." (who is the publisher for this disk). Since we know that the protection used is protection "#a"; locate protection #a for this company. Here we find instructions for copying this disk:

a. t22
t0-t23 parm 28=3

HOW TO USE THE INSTRUCTION FOUND IN THE LIST:

To make a back up copy of a program found in the list, you will need to know the coding used:

key: t = TRACK START and/or END
inc inc = INCREMENT TRACK value
parm mode# = PROCESS MODE#
normal = NORMAL; default values (push Return for all prompts)

Here is an example: Let's say you want to copy a program with the instruction
t0-t23

To copy this disk you will need to copy the range of tracks from track "0" through track "23". So, when copying the disk, enter the value "0" when EDD asks you for the START TRACK (it's already preset to "0"), and enter the value "23" when EDD asks for the END TRACK. Since the instructions don't tell you to change anything else, don't. Simply just press Return for all prompts.
Here is an more involved instruction example:

```
t0 parm 28=1
t1-t9 inc 4
tA-t22
```

mode#2 You will notice these instructions use three lines of information. Since there are three lines to this instruction and each line starts with a "t" (track) this means that there are three ranges of tracks to copy on this disk. The first range, "t0 parm 28=1" means that you will need to change the parameter "28" to the value of "1" (see OPTION 2). After the parameter is changed (any parameters that need to be changed for a range of tracks are always changed first), enter a "0" for the START TRACK. Since "t0" (track 0) is the only track specified, you will also need to enter it for the END TRACK. There is no additional information for this range, so just press return for all other prompts. After EDD is done processing track "0", EDD will say "process done". At this point, one range of tracks has been copied. The second range of tracks says, "t1-t9 inc 4". Enter the value "1" for the START TRACK, and a "9" for the END TRACK. When EDD asks you for the INC TRACK value enter a "4". After you copy this second range of tracks, EDD will again say "process done". The third range of tracks, "tA-t22 mode#2" is the last range that needs to be copied. Enter an "A" when EDD asks for the START TRACK, and a "22" for the END TRACK. When EDD asks for the PROCESS MODE, enter a "2" (synchronize tracks mode).

NOTE: You MUST copy the ranges of tracks in the order they are listed. One reason for this is because any parameter that may have been changed for a previously copied range of tracks stays changed for the next range. If the list tells you to "write-protect before running", be sure you put a write-protect sticker on the duplicate disk covering the notch, BEFORE attempting booting that disk! A good rule of thumb is: If an original disk has a write-protect sticker on it, always put a sticker on the duplicate disk before running it. Disk drive speed can be very critical on some disks.

-END-
E10 instead of EDIT 10

The control characters used for editing a line of BASIC code are:

control-A  Shift lock to allow lower case entry
control-B  Move cursor to beginning of line
control-C  Cancel editing of current line
control-D  Delete character under the cursor
control-F  Find next character typed and move cursor to it
control-G  Ring ProDOS bell (different than BEEP)
control-H  Left arrow or backspace function
control-I  Insert character(s) at the cursor
control-L  Change case of character under the cursor
control-M  Carriage return -- end of line edit
control-N  Move cursor to the end of the line being edited
control-O  Set insert mode to insert a special (control) character
control-P  Pack the line -- remove blanks
control-Q  Truncate the line being edited at the cursor, end edit
control-R  Restore line to former (pre-editing) state
control-T  Same as control-Q
control-U  Right arrow or forward space function
control-X  Cancel edit, edit range without changing current line
control-Z  Zap (delete) characters up to next character typed
ESCAPE  Same as control-A

A Few Last Words

Once you use EDIT.Pro I think you'll find it becoming an indispensable part of your hackers toolkit. Everyone that we've sent a copy to has nothing but the highest of praise for the job Ken has done in compiling and creating the latest in "state-of-the-art" utilities for Apple programmers. Val Golding called EDIT.Pro "one of the best utilities I've ever seen for the Apple programmer" -- and we think you'll agree once you've had a chance to put it through it's paces.

If you have any *brief* questions or comments about EDIT.Pro, leave E-mail for me [ 75746,2550 ] and I'll get back to you with an answer. If your question or comment requires some in-depth discussion, *do* *not* leave it as E-mail on this system!!!

Please direct any lengthy questions or comments (or just general BS!) to our bulletin board system in San Diego, Cal. The number is (619) 463-0176 and the password is 'guest'. The ProLine Message System operates 24 hours a day at 300/1200 baud -- except when Morgan or Joe are updating the software. If you would rather correspond in a different manner, please write to us at the address given at the beginning of this message or call us between 9 A.M. and 6 P.M. at (619) 222-6138. Remember we're on the West Coast, and make adjustments as necessary to your calling time...

Thanks for your interest -- hope to hear from you soon!

Jerry Hewett  Living Legends Software
ELIMINATOR SOFTDOCS
BY: DISK WIZARD

ELIMINATOR IS DESIGNED TO OPERATE WITH KEYBOARD, PADDLES, OR JOYSTICK. THE KEYBOARD IS ACTIVE REGARDLESS OF YOUR CHOICE. THIS ALLOWS YOU TO USE THE KEYBOARD WITH THE PADDLES.

KEYBOARD MODE
A - TOGGLES THRUST ON/OFF
S - TOGGLES DIRECTION OF SHIP
D - FIRES MISSILES
-> - MOVES SHIP UP
<- - MOVES SHIP DOWN
SPACE - STOPS SHIP
ESC - PAUSES GAME

PADDLES MODE
PADDLE (0) - SET DIRECTION AND THRUST
BUTTON (0) - FIRE MISSILES
PADDLE (1) - MOVES SHIP UP OR DOWN
BUTTON (1) - OPERATES THRUST

WHEN USING PADDLES, SET PDL(0) TO CENTER AND USE PDL(1) FOR VERTICAL MOVEMENT WHILE USING THE KEYBOARD FOR MISSILES AND DIRECTION. THE ADDITION OF A JOYSTICK WILL PROVIDE FOR MAXIMUM ENJOYMENT AND EASE OF PLAY. YOUR SHIP CAN BE MOVED VERTICALLY, REVERSED HORIZONTALLY BACK AND FORTH, AND THRUSTED WITH MOVEMENT OF THE STICK, REQUIRING ONLY A FREE FINGER TO FIRE MISSILES.

ELIMINATOR HAS FIFTEEN LEVELS OF PLAY. THE SPACE BAR WILL INCREMENT THE STARTING LEVEL AND ANY OTHER KEY WILL START THE GAME. NOTICE THE BLINKING SCORE IN THE CORNER. THIS IS THE BONUS YOU GET FOR COMPLETING THE FIRST LEVEL. AS YOU COMPLETE HIGHER LEVELS YOU WILL BE ALLOWED TO START AT HIGHER LEVELS. HOWEVER, THE MAXIMUM STARTING LEVEL IS FOUR. BONUS SHIPS ARE AWARDED EACH LEVEL IF YOU ELIMINATE ENOUGH ALIENS.

SHIELD TEMPERATURE IS INDICATED BY THE GAUGE AT THE TOP OF THE SCREEN. YOU ARE ALLOWED 16 HITS OF THE SMALL BOMBS EMITTED BY THE ALIENS BEFORE YOUR SHIP IS DESTROYED.

THE BLUE BAR MOVING ACROSS THE TOP OF THE SCREEN INDICATES YOUR TIME IN THE PRESENT LEVEL. THE COMPUTER WILL STOP GENERATING ALIENS WHEN IT REACHES THE FAR RIGHT.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 394 of 1262
Encrypt/Decrypt Information File
------------------------------------------
by Ed Watkeys
November 4th, 1990

Encrypt/Decrypt is an application which allows you to gain fairly good security. It was written in ZBASIC by Zedcor, Inc. Copy this program freely; if you find it useful please send me $10 at:

Ed Watkeys III
1616 Upper State Road
North Wales, PA 19454

By the time you read this, I should be able to be reached on America Online at EdWatkeys. Please send your suggestions.

ED encrypts files in the following manner:

1. Uses the key as random number seed.
2. Takes random numbers and processes them through a third degree polynomial.
3. Uses the bottom eight bits to XOR with a byte of data.

While this is no DES, but it works rather well when you aren't sending war plans or anything of that nature. If your security needs are that pressing, DO NOT USE THIS PROGRAM!

Each byte of the file is processed in the above manner until it is complete. You specify a source and a destination file, which ED reads from and writes to, respectively. The prefix should be set to the folder in which ED is run, because ED needs to find the run-time file(s).

Oh yes, when you enter the key, it should be a 16 bit signed integer (-32768 to 32767, if I remember correctly).

As far as plans for future versions, go, I think it would be nice if the program could encrypt batches of files with the same key, instead of requiring the user to go through the process however many times. Also, if ShrinkIt (the only NuFX program I know of) would include an option for encrypting files or putting some sort of password protection, there would be no use for this program. Unfortunately, the last time I checked, ShrinkIt has about two bytes of memory before it steps on the ProDOS global page, so this could be a problem. Perhaps I'll write a version which will encrypt files inside of a NuFX archive, although I've looked at the NuFX file format file, and it looks pretty imposing.
stations on the bottom row of the screen. Use the right and left cursor arrow keys to select the station you want to work with.

Leaving EOS

If you'd like to continue with the current game at a later time, select SAVE from the Goodies menu, and follow the prompts. (You can only save one game on each Mission Disk.) To leave the program, simply turn off your computer.

-END-

OBJECTIVE: THERE ARE TWO GAMES ON THE ESC DISK. (SPACE FORTRESS & ESC). IN SPACE FORTRESS THE OBJ. IS TO DESTROY THE ATTACKING SHIPS AND ESC TO THE NEXT GAME.

SPACE FORTRESS: (Y) - UP
(G) - LEFT
(J) - RIGHT
(SPACE) - DOWN

THE ABOVE IS FOR KEYBOARD CONTROL.

IF YOU ESCAPE THE SPACE FORTRESS ATTACKS YOUR MISSION IS TO PROTECT THE PLANET ( ESCAPE GAME). PADDLE 0 STEERS SHIP UP AND DOWN. BUTTON 0 FIRES LASER. IF 4 SHIPS PASS YOU AND BOMB THE PLANET, IT WILL EXPLODE AND GAME ENDS.
+++              FATCAT SOFTDOC

by

EVIL EYE                Mr. Floppy

By: John Romero

Fatcat is a disk directory manager from Beagle Brothers. It will make a
text  file  containing all of your floppy’s catalogs. It will work with
both DOS 3.3 and Prodos automatically. The commands for this program
are as follows:

Files needed:

EVIL EYE
EVIL.OBJ

---ommands. At the game demo, pressing a key will put you in keyboard mode, while
pressing a joystick button will put you in joystick mode. Pressing ESC will freeze the game.

To get back to the UpTime main menu, answer Y to the question “Do you really want to
quit? (Y/N):” in the ESC mode. Enjoy!

John Romero, author of EVIL EYE

NEEDED FILES:

EVIL EYE -fast loader
EVIL.OBJ -actual game

These commands assume that you have configured Fatcat to read from drive
two, if you have not, the commands above will always access drive 1. To
change the parameters (drives, 40/80 columns, etc.) just run the program
and when it asks if the current parameters are OK, respond with No and
change the parameters you wish to change. Fatcat will remember the
parameters you used last time so that you will not have to modify them
every time you run Fatcat. The rest of the questions asked by Fatcat
are self explanatory.

NOTE: Do not write protect your Fatcat disk, because Fatcat sometimes
writes to the disk (when running Fatcat at first, when changing
parameters, etc.)
Creatures of Western Middle-earth

Typed: Otay and Beowulf

AN OBSERVER'S GUIDE

DWARVES: A long-lived race of valiant warrior/craftsmen. Dwarves and elves harbor a deep and abiding dislike of one another, due to an unfortunate history of mutual competition and mistrust.

ELVES: An ancient noble race if immortal folk. Elves are fair to the eye, and wise beyond human understanding.

HOBBITS: A race of cheerful, strong-willed folk who chiefly inhabit the Shire. Shorter than dwarves, and lacking the latter’s over-developed musculature, hobbits are quite nimble and dexterous. Most hobbits cannot swim (Merry is an exception). Of all the party, Pippin is the most agile, Sam the most sturdy, and Frodo the smartest. Sam, being Frodo’s devoted friend and retainer, will always attempt to stay by his side.

MEN: Many different nations of men inhabit Middle-earth. The inhabitants of some, such as Rohan and Gondor, are implacable foes of the Dark Lord. Others, such as Umbar and Harad, aid Sauron with troops, war elephants, and gold.

ORCS: Orcs (or goblins, as hobbits call them) are the soldiers of the Dark Lord. They are powerful, stooped and twisted creatures, with long arms, hairy knuckles, and muzzles crammed with far too many teeth. Orcs hate sunlight, except for Uruk-hai, a new, more powerful breed recently spawned in the pits of Mordor.

TROLLS: Trolls are huge, flinty creatures; they have lumpen minds and brutal instincts and serve the cause of evil. They turn to stone when struck by daylight. In recent years, the Olog-hai - a wittier, more agile version of the troll that can withstand sunlight - have appeared on the scene. Observers report that they are similar in appearance to enormous, black Orcs of unusual ugliness.

WARGS and WOLVES: The wolves of the wildlands are particularly large and ferocious, and are frequently misnamed “Wargs.” Wargs proper are werewolf-phantasms which only assume their real (and deadly) shapes after darkness has fallen. Sunlight nullifies their power.

WIZARDS: A mysterious race of magicians who first appeared in Middle-earth several millenia ago.

END
SARUMAN: Saruman the White is the chief of the Order of Wizards, and the most accomplished of the Middle-earth's wizards. He presides over the White Council, the defense committee of the forces of good.

SAURON: The Dark Lord, Sauron is the embodiment of evil in Middle-earth. Once thought to have been destroyed during the wars against him in the Second Age, Sauron has risen again and seeks to recover his Ring of Power, which will give him the ability to vanquish the weakened forces of good and enslave right thinking people everywhere.

SHIRE: The Shire is the area between the Brandywine River and the Tower Hills which the hobbits have made their own. It is a peaceful land of small rivers, gentle woodlands, and well-tended fields.

- END -
In the middle years of the Second Age of Middle-earth, Sauron the Great, master of the evil realm of Mordor, beguiled the great Elvin Smith Celeborn of Eregion to teach him the craft of making Rings of Power. Three rings were made to grant the Elvish lords their powers of wisdom and magic. The Three Ringwraiths, and Celeborn labored together to create the Seven and the Nine, which were given to the great lords of Middle-earth. Unknown to Celeborn, Sauron had betrayed him. Deep within the bowels of Mount Doom, Sauron constructed the Ringing Rule, a ring that could enslave the wearers of other rings to him forever. So powerful was the spell that Sauron bound much of his power into it, forever linking his fate with that of the ring. When Celeborn realized that Sauron had betrayed him, he hid the Three Elvin-rings from him. Over the ages, the Dwarves eventually destroyed by the Dragons, but their wearers were even so brought into all-consuming greed and folly before they fell. The Nine-Mortal Lords "faded" from use of the rings and became the Nine-Ninetails, forever enslaved in Sauron’s will. A bitter war took place, with the prize being the fate of Middle-earth. At last Sauron was overthrown, and the ring was cut from his finger by the human King Isildur.

Isildur was in turn slain by orcs in an ambush many years later, the ring slipping from his finger as he tried to swim across a river to safety.

Several millennia later, the ring was plucked from the river by a hobbitlike creature named Deagol. Deagol was tricked into giving up the ring by Smeagol, a skulking character, who saw the ring and coveted it. Smeagol was soon corrupted by the ring and eventually fled with his prize to the heart of Misty Mountains. There he hid himself in the darkness, and became to be known as Gollum. The ring sustained his life force for many dark centuries before it sensed its master stirring once again.

Many years ago, Bilbo Baggins found the ring in a goblin's den, where it lay hidden. Bilbo was a hoarder of things, and was enchanted by the ring's dark history. The servants of the enemy even now are seeking the One Ring, and the hobbit Baggins who possesses it.

Gandalf tells you to take the ring to Rivendell, far to the east, and there see the wizard Gandalf, who will advise you on what to do to protect yourself and your companions. As the Enemy is watching the roads he advises you to travel by circuitous routes, and to adopt a pseudonym for the time being.

To aid you in your quest are your three hobbit companions: Merry, Sam, and Pippin joining you at the Bag End, your comfortable home in Hobbiton-on-the-Hill. Merry awaits the group at the house in Crickhollow to the east of Hobbiton, by the western bank of the Brandywine river.

A quality inherent in the ring is that it makes the wearer invisible to all but the most powerful creatures. Gandalf has warned you not to make use of the ring yourself, lest you also "fade" and become a Ringwraith. Gandalf will aid you as much as he can, but he has many other problems besides to perform to make the passage to Rivendell as safe as possible for you. For all intents and purposes you are on your own.

COMMUNICATING WITH THE PROGRAM

The Fellowship of the Ring includes a very sophisticated communications program called Inglish. Inglish will allow you to enter commands and converse with other characters in familiar sentences. Those of you who have played the Hobbit Adventure will find that the Inglish language has been enhanced in this program. More details are given later about the power of Inglish, but the important thing is that you can enter your commands in simple, everyday language, instead of computer terminology.

The Fellowship of the Ring has a very large vocabulary, so you should have little difficulty expressing your ideas and commands. Commands will usually take the form of actions, and this guide contains a special abreviated list of some of the actions you can use. The list, however, includes only some of the most common commands and words; the program actually knows over eight hundred words, and hundreds of these are available to you in playing the game. The best thing to do is to try a word. The computer will tell you if it does not know it. In some cases, if the computer does not understand your command, it will ask for a clarification.

THE SCREEN DISPLAY

The Fellowship Adventure screen is divided into two windows: the description window and the communications window. The adventure descriptions—the text that describes your surroundings and the activities around you—appear in the description window at the top of the screen. Whenever you enter a new location, the computer will give you a full description of the area, the objects that are in plain sight, and a list of exits that are visible.

The second time you enter a location, the computer will give you only a brief description of the location. If you wish to obtain a more complete description, simply enter the command, LOOK, and the computer will reply with the lengthy text.

The description window is also the area where the location graphics appear. A picture will appear many adventure times you enter a location, each time you use the LOOK command. The graphics provide you with pictures of the immediate location, though no characters will be pictured. These are left to your imagination.

Below the adventure script, and arrow indicates the communications window, or the space in which you type in the actions you wish to perform. These action commands will appear on the screen in capital letters.

Once you have type in and entered your commands, the computer will perform them and otherwise acknowledge your action, or inform you that it does not understand the command. Once the computer has acknowledged an entry, it will print any new text that results from your actions, and then indicate that it is ready to receive a new command.

ROLES YOU CAN PLAY

One of the most fascinating features of the Fellowship of the Ring is that it offers you the opportunity to play any one of seven roles within the game, and even switch roles while playing. This not only allows you to be "X" hobbit characters throughout the game, but it also allows up to four people to play the game simultaneously.

SINGLE-PLAYER GAME

When you first load the Fellowship Adventure one of the questions you will be asked is:

WHICH HOBBIT CHARACTERS DO YOU WISH TO PLAY?

Frodo, Merry, Pippin, or Sam?

At this point you will chose all of the characters you might like to be
during that session of play. If you are playing for the first time, it
is a good idea to choose only the role of Frodo. The first character you
enter is the first character you will "be" in the game.

Whenever you chose to play just one character, the computer will take
control of the other three characters and ensure that their actions are
in keeping with their personalities. It also means that whenever you
wish these characters to perform specific actions for you, you will need
to instruct them by talking to them directly, using the SAY TO command
(see the section of the English language).

When you play more than one character, the computer will look after the
characters you are not controlling at the moment, but only in situations
where you have not instructed them to do anything for a while, or when
the entire party moves somewhere else. This means that you will need to
instruct each character much more carefully than if you had chosen only
one character for the same session.

When you are ready to change characters, simply enter the command:

BECOME (name)

and you will be playing as that character. You may also change
characters by entering:

I AM (name)
or omit either command and simply enter the name of the character you
wish to become, as in:

PIPPIN

Once you have changed characters, it is a good idea to enter the LOOK
command, since you may very well find yourself in a different place and
situation.

MULTIPLE-PLAYER GAMES

The easiest way to play with more than one character is with a friend or
three, each of you controlling one of the hobbits. In this way, you can
help each other throughout the adventure, and the human interactions on
top of the computer will make the game that much more fun.

The initial selection of characters and the commands to change
characters are the same for a multiple player game as for a single
player game. You select all the characters you want to play at the very
beginning of the game. To change characters use the BECOME or I AM
commands, or simply enter the name. By using these commands, you and
your friends can "take turns" playing the different characters you have
selected.

THE INGLISH VOCABULARY

Included here is a list of actions you can use when playing The
Fellowship of the Ring. Please note that this does not include the
"magic words," or special verbs for actions that can be used only in
certain areas and at certain times. Finding out what these words are
and how to use them is all part of the fun of the game. Remember that
this is only an abbreviated vocabulary list. You can always try a new
word to see if the program will understand it.

MOVEMENTS

North (N)    Northeast (NE)    Northwest (NW)
South (S)    Southeast (SE)    Southwest (SW)

QUIT

-END PART 1 OF 2-
RULES OF INGLISH

Inglish is a very sophisticated language-recognition program developed especially for micro-computers. It allows you to communicate with the program in a language and a structure familiar to you.

The rules of Inglish are simple. The main thing to keep in mind is that each instruction must be in the form of verb + noun where the noun (or pronoun) is explicit or implied. Each sentence must have a verb.

You can use punctuation to separate sentences. Use commas and periods as you normally would. The only limitation on commands is that they should not be more than 128 characters long.

The following are some examples of the way Inglish sentences can be constructed. Note, however, that the specific example shown may not be valid in this adventure.

When an action does not directly relate to an object, only a verb is necessary.

WAIT
RUN

This is also the case if you simply wish to travel in a particular direction.

SOUTH OR S
EAST OR E

If the action relates to an object or a character, it must be identified by a noun. Inglish grammar applies, any order of different parts of a sentence is usually not critically as in:

WEAR THE RING
GO THROUGH THE DOOR
DROP THE ROPE ONTO THE TABLE

Adjectives must precede the nouns they describe. If it sounds in English, it's probably good Inglish.

THROUGH THE HEAVY AXE AT THE HORRIBLE ORC
LIGHT THE WOOD PIPE WITH THE MATCH

Commands you give the computer must be specific and unambiguous. If there are two doors in a room, one red and one green, and you were to say:

GO THROUGH THE DOOR

The computer is placed in a quandary as to which door to put you through. In such situations, the program will put you through the first door it finds, which may not be the door you intended.

In this case, it would be better to specify exactly which door you mean.

GO THROUGH THE GREEN DOOR

The meaning of many verbs can be altered by the use of prepositions, such as:

ON, OFF, ONTO, and so on. Examples of Inglish sentences are:

ATTACK WITH THE SWORD
PICK UP THE RING

In Inglish, prepositions usually go before the noun, but in some cases it sounds more natural to put them after the noun, such as:

TURN THE LIGHT ON
PICK THE GOLD UP

Prepositions can also be used to specify the position of an object, or where you wish an action to be performed, such as:

PUT THE GOLD INTO THE BAG
TAKE THE PIPE FROM THE BOX

If the action relates to an object or a character, it must be identified by a noun. Inglish grammar applies, any order of different parts of a sentence is usually not critically as in:

WEAR THE RING KILL GREEN WITH SWORD

GO THROUGH THE DOOR

Each of the commands will be carried out by the computer in the order in which they are listed.

SPECIAL COMMANDS

In addition to the extensive Inglish vocabulary, there are few commands specific to the Fellowship of the Ring. The following is a list of these special commands.

LOOK (which can be abbreviated to L) lets you see where you are, and all...
that can be seen at a particular location, and all possible exits. This command should also be used after you take over the role of another character at another location (that is, after you use the BECOME command).

INVENTORY (which can be abbreviated to I) gives a full description of all inventory you are currently holding or carrying.

EXAMINE is a standard English word, but special mention of it is made here because it is also very useful when trying to obtain more information about your surroundings in Middle-earth. Examining objects also reveals information about those objects that is not readily apparent from a brief look.

SAVE allows you to save the game for play at a later time.

LOAD loads a previously saved game. After loading, play continues from the point where the game was saved.

SCORE tells you what your percentage of play is.

PAUSE suspends the game until you press another key.

PRINT allows you to send text of the adventure to your printer and to the screen. This instruction will not result in a mass exodus to the treetops by all members of your party within earshot. Only Sam will climb the tree. If you leave without instructing him and he can still see you, Sam will follow you and perhaps eventually, catch up with you.

QUIT stops the game and returns you to the beginning.

OTHERS

SAY TO (name) "(sentence)"

As in:

SAY TO GANDALF "HELLO"

Saying hello is usually enough to draw most characters into conversation.

You can ask the characters within earshot to perform specific commands that are of use to you, such as:

SAY TO GANDALF "KILL THE ORC WITH THE SWORD"

SAY TO PIPPIN "TAKE THE GOLD FROM THE ORC"

It is not necessary to use the full form of:

SAY TO (name). You can just use the name of the character you wish to speak to, followed by the message, such as:

PIPPIN "GIVE THE GOLD TO ME"

Of course, because all the other characters act independently there is not guarantee that they will do as you ask. Their decision will be based on a number of factors, including their allegiance to you, what they are currently doing, and so on.

A few of the characters you encounter will have messages they will deliver only when you identify yourself or ask certain questions.

To solve some of the problems you will face in The Fellowship of the Ring, you will need to cooperate with other members of your party. Thus you will need to become familiar with the SAY TO command. Remember, too, that each character has its own limitations, such as degree of strength, and so on.

COOPERATING

In the Fellowship of the Ring you must lead a group of Hobbits through perilous situations. It will be necessary to tell other characters, including members of your own group, what you would like them to do in given situations.

Be warned, that, in order to succeed, certain actions must be performed by certain characters. Thus you will need to become familiar with the varied talents of each member of your party.

Since you will often be in a group, it is comforting to know that it is not necessary to instruct each and every character on what he should be doing every moment. Most will follow your lead without any prompting. It is also possible to instruct characters to perform actions that will exclude the rest of the party, as in:

SAY TO SAM "CLIMB THE TREE"

This instruction will not result in a mass exodus to the treetops by all members of your party within earshot. Only Sam will climb the tree. If you leave without instructing him and he can still see you, Sam will follow you and perhaps eventually, catch up with you.

You can speak directly to any character and ask him to perform an action involving another character, as in:

SAY TO PIPPIN "GIVE ROPE TO FRODO"

Friends and members of your party are more likely to respond favorably than strangers, unfriendly creatures, or followers of Sauron. But even friends may say no from time to time.

Besides following your lead, most members of your party will come to your defense if you are attacked by enemies. There is no cosmic law that stops you from ruthlessly attacking a member of your own party. Do not be too surprised, however, if the other members of the party are a little cooler toward you afterward.

You can talk to yourself, but the result is not going to be impressive. Suicide is quite possible, as long as you name your character as in any other attack. You could say (while playing the part of Frodo)

KILL FRODO WITH AXE

In all probability, the result will be something like: "You attack you with the axe. With one well placed blow, you split your skull." If you find this an attractive alternative, then by all means be our guest.

The Fellowship of the Ring allows you another method of instructing the hobbits in your party using the BECOME command you can take over another character for a short time. (It is recommended that you become familiar with the adventure from a single player point of view before tackling the multi-character game). You can say:

BECOME PIPPIN

This technique can be used whenever a player wishes to put a character through a series of complex actions, or react to ongoing situations that will confront the character. This is a useful means of conducting operations without endangering the Ring, or for controlling the party if you want the hobbits to split up and go separate ways.
Remember that you can only become one of the four hobbit characters you selected at the beginning of the game; for example, if you enter FRODO, you can only become FRODO. If you enter FRODO, SAM, MERRY, you can not become PIPPIN.

Note: The Original copy of The Fellowship of the Rings comes with a copy of J.R.R. Tolkien’s The Lord of the Rings (partly for reference).

GENERAL CONCEPTS

During the adventure, you will encounter many objects. Some are useable as weapons, others are intended as food or drink, still others are used as containers in which to carry things. In Middle-earth, liquids behave as they do in our world: they cannot be carried without a container. Also, a character cannot lift too heavy an object or carry too great a load.

Most containers must be opened in order to reach their contents. Once a container is opened, you may look into it or take out the objects in it. Once the objects inside a container have been exposed, they may be used. Some containers may be transparent, allowing you to see the contents without opening the container itself.

Some doors are locked. This means that you need either a key or magic to unlock them, or that someone on the other side of the door must open the door for you.

FINDING YOUR WAY AROUND

Their are 10 possible directions of travel: NORTH, SOUTH, EAST WEST, NORTHEAST, SOUTHEAST, NORTHWEST, SOUTHWEST, UP, AND DOWN. You can also abbreviate directions for each word.

PASSING THROUGH THE PORTALS

If you want to go through a portal, such as a door or a window, it is quite possible to say so directly, as in:

GO THOUGH GREEN DOOR

When you first enter a location and are given the full text description, all visible doors will be mentioned. However, on a second visit to the location, the brief description may not include all doorways, but only mention objects that can be seen in the immediate area. This doesn’t mean that the doors or portals have disappeared, you can always get the full description by typing look or L.

FOLLOWING

If a character you have an interest in leaves an area, you may wish to follow him or her. For instance, if Strider suddenly said that he was going to leave, you might decide to:

FOLLOW STRIDER

LIGHT AND DARK

In some areas, there will be no natural light. Unless you have the means to create light – such as matches and a candle – you will receive no description of the area in darkness. Once a light has been struck, you will be able to see.

If you choose to travel in darkness, you may avoid meeting some unwanted characters. Remember, however, that orcs can see perfectly well in the dark.

MAPPING THE ADVENTURE

You should keep a map of your travels to assist you in finding your way. However, even your own carefully constructed maps cannot be entirely relied upon. Some locations can be revisited in a straightforward manner. With others, the direction you traveled to get from Point A to Point B may not be the opposite of the direction you must travel to get from Point B to Point A. For this reason, you would be wise to construct a grid listing locations you have already entered and directions you used to get to them from other locations.

COMBAT

Hobbits are poor fighters, albeit brave, but can often surprise even themselves by their abilities in one-on-one combat. (Don’t let this give you any false confidence, however.) To attack an opponent, you must tell the computer that you wish to KILL it with a specific weapon, such as:

KILL WOLF WITH SWORD

If you do not specify a weapon, the program will assume that you wish to ATTACK with your bare hands. This is never a good idea.

It is not possible to attack inanimate objects. They must be BROKEN.

No matter how well you arm them, be wary of throwing hobbits into the midst of a gory battle. Being rather slight little creatures, they have a tendency to die with spectacular suddenness.

Persistence in combat is rewarded, but be careful: Most opponents hit back, and an already-wounded character is much more susceptible to being killed than a healthy one.

Some weapons (like axes) can be thrown at an opponent. This removes the weapon from your character, and drops it into the area in which you stand. If you throw your only armament, you will, of course, become unarmed, and unfortunate situation.

CARRYING ITEMS

During the course of play, you will have to pick up and carry inanimate objects. Once you have found and item, simply TAKE the item in order to pick it up and carry it, as in:

TAKE ROPE

To check in equipment you are already carrying, take inventory or INVENTORY or I. If you do not want the item you have picked up, you are carrying too much at once, or you already have a rope, you can say:

DROP ROPE

As an alternative, you may give the item to another member of the party, as in:

GIVE ROPE TO SAM

Some objects not only add weight to your burden, they increase your effective size. This can be troublesome if you intend to go through a small door or tunnel, so beware of adopting the pack rat syndrome.

FATIGUE, WOUNDS, AND EATING

All characters are rated for strength and stamina. During the game these characteristics may suffer due to combat fatigue, wounds or simple weariness.

As a character is wounded, its strength ebbs, and its hold on life grows more tenuous. And, as time passes, a character becomes more and more...
tired as energy is used up. Highly strenuous activities, such as combat, may exhaust it even more.

The best remedy for depleted strength or stamina is a good meal and some rest. In your travels, you may encounter skilled healers and magical herbs that cure fatigue and damage. Needless to say, these items are rare.

REAL TIME

In Middle-earth a wandering party might encounter a variety of characters. Some are friends, some are foes, but many simply ARE. Such characters live lives of their own, traveling about the lands attending to their own affairs. If a character you meet does not fall over himself to help you, try being patient. Just say hello, or try waiting until he notices you.

Remember, while you and your band of hobbits are busy saving Middle-earth from the terror of Sauron the Great, other creatures and characters are busy with their own lives and adventures. As time goes on and things change for you, so they change for Middle-earth. Things may not be as they were when you return to a particular location.

A FINAL WORD

The best hints for playing the Fellowship of the Ring can be gained through reading the book. Otherwise, the only real hints that can be given here are these:

Be careful. If you race through the game, you will only limit your enjoyment of it, but will fail to pick up valuable details that might come in handy later on in the game.

Be smart. Hobbits are neither wise, strong, nor magical. If you are going to get anywhere, you will have to use your wits.

Don't be scared to try risky actions. If you take no risks, you will find no rewards. In other words, "Nothing ventured, nothing gained." And keep a good pair of running shoes handy.

You're on your own!

END PART 2 OF 2-
Apple II Computer Info

The Other Stuff:
---------------------------------------

When the program boots, there is a very loud "static screen." If you would like to prevent the static from blowing your eardrums out, hold down the Open-Apple key until you see the screen.

To skip or terminate the opening title sequence, press the <spacebar>.

This program was developed under System Disk 5.0 running on a 1.75 meg GS. I have no idea how much memory this game requires, but it will probably run on a 512K GS. If it doesn't, then try booting it from Prodos16 V1.6. If this still does not work, then get more memory.

To contact either Brian or Dave, here is some info:

The Support:
---------------------------------------

* Pangea Software now has its own section on America Online in the Direct Connect section. Visit us there for talk about this and all of our other games including the critically acclaimed XENOCIDE!

* B&D Productions also has a support BBS where you can talk to us and download our other products. Call (916)894-0483 over at Dave's place.

We are always looking for new game ideas, so feel free to send us your ideas.

The Disclaimer:
---------------------------------------

* The characters and events portrayed in this game are fictitious and are not based on anyone, living or dead.

* Yes, this game does contain some material which may be offensive to some viewers, but even the most prude of humans should be able to take a joke which is exactly what this program is... a JOKE!!! HAHAAHAHAHA!!! So if you are a prude, don't give us a hard time or call us Sadists. Just laugh and enjoy it. This game is an amalgam of ideas that OTHER people gave to us, so blame them if you want to get all upset about a harmless joke.

P.S. If for some strange reason you don't like this game, just ask yourself one question: How much did you pay for it, eh?

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION file.a.trix.doc

File-A-Trix
---------------------------------------

File-A-Trix is a file-utility Classic Desk Accessory (CDA) for the Apple IIgs. It allows you to perform various operations on files and disks without leaving whatever application you happen to be working in. Because it is a CDA, you can use File-A-Trix from within virtually ALL applications, desktop or text-based, GS/OS or ProDOS 8.

File-A-Trix can perform the following operations (or "Trix"):
+ Catalog any online disk, showing the contents of any folder
+ Copy files from one disk or folder to another
+ Move files -- i.e., copy and then delete the original
+ Delete files
+ Lock and unlock files, or change their type or auhtype
+ Rename files
+ Create a new folder
+ View or print text files, and the text content of other files
+ Find a file on a disk, using its name or partial name
+ Initialize (format) 3.5" disks

File-A-Trix is freeware. You are welcome to keep it, use it, and to distribute it freely to anyone. Don't expect much in the way of user support, however. No further updates to File-A-Trix are planned.

New Stuff
---------------------------------------

For those familiar with earlier versions of File-A-Trix, here is a list of the features added since version 1.0:

1.01: Manual path entry under GS/OS allows "/" as a separator. First-letter keypress file selection now cycles around to the start of file list. The number of volumes File-A-Trix can display is no longer limited to ten. "View" now displays the name of the file being viewed, shows percentage position in the file, allows viewing of any type of file, jumps to start of the file being viewed with OpenApple-1, and allows printing of files.

1.02: Fixes some problems with copying Macintosh files on HFS disks, and with accessing over a network. Other minor bug fixes and changes.

1.03: Fixes a problem causing incomplete disk names when doing a "Volumes" under ProDOS 8.

1.1: Move function added. Find File function added. Set Preferences function added. Files being viewed can now be searched for occurrences of a word or phrase. Prefix numbers can be used when manually entering a path under GS/OS. OpenApple-X exchanges prefixes after copying, moving, or finding. OpenApple-A selects all files in current folder. OpenApple-l shows additional info on highlighted file in file dialogs. <Clear> key clears input when entering path for renaming, etc.

1.1.1: Fixes a bug in Find File that sometimes appears under ProDOS 8.

Installing File-A-Trix:
---------------------------------------

As with all CDAs, File-A-Trix is installed by copying it to the System:Desk.Accs folder of your startup disk, and restarting your computer. File-A-Trix requires System 5.0 or later. (Note to beginners: to access the CDAs installed in your system, press OpenApple, <control> and <esc> simultaneously.)

Using File-A-Trix:
---------------------------------------

I've tried to design File-A-Trix to be as easy to use as possible. For the most part, the use of File-A-Trix should be pretty self-evident from the on-screen prompts. You should read these instructions, however, to avoid any confusion. In this section I'll go over each of the available functions in turn.

File-A-Trix's opening screen shows its main menu, listing the functions available (Catalog, Delete, etc.). Highlight the function you want by using the up/down arrow keys, or pressing a letter key, then press <return>.
In most of File-A-Trix's functions, a text based file-selection dialog is used. Instead of clicking mouse buttons, the keyboard is used to navigate with this dialog. If you are in the file dialog note, you can hold down the space bar to bypass the delay. Locked files must be unlocked before each file is deleted to allow you to cancel the operation by pressing <return>. If you are deleting several files and want to speed up the process, you can hold down the space bar to bypass the delay. Locked files must be unlocked before they can be deleted, and folders must be empty before deleting. Because of limitations to ProDOS 8 (see below) extended GS/OS files can't be deleted under ProDOS 8.

Lock/Unlock, Set Attributes

Most users will probably only be interested in the lock/unlock portion of this function. The "Set Attributes" portion allows you to change the type and auxtype of files; this is more for the "power user". To perform either operation, first select the files you want to modify, and then press <return>. Each selected file will then be presented, and you will be allowed to lock or unlock it and/or to enter a new type and/or auxtype for it. After making these modifications to a file, pressing <return> will save the changes to disk and proceed to the next selected file.

Rename

Allows you to rename files. As usual, select the files you want to rename, and press <return>. Each selected file will then be presented, and you will be prompted for a new name. Press <return> and the new name will be written to disk, and File-A-Trix will proceed to the next selected file. Extended GS/OS files can't be renamed under ProDOS 8.

Create New Folder

With this function, the file dialog will prompt you to select a location for the new folder. As when you are selecting a destination folder for copied files, only folder files will be listed, with the words "Select Current Folder" at the top of the list. When you have navigated to the disk and folder you want, press <return> with "Select Current Folder" highlighted, and you will be prompted for a name for the new folder. Enter this, press <return>, and the folder will be created.

View Text File

This File-A-Trix function allows you to display ASCII text files (type TXT), source code files (SRC), and AppleWorks word processing files (AWP). When you use File-A-Trix under GS/OS, you can also view Teach files (type GWP). Teach files can't be viewed under ProDOS 8 because they are extended GS/OS files, and can't be opened by File-A-Trix.

View behaves a little differently from the other File-A-Trix functions, most notably in the fact that you can only select a single file at a time for viewing. When you select a new Text File from the main menu, the file dialog will only show the searched-for text will be highlighted. This search is not case sensitive; entering "Cat" will also find "cat" and "CAT".

As another prompt button mentions, you can also print a text file from the View function by pressing OpenApple-P. When you do this, the text will be sent to your connected printer port. A printing in progress can be canceled by pressing OpenApple-period or <esc>.

As is noted by yet another prompt button, you can find any occurrences of a word or phrase in the text you want to find. Enter this and File-A-Trix will scan through the file. If and when the text is found, the scan will stop at that page and the search-for text will be highlighted. This search is not case sensitive; entering "Cat" will also find "cat" and "CAT".

This function is the same as Copy, except that after copying a file, the original file will be deleted. If you are deleting several files and want to speed up the process, you can hold down the space bar to bypass the delay. Locked files must be unlocked before they can be deleted, and folders must be empty before deleting. Because of

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

While entering the filename, you also select whether you want File-A-Trix to find files that match with, or include the text you type in. This selection is made by using the up/down arrow keys to highlight "matches", "starts with" or "includes" in the text-entry prompt. After you enter the text to search for, File-A-Trix will scan the folder in which you selected. If a match is found, the contents of the folder the matching file is in will be displayed, and the matching file will be highlighted. At this point you can navigate around the disk as if you were doing an ordinary "Catalog" function with File-A-Trix. You can also continue the search by pressing OpenApple-X (as a prompt button notes) to find any other matching files. The search will be resumed from wherever the highlight bar is when you press OpenApple-F. A disk search in progress can be canceled by pressing (and holding for a moment) OpenApple-period or <esc>.

After successfully finding a file, File-A-Trix's other functions (Copy, Delete, etc.) will initially open the folder containing the found file. If more than one matching file was found (via OpenApple-F to find again), then you can switch back to the folder in which the previous matching file was found by pressing OpenApple-X in any function's file dialog.

**Initialize 3.5" Disk**

Initializes, or formats, 800K 3.5 inch disks. First you are asked to select a drive, and then to enter a name for the new volume. If GS/OS is active and you have the HFS FST (available with System 6.0 and later) installed, you will be given the option of initializing the disk as an HFS volume.

**Set Preferences**

The final item in the main menu is Set Preferences. This allows you to customize certain aspects of File-A-Trix's behavior. The procedure for changing preferences is clear from the on-screen prompts: The up/down arrow keys select an item in the preferences list, and the left/right arrow keys modify the selected preference. Preferences are set in the "main menu" when you exit from the function and keep the preferences you've entered, but they will not be saved to disk. <Return> also exits, saving the new settings to disk so they will be the same the next time you boot your computer. To ensure that your preferences are indeed saved to disk, use the Finder's (or another launcher's) "shut down" procedure before turning off your Ilgs. Here is a list of the preferences you can set:

- **Automatic**. When this item is set to "on", pressing a letter key under File-A-Trix's main menu will send you directly to the function corresponding to that letter. With the default, "off" setting you press a letter key and then <return>.
- **Hot keys in Main Menu**. With this set to "on", the highlight bar will automatically scroll to the next field after you select a file with <space>.
- **Delay between deletes**. As mentioned above, File-A-Trix normally pauses briefly between files when deleting several files at once. You can bypass this delay by setting this preference to "off", or by holding down the space bar during the delete process.
- **Default in Find File**. This controls whether the default option in the Find File function is "matches", "starts with" or "includes".

**Limitations, etc.**

There are two types of limitations that may effect your use of File-A-Trix:

- **Limitations of File-A-Trix itself**, and limitations of ProDOS 8. The former are unlikely to be significant, and the latter are only a factor when you use File-A-Trix from within a ProDOS 8 application.

**File-A-Trix Limitations**

File-A-Trix will not show more than 255 files in a folder. If you have more files than that in a folder, only the first 255 will be listed. You should manage your folders better than that.

When selecting files for any of the functions that require selecting, a maximum of 100 files can be selected at once.
WHAT IS A GRAFILE? A GRAFILE IS A BINARY FILE WHICH HOLDS ALL OF THE
EXTENDED SCREENS THAT YOU WILL BE WRITING ON. THE GRAFILE MUST BE MADE BEFORE
YOU START WRITING ON THE SCREEN. ONCE MADE, THE GRAFILE RECORDS INFORMATION
each time you go off the screen you are drawing on and then gives you more
room, until you are out of it.

FIRST, CHOOSE THE "G" COMMAND FROM THE MAIN MENU AND GO TO THE GRAPHIC
WRITER SECTION. ONCE THERE, YOU SHOULD LOAD YOUR FONT THAT YOU WISH TO USE ON
THE GRAFILE. IF YOU DON'T KNOW WHAT FONT YOU WANT TO USE, JUST HIT THE "D"
COMMAND AND CATALOG THE DISK. ONCE YOU'VE FOUND THE FONT YOU WANT TO LOAD,
JUST LOAD IT BY HITTING THE "F" COMMAND AND TYPE IN THE FILE NAME, WITHOUT THE
"SET" PART, IT LOADS THAT AUTOMATICALLY.

NEXT, YOU NEED TO OPEN THE GRAFILE. DEPENDING ON THE SIZE YOU WISH TO OPEN
IT AS, YOU WILL NEED, ROOM ON ANOTHER DISK FOR IT. IT'S A GOOD IDEA TO HAVE A
DISK COMPLETELY FOR GRAFILES. ANYWAYS, CHOOSE THE "O" COMMAND AND ENTER THE
HORIZONTAL AND VERTICAL SECTORS (A TABLE FOR DIFFERENT SECTORS ARE AT THE END
OF THIS SECTION). THE DISK WILL WHIR FOR A WHILE AND THEN, THE GRAFILE WILL BE
MADE.

NEXT, CHOOSE THE "W" COMMAND AND MAKE SURE THE GRAFILE DISK IS IN THE DRIVE.
YOU WILL NOW BE PROMPTED IN FRONT OF A BUNCH OF COMMANDS, THESE ARE THE HELP
COMMANDS, AND CAN BE DISPLAYED AT ANYTIME BY HITTING <CTRL-A>. NOW YOU CAN
TYPE WHATEVER YOU WANT, AND WHEN YOU ARE READY TO CLOSE THE GRAFILE, JUST TYPE
<CTRL-Q> AND THEN YOU WILL BE BACK AT THE MENU.

NOW, TYPE "C" FOR CLOSE AND THE GRAFILE WILL BE CLOSED. YOU CAN NOW GO TO
THE DUMP SECTION AND PRINT OUT YOUR GRAFILE. IN THAT SECTION ALL YOU HAVE TO
DO IS INPUT THE NAME OF THE GRAFILE AND THEN TRUE MAKE SURE YOUR PRINTER IS ON.

HORIZONTAL & VERTICAL SECTORS

HORIZONTAL SECTORS FOR A REGULAR 80 COLUMN PIECE OF PAPER IS 16.
MINIMUM HORIZONTAL SECTORS IS 5.
MAXIMUM HORIZONTAL SECTORS IS 20.

MINIMUM VERTICAL SECTORS IS 6.
MAXIMUM VERTICAL SECTORS IS 20.

GRAPHIC WRITER COMMAND CONTROL KEYS

CTRL - A = ASK FOR HELP (DISPLAYS SCREEN)
CTRL - B = SET BACKGROUND COLOR (CTRL-B + #)
CTRL - C = CAPS LOCK & UNLOCK
CTRL - D = DEFAULT WINDOW (RESELECTS WINDOW TO FULL SCREEN)
CTRL - E = ERASE WINDOW
CTRL - F = SET FOREGROUND COLOR (CTRL-F + #)
CTRL - G = GRAPHIC INPUT SELECTS CURRENT GRAPHIC INPUT DEVICE
CTRL - H = BACKSPACE

How About A Nice Game of Chess
By Larry Atkin

*** Softdocs by Buffalo Bill ***

How about a nice game of Chess is very similar to Odesta Chess 7.0 except that it is designed for the beginner and has a 6 chapter tutorial that teaches you the basics of chess. The game itself will play up to 10 levels of difficulty (0-9).

The game is designed to operate in the Apple //c or //e with 64 k and a mouse if you have one, if you don't then you can use a paddle or the cursor keys to move about the menu and the board.

The screen contains a chess board, a menu to the right and along the bottom and 2 status lines at the bottom left. When you first boot, the program goes through an intro which you can terminate by pressing the space bar or the return key.

To use the menu, move the cursor to your selection and then press return or the appropriate paddle button or mouse button,

The main menu is as follows:

Flip
Switches white and black on the board at any time, during or before play.

Change
Allows you to change a piece for another piece or clear the board and set up your own situation.

Level
Change level of play (degree of difficulty).

List
Show moves in standard chess notation.

Inward
This feature will show what chess pieces are affecting any specific square (attacking or defending). To use this feature, move the square white cursor to the square you are interested in using the appropriate device and then press return or the paddle or mouse button.

Outward
Shows which squares or pieces are affected (attacked or defended) by the piece in question. Used the same way as inward.

<--Board
Allows you to begin a game by moving to the chessboard and selecting and moving a piece.

Manual
Computer will not move, allowing 2 players to play against each other.

Switch
Computer will switch sides.

Auto
Computer will play itself. You will be able to select the level of play for the other side also.

Restart
Sets up Board for a new game

Quit
Just what it says.

Tutor
Takes you to the chapter menu at the bottom of the screen so that you can go through the tutorial chapters

Conditional Features.

Advice
Chess will suggest a move for you.

Option
Allows you to return to board from menu in order to continue play.

Back
Take move back, try again.

Replay
Shows a replay of a move that was taken back.

Program
When playing in manual mode, this instructs Chess to make the next move and return control to you.

Rerun
Replay all the moves in the game up to that point.

Resume
Restore Game to most advance point. Used if rerun is halted before entire game has been replayed.

Messages will appear at the bottom of the screen explaining what each function is.

To move a chess piece, select it with the cursor, press return. Then select the square you wish to move to and press return again.

Using the mouse with Chess is a little different all you have to do is move the mouse to the final location and click, if the move is valid the square will light up and all will go well, if it's not, you'll find out.

Skill Levels

0...Introductory
2...Intro level, Chess averages about 5 sec./move + opening lib.
5...Moderate Strength, Chess averages about 20-40 sec/move

The opening library contains around 7000 moves. Advice is usually only available above level 3.

Levels in depth:

Level time/move Search ply
0-2 Intro. 1-5 sec 0-1
3-6 Intermediate 10-80 sec 0-4
7-9 Advanced 1-6 min 2-6
Every Command is explained in a message line at the bottom of the screen, so it is very difficult to get lost. If you are in the middle of a game, pressing the "A", "I", or "O" keys will access the advice, inward or outward functions directly, without the need to go to the menu (that is if they are available at the time). Experiment with the tutorial as it is quite good and will allow you to practice. Pressing return at any point in a demo or tutorial will interrupt the computer and put you back in control, however sometimes it is fun to just watch. Have patience though, the computer moves slowly. Have Fun !!!

This exciting superhero series features a water beast of indomitable strength, a human gifted with flight of future visions, and an elfin princess of unearthly power! In Gamma Force No. 1, see the origins of the trio as they team up to free their planet from an evil overlord and his pit of a thousand screams!

Everything you need to know about Infocomics:

You need only 4 keys...

The RETURN key to *jump* when you see a turned-down page,

The LEFT ARROW key (<-) to rewind

The RIGHT ARROW key (->) to fast forward

The SPACE BAR to stop rewinding or fast forwarding or to pause

But, you can use...

The A key to advance one frame

The 1 key to change speed to SLOW

The 2 key to change speed to NORMAL

The 3 key to change speed to FAST

The B key to insert a Bookmark (story will restart from this point)

The R key to restart from the beginning

End of File
Lobbers: Lobbers attack by throwing rocks over the tops of dungeon walls. They run away so if you intend to fight them you have to corner them.

Sorcerers: Sorcerers can disappear while moving. They will attack evasively by flickering in and out of sight. They are immune to attack when invisible. Fight them hand to hand or shoot them.

Death: The Dark Prince drains health from you. He will steal up to 200 points from you and then die. Death cannot be killed by any weapon except magic.

Dungeons:
- The dungeons are filled with a variety of objects...some good some evil. You should collect the good ones and avoid the evil ones. Here are a few pointers to help you tell the difference.

- Potions: Poisons grant magical powers to those who know how to use them. When a potion is collected and used, all the monsters on the screen will be affected by the proportion to the magical power of the hero wielding the potion. Some potions. Some potions can be activated by a shot, but the effect is not as great.

- Special Potions: These are just like regular potions when they are shot, but if they are collected, they give special bonuses to the player.

- Food: Plates of cold food increase both your health and your score by 100 points.
- Cider: Cider is the same as food, except it can be destroyed by a careless shot.
- Poison: Looks a lot like cider, but it takes one special power and 100 points of health when consumed.

- Keys: Score 100 points for collecting each key. Keys are used to open doors.
- Treasure: Treasure chests are worth 100 points each.
- Amulet: A magical device that confers invisibility for a short time.

- Walls: Most walls are impenetrable, but some of the older ones can be crumbled by multiple shot.

- Traps: Glowing floor patterns that make some walls disappear

- Transporters: These powerful devices transport you to the nearest visible transporter. If there are several within the same distance then one is chosen at random. There are ways to influence the direction of travel if you can find them.

- Exits: These labeled holes lead down to specified level. If you do nothing for 30 seconds, then all walls will disappear, freeing all monsters. After another 30 seconds (if you avoid and combat) the walls turn into exits.

- When you use an exit, there is a chance that you will end up in a treasure room. Collect all the valuables you can and escape within the time limit for bonus points. No score will be awarded if you do not escape.

- In general, players are immune to each others shots, but in some portions of the dungeon, they may be stunned or injured by careless fellow adventures.

Keyboard Control:
- Player one: The right Apple key is your fire button. Return may also be used as a fire button. The following keys define movement.

[IL] Left  [LJ] Left  [NL] Up Right

Ghosts: Stay away from ghosts. They will only hit once then disappear. That one hit can hurt a lot, so shoot them don't run into them.

Monsters come in three levels of toughness (except death, more on him later). A level one ghost will take one hit to destroy, while a level three demon will take three hits to destroy.

The Villains:
- Scattered throughout the depths of the dungeon you will find Monster Generators. Creatures spew forth from these generators at regular intervals. Each generator creates a specific type of villain. There are three generator levels, creating monsters from merely strong to awesomely deadly. You can destroy the generators by shooting them or, for the tougher heroes, by pounding them into rubble or by using magic.

- The monsters come in three levels of toughness (except death, more on him later). A level one ghost will take one hit to destroy, while a level three demon will take three hits to destroy.

Gauntlet Instructions:

Heroes:
- Thor the Warrior
- Merlin the Wizard
- Questor the Elf
- Thyra the Valkyrie

The Villains:
- Scattered throughout the depths of the dungeon you will find Monster Generators. Creatures spew forth from these generators at regular intervals. Each generator creates a specific type of villain. There are three generator levels, creating monsters from merely strong to awesomely deadly. You can destroy the generators by shooting them or, for the tougher heroes, by pounding them into rubble or by using magic.

- The monsters come in three levels of toughness (except death, more on him later). A level one ghost will take one hit to destroy, while a level three demon will take three hits to destroy.

Ghosts: Stay away from ghosts. They will only hit once then disappear. That one hit can hurt a lot, so shoot them don't run into them.

Grunts: Grunts will immediately move up and attack you with their clubs. Either fight them hand to hand or shoot them from the distance.

Demons: Demons will shoot fire balls at you from the distance, and they will bite fiercely when they get in range. The fireballs are far more harmful than their bite. Fight them hand to hand or shoot them.
The arrow keys may also be used to move player one's character.

Player two: The left Apple key is your fire button. Use the D button to fire if player one is using a joystick. The following keys define movement.

- [W] Up Left
- [E] Up
- [R] Up Right
- [S] Left
- [F] Right
- [Z] Down Left
- [X] Down
- [C] Down Right

Reminders:
- Hold the fire button to shoot.
- Release to fire button to move.
- Shoot the generators to destroy them.
- Hand to hand combat score more points than shooting.
- Food increases scores by 100 points.
- Poisoned food looks a little different than regular food.
- Treasure is worth 100 points.
- Team play gives the best chance for survival.
- Avoid death unless you have a potion and someone who can use it effectively.
- Cooperate in treasure rooms.

END OF INSTRUCTIONS
To make your selections, use the joystick or appropriate up or down key to highlight the player you want. Then press the button (with the joystick) or <return> to make your selection.

After you've selected a player, highlight CONTINUE and press <return> or the joystick button to move to the next chalkboard.

You'll then see a screen that confirms your choices and tells you what color jersey each player will wear when play begins.

Press <return> to start the game. The computer-controlled cagers will play four six-minute quarters, moving up and down court automatically each time the ball changes hands.

You can pause play by pressing <esc> (this does NOT stop action if a player is shooting). To return to the initial chalkboard menu and select another game before the demo contest is complete, press <control> and the [>] key together.

Practice Options

No one wants to hit the courts cold. Just as in real basketball, it's a good idea to warm up a little before playing a game, so you may want to select PRACTICE from the opening chalkboard menu. Two-on-Two offers you two practice modes: ONE- and TWO-PLAYER.

Use the joystick or the up and down arrow keys to highlight the option you want, then press the joystick button or <return>.

ONE-PLAYER (one player on the court by himself)

You can practice with either the keyboard or the joystick; use the up and down arrow keys to gradually raise and lower the sound level.

The Chalkboard Menus

Following the introductory music and credit screens, a green chalkboard appears on your screen with three choices: DEMO, PRACTICE, and GAME. You'll notice the GAME option is highlighted in white. If you're using a joystick, pull back or push forward on it to highlight the option you want, then press the button. If you're using the keyboard, use the up and down arrow keys to highlight the option you want, then press <return> to make your selection.

(Note: Both players can use the up and down arrow keys to highlight selections and the <return> key to make selections while at any of the chalkboard menues.)

A new chalkboard then appears. What you see depends on which type of action you've selected.

If you selected PRACTICE or GAME you are prompted to select between ONE-PLAYER or TWO-PLAYER action. You should now skip to "Practice Options" to practice or "Game Options" to play a real game.

If you selected DEMO, the computer controls all players, and you're allowed to choose between SELECTED PLAYERS or RANDOM PLAYERS.

When you select RANDOM PLAYERS, the computer picks both players for both teams, then displays a chalkboard showing who was drafted. Press <return> to start the game.

When you select SELECTED PLAYERS, a chalkboard displaying the name of 10 players appears, and you're allowed to pick both players of both teams. You're prompted to first pick TEAM ONE PLAYER ONE and TEAM ONE PLAYER TWO, the repeat to process for TEAM TWO PLAYER ONE and TEAM TWO PLAYER TWO.
must keep track of the "score" yourself.

As with the ONE PLAYER option, each basket you hit is recorded on the scoreboard, and there are no fouls or time clock.

To leave the practice game and return to the chalkboard menus, press <esc>.

The Scouting Report

Once you're warmed up and ready to play ball, you still have to rate your playing abilities on a screen called The Scouting Report. It might look like this:

<table>
<thead>
<tr>
<th>INSIDE</th>
<th>OUTSIDE</th>
<th>STEALING</th>
<th>JUMPING</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>6</td>
<td>5</td>
<td>3</td>
</tr>
</tbody>
</table>

RACE: BLACK/(WHITE)

INSIDE refers to your shooting accuracy inside the key.
OUTSIDE refers to your shooting accuracy outside the key.
DRIBBLING rates your maneuverability with the ball.
QUICKNESS rates your maneuverability both on defense and when you're not handling the ball on offense.
STEALING rates your ability to outmaneuver the ball handler and steal the ball.
JUMPING rates your ability to block shots and come down with rebounds.

The highest rating you can give yourself is 6 (very skilled), and the lowest is 2 (minimally skilled). Notice that INSIDE and OUTSIDE are grouped together, as are DRIBBLING and QUICKNESS and STEALING and JUMPING. Within each of these groupings, the total skill level always equals 8.

So if you choose to rate yourself 3 as an outside shooter, you must be a 5 inside. If you choose a 6 rating at stealing, you'll only be a 2 at jumping. After all, you can't be great at everything. Remember, too, that in a game situation you'll want to select your offensive and defensive strategies according to your strengths and weaknesses.

Game Options

TWO-PLAYER HEAD-TO-HEAD

Each player has a computer teammate. Each player names his team, then types in his own name and rates himself when the Scouting Report screen appears (see page 7). (When entering your name or a team name, you may use up to 12 letters.)

Player One uses the joystick to highlight the choices and the joystick button to change the ratings and move between BLACK and WHITE. Player Two then uses the arrow keys to highlight CONTINUE and presses <return> to make the selection.

Each player also picks a computer teammate from the Player Draft, which includes ten pros, each one patterned after a real-life basketball superstar. (For details of the Player Draft, see the appropriate section.)

A STARTING LINEUP SUMMARY screen lists player names, with corresponding uniform colors, and shows which team is "home" and which is "visitor".

TWO PLAYER TEAMMATES

When you select this option, you and a friend team up against a hard-driving computer team. You first type in a TEAM NAME of 12 letters or less, then pick a DIVISION to play in. The division you choose determines the caliber of your computer opponents. NORTH is the easiest division, SOUTH is tougher, EAST is tougher still, and WEST is the toughest of all.

Take a look at the chart. It gives you a breakdown of all the teams in every division. Notice that the rating totals are higher in the tougher divisions. For example, in the easy North, the INSIDE and OUTSIDE ratings total 7; but in the tough West, they total 10. Since the players in the West are better, the West teams have higher ratings.

When Player One types in his name (12 letters or less) and presses <return>, the Player One Scouting Report allows Player One to rate his abilities. Then Player Two types in his name and rates himself. In this mode, Player One has the light blue jersey, Player Two the dark blue one.

ONE PLAYER EXHIBITION GAME

You and your computer-controlled teammate challenge a computer team. Type in your TEAM NAME and YOUR NAME and pick a DIVISION. Again, the division you select determines how tough your opponents will be. Next, rate yourself on inside and outside shooting, dribbling, stealing, quickness, and jumping.

Finally, you select your computer-controlled teammate from the Player Draft. Do you want the great outside shooting of Larry Berg or the dynamite inside moves of Kareem Ogrin? Strategy is important, because you'll want a player whose talents will complement your own, someone who's going to be effective against your opponents. (Again, use the chart "Your Computer Opponents" to scope out your opponents' strengths and weaknesses).

Your team will always be the HOME team, with the player you control in the light blue uniform.

ONE PLAYER LEAGUE PLAY

This game mode allows you and a computer teammate to play in league competition that can take you all the way to the GBA Championship.

You first choose a division to play in (North, South, East, or West), then play a five-game season against the other five teams in that division.

Once you've selected League Play, the computer screen will ask if you want to GET TEAM or assemble a NEW TEAM. If you select GET TEAM, the computer team will erase your current team. Select NEW TEAM to create a new team; your old team (if you had one) and its league record will be erased from the game disk. In other words, you can have only one team at a time. (If you try to create a new team and there's already a team on the disk, the screen will display the message "Warning: Selecting new team will erase your current team.") However, you can go from League Play to Exhibition Play without erasing your League Team from the game disk.

You'll play a five-game schedule. The computer will select your opponents within your chosen division until you've played all five. Playing in the easier divisions will of course mean easier games-- until you get to the playoffs. At the end of the season, the computer will compare your win/loss record with the records of the other teams in your division. If you have the best divisional record, or if you're tied for the division lead and have beaten your co-leader, you'll advance to the playoffs. The playoff schedule is set up so that the easiest division (North) plays the hardest division (West) in Game 1; in Game 2, South meets East. The winners from Game 1 and Game 2 then meet in the GBA Championship Game.

Your Computer Opponents

Divisions | Teams | Player #: | OUTSIDE | INSIDE | STEALING | JUMPING |
--- | --- | --- | --- | --- | --- | --- |
North | Cougars | 1 | 4 | 3 | 4 | 3 | 4
You're moving, in which case he'll never pass to you unless you press the joystick button. Also helps to have a high rating. The following charts show the percentage he sees that you're open, even if you don't press the joystick button—unless shooting percentage by working on the timing of your release. Of course, it may make you a ball hog now and then. Your teammate may also pass the ball to you if he wants him to pass to you, quickly press the button. Your teammate will immediately release the joystick button. If your teammate has the ball and must have a 4, 5, or 6 rating as an inside shooter. You must be at the baseline, as far downcourt as you can go, and you must shoot when you're in one of three areas: under the basket, half a step right of low post right (LPR) (see "Zones on the Court"), or half a step left of low post left (LPL), or half a step right of low post right (LFR) (see "Zones on the Court"). Finally, there must be NO DEFENDERS under the basket. If all of these conditions are met, a slam dunk will ALWAYS be successful.

To make a hook shot, you must be downcourt, near the baseline, with your back to the basket (as you look at your player on the screen, he must be facing 9 o'clock or 3 o'clock). With a hook shot, the ball is released as the player's arm "hooks" over his head. The advantage of this type of shot is that it cannot be blocked.

Joystick and Keyboard Controls

In one-player games against a computer-controlled team, you may use either a joystick or the keyboard to move your player around. In two-player games, the home team player uses the joystick and the visiting team player uses the keyboard.

The joystick works as described in "Passing" and "Shooting." The keyboard works as shown below; you may use either cluster of keys shown.

Joystick

- D - deletes last line entered, if followed by a number, the corresponding line is deleted. You can also enter a range of lines. (ex: .D, y)
- .E - allows you to edit last line entered. Also can be followed by a number.
- .N - displays help file for the editor.
- .I - inserts a line of text, must be followed by a number.
- .L - lists current content of editor.
- .N - clears contents of editor and starts over.
- .Q - saves the file directly, does not give chance to edit.
- .S - same as .O (saves file, skMarvels)

Keyboard

- Hawks 4 5 5 3 3 5 3
- Wizards 5 4 5 4 4 4 4
- Stars 5 5 5 5 5 5 5
- Dragons 5 4 5 4 5 5 5 5
- Cosmos 5 5 4 5 4 4 5 5
- Waves 4 4 5 4 5 4 4 5
- Lazers 5 4 5 5 4 4 5 4

How to Pass, Shoot, and Move Around

1. To move your on-court player in a particular direction, tap and release the joystick button. Use the <option> key as your "fire" button to jump and shoot.

Passing

Naturally, good teamwork means getting the ball to your teammate when he's in open. And to do that, you've got to become a good passer.

To pass to your teammate when you have the ball, quickly press and immediately release the joystick button. If your teammate has the ball and you want him to pass to you, quickly press the button. Your teammate will usually pass you the ball, but not always—after all, any player can become a ball hog now and then. Your teammate may also pass the ball to you if he sees that you're open, even if you don't press the joystick button—unless you're moving, in which case he'll never pass to you unless you press the joystick button. If you pass to your computer teammate while he's moving, he'll stop to try to catch the ball.

In order to catch the ball you must be directly in line with it. Otherwise, the ball will go out of bounds or will be stolen by your opponents.

Shooting

Shooting Basics

When you have the ball and want to make a shot, first hold down the joystick button. Your player will begin his shot by jumping and will release the ball at the same time you release the button. You must time the release to the jump. If you release the ball at the top of the jump, you have a better chance of scoring.

So your success in shooting depends on your ability to release the joystick button at just the right moment. If you look very closely, you'll notice that at the very top of his jump, your player will cock his wrist slightly, preparing to shoot. It is at this moment that you should release the button. If you release the button too early or too late, you will still make some of your shots, but a smaller percentage than if you time it perfectly. You must also be aware of that if you fail to release the button before your player comes back to the floor, you'll be charged with traveling (See "Penalties"). In addition to your timing, the other factor that will determine your shooting percentage is your Player Scouting Report— that is, your rating as an inside and outside shooter.

Hook Shots

To make a hook shot, you must be downcourt, near the baseline, with your back to the basket (as you look at your player on the screen, he must be facing 9 o'clock or 3 o'clock). With a hook shot, the ball is released as the player's arm "hooks" over his head. The advantage of this type of shot is that it cannot be blocked.

Slam Dunks

A slam dunk may be the most satisfying shot in basketball. What could be better than actually stuffing the ball through the hoop? To slam dunk, your player must have a 4, 5, or 6 rating as an inside shooter. You must be at the baseline, as far downcourt as you can go, and you must shoot when you're in one of three areas: under the basket, half a step right of low post right (LFR), or half a step right of low post left (LFL) (see "Zones on the Court"). Finally, there must be NO DEFENDERS under the basket. If all of these conditions are met, a slam dunk will ALWAYS be successful.

Tip-Ins

If an offensive player grabs a rebound while directly facing the basket (as you look at him on the screen, facing 12 o'clock with his back to you), he'll tip the ball in for a basket. As long as the player is facing the basket and underneath it, the tip-in will be automatic if you make your player jump. Again, only an offensive player can tip the ball in. (In the practice mode, either player can tip the ball in.)

Rebounds

A player can rebound only when he's in the area immediately surrounding the basket. To rebound press the joystick button in the same way you do to make a shot—your player will jump for the ball. Timing your jump is the key to successful rebounding.

Shooting Percentages

Nobody can make every kind of shot every time. But you can increase your shooting percentage by working on the timing of your release. (Of course, it also helps to have a high rating.) The following charts show the percentage
of outside and inside shots you'll make based on the timing of your release and your outside shooting ability.

Outside Shooting Percentages

3-Point Shots

If a player shoots a basket from outside the white 3-point line (see illustration on page 21), that basket is good for 3 points instead of the usual 2. Successful 3-point shots are based on a player's outside shooting rating and the timing of his release. However, if a player shoots from outside the white 3-point line, the odds of that shot being good are only half the odds of a regular outside shot. For example, if a 6-rated outside shooter releases the ball perfectly from beyond the 3-point line, he has only a 35% chance of making that shot.

Shooting From Under the Basket

Whenever a player shoots directly under the basket, his chance of scoring is based only on his inside rating, not on his timing. As long as he releases the ball before he's called for traveling, it's assumed that his timing is perfect.

Notes on Defense: Stealing the Ball and Blocking Shots

To steal the ball from the offense, you must "bump" the ballhandler on the side on which he's dribbling or holding the ball. Any player's success at stealing the ball will be based on his rating at STEALING-- see "The Scouting Report."

To block a shot, move in close to the ballhandler and press your joystick button to jump just as he goes up for a shot. Your success in blocking the shot will depend on how close you are to the ballhandler and your rating at JUMPING-- see "The Scouting Report."

Your Computer Teammate

Your computer teammate is an intelligent player. If he's under the basket, he'll shoot. If he sees that you're open under the basket, he'll pass the ball to you. If the block is about to run out (either the 24-second shot clock or the quarter clock), he'll shoot if he has the ball. If he's being covered and he realizes he can't drive to the basket, he'll pull up and shoot from as close as he can get.

Remember, just as in real basketball, the key element in Two-On-Two is teamwork. Your computer teammate is designed to work with you to beat your opponents. Not matter how good you are as an individual player, you'll never make it to the GBA Championship unless you learn to play as a team.

The Player Draft

After you've rated your abilities, you get to draft a computer-controlled teammate. In the two-player mode, each player gets to draft a computer teammate unless you're playing the TWO PLAYER TEAMMATES option. You have ten players from which to choose, each patterned after a real basketball superstar.

When the player draft screen appears, you'll see ten names in white letters, with the two "pointer" basketballs on either side of a name. Use your joystick to line up the basketballs next to the name of the player you want, then release the joystick and press the joystick button. This will highlight your choice in yellow. Finally, move the balls down to the word CONTINUE and press the joystick button to go to the next screen.

Your Superstar Teammates

Here are the computer stars you can play with:

Magic Lyndon. One of the best players in the game, famous for his sleight-of-hand passing. Now you see it, now you don't. Magic provides that extra magic that can take you all the way to the GBA Championship.

Jerry Orr. A consistently high scorer, Orr has been known to score over 50 points in a game. He knows how to draw fouls from opponents and almost never misses from the free throw line.

Elgin Cutter. Some say he's the best pressure player in the game. He once scored 61 points in a GBA playoff game-- a record. Cutter has some deadly inside moves.

John Madland. An excellent defensive player. When Madland's on the court, your team will be hard to beat. Madland never misses and he's a great rebounder.

Larry Berg. If you want a teammate who can do it all, Berg's your man. A real team player who knows how to win. Great all-around abilities. Berg can shoot and pass with either hand. He received the GBA Most Valuable Player Award two years in a row.

Kareem Ugrin. Some say he's getting too old, but Ugrin seems to just get better. A great inside shooter with an almost unstoppable hook shot, Ugrin recently became the highest scorer in GBA history. He's also a ferocious rebounder.

Walt Barnett. A superb rebounder and one of the best defensive players around.

Julius Keith. Dr. K. When he's not selling basketball shoes or soft drinks on TV, Keith can be found driving defenders crazy on the court. He averages over 30 points a game and has some of the best moves in the game.
Apple II Computer Info

Offense or Defense flashes.
Whenever you call a play, whether on offense or defense, you are telling your computer teammate what to do.

Following is a complete rundown of the plays. It will help you to understand the plays if you also study "Zones on the Court"

Zones on the Court

[Diagram of court zones]

Superstar Teammate Player Draft

The Super Teammate Player Draft chart rates the talents of your computer teammates. The numbers indicate their skills at inside and outside shooting, dribbling, stealing, quickness, and jumping. Unlike the ratings for yourself, these are fixed. Because all these stars are excellent players, they rate no lower than 4. A 6 is the highest rating a player can have.

Notice that the total within each grouping (Inside and Outside, Dribbling and Stealing, and Quickness and Jumping) totals 10 for your superstar teammate, as opposed to 8 for your other player.

Superstar Teammate Player Draft

THE PLAYERS: Outside Inside Dribbling Stealing Quickness Jumping

Magic Lyndon 5 5 5 5 5 5
Jerry Orr 6 4 5 5 6 4
Elgin Cutter 4 6 5 5 6 4
John Madland 6 4 4 6 5 5
Larry Berg 6 4 4 6 4 6
Kareem Ugrin 4 6 5 5 4 6
Walt Barnett 5 5 4 6 4 6

Oscar Dunbar 5 5 6 4 5 5
Wilt Dulmage 4 6 4 6 4 6

Calling Plays

In all the game modes except two-player teammates, you must choose an offensive and defensive alignment every time you're on offense or defense. The PLAYCALLING SCREEN comes up whenever there's a change of possession because of a basket, steal, defensive rebound, or penalty.

Although the game is actually played on a full court, you see only half the court at a time. Every time there's a change of possession or a basket is good, the players run down the court and the offense brings the ball up from mid-court.

The playcalling screen replaces the scoreboard for about seven seconds while the players automatically run down the court and bring the ball back into play. The playcalling screen disappears when the ball handler crosses center court. So you have seven seconds to select a play. If you fail to select a play, the computer will automatically pick one for you. (On defense the computer will pick LOW ZONE (LZN) and on offense it will pick BASKET (BKT)).

The playcalling screen is divided into OFFENSE and DEFENSE. For offense the screen shows a picture of your joystick surrounded by the abbreviations BKT, RHT, TOP, LFT, and SCRN, which stand for the five offensive plays you can choose from. For defense the screen shows a picture of your joystick surrounded by the abbreviations LZN, HZN, MMD, and MML, which stand for the five defensive alignments you can choose from.

You select a play by moving your joystick forward, back, right, or left to "point to" the play you want: forward for BKT or LZN, back for TOP or HZN, right for RHT or MMD, and left for LFT or MML. On offense you can also use the joystick button if want to select the SCRN play.

If you've called a play, but change your mind while the playcalling screen is still visible, simply push the joystick in the direction of the new play you want. Whenever you call a play, you'll hear a tone at the same time the word

Oscar Dunbar. A player with all the right moves, Dunbar is considered the best guard of all time. A great player at any position, he's equally adept at inside and outside shooting.

Wilt Dulmage. a.k.a. Wilt the Tilt. This man is great at blocking shots and coming down with the ball. Also one of the few unstoppable inside shooters.

Wilt Dulmage. a.k.a. Wilt the Tilt. This man is great at blocking shots and coming down with the ball. Also one of the few unstoppable inside shooters.
You have four defensive plays to choose from:

<table>
<thead>
<tr>
<th>Low Zone</th>
<th>LZN</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Zone</td>
<td>HZN</td>
</tr>
<tr>
<td>Man-to-Man Light</td>
<td>MML</td>
</tr>
<tr>
<td>Man-to-Man Dark</td>
<td>MMD</td>
</tr>
</tbody>
</table>

Low Zone. When you call low zone, your teammate will stay in the key (between the basket and the inner white line on the court). When an offensive player enters his zone, he covers him man-to-man. If the offense floods the low zone (which means BOTH offensive players enter the key), your teammate will cover the ball handler. You should cover the offensive player without the ball. When your opponents are not flooding the low zone, your teammate always takes the man in the low zone, and you take the man outside the key in the high zone.

High Zone. If you assign your teammate to the high zone, he covers the ball handler when that player is in the high zone. When the ball handler enters the low zone area around the key, YOU cover him, and your teammate covers the player without the ball.

Man-to-Man Light. Your teammate covers the opposing player who wears the light-colored uniform. He stays with that player everywhere on the court. You cover the player in the dark uniform. The goal in man-to-man coverage is to stay between the man you're guarding and the basket, trying to keep him from getting under the basket and making an easy shot.

Man-to-Man Dark. This is the reverse of man-to-man light. Your teammate covers the man in the dark uniform, and you cover the man in the light uniform.

Strengths and Weaknesses of Zone Defense

The zone defense is very effective against inside shooters. If the ball handler breaks away from the man playing the high zone, the man playing the low zone can usually cover the ball handler before he can get into position near the basket. The weakness of the zone defense is that one defender is always the key, resulting in a two-on-one situation outside the key. This sometimes means that one of the offensive players can take an easy outside shot.

If you're playing against the computer, it's easier to beat the computer when you play a zone defense. If you want a more challenging game, play man-to-man.

Playcalling and Loose Ball

If nobody grabs a rebound and the ball is loose, the computer will sometimes allow you to regroup your offense and call another play. You'll know this is happening if the playcalling screen appears.

Penalties

Bumping into an opposing player continuously for more than one second results in a foul in the following situations:

A defensive foul occurs when one of the defensive players bumps into the ball handler. The penalty is either the ball out of bounds to the offense or free throws.

Charging occurs when the ball handler bumps into a defensive player. The penalty is change of possession or free throws.

Fouls and other penalties are displayed on the scoreboard in flashing letters right after they occur. However, if a player is fouled while shooting, the foul won't be displayed on the scoreboard until after the shot has either gone in for a field goal or missed. Fouling the shooter results in one free throw if the basket is good and two free throws if he misses his shot.

The number of TEAM FOULS is also displayed on the scoreboard. Teams get five fouls per half; the count is reset to zero at halftime. If a team accumulates more than five fouls in a half, this results in bonus free throws for the other team.

Other Violations

Traveling is called if you jump to shoot but don't release the ball in time. It won't be called if your shot is blocked by an opponent and you come down with the ball. Traveling results in a change of possession.

The Three-Second Rule is invoked if an offensive player stays inside the key for more than three seconds at a time. However, when the ball is in the air or up for grabs, all players can stay in the key for as long as they like, until someone comes up with the ball. Staying in the key too long results in...
The 24-Second Shot Clock gives the offensive team 24 seconds to make a shot after they bring the ball into play. The scoreboard has a SHOT CLOCK which counts down the seconds. Failure to make a shot in time results in change of possession.

Here's a summary of all violations and penalties:

- **FOul**ing the **Shooter**:
  - if ball goes in................1 free throw
  - if ball misses................2 free throws

- **FOul**ing the **Ball** Handler:
  - Ball out of bounds to the offense

- **THREE SECONDS IN KEY**:
  - Change of possession

- **24-SECOND CLOCK**:
  - Change of possession

With more than three team fouls:

- **FOul**ing the **Shooter**:
  - if ball goes in................1 free throw
  - if ball misses................2 free throws

- **FOul**ing the **Ball** Handler:
  - 2 free throws

- **CHARGING**:
  - 2 free throws

- **24-SECOND CLOCK**:
  - Change of possession

A word about free throws. Players don't have control over free throw accuracy. It's based on the outside shooting rating. To make a free throw, just push the joystick button and release it. All players can rebound after the last free throw attempt.

### The Quarter Clock and Overtime

You'll play four 6-minute quarters in each game. If the teams are tied at the end of the fourth quarter, you'll automatically go into overtime, which is another 6-minute quarter. The amount of time left in each quarter is shown on the clock in the middle of the scoreboard. At the end of each quarter, a buzzer rings and the screen displays which quarter has just been played. You then go immediately into the next quarter.

At the start of the game, the home team always takes the ball out (Player One is always the home team). The visiting team brings the ball in play in the second quarter. The home team again takes the ball out when the third quarter begins, and the visiting team starts off the fourth quarter.

### Calling Timeouts and Pausing the Game

To pause the game, simply press the <esc> key on your keyboard; TIMEOUT OR ESC TO RESUME will be displayed on the scoreboard. If you merely want to pause the game, press the <esc> key when you're ready to resume.

You can call a timeout only when you're on offense. If you want to call a timeout, first press the <esc> key, then press the joystick button. Each team is allowed five timeouts per half. On the scoreboard you'll notice five little lights on the HOME and VISITOR sides of the board. Each time you call a timeout, one of the lights will go out.

Calling timeouts saves precious seconds at the end of the game. If your team is behind and the clock is about to run out, you should call a timeout right after you've called a play. When you call a timeout, your players don't have to take the time to run down court and set up the play; they'll just appear on the court, in position, when play resumes.

### After the Game

At the end of every game, you can read all about it. The sports page of the Gamestar Gazette appears on the screen with the following boxscore writeups: the team names, the final score, the total field goals for each team, shooting percentages, rebounds, steals, blocked shots, and the name of the leading scorer. Here's what the numbers mean:

- **Field Goals**: This is the total number of baskets that each team made. Each basket is worth either 2 or 3 points, depending on where the player was on the court when he made the shot. Free throws do not count as field goals.

- **Percentage**: The field goal percentage is calculated by taking the total number of actual field goals and dividing it by the total number of field goal attempts. That number is the team percentage.

- **Rebounds**: Every time your team pulls down a rebound, it's recorded here.

- **Steals**: This number records the number of times your team stole the ball from the opposition.

- **Blocked Shots**: There are two types of blocked shots. After the shot is blocked, either the defender comes down with the ball or the offensive player retains possession. Blocked shots are only recorded here when the defender gains possession of the ball.

- **Assists**: This is the number of times a player's passing sets up a teammate for a basket. To get credit for an assist, you must pass the ball to your teammate, who can dribble the ball only one time before putting the ball in the basket.

- **Fouls**: The number of personal fouls-- for example, charging and hacking-- each player commits is listed here.

- **Leading Scorer**: The top scorer's name will be displayed with the number of points he scored.

### GBA Championship Basketball

GBA Championship Basketball also gives you a breakdown of each teams' statistics. Press <return> and you'll see a linescore similar to:

<table>
<thead>

### Calling Timeouts and Pausing the Game

To pause the game, simply press the <esc> key on your keyboard; TIMEOUT OR ESC TO RESUME will be displayed on the scoreboard. If you merely want to pause the game, press the <esc> key when you're ready to resume.

You can call a timeout only when you're on offense. If you want to call a timeout, first press the <esc> key, then press the joystick button. Each team is allowed five timeouts per half. On the scoreboard you'll notice five little lights on the HOME and VISITOR sides of the board. Each time you call a timeout, one of the lights will go out.

Calling timeouts saves precious seconds at the end of the game. If your team is behind and the clock is about to run out, you should call a timeout right after you've called a play. When you call a timeout, your players don't have to take the time to run down court and set up the play; they'll just appear on the court, in position, when play resumes.
If the game was part of league play, GBA Championship Basketball lists the division standings after you press <return> to continue. It also tells you <Parent Dir> O <return>) to return to the chalkboard menu and start another game.

To Play Another Game

When a game ends, press the joystick button (or <return>) to return to the chalkboard menus. If you've just played any game (except league play) and want to play the same game again, you don't have to type in your name again or select a new computer teammate unless you want to. Just press <return> or highlight CONTINUE and press the joystick button as you move quickly through the menus.

[End of GBA Championship Basketball Documentation]
I wrote this program with no more intention than to satisfy a computer science project requirement. It became actually useful at one stage, and this is that stage, so I am letting it loose on you. The second version reflects suggestions from a few users. I would like some more suggestions, in order to make GenericComm a staple in a telecommunications diet. Don't expect the world, ok? I didn't spend a year writing this program, and it shows. It is a fast though, and to the point quick and dirty terminal mode program for general usage. In this current version it doesn't support things like: terminal emulations, protocol transfers, GS/OS interaction and file control, and fancy text editors (though I have some of these planned). But GenericComm v1.0 contains the following features:

- 65,535 line scroll back
- 65,535 line buffer ability
- 65,535 line buffer
- 255 item dialing list
- support for 300,1200,2400,9600,19200bps operation
- restartable and in expressload format for fast loading and re-execution

This program requires 768k and GS/OS. It should work in 512k, though no promises!

------------------------------------------------------------------
| Function Explanations | GenericComm v2.03 |
------------------------------------------------------------------

- Restartable
- Support for 300, 1200, 2400, 9600, 19200 bps operations
- 65,535 line buffer ability
- 255 item dialing list
- Support for 300, 1200, 2400, 9600, 19200 bps operation
- Restartable and in expressload format for fast loading and re-execution

There should be three files included in this NuFX archive.
- GENCORE.SYS16
- GENCORE.DOC
- GENCORE.ICS

One file is the one you are reading, the other is the actual program.

The file GENCORE.SYS16 is a GS/OS application and can be launched from any standard GS/OS launcher. The filetype "CAN" be changed to EXE and used from a shell like ORCA or ProSEL's shell.

The file GENCORE.SYS16 can reside anywhere on a valid GS/OS file system and will create a file if you use the dialing directory. The file is a standard TXT file called "DIALLIST".

The modem port settings should all be defaults except for the second and third last selections, they must be deselected so that the check mark doesn't appear beside them. Without this setting, there can be no communication with the modem whatsoever.

The buffering should be enabled at any speed above 2400 bps or if you wish not loose characters as you select menus.

The following is a list of keys and the functions they perform.

**Open Apple - ?** - HELP!

This key combination will present a summary of the commands available for your usage within GenericComm.

**Open Apple - A** - Add a system to the dialing list

After pressing this key combination, a blank entry will be added to the Dial list, with default entries.

**Open Apple - B** - Change the current bps connection rate

This quick menu list will allow you to change the bps rate at which your communications with your modem at (and ultimately the online system). It uses the up and down arrow keys to select the bps rate, and return to confirm it. Any other keys will abort the selection process. The current bps rate is displayed in the bottom left corner of the normal screen.

**Open Apple - D** - Dial a system

This menu selection allows you to select a system to dial by using your up and down arrow keys. Return will confirm your selection. The dialing list represents the online systems added using the Open Apple - A command.

Once confirmed, a second screen, which allows you to edit or dial the item is presented. Editing the entries is hopefully logical.

**Open Apple - H** - Hangup

This menu selection will allow you hangup from the foreign system. It will ask you to confirm you intention. Only by pressing return when "Hangup" is highlighted, will the program try and hangup. The hangup is performed by dropping the DTR line to the modem. Some modems have it set so that DTR is always held high, and as a result this command might not work with all modem configurations. Change your modem so that the "computer controls DTR" rather than "modem holds DTR constantly high". This will remedy any hangup problems you may encounter.

**Open Apple - Q** - Quit

This quick menu list will allow you to change the bps rate at which your communications with your modem at (and ultimately the online system). It uses the up and down arrow keys to select the bps rate, and return to confirm it. Any other keys will abort the selection process. The current bps rate is displayed in the bottom left corner of the normal screen.

This command does a GS/OS quit command and will mark the GenericComm program as restartable so that if you wished to run this program again, it will load from memory, rather than from disk. This command will confirm your desire to leave the program.

**Open Apple - R** - Remove online system from dialing list

Removing an online system from a dialing list will delete the entry for good and must be used with caution. No confirmation is made before deleting an entry.

**Open Apple - C** - Turn on or off buffer capture

At first, when you select this option, you will be asked to enter a file name to act as the text file buffer of the session. If the file already exists, you will be asked to confirm appendage. Once the buffer is turned on, the status line at the bottom of the screen will indicate that the buffer is on. Pressing the Open Apple - C sequence again will turn off the buffer and save the file.

**Open Apple - .** - Quit

This menu selection will allow you hangup from the foreign system. It will ask you to confirm your intention. Only by pressing return when "Hangup" is highlighted, will the program try and hangup. The hangup is performed by dropping the DTR line to the modem. Some modems have it set so that DTR is always held high, and as a result this command might not work with all modem configurations. Change your modem so that the "computer controls DTR" rather than "modem holds DTR constantly high". This will remedy any hangup problems you may encounter.

**Open Apple - Up Arrow** - Enter Scroll Back

By pressing the above key combination the user will enter the scroll back mode of GenericComm. Once in this mode, the four arrow keys are valid. Left and right arrow keys will move through the scroll back one line at a time, while the up and down arrow keys will move through scroll back at a full page at a time.
I do not know the limit of the dialing list. The limit would either be the limit of the document structure of the 360 TextTool Kit (65000+ entries), or the limit of the actual list structure which is 255 items I believe.

I have not tested what happens in low memory situations to the scroll back. Results would depend on the 360 TextTool kit used and how it is coded. The same is applicable to the buffered scroll back when turned on.

HST owners:
Because of the design of the HST in regards to error checking settings, when entering a dialing string include the following:
&m0 for 2400 or lower bps connections
&m4 for 9600bps HST connections

Since I am using the IIgs built in firmware there are limitations, including that of buffering. The limit on the IIgs firmware buffer is actually quite large, but to keep the code simple at the moment, I have not modified the internal buffer and it is left at 2048 bytes. On an HST connection, when large amounts of text are flowing into your computer, you will see the screen attempting to display text as fast as possible. I guarantee this will be faster in future versions, but for now you will loose characters after the program gets 2048 characters behind the incoming data.

GenericList is a quick and dirty GS/OS shell program for listing text and source files. Rather than loading a clumsy editor or using the aggravating type command from the APW/ORCA shell, use GenericList!

Features: GenericList is a clean and to the point program which will load a text file and display it. You can scroll up and down, left and right, at very high speed. It can be installed as a shell utility in the APW/ORCA shells.

Why did I write this? I've used an MS-DOS (I know, I know) machine for a while now for telecommunications. I buffered my sessions to disk, and viewed them later with a small program called "l". In the spirit of "l", and the need I had to continually view files and the desire not to load up MaxEdit to view one file, GenericList was born. (I also needed something to do after I cleaned my room up this afternoon).

GenericList is Copyright 1991 by ventureTech. I ask you give this to EVERYONE YOU KNOW. I won't ask for any money, though I will gladly accept some. What I do ask is that whether or not you like the program or will continue to use it that you send me a note saying that you've tried it. My addresses (email and otherwise) are at the bottom of this file. If you could also tell me where you got it from, it would be appreciated as well.

Installing GenericList:

GenericList consists of one EXE file (GS/OS Shell Executable) that can be run from anywhere. If you are installing it in an ORCA/APW system, copy it to your UTILITIES directory. Then edit your SYSTEM/SYSCMDNS file and add the following line:

```
L               *U
```

That way, when APW/ORCA is loaded, L becomes available from any directory.

Using GenericList:

To scroll up by one line: Press the left arrow key.
To scroll down by one line: Press the right arrow key.
To scroll up by one screen: Press the up arrow key.
To scroll down by one screen: Press the down arrow key.
To scroll right by one column: Press the "." key.
To scroll left by one column: Press the "." key.
To quit GenericList: Press space bar or ESC.

About the Program:

You may notice that the source code has been included for your viewing pleasure. I emphasize viewing, as you probably won't be able to compile it yourself. GenericList uses many routines from the TextTool Kit from 360 MicroSystems. (more on 360 MicroSystems later). The program is small, and the source code is reasonably well documented. Note: I am not a classical "C" programmer! I have very BAD habits, which are ingrained into me from years of AppleSoft BASIC, (I vow to torture Hume and Holt), and recently HyperTalk.

There are some limitations to this program that you may run across. If you loads faster than loading it into your memory size, unpredictable results may occur. I have no idea what might happen to your computer. Use caution with big files as the file is completely loaded into the IIgs memory before being displayed.

About the Author:

Matthew Montano is some strange, live by night programmer who works on a variety of projects. Recent IIgs projects include GenericComm v2.0 and several niche market Plus applications (a HyperCard compatible system form IBM's and Macs). GenericComm 2.1 or v3.0 (I haven't decided what version # to give it) is almost done and WILL include Xmodem/Xmodem-1k/Xmodem-4k upload and download abilities. Also recently finished are several programmers utilities for adding quick and dirty help screens to programs. Although my use of computers ranges across MANY platforms, I still have one favorite, the Apple IIgs. I simply enjoy using it and will continue to do little things like this as long as I continue to enjoy using it.

The Future of GenericList:

I will add, very shortly a "search ability" so you can quickly search a text file for a string of text. I will also make this available from the finder by changing the filetype to s16 and adding code to handle MessageByName messages that pass GenericList a filename. There will also be a command that will take all long line (>80) and wrap them to a single screen. Hopefully within a few weeks I'll get to it.

About 360 MicroSystems TextTool Kit:

The TextTool Kit is a library of routines accessible from "C", Assembler and Pascal ORCA/APW languages. It provides an incredible list of routines for managing text files, windows, mice, text ports, pull down menus, menu-lists, direct screen writes and buttons and controls. They are very well debugged (I only found two, and once notified, they were corrected promptly by 360 MicroSystems). Even with the advent of Apple's fantastic GUI based tools, I still believe there is a place for text based tools and programs.

GenericList and GenericComm I think are two righteous applications (a HyperCard compatible system form IBM's and Macs). For the price it is being offered for, you cannot go wrong. I do NOT work for 360 MicroSystems but have just over a $100US with them and am VERY satisfied with the support and products they develop and offer.

360 MicroSystems

Getting in touch with me:

Snail Mail: PO Box 867, Station F, Toronto, ON, M4Y 2N7
This program is dedicated to my girlfriend, Kerry, who has put up with me for 6 months already.

Long live The Cure and decent music everywhere!

Chapter 1

Now that you have downloaded, pirated, or otherwise illegally gotten hold of this fine program, you may wish to make backup copies for yourself (or a friend).

Program requirements:

Enhanced //e,//c with 128k and double hi-res with at least two drives and although a mouse is not required it is strongly recommended.

Along with the program and the docs that came with the original of the program came a IQR interrupt card which if you do not have a mouse re-routes the signals that were suppose to be going to the mouse to the joystick or the keyboard. This is not required, but there will be schemes for anyone wishing to build one out of 15 bux of (good ole) Radio Shack parts.

Boot the boot disk after it says 'OK' in a box press 'return' to continue. If you wish to install the boot on a hard drive hit 'h' a few times right after you press return and follow the instructions there. If not it will automatically load then. It will cycle thru the drives to find the on-line volumes and then the desktop will appear. Once this happens and you get a little arrow, use the U,i,o,j,k,l,n,m',' to move the arrows. You must hold down the open apple key at the same time. Insert the Drivers disk into the second drive and hit closed apple - a,b,c, or d to select which letter represents the drivers disk. Once is done loading the catalog track there will appear 6 icons of drivers for printers, etc... Move the arrow to the OPTIONS and use the 'k' to click that box a menu will appear and you can move the arrow down to the INPUT DEVICE and select the device you wish to use.

Once this has been done things get much easier. Repeat the procedure, but now for the printer, interface, Clock, aux drivers. Then after you have that done. In order for GEOS to load your configuration up when ever you boot the program, you must have the drivers that you selected on the boot disk. You will need to copy those driver files to the boot disk. Refer to Copy Files.

SYSTEM disk

When GEOS is booted it looks for the following things: Drivers on the boot disk or the SYSTEM disk or directory. If you have installed GEOS on your hard drive, you will need to create a folder or (directory) named SYSTEM for GEOS. Select the drive you wish to have the SYSTEM folder by moving the pointer over the disk icons and clicking the chosen one. Click the FOLDER menu or press closed apple - U and you will be prompted for a name. In upper case type SYSTEM and press
return. Once you have done this, you may wish to copy the following files into it:
Desktop, drivers (your selected ones) merge, Geopaint etc. This will be your work or SYSTEM folder where GEOS will go to upon booting. Once you have done this you will be all set up to run the programs and begin your using of GEOS and the other utilities. Refer to Copy Files later in the file.

VIEWing modes
-------------
Go to the view menu or press closed apple G and click the following commands:
: by size (apple S) Sorts items in dir by size, largest item first
by type (apple T) Groups items by file type
by date (apple Y) by date of last modification
by name (apple N) Sorts items alphabetically

Copying files
-------------
Select source disk by clicking icon or hitting closed apple a,b,c, or d. Then click file icon once and then a second later again. Drag the ghost icon (transparent) down to the bottom of the screen and click again. It will do a few disk accesses and then the icon will re-appear down at the bottom. After you have done this for all the files you wish to copy on that page or until the thing is full select the destination disk and click the icon on the bottom of the screen and drag it up to the work space and click again. It will copy the file. Repeat process for other files.

Group Icons:
if you wish to copy more than one icon onto a different disk select the icons by hitting closed apple and then the numbers 1-6 which rep the icons on the work space. After you have highlighted all the files you wish to by copied or dumped or whatever click any of the highlighted icons and then a group ghost icon will appear. This icon reps all the icons (or files) you have selected.

Quick references
----------------
geos
geos info: displays copyrights (ha!) and authors of geos (who cares)
desktop info: displays copyrights
alarm clock: a desk accessory for setting the time.
calculator: quick calculations
note pad: creating memos
photo manager: managing photo albums
text manager: managing text albums

NOTE: the geos menu displays the first eight accessories in SYSTEM folder

apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 427 of 1262
GERMANY 1985

-------------

GERMANY 1985 IS A SIMULATION OF A BATTLEFIELD IN WEST GERMANY BETWEEN NATO AND RUSSIAN FORCES. THE 39 X 28 GRID REPRESENTS 1 MILE PER HEX. EACH TURN REPRESENTS 4 HOURS OF TIME WITH NIGHT REQUIRING 2 TURNS.

UNITS

DUE TO THE LIMITATION OF THE TEXT SCREEN, I CAN NOT GIVE ACCURATE PICTURES OF THE UNITS.

NATO:

TANK BATTALION ARMORED INFANTRY BATTALION (APC) SELF-PROPELLED ARTILLERY (SPG) RECONNAISSANCE BATTALION ENGINEER BATTALION AIR CAVALRY UNIT

RUSSIAN:

TANK BATTALION MECHANIZED INFANTRY BATTALION (BMP) ARTILLERY BATTALION KATUSHKA BATTALION INFANTRY BATTALION ENGINEER BATTALION

A: NATE MARKER IS ALWAYS SOLID, WHILE THE RUSSIANS ARE OUTLINED. THE SYMBOL FOR 2 PIECES ON TOP OF EACH OTHER IS AN S (FOR STACK)

COMMAND KEYS

---------------

1

6 2

*  *

5 3

4

GLOBAL KEYS

---------------

These keys can be used when the cursor is flashing on the screen

B: NIGHT TURNS WILL BE INDICATED BY WHITE TERRAIN UNLESS THIS IS HIT

F: SWITCH TO TEXT/FULL SCREEN

P: DRAW THE STRATEGIC (FULL) MAP

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 428 of 1262
Apple II Computer Info

CTRL-E:
END PLAYED TURN

CTRL-V:
WILL INDICATE STATUS OF ENEMY, FRIEND, OR NEUTRAL UNIT

MOVEMENT KEYS
---------

THE FOLLOWING KEYS ARE USED WHEN A UNIT IS BEING MOVED

H:
SWITCH MOVEMENT TO THE OTHER UNIT IN THE STACK (IF POSSIBLE, OF COURSE)

1-6:
MOVEMENT KEYS (SEE ABOVE)

O:
CENTER UNIT ON SCREEN

S:
SCROLL (SEE ABOVE FOR DETAILS)

Q:
WILL EXIT FROM MOVEMENT PHASE

(ESC):
WILL EXIT FROM MOVEMENT PHASE, BUT IF UNIT HAS NOT MOVED, IT WILL BE able TO MOVE LATER

C:
ALLOW A UNIT TO CHANGE MODE

L:
ALLOW AN UNMOVED UNIT TO BE LEFT

O:
allows player to issue order to unit

CTRL-C:
allows continued combat without moving

CTRL-N:
hides/exposes and unit

SEQUENCE
-------

NATO PLAYED ALWAYS GOES FIRST DURING MOVEMENT PHASE, A PLAYED MAY MOVE AS MANY UNITS AS HE LIKES. BUT, A UNIT CAN ONLY BE MOVED ONCE PER TURN! IF UNIT ENTERS ENEMY CONTROLLED HEX (ECH) IT MUST ENGAGE IN COMBAT, AND IF IT STILL HAS THE MOVEMENT POINTS (MP) AFTER COMBAT, IT CAN CONTINUE MOVING DURING THE MOVEMENT PHASE, THE FOLLOWING INFORMATION IS DISPLAYED:

TERM:
TERRAIN

TYPE:
TYPE OF UNIT MOVING

MODE:
MODE OF UNIT MOVING

TURN:
The turn of game (this number is inverse at night)

SM:MN:NC:
INDICATES (IF INVERSE) IF HEX CONTAINS SMOKE, MINES, OR NUCLEAR CONTAMINATION

EF:
EFFICIENCY OF UNIT

HQ:
DISTANCE TO HQ (* IF IT IS HQ, "-" IF OVER 9 HEXES)

MV:
MP'S REMAINING

STN:
STRENGTH OF UNIT

RAN:
RANGE OF ARTILLERY FIRE

ON THE RIGHT HAND SIDE OF THE SCREEN, THE POSSIBLE DIRECTIONS ARE DISPLAYED:

NORMAL:
MOVEMENT IS POSSIBLE

INVERSE:
MOVEMENT IS IMPOSSIBLE

FLASHING:
HEX IS AND ECH

MOVEMENT POINTS
---------

THE FOLLOWING ARE THE MAXIMUM MP’S ALLOWED TO A UNIT

<table>
<thead>
<tr>
<th>NATO</th>
<th>RUSSIAN</th>
<th>MP</th>
</tr>
</thead>
<tbody>
<tr>
<td>TANK</td>
<td>25</td>
<td>25</td>
</tr>
<tr>
<td>APC</td>
<td>25</td>
<td>25</td>
</tr>
<tr>
<td>SHG</td>
<td>20</td>
<td>18</td>
</tr>
<tr>
<td>AIRCV</td>
<td>30</td>
<td>18</td>
</tr>
<tr>
<td>RECON</td>
<td>30</td>
<td>15</td>
</tr>
<tr>
<td>ENG</td>
<td>20</td>
<td>20</td>
</tr>
</tbody>
</table>

NOTE:
AIRCVC HAVE MP'S OF 15 AT NIGHT

THE ACTUAL NUMBER OF MP'S DEPENDS WHAT MODE IT IS IN, AND WHETHER ITS MAXIMUM MOVEMENT HAS BEEN HALVED. THE FOLLOWING RATIOS ARE USED TO CALCULATE THE INITIAL MOVEMENT ALLOWANCE. (IE. TANK IN NORM MODE WOULD HAVE 25*(3/4) OR 18 MP'S)

<table>
<thead>
<tr>
<th>MODE</th>
<th>RATIO</th>
<th>MODE</th>
<th>RATIO</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFN</td>
<td>0</td>
<td>RIVER</td>
<td>1/2</td>
</tr>
<tr>
<td>REOR</td>
<td>1/4</td>
<td>FIRE</td>
<td>1/2</td>
</tr>
<tr>
<td>SUPRT</td>
<td>1/4</td>
<td>NORM</td>
<td>3/4</td>
</tr>
<tr>
<td>ATCK</td>
<td>1/2</td>
<td>TRANS</td>
<td>1</td>
</tr>
</tbody>
</table>

MODE CHANGE
---------

THE CHANGE MODES, A UNIT MUST EXPEND MP’S BASED ON ITS EFFICIENCY AND THE NUMBER OF SIGHTING ENEMY UNITS (SEU)

EFFICIENCY

COST
6-7                SEU/2
3-5                SEU + 1
0-3                SEU * 2 + 1

WHEN CHANGING MODES, THE * INDICATES THEY THE UNIT CAN'T CHANGE TO THAT
MODE.

NEW MOVEMENT ALLOWANCE:
(MAX MP'S - CHANGE COST) * (NEW MODE RATIO) * (NUMBER MP'S LEFT / NUMBER
OF MP'S AT START)

IN OTHER WORDS (HA!) THE MORE ENEMIES AROUND, THE HARDER IT IS TO
DO ANYTHING

MODES
-------

DEFN:
(DEFENSE) ALLOWS A UNIT TO JUST DEFEND ITSELF

SUPPRT:
(SUPPORT) ALLOWS A UNIT TO SUPPORT THE DEFENSE/OFFENSE OF A
UNIT FROM THE SAME DIVISION

NORMAL:
OBVIOUS (1 HOPE)

TRANS:
(TRANSPORT) INDICATES THAT A UNIT IS USING A ROAD AND IS
VULNERABLE TO COMBAT

RIVER:
ALLOWS A UNIT TO CROSS A RIVER

ATTCK:
(ATTACK) GIVES INCREASED COMBAT ABILITY, BUT LOSES WILL INCREASE

FIRE:
ALLOWS ANY UNIT WITH AN ARTILLERY
RANGE ABOVE 0 TO FIRE

REOR:
(REORGANIZE) INDICATES THAT A
UNIT IS REFITTING AND IS
INCREASING ITS STRENGTH AND
EFFICIENCY)

TERRAIN
-------

<table>
<thead>
<tr>
<th>TERRAIN</th>
<th>MP'S</th>
<th>SIGHTING</th>
<th>COMBAT</th>
<th>DISTANCE</th>
<th>BONUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPEN</td>
<td>2</td>

<td>4</td>
<td>5</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AIRFIELDS AND NUMBERED HEXES ARE TREATED AS OPEN FOR MOVEMENT AND
COMBAT PURPOSES

MOVEMENT IN TRANS MODE COSTS 1MP/HEX AIRCV PAYS 1MP/HEX IN ANY TERRAIN

+2 MP'S TO ENTER SMOKE HEX
+1 MP (+2 IF IN TRANS) FOR EACH SEU
+1 MP IF IN TRANS MODE AND ENEMY HAS AIR SUPPERIORITY

ORDER PHASE
-------------

WHEN MOVING A UNIT, ONE CAN GIVE AND ORDER BY HITTING "C"

1-C:
WILL MOVE UNIT TO APPROPRIATE POINT USING ROAD NET (PRESENCE OF
ENEMIES NEGATES THIS ORDER)

D:
CAUSES UNITS IN NORM AND FIRE MODE TO MOVE AND FIRE DURING THE ENEMIES
MOVING PHASE

X:
WILL CAUSE THE UNIT TO EXIT THE MAP WITH A 25% CHANCE OF COMING BACK
AS A REINFORCEMENT AT THE SAME SPOT 1-3 TURNS LATER, OR BEING
ELIMINATED

V:
WILL CAUSE THE UNIT TO CAPTURE ANY VILLAGES WITHIN 5 HEXES AND
CONTINUE (ENEMIES PRESENT NEGATE THIS ORDER)

F:
WILL CAUSE THE UNIT TO FIRE AT THE BEST TARGET WITHIN RANGE

R:
WILL CAUSE THE UNIT TO RUN UNTIL OUT OF SIGHTING RANGE WHERE IT WILL
CHANGE TO REOR MODE IF POSSIBLE

S:
WILL CALL IN FIRE FROM ARTILLERY AND AIRSTRIKES WITHIN RANGE ON ALL
ENEMY UNITS WITHIN 3 HEXES OF THE MOVING UNIT

M:
WILL CAUSE THE UNIT TO ADVANCE AND FIRE ON ENEMY UNITS

N:
WILL CAUSE THE UNIT TO ADVANCE AND ATTACK ENEMY UNITS

IF THE ORDER CAN NOT BE CARRIED OUT, THE ANNOYING BEEP WILL SOUND AND
CONTROL WILL BE PASSED BACK TO THE PLAYER (NO EFFECT WILL BE TAKE
AGAINST THE UNIT)

HIDDEN MOVEMENT
-----------------

ANY UNIT MAY BE HIDDEN DURING ITS MOVEMENT PHASE PROVIDED THAT:

IT IS NOT STACKED
NOT ADJACENT TO A UNIT
NOT IN TRANS MODE
NOT SIGHTED BY AN ENEMY UNIT
COMMAND TO HIDE:
CTRL-H (OR <-)

IF A HIDDEN UNIT ENTERS TRANS MODE OR FIRES, IT WILL BE "UNHIDDEN"

SIGHTING
-------

A HIDDEN UNIT THAT IS SIGHTED BY AND ENEMY UNIT OR MOVES ADJACENT TO
AND ENEMY HIDDEN UNIT WILL BECOME EXPOSED THE DISTANCE UPON WHICH A
HIDDEN UNIT BECOMES SIGHTED DEPENDS ON:

TERRAIN
NIGHT (MAXIMUM OF 2 HEXES)
IN SMOKE
IF IT IS IN DEFN (1 HEX) OR REOR (2) MODE
WHEN A UNIT IS SIGHTED, THE SPEAKER MAKE A BEEP

DELAYED MOVE

A UNIT GIVEN A DELAYED MOVE IN THE ORDER PHASE OF ITS TURN MAY MOVE DURING THE ENEMIES TURN. UNITS IN FIRE MODE WILL ATTEMPT TO FIRE AT OTHERS AND UNITS IN NORM MODE WILL ATTACK. THE PROBABILITY THAT AN ENEMY UNIT WILL ACTIVATE AN ENEMY UNIT IN DELAYED MOVE DEPENDS ON THE NUMBER OF DELAYED UNITS WITHIN 5 HEXES.

L KEY

WHEN MOVING UNITS, IF YOU CHOOSE TO MOVE A UNIT AND THEN HAVE NOT DONE ANYTHING WITH IT, YOU CAN HIT "L" AND CYCLE AROUND TO THE NEXT UNIT WHILE COMING AROUND TO THE OTHER ONE LATER.

MOVEMENT RESTRICTIONS

NO MORE THEN 2 UNITS IN A HEX
NO UNIT MAY ENTER A UNIT OCCUPIED BY A HIDDEN UNIT
AIRCV’S CAN NOT ENTER RUSSIAN CONTROLLED VILLAGES, TOWNS, OR AIRFIELD HEXES
UNITS IN TRANS MODE MAY ONLY TRAVEL IN ROADS, OPEN TERRAIN, OR NON ENEMY CONTROLLED VILLAGES, TOWNS, AND AIRFIELDS
UNITS IN DEFN MODE MAY NOT MOVE

NIGHT MOVEMENT

DURING A NIGHT TURN, SIGHTING DISTANCE IS LIMITED TO 2 HEXES. AIRCV UNITS HAVE THEIR MOVEMENT ALLOWANCE HALVED.

NIGHT TURNS ARE INDICATED BY WHITE TERRAIN, UNLESS THE "B" KEY IS HIT. THE TURN COUNTER IS INVERSE WHEN NIGHT IS OCCURRING.

NIGHT OCCURS ON TURNS: 5, 6, 11, 12, & 17, 18

COMBAT

WHEN AN ENEMY UNIT ENTERS AN ECH (ENEMY CONTROLLED HEX) OR CTRL-C IS HIT, COMBAT IS INITIATED.

THE COMPUTER RESOLVES COMBAT CONSIDERING:

THE NUMBER OF ENEMIES SIGHTING THE ATTACKER
THE NUMBER OF FRIENDLY UNITS SIGHTING
THE DEFENDER
THE TERRAIN THE DEFENDER IS IN
THE NUMBER OF FRIENDLY UNITS SUPPORTING THE ATTACKER
THE NUMBER OF ENEMY UNITS SUPPORTING
THE DEFENSE
THE DISTANCE FROM COMBAT OF THE RESPECTIVE HQ UNITS
THE EFFICIENCES, STRENGTHS, MODES, AND TYPERS OF THE UNITS ENGAGED
THE AMOUNT OF ARTILLERY FIRE THE DEFENDER HAS SUFFERED

ALL ADJACENT DEFENDING UNITS ARE ATTACKED FIRST BEFORE THE ATTACKING UNIT CAN SUFFER LOSSES. A UNIT SUPPORTS THE ATTACK BY BEING IN SUPPRT MODE, WITHIN 3 HEXES OF ATTACKED, UNMOVED AND WITH NO ENEMY UNITS ADJACENT TO IT. VICE VERSA FOR DEFENDING UNITS. HQ UNITS SUPPORT THE ATTACK IF THEY ARE WITHIN 9 HEXES (BONUS AT 4 HEXES) AND ARE WITHOUT ANY ADJACENT ENEMY UNITS.

ARTILLERY BONUS

AN ENEMY UNIT HIT BY ARTILLERY WILL SUFFER A LOSS IN EFFICIENCY. FOR THE USE OF FRIENDLY COMBAT, ONLY THE FIRST 2 HITS HAVE ANY EFFECT. ARTILLERY WILL NOT AFFECT A RETREATED UNIT.

RETREATS AFTER COMBAT

AFTER COMBAT, A DEFENDING UNIT MAY BE FORCED TO RETREAT. IN THAT CASE, IT WILL SWITCH TO NORM MODE (OR FIRE MODE FOR ARTILLERY) AND RETREAT.

A RETREATING UNIT MUST FOLLOW NORMAL RULES AND NOT ABUSE IT'S MP’S
A RETREATING UNIT CAN’T INITIATE COMBAT
A RETREATING UNIT THAT FAILS TO RETREAT THE REQUIRED NUMBER OF HEXES, WILL SUFFER ADDITIONAL LOSES AND MAY BE DESTROYED. IF THE UNIT CAN NOT RETREAT 1 HEX, IT WILL ENTER DEFENSE MODE.

A UNIT MAY RETREAT ONLY ONCE DURING A TURN. IF IT IS REQUIRED TO RETREAT AGAIN, IT WILL INSTEAD SUFFER LOSSES.

DURING THE NEXT MOVEMENT PHASE, NOT INCLUDING AIRCV UNITS, THE UNIT WILL HAVE ONLY 1/2 NORMAL MP'S.

COMBAT DISPLAY
-----------------
DURING COMBAT, THE FOLLOWING WILL BE DISPLAYED:

UNIT:
TYPE
STRN:
OF THE DEFENDER (LIGHT, MEDIUM, OR HEAVY)
REL:
(Result) SEE LATER IN DOCS FOR EXPLANATION OF COMBAT RESOLUTION

ARTILLERY
---------
A UNIT MAY BE FIRED BY:
PRESS "O" AND THEN "F"
BEING CALLED INTO SUPPORT WHEN IN SUPPORT MODE
OPERATED MANUALLY BY ENTERING FIRE MODE AND HITTING CTRL-F, POSITIONING CURSOR, AND HITTING:
CTRL-F:
FIRE
CTRL-S:
SMOKE
CTRL-X:
RETURN TO MOVEMENT PHASE (WHEN IN THIS PHASE, THE COMMANDS WILL BE DISPLAYED IN INVERSE IF ILLEGAL)

RUSSIAN NOTE: THE RUSSIANS MUST USE THE SAME DIVISION TO SIGHT AN ENEMY

ARTILLERY SIGHTING
------------------
A UNIT MAY ONLY FIRE ON A SIGHTED ENEMY. ANY FRIENDLY UNIT MAY SIGHT A UNIT. A UNIT WILL INCREASE TO A MAXIMUM OF 12 STRENGTH POINTS AND 7 EFFICIENCY.

THE MANUAL APPROACH MUST BE USED TO DO THIS.

AIR POWER
---------
WHEN CTRL-A IS HIT, THE FOLLOWING WILL BE DISPLAYED:

NATO: #: #: RUSSIAN : ALC: KEYS
[A] SUPERIORITY : SPARE #: #: 0-9
[T] AC. SUPPORT : STRIKE #: #: C/F
#--A NUMBER BETWEEN 0-9

THE SIDE IN INVERSE HAS SUPERIORITY. IF BOTH SIDES ARE NORMAL, NEITHER HAS SUPERIORITY.

AIR SUPERIORITY
---------------
WHEN THE MENU IS DISPLAYED, THE PLAYER MAY ALLOCATE 0-9 POINTS. THIS IS DONE BY HITTING "A" AND THEN THE NUMBER.

SUPERIORITY IS DECIDED BY THE SIDE WHICH HAS MORE POINTS. A PLAYER MAY GET 1-2 EXTRA POINTS IF HE HAS HELF SUPERIORITY FOR MORE THAN 2 TURNS.

TACTICAL AIR STRIKES
---------------------
IN TURNS 0-3, A PLAYER CAN ALLOCATE 3 STRIKES. THIS CAN BE CHANGED BY 1-2 DURING THE LATER TURNS.

TO ALLOCATE THE STRIKES, HIT "I" AND MOVE THE CURSOR TO THE PLACE YOU WANT AND HIT CTRL-F TO PLACE THE CURSOR.

ON THE PLAYER'S NEXT TURN, WHEN CTRL-A IS HIT, AIR STRIKE MARKERS WILL APPEAR AT THE DESIGNATED PLACES. THEY MAY THEN BE CALLED IN BY UNITS ORDERING SUPPORT WITHIN 3 HEXES. IF THE OPPONENT HAS AIR SUPERIORITY, THE STRIKES FAIL TO APPEAR.

ARTILLERY
--------- MINES AND NUCLEAR
---------------
A UNIT MAY BE FIRED BY:
PRESS "O" AND THEN "F"

BEING CALLED INTO SUPPORT WHEN IN SUPPORT MODE

OPERATED MANUALLY BY ENTERING FIRE MODE AND HITTING CTRL-F, POSITIONING CURSOR, AND HITTING:
CTRL-F:
FIRE
CTRL-S:
SMOKE
CTRL-X:
RETURN TO MOVEMENT PHASE (WHEN IN THIS PHASE, THE COMMANDS WILL BE DISPLAYED IN INVERSE IF ILLEGAL)

RUSSIAN NOTE: THE RUSSIANS MUST USE THE SAME DIVISION TO SIGHT AN ENEMY

ARTILLERY SIGHTING
------------------ A HIDDEN UNIT IN REOR MODE HAS A SIGHTING DISTANCE OF 2 HEXES

A UNIT MAY ONLY FIRE ON A SIGHTED ENEMY. ANY FRIENDLY UNIT MAY SIGHT A UNIT. A UNIT WILL INCREASE TO A MAXIMUM OF 12 STRENGTH POINTS AND 7 EFFICIENCY.

THE MANUAL APPROACH MUST BE USED TO DO THIS.

BRIDGING
---------
THE ENGINEER UNIT CAN BE USED TO AID UNITS CROSSING A RIVER.
SAVING THE GAME
-----------------

TO SAVE THE GAME AT ANY TIME, JUST HIT CTRL-B. A SPECIAL SSI SAVE
DISK MUST BE INITIALIZED TO DO THIS.

TO RELOAD THE GAME, REPEAT THE CTRL-B PROCESS, BUT POSITION THE ARROWS
NEXT TO A NAME AND HIT <RETURN>. YOU CAN ALSO USE THE RESTART GAME
FEATURE ON THE MAIN MENU.

LEVEL STRUCTURE
-----------------

THERE ARE 3 LEVELS OF PLAY. I SUGGEST THAT YOU START OUT ON THE
EASIEST LEVEL OR THE COMPUTER WILL BEAT THE CRAP OUT OF YOU. CHANCES
ARE IT WILL DO THAT ANYWAY.

SCENARIOS
---------

GAME WILL END AFTER THE 20, 21, OR 22 TURN. THERE IS A 50% CHANCE IT
WILL END ON TURN 21, AND A 25% CHANCE FOR TURNS 20 AND 22.

ADVANCE TO COMBAT:

NEITHER PLAYER CAN GET AIR SUPERIORITY FOR THE FIRST 2 TURNS

INVASION:

THE RUSSIAN PLAYER HAS AIR SUPERIORITY FOR THE FIRST 2 TURNS. IN TURN
0, THE NATO PLAYER HAS THE OPTION OF SETTING UP HIS FORCES. THE
RUSSIAN SIDE PLACES 2 DROP ZONES FOR PARATROOPERS. IT IS A GOOD IDEA
TO PLACE THESE APART, BECAUSE IF A UNIT ATTEMPTS TO LAND ON A STACK,
IT WILL FAIL TO ARRIVE AND BE LOST FOREVER.

VICTORY
-------

VICTORY IS ATTAINED BY WHO CONTROLS THE MOST VILLAGES, TOWN, ETC.
USUALLY, WHEN YOU ARE PLAYING AND ONE SIDE IS KILLING THE OTHER, IT IS
BORING TO CONTINUE ANYHOW.

TYPE MODE TABLE
-----------------

Y = LEGAL  N = ILLEGAL

ENG 1 4 1 5 4 0

THIS CONCLUDES THE GERMANY 1985 DOCS.
When you arrive at the site of the disturbance, take the following steps with the joystick...

> Direct the first Ghost Buster toward the center of the building and push the button to deposit the trap. Then move him to the far left side of the screen, turn him towards the trap, and press the button again.

> The second Ghost Buster appears. Direct him to the far right of the screen, turn him toward the trap, and press the button. Both Ghost Busters will power up their negative ionizer backpacks.

> Move the Ghost Busters inwards to trap the slimer between the streams. But do Not, repeat do NOT, cross the streams.

> When you have the slimer over the trap, push the button... the trap will pull him in. (Be precise: if you miss, you know what will happen).

> Every trapped Slimer increases your credit rating. The amount earned depends on how quickly you respond. Your accumulated credit is shown on the screen at all times.

IMPORTANT SAFETY TIPS

> Hit the space bar during the game for a status report.

> Every escaped Slimer adds 300 to the city's PK energy level.

> Beware that monolith of marshmallow monstrosity. When a Marshmallow Alert flashes at the bottom of the screen, the Roamers will quickly run to inform him. You must immediately hit the "B" key to drop a dollop of bait before he stomps on any buildings.

END OF GAME: THE TEMPLE OF ZUUL

The game ends in one of three ways:

1. the Gatekeeper and Keymaster join forces at the Temple of Zuul and you have NOT earned more money than you started with.

2. Once the Gatekeeper and Keymaster have joined forces at Zuul, you DO have sufficient credit, but you are unable to sneak two of your three Ghost Busters into the entrance of Zuul.

3. You successfully reach the top of the Temple of Zuul by sneaking two Ghost Busters into its entrance.

THE STREETS

Steer the vehicle at passing Roamers (if you have frozen any) and push the button to vacuum them up. This keeps them from reaching the temple of Zuul. The city's PK energy lever jumps 100 points for each Roamer that reaches Zuul.

**Apple II Computer Documentation Resources (a2_docs_documentation.msw)**  
**DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 435 of 1262**
INTRODUCTION

Greetings: This manual is designed to assist you in the execution of commands found on your Gleaners diskette. The sequence of commands on the diskette corresponds to the steps in the manual.

As you proceed with the execution of the Glean program, the research potential for home and school becomes apparent. I feel that the development of research and computer skills with the use of the program makes for a winning combination.

It has been the intention from the beginning to share this program with students and educators. For all curious individuals who seek knowledge, especially with the help of National Geographic (R) magazines, I wish you the best of luck with this program!

I wish to thank my wife Trish, who's inspiration initiated the program, and who's many hours of data entry helped produce the final product.

Feel free to write or communicate with me at any time.

John Rubin

MAKING BACKUP DISKETTES

When you receive your Gleaners Index diskette, first make backup copy of it, then store the original in a safe place.

1) Format one blank diskette with the DOS format command, using DOS version 2.1 or higher.

2) Place the original Gleaner Diskette in drive A, and a new formatted diskette in drive B. At the A> type "copy *. E:"

CONTENTS OF DISKETTES

Glean.exe - Main program
Cat1.rec - People category file
Apple II Computer Documentation

**Using GLEAN.EXE**

Boot up the computer using DOS. Insert Disk #1 in drive A. At the A> type "Glean" and press enter (return).

An introductory screen will appear. To proceed into the program, press any key.

---

**The Windows**

Window #1 is the title window. In it will be the program name and the selection title.

Window #2 is the action window. It will either contain a menu or it will be where records are displayed, edited, deleted, added or searched for.

Window #3 is the key selection window. This window will display active keys and what they do.

---

**Special Keys**

F1 - The F1 key is the Help Key and it will activate a help window which corresponds to the screen you are viewing. You may use the PgUp, PgDown and ESC Keys to view the help file or exit the help file.

ESC - The ESC key will always bring the program back to the previous step in the program. Examples: if you are printing a category it will stop the printing, if you are at the main menu it will exit the program.
Below is a display of the CATEGORY MENU used in the program. You may search for the subject in any category by typing the corresponding number or all of the categories by typing "7".

**MAIN MENU**

There are 5 selections in the MAIN MENU as seen below.

GLEANERS NATIONAL GEOGRAPHIC (R) INDEX

(1) Search for a subject
(2) Display a category
(3) Print a category
(4) Edit or delete existing records
(5) Add new records

PLEASE MAKE YOUR SELECTION

TYPE IN THE CORRESPONDING NUMBER

SEARCH FOR A SUBJECT

At the MAIN MENU type in "1".

A) Entering a subject

You will be asked to type in any subject. At the question, type in a subject and press return.

The subject may be typed in any combination of upper or lower case letters. The subject matter may be as specific as "archeology under the sea" or a general as the letter "a". The program will search the files for the subject and print a list of articles which contain this subject.

B) Selecting a category
INDEX. Type "3" at the MAIN MENU. You will be asked for a password.
Type "PLEASE" and the CATEGORY MENU will appear.

Type in the corresponding number for the category you wish to print
or type "7" to print a complete category index.

DISPLAY A CATEGORY

Selection #2 of the MAIN MENU will print to the screen any or all
of the category files.

Upon typing "2" the CATEGORY MENU will appear. You may view any
category by typing the corresponding number.

The file will be displayed on the screen. You may scroll through
the file using the following keys.

Up & Down Arrows - Moves up or down one record.
PgUp & PgDown - Moves up or down one screen.
Home - Move to the first record.
End - Moves to the last record.

PASSWORD PROTECTION

Selection 3, 4 and 5 of the main menu, print a category, edit or
delete a record and add new records, are password protected.
The password is "PLEASE" is capital letters.

PRINT A CATEGORY

Selection #3 of the MAIN MENU will print out a copy of GLEANERS
EDIT OR DELETE EXISTING RECORDS

Selection #4 of the Main Menu will edit, delete or add records to an existing category file. Type "4" at the MAIN MENU. You will be asked for a password. Type "PLEASE" and the CATEGORY MENU will appear.

Type in the corresponding number for the category you wish to edit. Records can be added, deleted or edited to the selected category. There is a maximum number of 200 records which can be added or edited at any one session. If disk space is limited the number of records which can be edited will be displayed in window #3, the bottom window next to REC.

Use the SCROLL KEYS to select a record to edit or delete by moving the pointer to the desired record.

Use the SELECTION KEYS to either Edit a record, Mark a record for Deletion or Add a new record to the file.

Use the EDITING KEYS to perform the actual editing or adding of records.

***************************************************************************
*Each field, (Category, Title, Volume, Number & Date) is completed by pressing the ENTER key. The Record is completed when the ENTER key is pressed after the Date field. The Record that the pointer is sitting at when you escape out is not recorded.***************************************************************************

THE POINTER — >>>

SCROLL KEYS

Up Arrow & Down Arrow — Moves the pointer either up or down through the displayed records, one record at a time.

PgUp & PgDn — Moves the pointer either up or down through the displayed records, one page at a time.

Home — Moves the pointer to the first record.

End — Moves the pointer to the last record.

SELECTION KEYS

F1 - Help Key
F7 - Edit Key - Starts the editing of the record at the pointer.
F9 - Add Key - Starts the add records mode. Records are added continously until the ESC key is pressed. The record at the pointer upon quiting is not recorded.
(SELECTION KEYS cont.)

F10 - Delete Key - Toggle key for deleting or undeleting a record at the pointer. A deleted record will have a "D" next to the record.

<ESC> - Escape Key - Ends the add record session. The records are then sorted and recorded in the appropriate category file.

EDITING KEYS

Left Arrow & Right Arrow - Moves the cursor left or right one character.

Home - Moves the cursor to the beginning of the word, number or date.

End - Moves the cursor to the end of the word, number or date.

Ins - Inserts a space between two characters at the cursor.

Del - Deletes a character at the cursor.

Back Arrow - Deletes one character back.

Enter - Accepts the field and moves to the next field or if on the date field it moves to start of the next new record.

Esc - Quits to the Selection Screen. The record at the pointer is not recorded.

FIELD LIMITATIONS

CATEGORY - Only the selected category can be entered and is set by

<table>
<thead>
<tr>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. - People</td>
</tr>
<tr>
<td>2. - Place</td>
</tr>
<tr>
<td>3. - Event</td>
</tr>
<tr>
<td>4. - Animal</td>
</tr>
<tr>
<td>5. - Vegetable</td>
</tr>
<tr>
<td>6. - Object</td>
</tr>
</tbody>
</table>

TITLE - Any character is accepted. The field cannot be left blank.

VOL. - Any number between 0 & 999 may be entered. The field cannot be left blank.

NUM. - Any number between 0 & 9 may be entered. The field cannot be left blank.

DATE - Any date up to the year 2999 is accepted. The date is entered as MM/DD/YYYY. The MONTH is 2 numbers. The DAY is 2 numbers. The YEAR is 4 numbers. The Date Field may be entered with or without slashes. The Date is checked for a valid date when the enter key is pressed.
APPLE II COMPUTER INFO

ADD NEW RECORDS

Selection #5 of the Main Menu will Add new records to any category file. Type "5" at the MAIN MENU. You will be asked for a password, type "PLEASE".

Press the F9 key to start adding records.
Press the ESC key to end adding records.
Records can be added to any category. There is a maximum number of 200 records which can be added or edited at any one session. If disk space is limited, the number of records which can be edited will be displayed in window #3, the bottom window next to REC.
Use the SCROLL KEYS to select a record to edit or delete by moving the pointer to the desired record.
Use the SELECTION KEYS to either Edit a record, Mark a record for Deletion or Add a new record.
Use the EDITING KEYS to perform the actual editing or adding of records.

***************Important***************
*Each field, (Category, Title, Volume, Number & Date) is completed by pressing the ENTER key. The Record is completed when*
*the ENTER key is pressed after the Date field. The Record that*
*the pointer is sitting at when you escape out is not recorded. *

SEE EDITING RECORDS FOR DETAILS OF KEYS.

STARTING A NEW DATABASE

If you wish to create an index for another magazine or set of books, you may do this with GLEANERS INDEX. To do this, erase the Cat$.rec files and Gleaners Index will create new files when you add new records using the ADD NEW RECORD selection.

Another method would be to delete all the records from the Cat$.rec files using the EDIT OR DELETE RECORD selection. Either method will allow the user to create a new index.

GOOD LUCK !!!

If you need help or find a bug, give me a call or drop me a line.
The registration fee for Gleaner's Index is $15. If you use this program you should register with us. The fee is not an exorbitant amount of money and it encourages the production of both new and better programs for you and your children to enjoy.

Please send the registration to:
GLEANERS'S PRINTING
P.O. Box 617
Kingston, Nova Scotia  BOP 1RO
Canada

******* Thank you for supporting shareware software *******
John Rubin
INTRODUCTION

Computers are tools. The flexibility of a tool determines how useful it is. Early computers were much like the one this software was written for: the Apple Igs. They could only run one program at a time, and their usefulness was limited to what the particular program the user was executing offered. In the late 1960's, a team of researchers at AT&T began developing the Unix operating system. Unix's design was partially based on the premise that most programs are 1/0 bound, i.e. most of the time the program executes is spent waiting for user input or other 1/0 operations. While one program is waiting for 1/0, why not allow another program to execute? This is what AT&T did, and the result was one of the most successful computer projects ever. The Apple Igs, like the Macintosh it is modelled after, provides very limited multitasking abilities in the form of desk accessories (NDAs). The programs in the NDA menu are available in whatever application you as long as it follows Apple's guidelines. However, there are many graphics based programs that don't support NDAs, and in addition there is a wealth of software that has been developed for the Byte Works' Orca environment. This environment is mainly text-based, and thus makes access to NDAs impossible. As if that wasn't enough, it's very difficult to write an NDA to allow the application to keep running. So the benefits are lost, and we're back at ground zero.

Enter the GNO system. What was once just dreamed about is now a reality. GNO provides an environment that is almost entirely compatible with software developed for the Orca environment. But GNO provides a wealth of new abilities, lots of new ground for developers and users alike.

Before we begin describing, we'd like to rebuttal those who say such a multitasking system isn't possible on the Igs. Obviously it isn't. But GNO provides a method of impeccable indexing, via the grep program. The manpages detail exactly this way so that one need not constantly refer to a printed manual. It also provides a sort of 'textbook' understanding of how the system as a whole works. At the end of the manual you will find a canonical list of all the system calls. These are presented in a Unix manpage format. This means you will find these call descriptions on the GNO distribution disk. They are provided in such a way that old software can take advantage of these new features without modification. Following is a complete description of all the changes affected. Each section has call names in text, followed by a list of the specific GS/OS or Toolbox calls affected.

Mutual Exclusion in GS/OS and Toolbox calls

The Apple IIGS was not designed as a multitasking machine, and GS/OS and the ToolBox reflect this in their design. There are no processes with mutual exclusion. The GS/OS calls effected First off, GNO provides pre-emptive multitasking. Many programs can be executing at the same time. When a program is terminated (a 'process'). Each process is allowed to run for a short period of time (1/60th of a second on average). When its time runs out, the process is terminated, and the next process is started. This cycle continues. There are no more processes with mutual exclusion. The process itself, and the most starting up processes to run in 'the background' is a simple matter of adding a few characters to the Orca shell commands you're already familiar with. As mentioned before, most existing applications are compatible with GNO. GNO provides a new shell that takes full advantage of the multitasking ability provided. The most important feature of the shell is process control (starting them up, killing them, and suspending them). But the shell also provides power never before seen on the Apple Igs. The ability to choose files by 'wildcard' has been around for a while, but GNO takes this to a new level with 'regular expressions', a very powerful but yet simple programming language. Other benefits of the GNO shell are too numerous to mention. (see the chapter on the Shell for details).

In addition to being compatible with the Orca system, GNO is a very powerful programming environment. All the tools needed to control processes, support Inter-Process Communication, and other tools needed in a multitasking environment, (see the chapter on Kernel calls for details). GNO also has an all new, completely consistent method for accessing serial and console I/O. The Igs TextTools have been incredibly enhanced to provide a truly all-encompassing development environment. Imagine being able to attach terminals to your GS, and have a useful shell in each one. Multiuser BBSs, remote dial-ups, UUCP or SLIP that doesn't take over your computer- the applications are endless!

GNO works wonderfully with accelerator boards- in fact, software can work faster under the GNO environment than normal! Because programs no longer take processor time whenever an I/O event occurs, they also aren't constantly accessing the I/O memory- accelerator boards have to slow down and flush their caches when I/O is accessed. As an example, a GS/OS telecommunications program was 10-15% faster during file transfers.

With all this talk of shell utilities, have desktop users (users of programs like Prizm) been left behind? Absolutely not. GNO lets you run a desktop program to run concurrently, but it does let you run a desktop program with as many text applications as you like. In other words, no functionality is lost from the Igs by using GNO.

Finally, the GNO environment comes with a large number of free utilities that bring some of the power of a Unix system to the Igs. Also, a number of programming libraries are included that make it easy to port programs from Unix or MS-DOS systems to the Igs. A whole new world of software awaits the Igs.

GNO by itself does not require any resources above what you normally use in your development environment. However, if you're going to be running several large programs at once (for instance, background communications software or multiple compilers in the background), then you're definitely going to need as much RAM as you can afford. Also, since the Igs is by no means a speed demon, an accelerator card is recommended.

The next several chapters describe the resources provided by the GNO system in a general manner. They deal mainly with concepts, and exist to provide an overview and a sort of 'textbook' understanding of how the system as a whole works. At the end of the chapter there is a list of all the calls and functions that are available in the system calls. These are presented in a Unix manpage format. This means you will also find these call descriptions on the GNO distribution disk. They are provided in this manner so that one need not constantly refer to a printed manual. It also provides a method of impeccable indexing, via the grep program. The manpages detail exactly what the programmer must do in order to use the system calls, and also exactly what effect it has done.

NOTE: The material in this manual is of a technical nature. It is intended mainly for programmers who wish to write applications which take advantage of GNO's features. For information on using the shell, see the GNO Shell User's Manual.

Chapter 1: Modifications to GS/OS

The GNO system modifies the behavior of a number of GS/OS calls in order to allow many programs to take advantage of new features. Some of these new features are:

First off, GNO provides pre-emptive multitasking. Many programs can be executing at the same time. When a program is terminated (a 'process'). Each process is allowed to run for a short period of time (1/60th of a second on average). When its time runs out, the current process is set aside and another one chosen to run next. This cycle continues. There are no more processes with mutual exclusion. The most starting up processes to run in 'the background' is a simple matter of adding a few characters to the Orca shell commands you're already familiar with. As mentioned before, most existing applications are compatible with GNO. GNO provides a new shell that takes full advantage of the multitasking ability provided. The most important feature of the shell is process control (starting them up, killing them, and suspending them). But the shell also provides power never before seen on the Apple Igs. The ability to choose files by 'wildcard' has been around for a while, but GNO takes this to a new level with 'regular expressions', a very powerful but yet simple programming language. Other benefits of the GNO shell are too numerous to mention. (see the chapter on the Shell for details).

In addition to being compatible with the Orca system, GNO is a very powerful programming environment. All the tools needed to control processes, support Inter-Process Communication, and other tools needed in a multitasking environment, (see the chapter on Kernel calls for details). GNO also has an all new, completely consistent method for accessing serial and console I/O. The Igs TextTools have been incredibly enhanced to provide a truly all-encompassing development environment. Imagine being able to attach terminals to your GS, and have a useful shell in each one. Multiuser BBSs, remote dial-ups, UUCP or SLIP that doesn't take over your computer- the applications are endless!

GNO works wonderfully with accelerator boards- in fact, software can work faster under the GNO environment than normal! Because programs no longer take processor time whenever an I/O event occurs, they also aren't constantly accessing the I/O memory- accelerator boards have to slow down and flush their caches when I/O is accessed. As an example, a GS/OS telecommunications program was 10-15% faster during file transfers.

With all this talk of shell utilities, have desktop users (users of programs like Prizm) been left behind? Absolutely not. GNO lets you run a desktop program to run concurrently, but it does let you run a desktop program with as many text applications as you like. In other words, no functionality is lost from the Igs by using GNO.

Finally, the GNO environment comes with a large number of free utilities that bring some of the power of a Unix system to the Igs. Also, a number of programming libraries are included that make it easy to port programs from Unix or MS-DOS systems to the Igs. A whole new world of software awaits the Igs.

GNO by itself does not require any resources above what you normally use in your development environment. However, if you're going to be running several large programs at once (for instance, background communications software or multiple compilers in the background), then you're definitely going to need as much RAM as you can afford. Also, since the Igs is by no means a speed demon, an accelerator card is recommended.

The next several chapters describe the resources provided by the GNO system in a general manner. They deal mainly with concepts, and exist to provide an overview and a sort of 'textbook' understanding of how the system as a whole works. At the end of the chapter there is a list of all the calls and functions that are available in the system calls. These are presented in a Unix manpage format. This means you will also find these call descriptions on the GNO distribution disk. They are provided in this manner so that one need not constantly refer to a printed manual. It also provides a method of impeccable indexing, via the grep program. The manpages detail exactly what the programmer must do in order to use the system calls, and also exactly what effect it has done.

NOTE: The material in this manual is of a technical nature. It is intended mainly for programmers who wish to write applications which take advantage of GNO's features. For information on using the shell, see the GNO Shell User's Manual.

Chapter 1: Modifications to GS/OS

The GNO system modifies the behavior of a number of GS/OS calls in order to allow many programs to take advantage of new features. Some of these new features are:
allowed to run. The changing of machine registers to make the processor execute a program (such as the program counter, register values, etc) is termed pre-emptive multitasking, which means that processes are interrupted after executing a program and are placed in a queue. The next process to execute is determined by the system. This is called round-robin scheduling. Under certain circumstances, a process can actually execute longer than its allotted time slice because of a GS/OS or ToolBox call. In these cases, as soon as the system call is finished the process is interrupted.

Processes can give up the rest of their time slice voluntarily (but not necessarily explicitly) in a number of ways, terminal input being the most common. In this case, the rest of the time slice is allocated to the next process in line (to help smooth out scheduling). Other processes waiting on some event may also be blocked. There are many ways this can happen, and each will be mentioned in its place.

An important item to remember is the process ID. This is a number which uniquely identifies a process. If a process is created, it is assigned, and is made available for reassignment when the process terminates. A great many system calls require process IDs as input. Do not confuse this with a userID, which is a system for keeping track of memory allocation by various processes. It is handled (or not at all) by the Memory Manager toolset. Finally, do not confuse Memory Manager userIDs- numbers which are assigned to the various human users of a mutlisystem.

There are two methods for creating new processes- the system calls fork() and exec() (specifics for calling these functions and others is in the appendix "System calls"). fork starts up a process which begins execution at an address you specify. exec starts up a process by loading an executable file (S16 or EXE). fork is used mainly for use inside a specific application, such as running shell built-ins in the background, or setting up independent entities inside a program. Forked processes have some limitations, due to the hardware design of the IIGS. The parent process (the process which called fork) must still exist when the children die, either via kill() or by simply exiting. This is because the forked children share the same memory space as the parent; the memory the children execute from is tagged with the parent's userID. If the parent terminated, the children's code would be deallocated and likely overwritten. A second caveat is that the difference between it's UNIX fork and the GS/OS fork lies in the way the calling process executes after the call to fork. This cannot be accomplished on the IIGS because virtual memory is required for such an operation; the need to specify a fork child as a C function prototype and the knowledge of the calling process's data is not necessarily handled by the Memory Manager toolset. It is not possible for GS/OS to accomplish this in a GS/OS environment. The system call to accomplish this is called fork().

Chapter 3: Process Management

Before discussing process management using Kernel calls, it would be wise to define just what we refer to when we say process. A process is generally considered to be a program in execution. "A program is a passive entity, while a process is an active entity." (Operating Systems Concepts p.73, Silberschatz and Peterson, Addison-Wesley, 1989). The concept of process includes the information a processor needs to execute a program (such as the program counter, register values, etc). In order to execute multiple processes, the operating system (GNO and GS/OS in this case) has to make decisions about which process to run next. GNO supports what is termed pre-emptive multitasking, which means that processes are interrupted after a certain amount of time (their time slice), at which point another process is allowed to run. A process is allowed to run. The changing of machine registers to make the processor execute a program is called a context, and the information necessary for this is called it's context. The kernel maintains a list of all active processes, and assigns time slices to each process according to their order in the list. When the kernel has made changes to all the processes, it begins the list again at the next process in the list. This is called round-robin scheduling. Under certain circumstances, a process can actually execute longer than it's allotted time slice because of a GS/OS or ToolBox call. In these cases, as soon as the system call is finished the process is interrupted.

Processes can give up the rest of their time slice voluntarily (but not necessarily explicitly) in a number of ways, terminal input being the most common. In this case, the rest of the time slice is allocated to the next process in line (to help smooth out scheduling). Other processes waiting on some event may also be blocked. There are many ways this can happen, and each will be mentioned in its place.

An important item to remember is the process ID. This is a number which uniquely identifies a process. If a process is created, it is assigned, and is made available for reassignment when the process terminates. A great many system calls require process IDs as input. Do not confuse this with a userID, which is a system for keeping track of memory allocation by various processes. It is handled (or not at all) by the Memory Manager toolset. Finally, do not confuse Memory Manager userIDs- numbers which are assigned to the various human users of a mutlisystem.

There are two methods for creating new processes- the system calls fork() and exec() (specifics for calling these functions and others is in the appendix "System calls"). fork starts up a process which begins execution at an address you specify. exec starts up a process by loading an executable file (S16 or EXE). fork is used mainly for use inside a specific application, such as running shell built-ins in the background, or setting up independent entities inside a program. Forked processes have some limitations, due to the hardware design of the IIGS. The parent process (the process which called fork) must still exist when the children die, either via kill() or by simply exiting. This is because the forked children share the same memory space as the parent; the memory the children execute from is tagged with the parent's userID. If the parent terminated, the children's code would be deallocated and likely overwritten. A second caveat is that the difference between it's UNIX fork and the GS/OS fork lies in the way the calling process executes after the call to fork. This cannot be accomplished on the IIGS because virtual memory is required for such an operation; the need to specify a fork child as a C function prototype and the knowledge of the calling process's data is not necessarily handled by the Memory Manager toolset. It is not possible for GS/OS to accomplish this in a GS/OS environment. The system call to accomplish this is called fork().
If your applications require the GNO Kernel to be active (if it makes any kernel calls), then make sure this is so by checking the output of the kernVersion function. The call will return no error if the kernel is active, or it will return an error code of 0001 (Tool locator tool not found), in which case the value returned will be indeterminate if the kernel is not active, so you should only check for an error (toolerror() or _ toolErr in C, the value in the A register in assembly).

You can also determine the current version of GNO by making the kernVersion call. The format of the version number returned is the same as all the standard tools, and is documented in the Toolbox Reference.

Terminal I/O
The Apple II has always been lacking in standardized methods for reading keyboard input and controlling the text screen. This problem was compounded when Apple stopped supporting the TextTools in favor of the GS/OS Console Driver. The Console Driver has a number of problems that prevent it from being a good solution. There is high overhead involved in using it. It must be accessed like a regular file, which means any I/O on it must filter through several layers before being handled. There is no provision for patching the low-level routines, so it can be used over a modem or in a desktop program. And GS/OS must be called to access it, which means that while a Console Driver access is occurring, no other processes can execute (see Chapter 1).

GNO ignores the console driver and replaces the TextTools with a high-performance, very flexible generic terminal control system. GNO directly supports the console (keyboard and screen), as well as the serial ports, as terminals. In order for a user program to take advantage of these features and to be GNO compliant, you must do terminal I/O only through the TextTools. Calls to the GS/OS console driver will not crash the system, but they will make other processes stop until the call is completed. You must not get input directly from the keyboard latch (memory location $80COC00), nor may you write directly to the screen memory. The TextTools Terminal I/O system has been designed so you don't have to do either of these things. If you need to wait for keyboard input without stopping your application, you can make the appropriate Control call (see the chapter on Terminal I/O) to put the tools in the proper mode.

(Note: late breaking news has it that Apple has modified the Console Driver to allow patching of the low-level I/O routines. This means that Console Driver support can very likely be added to GNO while still maintaining current functionality. We salute this move on Apple’s part—keep up the good work!)

Stack Usage
Stack space is at a premium on the IIgs. Process stacks can only be located in Bank 0—a total of 64K. This theoretical limit doesn't apply, however, as GS/OS and other bits of system software reserve a large chunk of this without any way to reclaim it. There is approximately 48K of usable stack space. This space also has to be shared with direct page space for Tools and certain device drivers, however. For a program to be GNO compliant, stack usage analysis must be done and acted upon. Use of the stack should be minimized, in order that many processes can coexist peacefully. From experience we've found that 1K usually suffices for well-written C applications, and at a maximum 4K can be allocated. Assembly language programs are very efficient when it comes to use of the stack. The 1K provided by default to applications is usually more than enough for assembly language programs. However, C programs can use up tremendous amounts of stack space, especially if recursion is employed or string manipulation is done without concern for stack usage. Below are some hints to keep stack usage at a minimum.

- Avoid use of large local arrays and character strings. Instead, dynamically allocate large structures such as GS/OS strings with malloc() or the Memory Manager.
- Try not to use recursion unless absolutely necessary. All recursive functions can be rewritten using standard loops and creative programming. This is a good general programming rule—your program will run faster.
- Since GS/OS projects generally will not be desktop-based, make sure you judge how much stack your program will require and use the #pragma stacksize directive to limit how much stack space Orca/C tries to allocate for your program.

Disk I/O

Since the Apple IIgs doesn’t have coprocessors to manage disk access and the serial ports, either of these requires the complete attention of the main 65816 processor. This can wreak havoc in an environment with slow disks or high-speed serial links, as accessing disks usually results in turning off interrupts for the duration of the access. This situation is undesirable with a DMA disk controller, such as the Apple High Speed SCII or CV Technology RAMFast. But this isn't as bad as it sounds; the IBM PC and Macintosh also suffer from this problem, and the solution is robust programming. Make sure your communications protocol can handle errors where expected data doesn't arrive quite on time, or in full. The best solution would be an add-on card with serial ports and an on-board processor to make sure all serial data was received whether or not the main processor was busy (this is a hint to some enterprising hardware hacker, by the way).

Yet another concern for GNO applications is file sharing. GS/OS provides support for file sharing, but it is up to the application author to use it via the requestAccess field in the Open() call. GS/OS only allows file sharing if all current references to it (other instances of the file being opened) are read-only. GNO authors should use read-only access as much as possible. For example, an editor doesn't need write permission when it's initially reading in a file. Note that the fopen() call in C supports read-only mode.

INTERMEDIATE ALPHA RELEASE NOTES (August 10, 1991)

Known Bugs
GNO crashes if AppleTalk in turned on
Some programs (most notably editors like emacs and ROSE) lose characters due to conflicts with the GNO keyboard buffering scheme.
There is a random error that occasionally closes files when loading a program. This most often manifests itself when running programs in the gshrc file, but can wreak havoc elsewhere. Try 'ls & ls'. I've had trouble with an old version of magen not being able to find files.

Features
GNO now supports restartable programs, if they terminate with a Quit call and set the appropriate flags (the way Apple recommends it be done). Programs that I know support this are emacs. All applicable Shell Utilities will also support this at the next release.

About this special alpha version of GNO:
We have decided to release GNO in this partially-finished state for a couple reasons:
1) We want as much outside user commentary and suggestions as we can get. The feedback we receive on this alpha version will to a large degree determine the course of GNO, regarding functionality and features.
2) We wish to make a statement that this project is here, it's real, it's NOW. We want to make this clear to Apple and to other development community members. We want your support, and the best way of achieving that is showing what we have, and asking you where we should go.

Thanks for trying out the GNO system. I believe it can be a tremendous boost to the Apple II community; and it starts with you.

Sincerely,
Jawed Rizvi

p.s. Remember - if someone comes up to you on the street and offers you some IBM, Just Say GNO!
EXECVE(2)  SYSTEM CALLS  EXECVE(2)

NAME
exec  - load an executable file and launch as a new process

SYNOPSIS
#include <kerntool.h>

int exec(char *pathname, char *cmdline);

DESCRIPTION
exec is an alternative method for launching a new process under GNO. It is a combination of the fork() and execve() calls, and in fact is written in terms of them. The difference between exec and execve is that exec returns in all cases- it is a simplified interface for those who don't need to affect process information before a new executable begins (such as process group IDs or I/O redirection information).

The algorithm for exec (simplified somewhat) is as follows:

void exec2() {
    return execve();
}
int exec() {
    return fork(exec2);
}

RETURN VALUE
exec returns the process ID of the child, or SYSERR (-1) if an error occurs in the fork() call.

BUGS
See BUGS in execve(2) and fork(2).
If an error occurs in the execve phase of this call, it can't be detected by normal means. The wait system call must be used to get the return code of the process, which will be SYSERR (-1) if the execve fails.

SEE ALSO
execve(2), fork(2), wait(2)

EXECVE(2)  SYSTEM CALLS  EXECVE(2)

NAME
execve - replace current process with an executable image from a file

SYNOPSIS
#include <kerntool.h>

int execve(char *pathname, char *cmdline);

DESCRIPTION
execve is the preferred method for loading program files to be executed under the GNO system. A new userID is allocated for the process, and the GS/OS System Loader is used to bring the executable file into memory. The command line is only passed to an EXE executable. The 8 characters "BYTEWRKS" are prepended to the command line before being passed to the process (this is the same identifier used by the Orca shell). This Shell Identifier distinguishes the GNO and Orca environments from others that don't support the full range of shell calls, and can be accessed from C with the library function shellid(). The A register is set to the userID allocated for the process.

GS/OS prefixes 1 and 9 are set to the pathname of the directory containing the executable file; if the length of the path exceeds 64 characters prefix 1 is set to the null prefix (length 0).

The following information is inherited by the child: current machine state, controlling TTY, and process group ID.

Signal handling information is set to defaults. Any signals in the parent's queue are not passed to the child, and the child is started with no signals blocked. The child begins with no open files.

RETURN VALUE
A successful execve does not return, as the current executable is replaced with the one specified in the call. If for some reason the call fails, execve returns SYSERR (-1).

BUGS
Orca/C currently ignores any stack space allocated for it by the GS/OS Loader (which execve calls) or by default in execve. Stack space in Orca/C programs is determined by code in the .root object file, and can be set with the #pragma stacksize directive. Read the section on GNO Compliance in the GNO Kernel Reference Manual for more information on this topic.

SEE ALSO
execve(2), fork(2), wait(2)

FORK(2)  SYSTEM CALLS  FORK(2)

NAME
fork - start a new process from inside the current application space

SYNOPSIS
#include <kerntool.h>

int fork(void *addr);

DESCRIPTION
fork's argument is typically the address of a C function, although it can be any address inside the IIGS RAM space. fork creates a new entry in the process table, and sets up some default settings. The process is allocated 1K of stack space, and the direct page is set to the beginning of this memory. The process is executed in 16-bit full native mode, and the registers are set as follows:
A: the userID assigned to the process
X: 0
Y: 0

The child inherits the memory shadowing and machine state parameters of the parent, as well as signal blocking information and the ID of the controlling TTY. In addition, the child inherits the open file refNums of its parent. This can cause errors if the child closes an inherited file and the parent later tries to access it.

A forked process may share code with other children or the parent. However, this is only allowed in a forward manner- any forked process that exits by function return will be terminated. Note that any shared global variables will need to be moderated with some type of mutual exclusion, either the kernel semaphore(2) routines or custom routines.

RETURN VALUE
fork returns the process ID of the child, or -1 (SYSERR) if an error occurs.

**Bugs**

If a child closes a file refnum inherited from the parent, system accounting can become confused. Note that this shouldn't result in a crash, but spurious "Invalid reference number" (SIG3) errors can be generated. We need the equivalent of dup(2) for GS/OS refnums to make this problem go away (and a more reasonable limitation on multiple access of open files).

**See Also**

eexec(2), execve(2), wait(2), semaphore(2)

**Getpid(2)**

**Name**

g getpid - return process ID of caller

**Synopsis**

#include <kerntool.h>

int getpid(void);

**Description**

The process ID is a unique value associated with a process, and is needed for many system calls. Note that GNO pid's cover only a small range of numbers, as opposed to 'nix pid's which range from 0-65535. Some programs use getpid to seed random number generators. A much better approach on the IIGS is to use the horizontal and vertical positions of the electron gun, which can be obtained by reading the word value at absolute memory location #0C0E.

**Return Value**

The process ID of the caller is returned. No errors are possible.

**Kill(2)**

**Name**

kill - send a signal to a process

**Synopsis**

#include <kerntool.h>

int kill(int pid, int sig);

**Description**

Kill is used to send a signal to a process or group of processes. Signals are software interrupts; they act just like hardware interrupts and can also be used for basic IPC (Inter-process communication). The various signals are described in signal(3).

sig can be a signal number, or it can be 0, in which case no signal is sent, but error checking is done (this can be used to verify a process ID). If sig has been blocked (sigblock(2)), the signal is deferred until it is unblocked, and kill returns immediately. Any previously pending signals of the same sig are lost (i.e. signals are not stacked).

If pid is 0, the signal is sent to all processes with the same process group ID as the caller, except for system processes.

Processes may signal themselves, in which case the signal handler is invoked immediately (if installed).

**Return Value**

Normally kill returns SYSOK (0). The following conditions can cause kill to return SYSERR (-1):

- pid does not correspond to an existing process
- sig specifies an invalid signal number

**Bugs**

Currently there is no way to distinguish the types of errors that can cause kill to fail. There is no obvious way to return such a value from the toolbox routines that are the kernel (and are written in C).

**Ksignal(2)**

**Name**

ksignal - a simplified software signal interface

**Synopsis**

#include <signal.h>

void (*ksignal(sig, func))();

**Description**

Signals are a basic form of IPC (inter-process communication), and are generally used to notify a process of some atypical event (although there is little restriction on actual use). For example, signals are sent in each of the following situations: user typing certain chars at a terminal ('C, 'Z, etc.); execution of an invalid instruction; by request of another process (kill); stack overflow; and a process making an input request while running in the background.

Most signals cause termination, unless a handler is installed, or the signal is set to be ignored. Certain signals cannot have their default action modified; the system silently enforces this restriction. The following is a list of signals and default actions (taken from signal.h).

- SIGIP 1 hangup
- SIGINT 2 interrupt
- SIGQUIT 3 quit
- SIGILL 4 illegal instruction
- SIGTRAP 5 trace trap
- SIGABRT 6 abort (generated by abort(3) routine)
- SIGEMT 7 emulator trap
- SIGFPE 8 arithmetic exception
- SIGKILL 9 kill (cannot be caught, blocked, or ignored)
- SIGBUS 10 bus error
- SIGSEGV 11 segmentation violation
- SIGSYS 12 bad argument to system call
- SIGPIPE 13 write on a pipe or other socket with no one to read it
- SIGALRM 14 alarm clock
- SIGTERM 15 software termination signal
- SIGURG 16 urgent condition present on socket
- SIGSTOP 17 stop (cannot be caught, blocked, or ignored)
- SIGCONT 18 stop signal generated from keyboard
- SIGCHLD 20 child status has changed
- SIGTSTP 21 background read attempted from control terminal
- SIGTTIN 22 background write attempted to control terminal
- SIGCT 23 input/output possible on a file descriptor
- SIGIO 24 System V name for SIGIO
- SIGXCPU 25 System V name for SIGXCPU
- SIGXFSZ 26 exceeded CPU time limit
- SIGUSR1 30 user defined signal 1
- SIGUSR2 31 user defined signal 2

If func is SIG_DFL, the default action for the signal is reinstalled. This is normally termination if the signal isn't ignored or caught. Signals marked with @ are discarded, and signals marked with + cause the process to stop. If func is SIG_IGN, any future occurrences of the signal are discarded, as well as any pending instances. Any other value is treated as the address of a shandler routine. The system will block further occurrences of the signal before the handler is called, and will unblock the signal automatically upon return from the handler. The handler remains installed after return, unlike earlier Unix signal facilities.

If a signal occurs during certain system calls (wait(), and input from a TTY), the call is automatically restarted upon return from the handler.
A forked child inherits all signal information, including pending signals and blocking and handler information. `exec` and `execve` restore all signal information to defaults and purge pending signals.

**NOTES**
The signal handler should be defined as follows:

```c
void handler (int sig, int code)
```

* sig is the signal that invoked the handler, and code is additional information about the interrupt condition. Currently, code is always 0.

**RETURN VALUE**
The previous action is returned on a successful call. Otherwise, -1 is returned.

**Errors** will occur on any of the following conditions:

- sig specifies an invalid signal number.
- An attempt is made to ignore or supply a handler for SIGKILL or SIGSTOP.
- An attempt is made to ignore SIGCONT (by default SIGCONT is ignored).

**SIGBLOCK**

- sigblock is used to temporarily block the reception of signals. The input parameter mask is a bit vector that specifies which signals are to be blocked; a 1 in a bit n will block signal n+1. The mask is bitwise-ored with the current signal mask to create the new signal mask.

**SIGSETMASK**

- sigsetmask is a macro that can be used to calculate signal masks for `sigblock`. It takes a signal number (as listed in `KSIGNAL(2)`) as an argument and returns a mask.

**NAME**

`sigblock`, `sigmask` - temporarily block signals

**RETURN VALUE**

The previous value of the signal mask is returned.

**SEE ALSO**

- `kill(1)`, `execve(2)`, `fork(2)`, `getrlimit(2)`, `kill2V(2)`, `sigblock(2)`, `sigpause(2)`, `sigsetmask(2)`, `sigvec(2)`, `setjmp(3)`, `termio(4)`

**DESCRIPTION**

- `sigblock` is used to temporarily block the reception of signals. The input parameter mask is a bit vector that specifies which signals are to be blocked; a 1 in a bit n will block signal n+1. The mask is bitwise-ored with the current signal mask to create the new signal mask.

- `sigmask` is a macro that can be used to calculate signal masks for `sigblock`. It takes a signal number (as listed in `KSIGNAL(2)`) as an argument and returns a mask.

- If a signal is sent to a process but is blocked, the event is recorded for later release by `sigsetmask`. Blocked signals are not stacked; further occurrences of a blocked signal will overwrite any previous pending signal of the same signum.

**SEE ALSO**

- `kill(2V)`, `sigsetmask(2)`, `ksignal(2)`

**SIGSETMASK**

- `sigsetmask` is usually used to restore signal masks after modification by `sigblock`. The parameter mask is the absolute value the process signal mask will be set to (compare to `sigblock`, which adds the argument to the set of blocked signals).

- If there are pending instances of signals which become unblocked by the `sigsetmask` call, they are 'released': they are released into the system signal queue and their 'pending' status is cleared. (The system signal queue is maintained by the kernel null process, and is used in situations where signals could not normally be sent (such as interrupt handlers).)

- `sigmask` is a macro that can be used to calculate signal masks for `sigsetmask`. It takes a signal number (as listed in `KSIGNAL(2)`) as an argument and returns a mask.
RETURN VALUE
The previous value of the signal mask is returned.

CAVEATS
If somehow the process re-blocks a signal released by sigsetmask before the system
signal queue processes it, it will be blocked and marked as pending. This can happen
if a signal handler makes a sigblock call.

SEE ALSO
kill(2V), sigblock(2), ksignal(2)
Go into the bank. Make sure you know your account number. Go to a
teller and type GET MONEY. Give him the account number when he asks
for it. Go further into the warehouse, and read the poster inside. The
address to get tickets is next door to your old house. Go back outside
and down to the cemetery and find your parents' graves. (Hint: They are the only
two that look alike and are next to each other.) Read each grave, and
put the flowers down (sniff).

WHAT TO BUY IN BROOKLYN

Up to this point, everything you need to accomplish in Brooklyn is
the ship -- no matter which route you take to get to
California. If you are planning to go via sea, you must remember that
the steamship leaves exactly 18 minutes after the game begins. Go to
the house next door to your old one. Answer the questions the man asks
you, and tell him which ticket you want. (Note: The price of the
tickets will skyrocket after the GOLD Rush! starts. Make sure you buy
them before then.) If you intend to go via Panama, you'll need the
mosquito net from Hand's Hardware store. If you're planning to go via
the Cape Horn route, you will need the fruit.

If you want to go via land, then just go and buy your ticket from the
stagecoach office. After buying the ticket, go to the stable, and SHOW
TICKET to the little guy in white. He'll escort you to the coach.
Enter the coach, and the rest will take care of itself.

THE PANAMA ROUTE

There is nothing to do on the ship. You will not die of mosquito
bites if you bought the net. When you reach the jungle you will have
to follow the rest of the crew. Talk to the man under the tree, and
he'll give you a Bible. (No matter which route you take, there will
always be a man reading a Bible: Take the Bible.)

Walk to where you see the hanging vine. As soon as the killer ants
start to appear, jump onto the vine, and hang there until they leave.
Go onto the next screen. There are four paths through this screen, but
you can't see any of them. Do not use the first two. You will have to
do this screen by trial and error. (Save the game before you try it.)
The third and fourth paths take you through. For extra points, take
the fourth path -- the hardest to finish. When your toe hits
something, look down. Pick up the gold disk.

You will not die of scurvy if you have the fruit. Now, you need food,
and there seems to be plenty of fish in the sea; so, let's go fishing.
Do not stand on the deck during the storm; or you'll get swept
overboard. Sometime during (or after) the storm, get the string from
the bunks, paper clip from the captain's office, the nail
(halves from the cook's table, metal scraps from the hull of the ship, and a
pole from the bottom floor (where the engine is being stoked). Go to
the back of the ship and type FISH. The game runs by itself after
that, until you reach Sacramento.

VIA LAND

Once you join up with the mining company, go over and talk to the
captain. He wants money, so give him what you have. He'll ask you to
take animals for the trip. Go down a screen and buy animals. How many
animals do you need? You're going on a long journey, so you are better
off buying the mature mules.

Go back and tell the captain, and he'll give you a second job. He
wants you to tell him when it's time to leave. Go up a screen, and
keep looking at the grass. As soon as you get a message saying that
the ground is getting greener and drying up, tell the captain. You
should have also bumped into our friend with the Bible (he's sitting
under the tree).

When you reach the steep hill, unhitch the team, and let the animals
go to drink and rest. To stop them from pulling you and the wagon over
the cliff, you must lock the wheels. When you get thirsty, drink water
from the barrel in the coach.

SACRAMENTO

Whichever way you arrive, you must immediately go to the stagecoach
office. It's in the building just left of the middle of the screen. Go
in, and look at the schedule. If you have missed the stagecoach to
Sutter's Fort, then you will have to restore; otherwise, get onto the
stagecoach.

SUTTER'S FORT

Walk around the fort. Find the blacksmith, and talk to him. Give him
your name and your brother's name. He'll give you your brother's
branding iron. Go to the graveyard and read the graves until you find
your father's. Read the grave. There is a cannon at the top. Psalms
23? Read it in your Bible. The phrase "Green Pastures" is in capital
letters. Use the envelope. Move it around until you are told it's in
place. Aha! So that's what those strange markings were for. Read the
letters. It says ROOM 12, or is it ROOM 21? Go back into the fort and
buy a gold pan. It's time to try your luck at finding gold.

PANNING FOR GOLD

You have to be at least 10 miles from the fort to find gold. (The
bottom of the screen will tell you when you are.) Walk straight across
the swamp, or you'll sink in. Occasionally, a crocodile will eat you, too,
but not every time. If this happens, you will have to restore back to
Brooklyn. (Restoring to a point later than
Brooklyn won't help.)

You will not die of scurvy if you have the fruit. Now, you need food,
and there seems to be plenty of fish in the sea; so, let's go fishing.
Do not stand on the deck during the storm; or you'll get swept
overboard. Sometime during (or after) the storm, get the string from
the bunks, paper clip from the captain's office, the nail
(halves from the cook's table, metal scraps from the hull of the ship, and a
pole from the bottom floor (where the engine is being stoked). Go to
the back of the ship and type FISH. The game runs by itself after
and look around. There is a message box. Ask for your message. You are told you don't have any messages because you're not staying at the hotel! But can you do the man a favor by delivering a message to the man in Room 11. Say YES.

Take the message, knock at the door, and give the man his message. When he leaves, quickly walk into his room. (If he catches you in there, you'll have to restore.) To get into Room 12, go to the left wall, and look at the fireplace. Aha! You recognize that cannon. When you turn the wheel, the fireplace opens. Go through the fireplace into Room 12.

ROOM 12

Look around the room. Get the string from the floor, and the magnet and note from the table. Read the note. What is that bird cage doing there? Open the window, and in flies a bird. Look at the bird, read the note in the capsule, and put your identification in the capsule. What identification? The family picture, of course! Off flies the bird; when it returns, look in the capsule. Get the "pigieogram" and read it. Follow? Stubborn? Aha! You've heard the expression "as stubborn as a mule," right? Follow that mule!

JAKE'S HOME

Take the mule back out of town, and type FOLLOW MULE. It moves quite quickly, and seems to know where it's going; be careful not to lose track of it. (Watch out for robbers.) When you reach Jake's home, go inside. Get the matches. Go outside to the outpost, then go down the hole in the middle of the outpost.

THE CAVE

Light your lantern and proceed down the cave. Do this as quickly as you can; save whenever you make progress because you only have a limited amount of oil in the lantern. You reach a door that's locked, and you have no key. But there's a hole in the door, and it's the same shape as the branding iron! Tie the magnet to the string and lower it through the hole. Move it around until you hear a "clunk." Then, pull up the key carefully.

Open the door and go down in the cave. Be very careful on the ladders. Continue down to the bottom left, and get the pick. Keep digging for gold as you walk through the caves. Once you have found a couple of pieces of gold, go up the long ladder to the top. Take the gold nuggets on the right. Move down the ladder a little, and you find the mine on the left.

THE END

Carefully enter the mine (save the game first; it's very easy to fall off the ladder here). Down in the mine you go; keep using the pick as you go along. Eventually, you will find yourself in a large room which contains...your brother!

Talk to him, and he tells you that he's almost made the ultimate gold discovery! Use your pick. When you find gold, keep digging in that same spot. While you're digging, you will discover a cavern. As soon as the entrance is big enough, walk through.

You've done it! You and your brother now have as much gold as you could ever dream of! Well done!
reaches zero, Golem will be destroyed.

flower - A strange but harmless underground mutant that greatly increases your score.

lightning bolt - Alliance spies have not discovered what the lightning bolt does.

crew member - There are five crew members in the mines. If Golem makes it out of the caves alive he will receive 1000 points for every crewman he rescues or 10000 points if he rescues them all.

portal - The portal looks like a gray whirlpool. It is the entrance to the next level, but will not open until the key is found. The open portal is yellow.

bomb - A gray orb in the last level, the bomb must be shot with ten missiles before it will activate. Upon bomb activation, the portal will open and the whole room will begin to shake and flash. Get out as quickly as possible!

The mutants come in various shapes and sizes and pose the greatest threat to Golem in the mines:

Spiney - A mutated rock beast that eats rock and most anything else in its path. It also randomly lays gray rocks, constantly changing the layout of the level. If killed, a spiney will vanish and, possibly, reappear later.

rock flower - Rock flowers grow out of the ground, produce a flower, and then die. The flower has a tough outer shell, and can only be hurt when its flower is exposed. But beware - the flower is highly acidic and will destroy Golem if he drives over it.

Atom - Another mutated creature that only appears in the higher levels. The atom moves slowly around, occasionally emitting energy bursts. Golem will be destroyed if he is struck by an energy burst or if he shoots the atom. There is no known way to defeat this mutant...

?? creature - It resides below the terrorists headquarters in the next to the last room. It possesses the key for that level. What does it look like?

How to play:

The joystick moves the tank around the screen. The orange(main) button fires regular bullets, while the brown(secondary) button fires missiles. Note that the 'Open-Apple' key is equivalent to the orange button and the 'Option' key is equivalent to the brown button.

When the tank is destroyed press either joystick button to resume play.

At any time during the game, press either '?' or '/' to view the help screen and either 'Q' or 'q' to quit.

Other notes:

As the game level increases, creatures begin moving faster and more blue rocks must be destroyed before finding a key. Also the timer decreases more rapidly. Therefore, the higher levels require quick thinking and rapid movement.

Remember that 10 missiles are needed for the last level to destroy the bomb. When the detonation phase begins and the screen begins to flash, movement becomes very difficult due to the shaking ground. Try to shoot the bomb from as near the portal as possible and then get out fast!

The top ten scores of the game are automatically saved. If GolemGS cannot find the scores file it will automatically create a new one.

Other programs by me(Travelling Faire Software):

MAZE.LAUNCHER will run adventure game scenarios following certain guidelines. Included in the package are two scenarios and some starter characters.

The MAKE.CHARACTER program will create new characters for MAZE.LAUNCHER. It allows the creation of a character from various races and classes.

ExplorerGS - Graphic version of MAZE.LAUNCHER.

Shr Castle Metacus GS - navigate through the ever changing castle in search of five fragments of the star key.
How to Play:

You are standing at the tee on Hole #3 at the Pinehurst No.2 course. It's a par four, 316/335 yards in length, surrounded by bunkers. You must decide how to play the hole—just like on the golf course.

1. What club should you use?
2. How hard should you swing?
3. How should you hit the ball—straight, with a slice or hook?
4. In what direction should you hit?

Let's look at the hole and "practice" a little before we hit. Press the 2 key. You will see a legend showing the colors, and the patterns they represent. You will notice that the colors correspond to bunkers, fairways, greens, trees, rough, etc. Now hit any key and go back to the tee.

You can see the bunkers, trees, etc. on this hole.

Now let's think about club selection. At the end of this documentation you will see a table showing the clubs, force of swing, average roll, an degree of loft. This table helps you determine which club to select and the force with which to hit—full swing, half swing, quarter swing.

Your golf bag contains five woods, nine irons, a sand wedge, a pitching wedge, and a putter. The woods are numbered 1W-5W; the irons are numbered 5I-9I. The wedges are PW, SW, and the putter is PT.

Club Selection:

Look at the bottom left portion of the screen. You will see six figures: a golfer, a golf club, a vertical line, a clock, speaker, and letters with #s. Let's talk about the club first. Before you can hit, you must select a club. Press the letter 'C' and you will see this prompt:

Which club?0A

Type the two letter name of the club you want to hit with. For illustration, type 2W. You will return to the hole. Look at where the club was and you should now see 2W. You have selected the two wood. If you change your mind, type 'C' again and select a different club. You can select a club and return it to your "bag" as many times as you need, until you're satisfied with the selection.

Force of Stroke:

How hard should you hit the ball? Full swing, half swing, quarter swing? Anytime you select a wood or iron, you must decide on the swing; this is the force or the degree of swing.

Press the letter 'F' and you'll see the prompt:

Full, Half, Quarter:

Type 'Q' and return to the hole. Look at the golfer now; he's taking a quarter swing! (wow) Press 'F' again and respond by typing 'F'. Now he's taking a full swing. You can adjust the swing to fit the situation. For illustration, let's use a full swing. NOTE: The force of stroke is a little different for the wedges and putter.

We'll discuss this in a moment.

Style—Hook, Slice, or Straight

Does this hole require a hook or a slice? Do you need to hit it straight? The vertical line figure means that you are set to hit a straight shot. Press the letter 'S' and see the prompt. Hook, Slice, or Normal: Respond to the prompt by typing an 'H' for Hook. When the hole displays, look at the vertical line—it's bending to the left. If you typed S, it would bend to the right. Press S again and select a normal style (N). Hooks and slices are highly valuable. In general, the amount of curve is the greatest off the tee.

Direction:

So far, you have selected a club, a swing, and a style. The little clock figure displays the time of day. At the end of this documentation, you will see a table showing the clubs, force of swing, average roll, an degree of loft. This table helps you determine which club to select and the force with which to hit—full swing, half swing, quarter swing.

What club should you use? see the prompt. Enter direction: 00:00 Type in 10:30 and try to imagine where the hour hand is pointing when the time is 10:30. Watch the game plots your direction with a line. Did the line intersect with the hole? Play around with the direction and line the shot up with the hole. NOTE: If you do not select a direction, the ball will go in the general direction of the pin.

Stroke the Ball:

Are you ready? Have you selected a club, swing, style and direction? Good! Hit the ball by pressing 1. Watch the lower portion of the screen as the computer plots the flight of the ball. Hope you didn't hit a tree!

Quiet Please:

Suppose you'd like to play at work (during lunch, of course!) and don't want to disturb anyone—especially, your boss. Press 3 anytime to silence any any beeps, clicks, or music and your "speaker figure" will turn off its sound.

A Reminder:

The current hole you are playing and its par are displayed for your convenience.

Other Features and Shots:

See how easy it is? How did you do? Sometimes the ball may hook or slice even though you hit it straight. Don't get too frustrated—it happens to the pros, too. Let's play with some of the other features before you hit your next shot.

Range:

The range feature plots a line with a selected number of feet or yards, from the ball to the pin. Press the 'R' key to see the prompt. Enter range in units? For illustration, type 100 and press RETURN. You will see a line that represents a range of 100 yards (or feet) from your ball toward the pin. The computer determines if the unit should be yards or feet, depending upon how close you are to the pin. The "range" feature should be used to help you determine when to "play short," or "go for it."

Correction:

Press the ESC key, if you see you are entering an invalid response, and you will return to the main prompt screen.

The Second Shot:

Ready to hit the second shot? If you are within 70 yards of the pin, you will notice that you are seeing a different view of the hole. GOLF'S BEST<tm> shows three different views of the hole: one from the tee, one from the fair—way, and one from the green. You may need to select a
wedge for your next shot. The wedges (and putter) do not require you to select a degree of swing; instead you select force by specifying a distance, in feet.

**Enter Force:**
Type the distance you wish to hit the ball, in feet. Remember: You may need to hit your second shot. Select a club, force, style and direction. Press 1 and watch the ball go. (If you ended up in the woods, you may want to select a hunting wedge. HA!)

**NOTE:** You do not select a style for putts or wedge shots.

**The Putt:**
When you are on the green and ready to putt, press the letter 'C' to select a club and type 'PT'. Press the letter 'F' to select the force and enter the force in feet. The computer shows you the slope of the green by displaying an arrow that points to the LOWEST area on the green. Be sure to take this into consideration.

For example, if you are 20 feet from the pin and the slope is steep, you may need to hit with a force of 30 feet to "play the break." Now select a direction and press 1. Did it go in? No? Try again!

**The 19th Hole:**
That's all there is to it! Just select a club, force, style, and direction to hit the ball. It's just like being on the course!

In all cases, the normal rules of golf apply. The person who is the farthest from the pin hits first; all out-of-bounds and water shots will cost you a stroke; and no Mulligans are allowed! The computer keeps score for you. Press 4 to see the scorecard. How are you doing?

Sometimes the real world interferes with the important things we like to do- like play golf. From time-to-time, we must return to work and family duties. The player who is "up" can quit at any time: just press the letter 'Q' and respond to the prompt by typing the letter 'Y' (yes). Press RETURN and you're off the course and back at work.

No need to take a shower, turn in your cart, or carry your clubs to your car-they are safely stored away until the next game!

Have a good round on Pinehurst No. 2!

**Course Rules:**
1. Player farthest from the pin hits first.
2. One stroke penalty if ball goes in the water.
3. One stroke penalty if ball goes out of bounds & loss of distance.
4. Replace all divots!
5. Courtesy demands "quiet" when a player is ready to hit.

**Command Keys:**
- C - Club Selection
- Q - Quit
- D - Direction
- R - Range
- F - Force
- S - Style

**Function Keys:**
- 1. Hit the ball
- 2. Color Pattern legend
- 3. Sound Control
- 4. Scorecard Display

**Your Bag of Clubs:**

ESC Q — MEMORY CONTENTS
ESC S — SECTORS FREE
ESC H — DISPLAY CONTROL CHARACTERS
ESC M — RETURN
ESC N — CLEAR, START, STEP, FROM, TO

TO SEE WHAT ESCAPE FUNCTIONS ARE IN THE ESC MENU, BRUN ESCAPE PRINTER ON DISK.

YOU REMAIN IN LOWER CASE MODE UNTIL YOU TYPE ANOTHER CONTROL A. ONCE IN LOWER CASE MODE, A SINGLE CONTROL A PUTS YOU IN UPPER CASE MODE FOR THE NEXT CHARACTER ONLY. TYPING CONTROL A "TWICE" (CONSECUTIVELY) PLACES YOU IN UPPER CASE.

GLOBAL EDIT COMMAND:
A GLOBAL EDIT COMMAND DISPLAYS EACH LINE REQUESTED OR FOUND BY A SEARCH, ONE AT A TIME. AS EACH LINE IS DISPLAYED, YOU ARE PLACED IN EDIT MODE WITH THE OPTION TO FURTHER MODIFY THE LINE. PROCEED TO THE NEXT LINE, OR EXIT GLOBAL EDIT MODE PREMATURELY. TO AVOID ENTERING EDIT MODE FOR EACH LINE, USE THE FAST OPTION (/F) ON THE GLOBAL EDIT COMMAND LINE. THIS PERFORMS A QUICK GLOBAL SEARCH AND REPLACE, OR LISTS ALL LINES WHERE A CERTAIN STRING EXISTS. FOR EXAMPLE, CTRL E "POKE"/F QUICKLY LISTS ALL LINES CONTAINING THE KEYWORD "POKE".

EXAMPLES:
CONTROL E L1,L2,"STRING1","STRING2"/O
L1 = STARTING LINE NUMBER
L2 = ENDING LINE NUMBER
STRING1 = SEARCH STRING (16 CHAR.MAX)
STRING2 = REPLACEMENT STRING (16 CHAR.MAX)
O = OPTION: R=RAW SEARCH, F=FAST SEARCH

HOW LINE SHOULD BE TYPED:
CONTROL E 100,150 = EDIT LINES 100 THRU 150 CONTROL E 10,50,"POKE" = EDIT ALL LINES BETWEEN 10 AND 50 WHICH CONTAIN THE STRING "POKE" CONTROL E *READ*,"WRITE" = REPLACE EVERY OCCURRENCE OF "READ" IN YOUR PROGRAM WITH THE STRING "WRITE"

ALL OF THE ARGUMENTS DEFINED ABOVE ARE OPTIONAL. STRING1 AND STRING2 MUST BE ENCLOSED IN QUOTES (" "). TO IMBED QUOTES IN THESE STRINGS, YOU MUST DOUBLE THE IMBEDDED QUOTES. FOR EXAMPLE, IF YOU WANTED TO
G.P.L.E. SUPPORTS BOTH LOWER CASE ADAPTERS AND A VARIETY OF 80 COLU MON VIDEO
BOARDS. G.P.L.E. CONVERTS APPELS' DOS, AND MONITOR COMMANDS IN LOWER CASE
to UPPER CASE. G.P.L.E. ALSO SUPPORTS THE VERY POPULAR "SHIFT-KEY MODIF-
ICATION" WHICH MAKES ENTERING UPPER AND LOWER CASE A SNAP. CONTROL A PLACES YOU
IN LOWER CASE MODE; HOWEVER, LOWER CASE IS NOT TURNED OFF BY HITTING THE RETURN
KEY. YOU REMAIN IN LOWER CASE MODE UNTIL YOU TYPE ANOTHER CONTROL A. ONCE IN
LOW ER CASE MODE, A SINGLE CONTROL A PUTS YOU IN UPPER CASE MODE FOR THE NEXT
CHARACTER ONLY. TYPING CONTROL A "TWICE"(CONSECUTIVELY) PLACES YOU IN UPPER
CASE.

GLOBAL EDIT COMMAND:
A GLOBAL EDIT COMMAND DISPLAYS EACH LINE REQUESTED OR FOUND BY A SE ARCH, ONE
AT A TIME. AS EACH LINE IS DISPLAYED, YOU ARE PLACED IN EDIT MODE WITH THE
OPTION TO FURTHER MODIFY THE LINE, PROCEED TO THE NEXT LINE, OR EXIT GLOBAL
EDIT MODE PREMATURELY. TO AVOID ENTERING EDIT MODE FOR EACH LINE, USE THE FA
ST OPTION (/F) ON THE GLOBAL EDIT COMMAND LINE. THIS PERFORMS A QUICK GLOBAL
SEARCH AND REPLACE, OR LISTS ALL LINES WHERE A CERTAIN STRING EXISTS. FOR
EXAMPLE, CTRL E "POKE"/F QUICKLY LISTS ALL LINES CONTAINING THE KEYWORD
"POKE".

EXAMPLES:
CONTROL E L1,L2,"STRING1","STRING2"/O
L1 = STARTING LINE NUMBER
L2 = ENDING LINE NUMBER
STRING1 = SEARCH STRING (16 CHAR.MAX)
STRING2 = REPLACEMENT STRING (16 CHAR.MAX)
O = OPTION: R=RAW SEARCH, F=FAST SEARCH

HOW LINE SHOULD BE TYPED:
CONTROL E 100,150 = EDIT LINES 100 THRU 150
CONTROL E 10,50,"POKE" = EDIT ALL LINES BETWEEN 10 AND 50 WHICH CONTAIN THE STR
ING "POKE".
CONTROL E "READ","WRITE" = REPLACE EVERY OCCURRENCE OF "READ" IN YOUR PROGRAM
WITH THE STRING "WRITE".

ALL OF THE ARGUMENTS DEFINED ABOVE ARE OPTIONAL. STRING1 AND STRING2 MUST BE EN
CLOSED IN QUOTES (" "). TO IMBED QUOTES IN THESE STRINGS, YOU MUST DOUBLE THE I
MBEDDED QUOTES. FOR EXAMPLE, IF YOU WANTED TO SEARCH FOR THE STRING "ENTER",STR
ING1 WOULD BE ""ENTER"". A SEARCH STRING WILL BE IGNORED IF IT IS A
SUBSTRING OF A LARGER STRING. FOR EXAMPLE, THE SEARCH STRING "O" WILL NOT MATCH
THE "O" IN THE KEYWORD "POKE". G.P.L.E. WILL FIND THESE SUBSTRINGS WITH THE RA
W SEARCH (/R) OPTION ON THE GLOBAL EDIT COMMAND LINE.(E.G. CONTROL E "O"/R)

PAGE LIST COMMAND: YOU STILL USE CONTROL S TO STOP AND START A LISTING OR CATA
LOG, AND CONTROL C TO TERMINATE A LISTING. CONTROL P (PAGE LIST) HALTS A LISTI
NG AND EACH SUBSEQUENT CONTROL P DISPLAYS THE NEXT 20 LINES TO THE LISTING.

GRAFEDIT
BY: Philip Guiochon

GRAFEDIT can be used with keyboard, joystick or mouse, although some operations operate from keyboard only, as you will see. If you have a mouse card in your Apple, you may hit ESCAPE when prompted to do so in order not to use the mouse. A whole picture is devoted to menu, which is made up of icons. The icons are explained below.

Here are cursor moves with keyboard:

NOTE: Because of proportional spacing the following may look strange on the screen. A printed copy of this documentation will show correct spacing.

W             I
A   D         J   L
S             K

Use with or without CONTROL for faster movements in some cases. In all options, RETURN (or button 0 or a press on mouse) means "Go" while ESCAPE (or button 1) means "Out". With some functions, you will have to crop picture with following moves (some with CONTROL to go faster):

W

A   D         J   L
S             K

A little practice will show it is convenient, fast and easy! Do not forget that cropping is done only by keyboard! To go to picture after having selected a function, go to the lowest part of picture (on line 191) and press RETURN (or button or mouse).

Color selection is a little strange: work color is composed of one color for even Y and one color for odd Y. You have: color1+color2=work color. With cursor and RETURN (or equivalent), you have on screen:

back advance back advance result
col1 col12 col22 color

Note that all plots are solid ones, to have some good control over color problems: therefore, GRAFEDIT works in 140 mode, although it could easily adapted to "normal" but awful 280 mode.

Functions are, from upper left to lower right (in nearly all cases, ESCAPE or equivalent is a UNDO function). To go back to menu while working on a picture, place cursor at lowest part of screen (on line 191) and press RETURN. In most functions, a zoom feature is available with the SPACE bar, while one also can toggle joystick/keyboard with the "," key.

- erase screen in current color.
- cut window to create a window which can be saved and loaded later on. Crop it with the frame.
- paste: show the current window on screen. Then you can move it with A-S-D-W or I-J-K-L keys: ^T toggles bit 7, ^I inverse bits, ^R reverses it, ^F flips it, and four keys (; / > < on a II+) are used for rollings in four directions: which compensates for the byte operation.

NOTE: ^ = CONTROL

- text adding is easy: set cursor to position then RETURN. <- and -> arrows control case (for II+), while CONTROL with I, J, K and L does a bit movement. Some control characters allow a II+ to generate non-keyboard characters.

- DOS 3.3 menu is obvious: hit key (inverse character means with CONTROL) then give filename if asked to. RETURN to exit, or ^X. Suffixes are automatic. The "Command" prompt allows a DOS 3.3 command such as LOCK, DELETE, UNLOCK. You can load and save 33 sectors pictures (*.PI*), packed ones (*.FC*) or windows (*.WI*). To save packed picture, just crop part of picture you want to pack, then hit RETURN and give a name. ESCAPE cancels this operation. Be careful, as windows and packed files share the same buffer! RETURN alone exits DOS menu.

- point plots a point!
- draw draws continually until a RETURN.
- line wants a starting point and then a ending one, as in every graphics editor!
- lines links them automatically.
- fill allows you to fill on any standard primary color: it is fast and rather powerful. In some cases (on complicated colors), it can "hang up": press any key to exit or to stop filling.
- circle: select center, then radius in relation to Y movement.
- disk: same as circle, but will be a solid circle.
- frame: obvious!
- box: idem!
- reverse: works on the Y axis after cropping.
- flip: works on the X axis.
- toggle toggles bit 7 which changes colors.
- inverse toggles all bits.
- clean is a very useful function: it can erase all colors, letting only outlines on screen. Used with inverse, it allows to wipe out colors without having to redraw everything.
- shrink is a mere gadget, creating four small pictures with four different masks: not very useful with Apple's low Hi-RES resolution!

A zoom is available through SPACE key. You can toggle joystick and keyboard input with the [!] key.

We suggest that these instructions be printed for reference while working on a picture.

Files Needed
GRAFEDIT
GRAFEDIT.1
STANDARD.CS--Character Set (font)
DOCUMENT graphic.system

* Complete Graphics System *
* Command List *
* Written by the Ghost

11/9/84

This is only a list of the commands for the Complete Graphics System, if you want the complete docs, email me on Apple Manor, and I'll type them in. No Problem.

Main Menu
- D) Drawing module
- T) Text module
- S) Shape module
- P) Draw a 2-dim panel for 3-D module
- K) Shrink a picture
- C) Chose center, point is selected as in 'E' command
- A: Operate on all figures in memory

Drawing module
- L) Load picture
- C) Clear background to color 0-7
- D) Draw

L: Line mode, button 1 sets point, button 0 draws line
F: Fill mode same as line mode, except start point stays the same
A: Auto fill, button 0 fills enclosed black area with color 0-107, paddles position cursor.
F: Palette, displays palette for testing auto fill colors,
type color #,<CR> to display a color, C clears palette,
<space> returns to drawing page
C: Select color 0-7 or 0-107 depending on mode

B: Brush mode, select brush # 1-9, button 1 lifts brush,
button 0 sets it down, destroys shape table in memory
S: Shape mode, uses a shape table loaded in, button 0 plots
shape, button 1 allows the paddles to be used for rotation
and scaling. Any button returns from rotate and scale mode
R: Arc
E: Ellipse
Esc: Displays full screen graphics.
0: Returns to options
J: Joystick toggle
M: Returns to master menu

3-D Module
A: Add figure, enter a name, then you are put in edit mode
E: Edit a figure
Select name, type name or press <CR>, with the latter, names are displayed
one by one using the arrow keys until you press <CR> to select the name.

L: Display and edit lines, color point 1, and point 2 are shown
P: Display and edit points X,Y,Z coordinates are shown
D: Delete the line or point at the cursor position

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 461 of 1262

Apple II Computer Info

0: Return to options.
<Space> changes direction of cursor movement. Symbol in lower left corner shows direction(↑,↓)
<→> arrow keys move cursor left/right or down/up Moving past last point
or line adds a new point or line.
0-9 Enter number at cursor position and press <cr> to replace current value
V: View figure in memory
A: Operate on all figures in memory.
E: Edit a point by moving it only. Flashing cursor lets you select point
press <cr> to select point, any other key to move to next point.
C: Chose center, point is selected as in 'E' command
Esc: Full screen graphics, any other key returns to mixed.
0: Return to options.
V: Scale view on screen, but coordinates of figures remain unchanged.
<Space> change direction Following options depend on mode.

(Rotate, Scale, Move, D-stort)
L/R Left/Right
U/D Up/Down
C/C Clockwise/Counterclockwise
W Width
H Height
D Depth

For the first four, either letter in the option has the same effect
0-9 Number followed by <CR> selects constant to be used in Rotate, Move,
Scale, and Distort modes
<→> Arrows effect an operation(rotate, scale, etc) as per the displayed
parameters, -> is right/up/forward/larger, <- is left/down/back/smaller as per displayed
S: Save set of figures in memory.
L: Load a figure, you may give it a new name, in the case that more
than one figure will be loaded.
I: Save 2-D image as a picture that can be used be other modules.
D: Delete a figure name from memory
C: Clear all figures from memory.
M: Return to master menu.

Text Module:
L: Load a picture
T: Type paddles position cursor
J: Joystick toggle
S: Save a picture
0: Returns to options

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 461 of 1262
types ESC char.
Escc-.: One dot left
Escc-.: One dot right
G: Returns to options
I: Get font (large and small default are loaded automatically)
F: Save Font
E: Edit font
Displays large or small font, allows you to replace or edit characters.
You specify which keystroke for ESC character.

C: Create a character
  I,J,K,M normal movement
Z: Plot on
X: Plot off
F: Finished

Shape Module:
N: Clear memory for a new table
L: Load an existing shape table
A: Add a shape
K: Keystrokes
  I,J,K,M normal movement
Z: Plot on
X: Plot off
F: Finished
Paddles rotate and scale figure as it is shown.
P: Paddles, select width and height: paddles move cursor, button 0 plot on
  button 1 plot off
F: Finished
  Figure is displayed in hi-res and you have the following options:
  S: Save as is
  E: go back to lo-res and edit

R: Replace a figure that is already in table, same method as add
D: Delete shape from table
V: View a shape, paddles control rotation and scale, any key
  returns to options
M: Return to master menu

Panel Module:
S: Save panel on disk as a 3-D figure
C: Create panel, you may clear the screen. Or leave it displaying
  any previous panels for reference. You may also change the scale
  by which the points and distances are interpreted.
L: Draw a line connecting the points at the cursor positions
P: Move the flashing cursor to one of the previously used points Any key
  moves the cursor to the next point in sequence, <CR> selects that point
D: Display the coordinates of the cursor points and the distance between
C: Color, select 1,2,3,4,5,6, or 7 lines will be drawn in last
  selected color I,J,K,M normal movement.
  <space> switch cursors, so the other point will move
Esc: Full screen switch
F: Finished, return to options
M: Return to menu

Shrink Utility:
L: Load a picture
T: Transfer and save, transfers small pictures to page 1, and saves them.
Creating a New Document  

To create a new document simply start up GraphicWriter and you're ready to begin typing. If you're already into a document, then save the changes (if you wish to), then CLOSE the window and go up to the File menu and select "New Document". This brings up a new, "Untitled" window, just the same as if you boot-up from scratch. A blinking cursor awaits your keystrokes. The blinking cursor advances along as you type indicating the eventual position of the next typed character. As you are typing the pointer changes from an arrow to what we call an I-Beam. By moving the mouse you can select where you would like the blinking cursor to be positioned and inserted within your document. You can maneuver this I-Beam Pointer between characters, click the mouse button and a new position of the blinking cursor will be obtained. From there you can begin typing in new characters, or BACKSPACING out characters on the left.

Highlighting Text  

The key to using the Word Processor centers around HIGHLIGHTING TEXT. By "HIGHLIGHTING" we really mean "SELECTING". Thus, to process words, you need to tell GraphicWriter which WORDS you want to PROCESS and HOW you would like this done. Position the cursor next to the word(s) you wish to highlight, click and hold down the mouse button while DRAGGING the POINTER across them. Highlighted words become blackened.

Processing Highlighted Text  

When some text has been highlighted (selected), you can perform various operations on it. Examples would be choosing a different FONT from the Font menu, or a different SIZE from the Style menu, or any combination of them. Just the text that was highlighted will be changed. As your document grows, you can even highlight multiple paragraphs (by dragging across them) and "operate" on the entire sum of highlighted text.

Other Ways To Highlight Text  

There are a few other ways to highlight text besides dragging the pointer over it. DOUBLE-CLICKING ON A WORD will highlight that particular word. It doesn't matter which character of the word the pointer is on when you double-click, the whole word will become highlighted allowing you to choose a new font or style (or color) just for this word.

SHIFT-CLICK (holding down the SHIFT key while clicking) will highlight ALL OF THE TEXT BETWEEN the current position of the "blinking" edit cursor and the position of the click. For example, suppose the "blinking" cursor is located at the Beginning of a sentence. If you where to position the I-Beam pointer at the END of the sentence and do a SHIFT-CLICK, then ALL OF THE WORDS OF THE SENTENCE will be selected. In this way, multiple paragraphs, or even an ENTIRE DOCUMENT (through the use of "scrolling") can be highlighted and operated upon.

Cut-Copy-Paste  

The Edit Menu  

The Edit menu offers some "tools" that you can use while working with a document. It will allow you to take characters or words in your document and Cut them out, Copy them, or Paste the Copy back into your document. These are used so often that they have keystroke equivalents for them: OPEN APPLE-X to Cut, OPEN APPLE-C to Copy, and OPEN APPLE-V to Paste.

Removing Text  

It is very easy to REMOVE text from a document. All you have to do is highlight the desired text, then press the BACKSPACE key. Another way is to highlight the text and just start typing. The first keystroke will eliminate the highlighted text before inserting the newly typed characters. The text will be removed permanently. (However, if "Undo" is active on the Edit menu, you may select it to cancel the last activity.)

Copying Text  

A more sophisticated way to remove the text is to highlight the desired section and then Cut it from the document.

The Clipboard  

When you Cut out some text, it isn't gone forever. It goes into the Clipboard. This "stores" the text in memory for future use (replacing whatever text was there before it). You can always review the contents of the Clipboard by selecting "Show clipboard" from the Edit menu. The Clipboard window can be moved about the screen by dragging the window by it's top "black" part. You can put this Clipboard window away by clicking in it's Close Box or by selecting "Hide Clipboard" from the edit when presented (or by clicking directly on the title of your document).

Copying Text  

Another function you can employ while text is highlighted is to make a Copy of it. By selecting "Copy" from the Edit menu, the highlighted text will also be moved into the Clipboard, but this time the highlighted text will NOT be taken away from the document.

Therefore, the only difference between Cut and Copy is that Cut removes the text from the body of the document. They both will "save" the text on the clipboard.

Pasting Text  

When the Clipboard has some text in it, either by Cut or Copy, you can then take it's CONTENTS, and Paste it anywhere back INTO your document. To do this, position the I-beam pointer and click the mouse button at the desired STARTING location so that the edit cursor is "blinking" there. The pasted text will be INSERTED into the document beginning at this point upon selecting "paste" from the Edit menu, you might notice that the new text is placed into the document while retaining it's original font, size, color, and style.

It should also be pointed out that if any text is highlighted when selecting "Paste", then the highlighted text will be eliminated before the new text is inserted. This is exactly like removing the highlighted text by first hitting the BACKSPACE key just prior to Pasting.
RULER SETTINGS
---------------------

The RULER is used as a "measuring stick". Although it is displayed across the top of your document, it is only IMAGINARY in that it will NOT appear when you print your final document. It simply serves as a "guide" for FORMATTING your documents. By selecting various SETTINGS, the text can be "molded" or confined within certain boundaries dictated by left and right margins, or it can be forced into certain positions on a line by using what's called TAB MARKERS.

Rulers VS. Paragraphs
---------------------

A Ruler is always related to a specific PARAGRAPH. There is only one Ruler per paragraph and each paragraph will contain a Ruler. A paragraph is simply defined as a body of words or sentences that ENDS with a carriage return. When you are typing, as soon as you press the RETURN key, the paragraph ends and a new one begins. A new Ruler is automatically created for this new paragraph and will conveniently be an exact "copy" of the same Ruler from the previous paragraph just finished.

Since each paragraph has a Ruler, you can actually have SEPARATE Ruler settings for your paragraphs. A Ruler is set for a particular paragraph WITHOUT effecting any other paragraphs. The rule to remember: THE RULER YOU SEE ON THE SCREEN WILL ALWAYS BE RELATED TO THE PARAGRAPH THE "BLINKING" CURSOR IS LOCATED IN AT THE TIME.

Formatting A Document
---------------------

There are 4 possible ALIGNMENTS: Left, Right, Centered, and Fully Justified, as found under the Format menu. Select the type of justification and begin typing. The new text entered will then appear in the chosen ALIGNMENT. Or, for previously typed text, you can highlight the text (actually, any characters in the paragraph) and then select the justification. Multiple paragraphs can be highlighted, in the usual manner, and then justified all at once. LEFT JUSTIFY positions all the text, for each given line, at the LEFT SIDE of the document. RIGHT JUSTIFY forces each line to end exactly on the RIGHT SIDE of the document. CENTER JUSTIFY places the text an EQUAL distance between the LEFT and RIGHT MARGINS. FULL JUSTIFY is a type of alignment where the text is both LEFT AND RIGHT JUSTIFIED at the same time. If the words of the sentence do not add up to a full line across the page, the GraphicWriter adds spaces between the words in such a way until all of the words fit evenly on that same line.

Left And Right Margins
---------------------

The left and right sides of a document are called MARGINS. The RIGHT MARGIN can be set so that typing will never go past a specific mark.

Paragraph Indentation
---------------------

The INDENTATION MARK, at the LEFT SIDE of the Ruler, signifies where the FIRST WORD of a paragraph will be positioned. As you type, and the sentence "wraps", a new line will begin at the LEFT MARGIN MARK. The INDENTATION MARK can be moved by placing the pointer on it and dragging it to a new setting.

Single & Double Line Spacing
---------------------

The body of text of a document can also be formatted with Single or Double Line Spacing. Selecting "Double Spacing" from the Format menu will insert a BLANK LINE between every line. Re-selecting "Single Spacing" will remove the added lines. Note that the chosen Spacing will affect the ENTIRE document.

Tab Markers
---------------------

A TAB MARK is used to designate WHERE you want the cursor to go when you hit the TAB key. These MARKERS, when placed on the Ruler, will "force" the text to be positioned on the screen. When a TAB MARK setting is changed, the text will ADJUST to specific locations, as called for by the MARKS.

There are 3 types of TABS: Left; Center and Decimal, as found under the Format menu. They can be selected using OPEN APPLE-1, 2 or 3, respectively. They can be used individually or in COMBINATION. You may select up to a total of 6 for each paragraph.

Left Tabs
---------------------

When you select "Set Left Tab", a new mark will appear on the Ruler. To change this MARK, position the pointer on it and DRAG it to a new location. This will act upon the text in that paragraph only.

You can place multiple Left Tabs on the Ruler. For example, if a second Left Tab is placed at the 3 inch MARK, the edit cursor will move to the 3 inch MARK when you hit the TAB key again. In this way you can control where the edit cursor will move, but more importantly, you can begin to dictate where the typing will occur on the document window. This process is very important when it comes to designing the desired document.

Center Tabs
---------------------

A Center Tab can be placed in a similar manner and cause the text, after pressing the TAB key, to be CENTERED as you begin typing. The position of a sentence on a line will be determined by it's LENGTH when centered beneath this MARK.

Decimal Tabs
---------------------

A Decimal Tab has a "dot" to it's right. This is how you can tell the difference between a Decimal Tab and the other Tabs. The interesting thing about a Decimal Tab is that when typing begins, any numerical values will have their DECIMAL POINTS aligned vertically. This sets up the possibility of creating a professional report which will show a LIST OF AMOUNTS, such as PRICES or DOLLAR TOTALS and so forth.

Removing Tabs
---------------------

A TAB MARK can be removed at any time by simply dragging it off the Ruler and letting go of the mouse button.

PAGING
---------------------

Page Numbers
---------------------

You can type out a very long document without stopping (although you should always Save your document from time to time for "insurance" against unforeseen disasters). The Word Processor uses what's called VIRTUAL PAGE which means it acts as if you had an infinitely long piece of paper fed "forever" through the program's "typewriter".

As you type, the document will be separated into NUMBERED PAGES. These pages will simply be the divisions of what the document will look like when printed.
Each PAGE therefore represents ONE PIECE OF PAPER. The Page Number that you are currently typing in will be shown at the lower left corner of the window.

Scroll Bars

On the right side and along the bottom of the document window are what's called SCROLL BARS. These allow you to move through a large document rather swiftly, in order to pin-point the exact Page you would like to edit.

Clicking on the DOWN ARROW moves the contents of the window upward a LINE or two at a time. Or clicking on the UP ARROW will move the contents downward on the screen. Holding down the mouse button on an ARROW will act like "consecutive clicks" and continue moving the contents. You can also SCROLL RIGHT or LEFT by using the bottom SCROLL BAR which works in a similar fashion. However you will really only need to do this when your RIGHT MARGIN is set beyond 8 inches. Note that you can go out to the right up to 15 inches, but you can ONLY print such a document on the Wide ImageWriter.

The Thumb

The way to move through the document a few "screens" at a time is by dragging the white rectangle called the THUMB. You might have noticed that when you clicked on the ARROWS, this THUMB also moved. The THUMB rectangle is positioned along the SCROLL BAR in the exact PROPORTION of the contents you currently see with respect to the ENTIRE DOCUMENT. Thus, if the THUMB is at the top of the SCROLL BAR, then you will know that you are at the very beginning of your document. If you drag it to the middle of the SCROLL BAR, then release the mouse button, you'll be at the halfway point of your document, and so forth. Clicking on the actual gray part of the SCROLL BAR will also advance the contents a few "screen" at a time. You can reverse the "scroll" by clicking on the OTHER SIDE of the THUMB (when the gray appears on that side).

As you drag the THUMB, the Page Number of its position will also be shown (in its usual place at the bottom left corner). Therefore, you can drag the THUMB while examining the displayed Page Number in order to "pinpoint" the exact page you would like to go to. Note that the actual SIZE of the white rectangle represents how much memory remains for you document. As you document grows in length, the THUMB rectangle will shrink.

Page Breaks

As you are typing a document, you will come to the end of a page (as it would be printed on paper). At this time a line will be displayed across the screen indicating the fact. This is known as a PAGE BREAK. What this means is that during printing, the paper will be fed through the printer to the next sheet. You can force this to happen at any time by positioning the "blinking" cursor at the desired place and then selecting "insert Page Break" from the Page menu.

During printing, a form feed will occur exactly at this point, with subsequent printing continuing on the next sheet of paper.

You can always tell where a Page Break exists by the fact that the screen will be "empty" between the Break and the bottom of that Page. Of course, you aren't allowed to type within this area. Upon reaching such a Break during typing, the cursor will jump to the top of the next Page. However, an inserted Page Break can be removed by positioning the cursor anywhere within the LAST PARAGRAPH of the Page and selecting "Remove Page Break" from the Page menu thereby removing the Break "area" from the document.

Headers And Footers

A HEADER, or a FOOTER, is simply a line, or a few lines, that you would like to have at the top or bottom of every page. To insert a HEADER or FOOTER simply type the text and HIGHLIGHT it. Immediately select "Copy as Header" or "Copy as Footer" from the Page menu. The text will be saved (replacing any previous ones) and will appear during printing. You can examine a HEADER or FOOTER by selecting "Show Header" or "Show Footer" from the Page menu in which case they will appear on the screen. Common usages for HEADERS or FOOTERS include your company's name and address (or logos and other Graphics drawings as cover later) which will then become your special Letterhead stationery.

Show Full Page

Since an entire 8 1/2 by 11 page cannot "fit" onto the screen all at once, there is an item under the Page menu called "Show Full Page". By selecting this you will be shown a miniature representation of the current page of your document.

This function is often used to see what your page will look like prior to printing, especially when it contains numerous graphics drawings or complex layouts. By examining the Full Page from time to time, you can then create your document with full assurance it will be taking the form you had originally planned. Click the "ok" button when done viewing the Full Page window and you will be returned back to the normal editing mode.

Creating Documents

When you have finished typing your document and are ready to save it to your disk simply go up to the File menu and select "Save Document" or press OPEN APPLE-S instead. Upon doing so you will be asked to give your new document a NAME (For untitled docs). The default name "Untitled" appears at the bottom of this Save window. Note that it is highlighted. As usual, it can be edited by simply typing in a name or by clicking the pointer between characters and begin typing or backspacing.

When ready, click on the "Save" button, or press the RETURN key (the "ring" around the button means it is the default button), and the document will be saved. You will then be returned back to your document. Notice that the TITLE of the window will change from "Untitled" to "XXXX" (the name you enter).

About The Save Window

It is important to know some more things about the Save window. At the top you will be shown the name of the current PATHNAME. The Disk icon will be followed by a name that indicates the main directory to where your document will be saved. You are also given the amount of disk space remaining.

Those items in the window which are grayed mean they do NOT apply to the activity. Naturally saving your new document with the same name as one already saved will completely destroy the contents of the original. The Cancel button when clicked, will simply return you back to your document WITHOUT saving the document.

Saving To A Folder

What you are really trying to do when you save a document is to save it INTO A FOLDER. Thus, you locate the FOLDER you want (clicking on the Up or Down Arrows to scroll through a large list of them) and then click "open" or press RETURN, or you may double-click on the folder name. In any case, THIS IS WHERE THE DOCUMENT WILL BE SAVED.

A Folder icon represents a SUB-DIRECTORY which in itself can hold other files, and these files can only be found by examining this particular folder. You can recognize it as a SUB-DIRECTORY since the name includes slashes "/", each one meaning "go out a level" or " hierarchically within a folder". Again, this will be the FOLDER your document will be saved in (when you click on Save). When a folder icon is showing, the "Close" button will become activated. Clicking this will take you back to the
You can create a brand new folder by typing in a name for it then clicking on "New Folder". After this is done you would then type in the name for the document itself and save it into this new folder. The "Disk" button is used by first ejecting your disk and inserting another disk. Clicking "Disk" will then read the new disk for all of its FOLDERS, and then you can carry on as explained above.

**Opening Documents**

When a document is put away, you can then open a previously saved document by selecting "Open Document" from the File menu. In this case the Open Document window will open up. Selecting the filename, then clicking the "Open" button (or pressing RETURN), or double-clicking on the file's name will open the document. The new window will have the document's name as it's title.

**Working With Documents**

You can then start working with this document in the usual fashion. When finished, you have the option of Saving an changes and then Closing the window, or Close it and save it (or not) directly from the prompt window.

Sometimes one might just want to "see" a document, or "copy" some of its text (or graphics), then close the document and bring up another and paste the copy into this newly open document. Once you get the hang of it you will find there are a number of options available for creating and retrieving documents.

**OTHER DOCUMENTS**

You can work with an existing document by bringing it up, typing new data or making some changes to it and then selecting "Save As..." from the File menu. This will allow you to save this altered document to a different file name. The original document stays intact as the window’s title then changes to the new documents name (that you entered in the Save window). This is how you can create "templates" and other such files that you would like to have saved aside. Many documents might actually contain the same "structure", such as "letterhead" or reports, and by saving a "copy" you won’t have to always create a new document entirely from scratch.

**Saving A Copy**

You can create a brand new folder by typing in a name for it and then clicking on "New Folder". After this is done you would then type in the name for the document itself and save it into this new folder. The "Disk" button is used by first ejecting your disk and inserting another disk. Clicking "Disk" will then read the new disk for all of its FOLDERS, and then you can carry on as explained above.

**Closing Documents**

**Opening Documents**

You can create a brand new folder by typing in a name for it then clicking on "New Folder". After this is done you would then type in the name for the document itself and save it into this new folder. The "Disk" button is used by first ejecting your disk and inserting another disk. Clicking "Disk" will then read the new disk for all of its FOLDERS, and then you can carry on as explained above.

**Save Document As...**

**Import As Text**

A document can also be created from TEXT type files. This is the process you can use to bring into GraphicWriter any documents or TEXT created from other programs. When you select "Import Text File" from the File menu, another "Open" type window will be presented allowing you to choose a TEXT file (you may insert other disks during this "search"...). Then you select the TEXT file just like you were opening a normal document, but this time the data from that file will be inserted into your document. The insertion of the TEXT will occur at the current point of the "blinking" cursor. Thus, you should first position this cursor and then select "Import Text File". After the TEXT is inserted, you are welcome to edit it (cut-copy-paste, etc). You can also just bring up a "New Document" then import the TEXT. When ready you can Save this new document, or use "Save As..." to a completely different file for an altered document.

**Importing Text Files**

**Graphics**

The Drawing Tools

Each DRAWING TOOL can be selected by simply clicking on its ICON at the bottom of the screen. The "A..." (for ASCII) is used for what is called TYPING MODE. Clicking on it (so that the square becomes highlighted) means you can then begin typing. If you then click on any of the other squares means you will go into the GRAPHICS MODE.

Next to the "A..." we have the LINE TOOL. After selecting it, the arrow pointer becomes a CROSS when you drag it up to the middle of the screen. This is also how you can tell that you are in the DRAWING or GRAPHICS MODE and that you can NOT type at this time.

To use the LINE TOOL you first click and hold down the mouse button and DRAG the CROSS about the screen. A LINE will be drawn FROM THE STARTING POINT of where you FIRST clicked, TO THE ENDING POINT of where the CROSS is when you RELEASE the mouse button. You can "eyeball" the LINE until it is perfectly straight.

Next to the "A..." there are four SHAPE TOOLS: a rectangle, a rounded rectangle, a triangle, and a circle (or oval). These tools work the same way, that is, you click and DRAG to draw with them.

The next four FILL SHAPES work exactly the same way, but instead of drawing a "border", the entire area is filled in.

The hand tool is used for moving pictures about the screen. It works by clicking ON the picture, holding the mouse button down, and DRAGGING the picture with the HAND. A ghost picture moves with the HAND and when the mouse button is released, the picture will move from its original position to the new destination. If not satisfied with the position, simply drag it again to another place.

The LINE THICKNESS is determined by selecting one of the 5 CROSSES before you draw. Of course, only the NON-FILL SHAPES are affected by LINE THICKNESS since the FILL SHAPES are essentially solids.

You click on one of these drawing pointers and then choose the TOOL you wish to
draw with. To understand their differences, let's examine how the thinnest one can be utilized to create the same effects as the thicker ones. Using the smallest CROSS pointer, draw a rectangle, then position the pointer just inside the upper left corner and drag into place a new, internal rectangle. Repeating this process creates a thicker "border" just as if you used a larger CROSS. Therefore, as you draw with one of the larger CROSSES, adjacent multiple lines or "dots" are formed at the same time, thus yielding larger "rectangles".

The Paint Palette

Drawing in color is done with the aid of what is called the PAINT PALETTE. This is called up on the screen by selecting "Paint Palette" from the Goodies menu or using OPEN APPLE-A (for "Artist"). The palette is like an artist's tray of colors used during painting. The PAINT PALETTE can be kept on the screen as you are drawing and can be moved about by dragging on its top black part. It can be put away by selecting "Hide Paint Palette" from the Goodies menu, or by clicking in its CLOSE BOX. (Clicking on the title of your document at the very top of the window also puts the PAINT PALETTE away).

Selecting A Color

A COLOR is selected by simply clicking in one of the 48 colored ovals. A check mark next to the oval signifies that it has been selected. Also, the selected color will appear in the COLOR BOX at the bottom of the screen. All subsequent typing or drawing will be displayed in this color. Note that DOUBLE CLICKING a colored oval on the PAINT PALETTE will select that color and put the PALETTE window away.

Typing In Colors

The way to type in color is by first selecting one from the PAINT PALETTE just prior to typing. You can change the color of existing text by highlighting it and then selecting a color. Note that the text will remain highlighted and appear in an INVERTED color until you click the mouse to reveal its true color.

Painting Modes

There are 3 PAINTING MODES. The current MODE will always be checked on the Goodies menu. HEAVY PAINT is very simple to understand. Any color you draw with will paint directly over any drawings underneath it. WATER COLOR results in "mixed" colors when painting over a different color than the currently selected drawing color. The drawings below it will often "come through" resulting in bizarre combinations of colors. However, the primary purpose of WATER COLOR is TO LET THE BLACK SHOW THROUGH. DYE simply paints over any BLACK parts of a picture. On an empty screen, a drawing done in DYE will end up being transparent, but when you paint over a picture that contains the color BLACK, then just let the BLACK portions of the drawing underneath become DYED.

Hiding Colors

On the Display you will find "Hide Red, Blue, Green or Yellow. Selecting one of these will temporarily HIDE that particular color from the screen. The Display menu will then change to "Show Red" or "Show Blue", etc. Re-selecting one will once again SHOW that color. This is how you can view various colored OVERLAYS.

Living Color Or Black & White

You can also select "Black & White" from the Display menu in which case the entire screen will be displayed in black and white, or shades of gray where there are different colors. Selecting "Living Color" returns the screen back to all color again regardless of which colors were previously "hidden".

"Living Color" therefore SHOWS ALL COLORS, as if you selected them from the menu one by one. "Black & White" will override any "Show Colors" and HIDE them all at the same time.
When you draw a shape, it becomes what's called an OBJECT. This means it is INDEPENDENT from the rest of the document or other OBJECTS.

Selecting & Changing An Object

This is proven by the fact that you can change the size, position or color of an OBJECT without disturbing the others. This is done by SELECTING the OBJECT (clicking on it with the HAND TOOL). A "marquis" type border will surround the OBJECT telling you that it is currently SELECTED, which means you can now do various things with the OBJECT.

An OBJECT'S LINE THICKNESS can be altered by selecting the OBJECT and then immediately selecting a different CROSS.

An OBJECT can be RE-SIZED by holding down the CONTROL key while dragging it with the HAND TOOL.

An OBJECT can also be ROTATED by selecting "Rotate" from the Goodies menu. This is usually used on TRIANGLES to obtain "arrows" of different direction.

You can change an OBJECT'S COLOR by clicking a different colored oval on the PAINT PALETTE. Likewise, the DRAWING MODE for this particular OBJECT can be changed by selecting "Heavy Paint", "Water Color", or "Dye" from the Goodies menu.

Selecting Multiple Objects

You can select a number of different OBJECTS at the same time by holding down the SHIFT key while clicking on them one by one. Each one of the OBJECTS will appear with a "marquis" frame.

These selected OBJECTS will then behave as a GROUP. You can change all their COLORS to the same color, as well as change their LINK THICKNESSES or DRAWING MODES. You can move ALL of them in unison by holding down the SHIFT key while dragging. However, if you try to RE-SIZE any one of them (with the CONTROL key), only that one particular OBJECT will be altered since the others will then become "de-selected".

Cut/Copy/Paste With Objects

Just as you highlighted text and performed Cut, Copy, or Paste, so can you select an OBJECT (or multiple OBJECTS with the SHIFT key) and choose Cut or Copy from the Edit menu. The copied OBJECT will appear on the Clipboard, replacing whatever was there before it. As you'll recall, the Clipboard's contents can be viewed as desired by selecting "Show Clipboard".

When an OBJECT exists on the Clipboard, you can then select "Paste" from the Edit menu and the OBJECT will reappear at the top-left corner of the CURRENTLY SELECTED REGION. For example, if you Cut an OBJECT from your document, and then select a different REGION, the Pasted OBJECT will be placed at the top-left position of this REGION -- no matter what Page you are on (or have scrolled to). You may, of course, DRAG a Pasted OBJECT away from this position by using the HAND TOOL. When you Paste an OBJECT directly on top of another OBJECT, you might wish to move it away (using the HAND) in order to expose any "hidden" OBJECTS beneath it.

Regions

A REGION can be simply defined as "an area". A REGION is usually comprised of a "group" of multiple OBJECTS that form a single picture.

Typing Regions

The simplest REGION is called the TYPING REGION. When you create a new document, a large TYPING REGION is automatically created which essentially "covers" the entire document. You don't have to worry about it. You just keep typing and as you hit RETURN, the lines of text keep growing and growing.

Bottomless Regions

This beginning TYPING REGION is also known as a BOTTOMLESS REGION in that an imaginary "rectangle" surrounds the whole document, with no tangible BOTTOM. You can virtually type forever downwards. And just as you can keep typing, so can you keep drawing and adding OBJECTS into a BOTTOMLESS REGION.

Boxed Regions

A BOXED REGION is one that does have a bottom. It is finite to the degree that if you were to type in this REGION, you would eventually come to a point where you could no longer type, that is, the REGION'S boundaries will restrict the typing to the specified dimensions.

A BOXED REGION is most often used when you want to confine certain OBJECTS within a particular area and act on them without disturbing any others. Such is the case of a complex drawing that is complete to your satisfaction, and you wouldn't want it to be changed. The "set" of OBJECTS can be copied and sent to other places on your document, into other REGIONS or even to other documents (via the Clipboard, or GraphicWriter Scraps).

Creating a New Region

As previously mentioned, a new, "Untitled" document begins with a BOTTOMLESS TYPING REGION. To create and define a totally NEW REGION, simply select "New Region" from the Regions menu and a default "rectangle" will appear on the screen.

The Object Mode

REGIONS have 2 different MODES. The OBJECT MODE is fairly straight forward. The REGION is simply made up of a collection of OBJECTS brought together to form a single picture. You create and draw the OBJECT directly within the REGION.

The OBJECTS within a REGION can be Cut or Copied. You may also create an OBJECT outside the REGION, Copy the OBJECT then Paste it into the selected REGION. Therefore, the purpose of a REGION is to "group" OBJECTS together. The REGION will then behave as a single entity, which is discussed later. The reasons why you would want to use REGIONS will become much more evident under the heading "Page Making".

The Canvas Mode

The CANVAS MODE is quite different. This is where you draw within the selected REGION using the PAINT BRUSH TOOL to do "free hand" drawings. You must understand that the drawings performed in the CANVAS MODE are NOT OBJECTS. The drawings are nothing more than "dots on the screen". These "dots" CAN NOT BE MOVED nor can they be re-sized. They merely form a picture within the REGION and have become "blended" into the area. You can, however, draw right over them, or erase them by selecting and drawing with "White" paint. You may also Cut or Copy an ENTIRE CANVAS REGION and Paste it into another CANVAS REGION, but NEVER into an OBJECT REGION.
Apple II Computer Info

Text Plus Graphics

The basic rule to remember when combining text and graphics pictures is that the pictures will always "override" the typed text. This is because a drawing is really a "painting" and will usually cover-up the text. Of course, a WATER COLOR or DYE will change the apparent color of any underlapping text (until you move one of these OBJECTS away).

Typing Over Pictures

As you are typing, the characters might run under an OBJECT, as the text will tend to "disappear". In fact, you might even see a "blank line" across the screen during backspacing of text. What this means is that because you are in the TYPING MODE at the time, there will be an illusion of parts being "erased". You will experience this whenever you are typing and there are pictures that "get in the way".

To review the pictures or text, that is, to see what the document "really" looks like, all you have to do is click on the "Update" button at the bottom right hand corner of the screen.

This will show the OBJECTS in their proper and full pictures, in which case any text is underneath them, the OBJECTS will "another" the text so that the text will not be seen. (except for most Water Color and Dye OBJECTS).

Text Within Regions

The text entered into a BOTTOMLESS or BOXED REGION can be operated upon with the normal editing functions such as cut & paste, highlighting and changing font, size, or color, and so forth. However, the REGION can also maintain a set of TABS and MARGINS and because of this, the real power of GraphicWriter begins to be noticed.

When we create a NEW REGION, the MARGINS are set, as a default, to the left and right boundaries of the REGION.

You'll recall the rule that the RULER you see is for the current paragraph.

Well, in this case it's our REGION! As with any paragraph, dragging the RIGHT MARGIN MARK to a new setting will alter the text within that REGION.

Mixing Text And Graphics

You can also combine GRAPHICS pictures within the same REGION containing TEXT. For example, if you have a drawing in one REGION, and typed a "label" in a separate REGION just below the drawing, then if you wanted to move both the drawing and label to another position on the page (or to another page), you would have to move them individually. However, the correct way to do this is to COMBINE them all into one single REGION, making this unit much easier to work with.

Cut-Copy-Paste

You can use Cut, Copy or Paste on any TEXT within the OBJECT REGIONS. The TEXT is called REAL TEXT and can be typed in one column with the writing carrying over and continuing on in the other column.

You can create as many columns as you wish, with each REGION having a unique size, and you can scatter these REGIONS around a page as well as using multiple pages. (See "Page Setup" to learn how you can change the actual page lengths).

Documents can also be created that are "mixed". An example would be two REGIONS of text along with a third REGION dedicated to some artwork drawings.

IMPORTANT RULE: Once you have selected either the OBJECT MODE or CANVAS MODE and have started to draw in the REGION, you may NOT revert to the other MODE while working in that REGION.

Black On White/White On Black

The "normal" mode for most applications is "Black on White" which means "black text on white paper", much like a typewriter. However, GraphicWriter allows you to do the reverse by selecting "White on Black" from the Regions menu.

This ONLY EFFECTS NON-COLORED TEXT and pertains to the ENTIRE REGION. You can subsequently paint "over" any part of the REGION. You can revert to the opposite by re-selecting the other "inversion" from the Regions menu.

Selecting & Operating Upon Regions

A REGION becomes selected by holding down the OPEN APPLE key while clicking on it with the HAND TOOL. The OPEN APPLE key is necessary so as to distinguish the REGIONS from OBJECTS. Upon selection, you can operate on the entire area of the REGION at once, such as RE-SIZING it to different dimensions by holding down the OPEN APPLE plus the CONTROL key at the same time while "tugging" on the REGION with the HAND. Note that by using the SCROLL BARS it is possible to create a REGION which is larger than the viewable screen. You would alternately RE-SIZE and SCROLL. However, due to memory limitations, a CANVAS REGION may NOT be larger than 8 inches wide by 10 inches long.

You can change the REGION from "Boxed" to "Bottomless", or you may choose to put a BORDER around a REGION by selecting "Framed" from the Regions menu. This will draw a BOUNDARY FRAME, which can thereafter be removed by selecting "Unframed"/Unframed/Unframed.

Selecting "Show Regions" will allow you to see the positions and sizes of your REGIONS in the form of rectangular "frames" on the screen. Thereafter, the Regions menu will say "Hide Regions" which will, of course, remove the viewing frames.

Helpful Rules

The OPEN APPLE key always pertains to REGIONS. If you do NOT use the OPEN APPLE key, then you will be acting upon OBJECTS or TEXT.

The CONTROL key gives you "Control" of a REGION or an OBJECT.

The HAND is used for SELECTING, MOVING and RE-SIZING both REGIONS and OBJECTS.

The SHIFT key, while used to select MULTIPLE OBJECTS or TEXT, unfortunately may NOT be used to select multiple REGIONS. However, you can Copy OBJECTS within REGIONS or CANVAS pictures, individually into or out of the Clipboard or GraphicWriter Scraps and Paste them elsewhere as desired.

Page Design

For the advanced user or desktop publisher, REGIONS become almost mandatory for sophisticated page layout. For example, multiple text columns (required for creating a NEWSLETTER) can be defined by laying down REGIONS for these columns. You can choose separate colors for the entered text as well as separate justifications for each REGION. Changing one REGION will not alter the other. In this way, a whole text could be typed in one column with the writing carrying over and continuing on in the other column.

You can create as many columns as you wish, with each REGION having a unique size, and you can scatter these REGIONS around a page as well as using multiple pages. (See "Page Setup" to learn how you can change the actual page lengths).

Documents can also be created that are "mixed". An example would be two REGIONS of text along with a third REGION dedicated to some artwork drawings.
a WATER COLOR or a DIE OBJECT directly over it. (Of course, using HEAVY PAINT will cover the OBJECT or REGION completely).

Through the use of the "typing fields" and OVERLAYS sophisticated artwork can be obtained. Keep in mind as well that when your creative ideas come to life in the form of a really good drawing, make Copies of them for safe-keeping.

Layouts

You'll recall that "Show Full Page" can be selected from the Page menu in order to view a miniature representation of the PAGE on which you are currently working. This process proves very valuable when applied to Page Making.

Using "Show Full Page"

When brought up on the screen, Show Full Page presents for your inspection the "overall view" of a document Page. Lines of TEXT in this window will be displayed as "waves". The window represents a single page, about 8 1/2 inches across (the "viewable" section of the document window, which will be just a portion of a wider document) and you can view different pages by first scrolling to them prior to selecting "Show Full Page".

Rearranging The Layouts

One of the best uses for Show Full Page is that, by using the HAND, you can actually drag and maneuver the OBJECTS or REGIONS about the page. In this way, Page Making becomes much easier to accomplish. The OBJECTS or REGIONS can also be Cut, Copied, or Pasted directly on the window (or into the Scrapboard). An other process that you can perform on the "regular" document window with an OBJECT or REGION can also be done on Show Full Page. The only function you can NOT do is to RE-SIZE an OBJECT or REGION during Show Full Page.

Templates

A template is the term used for a document which serves as a "model" that can be used to create similar type documents. This is so you don't have to keep creating the same drawings or layouts over and over.

Creating A Template

It is very easy to create a TEMPLATE. All you do is perform your drawings and then Save it back to the disk. For example, a document that has a logo at the top can be used as Letterhead stationery. Then, you open up this TEMPLATE and of your graphics drawings will be printed nor will the TEXT be able to be cut, copied or pasted from it. A picture in this Scrapboard is like a "frame on film", The number of the picture is shown along with the total number of pictures (1 of 4, etc). You can move through the series of "frames" in the usual manner of clicking on arrows to scroll up or down, or by clicking in the scroll bar, or by dragging the scroll "thumb".

A picture can be Cut or Copied (by using the Edit menu) from your document and into the Scrapboard, or a picture can be Cut or Copied from the Scrapboard and then pasted into your document.

There is an important rule to remember which is called the FRONT WINDOW. If the Scraps window is the front most window at the time, the editing functions (cut, copy, paste) apply only to the Scrapboard and NOT the document. When you CLOSE the Scraps window (or click on the document window) then the document itself becomes the FRONT WINDOW and all editing functions behave as usual upon the document.

You can store various pictures of your choice into the GraphicWriter Scraps so that all of your documents can access and share them.

Page Setup

Printing your document is accomplished by first selecting "Page Setup" from the File menu. Upon doing so you will be presented with the "Page Setup" Window. The Page Setup Window allows you to choose various ways of printing. You may bring up this window at any time to "set" the parameters. However, there may be times when you'll want to make changes to these parameters just prior to printing a special document.

PRINTER represents the type of printer you will be using. You can choose the ImageWriter, the ImageWriter II (which can print in colors), the LaserWriter, or a Daisywheel type printer. (The latter can only print in DRAFT). To select a printer, simply click in one of the "radio" buttons.

QUALITY represents the type of printing you want to use. The DRAFT button signifies that you want to print the TEXT ONLY. This, of course, means that NONE of your graphics drawings will be printed nor will the TEXT be able to be printed in the different fonts, sizes, or styles (except bold and underline). This printing mode is used most often for business letters and reports.

STANDARD represents the normal mode for printing graphics. This mode does allow the fonts, sizes, and styles of your text to be printed. HIGH QUALITY mode is a "double-pass" graphics printing which results in a much sharper picture than with STANDARD (although this takes longer to accomplish). NOTE:At this time the routines are NOT included for HIGH QUALITY for the IMAGEWRITER II and no printing from the LASERWRITER. These will be included in GraphicWriter at a latter time when Adobe makes the routines available to the developers.

PAPER is for setting the paper length of each PAGE of your document. Note that you can control this length while you are creating a document. The Page Number on the screen, as well as Page Breaks, will be affected by this length. US letters is you normal 8 1/2 by 11 inches while US Legal is 8 1/2 by 14. A4 stands for the common Europen size. Computer represents paper that is 15 inches wide. Note that you can only print 15 inches wide PROVIDED you are using the Wide ImageWriter.

PAGE NUMBERS, HEADERS and FOOTERS are selected individually by clicking in their positions on the screen. You can also select a FOLDER on the disk for special PAGE NUMBERS, HEADERS and FOOTERS are selected individually by clicking in their positions on the screen.
Bitmap Files Changing the Master Palette

Remember, these Print Setup parameters are saved uniquely for each document. You can therefore have many different documents, all with separate settings.

Should your printing not quite come out as desired, then abort the printing and bring up the Page Setup window, select the appropriate option, then continue printing.

Print Setup

After assuring the Page Setup parameters are satisfactory, the very next step towards printing is to select "Print Setup" from the file menu. Upon doing so you will be presented with the Print Setup Window.

The COLORS boxes allow you to choose which of the main COLORS you would like included in your printing. You choose a color by clicking in its box (until it becomes checked). You can de-select (un-check) a COLOR by clicking the box a second time. If a COLOR is not checked, then it will be excluded from the final printing. In this way it is possible to print COLORED OVERLAYS by printing your document a number of times. Each time you can print by selecting different combinations of added or removed colors.

SCREEN TONES represent the degree of "screening" to be done during printing. This is as if a screen or "grid" of a specific DOT DENSITY was laid over the document, allowing only certain TIMES to show through. This is measured by the percentage of SOLID BLACK.

FORM FEED is your normal type of paper feed where the printer sends the specially prepared form paper on through during printing. CUT SHEET is where YOU manually feed each sheet of paper during printing, one by one when asked to do so.

The number of COPIES you wish to print can be entered by editing the COPIES box. Clicking "Cancel" returns you back to your document WITHOUT saving any changes to the Print Setup parameters.

Clicking the "START" button will save the current parameters and begins printing according to all of the parameters from both the Page Setup and Print Setup windows.

You can ABORT the actual printing by pressing OPEN APPLE- PERIOD.

IMPORTANT NOTE: These Page Setup parameters are always saved uniquely for each document. You can therefore have many different documents, all with separate settings.

You can ABORT the actual printing by pressing OPEN APPLE- PERIOD. You can therefore have many different documents, all with separate settings.

The number of COPIES you wish to print can be entered by editing the COPIES box. Clicking "Cancel" returns you back to your document WITHOUT saving any changes to the Print Setup parameters.

Clicking the "START" button will save the current parameters and begins printing according to all of the parameters from both the Page Setup and Print Setup windows.

You can ABORT the actual printing by pressing OPEN APPLE- PERIOD.

To Import A Bitmap File

1) SELECT or create a CANVAS REGION (you can only import a Bitmap File into a CANVAS REGION).

2) Select "Import Bitmap File" from the Goodies menu.

3) A standard file selection list window will be displayed. Select the file you wish to import.

A standard Bitmap File contains 32,000 characters which comprises an entire single GS screen in the High Resolution mode. The initial size of your CANVAS REGION is unimportant. The entire 640 X 200 matrix of "dots" is imported into memory. A smaller CANVAS REGION can be "stretched" in size in order to see more of the imported picture.

Exporting Bitmap Files

It is also possible to EXPORT a Bitmap File from GraphicWriter to another program or device (providing, of course, they have the capability of "excepting" such a file). To do this, simply SELECT a CANVAS REGION and then select the Bitmap Files* from the Goodies menu. As usual, you will be asked to enter a new name for the file just prior to saving it.

NOTE: Since Bitmap Files require large amounts of disk space, it is NOT advisable to use "Import" or "Export" just to transfer pictures between GraphicWriter documents. Instead, use either Cut/Copy/Paste or GraphicWriter Scrape.

The Master Palette

Since GraphicWriter uses "Super Hi-Res" graphics, there are certain restrictions applied to the selection of COLORS. In the "Super Hi-Res" mode, the GS can only display FOUR unique colors per screen line, and although this restricts the solid color spectrum, it is a necessary trade-off for good quality graphics or word processing.

GraphicWriter behaves like it uses more than FOUR COLORS by employing a technique known as DITHERING. This method, commonly used in the printing industry, blends the different colored "dots" into PATTERNS that give the appearance of different hues and shades. For example, the color PURPLE is created by displaying alternate RED and BLUE dots. ORANGE is created with YELLOW and RED dots, and so forth.

Changing the Master Palette

There may be times when SOLID COLORS will be preferred over DITHERED COLORS. For example, one might be designing a layout which will only have one or two colors for the camera-ready artwork at the printing press. In this case, the restriction to four colors (where WHITE and BLACK are two of them) is more desirable since solid, undithered colors are preferred.

By selecting "Set Master Palette" from the Display menu, the Set Master Palette Window will be presented. If you select "Dithered", colors will be displayed on your document using the DITHERING technique (described above). Note that the color selections have no meaning when Dithering is selected.
By selecting "Solid Colors", your document will be displayed using FOUR NON-DITHERED COLORS. White and Black are always chosen for two of the four colors as White is necessary for "background" and Black is necessary for "outlines". But, you can choose, Red, Blue, Green, or a combination of all three for the remaining two colors.

Red, Blue and Green are offered as choices that represent the actual colored "beams" that reflect on your monitor. By selecting different combinations, you can obtain the following solid colors. (Note: An X means the color box is checked while "O" means it is un-checked):

<table>
<thead>
<tr>
<th>RED</th>
<th>BLUE</th>

Colored Printing

How Colors Will Print

You can determine the exact way GraphicWriter will print colors to various printers by understanding three general rules:

1) If the selected print device is the ImageWriter II, the document is printed with the identical colored patterns as shown on the GS screen. 2) If the selected print device is the ImageWriter or LaserWriter, colors will print in Black and White patterns as follows.

A) If DITHERED is selected for the Master Palette, colors will be represented by various shades of gray, depending upon the original colors' relative lightness and darkness.

B) If SOLID COLORS is selected for the Master Palette, then all solid colors are printed as solid Black and patterned colors are printed as Black Dots. 3) If SCREEN TONES has been selected (from Print Setup), only the SOLID colors are affected. If DITHERED is selected for the Master Palette, then only Black is affected, whereas if SOLID COLORS is selected, then Black and ALL SOLID COLORS will be affected by the SCREEN TONE selection.

Color Separation

GraphicWriter is an excellent tool for preparing multi-colored copy for printing. However, it's important to plan your document in advance, keeping in mind the various methods for printing, in order to achieve the desired results. For example, if you are going to design a two or three colored promotional piece, it is best to force the Master Palette into SOLID COLORS. Then, you would print each OVERLAY one at a time. By selecting one of the colors from the Print Setup parameters (and remember Black is a color), only those specific colored portions of the artwork document will be printed in SOLID BLACK which is exactly what is required for your camera-ready copy.
This summary of the great graphics adventure will take you from the very beginning to the very end in the least amount of moves. Therefore, there will be some short cuts here and there.

OK...Let's begin!!!!

(actions are printed inside "greater than" and "less than" signs)

Now you must instruct the ship's computer where to go...

You are now on course towards Saturn
Now off to Titan to get a bomb. Along with a coordinate for the ship, a coordinate for the teleport is also required.

You are now on an alien ship...The objective here is to find the Black Orb. To open doors, you must use orbs to lock and unlock them. Meaning there will be a series of dropping and picking up orbs.

Back to Saturn!
To call this routine from BASIC follow this format:

```
CALL xxxx,A$  
```

[xx=variable address in program, A$=any string variable]

As before A$ can be any string variable, and if it is not a string variable or the comma is forgotten then a SYNTAX ERROR will result.

**Decimal locations:**
- $1650 = 5712
- $9200 = 37376
- $BC00 = 48128

In order to use GS CLOCK #2 with Telecat MF.STARTUP must be changed so
that the BASIC programs do not overwrite the clock drivers. To change
them LOAD MF.STARTUP and change the POKE 104,23 to POKE 104,24 - now
all BASIC programs will start at $1800, not $1700 as before. While you
do lose 256 bytes of memory for BASIC programs and variables I kind of
think it is worth it, I mean 256 bytes!

I'd also like to say that both programs can be used in any DOS, be it
DOS 3.3, ProDOS, or anything. GS CLOCK #1 is fully relocatable, whereas
GS CLOCK #2 is not - if you require a new originate address contact me or
simply change all of the address-dependent locations. Also do not try
to use either clock in immediate mode (from the "J" prompt) they are only
made to work inside of a BASIC program. The variable you signify when calling
either clock does not have to be defined already, if it is not it will
define it and if it is already defined then it will replace it. Another thing
is that the clock drivers must be BLOADED not BRUNNED to be installed in
memory.

Program and Docs by The Screamer -- 1/21/87

I can be found on these boards:
- Apple Tree //........................305/556-6858
- Cap. Connection }[...................716/473-8051
- Rock'n Roll Harbour..................305/821-2232

If you plan on using it on your Telecat board simply BLOAD GS CLOCK #1,A$1650
and to call it issue this CALL 5712,A$. MF.STARTUP does not have to be changed,
and you lose *NO* memory for BASIC programs or variables with this. Loading
it at $1650 gives you quite a bit of extra memory for your driver as well.

GS CLOCK #2:

```
This routine is the same as the first version, except that it's
output is exactly the way the Thunderclock, Thunderclock Plus, Timemaster II
H.O., and compatibles output time - it's also much more professional looking.
This routine is NOT relocatable and cannot be loaded anywhere in memory, if it
is not loaded at it's original address then it will also yield unpredictable
results. This routine is exactly 349 bytes long and therefore does not fit
at $300. I have assembled 3 versions, all the same but with different
origin address ($1650, $9200, and $BC00). The $1650 version should fit in
fine for all Telecat sysops with a minor change in MF.STARTUP (see end), the
original Telecat driver ends at $15F7 so this provides quite a few (about 70)
extra bytes for any modified drivers. The $9200 version is perfect
for 48k DOS and HIMEM must be set accordingly. The $BC00 version is perfect
for 64k DOS and HIMEM should also be set. By the way each version is
noted by it's end address (ie: GS CLOCK #2 $1650 = $1650 originate version).

The output for all of them is in this format:
SUN DEC 25 12:00:00 PM    
```

SUN DEC 25 12:00:00 PM
GSBug & Debugging Tools Update Release Notes
8/26/91

This folder contains the latest pre-release version of GSBug & Debugging Tools. These tools are useful with or without APW or CRCA development environments (i.e.: if you're using Merlin, Micol, TML, MPW IIgs, or any other development environment to write Apple IIgs software, then these tools (especially GSBug) will be very useful in finding bugs in the software you're developing.

These tools are a fully copyrighted work of Apple Computer, Inc and may NOT be redistributed. They are being provided to you for your own use as our way of saying, "Thanks for developing for the Apple IIgs". All Rights Reserved.

Further information on using GSBug itself can be found in the "GSBug.Tutorial" file in the same folder as this "Read.Me" file. Details on how to use the new "calls" that have been added to GSBug can be found in the "GSBug.Specs" file which is also in the same folder as this "Read.Me" file. Reading those two files will explain a lot of things to you. The tutorial is especially useful if you do not have the manual (or you have the manual, but never bothered to read it).

The tutorial and specs files will only teach you the basics, there is a lot more that can be done with GSBug, but you'll need the manual to be able to tap into them. The 140 page manual for GSBug & Debugging Tools contains full details on how to use these tools. Those of you without this manual can get one for ordering. Contact APDA at 1-800-282-2732 (in the U.S.), 1-800-637-0029 (in Canada), and 408-562-3910 (International). The part number for this package is "A0037LL/A" and the price is thirty dollars ($30). You no longer need to be a member of APDA to be able to order this product, contact APDA for full details.

GSBug best supports debugging of 16-bit software. Recent changes made to it provide minimal functionality for debugging 8-bit software. Please read the "GSBug.Specs" file for details.

ONLY the INIT version of GSBug is being provided. The application version is most likely going to "go away" in the future. Instead, we'll provide an easy way for you to install and remove the INIT version on the fly. Currently, you can remove the INIT version after booting by simply entering the debugger (the tutorial file tells you how) and typing "UNLOAD", then Pressing RETURN. This removes the debugger. If your application crashed into the debugger and you unload the debugger, your application will still be crashed (but into the monitor now that GSBug is gone). If your application is NOT crashed (i.e.: you entered the debugger by pressing the key sequence that drops you in safely), then unloading GSBug will resume operation of your application as though nothing happened (actually, plenty happened - GSBug was removed from memory and you can't drop into it any more because it's gone).

Having only the INIT version solves several problems you would have encountered had you tried using the application version of GSBug along with an application that uses resources. GSBug is technically the "current" application, so calls to the Resource Manager would actually lock in GSBug's resource fork (which is non-existent) instead of your application's. The INIT version prevents this conflict (and several other similar ones caused by confusion of which app is the "current" one).

Directions for installing these tools are below:

GSBug & Debugging Tools installation:
- copy the files in the "GSBug/System.Setup/*" folder
  to your boot disk's System.Setup folder (full path would be:
  "*/System/System.Setup/*"). This will provide you with the INIT version
  of GSBug the next time you boot your computer from the disk you just
- copy the files in the "GSBug/Desk.Accs/*" folder to your boot disk's Desk.Accs folder (full path would be:
  "*/System/Desk.Accs/*"). This will provide you with additional debugging
  tools such as loader/dumper, memory mangler, scrambler, and snooper. You
  must reboot from the disk you just installed onto in order for those desk
  accessories to show up.

- copy the Exerciser application to wherever you normally install your
  applications. It doesn't really care what folder it lives in. There is
  a desk accessory version of the Exerciser, so you don't HAVE to use the
  application version if you don't want to.

Double check your "*/System/System.Setup" folder to be certain that you have ONLY one copy of the GSBug INIT file. The old name for this file is "GSBug.INIT" and some pre-release versions went out with the INIT named "debug.INIT". Having two copies of GSBug will cause nasty things to happen since both copies would be trying to do the same thing. One GSBug is all you need.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 475 of 1262
GSBug -- Current Version 1.6b20

Version 1.6b20 (DAL)

Added new GS/OS call name SetStdRefNum, call number $203A.

Fixed the version string so it doesn't say "Apple Confidential."

Version 1.6b19 (DAL)

To automatically load a templates file at boot time, it must be named GSBug.AutoTemp (in the System.Setup folder).

If you use LoadTemp without a pathname, it still defaults to GSBug.Templates.

Version 1.6b18 (DAL)

Versions with 6.0 stuff included are now 1.6bxx; without 6.0 stuff is still 1.5bxx.

LoadTemp command no longer returns a bogus error after successfully loading a templates file. Also, if you type LoadTemp with no pathname, it uses */System/System.Setup/GSBug.Templates.

Turned off high bits on the GSBug.Setup file pathname, so you don't get a strange error while booting from an AppleShare server.

KNOWN BUG: Don't put a breakpoint on an imbedded name. If you do, the name can get overwritten when the breakpoint is removed.

Version 1.5b17 (DAL)

Now supports inline imbedded procedure names (as generated by the name and proname macros in M16.Debug, for example). These show up in disassembly and as the operands of JSRs and JSLs.

GSBreaks trigger regardless of call class now. For example, you can SetOSBrk for either Open or OpenGS, and either one will cause a break.

Changed named-resource call names to begin with RM (RMLoadNamedResource, etc).

When GSBug notices a toolbox call being made in other than full 16-bit mode, it displays a warning dialog (using TLTextMountVolume). Hitting ESC at that dialog cancels future warnings until you reload GSBug.

When GSBug notices a toolbox call being made with Decimal mode on, it stops cold at a BRK #F8, rather than letting things get completely baked before crashing.

Fixed one old reference to $010100 to store $C0 instead of $80. Interrupts should reliably use $100..1C0 for stack space now.

Added 5 blanks to end of 'TRACE ' message so it completely overwrites the 'SINGLE STEP' message.

Version 1.5b16 (DAL)

No such thang.

Version 1.5b15 (DAL)

Option-space now works reliably to bypass a memory-protect range, including a tool call. (This is an old feature, but keyboard translation normally prevented it from working!)

In trace mode, Space and ESC now kill "awainting RTx" mode.

Fixed "n" command so it won't crash if nobody has called DebugSetHook.

Having tool breaks on calls which get made indirectly by GSBug no longer cause a crash. You can break on NewHandle now, for example.

In Breakpoint subscreen, Space maps trigger count from 0 to 1 and from nonzero to zero. Tab moves between the address and count fields (easier than hitting arrows).

In the memory-protect subscreen, Tab moves between columns.

Added $01/FC00.FFFF (OS system service calls) to the memory protect list.

Changed the default trace-window setting to center-screen.

Changed the EmulStack value from $80 to $C0 (trying to get rid of some unpredictable crashes, probably caused by AppleTalk running out of stack space). This means you can safely trace a program while the stack is in the $01C1..01FF range, and that interrupts use $0100..01C0.

GSBug now takes a whole bank, minimizing its effect on things which are located in memory relative to each other, and ensuring that tool breaks work reliably (tool calls never break if they come from the same bank the debugger is in).

Note that templates do work; you can ignore the garbage error you still get from LoadTemp.

Version 1.5b14 (DAL)

Versions 1.5b12 and b13 were never officially released. 1.5b14 is fine, except that I make no guarantees about the Template commands. I think they work, but you'll get a funky error message from load-temp.

When you let a JSL execute in real time (including a tool call), the debugger temporarily changes the owner ID of its own handle to match the owner of the handle containing the code you're debugging. This way MMStartUp returns the appropriate memory ID, instead of always returning the debugger's ID.

DebugSetHook(nil) now removes the hook.

The 1K bank 0 segment GSBug allocates now has the same ID as the debugger (was previously always $80xx).

Fixed OS breaks to work after return from ProDOS 8 (added a Notify Proc to re-trap the OS vectors).

Changed the "." command so that if you don't type a number, it's like typing zero. For example, if you have a template called "Template" which displays an informational message, you can type ".Template" instead of ".Template 0".

DP:xxx command dumps 16 bytes from DP to the command line.

Tool call SocConf_DebugGetInfo(word):long. Word=0 returns the current value of the program counter (useful from a procedure called by the N command).

Note that real-time counted breakpoints don't work for JMP() ($6C), JMP(,X) ($7C), JML() ($DC), and JSR(,X) ($FC).

With Monte's help, located the misplaced CLI that was causing the X command used on a JSR to accidentally return with the Bank register set to the debugger's bank, and the Stack set to the Interrupt-time stack.
Version 1.5b11 (DAL)

You can use SetOSBrk and ClrOSBRK with call names now. Class-1 names all end in GS to distinguish them from their class-0 siblings. Examples:

SetOSBrk #1
SetOSBrk _Create
SetOSBrk #2001
SetOSBrk _CreateGS

The debugger now changes its own handleUs memory ID during a real-time JSL to match the code being stepped. For example, now you can step over an MMStartUp and get the expected ID returned (the application's instead of the debugger's).

Changed 'D' command to 'I' so it doesn't interfere with typing a hex number that starts with a D. The I command toggles the 'ignore REP/SEP instructions mode' when disassembling.

Changed parsing for the P (Print screen) command so that it just beeps if there are any characters after the P. (Typing 'put' instead of 'out' can no longer hang your system.)

Put the help screen for MP mode back in.

The solid flashing cursor in MEM, MP, and BF no longer flashes. In exchange for this, special characters (like braces) that happen to be in inverse don't flash while you're in the subscreens.

Added pseudo tool call $0BFF=DebugSetHook (one Long parameter). The N (*meat- o*) command calls this hook.

Removed a conditional hard-coded increment of $004002 when X-ing a JSR.

Added REP #$30 on the two tool-dispatcher-intercept routines. Making tool calls in other than full native mode is still not a good idea.

Fixed real-time breakpoints for most 1-byte instructions and all 16-bit load immediate instructions. Previously, they crashed when used with a count greater than one.

Please note that */System/System.Setup/GSBug.Setup is *already* loaded automatically (has been for quite a while).

Version 1.5b10 (DAL)

Stepping in emulation mode should be much more reliable now, although it isn't perfect (in particular, one place where there's a window of vulnerability is using X on a JSR in emulation mode, but if you have the I bit set in your P register there's no problem).

Having the stack in $01xx works much better now, whether you're in emulation or not. This works by frequently stuffing a $80 into $01/0100 (EMULSTACK, the location the interrupt manager and other things used to set the $01xx stack when needed).

If you trace code that actually uses the $01/0100 value to set the stack pointer, you still have a problem, since your program will start using the part of the stack that gets toasted on every interrupt. For example, now you've been able to use SetTBrk with a tool set number, to force a break on every call to that tool set. Now you can do it by name, too.

Examples:

SetTBrk #2
SetTBrk _Memory Manager
ShowBrks

Obsoleted call names removed:

1522 TEInsertPageBreak
2022 TEGetHooks
2122 TEGetDefProc
2222 TEGetDefProc

Call names corrected:

0D02 RemoveFromOMQueue
2115 SelectIText
1021 VDKeyGetKRCol
1121 VDKeyGetKRCol
1221 VDKeyGetKRCol

Call names added:

Debugger

Brought the list of GS/OS call names up to date for System Software 5.0.3.

GS/OS Call Names

Removed this call:

$000E ExpandPath (becuase there's no class-0 version)

 Added these class-1 call names:

$2029 Quit
$2033 FSTSpecific % display code was fixed so that the '*' would properly be displayed in front of any toolbox glue that is detected.
$2034 AddNotifyProc $2035 DelNotifyProc $2036 DRename $2037 GetStdRefNum
$2038 $2039 GetRefNum % Fixed template data display so that if the data being displayed crosses a bank boundry, the data is properly followed into the new bank.
$2039 GetRefInfo % Modified the IN command so that it respects trigger counts of 0 and does not insert real time breaks.

What It Doesn't Do Yet

Note--sometimes the debugger gets mysteriously disconnected from the Apple-Ctl-ESC vector. If you can reproduce this, let me know.

Some of the help screens are incompelete or inaccurate.

Templates currently limited to 64K. If template file >64K, it gets left open by accident.

Breakpoints don't work quite right in bank-switched memory, either (it doesn't store the original instruction into the right bank?).

Should show GS call names on a JSL $E100B0 (examine stack if stepping, and look for a PEA $xxxx in a disassembly).

The debugger chains into the tool-dispatcher vectors its own way. It should use the standard method defined in GS Technical Note #87.

Will implement pseudo Tool calls to set and clear debugger breakpoints under program control.

May make the MEM locations labelable (and save labels in the config file).

"Handle" template partially implemented?

Unload should call UserShutDown on self (under ProDOS 8, just beep instead).

Make sure that "\" for changing display modes is documented.

Error tool breaks - These also did not work well, and did not seem to be used by anyone anyway, so they have been removed to make room for GBreaks.

Version 1.5b3:

% display code was fixed so that the '*' would properly be displayed in front of any toolbox glue that is detected.

% Fixed template data display so that if the data being displayed crosses a bank boundry, the data is properly followed into the new bank.

% Modified the IN command so that it respects trigger counts of 0 and does not insert real time breaks.

Version 1.5b5:

% Added Glue tool break support. Now toolbreaks work for regular and glue tool breaks. ErrorBreaks do not work for glue as they do not make a lot of sense.

% Made debugger work even when a DA window is open. See new features below.

% Added keyClick so that you hear whenever the system draws a key from the event queue. Also, cleaned up some comments.

Version 1.5b6:

% Added new DebugStr toolcall that can be used to get more from the debugger.

Version 1.5b7:

% Added support for real time conditional breaks.
SetMileStone operates exactly the same way as debugstr except that the debugger is not actually entered. This will allow tracking of random crashes by allowing you to call the SetMileStone routine with milestones that have been met. Any time the debugger is entered via a BRK instruction or thru the keyboard, the last string passed via the SetMileStone call will be displayed. The call number for SetMileStone is $0AFF, the MPW IIGS Pascal interface might look like this:

```
Procedure SetMileStone (theString:str255);
  INLINE $0AFFA2, $E1000022;
```

These calls are added so that an application can identify the version of the debugger that is loaded and thus know what calls can be made to the debug tool. Currently, these calls are identical and return the same result. The DebugStatus call returns non-zero for true (as opposed to $FFFF which most people might want...) other than that these calls act the same as any other toolcall status or version call, each call requires a word space on the stack for the result which is on the top of the stack when the call completes. If a debugger is loaded that does not support this feature you will get a standard tool locator error. For version 1.5b8 the version number returned is $158F. As you might expect, this number will change as the debugger version changes and it will always go up, never down.

**Glue Snypher:**

Glue snypher is a routine that can recognize high level language tool calls that are made with the standard glue entry, when a call to glue is detected while disassembling an instruction the call to glue will be replaced with _TooName in a manner similar to how real tool calls now work. Glue snypher is also used by the memory protect feature, if a glue call is detected while the standard toolbox memory protect range is on, the glue call will be treated as if it were a JSL >$e10000. All glue entries MUST be a JSL to one of 3 standard types of glue that are shown below:

```
ToolGlueType1   LDX #$ToolNum
  JSL >$e10000
...
RTL
```

```
ToolGlueType2   LDX #$ToolNum
  JMP CommonCall
...
```

```
ToolGlueType3   LDX #$ToolNum
  JMP CommonCall
...
```

If any other types of glue calls are used, they will not be properly detected.

**Glue Breaks:**

In addition to glue snypher further support was added for high level languages by extending the tool break support to the glue vector ($e10004). Since error conditions are treated differently with glue (The second RTL ain't mine no more...) it seems unreasonable to also support error breaks via the glue vector.

```
Procedure DebugStr(theString;str255);
  INLINE $0AFFA2, $E1000022;
DebugVersion, DebugStatus:
```

OSBreaks:

OSBreaks work very much the same way that tool breaks work with three exceptions. First, instead of breaking on a tool call they will break on a call to the OS. Next, you can NOT specify an OS break by name, only by number. Lastly, they are not supported in trace mode, only in real time mode. To use OBSBreaks you simply type setOSBrk #xxxx where xxxx is the
number of the OS routine that you want to break on. This number is matched
effectively when an OS call is made, so if you do not know if the target call
is class 0 or class 1 you must set the break for both calls. OS breaks are
supported via both vectors, inline and stack based. The following is a
list of commands that operate on OS breaks and what they do.

SetOSBrk - adds a number to the OS break list
ClrOSBrk - Removes a given number from the OS break list
ClrAllOSBrk - Removes all numbers from the OS break list
OSBrkIn - enables real time scanning for OS breaks
OSBrkOut - disables real time scanning of OS breaks
ShowBrks - lists all tool and OS breaks currently set.

DA Debugging support:

In the past it has always been difficult to debug certain new desk
accessories because they accept keystrokes, and keep the debugger from
receiving them. I have added a patching mechanism to the system event
call that is installed when the debugger is installed that fixes this
problem. The way this feature now works is that if the caps lock key is
down no keyboard events get passed to system event (and then to any open
da’s) and the debugger will always get them. A side effect of this is that
when the debugger screen is not active applications will get the same
key stroke events if the caps LOCK key is down. As a gentle reminder of
this feature, when installed, it will make your GS speaker click whenever
a key is processed by getNextEvent. The debugger used to click on every
keystroke, regardless of the state of the caps LOCK key. Dave complained
enough that the debugger was changed to only click when keys are pressed
if the caps LOCK key is down.

New Template types:

We have added support for a few more data types in templates, these are
mainly for use with GS/OS strings, but can also be used for any word
length string. They are:

InputStr: This type will read the next word of data and treat it as
a length word for string data that follows. The entire
contents of the string will be displayed.

OutputStr: Similar to InputStr except that the first word is a buffer
length and the second word is the string length. After the
string is displayed the debugger will skip to the end of
the buffer to find the next byte of data to process.

RealTime Conditional Breakpoints:

The debugger now supports conditional real time breakpoints. In the past
when a breakpoint was entered in the breakpoint list and you used the IN
feature to make them work real time, the trigger count that you entered
was ignored. Now, if you the trigger count is supported the same way it is
supported in trace mode, that is, if you insert a real time breakpoint
with a count higher than 1 it will break on the Nth execution of the
opcode at that location. NOTE: Currently the following opcodes are not
supported as real time conditional breakpoints: JSL(mem), JSR(mem),
JSR(mem,x), JMP(mem), JMP(mem,x), RTI.

In addition to supporting a count value for real time break points, the
debugger now also allows a simple conditional statement to be used instead.
The debugger allows only one conditional statement at a time, but as many
of the breakpoints can use it as you want. To enable the conditional
statement (henceforth called IF) simply type an “if” when entering a
breakpoints trigger value instead of a hex digit. To set the current IF
use the command SetIF. The syntax of the SetIF command is as follows:

SETIF {width} {Spec1}{Operator}{Spec2}

About the templates

This is a complete set of templates for the Apple IIGS system software 5.0.2. It includes templates for almost all toolbox records, GS/OS parameter blocks, FST specific parameter blocks, and ProDOS 16 parameter blocks. GSBug cannot support variable length data structures, so those data structures were either implemented partially (up to the point where the structure becomes variable length) or were not included.

Very briefly, here’s how to use the templates:

Type "LoadTemp GSBug.Templates" to load the template file.

Type "_name address" to view the memory starting at 'address' through the template specified by 'name'.

About the help templates

Help templates are included in GSBug.Templates, so you don’t have to remember what data structures are templated or how to spell the template names. A help template will display a list of template names for the toolset or part of the operating system you specify.

Type "_Names 0" to see the names of all the toolsets and operating system parts. For example, with this release, you'll see this:

Templates

ADB
AppleShareFST
Controls
Dialogs
Events
Fonts
GSOS
HighSierraFST
LineEdit
Lists
Locator
Menus
MiscTool
NoteSeq
NoteSyn
Print
ProDos16
ProDosFST

About template formatting characters

Several of the data structures included in this template file have substructures imbedded in them (for example, in a GrafPort, the portInfo field is a LocInfo structure). To highlight the substructure fields in a structure, I've prefixed each field name with a "*" character. For example, here’s what the GrafPort template looks like:

_FILESTART_ GrafPort
portInfo(LocInfo)
>portSCB    WORD
>ptrToPixImage  LONG
>width  WORD
>boundsRect WORD  4
>portRect    WORD    4
clipRgn LONG
visRgn  LONG
bkPat   BYTE    32
pnLoc   WORD    2
pnSize  WORD    2
pnMode  WORD
pnPat  BYTE    32
pnMask  BYTE    8
pnVis   WORD
fontHandle  LONG
fontID  LONG
fontFlags   WORD
txSize  WORD
txFace  WORD
txMode  WORD

GSBug is Your Friend
(a quick intro to GSBug)

v.1.2
by: Tim Swihart

So, you just got GSBug installed for the first time and don't have a clue how to use it. Sure, you could call APDA (1-800-282-2732) and order the complete package (part #A0037LL/A, price $30), but you're not sure if GSBug will really help you find those nasty bugs in the Apple IIGS software you're developing. Well, from the next paragraph until the end of this file, I'll present a quick introduction to some of the reasons why GSBug is a "MUST HAVE" tool for all IIGS developers. It doesn't matter what language you program in, or which environment you use, GSBug is the key to tracking down and exterminating those nasty bugs that make your software look shabby.

The version of GSBug that APDA currently stocks is older than the version found on the disk containing this tutorial. So why buy APDA's version? To get the full manual - it's well worth the thirty bucks they're asking!

Installation:

Before we can really get into it, you need to install GSbug and the GSbug.Templates file and reboot your IIGS. If you only have one computer, then print this file and continue reading from the printout. GSBug is an INIT file with the name *GSBug.INIT* - install it by copying this file into your boot disk's SYSTEM/SYSTEM.SETUP folder. Copy the *GSBug.Templates* file into the same folder.

Over the course of time, the name used for the GSBug Init file has changed slightly. To be certain you don't accidentally install two (or more) copies of GSBug, carefully examine the contents of your boot disk's System/System.Setup folder. If you see more than one file with a name similar to "GSBug.init" (such as "debug.init" or "GSBug.bilininit") then take out all but the most recent one. Having more than one copy of GSBug installed tends to cause problems (such as crashes during booting).

Care & Feeding of GSBug:

Now that everything is installed, reboot your computer. No need to launch any particular application just yet, I have to explain the various parts of GSBug's screen and I want to cover a few basic GSBug commands before we go bug hunting.

I'll assume you're running the Finder right now, but it really doesn't matter what application is running, as long as it is a 16-bit application (i.e.: a true IIGS desktop application). GSBug is Your Friend

The top line of the screen starts off with "KEY  BRK  DebugD" - those are headings for the items in the second line of the screen. The meanings of those headings (and the items under them) are:

<table>
<thead>
<tr>
<th>Heading</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td>Modifiers used to separate debugger keys from application keys</td>
</tr>
<tr>
<td>BRK</td>
<td>(beyond the scope of this quick intro - see the manual)</td>
</tr>
<tr>

</tr>
</tbody>
</table>

You can pop into GSBug at any time (assuming interrupts aren't disabled) by pressing OPEN APPLE-OPTION-CONTROL-ESC (if you're having troubles remembering all of those keys at once, just think of it as the same keys that you use to get to the built-in control panel plus the OPTION Key). You'll be presented with a rather busy-looking 80-column text screen. (there's a screen dump right below this paragraph - I told you it was busy-looking screen)

------ cut here to start the screen dump ------

KEY BRK DebugD K/PC B D S A X Y M Q L P nvmxdicz e d
00 0d 9500 FD/688D FD 2500 1FE0 0000 4D95 0044 DC BE 1 03 00000011 0 0

The next major area of the screen is the 4-digit column of numbers running down the far left side. There is a colon on each line after the fourth digit, and then there is a column (two digits wide) of numbers. All of these numbers are in hex and this area is the stack. The four digit column, the colons, and the two digit column are collectively known as the "stack subdisplay area" - remember that, there's a test at the end of this file. The column on the left of the colon is the address of the stack and the column on the right (the two digit column) are the values on the stack.

The bottom-most four digit stack address is the "top" of the stack (i.e.: the most recent one). Having more than one copy of GSBug installed tends to cause problems (such as crashes during booting).
If your app pushes anything on the stack, that's the address it would wind up at. As you step through your application (we'll show how in a minute, patience...) the stack will scroll upwards as things are pushed onto it and downwards as things are pulled off of it.

The Not-So-Left-Hand Side:

The next major area should be a column of "00/0000: BE >:" known as the "RAM subdisplay area". This area is used to display any 19 memory locations that you want to keep an eye on. The value at each of those locations is shown in hex (that's what the "BE" means - location 00/0000 contains hex "BE" when I wrote this) and in ASCII (the ASCII version is between the single quote marks). There is also a count number ("*"; or "**") that GSBug prints on every line of this area. It is possible to have this subdisplay show a two-byte or a three-byte value instead of the one-byte value. You lose the ASCII display if you opt for the 2 or 3 byte values.

After I finish explaining the rest of the screen, I'll come back and describe how to change these 19 "windows on memory" to look at what you want to monitor.

The Center Part:

The next major area of the screen is the 9 lines of "00/0000-00-00", better known as the "Breakpoint subdisplay" (they're on the top half of the screen). GSBug lets you set up to 17 breakpoints in your program (not counting BRK instructions you imbed in your program yourself). Curious about how you set 17 break points when there are only 9 lines in this section? Did I mention that APDA stocks the manual (which has full details)?

Seriously, you can "extend" the breakpoint subdisplay by shrinking the section under it (which we haven't described yet). For the purposes of this quick intro, I'm not going to show how to do this (you need some kind of reason to get the manual). I'll just describe this area and later show how to set up to 9 break points.

The "00/0000" part of the breakpoint subdisplay is obviously an address - in fact, it's the address you want to break on. The next part "-00-" is the trigger value. GSBug is smart enough to count how many times an address has been traced - it will break on a certain address every time you single step (GSBug will break the third time that address is executed). The last part of this area is the running count - this is how GSBug lets you know how many times that area has been executed (rather than leave you wondering, it tells you and you can be ready for the break). You set the address and trigger portions and GSBug sets the count portion.

The Bottom Part of the Center Part:

The bottom half of the center of the screen is known as the "Memory Protection Subdisplay" and starts off with "E1/0000.000F-T". This area can be expanded (shrunk) by trading lines of this area for lines of the one above it (the "Breakpoint subdisplay"). If you want to know how to do this, read the manual from APDA, it's big (roughly 150 pages) and I'm not retrying all of it here! <grin>

The "E1/0000.000F" is the address range starting at E1/0000 and ending at E1/000F. The "T" at the end means that this range of memory is protected from code tracing. If you're tracing through your code and it jumps (JSR's, JSJ's, whatever) into this range of memory, then the code in this range will NOT be traced - it will be executed at full speed instead.

There are two other options for code protection ("#" and "*"). They are out of the scope of this quick tutorial (I'm only trying to cover the basics here).

Where You Type Commands:

The bottom line on the screen is the command line subdisplay (catchy name, eh?). When you first enter GSBug, this line will contain the copyright message and version number for GSBug (unless you've used the DebugStr or SetMileStone "tool" calls to change this string). As soon as you press a key, the line will show what message you typed and the display goes up next to the blinking cursor. This is where you'll type various commands to make GSBug help you get the kinks out of your software.

What's the Big Blank Spot For?:

The big blank area towards the far right of the screen is officially known as the "disassembly subdisplay" (it's one of the big reasons you're using GSBug - ever had something happen to your program when you're tracing through it, or just list areas of memory this area will show you the disassembled version of your program. One of the really slick things about this, then is that it's smart enough to know the names of GS/OS calls and Toolbox calls - so you see things like "_CheckUpdate" instead of "JSL E10000". That makes it very easy to line up pieces of your source with the disassembly if you're working in a high-level language. It also makes it a LOT easier to see what you're doing!

GSBug also knows about the alternate Toolbox entry point (E10004) and will display those as tool calls also. The leading underscore ("_") lets you know that GSBug is substituting the tool's name for you. If the tool call is being made through "glue", then the underscore is preceded by an asterisk ("**").

If you've ever used the built-in "monitor" (I'm not talking about your RGB monitor, I'm talking about the dissembler that's been built into Apple II's for a LONGGGGGGG time now), then you'll be able to quickly figure out that the left-most part of the disassembly subdisplay is the address, the inside columns are the hex bytes making up the code about to be disassembled, and the right-most part is the disassembled version of your software.

Your First GSBug Command:

OK, you now know what all of the various areas of this rather busy-looking screen are for, so let's get down to business! The first thing to do is press the "*" key (upper or lower case work the same these days) and then press RETURN. This will fill the disassembly subdisplay with 19 lines of disassembled code (which 19 lines were disassembled really doesn't matter). Study it until you can tell at a glance which parts are the address, which parts are the hex bytes, and which parts are the disassembled code.

Type "L" and press RETURN again - you get the next 19 lines of memory (see, I told you it was a lot like the built-in monitor).

Now, let's do something a tad more useful... Press the "S" key and RETURN (you just told GSBug to start single-stepping through your application). Be careful what keys you press while in the single step mode - lots of weird-looking things can happen (they're all normal, but if you don't expect them you can get confused). For now, ONLY press the keys this tutorial tells you to press and you'll be fine. I don't want you to hang on all of the obscure keys, then go ahead - reboot once you've totally confused yourself, pop back into GSBug and catch up with the rest of the folks reading this.

To tell GSBug to execute the highlighted instruction, press the SPACE BAR one time. Heck, press it several times so that you get a bunch of lines of disassembled code on the screen. Notice that the code scrolls up and the "highlighted" area stays in the same place? Notice it's kind of close to the bottom of the screen? Later I'll tell you how to move it up higher.

Press the ESC key. That takes you out of single-step and returns you to the command line. Press "F" and RETURN again to restart single stepping. Notice that the lines ABOVE the highlighted area have been erased? Remember that - if you halt single-stepping and need some piece of info above the highlighted area, then write it down because it'll be wiped out when you restart single-stepping (or when you do any of a bunch of different things). If you have your printer connected to slot 1, then you can print GSBug's screen using the "*" key and then press RETURN - be sure you're NOT single-stepping when you do this, "*" only prints from the command line).
Lock a Tractor Beam onto Them:...

Want an easy way to have the computer step through source for you without having to bang again and again on the SPACE BAR? Start single-stepping (**and RETURN), then press RETURN again. VRRRRROOOOOOOOOOM!!! Can't read all the stuff flying by? No sweat, press SPACE BAR and you'll be back to single-stepping. Pressing the RETURN key a second time kicked GSBug into "Trace" mode.

Trace actually has two speeds, the default is fast (we like to test developers' speed reading skills). To kick TRACE into low gear, press the left arrow key. If you're in single-step mode, then you won't see the speed change affect the tool breaks, but single-stepping does. Press ESC to stop single-stepping, and type "R" and RETURN to resume running the Finder. (If we didn't bother to single step across the NewWindow call, we would just fall right back into the debugger since we have a break point set on that call).

From GSBug's command line (press ESC if you're still stepping or tracing), type "settbrk _sysbeep" and press RETURN. If GSBug beeps at you instead of sharp, so I won't bore you with all the things this lets you do, I'll just mention that you can change the speed reading skills). To kick TRACE into low gear, press the left arrow key. If you're in single-step mode, then you won't see the speed change affect the tool breaks, but single-stepping does. Press ESC to stop single-stepping, and type "R" and RETURN to resume running the Finder. (If we didn't bother to single step across the NewWindow call, we would just fall right back into the debugger since we have a break point set on that call).

Take It Out, Wise Guy;

Tired of falling into GSBug everything a new window is opened? There are several ways to remove tool breaks. The easiest way is to type "tbkout" to stop breaking on the listed tool calls without trashing the list. Typing "tbkout" makes GSBug start breaking on them again.

To clear the list of tool breaks, either type "clrtbrks" (to remove the sysbeep break we put in earlier) and repeat that for _newwindow or wipe the all out with "clrtbrks". I'll let you decide...

Cheap Trick #1:

Being able to break into the debugger based on a tool call is VERY handy! But what if you want to see the stack being set up BEFORE your code gets all the way down to the tool call itself? After all, if you're not putting enough parameters on the stack (or too many), then breaking on the tool call itself is too easy. GSBug tells you how to set the stack as you're building it. There's an easy solution for this - stick a SysBeep call in your source ABOVE the tool call you really want to break on and set a tool break on SysBeep. This will let you single step through the stack setup for the call you're really interested in. OK, so it's a cheap trick, but it's darned effective...

This trick was invented in the dark ages before DebugStr was part of GSBug (DebugStr is explained near the very end of this document and is a little trickier to use than Cheap Trick #1).

I Don't Like My Registers:

Remember earlier when I mentioned that you can change the values of the various registers from within GSBug? This lets you change values that are about to be pushed on the stack and do all kinds of neat things. You're sharp, so I won't bore you with all the things this lets you do, I'll just cut right to the description of HOW to do it...

To change the accumulator's value, type "a=value" on the command line. Replace "value" with the hex value you want to stuff into the accumulator. Type "x=value" to set the x register, "y=value" to set the y register, etc. You can't type "a=x" to set the accumulator to the value in the x register, but since you can see the x register's value, this isn't that big of a loss.

Cheap Trick #2:

If you accidentally SKIP an instruction that you didn't mean to (and you haven't executed any more since then), you can "unskip" it by exiting single-step mode, then type "pc=addr" where "addr" is the Finder (or whatever app you just to be safe) that the skipped instruction is at. Press RETURN and then resume single-stepping (notice that you're back at the skipped instruction now).

This tricks works because the "pc" register is the program counter (the thing that determines what address will have its instruction executed next).
The material covered so far gives you a decent foundation to draw upon as you debug your apps when you can see their screens...). Jewel added several more reasons (he calls them features). All of these are useful! While if you want to create your own custom templates, then read the GSBug manual on the documentation folder -- www.textfiles.com/apple/ -- 18 September 2000 -- 485 of 1262

Apple II Computer Info

Cheap Trick #3:

Fudging the program counter (pc=value) will let you push extra info on the stack in cases where you didn't push enough for a call. Be careful with this -- you may need to set the accumulator before re-executing an already-executed PHA and you could totally trash the stack if you're not paying attention. One place this is handy is to compensate for passing a WORD instead of a LONG (easy to do with C when you're dealing with resource ID's). If you don't understand this trick, don't use it!

A minor modification on this stunt is (obviously) to pull extra bytes OFF of the stack while you left something on there but didn't have it left on. Once you spot problems like too much or too little data on the stack, FIX YOUR SOURCE CODE AND RECOMPILE IT!!! You don't really want to have to find this bug a second time do you?

Cheap Trick #4:

GSBug is a lot like the monitor in certain respects. That means many of the commands you're used to from the monitor will work under GSBug. Setting values in memory under GSBug is done just like it is under the monitor (i.e.: address : value1 value2 value3 value4 ...). addressT and RETURN starts tracing at the memory location specified by "address". addressS and RETURN starts single-stepping at the memory location specified by "address". addressI and RETURN lists 19 lines of disassembly starting at the memory location specific by "address". You can even use the built-in mini assembler if you want (type "asm" and RETURN).

Peering Into Memory:

The 19 "windows on memory" can be used by typing "mem" and RETURN on the command line. This puts the cursor on the far right of the first line in the RAM subdisplay area. Type the address you want to watch and press RETURN. That will move you to the next line (so you can set the address for the second memory location). If you want to see two bytes starting at that address, press "P". To see three bytes, press "L". "Z" toggles between direct-page and absolute addressing. "I" toggles between direct, 2-byte indirect, and 3-byte indirect addressing. Press "?" for more info.

This provides a nice way to look at variables in memory, dereference pointers/handles, etc. When the contents of any "peered into" location changes, the corresponding line on GSBug's screen will change also.

Cheap Trick #5:

(this one's actually not cheap, it's pretty danged useful!) While single-stepping or tracing, you can see other "screens" by pressing various keys. "D" will display the default off-screen from the workspace. "A" will display the SHR screen (i.e.: your desktop application's desktop), "H" to see the Hi-res screen, "F" to see the text screen, "M" to see 80-column display, "D" to see 40-column display, "H" to see the Hi-Res screen, "L" for the Lo-Res screen, and ESC to exit single-stepping. This lets you see your application's screen instead of GSBug's screen (makes it a LOT easier to debug your apps when you can see their screens...).

Study For The Test:

I told you earlier that there would be a test at the end of this tutorial, so now's your chance to kick back and study a bit. So far, we've covered what the various parts of GSBug's screen mean, how to disassemble pieces of memory (using "I"), how to single-step and trace (at different speeds) through your application, how to set, use, and clear breakpoints, how to display various screens, and how to set up the RAM subdisplay area.

Don't Touch That Dial!!

The material covered so far gives you a decent foundation to draw upon as you hunt bugs in your own software. We've only lightly touched on what GSBug can really do (I'm not typing all 150 or so pages of the manual into this "introduction" to GSBug). GSBug offers a lot of power and capabilities that should be learned by all developers.

Before I wrap up this tutorial I want to cover the use of templates and describe some of the new features in GSBug v.1.5b1. Some that aren't described in the APFD documentation (because we just added the features and haven't replaced APFD's master manual yet).

Templates By Jim:

GSBug provides an easy way for you to view portions of memory through templates. This allows you to "see" the data structures in memory just like they appear in the documentation (i.e.: see them divided into the various fields). The GSBug.Templates file that's placed in the SYSTEM/SYSTEM.SETUP folder of your boot disk contains a complete set of templates for use with our interface files. One of the Apple II Developer Technical Support Engineers put these templates together (and came up with a pretty neat way to build in a "help system" - so tell Jim "thanks" next time a template bails you out of a jam).

GSBug does NOT automatically load those templates unless you rename them (see the "GSBug.Specs" file for more information). You have to tell GSBug to load them (and you can unload them later). To load these templates, just type "loadtemp */system/system.setup/gsbug.templates" and press RETURN. Keep trying until you get it right - it does work (watch out for typos, etc).

To view a piece of memory with a template, simply determine the starting address of the template. The starting address can be found in a number of ways - you can dereference a pointer that you just pushed on the stack, etc. Then, type "template", the type of structure you want used, a blank space, and the starting address (don't forget the blank space). (i.e.: if you know you have agraf port starting at location 06/15E4, then type: "grafport 06/15E4" and press RETURN. To use the built-in help system that Jim came up with (thanks Jim!), just type "template" and press RETURN. This will give you a list of all the categories of help you can get more info on (such as ADB, FONTS, etc). The categories are grouped by toolbox manager. To get details on a particular toolbox manager's tool calls, type "toolmgrname 0" and press RETURN (replace "toolmgrname" with the name of any toolbox manager - lead with underscore or it won't work). (i.e.: "quickdraw 0" for details on QuickDraw data structures) For more details, read the separate documentation file on the templates.

If you want to create your own custom templates, then read the GSBug manual (pages 86-98) or decipher the templates in the GSBug.Templates file. To unload the templates (and free up a little memory they're eating), type "kiltemp" and press RETURN from GSBug's command line.

The New Stuff:

As if all of this weren't reason enough to use GSBug, the man behind this jewel added several more reasons (he calls them features). All of these are fake tool calls that the debugger sees, intercepts, and acts on.

The two most important ones (in my opinion) are "SetMileStone" and "DebugStr". SetMileStone simply changes the debugger's copyright message to be a string of your choice and lets your app keep running. If you're having a problem figuring out where your code was last at before it jumped off into the weeds, then sprinkle SetMileStone calls into your source code (with different strings on each, of course). Then, when your app chokes and dies, you'll be presented with the text from the last SetMileStone that was executed.

DebugStr works like SetMileStone (i.e.: changes the copyright string
to something with info about your application) except it dumps you immediately into GSBug. This is a little more work than Cheap Trick #1, but you can line up your source easier (since you'll have the debug string's message to guide you).

DebugVersion and DebugStatus act just like normal version and status calls for regular tool sets - they simply allow you to verify whether GSBug is running and if so, what version of the debugger is running before you try to make any debugger tool calls.

The tool numbers and parameter lists for these calls are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Tool #</th>
<th>Parameter (returns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DebugStatus</td>
<td>$06FF</td>
<td>(non-zero = true, ToolLocator error it not loaded)</td>
</tr>
<tr>
<td>DebugStr</td>
<td>$09FF</td>
<td>pointer to Pascal-style string</td>
</tr>
<tr>
<td>DebugVersion</td>
<td>$04FF</td>
<td>($159F for v.1.5B9)</td>
</tr>
<tr>
<td>SetMilestone</td>
<td>$0AFF</td>
<td>pointer to Pascal-style string</td>
</tr>
</tbody>
</table>

Cheap (and short) Trick #6:

If you get really fancy, you can build the strings for DebugStr and SetMilestone on the fly and imbued the values of key variables into them to further simplify locating bugs.

Calling all Debuggers:

Do **NOT** leave calls to these debugger tools in your software when you ship it to customers! Why? Because making these calls on a system that doesn't have GSBug installed makes a real mess...

Want More Info?

Contact APDA and order the full package (you have a newer version of GSBug with this file, but APDA has the full manual). Order it by calling APDA (1-800-282-2732) and asking for part A0037LL/A (the price is $30). Due to recent changes in APDA, you no longer need to be a member before you can order this product.

For those of you who had problems with GS2ii crashing, please try this one out and send me bug reports.

Now, then, here's the scoop on GS2ii+.

I've added BinHex decoding and sped up BinScii decoding *3 (at least).

It almost keeps up with D.W.'s BinScii (not bad for an NDA).

There is a skip button, it will allow you to go on to the next file in the queue if you selected a bunch of files.

There is a speed bar at the bottom of the screen:

1) GS2ii allows you to do other things while it is working because it gets called by the desk manager every so often.
2) In order to get any real work done, GS2ii needs to do several lines per call.
3) The more work GS2ii does per call, the slower the desktop will become.
4) This means, if you want the file decoded NOW and aren't going to do anything in the meantime, put it on fast.
5) If you are messing around with your current application and don't want to wait forever to get a response to your clicks, put it on slow.

There is some pretty extensive error testing upon startup, so lemme know if anything funny pops up on the screen and then won't let you do anything.

Re-written in C, so it's much more compact. However, ORCA/C is not perfect, so this is still a beta version, I'm not sure I've worked around all the compiler problems.

Mail me!!!

GS-ShrinkIt v1.0.5 (3/21/92)

- Fixed a bug which made GSKH unable to extract several (usually small) files from StuffIt and ARC files. The bug only happened if the file was compressed with RLE (run-length-encoding).
- Fixed bug when archiving, the name displayed would be prefixed by elipsis, but the right-hand side of the name wouldn't be displayed at all (Andy McFadden).
- The default text for "New Folder" is now selected.
- Fixed bug that caused EOF errors when extracting from .QQ files which were smaller than 4K (Karl Bunker and Bryan "Zack").
- Fixed a bug where if you'd extract and overwrite an existing file, the extracted file would magically inherit the filetype, auxtype, and other attributes from the file that was overwritten, not from the file that was being extracted (Karl Bunker).
- When archiving an HFS disk, if you have the HFS PST installed, GSKH will now save the file_sys_id for the disk inside the archive.
- Added "Save COMPRESS files as" popup to preferences so that when compress files are decompressed, they can be saved as binary or text files.
- Fixed bug where if a file was saved with "Save as .BXV file" and it was named something like "filename.bxy", the Binary II header would contain "filename.bxy.SHK". Now it properly contains "filename.SHK" (Dean Esmay).
- If "Save as .BXV file" is checked and the filename is filename.SHK (instead of the more common filename.BXY), the last character before the suffix will be incremented to provide a name unique from the outside name instead of incrementing the first character (which seemed to confuse some people) (Dean Esmay).
- Changed "Save as .BXV file" to "Add Binary II to this archive" (Dean Esmay).
- When archiving a disk with a bad block, GSKH will report the error instead of just closing the thermometer dialog and deleting the archive (how annoying!).
- The HFS filetype and creator are now used when extracting from a StuffIt archive (very handy if you're extracting to an HFS disk using System 6's HFS PST which you intend to someday use on a Macintosh).
- The high bits are only removed from files in archives which need them removed, not always removed. Also, slashes (/) are no longer turned into colons for files in StuffIt archives.
- GetFile dialogs now display prettier and more distinct icons in the standard file lists.
- Added elipsis to a few buttons to indicate a modal dialog will happen if the button is clicked.
- Changed text of 'Cancel' button in extraction dialog (the one with the thermometers) to more accurately be 'Stop'.
- Fixed bug which caused data to not be able to be extracted. The exact problem was that if a clear code was issued by the compressor with 1 byte remaining to be compressed in a 4k chunk, the decompressor would put garbage in the output file. The decompressor has been fixed (which means that if you archived something with an older version of GS-HK, if you use v1.0.5 to extract, you won't lose any data).
- GS-ShrinkIt v1.0.4
- Extracting NuPX from America-Online actually works now.
- Graph box now listens to OA-period to get it to abort.
- Fixed bug which would cause data to be archived such that it couldn't be extracted. The exact problem was caused by the string table filling up and issuing a clear code ($101) after the last character for a block had been output. The corresponding decoders in ShrinkIt and GS-ShrinkIt know nothing about any code above the final code in a block and get very confused at that point saying that the data has been corrupted.
- GS-ShrinkIt v1.0.3
- Fixed a bug which caused "Fatal Error $0401" to occur after clicking "extract" when some of the static segments were bank-aligned. Apple DTS (specifically, Dave Lyons) helped me track this down at the A2-Central Kansas-City Developer's Conference. Extra credit goes to Dennis Doms who built a system disk which duplicated the problem.
- GS-ShrinkIt v1.0.2
- The select-all button in the archive, addto, and delete dialogs now works faster.
- Fixed a problem that caused GSKH 1.0.1 to crash whenever someone hit a key which was mapped to the SF list on screen. This only happened to the archive, addto, and delete dialogs. (Stowe Keller)
- When a stuffit file's forks are split into separate file (presumably to make use of ResSpy), the filetype for the res fork was whatever the HFS filetype routines deemed appropriate. Now the res fork is saved as a BIN file to make ResSpying yet even easier -- it probably should have been BIN in the first place. (Robert Rosenberg)
- Prefix 18 is no longer used. Prefix 20 (and 8) are now saved before GSKH starts and restored after exiting gskh. (Bryan Pietrzak)
- Separate source and destination directories are now provided. The destination pathname is initially set to the source pathname (source path is left as prefix 8 if prefix 8 exists and prefix 0 if prefix 8 is null. "New Archive" works from the source TO the destination. "Open Archive" works from the source and TO the destination when extracting. The paths can not be predefined, yet. (most of the known world).
- GS-ShrinkIt v1.0.1
- DO NOT use the ShowText NDA or ShowPic NDA (below v4.60) with GS-ShrinkIt. ShowText causes really bizarre stuff to happen, especially when GS-HK shuts down. You will occasionally get an "Error $003" message if ShowText is installed. Chris Haun's WriteIt! 2.0 NDA is a good replacement for ShowText in that it's much faster and you can edit what you see. ShowPic's before version 4.60 can not handle having the "shadow" bit set in System 5 QuickDraw II and trash the scanline control-bytes (SCBs) leaving the screen a horrible mess.
- If you suspect something is wrong with GS-ShrinkIt, before you jump to any conclusions please remove all the Desk Accessories (DAs) and INITs from your system. It's quite possible that a DA or INIT is contributing to the problem. If you have a problem which occurs with GS-ShrinkIt and severalt-DAs (ie, each one seems to always cause the same problem in GS-ShrinkIt), then most likely the problem is with GS-ShrinkIt and you should tell me. If you find that the problem is only caused by a single DA or INIT, most likely the DA or INIT is flakey and you should contact its author.
Fixed problem that GSHK 1.0 had leaving a file open after receiving an error when someone would try to sort an archive, such as trying to sort on
a write-protected disk. (Stowe Keller)
A <Select All> button has been added to the New File Archive dialog, the
Add Files dialog, and the Delete Files dialog.
Because the AppleDisk5.25 Driver doesn't support getting the volume number
from a DOS 3.3 disk (or specifying it when formatting), DOS 3.3 disks
can't be archived or extracted under GSOS. Warnings have been installed
to this effect.
If the preference "Split Stuffit forks when extracting" is checked, each
of the forks of a Stuffit file will be saved as a separate file. The
res fork's default name is filename.r -- this should make people who use ResSpy
happy.
There are 2 more pop-ups in the prefs. "Save ARC files as: TEXT/BIN" and
Save ZOO files as: TEXT/BIN" -- these cover some of the most frequently
asked-for enhancements.
The TextEdit flag fRecordDirty is checked to see if any changes have taken
place since the last time the update button was clicked to determine whether
or not to highlight the update button instead of relying on finding that the
TE control got hit. This allows you to scroll through the comment without
GSHK thinking that you need to click the update button.
Changed the way the info icon is displayed. If any text is available in the
archive comment, the icon will be shown as a yellow comment icon. The
difference is probably subtle enough that some people will not notice the
change, but the icon looks better with the interior colored grey than if it's
masked with alternating dots. If you edit a comment and change the amount of
text in it, the correct icon will be redrawn in the list when the update
button is clicked.

Added HFS creator_type of "pdos" support for the unStuff routines. The
filetypes are now interpreted the same way that the AppleShare PST does a
filetype translation from Macintosh HFS. The ProDOS filetype and auxtype are
now set correctly if the creator is 'pdos'. If the filetype is TEXT, then the
prodos filetype is set to TXT. The create date is now set correctly when
extracting stuffit archives -- the mod date is set to the current date. The
correct filetype and creator are set if you unstuff to anAppleShare volume.

Added recursive delete routines to the DELETE option in the file menu. 1.0 used
to refuse to delete folders unless they were empty. Now, if you select a
folder, everything in that folder will be deleted. You'll be properly
prompted if a file is locked, also. (Dennis McClain-Purmanski)
Fixed problem with GS-ShrinkIt 1.0 reporting "file not found" when a folder with files
in it was archived with "Delete after archiving" turned on. This always
happened with 0 files remaining to be archived and didn't affect the
resultant archive. (Rick Zeman, Dennis McClain-Purmanski)
Fixed problem with GS-ShrinkIt 1.0 always saying it got error $1202 whenever it
couldn't finish the _StartUpTools call. The error code was wrong -- new error
codes have been installed which explain the error and what to do about it.

---

Most users of GS-ShrinkIt will be interested in unpacking files
that they have downloaded from a Bulletin Board Service or Information
Service. Others will also be using it to pack files that they want to
upload to such a service. In these instructions I will first describe
how one uses GS-ShrinkIt to unpack archives, and then how to create a
new archive file. Then I will give an explanation of each of the
options available in GS-ShrinkIt's pull-down menus. If you are ONLY
interested in how to unpack a file which you have downloaded, you can
read as far as the end of the section entitled "Unpacking an Archive",
and skip the latter sections. I will attempt to make these
instructions understandable to the relatively new computer-user; if
you are unfamiliar with any of the terms used, or become generally

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 488 of 1262
confused, you may want to consult the instruction manual to your telecommunications software, or a computer magazine article on telecommunicating with the Apple II.

System Requirements

GS-ShrinkIt requires a IIgs with System Disk 5.02 or later, and a minimum of 768K of RAM. If you are using a GS/OS program launcher other than the Finder, it's possible that your system (boot) disk doesn't have an "Icons" folder. GS-ShrinkIt requires that you have this folder on your system disk, and that it contain (at least) the file "FType.Main".

GS-ShrinkIt and ShrinkIt

GS-ShrinkIt is (of course) for the Apple IIgs. There are also versions of ShrinkIt available for 8 bit Apple II's. Archives created with GS-ShrinkIt can be unpacked with version 3.0.3 or later of the 8 bit ShrinkIt, providing that none of the files being extracted from the archive is an "extended" GS/OS file (also know as files with resource forks). Since ProDOS-8 can't handle extended GS/OS files, someone who doesn't own a IIgs would probably have no reason to extract such a file.

Distribution and Copyright Info

GS-ShrinkIt is a Freeware program. This means that you are under no obligation to pay the author anything for it, but the copyright is retained by him. You are encouraged to distribute this program to whomsoever you please.

Some Terms Defined

In the Apple II telecommunications community, there are a number of different file- and disk-packing formats which have been used over the years. Most of these formats have been superseded by ShrinkIt and its NuFX format, others are still used. These various formats are usually denoted by a three-letter suffix appended to the name (as in "MY.FILE.BNY"). The following is a list of the suffixes you are likely to encounter, with brief descriptions of their related file formats:

.BNY: Binary II format. Though not a true archive format, a Binary II "envelope" will preserve a file's attributes through a download or upload. GS-ShrinkIt can unpack .BNY files, and they can also be automatically unpacked during downloading by many telecommunications programs.

.BQY: "Squeezed" (i.e., compressed with a different algorithm than the one used by GS-ShrinkIt) files within a Binary II envelope. GS-ShrinkIt can also be automatically unpacked during downloading by many telecommunications programs.

.QQ: If you remove the Binary II envelope from a .BQY file, the squeezed files it contains will have the suffix .QQ. These files can be unsqueezed with GS-ShrinkIt.

.ACU: The archive format used by America Online (formerly AppleLink Personal Edition); these files can be unpacked with GS-ShrinkIt. (America Online currently uses .SHK format for new uploads.)

.SHK: NuFX format; can be created and unpacked with GS-ShrinkIt.

.BXY: NuFX archive within a Binary II envelope. This is the format currently required for new uploads to the Apple II libraries of GENie and Compuserve. .BXY files can be created and unpacked with GS-ShrinkIt. Although this "envelope" format may seem redundant, it has several advantages. Ideally, the Binary II envelope will be entirely "transparent" to end users -- it will be automatically added by telecommunications software during uploading, and automatically removed during downloading. As more telecommunications programs come to support automatic Binary II packing and unpacking, this ideal will be increasingly realized. Thus, if your telecommunications software supports automatic Binary II unpacking during downloading, you can turn this option on when downloading a .BXY file. Doing this will save you a downloaded file which has a "bare" NuFX format. Thanks to the Binary II wrapper, this file will automatically be given the correct name and filetype.

Unpacking an Archive

GS-ShrinkIt uses the standard Apple Desktop interface commonly found in IIgs programs, with the familiar pull-down menus and dialog boxes.

When you have downloaded a file with one of the suffixes given above, you will want to process this file through GS-ShrinkIt to unpack it and get at the files or disks it contains. It doesn't matter which of the packing formats your download is in; GS-ShrinkIt will automatically unpack the format and handle the file accordingly. To unpack an archive, you select "Open Archive..." from the "File" menu. This will give you an "Open Archive?" file-selection dialog box. In addition to the usual "Disk", "Open", "Close" and "Cancel" mouse buttons, there are also two radio buttons labeled "Show Only Archives" and "Show All Files". GS-ShrinkIt uses two methods to decide whether a file is an archive file: It checks the attributes of the file (its filetype and auxtype), and it checks to see if the filename has an appropriate suffix. When a file is downloaded, its attributes may not be preserved through the download. If your archive doesn't have EITHER the appropriate attributes OR a suffix that GS-ShrinkIt recognizes, GS-ShrinkIt won't be able to identify that file as an archive. If you don't see your archive file listed in the window (after you've opened the appropriate folder), try clicking the "Show All Files" button. When System 5.02 sometimes causes the file dialog to hang if it can't find a disk which it expects to be online. To avoid this, you should only swap disks in your drives AFTER the file dialog is on-screen.

When you click the "Open" button with your file highlighted, a window will be displayed showing what type of archive file you have selected, and listing the "Items" (the packed files or disks) contained within the archive. This window will also show several buttons: "Extract", "Info", "Delete", "Sort", "Add Files", and "Add Disk". To unpack an archive, you must first highlight those items which you want to extract. Usually you will want to extract all of the items listed, but you also have the option of extracting only a few items. To highlight all of the items, press Apple-A. You can select several individual items by holding down the Apple key while you click on the items you want. You can select a group of files by holding down the shift key and clicking on the first item in the group you want, and then on the last of the group. A When the items you want are highlighted, click the "Extract" button. Another file-selection dialog box will be displayed allowing you to choose which disk and folder you want to put the new, unpacked files in. Open the appropriate folder in the "Open..." box. If there is a file in the folder with the same name as the file you are about to unpack, GS-ShrinkIt will ask if you want to overwrite the existing unnamed, unpacked file, skip that file, or cancel.

You can set GS-ShrinkIt to automatically overwrite any existing same-name files by turning off the "Prompt before overwriting" check...
box which appears in the file-selection dialog. 

If the archive file contains a packed disk (or disks), GS-ShrinkIt will prompt you to select a "device" (disk drive) for the archived disk to be unpacked to.

Creating an Archive

As you might expect, creating an archive is somewhat more involved than unpacking one. However, the process is quite straightforward.

If you are going to be archiving files (rather than a disk), select "New File Archive..." from the "File" menu. A file-selection dialog will be displayed, allowing you to select the files to be archived. There are two check boxes in this file-selection dialog box; these let you choose whether to "Use Compression" (usually you will want to compress the files you archive) and to "Delete files while archiving".

As when selecting items to be extracted from an archive, GS-ShrinkIt gives you several ways to highlight files in this dialog box. You can select all the files in the open folder by clicking the "select all" button, you can select several individual files by holding down the Apple key while you click files, and you can select a group of files by holding down the shift key and clicking on the first and last files of the group.

When the files you want to archive are highlighted, click the "Accept" button. A new file-selection dialog box will appear, prompting you for a "Destination Name" -- a filename for the archive file you are about to create. After opening the disk and folder you want your archive to be saved to, enter a name for the archive in the text box. To avoid confusion, be sure the filename has the correct suffix: Straight NuFX archive should have the suffix *.SHK*, and NuFX-within-Binary-II archives should be suffixed *.BXV*. After clicking on the "OK" button, GS-ShrinkIt will create the archive.

There is a check box in the "Destination Name?" dialog box labeled "Save as '.BXY' file". This box must be checked if you want your archive to be saved to disk in the NuFX-within-Binary-II format. The best way to create a .BXV file is to use GS-ShrinkIt to make a .SHK file, and then let your telecommunications program add the outer Binary II envelope during uploading. However, not all telecommunications programs can do this. GS-ShrinkIt does not allow you to add new items to a .BXV archive after it has been created. This can only be done with "bare" NuFX archives. For this reason, if you are using GS-ShrinkIt to make a .BXV file, you must start out with all of the files you want to archive in the same folder, so you can select and pack them all at once.

After creating a new archive, you can perform a number of operations on it. You can delete items, you can add a file or disk item (provided the archive isn't a .BXV file), you can sort the archive to change the order in which its items are listed, and you can add a short message to the archive to be read when the "Info" button is clicked. All of these operations are performed via the "Open Archive..." option in the "File" menu; that is, you must first select and open the archive, just as you would if you were going to unpack it.

To add a message, or "comment" to an archive, you first highlight the top item listed in the archive, and then click the "Info" button. Enter the text of your message in the lower half of the "Info on Item" window, and then click the "Update" button in that window.

The other operations are performed by clicking the appropriate buttons in the Open Archive window. The various options for sorting items within an archive can be set in the "Preferences" dialog box, selected from the "Open Archive..." menu. This will be described later. The sorting operation requires an amount of free disk space equal to the size of the archive file. If GS-ShrinkIt doesn't find sufficient space on the currently open disk, it will report the problem and abort the operation.

To create a new archive from an entire disk, you would select "New Disk Archive..." from the "Disk" menu. Disks to be archived may be ProDOS disks, or they may use other operating systems, such as DOS 3.3, CP/M or Pascal. Some non-standard, "customized" operating systems can also be handled. Unfortunately, due to a bug in the IIgs 5.0.2 system disk, GS-ShrinkIt disk-archiving only functions correctly with 3.5" disks and ProDOS 5.25" disks; non-ProDOS 5.25" disks cannot be archived or unpacked. To archive or unpack 5.25" disks, you will have to use the 8 bit version of ShrinkIt.

Pull-down Menu Options

The above instructions give a fairly thorough overview of GS-ShrinkIt. This section provides a list of each of the options available in GS-ShrinkIt's pull-down menus. This will serve as a reference section to the instructions, and will also fill in some details not dealt with above.

"Apple" Menu:

About ShrinkIt...

Information about the programmer, distribution & copyright information, addresses for user support, thanks to those who helped out.

Your NDA's are also under this menu.

File Menu:

New File Archive... (Apple-N)

Create a new archive (from files).

Open Archive... (Apple-O)

Open an existing archive to unpack its contents or to modify it.

Delete... (Apple-W)

Delete files from your disks.

Quit (Apple-Q)

Exit from GS-ShrinkIt.

Edit Menu:

Undo

Cut

Copy

Paste

Clear

These are provided for use when editing an archive message, and for possible use by NDA's.

Select All (Apple-A)

Select all files in the displayed folder, or all items in the displayed archive.

Disk Menu:

New Disk Archive... (Apple-D)

Create a new archive from a disk.

Erase...

Erase the contents of a disk.

Format...

Format a disk. Due to a quirk in the ROM 03 IIgs firmware, the Format option will not work on this machine.

Special Menu:

Create AppleSingle...

AppleSingle is a relatively simple file-packing format designed by Apple, Inc. to provide a means by which extended GS/GS files can be handled on "foreign" file systems such as ProDOS 8. AppleSingle files can only contain one file, and don't use any compression. Because NuFX archives are also able to store extended GS/GS files, and have many other capabilities as well, most users will have no need for this option. GS-ShrinkIt can also unpack AppleSingle files, and...
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 491 of 1262

AppleSingle within Binary II files.

Preferences...
This option puts up a dialog box with several check boxes and pop-up menus, allowing you to set a number of parameters. These settings will be saved in an "invisible" file called "ShrinkIt.Prefs" in the folder containing GS-ShrinkIt.
The check boxes are as follows:
- Show invisible files
  Show invisible files (such as "Finder.Data") in file-selection displays.
- Prompt on every extraction
  When multiple items are selected for extraction from an archive, you will be prompted to select a new disk and folder for each file before it is unpacked.
- Force extracted names to fit ProDOS
  When extracting a file from one of the "foreign" archive formats (see below), the name of the file may not fit ProDOS's rules for filename syntax. With this box checked, GS-ShrinkIt will automatically modify such a filename to make it legal. If the box is unchecked, you will have to modify such filenames manually.
- Use sessions when archiving
  "Sessions", also referred to as "cache-deferred writes", are a feature of GS/GS which can save considerable time with disk-intensive operations, such as creating large archives. With "Use sessions" selected, the new archive will be saved in memory until the entire archive-creation process is completed (or until memory runs out). Then it will be written to disk. A disadvantage of using sessions is that it uses up memory which GS-ShrinkIt may need for its file compression process.
- Use sessions when extracting
  This option corresponds to "Use sessions when archiving" above, but enables the use of sessions when archives are being unpacked.
- Attach suffix when archiving
  With this box checked, GS-ShrinkIt will automatically add the appropriate suffix -- either ".SHK" or ".BXY" -- to the default archive name it offers you.

To the right of these check boxes there are eight labels with pop-up menus; the titles of these menus are:
- Sort by:
  This allows you to set how the items in an archive will be sorted when you click the "Sort" button. The choices are:
  - Name (Alphabetical order)
  - Length (Of the uncompressed file)
  - Percent Size (How much the file was compressed)
  - Date Archived
  - Filetype
  - Auxtype
  - Ascending
  - Descending

- Comment size:
  This lets you set the maximum size of the comment that can be added to an archive; the choices are:
  - 100 Bytes
  - 200 Bytes
  - 400 Bytes
  - 800 Bytes
  - 1000 Bytes

- Add Comment to:
  - First File
  - All Files

With First File (the default), a message can only be attached to the first item in an archive. This menu gives you the option of adding comments to all of the items.

Archive As:
- Hierarchy
  - Flat File
  It is possible to select a folder for archiving with GS-ShrinkIt. When you do this, the entire contents of that folder (including the contents of any folders within the folder you selected) will be archived. Normally, when an archived folder is unpacked, GS-ShrinkIt will first create the folder that was archived, and then extract the folder's contents, placing them within the new folder. By changing the "Archive As" preference from "Hierarchy" to "Flat File", you can change this procedure. A "Flat File" archive will only contain the contents of any selected folders; it will not contain the folders themselves. Thus, when this archive is unpacked, no new folders will be created, and the archived files will simply be placed "flat" in whatever disk and folder you selected.

Extract As:
- Hierarchy
  - Flat File
  This option corresponds to the "Archive As:" preference above, but it controls how an archive is extracted, rather than created. With "Flat File" selected here, an archive's contents will be extracted "flat", with no new folders being created, even if that archive contains one or more folders.

Save ARC Files As:
- Binary
  - Text

Save ZOO Files As:
- Binary
  - Text
  "ZOO" and "ARC" are two "foreign" archive formats supported by GS-ShrinkIt; this is discussed in more detail below. These two options in the Preferences window allow you to set how files which GS-ShrinkIt extracts from these archives will be saved on your disk. The ZOO and ARC archive formats don't include any internal information that GS-ShrinkIt can use to determine what type the files should be when they are extracted, so the user has to make this decision.

*Foreign* Archive and Compression Formats

This part of the instructions was left for last because it's a little technical, however you shouldn't feel too intimidated even if many of the terms used here are unfamiliar. The "short version" of this section is simply this: Thanks to the remarkable versatility of GS-ShrinkIt, IIgs users can now unpack MOST of the files found in MOST of the online services. Whether these files are for Macs, Atari STs, Amigas, IBM PCs, or Unix systems, there is a good chance that GS-ShrinkIt will be able to unpack them. Although programs which were written for other computers will not run on a IIgs, such things as text files, program source code and graphics files (which can be converted for IIgs viewing with utilities such as SHR.Convert) CAN be used on the IIgs. It's probable that certain other types of non-IIgs files will become usable on the IIgs in the future. The wide range of formats supported by GS-ShrinkIt make it the most versatile archiving utility available for ANY personal computer. So take advantage of this and go exploring in those other libraries!

What follows isn't intended to be a complete description of the archive and library standards used by these various other computers. It only presents the salient points of using GS-ShrinkIt with the archive formats it supports. The "foreign" (non-Apple II) formats...
supported by GS-ShrinkIt are:

- **StuffIt** (Used on the Macintosh)
- **ZOO** (Used on the IBM PC, Amiga and Atari ST)
- **ARC** (Used on the IBM PC, Amiga and Atari ST)
- **Compress** (Used on computers running the Unix operating system)

**StuffIt:**

GS-ShrinkIt can extract files from StuffIt archives, sort them, and delete items from them. Encrypted items can not be extracted, nor can HFS folders within other folders. Such items will be dimmed in GS-ShrinkIt's display. StuffIt archives within MacBinary I or II "envelopes" are supported, as are StuffIt archives from America Online.

**ZOO:**

ZOO archives can be opened and their contents extracted with GS-ShrinkIt. ZOO archives can't be sorted or items within them deleted, however.

**ARC:**

GS-ShrinkIt's unpacking of ARC archives works only for those created with ARC 5.0, not ARC 6.0, which are less common. Some of the types of compression used in ARC files are not supported, and archive items using these methods will appear dimmed. Sorting and deleting of ARC items is not supported.

**Compress:**

GS-ShrinkIt should be able to unpack all types of Unix Compress files.

Two fairly common archive formats which are not currently supported by GS-ShrinkIt are ZIP and LHArc (LZH). These formats are used on IBM PCs and other machines.

**Table of Supported Formats**

For reference purposes, the following is a table showing all of the file packing formats supported by GS-ShrinkIt:

<table>
<thead>
<tr>
<th>Format</th>

III. Creating your own GUI Files

This part gets a little technical. At this point, there is no way for the ordinary GS user to create his or her own "custom GUI files". In the future, if people show interest in the program (by paying the ShareWare fee, etc.), I will write a GUI editor using the standard GS desktop, which will be able to create GUIMaster compatible files.

If you are an ordinary user, and not interested in the technical mumbo-jumbo, skip to section IV.

A Little About the "Main" and "Support" Files

The "main" file stores all the color code information for the GS desktop, in addition to storing the file names of the "support" files. "Main" files are of filetype $C4. (Maybe in the future also by the three letter code GUI!)

"Support" files are merely the font files used to replace the standard GS controls and window icons. However, these font files must be created by modifying the provided standard control and window files, as they use custom boundaries, etc. The file names of the standard control and window files are "StandardControl" and "StandardWindow" respectively. Once again, "Support" files are standard GS font files; filetype $C8.

In addition, to standardize things, and can be edited with any GS font editor. Created "support" files should be given the name of the "main" file that they are associated with, suffixed with either a ".w" (for the window font), or ".c" (for the control font).

Writing "Main" Files

To understand how to write a main file, it is best to look at an example. The following is the source code for LacquerGUI (written in standard ORCA/M source), with added comments:

```asm
;EXEC File
keep LacquerGUI ;redundant if using
(start later on), otherwise set
;to name for
finished "main" file.

GUI start ;the label for the
;directive
can be anything
version equ $0100 ;$0100=v1.0 This is the current
(of the program at the time)
writing.

; Header Information----
signature dc c'GUIM' ;shows that this is a GUIMaster file
version dc i'currentversion' ;the current version (see equate above)

; The following is a 129-byte block holding the pathname of the "support" file
; containing the control icons. It begins with a standard Pascal string
; of x characters, and then a "ds" of 129-(x+1) bytes is added after it.
; The pathname MUST start with "/system/system.setup/guifiles/", and then
; MUST be immediately followed by the FILENAME of file.
controlpath dc i'43'
dc c'*/system/system.setup/guifiles/LacquerGUI.c'
da 85
```

The following is a 129-byte block holding the pathname of the "support" file containing the window icons. It begins with a standard Pascal string of x characters, and then a "ds" of 129-(x+1) bytes is added after it.

The pathname MUST start with "/system/system.setup/guifiles/", and then MUST be immediately followed by the FILENAME of file.
Apple II Computer Info

Once you have finished writing your source code, save it as you plan to name the finished "main" file, with the suffix "src", e.g., I saved "LacquerGUI" as "LacquerGUI.src". This will provide compatibility with the enclosed EXEC file.

The EXEC File and Assembling Your "Main" File Source Code

Encluded with this archive is an EXEC file for use in assembling your source into GUIMaster readable code.

To use the macro, enter "GUIMaster" followed by a space and the name that you plan to use for your "main" file (see Saving Your Source, earlier on), e.g., for a source code file called "LacquerGUI.src", be compiled into a GUIMaster "main" file called "LacquerGUI", enter "GUIMaster LacquerGUI.src". The "main" file that you wanted will then be generated and saved on your disk.

To manually assemble your source code, type:

ASNL +M "name of your source code"

MakeBin "name your file was 'kept' as" (using the keep primitive in the source)

File Type "the name your file was 'kept' as" 4c4

This will also create GUIMaster compatible code.

Making "Support" Files

See the A Little About the "Main" and "Support" Files section for details.

Installing Your New GUI

Follow standard GUI-installing instructions, aforementioned.

IV. Selecting Which GUI File to Use

Select this NDA "GUI Setup" to choose your GUI file. Make sure that you select a GUI file in the "GUIFiles" directory (see the installation section for more info).

In the future I'd like to write a cdev to do the work of this NDA, but I have no information on how to write a cdev (living in Japan leaves me out of touch).

V. Where It Doesn't Work and Future Upgrades

GUIMaster has trouble with new, extended controls implemented in system v5.0 and up. Unfortunately, this includes the new TextEdit controls and pop-up menus.

I tried very hard to implement support for these controls in this version, but could not. As a result, you cannot change the color of pop-up menus, or the frame or background of TextEdit controls. In addition, scroll bars that are part of the TextEdit control will appear in the usual GS desktop colors and format, although the icons will remain the same in.

Another drawback was unavoidable short of rewriting Apple's code for the list control: the list control cannot support a dithered frame. As a result, if you use dithered colors for your scroll bar, they may not blend in well with your list.

I also tried to add provisions for a default "desk pattern" to appear, but despite my efforts to do so with the new MessageCenter message type 2, I could not get this feature to work. (As a result of this, I have included a file called "DeskPicture" on this disk which works nicely with the LacqueredGUI GUI, through the use of a desk picture displayer such as DeskPicInit.)

Using this with programs that rewrite different parts of the two icon sets may cause an icon that you originally drew to take on a different shape. A good example of this is with AWGS v1.0 v (...?). In the telecomm module, among others, the resize window
There is only one actual inexplicable problem (*"bug" if you will) with this program: when using AWGS v1.0 v(...)?, various custom list records (such as the file requester list) will have some foreground and background colors swapped. I have no idea why. I don't know if this bug is present in v1.1. I was loaned my version from a friend of mine. If anyone knows why this happens, or if it happens in the latest release of AWGS, please write and tell me why, so I can fix it.

Future upgrades, in addition to attempting to fix the "bugs" and "shortcomings" present in this version, will probably include the aforementioned GUI Setup cdev in place of the NSA, and a desktop GUI-creation application.

There have been no other conflicts, unwarranted crashes, etc.

I plan to make all future upgrades of this program free, except for the cost of a disk and postage, to all registered users. I will notify registered users when an upgrade is available.

VI. ShareWare Fee and Final Notes

The ShareWare fee for this program is $5-$10, depending on how much you think it is worth (more is also accepted!). I spent 5 LOOOONG days writing this init file, a total of about 30 hours! Please be honest and pay the ShareWare fee if you think the program is worth it. Otherwise, delete all your copies of it.

Please give unaltered copies of the archive that this file came in to every GS owner you know!

The money I receive from this and my other ShareWare programs will go towards my programming. For further projects I have in mind, please see the "FutureProjects" file. I don't want to bore you here, but I think I have some pretty interesting projects, so it'll pay to send in the ShareWare!

If you find a bug, have a suggestion or complaint, or have created a nice GUI file, please write to me.

Enjoy!

Apple II Infintum!
Hackamatic will work on every Hayes known to mankind. For this reason I chose to stick to widely known BASIC wherever possible so the programs could be individually tailored to fit any modem.

I have also tried to maintain compatibility between the programs. They all use the same keyboard input routine. At every requested input, the default value is shown between brackets, and it can be changed by simply backspacing over it and typing the desired value. In each program, the default values are specified and REMarked in the first segment of the code. If you need or want to change the defaults, LIST the program from the beginning until you see REM DEFAULTS. After this point, the default variables are initialized. I have included REMarks for each variable value, and you should have no trouble changing them. Note, however, that this is not necessary if datafiles are used with the programs. Each of the three programs allows you to name and save a datafile which contains all necessary values. When the datafile is later loaded, the saved values become the defaults. This feature is very useful, since different prefixes, alternate long distance services, and mainframe systems behave differently but can be handled individually through separate datafiles.

Because of its many special features not found on other modems, the Prometheus Promodem is specifically supported in each of the programs. Since all of the methods of software Promodem identification I tried proved unreliable, the user is asked if there is a Promodem installed. If you have a Promodem answer (Y)es, and the special features of this modem will be used.

If you have any questions about the Hackamatic, I can be reached through the Utah Elite on:

<CR/PC><CPU>
(312) 623-6761

I would like to thank Peregrin Goodbody and The Crackon for the skull in the title sequence.

Oh yes, by the way....It has come to my attention that there is another pirate with the alias Automan. I strongly suggest that this person acquire a new pseudonym. I am AUTOMAN from area code 801, and I would *NEVER* operate a Cat-fur, a Cat-paw, a Cat-ear, or any other piece of bloody feline anatomy.

Yo ho ho.....Blow the man down...a bottle of rum...and all that rot.

May you hack long and pillage prosperously.

  AUTOMAN

  Kracking Guild

THE SCSI HACKER V1.1
A Format/Utilty Program for Apple's SCSI Card And ANY Hard Drive

THE SCSI HACKER is a "NO FRILLS" PROGRAM DESIGNED FOR THOSE WHO UNDERSTAND HARD DISK LOW-LEVEL FORMATTING (AND ITS IMPLICATIONS). THE PROGRAM HAS LIMITED WARNING MESSAGES AND NO HELP MENUS. IT IS CAPABLE OF TOTALLY DESTROYING ALL DATA ON ANY HARD DISK CONNECTED TO AN APPLE SCsi CARD, WITHOUT ANY CHANCE OF RECOVERY VIA *UNDELETE* TYPE PROGRAMS, ETC. THEREFORE, IF YOU DO NOT WHAT YOUR DOING, DO NOT USE THIS PROGRAM!

(C) 1988 Joe Jaworski
18405 Tamarind Street
Fountain Valley, CA 92708

GBnie: JVJAWORSKI
ComputServe: [73307,310]

THE SCSI HACKER is FREeware. It is copyright material but you may use it and/or distribute it free of charge to anyone for personal, non-commercial use.

Revision History:
Version 1.0 First Release 12/19/88
Version 1.1 Fix Error reporting bug 3/19/89

To get the most out of SCSI HACKER, you will need the following:
1) Apple SCSI Card (Rev C. EPROMs)
2) A SCSI Integrated Hard Drive or ST506/SCSI Controller
3) HDSPartition program (included on the SCSI.TOOLS diskette)
4) ADV.DISK.UTIL (from the GS System Tools diskette)
5) DiskTimerGS (FREeware program, available on most BBSs)

INTRODUCTION

THE SCSI HACKER allows you to low-level format any hard disk drive in your choice of interleaves. This will allow you to optimize your hard drive for the fastest possible speed. It also provides an extended (*overnight*) test program that will verify proper operation of a disk after formatting. In addition, you can selectively park the heads on any drive connected to the SCSI Bus.

 Needless to say, you should have adequate backup before experimenting with this program.

MAIN MENU

After launching, THE SCSI HACKER provides the following options in its Main Menu. If you get an error message, either a SCSI Card was not found in any of your slots or there are no devices currently active on the SCSI Bus. If you get an SME/ProDOS Error and an error number, see note 6 in the section on troubleshooting at the end of this file.
NOTE: The Apple SCSI Card only issues a SCSI HARD RESET on power-up. Among other things, this forces you to power-up your drive before your system unless the drive your using can respond to UNIT READY's before the motor is up to speed. If things aren't working properly, power-down for 10 seconds and power back up again—Drive first, then Computer second.

Test Unit: This option performs a READ test of every block on a formatted partition. It uses what is called a "butterfly" test, in which blocks are tested from the lowest to the highest and then are incrementally changed, which excersizes the stepper motor and most of the electronics on the hard drive. This test is non-destructive (only does READs) to the data on the drive. If you receive an error, HACKER will report the logical block number that is bad. Run Mr.Fixit or any other bad-block lockout program to prevent ProDOS from using the block. Depending upon how defects are mapped on your drive, bad blocks may be normal.

Select Unit: This option allows you to select any unit currently active on the SCSI bus. The currently selected volume (if any) is listed at the bottom of the screen. Also included is the current slot. If you have two SCSI cards installed in your system, only the one in the upper-most physical slot can be used with SCSI HACKER.

Low-Level Format: This option allows you to perform a low-level format of any drive. You will also have the opportunity to select an interleave value for the low-level format. This test is destructive, destroying all data, all partitions, and all directories on the drive selected.

For the last time, don't play games with your data. Do a full back-up before using this program.

Park Heads: This test will allow you to park the heads of any and/or all devices currently active on the SCSI Bus.

Quit: This exits you from THE SCSI HACKER, getting you back to more friendly territory.

OPTIMIZING YOUR HARD DRIVE

A Proper Interleave setting of your hard disk can make a tremendous difference in performance. Most manufacturers who sell hard drives (especially those who do in different markets) optimize the interleave factor for either the IBM-XT or the Mac. These systems are faster that IIGS's and use interleave factors that are completely different. The object here is to maximize the interleave for the IIGS and GS/OS. Once done properly, you will truly notice a speed-up in Disk I/O when using your everyday applications.

A few notes that will save you headaches:

1) Low-level Format your drive at room temperature. I've worked on these things long enough to know that most drives suffer from temperature differential problems, aggrevated at the high end. Leave your system powered-on for a half-hour before starting.

2) Make sure the drive is terminated. Look near the connector on the Drive's printed circuit board for resistor termination packs. Make sure they're firmly in their sockets. Also set the SCSI ID to 6 (for single drive setups) and if you have a choice of LUN settings (see your drive/subsystem manual), set the drive for LUN 0.

FINDING THE BEST INTERLEAVE

The first step is to find the best interleave for your setup. This is a trial and error period that will take some time, but once done, you'll never have to do it again.

Step by Step Procedure:

1) Low-level format the drive using the low-level format option in the Main Menu. As a starting point, set the interleave value to 5.

2) After formatting is completed, Run the HDSCPartition program that came on the SCSI.TOOLS diskette included with your Apple SCSI Card.

NOTE: If you have upgraded your SCSI card to a Rev C ROM via your dealer, make sure you also get a copy of the diskette called "SCSI Card Utilities". If your dealer is stupid (not uncommon), ask him if you can make a copy of the diskette included in the box with the new SCSI cards.

With HDSCPartition, It doesn't matter what partition sizes you set at this point, as long as you set one that is at least 10 megabytes in size.

NOTE: If you're launching these programs from the FINDER, be sure to answer EJECT from the Finder's request to initialize the volume. DO NOT use the Advanced Disk Utility (ADU) at this point. The two programs do two different things. HDSCPartition creates a DPM (Device Partition Map), while ADU will only allow you to modify the DPM. If ADU doesn't find a DPM, it will low-level format your drive at 1:1 interleave, something you do not want. Hence, don't use ADU at this time.

3) After running HDSC and then quitting, answer "Initialize" to the Finder's prompts this time, instead of EJECT. This will high-level format your drive, allowing you to name the volume(s). If you're not using the FINDER, run Copy II Plus or the FILER or any other program that does high-level formatting. Name the disk(s) anything you want. At this point, don't worry about capacity, even if your 64 Magabyte drive only shows up as 20 Megabytes. We'll be fixing that shortly.

The High-Level Format should take only a few seconds. If it takes longer, (indicating that a low-level format has been forced), you messed up somewhere, so go back and start over.

4) Put a Copy of DiskTimerGS on the new volume and launch it from there. Write down the test results.

5) Now try an interleave factor of 10 ($0A), going through each step again. Now do it again with 15($0F).

What we're doing at this point is finding the best interleave factor. For example, suppose you get the following results from DiskTimerGS:

Interleave: 5($05) 10($0A) 15($0F) 20($14)

READ Timing: 90 61 69 78

In this example, the READ numbers from DiskTimerGS got dramatically better when going from an interleave of 5 to 10. This means that the optimum interleave factor is somewhere between 5 and 10. (Don't concern yourself with the SEEK or ADAPTER numbers from DiskTimerGS). Also, you might want to run DiskTimerGS twice each time to make sure your numbers are stable.

Now go back and do the interleave one at a time, from 5 through 10. Your results might look like this:

Interleave: 5($05) 6($06) 7($07) 8($08) 9($09)

READ Timing: 90 95 96 58 59
Bingo! An interleave of 8 is best. This is where the READ timing drops off dramatically. However, as a rule of thumb always add 1 or 2 to get best overall performance when using real applications. Therefore, the best interleave for your drive is 9 or 10.

Now do the following:

1) Reformate at an interleave of 10 (if needed).
2) Run HDSCPartition as described above.
3) Run ADU.
4) Select your drive and set up your partitions exactly the way you want them. You should now get your full capacity. The partitions will be named "Apple //" from HDSCPartition. Name them to whatever you want to use as the volume names, adjusting partition size accordingly.
5) You're Done! Your hard drive will now work at peak performance.

USING TEST

It's a good idea to run the TEST option at least two passes on each partition before using your drive. TEST will run continuously until stopped by the ESC key, so if you want, you can run it overnight or all day while you're at work. Be patient. Even two passes can take over an hour, depending upon the capacity of your drive. You'll have to high-level format the drive before running TEST.

PROBLEMS, TROUBLESHOOTING, CAVEATS

1) It has been reported that PARK doesn't work right on Chinook drives. The park routine simply issues a SCSI STOP UNIT command to the unit selected. However, Seagate, Quantum, and Rodime drives support this command, as it is part of the Common Command Set and Apple's SCSI variation.

2) If your subsystem uses an ST-506 drive and a separate SCSI controller (in addition to Apple's SCSI card), make sure the drive's defects are recorded in the Primary List. The low-level format routine will map out primary list defects, but not grown defects. You may have to use an IBM or Mac with appropriate software to access the Mode Select pages to do this. Check the manual of the Controller. An alternative to fixing defects is to run a bad block mapping program (ala Mr.FixIt), but this is a less reliable method of finding all the media defects.

3) If your low-level format operation takes a horrendous amount of time, your controller is probably doing media Certifies. This is good, since all defects are being mapped out for you. Be patient.

4) SCSI HACKER won't run if it doesn't find an Apple SCSI card and at least one Unit on the SCSI Bus that will respond to a UNIT READY command. Therefore, the program won't work if you try to use it with anyone elses Apple Disk Controller card.

5) The permissible Interleave Factors are governed by the physical number of sectors on your drive. For standard RLL 26 sector units, you can use from 0 to 25 (0 or 1 will both format out to an interleave factor of 1). For 13 sector MFM drives, expect a range of 0 through 12. SCSI HACKER won't format if you specify a number out of range and will report an error message.

6) All error numbers reported are passed from the SmartPort and/or ProDOS 8. See APDA's SCSI reference manual or the ProDOS 8 reference manual for a list of error codes and their meanings.
You are sure to recognize this classic pen and paper favorite. The object is to complete the word by picking the correct letters before hanging your man. Each incorrect letter chosen will cause one body part to appear on the screen. You have seven guesses before your man is doomed beyond hope.

[ESC] will return you to the startup screen, where you may exit to Uptime or continue the game.

CTRL-S toggles sound on and off.

Note: There is occasion when the rare ?FORMULA TOO COMPLEX error will pop up. If this should happen just reboot the machine. The reason it happens is ?FAR TOO COMPLEX to explain.

HCADgs was originally conceived as HSKETCH on an Apple IIc in the heart of Nebraska in 1984 or 85 (I don't remember for sure). This 2-D high-res drawing program won the National Ak-Sar-Ben (Nebraska spelled backward) programming contest.

After winning the contest I continued to modify the program (of course). Somewhere along the line the name changed to HCAD. HCAD was a 2-D drafting program for the Apple IIc/IIe enhanced that had a drawing area of 512x184 pixels where 256x92 were visible at any one time. It sported a joystick or keyboard drawing environment, windows (of sorts), a "choose from list" file selection, and file packing.

Now several years went by as I fought my way through college (Aerospace Engineering, University of Kansas, Lawrence Kansas). During this time I got my Apple IIgs and learned to program in TML BASIC. Well one thing led to another and now you have a copy of what I have always dreamed of. A cheap 3-D drawing program for the Apple II. HCADgs.

Version 1.2: This version repaired many bugs that were found in 1.0 soon after its initial release. The general flow and features of the program were not altered.

Future versions (if anyone sends me the shareware fee) will have the following improvements:

Definitely: The ability to draw with the mouse as opposed to using the keyboard (if anyone wants, I could make a joystick version too I suppose). Multiple objects that can be moved in relation to one another. Rulers, gridlines, etc for measuring. These things are relatively easy.

Probably: Hidden line elimination, shading and reflection (if my plans for hidden line elimination work out, then the others will be simple). A 320 graphic mode version that uses shades of any hue that you wish for shading. Solid modeling. Fee form curves, circles, cylinders, spheres, cones, etc.

Wish List: High speed animated rotations (for now you will just have to purchase a Transwarp GS for that).

HCADgs is not difficult to use. It sports the standard graphic desktop interface complete with pull down menus and all your favorite desk accessories. When the program is initially opened it shows a blank screen with the x and y...
coordinate axes visible. The view angle is Rx = 0, Ry = 0, and Rz = 0 degrees.
The y axis is defined as positive downward, x is positive to the right, and z is
positive into the screen. If you hold down the Apple (Command/Propeller) key
and press 4 you will move the drawing cursor (a small red dot) to the left
(negative x) direction 1 unit. Whenever you use one of the drawing commands the
x,y,z position of the cursor will appear in the upper left hand area of the
drawing page. The drawing keys make use of the numeric keypad for drawing as
follows:
- \( z \) (7)   - \( y \) (8)    + \( z \) (9)
- \( x \) (4)   + \( x \) (6)
+\( \text{Ry} \) (1)    +\( \text{y} \) (2)    +\( \text{Rz} \) (3)
+\( \text{Rx} \) (0)

Just play with the direction keys (make sure you hold down the Apple key)
and learn how the drawing cursor moves. Press Apple-B to begin a line at some
x,y,z coordinate (initially the beginning will be set to 0,0,0). Move the
cursor to the 3-D coordinate for the end of the line and press Apple-D. The
line will then be drawn between these two points.

You may use Cut (Apple-X) to remove the last drawn line and you may use
Paste (Apple-V) to replace the last cut line with many lines
in a single sequence but you will only be able to paste back the last cut line! Remember
that. This is rather limited editing so look forward to better editing features
on future versions.

You may rotate the object that you are drawing by pressing Apple-R. You will
be asked to input the rotation angles in degrees. For example you could enter
the rotation angles in degrees about the x, y, z axes all at once. This is a commonly used setting for view angle. With the view set to this angle you will still be able to draw, but now Apple-4 will move the cursor
diagonally upward to the left. This is because you have rotated the xy plane (as
commonly used in 2-D engineering graphics) by 30 degrees. With the view
set to this angle you will still be able to draw, but now Apple-4 will move the cursor
diagonally upward to the left. This is because you have rotated the xy plane (as
commonly used in 2-D engineering graphics) by 30 degrees. With the view

The use of the numeric keypad for moving the cursor is explained above. You may
also use the Outo option. Here you may enter the 3-D coordinates that you wish
to move the drawing cursor to. With this you may jump around in a drawing
rapidly if you know the relative 3-D coordinates. This is often the case if
working from real engineering figures. You may use Cut (Apple-X) to remove
the last line you drew and then press Apple-D to begin the
beginning of a line that you wish to draw, then move to the end of the line you
wish to draw and choose Draw Line... This will draw in a line in 3 dimensions.

HCADgs is a shareware program. You may use this program on a trial basis
for 7 days. If, after seven days, you are not pleased with HCADgs, then please
contact me. You may Cut (Apple-X) to remove the last drawn line and you may use
Paste (Apple-V) to replace the last cut line with many lines
in a single sequence but you will only be able to paste back the last cut line! Remember
that. This is rather limited editing so look forward to better editing features
on future versions.

HCADgs is written entirely in TML BASIC. This has often turned out to be a
feast in itself. However, it turns out that TML is great for the number
of string variables. It is a mess.) The source code

HCADgs is a shareware program. You may use this program on a trial basis

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

55 -- You will become a registered HCADgs user and will receive the latest version of HCADgs (and any other useful programs that I just happen to have hanging around).

In both cases you will be supporting the development of useful software for the Apple II series. And if you pay the shareware fee, my family won't complain so bad that I spend to much time programming and not enough time working at a "real" job. :) 

Please send your shareware fee to:

Joseph A. Huwaldt
314 BB Bristol Terrace
Lawrence, KS 66044

IMPORTANT: Please include your real name, full address, and the program and version number that you are registering (I have several). I will then send you the latest version of HCADgs as soon as possible.

Thank You for your support.

Ad Astra,
Joseph A. Huwaldt

Hacking Construction Set's features:
1. Totally user-definable, including the service format.
3. Auto-verification of codes.
4. Random dialup delay.
5. Codes can progress forward or backwards randomly or stepping in any step up to 99999, or completely randomly.
6. Up to nine service configurations on one parm file.
7. Codes are dated to show age.
8. Codes are 95% reliable.
9. Easy to use; entirely menu-driven.

HCS is to the //c what Megaphreak is to the AppleCat!

HCS can only be used on a //c until I make a //e version.

Starting out
-----------

HCS will appear on the screen, and set up the modem. You will be prompted to set the date in MM/DD/YY format; set the date correctly.

The Screen
----------

At the top middle of the screen you should see a block containing

Main 04/14/86

The "Main" is the current module you are on, and the numbers are the current date.

On the bottom row of the screen you should see a line containing

CARRIER  CODE  WAIT 00  DISK  HUNGUP

These are the status registers. They are currently inversed (black on white), but if any of them become 'activated' they will be shown as normal (white on black).

Register.....Purpose

CARRIER to show if a carrier is detected
CODE to show if a code has been found
WAIT 00 to show a delay of 00 seconds
DISK to show any disk access
HUNGUP to show that the modem is hung up

NOTE: The WAIT register alone means awaiting carrier or service hangup.
Use: [ARROWS] to MOVE the highlight. [RETURN] to SELECT the highlighted service parameter file. If an EMPTY file is selected, jump to CONFIG MODULE. If a non-EMPTY file is selected, jump to HACKER MODULE. [SPACE] to EDIT the highlighted file. [D] to DELETE the highlighted file forever. [ESC] to RETURN to MAIN MENU.

After selecting an empty parm file

Use: [ARROWS] to MOVE the pointer. [SPACE] to EDIT value. [RETURN] to save and exit. [ESC] to exit.

Use arrows to advance off the page onto next page.

Page One of configure:

Name: Input the name of the service here.

Service Number: Input the access number for the service here.

Carrier Number: Input a number which will give a carrier CONSTANTLY when dialed up, and will NEVER be BUSY!

Format: Define the way in which you wish the digits to be dialed using [S]ervice Number: Dial Service Number. [C]arrier Number: Dial Carrier Number. [N]umber: Enter N followed by a numeric digit you wish to be dialed. EX: N0 dials 0. [T]ry code: Enter T followed by a numeric digit that specifies the number of digits in the CODE. EX: T6 try a 6 digit code [D]elay: Enter D followed by a numeric digit which specifies the number of seconds you wish the delay to be. EX: D4 wait 4 seconds.

Combine the five to make a dialing FORMAT that will work for your SERVICE. The most common example is:

**FORMAT: SD4TC**

dial service, wait 4 seconds, try 6 digit code, dial carrier number.

If you make a mistake, use the [DELETE] key to erase the last step you did. When you are satisfied with the format, hit [RETURN] to continue.

You will then be prompted for the Number of seconds to wait for a carrier. This is how long you want the modem to await a CARRIER after finishing the dialing FORMAT.

Page Two of the configure contains (If [ON] these will...):
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 503 of 1262
Press the escape key and then press 1 from any event to get back to the menu screen.

**COMMAND MODE**

The command mode allows you to perform various operations. Pressing the escape key takes you into command mode. Once in command mode, press a key as follows:

**KEY ACTION**

1 - Return to main menu
2 - Enter slow motion mode
3 - Save a performance
4 - Load a performance
5 - Watch an instant replay
6 - Enter control mode
7 - Turn sound on and off
8 - Switch between running and hurdles
9 - Switch to next player
I - Initializes a disk
D - Display the files on the disk
ESC - Leave command mode

**CONTROL MODE AND PLAY MODE**

Each event has two modes: a control mode and a play mode. In control mode, you review the established records in that event, and change some event options (such as type of dive and amount of weight). In play mode, you participate in the event. Press ESC-6 to go into control mode. Press ESC to exit control mode and return to play mode.

**CHECKING RECORDS**

To see the US, world and Olympic records in each event (except diving because no records are kept in diving), enter control mode by pressing ESC-6. Press the left or right cursor keys to cycle through the records.

**INSTANT REPLAY**

You can replay a particular performance if you want to watch it again and study your technique. Press ESC-5 and the last performance will replay. You cannot use the instant replay feature in the archery event.

**SLOW MOTION**

Press ESC-2 to participate in an event in slow motion. Slow motion works in all events except archery and weightlifting. Slow motion is in effect for one round only and can be used with instant replay by pressing ESC-2, then ESC-5.

**CLASSIC REPLAY**

The classic replay repeats any performance you have saved on a disk. The classic replay works with all events except archery.

**INITIALIZE A DISK**

To save one of your performances, you need a specially prepared performances disk. To prepare a performances disk, insert a new disk into the disk drive. Press the ESC key and then press 3 to start the save function. The program asks you for a filename. Press ESC and then 1 to start the initialization process. This will take about one minute. When initialization is completed, the program asks for a filename.

**DISK DIRECTORY**

To get a listing of the performances you have saved on a disk, first press ESC and then 3 (for save function) or ESC and 4 (for load function). The program will ask for a filename. Press ESC and then 5 to list the directory.

**SAVING YOUR PERFORMANCES**

First, make sure you have a prepared "performances" disk in the drive. To save your best performances, type ESC-3 from any event screen immediately after the performance. A filename prompt will appear at the top of the screen. The filename consists of an abbreviation of the name of the event, a slash, and a filename you provide.

**LOADING A PERFORMANCE**

To load a saved performance, type ESC-4 from the event screen. Make sure the disk with the performance that you want to load is in the disk drive. A filename prompt will appear - enter the appropriate filename then simply press RETURN.

Each event (except archery) has a sample performance on the HesGames disk. To load the sample, press ESC-4 and type in the following for the filename:

- R/Demo - Running
- H/Demo - Hurdles
- L/Demo - Long Jump
- C/Demo - Clean and Jerk
- T/Demo - Two Hand Snatch

After you have loaded in a performance, press ESC-5 to see the classic event replayed.

**100 METER SPRINT**

- Press the ACTION key once to indicate you are ready to start the race. You'll hear the message ON YOUR MARK, and soon after, GET SET. Begin the sprint when you hear the word GO. If two players are running, both must indicate readiness before the race can start. If a previous performance is loaded in, it is always in readiness.
- Press the ACTION key of the second player (when you are running by yourself) to run against the computer.
- The starting blocks are equipped with sensing devices to detect if a false start was made.
- The instant you hear GO, start running by pressing the RIGHT and LEFT keys in rapid succession until you reach the finish line.
- After the runner crosses the finish line, he will continue to run a victory lap until you press any key.

**SWITCHING BETWEEN RUNNING AND HURDLES**

You can switch quickly between 100 meter sprint and 110 meter hurdles. While in either one of these events, press ESC-8. Now use the left and right cursor keys to select the event, then press ESC to exit control mode and go to the new event.
110 METER HURDLES

- Press the ACTION key once to indicate that you are ready to start the race. When you hear the word GO run by hitting the LEFT and RIGHT keys rapidly.
- Run at an even pace between the hurdles and press the ACTION key when you want to clear the hurdle.
- Skip over the top of each hurdle- try not to fall down or tap the hurdle.
- Timing in the leap is critical- if you hit the hurdle you'll lose seconds.
- The hurdler will continue running a victory lap until you hit a key.

LONG JUMP

- Start off running as fast as you can by pressing the RIGHT and LEFT keys.
- The white line is the take-off board. Plant your feet and jump as close to the center as possible without going over the line (which would cause a foul and a message "bad jump"). Take off by pressing the ACTION key.
- To make sure you always land forward, press the RIGHT key just before you land.

ARCHERY

- Each player gets six shots at each distance. (The scores are multiplied by six so that they compare to the actual outdoor event.)
- Keep an eye on the wind speed and direction, which can be unpredictable depending on the weather conditions for that day, such as clear or overcast.
- To select between a clear or overcast day (an overcast day has variable and higher wind speeds), press ESC-8, and use left and right cursor keys to choose. Press ESC to return.
- Select one of the targets; roughly position the bow by pressing the keys below:
  - U I O
  - J K L
  - M , .
- Nock the bow by pressing the space bar.
- Aim the bow as above using the sight and adjusting for wind direction and speed. Press the space bar when you are ready to release the arrow.
- The longer you take to aim and shoot, the harder it will be. Your grip becomes unsteady as time passes, and muscle fatigue sets in under the strain.
- You are allowed only a certain amount of time to shoot. If you fail to shoot in the time allowed, that shot will be cancelled and you will get a score of 0.
- If more than one player participates in this event, pressing ESC-9 switches from player to player.

SPRINGBOARD DIVING

- Start with the easier dives until you get the feel of the board. You'll soon be able to execute more difficult dives with precision, and eventually be able to "call" the dive.
- For a simple dive, press RIGHT once for a forward dive, or LEFT for a reverse dive. This signals to the judges the type of dive you will perform. The scores will clear and you'll stand at attention to alert the judges that you are about to dive.
- Press the ACTION key once to start the forward momentum. You do not need to run down the board using the left-right motion.
- With no further action, the diver will spill off the end of the board. To make a better entry position, press the DOWN key to stop the rotation at the precise moment.
- Once having mastered the basics of diving, work on your spring action where you jump at the end of the board. Press the UP, DOWN, UP keys anticipating the movements of the diver towards the end of the board.
- Correct timing and rhythm give you the proper amount of height and power.
- Once in the air, time your entry into the water to complete the required number of sumersalts for your chosen dive. Press the DOWN key to begin the entry. In a perfect entry, you enter the water vertically, your toes are pointed, and you make very little splash.
- You will be making a total of five motions once the type of dive has been selected- ACTION to start the run down the board; UP-DOWN-UP to obtain the proper spring; and DOWN to start the entry.
- Each judge scores the overall dive, however they may have different criteria for scoring the dives.
- Practice different types of dives by playing with the timing if the up-down-up motions.

CALLING THE TYPE OF DIVE

To "call" or announce the dive you plan to do, enter the control mode by pressing ESC-6. The TYPE OF DIVE box should flash. The dive you are required to perform will be indicated before each round. Press the up cursor key (ctrl-k/II+) until the ROUND flashes. Select the round by pressing right or left cursor keys. Press the down cursor key (CTRL-J/II+) to move to TYPE OF DIVE. Press the right or left cursor keys until you want to perform for the selected round flashes. You can pre-set up to ten rounds. Remember to set the round back to 1 if you want to start at round 1. Press ESC when you are ready to begin the diving sequence.

If you fail to perform the dive announced, you will get a FAILED DIVE message and receive no points, even if the dive was done well. If you complete the dive you announced, the judges will add a bonus of 10% to the score for pre-calling the dive.

CHANGING PLAYERS
To switch to another player press ESC-9.

- Your weightlifting power is in your thighs. You can control the
  thigh muscles with the UP and DOWN keys.

- Start with lighter weights- 45 kg is the lightest; 300 kg is the
  heaviest, until you develop weightlifting skills. Timing is critical
  and changes as you increase or decrease the weight.

- If you watch weightlifters in action during competition, you may
  notice that the lifters develop precise rhythm as they lift all that
  weight.

- To obtain this rhythm, press the DOWN and UP keys, pausing briefly
  to rest and gather strength at critical moments.

- In the two-hand snatch, reach down, pull on the barbell, then bend
  down slightly to split the legs when the weight reaches chest level.
  Steady yourself and then thrust the weight up extending your arms
  overhead. (You will be making a total of four down and up motions—
  DOWN-UP-DOWN-UP.)

- In the clean and jerk, first lift the barbell up to hip level and then
  drop down into a squatting position. Pause slightly and strengthen
  your legs (up) as you hold the weight at shoulder level. Pause to
  summon more power. Drop down slightly to bend your knees and
  immediately push up to center the weight in front of your nose. Push
  down to split your legs and extend your arms. Steady the weight and
  push for the final thrust. (You will be making a total of eight up and
  down motions— DOWN-UP-DOWN-UP pause DOWN-UP-DOWN-UP.)

- One player will continue lifting until you switch to the second
  player by pressing ESC-9.

**CHANGING WEIGHTS**

To change the amount of weight on a barbell, first enter control mode
by pressing ESC-6. The weight box will flash. Use the left cursor key to
decrease the weight and press the right cursor key to increase the
weight. Hitting these keys will change the weights in 2 1/2 kg steps. The
minimum amount of weight is 45 kg, and the maximum is 300 kg.

**CHANGING EVENTS**

To switch from one weightlifting event to another, press ESC-6 to
enter control mode. Press the up and down cursor keys until the event
flashes. Press the left and right cursor keys until the name of the
other event appears. Press the ESC key to leave control mode and go to
the new event.

**CHECKING RECORDS**

To see the U.S., World, and Olympic records press ESC-6. Press the up
and down cursor keys until the records flashes. Use the left and right
cursor keys to cycle through the records. Press ESC to leave control
mode.

---

Apple II High Speed SCSI Card

Copyright 1990, Apple Computer, Inc.

The Apple II SCSI card significantly increases data transfer speed between
Apple II personal computers and SCSI devices such as hard disk and CD-ROM
drives. The card works with the Apple IIe and Apple IIGS personal computers
and is compatible with all SCSI devices. It provides the fastest data
throughput possible for Apple II users. Using direct memory access (DMA) data
transfer, II offers speed improvements of up to 10 times faster than that of
the previous Apple II SCSI Card, which it replaces. The new card also comes
with software utilities for use with hard disk and CD-ROM drives.

Users with a hard disk drive and the new SCSI Card will see a significant speed
improvement when using large software applications, such as AppleWorks GS,
or large data files.

**Features and benefits include:**

- DMA Data Transfer -- on the Apple IIGS computer, data can be transferred at
  a rate of up to 1MB per second. On the Apple IIe computer, data can be
  transferred at a rate of up to .5MB per second. There are four switches on the
  card. One is used to set DMA on or off. The other three are used to set the
  SCSI identification number of the card — each SCSI device, including the
  computer, is set to a unique number from 0-7.

- SCSI Compatibility -- compatible with all SCSI devices, the Apple II
  High-Speed SCSI Card requires only that device-specific applications and
  drivers be installed on the system. The card comes with drivers and
  applications for hard disk and CD-ROM drives.

- On-Board Terminator -- simplifies setup for the user when connecting SCSI
devices to the computer. The user simply places one terminator at the end of the
  chain of SCSI devices.

- Utilities -- comes with improved hard disk utilities that partition and
  verify hard disks, and backup information. The Partition and Verify utilities
  take advantage of the improved firmware commands for hard disk drives. The
  Backup utility is now able to handle the resource forks that are part of the
  IIGS files. These are all ProDOS utilities and can be used by both Apple IIe
  and Apple IIGS users. In addition, the CD-ROM desk accessory for the Apple
  IIGS, CD-Remote, comes with the card.

**System Requirements**

The Apple II High-Speed SCSI Card works on an Apple II GS personal computer
or an Apple IIe computer with a 6502 microprocessor (note: older Apple IIe’s,
that have a 6502 microprocessor, will need to upgrade with an Apple IIe
Enhancement Kit). The Apple II GS requires a 3.5-inch disk drive, while the
Apple IIe requires either a 5.25- or 3.5-inch drive. Both require a
device with a SCSI port, appropriate SCSI cabling, and one SCSI terminator.

There is no upgrade program for owners of the previous Apple II SCSI Card.

**Apple II High-Speed SCSI Card**

Order #: A02201/A

New Product Descriptions
New Product Highlights
3/19/90
Welcome to Middle-earth. This is the world of Bilbo the hobbit, of Thorin and Gandalf, of dwarves and trolls and wizards. This is the magical and mysterious land of J. R. R. Tolkien’s The Hobbit.

You are about to play one of the most sophisticated adventures ever designed for the microcomputer. Addison-Wesley and Melbourne House are very proud to be able to present the Hobbit Software Adventure, based on Tolkien’s brilliant fantasy novel.

In the Hobbit Adventure, you play the role of Bilbo Baggins. You will be able to roam freely throughout Middle-earth, explore and discover this enchanted land. You will meet all types of creatures, some friendly and helpful, others very dangerous. Your adventure will be exciting and will hold many surprises each time you play.

If you are unfamiliar with hobbits, you should know that they are "a little people," about half the size of humans. Since they spend a great deal of their time eating (at least six meals a day), they tend to have large and fat stomachs. Unlike most creatures of Middle-earth, they are not very magical, capable of performing only the most ordinary kind of trick. Hobbits wear bright-colored clothing but no shoes, since their feet have leathery soles and thick fur on the tops to protect them. They are a quiet and simple folk and do not care for anything unexpected. No self-respecting hobbit has any use for adventures.

Like other good hobbits, Bilbo just wanted to be left alone in quiet comfort. But there was always a little spark of adventurousness in him, a tiny bit of the not-entirely-hobbitlike Took-clan, inherited from his mother, Belladonna Took. Perhaps this was why Bilbo was singled out by the dwarves and mistaken for a burglar, and why he found himself reluctantly agreeing to join Gandalf and Thorin on the most incredible adventure any hobbit could imagine in his most unhobbitlike dreams.

As the adventure opens, Gandalf the wizard has talked you (as Bilbo) into entering a new and exciting adventure helping Thorin the dwarf. Your Mission is to seek out the evil dragon, return the treasure he is hoarding to your warm and comfortable hobbit-hole, and place it in a chest for safekeeping. As a secondary mission, you must look after Thorin and protect him. If he should die early in the game, it will be unlikely that you will be able to survive the dangers ahead of you.

It is also important for you to know that, as a hobbit, you are a rather small and mild creature, and most others you will meet along the way will be bigger and stronger than you. You will therefore need to exercise all of your cunning and skill to survive.

Best of Luck, Bilbo, and may you return with wondrous tales to tell on a cold winter’s evening in front of a log fire.

COMMUNICATING WITH THE PROGRAM:

In the Hobbit Adventure, the computer will act as a translator between you and the program. You will tell the computer what you want to do in English, and the computer will translate the request and the program will execute it.

The computer will also be your source of information about where you are, what you can see, and what other creatures in the adventure are doing.

If the computer is not sure of something you mean, or if there is an ambiguity in your instruction, it will come back to you with questions for clarification.

The Hobbit program has a large vocabulary (see the section on the English Language). It knows over 500 words and can perform over 50 different actions (combining verbs and prepositions), so it is capable of very sophisticated communication. The use of English to interact with the computer allows you to enter your instructions in familiarly structured sentences.

THE SCREEN DISPLAY:

The screen display is divided into two windows. The bottom five lines of the screen are the "communications window." Everything that you type in will be shown here. This is also the place where the computer will indicate when it does not understand something you typed. For instance, if you mistype the word door as "DOR," the program will come back with:

I DON’T UNDERSTAND THE WORD “DOR.”

Other messages will also appear when the program is unable to execute your instructions. Each window will scroll independently of the other.

The rest of the screen is the "adventure window." This is where you will find out what is happening in the adventure, what you can see, and what the other characters are doing and saying.

The adventure window is displayed on the screen in upper- and lowercase. Everything that takes place, whether performed by you or one of the other characters, will be shown here. Descriptions of locations and of objects and their contents, etc., will also be shown.

Usually, the text that is displayed on this screen is short enough to fit in one window. Occasionally, however, the screen must scroll to fit all of the information. When this happens, the screen will pause and the word MORE will appear. Press any key to see the rest of the information.

The adventure window is also the area where graphics depictions of the various locations will appear. Over 80 locations described in the book are represented in this adventure. When this happens, the bottom two lines of the adventure window will remain text to let you know what is happening, and the rest of the window will change to pictures.

Through the pictures of the locations contain many details, it is possible that Bilbo can see things and people in the area that you cannot see on the screen. Don’t be deceived by thinking that the screen shows everything. It is always a good idea to take a look around.

THE ENGLISH LANGUAGE:

The Hobbit program can understand the following words (valid
WITH THE SWORD CAREFULLY ATTACK THE TROLL

ATTACK THE TROLL CAREFULLY WITH THE SWORD

Adjectives that describe nouns must come before the noun. If it sounds right in English, it is probably valid in Inglish.

OPEN THE GREEN DOOR is correct, but

OPEN THE DOOR GREEN is not.

Prepositions usually come before the noun in Inglish.

ATTACK WITH THE SWORD

The preposition could go before or after some verbs, or even at the end of the sentence if it sounds more natural.

OPEN THE DOOR

USE OF AND:

You can use the word AND in all its normal meaning in Inglish. This means, among other things, that you can enter more than one sentence or perform more than one action at a time.

OPEN ALL EXCEPT THE GREEN DOOR

The rules of Inglish is simple. The main thing to keep in mind is that each instruction must be in the form of "verb-the-noun," where the noun (or pronoun) can also be implied.

Each sentence must have a verb.

RUN; CLIMB; WAIT

are all valid sentences, with an implied pronoun of "I."

The meaning of the verb may be altered by the use of adverbs.

RUN QUICKLY

VIOLENTLY BREAK THE DOOR

English grammar applies, and the order of the different parts of the sentences is usually not critical.
or DRINK DELICIOUS FOAMING BEER

all of these would result in quenching your thirst. You cannot, however, use the position of an object as its description.

DRINK BEER IN BOTTLE

would not be acceptable.

You cannot have more than one indirect object in a sentence. Basically, this means that you cannot do one thing in more than one way in the same sentence.

PUT THE ROPE ON THE TABLE and
PUT THE ROPE ON THE CHAIR

are both valid, but
PUT THE ROPE ON THE TABLE ON THE CHAIR

is not.

By the same general rule, you cannot say things like
ATTACK THE TROLLS WITH EVERYTHING

SPECIAL COMMANDS:

There are a number of special commands unique to the Hobbit Adventure:
LOOK (L) gives you a graphic depiction of your location. Then, by pressing a key, you will receive a text description of the location, including all exits and objects (other than any you are carrying).
INVENTORY (I) describes everything you are carrying.
EXAMINE (object) enables you to have a closer look at any object you come across.
WAIT passes the time.
@ (no return) instructs the program to repeat the last command. (This must always be the first input of a sentence.)
NOPRINT disables the PRINT command. (PRINT and NOPRINT may not be be available in all versions. Check your reference card.)
SAVE allows you to save your current game on disk. After you have saved the game, play will continue normally. The next time you play, you can pick up where you left off.
LOAD loads a previously saved game from the disk.
QUIT restarts the game.
SCORE tells you what your presentage is so far.
Pause suspends the game until another key is pressed.

One of the fantastic features of the Hobbit Software Adventure is ANIMACTON. With ANIMACTION, each creature in the program has an independent character of its own. It is capable of performing a wide range of actions and of making decisions based on what is happening around it.

Each character will follow a general course of action that is in keeping with its particular personality. However, the specific actions it takes are (naturally) unpredictable and will be different each time you use the program. They will react in some way, not only to what you do but also to what every other creature they come into contact with does!

Just like in our world, the creatures here are doing things all the time, even when you cannot see or hear them. They will go about their business even when you are not around. This is because the Hobbit is played in "real time," which means that things will happen even if you are doing nothing. If you just sit and watch the screen, you will find that after about 30 seconds, the following message will appear:
- You wait -

Only when you are actually keying in an instruction will time "stop" in Middle-earth.

Because of these special features, you will find that each time you enter the Hobbit Adventure, the game will proceed in a slightly different manner. The further you get into the Adventure, the more different your experiences will be. This means that there is no unique solution to the Hobbit Adventure; you will face slightly different problems each time you play.

This is not a program that you will use only once. Each time you play you will be embarking on a new exciting adventure.

CONVERSING:

The Hobbit Adventure also features Animtalk, which allows you to talk to the other creatures in Middle-earth.

Of course, because all creatures are animated through Animaction, they will make up their own minds about whether to talk to you or follow your suggestions.

The way one talks to others in the Hobbit Adventure is quite simple:

You enter
SAY TO (name) "(sentence)"

For instance:
SAY TO GANDALF "READ MAP"

But remember that although this form is certainly correct, you may still receive the message:
- Gandalf says "No!"
Try not to say too much to one creature at a time. If you are long-winded, a creature may think you are a bore and not agree to help you. For the same reason, it is a good idea to try to limit the use of ALL in your sentences to other creatures.

You must be more careful than usual in typing in what you say to other creatures. They, unlike the computer, will not tell you when they do not understand what you are trying to say. They will just think you are a little odd and will probably not be too anxious to stay around you.

COORDINATING

It is important for you to know that, for some of the problems in the Hobbit Adventure, a solution only exists if you are willing to cooperate with the other creatures in the adventure. As you are only a hobbit, you have no magical powers, and you will find that there are many things that others are able to do better than you (see the Laws of Physics in Middle-earth). So you must stay on good terms with your friends. Of course, sometimes you will have to be on your own and learn to fight your own battles.

FIGHTING

As much as Bilbo might like to think otherwise, there would be no adventure in the Hobbit without danger, and many of the creatures you will meet in Wilderland are less than friendly. Many will attack you on sight, some will try to kill you, while others will want to capture you. It is also safe to assume that any creature will fight back if it is attacked.

As you do not specify a weapon (even if you are carrying one), the program will assume that you want to fight with your bare hands. Because of the viciousness of some of the creatures in Wilderland, don't be surprised if you a dead body in your travels. Take care that it isn't yours!

*******************************************************************************

GENERAL CONCEPTS

As stated above, in the Hobbit Adventure you play the part of Bilbo Baggins, roaming around Middle-earth and interacting with the other characters.

On your adventure, you will encounter many strange and wonderful objects. Some may have magical properties. Some may be deceiving, and may not be what they first seem to be. Some can be used as weapons, others can be eaten, and so on.

LAW OF PHYSICS IN MIDDLE-EARTH:

There are certain general laws of physics that apply in the Hobbit Adventure and they must be understood and obeyed.

You cannot lift an object that is too heavy for a hobbit to carry. In addition, if you are already carrying something, you cannot lift another object if the combined load is too heavy. This applies to all of the creatures in the adventure, also. However, since they are likely to be stronger than you are, they will be able to lift objects tat you can't.

You do not have to be carrying an object in order to be able to use it. For example, if there is a sword lying on the ground, you can say

KILL THE GOBLIN WITH THE SWORD

combining the two actions (picking up and killing) into one sentence.

The exception is when the object that you want to use is being carried by someone else. Other creatures are not likely to let you take things away from them.

Some objects can act as containers, such as sacks, barrels, etc. You cannot put an object into a container if it is too large to fit, nor can you put something into or take something out of a container that is closed.

Some containers may be transparent; others are opaque. You will be able to see the contents of any transparent containers from the outside. However, you can only see the contents of an opaque container if you open it.

Liquids behave as you would expect - they cannot be carried unless they are in a container; if the container breaks or falls, the liquid will spill, and so on.

Some objects may be locked. Doors are obvious examples; others are windows, chests, caches, and so on. To unlock them, you will need the right key.

General Concepts: Some objects are breakable, so you must be careful in how you handle them. In some cases, you might want to break an object. Be careful how you choose to break things. If, for instance, you try to break a door with a bottle, you will find that the bottle will break not the door.

Fighting will make you weaker, as it takes a great deal of energy. You will need to eat regularly to get your strength back. If you don't you may find that you are too weak to lift even the smallest object. But be warned - don't be a glutton. While hobbits may be inclined to eat 7 or 8 meals a day in their quiet, ordinary lives, there isn't time for such adventures.

In order to reach the dragon and his treasure, you will need to go through caves, dungeons, and other underground locations. Some places will have natural light (if it is daytime), but others will be dark and forbidding. If you go into a dark location without a lamp or other source of light, you will not be able to see anything. Be careful, since you may become disoriented and lose your sense of direction. It is very dangerous to move around in total darkness.

FINDING YOUR WAY AROUND:

If you want to go through an entrance or passageway, it is quite valid to say something like

GO THROUGH THE GREEN DOOR

You may also go through windows, trap doors, and other passageways. Obviously, if a passageway is closed, you must open it before going through.

You are also able to LOOK THROUGH openings. This can be very useful if you want to see where you would get by going in that direction, or to see who is there waiting for you.

ENTERING PLACES:

If you know where you are going (maybe you have been there before), you can specify the location you want to enter rather than the direction of movement. For instance, to the east of your home is the Lonelands, so you could say

ENTER LONELANDS or GO INTO LONELANDS

if someone you want to talk to has entered another location, you can follow him.

FOLLOW GANDALF
SPECIAL CROSSINGS:

Crossing rivers, ravines, chasms, and so on can be dangerous and difficult. You can try to jump across a ravine or swim across a river. In some cases you might be able to use materials you find to build a temporary bridge, or use a rope to swing across.

MAPPING:

As you make your way around the wilderland, you will find that movement here is much more complex than it is in the world of man. You will find yourself on trails and paths, in caves passageways, some of which seem to go around in circles with no escape. For this reason, you will find it very helpful to make a map as you go along, adding to it each time you play the game.

However, one of the obstacles you will encounter in Middle-earth is that the direction you take from point A to point B may not be quite the reverse of the way from point B to point A. In addition, you will at times be climbing up or down, requiring representation of several levels in your map. Therefore you may need to devise an even more creative method of recording you movements. One way is to create a grid, such as the mileage charts used on some road maps. Locations travelled from could be listed on the rows and those travelled to in the columns. The intersecting spaces would contain the directions travelled to get there. Using a grid will enable you to record how you made your way from one location to another and even back again. You can keep track of where you have been and know where you can go from where you are. This method is particularly effective for mapping the twisting, turning paths of Wilderland, entering and leaving the underground locations, and keeping track of secret or magical passageways.

SCORING:

While playing the Hobbit Software Adventure, you build a cumulative score in increments of 2.5 percent for visiting particular locations or performing certain actions. If you should come to an untimely demise, the program will tell you what your score is. You can also receive the score "in progress" by typing the special SCORE command. You do not have to reach 100 percent in order to "complete" the adventure. In fact, you can fulfill your goal while accumulating a score of only 50 to 60 percent. To build your score, try to be as active as possible, visiting many locations and seizing all opportunities for adventure.

<CUSTOMIZE>

TO MAKE YOUR HOMEMWORD DISK FIT YOUR NEEDS.
You will be given the opportunity to attempt missions at three levels: protection, training, and assault. The marksmen can drop, roll, or duck down. Your marksmen are vulnerable when out in the open, since they have no protection.

To succeed, you must rescue all the hostages without losing any men. The government is counting on you to avert a disaster of international proportions. Good luck!

....SPECIAL ALERT.....

Attention all special forces personnel: Urgent. Hostage situation. Prepare for immediate action. Terrorists have stormed our embassy and forced their way past the security guards. An undetermined number of embassy personnel are being held hostage. The terrorists' demands are unacceptable and negotiations have broken down. These terrorists are heavily armed and considered extremely dangerous. As far as we can determine, they now control all three floors of the building. A six-member assault force team must infiltrate the embassy, neutralize the terrorists, and rescue the hostages before time runs out. The government is counting on you to avert a disaster of international proportions. Good luck!

....SPECIAL ALERT.....

"You have your orders, Lieutenant. High-ranking diplomats are being held at gunpoint, and it's up to you and your men to get them out alive. As you prepare for the assault on the embassy, take a moment to read through the enclosed briefing booklet. He means the rest of this file. It will familiarize you with the exact maneuvers required of your team, and provides useful tips from a number of assault force veterans. First, make sure that all of your equipment is ready and in working order. Next, proceed to command headquarters, where you will direct this life-or-death operation."

--- General Walter P. O'Donnell, Special Forces

WHAT YOU NEED:
- An Apple IIgs (You can have another computer if you don't mind not being able to play the game)
- A total of 512K memory
- Color monitor (A IIgs without color? What are they, kidding?)
- Joystick (optional)

LOADING INSTRUCTIONS:
- Put the game in the drive and boot the damn thing!

--- TACTICAL UNIT BRIEFING BOOKLET ---

It is your responsibility, lieutenant, to direct the six-member assault force team in a daring rescue attempt. Your objective is to bring all the hostages to safety and neutralize any terrorists who open fire. Time is crucial, so you will also be judged on how quickly your men complete the operation. You are given the choice of five missions; each one allows you less time than the last. To succeed, you must rescue all the hostages without losing any men and complete your mission before time runs out.

After reading the message on your monitor, press the fire button (or fire key) to begin.

YOUR RANK

You will be given the opportunity to attempt missions at three levels: protection, training, and assault. The marksmen can drop, roll, or duck down. Your marksmen are vulnerable when out in the open, since they have no protection.

CHOOSEING YOUR MISSION

Next, you must choose a mission from among the five shown. Missions are listed from easiest (training) to most difficult (assault) -- the harder the mission, the less time you have to complete it.

- TRAINING (without hostages)
- TARGET
- ULTIMATUM
- RESCUE
- ASSAULT

Move your control forward or back to highlight the mission you wish to choose, then press the fire button to select that mission.

You will direct all operations from command headquarters. Surveillance cameras will allow you to see what is happening at all times, and you will be in constant contact with your men; their code names are DELTA, ECHO, MIKE, HOTEL, TANGO, and BRAVO. They are all skilled professionals, but will not act without your guidance. While you are directing one man, the others will remain in their current positions.

--: ( STAGE 1 ) :--

THE MAP

After selecting a mission, your command console will display a map of the embassy and the surrounding area. A message detailing your first operation will scroll across the screen; when you have read the message, press the fire button to continue. Note the three locations that are marked on the map with an "X." Your first assignment is to place the team's three marksmen (DELTA, ECHO, and MIKE) in these strategic locations across the street from the embassy. Once inside the selected building, they will make their way to the rooftop and set up sniper positions to provide cover for the direct intervention team.

"Don't be tempted to put two men at the same location -- you want snipers on all three sides of the building. For maximum coverage, only one man should be placed at each target area. So what if the last guy takes a few hits -- that'll teach him to stay out of the line of fire next time..."
into doorways, or dive through windows to avoid the gunfire.

CONTROLS

STANDING UP

Hide

Run left < oo -> Run right

Roll left || \ Roll right

Drop

LYING DOWN

Stand up

Crawl left <- o -> Crawl right

To PAUSE the game, press the "P" key; press any other key to resume play. Move the joystick left, right, or back to leave your hiding place. If your man is lying down and does not crawl in either direction, he will automatically stand back up. If you do not move your man, he will automatically hide in the nearest location after a few seconds.

If one of your marksmen is gunned down on the street, you must return to the map and select another man (by pressing his function key). When your last man is in position, you are given the option of starting over or proceeding to the next stage. NOTE: If all three marksmen have been killed, you MUST start over.

---: ( STAGE 2 ) ::---

THE ROOF

Once your marksmen are in place, a helicopter will carry the three-member Direct Intervention Team (HOTEL, TANGO, and BRAVO) to the roof of the Embassy. Once your men are on the roof, the Console screen will display a map of the Embassy and the surrounding buildings. An "X" shows the position of each man on the roof, as well as the locations of the men stationed across the street. The "X" of the active man is shown in red; the others are shown in white. The name of the man currently under control is shown on the upper left side of the Console. You may switch to a different team member at any time simply by pressing the corresponding key:

Delta: Z
Echo: X
Mike: C
Hotel: V
Tango: B
Braavo: N

A control panel on the right side of the Console shows the time remaining and the names of the surviving team members. If one of the team members is in immediate danger, his name will begin to flash. In this case, you should switch to that man and take whatever action is necessary to prevent him from being killed.

USING YOUR MARKSMEN

---: ( STAGE 3 ) ::---

THE MINI-MAP

The mini-map shows the rooms and hallways of the floor that your man is on.

**R.J. Richter, Assault Force Captain 1980 - 1984**

*Think twice before you order a marksman to shoot -- the person in his gunsight may be a hostage, or even one of his own team. Be sure to scope out the situation using a man on the inside before you make your move.*

RAPPELLING

---: ( STAGE 4 ) ::---

The Direct Intervention Team (HOTEL, TANGO, and BRAVO) must gain access to the Embassy by positioning themselves on the edge of the roof, rappelling down the side, and breaking in through a window. To select one of these men, press the corresponding key. Next, you must position your man on the edge of the roof. Press the fire button to cycle through the available positions. When you have selected a position, press the ESC key to view the man as he prepares for his descent. Follow the instructions below to direct your man as he descends from the roof.

---: ( STAGE 5 ) ::---

INSIDE THE EMBASSY

---: ( STAGE 6 ) ::---

Once inside the Embassy, a view of the room your man is in is displayed on the right side of the Console. Above this screen is the name of the man currently being controlled. A control panel on the left shows the time remaining, and surviving team members. If one of the team members is in immediate danger, his name will begin to flash. In this case, you should switch to that man and take whatever action is necessary to prevent him from being killed. A mini-map is shown in the center of the control panel.

**R.J. Richter, Assault Force Captain 1980 - 1984**

*Think twice before you order a marksman to shoot -- the person in his gunsight may be a hostage, or even one of his own team. Be sure to scope out the situation using a man on the inside before you make your move.*
By noting where he came in, you will be able to pinpoint his location on the map and then follow his progress as he moves from room to room. The floor number is shown in the lower right corner of the map. Use the stairways on the east side of the building to move to a different floor; the stairs to a higher floor are marked with an up-arrow, the stairs to a lower floor with a down-arrow.

Additional Mini-Map Clues:
As a LIEUTENANT, you are given additional clues on the mini-map that show you the location of your men as well as that of the terrorists and hostages. The man you are directing is indicated by a small red arrow; other men are indicated by red dots; terrorists are indicated by yellow dots, hostages by white dots. As a CAPTAIN, you will see terrorists and hostages ONLY WHILE YOU ARE IN THE SAME ROOM WITH THEM.

Richard M. Lawrence, Assault Force Commander 1969 - 1977

"Pay attention to your surroundings and try to learn the layout of the Embassy like the back of your hand. Take advantage of the extra clues on the mini-map -- once you're promoted, you won't have that luxury anymore."

- CONTROLS -
  Forward
  Turn left < - o - > Turn right
  Turn around

FIRE: Fire button

MOVEMENT
-------
Move your man forward and turn left or right by moving the joystick in the corresponding direction. To turn completely around, pull the joystick back. Inside a room, your movements will always place you WITH YOUR BACK TO A WALL (or doorway), facing the center of the room. Move the joystick left to face left; move the joystick to face right. Push the joystick forward to move forward through a doorway. If you move forward toward a wall, you will automatically turn around so that your back is to the wall. If you are in a doorway, pull the joystick back to turn completely around; if your back is to a wall, you will not be able to turn around.

Connie Scum, Hostage GS expert 1990 - ?

"Steering yourself through hallways is a lot easier, but maneuvering around in rooms is a bit tricky and will take a little getting used to. But don't worry; it'll come to you in no time. After all, if you're smart enough to own an Apple IIgs personal computer, don't you think you'd be able to figure out some silly game controls?"

TERRORISTS
-------

When you encounter a terrorist, be prepared to kill... or be killed! Press the fire button to shoot. (You have unlimited ammunition.) While the fire button is pressed, move the joystick left or right to move your weapon in the corresponding direction. Pull the joystick back to shoot higher, and push it forward to shoot lower. (These are like the controls to an airplane, right?) Terrorists move quickly from room to room, and may hide behind other terrorists or a hostage. Hostages will only move if they are accompanied by a team member or a terrorist; if you see a hostage moving, you can be sure that there is a terrorist behind him! If a terrorist is guarding a hostage, you must try to kill the terrorist without harming the hostage.

Proterm Special Emulation

First of all ill just explain what this is, for those who dont know...

PSE is a special 'Apple' emulation developed by the makers of Proterm (an apple Terminal program) they took the idea of DataMedia Emulation (the use of inverse blocks and characters over the modem for crude graphics further by adding the capability of also using the apple's built in 'Mousetext Characters'. This allowed for an interesting way to 'Liven' up Bbs', menu's were no longer just text, but now could be snazzy and eye-catching...

To use Proterm special in the beginning you had to have Proterm version 1.9 or better, and you also needed a BBS that supported PSE. By setting the Emulation to 'Proterm Special' when calling a PSE Bbs, you would then see any PSE the board used... At first it was quite the trend, but like all things it died out eventually, and was seen here and there. But in the last few years it has come back into use for Bbs' and Advertisements for Bbs', along with some imagination, PSE was responsible for some of the best Bbs' seen...

'Emulation'

Quick reference for using the Emulation

[1] Boot up Proterm 1.9 or Newer (current is 2.2)

[2] Once at the Main Menu, you must goto your dial list (cmd 'D') and choose or add a PSE Bbs.

[3] If Editing an old Bbs dial data, you must choose 'EDIT'.

Now press return until the highlighter is on 'Status Bar: Yes No'

When using a PSE Bbs, it is best to turn off your status bar so that any PSE they use wont be messed up by the missing screen area... now rtr, This gives you the 'Terminal Emulation' Prompt, use your left and right arrow keys to flip through the supported emualtions until you find 'Proterm Special'. Press return until you are back at the 'Dial' prompt (Proterm will save the newly edited Spec's to Disk)

[4] Now... whenever you dial that BBS, you can view whatever PSE they have!

Proterm Special Charcters (Control & Mousetext)

When using PSE, you have the ability to Turn on & off the different functions such as 'Mousetext', 'Inverse', and Ascii. You do this by using the Control characters given in chart [--A.1--] & [--A.1b--], These Control Chars have various functions, from screen movement to Insert/Deletion.

Depending upon how you are typing up a PSE file, you might not have access to most or all of these options. When using the Proterm Editor you may use all of these options by pressing ::Open Apple 'P':: then you type the actual Character needed (example: Open Apple 'P' + 'N' this will show you the actual character in inverse like this ) By using certain of these you turn on Sub Functions like Mousetext, whatever is after the Ctrl-P in the file will be converted to its Mousetext Equivalent [Chart --A.2--] (Not all Keys have Mousetext equivalents).

Viewing PSE with Proterm outside of a BBS

---
[1] Boot Proterm 1.9 or Better
[2] Use the 'Open Apple/Control/T' command to put Proterm into a fake Online Mode
[3] Now use the Open Apple 'O' command to edit the online parameters.

Press Return until you reach 'Duplex', change this to Half. Change the 'Status Bar' to -No- status bar. And then change the Emulation to 'Proterm Special'

[4] Now use the Open Apple 'S' command (Send) and choose ASCII send

[5] You can either send a PSE file from disk or from the Copy Buffer, so choose whichever.

[6] Now, Edit the ASCII send Parameters like this:

Change the line width to 'AA'
Use the left arrow key to change the Inter-Char and Inter-Line to '0'
Now send... it should goto the screen, if not, recheck the Online parameters, and make sure you are in half duplex.

_chart [--A.1--]

The next chart [--A.1b--] contains more Ctrl Chars, but these require a better explanation, they are MORE involved

_chart [--A.1b--]
Apple II Computer Info

Control Characters:: Complicated
-------------------------------------------

Control 'R':::{[Repeat]}:::::::
This Control function is used when repeating one Character 3 or more times in
a horizontal line (ie: Top of a box) it is used like so:

-------- AB --------

'A' stands for the Actual Character you wish to repeat
'B' stands for the ascii equivalent of the number of times you want
it repeated

.ie: Line of 64 equal signs would be --> =@

Control 'T':::{[Tone]}:::::::
This is the PSE sound generator command, with some skill you can use this to
play simple songs... it is used in this format:

--------- T1T2D ---------

'T1' stands for Sound Tone 1
'T2' stands for Sound Tone 2
'D' stands for Duration

For a single tone use the same value for T1 and T2, dual tone use Diff
values for both...

Control 'E':::{[PSE Detect]}::::::
This is sent out by a BBS to detect wether PSE is allowed by the User.
If the user does have PSE active, a control-[j] is sent back (Ascii 29)
It gives an easy way to detect PSE users for ASCII/PSE BBS's

Control '"':::{[Position]}:::::::
This is an easy way to Position the Cursor anywhere on the screen. It is
used like this:

-------- -AB --------

'A' stands for the Ascii equivalent of the Horizontal position +32
'B' stands for the Ascii Equivalent of the Vertical position +32

.ie::Positioning the cursor at "horizontal=5 and Vertical=5" would look
like this: 5+32= 37 / Ascii(37) = % ------% real easy!!

The end.....

Well, this is just file one, the next files will discuss techniques of
making Fast/small PSE files, as well and hints on animation

Also, there will be specific files or parts of files discussing the different
PSE editors out (Thier good & Bad points!!)

Thank you all, Ace McCooy

Call these Bbs's 708/312 area code!

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 517 of 1262
Hello, yes, finally I have been talked into writing part 2 and soon part 3 of this series... maybe more? Dunno, but I am thinking of writing my very own Pse editor which will incorporate some of the best editors into a single easy to use program... well on to the file.

Proterm Special Emulation::: Speed and Size!

In using Pse you can do a number of things that will speed up those ads, most will be covered, those that aren’t will be at a later date once you’ve become Pse affluent...

---

---

Speed in Pse is a very touchy subject, alot of the best heavy pse games and boards out are slow and clunky... people still refuse to do the extra work required to make Pse go like lightening. Size, with the use of message bases to distribute Pse ads and animations, people started to worry about size. The normal msg base has a 4k limit on messages entered or uploaded, although this is plenty for a nice ad, some ads are chopped off, many don’t work at all! This is why you are going to learn about giving speed and size to Pse ads and animations!

Speedy Pse....

In using Pse you can do a number of things that will speed up those ads, most will be covered, those that aren’t will be at a later date once you’ve become Pse affluent...

---

---

<Control>-^ This function is used to position the cursor. If they are used to reposition the cursor space by space (like Street Scenes) the extra commands tend to slow the pse. So in order to speed up Pse, you should remove all extra ctrl-’s used...

Extra Ctrl-’s are used when you are positioning the cursor constantly space after space to print a horizontal sentence or string like so:

-abl-bbE-cbl-dbl-ebO-fb!-gb!-hb! (output line:66 columns:65-72)

(this prints the string "HELLO!!!")

Not all pse printing is done Horizontally, so it is best to first get the useable code. First make sure all of the parameter #2’s are the same, this means they are printed on the same line. Now use the Ascii table to figure if the parameter #1’s are in ascending order, (pse may be printed right to left, change for speed, but leave it if it is for effect) that is if it starts at a low column position and increases by one for each space.

Once you have the code you wish to use, printing in left to right order (if parm #2’s are in decending order, just flip it, use the last position and then assemble the string after it. Like so...

-abHELLO!!! (output same as above)

(Still prints ‘HELLO!!!’)

---

---

This also works for reperative strings like ‘xxxxxxxxxxxxxxxxxxxx’ But there is an even faster way to do those...

---

---

<Control>-R This function is used when repeatedly printing characters horizontally (example ‘xxxxxxxxxxxxxxx’), if you print the char in a line of 3 or more, you will save alot of wasted time...

A line printed like this:

-ab<bb<cb<db<eb<fb<gb<

Will give an output of ‘<<<<<<<’ at line:66 columns:65-71 this may be speeded up using the Control- Idea like so:

- аб<<-------

but this is made even faster by using the repeat char function, this function was explained in file 1 but will be repeated here in the appendix. Anyways, by using the Ctrl-R you will gain alot of speed... like so:

-abc

This does the same thing, just alot faster... rember, look to file #1 for Ctrl-R info... some is also given at the end of this file...

---

---

Size... it really does matter!!

Size in Pse ads is usually not a problem, seeing as you have a whole 4k to use that is... But in some really good ads where room is used in large amounts, it is best to try and shorten the file by removing unneeded characters...

Here are some of the most common space wasters in pse ad’s:

1. Excess use of Ctrl-’s... this was covered earlier in the file... it will make the pse faster and smaller.

2. Repeated characters without using ctrl-R. Use Ctrl-R whenever possible... it save alot of room and speed. It was also covered earlier.

3. Printing over 4 Spaces in a string when not needed. If you print a string like:

-abABCD{[F]GHJ.KL

MNOPQRSTUVWXYZ

You can save time and space by either replacing the spaces with a Ctrl-R of the equivalent number of spaces, or remove them and just use a Ctrl-’ to reposition the cursor to print the rest of the string that many spaces away... these are used like so:

-абабрифдгжк;л

mntopqrstuvwxyz

Ctrl-R: -абарифдгжк;л

Ctrl-': -абабрифдгжк;л
Both are the same size... but the Ctrl-R wastes a little time by printing the spaces, either will work though.

Well... this isn't as comprehensive as I had hoped... but it is fairly easy to understand for a person who read and understood the first part of this series. Look for updates to the series giving more detail and information, possibly, if I follow through, you will see a fully featured Editor combining the abilities of all of the best editors... it will even do speed and size editing (fudgepacking) on its files...

Don't get your hopes up though, you might just see improved or rewritten Street Scenes or Fudgpackers before then...

>>> Appendix <<<<

Control 'R': [Repeat]

This Control function is used when repeating one Character 3 or more times in a horizontal line (ie: Top of a box) it is used like so:

'=' AB

'A' stands for the Actual Character you wish to repeat
'B' stands for the ascii equivalent of the number of times you want it repeated

(ie: Line of 64 equal signs would be --> =@)

Control '^': [Position]

This is an easy way to Position the Cursor anywhere on the screen. It is used like this:

--- AB ---

'A' stands for the Ascii equivalent of the Horizontal position +32
'B' stands for the Ascii Equivalent of the Vertical position +32

(ie: Positioning the cursor at 'horizontal=5 and Vertical=5' would look like this: 5+32= 37 / Ascii(37) = % ------>> -%% real easy!!)

(Look to How.to.pse.pt1 for more indepth info on PSE)

DOCUMENT iconed

IconEd 1.3
Copyright (c) 1988, Paul Elseth
Documentation version 11/23/88 (4th draft)

IconEd is a shareware program for creating and editing Apple IIGS icons. With IconEd, you can change the appearance of icons, change the names of their files, and tell the Finder where to find the application that created a particular document file. You can also add icons to and remove icons from existing icon files, as well as copy icons between files. In short, IconEd is a complete icon maintenance utility.

Please note that IconEd is _shareware_, not public domain. You are welcome and encouraged to give copies away to anyone and everyone. If after using IconEd for a trial period you find it useful, you should send in the shareware fee of $15 (see below). If you do not want to pay the shareware fee, you should stop using IconEd.

--- Any commercial distribution of IconEd is expressly forbidden without prior written permission from the author.

I plan frequent and substantial improvements (and bug fixes), so registering would definately be to your advantage.

Here is the shareware deal:
When you send your $15, I will send you back a 3.5" disk with the latest version of IconEd, plus the next update free. After you register your copy of IconEd with me, you may use any future updates free. Updates ordered directly from me will cost five dollars or three dollars plus a blank disk.

Send your $15 to:
Paul Elseth
2739 Fairview Ct SE
Rochester, MN 55901

End.....

FILE Menu
New
Use New to create a new file of icons. A new icon window will appear, titled "Untitled.on", without any icons in it. You may copy icons from other icon windows, or create new icons from scratch.
Open
Use Open to load an existing icon file from disk. Icon files are usually stored in the folder called ICONS in the main directory of a disk. There must be a file called FINDER.ICON in the ICONS folder on the boot disk. In addition, any disk can contain a folder called ICONS containing additional icons (see ICONS AND THE FINDER below). IconEd can handle any number of icon files open simultaneously.

Close
Close closes the front window. If the front window is an icon file window and changes have been made to that file, you will be asked if you want to save the changes (just like selecting Save from the FILE menu).

Save
Saves the front icon file using it's current name. If you originally loaded this file from disk, it will be saved in the file it was loaded from. If this is a new icon file, you will be given a chance to indicate where you want the file saved (just like using Save as... from the FILE menu). If you've moved the icons in the window, the new positions are not saved with the file, however, the current order of the icons is saved.

Save as...
Similar to Save, but allows you to change the files name, and select where to save the file. If you want to Finder to use the icons in the current file, save it in the ICONS folder on the boot disk (or in the ICONS folder on another disk).

Save as source...
Saves the front icon file as an APW ASM65816 source file. This option can be used to generate source code for icons to be included in a program.

Quit
Use quit to leave IconEd. If you have any changed icon windows open on the desktop, you will be asked if you want to save them before quitting.

EDIT Menu
Undo
Undo will cancel the last change editing change made in the Fat Pixels window.

Cut
Cut will copy the first selected icon in the front window to the clipboard and remove the icon from the window. Cut will allow icon images to be "exported" into any program that supports the graphic clipboard.

Copy
Copy copies the first selected icon in the front window to the clipboard without removing it from the window. Copy will allow icon images to be "exported" into any program that supports the graphic clipboard.

Paste
Paste will copy a previously cut or copied icon from the clipboard to the front icon window. Paste also allows graphics to be "imported" from any program that properly supports the graphical clipboard, such as Deluxe Paint II. Note that icons in IconEd use 640 mode (with dithered colors). If you copy an icon from a program in 320 mode, you may end up with an icon of only the left half of what you intended. If this happens, either convert the original to 640 mode, or cut a section twice as wide as the intended icon. I am looking into this, and will hopefully come up with a better solution soon.

Clear
Clear removes the first selected icon without copying it to the clipboard.

Revert
Similar to Undo, but more extreme. Revert changes the icon being editing in Fat Pixels back to it's original form.

SPECIAL Menu
Cleanup
Cleanup repositions the icons in the front window in the current order (which can be changed by dragging the icons in the window - see REORDERING ICONS below).

Select all
Select all selects all of the icons in the front icon window.

Add new icon
Use Add new icon to create a new icon in the front icon window. Add new icon creates a generic document icon which can be edited to your liking.

Fat pixels
Use Fat Pixels to edit the first selected icon in the front icon window. This option will bring up the Fat Pixels window which allows you to change the appearance of the icon.

Edit attributes...
Edit attributes allows you to change the filename, file type, aux type, and application pathname associated with the currently selected icon.

Colored mask
The colored mask option allows color in the icon mask. This provides for "special effects" when the icon is selected. Experiment.

Copy icon to mask
Copies all the pixels in the icon image to the icon mask in the Fat Pixels window. All colors except white are copied as black.

Copy mask to icon
Copies all the pixels in the icon mask to the icon image in the Fat Pixels window.

Fill image
Fills the icon image in the Fat Pixels window with the currently selected color.

Fill mask
Sets the icon mask in the Fat Pixels window to all black pixels. (If Colored mask option is selected, Fill mask will set the icon mask to the current color.)

Clear mask
Clears the icon mask in the Fat Pixels window to all white pixels. (If Colored mask option is selected, Clear mask will clear the icon mask to all black pixels.)

VIEW Menu
by icon
Displays all of the icons in the front icon window in their large icon form.
If the Fat Pixels window is currently in front, displays the large icon for editing.

by small icon
Displays all of the icons in the front icon window in their small icon form.
If the Fat Pixels window is currently in front, displays the small icon for editing.

by name
Displays the filename associated with each icon beneath the icons in the icon windows.
The icon is made up of two parts: the icon image, and the icon mask. The icon's image defines the colors of the icon, while the mask generally defines its shape. When the Finder draws an icon on the screen, the image is "masked" against the icon mask. Every black pixel in the mask allows the corresponding image pixel to be displayed, while the white pixels in the mask allow the background to show through. The icon being edited can also be "shifted". Holding down the shift key while the cursor is in the image area changes the cursor to the "shift cursor" which appears as arrows pointing in all four directions. Clicking on the image with the shift key down and dragging allows you to move the icon image around. When you release the mouse button, the image and mask will be shifted to the new location (the image and mask can only be shifted together).

An icon is made up of two parts: the icon image, and the icon mask. The icon's image defines the colors of the icon, while the mask generally defines its shape. When the Finder draws an icon on the screen, the image is "masked" against the icon mask. Every black pixel in the mask allows the corresponding image pixel to be displayed, while the white pixels in the mask allow the background to show through. The icon being edited can also be "shifted". Holding down the shift key while the cursor is in the image area changes the cursor to the "shift cursor" which appears as arrows pointing in all four directions. Clicking on the image with the shift key down and dragging allows you to move the icon image around. When you release the mouse button, the image and mask will be shifted to the new location (the image and mask can only be shifted together).

Clicking on a pixel in the icon mask simply toggles the color of the clicked-on pixel. You cannot "pick" colors from the icon mask unless Colored mask is on. If Colored mask is ON, the mask pixels work just like the image pixels.

At the top of the Fat Pixels window (in the "Infobar"), IconEd displays the location (offset) of the pixel under the cursor in either the image or the mask. This will make it easier to align parts of the mask to the corresponding parts of the image.

The icon image is "blown-up" to four times its normal size in the Fat Pixels window. When the Finder draws an icon on the screen, the image is "masked" against the icon mask. Every black pixel in the mask allows the corresponding image pixel to be displayed, while the white pixels in the mask allow the background to show through. The icon image may be editing using all sixteen colors, while the mask normally may only be black and white.

If the Colored mask option is selected, masks may also consist of all sixteen colors. With colored masks, white pixels allow the corresponding image pixel to be displayed, while black mask pixels allow the background to show through. This is the reverse of when Colored mask is off. The purpose of colored masks is to allow a selected or "open" icon to be colored also. Experiment with colored masks, and watch the sample icons to see what happens. Note that to prevent confusion, you should generally not switch Colored mask mode between on and off repeatedly during an edit session.

To the right of the icon mask is the actual icon as it would appear in the Finder, shown normal, selected, and open - on both on white and colored backgrounds.

Beneath the icon image is shown the current height and width of the icon.
The Apple IIgs Finder gets its icons from the files in the ICONS subdirectory on any disk. The icons can be in any file with a type of $CA (ICN) in the ICONS subdirectory. The only required icon file is the file called FINDER.ICONS in the ICONS subdirectory on the boot disk. This file contains the generic icons and icons for disks and disk devices. When the Finder searches for an icon to match a particular file, it searches through all the icon files found, searching FINDER.ICONS last, so the icons in FINDER.ICONS are used only if another match is not found. You should normally not add any new icons to FINDER.ICONS. When you create new icons for files and documents, it is best to put them in another file, leaving FINDER.ICONS uncluttered, and used only for generic icons.

Any time a new disk is inserted into a drive, the FINDER checks for an ICONS subdirectory on that disk, and loads any icon files it finds there. Most application disks will have an ICONS subdirectory containing a file with the icons that are specific for that application.

When a document is opened from the Finder, it tries to run the document's application from the application pathname associated with the document's icon. This means that if you move or rename an application, it's document icon must be changed to reflect the new pathname.

Reordering icons can be useful since when the Finder is searching for an icon for a particular file, it searches only until the first matching icon is found. Therefore, the most general icons (such as the generic file icon) must appear last in each icon file. For example, the icon for IconEd (name = "*ICONED*" must appear before the generic GS/OS application icon (name = "**") otherwise when the Finder is looking for an icon for ICONED, it will stop when it finds the generic GS/OS application icon, and use it.

Note that since the FINDER.ICONS file is always last in the list, generic type icons should generally be in FINDER.ICONS.

Appendix A: ICON FILE STRUCTURE

This is a brief description of the format of an icon file on the disk. Fields used by the Finder internally are filled with zeroes in the disk file.

ICONBLK (icon file):

- IBlokNext: LONG
- IBlokID: WORD
- IBlokPath: LONG
- IBlokName: BYTE[16]
- IBlokIcons: ICONDATA[n]:

ICONDATA (icon record):

- iDataLen: WORD
- iDataPath: BYTE[64]
- iDataName: BYTE[16]
- iDataType: WORD
- iDataAux: WORD
- iDataBig: ICON

ICON (icon record - see QDAux chapter in ToolBox Ref II for more info):

- imimType: WORD
- imimSize: WORD
- imimWidth: WORD
- imimImage: BYTE[imSize]
- imimMask: BYTE[imSize]

This appendix lists the filetypes and device types currently known by IconEd, and has been newly updated for GS/GS.

NOTE: Do not attempt to enter the Control Panel once the game has booted. It will crash.

The morning sun heats the jagged peaks as you follow the forgotten road down to the valley floor. The bleached ruins of great columned temples and towering citadels rise from the grassy plain like the bones of some colossal beast. This was the ancient city or Erinoch, destroyed by dragon’s fire over 1000 years ago. Mordamir spoke often of this city... and the labyrinth below...

"Mordamir. You think back to the days when you were young and eager to learn the spells of sorcery. The old wizard Mordamir took you in and patiently taught you the arts of magic. He taught you how to read the runes and unleash their power. The power of charms and fire. He showed you the strength of steel and taught you to use your wizard’s cunning. Mordamir was your master, your mentor. He was your guide down the treacherous path of wizardry. He was your friend.

"Many years have passed since you last saw the old man. You assumed he was dead - that is, until a few nights ago, when he called to you in a dream. You woke with the uneasy feeling that Mordamir still lived - trapped in a bottomless cavern. And so you set out to unravel the secrets of the Immortal."

KEY COMMANDS:

Music On/Off:
To toggle the music on and off, press Ctrl-S.

Restart:
To restart a game/level, press Ctrl-R.

Quitting:
To quit, turn off computer. (simple, huh?)

GAME CONTROLS:

Your view is similar to Last Ninja (although much much, better!). However, you are not limited to only four directions... You may move the wizard in all 8 directions by means of the joystick (no keypad equivalents available).

COMBAT:

Attacking:
When a monster attacks, you cannot break away until your opponent is dead. Push the joystick forward to jab. To slash, pull joystick back first, and then forward.

Parrying:
To parry, move the joystick left and right. If the wizard is facing you, then the movements are reversed. Just remember that you must move the joystick in the direction you want him to lean, not "his right" or "his left". Remember, when an opponent pulls back, lean away from his weapon.

USING ITEMS IN PACK:
Once you take an object, it is in your pack. Hit button A to enter your pack. To use an object, highlight the object and hit the button to use. In some cases, the object is "used" by placing it on the ground, such as a gem. If you still want it later on, remember to pick it back up. To see other items in your pack, highlight "other*" (another simple one!) and hit a button. To exit, highlight an empty space, or an object you don't "use" (such as gold) and hit a button.

Most items are activated by simply selecting them - others require further commands.

Blink Spell/Fireball - once selected, use button B to cast.

Carpet/Protean Ring - select to use object. select again to stop.

NOTE: Each kind of item has a specific use - Spores can only be planted in the dirt, while the Troll Ritual Knife can only be thrown. You can't control HOW an item is used, just when and where.

ALSO: Some items only function on a particular level. Before you descend to the next level, the magic of the labyrinth will remove any items you don't need from your Pack.

RESTING:
Occasionally, you will come across a pile of hay. If you stand on it long enough, you will sleep on it. PAY ATTENTION TO YOUR DREAMS!

COMPLETING/RESTARTING A LEVEL:
Whenever you complete a level, you get a certificate number. You will be asked for a certificate if you wish to continue on that level later on.

To restart on the level you're currently on, when asked for a new game hit "NO", and when the certificate prompt comes up, hit a joystick button.

For a previously completed level, enter your certificate number after hitting "NO" for a new game.

To start again at level one, hit "YES" at the NEW GAME? prompt.

THE CODEX OF THE SERPENT

I, Mordamir, Wizard of the Crimson Keep, wrote these notes for you, my loyal apprentices and students, to explain the mysteries of this dark labyrinth.

Today, I go forth to explore the dragon's lair. I hope my wits are keen enough to escape her cunning again! Thus I leave these words for those who may have difficulty in understanding the secrets of the labyrinth.

LEVEL 1:
Dunric - my faithful student in the art of wizardry - will be the first to come looking for me. He's often accompanied by Erek, a fighter.

Ulindor - my servant and bodyguard.

Upper levels - a tribe of primitive creatures known as goblins. Hostile to strangers, but seem to possess reason, intelligence, some ingenuity with tools.

The tribe goes by the name of Drull. Their king is Gresh the Wise. The goblins are currently at war with a more hostile and powerful tribe of creatures known as trolls. Both sides desperately seek control over the upper levels of the dungeon. Perhaps a show of force would convince one of them that wizards make better friends than foes...

A safe path for the arrow room - along the right wall. I got midway before I set off the trap.
mechanism - hidden in one of the rooms below. The shaft of light on the other side is where the magic gate leads.

Trolls - The Shindrak, as they call themselves, rule much of the lower levels. For the most part, they are stupid and quick-tempered - something to take advantage of.

A troll will only throw his ritual knife when he wants to challenge another troll to combat.

Proteus, a god of the sea, was a master shapechanger. This ring was forged by Him when the earth was still young. It allows the wearer to take the form of a goblin. Beware! Some are too wise to believe it's charms!

Troll bombs - one whiff of these devices and trolls are paralyzed.

Red gems look best in purple light.

LEVEL 4:

When Dunric interfered with the trolls' battle against the goblins, they kidnapped his daughter, Ana, and dragged her into the labyrinth. As she possesses some of her father's skills in sorcery, she had no trouble escaping the trolls. But on her way out, she lost a special ring given to her by her father.

Some rings are never worn on the body.

LEVEL 5:

The potion transforms and poisons you at the same time. You will benefit from its power to shrink you, but you must find Water and drink it soon afterward or you'll never live past the hour.

Many mice but fewer men can pass through to the next level. The crack in the wall is the only way down.

Worm sensor - The faster it chimes, the greater your danger.

The weight of one will open the way. Set down food and a flying lizard could hold the door.

LEVEL 6:

When the giant spider rears up, she's ready to web. Move back! She's most vulnerable when all four legs are on the ground.

Now is not the time to imbibe spirits.

LEVEL 7:

The goblins crave the Water as much as men, but a horrid water creature guards the way! If the water monster were distracted long enough, the goblins could open the gate and the creature would be washed away into the deepest underground sea. Only a wizard, adept at sailing, stands a chance of distracting the monster and making his escape.

This is the final step before entering the dragon's lair... do whatever you must to help the goblins open the way. Your journey is almost complete - if fortune finds us, we will stand together against the dragon!

end of codex.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 527 of 1262
UTF-8
The strange little man in the trench coat and Porsche sunglasses seemed a little out of place. After all, the unveiling of the new McGibbits Wing of the Library of Congress (in honor of your 47-volume treatise on the Dewey decimal system) was a strictly formal affair. You paid little notice to him at the time, however, as you moved gracefully to the piano in your McGibbits Trim-Fit bulletproof jeans. As you started into the third movement of your piano Concerto No. 2 in E, you heard a whisper in your ear: "We need you Jimbo baby! The whole world is in danger and only a super-soldier, ace helicopter pilot, ballistics expert, engineer, neurosurgeon, politician, movie actor, rock star, world-class motorcyclist, explorer, karate expert, and devil-may-care all around nice guy like you can save the day!"

"Not again!" you thought to yourself as you finished up the concerto, christened the library, and leapt onto your Super Gizmo 8 motorcycle with cruise control, AM/FM, auto seat warmer, and heat-seeking missiles) all in one fluid move. "Its; getting so I barely have any time to myself what with that Mad Leader running around!"

Back at your modest country estate/training grounds/experimental aircraft test facility, you quickly solve the prime-key encrypted note the agent left with you (lucky thing one of your doctorates is in combinatorial mathematics and cryptography!)

"TOP SECRET"

Message to: Captain Johnny "Jimbo-Baby" McGibbits/AKA Infiltrator

Captain,

We need you! The world is on the brink of destruction only you save us. The Whizbang Enterprises Gizmo DHX-1 Attack Helicopter is on the pad. The mad leader must be stopped only you can stop him. Stop him at all costs. Enclosed is a Gizmo Flight Manual, secret communication code names, and other mission info, weapons film (with pre-paid processing mailer), and the McGibbits Guide to Ground Installation Infiltration (Pocket Edition).

Good luck Jimbo-Baby! - The fate of the world is in your hands!

Brigadier General Bunson "Old Blood -n- Guts"

O'Shaughnessy"
"So what else is new?" you say as you gather your gear and head out to the waiting Gizmo. "I guess this afternoon's open-heart surgery will have to wait. I hope the patient can." And whistling the theme from your new TV series, you head out to save the world....

You will begin all of your missions from Home Base, just beyond the border of the country. At the base, you will be briefed about your mission goal just before takeoff. You must successfully pilot your chopper from Home Base through enemy airspace and reach one of the Mad Leader's installations to complete the ground mission assigned during the briefing. There are a total of 3 missions, each progressively more difficult, in keeping with your growing skill, stature, and worldwide acclaim. Good Luck!

"OWNER'S FLIGHT MANUAL"

Welcome to the Whizbang Family

you should be feeling pretty good right now. You've just purchased a Whizbang Enterprises

Gizmo DHX-1 Attack chopper

Which is known affectionately around here at Whizbang as "The Snuffmaster"

Welcome once again to our family.

"WE THINK YOU'LL LIKE IT"

Your new Whizbang Gizmo DHX-1 Attack Chopper is loaded with the following Whizbang goodies:

* Turbine-Thrust Dual Propulsion Whizbang Whirler engine, capable of a top speed in excess of 450 knots
* Four Whizbang Waster air-to-air heat seeking missiles
* Two rapid-fire Whizbang Whizzer 20 mm cannons
* Anti-heat seeking missile magnesium flares
* Anti-radar guided missile chaff dispenser
* Whizang Whomper turbo booster
* Ultra-sophisticated communications systems
* State-of-the-art computer guidance, control, and surveillance systems
* Whizbang Whisper silent travel capabilities

"TAKEOFF PROCEDURES"

Upon entering the cockpit of your Gizmo, you will find yourself facing an ultra-sophisticated array of controls. Through the windshield you can see the Home Base. At the bottom of the screen, note your hands holding the control sticks which control the movement of the chopper. You might wish to take off after you finish admiring your manicure, so here are the instructions.

1. Turn the battery on by pressing the "B" key.
2. Initialize the computer and communication systems by pressing the "S" key. The computer screens will light up and the warning lights will initialize at the top of the display.
3. Turn on the engine ignition by pressing the "I" key. The engine will not provide enough power for movement until it exceeds 2300 rpm's.
4. Pull back on the joystick until you have cleared your base and are looking at a green landscape with mountains in the distance.
5. Press the FIRE BUTTON (note that your right and on the display registers this) and push forward to accelerate.

"THE CONTROLS"

(joystick) The joystick controls all of the movement of the helicopter.

To CLIMB, pull back on the joystick
To DIVB, push forward on the joystick

To ACCELERATE, hold the button down and push forward
To DECELERATE, hold the button and pull back
To BANK LEFT, push to the left
To BANK RIGHT, push to the right
To SPIN CLOCKWISE, hold the button and push to the right
To SPIN COUNTER CLOCKWISE, hold the button and push to the left

(keyboard) The keyboard is used to control all other functions in the helicopter.

B turns on the battery
S initializes the computer and communication systems
I turns on the ignition
G arms the cannon (guns)
R arms the heat seeking missiles (rockets)
F sets the flares for use
C sets the chaff for use
W toggles the Heads Up Display (hud)
W toggles whisper mode
* changes the view to the communications system
T switches the view to the computer terminal
+ turns the turbo booster ON
- turns the turbo booster OFF

The SPACE BAR has the following functions:

* Deselects weapons on the cockpit screen
* Returns to cockpit view from communications screen
* Returns to computer terminal from status display or tactical map screens

"COCKPIT DISPLAY"

ARTIFICIAL HORIZON (lower-middle gauge on main panel)
The artificial horizon indicates your present altitude (degree of tilt or bank) and indicates whether you are climbing or diving by the location of the horizon is level and centered in the gauge, you are flying straight and level.

DIRECTIONAL COMPASS (lower-right gauge on main panel)
The compass displays the directional heading of the Gizmo in degrees, shown in both analog and digital format. The dial is accurate within 23 degree increments; the digital readout is smaller values.

FUEL GAUGE (far right of side panel)
The horizontal bar displays remaining fuel. The tank is empty when the red bar disappears.

OIL AND BATTERY TEMP (on vary top of chopper)
These two bar graphs at the top of the screen display the temperatures of your battery and oil. When the bar reaches the red zone, heat is critical and the temperature warning lights will flash and beep until you reduce the heat (by slowing your speed to reduced strain on the battery or by turning off the turbo to conserve oil).

WARNING LIGHTS (on vary top middle of chopper)
The six warning lights at the top of the cockpit, when flashing red while a buzzer sounds, indicate:

E engine damaged
B attery overheated
O il overheated
Fuel low
A ltitude level below 200 ft.
R pm deficiency in engine or rotors

The warning lights will alert you to any noteworthy status conditions that require immediate attention. You have some direct control over the B, G, and A warning lights. The E, F, and R lights refer to problems that cannot be corrected mid-flight. In these cases, you might want to reach your destination as quickly as possible and avoid an further damage from air combat.
AIRSPEED INDICATOR (top-left on main panel)
This dial shows the Gizmo's present airspeed, in knots. The digital readout under the dial displays the same information. Maximum speed is 450 knots (without the turbo engaged).

ADF (top-middle of main panel)
The Automatic Direction Finder (ADF) will aid you in arriving at the proper destination. Therefore, you may want to program it immediately after takeoff. Once the ADF arm_COVER is set to your destination, if you are moving forward and the ADF points straight up, you will eventually reach your target, regardless of the compass heading. Moving off course will cause the ADF to spin itself to the Gizmo's orientation. The ADF will move only when you spin the helicopter or when you bank. To correct the orientation of your helicopter so it is heading toward the destination, you can either spin the horizontal stabilizer for minor heading changes or bank for more drastic changes in direction.

Note that if the ADF is blinking on and off, there has not been properly programmed at the communications terminal. (See Communications.) If the ADF is flashing black and white and moving around radically!!! then your direct over your destination. You should slow down and proceed to land immediately. (See Landing Procedures.)

ALTIMETER (top-right of main panel)
The altimeter displays your present altitude in feet. The hand on the dial is accurate only within jumps of 60 feet or more, so use the digital reading for greater accuracy. Each time the dial sweeps past 12:00, it registers 1000 ft. Maximum altitude is limited to 8000 ft. If your altitude is below 200 ft., the low altitude warning light and buzzer will sound.

RPM INDICATOR (bottom-left of main panel)
The RPM indicator displays the rate at which the blades are spinning. Helicopter blades do not speed up or slow down to maintain a constant rate since it is the angle of blade tilt that causes the movement. The onboard computer systems monitor and maintain steady rpm's. Optimum rpm's is 2300. No flying can take place until RPM's are at or above optimum. At this time the takeoff alert will sound until the Gizmo is airborne.

MISSILE WARNING LIGHTS (far-left of main panel)
The missile warning lights, to the left of your instrument panel, flash to indicate that a missile is heading toward your chopper. A warning siren will sound as well. If the R light is on, then a Radar guided missile is heading towards the chopper, and chaff must then be used to decoy it. If then H light is on, then a Heat seeking missile is headed towards the Gizmo, and flares must be used to decoy it.

"ARMAMENTS"
The next four items are represented by buttons that flash when set to active and are found on the lower left and lower right bottom of the cockpit. Once armed, they can be activated by pressing and releasing the FIRE BUTTON on the joystick. Any or all of these may be damaged or rendered inoperable by enemy fire.

CANNONS: The Whizbang Whizzer 20mm cannons are armed by pressing C (gun) key. An enemy in the HUD (heads-up display) cross hairs may be damaged or destroyed if you fire upon it. You have unlimited ammunition.

MISSILES: Pressing the R (rocket) key arms the Whizbang Waster air-to-air heat seeking missiles. An enemy must be visible to be hit, but it doesn't have to be in the cross hairs. You are limited to four (4) missiles per mission.

FLARES: Pressing the F key sets the flares. These are used to decoy enemy heat seeking missiles. The flares, made of Magnesium, will fool the missile into thinking that the flare is actually your exhaust.

CHAFF: Unlike heat-seeking missiles, radar guided enemy missiles must be deceived by dropping strips of metal into the sky, creating a fake radar image of Gizmo. Pressing the C key sets chaff for dropping.

HEADS UP DISPLAY: Pressing H displays the Head-Up Display (HUD). Using the latest technology available, a computer image of your cannons' aiming cross hairs is superimposed on your windshield. Use the to aim at a target for firing. With your cannon armed, any object that passes through the crosshairs should be hit. Missiles do not use visible tracking methods, so you may turn off the HUD if you wish by pressing H again.

TURBO BOOSTER-Press the + key to turn on the Whizbang Whomper turbo booster. Press the - key to turn it off. The turbo booster will double your present speed (to a maximum of 900 knots). It also causes the oil to heat up at a very fast rate, so it must be used sparingly. When the turbo booster is on, the turbo indicator to the right of the instrument display will light up. The turbo can be made inoperable if hit by enemy fire.

WHISPER MODE-Pressing the W key engages the Whisbang Whisper. This effectively silences the Gizmo. Whisper mode must be activated whenever attempting to make a secret landing, or else the noise from the helicopter may alert enemy ground personnel. When the whisper mode is on, the Whisper Indicator to the right of the instrument display will light up.

PAUSE-If you want to suspend the game and take a break from all this excitement, switch to either the computer terminal (press the T key) or the communications screens (press the * key). Press any unassigned key to get back into the thick of it.

THE COMPUTER TERMINAL

The computer terminal, the small screen located on the right of the cockpit, is activated by pressing the T key. You will then be presented with a weapons inventory and two optional categories for status update. Pressing any unassigned key returns you to the computer system has been destroyed by enemy fire, the cockpit terminal will be blackened and you will not be able to access it.

The Weapons store is displayed in LED bar graphs indicating remaining Missiles, Flares, and Chaff. Press the 1 key to view the status of your Gizmo. Press the 2 key to review your computer terminal screen.

1. Status Display- This represents your Gizmo's present status. If any damage has been sustained, the picture of your Gizmo at the top of the screen will be highlighted by visual damage circle indicators where the damage has occurred, accompanied by flashing text descriptors. Below this display are displays for remaining missiles, flares, and chaff. Cannon rounds are unlimited. Pressing the SPACEBAR returns you to the main terminal screen.

2. Tactical Map- The top of this screen houses a small computer screen with a digital readout. The numerical value is you calculated ADF frequency. See COMMUNICATIONS for more details. The large gridded map below is a tactical map of the country. Your position within the country is displayed by a flashing sphere with a crosshair underneath. The distance between the sphere and the shadow represents your altitude. If you have programmed the ADF, a small flag will appear on the map as well. This is your destination. This display can be used to determine your relative position to your destination at any time during your mission. Press SPACEBAR to return to the main terminal

COMMUNICATIONS

The Whizbang Gizmo DHK-1 is equipped with the kind of highly sophisticated communications equipment that is often necessary for the successful completion of missions for which this machine has been expressly designed. Pressing the *
key on the keyboard takes you from the cockpit display to the communications terminal (which is located on the left of the cockpit screen). Be careful, this system can be destroyed by enemy fire. The system is used as follows:

*Press "A" to program the Automatic Direction Finder (ADF). Type in the three numbers from the tactical display, ignoring the decimal point. Your ADF is now programmed. You do not have to program it again unless the numbers were entered incorrectly. Your ADF will not function properly if the values are incorrect.

*Press "S" to go into send mode. Send mode allows you to send messages to other aircraft or to ground controllers. Once you are in send mode, you may type messages at the top of the screen on the Comm-bar. No punctuation is allowed. Use the DEL(ete) key to backspace. Pressing RETURN sends the message to either another aircraft or to a ground controller (as appropriate). The flashing S or R represents the current Send or Receive status. Press the space bar to return to the cockpit view.

**OTHER AIRCRAFT**

As you begin a mission by flying the chopper to your destination, you will encounter other aircraft along the way. Some may be other infiltrators also trying to upset the Mad Leader's plans, while others may be staunchly loyal to the Mad Leader and his evil goals. There are three types of other aircraft: the friend, the enemy, and the manic. Upon encountering another aircraft, you must determine whether it is a friend or an enemy. Since there are no distinguishing markings on your ship, and because helicopters are not an unusual sight over the Country, other pilots will also try to determine your loyalties and intentions by talking to you via the communications system (sending and receiving messages). You should always try to communicate with an unidentified aircraft first. As soon as you see an aircraft for the first time, press the * key. Once on the communications screen, press the S key to send a message. The only phrases the comm systems will understand are:

REQUEST ID

INTEGRATOR (TYPE THAT TO A FRIEND)

OVERLORD (TYPE THAT TO A ENEMY)

After requesting the identification of another aircraft, examine the response for a code name. With experience, you should be able to distinguish friendly code names from those of enemies. This will provide you with the information necessary to respond properly to their request for identification. Giving the correct ID to an aircraft will allow you to continue on your mission unhindered. Giving the wrong ID to an aircraft will result in a battle that will last until one of you is destroyed!

oh, by the way, we weren't kidding about the manics out there. A few of the other infiltrators have snapped from the strain, and it really doesn't matter what code name you use in a response. They will always attack, and you're going to have to fight against a former friend, turned deadly foe!

SAMPLE FRIENDLY NAMES:

WHIPPLE AND HAYMISH

SAMPLE ENEMY NAMES

BOOMER AND SCUM

(The rest your on your own!)

**LANDING PROCEDURES**

Once you have arrived at your assigned destination, you will have to land to continue your mission. To land safely you must make sure of the following:

1. your speed is between 20 knots and 0 knots
2. the artificial horizon is level and you are not banking
3. your rate of descent is at minimum

Once you have descended below 200 feet, you will hear the low altitude warning buzzer sound. Pull up your rate of descent to a minimum. Wait until your altitude is reduced to 0 and the Gizmo shakes and thumps loudly as it hits the ground.

If you have landed at the proper destination, as programmed into the ADF, the ADF gauge pointer will be flashing black and white and spinning madly. Remember, you must have the Whizbang Whisper silent travel mode engaged to land without warning an enemy.

To take off once again, simply increase your altitude by pulling back on the joystick and increase your airspeed. While on the ground, do not back, accelerate, or spin, or you may crash!!

**UPON LANDING**

Once you have landed, your view will change. You will now be looking down at yourself standing next to your trusty chopper. You must pretend that you are an enemy guard, much as you may have had to pretend to be an enemy in the sky. Avoiding the enemy is the key to ground missions.

**OBJECTIVE**

To complete the mission displayed in the briefing without being captured, blown up, or running out of time. If you fail five times, your dead! There are three missions that become increasingly more difficult. Once you finish one mission you will be assigned your next task.

**MISSION COMPLETED AND LEAVING**

If you successfully complete your ground mission, make your way back to the helicopter. Moving into the cockpit section of the screen will take you inside so that you can return home. If you haven't completed your mission, you won't be allowed to enter the helicopter. You can check to verify that your mission has been completed by going to the inventory screen. A message will be displayed when you have completed the assignment, just to let you know it is time to get the "HELL OUT OF THERE!"

**RESUMING PLAY**

If you stop playing once you have successfully completed a mission, you will be given the option to either start from scratch or to start at the beginning of a new uncompleted mission when you load the game again. You cannot, however, embark on a new mission before completing the previous one.

**GROUND CONTROL AND INVENTORY ITEMS**

When you see the screen with a grey figure standing next to a helicopter, move the joystick in any direction to start the next phase of the mission.

YOU are the small dark grey figure on the screen. You have a limited amount of time and the use of several helpful devices (your inventory) to help you complete your mission. Pushing the joystick will cause you to move in that direction, unless you are busy with an item that is currently active. An active item is an object from your inventory that has been selected to be used. Note that at the beginning of the ground mission your papers are present as the active item.

**FIRE BUTTON**

Press the FIRE BUTTON to activate the active item. The current active item is always indicated at the bottom of the main screen. Depending on the item activated, you may not be able to move until you are finished.

**PAUSE**

To take a break, press the SPACE BAR to go to the inventory screen. Your game will pause until you are ready to continue. Press any unassigned key to return to the main screen, and your mission.

The inventory screen allows you to change the active item and displays important inventory information. You may select an item by moving the cursor with your joystick. Press the SPACE BAR again (or any unassigned key), and you
MISSION INTERFERENCE

Locked doors must be de-activated before you can enter these rooms. To unlock using the cursor on the inventory screen to select an item: You may search any of the chests (on the top far wall only - chests on the side walls seem to be empty...) in any room by moving in front of it and pushing up the joystick sprays the gas. You have specially treated nose plugs which allow you to breathe the gas harmlessly. 

PAPERS-These are your fake ID papers. You should activate your papers when a guard asks to see them. When that happens, move directly over and stand next to the guard. If the papers are not already active, move quickly to the inventory screen and select them. Return to the main screen, press the FIRE BUTTON on the joystick. Upon showing them, the guard will decide whether or not they are "in order" and valid. If they are in order, you can go about your business, undetected as an infiltrator. If they are out of order, you have a short tie to gas the guard or run away before he tries to take you in for questioning. But be forewarned, running away will cause the guard to sound an alert throughout the compound. (See Mission Interference)

GAS GRENADE-This grenade has the same effect as the sleeping gas canister, except that it has a greater range. When used inside, all guards in the room in which it is dropped will fall asleep.

MINE DETECTOR-This is used to detect mines. Selecting the mine detector on the inventory screen enables it to be used whenever you press and hold the FIRE BUTTON on the joystick as you move through enemy territory. You will hear the detector working. Stepping on a mine wit the detector activated is harmless and exposes that mine. Stepping on a mine without the detector activated is fatal-and stupid.

EXPLOSIVES-Explosives are planted by selecting the explosives icon on the inventory screen as the active item, and then pushing the joystick up under the main control panel in the control room or under the desk in the lab. Only one bomb per room is permitted. Upon setting your last remaining bomb, an automatic countdown timer will go off. You then have about 20 seconds to leave the building before all the bombs detonate. If you don't make it out of there in time, you will be trapped inside during the explosion, and it's bye! bye! (jumbo-baby that is!)

CAMERA-Use the camera to photograph any vital documents. To use it properly, face the papers you want to photograph and press the FIRE BUTTON on the joystick. Only one picture per room is permitted.

INFORMATION UPDATE-At the bottom of the inventory screen are four graphs which update the following:

Spray-How much sleeping gas you have left.
Grenades-The number of sleeping-gas grenades you have.
Film-How many more pictures you can take with the camera.

GEARS

Heroic deeds will be rewarded with new gear. You are given a choice of different ones throughout the game.

Paper-Your fake ID papers
Explosive-How many charges you have left.
Sleeping Gas-How much sleeping gas you have.

GUARDS

Enemy guards within the compound are fanatically loyal to the Mad Leader. They are assigned to patrol certain areas of the compound, and they will carry out their orders unflagingly. If one of the guards spots you, he may ask to see your papers. If you do not comply, an alert will be set off and guards throughout the compound will chase after you. Within the compound buildings, an electronic key will turn off the alarms temporarily, but it will only work once during a mission. Find the electronic key, and a line of text on the bottom of the inventory screen will note that you have it. Make your way to the alarm control center. Stand directly in front of the card slot in the wall and press the FIRE BUTTON on the joystick. This will turn off the alarms, except that it has a greater range. When used inside, all guards in the room in which it is dropped will fall asleep.

MINES

Mines are usually scattered in the forest and in restricted areas to prevent exact what you doing-infiltrating. Mines can be exposed with the mine detector. Stepping on a mine (without the mine detector activated) is a dumb thing to do; besides, it will kill you!

TIMER

A mission timer is visible on the screen at all times during the ground phases of a mission. If time runs out, you've blown it; your mission will end, and you will have to start over again. Tough luck dude! (you have about 20 minutes of real time for each mission until you have finished changing. An audible tone and accompanying text will indicate when you have finished.)

ENEMY INSTALLATION STRUCTURES

Inside a building you can search through chests and cabinets for gas grenades, security cards, and other useful and not so useful items. Travel to different levels within the same building is accomplished through elevators. Clothing disguises may be of some help. If you want to swap clothing, stand directly in front of a until you have finished changing. An audible tone and accompanying text will indicate when you have finished.

MAPPING UNIT

While inside any of the compound's buildings, your mini-mapping unit will appear at the bottom of the screen. The room you are in is represented by a flashing box within the mapper screen. All rooms are shown as boxes with highlighted doors. Moving into a new room maps it into the unit's screen.

ROOMS ARE COLOR CODED AS FOLLOWS:

RED: designates a room of great importance (prison, control room, etc.)
GREEN: designates the building entrance or an elevator
BLUE: represents a room of no special importance

SEARCHING CHESTS

You may search any of the chests (on the top far wall only - chests on the side walls seem to be empty...) in any room by moving in front of it and pushing up with the joystick until you find whatever it contains.

DOORS AND THE SECURITY ROOM

Locked doors must be de-activated before you can enter these rooms. To unlock all the doors in the enemy compound, you must first find the security card.
Apple II Computer Info

(search for it!). With it in your possession, you can unlock the doors. Once
you have found it, a line of text will appear on the bottom of the inventory
screen to indicate that it is in your possession. Now, find the security room.
It is the room with the lock status indicator light on the wall and a passcard
slot directly below it. To unlock the doors, stand directly in front of the
security card slot and press the joystick up. This will cause the security
card in your possession to be inserted into the slot, without having to select
it. (You cannot select this particular item to be active. If you have it,
activation will occur automatically when you push up on the joystick.) The
lock status indicator light is red when the doors are open.

THE END

DOCUMENT inspecto.app

THE INSPECTOR IS A UTILITY WHICH ENABLES ONE TO INSPECT EITHER MEMORY IN THE
APPLE OR ON A DISK. THE DISK BEING EXAMINED CAN BE EITHER NORMAL OR ABNORMAL
DOS. IT COMES IN 2 FORMS: AND EPROM WHICH IS PLUGGED INTO AN INTEGER CARD, OR
AS A PROGRAM WHICH IS LOADED INTO THE LANGUAGE CARD.

INSTALLATION OF EPROM:

I AM NOT GOING TO GET INTO THE EXACT DETAILS OF PLUGGING IN A CHIP BUT
BASICALLY, ON THE APPLE II (NOT +!) THE INSPECTOR REPLACES THE D8 ROM ON THE
MOTHERBOARD. ON THE II+ WITH INTEGER CARD, THE CHIP REPLACES THE D8 ON THE
INTEGER CARD. MAKE SURE THAT THE CHIP IS ORIENTED CORRECTLY, WITH THE NOTCH
FORWARD (OR UP, AS ON THE INTEGER CARD)

WITH THE DISK VERSION, BOOT A MASTER. INSERT INSPECTOR DISK AND TYPE "RUN
INSPECTOR" THEN YOU WILL BE PROMPTED WITH:

DO YOU WISH TO MODIFY
1) DOS 3.3 BASICS
2) DOS 3.3 SYSTEM MASTER

DEPENDING ON WHAT DISK YOU ARE MODIFYING, INSERT IT AND HIT <RETURN> THAT'S ALL
THERE IS TO IT.

ACCESSING THE INSPECTOR:

STANDARD APPLE II:

<table>
<thead>
<tr>
<th>FROM</th>
<th>TO</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>INSPEC. CALL -10240</td>
<td></td>
</tr>
<tr>
<td>MONITOR</td>
<td>INSPEC. C081 N D800G</td>
<td></td>
</tr>
<tr>
<td>APPLESOF</td>
<td>INSPEC. CALL-151 C081 N D800G</td>
<td></td>
</tr>
<tr>
<td>APPLE II+ WITH INT CARD OR LANG CARD</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

APPLE II+ WITH INT CARD OR LANG CARD

<table>
<thead>
<tr>
<th>FROM</th>
<th>TO</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>INSPEC. CALL -10240</td>
<td></td>
</tr>
<tr>
<td>MONITOR</td>
<td>INSPEC. C080 N D800G</td>
<td></td>
</tr>
<tr>
<td>APPLESOF</td>
<td>INSPEC. CALL-151 C080 N D800G</td>
<td></td>
</tr>
</tbody>
</table>

ONCE THE INSPECTOR IS INITIALIZED, YOU
CAN GO IT WITH THE FOLLOWING:

<table>
<thead>
<tr>
<th>FROM</th>
<th>TO</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>INSPEC. CALL -10240</td>
<td></td>
</tr>
<tr>
<td>APPLESOF</td>
<td>INSPEC. &amp;</td>
<td></td>
</tr>
<tr>
<td>MONITOR</td>
<td>INSPEC. &lt;CTRL-Y&gt;</td>
<td></td>
</tr>
</tbody>
</table>

THE DISPLAY:

WHEN THE INSPECTOR IS ACCESSED, THE
FOLLOWING WILL BE DISPLAYED:

| TRACK 00 | SECTOR 0 | SLOT 6 | DRIVE 1 |
AND THEN A BLACK SCREEN....

ALONG THE TOP OF THE SCREEN, HEX DIGITS 0-F ARE DISPLAYED ALONG WITH THE SAME DIGITS ON THE LEFT SIDE OF THE SCREEN. TO FIND A SPECIFIC BYTE, JUST ADD THE DIGITS TOGETHER. FOR INSTANCE, TO FIND BYTE 7D, LOOK IN ROW 7 AND COLUMN D.

DISK COMMANDS:

V: DOS VERSION
SWITCHES BETWEEN 13 AND 16 SECTOR DOS

P: PERIPHERAL SLOT
SELECTS WHICH SLOT OF THE DISK CONTROLLER CARD

D: DRIVE NUMBER
TOGGLES THE DRIVE TO BE ACCESSED

T: SELECTS THE TRACK THAT YOU WANT
TO READ OR WRITE

S: SELECTS THE SECTOR THAT YOU WANT TO
READ OR WRITE

NOTE: TRACK, SECTOR, AND BUFFER
INFORMATION ARE IN HEX

R: READ
CAUSES THE TRACK/SECTOR WHICH YOU HAVE DESIGNATED TO BE READ (ERRORS ENCOUNTERED WILL BE DISPLAYED IN THE UPPER RIGHT HAND PORTION OF THE SCREEN)

J: SCAN FORWARD
CAUSES THE NEXT SECTOR TO BE READ INTO THE PRESENT BUFFER LOCATION

_: SCAN BACKWARD
CAUSES THE INSPECTOR TO SCAN BACK ONE SECTOR AND READ INTO THE SAME BUFFER LOCATION

A: ASCII/HEX
TOGGLES BETWEEN ASCII AND HEXADECIMAL DISPLAY

X: EXCHANGE
EXCHANGES FLASHING AND INVERSE CHARACTERS WITH NORMAL ASCII CHARACTERS

E: EDIT
HEX EDITING:
1) TYPE HEX NUMBER OF BYTE TO EDIT
2) HIT <SPACE> TO DISPLAY CURRENT VALUE
3) TYPE IN NEW VALUE
4) HIT <RETURN> TO ENTER VALUE
5) IF YOU WANT TO CONTINUE EDITING, HIT <SPACE> INSTEAD OF <RETURN>
6) IN BYTES $00, ENTER LENGTH OF STRING
7) IF YOU WANT TO CONTINUE EDITING, HIT <SPACE> INSTEAD OF <RETURN>
8) IN BYTES $01 AND ON, ENTER THE APPROPRIATE BYTES FOR THE STRING WHICH YOU ARE SEARCHING FOR
9) HIT "F" TO START ROUTINE

ASCII EDITING:
1) ENTER BYTE TO CHANGE
2) TYPE: L FOR LOWERCASE
N NEGATIVE ASCII
<SPACE> NORMAL
NEGATIVE ASCII DATA IS ASCII WITH THE MOST SIGNIFICANT BYTE OFF (IT WILL BE FLASHING)
3) ENTER VALUE TO REPLACE THE BYTE
4) HIT <RETURN> TO ENTER IT AND EXIT FROM EDITING MODE

CTRL-W: WRITE
CAUSES THE CURRENT VALUES IN THE BUFFER TO BE WRITTEN TO THE TRACK/SECTOR

B: BUFFER LOCATION
Allows user to select buffer location which, if used, only the first 2 digits of the buffer can be changed. (Note: Do not use page zero for the buffer!)

CTRL-I: INCREMENTS BUFFER AND SECTOR
After you have read a track/sector into the buffer, hitting <CTRL:I> will increment both buffer and sector so that sequential sectors can be viewed without constant reading of the disk

M: MAP
DISPLAYS A MAP OF USED/UN-USED SECTORS OF A DISK. "$" MEANS USED AND "-" MEAN BLANK

N: NIBBLE READ
1) SELECT TRACK TO READ WITH "T" COMMAND
2) PRESS "N" TO NIBBLE READ
3) THE TRACK WILL BE READ AND THEN A HI-RES IMAGE WILL BE DISPLAYED. THE USE OF THIS DISPLAY CAN IMPLY HOW MUCH DATA IS ON THE TRACK. FF BYTES (SELF-SYNC NIBLES) APPEAR AS WHITE LINES
4) HIT ANY KEY TO ENTER NIBBLE DISPLAY MODE
5) NIBBLE DISPLAY MODE IS A DISPLAY OF ALL THE BYTES ON THE TRACK.

<FRETURN> EXITS FROM THIS MODE

F: FIND
THIS ALLOWS A SEARCH OF ALL MEMORY LOCATIONS FOR A STRING.
1) SELECT BUFFER TO PAGE ZERO ($0000)
2) PRESS A TO SELECT ASCII/HEX
3) TYPE "E" FOR EDIT MODE
4) IN BYTE $00, ENTER LENGTH OF STRING
5) IN BYTE $01 AND ON, ENTER THE APPROPRIATE BYTES FOR THE STRING WHICH YOU ARE SEARCHING FOR
6) HIT "F" TO START ROUTINE

NOTE: MAXIMUM LENGTH FOR STRINGS IS ASCII: 9 BYTES
HEX: $0F BYTES (15)

L: LOCATE
FINDS HEX AND ASCII STRINGS ON A DISK
1) PRESS "B" AND SET TO PAGE ZERO ($0000)
2) SELECT HEX/ASCII
3) ENTER "E" FOR EDIT MODE
4) ENTER LENGTH OF STRING IN BYTE $00
5) ENTER STRING IN BYTE(S) $01 AND ON
6) Press "L" to search disk
7) When a sector is found, a beep will be sounded

OTHER COMMANDS:
-------------------

CTRL-Z: User Command
When <CTRL-Z> is pressed, a jump to location $0300 is executed.

CTRL-C: Return to BASIC
This is fairly self-explanatory.

TIPS AND OTHER STUFF:
-----------------------

Finding RWTS on a foreign DOS disk
(This can be useful!)
1) Set buffer to $0000
2) Change bytes $00-$04 to 04 84 48 85 49 (This is the start location of almost all RWTS’s)
3) Press "F" to find this string
4) If found in a different than usual place, the inspector can be made to think it is normal by changing address $3D9 to point to DOS
5) Change buffer to $0300
6) Change byte $3D9 to indicate where DOS is

This feature is mainly usable by those of you who have the ROM version of the inspector. If you have the disk version, there is a good chance that it will be erased from the language card in the event of a boot.

Using a printer:
Enter the following at location $300

300:A9 01 20 95 FE 20 8E FD A9 FF 20 A8 FC A2 00 8A
310:21 01 28 85 10 A5 29 85 11 A0 00 B1 10 C9
320:AD 80 04 69 40 D0 FB 20 3A 03 C8 C0 28 D0 EE 20
330:8E FD E8 E0 18 D0 D8 4C 93 FE 48 A9 00 85 24 A9
340:01 20 5B FB 68 4C ED FD

Byte $301 is slot of printer
This function can be used with the CTRL-Z command to give a hard copy of data.

Saving the routine to disk: This can be done with any routine which is located in one page only. It takes advantage of the fact that DOS does not use track 2 sector F. If you are using that sector, do not use this routine!

1) Set buffer to $0300 (or whatever you want)
2) Set track to 2 and sector to F
3) Hit <CTRL-W>

To load, just do the same thing but hit "R" instead of <CTRL-W>

Turning printer on:
(Or using printer with Nibble Editor)
1) Set buffer to $0300
2) Enter the following in bytes

$$00$$-$05$
A9 01 20 95 FE 60 ^^
Byte $01 is slot of printer

Now, hitting <CTRL-Z> will turn printer on until <RESET> is pressed.

Reading half tracks:
Under normal DOS, the stepper motor on the drive is pulsed twice for every track it wants to move. However, if you force the motor to pulse >once< you will be at the half track. When reading half tracks with the inspector, only the nibble editor can be used. This is because RWTS does some checks to see if it is reading the correct track. Important: the inspector will not realize that it is doing half tracks! Therefore, to read track $4$, you must set the inspector to read track $8$. To read track $10$, you must read track $21$.

How to set up
---------------

1) Using the B command, set the buffer to $0200
2) Enter edit mode with E
3) Change byte $D4 from $01 to $00

You can now read half tracks

Avoid reloading language card:
This is not unique to the inspector, but I felt that there was justification to include it.

All you have to do is change byte $CC$ on track $0$, sector $9$ to $10$.

Nibble Info
-----------

This is just some basic info on using the Nibble Feature on the Inspector.

On DOS 3.3, 342 nibbles represent the 256 bytes. Each track on a disk is made up of 2 fields:
1) Address field (VOLUME, TRACK, SECTOR)
2) Data field (ACTUAL DATA)

Each field has a prefix and suffix which are unique to the disk. They are as follows:

Address field marker:
D5 AA 85 (13) D5 AA 96 (16)
Volume number/1: 2 nibbles
Track number: 2 nibbles
Sector number: 2 nibbles
Address field checksum: 2 nibbles
Address field trailer: DE AA

Data field marker: D5 AA AD
Data nibbles...........
Data field checksum: 1 nibble
Data field trailer: DE AA

The 2 nibble combinations are encoded with the following table:

Nibbles Value
--------------
AA AA 00
Ever wish you could whip up a super looking Icon?
Ever see a graphic on your SHR screen that you would like to have as an Icon?
Well, there's hope yet...... Instant Icon NDA will allow you to mark off part of the SHR screen and save it as an Icon. Just open the NDA, hold the mouse down to start marking off, and release the mouse when done. Fill out the attribute box, pick a filename, and that's it. Instant Icon.
The Icons you save will load into an Icon Editor, or can be used right away.

Tips:
Icon pathnames can be up to 64 characters long. You will only be able to view about 40 characters in the Instant Icon attribute box. You can keep typing, but you will only be able to view the first 40 or so characters.
You can "Capture" images from a 320 mode screen. Instant Icon will convert the colors to 640 mode.
Icons are displayed in the standard palette. If you create an Icon from a screen that is not in the default palette, it will usually look pretty sad...
Instant Icon will allow you to mark off approx a 70x70 square, although, you could make a rectangular Icon. Square Icons usually look the best, and not too large. Large Icons tend to clutter up the desktop.
This is version 1.2 of Instant Icon, the first release. If you have any suggestions, or find bugs, you can contact me at:

ABOUT INTELLIHACKER?

About a year ago I got my Apple //e. It was a great system, and a fantastic upgrade from my cassette based TRS-80 model 1. I had my first experiences with the TRS-80 and, since most of them were bad, the Apple was an enormous improvement.

I realized shortly after that, however, that programs are really expensive and some aren't even so great. That's why I was drawn to pirating.

A high school friend of mine introduced me to Apple pirating. Before I even had a modem, I had several thousand dollars worth of reasonably good pirated programs. I learned a hell of a lot by disassembling the guts of those programs, and finally, after investing about $750 in a 1200 baud modem, a Super Serial Card, and a modem program (Asciil Express, what else?), I started to pirate on my own. My first booty: Spy vs. Spy.

But, fuck, AT&T was making a god damn fortune off of me. I had built a blue box before, but had been caught BBing and didn't want to go through that shit again. Another friend on a now defunct AE line told me how to use my first extender. It was an 800 extender used by GM and he warned me not to get caught. "After about a week," he said, "hack out a new code on 'em." I didn't have the slightest idea what mm/e was but I took his advice and tried to hack out some codes. Without a program to do it, it's nearly fucking impossible. And, after getting MM/E, I found out it was only for the Micromodem. Well, I had spent a hell of a lot of money on an Applemodem 1200, and I had every intention of putting it to use.

I saw Smart Hacker on an AE line a few weeks later! Great, A phreaking tool for the Hayes Smartmodem, and mine is a compatible! After downloading this, I found that you had to adjust a DIP switch on the back of the modem, the DCC switch. Well, Apple didn't think to put this switch on the Applemodem, and I heard from a friend everyday he wanted to use AE, he had to put the switch in its original position again.

With no solution in sight, I made a decision to write a program that should be compatible with every Apple computer system, and be able to detect a carrier with no modifications. The result is IntelliHacker.
number that changes. You might try a range of suffixes, like 2112 to 9999. If your prefix is 212-637- this will try out every number between 212-637-2112 and 212-637-9999. That’s as complex as suffixes get.

Prefixes can be more complex, though. If you use an 800 extender to call the number, the prefix might be:

1-800-738-3849,...,828392 212-637-

The 1-800-738-3849 is the number of your extender number. The , , , , , , , , is to delay until the extender number is ready for you to dial your code. Since the Smartmodem recognizes each comma as two seconds, this will delay 10 seconds. The 828392 is your authorization code, and the 212-637- is your area code and exchange. That’s about as complex as prefixes get.

When the program asks you for starting and ending suffixes, put in any range of numbers that you want. They must be four digits long though. If the starting suffix is higher than the ending suffix, the computer will know to count backwards.

You can have the carrier numbers that it finds sent out to disk, and/or you can have them printed out. If you prefer to watch, you can do that too. You can have the speaker either on or off.

If you want to change the speaker status, just press joystick button 0 or open-joystick. Hold it down until it finishes calling the number it is trying. Let it go when you see on the status board that the speaker is off (or on, if it was already off).

If you want to pause the program, perhaps to make a phone call or build a bomb, press joystick button 1, or solid-joystick. When you here the bell the computer is in pause mode. Let go and go about your business. Just press the same button to start it up again.

If you want to abort the procedure all together, just hold both buttons down at once. When you hear the bells, the program is calling it quits. You will be taken back to the main menu.

CODE BREAKER

Boy, these dox are long! But, shit, it took me a few weeks to write the program and I’m no bum. There’s a lot to them! But, I realize that everyone wants to run the program, so I’ll condense the rest of the dox.

Code Breaker looks for authorization codes for a long distance number that you supply. The number for Sprint here in NY is 950-5779. This is the number that you would put in as the long distance company's number.

You then put in a range of codes to try. They must be of the same length.

There are more features to Code breaker, like increments. If you’ve used MH/e Hacker, you now that it counts in sequence. So does Code Breaker, but you define the sequence. Even though Code Breaker will count backwards, you must put in a positive number for the increment. To make it count backwards just make the starting code larger than the ending code. You can also have randomness with Code Breaker. Just say yes to the randomness feature and the program will stay within your bounds, playing tricks with the increment.

Again, the joystick/apple keys control the speaker, pause, and abort.

Unlike Terminator and most other modem hacking programs, Code Breaker also write and saves the bad codes to disk. The reason is simply this: with the randomness feature on, you have no other way of telling what numbers, bad or good, you’ve tried.

If this is an inconvenience, let me know.

SCAN MAN

If you call a lot of AE’s you know what it’s like to get a busy signal all night. And redialing with the modem is no fun. What this program does is scans a few BBS or AE or Whatever numbers until one picks up and you get a carrier. It then either switches you to Terminal Mode or boots the AE disk.

You have a directory with Scan Man. It contains your computer numbers. You can delete or add numbers as you please, keeping up to fifty numbers at a time. You will also be asked for a key by which to identify the number. An example key might be the password or the name of the BBS. It’s up to you, but there is a 34 character length limit on the key. You will also be asked if you use an extender for this number. If you reply yes, the computer will automatically dial whatever extender number you are using at the time. This way, when you change extenders (do it frequently) you don’t have to revise the entire directory.

When asked for the extender number, put in the long distance phone company's number, the time delay commas, and the authorization code. Scan Man will automatically dial it before the numbers that you ordinarily use with extenders, and won’t dial it for numbers that you don’t ordinarily use with extenders.

You can, of course, delete numbers from the directory, but by no means should you delete every number! This will cause an error and Scan Man will not work!!!!

Again, the joystick/apple keys control abort, pause, and speaker status.

CALL ME

If you have any problems, comments, suggestions, or just want to gab, call the Protester's AE/BBS at 512-396-0780. It’s not my AE but I am in charge of the Anarchy Board. It’s got all the latest wares and one of the coolest sysops around. Give it a ring.

And keep your eyes peeled for IntelliHacker V2.0. It will be a result of the feedback I get through the Protester's AE/BBS and a few other that I belong to.

Now, Scan, man.

BY THE WAY

If you want to really harass the shit out of someone, put their name and number in the Scan Man Directory. Then leave it on, calling their house every 30 seconds. Also, put their name on the directory and pass the program around with their name on and a note to bother the shit out of them. Before you know it, they’re getting calls from all kinds of pervs and who knows what the fuck else!!!! Great, huh?? Try it on your teacher some time.

Section 1: How it works:

1) Crack a ware

2) Make a title page program for it.

3) Boot the Intercept 1.3 disk.

4) SCANNING FOR BLANK SECTORS: Place the disk you plan to intercept in drive one or two and press the appropriate key. Intercept will begin to scan your disk for blank sectors that contain all 00s. If you already know where enough free sectors are to hold your title page program, plus 3 sectors for overhead, press the <ESC> key. Once you think Intercept has located enough free sectors to hold your title page, hit <ESC>. Note: You can let Intercept scan the whole disk for free sectors, as it will continue merrily along until it locates 255 blank sectors, but why spend the extra time?

5) DEFINING THE BOOT PARAMETERS: There are four parameters you will have to set for Intercept to continue. They are:

   CLEAR SCREEN TO: This option allows you to clear the screen either to spaces or to inverse @ signs. Choose whichever you like best.

   BOOT MESSAGE: This option allows you to enter a 20 character long message that will be displayed in the center of the screen as Intercept loads your title program. If you do not wish to have a boot message displayed, just hit <ESC> at the prompt.

   TITLE FILENAME: This is where you enter the name of the file you wish to use for your title program. Hit ESC to catalog the drive you booted Intercept from.

   FILE TYPE: This option allows you to select the type of file you wish to use for your title program. Use F if you simply have a standard hi-res picture, or P if your title program is a BRUNable file. If you choose the P option, Intercept will load the picture and ask you if it's the correct one. If so, the picture will be packed and an unpacker will be included as part of the title page.

6) DEFINING THE TRACK/SECTOR LIST: This section is where you work with the list of tracks and sectors on which you want your title page to be written. If you want to use the blank sectors found with the scan function, use option 1 at this menu.

   OPTION 1: USE BLANK SECTORS FOUND WITH SCAN: This option will allow you to use any blank sectors you found with the scan function as the track/sector list. You will be notified if not enough sectors were found to accommodate Intercept's requirements.

   OPTION 2: DEFINE TRACK/SECTOR LIST MANUALLY: This option will allow you to manually enter a track/sector list. Intercept will automatically stop asking for track/sector pairs once you have entered enough to hold your title program plus 3 sectors for overhead.

   OPTION 3: VIEW CURRENT TRACK/SECTOR LIST: This option will allow you to view your current track/sector list to verify that it's correct.

   OPTION 4: EDIT LIST: This option will allow you to edit the current track/sector list. Use the arrow keys to select the pair that you wish to edit, and hit the spacebar to edit it, or D to delete it from the list. Note that if you delete a track/sector pair from the list, you may have to add a pair using option 5 in order for there to be enough room for Intercept to function properly.

   OPTION 5: ADD TO LIST: This option is similar to option 2, except it does not initialize the track/sector list to 0 entries when you select it.

   Once you are finished editing/defining the track/sector list, hit <ESC> to intercept the disk.
7) INTERCEPTING THE DISK: Once you have completed the necessary preliminary steps, you will be prompted to place the disk to be intercepted in drive one, and to press <RETURN>. Make sure the disk to be intercepted is in drive one and not write protected. Intercept will attempt to place your title program on the disk. If an error occurs, you will be informed, otherwise, the message, "Intercept 1.3 has been successfully written to the disk" along with the ']' prompt will be displayed. I suggest that after you intercept a disk, you boot it and verify that it functions as it did before the Intercept process.

8) NOTES: If you make a BRUNable title page program, it MUST NOT BEGIN at an address lower than $2400. If it does, it will interfere with Intercept. If it DOES begin at a location lower than $2400, but greater than $BFF, you may still use it, but you’ll have to move it to a location higher than $2400 and write a memory move routine to move it to where it should go. Under NO circumstances may a title program begin at a location lower than $C00, as the area from $0000-$07FF is used by the Apple internally, and the area from $800-$BFF is used by the Intercept 1.3 loader program.

NOTE: If you’re a GnU WaReZ KiD, you can use Intercept to add a title page to cracks that are already out, but let’s face it...how much lower can you get than to steal credit for someone else’s crack? Well, that’s about it. If you’ve got any questions about Intercept, feel free to leave me mail on any of the following boards:

NoiseTracker v1.0 is FREWARE. It is supplied as a free program on all VAMPS DEMO disk sets. In my opinion this program is the most advanced music program yet made available for the Apple Igs and its users, who number over 1 million, world wide. The author/programmer, Olivier Goguel deserves praise and support for his efforts in developing and making such a supreme freeware Ilgs music program, from all those that use it.

Be sure to use your OPTION KEY to view the FREWARE INFO within, NoiseTracker v1.0. Send your comments and suggestions to him at the address noted:

* * * ( Olivier Goguel, 34 Rue Des Rotondes, 21000 Dijon, France ) * * *

He deserves all the support you can give him! He is one of the few programmers that develops software for the Ilgs, that really shows the full potentials the Apple Ilgs can present. Many of his software products; Photonix II, Fontrix GS, NoiseTracker, the SSS Sound Editors, etc., have made my computer music, art work and related efforts so easy and enjoyable.

What is IR 2.0?

IR 2.0 is a lot like IR 1.0, but better. IR originally stood for "Init Restart" and was written to get the GSBug Init installed after booting because it didn't work with my terminal program. It was quickly expanded to also load CDAs, NDAs and GS/OS drivers, and made it onto the Developer CD. There it stood for a long time.

The new features in System Software 6.0, specifically inter-process communication (IPC), make it possible to go IR 1.0 one better -- IR 2.0 installs a Finder Extension so that CDAs, NDAs, inits and GS/OS drivers even Finder Extensions are installed without ever leaving the Finder. It has preferences, presented through an "Extras" menu item and does a lot more than 1.0.

How do I use it?

To install IR 2.0, put it in the System.Setup folder of your boot volume's system folder, or double-click on it if IR 1.0 is installed. It's a permanent init.

Once it's installed, you'll see the "IR Preferences..." item in the Finder's "Extras" menu. Preferences available are discussed later in this document. More importantly, you can double-click on any of the document types listed above and they will be installed instantly. Usually you'll get extra copies of anything that was already installed when you double-clicked on it, but you can ask IR to try to kill old versions first, or instruct it not to do anything if an old version is around. NDAs appear in the Apple menu instantly and open their windows. Finder extensions' "Extras" menu items also appear instantly. New GS/OS volumes appear on the desktop instantly. Everything's very whizzy and happy.

Also included in this seed is a Nifty List 3.4p module called "IR.Module." This module will eventually include all kinds of IR things to do, but currently only has one command, "/killir". /killir takes no parameters and does what it says -- it kills IR. It displays error messages or tells you what user ID IR had before it was brutally murdered.

What is "not" yet included?

The following capabilities are coming someday, but aren't included in the 2.0 release of IR:

* Some inits don't want to be launched in the Finder, where all the tools are started. IR has an option to let applications have first shot at IR documents. The final package will include a C application that accepts Finder long path messages (message type #11, word-length strings and fully-expanded pathnames) to install these files. The source won't be too impressive; it will call the IR init to do all the work. The application will allow you to change IR preferences if you launch it with no message of type $0011.

IR's Preferences

IR's preferences dialog has three radio buttons, four checkboxes and three simple buttons to dismiss it. You might want to look at the dialog while reading these descriptions to make it clearer.

"Open existing NDAs' windows," if checked, instructs IR to just open the window of an NDA that's already installed instead of installing a duplicate copy. This allows you to double-click on something like the Control Panel NDA icon and get the window open instead of getting a second Control Panel in your Apple menu.

"Open new NDAs' windows," if checked, instructs IR to open NDAs after they're installed if possible. This is only possible if the Desk Manager is active.

"Install Finder extensions permanently," if checked, tells IR to install Finder extensions (file type $B8C, auxiliary type $0000) and forget about them; they'll be in the system until you reboot. If this checkbox is not checked, IR keeps track of each Finder extension it installs and shuts them down when the Finder quits or when IR is told to go away.

"Let applications try first," if checked, lets the Finder look for an application to launch first. Only if the Finder finds no application for the file will IR install it. In technical terms, checking the box makes IR respond to finderSaysOpenFailed instead of finderSaysBeforeOpen. You can reverse this preference on the fly by holding down the Control key as you open a file IR would normally install.

"Tell me about problems" tells IR to show alerts (if possible) in certain situations where you might want more information and a chance to change your mind. If you leave this box unchecked, IR won't display any such alerts.

The three radio buttons determine how IR responds to duplicates -- files the System Loader already knows about with the same pathname. *Install a new copy* -- what IR 1.0 did -- it blindly and always installs a new copy of the file. This creates duplicate entries in your DA menus and can cause problems with some inits.

"Try to remove the old one" sends the srqGoAway code to the existing copy in the system, which kills a new one whether or not the old one goes away. This is what I usually use.

"Always remove the old one" takes no action if the existing copy won't accept the srqGoAway code. This is the most conservative but least useful approach. If you also check the "Tell me about problems" checkbox, IR will tell you when a duplicate can't be removed and give you a chance to change your mind and install a new copy. If you hold down the option key while clicking "install another copy" (actually, IR doesn't check until immediately after the window closes), the old one will be killed without mercy. You should only do this if you know exactly what you're doing. It's necessary for Finder Extensions that accept the Finder's "goodbye" message but won't accept an srqGoAway code -- otherwise weird things could happen. Most Finder Extensions won't have this problem, but EasyMount does.

"Cancel" dismisses the dialog with no changes to your preferences. *Accept* dismisses the dialog, saving your changes in memory until you reboot. If you click "Save," IR writes your preferences to disk (in the same folder where the IR init file is located). IR will attempt to load such preferences when it's initialized, and the file is less than one block long so you might as well use it. (Actually, the logical length is only two bytes.)

Most of the controls have semi-logical key equivalents, too.

Programming with IR 2.0
IR 2.0 is a permanent init because it sits around and accepts requests to do things. In addition to accepting requests the Finder says, IR defines several requests you may send to it at the string "Apple-IR". The file E16.IR, included with this seed, gives the definitions of all the symbolic constants outlined here.

The requests are bits in a one-word field, and the bits of the field are defined in the E16.IR file also. Assemble whichever bits you want and pass them to the routines that take "preferences" or "flags." If you pass flags to the askIRInstall routine, be sure to set the low-order bit (irSpecialPrefs) or IR will use the existing preferences instead. If you want IR to write preferences to disk, also set the low-order bit, otherwise the preferences will stay in memory only.

Here are brief descriptions of the IR requests. They are all made to the string "Apple-IR" with the Tool Locator call SendRequest. See the System Software 6.0 Toolbox Delta ERS for details on SendRequest.

askIRStartUp

Starts IR. You shouldn't have to send this; the Init portion of the IR file sends this request as soon as the request procedure is installed. This is where IR calls ShowBootInfo to display the icon or text string. It also reads the IR preferences from disk if it can find them, and uses the default preferences if it can't.

```
dataIn: Pointer to IR's user ID.
dataOut: Reserved
Results: None.
```

askIRAreYouThere

A simple request; IR accepts it if it's present. An easy way to see if IR is around so you can send it other requests.

```
dataIn: Reserved
dataOut: Pointer to following structure:
    +000 Word recvCount (filled in by Tool Locator)
    +002 Word userID -- IR's user ID for your convenience
Results: None.
```

askIRToInstall

The workhorse. Here you give IR what it needs to install a file, and it does it if it can and if the preferences permit it.

```
dataIn: Pointer to following structure:
    +000 Word Flags/Preferences
    +002 Long Pointer to class one pathname of file to install
    +006 Word File type of file to install
    +008 Long Auxiliary type of file to install
dataOut: Pointer to the following structure:
    +000 Word recvCount (filled in by Tool Locator)
    +002 Word irError -- a result code about what happened
    +004 Word userID of file just installed
Results: irDuplicateWon'tDie -- you told IR not to permit duplicates,
    and it found one it couldn't kill.

irNoFinder -- Finder wasn't active when you installed
    a Finder Extension.

irG3OSNotAvail -- G3/GS isn't available so the file can't
    be read from disk and installed.

irNotIFile -- not a file IR can install

irBusy -- IR was already busy doing something non-reentrant
```

askIRGetPrefs

Returns IR's preferences. If the low bit of dataIn is set, the preferences are (re-)read from disk instead of returned from memory.

```
dataIn: Low bit set ==> read from disk
dataOut: Pointer to following structure:
    +000 Word recvCount (filled in by Tool Locator)
    +002 Word irError -- result code
    +004 Word flags (defined in E16.IR)
Results: irBusy -- IR was busy at the time
Toolbox or OS errors returned unchanged
(However, "file not found" makes IR create a new preferences file.)
```

askIRSetPrefs

Sets IR's preferences. The new preferences are in the low word of dataIn and are written to disk as well if the low-order bit is set. The preferences are always saved to memory even if disk errors occur.

```
dataIn: Preferences in low word, low bit set ==> write to disk
dataOut: Reserved
Results: irBusy -- IR was busy at the time
Toolbox or OS errors returned unchanged (except file not found)
```

askIRDoPrefs

Asks IR to present the preferences dialog, interact with the user and record the user's changes to memory and/or disk. The preferences dialog works in either 320 or 640 mode, and it is initialized with the current preferences; if you want to present the dialog with different preferences, you need to call askIRSetPrefs before calling askIRDoPrefs.

The dialog should only be presented if the Desk Manager (and NDA capability) is active, but right now it just assumes these things are there, so if it will probably blow up big-time if you call it without the desktop tools active.

```
dataIn: Reserved
dataOut: Reserved
Results: None.
```

A word about installing things like IR does yourself:

If you have any doubts that installing DAs and inits and stuff on the fly and making it do what the user expects is easy, check the voluminous release notes at the beginning of each source code file, especially RequestProc.aii. The entire process is pretty delicate to begin with, and trying to move it to your own application is still risky.

So now you have source code to IR and you know all of its secrets. Now you can go off and do these things in your own programs, right?

Wrong. Please don't, for several reasons.

First, the code is still kind of delicate. It has several interdependencies and I very seriously considered moving all the delicate stuff into a separate source file and not releasing it -- just releasing the object code to that part. I decided against it so you can see what's going on, not so you could duplicate it in your own programs.
Second, if you want your desk accessory or application or other code to duplicate IR functionality, there's no reason to require the user to take the memory to duplicate these functions. IR can do the same work and not require nearly as much space in your code.

It's by far easier and better to provide the same functionality by licensing IR and including it with your program, and using SendRequest to call it. Or, you can just use askIRAreYouThere to implement IR-like features if IR is already installed, avoiding any licensing paperwork.

This stuff is tricky and it can change without warning. I'd feel a lot better if you let IR take the risks and you just ask it to do the dirty work. That way, any number of desk accessories, applications or utilities of any kind can have useful IR-like features without taking up lots of memory and without taking undue risks.

You can either license IR (it will be, in the immediate future, part of the GSBug distribution package, which costs less to license than most programmers spend on fast food in a week) and ship it with your product, or (if, for example, you're a shareware author) you can just use the askIRAreYouThere request to see if IR is installed and enable IR-like features if it is. This allows virtually _any_ application to provide IR's capabilities when not in the Finder for very little memory.

You can contact Tim Swihart (AppleLink: TIM.SWIHART, address: 20525 Mariani Ave., MS: 70-9M, Cupertino, CA, 95014) for more information about licensing IR as part of the GSBug package. Once everything's settled, Tim will undoubtedly point you to Software Licensing, so if you know things are settled you should feel free to contact Software Licensing directly.

Please AppleLink comments/bugs/suggestions to me at DEATHERAGE1, or AIDITS. If you like the sample, you can tell my management that it was a good use of my time by writing to DTS.FEEDBACK.

Oh, by the way, IR 2.0 doesn't work reliably on any system earlier than 6.0D59, but it only checks for 6.0 generically.

Package release notes are not included here, but there are voluminous change histories at the beginning of each source file.

Matt Deatherage
Developer Technical Support
Apple Computer, Inc.

Program : Cracked By Static Vengeance       Docs: Typed By The Mechanic!

A dollar amount is assigned to each hole. Typically, the first six holes are worth one amount, the next six are worth twice that much, and the last six are triple the original prize. The best ball (lowest score on the hole) takes the prize.

If the hole is halved (two or more players tie for best ball) the money for the hole carries over to the next one. The means the money -- and the tension -- can add up fast. In one memorable Skins games, Gary Player had to roll in a 4-foot birdie to walk away with $170,000.

If you make five decisions about each player you choose for you much. For each decision:

- Point the mouse at the box beside you decision and click the mouse button.
- As you complete each player, point to the box OK to go to next player, and click the mouse button.
- After your final selection, point and click on the Done box to go to the next section.

Select Your Players (continued)

1. Player 1 Male Female
   - The average male player hits clubs longer than the average female player -- but, of course, anyone can make extraordinary shots.

2. Computer player Yes No
   - Choose from nine different computer players -- five men and four women.

Select Skins or Stroke Play

1. Use the mouse to point the pointer at the box beside the number of players you want to play. Notice that you can choose in either the Skins or Stroke Play formats. (Player description will follow).

2. Click the mouse button.

Skins

A game made popular in recent years by a special tournament that has pitted head-to-head: Jack Nicklaus, Gary Player, Arnold Palmer, Lee Trevino, and Fuzzy Zoeller. The rules are similar to Match Play -- you have to win a hole outright (no ties) -- but the betting system completely changed the objective. Instead of the most holes, you try to win the most money.

In stroke play, most great players consider the golf course to be their opposition more than their fellow competitors. That's because the goal is not to win holes (Match Play), or take the big money holes (Skins), but to shoot the lowest score over 18 holes. As Jack puts it: "Stroke play is an 18-hole game, but you can play it only one shot at a time."

Select You Players

You make five decisions about each player you choose for you much. For each decision:

- Point the mouse at the box beside you decision and click the mouse button.
- As you complete each player, point to the box OK to go to next player, and click the mouse button.
- After your final selection, point and click on the Done box to go to the next section.

Select Your Players (continued)

1. Player 1 Male Female
   - The average male player hits clubs longer than the average female player -- but, of course, anyone can make extraordinary shots.

2. Computer player Yes No
   - Choose from nine different computer players -- five men and four women.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 552 of 1262
Apple II Computer Info

-- with varied skills. (Check the next section for complete descriptions)

O Point and click on the left and right arrow keys which appear next to the Name Window to cycle through the players' names.

O Choose a name, point to the next OK to go to the next player, click on the mouse button, and the player's skill level, tee position, and gender are automatically set.

3. Name

O To create a new player, type the desired name (up to eight letters) and press Enter

4. Skill

O Beginner: Wind conditions don't affect your shots as much, and your slices and hooks are less extreme. On each shot, your club is automatically selected for you.

O Expert: Wind really comes into play, and hooks and slices are most extreme. In addition, you must select your club for each shot.

5. Tee: Pro Farthest from the hole

      Men's Far away, but not as far

      Ladies' Closet to the hole

Note: Some holes are designed with less than three tees, in which case some players share a tee.

Who Are These Computer Players?

Jack N

The Golden Bear himself. Naturally, the Player of the Century plays at the expert level and hits from the pro tees. Hits shots are carefully planned, well executed and he hits the ball further than the posted distance for each club. Nicklaus is one of those rare golfers who almost always does exactly what he set out to do.

Nancy D

Though enthusiastic, Nancy's just beginning. She often suffers a wicked slice on her drivers. And long putts give her lots of trouble.

Lars X

Calls himself Mr. X and likes to think of himself as an expert -- which is why he drives from the pro tees. has a tendency to hook drives and pull putts to the left.

Babs R

A true competitor, Babs considers herself an expert. She usually hits the ball straight -- with an occasional slice. When it comes to putting, she's overly cautious, and frequently leaves her putts short.

Art M

Art's a weekend golfer who could use a little practice. His shots tend to be short but straight. And his putts to be long and off-line.

Natasha

Natasha's a big hitter. She drives from the men's tees, and has played at the expert level for years. If she doesn't slice, her tee shots are beautiful. But she often lags her putts.

Eddie C

He's no Jack Nicklaus, but this guy's Good. So good, in fact, he makes a living sucking players into a "friendly" game of skins. Naturally he plays at the expert level and drives from the pro tees.

Sally C

Though she's been playing for years, Sally is still a beginner. She just can't seem to get the swing of it. She hits from the ladies' tees. Her drives could go either way -- hook or slice. And she leaves her putts short.

Curly O

Curly just took up golfing this year and loves it. Problem is, he doesn't really play that well. He shoots from the men's tees, and plays at the beginner's level. His slices could end up just about anywhere. So could his putts.

Select Prizes for Your Skins Game

You can choose to play Championship Skins -- a $36,000 match with single hole prizes of $100, $2000, and $3000 for each set of 6 holes -- or change the entire prize structure.

1. To play the existing game, point to the box beside Championship Skins and click the mouse button.

2. To alter the total wager, point the box beside Change Total Prize, then click the mouse button.

3. To alter the prize for any hole, point to the box beside Change Hole Prize, then click the mouse button.

4. Point and click on the Done box to continue to the next screen.

Pick A Game Option -- Practice or Play

Choose one of the following activities by entering its number.

1. Play a round

   O 18 holes: 9 out and 9 in

2. Practice a hole

   O Enter the number of the hole (1-18) you want to practice, and press Enter.

   O After you hole out, you automatically view the Scorecard and Statistics Sheet fro that hole.

   O Continue to press the mouse button to return to the Practice or Play menu.
A club is automatically selected for you on each shot from tee to ball. (or, you can point to where the computer calculates your yardage from the pin, then selects the club whose posted maximum distance (see the Club Distance chart on the back cover) is closest to that yardage.

You can override the computer's choice by pointing and clicking on the Up and Down arrows beside the selected club. Stop when the club of your choice appears:

- Eight irons (2-9)
- Two fairway woods (3-4)
- One pitching wedge (P-Wedge)
- One sand wedge (S-Wedge)
- One driver

You Don't Have To Use A Mouse

You can also use the keyboard to control aiming and swinging, but for sake of brevity we omit those instructions throughout. Use the left and right arrow keys to aim the shot, the Up and Down arrow keys to make your club selection, and the space bar to replace the clicking of the mouse.

2. Expert

- You must select your own clubs for each shot; the Club Selection box defaults to the last club you used until you select another stick.
- The computer automatically defaults to the sand wedge in the sand, the putter on the green, and the driver on the tee; but it won't default to the Driver off the tee.
- Base your decision on the yardage to the pin, then identify the optimum target areas for your shots.
- Check the Club Selection chart on the back cover to see the maximum distance each club can be hit without overswinging (no yardage appears in the Club Selection box).
- If you don't select a club, the computer selects either the last club you used (except the Driver), or the sand wedge or putter if you're in the sand or on the green.

A tip from Jack...

Club selection is wide open in this game except for three exceptions: Your driver can only be hit from the tee, your putter can only be hit from the green, and the sand wedge can only be hit from a sand trap.

But before you select any club, prepare for your shot mentally. "Before every shot, look hard at what confronts you and then decide on a club, and target," Jack says. "Identify the specific risks -- out-of-bounds, water, bunker, heavy rough, wind, ground slope, pin placement -- and weigh them against your capabilities."

Aiming Your Shots

Atop the Play screen, a small flagstick always indicates where the pin is located in relation to your position. (This is especially helpful on blind shots where hills or trees obstruct your view of the real flag.)

1. Point and click on the arrow keys beside Aim Shot to adjust the "Aiming Ball" to the left and right of the small flag. (or, you can point to..."
the Aiming Ball, click and hold the mouse button, and "drag" the ball to your desired location.)

2. Place the Aiming Ball directly over the flag if you want to aim your shot directly at the pin.

3. Place the ball to the left or right of the flag to compensate for wind conditions, obstructing hazards, hooks and slices, and for the break on putts.

Changing Your Perspective
If you don't like the direction you're aiming toward -- say a tree blocks your shot -- you can change it:

1. Point and clock on the arrow keys beside Aim Shot to slide the Aiming Ball past either of the two vertical pegs that bookend the top of the screen. (Or, you can point to the Aiming Ball, clock and hold the mouse button, and "Drag" the ball past the pegs.)

2. Slide it past the left peg: The screen automatically redraws and you now see what you would see if you had physically shifted your vision to the left.

3. Slide it past the right peg: It causes the same shift of perspective, but to the right.

4. If you want, you can continue to scroll right or left and see a 360 degree view of the hole from where you're standing.

A tip from Jack...
This feature can be used anytime, but it's especially helpful between the tee and green where you're deciding whether to gamble or not gamble. It's often better to shift trouble than to always aim for the pin on your approach shots.

It's usually higher handicappers who don't play away from obvious dangers -- bunkers, trees, water, etc. "Unless you are forced by the competitive situation to gamble," Jack says. "I lean toward playing safe and moving on. It's paid off for me -- especially on the tough courses used in major championships."

Swinging
The movement of the Power Bar on the left of the screen corresponds directly with your players' swing on screen. To control the swing, you control the Power Bar. And to control the Power Bar, you use the mouse.

Every shot required three clicks of the mouse button to execute. (The mouse pointer must be inside the golf course portion of the screen to make it work.) The timing of the clicks determines how hard and how straight you can hit the ball.

1. Click the mouse button once to begin your backswing.

2. Click the mouse button a second time to control the distance of your shot (and start your downswing.)

3. Click the mouse button a final time to strike the ball -- and control how far left or right of straight you want to hit it.

"Swinging" the Power Bar
The middle section of the Power Bar -- let's call it the Swing Zone -- is divided into ten segments, each of which represents 10% of your club's potential distance (as determined by the Club Distance chart, and as shown in the Club Selection Box.)

Thus, the bottom line of the Swing Zone represents 0% or 0 distance; the top line represents 100%, or the maximum distance for each club as set by the computer; and the Half Line represents 50% or half that maximum distance.

A Sample Shot:
You're sanding on the tee of a 300-yard hole, so you take your driver and you want to hit it full. If you're a man, a full driver, means 250 yards in this game. You decide to hit it dead straight because that's the way the hole goes, and there's no offending wind of hazards.

1. Click the mouse button to start your backswing; a color rises like mercury from the bottom of the Swing zone towards the 100% line.

2. Watch the rise carefully. Try to click the mouse button the moment it reaches the 100% line.

   o A Triangular arrow to the left of the Power Bar indicates exactly where you make your click.

   o After the click, the color descends, just like your backswing.

3. To keep your shot straight on target (the flagstick), make yours third click on the '0' line.

   o Another arrow appears to mark your click.

4. If each click is right on the button, your ball sails 250 yards straight down the fairway, and you're left with a 50-yard approach shot to the green.

   o The computer automatically tells you how far you hit your last shot.

Controlling Your Distance
Of course, you don't hit every club full if you want to stay in bounds. Let's continue the sample hole to see how to control the distance of your shots.

You're 50 yards from the pin, so you select your pitching wedge (P-Wedge) because the chart says the pitching wedge can whack it 100 yards if you hit it full. But you don't want to hit it full; you want to hit half a wedge 50 yards:

1. Click the mouse button to start your swing.

   o Notice that the color rises much more slowly with a wedge than it does with any other club.

   o The smaller the club, the slower the rise -- because the most humans smaller clubs (like the high irons) are easier to hit than big ones (Drivers and fairways woods)

2. Click the mouse button the moment the rising color reaches the Half Line -- that's 50% of the wedge's full distance (100 yards) or 50 yards.

   o Remember that each line in the Swing Zone represents 10 percent of any club's posted maximum distance

3. As the color descends, make your final click right on the bottom line of the Swing Zone to hit the ball straightaway.

   The ball should loop gently 50 yards into the air than nestle onto the green -- inches from the cup.

Overswinging and Underswinging
What happens if you don't make your second, or distance, click directly on the 100% line of the Swing Zone?

1. If you make the second click late -- inside the Power Swing Zone -- you overswing.
A Tip From Jack...

Overswings and underswinging are not necessarily bad. It depends on the situation. You have to underswing on some shots -- for example, when you have a 6-foot putt and you're holding a putter with an 80-foot range. And accuracy isn't sacrificed by underswinging, just distance.

On the other hand, a big hit sometimes, offers the better golfer a find opportunity to gain a competitive edge. "A prefect example is the 15th at Augusta National," says Jack. "Almost everyone cuts loose here because the reward can be a shot at the green with an iron for a two-putt birdie."

Hitting a Hook

If there's no wind and if you make your third, or accuracy, click right on the bottom line of the Swing Zone, the ball should fly straight. But just as you can't hit every club full, it's unlikely that you can hit every shot straight. And sometimes you don't want to hit it straight.

1. How to hit a hook, so that it "draws" the ball to the left (for a right-handed golfer):
   - After your second, or distance, click, the color descends toward the bottom line of the Swing Zone.
   - Click the mouse button before the color reaches the bottom line -- in other words, swing early -- and your shot hooks to the left.
   - How far it hooks depends upon how early you swing (the earlier the swing, the bigger the hook), and how hard you swing (if you overswing into the Power Swing Zone, the hook is randomly exaggerated)

2. How to hit a slice that "fades" the ball to the right (for a right-handed golfer):
   - After your second, or distance, click, the color descends toward the bottom line of the Swing Zone.
   - Click the mouse button after the color reaches the bottom line -- in other words, swing late -- and your shot slices to the right.
   - How far it slices depends upon how late you swing (the later the swing, the bigger the slice), and how hard you swing (if you overswing into the Power Swing Zone, the slice is randomly exaggerated)

Hitting a Slice

"Let's say I'm playing a 5-iron shot to a green 80 feet wide with the pin centrally located," says Jack. "If I aim at the pin and attempt to hit straight, I have only 40 feet of green to work with if I hook or slice the shot."

"But by aiming, says 20 feet to the left or right of the pin and trying to face or draw the ball in toward it, I give myself a much greater margin for error. Now I can "miss" the shot by 40 feet and still keep the ball within 20 feet of the hole."

"That is the tactical reason good golfers rarely try to hit the ball dead straight. The technical reason is that a straight shot is much harder to keep repeating than a fade or draw."

Hazards and Course Conditions

The "ability" to hook and slice can destroy a hole or an entire round, but with a little strategy, technique and practice they can give you a major advantage over your opponent.

"Let's say I'm playing a 5-iron shot to a green 80 feet wide with the pin centrally located," says Jack. "If I aim at the pin and attempt to hit straight, I have only 40 feet of green to work with if I hook or slice the shot."

"But by aiming, says 20 feet to the left or right of the pin and trying to face or draw the ball in toward it, I give myself a much greater margin for error. Now I can "miss" the shot by 40 feet and still keep the ball within 20 feet of the hole."

"That is the tactical reason good golfers rarely try to hit the ball dead straight. The technical reason is that a straight shot is much harder to keep repeating than a fade or draw."

Hazards and Course Conditions

Your swing isn't the only variable you have to consider (or overcome) when you're trying to hit the ball straight.

Wind

Tailwinds

A following wind makes it harder to stop the ball in the fairway or on the green. So you need a little time to adjust to the wind. But you can adjust to it, if you know what to look for. Tailwinds are the most common type of wind. "You can usually expect them on all golf courses," says Jack. "And they can be a real problem if you're hitting the ball from the tee."
Crosswinds

Jack: "You have two options whenever the wind is fully or partially across the line of a shot. One is to hook or slice against the direction of the wind, thus "holding" the ball more or less straight. The other option is simply to aim as much off the direct lines as you think the wind will move the ball and play your normal shot, allowing the ball to be blown back to the target."

Rough

Use more club or more power to hit out of the longer, thicker grass that borders the manicured fairways.

Sand Traps

Like the rough, you need more power or more club to get distance from a fairway bunker.

Water and Out-of-Bounds

Hitting into the water costs you a one-stroke penalty, and the computer gives you the option of hitting the ball again from the same location or dropping the ball near the water (but no closer to the hole).

Cart Path

It depends on the situation whether or not a cart path is hazardous or not. The ball bounces higher and farther off of it, which may be desirable on a trouble-free drive. But on some shots, the carom can carry you right Out-of-Bounds.

Putting

You can only hit the putter on greens, and you use the same technique to aim and stroke a putt as you use to hit any club.

Aiming and Stroking

1. Imagine an invisible straight line that connects your ball, the hole, and the Aiming Ball at the top of the screen.
2. Point and click on the Right and Left arrows beside Aim Shot to move the Aiming Ball onto the end of that imaginary line. (Or, point to the Aiming Ball, click and hold the mouse button and "drag" the ball there.)
3. Use the three-click procedure on the Power Bar to control the distance and direction of your stroke.
   - Remember that the maximum distance on your putter is 80 feet, thus every segment on the Power Bar represents 8 feet.

Reading the Break

Unfortunately, many greens aren't flat, so your putter won't always go straight. To find out how much a putt is going to break right or left, or if you're putting uphill or downhill, check the Break Indicator. It's in the same location as the Wind Gauge and operates, in a similar way.

Right, Left, Uphill, Downhill?

1. Imagine that the line in the circle has an arrow on it pointing outwards -- that's the direction that the putt will break (right or left) if you're aiming directly at the hole.
   - If there's no line, there's no break.
2. If the arrow points due south as on a compass, that means that the putt is uphill and has no break.

Apple II Computer Info

3. If the arrow points due north, the putt is straight downhill.
4. If the line points, say, northeast, that means you putt is uphill and it breaks to the right. Compensate for both factors.

How much does it break?

- A bar gauge labeled BREAK -- below the direction circle -- tells you the intensity of a putt's break.
- The Indicator is a red bar which slides from left to right on the gauge: if at the far left (no color), the break is virtually non-existent; if at the far right, you have a major break.

A Tip From Jack...

"The amount any putt breaks depends on its speed," says Jack. "The harder you hit it, less the break will alter its course. This is good to remember, especially on short putts when you're under pressure. The greater the pressure you're under, the better off you are playing boldly rather than cutely on must short putts."

The Scorecard, Statistics, Best Round Board

The Scorecard and Statistics screens appear consecutively after each hole. To view, the Scorecard in the middle of a round, press C. For the Statistics Screen, press S.

The Scorecard changes for each format:

Stroke Play Scorecard
- Shows the hole score and aggregate score for each player, as well as the par for each hole, each nine, and the course.

Skins Game Scorecard
- Indicates the winner of each hole, how much money is won on each hole, and the total money earned for each player.

Statistics Screen (the same for both formats)
- Longest drive (in years) and the yardage of your last drive.
- Closet ball to the pin (in feet, if you hit the green in regulation)
- # of Fairways hit (only on Par 4 or 5 tee shots)
- # of Greens hit (only on Par 3 tee shots)
- Putts taken
- Birdies and Eagles made

Best Round Sheet
- At the end of each round, your final score is compared to the score of anyone who has ever played your disk.
- It records the seven best rounds of all times of each course. (Make sure that your disks are "write enabled" which means that if you're using a 3.50" disk the sliding tab in the corner is closed.)
- To view it from the game screen, Press B.

Strategy
Be as accurate as you can on your second, or distance, clock on the Power Bar. If you go past your target, your shoot will be long.

Keep your eyes on the Power Bar (but watch other players when they're hitting -- the graphics are great!)

Use an iron, not a wood, when hitting from the sand or rough.

If you're shooting from heavy rough, take two more clubs than you normally use.

When in doubt, or you need a know your key commands, Press "H" for HELP!

It's not easy, but you can beat the computer Jack Nicklaus. One advantage you have over him is that you can hit the ball longer than he does (that's all we're going to tell you).

Putting: Remember that the break indicator only tells you the direction of the break when you aim directly at the hole. If you hit the ball too far, or to the right or left, the slope of the green -- and hence the break -- will change.

End of File.
JELLYFISH IS A SORT OF UNDERSEA DEFENDER. THE OBJECT IS TO DESTROY ALL OF THE CREATURES YOU SEE. (HA HA) BUT BEFORE YOU SHOOT ALL OF THEM YOU SHOULD GO DOWN TO THE VERY BOTTOM AND TRY TO PICK UP ALL 6 OF THE LITTLE THINGS THAT ARE EMBEDDED IN THE SAND. THE KEYBOARD IS THE EASIEST WAY TO CONTROL THE SHIP. THE CONTROLS ARE:

S - LEFT
D - RIGHT
E - UP
X - DOWN
Q - FIRE (ALSO EXTEND ARM TO GET SALVAGE)

WHEN YOU GO TO THE BOTTOM YOU'LL NOTICE THAT DOORS ON THE BOTTOM OF YOUR SUBMARINE OPEN. THIS MEANS IF SOMETHING IS IN YOUR WAY, YOU CAN'T SHOOT IT. ALSO TO PICKUP THE STUFF YOU SHOULD BE DIRECTLY OVER IT, PRESS THE Q ONCE, IF YOU DON'T EXPLODE OR YOU GOT IT OR MISSED ALL TOGETHER PRESS THE Q AGAIN, THIS WILL RAISE THE ARM BACK INTO THE SHIP. IF YOU RUN INTO ONE OF THOSE THINGS WITH THE ARM DOWN YOU WILL BLOW-UP. YOU GET 5 SHIPS IN TOTAL. YOU GET 1000 POINTS FOR EACH THING YOU PICK UP. ONCE YOU HAVE GOTTEN THEM ALL THE DOORS CLOSE AND YOU CAN SHOOT ANYTHING IN YOUR WAY AGAIN. BE CAREFUL, IF YOU DON'T HIT A CREATURE DEAD CENTER IT WILL BREAK UP INTO MANY CREATURES. HAVE FUN WITH THIS IT'S NOT TOO BAD.

due to blood draining from the head. If frame loading drops below -3 G’s, the pilot will red out as blood rushes to the head.

D. Gear Status Indicator

This indicator displays the aircraft’s landing gear status. Press Cntl-G to toggle the landing gear up or down as required.

E. Brake Status Indicator

This indicator displays the status of the jet’s air brake. To toggle the air brake on or off, press Cntl-B.

F. Fuel Level Indicator

This indicator displays the amount of fuel remaining as a percentage of total internal fuel capacity. As the throttle is increased, fuel consumption increases proportionally. With afterburners on, fuel consumption is doubled. If your fuel supply is depleted, the engines will flame out and you will have to attempt a dead stick landing.

Selectable Instruments

Several other instruments may be enabled or disabled at any time. These instruments are optional because they can obscure the out-the-window view and because they slow down overall animation speed.

G. Radar Display

The radar display is superimposed over the outside view. It shows the location of enemy targets—missiles and enemy aircraft—relative to your home base with respect to your aircraft. Your own aircraft is displayed as a blue dot in the center of the display. Enemy aircraft or ground targets appear as red dots (your selected target flashes red) and enemy missiles appear white. Your home base will appear as a flashing red/white dot. If your home base is outside normal radar range, the red/white dot will be plotted at the edge of the radar screen in the direction home base is located. The radar display can be turned on and off by pressing the [W] key.

H. Attitude Indicator

The attitude indicator is toggled on and off with the [A] key. This instrument shows the orientation of your aircraft with respect to the ground. A scale of lines in 20-degree increments both above and below the horizon indicates the pitch of your aircraft. Single points at the top and bottom of the scale indicate a 90-degree pitch attitude. The aircraft’s bank angle is displayed by rotation of the pitch scale. This instrument is very useful when the horizon is not visible outside the window.

I. Range Indicator

The range indicator is toggled on and off with the [R] key. This instrument, which appears as a circle in the center of the screen indicates the distance to your selected target (see WEAPONS SYSTEMS). A white circle indicates that the target is out of range. When the target comes into range, the circle turns black and diminishes counterclockwise as your close in. In Target Strike mode range is computed by measuring the distance to the point on the ground that intersects your aircraft’s flight path. This is the target point your guided ordnance will track. The range indicator can also be used in conjunction with the attitude indicator to determine precisely which way your aircraft is pointing.

View Control

---

Apple II Computer Info

Control Tower Mode: In normal flight mode, the out-the-window display is from the cockpit point of view. In control tower mode you can watch your aircraft from the control tower’s point of view. You may zoom in or zoom out (see VIEW DIRECTION CONTROL) but the view direction is fixed towards your aircraft. If you eject from the aircraft the view will track you as your parachute opens and you float gently (?) down to earth. Flying the aircraft in this mode is like flying a jet by remote control. Press [C] key to toggle between cockpit and control tower points of view.

View Direction Control

Keypresses:

- [5][F] - Left View
- [5][T] - Front View
- [5][G] - Upward View
- [5][H] - Right View
- [5][B] - Rear View

You can also zoom in and out, like a camera lens, to adjust your angle of view. 2x is the normal viewing angle, but you can zoom in to 8x or out to 1x as desired. The current zoom factor is displayed in the lower right corner of your Heads-Up Display:

- [Y] - Zoom in by a factor of 2
- [N] - Zoom out by a factor of 2

Flying the Jet

A. Flying by Wire

Fly by wire refers to a system of aircraft control in which the pilot sends steering commands to a computer which in turn generates actual elevator and aileron movement. All the pilot has to do is point the aircraft in the desired direction and the computer will keep it flying that way. Because the F-16 can generate up to 9 G’s of thrust and because it weighs, it can accelerate vertically and is considered ballistic. This allows any angle of controlled flight.

B. Controls

The Jet has five controls for flight operations:

- THROTTLE controls engine thrust. To decrease thrust press the [<-] key. To increase, hold down the [->] key for a few seconds & the thrust indicator will climb rapidly. When thrust percentage exceeds 99, the afterburners are activated and a red A.B. indicator is displayed. Press the [<-] key once to disable the afterburners.

- ELEVATORS controls the aircraft’s pitch attitude. Press [R] or pull back on the joystick to pitch up. If the aircraft has sufficient airspeed this will bring the nose of the jet up. To pitch the aircraft down, either press [F] or push forward on the joystick.

- AILERONS control the jet’s bank angle. To bank the aircraft left or spin counterclockwise, press [F] or move the joystick to the left. To bang right or spin clockwise, press [H] or push the joystick to the right.

NOTE: When using the keyboard for elevator/aileron control, note that the more times you press a control key the faster you rotate. Press [G] will stop rotation about both axes.

LANDING GEAR are used for all ground maneuvering. They are toggled up and down by pressing [Cntl-G]. You may not raise the landing gear while on the ground. When flying, the landing gear should be raised to reduce the drag on your aircraft. This will give you a higher top speed. If you attempt to land with the gear up you will, of course, crash.
The AIRBRAKE is used for landings and quick midair decelerations. Use 
[Cntl-B] to toggle it on and off.

Ejection
--------
In extreme emergencies (imminent crash or missile hit) it may become 
necessary to bail out of the aircraft. Press [Cntl-K] to eject.

Sample Flight
--------------
To begin a sample flight, load the Jet and select the appropriate dis-
play device. Make your menu selections as follows:

Game Mode       - [3] for Free Flight  
Skill Level      - [0] for Practice Mode  
Aircraft Type    - [2] for F-16

Now you should see the flight mode display, including the out-the-window 
view and instruments. Turn the attitude indicator on by pressing [A]. This 
overlays pitch markings on top of your window display. Turn on the 
range indicator by pressing [R]. This overlays a small white circle in 
the center of the screen which can be used to indicate direction the jet 
is flying in.

NOTE: You may pause the simulation at any time by pressing the P key. 
Press any key to resume flying. Press [Cntl-P] to pause the sim-
ulation without displaying the pause message.

Joystick: Press [Cntl-J] to enable and center the Joystick. Once the 
joystick has been enabled, it may be disabled by pressing [Cntl-J] again

Flight Simulation Continued Next File: Complete Jet Docs Part 2
First increase throttle to full thrust with afterburners on. Then press \[L\] to launch the jet will be released and will accelerate rapidly down the deck. As airspeed increases, pull back on the elevator. When the F-18 clears the bow of the carrier the nose will come up and you will start gaining altitude.

In order to re-arm or refuel the F-18 you must land back on the carrier. To this you should try to position yourself about 3 miles west and slightly south of the carrier on a heading of 80 degrees. As you approach the Nimitz the carrier's landing strip should be visible to the left of it's superstructure, angled slightly north with respect to the ship's hull. Lower your landing gear and engage the airbrake to reduce airspeed. Now you must try to keep the jet parallel to the landing strip by banking left or right, and aim your nose for the stern of the carrier by pitching up or down. Reduce the throttle to about 20% to cut airspeed even more. If you begin losing altitude too soon, increase the throttle. If approach speed is too high, decrease throttle. As you pass over the stern of the ship, begin to flare by raising the jet's nose and try to touch down just short of the trip wire. If you catch the tripwire the jet will stop abruptly & you will be returned to the launch catapult (in Free Flight mode) or to the re-arming menu page (for either combat mode).

Weapons Systems
---------------

A. Ordnance

In either combat mode, once you've selected a skill level the arming menu then appears as:

Select Armament

- [1] Aim-9 Missile 160 lbs x 0
- [2] Aim-7 Missile 500 lbs x 0
- [3] Agm-65 Missile 460 lbs x 0
- [4] Mk-82 Missile 500 lbs x 0
- [5] Exit Arming Menu

For the F-16 the following weight data appears below the menu:

F-16 Empty 14000 lbs
Internal Fuel 3700 lbs
Total Weight 17700 lbs

Corresponding figures are displayed for the F-18.

Choose your weapons by pressing the appropriate number key (of course). Each time you make a selection the number to the right of that weapon is incremented by one and your total weight is increased accordingly. If you select more than 6 of one weapon, that weapon's counter is reset to 0.

Press [5] when you're done. Remember the combined weight of your weapons affect the performance and flight characteristics of your jet. As you burn fuel and fire weapons your weight decreases and the jet becomes more maneuverable. When flying the F-16 you can return to the arming menu by catching the trip wire on the carrier's deck landing strip. After re-arming the F-18 you will be placed on the launch catapult.

Dogfight Armament:

- [1] Aim-9 Side Winder : 5 mile range
  - Heat seeking, light weight
  - Radar homing
  - Disadvantage - high weight

  - Optically guided
  - Large warhead - large hit radius

  - Tracks a point on the ground
  - Limited accuracy
  - Large warhead - large hit radius

  - 20mm cannon

Target Strike Armament:

- [1] Mk-82 Smart Bomb : Bomb. No propulsion
  - Tracks a point on the ground
  - Limited accuracy

The Dogfight Game
------------------

A. Object & Rules

Dogfight is an intense 3-dimensional combat scenario that pits you against Soviet MiG-21 and MiG-23 fighter aircraft. They are equipped with Atoll air-to-air missiles, while you can select from a variable arsenal of Aim-9 missiles and/or Aim-7 missiles along with your 20mm Vulcan cannon. Your mission is to engage and shoot down all enemy aircraft at the skill level you've selected (hint! Start off easy and work your way up. You don't want to fight their best, with your worst, now do you ??). Then return home to refuel and re-arm. If your mission has been a success, a new wave of enemy aircraft will then appear at the next higher level. For each successful enemy hit, you get one score. A token marker appears on the fuselage of your jet. Your score can be viewed on the rear window as the number of tokens lining the left side of your jet. If your score exceeds 9, ten digit tokens are marked along the left side of the fuselage. Shoot down all enemy aircraft before returning to base and a two-point bonus will be added to your score. A warning beeper will sound if an enemy missile comes within the danger threshold of your aircraft. If you're hit by an Atoll missile the screen will flash red and orange and the jet will spin out of control. You have seconds to eject before your jet explodes and your body becomes no more bits and pieces. If you eject in time you'll float back to earth (provided the parachute opens) where you'll be recovered and given a new jet to fly in combat. Once you get shot down 3 times, you are grounded and the game is over.

Enemy Aircraft
--------------

At the start of each mission, the enemy aircraft will come at you from the south. You will encounter two different types of enemy jets: the MiG-21 and the MiG-23. These aircraft utilize the same flight equations as your jet, but since they weigh more and have less thrust they are less maneuverable. The skill level you select will determine the type & number of aircraft you must shoot down. During a dogfight the MiGs will track you and fire their Atoll air-to-air missiles. Missiles also track your jet, and will detonate their warheads if they get within a hit radius.

To shoot down an enemy aircraft you must first select one as your target. The current targeted aircraft flashes out your window & on the radar display. Press the \[5\] key & your onboard tracking computer will begin tracking the next target. Since there can only be a maximum of 3 enemies in your airspace at any time, you can cycle to the desired target with a maximum of 2 keystrokes.
Once you've selected a target you can fire the active weapon. Press the [RET] or [CR] key to recycle through your available weapon systems & choose the one you'd like to use. Press the [Spacebar] to fire that weapon. Air-to-air missiles will automatically track the target and detonate if they get within the hit radius. A rising tone from your onboard computer will indicate that the MiG has been hit. The MiG will flash, spin out of control (leaving a trail of flak in its wake) and finally explode.

After shooting down all opponents, or if you run out of weapons and ammo you will have to return to base. Any remaining MiG's will chase you until you enter the safe zone surrounding your base. You then land, re-arm and get back up in the sky to nuke those Commie's.

The Target Strike Game

----------------------

Object and Rules:

Your mission in the Target Strike game is to seek out and destroy all enemy ground targets. When flying the F-16, targets will be randomly selected from the local area airstrips, fuel depots, factories, and missile silos. In F-18 mode, your targets are Soviet Knyda-class cruisers randomly placed in the sea to the south of your carrier. Each target will be designated by a flashing red point. Your ordnance can include both AGM-65 air-to-ground missiles and MK-82 smart bombs. Press [RET] or [CR] to cycle through your available weapons systems & choose the one you like best.

Turning on your range indicator automatically activates the ground target ing computer. As you fly, the range indicator will show the distance from your jet to the point on the ground that intersects your current flight path. If this distance is greater than the range of your selected weapon, the range circle will show all white. When you come within range, position the desired homing point in the center of the range circle and press the [Spacebar]. The weapon will be released and will track that point to the ground. If it impacts within the target's hit radius, the target will explode and a shock wave will spread from the impact point. Scoring is the same as in Dogfighting.

Surface to air Missiles

------------------------

Enemy SAM launchers are only capable of detecting your presence within the conical airspace directly above them. If you pass within this air-space they will track your jet and launch their missiles. Because of this you should fly as low as possible when nearing your target. Shoul you detect an approaching enemy missile, there are two ways to increase your chances for survival. You can try to evade the missile, but this will be difficult. However the missile will run out of thrust quick ly and lose speed rapidly once it begins to coast. Tracking imperfections can also cause the missile to miss you (don't count on it). Another way to avoid the dang thing is to fly at right angles to its flight path. It will keep turning, wasting its energy and degrading its homing accuracy. If all else fails, you can eject, but this will forfeit one of the three aircraft you are allowed each game.

**The Journey screen. When you have successfully loaded Journey and passed the title**

**screen and introduction, your screen will look something like this:**

--- END ---
The Journey screen is divided into three distinct areas:

A) The story of Journey will appear here. Frequently, however, there is more to be told than can fit within this area. In that case, the word "MORE" will appear at the bottom; you can view the rest by pressing any key on your keyboard (or pressing your mouse or joystick button).

B) You will glimpse the world of Journey through the handsome illustrations that appear here.

C) All of your selections, while playing Journey, will be made in this area, which itself is divided into three sections, described on the following pages in the Playing the game section.

The initial menu. On the startup screen, five options are displayed in the lower left.

Start - sets you off on your Journey
Background - relates the events leading up to your Journey. If you are playing for the first time, it would be worthwhile to read this prologue before selecting Start.
Change Name - allows you to personalize your Journey by renaming the narrator of the story from Tag to a name of your own choosing.
Help summarizes these instructions.

Game displays a group of options that do not affect the story, but rather the play of the game (e.g. saving your place, making a transcript, etc). These options are described in detail in the Game option section.

Selection methods. You can make selections with your mouse, joystick, or keyboard. If you have two these devices (e.g. a mouse and a keyboard), you can make selections with either of them or both.
Mouse: Point at, then click on, your desired selection.
Joystick: Move the joystick to highlight your desired selection, then press the joystick button.
Keyboard: Use the arrow keys to highlight your desired selection, then press the RETURN or ENTER key.

Party and individual commands. In playing Journey, you have the task of making decisions not only for your party of characters as a group, but the individuals as well. As each decision is made, the story will move inexorably forward. Looking at the bottom portion of the screen, you will see that it is divided into three areas.

The first column lists the PARTY COMMANDS, those actions which are taken by your entire party as a group. Most often, these will involve moving from one place to another. On the screen you would select Proceed to continue down the road or Enter to enter the provisioner's shop.

The second column lists the members of your party. When your Journey begins, there are four: Bergon, Praxix, Esher and Tag. During the course of your Journey, characters may be added (by choice) and lost (rarely by choice); all such changes will be reflected here.

I Background I I C I I I
I Change Name I I I I I I
I Help I I I I I I
I Game I I I I I

I Notes for keyboard users
1) A quick way to move the highlight bar back and forth between the PARTY COMMANDS section and the INDIVIDUAL COMMANDS section is to use the space bar.
2) You can quickly highlight AND select an option by typing its first letter. However, the highlight bar must be in the PARTY COMMANDS section to choose a party option or in the INDIVIDUAL COMMANDS section to choose an individual option.
3) You can select [cancel] with your BACKSPACE, back arrow or DELETE key.

HINTS: The musing option

Your Journey will be long and challenging, it is unlikely that you will see it through to a happy conclusion until you have played for some time. Do not fear - all of the obstacles and pitfalls you face can be overcome in a logical manner; yet some may initially baffle even the most sophisticated player.

If you should reach an unsatisfactory ending, you will have the option of reading some of the narrator's "musing", thoughts made in hindsight about the decisions made during the Journey. Each "musing" refers to a specific point in the story, when new information is added, rather than using these musings right away, it might be more enjoyable to first experiment with different courses of action.

The game option

Selection methods. You can make selections with your mouse, joystick, or keyboard. If you have two these devices (e.g. a mouse and a keyboard), you can make selections with either of them or both.

Mouse: Point at, then click on, your desired selection.
Joystick: Move the joystick to highlight your desired selection, then press the joystick button.
Keyboard: Use the arrow keys to highlight your desired selection, then press the RETURN or ENTER key.

Hints: The musing option

To the right of each character's name are INDIVIDUAL COMMANDS, actions which the character can perform at any given moment. On the screen you will see that Bergon can get the advice of the group (Get Advice), Praxix can cast a spell (Cast) and examine objects (Examine) and Tag can drop things (drop) and check on what he's carrying (Inventory). These options change frequently during play to reflect the circumstances of the story (e.g. Tag might have an option to Pick Up if there is anything on the ground to take).

Many of the actions you can select require additional information (e.g. which spell to cast, which object to take, which legend to tell). When you select one of these options a list of possibilities will appear. Simply select your choice from the list, or select [chance] to change your mind about taking that course of action.

Notes for keyboard users

1) A quick way to move the highlight bar back and forth between the PARTY COMMANDS section and the INDIVIDUAL COMMANDS section is to use the space bar.
2) You can quickly highlight AND select an option by typing its first letter. However, the highlight bar must be in the PARTY COMMANDS section to choose a party option or in the INDIVIDUAL COMMANDS section to choose an individual option.
3) You can select [cancel] with your BACKSPACE, back arrow or DELETE key.

HINTS: The musing option

Your Journey will be long and challenging, it is unlikely that you will see it through to a happy conclusion until you have played for some time. Do not fear - all of the obstacles and pitfalls you face can be overcome in a logical manner; yet some may initially baffle even the most sophisticated player.

If you should reach an unsatisfactory ending, you will have the option of reading some of the narrator's "musing", thoughts made in hindsight about the decisions made during the Journey. Each "musing" refers to a specific point in the story, when new information is added, rather than using these musings right away, it might be more enjoyable to first experiment with different courses of action.

The game option

Selection methods. You can make selections with your mouse, joystick, or keyboard. If you have two these devices (e.g. a mouse and a keyboard), you can make selections with either of them or both.

Mouse: Point at, then click on, your desired selection.
Joystick: Move the joystick to highlight your desired selection, then press the joystick button.
Keyboard: Use the arrow keys to highlight your desired selection, then press the RETURN or ENTER key.

Hints: The musing option
or No Commands. If you select Controls while you are making a transcript, you will be
given the option of Script Off; this option can now be used to end your transcript.

* Refresh: This option refreshes the screen display, in the unlikely event that it
should become garbled by a power glitch or other such nuisance.

* Version: This will display the release version of Journey as well as the serial
number of your copy of the game. Please include this information in any call to
Customer Support.

* Check Disk: This option performs a check on the contents of your game disks(s) to
ensure that they are undamaged. If you suspect a problem with your disk, use this
option to "verify" its contents. If the disk checks out "OK" then there may be either
a problem with your computer hardware or a bug in the game.

** Most of the Game Menu and Control Menu options can be accessed with function keys
(closed-apple/option key). The keys are defined as follows:
1 Save
2 Restart
3 Quit
5 Script On/Off
4 Refresh
6 Version

Tips for enjoying Journey
===================================
* Try to play as much as possible without overusing Save - remember all puzzles can
be solved logically and without resorting to "try-and-die, brute force" methods. If
you are unable to solve a puzzle, you might eventually want to refer to the musings
option after reaching an ending.
* You might find it appropriate to make a Save each time you visit the Wizard Astrix.
* There are no "dead ends" in Journey; feel free to experiment and take chances.
Every action you take will cause the story to move forward.
* Utilize the options available to you judiciously; if more than one character can
take the same action (e.g. examining something) do not assume that the result will
always be the same.
* If you are using a keyboard, remember the available shortcuts (space bar to move
between PARTY and INDIVIDUAL COMMANDS, and using the first letter of choices to make
a selection).

Some of my favorite boards:
Bombay.......................... 714-897-0412
Lexicon of the Cabal............213-690-6366
USA West......................... 714-592-8996
Digital Dimension.............301-599-1079
Bill's Board.....................602-298-9310

...note: this is all of the docs...there is no list of spells, the map that came with
it does not tell you much...certainly not how to get up the mountain (left 4-5 times,
then right, well it was the first time...maybe its random)...you also get a
crystal...and not a very good one at that...
The button will flap your wings and the joystick moves in the complementary direction in which you move it.

**Special Keys:**

As discussed in the earlier modes, there are but two special keys:

- **[CTRL-Q]**
  - Will exit the game and boot your disk drive.

- **[ESC]**
  - Will pause during play.

**The Game Itself:**

The objective of the game is to get as high a score as possible. In order to this you must joust and defeat all foes on the screen. As levels increase the plains will vanish, lava will be your base, and your foes will get much harder. Try to get eggs for bonus, and each level you increase also raises your score.

Everyone have fun with this one, it is a super game!

The Wyvern

Handle file attributes: No
Command/init files: Yes
Printer control: Yes

KERMIT-65 is a program that implements the KERMIT file transfer protocol for the Apple ][ micro computer system. It is written in 6502 assembly language and should run on any Apple ][ or compatible running DOS 3.3 or PRODOS 8. This section will describe the things you should know about the file system in order to make effective use of KERMIT, and then it will describe the special features of the KERMIT-65 program.

1.1. Apple DOS File Characteristics

Items of importance which will be discussed in this section include Filenames and File Characteristics.

1.1.1. Apple DOS Filenames

Filenames under Apple DOS may contain almost any ASCII character (including space). It is not recommended that special characters, (i.e. control characters or spaces) be used in a filename to be transferred by KERMIT-65 since they may cause problems when parsing the filename. Filenames may be up to 40 characters in length. No wildcarding is allowed in a filename to be transferred by Kermit-65 since they may cause problems when parsing the filename. Filenames may be up to 40 characters in length. No wildcarding is allowed in a filename to be transferred by Kermit-65 since they may cause problems when parsing the filename.

1.1.2. Apple DOS File Characteristics

All files in Apple DOS have a file type associated with them which is contained in the directory entry for the file but is not part of the filename itself. There are four types of files in DOS 3.3. They are:

- APPLESOFT BASIC
- INTEGER BASIC
- BINARY
- TEXT

All file types have their data stored in eight-bit bytes although not all of them need the eighth bit. The two file types containing basic programs required the eighth bit due to the nature of the data being stored. BINARY files are images of memory copied into a file. Often, these are machine code programs. These files require all eight bits. TEXT files normally contain only printable or carriage control characters. They are stored in the form of seven-bit ASCII characters but the eighth bit should always be set since Apple uses manipulate all text internally as ‘NEGATIVE ASCII’. When transmitting non text files the user must insure that both Kermits are handling eight bit data so that no information is lost. If an eight-bit data path is not available (i.e. the remote Kermit needs to do parity checking with the eighth bit), then eight-bit quoting should be used. Of course, BINARY files as well as Apple BASIC files will not have much meaning on a different system. If the user desires to edit a BASIC file on a mainframe, for instance, he must convert it to a TEXT file before sending it over. After receiving the file back on the Apple, the user may convert it back to BASIC once again. The reason BASIC files would be meaningless to a different machine is that the Apple stores BASIC keywords as single character tokens to save space and processing time. To convert a BASIC program to and from a TEXT file, consult the Apple DOS 3.3 Manual. File information can be obtained by issuing the CATALOG command. For example:

```
CATALOG
```

APPLESOFT BASIC

FILE-TYPE-MODE TEXT ! (or APPLESOFT or ...) on KERMIT-65

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 569 of 1262

Apple cannot be transferred unless Eighth-bit-quoting is acceptable to the host. If checking (i.e. most IBM machines). In this case some parity setting (other than none) all applicable parameters are set by KERMIT-65. Some mainframes may need parity from a TEXT file, consult the Apple DOS 3.3 Manual. File information can be obtained by issuing the CATALOG command. For example:

```
CATALOG
```

APPLESOFT BASIC

FILE-TYPE-MODE TEXT ! (or APPLESOFT or ...) on KERMIT-65

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 569 of 1262

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 569 of 1262
you have the parameters set correctly then the "connect" command will start kermit
talking out the com port.

File transfer is very dependent upon parity. Make sure the host and local parity are
the same. Following is one ibm sites method for file transfer:

We have an IBM 3033 and 4381 and use both 3705/3725 and 7171/Series 1 front ends. The
only difference in front ends as far as any microcomputer Kermit is concerned is
duplex (local-echo on for the 3705, local-echo off for the 7171). In Kermit-65 they
need to set the following parameters:

BAUD - whatever is supported.
PARITY - EVEN for us, maybe MNPX for others.
(It is the PARITY which usually causes people problems.)
FLOW - XON for the 7171, NONE for the 3705.
FLOW DELAY - 00

1.3.2. CONVERSING WITH KERMIT-65

KERMIT-65 reads file kermit.init from the default drive when started. The lines of
this file are executed one at a time starting at the beginning. This file should be an
ascii text file and contain commands to setup kermit the way you would like its
parameters set. It will also execute kermit's other commands. However, any command
which reads a file (like modem) or leaves local mode (like connect) will terminate
reading of this file and continue with the command specified. Use your favorite
editor to produce this file.

Following is an example of what might be in the file:

set display 80 3
set keyboard 2e
set baud 4800
modem

KERMIT-65's prompt is "KERMIT-65>".

To run KERMIT-65 and issue commands to it, type the following:

]BRUN KERMIT

NOSC/STEVENS/CU - APPLE ][ KERMIT-65 - VER X.XX

Kermit-65>SEND TESTFILE

file is sent

Kermit-65>STATUS

performance statistics are printed

Kermit-65>Other commands

.
.

Kermit-65>EXIT

]

KERMIT-65 uses a TOPS-20 style command parser. During interactive operation, you may
use the ?-prompting help feature ("?"") and recognition (ESC) features while typing
commands. A question mark typed at any point in a command displays the options
available at that point; typing an ESC character causes the current keyword to be completed
(or default value to be supplied). If you have not typed sufficient
characters to uniquely specify the keyword or filename (or if there is no default
value) then a beep will be sounded and you may continue typing.

Keywords may be abbreviated to any prefix that is unique. There are several different
Apple ][+'s which can run KERMIT-65. Kermit will have no problems running on an Apple
1.5.3. THE GET COMMAND

Syntax: GET remote-filespec

The GET command requests a remote KERMIT server to send the file or file group specified by remote-filespec. This command can be used with a KERMIT server on the other end. The remote filespec is any string that can be a legal file specification for the remote system; it is not parsed or validated locally. If the remote KERMIT is not capable of server functions, then you will probably get an error message back from it like "illegal packet type". In this case, you must connect to the other KERMIT, give a SEND command, escape back, and give a RECEIVE command. Currently, a packet can be retransmitted manually by typing anything on the keyboard. If a 'Q' is typed, the entire transmission will be aborted.

1.5.4. THE CONNECT COMMAND

Syntax: CONNECT

Establish a terminal connection to the remote system. Get back to KERMIT-65 by typing the escape character followed by the letter C. The escape character is Control-8 by default. When you type the escape character, several commands are possible:

- B Send a BREAK Signal.
- C Close the connection and return to KERMIT-65.
- D Drop the phone line to the remote and return to KERMIT-65.
- P Toggle the printer on/off.
- R Print the screen, >>/e required
- S Show status of the connection.
- W Swap the del and backspace key.
- D Send a null.
- Connect-escape Send the Connect-escape character itself.
- ? List all the possible single-character arguments.

You can use the SET ESCAPE command to define a different escape character. When 'CONNECTED', KERMIT-65 will be passing characters entered on the keyboard to the remote system, and passing characters from the remote system to the Apple screen. If VT52-EMULATION is turned on, KERMIT will trap escape codes and simulate the appropriate functions of a vt52 terminal. On an Apple ][+ with an incomplete keyboard, special characters can be obtained by prefixing regular characters with a right-arrow. Also, Uppercase is shown in inverse and lowercase characters are displayed as normal uppercase characters. Here are the rules for using the special 2/2+ input, to get all printable ASCII characters, and how they appear on the screen:

- Special meanings are applied in various contexts to certain characters. The left and right arrow keys do special things, and sometimes the escape key does as well. For letters, the keyboard is always in either default UPPERCASE mode or default lowercase mode. When in UPPERCASE, all letters typed are sent out as uppercase. In lowercase, all letters are sent as lowercase. To reverse the case for the next character only, hit the right-arrow (prefix) key. To switch the default case, hit the prefix-key twice in a row. For funny characters, the prefix key is also used to get the unusual punctuation characters which are not on the Apple keyboard. Here they are: (To represent the prefix character I am using the letter p).

<table>
<thead>
<tr>
<th>Command</th>
<th>Type</th>
<th>Appearance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Square Bracket</td>
<td>p&lt;</td>
<td>{</td>
</tr>
<tr>
<td>Right Square Bracket</td>
<td>p&gt;</td>
<td>}</td>
</tr>
<tr>
<td>Left Curly Bracket</td>
<td>p&lt;</td>
<td>(</td>
</tr>
<tr>
<td>Right Curly Bracket</td>
<td>p&gt;</td>
<td>)</td>
</tr>
<tr>
<td>Underline</td>
<td>p-</td>
<td>\</td>
</tr>
<tr>
<td>Backslash</td>
<td>p/</td>
<td>\</td>
</tr>
<tr>
<td>Tilde (wiggle)</td>
<td>p~</td>
<td>-</td>
</tr>
</tbody>
</table>

The left-arrow key sends a rubout.

With left-arrow and right arrow doing special things, its a little hard to enter their characters ('8' and '9' respectively). There is therefore an escape from prefix mode sequence. If you type prefix-ESC, the next character is sent without any interpretation. If you have the capability for upper/lower case etc then use the 'SET KEYBOARD' and 'SET DISPLAY' commands to specify complete keyboards.

1.5.5. THE HELP COMMAND

Syntax: HELP

Typing HELP alone prints a brief summary of the KERMIT-65 commands.

1.5.6. THE QUIT COMMAND

Syntax: QUIT

Typing QUIT causes the file KERMIT.MODEM in the default drive to be used as a menu. You will be able to select any line in the file to be sent to the modem. Sorry cant back up to a previous menu, you will have to quit and execute modem again. A 'connect' response from the modem will cause kermit to leave the modem command and execute the connect command. This file should have commands for a Hayes modem using text status responses (not numbers). One command per line with comments allowed after the first space (blank). Use your favorite editor to produce this ascii text file. Since the attention Hayes command requires a delay the & character takes on time delay for each. Each & causes a delay of one second on a 6052 chip. If you have a //gs or an accelerator board the timing may change and you may require several to produce a one second delay. Normally kermit will wait for 27 seconds (again on a 6052 chip) for the modem to respond, any character typed on the keyboard will terminate this wait. You may hear the busy signal and there is no sense waiting any longer, so hit (crash-not so hard) any key on the keyboard. Following is an example of the file:

```plaintext
+++644AF gets the hayes modem's attention and then hangs up
ATDP1234567 call your local bbs with pulse dialing
ATDT8901234 call your work dialup phone with touch tone dialing
```

1.5.7. THE CATALOG COMMAND

Syntax: CATALOG

Typing CATALOG produces a catalog listing of your default drive.

1.5.8. THE DELETE COMMAND

Syntax: DELETE filespec

Typing DELETE causes the file specified to be deleted.

1.5.9. THE SERVER COMMAND

Syntax: SERVER

Typing SERVER alone turns kermit into a file server to a remote kermit. Currently server mode will handle remote "send", "get" and "fin" commands. Varies of the above commands will probably work but file serving is very limited at present. Because the apple requires knowledge of file types and there is no current way for a remote to change the file type. You must set the appropriate file type before going into server mode. You can exit server mode by typing a control C ("C") when not doing file transfers or the remote can of course terminate via the "fin" command.

1.5.10. THE EXIT AND QUIT COMMANDS

Syntax: EXIT

Exit from KERMIT-65. You can restart the program, provided you haven't run anything else, by typing "CALL 4096".
Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 572 of 1262

1.5.11. THE SET COMMAND

Syntax: SET parameter [option] [value]

Establish or modify various parameters for file transfer or terminal connection. You can examine their values with the SHOW command. The following parameters may be SET:

- **BAUD** Which baud rate should the com card use?
- **CURSOR-KEYS-VT100** In vt100 mode cursor keys work directly.
- **DEBUGGING** TERSE or VERBOSE packet information.
- **DEFAULT-DISK** Diskette drive used for dos 3.3 file transfer.
- **DISPLAY** Which type of screen display is being used?
- **ESCAPE** Character for terminal connection.
- **FILE-TYPE** Type of Apple DOS file being sent/received.
- **FILE-WARNING** Warn users if incoming file exists?
- **FLOW** Should xon/xoff flow control be used?
- **KEYBOARD** [+ or //e keyboard.
- **KEYPAD** Is there a gs style keypad?
- **LOCAL-ECHO** Pull or half duplex switch.
- **PARITY** Character parity to use
- **PREFIX** Which default prefix to use with prodos?
- **PRINTER** Should the printer be used for the display?
- **RECEIVE** Various parameters for receiving files
- **SEND** Various parameters for sending files
- **SLOT** Which slot # is communication device in?
- **TIMER** Should Kermit observe the rec. timeout value?
- **TERMINAL** Which type of terminal should kermit emulate?
- **SET BAUD** Value is the baud rate for your com card. For the serial and the microtek it can be 300 to 19200. The actual values will depend upon the com card you are running with.

Syntax: SET CURSOR-KEYS-VT100

In vt100 emulation the cursor keys can also emulate the vt100 cursor keys.

Syntax: SET DEBUGGING

Record the packet traffic on your terminal. Options are: TERSE Show packet info only (brief). VERBOSE Display packet field descriptions with packet info (lengthy). OFF Don't display debugging information (this is the default).

Syntax: SET DEFAULT-DISK

This dos command will tell KERMIT-65 which disk drive should be used for file transfers. The three parameters which may be set separately are SLOT, VOLUME and DRIVE. The value for SLOT ranges from 1 to 7. The value for DRIVE is either 1 or 2. The value for VOLUME ranges from 0 to 255.

Syntax: SET ESCAPE

Specify the control character you want to use to "escape" from remote connections back to KERMIT-65. The default is 0 (Control-@). The number is the hex value of the ASCII control character, 1 to 37, for instance 2 is Control-B.

Syntax: SET FILE-TYPE

This will inform KERMIT-65 what type of file is being sent or received. It is important that this is set correctly since KERMIT-65 must create a file of the appropriate type when receiving (and it has no way of knowing what kind of file it is). When KERMIT-65 is sending, it must also know the type of file since that tells it how to detect the actual end-of-file. The keywords for this parameter are APPLESOFT, INTEGER, TEXT, BINARY and OTHER. Other has an added hex-value so that the user may specify the hex value of the file-type. This has meaning only in prodos and allows the user to specify any of the many different file types used in prodos.

- **APPLESOFT** - Applesoft Basic program.
- **INTEGER** - Integer Basic program.
- **TEXT** - ASCII Text file.
- **BINARY** - Binary image.
- **OTHER** - specified by the hex-value.

Some Common PRODOS FILETYPES:

Syntax: SET FILE-WARNING

This tells KERMIT-65 whether to warn the user about incoming filenames conflicting with existing files or not. If there is a conflict KERMIT-65 will attempt to change the file name to something unique.
Apple II Computer Info

SET FLOW

Syntax: SET FLOW (off/xon/delay) number

This allows one to use the xon/xoff protocol when you are connected to a remote site. Delay timings are a part of this command. Using delay times is probably a desperation move to keep the screen/printer from losing characters. Setting the timings will have to be set by experience. Perhaps the best way to set the timings is to bring the values down until you get failures and then double the timing figure. Both LOG and SET PRINTER will probably depend on flow control.

OFF - turn off flow control
XON - turn on xon/xoff flow control with the remote
DELAY number - delay the micro til xoff takes effect

Delay followed by number (including 0) delays the program for number milliseconds after the xoff is given to the remote. This delay allows the xoff to take effect before the program continues.

SET KEYBOARD

Syntax: SET KEYBOARD (2P/2E)

SET KEYBOARD tells KERMIT-65 if the user has a full keyboard (2E) or not (2P). If the user is on an Apple ][+, this should be set to 2P (which is the default). When set to that, certain character translations are available by using the right-arrow key as a prefix character.

SET KEYPAD

Syntax: SET KEYPAD (on/off)

SET KEYPAD tells KERMIT-65 if the user has a gs style keypad available. This is automatically set on a gs but must be set on other machines. With keypad set then "vt100 keypad on an apple keyboard" (see below) will not be used but the actual keypad will be.

SET PRINTER

Syntax: SET PRINTER (on/off/slot) number

This allows one to turn the printer on for printing what is displayed on the screen. With all the different printers and printer cards there will be a lot of variability here but flow control (xon/xoff) is probably required when you are connected to a remote site. The printer can also be toggled on/off via the ESCAPE character followed by the command "P".

Remember when you use your printer there are a lot of variables here. What was being sent to the screen now is being sent to your printer. If you were emulating the vt52 your printer may not know how to handle the escape sequences, tabs etc. It may be you can tell the host you are a tty or some such device that will give carrage returns etc. The printer can handle. Some printers may require the flow control and delay to get readable printing.

ON - turn the printer on, slot number is required
OFF - turn the printer off
SLOT number - printer card is in slot "number"

SET SLOT

Syntax: SET SLOT parameter

This option tells KERMIT-65 in which slot the communication device is located. The range for the parameter is 1-7.

SET TIMER

Syntax: SET TIMER ON or OFF

SET TIMER will turn on or off the timeout checking for receive file transfers. Since there is no clock for exact timing a loop of instructions has been set up assuming a 1 megacycle cpu. Cpus which run faster will have to make allowances via

the SET RECEIVE TIMEOUT command.

SET TERMINAL

Syntax: SET TERMINAL (monitor/none/vt100/vt52)

VT100 emulation

The vt100 is a small but working set of a true vt100 terminal, it appears to work with most of the standard full screen editors and processors onbsd un*x machines and vax vms machines. A //e, //c or //gs is probably required with the apple 80 column text card. Sorry but the II and II+ will probably have to use one of the other terminal options. The vt100 keypad has also been defined for the application mode via the CA/CA/game button. Following is a picture of what the keypad looks like to ed (vms). When using eve (vms) the meaning of the keys will of course change.

VT100 keypad on an apple keyboard.

As you can see the keypad is physically laid out like the vt100 keypad except for the lower right corner. Notice that above the keys are the vt100 labels while within the box (key) is the apple key label. Also the arrow keys work as vt100 arrow keys with the OA/CA/game button.

VT52 emulation

SET TERMINAL VT52 will turn on the vt52 terminal emulation. One thing that is required is your 80 column card must handle the 516 command in order for reverse scrolling to work. The /e 80 col handles this fine.

The vt52 keypad has been defined using the open/closed apple. For II or II+ one will have to have a game paddle or joy stick (key shift mod too????) and use the buttons. When a button /open /closed apple is pushed then the keys starting with 6,7,8 & 9 form the top of the keypad. Key 6 is the blue key key 7 is the red key etc. The keys directly below the 6,7,8 & 9 and shifted one-half key to the right form the second row of the keypad etc. Every thing is fine until you get to the last row on the keypad. There the sp bar is 0 and the other two keys are moved to the upper right as the 0 & - keys. This way the arrow keys are available as vt52 keys with the OA/CA/game button combination (thanks to Dick Atlee for this idea). With those two exceptions the keypad is physically similar to a vt100 keypad. Remember the open/closed apple or the game button must be pushed (like the cntl key) to get the keypad emulation.

1.5.13. THE STATUS COMMAND

Syntax: STATUS

Give statistics about the most recent file transfer. This includes information such as number of characters sent/received, number of data characters sent/received, and last error encountered.

1.5.14. THE LOG COMMAND

Syntax: LOG filespec

When connected to a remote site, log the remote sessions output to the specified file. The file type and file warning protocols are observed. This command is dependent upon the flow control (xon/xoff) working. Without flow control there is little possibility of getting a correct copy of the terminal session. The logging begins when you connect to the remote and is terminated when you escape back to the local kermit with the ESCAPE character followed by the "C" command.

1.6. Standard installation

To bootstrap kermit to the apple, get the files a2k3xx.1 thru a2k3xx.3 on a dos 3.3 diskette. Where xx is the current version. Make sure the diskette is a master diskette and empty. Rename the files to ker3xx.1 thru ker3xx.3. Then:

EXEC KER3XX.1,R25

You will be asked several questions about your hardware and the program should execute and produce a binary with some starting instructions. If you want to run kermit on prodos simply use the prodos conversion routines to move the binary to execute and produce a binary with some starting instructions. If you want to run kermit on prodos you must start the binary in text mode. Start up kermit and set all the parameters in kermit the way you want them. Then "exit" kermit and "bsave kermit,a$1000,l$6900". The next time you "brun kermit" you will find all your parameters already set.

FILES SUPPLIED FOR KERMIT-65

The following files should be supplied on the distribution tape:

a2acc.hex - apple com card hex
a2acc.m65 - apple com card source
a2ccs.hex - ccs 7710 com card hex
a2ccs.m65 - ccs 7710 com card source
a2cps.hex - cps com card hex
a2cps.m65 - cps com card source
a2diff.doc - difference between the original m65 doc and this
a2gs.hex - gs serial port hex
a2hmm.hex - Hayes micro modem card hex
a2hmm.m65 - Hayes micro modem card source
a2k3xx.1 - easy install file 1 (an exec file for dos 3.3)
a2k3xx.2 - easy install file 2 (an exec file for dos 3.3)
a2k3xx.3 - easy install file 3 (an exec file for dos 3.3)
a2m65.doc - complete documentation (it says here)
a2main.hex - main kermit pgm hex
a2main.m65 - main kermit pgm source
a2makn.unx - make file for unix xasm (to assemble kermit)
a2mvn.hex - microtec com card hex
a2mvn.m65 - microtec com card source
a2scs.hex - super serial com card hex
a2scs.m65 - super serial com card source
a2xasm.1 - xasm for unix system part 1
a2xasm.2 - xasm for unix system part 2
a2xasm.3 - xasm for unix system part 3

1.7. Alternate Installation

The main problem exists in getting the hex files onto your diskettes as a text file. But again that is a test of your creativity. If you have a version of kermit running then GET or RECEIVE the file as a text file and then GET or RECEIVE the file as a text file and separate into two assemblies then two hex files will have to be present on the diskette. Get the main hex file a2main.hex and select which com card hex you will need. First "exec p2main.hex", your apple (or compatible) will go into monitor and show you "s's for several minutes. This is the monitor loading the hex into binary. If you get beeps from the monitor it is probably because you didn't get a good copy of the text file. Now EXEC the com card driver you are going to use. You will have to get back into basic (aha another test for you, try "3d0G") to do this. And you will see the monitor loading the card driver. The order of the config is important. The com card should be loaded last. Next get back into basic and do a "BSAVE kermit,A1000,L6900" You may have to specify the drive to do this binary save, with a slot or drive on the end of the BSAVE (aha another test). You now run kermit via "BRUN kermit"

If you want to customize kermit for your equipment. Do all your "set's" etc and then do an "exit". Now you should be back in basic. At this point do a "BSAVE name,A1000,L6900" and when you do a "BRUN name" all your setup will be remembered.

NOTE: If you save your current settings via "bsave kermit..." you may find that moving that binary to another type of apple (eg. //e -> //e+) will not be possible. So make sure you keep the original binary to move between machine types.

Since the org is now $1000 if you have been using kermit and then went back to basic for some trivial thing a "CALL 4096" should start up kermit without having to reload it.

In summary:

EXEC A2MAIN.HEX
Choose the com card driver you will use. For example A22SSC.HEX.

3D0G
EXEC A22SSC.HEX
BSAVE kermit,A1000,L6900

And you should be in business. Remember there is the command HELP and whenever you are into a command a '?' will give you the possible options available at that point of a command. The escape key will finish typing an option if it is possible. The syntax of all the commands and options only requires enough characters to make that command or option unique.

1.8. Problems

1.8.1. Installation

NOTE: When using the super serial driver you must have the cards sw-2 on. This allows the card to use interrupts. The rest of the switches are set from within kermit. It appears to me that you can run your apple 2 with sw-2 on and in 99% of the cases will cause no problems. This is because dos runs with interrupts locked out ("sei" in assembly language) and the program must explicitly give a "cli" for interrupts to work (the super serial driver does). The microtek driver is a super serial look alike which does not run with interrupts. If you have trouble with the super serial driver you might try the msv driver. For you people with the msv-62152 card. You might try running a jumper from the UART 6551 pin 26 to the card edge pin 30. This will enable interrupts just like the ssc sw-2, and then you can use the super serial driver.

The prometheus card will work with the apple com driver. However you will have to set the switches on the card for baud etc. Evidently this card can not be programed by the software. If that is not true then here is an opportunity for you to write a better driver. If you do please pass it on for other prometheus users.

Unconfirmed reports have it that the apple cat will work with the apple com driver. Would appreciate a confirmation.

Some have noted the apple com card must be initialized via the "IN#x" before starting kermit. Ike has now updated this driver and the initialization is now done within the apple com driver. Thanks Ike.
1.8.2. Usage

There is the command HELP and whenever you are into a command a "?" will give you the
possible options available at that point of a command. The escape key will finish
typing an option if it is possible. The syntax of all the commands and options only
requires enough characters to make that command or option unique. When using flow
control you may appear to hang. Type a "Q" (control Q) and that may free you up.
Remember when you use your printer there are a lot of variables here. What was being
sent to the screen now is being sent to your printer. If you were emulating the v52
your printer may not know how to handle the escape sequences, tabs etc. It may be you
can tell the host you are a tty or some such device that will give carriage returns
e tc that your printer can handle. Some printers may require the flow control and
delay to get readable printing. File transfer is very dependent upon parity. Make
sure the host and local parity are the same.

1.9. Customizing Kermit-65

CUSTOMIZING AND BUILDING KERMIT-65

The source code to KERMIT-65 is in 6502 Assembler. It has been formatted for a
cross assembler which runs on a unix 2's complement machine. Files a2asm.1 thru
a2asm.3 are the cross assembler for unix. Get the files on a unix system and then
look at the documentation at the start. They will easily make you a xasm for kermit.
The file a2make.unx is the make file to use with the xasm to reassemble all of
kermit's parts. KERMIT-65 currently supports the following communications devices:
The Microtek SV-622 card
The D.C. Hayes Micromodem.
The Apple Super Serial Card
The CCS 7710 Serial Card
The Apple Com Serial Card
The Prometheus Versacard - uses the apple com card driver
The CPS card
The //gs serial card

Kermit 3 has now been separated into two assemblies. The main routines and the com
routines. A vector has been set up in low memory for the two assemblies to
communicate. Look at the working com drivers for tips on how to incorporate your
version of the com driver. some things to note: It is probably best to buffer the
input from the remote and to get input characters from the remote every chance you
can. Note the Microtek SV-622 driver, whenever the input is checked for a character
and has a character the character is put into the buffer immediately. Also when the
output is checked for ready to output, if the card is not ready to output then it is
checked for a character to input. All this should help prevent loosing characters.

1.9.1. Communications card vector area

A long, long time ago, when creatures of myth and magic walked the earth open to lesser mortals, there dwelt in the kingdom of a King name Graham. He had one the crown by his wit and courage, when he went forth to uncover and reclaim the three lost treasures of Daventry. Now Graham ruled over the land, with the aid of the mirror that foretold the future, the bottomless treasure chest, and the invincible shield. The people of Daventry prospered under the reign of the kindly monarch.

Just one year after returning from his first victorious quest, King Graham arose and looked into the mirror as he was wont to do daily. Much to his astonishment, he beheld the face of Edward, the King who came before him in the succession.

King Edward spoke, "Graham, your kingdom is strong now, thanks to the recovery of the three treasures and your wise leadership. But it will soon grow weak again, if you do not provide and heir to the throne. Marry, my son, and give your people a prince that make their future secure."

The vision faded. King Graham pondered how he might find a bride fit to reign over Daventry. He consulted with Gerwain, his wise prime minister.

"She must be good, and kind, so that she will love my people and they will love here," said Graham. "She must have the wisdom to counsel me in my daily problems, and a loving heart to bring me comfort. I wish my Queen to glow with an inner beauty of spirit as well as beauty of face and form."

Gerwain suggested that Graham host a celebration, and invite all the maidens of marriageable age from his whole kingdom. He could then observe and conserve with the likely candidates, and see if any one of them fit his idea of a queen.

The invitations were sent out, and the whole kingdom turned out for the celebration. From every corner of Daventry the maidens came. Short and tall, slender and plump, fair and dark, pretty and plain. There were maidens from all stations of life, from Dukes' and earls' daughters to the village goose girl and the scullery maid from the castle kitchens. They all had some fault, however small. It was with great relief that Graham saw his guests ride away at the end of the celebration. He retired to his room to reflect gloomily.

"My kingdom is home to hundreds of lovely maidens," he mumbled. "Why is there not one among them who touches my heart and my dreams."

As he asked the question, King Graham was standing near the magic mirror. He glanced toward it, and noticed that the glass had grown inexplicably cloudy.

The mist cleared, All at once, King Graham beheld the most beautiful maiden he had ever seen. She had hair of glowing auburn, and eyes of midnight blue. Her skin was the color of rich cream, but alas, no roses bloomed in her cheeks, and the corners of her pretty mouth drooped in sorrow.

She was standing at a window, motionless except for the stray breeze that stirred her hair. A tear fell from one eye, and sparkled on her cheek like a diamond on velvet. She put up one hand to brush it away, and Graham was struck by the grace of her movement. He wanted to take her in his arms, and protect her from trouble forevermore. Eagerly he consulted the magic mirror.

"Oh mirror wis," said Graham, "I have vowed to make this maiden my bride. Where may I find her?"

The mirror clouded again, and a voice was heard. "This is the maiden Valanice. She is from the kingdom of Kolyma, and is known for her goodness no less than her beauty. The jealous crone Hagatha whisked Valanice away to an enchanted land, and imprisoned her in a quartz tower guarded by a ferocious wild beast."

"I must rescue her or die in the attempt," declared King Graham. "How may I find this enchanted land?"

"You must travel to the kingdom of Kolyma," said the mirror. "There you may search for the keys which unlock the three doors to the enchanted land..."

The voice faded and the mirror cleared. Graham stared at his own reflection. Vainly did he call for its return, to give him more clues to the whereabouts of the magic keys. Finally, he shouldered his provisions, and set out on his quest of love.

Only you, my bold adventurer have the power to finish this tale. Accompany King Graham on his quest to find the magic keys. Encounter characters of legend, folklore and fantasy. Explore underground caverns, eerie towers, and ocean wonderlands. Help him rescue the enchanted maiden, so he can lay his kingdom and his heart at her feet.

You will be faced with challenges that would intimidate those of lesser timbre. Summon all your strength and courage. Leave no stone unturned, no avenue unexplored, and your perseverance will be richly rewarded.

It may be possible to find each key through more than one avenue. The more imaginative your solutions, the greater you reward.

Study all the ancient lores for clues. Along the way collect as many treasures as you can - treasures fit for a queen.

Game play instructions:
King's Quest II requires either a //c or a 128 //e with double hi-res graphics capabilities.

Commands for the Hero:

Talk to your computer in commands of one or two words, or even simple sentences.

Use a joystick or the Keyboard to move King Graham around.

Joystick-Directions for directions. Button 0 for return, Button 1 for swim.

Keyboard-
- North/Northwest
- North/East
- West
- South
- South/Southwest
- Northeast
- Southeast

Arrow keys for North, South, East, and West.
