Notes:

1. Archers have 12 shots
2. Archmages may cast 2 Fireball spells
3. Elves have 24 shots
4. Living Trolls regenerate to full hit points
5. Druids may cast 3 Lightning Bolt spells
6. Orcs have 6 shots
7. Giants have 6 shots
8. Dragons are immune to magic
9. Ghosts absorbs creatures they kill
10. Vampires heal thier own wounds equal to the damage they inflict
11. Demons may halve any troop

The crypt below the ruined keep was dank and musty. Moisture congealed on the floor, forming small puddles. A pair of grimy grave robbers braved the crypt and went in search of the tomb.

Caneghor the Mystic, old and bent, sifted through ancient relics buried along with an equally aged mummy. His young and somewhat frivolous companion, Hack the Rouge, sought treasure in the tomb of an ancient warrior queen. Caneghor smiled as he turned the pages in a book and silently wished Hack luck, warrior queens were not known for their bounty.

"Aha! Hack come here and look at this," chortled Caneghor. His eyes gleamed like a librarian who has found a rare and precious volume. One of the tomes floated in the air before Caneghor. He was studying it intensely, leafing through the pages with a rapidity surprising for one his age.

Hack strutted out wearing glistening jewelry he had just liberated from the warrior queen. His eyes betrayed fear as he noticed the levitating book. "I wish you wouldn't do that around me, I hate it!" Hack paused and gave an appraisal, "Book looks valuable...gold inlay on the leather...lemme see it!" As Hack reached for the floating book, Caneghor shouted fiercely, "No!" His eyes blazed with mystic power, "This is for the Master."

The cave was unfathomably large as was it's chief occupant Arech Dragonbreath. Arech wondered what his henchmen wanted now. Hack the Rouge was an unbearable, petty thief who acted the part of an accomplished master criminal. Arech laughed, hot smoke streaming from his scaly nostrils, as he thought of several bloody ways for Hack to die. Hack paled as he was bathed in the unendurable warm smoke. He backed away from the immense dragon, trying to blend in with the natural crevices of the cavern wall.

Caneghor decided that it was time to speak, "O Arech, mightiest of dragons, most cunning of all, I bring you knowledge of unbridled power."

Arech smiled, rows of dagger-sharp teeth glistening with saliva. Caneghor always knew how to please him. A very useful man, even though he was unambitious.

"What do you bring me, master sage, to enthrall me, mesmerize me?"

"A book, milord. A book with a prophecy," intoned Caneghor. He straightened, "The prophecy which foretells how Good King Maximus can lose his scepter to the base, sordid, lowly world.""How is that, Caneghor?"

"Arech's greed for power was aroused, "How can I dethrone Maximus?"

"Oh, the Scepter of Order," blurted the suddenly courageous Hack.

Arech glared at the Prince, daring him to continue.

"Ach, the Scepter of Order."

Prince Barrowpine stode regally into the room. The pair of guards escorting him remained just inside the entryway, waiting silently. The Prince spoke, "You should be studying, not daydreaming, O mighty wizard."

"Prophecy muttering to himself. Magus Deathspell could not believe it. He the translating the second part of the Prophecy, taunted the elf.

At first the battle went well. The Baron withdrew to a hill overlooking the field of battle surrounded by his entourage. His troops slaughtered the surprised garrison that met them on the field. Bargash Eyesore was especially impressive, laying waste to all about him. He pulverized friend and foe alike with his deadly spiked club.

Then, Maximus appeared on the castle parapet. He was adorned in mirrored armor, a beacon of blazing light reflecting the mid-morning sun. He held the Scepter of Order high, so all could see it. Suddenly, pikemen rushed from the hastily opened castle gates, clearing a path for the charging cavalry and knights.

"A dirt encrusted horsemen knelt before King Maximus, "My liege, Baron Makahl has been captured. We have thrown him in the dungeon next to his single visioned companion."

The King grinned, "Well done. The Four Continents are safer now that he lays in captivity."

"A bearded wizard, garbed from head to toe in crimson, bent over the Tome of the Prophecy muttering to himself. Magus Deathspell could not believe it. He had translated the second part of the Prophecy."

"Ach, the Scepter of Order."

"How dare you," he yelled. "What do you want?"

"We fight now," bellowed the dim-witted Bargash Eyesore. "Ach says attack castle now."

"Kill! Bargash smiled toothily as the slave crept with his subject. The Baron smiled, pretending not to notice the exchange. How quaint, the one-eyed monster wanted to play with the soldiers. "Prepare the troops. I will lead them myself. Now, leave me."

Baron Johnno Makahl stretched his considerable girth across the pillows which lay strewn across the tent floor. A slave girl murmered dreamily next to him. He knew how to please him. A very useful man, even though he was unambitious.
symbol of Chaos." Magus continued, "The only kings extant now are Maximus and
Urchak Kikleth, the Demon Kreech."

"Very well." sighed the Prince, "I suppose we should inform Arech of this."

IV

It was after midnight. Furtive clouds stole quickly over the face of the moon, as if afraid to remain in any one place for too long.

The devastated castle crested a desolate hilltop. Long moon shadows played ominously over the empty courtyards, highlighting the bleakness of the ruins. The whole place reeked of death, dead, as though death's dark hair, shaggy and unkempt, crawled all over it. In the still functional north wing of the castle, three figures sat across from one another at a table in a dimly light room. Two were Undead, and the third gestured wildly over a map which lay across the table. A demon, and a dragon, were plotted on the map. A demon, and a dragon, were plotted on the map. A demon, and a dragon, were plotted on the map. A demon, and a dragon, were plotted on the map.

"It cannot be done at night. It is not proper to conduct a battle after dusk. We have enough forces, let us attack by daylight," pleaded the lone human in the room, Auric Whiteskin.

Auric was a bear of a man, tall, heavily muscled, and full of life. He wore his custom tunic, a hideous mess of clothes, his long hair falling to his shoulders, his beard as long as his arm. He was a man of action, a man of war, and he knew it. He knew that the future belonged to those who fought for it, not those who sat back and waited for it to come to them. Auric was a warrior, a man of the sword. He was a man of the sword. He was a man of the sword.

His eyes, which some said revealed madness, darted back and forth across the room, glancing at everything and recognizing nothing. Nickolai's fists clenched and unclenched constantly, moving in a strange cadance with the mutterings which passed through his lips. His voice was a deep, rumbling growl, like the sound of a tiger roaring. He was a man of the sword, a man of the sword, a man of the sword.

"But Sir Moradon, you forgot. A demon is going to rule the Four Continents. No matter how powerful this dragon Arech is, will he be able to control a demon as he would a puppet? I think not. Yet I cannot agree that life would be much easier if Arech held sway in the government. I found his arguments very persuasive. Besides, I think it would be very thrilling to poison our unsuspecting Maximus at a public feast."

Nickolai stopped moving and silence spread over the room like a blanket. His eyes turned to the fire and he said, "We will side with Auric. The demon king will help us greatly as will Arech. We must act swiftly."

Aimola and Moradon turned and stared at one another. Maybe the rumors were true, their sorcerer Lord Nickolai had cast one spell to many in his thirst for power.

Nickolai made for the door and thrust it open. A kitchen boy, no doubt sent to notify the trio of the exact time they were expected at the feast, paled with fear at being caught evesdropping. The Czar picked up the child roughly and shut the door. Grinning savagely, he drew a long sharp dagger from a hidden sheath.

The boy struggled fiercely, trying to make noise, trying to bite the hand that smashed his mouth, trying to live. It was to no avail. Nickolai arched the boy's head backward and ran his razor sharp dagger across the exposed throat. A fountain of corrupting blood burst from the youth's slit arteries, spraying the walls with a multitude of tiny crimson droplets.

Moradon smiled a simple smile of pleasure as he watched Nickolai with utter fascination. The boy had not a single handkerchief to wipe the blood from his face with, and he did not utter a single sound of pain as she wrenched his gaze. Nickolai laughed with glee as he cleaned his knife on the back of the boy's tunic. Not a drop of blood stained his clothes.

"Let's prepare for the feast," he commanded the Czar. "Go to your rooms and meet me as soon as you can. I shall take care of my little mess."

Aimola and Moradon had left. Nickolai fell to the floor trembling. "No, no. Never will I stay in control. It was not to be. Flames leapt out of nowhere and danced all around him. He closed his eyes and disappeared."

The day swept over Nickolai's body. He stood up and surveyed the completely clean room with eyes of fire. There was no trace of the blood or the body, all that remained was a slight smell of sulfur.

V

King's Castle was in a state of uproar. Rebels had successfully wrested control of the entire continent of Sahara from King Maximus in a matter of days. A seemingly endless stream of refugees were pouring into the castle daily, seeking safety and shelter.

To make matters worse, a trio of disreputable nobles from a distant land were in the castle. They were forever wandering into restricted areas with innocent looks on their faces, and mercilessly running the royal stews, ragged. It seemed that the nobles felt that they had to take the king something, to make him feel the wrath of the gods. If it were a demon, the Czar would have no problem. Yet they have so much power to offer. Demons bother me, nothing else does. I don't let them bother me. Demons don't care what I let them do or don't do, they do what they want. What are you going to do?"

Sir Moradon the Cruel, a knight with a rather sinister backround, took the Czar's question as a cue, "I think we should ally with this Arech Dragonbreth. He has impressed me more than this knave Maximus. Arech said he would liberate Sahara and he did. Maximus was supposed to have a conference with us more than a week ago about establishing trade between our two empires."

A man of inaction and indecision does not impress me as much as a man who will take risks to get it done, even if it fails. He should rule the Four Continents rather than Maximus."

Moradon neglected to mention that he was secretly promised significant trade monopolies for cooperating with Arech. He had hesitated when Arech mentioned that a demon would rule as a figurehead, but his reservations were cleared when large parcels of land were dangled before his greedy eyes.

"Princess Aimola, a rather striking if overweight woman known more for her deceitfulness than her beauty, sat upon a great stuffed chair. Absentmindedly twisting a lock of her hair in her hand, what Sir Moradon the Cruel had said. She also pondered the treasure hoard that Arech had shown her. It was to be hers if she supported him with one small indiscretion."

"It is to be hers if she supported him with one small indiscretion."

The devestated castle crested a desolate hilltop. Long moon shadows played ominously over the empty courtyards, highlighting the bleakness of the ruins. The whole place reeked of death, dead, as though death's dark hair, shaggy and unkempt, crawled all over it. In the still functional north wing of the castle, three figures sat across from one another at a table in a dimly light room. Two were Undead, and the third gestured wildly over a map which lay across the table. A demon, and a dragon, were plotted on the map.

"It cannot be done at night. It is not proper to conduct a battle after dusk. We have enough forces, let us attack by daylight," pleaded the lone human in the room, Auric Whiteskin.

Auric was a bear of a man, tall, heavily muscled, and full of life. He wore his custom tunic, a hideous mess of clothes, his long hair falling to his shoulders, his beard as long as his arm. He was a man of action, a man of war, and he knew it. He knew that the future belonged to those who fought for it, not those who sat back and waited for it to come to them. Auric was a warrior, a man of the sword. He was a man of the sword. He was a man of the sword.

"But Sir Moradon, you forgot. A demon is going to rule the Four Continents. No matter how powerful this dragon Arech is, will he be able to control a demon as he would a puppet? I think not. Yet I cannot agree that life would be much easier if Arech held sway in the government. I found his arguments very persuasive. Besides, I think it would be very thrilling to poison our unsuspecting Maximus at a public feast."

Nickolai stopped moving and silence spread over the room like a blanket. His eyes turned to the fire and he said, "We will side with Auric. The demon king will help us greatly as will Arech. We must act swiftly."

"Let's prepare for the feast," he commanded the Czar. "Go to your rooms and meet me as soon as you can. I shall take care of my little mess."

"After Aimola and Moradon had left, Nickolai fell to the floor trembling. "No, no. Never will I stay in control. It was not to be. Flames leapt out of nowhere and danced all around him. He closed his eyes and disappeared."

"It is done, wizard?" That was Arech, impatient and imposing. "Let us finish our business."

"It is ready, Arech." Magus glared at the dragon and took a deep breath, "I should rest before I summon Urtherax Killspite, he is strong and I am too tired now to incant the spell of madness that progress was made deciphering the last part of the Prophecy. I am chaotic."

"Very well, Magus. I do not like having to wait, but I dislike the thought of having toמתimelapse this four hour spell, proclaimed Arech."

"The Wizard left and Arech flew out of the cavern entrance to do some research himself."

Magus walked through the tunnel system to the library. The network interlacing
parcels of land were dangled before his greedy eyes.
"In addition to the propechey," said Caneghor. "It seems that conditions must be met for the Sceptre to be released."

Barrowwine continued, "No evil maybe in the castle except the evil stealing the Sceptre. Once the Sceptre has been stolen, we must wait. King Maximus will sicken and die soon, after the theft. While he sickens, so will the land. Chaos will slowly replace Order. When the King is finally dead, the demon will sit upon the throne."

Caneghor concluded, "And with the demon on the throne, we will have accomplished all that we have strived for."

"I just hope Arech can control the demon," said Caneghor nervously, "I would not relish living under the rule of a freed demon."

"There is no fear of that happening, my incantations will bind the demon thoroughly," assured Magus.

The two youths left their leave and went to their chambers to rest and prepare for the evenings exertions.

Arech returned to his chambers. The news he had received was disheartening. He would have to arrange for his servitors to be removed from King's Castle. Baron Makahl and Bargash Eyesore were faithful servants and Arech knew their abilities completely. But the three new allies were another question altogether.

Czar Nickolia, Sir Moradon, and Princess Aimeola had held captive for attempting to murder Maximus. Overconfident, they had made mistakes. Before the feast had begun, an outcry was raised, a kitchen boy was missing. Maximus and the revellers left the table to search for the lad. The three panicked and began preparations to leave.

When the youth did not turn up after many hours, the search was called off until morning. The food for the feast had been left untouched and Maximus had given it to his servants. The one eating Maximus' portion had died from poisoning.

Conspicuous by their absence, the three were brought before the King. Poison had been found in Aimeola's belongings, which were packed neatly away for a midnight journey. Furious, the King jalled the three and set their execution for the first day of the Festival of the Peasent.

Arech wondered if he could trust such a trio to serve him. However, it did not matter. They had to be removed from the castle along with the rest. Arech rumbled and exhaled smoke, entranced by the sight of the fire. He knew just the pair to free them all from Maximus. Now, on to the conjuration.

VII

The two pirate ships cruised silently over the ocean waters. They were sailing blind at night, sneaking up on the King's Castle with only the light of the quarter moon to guide them. The two groups of pirates, one led by Rob and the other by Mahk, waited at the castle's perimeter. The shouts of the guards could be heard as the pirates crept past them.

All that remained now was to return the five convicts to Arech. Rob laughed gleefully. It had been horrendously easy. Walk in, free the prisoners, and walk out. Mahk had done his job excellently, drawing all of the attention to himself and allowing the demons to strike from behind.

All that remained was to return the five convicts to Arech. Rob laughed again, exulting in the sea breeze whipping across his face. They were asleep below decks and his and Mahk's ship were sailing quickly away, with no pursuit in sight. Arech would reward him well.

VIII

Magus stood in the center of the cavern dressed in his finest red robes with his arms upraised. His brow was furrowed in concentration which threatened to break as a single, warm bead of sweat slowly traced a cold, wet path down his forearm to his sweat drenched chest.

The incantation was harder than he thought. He realized that summoning Urthrax was working and no doubt sent by Urthrax to disturb the wizard. Magus shut them out, he did not want to be summoned and he was testing Magus to see if he was worth anything but a slow, lingering death.

Magus moved distantly around, attracted by the strong magic Magus was working and no doubt sent by Urthrax to disturb the wizard. Magus shut them out, they could not enter his protective circle anyway. No harm could be perpetrated, especially through Magus's line of sight. Urthrax had come! Sulfurous vapors swirled madly in the center of the pentagram. A ring of towering flames flared up inside the protective circle of the pentagram. The cavern turned totally black. Slowly, from the center of the pentagram, a firey light shone. Urthrax Killspite had come.

He was huge and terrifying. His skin was bright green and had a scaly texture. His arms were long and heavily muscled with cruel, sharp nails extending inches beyond the ends of his powerful fingers. His massive torso was topped by a ghastly head. Thick, green horns protruded from the side of his head. The features of his face were blunt and ugly. His manner reeked of death, command, and power.

When Urthrax spoke, his deep voice seemed to echo from the vastness of his dragon. He said, "I passed across Mark's green face. The cabin boy would live, it was time to fight! Mahk dressed quickly, picking up clothes off the floor of his cabin haphazardly. With care, he took his mighty two-handed sword from its protective coverings. It shined brightly in the dim lamplight.

Makh left the cabin and waited.

Murray, sometimes called The Misere, fell asleep inside the castle walls. He "slept" next to the gate mechanism for King's Castle. At the appointed time, he was to open the gate and allow a band of pirates to swarm the castle, freeing those political prisoners. He was attempting to murder Maximus and had given up.

Murray got up and stretched, the time was near. His aged bones cracked and ached when he got up. He scratched his balding head and rubbed his beard with his giant sword. It was getting darker and harder to wake up. He heard something.
LETTER OF TRANSMITTAL

FROM: Thometz, G., Admiral, Commandant, Star Fleet Academy, San Francisco, USNA, Earth

TO: Kirk, James T., Admiral, Star Fleet Command, commanding NCC-1701
ENTERPRISE, on active-mission status (via: Star Fleet Command/Deneb: scrambled/Captain's seal: hold for arrival: routing code EF7001732260124144039851825SF/FSIG)

SUBJECT: ADVANCED CADET-EVALUATION MATERIALS

Sirs:

You will be pleased to know that Star Fleet Command has chosen the Enterprise's recovery of the USS Robert A. Heinlein during the second five-year mission as the model for the new cadet-performance evaluation exercise at Star Fleet Academy, Earth and Star Fleet Academy, Deneb, supplementing the "Kobayashi Maru" scenario. (Star Fleet Academy, Vulcan is presently evaluating the supplement to see that it meets their logic standards, and Admiral T'Kaien's office assures me of a decision within several standard weeks.)

You have not been the only commander to point out the Academy's urgent need for a subtler and more complex evaluation scenario than the one offered by the "Maru."

While administering the "no-win" scenario gives us a good preliminary sense of who our potential heroes are, it leaves untested those qualities in a commander that are as important as heroism, but less spectacular: namely, observation, accurate evaluation, and multi-level "synthesis" -- not to mention sheer endurance, empathy, and humor. The Enterprise's recovery-mission scenario gives us ample opportunity to test for all of these, in depth. And since the mission results were (naturally) never declassified, the effectiveness of the material as a means of testing the command aptitude and intelligence of new cadets should be very high indeed.

I suspect that some of Fleet's eagerness to implement this new scenario has to do with the fact during the past year three more cadets have broken the old "Kobayashi Maru" scenario--and only one of them used methods similar to yours. (This information is to be treated as confidential until further notice.) Apparently, cadets are getting smarter. Or perhaps the no-win scenarios of the past are no longer a sufficient match for the deviuousness and resourcefulness of the present.

At any rate, we need to prepare our cadets for reality, not fantasy. Both the despair of the pure no-win scenario and the equally dangerous elation of the "no-lose" attitude lie mostly in the latter category. We look for good results from the new scenario, for it concerns the real-life, "gray" area between those two attitudes. Administration methods will vary. The test may be conducted via sleep learning or in computer simulation.

Star Fleet Academy, Earth will be administering it aboard the new training ship USS Sans Souci. I am enclosing a copy of the computer version for you to evaluate. Please feel free to make any suggestions you think will improve the usefulness of this scenario as a test for future starship captains.

Sincerely,
Admiral G. Thometz, Commandant Star Fleet Academy, Earth

(P.S.: Let's see them cheat on this one, huh, Jim? Also, 'Eliak sends her regards. Best, Greg)

BRIEFING

Transcript of disk SFC/SFAMK2 #664658: Audio/sleep-learning cadet preparation session. Authorized personnel only.

(CAUTION: Full Vulcan cadets should not take the direct-experiential version of this briefing, due to the presence of species-idiomsyncratic emotional reactions.)

The communicator whistles right into your ear. The dream you were having about hiking in the Grand Canyon falls right out of your head as your eyes snap open. You lie there staring at the ceiling for just long enough to let your heart rate slow down a little, then sit up and swing out of bed, hitting the communicator switch.

"Kirk here. This had better be good, Lieutenant."

"It may not be good, sir," says the dry voice of the duty communications officer, "but it's important. Eyes-only dispatch from Star Fleet."

You groan softly to yourself and sit up a little straighter, just enough so that you can reach the keyboard by the bed and type in the long string of characters that will give the comm officer access to your command ciphers.

"Have the computer send it down here."

"Aye, aye, sir."

You wait a few seconds. The communications officer wakes up your desk screen by remote, then switches off.

"Voiceprint," says the desk computer.

You say your name.

"Retinal," says the computer.

You hold still and let the low-power laser flicker in your eye. Without further ceremony the desk screen fills up with print, amber on black.

****************************************************************

From: SFC, EARTH VIA SFC, DENEB
To: JAMES T. KIRK, CAPT. (COMMANDING)

Subject: SPECIAL MISSION ORDERS

TEXT: U.S.S. Heinlein, on exploratory mission in Trianguli area, has fallen out of communication under what we consider suspicious circumstances. Routine hourly telemetry squirts ceased without explanation twelve hours ago. Appended to these orders is the contents of a single unscheduled squirt that came to us via an unusual routing—dumped to a robot communications satellite near Gama Trianguli, apparently by high-powered communications tachyon packet beam. You are to evaluate the contents of the telemetry squirt and report immediately at maximum warp to the Heinlein's last known position, which is indicated in the squirt.

WARNING: Heinlein was pursuing a mission, the objectives of which are highly sensitive and have not yet been declassified for any personnel except those of Star Fleet Command, Earth Fleet Admiral's Office. This mission material will be available to you as soon as declassification procedures are completed.

Address any inquiries to Star Fleet Command, Earth.

(Respectfully) NHS. Rihaul, Admiral, Star Fleet Command, Deneb

****************************************************************

You say a little where you sit, letting out a worried sigh as the screen scrolls down and adds:

****************************************************************

P.S.: Jim --- Stay out of trouble. You're going to be a long way from help. Best, Nhauris.

****************************************************************

"Stop," you say to the screen as you get up and head for the closet to get into uniform. Damn, you think. Sulu has the Heinlein. What's he gotten himself into now? Brand-new ship. And you were the one who recommended him for this temporary command assignment. When one of command rank with sufficient knowledge of the Trianguli sector was available, he was the perfect choice. You thought he'd just ride around for a few weeks, enjoy the scenery, and not get himself right into trouble.

You pull the uniform top over your head and sit down at the desk. "Go," you say to the computer.

"Appended," it says. "Visual and audio content."

"Ready. Go."

The text vanishes. Part of the screen begins reading out printed telemetry, the ongoing status of a starship's main function boards. The rest of it fills with an image of the ship's bridge. The Heinlein is one of the newer light-cruisers and, though the bridge is a touch smaller than the Enterprise's, it's sleeker, neater. Banks of switches have been replaced by light-controlled relays or motion sensors; screens are bigger and clearer: the fore screen looks more like a picture window, one that you could walk right out of and into the stars drifting slowly toward you. You look past the helm, at that screen. Sitting in the center seat is a lithe young form, with his back to you. You know that from where you are now. But he's not so young anymore, and very straight he sits in his own center seat, superbly self-assured. He is staring at the contents of the screen intently.

"Don't lose it, Michael," he says softly. "You lose it, I promise you I'll dock your pay."

The navigator looks over his shoulder for a second. Wearing the slightest grin, he says, "Sir, this fish is hooked. Eighteen light-years out of bed, having stared at it for so many years when you were sitting where he is now. But he's not so young anymore, and very straight he sits in his own center seat, superbly self-assured. He is staring at the contents of the screen intently.

"Screams," says Sulu.

"Deployed," says the helmsman, glancing over her board. "At full intensity."

"Phasers---"

"Ready, sir."

"Don't get trigger-happy, Brynne. They're just in case."
“Noted, sir,” says the helmsman. But you notice that her fingers are twitching a bit — the way Sulu’s used to, once upon a time. Despite the building tension, you smile a little.

“Target at sixteen light-years,” says the navigator.

“Identification yet?”

“Not close enough, sir.”

“I want to know who that is,” Sulu says softly, “and what they’re doing here so close to what we just passed.”

“Target’s accelerating, sir! Warp five now --- warp six ---”

“Oh, no you don’t,” Sulu says. “Catch him. Maneuvers at your discretion.”

“Warp seven now, sir,” says the navigator, and the ship moans softly in its bones as it leans into higher speed. You lean forward a little with it. Stars stream by the screen faster. And up there in the darkness, just barely visible, something shines.

“Visual!” says the comm officer. “No response to hails.”

“All right,” Sulu says, not sounding entirely regretful, “we’ll do this the hard way. Rhia, what do its engines’ power-consumption curves look like? Can you get a fix on them?”

— and your insides jump in terror as the screen whitens out, as the ship lurches madly and people caught entirely unaware spill onto the floor as the Heinlein’s automatic red-alert sirens begin wailing like banshees, as the moaning of the ship’s engines gets alarmingly loud. Sulu is still in his helm — how, you can’t imagine, shouting orders, hearing answers back before he finishes them.

“--- five ships --- six --- eight now ---”

“--- fore screens down to forty percent, sir!”

“--- fire at will ---”

“--- hull pressure ---”

“--- explosive decompression!”

“--- seal down decks five and eight ---”

“--- Wil, dump the log three ways, hurry it -- packet the top (justified or not), a brief career history of each crew member is included. (Excerpted from Who’s Who in the Federation, revised edition. Reproduced by permission, Marquis, Who’s Who Interstellar, Earth/Vulcan/Deneb V.)

“Star Fleet Command, Deneb, this is Heinlein ---”

“--- twelve of them, sir ---”

“What are they? who are they!”

“--- can’t even ---”

“--- hull pressure ---”

“--- starboard nacelle ---”

And then comes another terrible explosion and crash and flinging of bodies about. Visual goes down, leaving you with a screen two-thirds black, the rest displaying frantic and deranged readouts from science station, helm, navigations: all systems near failure, life support going, matter-antimatter reaction near critical --- and the voices, the terrible voices, confused, desperate, brave:

“--- come on, Wil, move it!”

“--- phasers ---”

“--- tubes are crushed, no use ---”

“--- Star Fleet, Deneb, do you read? U.S.S. Heinlein ---”

And worst of all, Sulu’s voice, flavored with something you’ve never heard in it before --- despair.

“Oh, my god ---”

A scream; then nothing but black noise, the complacent hiss of uninvolved stars. And even the telemetry dies.

“End file,” says the screen.

You have to hold still for a few seconds, again, to let your heart slow.

“Bridge,” you say then.

“Bridge. Lieutenant Renner.”

“Get me Star Fleet,” you say. “And once you’ve done that, recall the special-missions crew. We’ve got trouble.”

“Yes, sir”

Sulu... you think.

“Any other orders, sir?”

You think about that too.

THE CREW

Cadets may wish to review the histories and careers of the principal Enterprise special-missions command crew. Although much of this information is common knowledge among Star Fleet personnel, cadets of species in which latency has occurred recently (plus/minus ten standard years) may not be familiar with the qualifications of the command crew of the Enterprise. For their benefit, and to dispel many rumors, a brief career history of each crew member is included. (Excerpted from Who’s Who in the Federation, revised edition. Reproduced by permission, Marquis, Who’s Who Interstellar, Earth/Vulcan/Deneb V.)

ADMIRAL JAMES T. KIRK

Admiral (Commanding) James T. Kirk: A legend in his own time; soldier, diplomat, and student of history; past and present commander of a ship whose name is synonymous with bold adventure; born Iowa, U.S.A., 28 July 2132; graduated Star Fleet Academy with highest honors; relieved Captain Christopher Pike and served as captain of U.S.S. Enterprise for the duration of her second five-year mission; promoted to commodore, then admiral, and assigned to Star Fleet Command, San Francisco, Earth; reassigned to the refitted Enterprise at the time of the Virgil crisis; now commanding Enterprise for special exploratory, diplomatic, and interventional missions; adviser to the Federation Council on Interspecies Affairs; Chairman, Cadet Commandant’s Training Studies Group, Star Fleet Academy, Terra.
CAPTAIN SPOCK

CAPT. Spock First Officer and Science Officer, USS Enterprise
Half-vulcan

WEIGHT: 170 lbs. at 1g

Typical Vulcan physiology: Two hearts and manganese based blood cells. Special attributes: Contact telepathy; scientist and mathematician of galactic repute.

Captain Spock: An inseparable part of the Enterprise legend; galactically renowned scientist, research mathematician, and computer specialist; serving for these missions as First Officer and Science Officer; born ShiKahr, Vulcan, 56 Tasmeeen, 503 VSD; graduated Star Fleet Academy with highest honors; assigned to Enterprise during Captain Christopher Pike's command; associated with her ever since, excluding a period spent on sabbatical on Vulcan after the second five-year mission; returned to service aboard Enterprise during the Vejur crisis; promoted to captain shortly thereafter; assisting Star Fleet in designing the courses and curricula to be used when the Enterprise becomes a training ship; currently in special-mission service.

DOCTOR MCCOY

CMDR. Leonard Edward McCoy, MD.
Chief of Medicine and Psychiatry, USS Enterprise

Human - HEIGHT: 5'11"; HAIR: Brown; EYES: Blue; BLOOD TYPE: A+

Special Attributes: Fellow of the Interstellar College of Xenomedicine.

Leonard McCoy, M.D. (Commander): Another name that made Enterprise famous (or vice versa); chief medical officer during the second five-year mission and again (after a brief retirement) during the Vejur incident; commissioned full commander after the incident; born Atlanta, Georgia, 24 October 2119; M.D. and internships, Cornell Medical Center/New York Hospital; board certified in human and exopsychiatry, Payne Whitney Clinic; senior fellow, the Interstellar College of Xenomedicine; enlisted and assigned to Enterprise; one of the most decorated medical officers in Star Fleet; Legion of Honor; Star Fleet Awards of Valor; Fleet Surgeons' "LifeStar" with double cluster; rumored to have had the Enterprise's sick bay rebuilt to his own specifications.

COMMANDER SCOTT

CMDR. Montgomery Scott
Chief Engineer, USS Enterprise

Human - HEIGHT: 6'1"; HAIR: Brown; EYES: Brown; BLOOD TYPE: O-

Hobbies: Comparative alcohol appreciation, Reading technical manuals.

Commander Montgomery Scott: Renowned throughout Star Fleet as the man who can make anything work; chief engineer of Enterprise for almost her entire period of commission; born Aberdeen, Scotland, 31 August 2121; shipwright's apprentice in the P&O Orbital Shipyards at L5/"Glasgow Yonder" until old enough to enter Star Fleet Academy; junior engineer aboard U.S.S. Potemkin; assistant chief engineer aboard U.S.S. Hood; transferred to Enterprise under Captain Pike; brief stint at Star Fleet Corps of Engineers, Planetary Division, following second five-year mission; Nobel Prize nominee (structural engineering) for the design and construction of the dome for Greater Mariner Base; serving aboard Enterprise for special missions; working on engine plans for NX transwarp starships.

COMMANDER UHURA

CMDR. Nyota Uhura
Chief of Communications, USS Enterprise

Human - HEIGHT: 5'5"; EYES: Brown; HAIR: Black; BLOOD TYPE: AB+

Hobbies: Comparative Xenolinguistics, Denebian Opera.

Commander Nyota Uhura: Rumored to have opened more hailing frequencies than any other entity alive; known throughout the galaxy as "the Voice of Enterprise"; born Nairobi, United States of Africa, 24 October 2140; M.S., comparative xenolinguistics, Queen's College, Cambridge; enlisted in Star Fleet, Communications Division; assigned to Enterprise early in the second five-year mission; promoted to full commander at the mission's end; assigned to Federation True Universal Translator Project (which she created); serving as special-missions communications chief; concurrently conducting research on the potential of thought as a carrier for instantaneous interstellar communications and species-specific context in language.

LT. COMMANDER CHEKOV
LT. Pavel Chekov
Weapons Officer, USS Enterprise
Human - HEIGHT: 5'10"; HAIR: Brown; EYES: Brown; BLOOD TYPE: A+
Hobbies: Antiquing, Computer Simulations, Chess (2-D & 4-D), Limited Warfare, Graphic Design.

LT. Janice Kerasus
Chief of Linguistics, Communications Department, USS Enterprise
Human - HEIGHT: 5'9"; HAIR: Brown; EYES: Brown; BLOOD TYPE: A+
Hobbies: Children's Books, Surf Fishing.

LT. Olga Litowsky
Chief Computer Librarian, USS Enterprise
Human - HEIGHT: 5'10"; HAIR: Blue; EYES: Brown; BLOOD TYPE: B+
Hobbies: Graphics Arts, Historical Costumes.

LT. Jerry Freeman
Assistant to Security, USS Enterprise
Altonian - HEIGHT: 5'6"; HAIR: Black; EYES: Brown; BLOOD TYPE: B-
Hobbies: Antiquing, Comic Book Collections, Antique Entertainment forms, Image Processing.

LT. Azriech Lee
Junior Weapons Officer (specialist in phaser technology), USS Enterprise
Human - HEIGHT: 5'6"; HAIR: Black; EYES: Brown; BLOOD TYPE: B+

LT. Derval Seamonn Ni Avoca
Replacement Helm Officer, USS Enterprise
Human - HEIGHT: 5'11"; HAIR: Black; EYES: Brown; BLOOD TYPE: A+
Hobbies: Irish Studies, Amateur distilling of off color limericks.

LT. Sean Ohara
Destruction of all of the ship's dilithium crystals will force the ship to drop out of warp. The ship may proceed on impulse power until repairs are

LT. CMDR. Lia Burke, RN, MD, ND, FICN
Former Astronaut, USS Enterprise
Human - HEIGHT: 5'7"; HAIR: Blonde; EYES: Hazel; BLOOD TYPE: A+
Special Attributes: Past Contact Bridge Champion of the Federation - four standard years.

LT. Olga Litowsky
Chief Computer Librarian, USS Enterprise
Human - HEIGHT: 5'10"; HAIR: Blue; EYES: Brown; BLOOD TYPE: B+
Hobbies: Antiquing, Comic Book Collections, Antique Entertainment forms, Image Processing.

LT. AT. Tanzer
Assistant to Security, USS Enterprise
Human - HEIGHT: 5'8"; HAIR: Black; EYES: Brown; BLOOD TYPE: A+

LT. Atzi Leoh
Junior Weapons Officer (specialist in phaser technology), USS Enterprise
Human - HEIGHT: 5'6"; HAIR: Black; EYES: Brown; BLOOD TYPE: B+

LT. CMDR. Harb Tanzer
Chief of Recreation, USS Enterprise
Human - HEIGHT: 5'9"; HAIR: Sliver; EYES: Blue; BLOOD TYPE: A+
Special Attributes: Professional Violist; Third Degree Black Belt (Kung Foo)

Captain Hikaru Sulu: Former helmsman of Enterprise, temporarily assigned as captain of the exploratory ship U.S.S. Robert A. Heinlein; born Wailuku, Maui, Hawaii, 3 July 2141; enlisted in Star Fleet Academy; graduated with highest honors with a dual specialty in engineering and helm functions; assigned to Enterprise early in the second five-year mission; promoted to lieutenant commander at its end; transferred to Star Fleet Command, Earth; awaiting first officer's billet aboard one of the new Grissom class exploratory starships; currently posted to Enterprise for special missions; captain of the solar-sail yacht Volga and of the winning America's Cup sky yachting team for the past two years.

CAPTAIN SULU

Hobbies: Antiquing, Computer Simulations, Chess (2-D & 4-D), Limited Warfare, Graphic Design.

LT. Janice Kerasus
Chief of Linguistics, Communications Department, USS Enterprise
Human - HEIGHT: 5'9"; HAIR: Brown; EYES: Brown; BLOOD TYPE: A+
Hobbies: Children's Books, Surf Fishing.

LT. Olga Litowsky
Chief Computer Librarian, USS Enterprise
Human - HEIGHT: 5'10"; HAIR: Blue; EYES: Brown; BLOOD TYPE: B+
Hobbies: Antiquing, Comic Book Collections, Antique Entertainment forms, Image Processing.
They have small limited-range warp-field generators that enable them to explode. Some alien species (for example, Hortas) are not affected by big ship's phasers do. They can be set to intentionally overload and Handphasers have the same tendencies to burn out or lose chord as the power packs (which contain about fifteen minutes' power each). are rechargeable either aboard ship or, in the field, by use of extra for about twenty minutes' continuous use before needing recharge. They are 50 percent to 15 percent for each hit until there is no power left and the screens will begin overloading those screens and reducing their effectiveness. Subsequent hits knock the target's screen down another 10 percent to 15 percent for each hit until there is no power left and the target ship's naked hull is exposed.

Enterprise's phaser "banks" are located both fore and aft. The fore bank is located under the main "disk" hull, near the center; the aft bank, on the rear edge of the disk, above the impulse engines. Both banks are airmovable within about a 270-degree spherical radius, leaving very few unprotected angles. (But there are a few.)

Handphasers are small versions of the large ship's phasers. Setting range from "stun" to "kill." The stun setting will leave the average human being unconscious for anywhere from ten minutes to an hour, depending on the victim's physical condition. A handphaser on the highest setting is capable of heating a small boulder red-hot in a matter of seconds or melting through a metal door. Handphasers are good for about twenty minutes' continuous use before needing recharge. They are rechargeable either aboard ship or, in the field, by use of extra power packs (which contain about fifteen minutes' power each).

Handphasers have the same tendencies to burn out or lose chord as the big ship's phasers do. They can be set to intentionally overload and explode. Some alien species (for example, Hortas) are not affected by handphaser fire unless special alterations have been made to the weapon. They have small limited-range warp-field generators that enable them to be used against objects traveling faster than the speed of light.

A photon torpedo is a simple, elegant, and effective weapon comprised of a very small amount of antimatter contained in a magnetic bottle and the generating apparatus to maintain the bottle. On command, the bottle degenerates, which brings the antimatter into contact with the generator's matter and produces a tremendous explosion of both standard shock waves and extremely hard radiation. Photon torpedoes can be fired directly at a nearby object to explode on contact with it, or they can be set with delayed fuses and ejected as mines.

Photon torpedo "tubes" must be recharged after each use, both by reloading the tubes with new torpedo apparatus and equipping the torps with fresh antimatter from ship's breeder. The process takes from thirty seconds to a minute after a "full spread" has been fired. Enterprise is equipped to fire photon torpedoes from both front and rear: each bank is comprised of four aimable tubes. A "full spread" is eight torpedoes, one from each tube: front, back, right front, right rear, left front, left rear, upper center, lower center. Simultaneous fire from all four tubes pointing in a given direction may be concentrated on one point. Tractor beams are actually "grasers": coherent beams of gravity-wave packets. A tractor beam locks onto a given object.
and, by mimicking a radically increased gravitational field, pulls it closer to the ship for examination or other purposes. Pressor beams use the same technology but with polarities reversed to exert great gravitational pressure on a small area. Conventional tractors and pressors are effective only on massless or very large objects. Because of the extreme proximity of the tolerances to which they must be tuned to ensure that living beings get safely from one location to another, transports are cranky and delicate, and are constantly malfunctioning for one reason or another: dilithium-crystal misalignment, interstellar jamming, or "black noise" that can distort the signal: and so forth. When screens are up, the transporter cannot be used to beam out of the ship. Overuse (heavy continuous transorting for more than several hours) may cause transporter circuitry to burn out. Intraship beaming is extremely dangerous and is not recommended except in utmost emergencies. The result of beaming from one location to another within the ship is almost always fatal.

SENSORS

Enterprise's main sensor array (sometimes referred to as "scanners") includes a variety of tachyon-based devices capable of detecting movement or radiation and analyzing the composition and location of almost every known element. At short range (up to 500 miles), the sensors can detect individual creatures' life signs. At medium range (500 to 50,000 miles) they are better at detecting movement and radiation from the infrared up through visible light, the ultraviolet, and x-rays; and doing compound analysis. Long-range sensing (50,000 miles to approximately 10 parsecs, or 32 light-years) is confined primarily to very strong and artificial radiation sources (i.e., other ships, which in warp drive tend to leave a readable "ion trail" behind them). Like other tachyon-based devices, the sensors are extremely accurate.

Communicators use the same technology but with a shorter range (about 40,000 miles) and much lower power. Use in atmosphere limits their range to about 20,000 miles, because of the dissipation of tachyon pulses into Oreskovan radiation on contact with the gas molecules in air.

Sick bay contains various kinds of medical scanning equipment and numerous devices for healing the sick: primarily the "anabolic protolaser," which forces tissue regeneration. The more delicate or specialized the tissue (heart, brain, etc.) the longer such regeneration takes. A broken bone can be reknit in about an hour. Damaged brain or neural tissue regenerates in one to two days, but rehabilitation or retaining time must be added.

MISSION AREA

ORN/A IOTA TRIANGULI

This system has 6 planets
Planet #2 has 2 moons
Planet #3 has 3 moons

Free traders report one intelligent species (Name: ORNAN). They have a reputation as great tool makers. Last contact: One standard year ago. The Ornae were reported to be interested in Electronic Equipment and Extracultural Artifacts. A striking borderline M-class world of blue sandstone canyons and evaporated salt-pan seas. This is the home of the Ornae, a strange protoplasmic/amoeboid species... never yet contacted by Federation personnel but rumored by free traders to be the greatest toolmakers in the galaxy. An Ornaet will use anything as a tool... even itself.

MALAKITI 12/789 CIRCINI

This system has 9 planets
Planet #1 has 2 moons
Planet #5 has 3 moons
Number from primaries: 9
Diameter: 1860 miles
Mass: 3.5 sextillion metric tons
Distance from primary: 48.6 astro-units (4,519,800,000 miles)
Pre-existing information: Location uncharted; no preliminary mapping.
Planet name: Unassigned
From the surface of this small, dark rocky world, far out in its solar system, a radio signal whispers desperately into endless night, crying out for help...and the language it uses is ancient English.

ANDORGA/KAPPA-I APODIS

This system has 8 planets
Planet #1 has 3 moons
Planet #2 has 2 moons
Planet #3 has 7 moons
Planet #5 has 2 moons
Planet #6 has 4 moons
Planet location charted on two occasions. No confirmation of the presence of intelligent life. U.S.S. Hastings attempted contact and assumed lost. U.S.S. Vincennes also lost. Causes: Unknown. AREA QUARANTINED. Commanders are cautioned to keep clear of this system unless absolute necessity. An M-type world with a silvery, murky methane atmosphere and a bad reputation...no Federation vessel investigating it has ever come back.

HASTORANG/1214 NORMAE

This system has 6 planets
Planet #1 has 2 moons
Planet #2 has 8 moons
Planet #3 has 4 moons
Planet #5 has 1 moon
System charted and mapped.
Planet name: Hastorang
Translation: "Lifemother"
Intelligent Hominid life
Level of civilization: Feudal
Single language: Daiya

Opened to licensed free trade four standard years ago. Prime Directive is in force. A gorgeous M-type planet, almost a twin of Earth---but an Earth stuck fast in the tenth century and populated by alien kings, armored knights, distressed damsels, and wizards..."white" and otherwise. And what of the dragons?

ACHIR/R OCTANTIS

This system has 1 planet
Location and existence noted within last standard year. Area outside the Federation's patrol corridors. Several forms of intelligent life reported to share the sphere. All the species reported to be technologically advanced. An alien species has built a Dyson sphere around this lovely rose-colored sun—a stupendous feat of engineering, now home to billions of people. But the star is dangerously variable and about to flare up. Without the help of a Federation starship, billions could die.

NIAU/I 139 CIRCINI
************************
This system has 8 planets
Planet #1 has 2 moons
Planet #3 has 3 moons
Planet #4 has 2 moons
Planet #6 has 2 moons
Planet #7 has 2 moons
Planet name: Niau
Type of planet: Class "M"
Diameter: 6000 miles
Mass: 5 sextillion metric tons
Distance from primary: 2 astro-units (186,000,000 miles)
Satellites: 1
Intelligent life: Not confirmed
Contact: Unconfirmed finding of "BONES" of unknown landing party. An Earthlike planet populated by an intelligent feline species in the early stages of its space program. As yet there has been no official contact with the Federation. However, a delirious free trader picked up in a derelict ship near the system reported seeing the bones of a previous exploratory expedition there. This observation has not been confirmed.

JAUZAH/4403 PAVONIS
************************
This system has 4 planets
Planet #2 has 2 moons
Planet #4 has 3 moons
Location charted and preliminary mapping done. Intelligent life readings un-confirmed. Readings confused and no final determination made. No artifacts or other signs of life forms known to the Federation. Planet name assigned randomly. A small, dry, cold planet, rich in minerals, but barren of cities or other artifacts. Sensors insist that life has evolved here...but it has not yet been found. Star Fleet cannot tell if this is a trap, a sensor malfunction, or a misunderstanding.

KLUSOS/515 ARAE
************************
This system has 1 planet
Location charted and preliminary mapping done. Intelligent life found. Hostile action precluded direct contact. U.S.S. Nihal attacked in orbit. All communication refused. Nihal withdrew to avoid prolonging the engagement. About as non-Earthlike as a planet can get—a world of corrosive soil and an atmosphere full of hydrochloric acid. Why this world's sleek, glassy starships attack everyone who passes by remains a mystery...as does what can be done to stop them.

TSHIO/803 MUSCAE
************************
This system has 6 planets
Planet #1 has 4 moons
Planet #3 has 3 moons
Planet #6 has 7 moons
Location charted. No mapping. Intelligent life found. Anomalous sensor readings indicate possible contamination by more advanced culture. PLANET QUARANTINED. Position classified. Prime Directive in full effect. A world superficially Earthlike but housing a bizarre culture

Apple II Computer Info

uprooted from Earth by another spacefaring species in the dim past.

KHUT/43 PAVONIS
************************
This system has 2 planets
Planet #2 has 2 moons
Intelligent life found.
Contact: Ceased by request of Khut. Reclusive species, extremely cautious. Privacy has religious importance. Federation vessels are advised to avoid planet except in extreme emergency. A hot world of mountainous continents washed by soupy seas of hydrocarbons and liquid plastics. In those seas live the a'Khut, intelligent and reclusive beings who in the past have asked only to be let alone. Recently, however, they have been desperately hailing every ship that passes their planet.

DOCUMENT kobayashi.4

GENERAL INFORMATION
Star Fleet Command Verbal Commands and Queries

NAVIGATION

- TAKE THE CONN
- CHART (set or plot) A COURSE FOR (to)
- WARP (factor) (0-12)
- INCREASE/DECREASE WARP SPEED
- GO SUBLIGHT
- IMPULSE POWER
- ORBIT THE THIRD (3rd) PLANET
- ORBIT PLANET (#)
- (begin) EVASIVE MANEUVERS
- PERSUDE

SENSORS

- SCAN = LONG RANGE SCAN
- SCAN THE PLANET (object)
- LONG RANGE SCAN
- CLOSEUP OF THE PLANET
- SYSTEM SCAN
- SCAN FOR LIFE READINGS

COMMUNICATIONS

- OPEN A HAILING FREQUENCY (communications channel) TO (ship or planet)
- KIRK TO ENTERPRISE (or any crew member) [ACTIVATES THE INTERCOM AND COMMUNICATOR]

WEAPONS

- LOCK PHASERS (photon torpedoes or tractor beam) ON TARGET
- DIVERT ALL POWER TO THE SHIELDS (or any other system)
- SET PHASERS ON (to) FULL (maximum) (power)
- FIRE PHASERS (torpedoes)
- TRACTOR (beam) ON/OFF
- ENGAGE/DISENGAGE TRACTOR
- SHIELDS (screens) UP
- RAISE/LOWER SCREENS (shields)

TRANSPORTER

- SET COORDINATES (coords) AT
- ENERGIZE
- BEAM ME (us or any object) DOWN/UP
- TURBOLIFT

DECK (1-23)

ENGINEERING (or any location within the Enterprise)

OTHER COMMANDS

- TRICORDER READINGS
- ANALYZE (any object)
- GIVE ME THE (any object)
- SEARCH
- GO TO (any location or person)
- TAKE THE (object) TO (any person or location)

OTHER

- FIX (repair) THE (any piece of equipment)
- PREPARE A LANDING PARTY
- LAUNCH (land or dock) THE SHUTTLECRAFT
- BRING THE (object) TO ME (or any location)
- TELL ME ABOUT (an object or being)
- DAMAGE REPORT
- MIND MELD
- COMPUTER

- COMPUTER DATA (any planet or entity)

- QUESTIONS

- HOW LONG WILL THE REPAIRS TAKE
- WHAT IS WRONG WITH THE (any equipment)
- HOW ARE THE (any equipment)
- WHO ARE YOU
- HAVE YOU SEEN (any object or being)
- CAN YOU UNDERSTAND ME
- RESULTS

WHERE ARE YOU
- CAN YOU HELP US

- ACTIONS

- ACTIONS ARE CONTROLLED WITH SPECIAL KEYS, NOT WITH THE INTERACTIVE TEXT WINDOW. POSSIBLE ACTIONS ARE:

Inventory  Examine
Give      Look
Take      Drop
Use       Utilities
Shoot     

To see an index of actions on the screen, press SHIFT-1. When you press an action, a window appears in the upper-left corner of the screen. The options available for that action are listed in the window. To remove an action window, press ESC. Remember, you cannot use the interactive text window to perform any of these actions. However, you can use the text window to tell other crew members to do things for you.

WALKING

WALKING is controlled by the arrow keys. The arrow keys are your legs. You cannot walk from one place to another by giving a verbal command with the interactive text window. However, you can tell other beings to go from one place to another within the Enterprise or on a planet's surface. An arrow in the lower right of the status window indicates your current direction.

MOVE WEST/LEFT = <-
MOVE EAST/RIGHT = ->
MOVE NORTH/ENTER = ^
MOVE SOUTH/EXIT = v

EXCERPTS FROM STAR FLEET COMMAND SPECIAL REGULATIONS FOR THE KOBAYASHI ALTERNATIVE.

[THE PRIME DIRECTIVE OF NON-INTERFERENCE]
No Federation personnel shall interfere with the normal development of non-Federation life or societies unless such interference is vital to the safety and interests of the Federation as a whole.

[0324.52]
Command personnel shall become familiar with all printed materials and
computer data prior to proceeding with any mission.

Identify yourself by name to all alien beings.

Inform all beings that you come in peace.

Ascertain the identity and/or species of all alien entities.

Cautions is advised in the use of telepathy.

Personnel may "Fan Out," on a planet's surface, but must remain in radio contact at all times.

Understanding The Language Of Creatures

Ingredients:
One small feather from a bird
One tuft of fur from any animal
One dried reptile skin
One thimble full of dew
One magic wand

Directions:
I) Put the small feather in a bowl
II) Put the fur in the bowl
III) Put the reptile skin in the bowl
IV) Add a spoonful of powdered fish bone
V) Put the thimble full of dew in the bowl
VI) Mix with hands (mixture will be doughy)
VII) Separate mixture into two pieces
VIII) Put dough pieces into your ears
IX) Recite this verse:

feather of fowl and bone of fish,
molded together in this dish,
give me wisdom to understand
creatures of air,sea and land

X) Wave the magic wand

You will now be able to understand the speech of animals, birds and fish. You will not, however, be able to speak to them. The spell will last as long as the dough is in your ears.

Flying Like An Eagle Or A Fly

Ingredients:
One tail feather of any eagle (to fly like an eagle).
One pair of fly wings (to become a fly)
One pinch of saffron
Rose petal essence
One magic wand

Directions:
I) Put a pinch of saffron in essence
II) Recite this verse:

Oh winged spirits, set me free
of earthly bindings, just like thee
in this essence, behold the might
to grant the precious gift of flight

III) Wave the magic wand

You now have a potion which will allow you to cast the transformation spell. To cast the spell any time later:

Dip the eagle feather in the essence (if you want to become an eagle) or dip the fly wings in the essence (if you want to become a fly). You will turn into an
eagle or a fly. If you do not transform back into yourself, the spell will wear off after some time has passed.

You can use this spell until your rose petal/saffron potion is gone. To return to your own form before the spell wears off, recite this verse:

Eagle begone!
myself, return!
or
Fly begone!
myself, return!

Teleportation at Random

Ingredients:
One spoonful of salt grains
One sprig of dried mistletoe
One smooth rounded stone of unusual colour
One magic wand

Directions:
I. Grind a spoonful salt in a mortar (with a pestle)
II. Grind the mistletoe in the mortar
III. Rub the stone in the mixture
IV. Kiss the stone
V. Recite this verse:

With this kiss, I thee impart,
power most dear to my heart.
take me now from this place hither,
to another place far thither.

VI. Wave magic wand

You now own a charm which will allow you to cast the random teleportation spell. To cast the spell, rub the stone. It will instantly whisk you away from where you are. Remain alert, however—even though you use the spell to run away from danger, nothing guarantees that you will not arrive in a more precarious situation than the one you left. The power of the charm remains— or as long as you can retain the stone.

Causing a Deep Sleep

Ingredients:
Three dried acorns
1 cup nightshade juice
1 magic wand
1 empty pouch

Directions:
I. Grind the acorns in a mortar (with a pestle)
II. Put the acorn powder in a bowl
III. Put the nightshade juice in the bowl
IV. Stir the mixture with a spoon
V. Light a charcoal brazier
VI. Heat the mixture on the brazier [boil the mixture until the nightshade juice is almost gone, then remove from heat]
VII. Spread the mixture on a table [wait until dry]
VIII. Recite this verse:

Acorn powder ground so fine

nightshade juice like bitter wine,
silently in darkness you creep
to bring a soporific sleep

IX. Wave the magic wand
X. Put the sleep powder in the pouch [safekeeping]

You have now mixed a powder for casting a sleep spell over whoever is nearby. To cast the spell, pour the sleep powder on the ground [or floor] in a dark, dark place. Then recite:

Slumber, Henceforth!

Transforming Another into a Cat

Ingredients:
1/2 cup mandrake root powder
1 small ball of cat hair
2 spoonfuls of fish oil
1 magic wand

Directions:
I. Put mandrake root powder in a bowl
II. Put the cat hair in the bowl
III. Put 2 spoons of fish oil in bowl
IV. Stir mixture with a spoon [dough will be oily]
V. Put the dough on the table
VI. Pat dough into a cookie [let harden on table]
VII. Recite this verse:

With this kiss, I thee impart,
mandrake root and hair of cat
take me now from this place hither,
to another place far thither.

VIII. Wave the magic wand

You have just created a cookie that, when eaten, will turn the victim into a cat. Forever!

Brewing a Storm

Ingredients:
1 cup of ocean water
1 spoonful of mud
1 pinch of toadstool powder
1 magic wand
1 empty jar

Directions:
I. Put a cup of ocean water in bowl
II. Light a charcoal brazier
III. Heat the bowl on the brazier [heat slowly, but not to boiling, then remove from heat]
IV. Put a spoon of mud in the bowl
V. Add a pinch of toadstool powder
VI. Blow into the hot brew
VII. Recite this verse:

Elements from the earth and sea,
combine to set the heavens free.
When I stir this magic brew,
great god thor, I call on you.
VIII. Wave the magic wand
IX. Pour the storm brew into the jar [to store]

You have mixed a potion that you can use to brew a storm. To activate the spell, stir the storm brew with your finger and recite:

Brew of storms,
clear it up!

Outdoors, a rainstorm complete with thunder and lightning will occur. It will last for some time, but will eventually rain itself out. If you wish it to subside earlier, recite:

Brew of storms,
churn it up!

Page CLXIX

Ingredients:
1 jar of lard
1 cactus
1 spoonful of cactus juice
2 drops of toad spittle
1 magic wand

Directions:
I. Cut the cactus with a knife
II. Squeeze the cactus juice on spoon
III. Put the cactus juice in a bowl
IV. Put the lard in the bowl
V. Add 2 drops of toad spittle
VI. Stir the mixture with a spoon
VII. Recite this verse:

Cactus plant and horny toad
I now start down a dangerous road
combine with fire and mist to make
me disappear without a trace

VIII. Wave magic wand
IX. Pour ointment in the empty lard jar

You now have a magic ointment that will allow you to turn invisible [but beware, the ointment only works in a place where there is both fire and mist]. To cast the invisibility spell, rub the ointment on your body. You will be invisible for a short while. You have enough for one.
Programs that work under Leapfrog

SnowTerm(1)
Acer
the Finder
Music Seq Maker(2)
SHR Convert(3)
AWGS
Sonic Blaster Demo (From AE)
DiCeD

CTRL-R:
restarts
CTRL-L:
returns game to titles screen to change player and starting level.
ESC:
to pause. Begin again with spacebar or the joystick button. Repeat ESC key to advance game action one frame at a time.
CTRL-S:
toggles sound on/off
To throw, strike or fire weapon - joystick button 0
To throw net - joystick button 1
To repeatedly fire the gun from a standing still position, hold the button down and aim the joystick. To strike repeatedly with the club, javelin or trident, press and release the button for each hit.

There are 8 game levels. After level 8, the game returns to level 5 with more monsters and continues to cycle.

For Apple IIe:
boot and play with CAPS LOCK key locked down.

Programs that do not work under leapfrog

Tml Pascal 1.5A and II. They will load perfectly but they somehow take over and will not allow you to shell back out.
Any text based GS/OS applications (De-Arc)
320 Mode games

Some programs seem dependant on what order they were loaded. DiCeD and Fontasm seem to perform much better if they are loaded first or second. The finder seems to be able to be loaded at any time, as with Acer and SHRConvert.
"Leap Frog" -- a second pre-release version of a multitasking program
by
William Gulstad (wogg0743@uxa.cso.uiuc.edu)

Note on this release--Pre-release means that it works but not all
the time. A lot more programs will run successfully under this version,
but I would not (I must emphasize this) use Leapfrog in a situation where
valuable data could be lost.

"Leap Frog" is a program which allows up to eight other programs to run
all at the same time! It is like a combination of Multifinder and Switcher,
with some advantages all its own.

What is new in this (pre-)release: Resource-oriented programs should
now run more successfully, including AppleWorksGS. Also, the Finder will run
under Leapfrog (though I suggest that you make Leapfrog the Start program,
and rename the finder to "finder" if you want to try this). You cannot run
other applications from the finder by double clicking on an icon. All that
will happen is the finder will start to shut down and the system will crash.
Probably, though I will prevent the crash in a future version, Leapfrog will
never allow finder to run other programs. If Apple wants true MultifinderGS,
they can pay me to edit Leapfrog hooks into their finder code, otherwise
there isn't much I can do short of writing a program to patch finder, something
that strikes me as a stupid way of doing things.

How to use it--Run the program leadfrog from GS/OS 5.0.2 or later.
It will bring up its menu bar, which has apple, file, edit, and applications
menus. You may then proceed to open applications with the open menu item.

Shelling out of a program--press Control-@ at any time to return to
the standard Leap Frog menu bar. Use the applications menu to get back to the
program you want, open another application, or whatever.

Selecting windows--like Multifinder (on the Mac), if you click on a
window, the application owning that window becomes active. This does not work
while the Leap Frog menu bar is visible, only when an opened application is in
control.

Quitting--quitting from a program should return you to the Leap Frog
menu bar. All other programs opened should be accessible through the
applications menu.

How it works--Leap Frog uses patched to TaskMaster and GetNextEvent to
allow all opened programs to run at once. Only the "hot" program (the one
owning the top window) will receive input, but all others will continue to
operate, thus allowing any number of different activities (animation, sound
 generation, computation) to take place in the background.

William Gulstad
(e-mail me! I like user response. A new version of Carpet Bag is coming
real soon now.)
Upper left box is filled with missile count.
Lower left is speedometer.
Middle is radar.
Upper right: (S)hield Power (L)aser's ability to inflict damage.
Below Middle is a thin line which is fuel level.
Lower right is the time clock.
Under every gauge is a small indicator light:
  Green = Go
  Red = Damaged/Depleted

Joystick commands:
Button 0 - Thrust
Button 1 - Space Brakes
Both 0&1 - Fire Enabled weapon

Keyboard commands:
Ctrl-S - Sound on/off
Ctrl-j - Pause game

Ships:
  Blue - These weak vessels always attack you.
  Purple - getting tougher, this bandit craft is a formidable foe.
  Red - Top notch alien Terraxkian fighters that are mean in spirit, and deadly at heart.
  Green - These weak fighters are from the planets own defenses and they are your allies. They help in getting ships off your tail.

Objects in space:
  Moons - These annoying rocks in space will damage your craft on collision.
  Planets - You may only land on base planet (Big, half white half orange planet on map).
  Far planets - These can never be reached.
  Space stations - Green and white, 8 sided rotating object which you defend.

Misc bullshit:
To land on home base, fly into it then you will see the pad. Fly towards yourself then pull down to the right attempting to land on the pad's white cross in the center.
To win a mission, hyperdrive to a planet under attack, help it out, try to land on the station and get 10 tons of ore accumulated. After sufficient ore is stored on your ship, return to base planet to land.

Quadrant map:

Descriptions:

..  - Moons in sector and if attempting warp through these, you may encounter a hyperspace storm.
1  - Taurus. (Space station)
2  - Beta. (Space station)
3  - Gryphon. (Space station)
4  - Unknown planet (no ss)
5  - Unknown planet (w/ ss)
6  - Unknown planet (w/ ss)
7  - B-12. (Space station)
8  - Alpha. (Space station)
9  - Unknown planet (w/ ss)
10 - Quantum. (Space station)
11 - Epsilon. (Space station)
12 - Unknown (no ss)
BP - Base planet
O  - Outpost
How to set up LISA816:

LISA816 runs under the ANIX shell. Therefore, you must have ANIX running before you can use LISA816. Either

1) run ANIX.SYSTEM from basic (ie "ANIX.SYSTEM")
2) make a boot disk with PRODOS and ANIX.SYSTEM

Then, after you have run ANIX, from the ANIX command line, type

LISA816

(assuming that the LISA816 file is in the currently prefixed directory). ANIX is a command-line interface with many useful programmer extensions; that's why LISA816 uses it (ANIX was actually developed mainly so that there would be a decent environment to run LISA in).

After that, you're up and running. We hope.

Have fun!

Source Editing Commands

LISA has a few special characters of it's own, that only have meaning in the insert mode. These special characters are used to enhance source-file editing.

<<return>> is used to exit insert mode. This command, as do all the following commands, needs to be used as the first character of an insert line.

<<control-A>> has the effect of moving the insertion point to before the line immediately preceding the current insertion point. The previous line is displayed (for user convenience), and the new line number displayed for insertion.

<<control-B>> has the effect of moving the insertion point to after the line immediately following the current insertion point. The next line is displayed (for user convenience), and the new line number displayed for insertion. If the insertion point is line N, then line N+1 becomes line N, and the new insertion point is line N+1.

<<control-W>> has the effect of deleting the line previous to the insertion point, and then starting insertion at that point. The deleted line is displayed (for user convenience), and the new line number displayed for insertion. This is the most useful of the four special editing commands. Typically, a line will be entered, the user will press return, and then notice an error. Using <<control-W>> has the same effect as:

<<return>>

M nn
...

<<control-C>> has the effect of deleting the next line in the source following the insertion point, and placing the insertion point following that line. The deleted line is displayed (for user convenience), and the new line number displayed for insertion. If the insertion point is line N, then line N+1 is deleted, and the new insertion point is line N (because line N+1 was deleted).

Importing and Exporting Text Files

LISA source files are stored in a compressed, tokenized form. This has several advantages:

* files are smaller
* assemblies are faster
* most errors are caught at edit time, not assembly time

The disadvantage, of course, is that files are not stored in a pure text format. It is, however, easy to import text from a text file, or to save a LISA file out as text, by using the READ and WRITE commands. To import text, simply use a command of the form

```
READ nnn <textfile
```

where nnn is the line to start insertion, and textfile is the name of the text file to read from. LISA will convert each line from the text file into it's tokenized format. If an error is detected in a line, LISA will stop momentarily and ask you to fix it - note that you can abort the read-in process (if, for example, you weren’t reading a program text file) by pressing <return> by itself to exit insert mode.

Exporting to a text file is just as easy, using a command of the form

```
WRITE n1,n2 >textfile
```

where n1..n2 is the range of lines to write to the text file named textfile. Normally, LISA writes text files with no space padding to line columns up. If you want the space padding, insert the TAB switch in the write command:

```
WRITE -n1,n2 >textfile
```

and spaces will be added to pad the columns out as they would be if a LIST command were issued.

READ and WRITE can also be used to move portions of code from one LISA file to another. If you have libraries that you need routines from, or if you tokens equate files that you only want certain lines from, you would use WRITE to extract the lines needed, and READ to insert them into the correct source file.

LISA editor commands

Note: each command may be abbreviated to the characters shown in upper case. Optional parameters are enclosed in braces, as {optionalparms}; required parameters are encased in double-brackets as, <<requiredparms>>.

- `Ctrl-D` (execute ANIX command)

```
Parameters: output file/device.
Usage: `Ctrl-D` <anix command>
```

Executes the command following the `Ctrl-D` as an ANIX intrinsic command. ANIX will report any errors that occur in the execution of the command.

- `Ctrl-P` (toggle printer on/off)

```
Parameters: none
Usage: `Ctrl-P`
```

Toggles the setting of the ANIX printer device; if printer was off, printer is turned on, and vice versa. This action is the same as in the ANIX shell.

- `.` (list previous 20 lines)

```
Parameters: none
Usage: .
```

Lists the 20 lines previous to the last line listed (by any list command).

- `,` (list next 20 lines)

```
Parameters: none
Usage: ,
```

Lists the 20 lines after the last line listed (by any list command).

- `.` (list 20 lines around current line)

```
Parameters: none
Usage: .
```

Lists the 20 lines around to the last line listed (by any list command);

ie, from -10 to +9 around the current line.

- `?` (command help)

```
Parameters: output file/device.
Usage: ? (>outfile)
```

Prints a short summary of all the LISA commands available; if (>outfile) is present, output is redirected to the selected file or device.

- `Assemble` (assemble source)

```
Parameters: output file/device.
Usage: Assemble (>outfile)
```

Assemble the source file in memory; if the optional parameter (>outfile) is present, output is directed to the selected file or device. If the source file in memory ends with a CHN " <<file>>" and not an END, the file in memory is saved out to disk as "T.." and then assembly continues with <<file>>.

- `BReak` (break to monitor)

```
Parameters: none.
Usage: BReak
```

Exits from LISA into the LISA monitor. To return to LISA, use <<control-C>> for a LISA warmstart (leaves file intact) or <<control-B>> for a LISA coldstart (does a NEW on re-entry to LISA).

- `COPY` (copy source lines)

```
Parameters: start line, end line, dest line.
Usage: COPY <<startline>>, <<endline>>, <<destline>>
```

Copies source lines in the range <<startline>>.. <<endline>> to a position in the file starting at <<startline>>. Note that <<endline>> must not be less than <<startline>> and <<destline>> cannot lie within the selected range <<startline>>.. <<endline>>.

- `CPu` (set CPU type)

```
Parameters: CPU type
Usage: CPu <<cputype>>
```

Set CPU type to be of type <<cputype>>. CPU Type must be one of the three: 6502 65C02 65816

If <<cputype>> is omitted, the current CPU type is displayed.

- `Delete` (delete source lines)

```
Parameters: delete line 1, delete line 2.
Usage: Delete <<delline1>>, {delline2}
```

Deletes source lines in the range <<delline1>>.. <<delline2>>. If <<delline2>> is not specified, only line <<delline1>> is deleted. The range must be legal - <<delline2>> must not lie within the selected range <<delline1>>.. <<delline2>>.

- `DSt` (dump symbol table)

```
Parameters: optional file/device.
Usage: DS (>outfile)
```

Will print the symbol table from the last assembly to the standard output device. As usual, output may be directed to any ANIX device (>.P for printer, >filename for file, etc).

- `Find` (find search string)

```
Parameters: search string.
Usage: DS (>outfile)
```

Looks for <<searchstring>> in the file and displays all lines it is contained in. FIND may be aborted by pressing <<control-C>>. If no search string is specified, FIND will do nothing.

- `FReplace` (find and replace)

```
Parameters: search string, replacement string.
Usage: Find {searchstring} {replstring}
```

Copies <<searchstring>> to <<replstring>> in each line. Replacements are done in place.
Parameters: search string, replacement string.
Usage: FR (searchstring) ^ (replacestring)
Looks for (searchstring) in the file and replaces it with (replacestring) where-ever found. FR will prompt for replacement at each occurrence of (searchstring). FR may be aborted by pressing <<control-D>>. If no search string is specified, FR will do nothing. If no replacement string is specified, FR will delete the search string if allowed.

Insert (insert source lines)
Parameters: insert line.
Usage: Insert [insertline]
Starts insertion of source code lines at <<insline>>. If <<insline>> is not specified, insertion starts at the end of the file. Insert mode is exited by entering <<return>> on a blank line.

LENGTH (source file stats)
Parameters: optional file/device.
Usage: LENGTH >outfile
Will print the statistics for the current source file in memory- length, number of symbols.

List (list source lines)
Parameters: list line 1, list line two, output file/device.
Usage: List [linenum1],[linenum2],>outfile
Lists source lines in the range <<linenum1>>.. <<linenum2>>. If no lines are specified, then the entire source file is listed, starting at line 1. If only the first line is specified, then only that line is listed. If one line number is given, followed by a comma, then 20 lines are listed starting at that line number. If one line number is given, followed by two commas, then entire source file is listed, starting at that number. If both numbers are given, then the source lines in that range are listed. If the optional parameter >>outfile is used, output is re-directed to the selected file or device.

Load (load source file)
Parameters: ProDOS pathname.
Usage: Load <pathname>
Used to load a LISA source file from disk. Errors- applicable ProDOS errors.

Modify (modify source lines)
Parameters: modify line 1, modify line 2.
Usage: Modify <modline1>,<modline2>
Deletes source lines in the range <<delline1>>.. <<delline2>>. If no line numbers are specified, then the entire source file is deleted, starting at line 1. If only the first line is specified, then only that line is deleted. If one line number is given, followed by a comma, then 20 lines are deleted starting at that line number. If one line number is given, followed by two commas, then the entire source file is deleted, starting at that number. If both numbers are given, then the source lines in that range are deleted. If the optional parameter >>outfile is used, output is re-directed to the selected file or device.

New (clear LISA workspace)
Parameters: none
Clears the LISA workspace area in preparation for new source file creation.

Read (read text file source)
Parameters: insert line, read source.
Usage: Read [linenum],[<file]
Inserts lines from the specified text file starting at line linenum; if linenum is not specified, then insertion starts at the end of the source file. Insertion ends when end-of-file is reached.

SAVE (save source file)
Parameters: ProDOS pathname.
Usage: SAVE <pathname>
Used to save a LISA source file. Errors- applicable ProDOS errors.

SYstem (system call)
Parameters: none.
Returns control to UNIX shell. To return to LISA, type RUN 303 from UNIX.

Transfer (move source lines)
Parameters: start line, end line, dest line
Usage: Transfer <<startline>>, <<endline>>, destline
Moves source lines in the range <<startline>>.. <<endline>> to a position in the file starting at <<destline>>. TRANSFER is subject to the same restrictions as COPY; it is the same as COPY, except that it deletes the original lines from the file.

WRITE (write source lines)
Parameters: write line 1, write line two, output file/device.
Usage: Write (write line 1, write line two, output file/device.
Write out source lines in the range <<line1>>.. <<line2>>. If no line numbers are specified, then the entire source file is listed, starting at line 1. If no lines are specified, then the entire source file is listed, starting at line 1. If only the first line is specified, then only that line is listed. If one line number is given, followed by a comma, then 20 lines are listed starting at that line. If one line number is given, followed by two commas, then the entire source file is listed, starting at that number. If both numbers are given, then the source lines in that range are listed. If the optional parameter >>outfile is used, output is re-directed to the selected file or device. Note that this is the typical use of write.

LISA expression syntax
13.1 Definitions.
A token is the smallest meaningful unit of text in a LISA source line. The tokens of LISA are classified into special-symbols, identifiers, numbers, character-strings, and comments.
A LISA source line is composed of tokens, separated by blanks (a blank is defined as the ASCII space character). The tokens are classified by type according to the field where they are used- label field, opcode field, operand field, and comment field. Two adjacent tokens must be separated by one or more separators if each token is an identifier, number, or opcode. Only 1 token may be in the label, opcode, and comment fields, except- the operand field can (and often does) contain multiple tokens.
13.1.1 Character Set and Special Symbols.
The letters are the English characters A through Z, and a through z.
The decimal digits are the numerals 0 through 9.
The hex digits are the numerals 0 through 9, letters A through Z, and a through z. The binary digits are the numerals 0 and 1.

The special-symbols are tokens having one or more fixed meanings. The following single characters are special-symbols:

+= -= /= ^= &^ |\ [ \] , " ~ :      \   select high byte (LISA mode) or high word (APW mode 16-bit)

The following character-pairs are special-symbols:

\< >= <\ :A :L

13.1.2 Labels.

A label is an identifier appearing in the label field or the operand field (regular and numeric), or in the opcode field (macros only). A label serves to denote a constant, variable, program address, data address, or macro call. Identifiers can be any length up to 63 characters, all of which are significant. Case is not important in identifiers. Labels can have the same spelling as an opcode, because type is determined by context. A label must begin with either a letter (regular labels), or the special character (\^) (numeric local labels), or the special character (_{\}) (macro call). Regular labels can contain letters, numbers, and the special characters (_{\}) and (_{\}). A regular label in the operand field can be followed by the type-coercion tokens (:{A}) or (:{L}). Numeric local labels are (\^{\}) followed by a numeric digit, and are referred to as (\^{	iny{0}})\ldots(\^{	iny{9}}) in the label field, or (\<{	iny{0}})\ldots(\<{	iny{9}}) and (\>{\tiny{0}})\ldots(\>{\tiny{9}}) in the operand field. Regular labels must be unique (within their scope); numeric local labels do not have to be.

13.1.3 Opcodes.

An opcode is an identifier appearing in the opcode field. An opcode may be classified into one of three groups- instruction, pseudo-op, or a macro. The following opcodes are the legal instructions and pseudo-ops for the assembler:

ADC ADD ADR AND

The operand field contains one or more expressions; each expression is separated by the special symbol (_{\}). An expression consists of a term, which is an operand, character-string, or special operand, followed optionally by operator-term pairs. An operator is a special-symbol. The whole expression may be prefixed by one or more operators (\#), (-), (\*\*), and (\*\^). Byte selector operators (\#) (low byte), (/) (middle byte), and (^) (high byte) may also prefix the whole expression (before the normal prefix operators).

Word selector operators (\{\})-low word and (\})-high word may also prefix the expression. Type-coercion suffixes (:{A}) and (:{L}) must follow the label they apply to, not the expression as a whole.

13.1.4 Operands.

The operand field contains one or more expressions; each expression is associated with the special symbol (_{\}). Expression modifiers are used to modify an entire expression, and are always the first prefix to an expression. There are five expression modifiers:

- select low byte (LISA mode) or low word (APW mode 16-bit)
- select middle byte
- select high byte (LISA mode) or high word (APW mode 16-bit)
- select low word (LISA mode)
- select high word (LISA mode)

When used with a 65816 instruction, all the expression prefixes indicate immediate addressing mode. When used with LISA pseudo-ops, the expression prefixes select various parts of a 24-bit value for code generation.

13.1.4.2 Operators.

Operators are either monadic (operator preceding expression) or dyadic (operator infix between two terms).

A monadic operator is one of the following special-symbols.

- @

A dyadic operator is one of the following special-symbols.

+= -= /= ^= &^ |\ [ \] , " ~ :      \   select high byte (LISA mode) or high word (APW mode 16-bit)

13.1.4.3 Labels.

An label appearing in the operand field has the same format as one appearing in the label field, except for the special case of numeric local labels. A numeric local label reference in the operand field has the form (\^{\}) to (\^{	iny{9}}) and (\<{	iny{0}}) to (\<{	iny{9}}), where (\<) and (\>) indicate the direction relative to the expression of the particular local label.

A label in the operand field may have a type-coercion suffix that is used to force address mode type regardless of the declared type of the label- (:{A}) is used to force the absolute attribute for a label, and (:{L}) is used to force the long attribute for a label.

13.1.4.4 Numbers.

A number can be either decimal, hexadecimal, or binary. Decimal numbers use no prefix. Hexadecimal numbers use the ($) character as a prefix. Binary numbers use the (%) character as a prefix.

13.1.4.5 Character Strings.

A character-string is a sequence of characters delimited by the special string delimiter characters (\^*) or (\*\^). If (\^*) are used, the high-order bit of each byte is set to 0; if (\*\^) are used, the high-order bit of each byte is set to 1. Inside the delimiters, a doubled occurrence of the delimiter inserts one character of that delimiter in the string without terminating the character string.

13.1.4.6 Special Operand.

A special-operand is a sequence of one or more characters representing a certain value. There are several special operand types. The current program-counter value (of the assembler) can be referenced by (\^*). Macro parameters can be referenced (inside a macro) by (\{\})..(\{\}). Parameters to a macro are numbered by occurrence; parameters, where required, may not be omitted.

13.1.5 Comments.

A comment begins with the (\{\}) character, and optionally (first column only) with the (\*) character. The comment field is a last field in the source line, and is terminated by a \(<\text{return}\>\text{character.}
13.2 Source Line Formats.

Each source line is separated into 4 fields: label, opcode, operand, and comment. All four fields do not have to be present on a line, but there are some restrictions to field appearance. The general case of a LISA source line is:  

```
line # label opcode operand comment
```

The assembler supplies all line numbers. PROGRAM is in the label field (the first field), so it is parsed as a label. LDA is in the opcode field (the second field), so it is parsed as an opcode, and recognized as a 65816 mnemonic. SEQUENCE:L+R.OFFST is in the operand field (the third field), so it is parsed as an operand, in this case as an address expression. The remainder of the line starts with the character {;}, so it is parsed as a comment.

If a colon (:) follows the token in the label field, then the line is assumed to have only the label field in it.

29 STUB:

If the first character of the line is a comment char {;} or optionally {'*'}, the line is assumed to have only the comment field in it.

241 ; The next routine is responsible for gathering characters one at a time.

If the first character of the line is a blank (space character), then the label field is assumed to be null, not specified.

```
122 mv L.BANK,R.BANK ;move var set
```

If the line ends after the opcode field, or a comment character is found following the opcode field, then the operand field is assumed to be null, not specified.

```
45 asl ;shift twice for x4 indexing
46 asl
```

Note that in each of the above cases, the lines were listed as LISA would list them, not as they might be entered. LISA tokenizes and formats all source lines according to its model, checking syntax at entry time. A line entered in as:

```
122 draw lda #myset ;get set number for DRAW
```

would be parsed and listed as

```
122 draw lda MYSET ;get set number for DRAW
```

and

```
123 jsr newplot ;call version 2 plot routine
```

(with a leading space) would be parsed and listed as

```
123 jsr newplot ;call version 2 plot routine
```

13.3 Syntax checking.

Each line is checked for syntax errors on entry. The line is broken up into tokens, and each token analyzed according to its field position.

13.3.1 Label field.

There are two types of labels. Alpha labels must start with an alphabetic character, (upper/lower case), and contain only {A}..{Z}, {a}..{z}, {0}..{9}, {_} and { }. Labels have a maximum length of 63 characters. Alphabetic case is maintained as entered, but has no significance on assembly ("Label" is the same as "LABEL"). Labels start in the first column of a source line. Errors generated by a bad label include:

- Bad character in symbol
- Illegal label
- Label required here

Numeric local labels start with a caret {^} and are followed by a numeric digit {0}..{9}. Only 1 digit is permitted after the {^} symbol.

A space { } or a colon {;} must terminate entries in the label field.

13.3.2 Opcode field.

There are two types of mnemonics that are legal in the opcode field. The first type are the 65816 opcode mnemonics and LISA pseudo-ops. The second type are macro invocations. All legal 65816 opcodes and LISA pseudo-ops are listed in section 13.1.3. Macros are identified by a special lead-in character, currently defined as {_}. Examples:

```
23 jsr PRINT
24 byt "Enter file name",0
25 _GETNAME
```

where line 23 contains a 65816 mnemonic {jsr}, line 24 contains a LISA pseudo-op {byt}, and line 25 contains a macro call {_GETNAME}.

Errors pertaining to the opcode field include:

- Illegal mnemonic
- Illegal label

13.3.3 Operand field.

The operand field contains 1 or more expressions; the expression type depends on the mnemonic in the opcode field. Expressions can be:

- address expressions
- string expressions

If the mnemonic is a 65816 opcode, the expression is embedded in address type selectors, to indicate addressing modes. Legal 65816 address expressions are:

```
1 iny ;implied
2 asl ;implied (accumulator)
3 ldx #dexpr ;immediate (8 bit)
4 ldy #eexpr ;immediate (16 bit)
5 asl eexpr ;direct page
6 inc aexpr ;absolute
7 and leexpr ;absolute long
8 ldy dexpr,X ;direct page indexed,X
9 dec aexpr,X ;absolute indexed,X
10 ora leexpr,X ;absolute long indexed,X
11 ldx eexpr,Y ;direct page indexed,Y
12 ora aexpr,Y ;absolute indexed,Y
13 sbc (dexpr) ;direct page indirect
14 jmp (aexpr) ;absolute indirect
15 adc (dexpr,X) ;direct page indexed indirect
16 jsr (aexpr,X) ;absolute indexed indirect
17 cmp (dexpr,Y) ;direct page indirect indexed
18 eor (dexpr) ;direct page indirect long
19 jsr [aexpr] ;absolute indirect long
20 sbc [dexpr,Y] ;DP indirect long indexed
21 and dexpr,S ;stack relative
22 sta (dexpr,S,Y) ;stack relative indirect index
23 mvp bexpr,bexpr ;block move
```
The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used. The value of the local label is used.

There are 14 infix operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>addition</td>
</tr>
<tr>
<td>-</td>
<td>subtraction</td>
</tr>
<tr>
<td>*</td>
<td>multiplication</td>
</tr>
<tr>
<td>\</td>
<td>division</td>
</tr>
<tr>
<td>%</td>
<td>modulo</td>
</tr>
<tr>
<td>&amp;</td>
<td>bitwise AND</td>
</tr>
<tr>
<td>^</td>
<td>bitwise EOR</td>
</tr>
<tr>
<td>~</td>
<td>bitwise NOT</td>
</tr>
<tr>
<td>&lt;</td>
<td>logical LESS THAN</td>
</tr>
<tr>
<td>&lt;=</td>
<td>logical LESS THAN OR EQUAL</td>
</tr>
<tr>
<td>&gt;</td>
<td>logical GREATER THAN</td>
</tr>
<tr>
<td>&gt;=</td>
<td>logical GREATER THAN OR EQUAL</td>
</tr>
<tr>
<td>=</td>
<td>logical EQUALS</td>
</tr>
<tr>
<td>!</td>
<td>logical NOT</td>
</tr>
</tbody>
</table>

Address expressions consist of identifiers and constants combined with operators. An expression is of the form

(modifier) (prefix term) (operator-term) . . .

There are 5 expression modifiers:

<table>
<thead>
<tr>
<th>Modifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>use low byte (LISA mode) or low byte/word (APW mode) of expression</td>
</tr>
<tr>
<td>^</td>
<td>use high byte (LISA mode) or high byte/word (APW mode) of expression</td>
</tr>
<tr>
<td>\</td>
<td>use low word of expression</td>
</tr>
<tr>
<td>~</td>
<td>use high word of expression</td>
</tr>
</tbody>
</table>

There are 3 prefix operators.

- expr at-operator. evaluates to (PC-expr), where PC is the value of the assembly program counter at the start of the instruction line
- expr negate-operator. evaluates to (0-expr)
- expr not-operator. evaluates to ($FFFFF EOR expr)

There are 10 types of terms.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>statement label or equate label (from EPZ, EQU, EQL etc). The value of the label is used.</td>
</tr>
<tr>
<td>$3B</td>
<td>decimal number (no prefix character)</td>

<tr>
<td>=</td>
<td>logical EQUALS</td>
</tr>
<tr>
<td>!</td>
<td>logical NOT</td>
</tr>
</tbody>
</table>

The calculator screen should pop up, overlaid on your screen. Don't worry; since it's a pop-up window, it will restore the screen when you exit.

The calculator looks like this:

```
E: quit
T: ASCII codes
Q: ANIX equates
P: PRODOS equates
O: CHARIO opcodes

< | H | M | S
4 | ^ | -
+ | DECIMAL mode
8 9 A B *
= | change sign
4 5 6 7 /
0 1 2 3 %
| OR - I NOT
= | left shift
| > | right shift
```

Pressing ESC when the calculator is showing will return you back to what you were doing before you entered the calculator. So, you could be in the middle of entering a source line and want to calculate a constant before entry. Pressing ESC twice gets you into the calculator, you do the calculation,
note the result, press ESC again to return to line entry, and enter in the
calculated constant.

The calculator is fairly self-explanatory. It is a regular infix calculator
(78 style rather than HP style); so you enter number then operator then
number, etc. The RETURN key doubles as the "=" key, for ease of use (most
people are well accustomed to hitting RETURN after data entry, much more
so than "="). Also, once you've hit return, all is not lost. You can keep
on with operator and number pairs after that.

The calculator will also retain the value in the display between calls to it.
However, if you do an assembly, the accumulator will be lost. HEX,
DEG, RADS, SIGN, and NOT operations are instantaneous; they affect the
accumulator value only, and do not upset pending calculations.

In the upper right-hand corner of the calculator are some prompts for some
important help screens. First of all is the ubiquitous ASCII chart. This
comes handy every once in a while (although LISA does handle character
constants well, it helps to know what the actual values are if you're doing
anything the slightest bit tricky or innovative). Just hit a "T", and the
ASCII chart pops up. Press ESC to return back to the main calculator display.

Second, there is a help screen for ANIX equates. Pressing "O" will bring up
the ANIX equates screen. This comes in handy when you are writing programs
that will execute under the ANIX shell (extrinsics, little utilities,
etc), and don't want to include the master file of ANIX equates in your small
program. For ANIX v2.1 running LISA816 v4.0, this will be a list of absolute
equates (since this presumes you are running a //e, or IIGS in emulation
mode) for JSR calls; for ANIX v3.0 running LISA816 v5.0, this will be a list of
COP parameter values, since ANIX v3.0 calls are made via the COP
instruction. Once again, pressing ESC will return you to the main calculator display.

Third, there is a help screen for ProDOS equates. Pressing "P" will bring up
the ProDOS equates screen. This reference will not only show the ProDOS
call numbers, but also the parameter list structures for each call. Once
again, if you are running ANIX v2.1, this will show ProDOS 8 (which also is
applicable to ProDOS 1.1.1) calls, and their parameter lists; if you are
running ANIX v3.0, this will show ProDOS 16 calls. The ProDOS equates screen
will show the calls by name; pressing the letter next to the name will bring
up a further screen showing the parameter list required for that call. Press
ESC to exit from an individual parameter list, and ESC from the ProDOS equates
screen to return back to the calculator.

Finally, there is a help screen for the CHARIO calls. Pressing "C" will bring up
the CHARIO equates screen. This will show you the call numbers
for each CHARIO function; the call number is the parameter to CHARIO needed
for each CHARIO function; of course it is the parameter to CHARIO needed
to invoke that function for the installed console driver. Pressing ESC will
return you to the main calculator screen.

LISA pseudo-ops

Note: not all of these pseudo-ops are implemented in the share-ware
version of LISA816 (LISA v4.0G). Specifically:
HEX .DB .LA .LEX .SA .AX
LIB .PSM .LMK .RLS .CLC
Assembly listing control:
LIST turns assembly listing on,
NLS turns assembly listing off,
GEN prints all object bytes for each source line,
NCG prints at most 4 object bytes per source line,
EX turns assembly listing on conditional expansion,
NOX turns assembly listing of macro expansion off,
CND turns assembly listing of conditionals on.

Note: not all of these pseudo-ops are implemented in the share-ware
version of LISA816 (LISA v4.0G). Specifically:
HEX .DB .LA .LEX .SA .AX
LIB .PSM .LMK .RLS .CLC
Assembly listing control:
LIST turns assembly listing on,
NLS turns assembly listing off,
GEN prints all object bytes for each source line,
NCG prints at most 4 object bytes per source line,
EX turns assembly listing on conditional expansion,
NOX turns assembly listing of macro expansion off,
CND turns assembly listing of conditionals on.
LONG expr,... define long (and byte and word) constants

String declaration:
BYT "string" define string- {'} creates with bit 7=0, {'} creates with bit 7=1
DCI "string" define string as in BYT; bit 7 of last char is inverted from normal.
RVS "string" define string as in BYT, but with chars generated in reverse order.
STR "string" define string as in BYT, with length byte preceding string (PASCAL)
ZERO "string" define string as in BYT, with 00 terminating string (C-string)

Control operations:
CPU type set CPU to assemble for. type = {6502, 65C02, 65816}
.DB declare what bank the DBR (data bank register) is pointing to.
.LA declare 16-bit ACCUMULATOR mode.
.LX declare 16-bit INDEX mode.
.SA declare 8-bit ACCUMULATOR mode.
.SX declare 8-bit INDEX mode.
END end of source.
.TF "file",type declare file to which generated code is saved to, and type (type is defined in HEX).
.SAV "file" saves memory as binary file.
.ANX "cmd" send cmd to ANIX shell to be executed as an ANIX intrinsic.
.CHN "file" chain to next file to be assembled.
.INL "file" include source file in assembly.
.PSM "file" include packed-sym file in assembly.
.LNK "objfile" include object code in link.
.LIB "library" extract needed object code from library in assembly.
.RLV "objlib" include information from Run-Time-Library in linkage.
.GO expr jumps to address expr to execute a machine language routine.
.USR expr parses expr, and jumps to user command.
.MEG "string" print message to stdout during assembly
.PAU force assembly error ("*PAU encountered")

ANIX Commands

Catalog (CATALOG {pathname} <return>) Displays the listing of a directory file. Abbreviation: "CAT". The pathname is optional; if it is present, ANIX will give the specified directory, and if it is absent, then ANIX will look for the default directory. The pathname must be of a DIR (subdirectory) type file, or a disk (a disk is indicated with ".Dn", where "n" represents a number between 1 and 8).

Close (CLOSE <return>) Will close any and all open ProDOS files. This command may be useful after a program bombs, in order to make sure all the programs opened by the program are closed properly, and their buffers are freed by ProDOS.

Date (DATE <return>) This prints the date, in the format "mm/dd/yy"; it will, that is, if you have a ProDOS compatible clock installed. (always the case on a IIgs). Otherwise, this command will print the last date specified with the SETDATE command; and if the SETDATE command has not been used, then "NO DATE" will be printed.

Delete (DELETE <pathname> <return>) This will erase a file from a disk; the pathname is not optional for this command. It will not erase a file if its "D" attribute flag is turned off (if you don't know what an attribute flag is, wait for the latter part of this section), so it will have to be unlocked before it may be deleted.

Note: When deleting a subdirectory, it must be empty before the DELETE command will work on it.

Exec (EXEC <pathname> <return>) The EXEC command is used to redirect input from a textfile rather than a keyboard; the pathname is not optional, and must be the name of a TXT type file, a sequential text file. When the EXEC command is executed, ANIX then begins looking for ANIX commands from the named textfile rather than the keyboard.

Load (LOAD <pathname> <return>) Loads a BIN or SYS file from disk into memory; pathname is required, but the hex address is optional. If the optional hex address is not present, then the file is loaded at the location from which it was saved. Example: LOAD SHORT.PROGRAM

Lock (LOCK [-N -R -W -D] <pathname> <return>) This command and the Unlock command are closely associated, and they share the same syntax. The Lock command will set any or all of four attribute flags: the N (rename) flag, the R (read) flag, the W (write) flag, and the D (Delete) flag. The N (rename) flag, upon being set, will thereafter prevent the given file from being renamed, until the N flag for the file is Unlocked. The R (read) flag will stop anyone from reading a file which isn't meant to be touched. The W (write) flag will prevent someone actually saving a new version of a program with the same name of a version you wish to preserve. Finally, the D (delete) flag will stop the deletion of a file.

Any of these flags, once locked, may be reset, using the Unlock command.

Online (ONLINE <return>) Lists all the volumes currently on-line
The result will be a line for each volume of this form:

s/d volume-name

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 606 of 1262
In these lines, "s" is the slot number, "d" is the drive number, and volume-name is the name of the volume in the specified slot and drive.

Prefix

(PREFIX {pathname} <<return>>) The pathname is optional. See the discussion of pathnames and prefixes following this listing for an explanation of this command.

Rename

(RENAME <<pathname>>, <<pathname>> <<return>>) Changes the name of a file in a directory. The pathnames are not optional, and they must be the same, except for the ending filenames. Examples:

Rename /directoryname1/subdirectoryname2/thisprogram, /directoryname1/subdirectoryname2/thatprogram.

Run

(RUN <<hex address>> {parms} <<return>>) Runs (calls) the assembly language program at the hex address named; the hex address is required. The optional parameters are for the use of the assembly language program.

Save

(SAVE <<pathname>><<start addr>><<length>><<return>>) This is for saving out an object file. The hex address and length must be included.

Syssave

(SYSSAVE <<pathname>><<start addr>><<length>><<return>>) This is the same as the Save command above, except that it saves a SYS type file rather than a BIN type file.

Time

(TIME <<return>>) Prints the time, assuming there is a ProDOS compatible clock present. If there is no clock, then this command prints the last time set by the extrinsic SETTIME command, or 00:00 if SETTIME has never been used.

Unlock

See LOCK.

 документ

In your first session, you will be required to enter your name (as well as the date) for your research files. In all subsequent session, you will only be asked to enter the date. When entering the date, use the format MM/DD/YY. Thus, for example if you start a session on March 1, 1986, type: 03 01 86 and then press RETURN. The session number will appear below your name and will increase by "1" each time you start a new session with your LCP.

To change the researcher's name, type: "logon, please" and then press RETURN. Select the program called "NAME CHANGER" by pressing "1" on the keyboard. Then follow the instructions at the top of the screen.

MOVING IN

If this is your first research session, your house will be empty when it appears on the screen. Most LCP's are quite shy and will not readily rush into a new situation. Therefore, it may take several minutes before they actually muster the courage to step inside the new home you're providing for them. On the other hand, LCP's are quite loyal. Once they have moved in, you can expect them to be in their home on subsequent sessions. They rarely move out.

When an LCP enters the house for the first time, he will usually inspect the new home for anywhere from 5 to 10 minutes. They he usually leaves to retrieve his belongings. He will probably return shortly with his suitcase. Most LCP's also bring their dog. DURING THE MOVE-IN SEQUENCE, KEYBOARD COMMANDS ARE NON-FUNCTIONING.

HOW TO MAKE SURE THE LCP IS HEALTHY, HAPPY, AND TOTALLY AT HOME

Although LCP's are basically quite independent, once they move into their new home they are, in a sense, living in your world. So they will need help in certain areas. To insure that your LCP is healthy, see that he always has food and water (The dog also needs food). Both hunger and dehydration can make LCP's sick (thy generally turn green and just lie in bed when they are sick).

Also, because they tend to be quite active, they should not be allowed to sleep too much. They would much rather have your attention.

The following is a list of keyboard commands to help you to take optimum care of your LCP:

CARING FOR PHYSICAL NEEDS

[CTRL] F - food is delivered to his front door

[CTRL] W - fills the water tank (in the kitchen on the first floor).
Each time you press W, approximately one glass of water is added to the tank.
Apple II Computer Info

[CTRL] A - rings the alarm clock

[CTRL] D - leaves dog food at the nront door. Your LCP will do the rest.

CARING FOR EMOTIONAL NEED

Addressing the physical needs of your LCP is relatively easy. Simply look to see if his supply of food and water is running low. Addressing his emotional needs, takes more sensitivity and careful study. First of all, you must be aware of his different moods. Their are four distinct moods for LCP's as identified by the expression on his face.

Happy
He's probably getting plenty of attention

Content
He's fine but could be better (see MOOD BOOSTERS)

Sad
He needs MOOD Boosting immediately

Sick
This happens when he has gone without food or water for a while

MOOD BOOSTERS

There are several ways to elevate the mood of your LCP. Some are more effective than others.

[CTRL] C - a phone call Many LCP's enjoy receiving phone calls - unless they're constantly interrupted to the point of irritation. Who knows what they say or who they talk to.

[CTRL] P - physical contact ("petting") - In order to pet your LCP, he must be sitting in his easy chair in the living room. To call him to to the chair, press [CTRL] P and he will know you want to pet him.

[CTRL] R - leaves a record for his stereo at the front door

PLAYING GAMES

This is one of LCP's favorite pastimes, so naturally it makes them feel great. Usually, an LCP will allow you to make the game selection. He will knock on the glass of your TV or monitor to get your attention and ask you to select a game from the list at the top of the screen. Type in the number of the game you want to play.

1. CARD WAR

This is the standard game of WAR where each player is dealt 26 cards. You both draw the top card from your pile. The LCP will show you his card first. To show your card press "A" as indicated by the command menu in the upper right corner of the screen. Whoever has the higher card wins the hand and both cards are added to the inner's stack. When a WAR occurs (both of you have cards of equal value showing), the LCP will deal 4 more cards to each of you face down. He will turn over his last card; press "A" to show your last card. Whoever has the higher card wins the hand and all of the cards on the table are added to his stack. After the last card dealt reveals another WAR, then 4 more cards are dealt to each hand and play continues as above until he WAR is broken. If at any time you wish to quit before either of you has won all 52 cards, just press "D".

2. ANAGRAMS

The LCP will be the one to think of the word and you will be the one to unscramble it. A scrambled version of the word he's thinking of appears in big type on the screen. You type in what you think is the correct word and he will tell you whether your guess is right or wrong. He'll let you guess 8 or 9 times before he tells you the word.

If you need a hint, press "1" which will cause a letter to assume its correct place in the scrambled word. An LCP will not give you two hints in a row.

3. 5-CARD DRAW POKER

Standard poker rules apply. You each start out with 200 poker chips as displayed at the top left of the screen. Your number of chips is below his. Bets are limited to 20 chips apiece.

Press "A" to ANTE UP one poker chip. The LCP will deal you 5 cards (yours are face up) and ask if you want to bet any chips. Here are your choices:

A - Bet one poker chip
B - enters you bet
C - lets you PASS if you don't want bet or CLEARS your bet if you decide to bet a different amount

After you make a bet or pass, the LCP will either match your bet or pass. When the LCP asks if you want cards, press any combination of numbers from 1 to 5 (corresponding to the cards from left to right) on the keyboard to discard the cards that you don't want. Now press "A" to DRAW replacements or if you didn't want any, press "B" to stay. Your LCP then follows your steps himself. You now have the following above options (A,B, or C) to make another bet. At this point the LCP can raise his bet and gives you two choices:

A - lets you match his bet.
B - lets you fold, losing your bet.

Choosing option A gives you three more choices:

A - raise the bet even higher
B - enters your raise
C - stops betting for the hand and lays the cards down on the table to determine who has won.

After each hand you have the option of quitting by pressing "D".

RECREATION AND RELAXATION

Most LCP's are very good at entertaining themselves. They are good pianists and can play compositions from classical to jazz. They also like collecting records. So give them records often to please them. LCP's also exercise frequently, enjoy playing with their computers, or sitting down in their easy chairs with the newspaper. You may even be able to talk them into building a fire in the fireplace (see KEYBOARD COMMUNICATION).

KEYBOARD COMMUNICATION

You communication with LCP's by typing sentences in the form of questions, suggestions, or requests. This will evoke a wide range of responses and reactions from the LCP. Here are a couple of suggested requests:

Please type a letter to me Please light a fire

LCP's are especially responsive to good manners. So remember to incorporate the words "please" and "thank you" into your requests.

--END--
Introduction
What is Labels, Labels, Labels?

L.L.L. is a program which allows you to design and print fancy labels using Print Shop graphics, borders, fonts. L.L.L. allows you to:

- Print color labels on supported color printers.
- Use multi-color graphics like those found on the IIGS version of Print Shop and the IIGS Sampler Edition.
- Load graphics, borders, and fonts from DOS 3.3 or ProDOS disks.
- Design custom sized labels
- Load and save label designs
- Preview labels on screen
- Merge AppleWorks database records with fancy labels

L.L.L. can be used as a stand alone program, but it is designed to be used with AppleWorks, Print Shop, Print Shop GS, The Print Shop Companion, Print Shop Graphic Libraries, and MiniPix.

Compatibilities
What you will need

Apple ][+, //e, //c, IIGS, Laser 128 or Laser 128EX
Disk Drive (preferably two)
At least 64K of memory, 128K for color printing
Monitor or TV
Dot Matrix Printer - Appendix C for list
Printer Interface - Appendix D for list

Using L.L.L. with Print Shop

Some graphics, fonts, and borders have been included with L.L.L., but many others are available. L.L.L. is designed to work with "Print Shop" graphics, fonts, and borders. These are found on the "Print Shop" program disk, the Print Shop Companion, and The Print Shop Graphics Libraries. Elements from The Print Shop Companion and The Print Shop Graphics Libraries can be used without modification. Using elements from The Print Shop program disk requires placing them on a standard data disk. For graphics, this can be done with the Graphic Editor on the Print Shop program disk. Fonts and borders can be saved to a standard data disk by using the Font Editor and Border Editor on the Print Shop Companion disk. See Appendix A for more details. Print Shop is a trademark of Broderbund Software.

GS Print Shop

L.L.L. works with multi-color graphics like those found in the GS version of Print Shop. These can be printed in color on a color printer or with gray shades on a B/W printer. L.L.L. does not use multi-color borders.

MiniPix
L.L.L. can use graphics found on the MiniPix program by Beagle Bros Software. MiniPix is a trademark of Beagle Bros.

Newsroom Clip Art
-----------------
Newsroom Clip Art can be converted to a Print Shop compatible graphic with the PS Lovers's Utility Set (P.L.U.S.), available from the Big Red Computer Club. It may then be used with L.L.L.

Using Labels, Labels, Labels
-----------------
Making a Backup Copy
-----------------
L.L.L. is supplied on a ProDOS formatted disk and is not copy protected. You can make archive copies for your own personal use with the ProDOS Filer or System Utilities disk or other disk copying program.

Hard Disk and 3.5" Disk Installation
-----------------
L.L.L. can be used on a ProDOS compatible hard disk. To install the program on your hard disk, copy all of the files from the L.L.L. program disk to a subdirectory on your hard disk. L.L.L. will not function properly unless all the program files on the L.L.L. disk reside on the same directory.

Starting the Program
-----------------
Insert the L.L.L. diskette into your disk drive with the label side up. Turn on the computer or otherwise boot the L.L.L. program. This will bring up the LABEL MENU for the program.

Using the Menus
-----------------
Working with L.L.L. is easy because it is menu driven; that is, your choices appear in lists or menus on the screen. You make your selection by using the arrow keys to highlight your choice and then pressing the RETURN key. Pressing the ESC key returns you to the previous menu.

Remember:
-----------------
Use the arrow keys to highlight your selection, press the RETURN key to perform the selected function. Press the ESC key to return to the previous menu.

Cancelling Printer Operations
-----------------
It is possible to cancel all print operations by pressing the ESC key while the printer is working.

Creating Labels
-----------------
The same procedure is followed for creating each of the standard size labels. Creating a label is a process of choosing a border, graphic(s), a font, and then entering any text to be printed on the label. Users with color printers can also specify different colors for each element of the label.

Choose Size of Label
-----------------
Begin by highlighting the type of label you want to create from the LABEL MENU and press RETURN. Six standard label sizes are built into L.L.L.:

- 3-1/2" X 15/16"
- 3-1/2" X 1-7/16"
- 4" X 15/16"
- 5" X 15/16"
- 5" X 3-1/2"

Other label sizes can be created by selecting Custom Size which is explained in Appendix B.

The next screen asks if you want to create a label or load a previously saved label. When you load a label, it is automatically converted to the size of the label that was selected from the LABEL MENU. Once a label has been loaded, the PRINT MENU is displayed. The loaded label may then be edited or printed.

Select a Border Type
-----------------
You are first asked to choose a border or part of a border for your label. You can choose: no border; top only; sides only; top and sides; bottom only; top and bottom; bottom and sides; or full border. Highlight your choice and press RETURN. Choosing no border allows more room on your label for text and graphics.

Select a Disk
-----------------
When you boot the L.L.L. program, it examines you computer to identify all disk drives connected to it. Each time you load a border, graphic, or font, the available drives are displayed by their slot and drive number. To load an element, place the data disk in a drive and select that slot and drive number from the menu. A list of the borders, graphics, or fonts on the disk in the selected drive is displayed and you can select the element that you want to load. The data disk can be either a DOS 3.3 or ProDOS disk.

Place a disk with the desired border in one of your disk drives and choose the appropriate slot and drive from the menu. All of the borders on the disk are displayed on the screen.

Select a Border
-----------------
Choose one of the borders from the disk by highlighting it and pressing RETURN. When you press RETURN, the border is loaded from the disk. If the disk has been removed or some type of error occurs while reading the disk, an I/O error message will be displayed. If an error occurs, press ESCAPE, correct the problem and try again.

Select a Color
-----------------
If you have one of the supported color printers, select the color that you would like your border to be printed in. If you have a single color printer, you can choose any color, but it will have no effect on your printer.

Select a Graphic Type
-----------------
After selecting a border, the next screen asks you to select what type and how many graphics you want to use on your label. The options are: no graphics; one single-color; one multi-color; two single-color; or three single-color. Highlight your selection and press RETURN. Choosing no graphics leaves more room on your labels for text.

Multi-color Graphics
-----------------
Multi-color graphics are available only on the GS version of Print Shop. However, they may be used with L.L.L. on any Apple [] computer.

Select a Disk
-----------------
Place a disk with the desired graphic in one of your disk drives and highlight the correct slot and drive.

Select Graphics
-----------------
If you are working with single-color graphics, you can now choose each graphic, a color, and a position for it. If you are using a multi-color graphic, you can now choose one and position it.

Select Position for Graphics
-----------------
For each graphic selected, you can choose a position to print it on the label.
Graphics may be printed on the left, right, or centered.

Select a Text Format
----------
Once all the graphics have been selected, you are asked to select a text format for your label. The choices are: no text, one line of large, two lines of large, all large, or all small. Highlight your choice and press RETURN.

L.L.L. works with two types of text fonts. "Large Text" refers to Print Shop fonts. Depending on the size of the font, and the size of the label, L.L.L. will allow up to five lines of large text. "Small Text" refers to the normal 10 characters per inch font that is produced by your printer. You may have up to 5 lines of small text on your label, depending on the size of the label and the number of large text lines you select.

Select a Disk
---------------
If you choose to have large text on your label, you have to load a font from disk. Place the disk with the font you want in one of the disk drives and select the drive and slot on the screen. A list of fonts on the disk is displayed on the screen.

Select a Font
----------
Highlight the font that you want your large text to appear in and press RETURN. The font is then loaded from disk.

Enter Label Text
----------------
If you choose to have text on your label, your screen now displays a blinking cursor. You may now type the text that you want to appear on your labels. The program allows you to use the LEFT ARROW or DELETE key to back up and correct mistakes. Press RETURN after each line is entered. Press ESC to go back up to the previous line.

Editing Commands
------------------
Pressing Control-E deletes all text on the line that the cursor is currently on. Pressing Control-C allows you to choose a color for the current line. Control-P allows you to position the current line. Lines can be left, center, or right justified. Lines selected as centered or right justified are not displayed that way on the screen; however, they will appear correctly on your printed labels.

Position and Color Indicators
---------------------------
Indicators on the right side of the screen show the current color and position for each line. Position is indicated by an upper case L, C, or R. Color is indicated by the first letter of the chosen color, such as "g" for green. Black is indicated by a blank.

If you choose a large font, the text is displayed in that font. The size of the label and the size of the font determine how many characters you can get on each line of the label. The program does not allow you to type in more characters than will fit on a line.

If you choose one or two lines of large text, there may be room for 4 lines of small text, depending on the label size. Up to 29 characters can be entered on a line.

When you have entered all the text to appear on the label, the PRINT MENU is displayed.

Print Menu
----------
The PRINT MENU allows you to: Preview the Label, Print in a Single-color, Merge Multi-color, Print Multi-color, Merge Single-color, Merge Multi-color, Save Label, Change Printer Setup, or Exit to ProDOS

Preview Label
------------
When you select to preview the label, a graphic representation of the label is displayed on your screen. This should give you a rough idea of what the printed label will look like. The screen display of the label is coarse since the screen's resolution is much lower than the printer's.

Print Single Color
----------------
Choose this to print your label on a single color printer in a single color on a color printer. When you press RETURN, you are asked to select the number of labels you would like to print. Use the LEFT ARROW key to reduce the number and the RIGHT ARROW key to increase it. Press the RETURN button when you are ready to print. Make sure your printer is on and it is selected (online). Press ESC at any time to stop the printing.

Elements selected to be in color and multi-color graphics are printed using a gray scale when you choose to print them in single-color mode.

Print Multi-color
----------------
Choose this option to print labels on a color printer. When you press RETURN, you are asked to select the number of labels you would like to print. Use the LEFT ARROW key to reduce the number and the RIGHT ARROW key to increase it. Press the RETURN button when you are ready to print. Make sure your printer is on and it is selected (online). Press ESC at any time to stop the printing.

Merge Single-color or Multi-color
------------------------
The merge option lets you merge one of your designed labels with information from an AppleWorks Data Base (ADB) file. L.L.L. uses the AppleWorks Label Format to print your labels and the Selection Conditions to decide which labels to print. You must set up the Label Format and Selection Conditions ahead of time. When you are setting up your Label Format, remember that L.L.L. can print a maximum of 5 lines per label and 29 characters per line.

Number of Copies
------------------
When you choose one of the merge selections from the Print Menu, you are first asked to select the number of copies of each label to print. Use the arrow keys to select the number you want to merge with.

Select Slot and Drive for the ADB File
-------------------------
The next screen asks you to select the slot and drive in which your AppleWorks Database file can be found. Choose the appropriate slot and drive, place the disk in the drive and press RETURN.

Select ADB File
----------------
Now the list of all the AppleWorks Data Base files on the disk is displayed. Select the one you want to merge with.

Next, a list of the Label Report Formats for the file are displayed. Choose the format you want to use and press RETURN. All labels meeting the Selection Conditions in the Report Format are then printed along with the graph elements for the labels.

Select Label
---------
Use this option if you have created a label you want to use again or if you want to merge a database with this label. When you select Save Label, you are asked to select a slot and drive for the disk to save the label on. The disk must be formatted for ProDOS. Labels cannot be saved on DOS 3.3 disks. Place your disk in the correct drive and press RETURN. It takes about 18 blocks of disk space to save a label.

The screen now displays any labels which have been previously saved on the disk.
The selection "Enter Name For" is also displayed. Choose this selection when you want to enter a new name to save this label under. You may enter up to nine characters for the name of the label file. Once you have selected a file name or entered a new one, L.L.L. saves the label to disk.

Change Printer Setup

In order for L.L.L. to work with your particular system, you need to specify some information about your disk drive and printer. You can do this by selecting the SETUP option from the PRINT MENU. Once you have gone through the SETUP option, L.L.L. remembers your choices and you only have to use SETUP again if your Apple equipment changes. In the SETUP option, you are asked to enter the following information:

**Printer**

The SETUP program asks you to identify your printer from a list on the screen. Use the arrow keys to make your selection and then press RETURN. If your printer type is not shown on the screen, check Appendix C for a list of printers which are compatible with L.L.L.

**Printer Interface Card**

Select your interface card from the list on the screen. See Appendix D for a complete list of the interface cards supported.

**Printer Interface in Which Slot**

Now you need to select which slot your printer is in. This is usually slot 1.

**Exit to ProDOS**

Selecting this option takes you out of L.L.L. and into the ProDos Program Selector. Your current label will be lost unless you have saved it to disk.

Appendix A

Using Graphics from the Print Shop Disk

Start up your computer with either Print Shop or the Print Shop Companion Program. Select the GRAPHIC EDITOR Program utility from the main menu. Use Control-G to get a graphic from the Print Shop program into the editor. Then use Control-S to save the graphic onto your data disk. The graphic can now be used with L.L.L.

To transfer fonts or borders from the Print Shop program disk to a data disk, you must use the Print Shop Companion program. Select either the FONT EDITOR or the BORDER EDITOR and use the Control-G, Control-S options to transfer the desired files onto your data disk.

Appendix B

Creating Custom Sized Labels

To create custom sized labels in L.L.L., you must specify the size of the label in border elements. Each element of a border is approximately one fifth of an inch wide and 14/72nds of an inch high. The first two screens ask you to enter the width and height of the label in border elements. The last screen asks you to enter an adjustment factor which is the number of 72nds of an inch necessary to line up the next label.

**Width**

When you choose to create a Custom Size, you are first asked to enter the width of the label in borders. Each border element is approximately 1/5 of an inch wide. Multiply the width in inches times 5 to arrive at the number to enter for the width. So, for a 3" wide label, you would use the arrow keys to change the number to 15.

**Height**

Now indicate the height of the label by entering the number of borders which will fit vertically on the label. To calculate this number, measure from the top of one label to the top of the next label. Multiply this number by 72. Now divide the result by 14. Enter the integer portion of the result (the part to the left of the decimal point) for the height. Save the first digit of the remainder (the first number to the right of the decimal) for the next screen. If the labels measure 1.5" from top to top, take 1.5 times 72 = 108/14 = 7.7. Enter 7 for the height and 7 for the adjustment.

**Adjustment**

The next screen asks you to enter the adjustment factor. The adjustment is the number of 72nds of an inch that the printer needs to move down to start at the top of the next label. If your labels are not lining up correctly, you can adjust this number to correct the alignment.

Appendix C

Compatible Printers

The following is a list of printers which are compatible with L.L.L.

- Epson RX80, FX80 and compatibles
- Epson EX800
- Panasonic 1091
- Citizen
- Juki 550
- C. Itoh Prowriter
- NEC 8023
- Apple DMP
- Apple ImageWriter
- Apple ImageWriter II
- Apple Scribe
- Star Gemini 10X, 15X
- Okidata 192, 193

Appendix D

Compatible Interfaces

The following is a list of printer interfaces which are compatible with L.L.L.

- Apple //c Serial Port
- Apple Parallel
- Apple Serial
- Apple Super Serial
- Grafstar or Grappler
- Grappler Serial
- FingerPrint
- CCS 7710A Serial
- CCS 7720 Parallel
- CCS 7728 Parallel
- PKaso or PKaso U
- Primera 70
- Textprint Print-It
- Dumpling 64
- Dumpling GX
- Grappler+ or FingerPrint+
- Microbuffer II
- Videx Uniprint
- Apple IIGS Serial Port
- Pro Grappler set as Apple parallel
- Laser 128 set as //c Serial

Appendix E
Most problems with L.L.L. can be traced to the printer or printer interface card. If the printer doesn’t do anything or if it prints out garbage, please follow these steps:

Go back to the PRINT MENU and check the printer setup options.

If everything seems in order in the printer setup, try turning your printer off, pausing a few seconds to let it clear, and then turning it back on.

LLL v1.3 update

The version 1.3 update contains a simple database program for entering lists which can be merged with LLL. The database is a BASIC program and can be accessed by selecting Exit to ProDOS from the Print Menu. Type in /LLL when the screen displays ENTER PREFIX. Press RETURN. Then type BASIC.SYSTEM and press RETURN.

Using the LLL Database

A simple database program is included on your LLL program disk. It is designed specifically to be used with LLL. It allows you to enter up to 200 records in a file. Each record consists of 4 lines of text (25 characters each) and a sort key (5 characters).

The Sort Key

The sort key can be used to arrange the database file in any desired order. The most common entry for the sort key will be Zip Codes, but you could use the first five characters of a last name for an alphabetical sort. The sort key will not be printed on any of your labels.

Using a Data Disk

The program first asks for the location of your data disk. You may select drive 1 or 2 by entering the number or you may select a disk or directory by entering a prefix.

Database Functions

The database program is capable of performing the following functions:

A) Add a record
B) Change a record
D) Delete a record
S) Search for a record

When you run the program, any of these functions can be selected from the main menu by typing the first letter of the command. A=10

Searching

When changing or deleting a record, you are asked to input the record number. This number changes if you add or delete records from the file. Use the search function to find the record you want to change or delete. The program uses a substring search so you don’t need to enter the entire name to find a match. A=10

-KND-
Opening a resource file- To open a resource file for editing, select the Open item under the File menu. Select the file you wish to edit. A dialog box will appear on the desktop with the title of the file you just opened. Inside the window are two lists and four buttons.

Resource file information- Clicking on the Info... button in a file window brings up a dialog box displaying the number of resources, number of resource types, and size of the resource fork represented by the window. If resources already exist in the resource fork, this list will be empty because no type is selected. To select a resource, first click on the type of the item in the first list, and then the ID of the item in the second list. Note that various types of IDs can be selected (e.g., LLRE expects only resources). After this window is closed, the selected resource will be displayed in the name box and the resource ID will be automatically added.

Selecting Resources- The first list (on the left) is the list of resource types present in the file. The second list is the list of all resource IDs of the currently selected type (note that when the window is opened this list will be empty). To select a resource, first click on the type of the item in the first list, and then the ID of the item in the second list. Note that resources can be selected in two ways, as each byte in the resource representing either an ascii character or a hexadecimal byte is automatically edited with LLRE. These types include Pascal and C strings, and Textbox and TextBlock types. Non-text types are automatically edited as a hexadecimal stream. After selecting the desired resource(s) to edit, click on the Edit Resource button (or double-click the resource ID). To edit a resource in the non-standard way (for example, to edit a Pascal string as a hexadecimal stream), click on the menu bar where you can type the string (or hold down the option key while double-clicking the resource ID). An edit window will appear.

Creating New Resources- A completely new resource of any type and ID can be created by clicking the New... button in a file's window. A dialog box will appear asking for the resource type and ID of the new resource. As defaults for the type and ID, LLRE supplies the currently selected type and an unused resource ID. After selecting the type and ID, click the New Resource button to edit the new resource. To edit the resource in the non-standard way, hold down the Option key while double-clicking the New Resource button.

Edit Windows- After selecting resource(s) to edit, edit window(s) will appear. The title of each window will be the type and ID of the resource, and the information bar in the window will display the name of the file the resource is from and which kind of editing is being done.

The main part of the edit window is the large Text Edit box. This is where the editing is done. The resource will be displayed here as a text string (with each character representing one byte in the resource) or as a string of hexadecimal bytes separated by spaces (Note that there are NO carriage returns in the hex stream. LLRE expects only spaces between each byte). If the editing is done as hexadecimal, LLRE will supply guidelines on the top and left sides of the text box to indicate which byte is currently being edited.

Four buttons also exist at the bottom of the window. From left to right, the buttons are:

Import...- This allows the user to import a data fork of a file into another resource fork of a file. This method can also be used to supply a custom icon for an Alert resource file ($8015). The File Menu- This menu contains items which affect resource files. The items are:
when editing a resource requiring a converter. Code resources can be easily created with LLRE; however, even though they require converters, create a code resource by first linking the code as a generic load file and then importing it into a code (or CDev code) resource. (Look for a demonstration soon on creating CDevs with LLRE).

- Supplying key equivalents under TML Pascal II: TML Pascal II doesn’t handle key equivalents for controls correctly. Edit the control template with LLRE to easily fix this problem.

- Eliminating recompilation: Instead of recompiling a program after making modifications to its resource file, simply copy the resource fork of its resource file into the resource fork of the program.

- Easily edit file attributes with the check boxes and radio buttons

In Conclusion
I have made every attempt to make LLRE as complete and error-free as possible. If you have any complaints, suggestions, or recurring errors, please contact me. Also, thank you for participating in the shareware distribution system. Please copy this program and upload it and give it to everyone you know who is interested.

Introduction....
Loan Analyzer is a screen based program written to provide basic loan information on adjustable rate mortgages. It will also provide payment schedules based on the provided loan information. Loan Analyzer is menu oriented; that is, it will provide you with your choices in the form of a menu. To make a choice, just press the key of the letter in parentheses.

---- A COUPLE OF WORDS OF CAUTION ----
Although we have tested Loan Analyzer extensively, both Furry Programmers, Vltd., and UPTIME Magazine, IN NO WAY GUARANTEE THE ACCURACY OF THESE PROGRAMS, AND DO NOT ASSUME ANY RESPONSIBILITY FOR ANY DECISIONS MADE ON DATA FROM LOAN ANALYZER. We suggest that you talk to a loan officer at your bank or savings and loan for the latest rates, points, plans, and other information that will help you make the right decision.

We suggest that if you get an adjustable, or variable, rate loan, you obtain one with a cap on the range on how far the interest rate can climb or fall, and how far it can be adjusted each time. Also, consider a plan that does NOT allow the principle to rise, better known as NEGATIVE AMORTIZATION. Loan Analyzer assumes that you have a loan meeting these requirements.

Using Loan Analyzer.....
Before using Loan Analyzer, you should know the loan amount and/or the monthly payment, the prevailing interest rate, the period of the loan in months and/or years, the cap values, and the period between adjustments.

TO ENTER OR CHANGE DATA:
1. From the MAIN screen, press C for Change.
2. Press the key corresponding for what you want to enter or change.
3. Enter the new value.
4. Repeat steps 2 & 3 until done.
5. When finished, press return to accept the changes and go to the compute/generate screen.

If you need to restore the data to the value prior to being changed, press [ESC] to abandon the changes and return to the main screen.

TO COMPUTE A VALUE, OR GENERATE A TABLE:
1. From the main screen, press A for accept.
2. Select your choice by entering a number, then press return.
3. Answer the prompts as required.

NOTE: Computing a missing value will store the value computed, while generating tables does not change any value on the main screen.

Modifying the DEFAULT settings.....

THE DEFAULT SETTINGS FOR THIS PROGRAM ARE IN LINES 110, 120, AND 140.

THE COMMAND FOR THE LODE RUNNER EDITOR IS A <CTRL>E. THIS COMMAND WORKS DURING THE DEMO PROGRAM OR AFTER A GAME AND THE LOGO IS ON THE SCREEN.

WHEN YOU ARE IN THE EDIT FEATURE THE FOLLOWING COMMANDS WORK:

*P*—PLAY A SELECTED LEVEL
*I*—INITIALIZE A NEW DATA DISK
*E*—EDIT A LEVEL
*S*—CLEAR HIGH SCORE LIST
*C*—CLEAR A LEVEL
*M*—MOVE A LEVEL

<ESC> CANCELS ANY COMMAND.

IF YOU WANT TO 'E'DIT A LEVEL:

1 — BRICK (DIGGABLE FLOOR)
2 — BLOCK (UNDIGGABLE FLOOR)
3 — LADDER
4 — POLE
5 — FAKE FLOOR (LOOKS WEIRD, BUT LOOKS LIKE 1, WHEN PLAYING THE BOARD)
6 — LADDER THAT APPEARS AFTER ALL BOXES HAVE BEEN GOTTEN, WHEN PLAYING. LOOKS WEIRD ALSO, BUT LOOKS LIKE 3 WHEN PLAYING. MAXIMUM OF 45.
7 — BOX.
8 — ENEMY. MAXIMUM OF FIVE PER LEVEL.
9 — THE PLAYER. MAXIMUM OF ONE PER LEVEL.
0 — ERASES ANYTHING.

USE THE i, j, k, m DIAMOND FOR MOVING THE EDITING CURSOR.
CTRL-S SAVES YOUR LEVEL, CTRL-Q GETS YOU OUT OF EDITING MODE.
1] Use your position on the ladders to move the men left and right, dropping each man past and below you through the center channel before moving up to the next level.

1] Trap the men at the bottom center by moving to the bottom of the far left ladder.

2] Run over their heads and get all the chests on the right (the fifth chest from the right has a trap door under it).

3] Dig away all the bricks to the left of the men, letting one man free.

4] Dig a hole to the left of the man and walk over his head while he's in it, and force him to the right by positioning yourself at the right spot on the ladder.

Get the men into strategic "U"s and walk over their heads.

1] Climb either ladder and position yourself at the top so that the men fall into the "U"s.

2] Using their heads to stand on, dig and release them after getting the chests. They will drop into other "U"s and you can repeat the action.

3] Climb the ladder halfway, then lure the men into the trap at the bottom. Move them all the way to the left by descending the left ladder again. Then cross over to the right and repeat Step 2. If you move quickly, you'll fall to the ground with the second chest just before the men reach you.

Keep all the men together!

1] Move to the top right corner. 4 men will proceed up and left and the 5th will climb toward you. Just as he approaches, move left. As soon as he's near you, drop to the bottom, run right and up the ladder to a spot that makes him run left.

2] Stay high to draw all the men to the top left. Collect the chests from the right side and bottom.

3] Repeat this for all areas.

1] Go up the ladder toward the left hand corner of the screen. You'll have to duck into one of the diagonal channels and dig to get by one of the men.

2] Pick up all the chests across the top, dropping from diagonal to diagonal by blasting through the bricks.

3] Descend a diagonal to the lower left corner and make your way across the bottom in the same manner, picking up the remaining chests.

Another great T-Men file!

1]  Use  your  position on the ladders to move the men left and right, dropping each man past and below you through then center channel before moving up to the next level.

1]  Trap  the  men at the bottom center by moving to the bottom of the far left ladder.

2]  Run over their heads and get all the chests on the right (the fifth chest from the right has a trap door under it).

3]  Dig away all the bricks to the left of the men, letting one man free.

4]  Dig a hole to the left of the man and walk over his head while he's in it, and force him to the right by positioning yourself at the right spot on the ladder.

Get the men into strategic "U"s and walk over their heads.

1] Climb either ladder and position yourself at the top so that the men fall into the "U"s.

2] Using their heads to stand on, dig and release them after getting the chests. They will drop into other "U"s and you can repeat the action.

Keep all the men together!

1] Move to the top right corner. 4 men will proceed up and left and the 5th will climb toward you. Just as he approaches, move left. As soon as he's near you, drop to the bottom, run right and up the ladder to a spot that makes him run left.

2] Stay high to draw all the men to the top left. Collect the chests from the right side and bottom.

3] Draw all the men that are on the bottom to the right side, then up.

4] Go left and down, moving to the left ladder to keep all 5 men on the right side. Now clear the left side.

1] Move left, under the first man and over the next.

2] Lure the men individually into the one place on the board where you can dig and get rid of them one at a time.

3] Collect all remaining chests.
Clear the center arrowhead chests first and trap the men in the area.

1) First, dig a hole in floor above the point of the arrowhead (point X). Collect the chests that appear at the center of the arrowhead.

2) Collect as many chests around the arrowhead by digging from point 'X' and circling back.

3) Go to either the bottom right or left of the triangle of ladders above the arrowhead and dig a hole. Get a man to chase you to the top of the pyramid. At this point dig, trap the man, climb down the first ladder on the other side of the pyramid, and he'll eventually drop into the bottom center.

4) After all men are trapped, collect the chests.

1) Don't fall to the bottom. Step right as you pass the first opening.

2) Go up the first ladder and to the top of the first section. Dig your way to the gold chests in the first section in two passes.

3) Climb up the middle ladders and get the chests.

4) The far right section is a matter of timing. At the bottom right ladder, dig the top brick, hesitate, the next brick under it, hesitate, the next brick...as soon as you see the top brick forming, run across the top right to last right brick, dig, drop through, grab the chest and run through the left hole before the bottom brick forms.

Repeat procedure for the left side of the ladder.

1) To get to the second and third boxes on either side of the screen, you must cross over a falling man's head from the ladder.

1) Go to the far right & up the ladder.

2) The first, third and fifth cross on the top row are traps. Get the men to fall in them.

3) Get the last two men together & make them follow you in a circle while you collect the rest of the chests.

Get the men to bring the chests to you!

1) Collect the chests that aren't near the men.

2) Manipulate the men by moving up and down in the center part of the maze. Get by the leftmost man into the lower central portion of the board.

3) Continue to manipulate the men from this area as you collect the chests.

4) To get the leftmost man to part with his chest in the right place, draw him to the fifth floor on the right and stand at the left of the third ladder. When he's almost upon you, race up the third ladder and he'll race up the second ladder. Race down, collect the chest & race back up the ladder.

There's no specific strategy for this level except that by keeping the men together you have a better chance of controlling and getting by them.

Get the far right chest left.

1) Collect all chests across the top except the far right one.

2) Let the rightmost man out of the hole that he's fallen into and get any chest that may appear.

3) Manipulate as many men as needed to the bottom left of the board and use their heads to climb the far left ladder.

4) Get the last chest.

1) Collect some chests from the upper right side of the board.

2) Stay high on the board to attract the men. Then, go down and dig from the second floor from the bottom on the far right ladder and down the 'steps of bricks' to the bottom row of ladders...cross to the left side of the board. Run in circles to avoid the men.

3) Get a man to fall into the hole bottom hole in the center 'circle'. Collect the chests in the middle and get the other men to fall in to get them out of the way.

4) Collect the rest of the chests.
1) Use the two upper righthand corner bricks to trap and kill men until they appear at the right side of the board. Then, move down and draw the men onto the floor.

2) Try to trap the men in the bottom 2 holes of the board as you collect the chests.

3) Dig the middle chunk of bricks to the left of the long middle row directly above or from the right side. Don't get ANY of the chests by digging over the ladders to the left.

4) Collect the rest of the chests from the right side of the board, leaving the bottom right chest for last.

5) Fall onto the guard beneath you and while standing on his head, dig away the brick on his left and jump over onto the brick on his right when he starts to move away. When he drops onto the other guard, jump off the block you're standing on. Don't follow the guard, but dig out the rightmost brick instead so you can drop to the bottom and get out the ladder.

6) Climb up the bottom far right ladder and cross over to the left side of the two guards. Dig the brick to the right of the middle bottom ladder. Jump on the man's head, dig right then left, without hesitation and immediately run right. Pick up the chest and exit quickly to the right.

7) Pick up the remaining chests with the exception of the 2 chests in the bottom righthand corner and then work your way down to the lower righthand corner last.

Another great T-Men file!

As a general rule for this level, try to approach each gold chest from directly above or from the right side. Don't get ANY of the chests by digging over the ladders to the left.

The main clue is printed on the screen. There are 14 trap doors to look out for and they are all placed so that, if you do the obvious thing, you'll wind up in the pit at the bottom of the screen.

As a general rule, try to approach each gold chest from directly above or from the right side. Don't get ANY of the chests by digging over the ladders to the left.

Keep the men together.

LEVEL 21: TWENTY-ONE

Stack the men in the center. Get the men to retrieve the chests across the second from the bottom floor.

LEVEL 22: CRAZE MAZE

Try to trap the men in the bottom 2 holes of the board as you collect the chests.

LEVEL 23: BEST BUNGELINGS

Collect the rest of the chests from the right side of the board, leaving the bottom right chest for last.

Keep the men together.

LEVEL 24: EIGHT MACHINES

Collect the rest of the chests from the right side of the board, leaving the bottom right chest for last.

Keep the men together.

LEVEL 25: NINE MACHINES

Collect the rest of the chests from the right side of the board, leaving the bottom right chest for last.

Keep the men together.

LEVEL 26: TEN MACHINES

Collect the rest of the chests from the right side of the board, leaving the bottom right chest for last.

Keep the men together.
2] Collect all accessible chests while working your way to the lower right corner.

3] Collect the chests in the upper right corner.

4] Dig the bricks over and right of the 1st short ladder on the left, 2nd floor (from the bottom) and jump down on the chest from the top of the ladder.

5] To get the chest in the lower left corner, dig the brick at the bottom left of the bottom right ladder, then the top 2 bricks on the right of the bottom right ladder, then go back and re-dig the first brick, then the bottom brick next to the left ladder then the brick above the chest, drop on the chest and leave.

  * LEVEL 24: BROTHERBUNNY *
1) Go up the left ladder to the trap under the second bar.

2) Dig left after falling through and continue left down the trap doors. You'll fall right onto the chest.

3) Get the top left chest first. Dig the brick to the right of the short ladder and get the top man to run left into the brick as it reappears.

4) Dig down to the next section and get the far right chest. Dig to the left of the ladder, run to the right ladder and force one man into the reappearing brick.

5) Trap the last 2 men in the pit under the bar being careful that they don't take any chests with them.

6) Dig down to the ladder below and get the chests.

7) Attract all the men to the bottom left corner (you can do this from the bottom right corner) and collect all the chests.

8) Go down to the next level and get the remaining chests.

9) If any chest is picked up by a man, try to get him to drop it for you toward the bottom middle of the board.

LEVEL 33: RORSCHACH TEST

1) As the man starts down the second long ladder from the left after you, dig the brick to the right of the first short ladder. Get him to follow you through and exit down the ladder to the left, then back up the long ladder. This gets you past the man.

2) Get all the chests in the left section, taking one at a time, and each time escaping back through the brick left of the top short ladder.

3) Get the chest in the middle section by shooting holes to the ladders below the middle short ladder and always escaping back through your starting point.

4) Get all the chests in the right section and escape.

LEVEL 34: SPLIT SECOND

1) The only important thing to know about this level is to spend as much of your time as possible on the second row from the top. The men will bring you many of the chests and you can drop down to the ground level to pick up others after you've caught all of the men in the pits.

LEVEL 35: BARREN BOARD

1) Trap the men in the upper 2 chambers by leading them over the outer edges. Then collect the rest of the chests being careful you can always escape via the center ladders.

LEVEL 36: BI-PLANE CLIMB

1) Trap the men in the upper 2 chambers by leading them over the outer edges. Then collect the rest of the chests being careful you can always escape via the center ladders.

LEVEL 37: CREEPY CASTLE
Follow the man through the traps using him like an elevator to the first chest on the upper right. Collect the rest of the chests by clever digging.

LEVEL 38: BROTHERHOOD

Try to keep the men together. Get the first left chest in the ledge first.
1) First, get the first left chest in the ledge, using a man's head to step on.
2) Run to the bottom of the far right ladder on the floor and get all the men on the ladder to the left of you. Go to the top of your ladder to force the men to the top of their ladder. Collect as many chests as you can.
3) Use traps between the 2 ladders to get to the bottom of the board, and run quickly to the far left bottom ladder and climb them.
4) Collect as many chests as you can while keeping the men together on their ladder.
5) To keep them together and get past them, wait at the bottom of the far left bottom ladder, drawing them over and, at the last second, climb up and run for their ladder. The men will return to their ladder from below, but too late to interfere with you.
6) Collect the rest of the chests by repeating step 5.

LEVEL 39: OMEGA WABBIT

1) Trap a man in the brick at the bottom right of the long left ladder. Use this ladder to force the man left when he climbs out of the hole - he'll then fall into the chamber allowing you to get the chest in the center of the chamber.
2) Get the chest in the rabbit's left nostril, while you lead the men behind you.
3) Collect the rest of the chests.

LEVEL 40: TAX MAN

1) Lure the man into the left center pit, but don't get stuck there yourself.
2) Dig a column between first 2 rows of short ladders on the right to get the right bottom chest.
3) Repeat step 2 on the left side. Dig the brick left of the bottom left chest. If you move to the short ladder across from it the man will get the chest and when the brick refills, he'll be destroyed along with the chest.

LEVEL 41: HOMICIDE

1) Destroy the men repeatedly until they trap themselves in the 3 single holes across the top.
2) Collect the rest of the chests, leaving the bottom left chest for last.
3) When you get the last chest, the men will be released. To escape through the ladder that appears, run over the men's heads, from left to right to short right ladder on the 4th floor.

LEVEL 42: ETCH A SKETCH

1) Dig the 4 bricks to the right of the 4th ladder from the left, using timed digging as done in previous levels, to get to the chest beneath.
2) To get to the first chest on the right, start digging at the top of the top right ladder. Dig your way to the chest, leaving an exit path out to the left of the bricks to the right of the 4th ladder from the right.
3) Work your way to the left side of the board by exiting through the brick to the left of the short middle ladder.
4) Use timed digging on the bricks to the right of the far left ladder to get to the first left chest.
5) Dig the 3 bricks down the left side of the 8th ladder from the left. Dig down to the brick over the 7th ladder from the left. Run back up the ladder, drop down on the brick to the left of the 9th ladder from the left, dig it and get the chest and exit by digging the brick under it and dropping to the floor.
6) Work your way back to the left side of the board.
7) SURPRISE! The man trapped in the lower left chamber has a chest! You must release him and then trap him in order to get the chest from him.

LEVEL 43: STACK ATTACK

Stack the men on top of each other in the left and right ledges (second floor from the bottom) so that the top man can get at the seemingly unreachable gold chests on the left and right sides. Repetitive digging is required.

LEVEL 44: CAN OF CORN

1) Collect the left chest by descending then centermost of the 4 ladders that reach the top of the screen. Then dig away the brick to the left of the ladder's base. Drop in that hole and descend to the ladder beneath it, digging the 2 bricks to the left of the ladder as you descend. Then move left and dig away the brick immediately to the right of the gold chest. Race back up the ladders until you are standing just above and to the left of the first brick you dug. Go left and drop straight down onto the gold chest. Climb back to the top of the board before the bricks fill in.
2) The 2nd gold chest is easy to get to however, getting back to the top of the board is difficult since there's only one way. You'll have to travel the bottom bar to the leftmost ladder, climb up, and then work your way back to the right by digging in order to get out.

P.S. The ladder that appears at the far right after you collect the
This level makes extensive use of a little known capability—it is possible to blast bricks in the normal manner while standing inside a trap door.

1) Dig brick A and jump in. You'll fall into the trap door below brick A. Wait for brick A to reappear, then dig brick B, exit left to the top and then the bottom chests on the diagonal.

2) Be sure to pick up chest C by following the 2 guards you have trapped and running over their heads back to the middle ladder. Then dig your way to the right part of the board by blasting through the bricks to the right of point A and immediately cutting through to chest D.

3) Dig your way to the short ladder marked E and descend it to bring the last free man toward you and trap him in the hole to your right. Now clean up all the remaining chests on the board except for chests F and G.

4) You can get to chest F and G by digging the brick to the left of the 2 men stuck in the trap doors and jumping in the hole (the second brick down is also a trap door so you’ll be able to walk out of it to chest F). Pick up chest G and run over the other 2 men’s heads until you’re back on top of ladder E.

5) If the pit to the right of ladder E hasn’t been filled with a ladder, then one of the 2 men at the bottom is carrying a chest. You’ll have to kill them to fill the pit and free yourself. You can do this by digging the block to the left of ladder E, staying at the top of the ladder until the brick is about to fill in, and then descending to draw the guards toward you.

6) Move to the left and get the 4 men trapped into holes. Run over their heads and go to the ladder on the left.

7) Dig down to the 1st 4 chests at the bottom left rows.

8) Don’t stop for breath. Before the 3rd brick fills in, dig out the 4th. Then go back up the ladder and dig out the 1st and 2nd bricks again. Descend and dig out the 5th brick from the top. When the 4th brick reappears, dig out the 3rd and the 6th brick. Run right (across the top of the 4th brick) and dig out the brick just over the short ladder. Then back up one brick and dig out another brick. Jump down in the hole and, standing on the ladder, dig out the 2 bricks that form a wall to the left of the ladder. Then drop down to the chest below the short ladder and run left. The floating chest is left up to you.

9) Your exit is at the bottom of the bottom of the long ladder. There are 2 clever parts to the right side. In the top part, you’ll need to stand on the head of a falling man to pick up the leftmost chests. The most difficult part is the bottom.

Use timed digging, first to reach the top chest (digging bricks in the order A,B,C,D,E) then starting over and getting the bottom chest (Dig A,B,C,D,E,F and G). Run up and over brick A, which will have reappeared. Then drop down through brick D and dig H, I and J.

1) Get the top 2 men to fall into the 2 trap doors (marked T) by dropping to point A when a guard is at point B. Then you can clear up the left side of the board in peace.

2) Move to the left and get the 4 men trapped into holes. Run over their heads and go to the ladder on the left.

3) Next, position yourself just to the right of the rightmost man. Dig the 2 bricks to the right of him, work ing right to left (you’ll have to dig the 2nd brick while standing on his head). Take one step to the left as you finish digging the 2nd brick so you won’t fall when the man starts to move.

4) After he drops into the hole in the next row, jump in after him, run to the right, and repeat the process as you proceed to collect the top and then the bottom chests on the diagonal.

5) If the pit to the right of ladder E hasn’t been filled with a ladder, then one of the 2 men at the bottom is carrying a chest. You’ll have to kill them to fill the pit and free yourself. You can do this by digging the block to the left of ladder E, staying at the top of the ladder until the brick is about to fill in, and then descending to draw the guards toward you.

This level makes extensive use of a little known capability—it is possible to blast bricks in the normal manner while standing inside a trap door.
ladder and cross over to brick C, where you repeat the process. Once bricks B and D have been removed, you can enter the central room, recover the chest and dig down to the rooms underneath.

2] Many of the other bricks in this level play off the same trick— you stand inside a trap door and dig an adjacent brick.

LEVEL 50: YOU ARE A CHAMP

1] If you've gotten this far, you're a pretty good Lode Runner player, so you're going to have to figure out this level with the help of just one minor clue...

Here's the hint. Just as level 49 hinged on being able to dig from within a trap door, level 50 hinges on your ability to dig bricks while falling on the head of a man.

Good luck!

-- LongPlay

LongPlay v2.0.1
Copyright 1991
by
David Huang

What is LongPlay?
LongPlay is a program that plays digitized sound files. However, what makes this program different from the rest is its ability to play sound files of any size, even if they are larger than available RAM.

How to use LongPlay
LongPlay can be run from any GS/OS program launcher (Note: LongPlay requires System Software 5.0.2 or later). When the LongPlay icons are installed, it can also be run by double clicking on a .SND file from the Finder.

After LongPlay has been launched, you will be presented with three menus: Apple, File, and Edit.

The File menu contains the items Open..., Close, Edit file attributes, Compress sound file..., Expand sound file..., and Quit. Open allows you to select a sound file to play. Normally, it will only show files with type BIN, but if you hold down the Option key while selecting it, all files will be available for selection. In addition to the list of files, there are two radio buttons and a editline type box. If the radio button labelled "Use default" is selected, the sound will be played at the speed stored in the auxtype of the file if it is a raw binary file. If the file is in the Applied Engineering sound format, the sound will be played at the speed stored in the file. However, if "Enter own speed" is selected, the sound will be played at the speed that is typed into the editline box. If the file is a Sonic Blaster stereo file, you will be asked which channel you want to play. After a file has been selected, the sound will be played. To stop the sound before it is finished playing, hold down the Open-Apple key and press "." (period). Since the sound is loaded from the disk while it is being played, you should not remove the disk from the drive. Also, the sound will not be played properly if the sound is being played faster than the drive can read it. The same problem will occur if the file contains any $00 bytes (normally, a GS sound file shouldn't have $00s in it).

The Close item in the File menu is used only to close any NDA windows that may be open.

The Edit file attributes item can be used to change the filetype, auxtype, or access bits of any file. Normally, invisible files will not be displayed, but they can be displayed by holding down the Option key while selecting the menu item. After a file has been selected, you are allowed to enter a new filetype or auxtype, or toggle the access bits. Filetypes may be entered by their three letter mnemonic or as a "$" followed by a two digit hexadecimal filetype. Auxtypes must be entered in hexadecimal. Clicking in the check boxes will toggle the access bit. However, the "Needs Backup" bit cannot be changed with this program, clicking on it will not change its state. Clicking the
"OK" button will save the changes to the disk. Clicking "Cancel" will cancel the operation and the file will not be modified.

Compress sound file allows you to compress a sound file so it takes less disk space. Note that LongPlay can't play compressed sound files, they must be expanded first. After selecting the compress menu item, you will be presented with a dialog box asking what format you want to store the compressed file as. Selecting the "Same as original" button will cause LongPlay to store the compressed file in the format equivalent to the original file. I.e. if the file was originally a raw binary file, it would be stored as a type $CD ACE file. If the file was originally an AE file, it would be stored as a compressed AE file.
The other two buttons are more or less self-explanatory. Another set of buttons let you select the compression ratio. 8:4 compresses a file to half its original size, while 8:3 compresses a file to 3/8ths its original size. The drawback to the higher compression ratio is that files usually come out with a little more static than with the 8:4 compression. After clicking OK, pick the file you want to compress, then type in the name that you wish to store the compressed file as. LongPlay will then proceed to compress the file. If it can't find the correct volume, it will prompt you to insert the disk. At this point, you may either cancel the operation or insert the disk and continue. However, for some strange reason, clicking Cancel once usually doesn't work. Be persistent... click Cancel again and the box should go away.

The Expand sound file item lets you expand a compressed sound file so it can be played by LongPlay. Again, you will be presented with a dialog box asking in which format you want to store the expanded file. Again, "Same as original" stores the expanded file in the original's equivalent. A $CD ACE file will be converted to a raw binary file, while a compressed AE file will be expanded into an uncompressed AE file. After clicking OK, select the file you want to expand and type the name that you want to store the expanded file as. After this, things are about the same as the compress sound file option.

Of course, selecting the Quit item exits the program.

The items in the Edit menu are not used by LongPlay. They are provided so they may be used by NDAs.

Note about the icon file: you need to use an icon editor to set the pathname of LongPlay for double clicking on a .Snd file to work.

This program is ShareWare. Please distribute it as widely as possible. Although this program is publicly distributable, the author retains all copyrights to it.

If you like it, please send $5 to:

Revision History
================
WATSON is a powerful assistant to THE INSPECTOR disk and memory utility. Like THE INSPECTOR, WATSON is permanent—either on an EPROM or on disk ready to be merged with Int Basic for loading on boot. WATSON augments many of THE INSPECTOR's commands—making them loader, more automatic, more complete. For instance, you can now increment or decrement buffer locations with a single key-stroke. The disk map now also displays free space remaining on the disk. You can even reconstruct a VTOC automatically.

But WATSON brings along a whole new bag of tricks his own. A Disassembler that displays ASCII, an instant hex/decimal/signed decimal converter, the ability to EOR the buffer with any value, lock-out or free-up specific sectors on a disk, follow a file sector-by-sector automatically, and much more. Browse through all the new commands in this manual. You can now call for a jump to any of the nine of your own subroutines. If you enjoyed working with the INSPECTOR you'll love WATSON. When you quit WATSON, you can take a single-stroke Screendump along with you back into Basic. Or an automatic inverse display of all control characters. Together, WATSON and THE INSPECTOR give you by far the most complete disk and memory utility for your Apple.

SYSTEM REQUIREMENTS

INSPECTOR

1 DRIVE

RAM CARD

ACCESSING WATSON

WATSON is always in memory and available for use, WATSON can be used in a number of different APPLE configurations. Since each is slightly different there are a number of distinct procedures to be used depending on the computer configuration you are using. To access WATSON proceed as specified for the Apple configuration which you are using.

A. APPLE II STANDARD (INT VERSION)

<table>
<thead>
<tr>
<th>FROM</th>
<th>TO</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER WATERSON CALL-12288</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MONITOR WATERSON CB1 D000D</td>
<td></td>
<td></td>
</tr>
<tr>
<td>APPLESOFT WATERSON CALL-151 CB1 D00G</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

B. APPLE II+

<table>
<thead>
<tr>
<th>FROM</th>
<th>TO</th>
<th>TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER WATERSON CALL-12288</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MONITOR WATERSON CB1 D000D</td>
<td></td>
<td></td>
</tr>
<tr>
<td>APPLESOFT WATERSON CALL-151 CB1 D00G</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

WARNING!!!!!!! GOING DIRECTLY FROM APPLESOFT TO INTEGER WILL DESTROY THE APPLESOFT PROGRAM IN MEMORY (HOPE YOU KNEW THAT ALREADY). TO PREVENT THIS GO FROM APPLESOFT TO MONITOR AND THEN WATERSON.

COMMANDS

+ = CONTINUOUS SCAN FORWARD

Causes WATSON to start scanning forward sector by sector. When any key is pressed, scanning will stop.

- = CONTINUOUS SCAN BACKWARD

Same as above except backward.

, (period) = INCREMENT BUFFER

Increments the Buffer location by 1 page in memory. For example, if the buffer is currently set to $0800, pressing this key will change the buffer to $0900.

, (Comma) = DECREMENT BUFFER

Same as above.

CTRL-E = EOR BUFFER

This command will EOR the entire buffer with any entered value. Certain programs encode information by using this method, causing the information to be unreadable. By using this command, these may be decoded. To use the command do the following:

1. Press CTRL-E. The cursor will move to the upper left.

2. Enter value to EOR with and press return.

CTRL-D = DISASSEMBLE WITH ASCII

Disassembles instructions starting at the Buffer Location. The ASCII values of memory will be displayed in the right column. This is very Convenient for looking at data areas in Machine language programs.

1. press "b"

2. select memory location

3. press ctrl-D

4. press any key to stop scrolling

5. press any key to start scrolling
6. press (RETURN) to exit
CTRL-B = BUFFER TEST PATTERN
Fills buffer location with the values $00-$FF. Used to display character sets, or testing.
C = CONVERT HEX-DEC & DEC-HEX
1. PRESS "C"
2. ENTER NUMBER TO CONVERT. REMEMBER SIGN ($,-)
3. NUMBER WILL BE DISPLAYED IN THREE FORMS.
4. PRESS RETURN TO EXIT
M = MAP WITH FREE SPACE
This command is in THE INSPECTOR, but has been modified slightly. After pressing "M", a map will be displayed, an "M" will appear in the upper left-hand corner of the map, and the free space on the disk will be displayed at the bottom of the map, in the form of "F=xxx"
CTRL-T = DISPLAY ALL TRACK/SECTOR LISTS
Causes the disk to be scanned, and all sectors which could possibly be Track/Sector Lists will be displayed on a map. This is very convenient when trying to reconstruct a blow VTOC. To use this feature you should follow these steps.....:
1. Set the number of the track and sector you wish to begin scanning from.
2. Press "CTRL-T". The screen will clear below line 3, and a blank map will be displayed, containing a "T" in the upper left-hand corner. As WATSON scans the disk, sectors which may possibly be Track Sector Lists will be displayed on the map.
3. pressing any key will halt the scan.
4. After the last sector is read on the disk, the scan will stop.
CTRL-R = RECONSTRUCT VTOC
Reads the VTOC from a disk, then rebuilds the Track Bit Map from the Catalog Track. This is especially useful when a catalog is reconstructed from a blown disk, or a file is undeleted.
1. Insert the disk that you wish to be reconstructed in the drive 2. Press ^R. The Catalog Track will be read in the map. All files will be displayed as they are relocated 3. after the disk has stopped. The new VTOC may be saved to disk by pressing ^W
NOTE:DISK MUST HAVE A READABLE VTOC. IF NOT COPY ONE FROM ANOTHER DISK.
CTRL-K = KILL DOS ON DISK
Frees tracks 1 and 2.
CTRL-V = VERIFY THAT DISKS ARE ALIKE
This command may be used to compare two or more disks, and display a map of any sectors which are not the same. The first disk that is read will be placed in memory with sector checksums. As further disks are compared, their checksums will be compared to the previous disk, and any differences will be displayed on a map.....
1. insert disk
2. Set track and sector to start
3. Press "V", map will be displayed if this is the second disk differences will be displayed on map.
4. Stop by pressing any key.
CTRL-P = FILE FOLLOWER
Allows a file to be scanned sector by sector automatically, both forward and backward. This is accomplished by reading the Track/Sector List for a file, which is then used by WATSON to read each sector of the file.
--> = Read next sector in file
Increments sector. Is used with "F" to follow file. The apple will beep when you reach end of file.
<-- = Read previous sector in file
same as --> but it decrements.
CTRL/SHIFT-N = TEST OVERIDE
Pressing this will put WATSON in overide mode. Normally for the File Follower, WATSON checks to ensure that the Track/Sector list read in is valid. This mode ignores that test, in case the Track/Sector list is partially bad. Using this command, it is still possible to partially use the file follower command.
Z = SET UP $300 TO TURN ON PRINTER
In THE INSPECTOR documentation, it was explained how to install a routine at $300 to turn on the printer when ^Z is pressed. This is used for the Hex/Ascii and nibble dump commands. By pressing z a routine will be setup automatically to perform this function. $2BA contains printer slot.
CTRL-S = SCREEN DUMP Performs a screendump when pressed. Anytime a printout of the WATSON display is desired, pressing this will perform a screendump.
CTRL/SHIFT-M = PRINTER ECHO STATUS.
If your printer doesn't need carriage returns this is used.
CTRL-P = EXIT AND SETUP SCREEN DUMP
This command works much like the normal Screendump command, only it may be used from outside WATSON. After pressing "P" WATSON will return to DOS. Normal commands and programs can be run at this time, and a Screendump will be performed whenever a "Z" is pressed.
CTRL-O = EXIT AND OUTPUT CONTROL CHARACTERS
Exits WATSON, and causes all control characters displayed on the screen to appear in inverse. This will overlook with DOS and normal programs. This is helpful to find hidden ctrl characters.
ESC 1-9 = USER FUNCTIONS
Just as "Z" command will perform any jump to a subroutine located at $320, ESC 1 through ESC 9 will perform jumps to user subroutines. These jumps are specified by the bytes located at $3BE through $3CF (lo/high)
Introduction to ABT

[A] BOOT TRACER

The Automatic Boot Tracer is intended for use by the more experienced Apple programmer. It is actually a sophisticated debugger which can simulate the operation of the 6502 in the Apple. Because disk reading is simulated, it is possible to actually "boot" a disk (whether protected or not) under control of this debugger, and trace the boot code of the program.

Boot tracing, a normally manual and very tedious technique which is used by the most sophisticated "hackers", can be performed automatically under control of the Locksmith Automatic Boot Tracer.

To invoke the boot tracer, key 'A' from the main menu. You must have a RAM card of at least 16K on your system for ABT to work. If you have an Apple //e or Apple //c, the "built-in" 16K RAM will work.

Locksmith ABT will prompt you for the slot number of the RAM card. Key in a digit from 0 to 7.

The ABT will be installed on the RAM card you choose, and the ABT will be entered.

Note that in this manual, the ABT (automatic boot tracer) is also referred to as the debugger and the simulator, since it actually simulates the operation of the 6502, and can be used as a powerful debugger.

The screen will clear and a line of inverse text will appear on the top line of the display. The ABT is now operating.

If you press reset at any time, you will be placed in the Apple monitor and can reboot another disk by entering the slot number followed by control-P. Be careful not to reboot a disk which will automatically load over the ABT on the RAM card you selected.

INFORMATION LINE

The top line of the screen which appears in inverse text is a one-line status display which appears initially as follows:

FA62 CLD A=00 X=00 Y=00 P=34 S=FD

The first 4 characters are the program counter (FA62 in this example). The 6502 opcode at the program counter is also displayed (CLD in this example). Next, the values of the A, X, and Y registers are displayed. The "P=" value is the processor status register contents, and the "S=" value is the stack pointer.

At this time, press the R key followed by a key from A through X. Notice that...
the information line disappeared and moved to another line of the screen. You can put the information line on any line of the screen that is convenient for the software you will be debugging / tracing. If you don't want the information line displayed, you can place it on row Y or Z (which are off the screen).

**IDLE MODE**
The simulator is in "idle" mode at this time. That is, the program to be simulated is not currently running, but is stopped at the address displayed by the program counter.

Press control-C at this time to enable the processing of 65C02 instructions. This is necessary if you are running on an Apple //c or an enhanced Apple //e.

Press the S key to start execution under control of the simulator. The ABT is now running simulated 6502 code. The simulator is now in *running* mode. Note the rapidly changing program counter. The "beep" you hear from the speaker may sound a bit different than the Apple *beep* which you are used to, but that is only because under control of the simulator it is slowed down considerably and sounds lower.

To stop the program being executed, press (control-Z). You are now again in "idle" mode. Control-Z is the default character to stop execution of the simulated program, but it can be set to a different "stop" key if you need to be able to use control-Z with the software you are tracing. To change the stop key, first stop the program being executed and return to "idle" mode by pressing control-Z. Then press control-X followed by any other key, and the other key will be used for the "stop" key.

To reset the "stop" key to control-Z, enter idle mode and press control-X, control-Z.

Enter idle mode. Now press the space bar and watch the information line. The space bar is used in idle mode to single step one instruction. A "+" or "-" will appear after each conditional branch instruction, depending on whether the branch will be taken (+) or will be taken (-).

While in idle mode, enter control-Y. You are placed in the system monitor, and can enter any monitor commands such as "L" (to disassemble 6502 code).

While in idle mode, enter control-Y. You are placed in the system monitor, and can enter any monitor commands such as "L" (to disassemble 6502 code).

To re-enter the simulator, press control-C, RETURN. Before placing you in the system monitor, the simulator saved low memory pages 00 to 07 on its RAM card. After re-entering the simulator, this memory card is "refreshed", insuring that no memory was inadvertently changed while in the system monitor.

To review the idle mode commands we have already learned:

Space-bar single steps one instruction. It can also be used to "single-cycle" (see below).

"R" moves the information line to rows A through X.

"S" starts the simulated program running and enters *running* mode.

Control-Y enters the system monitor. To re-enter the simulator, press control-Y again, followed by the Return key.

Control-X is used to change the program *stop* key, which stops the program and enters idle mode.

Other idle mode commands:

"T" (trace subroutine) executes the simulator program until a JSR or RTS instruction is fetched.

Control-R causes a "simulated" reset to occur. The program counter is fetched from SFFPC.

Control-I causes a "simulated" IRQ interrupt.

Control-F turns off the "simulated" IRQ pending flag.

Control-N causes a "simulated" NMI interrupt.

Control-Q quits the simulator and returns to the system monitor.

Control-RESET also exits the simulator.

"I" is used to get single-cycle mode. In single-cycle mode, the space bar cycles one 6502 processor cycle at a time, instead of an entire instruction step.

"G" is used to set instruction-step mode. It is valid only when on an instruction boundary (not on a cycle in the middle of an instruction).

"P" turns the "beep" flag on and off. The beep is sounded when idle mode is entered.

"C" turns the "click" flag on and off. The click is sounded for every keystroke when not in "running" mode.

Control-C turns the 65C02 flag on and off. The default value for this switch is "off". If 65C02 instructions are to be simulated, this flag must be on. The Apple //e (enhanced version) and Apple //c both contain 65C02 processors in their resident ROM code. Note that the simulator itself does not use 65C02 instructions. You can therefore run 65C02 instructions on a normal 6502 processor.

"K" will take the next key pressed and place it in the keyboard character register. When instruction stepping through code that used the keyboard, this key allows a convenient way to enter a keystroke to the program being traced, without entering the keystroke in *running* mode.

"ESC" is used to enter the simulator control menu. The simulator control menu is used to display and change internal simulator control information.

**SIMULATOR CONTROL WINDOW**

Press the "ESC" key while in idle mode. The simulator control window is displayed, and the cursor appears in the upper left of the window. Use the RETURN key, and the left and right arrow keys to move the cursor around the simulator control window. These keys only move the cursor and do not change any information in the window. To change data anywhere in the window, simply position the cursor over the value to change and re-enter the desired value. To exit from the simulator control window and return to idle mode, press the ESC key again. If you wish to change changes made in the simulator control window, you may press control-C instead.

Let's look at the control window in detail.

The top line looks very much like the information line in idle mode, except that the program counter appears to be further to the right and no instruction is disassembled on the line. The number on the left of the line is used for single-byte reading, single-byte writing, and memory editing. Enter an address value followed by 'R' to read, 'W' to write (also specify value to write), and 'E' to edit, using the memory edit window.

To change display modes for the simulator program (text, graphics, hi-res, low-res, page 1, page 2, fullscreen, mixed), key in the address to toggle (6C050-SC057) and enter 'R'. When tracing a program in graphics mode, it is useful to put the information line on rows U,V,W, or X, and toggle mixed mode graphics. The simulator will display the information line on either text page 1 or 2, whichever is selected by the program being simulated.

Enter an address, followed by 'E' to enter the memory edit window.
While in the memory edit window, the memory is displayed in both hex and ASCII text. The cursor can be moved with the RETURN key and arrow keys. To change data, simply key in a new value in the appropriate address. The ESC key returns to the simulator control window, saving all changes to memory. If the changes made in the memory edit window are not to be made, enter control-C.

The second line of the simulator control window contains:

\texttt{RU=65 0=I 1=1 2=I 3=I 4=I 5=I 7=I}

\texttt{"RU=65" This value (decimal 101), the "register update" value, represents the number of instructions that are simulated before the program counter are updated on the screen, when in "running" mode. If this number is set small (01 for example), the registers will be updated after every instruction. This however causes the simulator to run less efficiently, because of the overhead involved in updating the information line.}

**SLOT SPECIFICATIONS**

The rest of the second line displays the slot numbers and how they are to be used. Because the simulator resides on a RAM board (indicated by 'S' in the slot display, for "SYSTEM"), it must know about all other RAM boards and firmware boards if it is to correctly simulate their operation. Initially, the slots will be set to 'I' (invalid). Any reference by the simulated program to these invalid slots will cause the simulated program to stop and control is passed to idle mode. Valid slot specification values are:

\texttt{'S' system (simulator) slot}

\texttt{'I' invalid}

\texttt{'D' floppy disk drive}

\texttt{'A' RAM card of 16K or 32K}

\texttt{'B' RAM card of 64K or more}

\texttt{'F' Firmware card or ROM card}

\texttt{'T' transparent}

If the specification for a slot is "transparent", any commands for the device in that slot will be given without any checking or conversion by the simulator. Transparent mode should be used for:

- Any devices such as RAM and ROM cards that bank select memory into the address range D000 to FFFF, which is used by the simulator.
- Any devices such as disk drives which are timing dependent, as the simulator runs much slower than the 6502 in native mode.
- Any devices that may use DMA (direct memory access) to modify memory from addresses S0000 to S07FF, as this memory is used by the simulator with a copy of the user's memory actually residing on the simulator's RAM board.

**ADDRESS COMPARE STOP**

The third line of the simulator control window starting with "PC" is the "PC compare stop" line. Up to four program counter values for "compare stops" can be specified. If the simulated program's PC equals one of these values, the simulator immediately enters idle mode. In addition, one "PC compare stop range" can be specified. To enter program counter stop values or a range, change the number (initially "0") to the number of stop addresses to be entered and then enter the addresses in the space provided.

To disable PC compare stop, set the number back to "0".

The "MR" line of the simulator control window is the "memory read address compare stop" line. Like the "PC compare stop" line, up to four addresses and one range can be specified. Whenever the simulated program attempts to read one of these addresses, either by direct addressing, indirect addressing or stack fetch, the simulator enters idle mode.

The "MW" line of the simulator control window is the "memory write address compare stop" line. Idle mode is entered whenever the simulated program attempts to write to one of the addresses specified here.

**PROGRAM COUNTER SWAP**

The "PCSW" area of the simulator control window is the "program counter swap" control area. Up to four address pairs can be specified here. If the simulated program's PC equals the first value of a pair, the PC is immediately set to the second value, and execution continues. This is very useful for eliminating slow timing loops, which are unnecessary in the simulator. Initially 3 pairs of PCSW values are given. They are:

- FCA8 FCB3 - This nullifies the monitor wait routine.
- BA00 BA10 - This nullifies the DOS 3.3 seek delay routine.
- BD9E BDAB - This nullifies the DOS 3.3 motor-on wait routine.

**PROGRAM COUNTER TRACE TABLE**

The bottom eight lines of the simulator control window contain the PC trace table. The last 64 values of the program counter are kept here, so that when the simulated program is halted, a history of the last 64 instructions can be examined.

**PROGRAM HALTS**

A program running under control of the simulator halts and the simulator enters idle mode whenever one of the following conditions is met:

- The "stop" key is pressed by the user.
- An invalid 6502 or 65C02 opcode is encountered. "???" is displayed in the information line where the opcode is normally displayed.
- A JSR or RTS instruction is fetched while running with the "T" (trace) command.
- A read or write to the device select addresses of a slot marked as "I" (invalid) in the slot table.
- A compare stop occurs for PC, MR, or MW, while running.
- An attempt is made to write to the floppy disk.

An attempt is made to reference certain I/O addresses. Among these are $C060 and $C068 for either read or write.

Note that in the case of a compare stop for MR or MW or an invalid device select reference, that idle mode is entered with the PC containing the address of the instruction <after> the one that caused the compare stop. Look at the last address in the trace table to find the correct address.

**INTERNAL OPERATION NOTES**

A few notes on the internal operation of the boot tracer / simulator / debugger:

Floppy disk reading is simulated by reading in an entire track of nibbles and...
passing them one at a time to the simulated program requesting them. Each time the simulated program requests a nibble, the next nibble in the buffer is returned. The simulated program never has to wait for a nibble by polling the high-order bit of the disk register. Because of this, framing bit timing is not reserved. In addition, the track is not synchronized to any other track upon reading. Floppy disk writing is not supported.

When reading a floppy disk, the simulator maintains the nibbles of the most current track on the simulator’s system RAM card. This track image is valid until either the slot or drive number is changed or reselected, or the read/write head is stepped to a different track. Only if the current track image is invalid will the real floppy disk be read again. Therefore, if the user performs a "CATALOG" operation while under control of the simulator and then changes the diskette and performs another "CATALOG" operation, the catalog information from the first disk will still be displayed because the catalog (located entirely on track $11) did not cause the head to change tracks and invalidate the track buffer. To manually invalidate the track buffer, change the slot specification to ‘I’ and back to ‘D’ while in the simulator control window.

The simulator has code for "sector assist" built-in. This means that when the simulated program requests a nibble followed by testing for disk register ready and compare for $D5, the simulator immediately finds the next $D5 in the track buffer and returns it to the simulated program, instead of requiring the program to ignore each nibble until the value $D5 is found.

The Paddle I/O addresses ($C064-$C067 and $C06C-$C06F) are correctly simulated if the code that accesses the I/O addresses is similar to the monitor routine at $FB1E (PREAD). If the reference is not similar to the monitor routine, idle mode will be entered.

END

Apple II Computer Info

System requirements:
Apple II, Apple II+, Apple //e, Apple //c, or compatible.
48K RAM and 1 disk drive minimum.
Optional RAM - 16K, 32K, 48K, 64K, 128K, 256K.

Common Locksmith Control Keys:
--------------------------------
These keys can be typed at any time while in Locksmith.

CTRL-Z - Will print text screen to printer. Printer slot assumed to be in slot 1, but may be changed by parameter PRT.SLOT.
ESC - Will abort current function and return to an earlier menu. Repeated pressing will return to main menu.
RESET - Will exit Locksmith and reboot system.

Note: Locksmith (LS) uses extensive memory overlays while performing tasks. Keep the LS disk in the boot drive until instructed to remove it.

The top 7 lines of the display show the status of the current operation. Tracks are number 0-23 (hex) corresponding to 0-36 (decimal). Quarter tracks are also allowed.

Main Menu:
--------
Booting the LS disk will result in the main menu appearing. The body of this menu displays the keystrokes (inverse) which you enter to perform certain functions. Briefly, they are:

(B) BACKUP/COPY - Backup protected software using LS standard copy functions.
(F) FAST BACKUP - Quickly create copies of unprotected software. Will utilize all additional memory in the computer for a copy process taking as little as 8 seconds.
(/) CLR STATUS - Clears the track status display at the top of the screen.
(N) DISK EDITOR - Formerly, the Nibble Editor. Allows manual reading, searching, changing, etc. of data in a sector format or nibble format. Can also be used to edit data in RAM.
(L) LOAD RAM CD - Will load slot 0 RAM with 12K of data found on tracks 12, 13 and 14 (hex) of LS disk. Useful for loading Inspector or Watson. Pressing I will invoke these functions once they are in memory.
(*) PARAMETERS - Allows display and changing of current LS operating parameters by name.
(T) TEXT EDITOR - Used to edit files containing LS Programming Language (LPL), which can be loaded and saved on the parameters disk. The BACKUP function allows automatic backup of protected software after specifying the name of the software.
(H) RAMSD UTILS - Can be used to test RAM cards in your Apple. Will test any size cards, and two tests are provided: a basic test and an extensive test. The test can be performed continuously or just once to help isolate intermittent errors. In addition, the contents of any 16K bank of the RAM card can be dumped to main memory, edited with the disk editor and re-loaded to RAM cards.
(Q) SCAN DISK - Allows you to examine the hi-res screen an overall "picture" of the disk, track by track. This is useful in determining which tracks are actually used.

(A) BOOT TRACER - A sophisticated debugger which can simulate the operation of the 6502 in the Apple. Because disk reading is simulated, it is possible to actually "boot" a disk (whether protected or not) under control of the debugger and trace the boot code of the program.

(C) CERTIFY DISK - Writes a special pattern to each track of a disk and verifies the integrity of the disk surface.

(U) 16-9 UTILS - Brings up a second menu of 16 sector utilities.

(D) DOS3.3 UTIL - Brings up a second menu of DOS 3.3 utilities.

(X) DISK RECOVER - Will read a difficult or impossible to read disk and write a good copy to another disk. Useful in transferring disks that were written in an improperly aligned machine.

(S) DISK SPEED - Allows speed adjustment of disk drives.

(I) INSPECTOR - Invokes Inspector or Watson utilities if loaded with the "L" menu item.

Backup/Copy Disk:

Pressing 'B' will invoke the standard default copy method for copying protected disks. This will work with most protected software.

Pressing 'F' will invoke the high-speed copy process. This only works for unprotected software and utilizes as much memory as you have available. The following commands are used in Fast Backup:

12 Copy drive 1 to drive 2
11 Copy drive 2 to drive 1
10 Copy to and from drive 1
22 Copy to and from drive 2
1 Read verify drive 1
2 Read verify drive 2
10 Copy drive 1 to memory
20 Copy drive 2 to memory
01 Copy memory to drive 1
02 Copy memory to drive 2
V Toggle verify flag after each operation

(SPACE or RETURN) to start operation

In addition to these commands there are several parameters which can be modified to allow read and write sector oriented protected disks, and set internal parameters. The following parameters apply:

0007=00 Requested output volume # or 0, if same as input volume.
0008=00 Begin track to process.
0009=22 End track to process.
0010=08 Maximum read retry count. Retry number is 1-9 for first 9 revolutions of disk, A-Z for next 26. After that the display will not change.
0011=03 Maximum verify after write retry.
0012=10 Motor On delay for read. 7F maximum.
0013=10 Motor On delay for write. Maximum is 7F.
An example: Get into the disk editor and CTRL-R to read a track of nibbles. Place the start '(' pointer to the start of the address field (G5 AA 96). Move the cursor down about 10 lines and set the endpoint ')'. Now move the cursor back up to the DE AA after the start of the address field.

The analyzer uses the data from the start pointer to the nibble immediately before the cursor as a "key". If you placed '(' before the D5 nibble and the cursor on the DE nibble, the key length would be 50H nibbles.

Enter the analyzer by pressing 'G'. The display shows the data being analyzed on the left with statistics on the right.

The following commands control the framing analyzer:

SPACE temporarily stops so you can examine statistics. RETURN start again.
<T> allows scrolling.
T switches from nibble to timing stats.

The info on the right of the screen might look like the following:

R=0000
F=07
-- +
0 07
1 00 25
2 25 03
3 02 00
4 01 01
5 00 18
6 0B 00
7 00 07
8 03

The R= value is the number of reads which occurred. The F= value is the number of reads in which the "key" of the data was found on the track. Because of limited buffer space, if a large data length is specified, it is possible that the buffer may not fully contain the data specified.

The table of numbers represents the count of the differences of the data read with the "ideal" values of 10, 20, 30, etc. These error differences range from 7 to 7, with 08 being ideal. For example, in the table above, the count for +1 is 25 (hex). This means that there are 25 occurrences of nibbles with timing values of one greater than the ideal value (11, 21, 31, etc.). The "8" count of 03 indicates 3 occurrences of timing values exactly halfway between ideal values. This indicates that more examples are needed. The "??" is displayed when the values for the +6,7, and 8 counts are non-zero, and indicates that more examples are needed.

When nibble data is displayed on the left side, the inverse/normal mode of each nibble indicates the number of framing bits after the nibble. Normal text indicates no framing bits. Both digits are inverse if 2 framing bits while only one digit means 1 framing bit. A flashing value is 3 or more framing bits. If the nibble data has the high order bit turned off, this indicates that at least one read occurred where the data after the key did not match. This could have been caused by a loss of sync while reading or by the key being specified as too short which caused a non-unique part of the track to be analyzed instead of the desired part.

Load RAM Card:

Pressing 'L' from the main menu will cause tracks $12, $13, and $14 to be read into memory addresses $0000-$FFFF of a RAM card in slot 0 (or the top 16K of a 64K /e or /c).

If you have Inspector or Watson you can load it into RAM as follows:

1. Boot Inspector or Watson.
2. Enter Inspector or Watson, insert your LS disk and press the following:
   1. D 0 <return> 2. T 1.2 <return> 3. CTRL-W
3. Then press CTRL-I 15 times.

This will write Inspector or Watson you your LS disk.

Your LS disk normally contains a copy of Integer Basic and the monitor on tracks $13 and $14. Inspector/Watson will go on track $12.

Parameters:

Pressing "" will allow display and modification of parameters using their LS Programming Language variable names. To display the value of a parameter, enter the keyword "SHOW" followed by the parm name. For example, to display the current value of the parameter SLOT, enter SHOW SLOT. To change the value, enter the parm name and new value, SLOT 4. If you make an error, LS will beep and ignore your request.

The following patch is useful in reading sectors from a disk that reads unreliably. This patch to RWTS will defeat the head recalibration routine after an I/O error and try to read again: BDCC 4C C1 BD. To reset the normal value, use BDCC 10 F3 AD. To restore parms to their original values, just reboot LS.

Backup Using Custom Parameters:

The text editor function is used to automatically select a parameter file to be used to back up a disk. To enter this function, press 'N' for NEW (clears the buffer followed by 'g' for Backup).

If the parm disk is not in the drive, you will be prompted to insert it. A list of directory entries will be displayed. Move the "light bar" using the arrow keys to the proper selection (or CTRL-W, CTRL-J). CTRL-W and CTRL-F will move by pages. If you know the name, just type the first letter to find the proper selection quickly.

Pressing RETURN will enter your selection.

Loading A Parameter File:

Pressing 'L' will prompt you to load a parm file from the parm disk. Follow the directions under Backup Using CustomParms.

Saving A Parameter File:

New - Create Edit Work Area:

'T' will save a parameter file to the parm disk. You may create your own, or transfer one from one disk to another.

RAM Card Utilities:

RAM card utilities are selected with 'R'. They are self-explanatory and include a helpful RAM card test feature as well as being able to dump the contents of the ram card to and from main memory 16K at a time to locations 2000-5FFF as follows:

- 2000-2FFF RAM card pages D0-DF alternate
- 3000-3FFF " D0-DF
- 4000-4FFF " E0-EF
- 5000-5FFF " F0-FF

Scan Disk:

- 'Q' will help you to determine what tracks are in use on a disk you are trying to copy. This utility will scan a disk for valid data. The display is hi-res and...
runs from bottom to top of the screen. The first time you run the utility, you should use a normal disk. If you select a first try tracks 0-22 in whole increments. This will show what a normal good disk looks like. The series of dots above each track number are the gaps of self sync bytes between each sector. Normally, on a 16 sector disk there will be 16-17 of these dots. A 13 sector disk will have 13-14 dots. On a 16 sector disk, one of the dots will be a little longer than the others, relating to self sync bytes before track 0. You will notice that the dots will either move up or down as you move from track to track. This is due to the time it takes to move the disk drive head from track to track. Spiral tracking from .5 to 22.5 in increments of .1. You will see very long white lines with no particular pattern. This means there is no valid data on that track. Some evidence of valid data such as short bursts of dots in cross-talk between adjacent halftracks.

Automatic Boot Tracer:
---

The Automatic Boot Tracer (ABT) is intended for the more experienced Apple programmer, but may be the greatest utility on the LS disk. It essentially simulates the 6502 processor in your Apple in a very slow speed so you can boot track disks, copy protected or not.

Pressing `A` invokes the ABT function and requires a RAM card of at least 16k to work. The upper 16k in a /e or /c works fine. `L` will prompt you for the slot of your RAM card, normally you select 0. ABT will be installed and then entered. (ABT will sometimes be called the simulator or debugger in this discussion.)

The screen will clear and an inverse line of text will appear on the top of the screen indicating ABT is now operating. Pressing `reset` now will enter the ABT and you can boot a disk with `CTRL`-P. Unfortunately, a disk that boots into the RAM card area will destroy the simulator function.

Information Line:
The top line in inverse normally starts out as:

FA62 CLD
A=00 X=00 Y=00 P=34 S=FD

The first 4 characters are the program counter address followed by the opcode to be executed. Next are the A, X, Y, and Z registers, the processor status register contents and the value of the stack pointer.

`R` is followed by any key from A to X. This moves the inverse status line to another location on the screen. Y or Z will move the line off the screen.

Idle Mode:
The rest of the simulator is in idle mode at this time. The program is running but all activity has ceased at the address shown.

Press CTRL-C at this time to enable the 65C02 instructions, especially if you have the changes you made.

The 'S' key will start execution under control of the simulator. The ABT is now running. The display will rapidly change as the boot is started. The "beep" you hear from the speaker will be slightly different than the normal Apple beep.

To stop the simulator, press CTRL-Z putting you into the idle mode. This is the normal stop key but can be changed if you need CTRL-Z in your program. To change it, stop the program with CTRL-Z then press CTRL-X followed by whatever key you want to assign to the stop function.

Enter the idle mode and press SPACE to single step the program. A "*" or "-" will appear after each conditional branch depending on whether or not the branch will be taken (+) or not (-).

In idle mode, CTRL-Y will place you in the monitor where you can use 'L' to disassemble the code. To reenter the simulator, press CTRL-Y <RETURN>. Before placing you in the monitor, the simulator saved low memory pages 00 to 07 in the RAM card. After reentering the simulator, this memory was refreshed, insuring that no memory was changed.

Other idle mode commands are:

- **T** - Trace subroutine until a JSR or RTS is fetched.
- **CTRL-R** - Causes a simulated reset to occur. The program counter is fetched from $FFFF. dump.
- **CTRL-I** - Causes a simulated IRQ interrupt.
- **CTRL-F** - Turns off IRQ pending flag.
- **CTRL-H** - Causes simulated NMI interrupt.

CTRL-Q - Quit simulator and go to monitor.

The third line of the simulator window starting with "PC" is the "PC compare stop" line. Up to 4 program counter values for "compare stop" can be specified. If the simulated program's PC equals one of these values, the simulator immediately enters idle mode. In addition, one compare stop range can be specified. To enter program counter stop values or a range, change the number (initially 0) to the number of stop addresses to be entered and then enter the address. To cancel, reenter 0.

The "MW" line is the "memory write address compare stop" line. Again, up to 4 stops and 1 memory range can be set. Whenever the simulated program attempts to read one of these addresses, either by direct addressing, indirect addressing, or stack fetch, the simulator will enter idle.

The "MM" line is the "memory read address compare stop" line. It follows the same conventions as the MR line.

END OF LOCKSMITH 6.0 DOCS - PART 1 of 2 PARTS

Locksm 6.0 Docs - Part 2
by Mr. Wiz

Program Counter Swap:
The "PCSR" area of the window is the "program counter swap" control area. 4 address pairs can be specified here. If the PC equals the first value of the pair, the PC is immediately set to the second value, and execution continues. This is useful in eliminating slow timing loops, which are unnecessary in the simulator. Initially 3 pairs of PCSR values are given: FC88 FC83 - nullifies monitor wait routine
BA00 BA10 - nullifies DOS 3.3 seek delay routine
BD90 BD80 - nullifies DOS 3.3 motor-on wait routine

Program Counter Trace Table:
The bottom 8 lines of the window contain the PC trace table. The last 64 values of the program counter are kept and when the simulator is halted, a history of the last 64 instructions can be examined.

Program Halts:
A program running under control of the simulator halts and the simulator enters idle mode whenever one of the following conditions are met:

- The stop key is pressed.
- An invalid 6502 or 65C02 opcode is encountered. 77? will be displayed where the opcode should be.
- A JSR or RTS instruction is fetched while running in "T" (trace) mode.
- A read or write to the device select addresses of a slot marked as "I" (invalid) in the slot table.
- A compare stop occurs for PC, MR, or MW while running.

An attempt is made to write to the floppy disk. An attempt is made to reference certain I/O addresses.

Among these are SCO60 and SCO68 for either read or write.

Internal Operational Notes:
A few notes about the internal operation of the boot tracer/simulator/debugger:

- Floppy disk reading is simulated by reading an entire track of nibbles and passing them one at a time to the simulated program requesting them. Each time the simulated program requests a nibble, the next nibble in the buffer is returned.

- "I" and back to 'D' while the simulator is running. The paddle I/O addresses ($C064-$C067 and $C06C-$C06F) are correctly simulated.

- Both lines are equal, valid statements after a colon will be acted upon.

- The .I must appear as the first characters on the line, followed by a space and the name of the file. To include part of a file, specify the starting and ending line numbers:

  .I TESTFILE,4-1F

- Each line in an LPL file is given a line number (in hex and inverse). Line numbers are really unimportant except for reference purposes. Lines cannot exceed 38 characters in length. The following is an example of an LPL line:

  FND D5 AA 96

- This is an example of a single LPL statement. Multiple statements are allowed separated by a colon (:). Example:

  SLOT 6 : IN.DRIVE 1 : OUT.DRIVE 2

- Spaces before and after colons are not necessary.  If a line will exceed 38 characters it can be continued on the next line by coding a "-" as the last character on the line:

  DEPOSIT (DF) (DF) (DF) (FF) -
  D5 AA 96 AA AA

- You may insert remarks or comments if proceeded by an asterisk (*). Examples:

  * SET SLOT NUMBER : SLOT 6
  SLOT 6 : * SET SLOT NUMBER

- Both lines are equal, valid statements after a colon will be acted upon.

- LPL Statements:
LPL statements consist of "tokens" which can be thought of as words in a sentence. Tokens are separated by blanks. The first token used in a statement determines the type of the statement. A token can represent variable names or parameter names, a constant, or a processing routine name. Statements can be grouped into the following categories:

  - Comment or blank line
  - Statement label
  - Assignment statement
  - Processing
Any statement may have a statement label preceding it. Statement labels are optional and are used for branching within the LPL file with the GOTO statement. A statement label begins with the keyword "LABEL", and is followed by a name. Label names can be of any length, and are any sequence of alphanumeric characters or any period, with the first character alphabetic. Examples:

```
LABEL READ.TRACK.AGAIN :
GOTO READ.TRACK.AGAIN
```

Types of Constants:
Several types of constants are used in LPL. They are described herewith.

Single byte constant (hex):
- D5
- 6
- 00
- (FF) single bytes in parentheses indicate self-sync

Multiple byte constant (hex):
- D5 AA 96
- 00 10 20 30 40 50 60 70 80

Double byte constant (hex):
- 1A70

Double byte constants usually represent addresses or lengths.

Track value constant (hex):
- 12.5
- 1A.75
- 11.0
- 0.

Track value constants contain a decimal point.

Single byte character constant:
- "X"
- 'X'

Note that either single or double quotes are used.

Multiple byte character constants:
- "DON'T FORGET TO COVER NOTCH."
- "GRD"

If a quote is to appear in the constant, use the other quote to delimit the string.

Multiple byte constants can consist of a mix of hex and ASCII:
- 89 'GRD' 8D

Special constants:
- ? - represents a "don't care" value when used in a search pattern.

Flag constants:
- YES
- NO
- ON
- OFF

These are equivalent to 0-FF, but are preferred because of their readability.

Types of Variables:
Variable names within LPL usually have a specified use for each name, although some general purpose names have been provided for the user. Several types of variable names are provided within LPL:

Single byte variable:
- SLOT
- IN.DRIVE
- OUT.DRIVE

Multiple byte pattern/string variables:
- PAT1
- GR.CHARS
- DF.HDR3
- AF.HDR3

Pattern/string variables are variable length, and have a one byte length as the first byte of a variable. Although pattern/string variables have a variable length, each is allowed a maximum length of 15 (decimal).

Multiple byte variable:
- RD.NIB.TRANS
- SEC.TRANS
- SELECT.TAB

These variables refer to multiple-byte areas of memory of fixed length, such as lookup tables.

If you have a need to refer to a byte within a multiple byte variable, you can code a plus sign followed by the displacement into the table:
- NIB.TRANS +2F

Double byte pointer variable:
- START
- END
- CURSOR
- PTR.W
- PTR.X

Double byte pointer variables can also represent length.

Track variable:
- BEGIN.TRK
- END.TRK
- CURSOR
- PTR.W
- CURSOR

Track variables can represent integral track values or 1/4, 1/2, or 3/4 tracks.

Flag variable:
- SYNC
- COUNT
- SHOW.ADDR

Flag variables are single byte variables that contain a flag of YES/NO, ON/OFF, or FF/0 and act as switches which can be set and tested. Values other than these may have unpredictable results.

The Assignment Statement:
Used to assign a value to a variable. The variable can be assigned the value of a constant or another variable. The variable and the constant to which it is assigned must be of the same type. For example, a pointer variable can only be assigned to another pointer variable. Examples:

```
START CURSOR - Set the variable START (start of track data) to CURSOR (current cursor location).
CURSOR 2040 - Set variable of CURSOR to point to 2040.
SLOT 6 - Set one-byte var SLOT to value of 6.
BEGIN.TRK 12.5 - Set track var BEGIN.TRK to value of 12.5
COUNT YES - Set flag var to flag value of yes.
PAT4 D5 AA 96
PAT4 PAT7 - Both examples are valid.
GR.CHARS 89 'GRD' - Set string var GR.CHARS to 4 byte string consisting of hex 89 (CTRL-I) followed by ASCII 'GRD'.
DF.HDR3 B4 : AF.HDR3 DD - Set the third data field header byte to B4 (normally AD) and third address header byte to DD.
```
Apple II Computer Info

Processing Routines:

LPL processing routines (algorithms in earlier versions of LS) are routines that the user can invoke on demand using LPL. Some of the routines are complex and are driven by many variables, while others are simple and operate using only one or two variables. Some routines use parameters consisting of constants or pointers passed to them and some accept no parameters at all. The valid syntax of each processing routine is described in an addendum, but we will describe some of the routines here and give some examples of their use. The Parm disk has excellent examples of routines.

ABORT "DATA NOT FOUND" - Abort current operation and return to LS main menu.

FAUSE "ENTER 1,2 OR 3:" - After a keypress, the value of the key is placed in the single-byte variable KEY.IN

PRT "DISK MUST BE WRITE/ENABLED" - Prints message on screen. If last character is blank, cursor remains on same line.

SHOW SLOT - Print value of variable named slot. If flag variable SHOW.ADR is YES or NO, the address of the variable SLOT is also printed.

GOTO READ.AGAIN - Branches to label READ.AGAIN elsewhere in LPL.

FIND D5 AA 96 - Search from current cursor position until END pointer, searching for D5 AA 96.

FIND PAT4 - Same as previous example, except search for the contents of string var PAT4.

ERROR '5' - Causes the character '5' to be placed in the current track of the status display area.

PAT4 D4 DD FF

PAT5 D5 AA 96

CHANGE PAT4 PAT5 - Changes all occurrences of first string to second string for entire range of START to END.

ERASE - Causes track to be erased on the output drive.

FORWARD TRK.LEN

BACK TRK.LEN - Cause CURSOR to be moved forward or back by the length determined by variable TRK.LEN. These routines can also be used with a 2-byte constant: FORWARD 024E or BACK 0042

CODE AD CUR.TRK 0A 0A 0A 0A 60 - CODE processing routine is provided for 6502 M/L programmer.Parms supplied are decoded, placed in a contiguous area of memory, and given control with a JSR instruction.

PRT "ASCII TEXT TO PRINT" - The PRT routine prints data on screen. If last byte is blank, no new line is started. Example:

PRT "TRACK INCREMENT IS " : SHOW INCR.TRK

Some processing routines function slightly differently depending on whether in "nibble-mode" or "byte-mode". If the last read or write command was NREAD or NWRITE, the nibble-mode is used. If last read or write is SREAD, SWRITE, TREAD or TWRITE then byte-mode is used.

The routines which function differently depending on whether in nibble or byte mode are FIND, VER, and CHANGE.

In nibble mode, a zero value in the pattern specified acts as a "don't care" value. It can be either coded as "?" or "0".

In byte mode (used when reading or writing sectors), the zero value in a pattern is significant. Example:

NREAD : FIND D5 00 96

Performs a nibble-read of the current track, and places the CURSOR on the first occurrence of a D5 value, followed by any value, followed by a 96 value.

The following processing routines accept either string vars or multiple byte constants:

FIND

VER

REP

DEPOSIT

The nibble or byte mode can be changed manually by setting the flag variable BYTE.MODE to YES if byte mode is desired, or NO if nibble mode is desired.

Track Procedures:

A track procedure is a sequence of LPL statements that are to be executed for each track that is being copied. The track procedure is defined with the BEGIN.PROC and END.PROC statements. The procedure is then later invoked for each track to be processed, by the processing routine which will invoke the track procedure. There is currently only one procedure to invoke this processing, the COPY procedure. The "current" procedure is the last one to be defined. If no procedure is defined, then the default LPL procedure will be used. For example:

BEGIN.PROC

... track procedure A

...
In this example, the first 2 copy procedures will use track procedure A, the second two will use procedure B.

The LPL statements within the track procedure can be used to process a track in one of two modes. Either in nibble-mode or sector-mode. Nibble processing routines are NREAD, NWRITE, NVERIFY, which process a track in the form of nibbles. Sector-mode processing routines are TREAD, TWRITE, TVERIFY which process a track in the form of 16 separate sectors.

The format of a COPY command is: COPY <begin track> <end track> <track increment>. The values are stored in the variables BEGIN.TRK, END.TRK, and INCR.TRK.

If tracks are to be synchronized or nibble counting is to be used, set track variables SYNC or COUNT to YES. The SYNC and COUNT keywords are not set to YES as in LS version 5.0.

LPL Error Codes:

During execution of the LPL program, some errors may be encountered which cannot be checked for during syntax checking. If an error is found, processing stops and the following message is displayed on the screen:

   LPL CODE ABORTED

   ERROR CODE xx

where xx is one of the following:

01 GOTO statement encountered without finding the matching LABEL statement.
02 BEGIN.PROC statement encountered while already within a track procedure.
03 END.PROC statement encountered while already outside a track procedure.
04 COPY statement encountered within a track procedure. The COPY statement invokes a track procedure and cannot occur within one.
05 USE.DEFAULT.PROC encountered while within a track procedure.

Data Field Nibble Encoding Table:

The following translate table is used for calculating data field checksums. It is described in the chapter on the disk editor describing the 'D' command.

<table>
<thead>
<tr>
<th>00:96</th>

Introduction to Lucifer's Realm

Your hear the doctor telling the nurse "he will die very soon". You go to the wrong place, but amazingly enough, Satan, for the first time since humanity gives you an option to go to Heaven. If it was easy, Satan would have done it himself, and since eternity is a pretty long time, he knows it will take a long time to complete the adventure. You should be warned: If it was easy, it wouldn't be any fun. In "Lucifer's Realm", commands don't always work as on earth, also, you must be forewarned that even if Satan allows you to go to Heaven, you must get permission to go.

Moving Around Lucifer's Realm

Remember, you are in hell. "Lucifer's Realm" recognizes two word commands to be input as verb followed by a noun. You must type in the full words, no abbreviations. In Hell, Directions can be different, and the length of the two forks, followed by the data fork: the data fork contains arbitrary data much as other computer's files do, and the resource fork contains a series of discrete data items ("resources") such as icons. A Mac file may be missing one or both forks; document files tend to be mainly data, while program files tend to be mainly resources. This file arrangement makes it impossible to simply send a Mac file via modem: there must be some way to recreate the two forks and the file's directory information.

MacDown is a utility for converting some downloaded Macintosh files into formats usable on Apple II-series computers. It will run on any Apple II that supports ProDOS (in other words, at least 64K memory), but the screen displays will probably not be readable on an Apple ][ or ][+, even with a lower-case adapter. The program is freeware, meaning that it is a copyrighted work but I give users the right to freely distribute it and upload it to computer services.

MacDown 1.0  Copyright 1988 Jason Harper

The program is freeware, meaning that it is a copyrighted work but I give users the right to freely distribute it and upload it to computer services.
To apply some sort of compression to them. There are two compression methods in current use: Packit and Stuffit. Such files can be easily identified because their names will end with .PIT or .SIT, respectively. Another advantage of using these schemes is that related files (a program and its documentation, for example) can be packed into one file for transmission: unlike Binary II, the current implementation of MacBinary does not allow for multiple files. Stuffit is the more recent and more efficient of the two formats: unfortunately, its author has not seen fit to release enough information on the format to allow decoders to be developed for other computers. Packit is, however, publicly defined and MacDown will allow you to decompress such files for use on an Apple II.

Mac file formats.
Mac files are identified by a 4-character filetype code and a 4-character creator code: for example, a MacPaint picture has filetype=PNTG and creator=MPNT. A MacPaint-format picture generated by some other program will still have a filetype of PNTG but will have a different creator. Some common types:
- PNTG: MacPaint picture. MacDown will allow you to view these in HiRes graphics. If you have an Apple Igs, see my SHRConvert utility which will convert these files directly into several Igs SuperHiRes formats.
- TEXT: plain text. Usable with any Apple II program that deals with text, although some Mac characters (accented vowels, for example) will not translate properly.
- APPL: application program. Totally useless on a II.
- PIT: Packit-format compressed file.
- SIT: Stuffit-format compressed file: currently unusable.

There are numerous other Mac file formats, such as word processor documents, that could be used on an Apple II if someone would write a converter for them (hint hint).

Using MacDown.
MacDown is a ProDOS SYStem program, so you can run it from Basic by typing "MACDOWN" (without the quotes, of course). The program should be fairly easy to use: it is controlled entirely with the arrow keys (to move the highlighted selection up or down), Return (to accept the current selection), and Escape (to go back to the previous menu). The trickiest part is the file selector routine used in various parts of the program: I'd suggest that you put an unimportant disk in a drive, select 'ProDOS commands' from MacDown's main menu, and play with it for a while. Pay close attention to the [set prefix here] option at the top of each directory listing: you must use that command at some point to select where you want converted Mac files to go. If you're trying to put converted files on a different disk, both disks must be online at the same time: disk swapping is not allowed. All downloaded Mac files should first be processed with the 'Extract MacBinary' command. If the file is Packit-compressed, you should then use 'De-compress PackIt' on the extracted file. You can then use 'MacPaint => hires' to display any picture files. For each file produced by the conversion process, you will be presented with some info about the file, and given options to save or not save each fork. You generally won't want to save the resource fork of any file, since it is not meaningful on an Apple II. Data forks will be saved with the closest ProDOS equivalent to the original Mac filename: resource forks will be saved with the same name with '.R' appended. If a name conflict arises, you will be given options to cancel, save with a different name ('.N' will be added to the name), rename the existing file ('.O' will be added), or delete the existing file. Note that PackIt files will take a long time to process, even if you aren't saving either fork.

BY: THE DRAGON LORD

AS YOU ALL KNOW THIS IS THE NEW, AMAZING GAME BY ATARISOFT.

WHEN THE FIRST TITLE PAGE APPEARS USE THESE KEYS:

CONFIGURATION

[S] - TOGGLES SOUND

[K OR J] - FOR KEYBOARD OR JOYSTICK

[1 OR 2] - FOR 1 OR 2 PLAYERS, IF PLAYING 2 PLAYER ONE IS CONTROLLED BY JOYSTICK AND PLAYER 2 IS CONTROLLED BY THE KEY BOARD.

[C] - THE WILL ALLOW YOU TO CHANGE THE CURRENT CONFIGURATION OF THE KEYBOARD.

[< - >] - THE ARROWS WILL CHANGE THE STARTING LEVEL, UP TO 25

[SPACE BAR] - PRESS SPACE WHEN ALL DONE

STARTING OUT

THE OBJECT OF THE GAME IS TO KILL ALL THE MONSTERS BEFORE THEY KILL YOU, SIMPLE ENOUGH. TO KILL A MONSTER HIT THE MONSTER FROM THE BOTTOM, AFTER THEY ARE ON THEIR BACKS RUN OVER THEM. ANOTHER WAY OF KILLING THEM IS TO HIT THE POM IN THE MIDDLE OF THE SCREEN. SOME MONSTERS [THE CRABS] HAVE TO BE HIT TWO TIMES, WHILE OTHERS JUST ONCE.

ENEMIES

TURTLES:

MOVEMENT: SLOW UNTIL ONE LEFT

TYPE OF MOVEMENT: WALKING

# OF HITS TO DIE: ONE

CRABS:

MOVEMENT: MEDIUM UNTIL ONE LEFT

TYPE OF MOVEMENT: WALKING

# OF HITS TO DIE: TWO

FIREFLIES:

MOVEMENT: MEDIUM UNTIL ONE LEFT

TYPE OF MOVEMENT: BOUNCING

# OF HITS TO DIE: ONE

FIREBALL [2 TYPES, BOTH THE SAME]:

MOVEMENT: MEDIUM, UNLESS KILLED ONCE ALREADY.

TYPE OF MOVEMENT: FLOATING IN MID-AIR

# OF HITS TO DIE: ONE

GLACIER:

MOVEMENT: NONE, FORMS ON THE CEILING, THEN DROPS.

TYPE OF MOVEMENT: DROPS PRETTY FAST

# OF HITS TO DIE: CAN KILL WHEN IT IS JUST FORMING BY HITTING IT.

ICEBALL THINGYS:

MOVEMENT: MEDIUM

TYPE OF MOVEMENT: SLIDES ALONG GROUND WHEN IT STOPS IT FREEZES TO THE FLOOR.

# OF HITS TO DIE: ONE

POINT SYSTEM:

KNOCKING MONSTER OVER..........10

RUNNING OVER THE FIRST MONSTER...800

RUNNING OVER THE SECOND MONSTER..1600

RUNNING OVER THE THIRD MONSTER..2400

RUNNING OVER THE FOURTH MONSTER..3200

RUNNING OVER THE SPINNING DISKS..800

KILLING THE ICE BALL THINGY......500

KILLING THE GLACIER..............0

KILLING FIREBALL [THE ORANGE]....1000

[THE BLUE]......200

CONTROLS:

JOYSTICK CONTROL MOVEMENT [OBVIOUSLY] AND THE KEYBOARD CONTROLS ARE:

RIGHT: -=>

LEFT: <-

JUMP: SPACE BAR

BONUS ROUND:

THE OBJECT IS TO GET ALL THE SPINNING DISKS BEFORE THE TIMER RUNS OUT, EACH IS WORTH 800 POINTS. IF YOU GET THEM ALL YOU GET AN ADDED 8 THOUSAND BONUS.

WHEN PLAYING

CTRL Q - [START OVER]

CTRL O - [GOTO THE OPTION SCREEN]

CTRL S - [TOGGLE SOUND]

ESC [PAUSE ON/OFF]

EXTRA MEN:

YOU START OUT 5 MEN AND GET ONE MORE AT 20000.
For a one player version of the Battle of Agincourt, just run AGINCOURT.1PLR (it is a SYS16 type file). The file MEDEVL.WAR.2PLR (also a SYS16 type file) is the two player version master program for MEDIEVAL WAR. The file GAMEDATA is a TXT file containing the data for a generic sample version battle for this game. Please rename GAMEDATA to SAMPLE.GAME and then rename either AGINCRTDATA.2PLR or CRECTDATA.2PLR to GAMEDATA to play either the two player version of the Battle of Agincourt or a two player version of the Battle of Crecy.

This is now the first real version, one in that it is the first two player version I have released and two in that I think all of the obvious problems have been worked out. I will say from the start that I am not happy with both players having to use the same mouse for input, but until I find a better solution it will have to do (any suggestions are most welcome). This is also my first attempt at a wargame and I need some feedback from other gamers as to what is right and what needs changing. So don’t be afraid to send me some criticism, that’s why I sent this version. The game also needs some additions, better graphics, easier user interaction, etc. Unfortunately, I don’t have a hard drive and only have one 3 1/2 drive (which is supposed to be little to use APW). The program is as large as I can produce with the work-arounds I use. I am planning on getting the Harddrive before I produce the final version (in a few months or so hopefully).

**This info is included for those interested, if you are also curious about Crecy there are many good books on the subject of medieval warfare. Sorry I am too lazy to write about both battles. The battle already named GAMEDATA is just a fictional battle between two evenly matched sides on terrain demonstrating all the types of terrain.**

This was the info included with the one player version.

The battle of Agincourt was chosen because it seemed to be an easy game for a one player version (plus it is a favorite of mine). Here is a little background on the battle (those that know the history of the Hundred Years War will please forgive the liberties I took with the game, most are due to my lack of finding a way to incorporate the into the game). In 1415, an English armada carrying Henry V and 8000 archers and 2000 men-at-arms toward France. The English landed in Normandy, near to the port of Harfleur. The King’s plan was to take the port and then march on Paris. This plan was changed after a month long siege in which the English won but lost over a third of their men. King Henry decided that attempting Paris was foolish, so he decided to march across northern France to Calais. They of course did as much damage as possible in the process. To make a long story short, after a long and grueling march the French trapped them into a fight. Much to the Frenchmen’s misfortune they chose a plowed and muddy field just outside of the town of Agincourt. The field was bounded by woods and the field was sloppy with deep mud. There wasn’t nearly enough room on the field to spread out the French men-at-arms and in their heavy armor they were virtually immobile in the mud. Henry V arrayed his men with archers interspersed with men-at-arms and protected by sharp stakes planted in the mud in front. The French arrayed into three major lines, the first and second were men-at-arms on the flanks they had mounted men-at-arms and in between were crossbowmen. The back row was mostly mounted men-at-arms. Most of the morning was spent staring at each other across the field until finally King Henry decided that if he didn’t do something he and his exhausted would lose by default (the odds were against them, 5000 archers, 1000 men-at-arms against 60,000 Frenchmen). He called an advance and the line advanced to within bow range and the English...
longbows began a deadly rain on the French front line. The French attempted to counterpunch with cavalry charges but the French cavalry was destroyed on the stakes. Then the front line of french men-at-arms advanced into the arrows and they were virtually decimated before they even reached the English line. And the English knights destroyed what was left. Those that fled were trampled by the advancing second line which met the same fate. What was left, other than a few colorful incidents, was for the French to flee the field defeated by the English longbow.

This is hopefully the first in many battles I will upload (as well as a program to produce any game you want). This version is designed for ancient combat, but will produce a modern version soon also. So send suggestions for battles (both modern and ancient). I will try to briefly explain how to play the game, please send me a message with any questions you have.

The screen is divided into three parts: top row - lists each sides morale, score, and the time. The English morale is the leftmost number (50 to start). Next to this is their score. In the middle is the time and to the right of the the time is the french score and morale in that order. All the way over on the right side is a blue square which is the exit button to end the game.

Middle map - The map and units. the following types of terrain are possible (the number following them is the number put into the battle file).

- clear - 1
- upslope east - 2
- upslope west - 3
- upslope n or s - 9
- hedge - 3
- woods - 4
- water - 5
- ford - 6
- ditch - 7
- town - 8

Each area (which is five pixels square) also has an elevation level 0 to 4 (0 lowest), a movement rating 0 to 9 (0 being easiest to move over, the highest movement rating is 5 for cavalry so any rating above that will act as a effective rating). the more versions of the game will probably be added as the type of terrain. In the battle files I have created, for example the hedge terrain type. The Hedge is near the west edge of the map and one side (the red side) will probably use it for defense. So I made the combat rating of all terrain to the west side of the hedge for 15 pixels a higher number. That way when a red unit is sitting right behind the hedge, the hedge will increase their strength as it would in reality. The same is try beside all slopes, the areas at the top have higher combat numbers so a unit at the top will have an advantage and the movement numbers on the slope are higher so moving up the slope is slower. the lowest a unit can move is 1 pixel per turn so a unit moving at 1 will move the same speed over all terrain. You can really see the affects when you send an archer as well as a program to produce any game you want). This version is designed for ancient combat, but will produce a modern version soon also. So send suggestions for battles (both modern and ancient). I will try to briefly explain how to play the game, please send me a message with any questions you have.

COMMANDS - Different commands that can be given are:
- movement - to command a unit to move just click where you want the unit to move and make sure the unit is facing that direction. units will not move any faster than their movement rating.
- facing - turn a unit is done by clicking in one of the triangles on the right side of the command screen. the top triangle will turn a unit counterclockwise, the other triangle clockwise. a unit can't turn when in another units ZOC (zone of control).
- speed - the speed will be shown in the speed box in the lower left side. the maximum for units is: cavalry - 5 infantry - 2 archers - 3
- clicking on the number lowers it by one, and clicking on zero changes it to the fastest speed. A unit with a movement of zero will not move.
- formation - the formation affects speed and combat effectiveness, you can change the formation by clicking on the present formation which is displayed in the box. some of the formations are line, wedge, march. March is best for free movement but terrible for combat. Wedge is good for defense but then not as good for offensive. Line is best for attacking but not defending. sometimes because of combat it is best to disorganize a unit so you cannot affect a disorganized unit until its leader gets control of it and gets it organized. this is done automatically, you just have to wait (if the leader of the unit will not get organized so just use it as best you can).
- charge/fire - To use this click on the charge/fire button (the button will invert) then click on the unit you want to charge or fire at (then the button will be outlined). Cavalry and infantry can charge, archers fire arrows at enemy units. A cavalry unit charging an infantry unit will do lots of damage with the charge and can quickly disorganize them. but can also take lots of damage if the unit is set and ready for the charge. Once a unit contacts its target it will stay and fight until you give it another command or the unit is destroyed. Archers fire at the designated target until given other orders or the unit is destroyed or the unit is out of range. The range of archers in the Agincourt version is approximately 1/5 the width of the screen. If you order archers to fire at units outside their range they will just stand still.
- defend/spike - this is the defensive mode for when a unit is expecting to stand for an enemy unit charge. cavalry usually or infantry this is a defensive stance, for archers however it means they set their stakes in the ground in front of them. This takes some time, so the button will not turn until the stakes are set.
- retreat - is just what it says, the unit will retreat towards the home edge (the left edge for the English). sometimes because of loses in combat a unit will become demoralized and begin to retreat on its own. you can't change its direction until the unit is not the same as the disorganization where you just can't change formation - this is where the unit is completely out of control. If the leader can't get control before the unit flees off the map the unit is considered destroyed.
- patrol - (probably not named right) this is the same as charge/fire except that it is not directed at any particular unit. by giving a command a unit will sit until an enemy unit moves within range, which is 1/5 of the screen width. cavalry and infantry will charge the first unit to move

Lower command/message region - during play messages will appear in this area. These messages are anything from what a unit is doing to the death or injury of a leader. when you click on a unit the main command screen will appear. this will be described in detail later. Other screens that can be called up are the unit info screen which tells you strength and morale and other info on the unit and the leader screen which lists leader and their condition. to exit a screen click in the command screen not in a button (there are no buttons on the message, leader, and unit info screens)
within there range, archers will fire at the enemy unit.

red rectangle - will bring up the unit info screen.

green rectangle - will show the leader screen.

BATTLE FILE - The battle is loaded when you click on the initial screen. The game loads the file GAME DATA from the directory the game is in. I have uploaded a game already called GAME DATA, and two historical battles - AGINCOURT.WAR and CRECY.WAR. To use either of these or any file you create just rename it GAME DATA.

section 1 is one line. the line is all numbers these are:

2 digits - the number of red units
2 digits - the number of blue units
2 digits - reds morale at start
2 digits - blues morale at start
1 digit - tens digit of hours at the start of game
1 digit - tens digit of minutes
1 digit - units morale to start (1 to 5)
1 digit - units morale to start (1 to 5)
1 digit - not used now - so just put any digit in. It will be used later when I have added AI to the game to play either side and when I have added group commands string - this can be of just about any length, it reads until the first blank so use " " in place of blanks, the program will remove them. No quotes are needed, just put the string.

section 2 is the map. there are four lines per row on the map. since there are thirty rows to the map there will always be 120 lines. there are 66 digits to each line, one for each column on the map. The first line is the type of terrain, the second is the column movement rating, the third line is the combat rating, and the fourth is the terrain level. Then you start over again and do the four lines for the next map row.

section 3 is the leader list. Each unit starts with five leaders so the number of lines is this section is 5*(number of red units + number of blue units). Each line has 2 digits and the leaders name. The first digit is the leaders value (1 to 5). The second digit should always be a 3 because that means the leader is alive and leading the unit. The last is a string. The program reads the string (no quotes necessary) until the first blank space or the end of the line. If you wish blanks in the name put " " in place of the blanks and the program will replace them with blanks.

section 4 is the list of units. there will be one line for each unit in the game (ie. red units + black units) the red units should all be first and the black units second, other than that the order does not matter. The numbers are:

3 digits - x coordinate (ie side to side) the screen is in 320 mode so anything outside the 0 to 320 range will immediately be destroyed (leaving the map destroys a unit) a units coordinates are for the upper left corner of the unit so if you give it a coordinate of 320 it will actually be drawn of the map.

3 digits - y coordinate (ie. top to bottom) the limits are 10 to 160.

1 digit - unit type (right now there are 3 types possible): 0 - cavalry 1 - infantry 2 - archers

2 digits - units strength (1 to 99)

1 digit - initial facing 1 - north 2 - northeast 3 - east 4 - southeast 5 - south 6 - southwest 7 - west 8 - northwest

1 digit - units initial speed setting (units are not moving at the start but it is annoying to have to change the setting of each one at the start) the maximums are: cavalry - 5 infantry - 2 archers - 3

3 digits - the distance the units bows will reach if they are archers (the 3 digits must still be there even if the unit is not archer type) I have made the scale about 70 for longbows down to 30 for crossbows, but this will depend on the scale of the game you create.

1 digit - units morale to start (1 to 5)
The assembler supports the 4 arithmetic operations + - / and *, It also supports arithmetic and logical operations in expressions. The high bit will be on if a " is used, and off is a ' is used. The type of operand for almost all of Merlin's pseudo ops and the 6502 and 65C02 microprocessors can be grouped into one of the four categories:

1) Expressions
2) Delimited Strings (d-strings)
3) Filenames or Pathnames

**ASSEMBLER SYNTAX CONVENTIONS**

A line of source code typically looks like:

```
label    opcode    operand        ;comment
```

The maximum allowable label length is 13 characters, but more than 8 will produce messy assembly listings. A label must begin with a character at least as large, in ASCII value as the colon and may not contain any characters less in ASCII value than the number zero. Note that periods (.) are not allowed in labels since the period is used to specify the logical OR in expressions.

A line may contain a label by itself. This is equivalent to equating the label to the current value of the address counter.

**Source Opcode and Pseudo Opcode Conventions**

The assembler examines only the first 3 characters of the OPCODE (with certain exceptions such as macro call and the Sweet 16 POPD). For example you can use PAGE instead of PAG (because of the exception, the fourth letter should not be a D). The assembler listing will not look well with an opcode longer than five characters unless there is no operand.

**Operand and Comment Length Conventions**

The maximum allowable combined OPERAND + COMMENT length is 64 characters. You will get an operand too long error if you use more than this. A comment line by itself is also limited to 64 characters.

**Number Format**

The assembler accepts decimal, hexadecimal and binary. Hex numbers must be preceded by $ and binary by % thus the following four numbers are all = 100 $64 %1011001

As indicated by the last binary number, leading zeros are never required.

**Immediate data vs addresses**

In order to instruct the assembler to interpret a number as immediate data the number must be prefixed by $ and binary by % thus the following four numbers are all = 100 $64 %1011001.

A number not preceded by # is interpreted as an address (LDA $64) Loads the accumulator with number in loc $64

Primitive Expressions

Expressions are built up from primitive expressions by use of arithmetic and logical operations. The primitive expressions are:

1) A label
2) A number (dec, hex or binary)
3) Any ASCII character preceded or enclosed by quotes or single quotes
4) The character * (standing for the present address)

All number formats accept 16-bit data and leading zeros are never required. In case 3 the value of the primitive expression is just the ASCII value of the character. The high bit will be on if a " is used, and off is a ' is used.

**Arithmetic and Logical Operations in Expressions**

The assembler supports the 4 arithmetic operations + - / and *, It also supports the three logical operations: ! (Exclusive OR), . (or), and & (AND).
The assembler will assemble 65C02 source code as well as 65802 source code. The XC pseudo opcode activates these features. This opcode is discussed in the Pseudo ops section.

ASSEMBLER PSEUDO OPCODE DESCRIPTIONS

DIRECTIVES

EQU (=)  Label EQU expression

Label EQU [label is external labels name]
PRINT EQU [ define PRINT as external]
This pseudo op defines a label as an external label for use by the Linker.

ENT (Entry label)
label ENT
PRINT ENT [ define PRINT as entry label]
This pseudo op will define the label in the label column as an ENTRY label. An entry label is a label that may be referred to as an EXTERNAL label by another REL code module. The true address of an entry label will be resolved by the LINKER.
The REL code module being written or assembled may refer to the ENT label just as if it were an ordinary label.

ORG (set ORiGin)
ORG expression
Establishes the address at which the program is designed to run. It defaults to $8000. If more than one ORG is used the first establishes the Load address and the second the origin. You cannot use ORG-1 to back up the object pointers as is done in some assemblers. This must be done instead by DS-1.

REL (RELocatable code module)
This instructs the assembler to generate code files compatible with the relocating linker.

OBJ (set Object)
OBJ expression
This is accepted only prior to the start of the code, it only sets the division line between the symbol table and object code read in memory (which defaults to $8000). If the REL opcode is used then OBJ is disregarded.

PUT (PUT a text file in assembly)
PUT filename
PUT reads the named file and inserts it at the location of the opcode. There are two restrictions on a PUT file. One there cannot be MACRO definitions inside a file which is PUT, they must be in the main source or in a USE file. Second a PUT file may not call another PUT file with the PUT opcode. Of course linking can be simulated by having then main program just contain the macro definitions and call in turn all the others with the PUT opcode.
Any variable may be used as local variables.

USE (USE a text file as a macro library)
USE filename
This works like PUT but the file is kept in memory. It is intended for loading a macro library that is USEd by the source file.

VAR (setup VARIABLES)
VAR expr;expr;expr
VAR 1;5;LABEL [set up VAR's 1, 2 and 3]
This is just a convenient way to = the variables 1 | 18. VAR 3;42;LABEL will set [1]=3 [2]=42 and 3 = LABEL. This is designed for use just prior to a PUT. IF a PUT file use 1 | 18, except in PMC (or >>>) lines for calling macros, there must be a previous declaration of these.

SAV (SAVE object code)
SAV filename
Will save the current object code. Acts same as the EXEC mode but it can be done several times during assembly. Together the PUT and SAV make it possible to assemble very large files.

TYP expression
This sets the file type to be used by DSK or SAV. The default is BIN. Valid file types are 0, 6, 80F-8F7 and FF (no type, BIN, CMD, user defined, SYS)

DSK (directly to disk)
DSK filename or pathname
DSK will direct the assembly directly to disk.

END (END of source file)
This rarely used opcode instruct the assembler to ignore the rest of the source.

DUM (DUMmy section)
DUM expression
This starts a section of code that will be examined for value of labels but will produce no object code.

DEND (Dummy END)
This ends a dummy section and reestablishes the ORG address to the value it had upon entry to the dummy section.

Sample usage of DUM and DEND

1 ORG $1000
2 3 IOBADRS EQU $87EB
4 5 DUM IOBADRS
6 IOBTYPE DFB 1
7 IOBNAME DFB $60
8 IOBDRV DFB 1
9 IOBVOL DFB 0
10 IOBTRACK DFB 0
11 IOBSECTION DFB 0
12 IOBLOAD DFB 2
13 IOBUFSIZE DFB 0
14 DUM
15 IOBCMD DFB 1
16 IOBERR DFB 0
17 ACTIVOL DFB 0
18 PREVSL DFB 0
19 PREVDR DFB 0
20 IOBSECT DFB 0
21 DEND
22 START LDA #SLOT
23 STA IOBSLOT
* And so on

FORMATTING PSEUDO OPS

LST ON/OFF
LST ON [ turn listing on]
LST OFF [ turn listing off]
LST [ turn listing on]
This controls the assembly listing to be sent to screen (or other output device). If the LST is off the object code will be generated much faster, but this is recommended only for debugged programs. Note: CONTROL D from the keyboard toggles this flag during the second pass.

EXP ON/OFF/ONLY (macro EXPand control)
EXP ON [ macro expand on]
EXP OFF [ print only macro call]
EXP ONLY [ print only generated code]
EXP ON will print an entire macro during the assembly. The OFF condition will print only the PMC pseudo-op. EXP defaults to ON. This has no effect on the object
Different delimiters have effects. Any delimiter less than (in ASCII value) the
General notes on String Data and String Delimiters     HEX FD,ED,C0   \[results: FD ED C0 in memory\]
STRING DATA PSEUDO OPS          HEX (define HEX data)
The CYC opcode will also work for the extra 65C02 opcodes in Merlin. It will not
this case the extra cycle is displayed and added to the total.
A double quote after the cycle count indicates that the assembler has determined
A single quote after the cycle count indicates a possible added cycle, depending
second number displayed is the accumulated total of cycles in decimal.
The first number displayed is the cycle count for the current instructions. The
The CYC opcode will also work for the extra 65C02 opcodes in Merlin. It will not
string. Any of the following syntaxes are acceptable:
All of the opcodes in this section except REV also accept hex data after the
This stores the two byte value of the operand usually an address in the object
code. This causes the listing of DO OFF areas of code to be printed in listing or
This sends a formfeed to the print.
TR ON/OFF (TRuncate control)
TR ON or TR (alone) limits object code printout to three bytes per source line,
even if the line generates more than three. TR OFF resets it to print all object
This puts a delimited string in memory in inverse format.
This sends a formfeed to the print.
On the second pass this cause assemblu to pause until a key is hit. This can
not to be printed.
This prints the current date and time on the second pass of the assembler.
inv (define INVerse text)
This prints the current date and time on the second pass of the assembler.
This puts the byte specified by the operand usually an address in the object
This opcode causes the listing of DO OFF areas of code to be printed in listing or
This puts the byte specified by the operand usually an address in the object
This sends a formfeed to the print.
This puts the byte specified by the operand usually an address in the object
This is the same as ASC except that the string is put into memory with the last
character having the opposite high bit to the others.
IMPL OFX (IMPLMENT in object code)
This will print out just as if the macro lines were written out in the
source.
LSTDO OFF    [ don't list DO OFF areas]
LSTDO ( LIST THE DO OFF AREAS)
This opcode causes the listing of DO OFF areas of code to be printed in listing or
not to be printed.
This sends a formfeed to the print.
This stores the two byte value of the operand usually an address in the object
This is the same as ASC except that the string is put into memory with the last
character having the opposite high bit to the others.
inv (define INVerse text)
This puts the d-string in memory backwards: Example REV "DISK VOLUME" gives
EMULOV KSID . Hex data may not be added after the string terminator.
STR (define a STRing with a leading length byte)
This puts a delimited string into memory with a leading length byte. Otherwise
works same as ASC. NOTE: the following HEX bytes if any are not counted in the
length. This is mainly intended for use with ProDos which uses this type of data
deextensively.
DATA and STORAGE ALLOCATION PSEUDO OPS
DA OR DW (Define Address or Define Word)
This puts the d-string in memory backwards: Example REV "DISK VOLUME" gives
EMULOV KSID . Hex data may not be added after the string terminator.
STR (define a STRing with a leading length byte)
This puts a delimited string into memory with a leading length byte. Otherwise
works same as ASC. NOTE: the following HEX bytes if any are not counted in the
length. This is mainly intended for use with ProDos which uses this type of data
deextensively.
DATA and STORAGE ALLOCATION PSEUDO OPS
DA OR DW (Define Address or Define Word)
This puts the d-string in memory backwards: Example REV "DISK VOLUME" gives
EMULOV KSID . Hex data may not be added after the string terminator.
STR (define a STRing with a leading length byte)
This puts a delimited string into memory with a leading length byte. Otherwise
works same as ASC. NOTE: the following HEX bytes if any are not counted in the
length. This is mainly intended for use with ProDos which uses this type of data
deextensively.
DATA and STORAGE ALLOCATION PSEUDO OPS
DA OR DW (Define Address or Define Word)
This puts the d-string in memory backwards: Example REV "DISK VOLUME" gives
EMULOV KSID . Hex data may not be added after the string terminator.
STR (define a STRing with a leading length byte)
This puts a delimited string into memory with a leading length byte. Otherwise
works same as ASC. NOTE: the following HEX bytes if any are not counted in the
length. This is mainly intended for use with ProDos which uses this type of data
deextensively.
DATA and STORAGE ALLOCATION PSEUDO OPS
DA OR DW (Define Address or Define Word)
This puts the d-string in memory backwards: Example REV "DISK VOLUME" gives
EMULOV KSID . Hex data may not be added after the string terminator.
STR (define a STRing with a leading length byte)
This puts a delimited string into memory with a leading length byte. Otherwise
works same as ASC. NOTE: the following HEX bytes if any are not counted in the
length. This is mainly intended for use with ProDos which uses this type of data
deextensively.
DS 10     [zero out 10 bytes of memory]
DS 10,80  [put 80 in 10 bytes of mem]
DS \     [zero mem to next memory page]
DS \,80  [put 80 in mem to next page]

This reserves space for string storage data. It zeros out this space if the
expression is positive. DS 10, for example will set aside 10 bytes for storage.

NOTES for REL files and Linker
The \ options are intended for use mainly with REL files and work slightly
different with these files. Any DS\ opcode occurring in a rel file will cause the
linker to load the next file at the first available page boundary.

MISCELLANEOUS PSEUDO OPS

NOTES for REL files and Linker

LUP

LUP expression (LOOP)
---^  (end of LUP)
The LUP pseudo opcode is used to repeat portions of source between the LUP and
then ---" expression number of times. An example of this is:

LUP 4
ASL
---^ which will assemble as:
ASL
ASL
ASL

and will show that way in the assembly listing with repeated line numbers.
Perhaps the major use of this is for table building. As an example

|A  =  0
LUP $FF
|  = |A+1
DFB  |A

Will assemble the table 1, 2, 3, ....,$FF
The maximum LUP value is $8000 and the LUP opcode will simply  be ignored if you
try to use more than this.  NOTE: the above use of incrementing variable in order to
build a table WILL NOT work if used within a macro.  Program structures such as this
must be included as part of the main program source.

CHK (place CHecKsum in object code)
This places a checksum byte into object code as the location of the CHK opcode.
This is usually placed at the end of the program and can be used by your program at
time to verify the existence of an accurate image of the program in memory.

ERR (force EBBor)

ERR $80-($300)  [error if $80 not in $300]
ERR "-1$/4000  [error if PC>$4100]
ERR \$5000  [error if REL code address exceeds $%000]

ERR expression will force an error if the expression has a non zero value and the
message break in line ??? will be printed.

NOTE for REL Files: The ERR$expression syntax gives an error on the second pass
if the address pointer reaches expression or beyond.  This is equivalent to ERR "-
1/expr, but if when used with REL files it instructs the linker to check that the
last byte of the current module does not extend to expressions or beyond (expression
must be absolute).  If the linker finds that the current module does extend beyond
expression, linking will abort with a message Constraint error

SW (SWeet 16 opcodes)
This enables sweet 16 opcodes.

XC (eXtended 65C02 and 65802 opcodes)
[enable the 65C02 option]
[enable the 65802 option]
This does not enable the extended BIT opcodes used on the Rockwell 65C02 chip.
There is a macro library file included on the Merlin disk that can be USEd to
implement these additional code.
MX (long status mode of 65802)
MX \#00 [ M & X 16 bit modes on]
MX \#10 [ M mode on X mode off]
MX \#11 [ X mode on M mode off]
MX \#3 [ M & X 16 bit modes off]

This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the MX opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

CMND (COMMAND)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the CMND opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

CMNS (CMND)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the CMNS opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.

VAR (Variable)
This is used to inform Merlin of the intended status of the long status of the 65802 processor. The assembler cannot determine if the processor is in 16 bit memory mode (M status bit =0) or 16 bit index register mode (X status bit =0). The purpose of the VAR opcode is to inform the assembler of the current status of these bits.

This opcode must be used when using Merlin's 65802 capabilities to inform the assembler of the proper mode to use in order to insure proper assembly of immediate mode commands.
Macros are user-defined sequences of assembly language statements, with general purpose operands. You define the macro in a general way and when you use it via a macro call, you fill in the blanks left when you defined it. EXAMPLE:

```assembly
MACRO SWAP
  LDA ]1; load accu with variable ]1
  STA ]2; store accu in location ]2
  STA FLAG,X; substitute second parm
  STA DEST; substitute first parm
<<
  ;this signals the end of the macro

Would assemble as follows if ]1=300 and ]2=400
LDA 300
STA 400
```

It is very important to realize that anything used in the parameter list will be substituted for the variables. Forward reference to a macro definition is not possible and will result in a not macro error message. A macro must be defined before it is called by NAME, PMC or >>>. The conditions are:
1) IF: ELSE and FIN may be used within a macro.
2) Local labels CAN be used for forward and backward branching, while variables cannot.
3) Labels beginning with :, Local labels, are identified and treated differently by MERLIN.
4) Local labels do not save space in the symbol table, while variables do.

There are three distinct types of labels used by the assembler. Each of these are identified and treated differently by MERLIN.

Global labels: labels not starting with ] or : Local labels: labels beginning with ] Variables: labels beginning with :

Local labels do not save space in the symbol table, while variables do.
Local labels CAN be used for forward and backward branching, while variables cannot.

All programming practice dictates the use of local labels as branch points, variables for passing data.

### MACROS

Macros represent a shorthand method of programming that allows multiple lines of code to be generated from a single statement. Example of the first type in T.MACRO LIBRARY file are simple means to eliminate repetitive entry of frequently used program segments. Example of more complex macros can be found in the T.FP Macros and the T.RWTS Macros. Macros can be used to simulate unimplemented opcodes or to simulate the Rockwell 65C02.

A macro is a user named sequence of assembly language statements, with general purpose operands. You define the macro in a general way and when you use it via a macro call, you fill in the blanks left when you defined it. EXAMPLE:

```assembly
MACRO SWAP
  LDA ]1; load accu with variable ]1
  STA ]2; store accu in location ]2
  STA FLAG,X; substitute second parm
  STA DEST; substitute first parm
<<
  ;this signals the end of the macro

Would assemble as follows if ]1=300 and ]2=400
LDA 300
STA 400
```

### MACRO DEFINITION

<table>
<thead>
<tr>
<th>NAME expr1;expr2,expr3,...</th>
<th>RESULT CODE EXAMPLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEMP</td>
<td>TEMP.EQU $10</td>
</tr>
<tr>
<td>MAC</td>
<td>LDA ]1</td>
</tr>
<tr>
<td>STA ]3</td>
<td>STA TEMP</td>
</tr>
<tr>
<td>STA ]2</td>
<td>STA $07</td>
</tr>
<tr>
<td>LDA ]3</td>
<td>LDA TEMP</td>
</tr>
<tr>
<td>STA ]2</td>
<td>STA $07</td>
</tr>
</tbody>
</table>

This segment swaps the contents of location $6 with that of $7 using temp as a scratch depository, then swaps the contents of $6 with that of $1000.

If as above some of the special variable are used in the MACRO definition, then values for them must be specified in the PMC (or >>>) statement. In the assembly listing, the special variables will be replaced by their corresponding expressions.

The number of variables may not exceed the number of values used in the macro definition. A BAD VARIABLE error will be generated if the number of values is less than the number of variables used. Macros will accept literal data. Thus the assembler will accept the following type of macro call:

```assembly
MUV MAC
```
In order to use the Linker, the files to be linked must be specified. The linker uses a file containing the names of the files to be linked for this purpose.

Pseudo Opcodes for Use with Relocatable Code Files

REL

This instructs the assembler to generate a relocatable code file for use with the relocating linker. This must occur prior to definition of any labels. REL files are incompatible with the SAV op and with the EXEC mode object code save command. To get an object file to the disk you must use the DSK opcode for direct assembly to disk. An ORG at the start of the code is not allowed. Multiplication, division, or logical operations can be applied to absolute expressions but not to relatives one.

Example of absolute expressions are:

- An EQUate to an explicit address
- The difference between two relative labels
- Labels defined in DUMMY code sections
- Examples of relatives expression not allowed

- Ordinary labels
- Expressions that utilize the PC, like LABEL=*

The starting address of an REL file, supplied by the assembler is $8000, it will be changed by the linker, for this reason no ORG opcode is allowed. There are some restrictions involving use of EXTERNAL labels in operand expressions. No operand can contain more than one external. For operands of the following form: #expression or >expression where the expression contains an external, the value of the expression must be within 7 bytes of the external labels value.

- LDA #EXTERNAL+8   [illegal expression]
- DFB >EXTERNAL-1    [legal expression]

Object files generated with the REL opcode are given the file type LNK under ProDos. This is the type that will show if the disk is cataloged by Merlin. This type is file type $F8

EXT

label EXT

This defines the label in the label column as an external label. Any external label must be defined as an ENTRY label in its own REL module, otherwise it will not be reconciled by the linker. The EXTERNAL and ENTRY label concepts are what allows REL modules to communicate and use each other as subroutines.

ENT

label ENT

Defines label as an ENTRY label. This label can be referred to as an external label. This allows other REL modules to use the label as if it were part of the current REL module. If a label is meant to be made available to other REL modules it must be defined with the ENT opcode. The example of a segment of a REL module will show the use of this opcode:

21 STA POINTER
22 INC POINTER
23 BNE SWAP
24 JMP CONTINUE
25 SWAP EXT ;MUST BE DEFINED IN THE CODE PORTION OF THE
26 LDA POINTER ;CODE PORTION OF THE
27 STA PTR+1 ;MODULE AND NOT USED
28 LDA POINTER+1 ;AS AN EQU LABEL
29 STA PTR+1
30 ETC

Note that the label SWAP is associated with the code in line 26 and that the label may be used just like any other label in a program.

DS

[skip to next REL file, fill mem with 0's to next page break]

When this opcode is found in an REL file it causes the linker to load the next file in the linker name file at the first available page boundary and to fill memory either with zeros or with the value specified by the expression. This opcode should be placed at the end of your source file.

ERR

ERR/4200 [error if current code passes address $4200]
The source is placed at STARTOFSOURCE when loaded, regardless of its original address. Important pointers:

- **STARTOFSOURCE**: set to $9001
- **HIMEM**: SC, SD
- **ENDOF SOURCE**: SE, SF
- **HIMEM** does not change unless a USER routine changes locations $73, $74. Such a change will be copied automatically into location SC, SD.

**General Information**

When exit to basic or monitor pointers are save on RAM card at $8000-$9000. They are restored upon re-entry to Merlin. Entry to Merlin sets current I/O hooks to PRODOS. Important pointers:

- **keyboard**: $8C, $8D
- **printer**: $901
- **RAM**: $9000
- **file start address**: location $C, $D.

**Symbol table flags**

- **MD**: MACRO DEFINITION
- **M**: LABEL DEFINED WITHIN MACRO
- **V**: VARIABLE (VAR)
- **?**: A SYMBOL THAT WAS DEFINED BUT NEVER REFERENCED
- **X**: EXTERNAL SYMBOL
- **E**: ENTRY SYMBOL

**Configuration (ProDos)**

Configuration data is in file called PARM.S, to change data just change the source file PARM.S and reassemble. (DOS 3.3)

**Data statements in HELLO file contain configuration.**

**DOCUMENT merlin.docs3**

**DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 653 of 1262**

**Configuration (ProDos)**

**HIMEM**

- **$C, $D**
- **[$9853 DOS 3.3 $AA00 IN ProDos]**

**STARTOFSOURCE**

- **$A, $B**
- **[$901]**

It is wise to use a full pathname in operands of the SAV, USES and PUT opcodes, since otherwise the current prefix will be attached to the name and that may not be the prefix you want.

Since Merlin runs under its own interpreter rather than the BASIC interpreter, there is no warm re-entry as with the DOS 3.3 version.

The ProDos volume /RAM/ is disconnected by Merlin.

**Transferring file from DOS 3.3 to ProDos Merlin Pro**

There are two methods of transferring files from the DOS to ProDos. Since ProDos version of Merlin uses text files only, you could load files into the DOS 3.3 version and write them as text files and then transfer them with Apple's CONVERT program. CONVERT is not a literal transfer, as it will clear the high bits in the file. The ProDos version will set the high bits again, but the tabbing in the editor will be fouled up by this procedure. But you can type FIX in the editor and resave the source file to fix this problem. Files intended for PUT or USE should be resaved because otherwise, assembly will be slowed.

Another method is to transfer the files as binary files from DOS 3.3 and use the fact that the ProDos version of Merlin has the ability to load binary files (or any type). After loading a binary source file, it should be deleted and save back (as a TXT file). The load command automatically permits loading og TXT and BIN files. Other types of files can be loaded by changing the byte used to designate source file type which is kept in location $BE5D, this usually holds a 5.

**ERROR MESSAGES**

- **BAD OPCODE**: Occurs when the opcode is not valid or the opcode is in the label column
- **BAD ADDRESS MODE**: The addressing mode is not a valid 6501 instruction
- **BAD BRANCH**: A branch to an address that is out of range, further than 127 bytes
- **DUPLICATE SYMBOL**: On the first pass, the assembler finds two identical labels.
- **MEMORY FULL**: This is usually caused by one of two conditions: Source code too large or symbol table too large.
- **UNKNOWN LABEL**: Your program refers to a label that has not been defined. Also occurs if you try to reference a MACRO definition by anything other than PMC or >>>
- **NOT MACRO**: Forward reference to a MACRO, or reference by PMC or >>> to a label that is not a macro
- **NESTING ERROR**: Macros nested more than 15 deep or conditionals nested more than 8 deep
- **BAD PUT**: This occurs by a PUT inside a macro or by a PUT inside another PUT file.
- **BAD INPUT**: This results from either no input or an input exceeding 37 characters in answer to the RRD opcodes request for the value of a label.
- **BREAK**: This message is caused by the RRD opcode when the expression in the operand is found to be non zero.
- **BAD LABEL**: This is caused by an unlabeled EQU MAC ENT or EXT, a label that is too long or containing illegal characters.
- **BAD ORG**: Result from an ORG at the start of a REL file
- **BAD OBJ**: An OBJ after code start or OBJ not within $4000 to $BFE0
- **BAD REL**: A REL opcode occurs after some labels have been defined.
- **BAD EXTERNAL**: EXT or ENT in a macro or an equate of a label to an expression containing an external, or a branch to an external (use JMP)
- **BAD VARIABLE**: This occurs when you do not pass the number of variables to a macro that the macro expects. It can also occur for a syntax error in a string passed to a macro variable, such as a literal without the final quote.

---

**Apple II Computer Documentation Resources (a2_docs_documentation.msw)**
If an illegal opcode is encountered, the bell will sound and opcode will be printed as three question marks in flashing format. In the source code itself, unrecognized opcodes are converted to HEX data, but not displayed on the screen.

S (SWEET)  
Similar to L but forces disassembly to start in SWEET 16 mode.

N (Normal)  
This is the same as L, but forces disassembly to start in normal ^%02 mode.

H (HEX)  
This creates the HEX data opcode. It defaults to one byte of data. If you insert a one byte hex number after the h, that number of data bytes will be generated.

T (TEXT)  
This attempts to disassemble the data at the current address as an ASCII string. Depending on the form of the data, this will be disassembled under the pseudo-opcode ASCII DDB. The appropriate delimiter is automatically chosen. The disassembly will end when the data encountered is inappropriate, when 62 characters have been treated, or when the high bit of the data changes. In the last condition, the ASCII opcode is automatically changed to DCI. Sometimes the change to DCI is inappropriate. This change can be defeated by using TT instead of T in the command.

W (WORD)  
This disassembles the next two bytes at the current location as a DA opcode. Optionally, if the command WM is used, these bytes are disassembled as a DDB opcode.

If W- is used as the command, the two bytes are disassembled in the form DA:LABEL-1. The latter is often the appropriate form when the program uses the address in a table of equates. It should not contain any zero page equates except ones resulting from DA's Jmp's or Jsr's. This is almost a sure sign of an error in the disassembly.

Q (Quit)  
This ends disassembly and goes to final processing which is automatic.

DEALING with the finished source
You may notice that some DA's would have been more appropriate in the DA LABEL-1 or the DDB LABEL formats. In this and similar cases, it may be best to do the disassembly again with some notes in hand.

You may notice that some DA's would have been more appropriate in the DA LABEL-1 or the DDB LABEL formats. In this and similar cases, it may be best to do the disassembly again with some notes in hand.

Changing Sourceror's label table
The label tables used by Sourceror are just assembled Merlin source files. The source file is on the Merlin disk and can be modified directly by the user. It must be assembled and saved under the same name as the previous label files.

APPLESOFT LISTING INFORMATION
A fully labeled and comment source listing of Applesoft Basic can be generated by the program SOURCEROR.FP on the opposite side of the ProDos Merlin Diskette.

WARNING: SOURCEROR.FP and some temporary work files are deleted when sourceror.fp is brun. For this reason make a backup copy and uses the backup copy.

1. Boot ProDos Merlin
2. BRUN SOURCEROR.FP form Merlin's Disk command
3. When Sourceror.fp finishes, lload the file APPLESOF.
4. Type the following to print the listing on your printer:
   PRTR 1 "I80N" "APPLESOFT LISTING"

   By using the XREFA utility with the Applesoft source you can produce a listing of
   every subroutine, zero page address and where they are used and called. To do this:
   1 Load the Applesoft file from the SOURCEOR.FP disk
   2 Quit to the EXEC mode and press D for disk
   3 BRUN /MERLIN/UTIL/XREFA
   4 Go to the EDITOR
   5 Issue the following command : USER 3,
   6 Issue the FRTR command : PRTR 1 "I80N" "APPLESOFT XREF".
   7 Issue the ASM command to start the assembly process.

   UTILITIES

   FORMATTER
   This is for enhancing the use of Merlin as a general text editor. To use BRUN if
   from the exec mode, then issue the USER command from the editor.
   XFER,XREFA
   These provide a means of generating a cross reference listing of all labels used
   within a Merlin assembly
   XFER instructions
   1 Go merlins exec mode and C the disk then BRUN XREF
   2 Type in appropriate USER command at editor
   USER 0 - prints assembly listing and alphabetical cross reference
   USER 1 - print assembly listing and both alphabetical and numerically sorted
   cross reference
   USER 2 - print alphabetical cross reference only.
   USER 3 - Print alphabetical and numerical cross reference
   XREFA
   This is an address cross reference program and is handy when you have lots of PUT
   files

   PRINTFILER
   Saves an assembled listing to disk as a sequential disk file.
   Applications
   Incorporating the assembled text file in a document being prepared by a word
   processor.
   Sending the file over a telephone line using a modem.
   Mail the file to someone who wants to work with the complete disassembly without
   having to assemble the program.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 656 of 1262
Merlin Pro's Full Screen Editor is very compact and powerful. It's command structure is modeled closely on the Merlin Pro Standard Editor so that you don't have to learn another radically different set of commands.

After it has been loaded, it is accessed from within the editor by typing an "A" command. If there is a source file in memory then the "K" command also sends you to the Full Screen Editor.

If you have one of the new 65802 16-bit microprocessors in your Apple //e or //c then you can make use of the "ED.16" version of the Full Screen Editor. This is faster and has far more capabilities such as the ability to move source files easily and quickly between DOS 3.3 and ProDOS versions.

The 65802 can be plugged right into your Apple //e or //c, replacing the existing 65C02 or 6502. There are no known incompatibilities with this chip, except for those that already exist for the 65C02. The entire 65C02 instruction set is supported, with the exception of the so called Rockwell codes. Those codes only exist on the Rockwell version of the 65C02 and do not exist on the versions used by Apple Computer for the //c or the //e enhancement.

It is strongly suggested that you install the Enhancement Kit in your //e if you don't already have it. This is not strictly required, but the Mousetext Toolkit characters will produce a substantial improvement of appearance.

4. COMMAND SUMMARY

The command structure follows that of the Standard Editor as much as possible. Commands that are 'global' in nature use the same control character as the but use the Open Apple (OA) key as prefix instead of the Control key. If you are familiar with Merlin Pro's Standard Editor, or the many editors with similar command structure, these commands will seem very natural.

CONTROL COMMANDS (line oriented and cursor moves)

Control B ........ Cursor to beginning of the line
Control D ........ Delete character under the cursor
Control F .......... Find next word (alphanumeric)
Control I .......... Toggle character insert mode
Control L .......... Toggle lower case convert mode
Control N .......... Cursor to end of the line
Control Q .......... Delete all characters from cursor to end
Control R .......... Replace original line
Control S .......... Show memory status box
Control W .......... Find next word (alphanumeric)
Control X .......... Cancel global exchange in progress
Control Y .......... Remember current line for recall by OA Y
Control Z .......... Move cursor
DELET . ........ Delete character typed next (recursive)
DELETE . .......... Delete character to the left of cursor
ESC . .......... Move cursor to the start of next line
RETURN .......... Carriage return and insert new line
TAB . .......... Toggle insert mode

5. OPEN APPLE COMMANDS (global)

OA DELETE . . . . Delete previous line (UNDO by OA TAB/OA R)
OA DOMM ARROW . . . Cursor down 10 lines, screen centered
OA ESC . . . . . . . Return to the standard editor
OA TAB . . . . . Insert new line at cursor
OA UP ARROW . . . . Cursor up 10 lines, screen centered
OA B . . . . . . . . Go to the beginning of source, screen centered
OA C . . . . . . . . Cut to the clipboard, start select if 1st time
OA D . . . . . . . . Delete current line (UNDO by OA TAB/OA R)
OA F . . . . . . . . Find text (recursive)
OA I . . . . . Insert new line at the editor
6. EXPANDED EXPLANATION OF SOME COMMANDS

6.1 CUT AND PASTE

Open Apple C starts the select mode and selects the line the cursor is on. After this, you can select further lines with the down arrow key. The up arrow key does not cancel select mode, so you can adjust the select range if you go to far.

However, the select mode will be canceled if you move the cursor above the first selected line or past the top of the screen. Any other command will cancel the select mode. Selected lines are shown in inverse. When you want to cut, type OA C again. The selected lines will disappear from the screen and are placed on the clipboard.

Open Apple Q selects everything from the current line to the end of the file for cutting. OA C will then cut the file and cancel the select mode. This provides a simple means of moving the entire file to the clipboard.

Open Apple P pastes the current contents of the clipboard on the screen starting at the line containing the cursor. Only full lines are moved. This does not change the contents of the clipboard, so that this can be used to replicate a range of lines.

7. FIND TEXT and GOTO LABEL (or line number)

The OA F command brings up a box which asks for the find text. It then finds the first occurrence of the text in the entire file text. The text can be anywhere on a line. After the first find, you will be led to the next occurrence by typing another OA F. You can edit the line and then type OA F to go to the next occurrence.

The OA B command and the Control-S status command both cancel the find mode, as does failure to find the text below the current line. This continued find mode is indicated by one or more ‘*’ signs preceding the line number at the top right corner of the screen. The continued find starts from the row the current line, so it locates only one occurrence per line.

The OA W command is identical to OA F except that it finds only whole words bounded by non-alphanumeric characters. If you type either OA W or OA F to find the next occurrence, this mode will change accordingly.

The OA L command asks for a label or any text to locate. It finds the first occurrence of that text in the file, but only in the label column. Only the characters typed are compared with the label, so in some cases you may wish to end your input with a space.

The intended use of this command is to move rapidly to a particular place in the source. You can use ‘markers’ to enhance the capability of this command. Therefore, if a line starts ‘* 7’, you can specify ‘* 7’ as the find text for this command and it will work.

If you type a number for the label in an OA L command, you will be sent to that line number. This is convenient when editing a source file using the printed listing.

In all cases the line containing the text is moved to the center of the screen, unless it is within the first 10 lines of the start of the source.

8. GLOBAL EXCHANGE

The OA X command produces a dialog box that asks for the text to change, and the new text to replace it (if you just type RETURN for either of these, the command is aborted). Then the file is searched for the change text. Unlike the FIND command, it looks only for full words. That is, the text found must be bounded by non-alphanumeric characters or it will be ignored.

If text is found with this method, the screen is reprinted with the replacement made and the cursor is placed on the first character of the replacement. Now you must hit a key to continue. Pressing RETURN or any other control character will defeat the change, and the routine will look for the next occurrence of the text to change. Pressing the space bar or any other character will accept the change and the routine will continue.

One exception to this is the Control-X key, which will abort the process and return control to you. Another exception is the ‘A’ key which will cause all changes to be canceled. Caution: this can be aborted only by RESET.

You can tell when the routine is finished by the fact that the line number at the top right is missing during the exchange sequence and will return when there are no more matches for the change text, or until you press Control-X.

9. REPLACE LINE and DELETE LINE

The OA D and OA-DEL commands delete a line from source and place it in a special ‘undo’ buffer, which is independent of the clipboard. The OA R command exchanges the current line with this undo buffer. Thus two successive OA R commands cancel one another out. OA R on an empty line places the undo buffer at that line and clears the undo buffer.

Note that these commands can be used to move a single line to another location. Just place the cursor on the line to be moved and type OA D; then move the cursor to an empty line or anywhere else. Now press either OA-TAB or RETURN to create an empty line, and then type OA R.

OA R can be used by itself to easily interchange two lines. Just place the cursor on the second line, press OA R again, move the cursor back to where the first line was and press OA R for the third and final time.

10. OPEN APPLE UP AND DOWN

The OA DOWN ARROW command moves the cursor to the 10th line below its present position and then reprints the screen so that the cursor will be on the 11th line. If this command is repeated it has the effect of moving the current line to the top of the screen and then moving the cursor to the 11th line on the screen.

Similarly repeating the OA UP ARROW command moves the top line to
the 11th line on the screen and puts the cursor on that line.

11. STATUS
The Control-S command displays a status box showing the number of
used and free bytes.

12. CHARACTER INSERT MODE
The character insert mode defaults to ON upon entry. When you
change it with the TAB or Control-I key, it remains that way until
changed again. Thus, moving from one line to another has no effect
on this status.

The status is indicated by the type of cursor displayed. It is an
inverse 'I' when insert mode is active, and an inverse space when
it is not active. The cursor is an inverse 'F' when you are in
find mode.

13. LOWER CASE TOGGLE
Ordinarily, unless the cursor is in a comment or an ASCII string,
lower case characters will be converted to upper case characters.
This is also defeated when the tabs are zeroed. To override this
conversion, or to reinitiate it, just use the Control-L command.
This conversion is also in effect when you use the OA F or OA L
find commands.

14. LINE NUMBER and EOL MARKER
At the upper right hand corner of the screen, the number of the line
containing the cursor is printed. Somewhat to the left of
this you may see a vertical bar. This bar indicates the position
at which an assembly listing will overflow the printer line. You
can get characters beyond this mark, since it is for information
only. The position of the mark is calculated using your line
length parameter in the PARMS file. If this is very large, the
mark will not be shown.

15. GENERAL REMARKS
When you move the cursor between lines its horizontal position will
jump around. This is because it is based on the actual position in
the line and not on the screen position. If the tabs are zeroed
you will not notice this, except for the fact that the cursor is
never beyond the last character in the line.

The editor works with any 80-column card and supports all modes of
the Ultraterm and Multiview cards. Except for minor details, it
even works on the 40 column screen. However, only that part of a
line that can fit on one screen line is displayed.

The maximum line length is 192 characters. Lines longer than that
will be truncated if they are edited.

The editor uses the mouse text characters in some places, but this
is just cosmetic. In 40 column mode these will show up as strange
characters because Merlin Pro does not use the video firmware in
that mode.

You must return to the standard editor (OA ESC) in order to use
the ASM command to assemble, or to Quit and access the EXEC mode,
the monitor, etc.

If the 'search character' parameter location is in negative ASCII,
then when you return to the standard editor, the 'A' and 'E'
commands no longer send you to the screen editor. This way you
still have use of the standard editor if you desire. The entry to
the screen editor is reestablished when you go to EXEC mode and
back, or when you assemble a file.

On the other hand, if you defeat the 'Update source (?)' question
by putting a zero in this parameter location, then the 'A' and 'E'
commands will always send you to the screen editor. The standard
editor can be used only for immediate commands. Using any positive
byte except zero for this parameter will defeat the 'Update source
(?)' question but still allow access to the standard editor.

The editor conflicts with some other utilities in its use of memory
such as SOURCEROR. To use these utilities you should remove the
editor by running the REMOVE.ED program. This pertains only to the
ProDOS version.

Users of the Ultraterm or Multiview cards can set up any mode of
the card by typing the appropriate ESCAPE sequence when in the
standard editor. That mode will then be automatically supported
when you go to the screen editor.

Unlike the standard editor, the Control-Q key does not move to the
next line after deletion of characters from the cursor on. This
makes it possible to use the Control-R key to undo this command.

An assembly will delete the current clipboard file. RESET will
return to the EXEC mode with everything intact.

The editor has keyboard buffering so that keys will still be read
during time consuming operations such as reprinting the screen or
moving data to and from the clipboard.

16. MEMORY USAGE
The ProDOS version uses 12 pages (3K) from the top of source file
memory if you use the EDMAC. It uses for EDMAC it uses and
additional 2 pages. It is protected from overwrite. The DOS 3.3
version uses the other language card and thus does not use any
memory ordinarily used by Merlin Pro.

17. INSTALLING ED ON THE FLY
If you have deleted line 80 from the DOS 3.3 HELLO program, and you
want to install the Full Screen Editor from within Merlin Pro,
press C to Catalog from the EXEC mode, and at the BASIC prompt type
BRUN ED. You can also BRUN ED from BASIC after Merlin Pro is in
memory.

With the ProDOS Standard Editor version, press D for Disk command
from the EXEC mode, and type BRUN/MERLIN/UTIL/FS.ED at the command
prompt.

18. THE KEYBOARD MACRO PROGRAMS (EDMAC)
These are versions of the keyboard macro parts of KEYMAC that will
support the screen editor. The macros are invoked by pressing the
Close Apple key along with other keys. The source files are
provided so that you can change the macro definitions if you so
desire. To set up the keyboard macros, press C to catalog from the
EXEC mode (assuming ED has been loaded), and at the command prompt,
type BRUN EDMAC.

19. OOPS

Virtually any command can be undone. The proper undo command is of
the same 'type' as the command you want to undo. Line editing
commands are undone by Control-R. This includes the OA E, OA 9, OA
-, and OA = commands which are regarded as line editing commands
for this purpose.
20. THE ED.16 VERSION

ED.16 is for use with the 65802 or 65826 chip. The speed sensitive parts of the editor make use of the enhanced abilities of these chips. For very large files the difference is substantial. Do not run ED.16 with a 6502 or 65C02. It should have no effect, but this has not been tested.

If you have a 65802 in your Apple, you can use ED.16. Just rename ED.16 so that it becomes 'ED'. If you have a program selector, tell the selector to use 'ED.16' as a 'startup'.

There are extra features in ED.16. The 'A' entry goes to end of source and the 'E' entry with line number goes to that line, unless the line is less than 11. The Control-S status request also shows the length of the clipboard, if any.

There are two more OA commands, OA LEFT ARROW and OA RIGHT ARROW. These move through the text a page at a time. This is roughly equivalent to two successive OA UP or DOWN Arrows.

The Control-O override command enables insertion of control characters in the text file.

The clipboard is this version only can be used to transfer files between ProDOS and DOS 3.3. To do this, place the cursor on the first line and type OA Q then OA C which will place the entire file in the clipboard. Then boot up the other version of Merlin Pro and ED.16 and type OA P.

If you use OA F, OA W, or OA X while a range is selected by OA C and Down Arrows, only that range will be searched. Otherwise, the entire file is searched. These commands cancel the select mode.

If the OA P paste command is used when a range is selected, the clipboard replaces the text in that range. Note: text deleted in this manner is not recoverable.

Things that will destroy the clipboard:

1. Turning off the computer
2. Writing to /RAM (but the A register does not matter. If this routine is changed the entire file is searched. These commands cancel the select mode.
3. Using any program that writes to auxiliary memory.
4. Using the SWAP command in the standard editor.
5. Assembling a file.

Things the clipboard will survive (ED.16 only)

1. A cold boot (Control OA RESET).
2. Running a program that does not use auxiliary memory.
3. RAM format request (but no writing of files).
4. Loading and saving files (all ED versions).

21. LOADING OTHER UTILITIES

You can have another utility such as XREF or SOURCEROM, loaded on boot instead of ED. To do this, change the name 'UTIL/ED' located at $2006 with a leading length byte, in MERLIN.SYSTEM, to the path name of the utility you want executed upon boot. This is for the ProDOS version only.
There is an alternate way to set the disk prefix. Press D for disk command, then enter PFX= or PFX=1 to specify slot 6, Drive 1, or PFX=2 for Slot 6, Drive 2. You can use the new slot command to specify slots other than 6. SLOT is to be used with the PFX= and CATALOG command as described below.

27. CATALOG COMMAND

After using the CATALOG command, if you press =, =1, or =2, Merlin Pro will set the prefix to the volume found in the specified drive and then catalog that volume. If you press OPEN APPLE during a catalog, Merlin Pro lists only the .TEXT files present in the specified directory.

If you press OPEN APPLE and CLOSED APPLE at the same time during a catalog, Merlin Pro lists only the .BIN files present in the specified directory. These keys must be pressed and held during the entire catalog process.

28. INTERPRETER

If the Merlin Pro ProDOS interpreter cannot find a disk volume required for linking or assembly, it will ask for the correct volume to be inserted. This request can be aborted by pressing Control-C or RESET. This only applies to volumes, not files. If you want a PUT opcode to prompt you to switch disks, you must use the full path name with the PUT opcode.

This feature will not work with the Linker when using one disk drive. If the present prefix does not correspond to any volume online, Merlin Pro will give a VOLUME NOT FOUND error.

The PROGRAM TOO LARGE error message has been changed to MEMORY IN EXCESS. See page 104 in the main Merlin Pro manual.

29. NEW DISK COMMANDS [DOS 3.3 Version]

The DOS 3.3 version does not perform the same volume checking as the ProDOS version. However, it is possible to simulate this with the following code:

```
LST XXX KBD "INSERT MYFILE DISK AND TYPE 0 <RETURN>" PAUSE
```

The assembler will stop at KBD on the first pass and assign a 0 value to XXX (any dummy label you desire). Pause forces a pause on the second pass and LST makes sure you see the KBD line. On the second pass, assembly resumes when you press any key (it is not necessary to type 0 and press RETURN.)

30. [ProDOS and DOS 3.3 versions]

30.1 Merlin Pro and 'SPEED UP' CARDS

Merlin Pro will work either in main or auxiliary memory (aux is the default). If you are using the main memory version, you will get about a 1.6 speed improvement with the SpeedDemon card, and about a 2x increase with the Accelerator. This is due to the heavy use of auxiliary memory during assembly. To select the main memory version with DOS 3.3, change the HELLO program to BLOAD MERLIN.X instead of MERLIN.

To select the main memory version with ProDOS, use a SC3 as the fifth byte in the FANS file. The V-bit of that location is used as a flag to instruct the interpreter to make the main memory modifications. A + sign after the MERLIN PRO VERSION 2.xx on the EXEC mode screen indicates the main memory version is active.

Some utilities do not work with the ProDOS main memory version because ProDOS is moved to aux memory. Programs that do not switch zero pages will work fine. Programs designed to be run in 64K will most likely run properly. The Filer and Convert programs run as long as the - command is used to run them, and all Merlin Pro utilities will work. The QUIT command moves ProDOS back to main memory.

MACROS

Errors in macros no longer abort assembly.

31. LINKER

The addresses of all external references are printed whether or not they are resolved. If you use the TRON command prior to the LINK command, only the errors will be printed in the external list (NOT RESOLVED and DUPLICATE errors).

32. LUP

In a LUP, if the @ character appears in the label column, it will be increased by the loop count (thus A, B, C...). Since it is a countdown, these labels go backwards (the last label has the A). Thus it is possible to label items inside a LUP. This works with a maximum LUP length of 26, or you will get a BAD LABEL error and possibly some DUPLICATE LABEL errors.

33. CLOCK

This utility is an interrupt driven software clock for the //c which lacks a clock to do ProDOS time stamping. It uses the VBLINT interrupt provision of the //c. This should be used with caution! If overwritten, anything might happen. Press RESET to turn off interrupts. The source files are provided in the SOURCE directory on the ProDOS version.

34. CONV.LNK.REL [ProDOS only]

This makes Merlin Pro's REL files compatible with Apple's RLOAD and RBOOT programs. It will convert a Merlin Pro LNK file to Apple's REL format (only if there are no externals). You can BRUN it from EXEC mode. If there is a source file in memory, it will just return, so enter NEW first in the editor.

You will be prompted for the path name of the file. The program will do the conversion and set up the converted file for Merlin Pro's object save command. The CONV.LNK.REL utility does not write anything to disk and does not delete or otherwise damage the original file.

35. CLR.HI.BIT [ProDOS only]

This converts a source file in memory to positive ASCII so the file can be sent to other programs that expect data in this form, such as Apple's ProDOS ED/ASM. To use it, just BRUN UTIL/CLR.HI.BIT and the save the source. CAUTION: If you re-enter the Editor, the source will be deleted from memory, since the Editor does not like this format.

36. 65C02 SPECIAL NOTES

To assemble or disassemble 65C02 code with the older //e ROMs, you must first BRUN MON.65C92. This must be done from BASIC if you are using the DOS 3.3 version. This utility is not needed with the newer //e of //c ROMs.
With both versions, you MUST use the XC opcode (see page 75 for details) as the very first line in your code. This flag tells Merlin Pro you are using 65C02 or 65802 opcodes.

You will have problems if you do not use the standard 65C02 opcodes as specified by GTE, NCR, and Rockwell. In creating the Reference manual, Apple apparently did not check with the manufactures regarding the final set of opcodes. Thus, Apple refers to three non-standard opcodes.

For example, to increment the Accumulator, you must use INC with no address argument, not in a. Branch on Bit Set (BBS) and Branch on Bit Reset (BBR) are also non-standard opcodes and are not supported by the NCR and GTE chips.

37. MANUAL CORRECTIONS and ADDITIONAL INFORMATION

37.1 Configuration (ProDOS version)

Configuration data is kept in a file called PARMS which is loaded when the assembler is run. To change the data in the source file called PARMS.s, with the prefix set to /MERLIN/, type L to load source. Then type SOURCE/PARMS at the prompt. When you are done making changes, reassemble the file. Use S to SAVE the source code as /MERLIN/SOURCE/PARMS by using the O command.

37.2 (page 117)

37.2.1 SOURCEOR

SOURCEOR is a sophisticated and easy to use co-resident disassembler designed to create MERLIN source files out of binary programs, usually in a matter of minutes. SOURCEOR disassembles 6502, 64C02, 65802, and Sweet 16 code.

37.2.1.2 Using SOURCEOR

1. [DOS 3.3] From the EXEC mode, type C to Catalog Merlin Pro. At the command prompt, type BRUN SOURCEOR. [ProDOS - see note on page 1 of this manual] From the EXEC mode, type D for DISK COMMAND. At the prompt, type BRUN/MERLIN/SOURCEOR/OBJ.
2. From the EDIT mode, use ESC CTRL-Q (not Escape-4) to set the screen to 40 columns, then type USER. If the screen is in 80 columns, the USER command will be ignored.
3. You will be asked if you want to load an object file to be disassembled. If you have loaded the object file prior to using SOURCEOR, type N.
   If yes, type Y and enter the filename. It will load and show the load address and end of program address. Note: If you type CTRL-S after the filename, files using a RAM version of Sweet 16 can be disassembled.
4. Next, you are asked to press RETURN if the program to be disassembled is at its original (running) location, or you must specify, in hex, the present location of the file to be disassembled. You will then be asked to give the ORIGINAL location of the program.
5. Finally, the screen displays the disassembly commands. You may begin disassembling now, or use any of the other commands shown. Your first command MUST include a hex address. Thereafter, this is optional.

37.2.1.3 Bird Tracks

Take the situation where you have stored a file that runs at address "X" and because it interferes with Merlin memory usage or whatever, you have stored it with a different loading address "Y." If you then answer yes to the above the program will be loaded at "Y." This will cause the disassembly to be messed up. The way around all this is to either load the file from the command mode or allow Merlin to load the file and accept Merlin's decisions. You then disassemble no more than one "L" of program. QUIT and be returned to the editor where you once more enter Sourceor where you state that the program is already in memory at address "Y." "BUT" it normally resides at address "X."

37.2.2 (Page 125)
4. Type the following to print the listing to your printer:
   PRTR 1 "180M" APPLESOFT LISTING
   ASM

37.2.3 (page 126)
5. Issue the PRTR command: PRTR 1 "180M" APPLESOFT XREF

6. Issue the following command: USER 3

37.2.4 (Page 135)
3. Enter the Editor and type in the appropriate USER command:

37.2.5 (Page 137: Last sentence in step 3)
In this case enter the following instead if the USER command: PRTR 8 "path name" page header (quotes only for path name).

37.2.6 MERLIN PRO & SOURCEOR FP

1) Make a copy of the Sourceor.FP diskette as per the warning on page 124 in the Merlin Pro manual.
2) Boot the Merlin Pro ProDOS diskette.
3) Insert the Sourceor.FP diskette.
4) Press D for Disk command. At the prompt type:
   BRUN/APPLESOFT/SOURCEOR.FP
5) From the main menu, type L to LOAD, then:
   /APPLESOFT/APPLESOFT
6) Enter the Editor, and type:
   PRTR1**APPLESOFT LISTING
7) Then type:
   ASM
   N (This is not needed if you have defeated the stupid "Update" prompt.)
8) You'll be prompted as follows:
Print DO OFF areas ? (Y/N) (You may answer Y or N)
Assemble new ROM version ? (Y/N) If you answer N, you'll get the '+' version.
(If you answer Y, You'll be prompted with:)
Assemble //c version ? (Y/N)
(answer Y for the //c & enhanced //e version.)
(Answer N for the original //e version.)

37.2.7 SOURCER.FP & XREF LISTING

1) Boot the Merlin Pro ProDOS diskette.
2) Insert the Sourceror.FP diskette
3) Type L to LOAD, then: /APPLESOFT/APPLESOFT
4) Type Q to quit the Editor, & return to the EXEC mode.
5) Insert the Merlin Pro ProDOS diskette.
6) Press D for Disk command, then type: BRUN/MERLIN/UTIL/XREF
7) Enter the editor then type: PRTR1"APPLESOFT XREF
8) Then type: USER 3
9) Then type: ASM

N (Not needed if update prompt is defeated)
10) You'll be prompted as follows: Print DO OFF areas ? (Y/N)
(You may answer Y or N Be smart, answer Y)
Assemble new ROM version ? (Y/N) (If you answer N, you'll get the '+' version) (If you answer Y, you'll be prompted with:)
Assemble /c version ? (Y/N)
(Answer Y for the //c and Enhanced //e version.)
(Answer N for the original //e version)
11) Insert the Sourceror.FP diskette at the prompt:
    Insert /APPLESOFT/APPLESOFT.A.S
12) Press RETURN and you're done.
Metal Paddleball was thought up one day from some Pascal source in a MacIntosh book. I had figured it would be easy enough to write, and no one had ever done anything like this before for the modem, so I decide to write it and put it out as a demo until the final version of Metal is complete and available to the public. This game is relatively short, and looks nice, as well as works nice. Needless to say, it's not perfect, and isn't bugfree, nor is this the final version of the game. The most interesting thing about the game is it's speed. Metal is fast as it is, but the game is well written to take full advantage of the system. Because of the speed of the Metal software, this game is possible. Locally is warps. Check it out on a Ile and a Iigs. You'll find it's very fast and smooth on both. Speed over the modem should be comparable because of the way the new modem drivers are written.

The modem drivers are interrupt-driven as well as have input and output buffers of reasonable size. This allows the modem to send and receive much quicker than the conventional polling method of the Macos/Acos drivers. Even 1200 baud will seem a bit faster. Anyway, this is the first demo version of the game and I hope you enjoy it.

By the way, to play the game, the controls are the HS & SU keys and the space bar.

The Language --

Well folk, the language is improving at a rapid rate. More and more things are being added daily, and more and more bugs&glitches worked out by the day. We have just added another person to the Metal Development Team. Joshua Thompson, the author of the NuPak unpacking software has just jumped in with us and will be helping with ideas and writing the 16bit side of the software. Reminding you that Metal WILL NOT be full 16-bit. It will be predominantly 8-bit with some minor 16-bit features. The most important and versatile of these features is the 16bit Variable Memory Handler. This will allow you to address ALL of your GS's memory for variable space. Imagine the arrays you can have with this thing! However, this does not leave the 8-bits out in the cold. You have a built in 40k or so var memory and there will be 8-bit drivers for those of you with Ile's and extra memory beyond the required 128k.

The current requirements of the system software include:
- An Apple Ile (Enhanced), Iic, Iic+, or Iigs
- At LEAST 128k memory
- A Clock
- A modem of any baud rate
- At least 280k of storage. Metal is big.

Optional: Joystick, More Memory, etc...

The current price of the software is $75.00 which includes a FULLY written BRB and 250-300+ page manual with 1 year of support. This package will, beside the aforementioned items, include plenty of extra examples, lots of machine language externals, information on some of the internal workings of Metal, and information on writing externals, writing modem drivers, and many other things. This is by no means a complete update on everything that has happened and none of the information stated here is guaranteed to be complete or true. I'm telling you folks what I know to understand. Again, be patient. We realize we are late, but financial difficulties have made it hard, and we are doing are best to find AS MANY bugs as we can so that you may not have to through the hell of rewriting your code around the inconsistencies of the language like you had to do with Acos and Macos. We are all trying to make this the best, and most worthwhile $75 dollars you have ever spent on BRB software. I have no idea how much longer it will be before Metal is made available to the general public for purchase, but it will be soon. Thank you for being so supportive.
After booting up your Micro League Baseball diskette, you will be given 2 choices. 1) To start a game or 2) Watch a demo game. A demo game simply shows what the game looks like, but doesn't give any docs.

Once you've started the game, it will give you a screen giving you some idea of what you're supposed to do. Just ignore this, since it may confuse you more, and these docs cover what it tells you to do. What you should be concerned about is what it is asking you at the bottom. It requests whether or not you want a designated hitter. A designated hitter (DH) takes the place of the pitcher when your team is at bat, because most pitchers cannot hit for the life of them. DH's do not play when your team is out in the field. If you don't choose to have a DH, your pitcher will be placed on the batting line-up.

Once you've answered it, you'll be given a list of different teams, and are asked to choose a visiting team. Do this by simply pressing the letter corresponding to the team you want. After doing so, it will ask whether you want to control it or have the computer control the team. If you're playing alone, I suggest you pick the computer to control one of the teams, unless you want to play a highly boring game.

Once you've chosen the visiting team, you must do the same thing for the home team. Once you've finished that, you will be given 4 different menus. The 1st one gives you the starting pitcher and the pitching bench for the visiting team. The menu at the bottom should be fairly easy to understand, and you can switch your pitchers around the way you want to.

The 2nd menu is the batting and position line-up for the visiting team. Again, you can follow the menu at the bottom to manipulate the line-up. One point though. Most players can play 2 positions. This is designated by a position/position next to the name (1B/3B or SS/3B for shortstop and 3rd base.) If you change a position from one player to another, and the new player you are putting into the position has can play one of those positions, it will accept the change. You cannot however, place a player who can only play, say 1st base into left field.

The 3rd and 4th menus are the same exact thing for the home team.

After you're done, the field will come on the screen, and the home team will walk and the scoreboard will appear. Once the opening themes are done, you will be given a certain prompt depending on which team you are playing and how many players there are. If there is only 1 player, you will be given either the OFFENSE or DEFENSE prompt, depending on if you're playing the home or away team. If you are given the DEFENSE prompt (which means you're team is out on the field) you can do the following...

DEFENSE MENU

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Change your pitcher</td>
</tr>
<tr>
<td>1</td>
<td>Pitcher throws a fastball</td>

</tr>
</tbody>
</table>

Keys # 1, 2, 3, 4 I don't think I need to explain. They are the 4 different types of pitches you can throw.

Key #5 throws a pitch out if you think someone on base is going to steal.  If you throw a pickoff and he does try to steal, it gives you a better chance to pick him off.

Key #6 brings your 1st and 3rd basemen in. This gives you a better chance to field a bunt or get a double play if the batter hits a ground ball. After you hit 6, it will ask you what type of pitch you want to throw (either 1, 2, 3, 4)

Key #7 does pretty much the same thing, except your 1st, 2nd, 3rd, and shortstop all come in.

Key #8 throws an intentional walk. This is useful if a powerful hitter is up and you want to avoid the chance that he might hit a home run or a good hit.

Key #9 allows you to change pitchers. Your pitcher might get tired sometime in the game, and you may want to put in a relief pitcher.

If you are given the OFFENSE prompt (meaning your team is up at bat) you can do the following...

OFFENSE MENU

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Try to hit a power shot</td>
</tr>
<tr>
<td>2</td>
<td>Try to hit a slow mover/blooper</td>
</tr>
<tr>
<td>3</td>
<td>Runners on base attempt to steal</td>
</tr>
<tr>
<td>4</td>
<td>Hit &amp; run play</td>
</tr>
<tr>
<td>5</td>
<td>Bunt with man on</td>
</tr>
<tr>

<td>Change your line-up</td>
</tr>
<tr>
<td>0</td>
<td>Normal hit attempt</td>
</tr>
</tbody>
</table>

Key #1 can only be used when you have 1 or more men on base. This tells the batter to go for a long hard hit (Namely, a home run). It doesn't always work though.

Key #2 can only be used when you have 1 or more men on base. This tells the batter to go for a short weak hit which may fall between the infield and out-field, or to hit one slow enough so he can beat out the throw to first. Again, it doesn't always work.

Key #3 tells all players on base to attempt to steal.

Key #4 starts a hit & run play. As soon as the pitcher throws the pitch, the runners run as though they were going to steal. However, the batter attempts to hit the ball no matter where it is. This way, the runners may get more bases than they would have normally. Note: If the batter fails to hit the ball, the game considers the play as though the runners were attempting to steal.
Key #5 can only be used when you have 1 or more men on base. This is used for a sacrifice bunt. Using this will usually result in the batter getting out, but will move your runners over one base safely.

Key #6 tells the batter to bunt also. However, this bunt gives your batter a better chance of reaching first. However, if you have any runners on, they may get out depending on where the ball was hit.

Key #7 allows you to change your pitcher.

Key #8 allows you to put in a pinch hitter or runner.

Key #9 allows you to change your line-up.

Key #0 is your normal hit key. Use this key for a normal hit (which can be pretty much anything).

Those are pretty much all the docs. There are a few other notes, however.

The computer picks a random ball-strike count. Which means... you don't get 4 balls and 3 strikes like in real baseball. The game only allows one ball or...

Before you change sides (after 3 outs) and if you've made a batting or pitching change, the system will ask you to hit a key. I don't know why it does this... but sometimes it will put you back in either the line-up or pitching menu. If you've already made the change, simply hit escape.

There may be a bug in your copy. If you allow a designated hitter, the game may royally screw up your lineup (like... you may have the same guy playing 5 different positions). If this happens, you cannot have a designated hitter. Re-boot your game and answer N to the question "Do you want a designated hitter?".

When you decide to change your pitcher, it's alright to simply take a pitcher off your bench, but he won't be warmed up and he may be hit off of the first couple innings he's in. It's better to put your relief pitcher in the bull pen for a few innings before bringing him in, which warms him up a lot.

** Special Keys **

Hitting an "M" at the OFFENSE or DEFENSE prompts will turn the organ on & off. Hitting an "R" at the OFFENSE or DEFENSE prompts will toggle on & off whether the players run on and off the field when changing sides. When you turn the "Run to Dug out" off, the players change sides instantly, which decreases game time (You don't have to sit and watch them run back and forth...).

Anyway... that's pretty much it. Have fun and...

PLAY BALL!
MICROWAVE IS LIKE PAC-MAN WITH A FEW DIFFERENCES. YOU START OUT IN A MAZE WITH VARIOUS OBJECTS DROPPED ALL ABOUT YOU. THE OBJECT IS TO PICK UP ALL THE OBJECTS AND GET OUT AT THE OTHER SIDE. HOWEVER IN THIS GAME YOU HAVE A FEW 'FRIENDS' CHASING YOU; LURCH, TRIXIE, BIFF AND TEDDY. LURCH SEEMS TO BE THE FASTEST AND MOST OMINOUS.

AS YOU RUN AROUND THE MAZE ALL YOU NEED TO GET AN OBJECT IS TO RUN OVER IT. SOMETIMES YOU WILL SEE A GRENADE. YOU CAN'T GET THESE, BUT THEY CAN GET YOU. THEY'RE SAFE WHEN THEY ARE GREEN, BUT ONCE THEY TURN BLUE THE EXPLODE IN ABOUT 1-2 SECONDS. YOU ALSO HAVE A WEAPON. IT'S A MICROWAVE BEAM. WHEN YOU FIRE THIS IT FIRES IN THE DIRECTION DEFINITELY OF WHAT YOU WERE TRAVELLING. IT WILL EXTEND AS FAR AS IT CAN IN A STRAIGHT LINE UNTIL IT RUNS INTO A WALL. IT STAYS ON FOR ABOUT 5 SECONDS. ANY CREATURE CAUGHT IN IT SHRIVELS AND DIES INSTANTLY. SOME MAY RUN INTO IT, BUT THIS DOESN'T HAPPEN OFTEN. THEY ARE REGENERATED IN (ABOUT) 7 SECONDS.

YOU GO THROUGH 4 DIFFERENT MAZES, EACH WITH A FEW MORE OBJECTS THAN THE FIRST. ON THE BOTTOM LEFT OF THE SCREEN IT SAYS 'POWER' AND GIVES A NUMBER. THIS IS THE NUMBER OF MICROWAVES YOU CAN SHOOT. YOU CAN GET ONE MORE SHOT PER MAZE BY RUNNING OVER WHAT LOOKS LIKE A SQUARE. YOU CAN ALSO WALK INTO YOUR MICROWAVE TO HIDE, BUT DON'T STAY IN THERE TOO LONG OR YOUR LIFE-SUPPORT WILL GET LOW THEN CRITICAL THEN FLASHING CRITICAL AT WHICH POINT YOU PROBABLY WILL DIE. ONCE (IF) YOU HAVE GOTTEN THROUGH ALL 4 MAZES IT REPEATS ITSELF ONLY WITH MORE STUFF. I FOUND THIS GAME TO BE EASIEST USING THE KEYBOARD. JUST PRESS 'K' AT THE BEGINNING AND THEN IT'S:

<--- FOR LEFT  
--- FOR RIGHT  
'A' FOR UP  
'Z' FOR DOWN.

AND SPACE BAR FIRES THE MICROWAVE.

---

War in Middle Earth Documentation

There are three different screen levels. The top level shows the whole map of Middle Earth. This game is icon oriented. The three icons to the side are:

- Orb - tells status off all forces on map
- Load/save - loads/restores saved game
- Magnify - allows you to go to the next map level down
- Hourglass - changes rate at which time goes by

At the middle level, the icons go as follows:

- Orb - tells status of selected party
- Map - goes to top map level
- Magnify - allows you to go to the next level down
- Hourglass - changes rate at which time goes by

At the scene level, the icons are:

- Orb - tells status of party on the screen
- Map - goes to middle level map
- Hand/bottle - gets/puts things down

I assume that your mission is to get the ring to Mt. Doom. To do so, you have all the good forces at your disposal. The blinking forces are yours to do so as you wish. The non-blinking ones are either your enemies or neutral forces. Neutral forces go under your command at different times of the game or when you get certain magical objects to those groups.

The best way to learn how to play is just dive in. At first be careful of the Nazgul. They'll kick yer ass quickly if they get to Frodo. You would be best going to Bree first via Bombadil's house.

To see what a certain place is, just click on it. If it is important at all, the game will tell you so. You can play the game militarily forgetting the books altogether, or you can play it following the book (which is probably safest at first).

At some point in time, the protection scheme will ask you for coordinates to a particular place. What follows is a list of places and what I believe to be their coordinates.

<table>
<thead>

</table>
Before starting the adventure...read the living tutorial on the disk and that should help you understand how this adventure works.

Also--certain shift keys will print out things automatically like:

- **Shift 1** = Save the game
- **Shift 2** = Load the game
- **Shift 3** = The last command or set of commands repeated
- **Shift 4** = Help me condor
- **Shift 5** = Drop
- **Shift 6** = Get all
- **Shift 7** = Quicksave
- **Shift 8** = Quickload

That's all of 'em...you can also string directions by putting periods in between them (N.S.E.W...).

Commands in brackets [] are strung commands.

First U start on the island--

Get shell, n, go hut, get straw, s, e, get steel, e, get vine, w, w, drop all, get vine, s, e, tie vine to rock, d, w, get rock, dig, get map, e, u, w, get all, n, n, e, n, e, s, s, s, e, s, e, s, s, s, (wow! another beech!), look trunk, get bottle, w, n, n, w, s, w, s, s, [drop straw, map], hit rock with steel, drop bottle

Now to the infamous pirate ship!...

N, n, w, n, s, s, look lifeboat, get canvas, n, e, e, s, w, s, punch man, s, get cleaver, n, n, e, s, s, s, w, cut chain with cleaver, [drop rock, steel, cleaver], e, n, n, e, e

On to merry ol' England!...

E, e, e, e, search man, get hat, n, w, w, s, buy pole, n, w, fish junk, get paper, read paper, e, n, lay, give money, s, e, n, n, e, say Chandralil, give money, w, s, e, give hat, e, look drink, chase man (kick his ass!!), s, w, get hat, w, s, w, n, n

Go plane

Now landing at Luxembourg....

N, w, look in hat, boot 11, search man, [get id, note], read note, drop note, e, f, n, n, w, talk clerk, u, n, n, w, duck, get parchment, read parchment, drop parchment, n, d, e, e, e, s, s, e, dig, get leaflet, read leaflet, drop leaflet, w, n, n, w, w, talk man, ani 1649, open box, get gun, give box, e, n, w, u, n, n, n, e, shoot man, get message, read message

The grand finale!... (U could do this in the beginning of the game)
Miner 2049'er : new from livesay computer games. Programmed by mike livesay and I must say that this program is destined to be a winner on the software market. Overall, I rate it a 9.8 the graphics in this game are done very well, and the game itself takes on the form of Donkey Kong. To my knowledge, the game has 4 levels, but there could be more, the fact that this game has 4 or more different levels makes it superior to the other games released for the apple which also take the form of Donkey Kong. You complete each level by covering all of the lined ground and eating the apples. Note that the apples also serve as energizers. On level 3, there is an elevator. To activate this, climb in and press 2 to go to floor 2, 3 to go to floor 3 and so on. To descend, simply press the 1 key. 'esc' toggles play and freeze mode. One other thing, the game plays a lot better with a joystick. Unfortunately, the keyboard functions are not incorporated into the program.
early, and the ball veers left. When you release the button, the ball will begin to move.

CHECK IT OUT (the scorecard)

At the end of each hole, the current score for all players appears on the scorecard screen. If you wish to see the score at any other time, press the space bar.

HOT TIPS FROM THE CLUB PRO

TIMING SHOTS: The ball doesn’t move until you release the button on the accuracy bar. When you’re trying to putt through a moving object (a windmill, for example), use this fact to aid you in your timing.

MAKING PAR: In most cases, you’ve got several ways to make a shot. The easy route to the hole requires more strokes than the trickier multiple-bounce shots, but, of course, it’s safer. To make par on some holes, it may be necessary to take the more difficult shots.

TERRAIN:

Smooth: Constitutes the main playing field. It is flat and solid in color.

Slopes: Slopes and breaks are indicated by arrows that point in the direction they influence the ball to go. Dark arrows on a light colored background break slightly faster.

Walls: Walls and diagonals cause the ball to rebound in a manner dependant on the speed and direction of the approaching ball.

Water: Water pools and traps may or may not be surrounded by walls. If your ball lands in the water, your next stroke is played from the point where it entered the water. A one stroke penalty is added to your score.

Bridges: Bridges may be flat, or sloped in any direction. Some bridges (like draw-bridges) involve timing events; others require more power in the shot. Some are bordered by walls, while others have no such safety rails to prevent the ball from falling into the water.

SPECIAL KEYS

ESC: On menu screens, returns to previous menu screen.

During the game, quits the game and returns you to the first menu screen.

Spacebar: Displays the scorecard.

S: Toggles sound on/off.
MINIT MAN is a three-screened game in which you have to load and launch 3 interplanetary missiles before the alien mother ship destroys you. The missiles you must use to destroy the mother ship are on the other side of a gorge with a broken bridge. You have to fly to the government warehouse on the right-hand screen, pick up trusses and beams, one at a time, and fly them back to complete the bridge on the left-hand screen. Meanwhile, you must protect the launch computer in the command building in the center screen from the attacking alien robots. Once you have built the bridge, the train automatically brings a missile to the launching pad on the middle screen. You then land, leave the 'copter, and proceed down the back-and-forth hallways of the command building and reach the computer which then fires the missiles. You must launch all three missiles in under 5 minutes in order to complete the first level.

To build bridge: once you have a beam or truss picked up from warehouse, fly to bridge, position it EXACTLY and press both fire buttons at the same time.

To kill robots: robots fly down at center screen and enter command building to get launch computer. When they are hit with 3 shots, they turn into a land mine which kills a robot if it is touched. Sometimes a robot will fly to destroy bridge instead of computer, so you must try to protect both screens at the same time. The minit man can fire lazer, jump mines, & duck shots. At the beginning of the game or after a game has been saved you may undertake the quest. Each player can choose a character from the table of nine characters. One person can make the moves for each character in turn or a number of players can take turns at the keyboard.

To maneuver helicopter: it faces in 5 directions, and it flys fastest in the direction it is facing. To change directions, push button 1 while pointing joystick to desired direction. Fire lazer cannon with button 0.

You lose when: the time on the clock runs out, all 5 minit men die, or a robot gets to the launch computer.

If all this sounds tough, there are some advantages you do have. Your copter flies faster than the robots, you can shoot through the windows in the command building to kill robots easily, and if minit man dies inside the building, he leaves a power pill which makes next minit man faster and clogs robot's lazers.

Miscellaneous: you can enter the command building from either the center or right-hand screen. Also, watch out for robot lazer cannons perched above the bridge on left screen and warehouse on right screen.

This is a difficult game to master, if you can ever master it at all!
The Following Characters are available to join the party:

- (0) Previous Character
- (1) Fighter with Sword
- (2) Wizard
- (3) Elf with Bow
- (4) Dwarf with Ax
- (5) Fighter with Ax
- (6) Elf with Sword
- (7) Dwarf with Hammer
- (8) Fighter with Bow
- (9) Cleric

How to move:

- Up arrow or Return ------ Moves forward
- Down Arrow         ------ Moves down
- Left Arrow         ------ Moves left
- Right Arrow        ------ Moves right

the ( <-- , --> ) keys move characters in 90 degree angles....

DOORS:

Locked- You can BASH or UNLOCK a locked door... when bashing, the party moves forward trying to break the door, afterwards you move thru one square, but have a high probability of setting off a trap. Unlock is simple, press (U) and then choose who you wish to attempt to pick the lock, a robber has the greatest chance of succeeding. Also capable of setting off a trap if fails.

WALLS:

Most say (Solid, or impassible, etc.. ) if they can not be moved thru, but there are secret passages and they can be found anywhere.

GAME COMMANDS WHILE MARCHING:

Movement - (above.^")

[O] - Order -- Rearranges the order of the party. Hit ESC to abort.

[P] - Protect -- Displays currently active spells covering the entire party.

[R] - Rest -- Rests party overnite in square currently occupied. Rest restores all character’s Hit Points and/or Spell Points, unless inhibited by special conditions. Rest requires one food unit from each character’s food supply. All protection spells wear off during rest and must be recast upon awakening.

[S] - Search -- Finds treasure or other items hidden in square occupied by party. You should always search after defeating a monster and before moving off the square in which an encounter occurred. However, you do not need to search immediately after combat. You may want to rest, cure wounds, etc. first.

[B] - Bash -- (Explained above ^")
[U] - Unlock -- """

[Q] - Quickref -- Displays a brief overview of all party members' Hit Points, Spell points, Armour Class, and Condition. Press ESC to go back to 3-D screen.

[#] - View character statistics:

[C] - Cast -- Casts a non-combat spell, providing character at that level and has the required number as spell points and magical gems.

[D] - Discard -- Permanently removes item from character's backpack.

[E] - Equip -- Shifts item from character's back pack so he can use it. A maximum of 6 items may be equipped. Only one hand/hand weapon, one armour, one shield, one missile weapon can be equipped at a time.

[G] - Gather -- Transfers all gold, gems and food carried by other party members to that character, up to the maximum amount of each item which the character can carry.

[R] - Remove -- Shifts Item from equipped to the back pack.

[P] - Protect -- Allows you to see all currently active spells which are cast by your entire party.

[S] - Share -- Evenly distributes all gems, gold or food in the party's possession among all party members.

[T] - Trade -- Transfers an amount of gems, food, or particular item from viewed character to another character.

[U] - Use -- Activates an item that has special powers. Items may or may not be equipped for use.

[V] - Volume -- Turns sound ON/OFF.

------------------------------------------------------------------------

COMBAT:

Divided into rounds, A (+) in front of a character's number means that is able to engage in hand to hand combat. With the exception of archers, and characters who engage in hand to hand combat can't use missile weapons.

Non-Combat Commands

[D] - Delay -- Allows you to set the duration of the on screen messages to any number between 0-9. (0 is the shortest duration, 5 is default)

[P] - Protect -- Allows you to see all currently active spells which cover your entire party.

[G] - Quickref -- Displays the QUICKREF list of characters.

[#] - Views character -- that's right!

Handicap

The handicap prompt indicates whether monsters or party members have been given a speed handicap for the current round of combat. If the monsters have been given the handicap, a prompt will show MONSTER + the number by which all party members' speed has been increased. If party members have been given the handicap, the prompt will show PARTY + the number by which all party members' speed has been increased. If neither, prompt will show EVEN.

Battle Options

[A] - Attack -- Character attacks monster in the A position, with whatever weapon he/she has equipped. If monster A dies, all other monsters move up one position.

[F] - Fight -- Character attacks monster in a hand-to-hand battle position, with whatever weapon equipped. A prompt will ask which monster he wishes to fight.

[R] - Retreat -- Character gives a general retreat command for the entire party. Chance of success is slim.

[S] - Shoot -- Character fires missile weapon at monster of choice. Only available when character has missile weapon equipped and is in a non-hand to hand situation.

[C] - Cast -- Character casts a combat spell. Only appears for spell casters.

[U] - Use -- Character activates special power for an item in his possession.

[B] - Block -- Character increases his Armour Class for this round.

For Advanced Players

To speed up combat, hold down CTRL-A together. The character with combat initiative will:

- oAttack the monster is position A, if engaged in hand-to-hand combat.
- oShoot the monster in position A, if not in hand-to-hand.
- oBlock, if neither option is open.
Battle Over

Combat continues until one side is destroyed. If party wins, remember to search.

GAME OVER

If you want to interrupt the game, but save the experience points and other abilities gained by your characters during the most recent game session, you must take your party to the inn in one of the five towns and SIGN IN.

Beginners Guide to Adventure

THE WORLD

The world is divided into five towns, underground caverns and dungeons, open terrain, rivers and seas, and mountainous areas. In general, the more dangerous the area is, the more treasure you can expect to find.

Towns are important because they contain:

- Shops where food, weapons, armour, and other equipment can be purchased.
- Temples where sick or injured character may be healed.
- Training grounds where characters may advance to higher experience levels, provided they have the required experience points.
- Inns where characters must be taken for safe harbour at the end of each game session, if the game information is to be saved.

Underground caverns and dungeons contain multiple levels, with the danger (and possible gains) increasing at each lower level.

Mountains and bodies of water frequently offer only one route of passage, which may be heavily guarded by dangerous monsters.

Avalanches may cause montain passes o shift, and spring torrents may flood river fords.

SPELLS

Only certain classes of characters may cast spells. There are 94 different spells, divided into CLERICAL and SORCEROR spells, with 7 SPELL LEVELS in each division.

Characters who may cast clerical spells may not cast sorceror spells, and vice versa.

The level of spell which a character may cast is determined by his experience level. When you first begin, concentrate on level one spells, since these are the only ones you may cast.

All spells cost spell points. Higher level spells may also cost a number of magical GEMS. Gems must be found along the way.

OK... well... this is the end of the docs.. Along with this file you should obtain these others...

Spell Points

A byte of (27) would be equal to 39 in the game. Must have both numbers the same.

Abilities

Intell are the first #’s that are the same from Example #1.
Might is next, Personality and so on...
Endurance
Accuracy and Speed
Lucky.

For each ability both numbers must be the same. For example a byte of (50) would be equal to 80 on the game.

Alignment

---------                       ----- 33      sharp sword                     34      accurate sword

Well that's about it and remember to leave mail if there is any problems.

The First Cheat made by W.C.C.T.

Don't forget to call the above boards.

Might & Magic Solve coming soon...

-END-
At any time before selecting a class, you can return to the MAIN OPTIONS MENU by pressing ESC.

Assign A Race
After selecting a class, choose the character's race. Race options will replace class options on the screen.

HUMAN, ELF, DWARF, GNOME, HALF-ORC
To select a race, type the NUMBER next to the desired race.

Select Alignment
After assigning race, select the character's alignment. Your choices are:

GOOD, NEUTRAL, EVIL

Choose Character's Sex
MALE or FEMALE (tough one)

Name your Character
Type (ANY NAME HERE) then press RETURN

Save Your Character
TYPE C.

VIEW ALL CHARACTERS
From the Main Options Menu you can view a list of all characters stored on the disk B copy which you are using. This includes the 6 pre-programmed characters, unless you have deleted any of them.

CREATE NEW CHARACTERS
The View All Characters list includes:

- KEY LETTER for character
- NAME of character
- TOWN in which character is currently located
- LEVEL OF EXPERIENCE which character has achieved
- CLASS of character

Character Profile
All information on the Character Profile screen is in abbreviated form.

LEVEL = Experience Level
SP = Spell Points
HP = Hit Points
AC = Armour class
COND = Condition
EXP = Experience Points

Delete A Character
To delete the character displayed by the Character Profile, hold down the CONTROL (CTRL) key and press D.

Rename A Character
To rename the character displayed by the Character Profile, hold down the
CONTROL key and press N. Then type the new name.

GO TO TOWN

Each time you play Might and Magic, your party of adventurers sets out from the inn in one of five towns. The town from which you set out is the town containing the characters in your party. All characters, preprogrammed or created, first start out in Town 1, so this is where you begin the game. Later, as your party travels to and lodges in other towns, you will set out from towns 2-5.

From the Main Options Menu, type the NUMBER of the town. The screen will show a list of characters in that town. If there are no characters in the town you have selected, you will see the message: NO AVAILABLE CHARACTERS.

Set Up Your Party

To add a character to your party, hold down CONTROL and press the KEY LETTER next to the character's name on the list of available characters. A @ sign will appear to the left of the name.

Do the same process to delete character from party set-up.

Now you are ready to begin adventuring.

Might and Magic Adventure instructions in different documentation file.

Apple II Computer Info

Level #6
1- Moon Ray  6SP + 4 GEMS
2- Raise Dead  6SP + 4 GEMS
3- Rejuvenate  6SP + 4 GEMS
4- Stone To Flesh  6SP + 4 GEMS
5- Town Portal  6SP + 4 GEMS

Level #7
1- Divine Intervention  7SP + 10 GEMS
2- Holy Word  7SP + 5 GEMS
3- Protection f/Elemnts  7SP + 5 GEMS
4- Resurrection  7SP + 5 GEMS
5- Sun Ray  7SP + 5 GEMS

Sorceror Spells

Level #1
1- Awaken  1SP
2- Detect Magic  1SP
3- Energy Blast  1SP
4- Flame Arrow  1SP
5- Leather Skin  1SP
6- Light  1SP
7- Location  1SP
8- Sleep  1SP

Level #2
1- Electric Arrow  1SP
2- Hypnotize  2SP
3- Identify Monster  2SP + 1GEM
4- Jump  2SP
5- Leviate  2SP
6- Power  2SP
7- Quickness  2SP
8- Scare  2SP

Level #3
1- Fire Ball  1SP + 1 GEM
2- Fly  3SP
3- Invisibilty  3SP + 1GEM
4- Lightning Bolt  1SP + 1GEM
5- Make Room  3SP
6- Slow  3SP
7- Weaken  3SP + 1GEM
8- Web  3SP

Level #4
1- Acid Arrow  4 SP
2- Cold Beam  4SP
3- Feeble Mind  4SP + 2SP
4- Freeze  4SP
5- Guard Dog  4SP
6- Psychic Protect.  4SP + 2 GEMS
7- Shield  4SP + 2GEMS
8- Time Distortion  4SP + 2GEM

Level #5
1- Acid Rain  5SP
2- Dispell Magic  5SP
3- Finger of Death  5SP + 3 GEM

This is a list of all the spells available for Might and Magic, a more descriptive list will be out in a couple of days when I find the time.

-END-
Esc pauses game and music. Press any key to continue.

For the most part, these are classic Apple II keys, but here they are:

- **Q** quits the game and returns to whatever launched it.
- **S** toggles sound effects on and off.
- **M** toggles the music on and off.

### Game Keys

- **Esc** pauses game and music. Press any key to continue.
- **M** toggles the music on and off.
- **S** toggles sound effects on and off.
- **Q** quits the game and returns to whatever launched it.

#### Problems and Coming Attractions (this is a beta version)

- There is only one level, "Pong the Mac Pluses".
- You have unlimited lives (some won't consider this a problem!)
- You will get the same score every time you finish (this is due to the first two).
- The ball occasionally skirts a Mac and erases part of it by mistake.

#### Possible Level Ideas

- Pac-Mac with Mac IIs
- Mac Invaders with Mac SEs
- Maccer (Frogger) with Mac LCs

### Unpack Mega Mac Munch and its companion picture data file to the same place.

Mega Mac Munch is copyrighted (c) 1991 Ian Schmidt. All Rights Reserved. Programming, and design by Ian Schmidt. Graphics by Ian Schmidt and MMM logo by Anthony Mattick. Music and sound by Ian Schmidt, some music code by Jim Maricondo of Digital Youth Alliance.

I would like to hear your feedback concerning this game! Please send E-Mail on America Online to IRSMan, or you may contact me at:

Ian Schmidt

Thanks for trying the game! If you'd like to see an enhanced version with more levels and other 'goodies', let me know.

Ian Schmidt
July 7, 1991

The year is 1995. The Mac has taken over the world, crushing IBM and its clones like so much silicon styrofoam. The evil Emperor Scully has decided that the next target is: the Apple II! He plans to stop the Apple II by kidnapping its users and placing them in a series of challenges in the hopes that they will become "Mac-ified". Their only hope is to destroy the Macs.

For this first round, you have unlimited chances at the Macs. In later contests, you might not be so lucky. Can you save the Apple II?

Or will Scully reign over the computing world? Only you can find out!

Play Mega Mac Munch!
ModemBuffer is meant for IIgs users whose communications program can't keep up with their modem, particularly modems 9600 bps and faster. It is an init that should be placed in the System/System.Setup folder of your startup disk. It sets up a 64K buffer for the GS modem port. If your communications program doesn't enable buffering, be sure to enable it in the control panel. ModemBuffer.1 uses slot 1 and ModemBuffer.2 uses slot 2. Be sure to use the appropriate one.

This is ModemBuffer version 1.1. It represents a significant improvement over version 1.0. Version 1.0 did not work. Version 1.1 does work. It should work with any communications program that uses the firmware. If a program can't keep up with fast modems, it is likely that it uses the firmware. If ModemBuffer can't allocate memory, you will get an error $201 and will have to reboot; sorry.

Jay Krell
GBnie: J.Krell

1.0 - didn't work
1.1 - does work

QuickDocs for MODZap v00.41a. These docs and the MODZap program are copyright (c) 1992 Ian Schmidt and Two Meg Software. All Rights Reserved.

MODZap is the ultimate in MOD players for the Apple IIgs. It offers full support for 15 and 31 instrument MOD files used by the Amiga programs NoiseTracker, ProTracker, and StarTrekker. It plays these files on any speed Apple IIgs using pitchbend and other special effects programs like NoiseTracker IIgs just don't give you. And unlike NoiseTracker, it runs under GS/GS and uses the friendly desktop interface you already know how to use. It's also fully compatible with the new System 6.0 (in fact it works better with 6.0!).

To use MODZap, just run it. Load time should be practically instantaneous since it's a <7k application. Once you have a menu bar up, load a MOD, any MOD, including ones NoiseTracker GS chokes on. As with MODifier, you must guess if the MOD is 31 or 15 instrument. Start by trying 31, as most MODs are of this type. If the program hangs or crashes, try 15 instead. To play, pull down the Sound menu and select Play MOD. The Not-So-Scrolly Player will appear before your eyes. To end playback, simply press the Open Apple key on your keyboard. The song will repeat forever if you do not stop it.

If you run into any MODs which MODZap does not play correctly, tell me!

Moral Support from Dave Huang, Tim Meekins, Mike Horwath, Richard Wifall, and of course Yoshi ;-)
LADDERS: Joe can go up or down them, but can't jump off or onto one.

POLES: If Joe jumps on to one, he slides down, if he misses, he dies.

CHAINS: Just like LADDERS except he can jump off or onto one.

The tools/objects:

AMULETS: They look like hammers and when taken, turns killer creatures grey and allows him to pass by harmlessly. After a few seconds it disappears and does the grey color. Taking one is worth 100 points.

KEYS: Three different colors to open doors. The one used disappears after opening a door.

SWORDS: If Joe runs into some creatures with a sword, he kills the creature and loses the sword.

JEWELS: If your trying to find for a big 1000 points cache. One catch, if Joe has more than 5 swords/amulets/keys, he can't take any. He may get as much as he can get his hands on. Doesn't count as a tool.

TORCHES: Help light dark rooms. Otherwise, you only see creatures and fire pits there. Counts as an object. Worth 3000 points if you get one.

Note: You must jump to grab an object. Maximum of 5 tools you can have at one time. You can have an unlimited amount of jewels.

Killer Creatures:

SKULLS: These guys are either rolling or bouncing. Jump over rolling ones or walk under bouncing ones or die. (I never tried jumping a bouncing skull, etc.) You might get hit by a bouncing one from below so watch out. Killing a skull with a sword is worth 2000 points.

SNAKES: They don't move, run into one and die. You can't kill them.

SPIDERS: These critters crawl all over the place, even up and down ladders. Get hit by one and die. Kill one and get 3000 points.

TREASURE ROOM: When Joe jumps into darkness to find chains and jewels. Don't jump onto a pole or else go to next difficulty level. Grab as many jewels as quick as possible. Don't miss any chains or else you grab a pole and slide down to next level.

With joystick, make sure you move the joystick up, down, left and right before you start to calibrate it.

If you lose all your Panama Joes, press the Jump button to restart "once" where you left off, resetting the score to 0.

SCORING:

COLLECTION SPECIAL TOOLS AND REWARDS:

Introduction
MoreInfo is an Apple IIgs Finder Extension, i.e., it adds to the Apple IIgs System Disk 6.0's Finder (Finder version 6.0) and later versions. What it adds is a "More Info" option to the Finder's "Icon Info" menu item.

The "MoreInfo" window shows you and allows you to change:
   o File type
   o Aux File Type
   o Creation Date
   o Modification Date
   o In invisible/visible
   o Backup needed/not needed
   o Read access
   o Write access
   o Delete access
   o Rename access

In addition, it also shows you (but you cannot change):
   o Full pathname
   o Storage type
   o Data fork size
   o Data fork blocks
   o Resource fork size
   o Resource fork blocks

This program requires Apple IIgs System Disk 6.0 or later to run.

Installation:
Just copy the file "MoreInfo" to your folder named:

COPYRIGHT (c) 1992
All Rights Reserved.

SHAREWARE: MoreInfo is Shareware. This means that if you like this program, send $10 to the following:

Bill Tudor
3925 Greencastle Rd. Suite #108
Burtonsville, MD 20866

If you do not believe this program is worth $10, well, then send me a note on how I can make the program better.

Thanks very much in advance.

This program may be passed around freely to anyone you like. The complete APC/plus source code to version 1.0 is also available. Please include this file with the distribution since MoreInfo does not have a "Help" or "About" button.

....now down to the real stuff........

....now down to the real stuff........

Introduction
MoreInfo is an Apple IIgs Finder Extension, i.e., it adds to the Apple IIgs System Disk 6.0's Finder (Finder version 6.0) and later versions. What it adds is a "More Info" option to the Finder's "Icon Info" menu item.

The "MoreInfo" window shows you and allows you to change:
   o File type
   o Aux File Type
   o Creation Date
   o Modification Date
   o In invisible/visible
   o Backup needed/not needed
   o Read access
   o Write access
   o Delete access
   o Rename access

In addition, it also shows you (but you cannot change):
   o Full pathname
   o Storage type
   o Data fork size
   o Data fork blocks
   o Resource fork size
   o Resource fork blocks

This program requires Apple IIgs System Disk 6.0 or later to run.

Installation:
Just copy the file "MoreInfo" to your folder named:
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

You can alternatively just copy the file "MoreInfo" to a folder named:
"*:System:FinderExtras"
on your boot disk and then just run the Finder!

That's it.

Note: You place MoreInfo in either System.Setup or FinderExtras folders. Either place, it works great!

Using the Program:
-------------------
Run the Finder. Select some icons. Hold down the SHIFT key. Choose "Icon Info" from the Finder's menus.

You will get the MoreInfo window instead of Finder Icon Info windows. Note that without using the SHIFT key you get the normal Finder stuff.

MoreInfo shows you the pathname, type, aux type, creation date, modification date, access, storage type, data size, data blocks, resource fork size, and resource fork blocks for the file. Please note that I have not duplicated most of the stuff you can find using the regular Finder Icon Info command.

The arrows at the lower right allow you to move through all the icons that you have highlighted before invoking MoreInfo.

Please note that you can alter many of the values. Only change the ones where you know what you are doing, then click the "Change" button to make the changes happen. You cannot, for example, simply change a file of type TXT ($04) to type S16 ($B3) and expect the former text file to now be a IIgs Application program as if by magic. In addition, some file systems under GS/OS will not allow all of MoreInfo's features to take effect. As an example, changing just the rename access of an HFS file system file will not work. This is an illegal operation under HFS. Since no one knows what future file systems may be added, MoreInfo will try to do what even you ask it to, and after selecting the "Change" button the file information will be re-read from the disk and the MoreInfo window will be updated so you can see if your change request "stuck".

Filetypes may be entered as hexadecimal numbers or as 3-letter filetype abbreviations (such as SYS, S16, TOL, NDA, CDA, etc). Do not preceed the hexadecimal entries with a "$". Auxiliary file types must be entered as hexadecimal numbers.

Note: You must click the change button to make changes. Do this before leaving the current display and moving on. Whenever the Change button is enabled, this means that you may have made a change and you should click the change button to make it stick.

After you click "Change", MoreInfo will re-read the information from the disk to see if the changes were allowed. For example, you can _try_ to change the filetype of a folder...it simply won't be allowed.

Revision History:
------------------
v1.0 + <Original release>
v1.1 + Boot text string was changed
      + New Date & Time change/display method
      + Fixed a few bugs with the Trash icon display

Credits:
-------
This program could not possible have been developed as easily without the Orca 2.0 (Byteworks) environment, APW/C (Apple) compiler, Edit-16 text editor (SSSi and yours truly), and Rez (Apple) and Genesys (SSSi) for resource fork creation/editing. Also, the engineers at Apple who developed all this great system software for the GS.

Have Fun!

>end
MORIARTY, CURRENTLY AT VERSION 1 RELEASE 2, IS A SYSTEM DUMPING UTILITY DESIGNED TO DUMP TO DISK THE LOWER 48K OF AN APPLE 2 EXACTLY AS IT WAS WHEN RESET WAS PRESSED.

MORIARTY CAN BE TRIGGERED BY RESET OR NMI. A 16K RAMCARD IS NECESSARY, AND A SLOT ZERO SWITCH IS DESIRABLE. I DO NOT KNOW HOW WELL IT WORKS ON A 2E, A FULL SCREEN MENU ALLOWS ACCESS TO THE VARIOUS OPTIONS OF MORIARTY. TWO USER EXITS ARE PROVIDED FOR THE AMBITIOUS.

PHYSICALLY, MORIARTY IS ONE FILE, AND NEEDS NO OTHERS UNLESS YOU RUN IT FROM AN INTEGER MACHINE, IN WHICH CASE HE NEEDS FPBASIC ON THE SAME DISK.

LOGICALLY, HE IS FOUR FILES:
THE SETUP PROGRAM
THE MEMORY FILL PROGRAM
THE REG OR NMI HANDLER
THE SMALL RWTS ITSELF

ALL OF THE MODULES ARE IN ONE BINARY LOAD, AND RELOCATED BY THE SETUP PROGRAM ACCORDING TO THE VALUES SPECIFIED BY THE USER. IN ADDITION, IF YOU PUT THE INSPECTOR AT THE END OF MORIARTY, HE WILL FIND IT AND PUT IT IN THE CORRECT LOCATION SO YOU CAN USE THE INSPECTOR WHEN THE DUMP IS TAKEN.

TO USE MORIARTY, RUN THE PROGRAM AND LOOK AT THE MENU. BELOW THE BANNER WILL BE A LINE DESCRIBING WHAT TYPE OF MACHINE HE THINKS YOU HAVE. IF IT ENDS IN A QUESTION MARK, OR IS NOT THE TYPE OF MACHINE YOU HAVE, CHECK YOUR BANK SO WHEN HE DOES NOT KNOW WHAT IS THERE, BECAUSE I THINK TRIGGERING I/O IN SOMEONE ELSE'S MACHINE WITHOUT TELLING HIM IS A ROTTEN THING TO DO. REMEMBER EPOCH? THE REST OF THE MENU IS FAIRLY OBVIOUS. JUST BE SURE NOT TO CONFUSE THE BOOT SLOT WITH THE DUMP SLOT. NOTE THAT HE WILL NOT ALLOW YOU TO ASSIGN THE BOOT SLOT TO THE SAME SLOT AS THE RAMCARD SLOT. THE LEFT AND RIGHT ARROWS MOVE THE CURSOR UP AND DOWN, SO JUST GO BACK AND CHANGE YOUR MISTAKE. SIGN THE CURSOR UP AND DOWN, SO JUST GO BACK AND CHANGE YOUR MISTAKE. SIGN THE

STACK IS A VERY USEFUL OPTION IF YOU DO NOT HAVE AN NMI TRIGGER. AT RESET HE WILL PUSH THE P-REG ONTO THE STACK THREE TIMES, THEN THE A-REG AND THE Y-REG POINT HI-LO TO A DATA STRUCTURE KNOWN INTERNALLY AS "THE BLOCK". IT IS THE ANCHOR POINT FOR ALL OPERATIONS.

DOCUMENT mouselink

MouseLINK Version 2.0 fx
Released: January 7, 1988

Ever since the Release of AppleLINK, people have wanted On-Line mouse control in the *Private* BBS world. Well it's here now, and it's hip, it's rad, and it's now. This file contains a small explanation of how to use MouseLINK on your own BBS, and where to see it in action. We believe this will revolutionize the Apple BBSing world.

For On-Line Mouse Control Call these Terrific Systems:

- Off The Wall //gs (319)354-7959 12-9600 bauds Mercenary & Hack
- Scrl Down: Ctrl-Z. Scrolls special window up one line.
- Gold Mine GS (213)277-8292 24-9600 bauds Vindicator & Cy
- Proterm Special work at the same time as the additions. Scrl Up: Ctrl-Z. Scrolls special window up one line.
- Pandemonium GS (416)273-7619 24-9600 bauds Apple Clone
- X.A. Systems (815)756-9567 24-9600 bauds Dr. Ditto
- DJ's BBS
- Pandemonium GS
- Gold Mine GS
- Off The Wall //gs

: This file and the Mouse.da Written By: Joe Hack :

This version of the MouseLINK.da should be included on a copy of ProTERM 2.1, it's been designed so all you have to do is run mouse.system, and if everything else is left the same, it will auto-start ProTERM 2.1.

You can access this DA thru the control panel just like any other DA, and you can adjust the mouse sensitivity, and whether or not the da is on or off from the main menu.. It should be self-explainatory.

Anytime, ProTERM has a hard time handling interrupts if you go into the Control Panel, this will sometimes cause a freeze, you merely have to hit reset, to get back into ProTERM. (** Exception to the Rule, if ProTERM is initializing the modem, don't ever just hit Reset, in that case you must Reboot the machine.)

Known Flaws

- Naturally if you have the Mouse.da activated and you goto a program that uses the mouse, there's going to be some fighting over control of the mouse, I suggest you turn off the DA whenever you go to a mouse controled program, since the da, will keep reinitializing the mouse if it detects that another program has modified the mouse clamps.
- If you hold the Control Key down when you click the mouse button it will create undesired results. The same thing goes for the shift key, and CAPS-Lock, it's very important that caps lock is up, when you are using the da. Besides that, CAPS went out with the Timex Sinclair, so I don't think it will be any big deal.

One other thing, ProTERM has a hard time handling interrupts if you go into the Control Panel, this will sometimes cause a freeze, you merely have to hit reset, to get back into ProTERM. (** Exception to the Rule, if ProTERM is initializing the modem, don't ever just hit Reset, in that case you must Reboot the machine.)

Known Flaws

- These commands are Additions to PS Emulation, all the commands in normal Proterm Special work at the same time as the additions.
- I. You can view SHR files On.Line.
- II. The Mouse Cursor is Defineable.
Set Mouse Mode: Ctrl-M+chr$(x). x is defined to be a value from 1-3. Mode 1 is the default, and when the mouse button is pushed, a ctrl-chr$(30) is sent out, followed by the X and Y position of the mouse cursor on the screen. This is standard Datamedia/ProTERM Special Coordinate system, and if you don't know about it that's too bad. When mode 2 is set, the mouse cursor is no longer shown, instead, when the user moves the mouse up, it's just like he/she hit up arrow, same for the other directions. The button will return a chr$(13) in this case. Mode 3, is identical to mode one in all but one respect, it sends a chr$(2) instead of a chr$(30).

Mousetalk Docs

Chapter One: Hardware Requirements

Hardware Requirements: Certain pieces of hardware (such as your computer and a modem) are required for Mousetalk to work properly. To use Mousetalk, you should have:

- An Apple personal computer or compatible
- 128K Memory (64K internal and 64K Text Card)
- Mouse and Mouse Card
- External Modem
- Serial Card

Mousetalk will not work on the Apple II, Apple II+, or unenhanced Apple IIe computers. While Mousetalk can be operated without an Apple Mouse, we encourage you to have and use one.

Additionally, optional equipment includes a printer, extra disk drives, and a hard drive. Though not required, we do recommend you have a printer, and a hard disk drive is one of the best things that you can have for your computer. Mousetalk works with all ProDOS-compatible printers, hard disk drives, including the Unidisk 3.5 drives.

Mousetalk does not support any internal "plug in" modems, except internal modem/serial card combinations, such as the Prometheus 1200A.

Note: The caret (^) or hat, is used to indicate a control character or code. For example, ^D is CONTROL-D.

Well, that’s about it from me. I’d like to thank Ron Mercer, without him there wouldn’t be a shrsend use command. If you need to know anything else, you can contact me at Off The Wall //gs 319/354-7959.

Thanks for your patience with this endeavor, and from now on, the only thing that will need updated is the da, possibly some use files for SysOps, it’s all yet to be seen.

-- Joe Hack
Chapter Three: Getting Started

The Mouse Pointer: Is controlled by moving the mouse. Usually, pointer resembles an arrow head, but depending on which part of the program is used and when it is used it can change to different characters.

Insert Cursor: When editing, the mouse pointer changes to a large "I" shaped cursor. It is controlled the same way as the mouse pointer.

Bracket: When using MT's Review window, the mouse pointer changes to the left bracket "[". This is only in the actual Review window itself.

Nothing: When typing in MT's editor, or when the screen scrolls in terminal mode, the pointer disappears from view. Any movement of the mouse will bring it back.

Buttons: to press a MT button, click the mouse on the button, clicking the mouse on the menu bar is usually the same as clicking the [OK] button.

Checkbox: is a box which indicates whether a function is on or off. A check appears in the appropriate box. To change it, just click the mouse on the other box. When a function doesn't have an On or Off checkbox, a check in it's checkbox indicates that it is on, no check means it is off.

Radio Buttons: to press a MT button, click the mouse on the button, clicking the mouse in a selection (such as a file name). When several input boxes appear in one dialog box, click the mouse in the one you want to activate it. All editing functions are available in an Input box (see chapter 9)

Scrolling Windows: used to display long lists. Only a set about of the "roll of paper" can be seen at a time. Clicking the down arrow key next to the list scrolls the list down, the up arrow scrolls it up. The small rectangle in the scroll bar area is like a tiny picture frame which moves up and down the list showing approximately where the window is looking on the list. To select an item from the list, either double click the mouse on the item, or click the [OK] button to confirm the selection. To hide a menu, click the close box(a small box with a dot in it).

Pseudo-Mouse: Usually, when a dialog or alert box asks [OK] or [Yes], RETURN will substitute, and ESC for [Cancel] or [No]. Pressing OPEN-APPLE-7 in a dialog box with a [help] button is the same as selecting [help] OPEN-APPLE/- is the same as OPEN-APPLE-?. A scrolling window can be positioned using the arrow keys(Up arrow for up etc...) to highlight one entry in the list. To scroll the window bar, use the OPEN-APPLE with the up or down arrow keys. The TAB key can be used to switch from one input box to another. Some items in the menus can be done by down the list showing where the window is looking on the list. To select an item from the list, either double click the mouse on the item, or click the [OK] button to confirm the selection. To hide a menu, click the close box(a small box with a dot in it).

: Holding down the OPEN APPLE key and pressing ESC will turn on the imitation mouse mode, the menus can be selected with the arrow keys. To switch on the mouse movement mode, hold down both APPLE keys at once and then let the SOLID APPLE. press any of the arrow keys to move the mouse pointer and SOLID APPLE to click. Once the OPEN APPLE is released, imitation mouse mode is over.

Chapter Three: Getting Started

Getting Started...the mouse controller card is recommended for slot 4 and the modem in slot 2.

Super Serial Card:MT only pays attention to switches setting SW1 number 7 and SW2 numbers 6 and 7. other switches should be set according yto your manual.

Printer: SW1 number 7 should be ON.

SW2 number 6 and 7 both should be OFF

Modem :SW1 number 6 and 7 should be ON

SW2 #6=ON, #7=OFF

Software:

Chapter Five: Communicating with MT

---

MT allows your computer to communicate with other computers working as a remote terminal. This Chapter is provided as any easy, non-technical overview of how computers communicate with each other.

Bits, Bytes and Characters: Computers operate on a binary counting system. The numbers 0 and 1 represent off and on. A bit (Binary Digit) is either a 0 or 1 A byte is a set of bits, typically 8. The eight bits in a byte can be arranged in 256 different ways. Each of these represents a value from 0 to 255. The first 128 of the 256 arrangements represents characters, each separate number, corresponding to a letter, number or symbol. The standard set of the 128 characters is the American Standard Code for Information Interchange (ASCII) and represent the numbers, letters in upper and lower case, punctuation and special control codes.

The Modem: The modem is a contraction of MODulator-DEModulator, it translates the digital bits a computer understands to analog sounds, which are sent over the phone line, and translated back.

Carriers and Breaking: Once two modems are talking to each other, they send a special signal to each other, called a carrier, the pitch of which is either the Originate or Answer (to tell which computer is sending what info.). When the carrier stops, communication ends. It usually means that the other modem has hung up. Breaking is a special interruption in the carrier, about 1/3 second long. The break can be used in many different ways, depending on the host computer. Some interpret it as a break signal as in Basic, others don't, but it really is just a part of the computer.

Data Word Format: refers to how your computer's serial interface interprets bits coming in from the modem. The bits of the information is sent in a stream between computers, but a special format is needed to tell when one character ends and the other begins. The idea is that the bits are sent backwards. The 128 characters is represented by the last 7 bits, the 8th used to flush it out to 8. The 8 bits are followed by an optional value called the parity bit. If an odd parity check is used, and the sum of the bits is odd, the parity bit is set to 0. If the sum is even parity check is used, the parity bit is set to 1 when the sum is odd. The parity bit occupies the 8th bit in the byte, since ASCII uses only the first 7. The 10th bit, is the stop bit, used to tell when the character stops.

Echo: Usually, on-line communications is a two-way street, you send a character to another computer and that computer echoes the same character back at you. That means that all the characters you see are sent by the other computer. But that is not always the case. Some systems don't send back an echo, and therefore your system must display the characters sent out. On most systems echo is on, therefore, the local echo is off, but if you cannot see what you are typing, local echo must be turned on. If double characters appear, local echo must be turned off.

Chapter Six: Controlling the Terminal

---
The terminal is where most on-line communications take place, and where the most time off the host can be spent on MT.

The Session Menu: Configuring MT’s communications options is done in the Session menu. The menu is divided into two basic parts. The first several items, NEW SESSION, LOAD, WRITE, WRITE SESSION, MACRO EDITOR, SESSION TYPE, DIAL SETTING, and ANSWER SETTINGS allow changes made in the terminal mode to be saved to disk in a session file. Adjustments can be made for each on-line system and be recalled later for use. These are discussed in chapter 10. The remaining items can be used to customize MT’s terminal for each different call:

System Settings controls various aspects of MT’s Terminal Speed adjust the bits per second at which MT sends and receives characters.

Data Word Format selects the way MT interprets data received.

Terminal Emulation allows MT to emulate the behavior of several popular computer terminals, and is discussed in Chapter 11.

Char Suppression selectively filters control characters received by MT.

Here-is is an option which allows MT to automatically send a response each time it receives the special “Here-is” character.

System Settings: Pull down the Session Menu and choose System Settings, or press OPEN APPLE-U. Most of the items displayed in this dialog box can be toggled on or off. After the necessary changes are made, click [OK] to put them into effect.

Add Line feeds: This is used when the host computer is not supplying line feeds for your screen or printer. The line feed character usually follows the carriage return. If a line feed does not, all characters received are written over on the same line.

Chat: If you are on line with someone, and you cannot see what you are typing, but can see his, choose the Chat option. The chat can also be used to communicate with dumb terminals or on-line printers.

Display Menu Bar: The menu bar on the top of the screen can be turned on or off. When off, the menus can be accessed by moving the mouse to the top of the screen and pressing the mouse button.

Flow Control: refers to MT’s ability to control the flow of text coming from the host computer, flow control works by sending the XOFF and XON characters (CONTROL-S and CONTROL-Q). This will pause and resume transmission. Normally, there is no need to turn this off, since most hosts will support it. Also, when this is off, typing CONTROL-S and CONTROL-Q manually can still be done. You can redefine the XON and XOFF characters in the boxes below the option.

Key Click: When this on, a click will be heard whenever a key is pressed.

Local Echo: See ch. 5. Show Control Chars: ASCII characters 0 through 31 are called control characters and are not displayed like normal characters. When this option is on, a control character received will be shown with a * (asterisk) in front of it. (i.e. CONTROL-C = “C”) The only ones not shown are CONTROL-M (carriage return) and CONTROL-W/CONTROL-J (carriage return with line feed).

Speed: is the communications speed in bits per second. Pull down the Sessions menu and choose Speed. The speed at which communications will be done can be chosen by clicking the mouse.

Data Word Format: refers to the format of the parity and ASCII bits (see ch.5). The first character stands for the word length, the second for (e)ven or (o)dd parity bits and the last for the amount of stop bits.

Character Suppression: directs MT to filter or suppress received control characters as they are received. Listed is a table of ASCII control characters, a check by the suppressed ones. To change the status of one, click the mouse on it.

Here-is: This option directs MT to look for a specific character sent by the host. When this character is received, MT sends a response automatically.

The Review Buffer: is where MT holds the last 8,192 characters (8K) received, when it is full, MT deletes the oldest characters and makes room for the new. The review buffer can be used anytime, on-or off-line. Just pull down the review menu and choose review. Use the Scroll Bar to look back through the text. To get out, pull down the Review menu and choose Terminal, press OPEN APPLE-R.

Selecting Text: it’s possible to copy portions of the text in the review menu to MT’s Clipboard, the printer or to disk. Move the mouse to the review window, and select a block of text. Pull down the Edit menu and use one of the following options.

Copy to Clipboard: stores a copy of the selected text to the Clipboard.

Copy to Printer: sends a copy of the text to the printer.

Copy to Disk: save the block to disk.

Chapter Seven: Working with files

A file is a collection of information on a disk. The 3 types of files referred to in this manual are:

Text Files: consist of ASCII text, typically containing information made by text editors and word processors, or contain text sent over the modem.

Data Files: contain binary information, such as facts in a database or numbers in a spreadsheet.

Program Files: contain programming instructions and code, which the program reads from its instructions.

The File Menu: The file menu is where most of MT’s file related commands are located. The command areas are the Editor commands, dealing with the MT editor, which are discussed in Ch. 9. Disk Utilities are general disk file commands. Quitting commands, either to quit to ProDos, or to the Install program.

Disk Utilities: Catalog: to see a list of files on the current directory. At the top of the Catalog dialog box is the name of the current directory, or subdirectory. Below the directory name is a scrolling window listing every file in the directory, in alphabetical order. Depending on the file type, it is possible to view the name of the file is a 3 file type (i.e. BAS for BASIC, TXT for ASCII). The size of the file in blocks (of 512 bytes) is shown after the file type, followed by the date of creation, and the date of last modification. The last number is the size of the file in bytes. Use the [PREFIX] button to catalog another volume.

Volumes: displays information about all the disk volumes in your system. The first item is the name of the volume, followed by its slot and drive. The next item is the total # of blocks on the disk, and the number of blocks used and free.

View a File: displays the contents of a text file. Double click the file name to select it. While viewing it, the space bar or the mouse button will pause and unpauses the scrolling. Press ESC or OPEN APPLE-PERIOD.

Rename a File: will change the name of a file. If a file is locked, the disk error box will appear, the name cannot be changed by MT.

Delete a File: will delete a file from disk. To delete a Subdirectory, choose the name from the scrolling window.

Prefixes: The [PREFIX] button appears in every dialog box dealing with files. When it is pressed, a dialog box will appear. Listed in the scrolling window are the available directories under the current directory. When at the volume directory level, (as shown by one /), the names of each volume are displayed in the window. Click the [<] button to move from a subdirectory up to the parent directory, and the [>] button to move down one level to the subdirectory. If the name of a prefix is entered

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 689 of 1262
that does not exist, MT creates it for you. Just enter the name of the Subdirectory, and MT will create it and automatically switch to it. All Prefix dialog boxes are operated in the same way, however, changing the prefix for one command does not change it for all. MT has 4 separate prefix groups: The first includes all MT's primary disk and file access commands: VIEW, DELETE, RENAME, CATALOG, OPEN, SAVE AS, SEND FILE PROTOCOL, RECEIVE FILE PROTOCOL, and SEND TEXT FILE.

The second controls Recieve to File. The third controls MT's Session commands. The fourth cannot be changed by using a [PREFIX] button, and is where MT looks for it's own program files.

About MouseTalk shows information about the MouseTalk program, including the program drivers and modem selection.

Prefix changes, or logs, to a new sub directory or disk drive. Use the arrows to move up @H or down @U one level in the directory structure. Choose a subdirectory from the window, or type its name in the input box. Click 'Done' once a new subdirectory is selected.

Open loads a text (TXT type) file into the Editor. Choose a file from the window, or type its name in the input box. Click 'Prefix' to choose a new disk drive/directory. Click 'OK' once a file is selected.

Clear Editor wipes clean the contents of the Editor. If a document in the Editor has not been saved since the last change, Clear Editor asks to verify the clear. The Editor must be clear before a new file can be opened.

Close ends the editing session. If the file has been changed since the last save, you will be prompted to proceed with the close or given another chance to save. After Closing, the Editor is emptied.

Read inserts a text file into the Editor at the cursor's location. This is similar to Pasting a text, though an entire file is inserted.

Save As saves all changes made in the Editor to the disk file being worked on.

Save As saves the contents of the Editor to disk. Choose a file name from the window or type the name of a new file in the input box. Click 'Prefix' to choose a new disk drive/directory. Click 'OK' to save the file. If an existing file name is used, MouseTalk will ask if you wish to re-use or append to the file.

Find locates a word or phrase of up to twenty characters typed in the input box. Choose Forward to search after the cursor position, or Backward to search before. Click 'Find' to start the search. Once the text is found, MouseTalk selects (highlights) it.

Find Next locates the next occurrence of text entered using the Find command. It's the same as re-using Find and clicking 'Find'.

Change Case alters the case of selected text to either all upper, all lower, or mixed case.

Fill puts as many words possible on each line in a paragraph and word-wraps text to the next line. Fill works only on selected text. A paragraph is considered any group of letters, words and numbers followed by a blank line.

Clean Up removes all control codes from selected text. After 'Cleaning Up', the text will only contain carriage returns.

Show Clipboard displays text held in temporary storage in the MouseTalk Clipboard.

Install Program leaves MouseTalk and runs the installation program. Be sure to Save the contents of the Editor before choosing this item.

Quit exits MouseTalk, and returns to ProDOS. Be sure to Save the contents of the Editor before quitting.

Cut removes selected text and places it in the Clipboard. The text can be recalled using the Paste command. Note that the most recently Cut text replaces the old contents of the Clipboard.

Copy duplicates selected text, copying it to the Clipboard. Note that the most recently Copied text replaces the old contents of the Clipboard.

Paste inserts text from the Clipboard into the Editor at the cursor location.

Copy to Printer prints selected text. Make certain the printer is on and ready to print before choosing this option. To stop printing, hold down the @A key and press (period).

Copy to File saves selected text to a file on disk. Choose a file name from the window or type the name of a new file in the input box. Click 'Prefix' to choose a new disk drive/directory. Click 'OK' to save the file. If an existing file name is used, MouseTalk will ask if you wish to re-use or append to the file.

Redial option automatically redials the number if a connection is not made. Click 'Dial' to dial the number.

Tone or Pulse dialing depends on the phone company equipment installed at your house. The Redial option automatically redials the number if a connection is not made. Click 'Dial' to dial the number.

Hang up disconnects (hangs up) the modem. Click 'OK' to hang up or 'Cancel' to return back on-line.

Do Session loads and executes a pre-written "script" of commands, customized to a particular on-line system. Choose the Session file from the window or enter the
Apple II Computer Info

file's name in the input box. Click 'Prefix' to choose a new disk drive/directory. Click 'OK' to load the Session and, if listed, dial the phone number. 

Redo Session replays a Session currently in memory. 

Send From Editor sends the contents of the Editor to another computer, similar to Send From File. 

Send From File sends a text (TXT type) file to another computer. Choose a file from the window, or type the file's name in the input box. Use 'Prefix' to choose another disk drive/directory. Click 'Modify' to control how the file is sent. Protocol Send sends a file on disk using Christensen protocol for error-free transmission. Choose a file from the window, or type the file's name in the input box. Click 'Prefix' to select another disk drive/directory. 

Protocol Receive receives a file using Christensen protocol for error-free data transmission. If the name of a file to receive is chosen from the window, you're asked if you wish to replace it. If the name of a new file is typed in the input box, the file is created. Click 'Prefix' to choose a new disk drive/directory. 

Receive to File saves incoming text to a file on disk. The file is chosen with Set Filename. A receive appears by this option if Receive to File is currently active. Receive to Editor copies (appends) incoming text to the MouseTalk Editor. When Receive to Editor is active, a receive appears by this option. 

Receive to Printer copies incoming text to the printer. When Receive to Printer is active, a receive appears by this option. Select the card from the window. Click the mouse by the slot number of the card. Click 'OK' when done. 

Do (macro label) executes a macro element. The element is created in the Macro Editor and can be part of a Session file. 

The Macro Editor is used to create or modify macros for a particular Session file. 

Load Session loads a previously saved Session file into memory for modification and editing. Choose a Session file from the window, or type the file's name in the input box. Click 'OK' to load the Session file. Write saves the session in memory to disk. Choose a file from the window. Write As copies the incoming text to a file. 

Send From File. Click 'Write' to write the file or 'Cancel' to make more modifications. 

Write As saves the session in memory to disk. If a file is chosen from the window, the contents of that file will be replaced. If a file name is entered in the input box, MouseTalk creates a new Session file. Write As prompts to save the Session as a Dial or Answer Session. Click 'Write' to save the file or 'Cancel' to make more modifications. 

New Session resets all MouseTalk's commands and functions to the same as when the program was started. 

Speed selects the speed of data transmission in Bits Per Second. Choose a speed by clicking the box next to the desired value. 

Terminal Emulation allows MouseTalk to mimic the display characteristics of a specific terminal. Choose the name of the terminal to emulate from the window, then click 'OK'. 

Character Suppression filters characters, specifically control codes, as they are received by MouseTalk. Click the mouse on the character to suppress. A check appears by characters currently suppressed. Click 'OK' when done. 

Data Word Format selects a specific format for character transmission. Click the box next to the appropriate Data Word Format, then click 'OK'. 

Here-is sends an "answer back" string to another computer if that computer sends the proper Here-is character. Type the Here-is character into the input box. For example, CONTROL-E. Type the answer back string into the Response input box. Click 'OK'. 

The Answer mode answers the phone, allowing remote callers access to your computer. Enter an Asterisk into the input box. Type the name of a text file into the Hello file box. The Hello file will be displayed after a caller enters the correct password. Click 'Access' to define which prefixes are available to the remote caller. Click 'OK' to enter the Unattended mode and wait for a call. 

Answerback options are discussed at length in the manual. 

Accessible prefixes define prefixes, or sub-directories, which are available to the remote caller. Click Pull access 'OK' to grant a caller access to all your disks and directories. Initial Prefix defines which prefix the caller is logged to after entering the correct password. The Initial Prefix should contain the Hello file if one is specified. 

MouseTalk Installation allows you to reinstall the entire program, or simply change a single item. On the right side of the window are MouseTalk's current settings. Click 'Format' then 'Copy' to create another MouseTalk disk, or just 'Format' to make a data disk. Click 'Choose Computer' to reinstall the entire program. Click an individual item to change only it. Click 'Save' to record the changes, then 'Run' to go back to MouseTalk. 

Choose Communications Card informs MouseTalk which serial interface card your Apple uses. Select the card from the window. Click the mouse by the slot number of the card. Click 'OK' when done. 

Choose Printer Card informs MouseTalk which printer interface card your Apple uses. Select the card from the window. Click the mouse by the slot number of the card. Click 'OK' when done. 

Choose External Modem informs MouseTalk which type of external modem you're using. Choose the name of the external modem from the window. Click 'OK'. 

Choose Computer informs MouseTalk which type of computer you'll be running the program on. If you have an Apple //c, click the mouse on Apple //c. After choosing your computer from the window, click the 'OK' button. MouseTalk proceeds with an installation tailored to your particular type of computer. 

Copy MouseTalk Disk copies all the files and programs needed to run MouseTalk from MouseTalk's prefix to the current prefix (disk drive or directory) specified. The two prefixes must be different for the copy to work. To choose a new destination for the files, click 'Prefix'. The files copied are: 

MT.SYSTEM 
MT.BIOS 
MT 
MT.INSTALL 
MT.HELP 
MT.BIOS 
MT.TERM 

* copied only if the destination prefix is a root directory (disk rather than subdirectory). 

Format the Disk formats, or initializes, a diskette for storing data. If the diskette already contains data, you will be asked to confirm that you want the old data erased before formatting. Enter the volume name of the new disk in the input box. Click the mouse by the slot and drive number of the drive containing the diskette to be formatted. Click 'OK' to begin formatting. 

The Editor is full! Either Close the Editor, saving the contents to disk, or delete some text to allow further editing. 

The file you're saving is already on disk. Click 'Re-use' to erase the old file and save the new, or 'Append' to place the new file at the end of the old. 

Something's wrong with the printer. Fix the printer, then click 'Retry' to continue, or click 'Cancel' to stop printing.
Send Break sends a modem break signal to the host computer.

System Settings are miscellaneous communications parameters which can be toggled on or off. To turn an item on, click by that item. Items currently on have a checkmark by them. A new XON or XOFF character can be entered into the appropriate input box.

Session Type chooses whether the current Session is defined as a Dial or Answer Session. To choose either one, click the mouse by Dial or Answer.

To confirm the Session to be saved as a Dial or Answer Session, click 'Save'. To change the Session type, click 'Cancel', then choose Session Type again from the Session Menu.

Enter the name of a file for use with the Receive to File command. After a file is chosen from the window, or the name of a new file entered in the input box, toggle Receive to File on to begin saving incoming text to the file.

Dial Settings is where a phone number for a Session file is entered. Options here are the same as for Dial under the Phone menu, however, the phone number and options become part of a Session file -- the phone number will not be dialed when 'OK' is clicked.

Answer Settings is where information for an Answer Session is entered. Options are the same as for Answer under the Phone menu.

Options controlling how a text file, or text from the Editor are sent are controlled in this dialog box. Enter the type of send, either Line or Character, Interline and Intercharacter delays if necessary, a Line Prompt (handshaking character), and set Add LF to CR and Fix blank lines options. For a detailed description of each item, refer to the MouseTalk Manual.

The Review buffer is where the most recent 8,192 characters received by MouseTalk are stored. To look back at this information, choose Review from the menu, or press @AR. To return to the Terminal mode, press @AR again, or select Terminal from the Review pull down menu.

Select all selects and highlights all text in the Review buffer, Editor or Macro Editor.

In order to Dial a phone number, MouseTalk will first hang up the phone. If you're sure you want to hang up now, click 'OK'.

d-wraps text to the next line. Fill works only on selected text. A paragraph is considered any group of letters, words and numbers followed by a blank line.

Clean Up removes all control codes from selected text. After 'Cleaning Up', the text will only contain carriage return codes.

This is why the current state of GS animation is to create a $c2 "SHOW" file. This is basically the same idea but the files must be compressed into the special $c2 file and thus does not facilitate easy editing. Also, most $c2 viewers load the movie into RAM, thus necessitating a large amount of free memory.

MOVIE.VIEWER views standard, uncompressed, $c1 files. MOVIE.VIEWER also loads files directly from your hard drive. This slows performance noticeably, but good frame rates are still achievable. Tests are to be completed on systems with a RamFast controller and accelerator card too see if performance is improved. Advantages of using hard drive reads are that files need not take up large amounts of free RAM space.

How do I use MOVIE.VIEWER?

I. Create a movie.

You may create a movie in a variety of ways. The 'frames' of the movie should be similar enough so that when cycled through the create the illusion of smooth movement. These files should be stored all in the same subdirectory with sequential file names. Some latitude is given on the names. The key is to have a counter somewhere within the names of the files. For instance valid frame names might be... STAR.TR.1 or F1.GS MOVIE1.PHOEBE STAR.TR.2 or F2.GS MOVIE2.PHOEBE STAR.TR.3 or F3.GS MOVIE3.PHOEBE...

As you can see all have the sequence 1,2,3,... in them somewhere. These would be referred to by MOVIE.VIEWER as...

Movie Name   Suffix  
STAR.TR.   .GS MOVIE.PHOEBE
F          .GS MOVIE.PHOEBE

If the movies are in a subdirectory you may use an absolute pathname as the movie name.

Once again please note this is the very first BETA release of the program. Very little error checking is done. A much more developed package will be released soon.

SHAREWARE NOTICE:

You are free to copy, and distribute this program, so long as no fee is charged and the original documentation is distributed with it. However if you decide to use this program after 10 days you may do so legally only under the following terms.

1) You must send me a letter saying, "Hey this works great! Keep writing stuff for the GS. etc."

2) Give me ideas for updating MOVIE.VIEWER. I would like this to become an animation development tool.
Movie Maker Documentation File. By the Disk Jockey. Formatted in 70 columns.

NOTE: Movie Maker requires 64K of memory. Also, Movie Maker consists of TWO (2) disks (sides)!

I will summarize the list of commands for Movie Maker first, for those who just want to skim through the docs.

Apple II Computer Info

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 694 of 1262
Apple II Computer Info

To Create a Background:
Press the space bar to clear the current command. Press ESC twice to
go to the background page. Press ESC to toggle between shape and
background pages (observe S and B upper left corner of the help
line). To draw, use P for pen and a color number between 0 and 7.
Move the joystick. Press the joystick button.

You may pick up a shape from your shape page and bring it to your
background page. Hit the space bar to clear memory. Press ESC to goto
the shape page. Press W for window. Place the box over the desired
shape. Press O for outline, D to duplicate, joybutton to pick shape
up, and ESC to bring it to the background page. Press the joybutton
to deposit the shape where desired. Press the space bar to clear
memory. Use a shape as a paint bruse. Press E to erase the shape in
the box.

To View Sequence Over Background:
Press A for action. Hit the space bar. Control movement with the joystick.

These animations can be recorded by using a blank formatted storage
disk and by following simple screen prompts through MENU selection.
You can SMOOTH and PLAYBACK your finished COMPUTER MOVIES (MVM's).
You can develop a sequence and transfer it to videotape. Be creative.

Some notes:
Animation may be up to 338 frames. This will take a longer or shorter
time, depending on the frame rate setting. A 338 frame movie with a
faster frame rate will play more quickly than the same movie with a
lower frame rate.

A longer movie may be made by stringing finished animations back to
back. To do this, use the auto play side of MOVIE MAKER and make a
copy with COPYA. Then delete all the files from this copy except for
CNTDOWN.INI and MAINAP, and put your Movie Maker files on this disk
(use FID from your system master disk). NOTE THAT THE FILES
CNTDOWN.INI AND MAINAP MUST REMAIN ON THE DISK. When the disk is
booted, it will automatically play your movies (the MVM files) in the
order you copied them onto the disk.

Also, if you have two (2) drives, leave the Movie Maker disk in drive
1, and have a data disk (formatted) in drive 2. Now change drive
assignment by selecting COMPOSE from the main menu, and then RECORD,
or SMOOTH utility menus. Move the inverse bar to SELECT DRIVE, and
press RETURN.

After you have created a movie, you may save it by getting to the
main menu (use the U command). Then select COMPOSE, and move the
inverse bar to KEEP FILE. Put a blank formatted disk in the proper
drive, and press RETURN. You will be prompted for a filename.

Movie Maker REQUIRES AN APPLE II+ OR IIE OR IIC WITH 64K OF MEMORY AND
2 DRIVES ARE OPTIONAL THE GAME IS 2 DISK SIDES.

I will summarize the list of commands for Movie Maker first, for those
who just want to skim through the docs.

Keyboard assignments for Apple II family:

<table>
<thead>
<tr>
<th>Apple IIe/c</th>
<th>Apple II+</th>
</tr>
</thead>
<tbody>
<tr>
<td>To move around menus:</td>
<td>&lt;-- --&gt;</td>
</tr>
<tr>
<td></td>
<td>! v</td>
</tr>
<tr>
<td></td>
<td>M</td>
</tr>
<tr>
<td>Nudge (with &quot;M&quot; key)</td>
<td>&lt;-- --&gt;</td>
</tr>
<tr>
<td></td>
<td>! v</td>
</tr>
<tr>
<td></td>
<td>without drawing.</td>
</tr>
<tr>
<td>To move pen around</td>
<td>ctrl E</td>
</tr>
<tr>
<td>and draw.</td>
<td>ctrl S</td>
</tr>
<tr>
<td></td>
<td>ctrl X</td>
</tr>
</tbody>
</table>

Special Note: A joystick may be used instead of the keys referred to
above. The keys are intended for fine adjustment or for moving thru
menus.

Alphabetical command list for Apple Movie Maker:

<table>
<thead>
<tr>
<th>Command</th>
<th>Compose</th>
<th>Record</th>
<th>Play</th>

Apple II Computer Info

To Draw Original Shapes:
Press U for utility. Place the inverse bar over MAIN MENU and hit RETURN. Load COMPOSE by pressing I and RETURN. Place the inverse bar over CLEAR MEMORY and hit RETURN. Place the inverse bar over EVERYTHING and hit RETURN. Place the inverse bar over COMPOSE and hit RETURN. You will see a blank screen with a box (draw inside the box). To enlarge the box, press B for border. Press the joystick button to place upper right corner. Use the joystick to enlarge the box. Press the joystick button.

To Draw:
Press the space bar to clear any present commands. Press P for Pen plus a color # between 0 and 7:
0 Black
1 Green
2 Purple
3 White
4 Black
5 Orange
6 Blue
7 White
(Note the first black and white are to be used with green and purple, and the second black and white are to be used with orange and blue).

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Boot the program and you will see Movie Maker’s main menu. Load RECORD by pressing 2, and then RETURN. After a moment the record utility menu will appear.

To Alter Window Size:
To manipulate the inverse bar use the arrow keys (for the //e,c) or I, J, K, M for a II+. Move the inverse bar to cover GET, and press RETURN, Select Shape, and press RETURN. Type DOG, and hit RETURN. Select Record, and hit RETURN. You will see the DOG shape page.

To Insert Color Into Shape:
Press A1 for actor #1. Press S1 for sequence #1. Using your joystick, position the DOG to the desired starting location. Hit the space bar to begin the record mode. Use the joystick to control your DOG’s path. You have now created your first animation using up to 338 frames. Remember to press O to outline new shapes.

To See a Playback:
Press the space bar to see playback. To control Frame Rate or speed of execution, press F and #0-9. F0 advances frame by frame using the space bar. Pl-9 increase speed from slow to fast. To rewind press R, and hit the space bar to stop. To playback forward, press P and #0-9 to control the speed.

To Make a Sequence:
Press the space bar to clear the current command. Press S1 for the first sequence. Use the joystick to position over the first shape and press the joystick button. Watch help line S1.01, S1.02, etc. Repeat selecting shapes (maximum 16 shapes per sequence).

To Make a Second DOG:
Press G to goto the beginning. Press A2 for Actor #2. Press S1 for Sequence #1. Position your second DOG with your joystick. Hit the space bar to start and stop. To playback forward, press P and #0-9 to control the speed.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Press the arrow key to flip in the desired direction. Press O to outline a new shape. You may develop these shapes as paint brushes.

To Alter Window Size:
Press the space bar to clear current command. Press B and press the joystick button to define the corners of the border. To erase a shape in a box, press E for erase.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Press the arrow key to flip in the desired direction. Press O to outline a new shape. You may develop these shapes as paint brushes.

To Alter Window Size:
Press the space bar to clear current command. Press B and press the joystick button to define the corners of the border. To erase a shape in a box, press E for erase.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Press the arrow key to flip in the desired direction. Press O to outline a new shape. You may develop these shapes as paint brushes.

To Alter Window Size:
Press the space bar to clear current command. Press B and press the joystick button to define the corners of the border. To erase a shape in a box, press E for erase.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Press the arrow key to flip in the desired direction. Press O to outline a new shape. You may develop these shapes as paint brushes.

To Alter Window Size:
Press the space bar to clear current command. Press B and press the joystick button to define the corners of the border. To erase a shape in a box, press E for erase.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.

To Mirror Shapes:
Press the space bar to clear any current command. Press M for Mirror. Press the arrow key to flip in the desired direction. Press O to outline a new shape. You may develop these shapes as paint brushes.

To Alter Window Size:
Press the space bar to clear current command. Press B and press the joystick button to define the corners of the border. To erase a shape in a box, press E for erase.

To Insert Color Into Shape:
Press the space bar to clear the current command. Press I for insertion, position the joystick, and press the joystick button. To insert a different color, press I for insert and color #0-7. CAUTION: Make certain shapes are closed so that inserted color will remain contained in desired area. Remember to press O to outline new shapes.
stop. Press F and #0-9 to control frame rate. Press the space bar to start and stop. P0 progresses frame by frame. Advance to the next frame using the space bar. F1-9 increases speed from slow to fast.

To Create a Background: Press the space bar to clear the current command. Press ESC twice to goto the background page. Press ESC to toggle between shape and background pages (observe S and B in upper left corner of the help line). To draw, use P for pen and a color number between 0 and 7. Move the joystick. Press the joystick button.

You may pick up a shape from your shape page and bring it to your background page. Hit the space bar to clear memory. Press ESC to goto the shape page. Press W for window. Place the box over the desired shape. Press G for outline, D to duplicate, joystick to pick shape up, and ESC to bring it to the background page. Press the joystick to deposit the shape where desired. Press the space bar to clear memory. Use a shape as a paint brush. Press E to erase the shape in the box.

To View Sequence Over Background: Press G to goto the beginning. Press A for action. Hit the space bar. Control movement with the joystick.

These animations can be recorded by using a blank formatted storage disk and by following simple screen prompts through MENU selection. You can SMOOTH and PLAYBACK your finished COMPUTER MOVIES (MVM's). You can develop a sequence and transfer it to videotape. Be creative.

Some notes:

Animation may be up to 338 frames. This will take a longer or shorter time, depending on the frame rate setting. A 338 frame movie with a faster frame rate will play more quickly than the same movie with a lower frame rate.

A longer movie may be made by stringing finished animations back to back. To do this, use the auto play side of MOVIE MAKER and make a copy with COPYA. Then delete all the files from this copy except for CNTDWN.INI and MAINAP, and put your Movie Maker files on this disk (use PID from your system master disk). NOTE THAT THE FILES CNTDWN.INI AND MAINAP MUST REMAIN ON THE DISK. When the disk is booted, it will automatically play your movies (the MVM files) in the order you copied them onto the disk.

Also, if you have two (2) drives, leave the Movie Maker disk in drive 1, and have a data disk (formatted) in drive 2. Now change drive assignment by selecting COMPOSE from the main menu, then RECORD, or SMOOTH utility menus. Move the inverse bar to SELECT DRIVE, and press RETURN.

After you have created a movie, you may save it by getting to the main menu (use the U command). Then select COMPOSE, and move the inverse bar to KEEP FILE. Put a blank formatted disk in the proper drive, and press RETURN. You will be prompted for a filename.

---

Mr. Fixit contains several utilities that let you identify and recover "blown" disks without needing an intimate knowledge of Apple DOS.

Scan utility: Identifies flawed track/sectors on disks. Copy utility: Ignores flawed sectors as it copies a diskette. Edit utility: Allows you to change disk sectors & also contains a disassembler. File restoration utility: Allows you to recover deleted files. There's also a Aatalog repair utility.

BOOTING AND RUNNING

Boot with 16K Ram card, Language card, Apple //e:

Mr. Fixit contains several utilities that let you identify and recover "blown" disks without needing an intimate knowledge of Apple DOS.

Scan utility: Identifies flawed track/sectors on disks. Copy utility: Ignores flawed sectors as it copies a diskette. Edit utility: Allows you to change disk sectors & also contains a disassembler. File restoration utility: Allows you to recover deleted files. There's also a Aatalog repair utility.

BOOTING AND RUNNING

Boot with 16K Ram card, Language card, Apple //e:

Mr. Fixit will be loaded into the program area. After you run a BASIC program or perform a DOS function (if you've overwritten page 3 in RAM), you'll have to reload Mr. Fixit.

DISK SCAN UTILITY

This utility won't scan copy protected disks.

ESC = Abort scan

The scan will start with the first track and sector (T0,S0). As the scan progresses, the current track and sector number will be displayed in hexadecimal on the fifth line along with the status of each sector. The scan will report each flawed sector on a separate line. When the scan is completed, you can print the results by typing 'P' when the prompt appears. This will print the result to a standard Apple printer with the card in slot 1.

Interpreting the Scan

---

TRACK/SECTOR nn/n FLAWED BUT READABLE. When you see this message for any track, your disk is still ok, but it would be wise to make a copy of it immediately using the Mr Fixit Copy Utility.

TRACK/SECTOR nn/n UNREADABLE. You will not be able to copy the disk with COPYA.

The Copy Utility will copy the disk, but any unreadable sectors will be filled with hex FF in the copy.
You may choose to use either the Mr. Fixit Copy Utility or the Mr. Fixit Edit Utility to recover a disk with unreadable sectors. The Edit utility will read some flawed sectors into memory, so if you’re familiar with what should be on the disk, you may be able to recover everything.

First 3 tracks flawed -- Systems Image Clobbered. An easy fix is to INIT another disk and FID your files to it.

Track 11 Flawed - VTOC Errors. To fix these disks, run the Catalog Repair Utility. Before you start to fix the catalog track, you should make a backup copy of the disk with the Copy Utility.

THE DISK EDIT UTILITY (DEU)

All standard DOS 3.3, Pascal, and CP/M disks can be edited with the utility. Most copy protected disks can't be read with DEU. DEU works with individual sectors. With DEU you can read a sector from the disk, change the sector in memory and then write the changed sector back to a disk. The Edit utility also lets you "dis-assemble" modules into 6502 mnemonics.

Overview of DEU:
1. Diskette Parameters Line - Shows the track, sector, slot and drive.
2. Command Line - When you enter your commands and change sector data one byte (character) at a time.
3. Sector Display Area - Where you enter your commands and change sector data one byte at a time.
4. Sector Display Area - Where you enter your commands and change sector data one byte at a time.

E = Edit
ESC = Return to command mode from edit
H = Help
M = Return to main menu
R = Read sector
CTRL Q = Quit Mr Fixit
CTRL RESERT = Restart DEU
& <RETURN> = Re-enter DEU from Applesoft
CTRL Y = Re-enter DEU from monitor
(These work unless you've overwritten DEU (to page 3 of RAM)

CHANGING DISKETTE PARAMETERS

T = change track # (0-22 hex)
S = change sector # (0-0F hex)
D = change drive # (1 or 2)
CTRL S = change sector # (1-7)
ESC = aborts change

OPTIONS AFTER READING A SECTOR

1. Change which sector is displayed
2. Change the display to ASCII
3. Print display
4. Dis-assemble the Binary files
5. Edit the sector buffer
6. Write the edited sector buffer to a disk
7. Copy sectors

-> Reads the next sector
<= Reads the previous sector
. Increases the sector # by one without doing a read
. Decreases the sector # by one without doing a read

FLAWED SECTORS - SPECIAL READ (CTRL R)

If a sector can't be read because it's flawed, pressing CTRL-R will tell DEU to read the sector ignoring some of the error checking code (e.g. checksum). If the sector isn't badly flawed it can be read and then written back to the diskette. Sometimes repeated reads of a flawed sector can't get entirely reproducible results. When this happens you must use your own judgement as to what should be written back to the disk. In cases of badly flawed or copy protected disks the edit may not be able to read a sector and return an error message.

CHANGING THE SECTOR DISPLAY TO ASCII

'A' or CTRL A will toggle the display between ASCII and hex format.

If your Apple can't display lower case characters, the buffer display area may not display the proper ASCII character. Since the Apple can't display inverse lower case characters, erroneous characters may be displayed in the inverse cell. Also, any ASCII character with a value greater than 60 hex will display improperly in the inverse cell.

Inverse Mode for Control Characters. The ASCII format displays control characters in the inverse mode. Negative ASCII (most significant bit = 1) and positive ASCII (most significant bit = 0) characters are not differentiated. This is important since DOS 3.3 TEXT files are stored as negative ASCII characters and CP/M files are stored as positive ASCII characters.

PRINTING THE SECTOR BUFFER (CTRL P)

Printing the display screen CTRL P. The screen contents can be printed on any standard printer configured to slot 1 by pressing CTRL P. If the ASCII format is in effect, the control characters will be printed as blanks, because many printers use control characters to perform special functions. Printing can be stopped by pressing the (ESC) key.

The Disk Dis-assembler

Pressing the 'L' key dis-assembles the contents of the sector buffer into 6502 mnemonics. A word of caution here.

Since the last one or two bytes of the buffer may contain an incomplete instruction, the last dis-assembled instruction may be incorrect. An error may be present if the last instruction is a two-byte instruction with the second byte 00, or if it is a three byte instruction with the third or second and third bytes 00. The check is to examine the sector buffer for the contents of the last two bytes. The dis-assembler always starts the disassembly with the first byte in the sector buffer. The dis-assembly can be printed on any standard printer configured to slot 1 by pressing CTRL L. Printing can be stopped by pressing the (ESC) key.

EDITING THE BUFFER

To edit the sector buffer enter 'E' on the command line followed by the hexadecimal buffer cell # of the byte you want to change. Then press the space bar to enter the editor. The buffer cell # may be omitted in which case 'E' followed by space bar will give you buffer cell #00.

The edit mode is exited by pressing the (ESC) key. The sector display will still be on the screen and you can print it (CTRL P), dis-assemble it (L), copy it (CTRL C), etc.

After entering the edit mode the selected buffer cell is displayed in inverse.
Apple II Computer Info

-> Move to next buffer cell (increases buffer cell # in command line by 1 and display next byte in inverse mode.)

<- Move to previous buffer cell (decrease buffer cell # in command line by 1 and display previous byte in inverse mode)

CHANGING A BYTE IN THE BUFFER CELL

The current buffer cell is changed by entering the new value in hex and pressing the space bar or the arrow keys. If an error is made either type until the correct value is displayed or erase the input with CTRL X.

ENTERING ASCII (TEXT) DATA

The edit mode permits the direct entry of ASCII characters. Enclose the ASCII value you want in single quotes (e.g. 'B') for negative ASCII or double quotes (e.g. "B") for positive ASCII. The first quotation mark and the last quotation mark must be of the same type. Just as with hexadecimal changes, you can change many one byte (one ASCII character) of the sector buffer at a time. CTRL X and ESC CANNOT be entered this way - they must be entered as hex values (CTRL X will cancel the input, ESC will exit the edit mode). Double and single quotation marks should be entered as hex values.

If you type the wrong ASCII value, just keep typing until the value you want is displayed on the command line.

The ASCII character is placed in the buffer cell by pressing the space bar or either arrow key.

Press CTRL W to write the sector buffer to the disk. Once a sector has been altered, its original contents are lost.

The copy function is available for systems having two drives in the same slot. Press CTRL C writes the contents of the sector buffer to the same track/sector on the disk in drive 2. The sector is increased by one and the disk in drive 1 is read to the sector buffer.

THE DISK COPY UTILITY

The difference between this copy program and DOS COPYA is that this copy will attempt to copy flawed sectors. If they copy finds a sector it can't read, it reports an error and writes a sector of hex FF (that is, it doesn't copy any- thing it can't read from the flawed sector, it just fills the sector on the new disk with a 'code'). Because of Mr Fixit's attempts to copy flawed disks, this copy takes much longer than COPYA.

The Disk Copy Utility works on standard DOS 3.3, CP/M, & PASCAL formatted disks.

This utility doesn't support copy protected disks. It will report all tracks as unreadable (copying FF to all sectors) on most copy protected disks.

The copy does three steps for each track. The line after the line labeled "PRESS THE ESC", tells you which of these steps the copy is in:

1. Track nn Read - Reads a track from the disk to be copied into memory.
2. Formatting disk - Formats the corresponding track on the disk receiving the copy.
3. Track nn Copied - Writes the memory copy of the original disk track (DRIVE 1) to the corresponding track on the disk receiving the copy.

If you have only one drive, you'll have to swap between the original disk and the receiving disk for each track. Mr Fixit will prompt you when it needs a disk swap. So during the copy, you will see the following series of four screens for each track:

1. A screen prompting you to place the original disk into the drive.
2. A screen letting you know that a track from the original disk is being copied into memory.
3. A screen prompting you to place the disk to receive the copy into the drive.
4. A screen showing the results of the copy for that track. As screen 1 and screen 3 display, put the requested disk in the drive, and press the space bar to continue the copy.

To return to the Copy sub-menu type (ESC).

If there's a read error during the copy it will try to read the sector 3 times using a modified RMS.

When this happens one of three error messages may be displayed on the fourth line of the screen (in place of the 'Track nn Copied' message). Track nn Flawed, Reliably Read: means at least two of the three reads were identical and the sector (as it was on the two matching reads) is written to the receiving disk. If this error message is the only error displayed through out the copy run, your disk should be ok.

Track nn Flawed, Unreliably Read: none of the three reads agreed. The data stored from the last read is written to the receiving disk. If you receive this message only once during the copy, the disk receiving the copy may have some invalid data. If the disk was a program disk, you can try to run the programs to make sure they all work properly.

If it is a data disk, you can run the programs to make sure they all work properly, or display the data on the screen using ASCII mode of the Edit utility of Mr Fixit to make sure all the data on the disk is correct.

Track nn Flawed, Unreadable: This means Mr Fixit couldn't read the sector. After three attempts, Mr Fixit stops trying to read the sector and writes a code (hexFF) to the sector on the receiving copy.

FILE RESTORATION UTILITY

Will restore most deleted files. This utility uses only drive 1. When you've written on a disk after a delete, this utility may not restore the file. There are four error messages from this utility:

T/S list overwritten: means that the file may still be intact, but DOS doesn't know where the file is. It means the track/sector list no longer has a 'pointer' to locate the file.

File Overwritten, File not Restored

Disk Write protected

Drive Error

CATALOG REPAIR UTILITY

The Catalog Repair Utility repairs disks with damaged catalogs to full operation. Symptoms of catalog damage include I/O errors with executing the DOS CATLOG command or files suddenly disappearing from the...
catalog listing. You get these errors because the catalog, which contains the information DOS needs to locate and reserve sectors for each file saved on the disk, doesn’t look like DOS expected to look at it.

The first thing to do when a disk is giving I/O ERROR messages or won't CATALOG properly is to use the Disk Copy Utility to make a working copy of the damaged disk. Place the working copy in drive 1 and select the Catalog Repair Utility.

First, the repair utility checks the first five bytes of each of the 16 sectors on track 11 hex. These bytes must have certain values on properly formatted sectors. If these bytes have improper values, the repair utility assumes the sector has been clobbered. When sector 0 is clobbered the VTOC is damaged and a message is written to the screen. When any of the remaining sectors are clobbered the directory (or catalog) damaged and this is reported to the screen.

If the VTOC alone is damaged, then a check is made against the directory for saved files, and the VTOC is reconstructed.

If the directory alone is damaged, the disk is searched for track/sector lists. The track/sector lists are checked against the VTOC and the remaining good directory sectors. The lost files are identified and written back to the damaged directory sector.

If the VTOC and directory sectors are damaged, a search for track/sector lists is made. The VTOC is rebuilt to show all sectors used. All the track sectors not identifiable with files on the undamaged directory sectors are written to the remaining directory sectors as saved files.

When the VTOC and catalog are damaged the Catalog Repair Utility attempts to recover all files (including files which may have been deleted and overwritten the damage catalog no longer contains the information necessary to do anything else). Also, when the damage is this bad, some of the file names have been lost. When the file name is lost, the Catalog Repair will give the file a 'dummy' name 'FILE n' where n is just a sequence number. Finally, the file type designation is lost when the name is lost, so the type preceding the name of all FILE n files is only an 'educated guess'.

**FIXING A DISK WITH VTOC AND CATALOG DAMAGE**

1. Get a catalog list with sub-menu 4
2. Use sub-menu 3 to change file types
3. Use sub-menu 2 to rename File n files
4. Working from the new catalog list, decide which files are no longer needed and delete them.

**CATALOG THE DISK:**

Each file with the name FILE n is a file which was "lost." You should replace the File n name with the "lost" name. Before you rename the files, make sure the file types are correct.

**Checking the File Type Designation:**

The Catalog Repair Utility must look into each file with a FILE n name to determine whether it is an A, I, B or T type file. The correct file type will be assigned in the majority of cases. It's possible, although unlikely, the Catalog Repair Utility can be fooled and assign the wrong file type. It's for this reason that the File Type Change Utility is provided. The utility will prompt you on how to change the file type of a specific file. Keep changing file types until you get your program to run.

The Catalog Repair Utility contains a menu for renaming files. This program is available so you don't have to leave the utility to rename the file. Don't attempt to identify a file by its position in the catalog listing. The Catalog Repair Utility often juggles the order of the catalog listing while it's doing it's magic.
Mr Robot, Datamost's newest release, is one of the more entertaining game since Loderunner. The game is a cross between Loderunner, in the way that the player can design his own screens, and Miner 2049'er in every other way.

Controls ---> Joystick, or Keyboard left= <- right= -> up= A down= Z

Scoring
-------
Girder dots ----------------- 10
Horseshoe (small) ------------ 100
Pac-Man --------------------- 100
Energizer ------------------- 200
Exploding a bomb ------------- 500
Kill fireball while energized -- 500
Kill fireball w/bomb --------- 30,000

Control characters
------------------
CTRL-F Factory editor
CTRL-G Game mode
CTRL-N Next screen
CTRL-P Toggle Joystick/Keyboard
CTRL-S Sound off/on
CTRL-T Main menu
CTRL-X Reverse X-axis
CTRL-Y Reverse Y-axis
CTRL-Z Switch X & Y axis

The Factory Editor
--------------------
>  Conveyor belts - move in the direction of > or <
c  Small magnets - magnetize you in the direction in which the
is closed
O  Blinking dots - Energize you. Allow you to kill fireballs
F  Keyboard notes - Toggle sound off/on
=  Elevator - raise you up until a girder is encountered - jump to elevate
//  Pole - allow you to slide down safely, assuming the drop from the base of
the pole to the girder is not a fatal drop.
X  Purple/Blue girders - Teleporters
I  Trampoline - self-explanatory

Other figures which appear to do nothing:
Large magnets
Pac-man shaped ball
Object - Simple enough. Clear girders of all dots.
Neuromancer Quick Reference

GETTING AROUND IN THE REAL WORLD

While walking through Chiba City, you'll see the world one "room" at a time. Many rooms have exits or doorways you can walk through. Exits at the bottom of the main screen are represented by a black line. Some doors may be locked or guarded; in this case it is up to you to find out how to get in.

As you cruise through each room, you'll see and talk to other people. You can control your actions and movement using keyboard commands or a joystick (more commands later).

The screen is divided into three main areas. The largest section shows the room itself. In the bottom left corner are the eight command icons. In the bottom right corner is a special text window used for room descriptions and other short bits of text. When a conversation is in progress, "word balloons" will appear above the speaking characters in the room.

JOYSTICK CONTROL

To toggle the joystick on and off, press "J" while holding down the "open-apple" key. If you have a joystick, you can use it to move a "pointer arrow around the screen. Whenever you want to select anything on the screen -- a command icon, a menu option, some software to download -- you can just point to it with the pointer and press the joystick button.

COMMANDS WITHIN MENUS:

Menus may appear throughout the game when you look at lists of items -- prices in a shop or your inventory list, for example. You can select a menu option with the keyboard, or point to the option with the joystick pointer and press the joystick button. There are several commands commonly used within menus:

COMMAND KEY DESCRIPTION
------------- --- -----------
EXIT X Leave the current menu
WORK M View more menu options (if available)

After you select an item in your Inventory menu, you can choose from three special commands:

OPERATE O Operate an item.
GIVE G Give an item to another person.
DISCARD D Discard an item, permanently.

CONVERSATIONS

In Talk mode (type "T" or select the Talk icon), you can carry on conversations with other characters in a room through the use of "word balloons". Word balloons allow you to choose among several responses or questions that are appropriate to the situation in that room. When a word balloon appears over your head, you can see all of your possible responses by pressing the space bar or pulling back on your joystick after each response is displayed. When you decide on the proper response, press return or the button on your joystick. The response you select will be displayed a second time as you "say" it. After you read a word balloon that you or another character has "said", press the space bar or joystick button to continue. You can leave a conversation your character initiated with the "talk" command by pressing the "ESC" key.

USING THE PAX

When you operate a PAX machine (by selecting the PAX icon or pressing "P") the machine will give you three access codes and ask you for

Eastern Sea Board EASTSHABD ONGELAND
Gentlemen Loser LOSER WILSON, LOSER
Tozoku Imports YAKUSA YAK
Bank Gemeinschaft BANKE GEMEIN REINTITT, VERBONEN
Justice Department JUSTICE no password

All these bases can be reached by using a deck and a cyber jack. but some boards need a higher version of Comlink to be able for you to reach.

SOFTWARE LIST & FUNCTION
(Unless noted, the highest the version, the better)
JAMMIES, SLOW- These are cyberspace interface corruptor, which slows down the ICE's attack.
THUNDERHEAD, PYTHON, ACID, INJECTOR- Cyberspace ICE viruses, use these on ICE to slowly destroy the ICE defense.
VACCINE, CYBERSPACE- These are communication software for entering the cyberspace.
BLAMMO, BATTLECHESS 4.0- These are deck viruses, don't use them no matter what happen!
DOORSTOP, DECODER, BLOWTORCH, DRILL, HAMMER, DEPTHCHARGE, CONCRETE, LOGICBOMB- These are your ICE breakers, collect them all.
SEQUENCER- USE THESE TO FIND OUT LEVEL ONE PASSWORD, OR TO access Justice, bobobank after you use COMLINK (after the base into appears, move your joystick to inventory and select this software, this will run the software while you're on-line)
ARMORALL- Use this one, if your shield is down. warning, this only work once per ICE.
KGB 1.0- Use this in cyberspace to teleport you to KGB base.
COMLINC- communication software, version 6.0 allows you to enter cyberspace.
PROBE- allows you to find out the name of the base that ICE's are guarding, in higher version, you can ever find out if AI's are present.
EASYRIDER 1.0- allows you to travel over to the other zone in cyberspace.
BATTLECHESS 1.0- a chess program.
SCOUT- used in link lines to find out the numbers of levels in a base. (same way as in using a SEQUENCER)
HENLOCK- use this to 'kill' Greystoke AI.

THE PURPOSE OF CYBERSPACE IS TO BREAK INTO A BASE WITH THE HIGHEST POSSIBLE LEVEL ACCESS WITH-OUT A PASSWORD. YOU MUST USE YOUR SOFTWARE TO MELT DOWN THE ICE IN-ORDER TO REACH THE BASE.

SOMETIMES, an AI (artificial intelligence) is present after you melt the ICE. you must use your skill to kill them, if you don't know which skill to use.... try psychoanalysis.

P.S only once ICE can be defeat only with a software, and that's Greystoke.
Here is the post I promised.

Call these places:

- link code  password
- regfellow  visitor
- freematrix  cfm
- yakusa  yak
- loser
- eastseabod  longisland
- soften  permafrost
- hosakacorp  fungeki

To get cash:

1. Call Hosaka and upload comlink 6.0.
2. Call Hosaka and get new employees. Select one. Hit edit. Put ya name and bama id on there.
3. Call Keiatsu pass supertac and put larry moe on the warrant list his number is 062788138. Goto Microsofts. Enter back room. Ask Lupus about account bank.

Now, Goto cheap hotel to call some more boards. Call Bozobank <use sequence to get in on the welcome screen type I and hit sequencer> open an account. Call bankgemein pass verboten. Do a funds transfer. Type the source acc# <the one lupus gave you> link code <bozobank> source acc# <your account at bozobank> and the amount to xfer <30000>.

That should hold you off for cash, now let's explore Cyberspace.

Here is the post I promised. First, a short explanation of the evolution of code wheels. The code wheel is a form of protection against piracy of a particular game. They first appeared (to my knowledge) in the Electronic Arts game Amnesia in the form of a "street index". The second appearance was much later, in Legacy of the Ancients, also EA. The third (and most complicated one) was included in Bard's Tale III. And, as you may have guessed, the latest use is in Neuromancer. The first two are included disk protection, but the companies seem to be relying on just the code wheel for their protection against piracy, as the last two have had no disk protection whatsoever. The protection comes when, at certain points in the game, you will be given a set of two, three or four (depending on the complexity of the wheel) words or locations or whatever, and, using the code wheel, you must provide the required answer, or you will not be able to proceed with that function. Without the wheel and without altering the programming of the disk, you are stuck.

What is a code wheel? It is two or three concentric paper circles, each one smaller than the one beneath it, so that only the outer ring of the larger one shows. It is on the outer ring that one set of words are printed. On the outside edge of the smallest circle can be found the second set of words. One or several small windows are also cut out of the smallest circle (and in the case of three wheels, windows may also be cut out of the middle wheel at random points) so that the requested code numbers or words may be seen through them. If there is more than one window, each window will have its own name printed above or below it. In the most simple application, the use would be something like this: the player is given the conditions of A and B. He would rotate the code wheel until A on the outer circle lines up with B on the inner circle and observe the code through through the window. In the case of multiple windows, he would have been given A, B, and C, rotated as before to line up A and B and look through window C for the answer. Such is the case with Neuromancer.

The code wheel in Neuromancer is used to operate the FAX machine found at various locations throughout the game. You will be given three access codes and asked for a verification code. There are 16 possible A's, B's and C's. The codes are broken down into two tables. The first two tables give A (outer ring) and B (inner ring), to be cross referenced to each other to get a position number. This position number will be cross referenced with C (windows) to give the 3 to 6 digit verification code. The access codes you will be given are listed below with THREE LETTERS IN UPPER CASE (usually the first three, but not always, so I have tried to draw your attention to the ones that do not have the first three in caps). These will correspond to the abbreviations in the tables. Good luck!
To install Templates 1.0, copy the Templates file into the
 hệ system:Desktop directory of your GS/OS boot disk, and then reboot.

NOTE: To be able to use Templates 1.0, you MUST have a copy of
 the GSBug "GSBug.Templates" file, or you can create your own
 following the GSBug.Templates file format. You can acquire
 the GSBug.Templates file, as well as GSBug, from APDA.

Templates is FREeware!

Templates 1.0 is Freeware. Please give copies to your friends, your
 club libraries, your favorite bulletin boards, etc. It is included
 in this ShareWare Nifty List package for your convenience.

PLEASE pay for Nifty List -- it is an excellent tool for your IIGS
 and deserves far more than the meager $15 that Dave asks.

The Templates module gives Nifty List, version 3.0 or better, the
 ability to use GSBug style templates. A template is basically a
 structured way to view memory. For example, there are all kinds of
 parameter blocks for GS/OS sitting around in memory that you could
 view with Nifty List's ;h command. But, with the ;h command, all
 you would see is a big unstructured group of bytes. With a template,
 memory is broken down into fields which can be displayed with meaning.

To view memory. The \loadtemp command uses a default filename of
 Template: DESK.dir. You must first load a template file (obviously)
 before you can use a template.

While this command isn't specific to Templates, it will show you all
 the commands that you can issue for Templates 1.0. Don't forget
 that you can issue the = command on each template command to find
 out more about it. For example:

= \loadtemp

Will show you the help information for the \loadtemp command.

\loadtemp

The \loadtemp command loads in a GSBug style template file. You must
 first load a template file (obviously) before you can use a template
 to view memory. The \loadtemp command uses a default filename of
 **:System:System.Setup:GSBug.Templates** to load a template file. If
 you wish to load in a different template, you can specify the name,
 in quotes, after the \loadtemp command. For example:

\loadtemp "GSM.Templates"
Once a template file has been loaded, it sits around in memory until you feel the need to unload it. Template files take up a lot of memory, so if you have loaded a template file and think you will no longer need to use it, unload it to reclaim some memory. You can always reload the template file later if you need to use it again.

If, for some reason, you want to find out some information about the template file that you have loaded, you can use the \tempinfo command to do just that task. The \tempinfo command will show you the path name of the template file you have loaded as well as some information about the memory that the template file occupies.

The real work of the Templates module comes from the \temp command. With the \temp command, you can apply a template to a particular area of memory. The \temp command has the syntax of:

```
addr\temp "template"
```

Where addr is the starting memory address to apply the template to and template is the name of the template to overlay on that memory area. For example:

```
12/54AF\temp "OpenRecGS"
```

This takes the template called OpenRecGS and applies it to the memory starting at location 12/54AF.

To see the master GSBug template list, you can issue the command:

```
\temp "Templates"
```

You would then see the major template categories. You can then look at the subcategories by issuing yet another \temp command, for example:

```
\temp "GSOS"
```

End of Templates 1.0 description
The command table looks like this:

* Command Table—for each command in this module:
  * +000: pointer to command name (Pascal string)
  * +004: address of command entry point
  * +008: address of help routine
  * *(The first entry is for the module itself.)*

For each command there's a pointer to the Pascal-string name, a pointer to the command's entry point (which should RTL), and a pointer to the command's Help routine (which should display help and then RTL).

```
pea nlXXXXX
jsl NService
;pull 4-byte result
```

Here is a list of all the services.

* Environment management
  * 0000 nlRecover():
    Does not return. Enters Nifty List command level but BRKs when you leave. For debugging when you've crashed and need a special way to go into Nifty List because you were already in a CDA.
  * 0001 nlEnter():
    Attempts to call Nifty List command level. Returns 0 if successful.
  * 0002 nlRemoveNL(@WordBuff):Handle
    Data = pointer to 2-byte result buffer (gets ID for UserShutDown), Result = handle to feed to RemoveCDA (NIL if can't remove)
  * 0003 nlGetInfo(@Buffer):
    Data = pointer to 256-byte buffer to receive table; first word = length in bytes, including the length count itself.
  * 0004 nlInstallHook(ref,@hook):[not implemented]
    This will allow modules to install routines for NL to call at certain times.
  * 0005 nlRemoveHook(ref,@hook):[not implemented]
    * 0006 nlGetDirectory():@dirname
      Returns pointer to class-1 string giving name of directory Nifty List is executing from. (Don't change the string, just use it.)
  * 0007 nlNewSession(@callBackProc):sessionRef
    Creates a Nifty List session and returns a long value distinguishing the new session from all other sessions.
  * 0008 nlKillSession(sessionRef):[not implemented]
    Destroys a Nifty List session that was created with nlNewSession.
  * 0009 nlSetSession(sessionRef):oldRef
    Makes the specified session the current one, returning the old session reference. When you're done doing your stuff, call nlSetSession again to restore the old one.

To call a service with no result space:

```
pha
phx
pea nlXXXXX
jsl NService
```

The service removes the long input and the service code from the stack before returning (just like a toolbox call would).

To call a service that needs result space:

```
pha
phx
;make room for result
phx
;push 4-byte input
```

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 707 of 1262
Apple II Computer Info

S1 = cbAbort (abort, don't return!)
S2 = cbGetString (input into GS/GS result buffer at LongIn)

Callback is called with B and D undefined (must preserve).

000A nlWelcome(0)
  Outputs the Nifty List title screen.

000B nlLoadStuff(0):error
  Forces the data file to get loaded, if it isn't.
  Input parameter is 0. Result is error code (0 if no problem).

000C nlGetTextState [NL 3.3]
  [For internal use for now.]

000D nlSetTextState [NL 3.3]
  [For internal use for now.]

* * Information services * *

0010 nlGetFirstHandle(Kind):Handle
  Kind = 0, 1, or 2
  Result = first handle in one of the Memory Manager's 3 handle chains (0=Used, 1=Purged, 2=Free)

0011 nlGetHandleInfo(@info)
  info = handle (Long)
  +000 = handle (Long)
  +004 = @buffer
  What's returned in buffer:
  +000 = count of bytes returned
  +002 = at least 20 bytes of stuff—a copy of the *current* format of a Master Pointer record (ptr, attr, id, size, previous, next)

0012 nlLookup(@stuff)
  Data = pointer to stuff:
  +000: Word Section number to look in (nlSecSysTool, etc)
  +002: Long Data to look up
  +006: Page @outbuffer (256 bytes)
  Returns a pascal string in the output buffer (null string means nothing found)

0013 nlIndLookup(@stuff)
  Data = pointer to stuff:
  +000: Word Section number to look in (nlSecSysTool, etc)
  +002: Long Index (1=first item in section, etc)
  +006: Page @outbuffer (256 bytes)
  Returned in outbuffer:
  +000: Long Value associated with the Index-th piece of data
  +004: PString String associated with the Index-th piece of data (null string if no data found)

0014 nlGetProcName(address/4):@procName [NL 3.1]
  Data = address.
  Result = address of Pascal string name associated with the address, or NIL if none.

0015 nlClassifyAddr(address/4):result [NL 3.3]
  Data = address.
  Low word of result indicates the owner of the address:
  0 = System (for example, ROM or a RAM-based system tool set)
  1 = System-owned toolbox patch (within TSx)
  2 = non-system-owned RAM address
  3 = strange or invalid
  High word of result contains a corresponding ASCII character:
  0 = blank
  1 = "*
  2 = "**
  3 = "?"

* * Utility * *

0020 nlScanHandles(@parms)
  params:
  +000 Word WhichList (0=used handles, 1=purged, 2=free)
  +002 Ptr BankValue Any pointer to desired bank
  +006 Ptr theProc Procedure to call for each handle (gets parameter = Handle)

  theProc must remove the 4-byte parameter from the stack before returning. When theProc gets control, the Bank register is already set to the bank specified by BankValue (byte +2).

0021 nlDisasm1(@code):@NewAddress [NL 3.2]
  Disassembles one line of code at the specified address, and returns a pointer to the byte just following the line disassembled.

0022 nlExecCmdLine(@cmdline):0
  Executes a specified command line (pointer to GS/GS string). The return value is reserved & is currently always 0.

0023 nlGetRange(@buffer):NumParms
  Returns 2 if the user typed a range before your command; otherwise returns 1.

  Fills your 16-byte buffer with the following:
  +000: rangeStart
  +004: rangeEnd
  +008: rawStart
  +012: rawEnd

  This is for fetching the one or two hex numbers or addresses the user typed 'before' your command. They are already parsed by Nifty List.

  Use rangeStart and rangeEnd if you're looking for 'addresses'. The bank byte is handled appropriately for you.

  Use rawStart and rawEnd if you're looking for 'numbers'; no special bank handling is done for these values, so typing a 0 always gets you a 0, not a $xx0000.

0024 nlGetAGlobal(ref):value/4
  Data = reference number, value = long result
  Retrieves a value from a Nifty List global variable (the reference number values are in the equates file).

0025 nlSetAGlobal(@(ref,value))
  Data = ptr to a record:
  +000: reference word
  +002: long value
  Stores a value into a Nifty List global variable.
  ref = nlgNUM1: the number parsed before your command

0026 nlAbortToCmd(ignored)
  Aborts to the Nifty List command line, if possible
  [should return error if Nifty List not active—doesn't check yet]
* Input/Output

0030 nlWriteChar(char)
   Outputs a character—control characters are acted on.

0031 nlShowChar(char)
   Outputs a character, but nonprintable characters show up in a harmless way (like as periods).

0032 nlWriteStr(@pascalString)
   Outputs a Pascal string.

0033 nlShowStr(@pascalString)
   Outputs a Pascal string, but nonprintable characters show up in a harmless way.

0034 nlWriteCStr(@cString)
   Outputs a C string.

0035 nlShowCStr(@cString)
   Outputs a C string, but nonprintable characters show up in a harmless way.

0036 nlWriteText(@record)
   record+000 = length of text
   record+002 = pointer to text
   Writes the specified number of characters.

0037 nlShowText(@record) [see above]
   Writes the specified characters, but nonprintable characters show up in a harmless way.

0038 nlWriteByte(byte)
   Outputs a byte in hex (2 characters).

0039 nlWriteWord(word)
   Outputs a word in hex (4 characters).

003A nlWritePtr(long)
   Outputs a pointer (xx/xxxx).

003B nlWriteLong(long)
   Outputs a long in hex (8 characters).

003C nlGetIn(...)
   [not implemented]

003D nlGetChar(dummy):char
   result = character (waits for one to be input)

003E nlCheckKey(dummy):result
   result, low word 0=no key pressed; nonzero=a key was pressed

003F nlCrLfout(dummy)
   Outputs a carriage return (begins a new line). Does NOT return to the caller if the user hits Apple-period, etc!

0040 nlSpout(dummy)
   Outputs a blank.

0041 nlPause(dummy)
   Lets the user pause the screen, do screen dumps, etc. Normally returns right away. Does not return if the user wants to abort.

0042 nlHandleInfo(handle)
   Displays address and owner information for a handle, in the same format as the "I" command.

0043 nlWriteNoVoice(@cString)
   Displays a C String if and only if the user did not set the "v" flag (avoids annoying decorative displays, like lines of dashes, which may be pronounced "dash, dash, dash, dash...")

0044 nlShowWSTRing(@wString)
   Displays a string that begins with a length word. Nonprintable characters appear in a harmless way.

* Parsing

0050 nlChrGot():char
   Advances to the next character on the command line and returns is.

0051 nlChrGot():char
   Returns the command line character we're already on.

0052 nlEatBlanks():char
   Advances 0 or more times, until we're not sitting at a blank. Returns like nlChrGot.

0054 nlEvalExpr(@buffer):actualSize
   buffer:
   +000  Word     MaxExprSize   maximum size of expr this buffer can hold (must be at least 4)
   +002  Word     ActExprSize   actual size of parsed expression (returned)
   +004  n Bytes  Expr          parsed expression (0 or more bytes, returned)

   The nlEvalExpr result is just a copy of the ActExprSize word returned in buffer.

   Note that calling nlEvalExpr is a simple way to let the user type a GS/OS pathname. The expression, starting with the length word, is already a class-one GS/OS string.

* Memory access

0060 nlGetByte(@addr):byte
   Data = addr; value = byte found at that address

0061 nlGetWord(@addr):word
   Data = addr; value = word found at that address

0062 nlGetLong(@addr):long
   Data = addr; value = long found at that address

Reference numbers for globals:
01 = nlgNUM1 (appropriate for getting an address-type value that NL parsed before calling your command)
02 = nlgADDR
03 = nlgInfoTable (address of the table nlGetInfo uses; need to document which fields are ok)

[end of Writing.Modules]
INTRODUCTION

TURNS

EACH TURN IS 12 HOURS YOU MAY:

1) BUILD AND ADJUST FRIENDLY TASK FORCE
2) MOVE TASK FORCES
3) LAUNCH AIR MISSIONS
4) LAUNCH MISSILE ATTACKS
5) RESOLVE COMBAT

(FOR THE PURPOSES OF MY TYPING, THE WORDS "TASK FORCE" WILL HEREBY BE REFERRED TO AS: TF)

NOTES

WHEN TYPING IN NUMBER INPUTS, HITTING <RETURN> IS REQUIRED
WHEN ANSWERING A YES/NO QUESTION, ONLY Y OR N IS REQUIRED
PRESS INT <CTRL-C) CAUSES THE PROGRAM TO HALT

THE MAP IS A 40 X 40 SQUARE GRID REPRESENTING THE NORTH ATLANTIC AREA. EACH SQUARE IS 100KM IS DEPTH. GREEN: LAND BLUE: OCEAN WHITE: BASE RED: SOVIET TF BLACK: NATO TF

DISTANCES ARE ALWAYS ROUNDED UP!
EXAMPLE: X

5 ACROSS, 1 DOWN: DISTANCE IS 6 (REALLY, IT IS 5.099)
START

BOOT UP THE DISK WITH AN APPLE ///, USE EMULATION MODE

PASSWORDS

EACH PLAYER MAY HAVE A SECRET PASSWORD SO SECRET INFORMATION WILL ONLY BE GIVEN TO HIM. CHOOSE SHORT EASILY REMEMBERED PASSWORDS

ABBREVIATIONS

CVN NUCLEAR AIRCRAFT CARRIER CV AIRCRAFT CARRIER

SEQUENCE OF PLAY

NATO FORCES: HUMAN
SOVIET: HUMAN OR COMPUTER

IN GAME:

1) NATO TF ADJUSTMENT
2) SOVIET MOVEMENT
3) NATO MOVEMENT
4) SOVIET TF ADJUSTMENT
5) SOVIET AIR OPERATIONS
6) NATO AIR OPERATIONS
7) COMBAT RESULTS
8) SAVE GAME

TF ADJUSTMENT

FORMING TF

1) ENTER PORT CODE
2) ENTER MISSION CODE
3) THE COMPUTER WILL LIST ELIGIBLE SHIPS
4) CHOOSE THIS SHIPS YOU WANT

COMBINING TF

COMBINATION
2 TF's in the same grid may be combined following this procedure:

1) ENTER NUMBER OF GAINING TF AND MERGING TF
2) ALL SHIPS IN MERGING TF WILL BE ADDED TO GAINING TF, AND THE MERGING TF WILL BE DELETED
3) THE GAINING TF HAS THE LOWER OF THE 2 ENDURANCES
4) SUBMARINES TF's MAY NOT COMBINE WITH NON SUB TF's
5) AIRCRAFT CARRIERS MAY NOT MERGE WITH NON COMBAT PATROL
6) TRANSPORTS MAY NOT COMBINE WITH NON TRANSPORT TF's

DIVIDING TASK FORCE

1) ENTER NUMBER OF TF TO DIVIDE
2) THE SOVIET PLAYER IS ALLOWED: 9. THE NATO PLAYER IS ALLOWED: 11
3) ENTER THE NUMBER OF THE SHIPS THAT YOU WISH TO TRANSFER. THE NEW TF WILL HAVE SAME MISSION AND ENDURANCE AS OLD ONE
4) IF YOU HAVE FEWER THAN THE MAXIMUM TF's, DIVIDE TF MAY BE USED TO SCUTTLE SHIPS. JUST REPLY WITH "S" AFTER THE SHIP NUMBER

LOADING TRANSPORTS

TROOPS AND SUPPLIES MAY BE LOADED ON A TRANSPORT IF THE SHIPS ARE IN A FRIENDLY PORT

1) USING THE LOAD TRANSPORT COMMAND, ENTER THE PORT CODE. THE COMPUTER WILL LIST ALL ELIGIBLE SHIPS
2) ENTER THE SHIP NUMBER AND THEN WHAT SHOULD BE LOADED. (100 MEN->COMPANY)
3) IF YOU WISH TO UNLOAD, JUST TYPE "U" WHEN IT ASKS FOR THE NUMBER OF MEN/SUPPLIES TO BE LOADED
4) ONLY SUPPLY UNITS MAY BE LOADED ON A SHIP WITH A PREFIX "A" (AP,AK...)

CHECKING PIPELINE

REINFORCEMENTS AND REPAIRED SHIPS ARE SENT TO FRIENDLY PORTS. TO CHECK THESE SHIPS, CHECK THE "PIPELINE."

1) ENTER PORT CODE
2) ENTER SHIP PREFIX (<RETURN> FOR ALL SHIPS)
3) ENTER MAXIMUM DELAY TIME (<RETURN> FOR ALL SHIPS)
4) THE COMPUTER WILL LIST THE SHIPS
5) FOR SHIPS IN REPAIR, REPAIR, OR REINFORCEMENT, THE COMPUTER WILL DISPLAY THE TIME WHEN THEY WILL ARRIVE

SUNK SHIP DISPLAY

THE COMPUTER WILL DISPLAY THE SUNK SHIPS AND THE POINTS AWARDED FROM THEIR SINKING.

AIR GROUP DISPLAY

THE COMPUTER WILL LIST THE NUMBER OF EACH TYPE OF AIRCRAFT ASSIGNED TO EACH CARRIER OR BASE THAT IS ACTIVE.

LIST ACTIVE TF'S

1) THE COMPUTER LISTS THE TF NUMBER, MISSION, AND ENDURANCE FOR EACH TF
2) ENTER THE TF NUMBER TO EXAMINE (OR <RETURN> FOR NONE)

MAP DISPLAY

THE COMPUTER WILL DISPLAY THE MAP AND ALL FRIENDLY TF's. TYPING A TF NUMBER WILL CAUSE THAT TF TO FLASH.

BASE DISPLAY

THE COMPUTER WILL SHOW: INFANTRY, SUPPLIES, AIRCRAFT AND UTILITY AIRCRAFT AT EACH BASE. (AND MORALE POINTS FOR THE NATO PLAYED).

END GAME

WEAPONS DISPLAY

PROMPTS FOR A SHIPS I.D. NUMBER AND THEN DISPLAYS THE WEAPONS AVAILABLE FOR THAT SHIP.

1: MURMANSK
2: RIGA
16: AMERICA

MAIN GUNS: LARGER AND 150 mm. GOOD FOR SHORE BOMBARDMENT
LIGHT GUNS: 50-149mm. BOMBARDMENT, SHIP COMBAT, OR AIR DEFENSE
MISSILE DEFENSE: RATING OF SHORT RANGE GUNS AND ANTI-MISSILE MISSLES
HELICOPTERS: PARTOL/ASW HELICOPTERS CARRIED BY A SHIP
AIR-RECON: RECONNAISSANCE AIRCRAFT CARRIED BY A CARRIER OR BASE.
ONLY SURFACE SEARCH
AIR-EM: ELECTRONIC WARFARE CARRIED BY A BASE OR CARRIER, USED TO DESTROY MISSLES.
AIR-ASW: ANTI-SUB WEAPONS CARRIED FOR USE BY AIRCRAFT
AIR EARLYWARNING: ALLOWS A SHIP/BASE TO SEE AN ATTACK APPROACHING
SSM-SYSTEM: SURFACE TO SURFACE MISSLES (DISPLAY: # IN SALVO, TOTAL CARRIED, RANGE IN KM.)
ASM SYSTEM: LONG RANGE ANTI-SUB WEAPONS
SAM SYSTEM: LONG RANGE SURFACE TO AIR MISSLES
AST SYSTEM: ANTI SUBMARINE TORPEDOES (MK.48, TIGERFISH AND 533'S CAN ALSO BE USED AGAINST SHIPS)
EW STRENGTH: STRENGTH OF ELECTRONIC WARFARE (FOR SUBS, QUIET RATING)
SONAR STRENGTH: RATING FOR SONAR EQUIPMENT
TASK FORCE MOVEMENT

MOVING OF TF'S EXPENDS MOVEMENT POINTS. THE POINTS ARE DETERMINED BY FLEET SPEED.

FLEET SPEED

30 KNOTS OR THE LOWEST SPEED OF THE SLOWEST SHIP, WHICHEVER IS LOWER
MOVEMENT  

1. TF receives 1 MP for each 2 1/2 knots. (At least 3 MP's)  
2. 2 MP's for each move N, S, E, W.  
3. 3 MP's for each move NW, NE, SW, SE.  
4. TF with fewer than 2 MP's can not move, but can dock.  
5. Pressing "A" will start the move over for that ship only.  
6. TF's can not enter land.  

ENTERING HARBOR-UNLOADING  

1. TF that begins move on friendly base may unload by docking. If you begin in harbor and wishes to exit harbor but stay in same square, hit "0".  
2. Each ship may inload 18 components or 3 supplies.  
3. While in harbor, a TF is immune to ships, subs, or missiles.  
4. While in harbor, a ship is easier to hit with bombs.  
5. To unload troop/supplies at and enemy base, follow the above procedure but the rate is halved.  

MOVEMENT SEQUENCE  

1. Move TF's by number. Once a TF has been moved, it can not be reversed.  
2. Pressing "S" will examine a TF.  
3. Press "M" for EM mode: TF's in EM will be automatically seen, but will find targets easier.  

LAND ATTACKS  

When Soviet and NATO troops occupy Iceland or Faroes, land attack will take place:  
0=NO ATTACK  
5=BANZAI!  
(Supplies consumed will equal the level of attack.)  

AIR OPERATIONS  

1. CAP  
2. Observe search results  
3. Launch strikes  
4. Transfer aircraft  
5. Launch SSN/ASW attacks  

CAP (Combat Air Patrol)  
---  
1. At start of air operations, determine how many planes will fly CAP missions  
2. Fighters fly: normal CAP, and long range CAP.  

NORMAL- protect TF or base from which it originated.  
LONG RANGE- protect any base/TF within its range. (For CAP, range=1/2 strike.)  
3. There are 2 ways to intercept air to air missile disfight.  
(Both will occur if CAP intercepts aircraft with standoff range as 0)  
4. Average/maximum interception ranges  

LONG RANGE CAP

Apple II Computer Info

TORNADO 1200 AMRAAM 150*
FALCON 900 SIDEWIND 10
EAGLE 1000 AMRAAM 150*
TORCH 1000 PHOENIX 300*
CORSAIR 600 WALLEYE 50
INTRUDER 800 HARPOON 110
HARRIER 400 SIDEWIND 10
FORGER 300 APHID 10
FLOGGER 1000 APEX 150*
FENCER 1200 A-7 10
BACKFIRE 2500 A-6 300
BAGGER 1800 A-6 300
CUB 2500 NONE ---
STARCÚTER 2500 NONE ---

* 100 ADDED TO RANGE OF LONG RANGE
AAM’S FOR INTERCEPTION RANGE

AIRCRAFT TRANSFER

1) ONLY 4 TRANSFERS PER TURN
2) TRANSPORT CRAFT (CUB, STARCÚTER) MAY BE INCLUDED IN THE FIRST 2 MISSIONS IN A.M. TURNS ONLY
3) RANGE IS TRIPLED

(AFTER USING THE TRANSORT CRAFT, YOU MAY CHOOSE TO SEND TROOPS OR SUPPLIES ALONG WITH THEM)

AIRCRAFT TRANSFER

1) AIR STRIKE
2) MISSLE (SSM, ASM, ASW)
3) SURFACE AND SUB COMBAT
4) RETURN AIRCRAFT TO BASES

1) EARLY WARNING AIRCRAFT DETECT STRIKES 8 SPACES AWAY.
2) LONG RANGE AAM COMBAT MAY OCCUR IF THE CAP IS EQUIPPED WITH:
   PHOENIX, AMRAAM, OR APEX MISLLES

3) THE CHANCE OF HITTING AN ENEMY PLANE WITH A MISSLE IS AFFECTED BY THE ECM RATING OF THE TARGET:
   PHOENIX: 3
   AMRAAM: 2
   APEX: 1

4) SHIPS IN TARGET TF'S MAY FIRE SAM’S IF THERE IS NO STANDOFF RANGE OR THE MISSLE RANGE IS GREATER THAN THE STANDOFF RANGE. NUMBER OF SAM’S FIRED IS DEPENDENT UPON TYPE OF SAM:
   STANDARD: 4 SA-N-1: 1 SA-N-6: 3
   SEASLUG: 4 SA-N-3: 2 SA-N-7: 4

5) BOMBERS THAT SURVIVE MAY SHOOT ASM’S

6) IF STANDOFF RANGE IS 0, THE BOMBERS WILL BE ATTACKED BY FLAK.
SURVIVORS WILL BE PERMITTED TO ATTACK.

7) THE CHANCE OF A BOMBER BEING SHOT DOWN BY FLAK = TF FLAK STRENGTH + TARGETS MISSLE DEFENSE STRENGTH, DIVIDED BY 500. THE TF FLAK STRENGTH IS COMBINED AA RATING OF ALL SHIPS IN THE TF. IF THERE ARE MORE THAN 12 SHIPS IN A TF, THE RATING IS THE AVERAGE OF THE SHIPS.

8. CHANCE OF BOMB HITTING TARGET IS AFFECTED BY:
A. BOMBER ACCURACY
B. MAXIMUM SPEED OF TARGET
C. FLAK INTENSITY
D. RANGE OF STRIKE
E. SIZE OF TARGET
F. RADAR ON BOMBER (NIGHT ONLY)

TABLE OF BOMBER ACCURACY/RADAR:
TORNADO 14/9 CORSAIR 7/5 FLOGGER 1/4
FALCON 6/4 INTRUDE 10/8 FENCER 9/7
TOMCAT 10/8 HARRIER 6/2 BACKFIRER/S
EAGLE 10/6 FORGER 3/1 BADGER 3/3

MISSILE RESOLUTION
1. PRIOR TO ATTACKING A SHIP, THE ANTI SHIP MISSLES MAY BE ENGAGED BY CAP, SAM'S, LIGHT GUNS, TARGET DEFENSE. SAM'S WILL NOT BE FIRED AGAINST SURFACE SKIMMING MISSLES. SAM'S MAY NOT FIRE IF EARLY WARNING WAS UNSUCCESSFUL AND TARGE TF IS IN PASSIVE EW-MODE. THERE IS A CHANCE THAT A SHIPS WILL SWITCH TO ACTIVE EW-MODE DURING A MISSLE ATTACK.

2. MISSLES THAT SURVIVE AAM AND SAM ATTACKS WILL BREAK INTO GROUPS OF 1-7 MISSLES. EACH GROUP WILL SELECT A TARGET.

3. MISSLES THAT SURVIVE DEFENSES MAY BE JAMMED. JAMMING POSSIBILITY IS AFFECTED BY THE TARGETS EW RATING AND THE MISSLE RATING.

4. IF A MISSILE SURVIVES THE ABOVE MENACES, IT MAY MISS OR HIT THE TARGET.

ACCURACY RATINGS:
HARPOON 9* SS-N-7 7* SS-N-12 6
TOMARHM 9* SS-N-2C 5 SS-N-19 7
EXOCET 9* SS-N-3 4 AS-6 5*
WALLEYE 7 SS-N-22 7 AS-7 7

* SURFACE SKIMMING

5. THE PROBABILITY OF AN ANTI-SUB MISSLES HITTING THE SUB DEPENDS UPON THE SUB'S SPEED, THE SUB'S EW RATING AND MISSLE ACCURACY.

SURFACE COMBAT
--
SURFACE COMBAT MAY OCCUR BETWEEN TWO TF'S OCCUPYING THE SAME SPACE WITH ENDURANCES OF 9 OR MORE

1. RESOLUTION:
A. EACH SOVIET SHIP IN TF PERFORMING A "C" MISSION WILL FIRE AT ONE OF THE NATO SHIPS
B. EACH NATO SHIP WILL FIRE AT A SOVIET SHIP
C. EACH NATO SHIP IN A "C" MISSION WILL FIRE
D. EACH SOVIET SHIP WILL FIRE AT NATO TF

2. WHEN ATTACKING, EACH SHIP WILL FIRE TORPEDOES MAIN GUNS LIGHT GUNS ONLY SOVIET SHIPS WITH 533mm TORPEDOES CAN FIRE TORPEDOES IN SURFACE COMBAT

SUBMARINE COMBAT
--
1. SUBMARINES PATROL AN AREA TWO SPACES AWAY FROM THE TF LOCATION
2. Each sub in a TF will have a chance of engaging a sub within its patrol area. This chance is dependent on speed, sonar, and EW mode. Subs that have been detected have their own detection chances reduced by 2/3. The chance of engaging an enemy sub is 1/4 that of engaging an enemy sub.

3. The chance of engaging/torpedoing will be reduced by the number of enemy ASW ships in the enemy TF.

4. In an attack, a sub will fire 2 torpedoes. After each attack, there is a 10% chance of a sub running out of torpedoes in which it will have to return to port for a restock.

5. After a sub attacks a TF, the ASW ships in the TF will attempt to fire back.

6. Range/accuracy of ASW/AST weapons:

   - ASROC 20/4, MK 48 50/5
   - SUBROC 55/4, TIGERFISH 40/4
   - IKARA 20/3, 533mm 20/3
   - FRAS-1 50/3, 400mm 7/4
   - SS-N-14 50/3, MK46 10/4
   - SS-N-16 72/4

AIRCRAFT RETURNING TO BASE

1. After completion of mission, aircraft will attempt to return to base from which they came.

2. If launched from a carrier which received 26% or greater damage, the aircraft will try to make an emergency landing on another base.

3. Emergency landings will occur automatically if there is a friendly base or carrier within 3 spaces.

INVINCIBLE, ARK ROYAL: HARRIERS ONLY, MINSK: FORGERS ONLY

4. If an emergency landing is required and there are no available bases, the aircraft will ditch in the ocean.

5. Aircraft which engage in CAP, STRIKE, or TRANSFER missions will suffer 1% losses. Troops and supplies being transported will also suffer 1% damage.

LAND COMBAT

LAND COMBAT will occur when there are both NATO and Soviet troops on Iceland or Faroes.

1. Order of land combat:-> defender fires and then surviving attackers fire.

2. The greater the attack level, the greater the casualties on both sides. Attacks made without adequate supplies will suffer double casualties. Defensive fire without required supplies will be only half as effective.

3. If total combat strength of attacker (TCS) is greater than that of the defender, the airfield is taken.

Attacking TCS=(Infantry Companies+ Ground Attack Points)*Random Number

Defending TCS=Infantry Companies+ Ground Support

4. And airfield under heavy fire will not be able to conduct operations in the following turn.

GROUND SUPPORT AND BOMBARDMENT

LAND COMBAT may be influenced by bombers and bombarding ships.

1. Bombers flying ground support over Faroes or Iceland will add to land combat strength. TF's with "B" mission will also help if they occupy the Faroes or Iceland square.

2. Battleship main guns are worth 3 points each. Light guns are worth 1/2 point each. Cruiser main guns are worth 1 point each.

3. Ground support points have the following effect:
   - Each point will suppress one infantry company (usually)
   - Each point will add 1/2 point of friendly fire (usually)

4. Aircraft's ground support rating is determined by -> accuracy of bombs, and radar ratings (F.M. turns only). During a bomb, each "<"<>" means 2 ground support points have been scored.

REPAIR AND REFIT OF SHIPS

1. Damaged ships which docked are placed in the repair and refit pipeline. Undamaged ships will be placed in the refit pipeline. A base from which they came TF which docks with an endurance greater than 50 will not be required to refit. Refit time is 3 days.

2. Repair times is equal to: 9 x damage points suffered. Damage points suffered is: defense factor or ship x damage percentage. Repair time may be doubled for some ships with smaller ships having a greater chance of lengthened repair time.

REINFORCEMENT ARRIVAL

Ships will arrive as scheduled in pipeline. Infantry, supply, and aircraft will be reinforced as follows:

<table>
<thead>
<tr>
<th></th>
<th>C</th>
<th>I</th>
<th>S</th>
<th>A</th>
<th>F</th>
<th>F</th>
<th>A</th>
<th>I</th>
<th>S</th>

(2) 0 30 0 6H 0 6H 6H 0
(B=BERGEN  H=HAMBURG)
(1->MURMANSK  2->RIGA)

Scapa Flow

3. America

4. Scapa Flow
1. Each turn (during campaign games only) there is a 1/16 chance of these reinforcements arriving.

2. The Soviets will be more likely to receive #1 during first weeks in October than last week in September.

3. The Soviets will automatically receive #3 following any turn in which Tornadoes+Eagles+Falcons<50. When this happens, the Soviet will be awarded 25 victory points.

4. NATO will automatically receive #3 following any turn in which Tornados+Eagles+Falcons<50. When this happens, NATO is awarded 50 victory points.

5. Only "E" may initiate combat.

6. Surface combat may cause a "B" to abort its mission (causing it to become an "R").

7. Submarines with 0 endurance may not fire torpedoes.

---

**Mission Endurance (Turns)**

<table>
<thead>
<tr>
<th>Mission</th>

</tbody>
</table>

(1 day = 2 turns)

---

1. Carriers may only perform "C".

2. AP, AK, AC, AE, AKR, and AFS may only perform "T".

3. LST, LRA, LPH and LPD may only perform "T" or "E".

4. SS, SSN, or SSNG may only perform "U".

**General Operations**

---

**Ship Damage**

---

Ships receive damage points when they are hit by bombs, torpedoes, missiles, or gunfire. When damage points are greater than defensive factor, the ship will sink. When damage points are greater than 50% of the defensive factor, the ship is crippled.

1. Damage Points Caused by Weapon:

<table>
<thead>
<tr>
<th>Weapon</th>
<th>Damage Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Light (AA) Gun</td>
<td>0.5</td>
</tr>
<tr>
<td>CL Main Gun</td>
<td>1.0</td>

</tr>
<tr>
<td>AS-7:</td>
<td>15.0</td>
</tr>
<tr>
<td>SS-N-22:</td>
<td>16.0</td>
</tr>
</tbody>
</table>

2. ASW/Torpedo hits will always sink a submarine.

3. Torpedo hits will always reduce a ship's speed by at least 5 knots.

4. Ship that is hit may suffer additional damage, hence the message, "Explosion on Board." (This indicates a critical hit).

5. Crippled ships may accrue additional damage while returning to port. It is possible for a crippled ship to attempt repairs while at sea. It will attempt to repair itself until no longer in critical condition.

6. Carriers with 26% or greater damage may not launch/receive aircraft.

7. U.S.N. carriers with damage between 26% and 35% will attempt repairs until below 26%.

**TF Missions**

---

Below is a list of missions and endurance.
Apple II Computer Info

REQUIRE SUPPLIES

SCORING

------
1. PLAYES GET VICTORY POINTS (VP) BY SINKING ENEM SHIPS. THE VP'S EQUAL TO DF+CARGO/AIRCRAFT CAPACITY
2. NATO PLAYER RECEIVES 1 POINT 10 VP'S FOR EACH MORALE POINT REMAINING. (CAMPAIGN SCENARIOS ONLY)
3. EITHER PLAYED MAY SCORE 500 VP'S FOR POSSESSIONS OF ICHELAND OR FAROES AT END OF GAME.
4. SOVIET PLAYER RECEIVES 1000 VP'S IF NATO MORALE IS 0
5. VICTORY TABLE:

<table>
<thead>
<tr>
<th>SCORE</th>
<th>RESULT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000+</td>
<td>NATO DECISIVE</td>
</tr>
<tr>
<td>500-999</td>
<td>NATO SUBSTANTIVE</td>
</tr>
<tr>
<td>100-499</td>
<td>NATO MARGINAL</td>
</tr>
<tr>
<td>(-99)-99</td>
<td>DRAW</td>
</tr>
</tbody>
</table>

FOR SOVIET WIN, JUST CHECK IF IT IS NEGATIVE AND CONSULT ABOVE TABLE

WEATHER

------

CLEAR, LIGHT OVERCAST, HEAVY OVERCAST, AND STORM

1. THERE IS A RANDOM CHANCE EACH TURN THAT THE WEATHER WILL CHANGE.
The weather only changes in steps of 1. There also is a random chance
a heavy overcast will become a storm. Storms are rare in Sept-Oct and
more frequent in Nov-Dec.
2. WEATHER INFLUENCES THE ABILITY TO SPOT TF'S AT A RANGE OF GREATER THAN 1.5. THE CHANCE OF SPOTTING A TF AT GREATER THAN 1.5 WILL BE REDUCED BY 1/3 DURING LIGHT OVERCAST AND 2/3 DURING HEAVY OVERCAST. STORMS WILL PREVENT ALL AIR AND MISSILE OPERATIONS
3. DURING STORMS, ALL TF'S WILL HAVE THEIR SPEED REDUCED TO 5 KNOTS
4. THE LIGHT BLUE AREA A TOP OF SCREEN IS ICEBERG ZONE. SURFACE TF'S WILL HAVE TO MAKE ONE STOP WHILE ENTERING AND ICEBERG, BUT SUBMARINES ARE UNAFFECTED. THE ZONE PROGRESSES SOUTHWARD AS THE GAME GOES ON

AIRBASE CAPACITY

------

TABLE OF MAXIMUM AIRCRAFT

ICHELAND: 80 HAMBURG: 600 RIGA: 900 FAROES: 60
SCAPA FL: 900 USA: 900 BERGEN: 500 MURMANSK: 900

NATO MORALE

------

NATO MORALE WILL BE REDUCED BY LONG PERIODS OF INADEQUATE SUPPLY

1. LEVEL STARTS AT 100 FOR CAMPAIGN ONE OR 40 FOR CAMPAIGN TWO
2. NATO MORALE WILL BE REDUCED BY ONE FOR EACH TURN SUPPLY'S AT SCAPA FLOW ARE LESS THAN 10 OR TROOP LEVEL IS LESS THAN 20000

NORTH ATLANTIC '86 IS A VERY COMPLICATED GAME, EVEN MORE SO THAN GERMANY 1985, ON WHICH I HAVE ALSO WRITTEN DOCS. ONE MUST BECOME FAMILIAR WITH THE DOCUMENTATION TO THIS GAME BEFORE GIVING ANY THOUGH TO PLAYING. THE GAME WILL START SLOWLY, BUT SPEED UP AS THE PLAYERS UNDERSTAND WHAT THEY ARE DOING. NOTE WELL, THAT YOU WILL BE CRUMBLED AT FIRST, BUT DON'T WORRY. NATO: ABANDONING FAROES AND EVEN ICHELAND IS NOT ALWAYS BAD
NOISE TRACKER GS v1.0, By FTA.

This program is for advanced users only !!!

Please Wait ! The real documentation is coming soon... (I hope...)
This text file contains just some hints to help you apprehending NoiseTracker.
Don't forget to read this file each time you get a new version of NoiseTracker!
It should describe the important new features, or modifications...

Installation
------------

This program may be copy on your hard disk. Just copy the files NOISE.TRACKER, and NOISE.DATA in the same folder... (If you have created some partitions on your hard disk, choose a folder in a partition recognized by ProDOS 8.)

(Note that old 5'1/4 Disks are not recognized by Noise Tracker GetFile program...)

It uses the Memory Manager to allocate memory (badly, but it uses it!), so you can execute this program from GS/OS. But if you haven't got a lot of memory, I recommend to launch it from a ProDOS 8 disk, because you'll gain about 400/500ko of memory, which is the memory reserved by the GS/OS system.

Also, copy the icon file NT.ICONS in your Icons folder... (Icons courtesy of Michael Guitton), and modify the application path of each icons (using IconEd for example) to allow the system to locate the Noise Tracker program when double-clicking on a music file from the finder. (Since version 0.70, all the files created by Noise Tracker have their auxtype set to $0220.)

(You can skip the loading of the picture and the music by pressing the Open-Apple key while loading.)

How does it work ?
------------------

NoiseTracker is a new kind of music software for the IIgs, very different from all the previous ones (Soundsmith, Synthlab, Music Studio...) by the fact that it can use almost as many instruments as you want (up to 64) and you're no more limited by the size of the Ensoniq Ram (64ko) !!!

NoiseTracker uses two kinds of instrument... Those always in the EnsoniqRam, and those which are in the GS-Ram, and which are moved to the Ensoniq when needed... But, luckily, when playing a music, you can hardly notice the difference between these two kinds !!!

Each kind of instrument must be played on its own dedicated tracks... These are Tracks A..G for the instruments in the GS-Ram, and Tracks 01..15 for those in the Ensoniq...

Using the Sound Parms option, you select how many tracks are reserved for the GS-RAM based sounds... (Actually, each track reserves a small part in the Ensoniq Ram which is used for swapping and playing part of the sound...)

(For those interested in the technical part, you can press 'T' at anytime to toggle the display of the Ensoniq DOC registers.)

Loading A Music
Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 719 of 1262

NoiseTracker can load a lot of music formats; there are 3 menu options involved for loading a music...

- OPEN MUSIC (Music Menu)
  Load a NoiseTracker Music Format file (compacted).
  After loading a NT music, the program will ask you if you want to load the wavefile associated to this music (same name, with the suffix .W)
  Load a Soundsmith Music format file. The instruments are automatically loaded (like in soundsmith) if they're found in the same directory... If not, NT can load directly the 64ko Wavebank file generated by soundsmith, and get the instruments directly from this file!
  (Beware! This is not the main goal of NoiseTracker to replay soundsmith music... So most of the Soundsmith musics will be played normally, but some of them won't! (depending on the kind of instruments and the kind of effects used...))

- OPEN MODULE (Module Menu)
  Load the NoiseTracker Module Format file... This is the format used by the NoiseTracker player to allow you to replay the musics in your own program... (see Player Info below...)

  This format includes the tracks used by the music and also the instruments...

- AMIGA IMPORT (Module Menu)
  This is one of the most powerful options of NoiseTracker... It allows you to import directly music modules from the Amiga... Just convert the module created on the amiga (by SoundTracker, NoiseTracker, ProTracker...) to a IIgs (using a Null-Modem cable, or a modem, or DOSEZDOS on the Amiga then APPLEFILEXCHANGE on the Mac, or PC Transporter on a IIgs to read PC disk format...) and load it with this option (The module name must begin with the prefix MOD.). Then play it and enjoy! That's all!!!

Composing a Music

If you want to create your own music, it's very easy... (just like in Soundsmith! (Sorry, Noise Tracker is not midi compatible!))

Select the instrument (double clicking in the instrument list, or in the selection box to enter it through the keyboard, or using directly a non-keypad key number), then the octave (using the keypad), and the notes (using keys: GJIKL;' and YUOP[). If everything OK, you should hear the sound! (Be careful of the good use of the Tracks and Instruments or you'll get nothing...Tracks A...G are for RamBased instruments only, and the others for the ensoniq ones.)

Then depending on the state of the LOCK flag (use TAB to change it, or click on it), the new note will be or not added to the 'partition'... (This is very useful to verify any note to be played...) About the effects, only two are supported by NoiseTracker : V to change the volume of a sound, and T to change the music tempo.

Playing the music in your own program

Since version 0.55, the music player is included on the disk... It exists under 2 formats, a tool (Tool220), and a player to be linked... These two players can only replay a music saved under the MODULE format !!! (Current version is 1.2 ($0102). Old version can't replay modules with more than 16 instruments)

See the NTSAMPLE.S and SAMPLE.S16 file to see how to use it... There shouldn't be any major problem to replay a music by yourself!

Just two points I have to insist on, because they may be the source of major malfunctioning:

- When making the NTInitMusic call, you must give as parameters the address of the music module in ram (X=^@Module,Y=@Module). This address (@Module) must be PAGE ALIGNED !!!!

- Don't forget to make the call NTUpdateSound very often in your program just after have launched the music, because this is that call which will move, when needed, the instruments from the GS-RAM to the Ensoniq... (The call can move up to 7*256 bytes at a time).

If you forget to make this call, or if your 'calling rate' is too slow, then notes on the tracks dedicated to Ram Based sounds (Track A...G) won't be played normally !!!!

Have Fun with NoiseTracker !

Any Problem? Call 1-900-FTA-RULE ! (Hey?! It's a joke!!!!)
NoiseTracker GS v1.0

Originally Released by The New I.C.i.A. Team Italy 1991 & FTA 'FEU' (1992)

Modified by:  Dr. Tom and Re-released as NOISE TRACKER GSv1.0 - (VAMPS)-DEMO disks

A list of NEW FEATURES for v1.0 follows:

(1) NoiseTracker v1.0 now allows you to assign single or both channels in the
    Ensoniq-RAM and also in the GS-RAM.

(2) An auto screen saver will activate giving you a black screen with dancing pink
    notes, if you don't do anything with the current screen, after a brief time of non-
    activity on-screen.

(3) A new 'NEXT' animation is included, (within the INTROPIC) with an impressive
    bouncing 3-D ball pyramid, during the INTRO portion of NoiseTracker, as the
    INTROMUSIC is playing.

(4) This animation will not be observed, if no INTROPIC, INTROMUSIC & INTROMUSIC
    wavefile is included, and you can press any key or click the mouse to enter the
    program.

(5) A new circular opening portal-scroll introduces you to the main program
    operational screen.

(6) The main programs operational screen has a display box that shows the music title
    that is loaded and/or playing. You can change the color of the screen, by clicking
    the mouse on this display box. The color will change to another, if you click on that
    display box again and so on and so on.

(7) Full development credits are viewable, via the 'About Program' option.

(8) Freeware info is available, via the Freeware Info option.

(9) You can visit the "Underground World", and try your hand at guessing.
    "The Word" or (QUIT) & exit back into NoiseTracker. (See: TIPS & HINTS,
    below for more information on this option). (who knows what "EASTER-EGGS" lurk
    within this option). See Freeware Info option, write the programmer and ask him if
    any more, not given below, might be found and/or activated.

(10) New SHR graphic "Original" INTROPIC and INTROMUSIC-INTROMUSIC.W are included.
    PLEASE NOTE: these original 3 files have been replaced on this disk. They can be seen
    and listened to on the official original released NoiseTracker v1.0 disk.
    You should be able to obtain the original released disk from (AOL) America-on-line or
    you can write to me and send me a blank 3.5" disk and a self-addressed return postage
    envelope and I'll send the original v1.0 disk to you. IT IS FREEWARE!

For all the latest, & custom,
one-of-a-kind; VAMPS Songs-musics-instruments-sounds,
wavebanks, samples, special effects, Music NDAs, etc.
for the Apple Ilgs programs; Noise Tracker,
NuPak IIGs is an innovative creation in packing utilities. NuPak IIGs offers the ability to pack and unpack not only ShrinkIT(tm) type files, but files in several other formats as well. However, the biggest advantage of NuPak IIGs is the ability to pack files with resource forks. With the onset of GS/GS(tm) 3.0, files containing both resource and data forks will become more prominent. Programs utilizing this format are following a format found in most Macintosh programs. Such programs already exist on the IIGs—most notably the CDEV files found on the IIGs System Disk and this program. Until now, there has not been a way to pack files with resource forks. One had to pack a whole disk in order to send any file with a resource fork—that is, until NuPak IIGs. Now you will be able to pack single files and send them like any other file.

NuPak IIGs is a full fledged 16-bit packing and unpacking program, running under GS/GS, that follows the human interface guidelines. It therefore offers an easy to use substitute for the myriad of archival programs for the Apple II series (as well as for other computers). Although, the main focus of NuPak is on NuFX(tm) archives such as those created by ShrinkIT.

Another ability that makes NuPak unprecedented, is the promise of accessing other operating systems when FSTs become available. It currently supports AppleShare(tm) network file servers. However, what sets NuPak off from the rest is its ability to unpack Macintosh files compressed with StuffIT(tm), the most widely used Macintosh archival program. This can be done without waiting for Apple's FSTs.

Comments, suggestions, enhancements, and/or bug reports can be sent to the author on America Online(tm), on Internet, or via US Mail. See the end of this file for additional information.

Notes Version 2.0

This is it folks, version 2.0! I decided to jump the major version number because I've added along awaited feature...StuffIT support! This program can now handle Macintosh "StuffIT" archives, with either a 32-byte header from downloading the archives from America Online or a 128-byte Macbinary header (used on BBS's).

Another major development is speed. Version 2.0 has had its decompression routines totally reworked and enhanced. The old slowness of version 1.x is no more.

I have changed the user interface in a few places to be more friendly. The most major change is at points where the user is prompted to enter a device name. All such dialogues have been replaced with a standard dialog window allowing the selection of a device from a displayed list of available devices. This prevents the user from having to memorize the exact names of devices.

I have also added the "View Help File" option. This option brings up a help window containing the quick-help list describing the menu options in minor detail.

Version 2.0 also supports User Preferences and the creation of Binary II files, a very useful option for users of services such as Compuserve and GENie which want Binary II headers on uploaded files.

Ghost of Features Present

Here is a listing of what Version 2.0 can do:

- Extract files from NuFX, Binary II, ACU, BXY, and StuffIT archives.

The following features are planned for versions in the near future:

- Actually compress files while adding, using Huffman or Dynamic LZW.
- Add messages while adding files to NuFX archives.
- Display messages that are in NuFX archives.
- Add whole disks to NuFX archives.
- Work with even more archive types (Arc, Zip, Zoo, etc...).
- A mini-editor for composing quick text messages.

Please do drop me a letter on America Online, on Internet, or by US Mail, especially if you find bugs. I wish to incorporate features YOU want, so I have to be informed. I also can't test the program in every possible machine configuration or situation, so there may be rare bugs that have yet to crop up.

Getting Started

This program needs System Disk 5.0.2 or higher to run correctly. If you don't have the necessary system disks, try to download them from America Online or goto your local user group to obtain them. You might also want to see your local dealer and obtain a copy. Most dealers will let you copy it, or you can buy the three-disk set with manuals for around $40.

Start by copying the program to where you want it. It will run on any GS/GS-compatible device, including 3.5" and 5.25" drives, hard drives, and AppleShare file server volumes. You absolutely MUST use the Finder or another GS-based copy program, since the program does have a resource fork and cannot be copied by a ProDOS 8 program.

Please note that the NuPak IIGS program cannot be "locked" or write-protected in any way. This is because NuPak writes back to itself to save the user preferences. If you forget and accidentally lock or protect the file, NuPak IIGS will kindly tell you this and exit back to your program launcher.

Quick Help List

After running the program from the Finder(tm) or another program selector, the NuPak IIGS desktop will pop up and the File, Edit, Archive Options, and Special menus will appear.

Note that currently unavailable options are marked with "| N/A |".

**** The menu underneath the Apple contains 2 options:

"About NuPak IIGS" will bring up a series of dialogues showing some info about who contributed to this program, as well as version number you are using.

"View Helpfile" opens a window in which you can view the miniature help file. If the help window is already open, this option brings it to the front.

(These are followed by any NDAs you have installed.)

**** The File Menu has several options:
"New" will create a new NuFX archive, allowing you to select its filename and location before it is created. Any current archives are not closed.

"Open" will allow you to select a file, which is then opened as an archive. NuPak will automatically figure out what type of archive it is. If it can't figure out what the file format is, it will tell you so. Any current archives are not closed.

"Save" and "Save As" aren't used and are for future use.

"Close" will close the currently active window, be it an NDA, archive window, or whatever. If it is an archive window, the archive file is closed and any data buffered in memory is flushed to disk.

"Delete" allows you to select a file, which is then deleted. You are asked to confirm before the file is actually destroyed.

"Rename" will let you rename a file you select. You can change the entire path of the file, even move it between directories! The only restriction is that you cannot move it across volumes. You select the file and can then edit its full pathname. The option is abortable.

"Format" lets you format a disk. NuPak will display a list of devices from which you select the device to format. You also enter the volume name to use in formatting the disk. NuPak then tells GS/OS to format the disk.

"Erases" is just like Format, except it simply writes a new volume directory to the disk without reformatting it.

"Page Setup" and "Print" do nothing.

"Quit" will quit back to the program selector.

**** The Edit menu has only one option used by NuPak.

"Select All" will automatically highlight all files in the currently open archive with. If there is no archive open, or if the currently highlighted window is not an archive (ie, an NDA is in use), nothing will happen.

**** The Archive Options menu contains four options:

"Extract Records" will extract whatever records you have highlighted in the archive window. You are prompted first for a disk or directory to extract to.

"Add Records" allows you to add files to *NuFX* archives. You select the file or files to add, and then select message information. The files are then added to the current open archive, using the compression method selected under User Preferences.

"Delete Records" is not functional as of yet and therefore dimmed. In the future it may be possible to delete records within a NuFX archive.

"Rename Records" is not functional as of yet and therefore dimmed. In the future it may be possible to rename records within a NuFX archive.

**** The Special Menu contains four options:

"Set Preferences" will allow you to configure NuPak for your own personal tastes. You can select compression method (for use when adding to archives) and the default pathname for use in extracting. These options are saved and will be set each time you run NuPak again. Note that the only compression method currently available is "uncompressed", and all other compression options are dimmed and cannot be selected.

"Make Binary II file" will allow you to make a Binary II file from a specified file. You specify the source file and a destination filename, and a Binary II archive is created using the specified destination filename and containing the selected source file.

"Make AppleSingle File" will allow you to take a selected file (of any type) and make it into an Applesingle format file [ N/A ].

"Make AppleDouble File" is the same as above, but produces its output in AppleDouble format [ N/A ].

Now that you have a brief knowledge of the menu options, let's talk about some other basic operations.

Working with Archives

After you select an archive with "Open" (or make a new one with "New"), a window will appear on the screen. The title is the filename and is followed by the type of archive, such as "Nuarchive (NuFX)". You can have more than one archive open at once. If you have multiple archives opened, simply click in the window of an archive to select it as the current archive. The current archive always has its window highlighted. Not that there doesn't have to be a current archive; an NDA can be the currently active window instead of an archive window.

Inside the window is a general information line right below the title. It shows the creation and modification dates of the archive, and the number of files in the archive. If the archive doesn't supply one of the dates, that field is dashed out. The other is a list control showing all the files in the archive and some information on each one. Generally it will show filename, filetype, axuptime, date when it was archived, size of the file, compression method, and how much it is compressed in percent. A scrollbar in the window allows you to scroll if there are more than 12 files.

The listing operates like this: if you click on a name, you select it and deselect all others. Dragging the mouse drags the selection bar. If you reach the top or bottom, the listing scrolls automatically. There are, however, two keys that modify the way you select items. Holding SHIFT down will select a "range" of records. For instance, if you clicked the first file, then held down shift and clicked on the last one, all files in between would be selected. So you would select seven records with only two clicks. And if you hold down OPEN-APPLE, clicking on a record will select that record but other records will NOT be deselected. The best way to learn this is to try it first hand by opening a big archive if you have one.

Once you select your files, you then select what to do with them. Currently the only thing you can do is "Extract" files from the archive (Open-Apple-E on the keyboard) although in the future you may be able to rename or delete files within the archive. After selecting extract, if any of the records to extract are files, you are asked to select a destination pathname (If you have a default pathname set up in the preferences, see "Misc Options" section, this will be the initial location pointed to in the window). Choose the volume using the Disk button. This can be any writable device, be it a floppy, hard disk, or file server volume. Next, use the Open and Close buttons to move in the desired subdirectory. When you double-click a directory also opens a it. After selecting the destination pathname, you can either click the "Cancel" button to abort extraction, or click the "Extract" button to continue.

When extracting disk records from an archive, NuPak displays a window from which you select the destination device for the disk record. The window contains three controls. The first two are buttons, the default button (selected by clicking it) is "Continue", the second is "Cancel", which must be clicked to be selected. The third control is a list of devices from which you select a destination device. Up to five names are displayed at once; if there are more than five, you can scroll the listing to display the extra devices. NuPak automatically makes sure you extract onto a device of the correct type to hold the disk record. If the device cannot accept the record, you are given another chance to select a device.

The program begins the extraction process and a status dialog is placed on the screen which will show the filename being extracted and the status using three "thermometers". The top thermometer is labeled "Data Fork", and fills up red as the data record of a file (or a disk) is written out. The middle thermometer is labeled "Resource Fork" and fills up with the color blue as the resource fork of a file is...
extracted. Many files do not have resource forks, and disks never do, so you probably will not see it fill very often. The final thermometer is labeled "Message" and it will fill up with the color yellow as each message is loaded into memory for you to look at. Finally, there is a "Cancel" button you can click which will abort extraction, but only between records (you cannot currently abort in the middle of extracting a single file or disk).

Several things can interrupt extraction. Errors that abort extraction include GS/OS errors (such as volume full or I/O error), unknown thread types in NuFX archives, and out of Memory errors. If a compression method is encountered that NuPak can't handle, it will ask you what to do. You can either continue and extract the file to disk (so that you may use another program to decompress it), or skip that file. If a file is being extracted already exists, you are given the option to skip that file, extract to a different filename (N/A), or delete the old file. And if messages are encountered in a NuFX archive, you are asked at each message if you want to view it, save it to disk, or both. Note that any records that NuPak never attempted to extract (if you abort or if an error aborts the extraction) are not deselected when the extraction process ends.

There are two messages that can be displayed during or after extraction of a record. The first message can appear anytime during uncompression, it is a "Data Damaged" message. This means that the data is seriously damaged and NuPak cannot continue uncompressing reliably. This error will abort the extraction process. The second error occurs at the end of extracting a record. It tells you that the "CRC" of the data does not match". NuFX archives have several checks for damages, called CRCs. NuPak always calculates CRCs on its own and makes sure they match those stored in the archive. If they don't match, then the data is damaged. This error is not serious enough to abort extraction, and NuPak will continue to the next record. Text files or pictures may be intact enough to warrant keeping, but a program file will very likely not run correctly.

When all records have been extracted, you will see an "Operation Completed" message. You can click the Continue button or just press Return, and you will be returned to the "normal mode" of the program, ready to open new archives, add, or whatever you wish.

Adding to an Archive

NuPak IIgs also offers the ability to add files to NuFX archives. In the future it will also be possible to compress files as they are added, as well as add whole disk to an archive.

Adding is functionally similar to extracting. After opening the NuFX archive to add to, select "Add" or OA-A from the keyboard. You will be presented with a dialog window to select files to add. The Disk, Open, and Close buttons function normally. To select files to add, use the mouse button and the SHIFT and OPEN-APPLE keys as outlined in the previous sections. When finished selecting, click Accept to continue or Cancel to abort.

After selecting your files to add, you are next asked to select any message types to add. Since this is not yet completed, just click "No It" to continue.

From here on the adding process is just like extracting. The status window has three thermometers that fill up as the files are added, and errors behave the same way as in extraction.

StuffIT Support

Version 2.0 of this program offers support for StuffIT archives, which is pretty much the standard for the Macintosh, on BBSs and on America Online.

NuPak IIgs can handle StuffIT archives in two formats. The first is the archive with a 32-byte header. This format is used when downloading the archives from America Online, using the Apple II (or IIgs) version of the program. The other is the archive with a 128-byte Machinary header. You will find archives this way on local BBSs and on other information services. Please note, however, that the format of the archive is transparent to you; the program senses automatically and adjusts itself.

Extracting from StuffIT files is very much like normal extraction procedures with a few minor changes:

- Filenames are converted to ProDOS format IF NEEDED. Which means if an HFS FST becomes available, you can unpack right to an HFS disk with no filename translation.
- Directories in an archive don't list the contents of the folder, only the folder itself. The folder's size will be the size of all its contents. Extracting the directory extracts everything in it as well.
- Filetypes are translated if necessary into ProDOS filetypes. As of this writing, the following HFS filetypes are converted:
  - "TXTT" becomes "TXT"
  - "APPL" becomes "S16"
  - "CDTV" becomes "CDV"
  - "SIT!" becomes "LBH", subtype $0000
  - "FIT!" becomes "LBH", subtype $0000

All other filetypes are extracted as "BIN" files.

- At this time the date IS NOT PRESERVED during extraction. When you get info on the date format on the Mac I'll fix this.

If you experience any problems with unStuffing, PLEASE TELL ME! This has never been done on an Apple Igs (or any other Apple II) before, and I'm not an expert on StuffIT archives.

Miscellaneous Options

**Format/Erase:**

These two options allow you to format or erase a disk. Formatting physically reformats a device, while erasing simply erases the main directory and makes the disk look fresh, but doesn't physically reformat (meaning the data is actually still on the disk). Both options work the same way. NuPak will display a window (almost exactly like the window when extracting a disk from an archive) with four controls in it. The first two are "Continue" and "Cancel" buttons. They are pretty self explanatory, but you should know that hitting RETURN selects "Continue" by default. You still have a second chance to cancel after that, so don't get excited if you mess up.

The third control is a list of all available devices on your system, from which you select the device to format/erase. Only five names are displayed at once; additional names can be reached by scrolling the listing with the scrollbar. If there are five or less names, the scrollbar is inactive and doesn't function.

The fourth and final control is an editing line directly below the device name listing. Here, you enter the name to use when formatting or erasing the selected disk. Click in this box brings up the cursor, as will hitting any key except RETURN (which of course selects "Continue"). The default name here is "Untitled", just like in the GS Finder.

Once you have selected a device and entered a volume name, hit RETURN or click "Continue" to go to the GS/OS format menu. I won't explain the GS/OS menu, as it's the same thing as what comes up in the Finder when you select Format or Erase. You can also Cancel from here if you change your mind.

**Delete/Rename:**

These two options allow you to delete or rename any file. For delete, you are prompted to select the file to delete from a list of files. Clicking "Open" or hitting RETURN will continue. You are then asked to confirm the deletion. Here,
hitting RETURN will select "Cancel". If you wish to continue, click the "Delete"
button. The file will be deleted if possible.

The rename option works similarly. After selecting the file to rename, you
are prompted to enter the new name for the file. The default pathname is the current
pathname. Note that you can actually rename a file to a different directory ON THE
SAME DISK ONLY, as well as just rename the file itself. To rename a file to a
different directory, leave the pathname alone, and just edit the appropriate
directory name(s) in the displayed pathname. After you enter the new name, click
"Rename" to continue, or press RETURN or click "Cancel" to cancel the option and
leave the file alone.

Preferences:

This option (under the Special menu) allows you to set certain defaults which
are set every time you run NuPak IIGS. This option displays a dialog, from which you
can select compression mode and a default pathname.

To select the compression mode, click on the appropriate "radio button" to
select that option. Only one option can be selected at once...selecting a mode
deselects all other automatically.

The default pathname is simple to edit. Just type in the full GS/OS pathname
of where you will most often put extracted files. Leaving this name blank tells
NuPak to not bother with a default pathname. What NuPak does with the default is set
the path to your default pathname right before putting up the "Select Pathname"
before putting up the "Select Pathname"

For saving your preferences, you have three options. Hitting RETURN or
clikcing "Cancel" aborts the changes you have made and leaves the preferences alone. Clicking "Make Changes Temporary" will change the preferences, but the changes will not be saved back to disk. Use this, for instance, to temporarily use a new default path or a different compression mode. And finally, if you select "Make Changes Permanent", NuPak will not only change the preferences, but will save them back to disk WHEN YOU QUIT THE PROGRAM. If you Ctrl-Reset and reboot out of NuPak without quitting, your preferences are not saved, so be careful!

Make Binary II File:

The final option is Make a Binary II file. Many information services require
uploaded files to be in Binary II format.

First, you are prompted for a source file to make the Binary II file with.
Select the file from the list and click "Open" to continue or "Cancel" to abort.
Second, you are prompted for the filename to use in creating the Binary II file.
Select an appropriate directory, type in a filename, and click "Save" to continue or
"Cancel" to abort.

NuPak will now make your Binary II file. What happens is the output file is
created and a Binary II header written to it. Then the source file is copied byte-
for-byte into the output file, creating your Binary II file. As this process
continues, you can watch the progress in a window like that used during extraction.
A thermometer will fill red as the process continues.

NOTE: You may have heard of "BXY" files. Some services prefer this format of
file. A BXY file is simply a Binary II file containing a NuFX archive. To make a
BXY file, simply create a Binary II file using a NuFX archive. You can either do
this to an existing archive, or create a new one within NuPak, add files to it, save
it, and then convert it to BXY.

Conclusion

Now you have mastered NuPak IIgs and you should be ready to use the program
the next time you wish to pack or unpack an archive. Keep an eye out for future
revisions as they are just around the corner. You may have also noticed new options,
Odometer Mouse v2.20

June 12th, 1992
Written by Paul Meyers
HippoCoders (C) 1992 ShylarWare

Here it is again. You saw the original in the Incider/A+ June 1992 issue, the mouse odometer for the Macintosh. No, here's the best, the GS version! This is a handy dandy NDA that tracks how far your mouse travels. It measures in pixels, inches, feet, miles, centimeters, meters, and shylars. Best of all, its freeware. If you have any comments, please contact me. I don't care if you call me at 3 in the morning (chances are, I'll probably still be awake, and would welcome the company).

Paul Meyers

Shylar: A person who uses big long complex words, has no idea what he's talking about, and makes a fool of himself in the process.

***** II INFINITUM *****
(consider the alternative)

1. Place the OGRE disk, label side up, in the disk drive and turn on the power.

2. Once past the title page, a dialogue box will prompt for the type of input device: K-keyboard, M-mouse, or J-joystick. The options may vary depending on what input devices are installed. The desired device is selected by pressing the appropriate key. In addition, the joystick can be selected by moving it or pressing its button.

3. OGRE will start in the Field Editor, from where the player can either continue a previously saved game or start a new game.

OGRE CONTROL

Making Choices. Choices are made in OGRE through the use of the pointer, a black, triangular object that can be moved around with a mouse, joystick or keyboard. A mouse (if available) or joystick is highly recommended for playing OGRE.

OGRE can be played using the keyboard to move the pointer and to simulate 'clicking' or pressing a button, or it can be played entirely with 'pointing', 'clicking' and 'dragging' techniques using a mouse or joystick.

Clicking. Some selections in OGRE are made by first moving the pointer to the desired object or option, then pressing and quickly releasing the button. This is referred to as clicking. When playing with the keyboard, typing RETURN will simulate pressing or releasing the button.

Dragging. Another method of designating choices is by dragging. Dragging is accomplished by placing the pointer over the desired object then pressing and holding the button while moving the pointer to another location. Releasing the button completes the drag. If playing with keyboard control, typing RETURN will simulate holding the button down. When the pointer is in the desired location, typing RETURN again will release the button and complete the drag.

Pulling down the Menu. In the upper right corner of the screen are two menus that can be pulled down. The first is titled 'Menu' and the second is 'OSI'. To pull down either menu place the pointer over the desired title and press and hold the button. The selected menu title will become highlighted and a list of commands will appear beneath the title. Releasing the button without moving the pointer will cause the menu to disappear. The menus can also be pulled down by typing M (on a //e or //c) or SHIFT-M (on a //, //+ or ///).

Choosing Menu Commands. Menu commands are chosen by using the dragging technique. Position the pointer over the selected menu title and pull...
down the menu by pressing the button. While holding the button down, drag the pointer to the desired menu command. As the pointer moves through the menu, each command is highlighted in turn. When the desired command is highlighted, releasing the button selects it. If you change your mind about choosing a command, move the pointer off the menu, or back up to the title, then release the button. Nothing is chosen unless you release the button while one of the commands is highlighted.

Dimmed Commands. When 'Menu' is pulled down, some of the commands are less distinct than others. These less distinct commands are referred to as dimmed. Dimmed options are ones that cannot be used at that time.

Dialogue Boxes. Whenever additional information is required to complete a command, a dialogue box appears. Dialogue boxes usually have special areas called 'buttons' to click, such as 'OK' or 'Cancel'. Sometimes, they present further options for selection. Dialogue boxes are also used to warn you if you're about to do something that is irreversible. If keyboard control is used, the pointer will automatically move to a dialogue box anytime one appears. Typing O or V will move the pointer to the 'OK' button and typing RETURN will press it. Typing Ctrl-O or Ctrl-V (or button 1 on the joystick) will automatically invoke the 'OK' button.

Control Keys. In most cases, pressing single keys, such as O or V, will move the pointer to a command area (i.e. the 'OK' button, or the 'Menu') without invoking that command. The command must then be invoked by a second keystroke, such as typing RETURN. This two-step process is a safety precaution against accidentally choosing the wrong command. This precaution can, in most cases, be overridden by pressing the CTRL key while simultaneously pressing the desired command key. This will automatically invoke the desired command without requiring the additional keystroke.

LOADING and SAVING GAMES

A previously saved game can be loaded at any time. If a battle is in progress when another game is loaded, the current game will be lost unless it is saved first. To load a game, select "Load a Game" from the Menu.

A dialogue box will appear from which one of five saved games can be selected. Select the desired game and then click 'OK'.

The selected game will be loaded in and the battle will proceed from where it was saved.

The current status of a battle can be saved for continued play later by selecting "Save a Game" from the Menu.

A dialogue box will appear, from which one of five games can be selected for saving. Select the desired game and then click 'OK'. The game will be saved and play can continue.

< slow pointer movement > fast pointer movement

The movement keys are active only when the keyboard is selected for input. Apple //, //+, and // use IJKM only. //e and //c use arrows only. All other keyboard shortcuts are active at any time during play, except where noted.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 726 of 1262
Ctrl-G Invokes Group function

R Moves pointer to Range button

Ctrl-R Invokes Range function

D Moves pointer to Done button

Ctrl-D Invokes Done function

E Examine and/or select piece pointed to (keyboard control only)

T, SPACE BAR, or joystick Button 1 Invokes targeting with/at selected defender

DIALOGUE BOX

(Not: If keyboard is being used, pointer goes to dialogue box automatically.)

O Moves pointer to OK button

Ctrl-O or joystick button 1 Invokes OK button

C Moves pointer to Cancel button

Ctrl-C or ESC Invokes Cancel function

Ctrl-G Invokes Group function

Ctrl-D Invokes Done function

Ctrl-R Invokes Range function

R Moves pointer to Range button

E Examine and/or select piece pointed to (keyboard control only)

T, SPACE BAR, or joystick button 1 Invokes targeting with/at selected defender

DIALOGUE BOX

(Not: If keyboard is being used, pointer goes to dialogue box automatically.)

O Moves pointer to OK button

Ctrl-O or joystick button 1 Invokes OK button

C Moves pointer to Cancel button

Ctrl-C or ESC Invokes Cancel function

Here are some examples of how keyboard controls can be used to speed up game play.

Ogre attacking defender:

1. Move the pointer to the desired defender.
2. Press the SPACE BAR, T, or joystick button 1 to invoke the targeting dialogue box. If the defender is within range the dialogue box will appear.
3. Select the desired weapons then type Ctrl-O for 'OK'.
4. Type Ctrl-F to fire.

Splitting Infantry:

1. Move the pointer to the desired infantry.
2. Type E to examine the infantry's statistics. The main purpose in this is to select the infantry without having to type RETURN twice.
3. Type Ctrl-S to split the infantry.

Ranging a unit:

1. Move the pointer to the desired unit.
2. Type E to examine/select the unit.
3. Type Ctrl-R to view the unit's range.
4. Type another key to continue.
The infantry had met it--finally--but powered armor notwithstanding, they against the Ogre's mobility will cost you casualities. Failure to slow the

-------------------------

Basic Strategy

```

```

The harsh truth is that you must *always* take whatever steps are necessary, no matter how drastic, in order to hold your ground and to preserve your Command Post. If your Command Post is lost, battle statistics suggest that the remainder of your force will also be lost, as will the Conflict Zone itself.

Successful defense against an Ogre means meeting two basic goals: Disarming the Ogre and Immobilizing the Ogre. Any plan which meets these two goals is a good plan! Alliance commanders have devised a wide variety of battle plans which both disarm and immobilize Ogres. Though battle plans or strategies have almost limitless variety, most successful plans have certain basic features in common. For simplicity's sake, three basic defensive points your plan should observe are:

1) Delay the Ogre as soon as possible! As it starts its invasion, an Ogre is as fast or faster than all Alliance infantry squads, missile tanks, and heavy tanks. There is a very real danger of the Ogre outrunning the first wave of defenders it meets. If this happens, second wave forces will have to bear the brunt of a full-strength Ogre attack. To prevent this sort of Ogre maneuver, most successful defense strategies call for forces to strike early and hard at the Ogre's tread sections (giving secondary attention to knocking out the Ogre's longer range weapons). We must be candid: opening attacks against the Ogre's mobility will cost you casualties. Failure to slow the
The Ogre early on, though, will cause even heavier losses later on. As a general rule, try to stop the Ogre's speed before it has progressed more than 1/3 to 1/2 of the way to your Command Post. To let the Ogre proceed at full speed beyond this point is to invite disaster. Alliance commanders usually concentrate on knocking out its most powerful weapons. The reason is that, from the midpoint of the Conflict Zone, the Ogre's longer range weapons are almost within range of your Command Post. You need to prevent a long range attack, and you should allow the Ogre to travel the full length of the Zone in its attempt to destroy your Command Post. In this way, you force the Ogre to expose itself to defensive fire which it cannot easily return. Appropriate targets, descending in order of priority, are the Ogre's main batteries (if any remain), and secondary batteries. While your forces "whittle away" at the Ogre's weapons, it is important to continue your attack against the Ogre's weapons and its bulk.

The Ogre becomes a threat when it is slowed and mostly disarmed. Commanders should make an immediate and concerted effort to stop the Ogre's speed before it has a chance to roll over your Command Post. Oddly enough, inexperienced commanders sometimes overlook this point; it seems they become so preoccupied with fighting the Ogre's weapons that they forget the machine is about to crush them. This is a fatal mistake. A key point to remember is this: An utterly disarmed but mobile Ogre can still accomplish its combat mission (i.e., destroying your Command Post). The same is not (usually) true of a completely immobilized Ogre. Let these simple truths guide you as you set your combat priorities.

The Defensive "Scramble:" To prepare for Zone defense, your GEVs should be spread evenly across an intercept line placed fairly close to the mouth of the Conflict Zone. The idea is to bring the Ogre to a standstill. when an Ogre is slowed and mostly disarmed, commanders usually make an immediate and concerted effort to stop the Ogre's speed before it has a chance to roll over your Command Post. Oddly enough, inexperienced commanders sometimes overlook this point; it seems they become so preoccupied with fighting the Ogre's weapons that they forget the machine is about to crush them. The same is not (usually) true of a completely immobilized Ogre. Let these simple truths guide you as you set your combat priorities.

As mentioned above, Alliance commanders have been inventive in creating defenses which can defeat Ogres. We hope you will carry on in this tradition of creativity. However, we feel your training will not be complete until you have mastered the three "classic" Alliance defense strategies.

The Multiple Howitzer Defense

The basic concept behind this defense is easy to grasp. You build your defense around a sizeable number of our most powerful and longest range weapons: namely, the howitzers. By placing three, four, or more howitzers so that their fields of fire and reinforce each other, you create a "Howitzer Wall." The Ogre must pass through the howitzer wall. If it can do so without being stopped, the Ogre is disarmed, remaining Alliance forces the Ogre's speed advantage. The Ogre becomes clear. Swarming GEV attack groups can close on the Ogre, fire their weapons, and then escape to relatively safety--all within the time it takes another vehicle to reach the Ogre. At close range, the Ogre will be brought to a halt and its weapons disabled. Ogres are enormously sturdy machines. The Ogre's pursuit speed is cut back, its weapons systems disabled. The Ogre is now a defense which can defeat Ogres. We hope you will carry on in this tradition of creativity. However, we feel your training will not be complete until you have mastered the three "classic" Alliance defense strategies.

The Multiple Howitzer Defense

prolonged attack from your GEVs and infantry.

**Final Phase of Attack:** When the Ogre approaches your Command Post, it is time to redirect your focus of fire once again. Whether or not your middle phase attack on the Ogre's weapons was successful, you must now throw all the firepower you can muster against the Ogre's tread sections. Recognize that a disarmed but mobile Ogre is still a formidable weapon. If, at this stage in a battle, you have lost a great number of GEVs, infantry forces become critical. Infantry must present solid resistance to the approaching Ogre, and must press home the attack against its treads. Infantry casualties will likely be very high. A spirit of sacrifice is essential. In fact, if your situation becomes desperate, you may need to sacrifice GEVs or other vehicles by ramming the Ogre (to destroy its few final treads). If you must use (fatal) sacrificial maneuvers, make sure they prevent the Ogre from crushing your Command Post.

Otherwise, we suggest your preserve your armor units in the hope of destroying the Ogre before it can escape.

**Comments:** the GEV-centered defense is built on three distinct phases:

First, slowing the Ogre somewhat; second, disarming the Ogre almost completely (by bringing the Ogre to a complete standstill. It is very important to execute each phase in a crisp, disciplined way. When GEV-centered defenses fail, it is often because the defensive commander fails to pay attention to the basics. For example, the commander fails to slow the Ogre early on, and hence loses too many GEVs to follow through with later phases of his attack. Or the commander continues the middle phases of his attack too long, only to see a disarmed but quite mobile Ogre flatten his Command Post. If you use the GEV-centered defense, do you best to complete each phase of your attack in the proper sequence.

Commands should be wary of the Ogre's attack algorithms. We have reason to believe the Ogre can recognize a GEV-centered defense, and that is it programmed to do all it can to disrupt early phases of the GEVs attack.

For example, and Ogre may respond to early GEV attacks by moving laterally or rearward to pursue escaping GEVs. If the Ogre employs these tactics, it is important to regroup your forces and proceed with your battle plan. If you let yourself be thrown by unpredictable moves on the Ogre's part, you are apt to lose sight of your combat goals. Steady nerves and sound tactics can help prevent from happening.

On a tactical level, we suggest you pay close attention to the escape paths your GEVs take after they first fire on the Ogre. All too often, commanders take the uninitiated approach simply of ordering their GEVs to get as far from the Ogre as possible. The problem with this approach is that is also tends to leave small groups of GEVs isolated far from each other. This approach can even leave GEVs trapped behind the Ogre. Beware such "divide and conquer" ploys on the part of the Ogre. When your GEVs escape, they need to think not only of temporary safety, but also of second and third attacks to come.

The GEV-centered defense can be very successful against both the Mk III and Mk V Ogres. Be aware, though, that the defense requires discipline, insight, and a keen sense for split-second timing.

The Mixed Defense does not rely on any one class of armor or artillery; instead, it is built around a varied armor force. Like the GEV-centered defense, the Mixed defense calls for initial intercept forces to slow the invading Ogre. Once the Ogre is slowed, though, the Mixed defense adopts an unique attack style of its own. The Mixed defense's flexibility allows it to throw a variety of weapons at the Ogre simultaneously.

Typically, defensive actions start with a group of GEVs attempting to shoot away about one third of the Ogre's tread sections (the "slow the Ogre" phase of the attack). The first wave(s) of GEVs are backed up by a mixed force of heavy tanks (placed closer to the Combine lines) and missile tanks (placed closer to the CP). This mixed force is very flexible and can attack both the Ogre's weapons systems and its tread sections. Finally, the "front" mixed force is backed by an additional "rear" mixed force, typically formed of missile tanks, missile howitzers, and infantry (some commanders choose additional GEV forces in lieu of howitzers). The "rear" mixed force surrounds the Command Post with a protective ring of fire, and does its best to stop and/or disarm the (presumably) badly damaged Ogre as it lumbers toward the Command Post.

The precise strategy of the "rear" mixed force is to some extent determined by the condition of the Ogre as it draws close to the Command Post. If the Ogre has few tread sections remaining, the "rear" force can attack the Ogre's weapons first, and then attack tread sections at the penultimate moment. Most typically, the Ogre arrives with few weapons remaining, but with a frag to make up for what is lost. As a complement of tread sections intact. In this case, the "rear" force throws all its firepower at Ogre tread sections, addressing the weapons later on.

The Mixed Defense relies on the same principle which makes the GEV defense work; namely, striking the Ogre with a greater level of fire than the Ogre can return. The GEV defense achieves this goal by using fragile GEV forces to "divide and conquer" ploys on the part of the Ogre. When your GEVs escape, they need to think not only of temporary safety, but also of second and third attacks to come.

The GEV-centered defense can be very successful against both the Mk III and Mk V Ogres. Be aware, though, that the defense requires discipline, insight, and a keen sense for split-second timing.

The GEV-centered defense can be very successful against both the Mk III and Mk V Ogres. Be aware, though, that the defense requires discipline, insight, and a keen sense for split-second timing.
Middle Attack: It is important to keep your "front" and "rear" mixed forces truly mixed. While we do not fully understand the Ogre's attack algorithms, we believe the Ogre usually has a harder time dealing with varied types of vehicles as opposed to clusters of identical vehicles (GEVs excepted). The Mixed defense derives much of its flexibility from striking the Ogre simultaneously with short and long range weapons. Don't lose this advantage when you don't have to. Be wary of Ogres which seem to break off their attack and instead maneuver diagonally across the Conflict Zone. Experience has shown that this is often an Ogre ploy calculated to draw out your forces, separating them into groups of fast, faster, and fastest vehicles. Once the Ogre separates your force into distinct classes of vehicle, it has much easier time methodically eliminating one class of vehicle at a time.

Final Attack: As mentioned under other defense sections, above, you must have a keen sense of timing to know when to begin your all out drive to immobilize the Ogre. Infantry are again required to play a critical, and deadly, self-sacrificial role in shooting away Ogre tanks before the Ogre closes on your Command Post, you must make sure that your infantry squadrons are in correct position to intercept the Ogre. We remind you once again that a disarmed but mobile ogre is a deadly weapon!

Comments: The Mixed defense is effective against both Mk III and Mk V Ogres. Of the "classic" defense schemes mentioned here, the Mixed defense is probably the easiest for an inexperienced commander to master. This is true mostly because the Mixed defense offers extra flexibility in selecting targets (at the mid-point of an invasion, both Ogre weapons and tread sections are suitable targets), and because the mixed armored force tends to help the commander recover from (small) tactical mistakes.

[Strategic Suggestions for Ogre AI Programmers]

Basic Strategy

This manual addresses the particular type of cybertank mission where a single Alliance ground force invades a Conflict Zone. The Mixed defense is derived for the Ogre-centered defense. Unless a change in the Ogre's defense shows an inverse of the argument for the howitzer-centered defense. The Ogres are in correct position to intercept the Ogre. We remind you once again that the Ogre can be a disarmed but mobile ogre is a deadly weapon!

2 Howitzers, 2 Heavy Tanks, 2 Missile Tanks, and 4 GEVs. The standard defense is very flexible, and enables the Alliance commander to resist the cybertank in several ways. The defense can be optimized to target either cybertank treads or weapons. The standard defense is perhaps the most difficult for the cybertank to "read," since the defense permits Alliance Commanders to mask their intentions until the last moment before their units close on the cybertank. If skillfully managed, a standard defensive force can bring numerous types of weapons to bear on the cybertank simultaneously.

Response Strategy: Our cybertanks do quite well against the standard defensive force provided only part of that force is engaged at any given moment. It is often useful for the cybertank to play a waiting game, using some lateral movement to draw the Alliance’s faster units forward. The main idea is to string out Alliance forces across the length of the Conflict Zone. In this way, the cybertank can tackle separate groups of armor rather than attempting to forge its way straight through a highly concentrated group of armor units. As the cybertank encounters small groups of armor, it should, where possible, take the added precaution of "sideslipping" past the edges of the groups. The sideslip maneuver helps keep the cybertank from being trapped, and helps ensure that the cybertank will arrive at the enemy Command Post with adequate mobility and firepower in reserve.

Entry to the Conflict Zone
==========================

Alliance commanders almost always locate Command Posts at the rear edge of the Conflict Zone, near the Center. Thus, to minimize travel distance across the Zone, and to permit greater flexibility of movement within the Zone, the cybertank should usually enter from a central location. There are a few exceptions to this rule. Some Alliance Commanders run the standard defense by placing both their Command Post and the bulk of their defensive forces in a rear corner of the Conflict Zone. When facing forces deployed in this way, the cybertank might benefit from entering the Zone at the opposite front corner of the Zone. In this case, an entry from the opposite corner tends to lure Alliance forces away from their strong position near the Command Post.

Use of Missiles
===============

Because missiles are the most powerful and longest range weapons in the cybertank arsenal, many AI programmers instruct cybertanks to hold at least a few missiles in reserve to handle contingencies arising late in the attack. On an intuitive level this strategy makes sense, but recent combat analysis by Combine intelligence indicates that the strategy simply does not work. In far too many cases, missiles are destroyed without ever leaving their launching tubes. Thus, the latest Combine doctrine holds that missiles should be held back only so long as the cybertank's "conventional" guns are able to handle nearby Alliance armor units. In all other cases, the missiles should be treated like any other weapon in the cybertank arsenal, and should be used as needed. This does not mean that missiles should be used haphazardly (e.g., to attack a single squad of infantry). It does mean that missiles can and should be used on a wide range of appropriate targets (e.g., to destroy Command Posts, or to eliminate Howitzers or armor units blocking the cybertanks path). Over a century ago, the first builders of nuclear weapons said it best: "Use 'em or lose 'em."

Use of Terrain
==============

Since both Mk III and Mk V cybertanks are free to move over all but the most difficult land surfaces, most AI programmers give little attention to terrain (apart from avoiding such obvious hazards as full-size bomb craters and swamps). To be blunt, this is a mistake. While terrain does little to affect the cybertank, it does affect the cybertank's enemies (in particular, very few vehicles can cross huge piles of battlefield rubble the way a cybertank can). In many cases, the cybertank can use rubble or bomb craters to block pursuit from Alliance armor units.

Some AI programmers send cybertanks along the very edges of impassable areas. The theory is that, in following this path, the cybertank can be attacked from one side only. This approach carries some merit. However, recent Combine combat analysis shows that the "edge" movement is not a good solution. The cybertank must trade freedom of movement for (relative) safety. The tradeoff is not a good one. We suggest you program cybertanks to search for travel paths which lie somewhere between the center and the perimeter of the Conflict Zone.

[End of Part 2]
The first step in designing the Ogre's Artificial Intelligence (OAI), was to determine just what an Ogre should do. This required much research into how "experts" played the game, in addition to many hours of game play to test various OAI concepts. The single most difficult aspect of designing the OAI was the fact that Ogre is a game based on probabilities. Every time the Ogre fires at a defender there is a chance of hitting, disabling, or missing. Assessing all of these chances for every possible combination of targets the Ogre may have, for every possible move the Ogre can make, evolved into a monumental task.

The Ogre's ultimate goal is to destroy the Command Post (CP) and get away. Its highest priority is to destroy the CP. Its secondary priority is to get away. On its way to the CP, the Ogre will be trying to destroy as many defenders, while sustaining as little damage to itself, as it can. This means the Ogre must not blindly dog a path straight to the CP, or the defense would merely set up a gauntlet that would destroy the Ogre before it could reach the CP.

The Ogre employs two intelligence techniques: strategic and tactical. Ogre Strategy involves long-range targetting of howitzers and the CP and avoiding terrain traps created with the editor. Ogre Tactics involve short-range maneuvers while enroute to its next long-range target.

At any given time, there is a limited number of hexes the Ogre can't legally move to. Some of these hexes are more advantageous to the Ogre than others. The Ogre's tactical intelligence determines which hex has the highest value.

The factors involved in determining the value of a hex are:

1) The distance of the hex from the current long range target (i.e. Howitzer or CP.)
2) The value of the defenders the Ogre can attack from that hex.
3) The amount of damage the Ogre may suffer in that hex.

The steps in determining the Ogre's best move look something like this:

1) Find a legal path to a target hex.
2) Determine the value of the defenders the Ogre can attack from the target hex (henceforth referred to as "Attacking Val").
3) Determine the amount of damage the Ogre may suffer in the target hex (henceforth referred to as "Damage Val").
4) Determine the value of the target hex using its distance from the current long-range target, and the hex's AttackVal and DamageVal.

These steps are performed for every hex the Ogre can reach from any given position. The Ogre then moves to the hex with the highest value.

Each defender is assigned a relative value by which the Ogre assesses their worth. For each hex the Ogre can reach, every defender that can be fired upon from the target is assigned a percent chance of being hit (%HIT). As the Ogre rams, overruns, or hits the various targets, those targets %HIT will be increasing (usually). As soon as the Ogre has completed its simulated attack from the target hex, each piece will have its relative value modified by the Ogre's percent chance to hit it. The summation of the piece's modified relative values will be the target hex's %HIT.

The same %HIT will be used to modify each piece's ability to damage the Ogre from any given target hex and the summation of these values will be the target hex's DamageVal.

The remainder of this section explains the techniques that are used in determining strategig targetting and in performing the four steps outlined above for computing the next best hex.

Strategic Long-Range Intelligence

Due to the long-range striking power of howitzers, it is necessary for the Ogre to be able to plan an overall strategy concerning howitzers. If it weren't for the howitzers, the Ogre could play a good game without looking more than 1 move ahead (except for being drawn towards the CP). Sometimes it is best to make the CP the only long-range target and disregard any howitzers. Other times it is necessary to target certain howitzers, or a sequence of howitzers, before heading for the CP.

There are two main considerations when planning Ogre strategy strictly around the howitzers and the CP. 1) getting to the CP in the least number of turns, and 2) suffering the fewest number of howitzer hits in the process.

The strategies the Ogre will consider will vary in value based on the defenders howitzer setup. One approach will be to target the CP alone. Another will be to target each howitzer, prior to the CP, in varying orders. The prime strategy will be the one that gets the Ogre to the CP in the fewest number of turns with the least number of hits.

The final long-range goal the Ogre will consider is leaving the map. This is a goal the Ogre will never consider unless the CP has been destroyed. Once the CP has been destroyed, the Ogre will try to leave the map as quickly as it can.

Tactical Short-Range Intelligence

A finite number of Paths are available to the Ogre and a complete list of these paths was compiled. The list consisted of 58 paths for any one of the six facings from a source hex.

Selecting a Path

In the path representation, the letter "S" denotes the Source hex (or starting hex), and the letter "T" denotes the Target hex (or destination hex). The arrows show direction of movement. The numbers label each move. The shaded circles represent craters. The example below illustrates using two movements to go a distance of two hexes.

![Diagram #1 Here](See Ogre Strategy Diagram Pic)

The Ogre will start looking at paths that have a distance of 1 and work up to paths that have a distance equal to its current movement value.

![Diagram #2 Here.](See Ogre Strategy Diagram Pic)

Certain paths are designated as RAM paths (RPath). An RPath is a path that does not use the direct route to the target hex. The purpose of an RPath is to attempt to ram a defender (or to overrun infantry) while enroute to the target hex. Illustrated is an RPath that is almost identical to the above path. Both paths have the same source and target hexes. The difference is that upon arriving at the target hex the Ogre expends a third move to potentially ram a defender a second time.
If no ram, or overrun, has occurred upon reaching the end of an Rpath, then no attempt is made to evaluate the target hex for its AttackVal and DamageVal, since the target hex will already have been evaluated by a previous, more direct path.

Actual game play allows a 50% chance of destroying a mobile armor unit with a single ram. For simulation purposes, however, if an active mobile armor unit is rammed, it will be marked as disabled and assigned a 75% WHIT. If a disabled, or immobile, unit is rammed it will be assigned a 100% WHIT. If an INF 1 is determined it will be assigned a 100% WHIT. If an INF 2 or INF 3 is overrun it will be reduced to an INF 1 or INF 2, respectively, and AttackVal will be increased by the value of an INF 1.

Ramming an armor unit costs the Ogre 1 tread unit. It was therefore necessary to assign a value to the Ogre's treads so that the DamageVal could be increased whenever the Ogre decides to ram. Decreasing this tread damage constant causes the Ogre to ram more frequently.

If, after all legal paths have been simulated and the Ogre is actually moving along the selected path, a single ram destroys an active, mobile armor unit anywhere before the end of that path, then the Ogre will re-evaluate a new path using the remaining of its movement value. This is necessary due to the fact that, in actuality, the Ogre has a 50% chance of destroying a mobile, active armor unit with one ram only, whereas the simulation logic always counts a single ram as a disable with a 75% WHIT.

The Ogre must have at least 3 treads to ram a heavy tank and 2 treads to ram all other armor units, except the CP (so it won't immobilize itself).

Evaluating a Hex's Attack Value

The "attack value" of a position to the Ogre is represented by AttackVal. Each defender will have a relative value assigned to it, referred to as AttackVal(defender). These relative values look something like this:

1) CF : 255
2) Howitzer : 200
3) GEV : 100
4) Missile Tank : 100
5) Heavy Tank : 100
6) Infantry 1 : 60
7) Infantry 2 : 40
8) Infantry 3 : 20

AttackVal will be based upon the cumulative AttackVal(defender) for each defender the Ogre can bring weapons against. The Ogre will deploy its weapons against all possible defenders and assess the potential value of those defenders. The weapons are deployed in this order:

1) Antipersonnel (AP)
2) Secondary Batteries (SB)
3) Main Batteries (MB)
4) Missiles (MSL)

If there are no defenders at exactly 3 hexes away from the Ogre's targetted hex then MB's will be processed before SB's. This is because there is no point in holding the MBs for a target out of reach of the SBs if there aren't any.

Each time the AttackVal of a hex is determined, every defender will be initially assigned a 0% chance of being hit (WHIT) by the Ogre. As the Ogre simulates a hit against a target, the target's %WHIT will be increased. As soon as the Ogre has completed its simulated attack for all weapons, each piece will have its WHIT multiplied by its relative value. The summation of the piece's modified relative values will be the target hex's AttackVal.

In determining a target's WHIT for any given weapon, the ratio of the Ogre weapon's attack strength to the target's defense strength is used. The WHIT values for both enabled and disabled targets for each of the various odds are as follows:

<table>
<thead>
<tr>
<th>Odds</th>
<th>Percent Chance To Hit Enabled Pieces</th>
<th>Percent Chance To Hit Disabled Pieces</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than 1-2</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>1-2</td>
<td>25%</td>
<td>33%</td>
</tr>
<tr>
<td>1-1</td>
<td>50%</td>
<td>67%</td>
</tr>
<tr>

<td>100%</td>
</tr>
<tr>
<td>better than 4-1</td>
<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

Infantry 1 targets are counted as disabled pieces.

Since the Ogre only gets one attempt with antipersonnel (AP) against infantry, it must deploy its AP with optimum efficiency. The algorithm outlined below assumes optimum deployment consists of hitting as many pieces as possible, it, therefore, deploys starting with the lowest odds (1-2) and works its way up.

The Algorithm goes as follows:

1) Sort the infantry within 1 hex of the Ogre in descending order of defense points (D).
2) Go 1-2 starting at the bottom of the list and working up.
3) Go 1-1 starting at top and working down.
4) Go 2-1 starting at top and working down, skipping 1s (D=1).
5) Go 3-1 starting at top and working down, skipping 1s.
6) Go 4-1 starting at top and working down, skipping 1s.
7) Go 2-1 starting at top and working down, including 1s.
8) Go 3-1 starting at top and working down, including 1s.
9) Go 4-1 starting at top and working down, including 1s.
10) Put remaining AP on lowest infantry.

The diagram below depicts the Ogre surrounded by 5 infantry units that have a combined defense value (D) of 9. The following example uses the above algorithm to determine the AP values represented in the diagram.

```
    3) Deploy at 1-1 from top to bottom:
D = 3 2 2 1 1
A = 1 1 1 1 1
    1

    1

    1
```

The last AP was deployed against the first "2" in the list, so the loop is exited.

The AP deployment now equals the values you see in the diagram above.

Once the AP are deployed, they will be used in a simulated attack against the selected targets. The ratio of AP to DP will be used to determine the WHIT used in modifying the AttackVal(defender) and the defender's damage potential. If, for example, the Ogre deploys 2 AP against an infantry 3, then the ratio will give 1-2 odds which renders a 25% chance to hit the infantry.
2) Secondary Batteries

First, all targets within range (2 hexes) of SBs are listed. Then the cumulative %HIT for those targets is computed. Deploy 1 SB against the defender with the most valuable target with the lowest cumulative %HIT. If there is a tie for the most valuable target, then the defender that is closer to the Ogre's current long-range target has priority. Using the ratio of the attack strength of the SB and the target's defense strength, determine the cumulative %HIT. Use the new %HIT to re-compute the target's value. Repeat the SB deployment until all SBs are used or until all targets have a 100 %HIT.

3) Main Batteries

This is done the same way as the SBs.

4) Missiles

Missiles will be deployed similarly to the main and secondary batteries but with a few modifications. It is desirable that missiles be reserved as long as possible for use against howitzers or the CP. The missiles will, however, be deployed if it appears they may be destroyed. Once all weapons have been deployed, the targetted pieces will have heir relative values modified by their %HIT and the total of there values will be assigned to AttackVal.

Evaluating a Hex's Damage Value

All of the defenders that can strike against the Ogre for a particular move contribute to a hex's DamageVal. It was necessary to establish a meaningful relationship between AttackVal and DamageVal. The first step in doing this was to determine what the Ogre would consider an even trade of damage inflicted for damage received. A constant was arrived at that is multiplied by the total attack points of the defenders that can reach the Ogre in the target hex. The formula to determine DamageVal for a particular hex looks something like this:

\[ \text{DamageVal} = (\text{Defender Attack Points}) \times \text{Damage Constant} \]

Modifying the Damage Constant makes the Ogre play more aggressively or more cautiously. All defenders are checked to see if they can strike the Ogre on their turn (taking into account the defender's attack range, movement value and terrain). The attack strength of each defender is modified by their %HIT computed by the attack evaluation logic.

TargetVal is the variable that causes the Ogre to move towards the current long-range target (i.e. a howitzer or the CP). There are three situations when considering the Ogre's movement relative to its current target:

1) decreasing its distance (a positive effect)
2) not changing its distance (a negative effect)
3) increasing its distance (a strong negative effect)

When moving towards its current target, the best the Ogre can do is decrease the distance by the amount of its movement value. Anything less than this is suboptimal when considering movement only. If the Ogre can increase its advantage by not moving as close to its target as it can in order to destroy a defender(s), then it should do so.

The technique for determining TargetVal is to divide a constant by the Ogre's maximum movement value and multiply the result by the number of hexes that the Ogre moves towards its current target (a positive value) or away from its current target (a negative value).

Several factors may modify the attraction of a target. Some of the factors are:

* Often it is desirable to move away from the current target in order to destroy a relatively defenseless defender(s). Thus, a path that shows a high attack value with little or no damage value is weighed positively, whether it is far away from the current long-range target or not.

* If the Ogre is in a howitzer umbrella, then the Ogre will have a greater tendency to move towards its current long-range target, thus keeping the howitzer from getting too many shots at it.

* * If the current long-range target shows at least 50% chance of being destroyed (which is also a sure disable), then the Ogre will be pulled to the next long-range target. This will keep the Ogre from getting closer to the current target than it has to in order to destroy it.

* In order to keep the Ogre from "wimping out" (i.e., running scared), a path that moves away from the current long-range target that shows zero AttackValue, is weighted negatively.

Once all of the factors for a hex have been evaluated, they can be combined to arrive at the overall value for that hex.

The formula for determining the value of a hex is:

\[ \text{HexVal} = \text{AttackVal} - \text{DamageVal} + \text{TargetVal} \]

The Ogre performs these computations for every legal move it can make from its current location, then selects the hex that has the greatest value.

[End of Ogre Strategy Notes]

Courtesy of L.S.D. Remember-you always have a friend in Texas! Strategy Notes typed by Sector Seventeen.
The tank-type vehicle, considered obsolete by the end of the 20th century, ruled the battlefields of the 21st.

Several factors led to the reappearance of mechanized warfare. The first was the development of biphase carbide armor (BPC). Stronger than any steel, it was also so light that even an air-cushion vehicle could carry several centimeters of protection. The equivalent of a megaton of TNT was needed to breach even that much BPC armor - which meant that, in practice, nothing less than a tactical nuclear device was likely to be effective.

Infantry, which had for a time eclipsed the tank, declined in importance. Although an infantryman could carry and direct a tactical nuclear missile, he had to be extensively (and expensively) protected to survive the nuclear battlefield. Thus, the "powered suit" was developed. Four cm of BPC, jet equipped, it could guard a man for about a week (in increasing discomfort) from shrapnel, background radiation, and biochem agents. However, the cost of equipping infantry reduced their value. They were still more flexible and maneuverable than armor, and now they were almost as fast - but they were no longer cheaper.

Long-range nuclear missiles, which had been expected to make a mockery of "conventional" operations, likewise declined in value as jamming technology and laser countermeasures improved. Without satellite guidance, no missile could hit a less-than-city-sized target at more than 30 km - and no combatant could keep a spy satellite operational for over an hour. Missiles big enough to carry jam-proof guidance systems were sitting ducks for the big laser batteries - for, although lasers had proved too temperamental and fragile for battlefield use, they were fine as permanent antiaircraft units.

Thus, the tank-type vehicle - fast, heavily armed and armored, able to break through enemy positions and exploit disorganization - returned to wide use. And once again, planners fretted over priorities. More guns? More armor? More mobile? Increase one and lose on the others? Increase all and build fewer units?

Some interesting compromises appeared. The 21st-century infantryman, especially with the later "heavy powered suit", was a tank in his own right, at least by 20th-century standards. The armored hovercraft or ground effect vehicle (GEV), equipped with multi-leaf spring skirts for broken ground, could attain speeds of 120 kph on any decent terrain, and 150 on desert or water. Conventional tanks were slower but tougher. All fired tactical nuclear shells.

The ultimate development of the tank-type weapon, though, was the cybernetic attack vehicle. The original tanks had terrorized "she". Friendly units of the speaker's acquaintance were "he"; otherwise "it". And the term "cybertank" was rarely used. People had another name for the big war machines - one drawn from the early Combine units and, before that, from dark myth. They called them Ogres...

The game: Ogre is a game of mechanized tank warfare set in the 21st century. A cybernetic fighting unit - the Ogre - has been sent to destroy the opponent's strategic Command Post. Which was the First Army's headquarters. The Ogre's primary objective is to destroy the Command Post; destruction of all other units is its secondary objective. The armor battalion has but one objective: Defend the Command Post. To do so, they must destroy the Ogre.

Making choices: Choices are made in OGRE through the use of the pointer, a black, triangular object that can be moved around with a mouse joystick, or keyboard.

Clicking: Some selections in OGRE are made by first moving the pointer to the desired object or option, then pressing and quickly releasing the button. This is referred to as clicking.

Dragging: Another method of designating choices is by dragging. Dragging is accomplished by placing the pointer over the desired object then pressing and holding the button while moving the pointer to another location. Releasing the button completes the drag.

Pulling down the menu: In the upper right corner of the screen are two menus that can be pulled down. The first is titled "Menu" and the second is "OSI". To pull down either menu place the pointer over the desired title and hold the button. The selected menu title will become highlighted and a list of commands will appear beneath the title. Releasing the button without moving the pointer will cause the menu to disappear.

Choosing menu commands: Menu commands are chosen by using the dragging technique. Position the pointer over the selected menu title and pull down the menu by pressing the button. While holding the button down, drag the pointer to the desired menu command. As the pointer moves through the menu, each command is highlighted. Releasing the button selects it. If you change your mind about choosing a command, move the pointer off the menu, or back up to the title, then release the button. Nothing is chosen unless you release the button while one of the commands is highlighted.

Using the keyboard: A mouse (if available) or joystick is highly recommended for playing OGRE. OGRE can be played using the keyboard to move the pointer and simulate a button. It can be played entirely with pointing, clicking, and dragging without reference to the various input devices.

Dimmed commands: When "Menu" is pulled down, some of the commands are less distinct than others. These less distinct commands are referred to...
as dimmed. Dimmed options are ones that cannot be used at that time.

Dialogue Boxes: Whenever additional info is required to complete a command, a dialogue box appears. Dialogue boxes usually have special areas called buttons to click, such as "ok" or "cancel", and sometimes they present further options for selection. Dialogue boxes are also used to warn you if you're about to do something that is irreversible. For an example of a dialogue box with general information, select "About Ogre" from the OSI menu. Clicking the "ok" button removes the dialogue box.

THE BATTLEFIELD:

General: The defender's Command Post has been located in the most defensible terrain available – a battered stretch of land 22.5 kilometers wide by 53 kilometers long (14 miles by 20.5 miles). It is bounded on three sides by impassable swamp and on the fourth by a very deep wide river. A map representing the standard battlefield is displayed on your computer screen. The map is divided into hexes, each representing an area 1500 meters (0.93 miles) across.

Viewing the Map: Only half of the map can be viewed at one time. The map can be moved vertically by clicking on one of the arrows positioned at the four corners of the map. At the upper left and lower left corners of the map are arrows with horizontal bars at their tips. These arrows are used to display the top or bottom half of the map. Clicking on arrows in the upper right and lower right corners moves the map up or down one hex at a time.

Craters: The battlefield is scarred with craters from past nuclear detonations. Craters are represented on the map by solid circles. Nothing may move into or over a crater. It is possible, however, to fire across craters.

Rubble: The battlefield is further obstructed by great piles of earth and rubble. These piles of rubble are represented on the map by solid black lines along the edges of hexes. Only the Ogre and infantry can be moved across this rubble. Other arm units cannot cross. Any unit can fire across the rubble.

Areas: The standard battlefield is divided into two basic areas. The majority of the map (the top 16 rows of hexes) is referred to as the "obstructed" area. This is the area containing all of the craters and rubble. The bottom 6 rows of hexes, free of craters and rubble, are referred to as the "clear" area. Both the left-most and right-most column of hexes contain only one crater. These craters are located in the bottom row down from the top. A line drawn between these two crater hexes is referred to as the "crater line". The obstructed area, clear area, and crater line are referred to during the initial deployment of defensive forces.

THE COMBATANTS:

The combatants are rated by Combat Factors. The main combat factors are Armor, Attack Strength, Attack Range, and Defense Strength. Attack Strength reflects a weapon's destructive power. The effective distance a weapon can reach is its Attack Range, and a unit's capability to withstand an attack is referred to as its Defense Strength. These factors will be further expanded upon when discussing combat.

THE Ogre:

There are two types of Ogres, the Mark III and the Mark V. The Ogre is a cybertank, approximately 30 meters in length, equipped with guns, missiles, antipersonnel weapons, and 3 meters of biphase carbide armor.

An undamaged Ogre can travel at about 45 kph, i.e., 3 map hexes per turn. The Ogre’s goal is to destroy the Command Post and, if possible, the entire defensive arm unit. The Mark V is a larger, more formidable version of the Mark III.

COMMAND POST: Att.S - 0 Att.R - 0 Def.S - 0 Movement - 0

This is the defender's strategic communications center. The Command Post, once positioned, cannot be moved. The Command Post is incapable of attacking the Ogre, or of defending itself. An attack from any of the Ogre's weapons automatically destroys Command Post. At times the Ogre will, with seeming cruelty, elect to destroy a Command Post, not quickly and mercifully with one of its nuclear weapons, but instead by fire upon it. This leave the heavy tank vulnerable to almost all of the Ogre's weapons, including the possibility of being crushed beneath the Ogre's treads.

### Armor Units - There are four types of defensive armor units: the Heavy Tank, the Missile Tank, The Howitzer, and the Ground Effect Vehicle (GEV).

This is the defender’s main battle tank. A heavy tank is big, powerful, and heavily armored. Its speed is such that it can keep pace with the Ogre, except when maneuvering around rubble. Unfortunately, a heavy tank must get within 3 km. (2 hexes) of the Ogre in order to fire upon it. This leave the heavy tank vulnerable to almost all of the Ogre's weapons, including the possibility of being crushed beneath the Ogre's treads.

A missile tank is smaller and less heavily armored than a heavy tank. The broad, sturdy surface from which the missile tank commander fires long-range missiles sits atop a set of wide crawler treads that move the missile tank slowly across the battlefield. The missile tank is boot keep pace with the Ogre, thus requiring the missile tank commander to continually anticipate the Ogre's movement in order to keep it within
range of his missiles. The missile tank’s saving grace is that it can fire upon the Ogre from 6 km. (6 hexes) away, allowing it to pound the Ogre while staying out of range of most of the Ogre’s weapons.

Howitzer: Att.S. - 6 Att.R. - 8 Def.S. - 1 Movement - 0
The howitzer is the defender’s hardest hitting and longest range weapon. A howitzer can reach an Ogre up to 12 km (8 hexes) away. This allows a howitzer to get to 2 to 3 shots at an Ogre before the Ogre can get within striking distance. Howitzers are permanently installed and cost twice as much as any other armor unit. The fact that a howitzer annoys move is its greatest weakness. In addition, it is all but defenseless. The defenders must try to buy a howitzer time with the mobile armor units so that the howitzer may re-use its weak considerable damage on the howitzer. The howitzer or move scenario.

Propelled by air-cushion suspension, the GEV is the defender’s fastest moving vehicle. It can move more than twice as fast as any other unit including the Ogre. GEVs move once in the defender’s regular movement phase and again after firing in the GEV movement phase. The seasoned GEV controller will swoop in close enough to fire at the Ogre and then dart away just beyond the reach of the Ogre’s weapons.

Infantry: Att.S. - 1, 2, or 3 Att.R. - 1 Def.S. - 2, 3, or 4 Movement - 2
Infantry are in groups of one, two, or three squads. Infants are armed with conventional and anti-tank weapons and have no power to battle the Ogre’s antipersonnel weapons, as well as to be overrun by the Ogre. Many infantrymen swear to the supposedly emotionless Ogre derives great pleasure from the feel of battlesuits being crushed beneath its treads.

Deployment:
The defending player must deploy forces in anticipation of attack. Battlefield alterations and force deployment are controlled in the field editor. A detailed discussion of the Field Editor can be found in the “Field Editor” section. To quickly get started playing Ogre (oh boy!!), use one of the predefined fields or battles.

Loading/Saving Fields: There are five predefined fields from which the player may choose. In addition to the five predefined fields, the player may save five fields of original design. To load a field, select “Load a Field” from the Menu. A dialogue box will appear from which one of the original or preset fields can be selected for loading. Click on the field of choice and then click “ok”. The selected field will be loaded in and displayed.

Loading/Saving Games: A previously saved game can be loaded at any time. If a battle is in progress when another game is loaded, the current game will be lost unless it is saved first. To load a game, select “Load a Game” from the Menu. A dialogue box will appear from which one of five saved games can be selected. Select the desired game and then click “ok”. The selected game will be loaded in and the battle will proceed from where it was saved. The current status of a battle can be saved for continuation later, to save the battle status, select “Save a Game” from the Menu. A dialogue box will appear, from which one of five games can be selected for saving. Select the desired game and then click “ok”. The selected game will be loaded in and the battle will proceed from where it was saved. The current status of a battle can be saved for continuation later, to save the battle status, select “Save a Game” from the Menu. A dialogue box will appear, from which one of five games can be selected for saving. Select the desired game and then click “ok”. The selected game will be saved and the button is dimmed. During a movement phase, the top buttons are labeled “Undo” and “Group”. During an attack phase, the top buttons are labeled “Clear” and “Fire” (the buttons work as follows:

- Range Button: The “Range” command is used to view a piece’s movement and
- Attack Button: The “Attack” command is used to select a piece and
- Move Button: The “Move” command is used to move a piece to a new
- Status Button: The “Status” command is used to view a piece’s
- Info Button: The “Info” command is used to view a piece’s

Playing Ogre:
Starting the Game: Once the player chooses the field configuration and weapon deployment, then selecting “Play a Game” from the Menu will start the actual battle. A dialogue box will appear asking which battle option the player desires. There are two battle scenarios: Mark III or Mark V. Either scenario can be played with two players or the computer can control the Ogre. Select the desired option and click “ok”. If this is a continuation of a previous game, a dialogue box will ask whether to start a new Ogre or continue with the original Ogre. Select the desired option and click “ok”. When starting a new game under the two player option, the player controlling the Ogre must select one of the hexes at the bottom of the map as and entry point for the Ogre. Click “ok” on the dialogue box asking for an entry hex and then select an entry hex by clicking on it. Once it has entered, the Ogre can move two hexes. Most player options are locked out at this point until and entry hex has been selected for the Ogre. The map can be moved in order to scan the battlefield.

Changing Between One and Two Player Games: It is possible to change from a one player game to a two player game and vice versa. To do so, enter the Field Editor by selecting “Edit the Field” from the Menu, during actual game play. Select “Play a Game” from the Menu. When the battle option dialogue box appears, select the desired scenario and click “ok”. When the next dialogue box asks to start a new Ogre or continue with the old one, select the “Keep old Ogre” option. This process allows the battle to continue but with someone (or something) else controlling the Ogre. This operates somewhat differently when changing between Mark III and Mark V scenarios. If “Keep old Ogre” is selected, when changing between Mark III and Mark V scenarios then the number of players will change but the original Ogre type will be maintained. If “Start new Ogre” is selected, the Ogre type will enter at the bottom of the map with full weapons and no damage.

Game Phases: The Phase window near the top of the sidebar displays the current phase of game play. The first phase is the Ogre Entry phase which occurs only at the beginning of a game. During that player’s turn, that player may move any or all of his units, and fire with any or all of them. The phase sequence is:

1) Ogre Enters
2) Ogre Moves
3) Ogre Fires (After the Ogre fires, all armor units disabled the previous turn become active again)
4) Defense Moves
5) Defense Fires
6) GEVs complete their movement

The Sidebar: The sidebar is different while playing the game than when in the Field Editor. The area directly beneath the Ogre jumps to the next dialogue box.

GEV: Att.S. - 2 Att.R. - 2 Def.S. - 2 Move - 4,3
Propelled by air-cushion suspension, the GEV is the defender’s fastest moving vehicle. It can move more than twice as fast as any other unit including the Ogre. GEVs move once in the defender’s regular movement phase and again after firing in the GEV movement phase. The seasoned GEV commander will swoop in close enough to fire at the Ogre and then dart away just beyond the reach of the Ogre’s weapons.

To quickly get started playing Ogre (oh boy!!), use one of the predefined fields or battles.

Loading/Saving Fields: There are five predefined fields from which the player may choose. In addition to the five predefined fields, the player may save five fields of original design. To load a field, select “Load a Field” from the Menu. A dialogue box will appear from which one of the original or preset fields can be selected for loading. Click on the field of choice and then click “ok”. The selected field will be loaded in and displayed.

Loading/Saving Games: A previously saved game can be loaded at any time. If a battle is in progress when another game is loaded, the current game will be lost unless it is saved first. To load a game, select “Load a Game” from the Menu. A dialogue box will appear from which one of five saved games can be selected. Select the desired game and then click “ok”. The selected game will be loaded in and the battle will proceed from where it was saved. The current status of a battle can be saved for continuation later, to save the battle status, select “Save a Game” from the Menu. A dialogue box will appear, from which one of five games can be selected for saving. Select the desired game and then click “ok”. The selected game will be saved and the button is dimmed. During a movement phase, the top buttons are labeled “Undo” and “Group”. During an attack phase, the top buttons are labeled “Clear” and “Fire” (the buttons work as follows:

- Range Button: The “Range” command is used to view a piece’s movement and
- Attack Button: The “Attack” command is used to select a piece and
- Move Button: The “Move” command is used to move a piece to a new
- Status Button: The “Status” command is used to view a piece’s
- Info Button: The “Info” command is used to view a piece’s
attack range. To view a piece's range, select the piece by clicking on it; then click the "Range" button. All of the hexes within a piece's movement value (disregarding having to move around rubble) are turned blue. Any piece that falls within this "umbrella" is highlighted. Clicking anywhere on the screen will remove the umbrella.

Done Button: The "Done" button is used to end a phase. If a player has not moved or fired all of his pieces when the "Done" button is pressed, a dialogue box will require verification from the next player before proceeding to the next game phase.

Undo Button: The "Undo" button allows any piece's move to be undone, or restarted at any time during the Movement Phase. To undo a move, select the desired piece by clicking on it; then click the "Undo" button. The piece will move back to its original location. The "Undo" button remains dimmed unless a piece that has moved is selected. If the Ogre has rammed or overrun a defender, it can only be undone back to the hex where the ram or overrun occurred.

Clear Button: The "Undo" button changes to the "Clear" button during an attack phase. The "Clear" button is used to deactivate weapons that have been aimed at a target.

Group/Split Button: Explanation of the button is covered in Grouping Infantry and Splitting Infantry in the Movement section.

Fire Button: The "Group/Split" button changes to the "Fire" button during an attack phase. Once weapons have been aimed at a target, clicking the "Fire" button fires them.

MOVEMENT:

Moving a Piece: To move a piece, click on it, and while holding the button down, drag the pointer to another hex and release the button. If an illegal move is attempted (i.e., moving onto a crater, across rubble, off the map, moving a piece that has already moved, or moving a piece farther than it can) you will hear a beep and a message informing you of your error will be in the Tactical Display. Once a piece has moved at all, it appears dimmed (green). This alerts the player that any solid (black) pieces have not moved yet. A piece can move up to its maximum movement value. It is not necessary to move a piece at all if it is already well located.

Ogre Movement: The Ogre's movement depends on the number of treads it still has intact. A Mark III starts with 45 treads; a Mark V with 60. When the Ogre's treads are reduced to two thirds their original total (30 for Mark IIIs and 40 for Mark Vs), the Ogre's movement value is reduced from 3 to 2. When the treads are reduced to one third their original total (15 for Mark IIIs and 20 for Mark Vs), the Ogre can move only one hex per turn. When the Ogre's treads are completely destroyed it can no longer move. It can still attack anything within range.

Selecting the Ogre will display the "Ogre Summary" in the Tactical Display and will show the Ogre's current movement value as well as the number of treads remaining.

Movement Through Occupied Hexes: In general, only one unit at a time may occupy a hex. Any unit may move through a hex occupied by a friendly unit. When moving onto a hex occupied by a friendly unit, the top piece will be highlighted. Clicking
on this hex brings the bottom piece to the top. One of these pieces must be moved before any other action can be taken. Attempting any other action (except moving the map, undoing, or moving one of the stacked pieces) elicits a beep and the message "Please move from one full hex".

Grouping Infantry:
The maximum number of squads of infantry that can occupy a single hex is three. Two 1-squad units may be grouped into a 2-squad unit. Three 1-squad units, or a 1-squad and a 2-squad unit may be grouped into a single 3-squad unit. To group two infantry units, move them to the same hex and click the "Group" button. WARNING - When two infantry units are grouped together, the newly merged unit will have a remaining move value equivalent to whichever of the two original units has moved the farthest. Also, grouping infantry CANNOT be undone.

Example: an INF 1 uses its first move to move onto an INF 2 that hasn't moved at all. At this point, the INF 1 has moved 1 hex and has 1 move remaining. The INF 2 hasn't moved at all, therefore, has 2 moves remaining. If so desired, the INF 1's move can be undone at this point. Clicking the "Group" button, will change to the "Split" button. Clicking the "Split" button will cause a 1-squad infantry unit to be split off and share the hex with the remaining squad unit. The two new infantry units will have the same "moved" status as the original unit.

(Splitting Infantry:
2-squad or 3-squad units may be split into two infantry units. Whenever a 2- or 3-squad infantry unit is selected, and is not currently sharing a hex with another piece, then the "Group" button, will change to the "Split" button. Clicking the "Split" button will cause a 1-squad infantry unit to be split off and share the hex with the remaining squad unit. The two new infantry units will have the same "moved" status as the original unit.

Example:
If an INF 2 is split after having moved one hex, then the two new INF 1 units will both have moved 1 hex and can be undone back to the same hex as the original INF 2). The "Split" button will immediately change back to the "Group" button allowing the two infantry units to be recombined if so desired.

Ramming:
An Ogre can damage or destroy an armor unit by ramming it. This is accomplished by moving onto its hex. Any immobile armor unit (i.e., a howitzer or any junt that has been disabled) is destroyed when rammed by the Ogre. Any mobile armor unit has a 50% chance of being disabled and a 50% chance of being destroyed when rammed. To ram a unit, click the "Ram" button. Ramming a heavy tank, the Ogre loses 2 treads. Ramming any other armor unit costs the Ogre 1 tread. An Ogre can completely destroy the Command Post with a single ram at no tread loss. The Command Post. If the Ogre disables a piece when ramming it, then the Ogre will be highlighted to indicate that a piece is underneath it. If the Ogre has any movement left it can ram the piece again, thus destroying it. If the Ogre moves off the disabled piece, the piece will be dimmed (blue) as an indication that it is disabled. THE OGRE CAN ONLY RAM TWICE IN ONE TURN. Armor units may ram first, ram the Ogre. This ram, however is sacrificial and destroys the ramming armor unit. (Sort of like using your compact car to ram the crawler that carries the Space Shuttle to the launching pad). The Ogre loses 1 tread due to this. This ploy is not recommended except in dire emergencies.

WARNING: A Ram CANNOT be undone. Therefore, any time a piece moves onto an opponent's hex, a dialogue box appears requesting verification of the ram. Clicking "ok" allows the ram to proceed. Clicking the "cancel" will abort the move.

Overruns:
Infantry are not rammed by an Ogre, but overrun. If an Ogre moves onto a hex occupied by infantry, that infantry is reduced by one squad IF THE OGRE HAS ANY ANTIPERSONNEL WEAPONS LEFT. If the Ogre does not have any antipersonnel weapons, the infantry is not reduced. There are no limits on overruns; the Ogre can overrun for as many moves as it has. In addition, overruns do not cause the Ogre any damage. An infantry unit may move onto a hex occupied by an Ogre without any immediate effectss. The infantry will, however, be reduced by one squad at the beginning of the Ogre's Movement Phase, providing the Ogre has any antipersonnel weapons, without the Ogre having to expend movement points to do so. WARNING: Overruns cannot be undone. Therefore, any time an Ogre moves onto a hex containing infantry, a dialogue box appears requesting verification of the overrun. Clicking "ok" allows the overrun to proceed. Clicking "cancel" will abort the move.

GEV Double Movement:
A GEV may move twice per turn - once (up to four hexes) during the defender's Movement Phase, and again (up to three hexes) during the GEV Movement Phase following the defender's attack phase.

Ending Movement:
To end the Movement Phase, click the "Done" button. If all of a player's pieces have not been moved when the "Done" button is clicked, a dialogue box appears requiring a verification to end the Movement Phase.

One-Player Ogre Movement:
During the Ogre Movement Phase in the one-player game, the pointer will disappear while the Ogre is thinking about where to move. When done, the Ogre automatically moves. If the Ogre rams a piece, there may be another pause while the Ogre considers a different move.

COMBAT:
A Combat Phase occurs after each Movement Phase (except for GEV second-phase movement). During a Combat Phase, the "Undo" and "Group/Split" buttons in the sidebar change to "Clear" and "Fire", respectively. These buttons are dimmed initially, and remain so unit weapons have been aimed.

Weaponry:
Most weapons are heavy rapid-fire cannon using tactical nuclear shells, capable of firing in any direction. Each unit may apply its attack strength once per turn. Each intact Ogre weapon may apply its attack strength once per turn, with the following exceptions:

Antipersonnel:
The Ogre's antipersonnel weapons are effective only against infantry and the Command Post. No infantry unit may be attacked more than once per turn. When applied to antipersonnel weapons, an Ogre can no longer reduce an infantry unit's strength by overrunning it.

Missiles:
Each of the Ogre's missiles are one-shot weapons. Once fired (or destroyed before firing), they are gone.

Ogre Attacks:
An Ogre may attack an enemy unit by dragging from the Ogre's hex to the enemy hex. If the Ogre has any unfired weapons that can reach the enemy, a dialogue box will appear offering the available weapons. Weapons that have been fired, destroyed, or are out of range will be dimmed and cannot be selected. Clicking on the desired weapon highlights it and displays the weapon's attributes in the sidebar. Clicking on the up arrow in the dialogue box will increase the number of the selected weapon to be fired (up to the maximum number of this type weapon available). Clicking the down arrow will decrease the number. At the very bottom of the sidebar is a window displaying the probability of...
killing the target with the selected weapons. Any number and type of weapons can be fired in combination to increase this chance. The probability of killing will not always be increased by combining weapons. This probability is derived from the ratio of the total Attack Strength of the attacker(s) to the Defense Strength of the target. Sometimes the combined attack strengths are not enough to reach the next highest ratio. The following table contains the probabilities for all possible ratios.

<table>
<thead>
<tr>

OGRE lets you customize various game features to suit your own taste, and can be used before or during a game. Selecting "Preferences" from the "OSI" menu will display the Preferences dialogue box. This presents you with five options to modify. Clicking on an option will change it. If an option has more than one choice, click on it until the desired choice is displayed.

The Options are:

Sound Effects: The default is "yes" (meaning sound effects will be heard). Turning sound effects off not only makes OGRE play more quietly (in case someone in the house is trying to sleep), but also causes the program to operate a little faster.

Reminders: During play, various dialogue boxes will appear as reminders that you have not performed all of the actions available to you, or that you are about to perform an irreversible action. If, for example, "Done" is clicked during the Defender Move phase and all of the defenders that can move have not done so, then a reminder dialogue box appears. There is a reminder for the end of each game phase as well as reminders for ramming and overrunning. The default for reminders is "yes".

Skip Empty Turns: There are times when there is no possible action during the phase. If, for example, the Ogre has had all of its weapons destroyed, then there is nothing for the Ogre to do during the Ogre Attack Phase. Nonetheless, the Ogre Attack Phase appears and "Done" must be clicked to go on to the next phase. These "empty" turns can be bypassed automatically by setting "Skip Empty Turns" to "Yes". The default for skipping empty turns is "No".

Ogre Message Speed: During the one-player game where the Ogre is controlled by the computer, various messages will appear informing the player as to what the Ogre is doing. The time that these messages remain visible can be modified with "Ogre Message Speed". The choices are "low", "med", and "high". The default is "low". This option appears dimmed during a two player game.

Ogre Skill Level: This option allows the player to modify the level of intelligence with which the Ogre plays during the one player game. The levels are "low", "med", and "high". The default is "low". This option appears dimmed during a two player game.

DETERMINING COMBAT RESULTS AND THE COMBAT RESULT TABLE:

Here is how combat results are determined in the original OGRE as designed by Steve Jackson. The computer version of OGRE computes combat results in the same fashion, but in a manner totally transparent to the player.

In general, each attack is resolved by comparing attack and defense strengths of the units involved, and then rolling a die. Specifically: For each attack, all attack strengths involved are totaled, and then
compared with the defense strength of the target in ratio form. This ratio is then rounded off in the defender's favor to one of the ratios shown on the COMBAT RESULTS TABLE. In other words, the target of the attack, be it Ogre or standard unit, gets the benefit of the rounding-off. Examples: 2 attack points against 1 defense point would be a "2 to 1" attack. 2 attack points vs. 2 defense points = 1 to 1; 3 attack points vs. 2 defense points = 1 to 2; 6 attack points vs. 1 defense point = 6 to 1 (treated as 5 to 1; see the Combat Results Table). Once the ratio is determined and rounded off, the attacker rolls the die and consults the proper column of the Combat Results Table to find the result. Results are applied immediately.

Attacks at less than 1 to 2 are always ne
Attacks at 5 to 1 or better, are always and automatic x

Explanation of Symbols:

ne: "no effect", The unit attacked is undamaged.
d: Four Possible results, depending on the unit attacked.
1) An Ogre is undamaged. (This shows as "glanced" in the sidebar)
2) An infantry unit has its strength reduced by 1
3) An armor unit is disabled, the unit can neither move nor fire next turn. An armor unit remains disabled until the end of the enemy's next Combat Phase.
4) A disabled armor unit is destroyed if it receives a second "d" result while disabled.
x: If the unit attacked is an Ogre, the part of the Ogre that was attacked is destroyed. If the defender is any unit other than an Ogre, it is destroyed.

FIELD EDITOR MESSAGES:

Command Post Already Present: Appears when the player attempts to put more than one Command Post on the field
Crater in the Way: Appears when the player attempts to move the Ogre onto a crater.

Please stay on the Map: Appears when a click occurs anywhere except in a legal area.

GAME MESSAGES:

2 units in hex Please move 1: When two defenders are in the same hex, one of them must be moved off before any action may be taken elsewhere. This message appears if any action is attempted with a defender other than the two are residing in the same hex.

can't move onto a crater: Appears when attempting to move a piece onto a crater.

can't move that far: Appears when attempting to move a piece more than its movement allowance.

Command Post can't attack: Appears when the player attempts to target the Ogre with the Command Post.

Disabled Can't attack this turn: Appears when the player attempts to target the Ogre with a disabled piece.

Disabled Can't move this turn: Appears when the player attempts to move a disabled piece.

Entire squad has aimed or fired: Appears when the player attempts to target the Ogre more frequently than the number of units in the squad.

No attacker: Appears when the player attempts to target opponent by dragging from a hex that doesn't contain a piece.

No clear path: Appears when the player attempts to move a piece from one hex to another, and there is no path of empty hexes short enough to complete the move.

No combined on attacks on treads: Appears when the player attempts to combine pieces in an attack against the Ogre's treads

No Target: Appears when the player attempts to target the opponent by dragging from a piece to a hex that doesn't contain an opponent.

No treads left!: Appears when the player attempts to move an Ogre that has no treads.

Not enough treads to ram: Appears when the player attempts to ram that will cost the Ogre more treads than it has remaining.

Ogre can't enter on a crater: Appears when the player attempts to bring the Ogre onto the field on any row other than the bottom one.

Only two rams per turn: Appears when the Ogre player attempts to ram more than two pieces in one turn.

Piece cannot move: Appears when the player attempts to move the Command Post or howitzer.

Please move a piece: Appears when the player attempts to move a piece that is already aimed at the Ogre.

Please stay on the map: Appears when a click occurs anywhere except in the legal area.

Target one unit at a time: Appears when the Ogre attempts to target more than one defending unit at a time.

Target out of attack range: Appears when the Ogre is beyond the range of the attacking piece, or when the ogre attempts to target a piece beyond the range of its available weapons.

This hex is full: Appears when the player attempts to move a defending unit onto a hex that already contains the Ogre and another defending unit.

This unit has moved: Appears when the player attempts to move a piece that has already moved it's full movement allowance.

Unit already aimed this turn: Appears when the player attempts to target the Ogre with a piece that is already aimed at the Ogre.
YOU'RE RICH...MAYBE. GEOLOGISTS HAVE JUST LOCATED ONE OF THE LARGEST OIL DEPOSITS IN NORTH AMERICA, ON YOUR LAND! BUT YOU HAVE TO GET IT OUT OF THE GROUND BEFORE YOU CAN SPEND IT.

THE OTHER OIL BARONS ARE JEALOUS, AND THEY WOULD DO ANYTHING TO SABOTAGE YOUR OPERATION. THEY HAVE PLANTED OOZIES AND LAND MINES IN YOUR OIL FIELDS TO WRECK YOUR DRILLING EQUIPMENT.

DON'T LET THEM CHEAT YOU OUT OF YOUR
-------------------MILLIONS!-------------------

CONTROLS:
--------

JOYSTICK-

USE STICK TO DRILL IN ANY DIRECTION.

PRESS FIRE BUTTON TO RETRACT DRILL BIT.

CONTROL KEYS:
----------------

[CONTROL-S] TOGGLE SOUND OFF OR ON
[ESC] PAUSE GAME
[CONTROL-R] RESTART GAME-W/NEW OPTIONS
[SPACE BAR] RESTART GAME-W/SAME
[CONTROL-H] DISPLAY HIGH SCORES PAGE

HOW TO PLAY OIL'S WELL:
-----------------------

YOUR GUSHER CAME IN, BUT THAT HAS NOT MADE YOU A MILLIONAIRE. NOT YET, ANYWAY. THE COMPETITION IS GIVING YOU TROUBLE.

EVERY TIME YOU START DRILLING, AN OOZIE ATTACKS YOUR PIPE AND EATS RIGHT THROUGH IT. OR YOUR DRILL BIT SETS OFF AN UNDERGROUND LAND MINE THAT SOMEONE HAS PLANTED IN YOUR OIL FIELDS. IF YOU CAN'T AVOID THESE HAZARDS YOU MAY HAVE TO SHUT DOWN!

AS YOU GATHER IN ALL THOSE PRECIOUS OIL PELLETS, WATCH FOR EXTRA-RICH DEPOSITS OF HIGH GRADE OIL. LAP UP THAT LIQUID GOLD, LIKE GLEAMING GOBLETS OF GOLDEN NECRAR.

IN THE DEEPEST, DARKEST CAVERNS BELOW YOU WILL FIND AN OCCASIONAL DEPOSIT OF PETROMIN. WHILE THIS RARE MINERAL IS FLOWING UP YOUR PIPE IT CREATES A FORCE FIELD WHICH SLOWS DOWN THOSE OOZIES, GIVING YOU A
Apple II Computer Info

CHANCE TO MINE SOME OF THOSE DEEPLY BURIED OIL PELLETS. BE CAREFUL, THOUGH—THE LAND MINES ARE NOT AFFECTED BY PETROMINS.

AS YOU MINE EACH OF YOUR EIGHT OIL FIELDS, CONSTRUCTION WORKERS ARE BUSY OVERHEAD BUILDING A REFINERY. CLEAR OUT ALL THE FIELDS AND YOU REFINERY WILL BE FINISHED. YOU CAN SELL YOUR REFINED OIL, AND LIVE ON EASY STREET FOR THE REST OF YOUR LIFE!

WHAT ARE YOU WAITING FOR? YOUR FIRST FORTUNE IS ONLY MINUTES AWAY!!!

THE PLAYERS

DRILL BITS
(THAT'S YOU!) YOU GET 3 TO START WITH, AND ANOTHER EVERY 10,000 POINTS. EACH HAS A LIFE SPAN OF 990 TICKS.

LAND MINES
(BOMB-LIKE) YOUR DRILL BIT WILL DETONATE THIS, BUT IT WON'T HURT YOUR PIPE.

OIL PELLETS
(DOTS) Gobble up EVERY ONE >10 POINTS< OF THESE TO ADVANCE TO NEXT FIELD.

PETROMINS
(LOOKS LIKE A SUN) SPECIAL OIL NUGGETS THAT SLOW DOWN THE OOZIES.

OOZIES
(LITTLE SNEAKER MEN!) THESE >20-170 PTS.< THESE WILL DESTROY YOUR PIPE, BUT YOUR DRILL BIT WILL DEVOUR THEM (POINTS INCREASE AS YOU DIG DEEPER)

GOBLETs
YOUR DRILL BIT CAN MINE >1000 PTS.< THESE SUPER-RICH DEPOSITS; THEY PASS HARMLESSLY THROUGH YOUR PIPE

BASKETBALL- A VERY FAST GROWING SPORT. THE GAME OF BASKETBALL HAS NOW BEEN RE-INTRODUCED INTO THE COMPUTER GAME INDUSTRY. WITH THE HELP OF TWO BASKETBALL STARS, DR. J & LARRY BIRD; ELECTRONIC ARTS HAS OUTDONE THEMSELVES AGAIN BY COMING OUT WITH THE NEWEST IN REAL-ACTION SPORTS GAMES- ONE ON ONE. IN THE NEXT FEW PAGES I WILL TRY AND GIVE YOU AN OVERVIEW OF THIS GAME AND SOME STRATEGIES AT PLAYING IT.

OBJECT- THE OBJECT OF COURSE IN ONE ON ONE IS TO MAKE MORE BASKETS THAN YOUR OPPONENT, JUST LIKE IN ANY GAME OF BASKETBALL.

CONTROLS- THE CONTROLS USED IN ONE ON ONE ARE EITHER THE KEYBOARD OR THE JOYSTICK. I HAVE FOUND THAT JOYSTICK IS MUCH EASIER TO USE. IF YOU DO USE KEYBOARD YOU MAY CHANGE THE KEYS TO YOUR LIKING.

THE CHOICE PALET- AFTER THE GAME HAS BEEN RUN YOU WILL SEE A DEMO, PRESS THE BUTTON OR <SPACE BAR> AND YOU WILL BE PROMPTED WITH THE "CHOICE PALET" THIS IS WHERE YOU CUSTOMIZE YOUR GAME. YOU MAY FIRST CHOOSE WHETHER YOU WISH TO HAVE THE WINNER (ONE WHO MAKES THE BASKET) OR THE LOSER TAKE OUT THE BALL AFTER EACH SHOT. YOU MAY THEN CHOOSE TWO-PLAYER OR ONE PLAYER. IF YOU CHOOSE ONE PLAYER YOU MUST DECIDE WHO THE COMPUTER WILL PLAY (DR.J OR BIRD). IF YOU CHOOSE TWO PLAYER YOU HAVE THE CHOICE OF PLAYING WITH TWO JOYSTICKS (IF YOU HAVE TWO JOYSTICKS) OR DEFENSE ON KEYBOARD. (PLAYING WITH TWO JOYSTICKS IS, OF COURSE, MUCH EASIER) SINCE MOST PEOPLE DO NOT HAVE TWO JOYSTICKS YOU WILL HAVE TO CHOOSE THE KEYS YOU WISH AND PLAY THAT WAY. WHEN YOU DO PLAY EVERY TIME THE BALL SWITCHES OVER TO THE OTHER PLAYER YOU MUST SWITCH CONTROLS (ACTUALLY CHANGING HANDS). THAT CAN BECOME A REAL DRAG.

THE NEXT THING YOU MUST CHOOSE IS WHAT TIME OF SKILL LEVEL YOU WISH TO PLAY AT. THERE ARE FOUR:

LEVEL 1 (EASIEST) IS PARK & REC
LEVEL 2 (EASY) IS VARSITY
LEVEL 3 (MODERATE) IS COLLEGE
LEVEL 4 (VERY HARD) IS PRO

THE LAST THING YOU HAVE TO CHOOSE IS THE ACTUAL GAME PLAY, WHAT I MEAN IS DO YOU WANT TO START A NEW GAME OR RESUME THE GAME YOU LAST WERE PLAYING OR JUST GO TO A DEMO, USING YOUR CHOICES.

IF YOU DO FOLLOW THE BASKETBALL SCENE YOU WILL SEE FROM THIS GAME THAT MANY OF THE PLAYERS' REGULAR SHOTS IN REAL LIFE ARE USED. FOR INSTANCE IF YOU PLAY PRO, WITH YOU BEING THE BIRD, DR. J BLOCKS YOU LIKE CRAZY WHEN HE'S ON DEFENSE, AND WHEN HE'S ON OFFENSE, HE'S HARD TO BLOCK.

PROPS-
* THE CLOCK - DISPLAYS, OF COURSE, TIME REMAINING IN THE QUARTER, THE NUMBER OF
FOULS YOU HAVE (DISPLAYED AS DOTS UNDERNEATH EACH PLAYER'S NAME); AND THE QUARTER YOU ARE IN.

* THE SHOT CLOCK - THIS DISPLAYS THE AMOUNT OF TIME YOU HAVE LEFT TO SHOOT THE BALL. IF YOU DON'T SHOOT BEFORE TIME IS UP, YOUR OPPONENT GETS THE BALL.

* THE BACKBOARD - YOU KNOW WHAT THIS IS AND SOMETIMES YOU CAN BREAK IT, BUT BETTER NOT, OR YOU'LL GET YELLED AT.

* THERE IS EVEN A REFEREE THAT COMES OUT AND BLOWS A WHISTLE IF YOU FOUL, AND THEN DISPLAYS YOUR FOUL. THEN YOUR OPPONENT USUALLY GETS ONE OR TWO FREE-THROWS.

--- SPECIAL COMMANDS:

IF YOU WANT TO GET RID OF ALL THAT FATIGUE YOU HAVE, JUST PRESS "T" WHEN YOU HAVE THE BALL AND YOU WILL CALL A TIME OUT, BUT YOU CAN ONLY CALL ONE PER QUARTER, AND YOUR OPPONENT ALSO GETS TO REST DURING THAT TIME OUT, SO HIS FATIGUE GOES DOWN TOO. SO USE IT WISELY.

IF YOU WISH TO CHANGE THE CHOICES YOU MADE AT THE BEGINNING OF THE GAME JUST PRESS (CTRL-R) AND YOU WILL GO BACK TO THE CHOICE PALET. AFTER YOU FINISH, YOU MAY "RESUME GAME".

IF YOU NEED TO DO SOMETHING, JUST HIT THE <ESC> KEY AND THE GAME WILL PAUSE UNTIL YOU TOUCH THE <SPACE-BAR>.

ANOTHER COMMAND THAT YOU MAY WISH TO USE IS THE <SHIFT-!> COMMAND. IF YOU PRESS THIS YOU WILL PLAY IN SLOW MOTION. TO SWITCH BACK TO NORMAL PLAY, JUST TYPE IT AGAIN.

--- WHILE PLAYING:

IF YOU GET THE BALL AFTER YOUR OPPONENT MISSED, MAKE SURE YOU COME BACK AND CLEAR THE BALL, OR BRING THE BALL BEHIND THE CENTER LINE, OTHERWISE YOUR POINT (IF YOU MAKE A SHOT) WILL NOT COUNT.

YOU MAY THINK THAT YOU CAN NOT BLOCK YOUR OPPONENT'S SHOTS, WELL, LET'S JUST SAY IT'S HARD.

WHILE YOU ARE PLAYING, ON OFFENSE YOU CAN PRESS BUTTON (0) JUST SLIGHTLY AND YOU WILL SPIN TOWARD OR AWAY FROM YOUR OPPONENT. IF YOU PRESS BUTTON (0) HARD OR LONG YOU WILL SHOOT THE BALL. (SPACE BAR FOR KEYBOARD).

ON DEFENSE BUTTON (0) IS USED FOR:

A) JUMPING TO BLOCK A SHOT
B) TRYING TO STEAL THE BALL

WHEN YOU ARE "ON TOP OF" YOUR OPPONENT AND PRESSING THE BUTTON YOU WILL BE TRYING TO STEAL THE BALL, OTHERWISE IF YOU ARE AWAY FROM YOUR OPPONENT AND PRESS BUTTON (0) YOU WILL JUMP UP. (THE MORE FATIGUE YOU HAVE THE LESS YOU CAN JUMP).

IF YOU GET THE BALL IF YOUR OPPONENT MISSES THE SHOT, BUT IT CAN BE DONE, A HINT IS TO TRY AND JUMP BEFORE HE DOES, OR DO IT AS SOON AS YOU THINK HE MIGHT TRY AND SHOOT, OR YOU COULD TRY AND GO BACK FARTHER AND WAIT UNTIL IT GETS NEAR THE BASKET AND TRY TO TIP IT OUT.

MOST PEOPLE ALREADY KNOW THIS, FROM JUST KNOWING HOW TO PLAY BASKETBALL, BUT FOR THOSE OF YOU WHO DON'T, YOU CAN GET THREE POINTS, INSTEAD OF TWO, IF YOU SHOOT THE BALL, AND MAKE IT, FROM THE BIG HALF-CIRCLE ON THE OUTSIDE.

IMPLANTED IN THE GAME IS A MODE CALLED "HOT STREAK". IF YOUR PLAYER MAKES THREE CONSECUTIVE SHOTS (IN) THE NEXT SHOT WILL AUTOMATICALLY GO IN, FROM WHEREVER YOU ARE. THIS CAN BE HELPFUL IF YOU ARE ONLY BEHIND BY ONE OR TWO POINTS. YOU COULD QUICKLY GO DOWN TO THE WIDE HALF-CIRCLE ON THE OUTSIDE AND SHOOT, AND YOU'D KNOW IT WOULD GO IN. THAT'S IT, HAVE FUN!
This documentation contains the Operators Manual, Letter from the President of the Space Ecological Society, and the Auto Flight Log.

OPERATORS MANUAL

This operator manual contains important information regarding operation of the Intergalactic star fleet Astro Mega Class series of intermediate-range spacecraft.

In order to obtain maximum usage of this spacecraft, we suggest all craft pilots familiarize themselves with the contents of this booklet and follow the recommendations outlined.

The Astro Mega Class vehicles should be operated only by a trained, licensed pilot. This book is NOT meant to be used as space flight instruction. The Astro Mega Class meets or exceeds all applicable Intergalactic Federation star fleet safety standards. Effectiveness of these safety features can best be continued through regular craft inspection and maintenance. Proper repair of this craft should be done only by a qualified Astro Development technician. Always specify Astro Development parts for maximum performance and economy.

Observe all flight regulations. Make safety a habit!

Main Computer

Using advanced technology, the Astro Mega Class craft is virtually self-operational. The on-board computer system provides all engine control, navigational maneuvers, and systems monitoring necessary for intermediate-range space travel.

The Main Computer is entirely voice-activated. The system receives audio input only at the Main Computer Console, located behind the bridge on the port side. However, the system provides audio output anywhere on-board.

COMPUTER OPERATION—When the vehicle is in total shutdown, the computer must be re-activated for flight. Audio input of the MISSION CODE is required to begin computer functions. Audio input of the word "STATUS" initiates a computer check of all on-board systems. Audio output will notify the pilot of malfunctions, safety hazards, or any other disorder that would imperil space travel. Intergalactic Federation safety codes require that ALL SYSTEMS MUST BE IN PROPER OPERATING CONDITION IN FOR THIS CRAFT TO ENTER FLIGHT. Audio output will notify the pilot of lift-off condition with the ALL SYSTEMS CHECK response.

The Main Computer performs other functions besides standard ship operation. For example, with audio input of the word "VALUE," it will appraise any item and supply currency exchange rates for nearby star systems.

Bridge Controls

Bridge controls are automatically activated and monitored by the Main Computer. Override Systems will function only during an emergency landing situation.

Primary Components

1) ACCELEROMETER: an instrument that measures the rate of acceleration changes. Located on the Bridge control panel by the co-pilot chair.

2) AIRLOCK: a chamber that adjusts air pressure for passage from on-board to extravehicular environment and vice versa. Located mid-ship on the port side.

3) APOGEE KICK MOTOR: a rocket motor that fires at the apogee of an oval transfer to launch the craft into a circular geostationary orbit. Located in the Port Engine Room.

4) AVIONICS: the electronics system and instruments that monitor and control ship functions in flight. Located on bridge.

5) COMPUTER CARD UNIT: storage for individual Universal Activan Data Cards to control various computer information functions. The cards can easily be exchanged and updated to the next recent banks. Located in the Main Computer on the port side before entering the Bridge.

6) CRYON PURIFIER: a filter that intensifies cryon particles emitted by the power cylinder. Located in the Port Engine Room.

7) ENERGY CONVERTER: an "Xchanger" energy converter that uses zellium-based internal coils to convert various forms of energy created by the power cylinder into usable light drive energy. Located in the Port Engine Room.

9) EXTRAVEHICULAR SPACE SUIT: a self-sealing and regulation thermo-space suit used in conjunction with Extravehicular Helmet and Thermo Gloves for hostile and no-environment extravehicular activity.

10) GYRO-MATIC LEVELER: a system that stabilizes the spacecraft during flight. Controls stability along linear (roll), planer (pitch) and vector (yaw) axes. Located in the Bridge control panel.

11) HYDRO-PARTICULATOR: a life-support component that purifies and recycles condensation from internal atmosphere of the craft into the water system. Located in the Life-Support Center.

12) KRYLLIAN CHIP: a vital component of the transmission beacon. Located on the Bridge.

13) LIGHT-ROD: a short-term source of light that absorbs energy from available light when not in use. Required in the Life-Support Center during flight and removable for emergencies.

14) MAIN SHIELD UNIT: a protable protective unit that, when installed, creates a "cushioning" shield around the spacecraft to prevent damage from micro-meteoroids and other space debris. Installs on the garon ray transfer housing in the Starboard Engine Room.

15) NAVCHIP: a computer component that contains current interstellar causeway information and navigational beacon. It controls firing of the external retro-rockets during flight. Located in the Bridge control panel.

16) OXYGEN RECIRCULATOR: a vital component of the Life-Support Center that removes condensation and harmful gasses from the internal atmosphere of the ship. Whater particles are channeled into the hydro-particulator and gasses are jettisoned into open spaces. Located mid-ship on the starboard side.

17) THERMO GLOVES: self-sealing hand protection used in conjunction with Extravehicular Helmet and Extravehicular Space Suit for hostile and no-environment extravehicular activity.

18) TACHYON POWER CYLINDER: a power intensifier that creates a radioactive
zone around the engine core using intense alpha-coronic waves. Supplies limitless engine power and life support capabilities. Located in the Port Engine Room.

CARGO BAY

The Cargo Bay is located in the center of the spacecraft and measures 8 x 7 x 7 fleegs. The entrance to this area of the ship is airlocked since the CARGO BAY doors must sometimes be opened during flight. The Cargo Bay is designed to accommodate most cargo and payload support equipment (i.e.- for specialized atmospheric control). The size and weight of all cargo support equipment must be included with data that is fed into the Main Computer to determine exact payload limit.

PAYLOADS

The Mega Class spacecraft is capable of carrying two types of payload:

1) ATTACHED PAYLOAD: remains in the cargo bay during flight and unloaded only at fixed landing destinations.

2) FREE-FLYING PAYLOAD: is deposited in space through the Cargo Bay airlock during flight. Free-flying payload requires proper orientation training and instruction. It is best to check the payload manufacturer for recommended disembark information.

EMERGENCY LANDING

The Main Computer operates all emergency landing functions. However, in an emergency landing situation, the pilot can engage the Main Computer auto-pilot override system. This enables the pilot to combine Main Computer scanning data with optic visualizer input.

SPECIFICATIONS

Ship type: Mega Class Tachyon Drive
Model 12,288
Identification Code: XX4357G9005.1
Weight (Fueled): 75,000 BS (165,000 LM)
Cargo Capacity: 1,000,000 BS (2,200,000 LM)
Wingspan: 25.73 FG (84.42 T)
Length: 35 FG (114.83 T)

External Hull Composition: Ablative Nuvonic Trainium
Inner Hull Composition: Spanedar Voraxion
Engine Type: Taychon-convert 5000
Engine Thrust: 14,900,000 KN
Maximum Speed: 4.5 LPM
Fuel Capacity: 400,000 Lemperes-

-NOTE: Use ONLY ungarbonized fuel.

SPACE ECOLOGICAL SOCIETY
OFFICE OF THE PRESIDENT

J. Castor Nebulus
President

Date: 51.7.290
Time: 06.13.00
Communication: Argo HQ, President
To: Flight Commander Argo Base

Mission Code: TSE957X
Priority: Urgent—red level
Depart: White Bay 2. Maximum speed, immediate upon receipt of this directive.
Destination: Observation Labport 5V, Station 5 Omega Sector 12
Objective: Transport protective compound to Labport

Background: Outside the boundaries of star system 69 Omega is Observation Labport 5V. Subject of this Labport is star 69B and surrounding planets. The third planet of this system (Earth) is inhabited. Earth has no knowledge of or contact with the numerous members of the Intergalactic Society. An interstellar transport carrying power transfusion waste collided with a meteor and its toxic contents have scattered into open space. These contents are being drawn toward star 69B (SOL) and Earth is in the path. The transfusion waste is so deadly that all lifeforms on Earth could be destroyed on contact. Earth is not aware of the problem and does not have the technology to avert a disaster. A protective compound has been synthesized by SES scientists. With seeds of this compound, Labport 5V can produce the chemical and secretly introduce it into Earth's atmosphere. It is IMPERATIVE that no attempt be made to communicate directly with lifeforms on Earth. Earth is within a restricted travel zone. Sudden contact with other lifeforms could cause irreparable damage to Earth's development.

Comments: The SES has great hopes for the inhabitants of Earth. It is of the utmost importance that we do whatever possible to avert this disaster.

Good Luck,
J. Castor Nebulus
PRESIDENT
JCN:ps

AUTO FLIGHT LOG

Date: 54.7.290
Mission code TSE957X

Time: 07.23.12 Mission code accepted. Prepare for departure. Audio input received. Executing on-board systems check. Please be seated and fasten your safety harness.

Time: 08.01.09 Departure successful. Mission course preset. Destination: Observation Labport 5V. ETA: 310 minutes.

Time: 13.01.22  ABORT EMERGENCY LANDING! Scanners indicate sea composed of highly corrosive materials. Auxiliary emergency landing site located. Prepare for hard landing on beach.

Time: 14.00.12  Scanners indicate buildings due west of beach. Unidentified life forms approaching ship on port side. Life forms not indigenous to Oo-Topos. CAUTION: data analysis suggests Oo-Topos is a likely base for space pirates. Scan...............................ALERT! Breach in outer airlock..... . . . . . . . . . . . .
Presented by BETS C.

An Extraterrestrial Adventure
By Michael Berlyn
Sentient Software

The object of this 142 room text adventure is to rebuild your ship and gather up your scattered cargo. There are about 45 items to find. When you're done, and the items are in the hold type SCORE.

Object List
-----------
Laser
Dart
Needler
Seeds
Tachron Power Cylinder
Gyroscopic
Oxygen Recirculator
Seamless box (compass)
Navigation Chip
Repair Manual
Converter
Water System
Goggles
Vibroaxe
Gloves
Pressure Suit
Flask
Cage
Field Nullifier
Light Rod
Translator
Plaque
Small Ring
Library Crystal
Plasma Sphere

Special Thanks to Bill Heineman for Believing in the Apple IIGS
Support Him and Others Like Him by PURCHASING Quality Software!
The Oversampler isn't anything special at all. It's just a small program demonstrating the oversampling technique on the Apple IIGS. The other major feature of Oversampler is the ability to play digitized sound directly from disk without loading them into memory. The advantage is that you can instantly play long long sounds without waiting to load them from disk and you don't need to have 8 MB ram to play sounds of 8 MB - in fact Oversampler only requires 16 KB of free space!

Oversampling

If you own a CD player you may have read in the manual that your CD player uses four or eight times oversampling to improve sound quality. Oversampler is doing the same. With 2-times oversampling the program loads 8 KB of sound into memory, doubles the wave to 16 KB in sound ram by adding an intermediate value between every two values (e.g. 10, 20, 40, 25, 15, ... becomes to 10, 15, 20, 30, 40, 32, 25, 20, 15, ...) and doubles the frequency in order to play the sound at the correct speed. 4-times oversampling quadruples wave size and frequency by inserting 3 intermediate bytes and so on...

50
45
40 x
35
30 2-times
25 x oversampling
20
15
10 x
0 ...
-10
-15

Using the program

Open first a sound file by selecting 'Open' from the 'File' menu. You can select files of any type but Oversampler treats every file as raw data. Zeros in the data are converted to $01 so you're able to play Macintosh sounds as well. (Otherwise the oscillator would stop when detecting a zero.)

A dialog box appears with following options:

Volume: Set the volume of the selected output channel. Explained in section 'Output'

Frequency: With this scroll bar you can set the playback rate. When you open a file the auxtype is taken as default frequency (if 10 < auxtype < 900 else freq = 200.) To get the frequency in Hertz just multiply the shown rate by 51.406.

Echo Delay: Use this scroll bar to set the echo to off (default) or to the delay you desire. A delay of 16 is about 1/3 second (16/60) so the echo source would be approximately 55 m (180 ft) away. Echo and oversampling mode won't work together (yet!) The echoed channel (right) has about 3/4 the volume of the original channel (left).

Output: Stereo (default): Select this if you own a stereo card. The volume control will affect the oscillators volumes.

Left & Right: Use these options to test you stereo card...(well, actually I don't know why I added these options.)

Internal: If you use your internal speaker or if you have connected your GS to an external speaker via phone plug select 'Internal'. The volume scroll bar will only change the system volume.

Oversampling: Off: (default) No oversampling.
2-times/ 4-times: Enables the oversampling mode as explained earlier. Please remind that Oversampler internally doubles/ quadruples the frequency rate and disk access will be twice/ four times as fast as at normal playback. Your disk might be too slow then. (→ Play)

Close: Closes the file. (Shortcut: Command-W)

Play: Starts playing the sound from disk. Press the ESC key to stop the playback. If your disk device is to slow to keep up with the playback rate you'll get a message. In this case try decreasing the frequency or disabling the oversampling mode. The highest rate for the Apple 3.5" drive is about 375 (with Transwarp and w/o oversampling). My Vulcan - and most harddisks I think - won't have any problems at rates above 900.

Oversampler was written in 100% assembly language on Merlin 16+ (the best programming environment!) Resources were created on Genesys (the best resource editor!).

1. PRESS <ESC> TO GET TO AND FROM MENU. SELECT A MENU ITEM WITH THE ARROW KEYS, PRESS <RETURN> TO CARRY OUT THE ACTION SELECTED.

2. SELECT THE ITEM "COLOR:" AND PRESS <RETURN>. CHOOSE A COLOR.

3. DRAWING WITH PEN: OFF
PRESS <ESC> TO LEAVE THE MENU. THE PADDLE CONTROLS "PDL(0) AND PDL(1)" MOVE A SPOT ON THE SCREEN. BUTTON 0 MAKES A MARK; BUTTON 1 DRAWS A LINE TO THAT MARK IN THE CHOSEN COLOR. THE OLD ENDING POINT BECOMES THE NEW STARTING POINT.

4. DRAWING WITH PEN: ON PUSH BUTTON 0 TO MAKE A MARK ON THE SCREEN, THEN PRESS <ESC> TO GET TO THE MENU. SELECT THE ITEM "PEN:" WITH THE ARROW KEYS AND PRESS <RETURN>. THE PADDLE CONTROLS NOW WORK LIKE THE KNOBS ON AN "ETCH-A-SKETCH".

5. SPECIAL EFFECTS: FILL
FILL IS USED TO FILL AREAS WITH A SOLID COLOR. USE BUTTON 0 TO SET 4 POINTS IN THE FOLLOWING ORDER:

```
1  2
*  *
*  *
3  4
```
THEN PRESS <ESC> TO GET THE MENU, SELECT "SPECIAL EFFECTS", AND PRESS "F" FOR FILL. THE AREA INSIDE THE 4 POINTS WILL BE FILLED WITH THE SELECTED COLOR. OF COURSE, THE POINTS CAN BE ENTERED IN OTHER ORDERS & OTHER THINGS WILL HAPPEN.

6. SPECIAL EFFECTS: CURVES
THIS SPECIAL EFFECT WORKS SOMewhat LIKE A SPIOGRAPH. MARK 2 POINTS WITH BUTTON 0 IN THIS FORMAT:

```
1
*
*
2
```
C(URVES (CONT)

THESE POINTS DETERMINE THE SIZE AND LOCATION OF THE CURVE. PRESS <ESC> TO GET THE MENU, CHOOSE "SPECIAL EFFECTS", AND PRESS "C" FOR CURVES ENTER VALUES FOR A AND B (THESE DETERMINE THE SHAPE OF THE CURVE). NEGATIVE NUMBERS INVERT THE CURVE. THE CURVE "BOUNCES OFF" THE TOP, BOTTOM, & SIDES OF THE SCREEN. NEXT ANSWER "MODULATE THE CURVE?" WITH Y OR N. MODULATION ALTERS THE BASIC SHAPE. ENTER NUMBERS FOR "% AMPLITUDE" AND "FREQUENCY". USING 3,3 FOR A AND B (WHICH PRODUCES A CIRCLE), TRY:

- AMPLITUDE=20, FREQUENCY=9
- AMPLITUDE=30, FREQUENCY=9
- AMPLITUDE=30, FREQUENCY=-9

**NOTE**
BUTTON 1 CAN BE USED TO BREAK OUT OF EITHER EFFECT AT ANY TIME. IN CASE OF ACCIDENTAL EXIT, RETURN TO BASIC BY ENTERING 3D0G AND <RETURN> IF REQUIRED. THEN TYPE GOTO 1000 AND <RETURN>.

OTHER INTERESTING SHAPES ARE PRODUCED BY

- A=4, B=4;
- A=10, B=23;
- A=33, B=33;
- A=12, B=6.

FINALLY, TRY A=-3, B=-3, AMPLITUDE=30, FREQUENCY=3. SURPRISE!!
Penetrator allows you to create a database of such commonly used passwords for automated educated guessing. Such passwords often consist of words such as "secret", "love", or "password"; single letters; first names; or initials. All of these are easily supported by the Penetrator. Included with the Penetrator are expandable databases of first names, initials, common account names, and all purpose passwords. Eventually new password allocation systems will be created such as passphrases and pseudo-random phonetic passwords. Under the passphrase system, human stupidity will remain in existence, and the Penetrator will still be useful.

II. Main Menu Options

Here are the explanations of each option on the main menu:

1: LOAD MAINFRAME DATA FILE

This allows you to load a pre-saved datafile containing all the modem/hack parameters for a specific mainframe. It contains the Dialogue which will be explained later. Values loaded from this file will replace the defaults at the various prompts. Note: the password database itself is NOT saved in the mainframe data file. The database "NAME", however, along with the number of the last password used in that database are saved in the Mainframe Data File. You are first prompted to select the disk drive from which the file will be loaded, and then to enter the filename. You can press [ESC] to exit the option. Sample Mainframe Data Files included on the Hackamatic disk are: "DEC20", "PDP11", and "DATA GENERAL".

2: SAVE MAINFRAME DATA FILE

This allows you to save a mainframe data file (as you might have guessed.)

3: LOAD PASSWORD DATABASE

This option loads a password database into memory for use by the Penetrator in hacking. The Password Databases supplied on the Hackamatic disk are called "ALL PURPOSE P/W'S", "FIRST NAMES", "INITIALS1", and "INITIALS2".

4: SAVE PASSWORD DATABASE

Allows you to save your own databases, or save changes to previously created password files.

5: EDIT DIALOGUE

The Dialogue is the conversation (so to speak) carried on between the PPP and the mainframe. It is mean mainframe system...during password hacking. The Dialogue Editor allows you to enter and edit up to 30 lines of dialogue - more than enough for any system. To get a first feel for it, use the LOAD MAINFRAME DATA FILE option to load the Data General file from the Hackamatic disk, then use the EDIT DIALOGUE option to have a look at it. The screen displays a sequence of lines representing the system's prompts and the PPP's responses. A typical dialogue might look like this:

```
0 - FFP: [CONNECT TO MAINFRAME SYSTEM]
1 - SYS: <IGNORED>
2 - FFP: <C/R>
3 - SYS: ENTER USERNAME:
4 - FFP: I. M. HACKED
5 - SYS: ENTER PASSWORD:
6 - FFP: <P/W>
```

A manual hack attempt done for this system without the PPP would look like this:

```
ATDT XXX-YYYY
CONNECT
<you hit RETURN here to activate the system>
Enter Username: I.M. HACKED
Enter Password: THE
```
While editing a line you can:

- Press [E] to edit the dialogue line highlighted in the lightbar.
- Press [ESC] to exit the Dialogue Editor.
- Press [F] when finished editing the Dialogue to specify other hack parameters.
- Press [C] to clear the dialogue in memory.
- Press [D] to delete PPP/SYS pairs.
- Press [I] to input new PPP/SYS pairs.

Use the arrow keys to move the lightbar through the dialogue.

Now look at the sample dialogue above. (*Scrolled into the Twilight Zone" you say? Should have used your printer.)

Line 0 represents the PPP dialing and connecting to the victim (I mean system). Line 1 indicates that the PPP ignores the system (SYS) immediately after connect and proceeds to line 2, where the PPP sends a carriage return to activate the system. (Hence the "C/R" for Carriage Return at line 2). At line 3, the PPP waits for the system (SYS) to send "ENTER USERNAME:" at which point the PPP sends "I.M. HACKED", the name of our poor unsuspecting user (line 4). The PPP then waits to receive "ENTER PASSWORD:" from the SYS (line 5), after which the PPP tries a password from the database in memory (line 6). (The "<P/W>" at line 6 stands for <P>assword as you might have guessed).

From this example you should see the correlation between the dialogue and the sample hack attempt. You might want to think of the SYS and PPP lines as INPUT and OUTPUT, respectively. If your computer displays lower case then you should have noticed that all Dialogue entries were in upper case, even though the hacked system’s messages contained lower case letters. The Penetrator ignores case on incoming data, so all dialogue info is stored as upper case. The dialogue editor is simple yet versatile, and can be used to create a dialogue sequence for virtually any system.

Dialogue Editor Commands:

- Use the arrow keys to move the lightbar through the dialogue.
- Press [I] to input new lines in PPP/SYS pairs.
- Press [D] to delete lines in PPP/SYS pairs.
- Press [C] to clear the dialogue in memory.
- Press [F] when finished editing the Dialogue to specify other hack parameters.
- Press [ESC] to exit the Dialogue Editor.
- Press [E] to edit the dialogue line highlighted in the lightbar. During editing, any embedded control characters (including ctrl-P's and ESCape characters) will be displayed in the line.

While editing a line you can:

- Enter [ESC] as the first character in any dialogue line to instruct the program to ignore that line and move immediately to the next.
- Enter ctrl-P as the first character in a PPP (not SYS) dialogue line to specify the location of the password from the database. The Penetrator will display the ctrl-P in dialogue listing as "<P/W>", just as it displays an ESCape character as "<I/GNRED>".

NOTE: The ctrl-P and ESC characters must be entered as the FIRST character on a Dialogue line in order for them to function as password and ignore flags, respectively. If either a ctrl-P or an ESCape is entered in a dialogue line beyond the first position, it will be taken literally by the Penetrator.

Enter a semicolon (;) as the last character in a PPP (output) dialogue line to suppress the implied carriage return at the end of the line just as in BASIC when using the PRINT command. If in a PPC line, the last character in a PPC line is a semicolon, the program automatically adds a carriage return after sending the line.

IMPORTANT! You should enter all dialogue UP TO THE POINT at which the PPP should wait for the message sent by the system in response to an incorrect password. DO NOT ENTER THE SYSTEM'S BAD PASSWORD MESSAGE IN THE DIALOGUE LISTING! You will enter it after typing the <F>inished command. After you have finished creating your dialogue, you MUST exit using the <F>inished command. You will then be asked to enter a series of other hack parameters.

Immediately after you type <F> the Penetrator will ask "MAINFRAME RESPONSE TO INVALID PASSWORD". Here you enter the text (or part of it) displayed by the mainframe after it receives a bad password. For the sample system above, you would enter "NICE TRY SUCKWEED" or "NICE TRY" or "SUCCWEED", or something else from the bad password message.

The Penetrator’s next question is "BRANCH ON BAD PW TO LINE:1". Immediately after the prompt, the current bad password branch line is displayed in parentheses. Use the arrow keys to move the lightbar to the line to which the PPP should branch after receiving the bad password message entry previously described. For the sample system above, you would move the cursor to line 3 where the Penetrator waits for the mainframe to display "ENTER USERNAME:" since the system drops back to this prompt after displaying "NICE TRY SUCKWEED."

Next Penetrating question... "# OF PW ATTEMPTS BEFORE RESET?" Here you enter the number of passwords the Penetrator should attempt before bagging it, or resetting. Many mainframe systems, like the sample system above, will let you screw up the password a fixed number of times after which they hang you up or shut down. For the sample system above, you would enter 4, since the system hangs up after 4 botched passwords.

Moving right along... "DELAY BEFORE RESET <0-255 SEC.:". Some systems, rather than hanging up after a number of password screwups, lock up and ignore input for a period of time. An example is some Data General systems, which say "TOO MANY ATTEMPTS, CONSOLE LOCKING FOR 10 SECONDS." For such a system, you would enter 10 at the prompt. For the sample system above, you would enter 0, since the system hangs up and the PPP will have to redial anyway.

MAKE UP! YOU AREN'T READING THIS FOR YOUR HEALTH. The next prompt is: "RESET TO LINE:". As with the "BRANCH ON BAD PW TO LINE:" prompt, you use the arrow keys to move the lightbar to the line to which the PPP should branch after trying the specified number of passwords and a reset. After the sample system above, you would move the lightbar to line 0, to make the PPP to redial the mainframe system. Some other systems, like the type of Data General mainframe described above, do not require redialing. They will often just revert back to their initial activation sequence in which case the reset line in the dialogue would not be line 0.

Once you have selected the reset line, the PPP displays "MAINFRAME RESPONSE TO INVALID PASSWORD ON LAST ATTEMPT BEFORE RESET." On many mainframe systems, the mainframe's response to the final bad password before reset will be the same as for any bad password. On some systems, however, like the imaginary one described above, the response to the final bad password before reset will differ. For the sample system above, you would enter "SORRY SUCKWEED" or "SUCCWEED" or something else from the mainframe's final message before reset.

Dismissing... Goodbye... IMPORTANT! You should enter all dialogue UP TO THE POINT at which the PPP displays the "SAME USER NAME" message. This is the database in memory (line 6). (the "C/R" at line 6 stands for <C/R>arriage Return as you might have guessed).
Next prompt: "TIME TO WAIT FOR PAD PW MESSAGE: (TIMES APPROXIMATELY 5 SECONDS)". After the Penetrator finishes with the dialogue, it waits to receive the bad password message you entered. If that message is not received in the amount of time you specify at this prompt, the Penetrator assumes it is a good password. At this prompt, enter a value which will produce a delay sufficiently long to receive the bad password message. The actual amount of time delayed by the FPP will be roughly (in seconds) 5 times the number you enter here.

The FPP will then ask you "OUTPUT SPEED <0-255>: ". Since some systems cannot receive data from the FPP at full speed, especially during times of heavy use, the speed at which the Penetrator sends data to the victim (1 mean system) can be varied. Enter a value between 0 and 255, with 255 being the fastest.

The next option is "CASE TOGGLE ON PASSWORDS? ". If you answer [Y], the FPP will automatically resend every password in lower case. Normally, the FPP uses only upper case in passwords since many mainframe systems are case-insensitive on passwords.

Go ahead and sleep; this is the last one anyway: "START AT PASSWORD # ". Here you enter the number of the password in the database at which the FPP will start hacking. This is especially useful if you know either the first or last name of the user whose account you are hacking, and would like to try hacking his initials from the INITIALS password databases (supplied on the Hackamatic disk). If you stopped the FPP on a previous hack before it had reached the end of the password database, the number of next password in the list will be the default.

If you are using a previously created dialogue and accompanying set of hack parameters, then you do not need to use the [F] command and go through all of its options unless you plan to change them. Once you have completed these options, it is safe to hit [ESC] to exit the dialogue editor, rather than typing [F].

Finally, now back to the main menu options... (there are others you know)

6: EDIT PASSWORD DATABASE
The Password Database Editor is essentially the same as the Dialogue Editor, but there are a few minor differences. It allows you to enter and edit a database of up to 500 passwords.

PASSWORD DATABASE EDITOR COMMANDS:
Use the arrow keys to move one password at a time through the list.
Use the < and > keys (unshifted) to move ten passwords at a time through the list.
Press [I] to insert a password.
Press [D] to delete the password in the lightbar.
Press [B] to jump to the beginning of the list.
Press [N] to jump to the end of the list.
Press [C] to clear the database in memory.
Press [ESC] to exit the Password Database Editor
Press [R] to edit the password in the lightbar.
Note that in the Password Database Editor all characters placed in passwords are taken literally.
Press [F] to find a password in the list BELOW THE LIGHTBAR. The find command searches only the passwords below the lightbar. This was done to facilitate scanning for repeated passwords. If you wish to search the entire list, use the [B] command to jump to the beginning of the list, then the [F] command to search.

The passwords are stored and hacked in the order in which they are entered. I considered alphabetizing the list, but decided against it so they could be hacked in order of precedence and frequency of use.

7: SET MODEM PARAMETERS
This section is essentially the same as that in the Prefix Prowler and the Code Crusher. There is nothing particularly new or tricky.

8: RESTORE DEFAULTS
This option clears the currently loaded Mainframe Data File values and resets to the original defaults. If you have loaded a mainframe datafile, you will be prompted before the memory is cleared.

9: TERMINAL MODE
This option puts you into the terminal program from the Super Serial Card firmware. From here you can send commands to your modem, call victim systems to get the dialogue format, etc. To send output to your printer, type ctrl-A and at the "APPLE SSC:" prompt (or ? if you are using a //c) type nS, where n is the slot of your printer. To set the baud rate, type ctrl-A 6B for 300 baud, or ctrl-A 8B for 1200. Consult your SSC manual for further Ctrl-A commands. Type ctrl-A and at the SSC prompt to exit terminal mode and return to the main menu. It is advisable to hang up your modem before exiting terminal mode.

10: HACK AT IT
This option frees the Penetrator to do what it does best. It will not work, however, unless you have entered a dialogue and some passwords. The Hack Screen is similar to those of the Prowler and Crusher. The top window displays commands sent to your modem and the conversation as it occurs between the FPP and the victim (system). When waiting for input from the system being hacked, the Penetrator displays "SYS:" and then displays the characters as they are received from the system (with optional sound effects). The incoming data is displayed in upper case only. From this display you can see exactly what the Penetrator has received, and make corrections to the dialogue if characters are missed during input. Occasionally seemingly strange characters will appear immediately after the "SSC:". These are usually system echoes of the last few letters from the FPP's last output line. The center window displays passwords as they are attempted. A password will flash if the FPP finds it a possible success. The bottom window displays the runtime commands summarized below.

If, after you select the "HACK AT IT" option you get:
1. "PASSWORDS AND/OR DIALOGUE NOT ENTERED," it means that you haven't loaded a password database, or that you haven't entered sufficient Dialogue info through either a datafile or the keyboard.
2. "STARTING PASSWORD POINTER IS GREATER THAN THE NUMBER OF PASSWORDS IN THE CURRENT DATABASE," it means that the starting password number, entered through the Dialogue Editor, was greater than the number of passwords currently in memory. Fix it by entering the Dialogue Editor, pressing [F] to get the hack parameters in the bottom window, and go through all the options until you reach the "START AT PASSWORD #" prompt. Here you can change the value accordingly.
3. "CURRENTLY LOADED PASSWORD DATABASE DOES NOT MATCH LAST-USED DATABASE. CONTINUE ANYWAY?" It means that the password database in memory does not match the name of the last-used password database which was stored in the Mainframe Data File. If you do not care, type [Y] to continue. NOTE however, that the FPP will start at the password in memory with the same number as the last-used password in the last-used database.

PPF RUNTIME COMMANDS

Apple II Computer Info

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

Before the Penetrator starts hacking passwords, it goes through a modern initialization by telephone, and sends the necessary dialing commands. During these processes you can press [ESC] to exit and return to the main menu. Once password hacking is in progress, press [ESC] to get the "COMMAND?" prompt (in flashing video at the bottom of the password window). Notice that the PPP will not stop to accept commands until it reaches a convenient stopping place. After it knows whether the password it is currently hacking is good or bad. Patient, it knows you pressed [ESC]. The PPP will beep when it sends the "COMMAND?" prompt. At the prompt you may enter any of the following characters:

[S]: Toggles the sound effects on incoming data on and off.

[G]: Pops up Hires page 2. Due to the length of the Penetrator the hires screen will always be filled with trash -- loading a picture before running the PPP won't work. Tell your mom that it is a school project on randomness and that you are trying to generate simulated static. You will notice small distortions in the image as the program hacks. Point out these glitches to your parent if she is not convinced. Note that the text screen is restored at the "COMMAND?" prompt if you press [ESC] while in graphics mode.

[T] to enter terminal mode. This is somewhat dangerous as it is difficult to get the PPP re-started after exiting terminal mode, and you will probably have to press [RESET] to abort hacking.

[G] to quit and save Mainframe Data File, if one was used. The Mainframe Data File must be saved if you plan to later start the PPP where it left off.

If the PPP finds a possibly successful password, it will stop and beep the speaker until you press a key. You are then dropped into terminal mode to hack at your leisure. After you exit terminal mode with ctrl-A Q, the PPP will quit and allow you to re-save the Mainframe Data File. You can restart the PPP where it left off, if necessary, with the HACK AT IT option on the main menu.

If the Penetrator stops during hacking because the data it is waiting for has not been received, (due to errors in your Dialogue or other unforeseen difficulties) you can enter the awaited messages from the keyboard. The PPP handles input from the keyboard the same as input from the connected mainframe. If you cannot restart the Penetrator by typing data from the keyboard, you can press [RESET] to return to the main menu. You can then manually save the Mainframe Datafile if needed. This [RESET] option is most useful for aborting a hack to correct problems in your Dialogue entries.

11: ENTER DOS COMMAND
This option allows you to enter any DOS command, especially CATALOG's.

12: QUIT
Funny, I seem to have forgotten what this does.

III. Password Penetration tactics:

For best results, use sections of the mainfram's responses which begin a few characters into the message in the dialogue editor to minimize the possibility of lost characters during hacking. In the example system in the Edit Dialogue explanation above, good dialogue representations of the system's "SORRY SUCH WEED" message would be "SUCKWEED" or "WEED". The same applies to the "MAINFRAME RESPONSE TO BAD PASSWORD" inputs.

The dialogue line containing the ctrl-P password flag can hold more data, (including the semicolon carriage return suppression flag) provided it comes after the ctrl-P. If you do not know an account or user name, and need one to successfully logon, try generating the "ACCOUNT NAMES" password database. Note that this is effective only on (wimp) systems which tell you if your account name is invalid. On not-so-wimpy systems like VAXes, the "FIRST NAMES" password database can be effective. I forgot to mention above that the ctrl-P password flag can be entered more than once in the Dialogue. Suppose you just connected to a Data General system and decided to use the name "John" as both the username and the password. It would look something like this:

(You press RETURN here)
Username: JOHN
Password: JOHN

Invalid Username/Password pair
Username: .
Password: .

The corresponding dialogue could look like this:

0 - PPP:[CONNECT TO MAINFRAME SYSTEM]
1 - SYS: <IGNORED>
2 - PPP: </R>
3 - SYS: USERNAME:
4 - PPP: </W>
5 - SYS: PASSWORD:
6 - PPP: </W>

Thus, if you used the FIRST NAMES password database, the PPP would enter a name from the list as both the Username and the Password. Since many people use their first name as both username and password, this can be particularly effective if you cannot get a valid username used on the system.

The "INITIALS1" and "INITIALS2" files contain all possible combinations of two letters except for those extremely unlikely to be used as initials for normal human beings. They are released if you have a valid username which consists of either a first or last name. Suppose you knew that "FRED" was a valid account name, but you had not yet found a password. You could then load the "INITIALS" password database, hop into the Password Database Editor, and find the number of the "FA" password in the list. You could then select that number in response to the "START AT PASSWORD # " prompt in the Dialogue Editor section of the PPP. This would allow you to attempt all 26 possible two-letter initials combinations starting with the letter F. To use three-letter initials combinations starting with the letter F, you could place the F in the Dialogue on a PPP output line, followed by an ignored SYS line, followed by a ctrl-F password flag in the next PPP line like this:

0 - PPP: [CONNECT TO MAINFRAME SYSTEM]
1 - SYS: <IGNORED>
2 - PPP: </R>
3 - SYS: USERNAME:
4 - PPP: </W>
5 - SYS: PASSWORD:
6 - PPP: </W>

You would then run the Penetrator through both the entire INITIALS1 and INITIALS2 databases to hack all possible (likely) 3-letter combinations starting with "F". Nice eh? Similarly, suppose you knew that "SMITH" was a valid username, and wanted to try all possible 3-letter initials combinations ending with "S". A section of the dialogue could look like this:

0 - PPP: [CONNECT TO MAINFRAME SYSTEM]
1 - SYS: <IGNORED>
2 - PPP: </R>
3 - SYS: USERNAME:
4 - PPP: </W>
5 - SYS: PASSWORD:
6 - PPP: </W>

Where line 6 was entered as "ctrl-F S". This example illustrates the capability of the Penetrator to accept more text after the ctrl-F on a password-containing line. With line 6 entered in this way, the Penetrator would send two-letter combinations immediately followed by an "S" like this:
Running Monte Carlo (and other software from PBI) from a hard disk.

The problem: Too many CDA's or NDA's loaded cause Monte Carlo to fail with a "Memory allocation error" when launched from a hard disk.

The reason: Poor memory management by PBI (Or perhaps a poor method of attempting to do Copy Protection). Anyway, PBI tries to allocate a specific storage location that may not be available if CDA's or NDA's have been loaded.

The solution (At least one anyway):
Two small programs to execute at boot-up time to reserve the memory that PBI wants later on. One program reserves the memory before any CDA or NDA loading takes place, the other releases the memory after loading has been completed.

REQUIREMENTS: You MUST be booting into Prosel's START program in order for all this to work correctly and automatically. I have been using this set-up for a while and have seen no problems so far.

The set-up: There are two programs included in this download.

MEM.SAVE is a File Type $B6 file. This type of program is executed by /system/system.setup directory AND MUST be moved to the TOP of the directory! Of course, since you must be a Prosel user to use this, you can use CAT.DOCTOR to re-sort your directory and move this file to the TOP.

MEM.CLEAR is a File Type S16 file. I recommend that this file be copied into the /system directory.

IMPORTANT!!!!!!!!!!!!

The START program from Glen Bredon needs to be modified via Block Warden:

Glen has included a feature in Block warden to detect if the program being edited supports the Prosel start-up pathname feature. See the Prosel documentation for more details. The program START must be modified to set the start-up path to:

*/system/mem.clear

NOTE: If this step is NOT done then you will probably have BIG problems since the memory has already been reserved by MEM.SAVE but NOT made available again by MEM.CLEAR.

For the curious: The two programs were written using APW assembler and contain tool calls to the memory manager to perform the allocation/de-allocation functions.

This set-up appears to work for me. If you have any questions, I can be reached at:
Compuserve: [73177,2323]
GEnie: D.G.SHIELDS

Special Note: If you manage to win a large sum of money at Monte Carlo (I have accumulated over $1,000,000 on the video poker machine) I will accept any and all donations from the proceeds.

- Dale G. Shields -
Apple II Computer Info

If the date shown on the screen is already correct, you need not enter it again. Just press return.

The program automatically saves the date to disk so you need not type it in next time.

CONFIGURATION

If it is the first time you have booted, you will need to configure. You will be asked several questions, and they will be saved to the disk, so you need not enter them again.

MODEM TYPE

Enter the correct modem type by pressing the number indicating it on the left hand side of the correct modem type.

GS USERS ONLY: USE GS MODEM PORT?

If your modem is in the gs modem port, not in a slot, select this option.

SLOT OF MODEM

Simply enter which slot your modem is in. If you own an Apple //c, it is slot 2.

SLOT OF PRINTER

Enter the slot your printer is in. If you don't have one, simply press '0'. On the Apple //c, the slot is slot 1.

Then the program will save your setup, and continue on.

USING THIS PROGRAM ON A HARD DRIVE OR UNIDISK

There is no need to specify a prefix within the Pcp Hacker. All you must do is copy ALL the files and ALL the DIRECTORIES to your 3.5" disk or Hard Drive. Then make a program that does PREFIX /your.directory/ and then runs STARTUP.

Example: You copy ALL the files to /hard.drive/pcp.hacker/

You then make a program called /hard.drive/pcp.run

NEW

][10 D$ = CHR$(4)
][20 PRINT D$"PREFIX/HARD.DRIVE/PCP.HACKER/"
][30 PRINT D$"*STARTUP"
][40 SAVE /HARD.DRIVE/PCP.RUN

and then you just "RUN PCP.RUN" anytime you want to use the Pcp Hacker.

TITLE PAGE

The title page will be shown on the screen. Press any key to continue once you have viewed it.

MAIN MENU
From the main menu you have six options. View good codes. Delete good codes.
Start hacking. View these docs. Reconfigure. And a hidden option, the 
credit screen.

VIEW GOOD CODES
First you must enter the correct prefix. Use the correct ProDOS format.
Example: /proterm/pcp.codes
At the input prompt, where you are asked to enter the prefix, press 'esc'ape
return to the main menu.
This allows you to view a list of saved PCP codes you have, and if you wish,
print the list out.
Use the arrow keys, and when the file you want is highlighted, press return.

DELETE GOOD CODES
First enter the correct prefix. Use the correct ProDOS format.
Example: /proterm/pcp.codes
At the input prompt, where you are asked to enter the prefix, press 'esc'ape
return to the main menu.
This allows you to delete a list of saved PCP codes you have.
Use the arrow keys, and when the file you want is highlighted, press return.

CREDIT SCREEN
Press ? to access this. It is a simple explanation of the program and a quick 
credit for me, the author of the program. Also you may choose CREDITS.

START HACKING 
<see hacking procedures, roman numeral III>

VIEW THESE DOCS
Hell, you got here, you should remember!
When it asks if you wish to print the docs out, you may press 'esc'ape to abort
the main menu.

RECONFIGURE
This takes you back, and allows you to change your modem type, modem slot 
and printer slot.

PCP SCANNER
Final addition to the program. Scans out pcp addresses. No documentation, 
pretty simple to use.

III. Hacking Procedures
First the program will load in Modemworks, the correct driver, and Amperworks.
Then it will run the PCP Hacker. You must again answer a couple more 
questions.

PCP NUMBER [xxx-xxxx]
Enter the number of your local PCP port in the format shown. If you wish to 
call a port that is not local. Enter it in as 1-(xxx)-xxxx (you'll overrun 
the brackets - but that doesn't matter).

STATE AND CITY DESTINATION
This is the abbreviation of the state and city put together you use to connect. 
You can get a list of these from your local PCP port by entering at the @
prompt, C PURSUIT - at username and password type guest - then go to the 
main menu, then go to the downloads. Look through the downloads, and you 
should stumble across a list. Some popular examples: MNMIN, CALAN, NJNEW, 
TXDAL, TXHOU, etc. It's usually best to pick a less popular state - for 
sometimes the PCP ports can get congested and that would ruin your hacking 
efforts because an error message would be sent back, and the program would 
be unable to connect.

SPECIFIED PCP FORMAT
This next question will allow you to choose whether you wish to hack with 
a specified pcp format (this is very selective, and allows by far the best 
accuracy when hacking) or what I call the controlled chaos format. The 
controlled chaos format basically allows the user to add a suffix and prefix 
to the id and password, and it allows you to control the length of the id 
and password, by allowing you to set limits for randomizing the lengths.

Comparison between formats:

CONTROLLED CHAOS SPECIFIED PCP FORMAT
Will allow the randomization of length of the password and id. One specified length.
Will allow a suffix and prefix to be added to both the password and id. Allows the pinpointing of exactly
what should be a number, letter, copying of other characters, selection from a preassigned
list format, and an unkown mark.

SPECIFIED PCP FORMAT
If you choose the specified pcp format option, a row of numbers will appear.
000000000111111 etc.
1234567890123
x

The numbers are to be read from top to bottom. Example: See where the x 
is? Notice it is under a 2. And notice above the two is a 1. So reading 
it from top to bottom you get 12. The x is in space 12. This will be used 
later with the copy function.

ENTERING THE FORMAT
You can use any of the following commands.

CONTROL-L or } = Limited Set.
CONTROL-C or | = Copy.
? = Unknown.
# = Number.
$ = Letter.
, = Seperation of Id and Password.
any # or letter = Preassigned Specified Characters.

CONTROL-L or | [LIMITED SET]
This basically allows a random choice from a list that you enter. Let's say 
you know the first character is always either an A a 6 or a Z. The first 
thing you would press is CONTROL-L or |. Down the screen the following 
will appear: [Set]: at this you would enter the set. A6Z - making sure to 
seperate each character with a SEMI-COLON. (;). Example

PCP SCANNER 
CONTROL-L or } = Limited Set.
CONTROL-C or | = Copy.
? = Unknown.
# = Number.
$ = Letter.
, = Separation of Id and Password.
any # or letter = Preassigned Specified Characters.

CONTROL-L or | [LIMITED SET]
This basically allows a random choice from a list that you enter. Let's say 
you know the first character is always either an A a 6 or a Z. The first 
thing you would press is CONTROL-L or |. Down the screen the following 
will appear: [Set]: at this you would enter the set. A6Z - making sure to 
seperate each character with a SEMI-COLON. (;). Example
Apple II Computer Info

00000 etc. 123456

[Set]: A;6;Z

Now you will be returned to space 02. Now when hacking, the first characters will either be an A a 6 or a Z, depending on how the randomization turns out.

Example: C D/MMM8N/12,A < that first character will either be an A, a 6 or a Z.

NOTE: You can only have one character inbetween the seperating markers. In other words, you can't have "16;20;30" because they would each take up too many spaces, and these are only good for ONE space.

CHANGING THE RANDOM PROBABILITIES IN A LIMITED SET

The way the set command works is, let's say you entered [Set]: A;6;Z - okay, so then you finish entering everything, and the program calls up Pcp and starts a nice little hacking job. It goes through, printing the characters to the screen, then it comes to the set command. It says "Hmm, I see there are three characters that aren't semi-colons in that set. So, I'll pick a random number 1-3. Then I'll compare it to the set to come up with a number. Okay, here goes. **** 3 - so we'll use the Z*. - get it? Pretty simple.

What you can do to offset the outcome some, is enter more of the desired character. Let's say you know the second character of the id is either a 0 or a 1. You also know the 0 is used more frequently. You would go like this: [Set]: 0;0;0;1 or [Set]: 0;0;1 or [Set]: 0;0;0;0;1 - or however much you want to offset the balance. In the first set [0;0;0;1] there would be a 3 in 4 chance the 0 would be picked, and a 1 in 4 chance the 1 would get picked. So in the [0;0;0;1] set, there would be a 2 in 3 chance the 0 would get picked, and a 1 in 3 chance the 1 would get picked. It is very simple.

CONTROL-C or { (COPY)

This fuction allows you to duplicate another character. Here's an example.

00000000 etc. 12345678
#$#$

As later you will learn, # picks a random number, $ a random letter. So, let's say you know the pcp format is number,letter,number,letter,number,letter, letter, number, and then the next character (the 08 character) is the same as the first character (01). So let's say a 9 comes up in 01, then a 9 should be in 08. So all you do is go to 08 and hit { or CONTROL-C.

0000000001 12345678901
#$#$#(#

[Copy]:

Now, at the [Copy]: prompt, you should enter the space you wish to copy. Since you want the (08) space to be the same as the (01) space, you should enter 01, or just 1.

[Copy]: 1

Now, when the program hacks the 08 space will be the same as the 01 space.

00000000 12345678

Example: C D/MMM8N/12,92ZC4279

Notice the 08 space and 01 space are the same.

(Note, when copying, you must use a number BEFORE the number you are copying. In other words you CAN COPY 01 if you were at 08, but you CAN'T COPY 13. If you wanted 08 and 13 to be the same, you would put the correct sign at 08 (like are 08 and 13 always numbers? then put a $, or letters? put a $) and then when you get to 13 you would do a COPY and then [Copy]: 08.)

? (UNKNOWN)

The unknown marker is basically for if you don't know if it's a letter or a number. Example:

00000 12345
#$#$?

Number, letter, number, letter, then either a number or a letter.

# (NUMBER)

You would use this to signify a number in the format.

For example, if you knew the format was always number, letter, number, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter, number, letter.

$ (LETTER)

You would use this to signify letter in the format.

For example, if you knew the format was always number, letter, number, letter, you would put $# (the # represents a number).

, (Separating the id and password)

As you know, when you enter the id and password when connect to pcp, you enter the id,password. Example: PLL000000L,L0000L - Notice the comma separates the id and password. Well, when entering the format, you will use the comma to separate the id and password also. Example: #$#$#$,#$#$#$ would mean the id consists of number, letter, number, letter, number, letter, number, number, letter, number, letter, letter, letter, number.

PREASSIGNED SPECIFIED CHARACTERS

You would use this if you knew a character was ALWAYS THE SAME.

Example: Let's say you knew the format ALWAYS STARTED WITH Pcp then had a number. You would go: PCP# - not too hard.

PUTTING IT ALL TOGETHER

Let's pretend (boys and girls) that after studying 80 old Pcp id's, you suddenly discovered a pattern. The pattern goes like this:

The id always starts with the letters PLL. The next character is either a 0 or a 1 followed by three numbers, a L and then two more numbers.

The password starts with a letter, followed by a number, then a 3, followed by two more numbers, and then the last character is always the same as the first in the password.

0000000001111111 12345678901234567
PLL###L##,$#3##{{

That is what you would enter (PLL###L##,$#3##{).
Here's why:

The id always starts with PLL, so you simply type PLL.

Then next character is either a 0 or a 1, so you would use the LIMITED SET command. You would hit CONTROL-L (or the | character) and at the [Set]: prompt, you would enter 0 and 1 like this: [Set]: 0;1

NOTE! YOU MUST REMEMBER TO USE A SEMI-COLON (;) TO SEPERATE THE ITEMS.

IF EXTRA IGNORED? APPEARS - THAT MEANS YOU FORGOT, AND EITHER USED A COMMA OR A COLON (:) TO SEPERATE THE ITEMS WHICH IS A * NO-NO *.

The next three characters are numbers. So you enter a # for each of them.

Then there is always a L, so you press L.

Then there are always two more numbers, so press a # for each of them.

The password starts with a letter, so enter $.

Then the next character is always a number, so enter ".

The last character is always the same as the first in the password. So you would use the { or CONTROL-C, the copy command. At the [Copy]: prompt you would enter 12, since you want the character to be the same as the 12th character. (Haha! Lost? Did the example roll off into the twilight zone? Should have printed the docs out!). (Hmm, where have I heard that before?).

CONTROLLED CHAOS FORMAT

This applies only if you chose not to use the specified pcp format option.

PCP ID TO USE OR RETURN

If you want to hack a specific PCP id you, lets say, accidently saw after accidentally reading someone's email or something, at this point you would enter the id (like if you only found the id, and not the password).

EXAMPLE: PLL000000L or PCP1234LLL

If you don't have a specific ID you want to hack, simply press return.

PCP PASSWORD TO USE OR RETURN

Similar to the PCP ID TO USE input, except in this case, lets say you stumbled accross a PCP password, but not the ID, then you enter the password at this prompt.

If you don't wish to hack a specific password, press return.

RANGE OF NUMBER OF DIGITS NOT INCLUDING PREFIXES AND SUFFIXES

Lets say you know that the ID's always have 8 digits, and the passwords always have between 3 and 6 digits. But the ID'S always begin with PCP. Here is how you would enter that.

NUMBER OF DIGITS IN PCP ID

From [5] (since you don't include the PCP, since that is a prefix - it's always the same)
To [5] (There are only 5 random digits in the ID, so you type the same number in the TO box that is in the FROM box).

NUMBER OF DIGITS IN PCP PASSWORD

TOTAL NUMBER OF CHARACTERS

Let's say you only know that the passwords have at least 6 digits, and that there are always a total of 16 digits if you add both the digits of the password and id together. Here's how you would enter that.

NUMBER OF DIGITS IN PCP ID

From [1] > Remember, you know at least 6 digits are in the To [10] > password, so that means there is always anwhere between one and 10 digits (16-6=10) in the ID.

NUMBER OF CHARACTERS IN BOTH THE ID AND PASSWORD

[16]
Not *too hard.

Now, it will ask you if you wish to add a prefix to the ID. See up before, in the first exemple where we said that all the ID's began in PCP (what, did that scroll off into the twilight zone you say? * you should have printed this sucker out!) (Hmmm? Where did I hear that before?) well, this is where that comes in. When it asks if you want a prefix to the ID, you enter "PCP" - (prefixes come before, suffixes are attached to the end). When it asks if you want a suffix, if we were using the above example, we would hit RETURN. We would hit return when it asks if we wanted a prefix or suffix for the password too, since there was none. But lets say you think all codes end with the letter Z. You would enter Z instead of return when it asked you SUFFIX FOR THE PASSWORD?

DOCUMENTATION THAT APPLYS FOR BOTH FORMATS

Okay, back to the documentation that applys to both formats.

BAUD RATE

Use the arrow keys, and when you have your selection highlighted, press return.

Remember, you can only use 2400 baud in pcp ports that are made for 2400 baud. NOT ALL PORTS WILL WORK WITH 2400 baud. Sorry, modemworks doesn't support 4800 or 9600, so therefore this program cannot.

SPEAKER ON/OFF

This will either turn the speaker on or off when it dials the PCP port.

NUMBER OF CODES TO FIND

This allows you to set how many codes to be found before the program shuts down.

NUMBER OF TRIES

This allows you to set, lets say 100 tries, and after the program attempts
100 tries, it will automatically turn itself off.

OUTPUT OF VALID CODES
You can either select PRINTER, DISK or BOTH.

PRINTER
Prints a found code onto the printer, using the printer slot given when you configured.

DISK
Appends the code onto a file. If you choose this you must choose the prefix and filename to store the file at. Use the correct prodos format. Example: /PROTERM/PCP.CODES - the program will print the code and the date.

BOTH
Puts it to both the PRINTER and DISK.

Press a key to start or escape to abort. Your final decision. Go for it, or not?

While it hacks... PRESS CONTROL RESET for an instant abort. This is the only way the modem will shut off immediately.

OTHER
How do you know you have the wrong driver? The program will say "Beginning Hack Procedure..." and freeze up on you. I personally use the "OTHER" driver with my /c, Apple Modem 1200. (Fully hayes compatible).

At the top of the screen, across from my credit line, it says FOUND: there it will print how many codes have been found.

How the program works - the program enters a code in the correct format. Then it searches for the $ prompt. If it finds the $ prompt, it assumes it is a bad code. If it does not get the $ prompt, it will continue and wait for the prompt for 60 seconds, and if the prompt is still not given, assume that it is a good code.

This is based on how Pcp works.

Example run:

$C D/MNNMIN/12,PLL000000L,L0000L
INVALID ID OR BAD PASSWORD

here the program will wait for the $ prompt, and get it, so it will continue to hack.

$C D/MNNMIN/12,PLL000001L,L0000L
CONNECTED /MNMIN/

here, the program will wait 60 seconds, and since no $ prompt appears, it will assume it is a good code, and same the code.

IV. HOW TO USE THIS PROGRAM (AND WHEN)

No one I've ever heard of has gotten busted using PCP. So, let it hack all night. Set it up at about 8pm, and go away, do whatever. And let it hack until 8pm or 10pm the next morning. Remember, the only drawback to hacking PCP accounts is ---- THEY TAKE A LONG TIME TO GET!! Basic estimates into how much time it does take was given to me by an IBM user as one day per code.

V. CREDITS
Thanks to...

Ar Zimrathon for technical support, ideas, and some IBM information.
The author of modemworks, for whether he knows it or not, he's helping the apple phreaking world more and more everyday.
The users who use this program. We need PCP CODES and NOW. That's my motto.

This has been a Viper Ltd. Production
PD-Edit Users Guide

By Rosemary Robertson-Smith

IV  COMMAND KEYS

Command keys are editing commands that invoke editor features. The following describes each key:

- **Left-Arrow**
  - Move left one character.

- **Right-Arrow**
  - Move right one character.

- **Up-Arrow**
  - Move up one line.

- **Down-Arrow**
  - Move down one line.

- **Delete**
  - Delete previous character.

- **Tab**
  - Insert spaces to next tab stop. Tab stops are user adjustable, but default to 4 character intervals.

- **Control-E**
  - Toggle edit mode. The two modes are insert and overstrike. The current mode is always displayed in the status line.

- **Control-Z**
  - Clears buffer.

- **Escape**
  - Execute special command. Special commands are:
    - **READ [file-name]**
    - **WRITE [file-name]**
    - **EXIT**
    - **QUIT**
    - **TABS [Width from 1 to 32]**
Return
Start a new line.

Open-Apple-Left
Move left one tab-width.

Open-Apple-Right
Move right one tab-width.

Open-Apple-Up
Move up 16 lines.

Open-Apple-Down
Move down 16 lines.

Open-Apple-Return
Move to beginning of next line.

Open-Apple-A
Insert a special character. It requests an ASCII code to insert at the current position. The special character will be represented by the checkerboard character.

Open-Apple-B
Move to bottom of buffer.

Open-Apple-C
Cut selected area. PD-Edit attempts to write the selected area to the file /RAM/PASTE.EDIT; however, if you do not have sufficient space in the /RAM directory, the file will be written to the current directory. This implies that the cut lines can be repasted in another editing session.

Open-Apple-D
Delete current line.

Open-Apple-E
Move to end of line.

Open-Apple-F
Find text. The search is case sensitive.

Open-Apple-G
Goto a line number. Line numbering begins with the [Start of Buffer] marker.

Open-Apple-I
Insert a new line after the current line.

Open-Apple-K
Start selecting lines for cut. Only whole lines may be cut and pasted.

Open-Apple-L
Toggle macro mode. When macro mode is started, the status line will display the word LEARN. Until the Open-Apple-L command is pressed again, all keystrokes are recorded.

Open-Apple-M
Execute the macro that was most recently recorded by the Open-Apple-L command.

Open-Apple-N
Find next occurrence of search string that was entered using Open-Apple-F.

Open-Apple-P
Paste previously cut lines.

Open-Apple-R
Set a repeat count. A repeat count will cause the next command to be repeated the specified number of times.

Open-Apple-S
Substitute for text. It will request a search string and then a replacement string. You have the option of replacing none, the high-lighted characters, or all occurrences of the search string. You may type in any printable or non-printable character for the search.

Open-Apple-T
Move to the top of buffer.

Open-Apple-U
Undelete a line. Undelete only recalls the last deleted line. Two deletes in a row will only permit the undo of the most recent delete.

Open-Apple-W
Move the cursor forward to the first character after the next white-space. If there are no white-space characters on the line, the cursor will be placed at the first non-white-space character in the next line.
open-apple-x
delete current character.

open-apple-z
refresh screen, placing the current line near the middle of the screen.

v requesting more information
for certain commands, you will be prompted for more information. the routine that requests the input has the following edit features and restrictions:

- control-z will clear the current input buffer.
- delete will erase the previous character.
- escape will cancel the input and return to the editing window.
- cursor key movement is not supported.
- a beep will sound when you reach the maximum number of characters or you attempt to insert an invalid character.
- to insert non-printing characters such as a tab or formfeed, you must hold the open-apple key down while pressing the desired key.
- if the input has a default value, the cursor will be placed after the last character in the default.

vi editing tips
if your line exceeds 80 characters, an exclamation mark will appear at the end of the line. this indicates that there are hidden characters. you can still use all the cursor movement and search commands; however, while accessing characters past the 80th column in a line will keep the cursor at physical column 80.

if you move the cursor down to a line that is actually shorter than the previous line. the cursor will not be placed at the end of the line; instead, it will maintain its horizontal position. if you do not insert any characters, the original end-of-line will not change; however, if you do insert a character, pd-edit will fill the line with spaces until the end-of-line is at the current cursor position.

tabs insert spaces and not the ascii tab character. this costs more memory; however, it makes your text files compatible across many platforms.

vii running pd-edit from the basic system program
the following exec file should be created to properly run pd-edit from apple basic:

brun edit -basic.system

the reason for reloading basic after running the pd-edit is that some global information is overwritten by the editor. this will prevent proper basic operation.

viii editing an apple basic program
to edit an apple basic program, you must first convert the program to a text file by placing the following lines at the beginning of the basic program:

1 print chr$(4);"open program.bas"
2 print chr$(4);"write program.bas"
3 list
4 print chr$(4);"close program.bas"

this will cause a listing of the current program to be placed in the file "program.bas", which can then be edited by pd-edit.

to convert the text program back to basic, issue the following command:

exec program.bas

ix program tampering
if you suspect program tampering, or you just want to reassure the integrity of the editor code, there is a checksum program that can be run. execute the following procedure:

1. get into apple basic
2. brun checksum
3. it will then prompt you for the editor file name. you must provide the complete prodos path.
4. the program will print out 3 numbers.
5. call the author and request a program checksum validation. you must provide the numbers printed out by checksum and the pd-editor version number. the author will confirm whether the program has been modified by an unauthorized user.
**X** TECHNICAL INFORMATION

PD-Edit has approximately a 17,000 character limit on the size of a file. If you attempt to load a file that is larger than this limit, PD-Edit will truncate it. The 17,000 value may vary due to file attributes. A line in a file requires 9 bytes for overhead, so the amount of memory available to the editor is directly proportional to the number of lines in the file and each line length.

The maximum line size is 250 characters.

The maximum file-name length is 64 characters.

The maximum repeat-count is 5000.

The maximum search/replace string is 32 characters.

The maximum tab width is 32 spaces.

The maximum length of the macro buffer is 255 characters.

PD-Edit is written using the C language and 6502 assembler.

---

**Part I: Getting To Know Your Hydrofoil**

**Preliminary Training:** If this is your first experience controlling a Hydrofoil, you may want to sit back and watch a demonstration.

**Here’s how:**

When you have your computer up and running, you will be presented with a selection of assignments. Each assignment is a mission taking you to various sensitive parts of the world. These are described in detail in Part II of this manual. To watch the demo, select MISSION 0 from the list of nine. As you watch, take note of the two ‘view modes’ (Bridge and Operations Map) and the features you can control from each. You may want to read Part III of this manual as you watch the demo.

When you feel you are ready to undertake a real mission, press Shift-Q to quit the demo and then select another one. We suggest you start with one of the early missions before attempting the more advanced ones.

**Part II: Assignments**

Once you have received basic Hydrofoil training, you will be in a position to undertake the following assignments as part of the TAG task force. Of these eight assignments, the first two are part of your advanced training, and provide you with simulated combat experience. We strongly recommend that you gain proficiency in the first two assignments before you proceed to the more advanced missions.

At the end of each assignment you will receive a score and a rank, based on your performance during that mission. Scores are calculated on the basis of five factors, as described below. Note that the actual values will vary from mission to mission, because of the different objectives of each one. For example, in the first assignment (Battle Training), speed and destruction are the most important factors, while survival is not. By contrast, in the fourth mission (A Better Part of Valor), survival is most important, while destruction of enemies is relatively unimportant.

**Scores:**

1. **Main Objective:** Full points are awarded if the mission is successfully completed; no points if the main objective was not accomplished.
   
   Range: 1000 - 5000 points.

2. **Enemies Destroyed:** Points are awarded for each enemy destroyed.
   
   Range: 50 - 500 points.

3. **Enemies Damaged:** Points are awarded for each enemy hit but not destroyed.
   
   Range: 25 - 250 points.

4. **Time Remaining:** Points for time remaining are awarded only when the mission is successfully completed before time runs out. Points are for each minute remaining.
   
   Range: 1 - 4 points/minute.

5. **Survival Bonus:** Survival points are awarded when the mission is successfully completed or when time runs out, assuming you haven’t been blown to shit by the enemy. Points are awarded for each of the twelve sections of
the ship that are capable of sustaining damage (six for the hull and six for the systems). Full points are awarded for undamaged sections, half for slight damage (yellow on the damage display), and no points for heavy damage (red on the display). Range 20 – 200

RANKS:

Ranks are based on points earned, with different scales for each mission, depending on their relative difficulty. For example, because the training exercise is the easiest of all the missions, you can only advance to Lieutenant, no matter how high you score [Sucks]. More difficult missions, such as Search For Terrorists, allow you to achieve rank of Captain, while the most difficult ones, such as Supply Convoy, allow you to reach the top rank of Admiral [wow!]. In any case, to achieve the top rank in a mission you must accomplish the main objective.

The ranks, in ascending order, are as follows:

Deck Mopper
Ensign
Lieutenant
Commander
Captain
Commodore
Rear Admiral
Admiral

The Missions:

1) Battle Training: Ten enemy ships will be introduced to your training area off Key West, one at a time. These vessels will range from simple patrol boats all the way to powerful Nanuchka II missile corvettes. This exercise is designed to familiarize you with the PHM and its weapon systems.

Objective: Sink all simulated enemy ships.
Rank Attainable: Lieutenant

Strategy Tips: This is a good learning assignment, so use your gun on the patrol boats, and save your missiles for the bigger ships.

2) Graduation Exercise
In this exercise, all the enemy vessels you see in the first assignment will be coming at you all at once, doing their best to blow the shit out of you. Sinking all the enemy vessels as quickly as possible is more important than surviving undamaged.

Objective: Sink all simulated enemy ships.
Rank Attainable: Lieutenant

Strategy Tips: Get moving right away; you’re a sitting duck if you don’t. Use your missiles on the more distant ships and your gun on the closer ones. Watch your radar for fast-moving dots approaching your ship. These are enemy missiles. Use chaff to deflect them. (See Part III).

3) Terrorist Attack
Approx. eight hours ago, terrorists attacked a seaside resort, killing dozens of vacationers and wounding hundreds. The terrorists were seen fleeing west in various patrol craft. Witnesses estimate seven to ten vessels of varying types, some suspected to be OSA I missile boats, others small patrol vessels. Your mission is to seek and intercept these vessels, and sink them.

Objective: Sink all simulated ships.
Rank Attainable: Commander

Strategy Tips: The terrorist vessels are to the west of your starting position and moving rapidly north. Try to cut them off, while avoiding their allies coming in from the northeast. Save you missiles for the OSA class ships.

4) A Better Part of Valor
War is brewing in South America. Your PHM is needed as soon as possible. From your base at Key West, you will need to navigate the dangerous Yucatan Straits between Mexico and Cuba in order to reach southern waters. To accomplish your objective in this assignment, you need only to get PHM to the southern edge of the map. Look out for enemy vessels who will be trying to stop you. Use your SeaSprite helicopter to screen your PHM and help you avoid the enemy, or to help you seek out and destroy the bastards.

Objective: Escape with your Hydrofoil off the south edge of the map with as little damage as possible.
Rank Attainable: Commander.

Strategy Tips: Keep moving at full speed. Engage enemies at extreme range with your missiles if they are in your path.

5) Search for Terrorists
To missile corvettes have unsuccessfully attacked an American base off the southern coast of Sicily. A Sparviere Hydrofoil and an AB 212 helicopter are available to help hunt them down. The mission objective is to sink both attackers (who will be fleeing south) before they escape. They are thought to be fleeing toward Tripoli, and can be distinguished from similar vessels by their course. Although a variety of enemy ships will be patrolling along a line north of Tripoli, remember that the fleeing ships are your main objective!

Objective: Sink the two fleeing Nanuchka II class ships.
Rank Attainable: Commander.

Strategy Tips: Try to avoid the other ships on your way to your objective. Save your missiles for them.

6) Supply Convoy
A South American country has been taken over by a dictator, who has succeeded in turning the Caribbean into a war zone. Your mission is to escort a high-speed cargo ship carrying medical supplies and food to a group of refugees. The dictators forces consist of two varieties of a convertible Vosper-Thornycrft Hydrofoil ship that comes with either missiles and a small caliber gun, or just a 76mm cannon identical to your own.

Objective: Get you convoy ship to the southern part of the eastern edge of the map.
Rank Attainable: Admiral

Strategy Tips: Conserve fuel by keeping your engine setting at 2 or less as much as possible, sprinting ahead at high speed only when you spot enemies or when you fall behind your convoy ship. Keep the convoy moving at full speed toward the south one-third of the south edge of the map, and use your helicopters to spot attackers before they can get close. Keep your ship between the attackers and the convoy.

7) Surveillance Mission
It is suspected that the military equipment is being smuggled to the dictator through an outwardly neutral South American country. A cargo ship has been photographed loading up with tanks and aircraft parts in the Baltic, and is believed to be approaching Nicaragua. Seven ships of similar construction carrying farm machinery and building supplies are also entering the area to provide cover for the arms ship. Your mission is to find all eight ships and photograph them at close range so their identities can be established and compared with that of the suspected arms ship. Photography is accomplished automatically by approaching to within 1500 feet of the ship and training your binoculars on it (by choosing it as a target), BUT be careful not to sink them indiscriminately; these vessels will result in an international incident, and immediately end the mission in failure. Use your two SeaHawk helicopters to scout out the cargo ships. Some of the dictators forces are believed to be in the vicinity.
this area, so try to identify any ships you find at as long a range as possible. Watch your fuel usage!

Objective: Find and photograph all eight cargo vessels in the Caribbean without sinking any.

Rank Attainable: Rear Admiral.

Enemy Vessels: Cargo ships, OSA II missile boats.

Strategy Tips: The cargo ships move slowly, but they are scattered all over the sea and will eventually reach a safe port. Move fast, and use your helicopters to find them as soon as possible.

8) Jihad:

Your mission is to escort a supply ship out of the Persian Gulf. The only complication: a war is going on ([christ, thats all?] ), and innocent ships are being fired upon without warning. The supply ship is trying to evacuate westerners from the war zone, but the captain is too frightened to try and escape through the maelstrom of warring factions that fill the Gulf. You will need to make your way through the Straits of Hormuz to Kuwait where you will rendezvous with the supply ship. The supply ship will respond to your controls in the same was an auxiliary helicopter (see Part III).

Try to avoid conflict if possible. Enemies are less likely to attack if you are peaceful. However, if you take hostile action or if you get too close, they will pass the word to their fleet to attack. The supply ship will be a tempting target for them at all times, so guard it well. In any case, remember that your primary mission is to get the ship shit out safely — damage to your Hydrofoil is important only insofar as it compromises that mission. Use your Seahawk helicopters to provide you with critical info on ship movements.

Objective: Escort the supply ship safely into the Indian Ocean.

Rank Attainable: Admiral.

Enemy Vessels: OSA I and OSA II missile corvettes.

Strategy Tips: You're on your own for this one...

Part III: Hydrofoil Operation

Introduction:

The Hydrofoil is an all weather, high speed, compact weapons system, making it ideal for strike, patrol and surveillance missions. Because of its fully submerged foils, the Hydrofoil is capable of sustained high-speed runs across the highly navigable, and with a maneuverability of a 76mm gun, missiles, and chaff for radar deflection.

As Hydrofoil commander, you can switch between the view from the Hydrofoil bridge and a top-down view of the operations map. Each uses its own set of the keyboard and joystick controls. Specific operating instructions are given in the command summary card, included in your information packet. [what a joke]

The View From The Bridge:

The top half of the screen shows the view from bridge. The cross is the aiming cursor, while the blinking little line is the aim correctors light, and the think that looks like a shoe is the binocular view. The bottom half shows the Weapons indicator on the lower left side (where it says gun, chaff, HAMS) the middle where the circle is, is the radar screen, and on the right side, the damage indicators appear. The bottom has the time compression on the lower right half of the screen. The Hydrofoils Instruments are composed of:

- Gyrocompass - Indicates Hydrofoil current bearing; north being straight up
- RPM - Indicates Hydrofoils engine speed
- Speed - Indicates Hydrofoil speed in knots
- Radar - Shows all craft within Hydrofoils radar range
- Weapons Status - Indicates which weapons are currently active and the number of rounds remaining
- Fuel - Indicates the amount of fuel remaining
- Warning Indicators - Red warning indicators show a potential problem
- Depth - Indicates danger of running aground. Flashes when heading

Towards land

Lock - One or more enemy missiles are locked onto you. Fired or are about to be fired upon by enemy ships.

Damage - Shows which parts of the ship (yours) are damaged.

Operations Map:

The Operations Map shows the helicopters, convoys, and the Hydrofoil. The circle with one dot is helicopter 1. If it has 3 dots, its helicopter 2, the diamond is a convoy, and the small circle is your ship. You can switch from the view from the bridge to a map of the surrounding area. The map shows the entire area of operations for the current assignment. It shows all the major land masses, the borders of the assignment area, the current location of the Hydrofoil, the locations of all the friendly forces and its radar range. In addition, the operations map shows the locations of your helicopters. Control of such helicopters or an escorted convoy is maintained from the Operations Map.

Weapons and Defenses:

- 76mm cannon: Its fire rate is 90 rounds per minute, its effective against Aircraft and missiles, its range is about ten miles. Because of the needed time for a shell to travel to its target, the effective range against moving targets is approx. six miles. Thus, even though your fire control radar allows you to lock on to a target, you will need to 'lead' your cannon ahead of moving targets further then one or two miles away.

- Chaff rockets: These allow you to fire exploding rockets filled with aluminum foil into the air. When they explode, the rockets disperse their chaff into the air, attracting the enemy missiles and deflecting them from your ship. Your best strategy on using the chaff rockets is to fire them when you are moving at a right angle to the oncoming missile. Chaff is best fired when the enemy missile is about a mile away.

- Harpoon Missiles: These are the most accurate and most potent weapons. They will hit their target 90 per cent of the time and will destroy most small ships with a single hit. Because your radar is likely to be more accurate over a greater distance than enemy's, you can destroy an enemy by firing a Harpoon at your maximum (40 mile) sighting range even before the enemy has a chance to launch against you.

- Gabriel Missiles: This missile has a shorter range then the Harpoon missiles, but their guidance systems are reputed to be slightly more accurate then those of the Harpoons. They carry a 400 pound high explosive warhead. Use these suckers against ships beyond gun range.

- Exocet Missiles: Same as Harpoon Missile.

Radar:

- Your radar system's range is about 40 miles, although it is greater from the front or the back of the Hydrofoil. You can take advantage of this by turning the Hydrofoil towards the target. Your Hydrofoil is represented by a flashing 'blip' in the center of the display. If this 'blip' isn't flashing, another ship is very close to you.

Auxiliary Craft:

- Some assignments involve the use of search helicopters. In such cases, helicopters are controlled from the Operations Map, same applies to Convoy ships.

Damage: Your Hydrofoil is capable of operating even if it sustains damage.

Null Damage: The Hydrofoil's hull is separated into six watertight compartments. Light damage to any of the six compartments does not affect the ship, but serves as a warning that continued hits will cause heavy damage. Heavy damage to a critical number of compartments can sink your Hydrofoil. This critical number varies among the different Hydrofoils, as follows: the PHM can sustain heavy damage to four compartments before sinking, the Israeli Flagstaff II will sink after heavy damage to two compartments.
System Damage:

- 76mm Cannon: Light damage may cause your gun to misfire; heavy damage will disable it completely.
- Radar: Light damage restricts your radar to 20 miles; heavy damage restricts the range to 10 miles.
- Missiles: Light damage causes misfire, while heavy damage knocks them out altogether.
- Fuel Tanks: Light damage increases fuel drain; heavy damage increases it even more.
- Engines: Light damage decreases your max speed; heavy damage decreases it even more, sometimes to the point of immobility.

Operating Instructions:

You can operate your Hydrofoil either from the Bridge or from the Operations Map. To switch from one to the other, press 'V' on the keyboard. From the Bridge you can maneuver the Hydrofoil, or select, aim, and fire your weapons. You can also adjust your radar scanning range from 2.5 miles to 40 miles. From the Operations Map you can control your aux. vessels, or you can set your Hydrofoil on a course using automatic pilot. Some operations are available in either mode. Thus, from either the Bridge or the Operations Map you can pause and restart proceedings, you can quit and select a new mission, and you can speed up or slow down the passage of time. You can speed time up to 128 times; thus, when you do so, every element is affected equally.

Bridge:

- Maneuvering the Hydrofoil: You can maneuver your Hydrofoil with either the keyboard or joystick. Moving the joystick forward speeds up the ship, while pulling it back slows it down. Moving the joystick right or left moves your ship that way. See the command summary card for the keyboard equivalents. Note that the Hydrofoil operation is by means of keyboard and joystick. You can use either to maneuver the hydrofoil and aiming your weapons. To aim at a target, you first need to select it from among the enemy craft within your radar by pressing T several times until the target is bracketed on your radar screen. At that point the target vessel appears in the binocular view at the top of the screen. To aim your gun, move the aiming cursor toward the target, press the 'aim corrector', move the aiming cursor toward the aim corrector and fire again. Note that you only need to aim your gun once. Missiles automatically go toward the ship in the binocular view at the time of firing, while chaff affects all incoming missiles depending on their distance from the Hydrofoil. You select among the available weapons from the keyboard, see your command summary card for details.

Aiming and Firing Weapons:

- You can also use the joystick to aim and fire your weapons. Pressing the <Spacebar> toggles the joystick between maneuvering the hydrofoil and aiming your weapons. To aim at a target, you need to select it from among the enemy craft within your radar range. At that point the target vessel appears in the binocular view at the top of the screen. To aim your gun, move the aiming cursor toward the target, press the 'aim corrector', move the aiming cursor toward the aim corrector and fire again. Note that you only need to aim your gun once. Missiles automatically go toward the ship in the binocular view at the time of firing, while chaff affects all incoming missiles depending on their distance from the Hydrofoil. You select among the available weapons from the keyboard, see your command summary card for details.

Operations Map

- Automatic Pilot: To set a course for hydrofoil, first make sure that the Hydrofoil is selected by pressing the appropriate key. Next, move the cross hair to your destination point and press a key (1 through 5). Pressing 5 moves the Hydrofoil to its destination at full speed, while 1 moves the Hydrofoil at its slowest speed. If you already have a speed selected, you can press the joystick button to move the Hydrofoil to the new destination at the currently selected speed. Pressing 0 stops the Hydrofoil. When you return to the Bridge, changing direction (w/keyboard or joystick) disengages the automatic pilot and returns you to manual control. You can, however, change the Hydrofoil's speed from the Bridge by pressing keys 1 through 5 without disengaging the automatic pilot.

To re-engage automatic pilot, return to the Operations Map, select the Hydrofoil, then press the joystick button or select a speed as before. Your Hydrofoil will then move toward the previously selected destination. Messages on the Bridge and Operations Map indicate current status of the automatic pilot.

Controlling Aux. Craft: When you are in the Operations Map you can also control the aux. craft that are available to you. Depending on the assignment, these can include helicopters, or a convoy of ships. To control an aux. craft, first select it by pressing the key for that craft (see command summary card). You can switch between the Bridge and the Operations Map to control aux. craft.

Time Compression: You can use time compression to speed up events in the Operations Map until you get to the center of the action. You can then slow events back down, or you can leave them speeded up. If you compress time to more than eight times normal, any action from the enemy (such as missile or cannon shot) will automatically slow it back down to eight times. This way you can use time compression to make your assignments more challenging.

OVERVIEW

PHM Pegasus is a simulation requiring both strategic and tactical ability. The object is to complete each mission by achieving its main objective in as short a time as possible. See your Manual for details on the assignments.

To engage and disengage the automatic pilot, return to the Operations Map, select the Hydrofoil, then press the joystick button or select a speed as before. Your Hydrofoil will then move toward the previously selected destination. Messages on the Bridge and Operations Map indicate current status of the automatic pilot.

System Damage:

- 76mm Cannon: Light damage may cause your gun to misfire; heavy damage will disable it completely.
- Radar: Light damage restricts your radar to 20 miles; heavy damage restricts the range to 10 miles.
- Missiles: Light damage causes misfire, while heavy damage knocks them out altogether.
- Fuel Tanks: Light damage increases fuel drain; heavy damage increases it even more.
- Engines: Light damage decreases your max speed; heavy damage decreases it even more, sometimes to the point of immobility.

Operating Instructions:

You can operate your Hydrofoil either from the Bridge or from the Operations Map. To switch from one to the other, press 'V' on the keyboard. From the Bridge you can maneuver the Hydrofoil, or select, aim, and fire your weapons. You can also adjust your radar scanning range from 2.5 miles to 40 miles. From the Operations Map you can control your aux. vessels, or you can set your Hydrofoil on a course using automatic pilot. Some operations are available in either mode. Thus, from either the Bridge or the Operations Map you can pause and restart proceedings, you can quit and select a new mission, and you can speed up or slow down the passage of time. You can speed time up to 128 times; thus, when you do so, every element is affected equally.

Bridge:

- Maneuvering the Hydrofoil: You can maneuver your Hydrofoil with either the keyboard or joystick. Moving the joystick forward speeds up the ship, while pulling it back slows it down. Moving the joystick right or left moves your ship that way. See the command summary card for the keyboard equivalents. Note that the Hydrofoil operation is by means of keyboard and joystick. You can use either to maneuver the hydrofoil and aiming your weapons. To aim at a target, you first need to select it from among the enemy craft within your radar by pressing T several times until the target is bracketed on your radar screen. At that point the target vessel appears in the binocular view at the top of the screen. To aim your gun, move the aiming cursor toward the target, press the 'aim corrector', move the aiming cursor toward the aim corrector and fire again. Note that you only need to aim your gun once. Missiles automatically go toward the ship in the binocular view at the time of firing, while chaff affects all incoming missiles depending on their distance from the Hydrofoil. You select among the available weapons from the keyboard, see your command summary card for details.

Aiming and Firing Weapons:

- You can also use the joystick to aim and fire your weapons. Pressing the <Spacebar> toggles the joystick between maneuvering the hydrofoil and aiming your weapons. To aim at a target, you first need to select it from among the enemy craft within your radar by pressing T several times until the target is bracketed on your radar screen. At that point the target vessel appears in the binocular view at the top of the screen. To aim your gun, move the aiming cursor toward the target, move the aiming cursor toward the aim corrector and fire again. Note that you only need to aim your gun once. Missiles automatically go toward the ship in the binocular view at the time of firing, while chaff affects all incoming missiles depending on their distance from the Hydrofoil. You select among the available weapons from the keyboard, see your command summary card for details. (ok.)

Operations Map

- Automatic Pilot: To set a course for hydrofoil, first make sure that the Hydrofoil is selected by pressing the appropriate key. Next, move the cross hair to your destination point and press a key (1 through 5). Pressing 5 moves the Hydrofoil to its destination at full speed, while 1 moves the Hydrofoil at its slowest speed. If you already have a speed selected, you can press the joystick button to move the Hydrofoil to the new destination at the currently selected speed. Pressing 0 stops the Hydrofoil. When you return to the Bridge, changing direction (w/keyboard or joystick) disengages the automatic pilot and returns you to manual control. You can, however, change the Hydrofoil's speed from the Bridge by pressing keys 1 through 5 without disengaging the automatic pilot.

To re-engage automatic pilot, return to the Operations Map, select the Hydrofoil, then press the joystick button or select a speed as before. Your Hydrofoil will then move toward the previously selected destination. Messages on the Bridge and Operations Map indicate current status of the automatic pilot.

Controlling Aux. Craft: When you are in the Operations Map you can also control the aux. craft that are available to you. Depending on the assignment, these can include helicopters, or a convoy of ships. To control an aux. craft, first select it by pressing the key for that craft (see command summary card). You can switch between the Bridge and the Operations Map to control aux. craft.

Time Compression: You can use time compression to speed up events in the Operations Map until you get to the center of the action. You can then slow events back down, or you can leave them speeded up. If you compress time to more than eight times normal, any action from the enemy (such as missile or cannon shot) will automatically slow it back down to eight times. This way you can use time compression to make your assignments more challenging.

OVERVIEW

PHM Pegasus is a simulation requiring both strategic and tactical ability. The object is to complete each mission by achieving its main objective in as short a time as possible. See your Manual for details on the assignments.

Hydrofoil operation is by means of keyboard and joystick. You can use either to control the hydrofoil's movement, weapons aiming and firing, and any auxiliary craft. Use the joystick to pause and resume play, to increase or decrease time compression, to switch between the Bridge and the Operations Map, and to select weapons or auxiliary craft.

Two main viewing "modes" are available at any time - the Bridge and the Operations Map. The key table that will follow shows the effect of each keystroke under each of the two modes.

GETTING STARTED

Let's skip this.

SPOTTER CARDS

The identification cards in the center of your Manual can help you spot and identify the vessels and aircraft that are active in each mission. Shooting friendly vessels can make you very unpopular with the Commodore (I almost barfed when I saw that word too) so it is particularly important that you identify the vessels in each mission. This way you won't end up shooting the convoy you are trying to rescue. To use the cards, CAREFULLY remove them from the manual by tearing the center perforation, and then tear out each card individually. Before you start an assignment, read the mission description in the Manual and select the card for each vessel in the mission. Keep the cards handy as you proceed with your assignment, and refer to them when you need help identifying one of the vessels.

KEYBOARD COMMAND SUMMARY

(Note: some of the following commands are accessible through the joystick. Such commands are marked with an asterisk *). See Joystick Control section following.)
Apple II Computer Info

P       Pause/Resume play                 Same
Ctrl-Q  Quit                              Same
V       Toggles view between Operation Map and Bridge Same
+ or = Each press doubles time rate up to 128 times real time Same
-       Each press halves time rate down to real time Same
N       Returns time rate to real time Same
1-5*   Sets hydrofoils max. speed Set max. speed for hydrofoil or aux.
0*     Stops hydrofoil                   N/A
Ctrl-R Each press doubles radar scan from 2.5 miles to 40 N/A
R       Each press halves radar scan down to 2.5 miles N/A
T       Selects targets for view in binoculars N/A
Ctrl-S Toggles sound on/off                Same
D       N/A Toggles radar circle & vessel icons
6       Selects cannon Selects hydrofoil
7       Selects chaff rocket Selects helicopter 1 (when avail)
8       Selects missiles (harpoon or Exocet) Selects helicopter 2 (when avail)
9       Gabriel missile (when avail) Selects convoy (when avail)
SPACE  Toggle between maneuver and weapons aiming modes N/A
RET*   Fire currently selected weapon N/A
IJKM*  Aim weapon up, down, left, right Move destination cursor
COMMA* Turn hydrofoil left N/A
PERIOD* Turn hydrofoil right N/A
W       Toggle among weapon types N/A

JOYSTICK CONTROL

You can use the joystick either to control the hydrofoil or to aim and fire your weapons. From the Bridge, in Movement mode, you can control the hydrofoil's movement by moving the joystick left or right, and its speed by moving it forward or back. In Weapons mode, use the joystick to move the aiming cursor around the binocular view. Fire your weapons in either mode by pressing the fire button. You can toggle between Movement and Weapons mode by pressing the spacebar. From the Operations Map, use your joystick to set your destination cursor, and the fire button to set off on your course.

- END -
Retrace refers to the ability to land on a square that has been occupied previously by one of the player's pieces. If you choose "No", once a player lands on a square, it can't be occupied again by either one of the player's or the computer's pieces. These squares will be marked as you go along so you know which ones can't be landed on. If a computer's piece lands on one of these squares, it will make its move again according to its set pattern. A player loses the game by landing on one of these squares. In a two-player game you can use this option to be able to block your opponent's path to the other side of the board. If you choose "Yes", any of the squares may be landed on again by either players' or the computer's pieces.

MOVES AHEAD: ENTER 1-4

This is the number of moves you choose before you get the opportunity to pick another move or set of moves. During play, first your piece makes one move, (In two-player mode, the second player would then move), then the computer's pieces move and you continue to alternate moves. In the tournament mode, you must choose at least two moves.

PLAYERS: ENTER 1 OR 2

If you choose 1, your piece just needs to avoid the computer's pieces. Choosing 2 means you have to avoid not only the computer's pieces, but an opponent's as well. In the two-player version, moves may not be deleted. Once entered, they stand.

GAME ID: XXXX

After you enter your options, press RETURN. If you don't want to change an option, pressing RETURN will enter the option shown.

MODE: ENTER P OR T (for Practice or Tournament) In the practice mode, you choose the pieces to play against and their positions on the screen. The computer will ignore the numbers after the Round and Level options.

In Tournament mode, the computer chooses the pieces you play against and their positions.

ROUND: ENTER 1-9

The higher the number you enter, the greater the number of pieces on the board. Round one starts with four pieces. One additional piece is added each round. No more than 25 pieces will be placed on any one board, however. This option isn't valid in practice mode.

LEVEL: ENTER 1-9

The skill level determines the complexity of the playing pieces selected for play in the tournament mode. This option is not valid in practice mode.

SPEED: ENTER 1-9

This is the speed at which the pieces make their moves. 1 is the fastest and 9 is the slowest. Should a player wish to follow the moves in detail, a slower speed should be selected. Once a player has mastered the moves, a faster speed will allow victory to come swiftly!

RETRACE? ENTER Y OR N (YES OR NO)
numbers of the pieces you want to play against. Press return after choosing the number. See the chart below for the ID #s of the pieces. Use the I,J,K,M keys to position the pieces on the board. Press return when each piece is in the position you want. When you have entered as many pieces as you want (1-25), press ESC to begin and choose a starting location for your piece. Enter 1-8, or "N" for New if you decide you want a different board setup.

In practice mode with only one player and more than one move ahead chosen, the "/" key allows a move (or moves) to be erased. You can't erase the last move, however, since once that is entered, the pieces begin to move. On the Apple //E, the DELETE key also works. During move selection, pressing "*" allows you to review the options you selected. Press any key to return to the game.

TO PLAY IN TOURNAMENT MODE
----------------------------------
You must choose at least two moves ahead. After you've entered your options, press ESC. If you want to use a different setup, press N for New. Then choose the square you want your piece to start on. Enter 1-8. To choose your moves, use the I,J,K,M keys. In the two-player mode, players alternate selecting moves. The computer's pieces move according to the chart below.

During move selection, pressing "?" allows the review of the options selected. Press any key to return to the game. If you lose, the game will go back into Demo mode. Press ESC to begin another game, press R to Replay the last game with the same setup or press I to see an instant replay.

### INSTREAD FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 774 of 1262
Well, here it is Phantom Access. If you have it already, it's most likely thanks to me, at least indirectly. I got it at a TAP meeting from The Plague earlier in the year and I have given it to whoever asked me, namely The Watcher(Cap. Con []), Celtic Phrost and a friend of Celtic's. Since then I've heard that these people have been giving to other people, they promised not to, but I suppose I couldn't expect them not to (I did, after all...). It's been years since all the hoopla really started and the point has become moot, so I'm releasing it everyone. The old TAP kids don't mind and I might as well take this advantage to put my name in a nice big font, right? TAP by the way is disbanded, perhaps there will be an annual get together, but I doubt it. Most of the stuff said about TAP wasn't true and has come from me anyway. For instance Chris, in Fall of the Modem World, called me an idiot and then went on to directly copy my sometimes incorrect or obsolete information from Tap.Interviews II. Enough about that however. Here is Phantom Access 5.7k, complete with docs. It's not really that big of a deal as you can see, and the nonsense about it "not falling into the wrong hands" is just that, nonsense. For years everyone who didn't know what it was wanted it, and people who did know what it was didn't. For example, Sigmund Fraud turned down a copy. Anyway, enjoy the program, let the big debate end (but now I guess you'll all have to debate about just what kind of loser/lunch/rodent would give it out!). Please give to everyone you know. Also, enjoy the title page I tacked on...(please disregard the insults on it, I meant them as jokes....)

later

212-703-0095-answering machine
DOCUMENT phantom.access2

---

The entire Phantom Access series was written as a set of programmable modules, that are easily intergratable with each other, and can accomplish various tasks without the need of supervision.

For example:

1. Hack #: NPA-ANC-XXXX until you have 4 valid codes.
2. Using the 4 valid codes from step 1: Scan the exchange of: NPA-ANC-XXXX
   In this exchange note all systems that connect at 1200bps and identify themselves with /login/ usually indicating a Unix. If task is complete & it is no later then xx;xx;xx;xx go on to step 4.
3. End, write all information to a file, and shut down.
4. Login to TRW using password x & dialup y, if password x no longer works then use password x1, x2, etc, until you hit one that is still valid. once connected pull reports on the people in file z. if no password still valid; look at time, if it is no later then xx;xx;xx;xx go onto step 6.
5. End, write all information to a file, and shut down.
6: ........etc

In short; a series of programs with the same style of syntax, that write and retrieve information from a set of files whose format is compatible with all of the other programs that work with them. => a primitive Database with 'infinite' capabilities. Using simple commands you could create a custom system for whatever task(s) you wanted.

Phantom Access 5.7K (X = The hardware specific version you are using.) is the code hacker of the series. It is fully 'programmable' in the sense that you can customize existing example modules to hack whatever you want them to. Or just as easily create new modules for complex system's.

For example:

1: Call MCI
2: Enter valid code for MCI
3: Call PBX NPA-ANC-XXXX
4: Hack code for PBX
Or:
1: Call MCI
2: Enter valid code for MCI
3: Call Number NPA-ANC-XXXX
4: Trunk it
5: K(p=MF).etc.S(t=TT)
6: etc...

Obviously the longer the set of 'blocks' the more time it will take to go through one 'block-set' and repeat the sequence with the code being incremented or whatever it is that you're doing.

---

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 776 of 1262
limit’ question, asks: do you want to install a limit on the number of times that ‘pound out’ can fail. (After it ‘pounds out’ <#> the hacker searches for a dialtone, indicating that it can go on & redial, if none is found, then it will cycle through to a physical hang-up, followed by a redialing to the OCC, and re start from where it left off.) Answering yes, allows you to impose a limit on the number of times this audio test can fail, and provided that it fails more times then you chose to allow, the hacker will shut itself down. Answering yes, allows you to impose a limit on the number of times this audio test can fail, and provided that it fails more times than you chose to allow, the hacker will shut itself down.

---

OCC dialup: (dialup to Occ node)
Valid code for OCC: (valid code)
Install maximum fail limit? (answering yes will go to the next question, a no will jump to ‘is everything correct.)

Maximum # of times Audio test can fail: (maximum # of times the OCC can fail to ‘pound out’)

---

Is everything correct? (yes- starts hacker, no- goes back to ‘rnd / seq’ input)

Hacker Status: Everything is more or less self-explanatory. Esc quits and asks you if you desire a status report on the scan that was just done. And brings you back to main menu.

---

[Footnote#1]: MCI = ANY system that will return the initial Tone back with a #, key. As far as I know AllNet, and several other OCC’s do this as well.

Lord Digital

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
Once a pipe piece fills with flooz, you can no longer replace it. And, at higher levels, the game field will contain advanced pipe pieces and obstacles. You can't "bomb" and replace those special pieces that appear at the start of a round. After the round has started, a timer set for the level of difficulty in that round will allow the flooz to start flowing from the starting piece into the pipeline you're constructing. Keep placing pipes and adding to the pipeline until the flooz catches up with you or spills off the edge of the playing field. When the flooz reaches the end of your pipeline, the round is over.

Once you've placed all the pipe pieces you can (or want to), press the "flow" (F) key (as in "fast flowing flooz") and the flooz will speed up and end the round quickly. You will score double points for each additional pipe piece the flooz flows through.

ADVANCING TO THE NEXT LEVEL

In order to advance to the next level, you must make the flooz flow through a certain number of pipes. Look at the counter in the upper right corner of the screen. At the start of each round, this counter tells you how many pipes the flooz has to flow through in order to advance to the next level. Then as the flooz flows through the pipeline, the counter decreases, keeping track of how many more pipes the flooz must go through. When the counter reaches zero, you qualify for the next level.

On higher levels, many things change:
- The flooz flows at a faster rate.
- Obstacles appear on the playing field. You can't place pipes in those squares.
- Bonus pieces may show up. These earn you extra points if the flooz goes through them.
- One-way pieces appear in your pipe dispenser. The flooz can only flow through these in one direction.
- End pieces show up. In addition to achieving the required pipeline length, you must direct the flooz into the end piece in order to advance to the next level.
- Reservoir pieces appear. The flooz takes a little longer to fill these up, so they gain you some valuable time.
- There are sections of the playing field that allow the flooz to exit one side of the screen and reappear on the other side.

SCORING

BASIC GAME SCORING
- 50 points for each pipe the flooz flows through, until you reach the distance required to advance to the next level.
- 100 points for each pipe the flooz flows through after you reach the distance required to advance to the next level.
- 500 points for each time the flooz crosses itself in a cross pipe. (If the flooz does not cross itself you can still receive 50 or 100 points for going through the cross pipe).
- 500 points for each bonus or reservoir piece the flooz flows through before you reach the distance required to advance to the next level.
- 1000 points for each bonus or reservoir piece the flooz flows through after you reach the distance required to advance to the next level.
- 1000 points for using the end piece.
- 100 point penalties at the end of the round for each unused pipe left on the playing field.
- 50 point penalty for each replacement made.
- After you hit the "flow" key, every pipe the flooz flows through earns you double the usual point value.

EXPERT ONE PLUMBER
The basic scoring rules apply, but:
- 100 bonus points are given every time the flooz flows through pipe pieces selected from alternating (top and bottom) dispensers.

COMPETITIVE TWO PLUMBER
The basic scoring rules apply but:
- Points from the flooz flowing through a pipe -- including the 500 point bonus for crossovers -- are scored only by the player who placed the pipe.
- The 100 point penalty from the flooz not flowing through a pipe is levied to the player who placed that pipe.
- The bonus piece points go to the player who placed the previous piece and connected it to the bonus piece.

Two-plumber Pipe Dream encourages both teamwork and competition. You have to work together to keep the flow going, but you'll want the flooz to flow through more of your own pipes, and fewer of your opponent's.

PIPE DREAM PLAYING MODES

Pipe Dream has three playing modes: basic one-plumber, expert one-plumber, and competitive two-plumber. There is also a training mode that allows you to play any of these modes at a slower rate of flow.

BASIC ONE-PLUMBER
Pipe pieces appear in a single dispenser on the left side of the screen. You can always see the next five pipes in the dispenser.

EXPERT ONE-PLUMBER
Pipe pieces appear in two dispensers on the left side of the screen, one above the other. The pipe pieces nearest the middle of the screen are available to be placed on the playing field. You can always see the next three and one-third pipes in each dispenser.

COMPETITIVE TWO-PLUMBER
As in expert mode, pipe pieces appear in two dispensers on the left side of the screen. Player One uses the pipes from the top dispenser, and Player Two uses the pipes from the bottom one.

PLAYING TIPS
- Use the training mode to become a good plumbing strategist. Learn how to visualize the completed pipeline and place pieces accordingly.
- If you want a big score, don't be too eager to advance quickly to the next level. Earn as many points as you can on each level.
- Think ahead. If you don't need a piece right away, put it where you can connect it later. Blowing up pipes wastes time and valuable points.
- Use cross pipes wisely. You only get a limited number of them, and each one can deliver bonus points. Make sure you place them where there's room to loop back through.
- Even if you're way ahead of the flow, work fast. That way, you'll have time to figure out how to fill as much of the playing field as possible. Or you
can press the "flow" key and score bonus points.

end of file.

FIRST OF ALL, I'D LIKE TO POINT OUT THAT THIS IS ONLY A PRE-RELEASE, DUE TO THE MANY DEMANDS I'VE GOT ABOUT PPP.

THIS MEANS THAT SOME FACILITIES HAVEN'T BEEN INCLUDED IN THIS VERSION, LIKE THE POSSIBILITY TO GET A PRINTOUT ON A PRINTER, EDIT THE CODE (RIGHT NOW YOU HAVE TO DELETE THEN INSERT, BUT IT WORKS ALRIGHT!) AND SOME OTHER MINOR "FAULTS". ALL THESE WILL BE INCLUDED IN THE NEXT VERSION, V2.0, LOOK FOR IT!!

SECOND, THIS IS ONLY A PRELIMINARY DOX, METHE "PROGRAM COUNTER" WILL JUMP TO "INDEX" UNLESS THE "DELAY1" VALUE REACHES ZERO. WHEN IT DOES, "DELAY1" WILL BE RELOADED AS DESCRIBED ABOVE AND THEN THE NEXT INSTRUCTION WILL BE EXECUTED.

WAIT HAS ONLY ONE PARAMETER, "VALUE". THIS IS THE AMOUNT OF TIME PERIODS YOU WANT THE EXECUTION TO STOP FOR. THAT IS, IF YOU'RE GOING TO HAVE, LET'S SAY, ONLY ONE "FLASH", THEN IT'LL PROBABLY FLASH TO FAST, BUT THEN YOU ADD A WAIT OF 100 (OR SOMETHING) AND YOU'LL FIND THAT IT LOOKS QUITE BETTER ON THE SCREEN!

THE FOLLOWING INSTRUCTIONS;

INC/DEC/EOR/SET/ADD/SUB

ALL MODIFY THE ROUTINE CODE IN SOME WAY. THESE ARE USED WHEN YOU'RE GOING TO MAKE SOME "ADVANCED" EFFECTS.

INC AND DEC, WANTS ONLY ONE VALUE AND THAT'S "INDEX". WHAT THEY WILL TO IS RATHER OBVIOUS, INCREASE AND DECREASE THE VALUE AT "INDEX". IF YOU'RE GOING TO MAKE A BOX SHRINK OR GROW, THESE ARE THE INSTRUCTIONS YOU'LL HAVE TO USE.

EOR AND SET, WILL ASK YOU FOR A VALUE AND FOR THE INDEX. EOR WORKS AS THE ASSEMBLY EQUIVALENT, THAT IS, IT EOR'S THE BYTE AT "INDEX" WITH THE SPECIFIED VALUE AND THEN STORES THE VALUE BACK AT "INDEX".

SET DOES THE SAME, EXCEPT IT DOESN'T EOR THE VALUE, IT JUST PUTS IT THERE. IF YOU'RE GOING TO MAKE THAT SHRINK/GROW TRICK, THEN YOU'LL HAVE TO RESTORE THE SCROLL'S VALUE BEFORE THE ROUTINE IS RERUN, AND THAT'S WHAT YOU USE SET FOR.

ADD AND SUB WORK EXACTLY LIKE EOR, BUT INSTEAD OF EOR:ING THE BYTE THEY ADD/SUB RESPECTIVELY.

AND FINALLY, SOUND, CLICKS THE SPEAKER. IT WORKS EXACTLY LIKE A "$C030" FROM THE MONITOR.

WELL, THIS WAS THE INSTRUCTIONS IN A NUTSHELL. I KNOW I'M NOT THE BEST AT EXPLAINING THINGS, JUST SIT DOWN AND TAKE YOUR TIME AND YOU'LL UNDERSTAND HOW IT WORKS. TRY LOADING THE DEMOS AND LOOK AT THE CODE, IT
SID MEIER'S PIRATES!

PIRATES: "ACTION AND ADVENTURE ON THE SPANISH MAIN"

PIRATES FEATURES INCLUDE:
- ACTION...SHIP BATTLES, LAND CONQUESTS, FENCING AND SAILING
- STRATEGY...PLUNDERING, TRADING, NEGOTIATING AND FORGING ALLIANCES
- GOALS...TREASURES, ROMANCE, STATUS, POWER AND PRESTIGE
- NEW EXPERIENCES...EXPLORE ACROSS A MAP OF THE ENTIRE CARIBBEAN
- EXTENSIVE GRAPHICS...OVER 70 DIFFERENT SCENES AND PICTURES
- EXCITEMENT...TRIUMPHS AND TRAGEDIES, VICTORIES AND DEFEATS!

PIRATES BY: MICROPROSE
PIRATES DOCUMENTATION BY:
THE PERPLEXER

SAVING THE GAME:
YOU WILL NEED AN EXTRA, BLANK DISK TO SAVE PIRATES! DURING PLAY. TO SAVE THE GAME,
ENTER ANY TOWN AND CHECK INFORMATION. THE LAST INFORMATION OPTION WILL BE SAVE GAME.
SELECT THIS OPTION AND FOLLOW THE INSTRUCTIONS. PIRATES! SAVE-GAME DISK USE SPECIAL
FORMAT. YOU MUST USE THE FORMAT OPTION OFFERED IN SAVE GAME, A NORMALLY FORMATTED
DISK WILL NOT SUFFICE. NOTE: THAT FORMATTING A DISK PREPARES IT FOR SAVING GAMES, BUT
DOES NOT SAVE ANYTHING. HAVING A FORMATTED DISK IS ALSO NECESSARY TO RECORD YOUR FINAL
SCORE ON THE HALL OF FAME IF YOU WISH TO.

STARTING THE GAME:
(THE QUICK START, IF YOU WISH TO LEARN TO PLAY THE GAME FROM EXPERIMENTATION)
NOTE: IF YOU WISH TO UNDERSTAND WHAT IS GOING ON BETTER, CONTINUE TO READ DOCS!

STARTING OPTIONS: BEGIN YOUR 1ST GAME WITH THE FOLLOWING SELECTIONS:
1. WELCOME: START A NEW CAREER
2. SPECIAL HISTORICAL PERIOD?: NO
3. WHAT NATIONALITY ARE YOU?: ENGLISH
4. TYPE YOUR NAME (MAXIMUM: 9 CHARACTERS) AND PRESS 'RETURN'
5. YOU ARE AN: APPRENTICE
6. SPECIAL ABILITY: SKILL AT FENCING
   (IF CONFUSED READ ON FOR MORE DETAILS)

IMPORTANT!!!: YOU MUST KNOW WHEN THE TREASURE FLEET OR SILVER TRAIN ARRIVES!
(SO READ ON UNTIL YOU FIND OUT)

IN PORT: EXPLORE THE PORT & OPTIONS AVAILABLE THERE BEFORE LEAVING FOR YOUR
FIRST CRUISE. DON'T, HOWEVER, DIVIDE UP THE PLUNDER YET!!

CRUISING THE SEAS: SEE THE CONTROL SUMMARY FOR MORE INFO. (LURKING NEAR SEA PORTS
SOften LEAD TO A PROMISING ENCOUNTER, FRIEND OR FOE)

FINISHING YOUR VOYAGE: RETURN TO PORT AND SELECT 'DIVIDE THE PLUNDER'. AFTERTHAT,
SELECT RETIREMENT. THIS ENDS THE GAME AND SHOWS YOUR SCORE. DON'T WORRY YOU CAN
COME BACK FROM RETIREMENT (HEALTH PERMITTING).

NOTE: YOU CAN STILL DIVIDE UP PLUNDER WITH-OUT RETIRING DO THIS WHEN YOUR MEN START TO
GET ANGRY BUT ONLY IF IT HAS BEEN CLOSE TO A YEAR! THEY GET ANGRY SOMETIMES BUT YOU
CAN GET MORE GOLD TO CAUSE THEM TO BECOME HAPPIER. READ ON FURTHER FOR MORE
INFORMATION!

CONTROL SUMMARY: (VERY ABBREVIATED)

CONTROLLING MENUS:
MOVE CURSOR: PUSH JOYSTICK IN DIRECTION DESIRED
SELECT HIGHLIGHTED OPTION: PRESS JOYSTICK TRIGGER.

TRADING & MOVING GOODS
SELECT TRADE LINE: PUSH JOYSTICK TO POINT TO LINE ON SCREEN
BUY (TAKE) GOODS: FLICK JOYSTICK TO LEFT TO MOVE GOODS TO YOUR PARTY
SELL (LEAVE) GOODS: FLICK JOYSTICK TO RIGHT TO MOVE GOODS AWAY FROM YOUR PARTY

FENCING & SWORDPLAY:
AND MILITARILY WEAK SPANIARDS. HOWEVER, Duplicating L'OLLONAIS' ACHIEVEMENT OF
WILL TAKE A COMBINATION OF GOOD LUCK AND PERSISTANCE AT THE RIGHT PLACE AND TIME.

CONTINUE FOR QUITE SOME TIME.
CONTINUE A SAVED GAME: ALLOWS YOU TO RESUME ANY GAME IN PROGRESS. YOU WILL NEED THE
DISK UPON WHICH YOU SAVED THE GAME. DONT INSERT THE SAVE-GAME DISK UNTIL INSTRUCTED TO
COMMAND A FAMOUS EXPEDITION: IS A SHORT GAME WHERE YOU COMMAND JUST ONE EXPEDITION.
THESE EXPEDITIONS ARE USUALLY LARGE, BUT END WHENEVER YOU DIVIDE UP THE PLUNDER.
FAMOUS EXPEDITIONS ARE NOT FOR A NOVICE--DOING AS WELL AS THE HISTORICAL MODELCAN BE
A VERY CHALLING TASK! FAMOUS EXPEDITIONS: YOU MUST RE-ENACT THE ORIGINAL SKILLFUL LEADERS EXPEDITIONS!
JHON HANKINS,1569: THIS IS A FAIRLY DIFFICULT SITUATION. YOU HAVE A LG. POWERFUL
SQUADRON BUT ARE IN TOTAL SPANISH CARIBBEAN. THE ONLY FRIENDLY PORTS ARE TINY
ANCHORAGES. IN REALITY, HANKINS TRIED TO BE A PEACEFUL TRADER (SOMETIMES AT
GUNPOIN--A MOST PECULIAR COMBINATION), AND FAILED.
FRANCIS DRAKE, 1573: THIS IS A VERY DIFFICULT SITUATION. LIKE HANKINS, YOU ARE
INTOetsy SPANISH CARIBBEAN, BUT NOW YOU HAVE A SMALL FORCE. IN REALITY, AFTER AFEW
FALSE STARTS, DRAKE'S BOLDNESS & BRAVERY MADE HIM SUCESSFUL.
PIET HEYN,1628: THIS IS A FAIRLY EASY SITUATION. YOU HAVE A BALANCED TASK FORCE, AND
ARE ADIMIRABLY POSITIONED TO INTERCEPT SPANISH TREASURE GALLEONS OFF THE HAVANA OR IN
THE FLORIDA CHANNEL. EQUALLING HEYN'S FEAT OF AMBUSHING THE ENTIRE TREASURE FLEET
WILL TAKE A COMBINATION OF GOOD LUCK AND PERSEVANCE AT THE RIGHT PLACE AND TIME.
L'Ollonalis,1966: THIS IS AN EASY SITUATION. YOU HAVE MANY POTENTIALLY FRIENDLY PORTS
AND MILITARY WEAK SPANIARDS. HOWEVER, Duplicating L'Ollonalis' ACHIEVEMENT OF
CONQUERING AND PLUNDERING THE ENTIRE MARACAIBO REGION MAY PROVE TAXING.
HENRY MORGAN,1671: THIS IS A VERY EASY SITUATION. YOU HAVE OVERWEIGHTING
FORCES, EASY GRAND ATTACK, HENRY'S BRAVE & JOYSTICK WEAKENED BY EARLIER RAIDS.
MORGAN CAPTURED PUERTO BELLO AND SACKED PANAMA.
BARON DE POINTIS,1697: THIS IS ANOTHER EXTREMELY EASY SITUATION. YOU HAVE POWERFUL
FORCES, WHILE THE SPANIARDS ARE AT THEIR LOWEST MILITARILY. IT DOESN'T TAKE MUCH
BOLDNESS TO DUPLICATE DE POINTIS' CAPTURE AND SACK OF CARTAGENA.
SELECTION OF AN HISTORICAL TIME PERIOD:
(A NOVICE PLAYER SHOULD ANSWER 'NO THANKS' THIS GIVE YOU THE EASIEST ERA)
THE SILVER EMPIRE: (1560)
THIS ERA THE SILVER EMPIRE IS AT ITS PEAK. ALL THE COLONIES (EXCEPT ONE) ARE
SPANISH, ALL THE MAJOR PORTS & TRADE ARE CONTROLLED BY SPAIN! HOWEVER, SPAIN'S
GAINS HAVE BEEN SO GREAT OTHER EUROPEANS ARE ATTRADED TO STEAL AND PLUNDER WHATEVER SPAIN
CANT PROTECT. BECAUSE OF SPAIN'S GREAT POWER, THIS IS AN EXTREMELY CHALLING ERA,
AND SHOULD NOT BE ATTEMPTED BY NOVICES.
MERCHANDERS & SMUGGLERS: (1600)
THIS ERA IS VERY SIMILAR TO THE SILVER EMPIRE, BUT SPAIN IS SOMEDWHAT WEAKER. A FEW
ABORTIVE NON-SPANISH COLONIAL VENTURES HAVE BEGUN, BUT THE CARIBBEAN
REMAINESSENTIALLY SPANISH. ANOTHER CHANCE IS THE PREDOMINANCE OF THE DUTCH
SMUGGLING TRADE. THIS SHOULDN'T BE TRIED BY NOVICES!
THE NEW COLONISTS: (1620)
THIS ERA SEES THE FIRST SUCCESSFUL COLONIES FOUNDED BY THE ENEMIES OF SPAIN, WHILE
THE SPANISH POWER CONTINUES TO DECLINE. WITH THE NEW COLONIES, PROSPECTS FOR PIRACY
AND PRIVATIZATION ARE IMPROVED. LIFE IS FAIRLY CHALLING FOR MOBIL-WE BIRATE AND
PRIVATEERS.
WAR FOR PROFIT: (1640)
THIS ERA IS THE HITEADY FOR SMALL, INDEPENDENT BUCCANEERS. THE SPANISH MILITARY AND
ECONOMY ARE AT THEIR NAIR, WHILE NEW EUROPEAN COLONIES ARE BLOOMING THROUGHOUT THE
ANTILLES. THIS PERIOD IS A GOLDEN AGE (LITERALLY) FOR THE INDIAN AND
RESOURCESFUL BUCCANEERS WHO LIGHT AN ENJOYABLE ERA FOR PLAYERS OF ALL SKILL LEVELS.
THE BUCANEER HEROES: (1660)
THOSE DECADES ARE THE PEAK OF SWASHBUCKLING ADVENTURE IN THE CARIBBEAN.
SPANISH POWER IS FEAR-PROOF, BUT A WAVE OF EUROPEAN COLONIES AND PORTS ABOUND, FORTUNEHUNTING SAILORS CROWD THE TAVERNS, SEARCHING FOR
LUCKY CAPTANS. THIS IS FOR ALL LEVELS!
THE CARIBBEAN PIRATE ADVENTURING. EUROPEAN NATIONS NOWTAKE
SERIOUSLY EVENTS IN THE CARIBBEAN. NAHY WARSHIPS ARE ON PATROL, LETTERS OF MAQUE ARE HARD TO FIND, AND THE GOVERNDORS ARE LESS TOLERANT. ENJOY THIS ERA WHILE YOU CAN, FOR
ITS THE END OF AN AGE. THIS IS TOUGH FOR NOVICES BUT CHALLENGING FOR OTHERS.
SELECTING NATIONALITIES:
(A NEW PLAYER SHOULD SELECT ENGLISH BUCCANEER....) THE ROLES YOU CHOOSE DETERMINES
WHERE YOU START, WHAT SHIP'S YOU HAVE, THE SIZE OF YOUR CREW, YOUR INITIAL WEALTH AND
REPUTATION, ETC... YOUR INITIAL NATIONALITY DOES NOT REQUIRE YOU TO SUPPORT THE
NATION ( YOU CAN BE DUTCH, AND ATTACK DUTCH SHIPS...ETC...) YOUR ACTS SPAK FOR YOU:
YOU IF YOU DED PLEACE A NATION, A NATION MAY REMARK YOU. IF YOU ANGER A NATION,
A GOVERNOR CAN ORDER HIS HARBOR FORIS TO FIRE ON YOU!!!
IN ENGLISH THIS NATION SUPPORTS PRIVETEERS IN THE 16TH CENTURY, AND JUST AS GENEROUSLY
SUPPORTED PRIVATE COLONIZATION VENTURES IN THE NEXT CENTURY.
FRENCH: IS SECOND FOR PIRATES, ALTHOUGH THIS NATION PROVIDES LESS SUPPORT TO ITS SONS
OVERABDAR. THIS GIVES THEM MORE INDEPENDENCE, MORE FREEDOM OF ACTION. FURTHERMORE,
THE GROWING 17TH CENTURY FRENCH COLONIES ON WESTERN HISPANIOLA AND TORTUGA ARE IDEAL
PIRATE BASES.
DUTCH: EXCEPT IN 1600'S, THE DUTCH SAILED AS TRADERS TO THE CARIBBEAN, NOT AS
WARRIORS. OF COURSE, ONCE IN THE CARIBBEAN, MORE THAN A FEW SUPPLEMENT THEIR
TRADING WITH MORE VIOLENT AND PROFITABLE PURSUITS. AS A RULE, DUTCH TRADERS TRIED TO
DIVIDE UP THE PLUNDER, WITHOUT GIVING THEM MORE INDEPENDENCE, MORE FREEDOM OF ACTION.
FURTHERMORE, THE GROWING 17TH CENTURY FRENCH COLONIES ON WESTERN HISPANIOLA AND TORTUGA ARE IDEAL
PIRATE BASES.
DIFFICULTY LEVEL: (NEW PLAYERS SHOULD BE APPRENTICES)
THE TREASURE FLEET IN 1560:

*CARACAS-E/AUGUST  PANAMA-L/AUGUST  NO. DE DIOS-E/OCT*

PERSONAL STATUS: SHOWS YOUR STANDING WITH EACH NATION, AND PERSONAL DETAILS ABOUT YOUR

When does the Treasure Fleet and Silver Train arrive at certain times????

To determine when these events occur, consult the documentation or the game’s help guide. The Treasure Fleet and Silver Train may arrive at specific dates based on the player’s actions and decisions. To find these dates, check the game’s manual or online resources dedicated to the game.

THE TREASURE FLEET IN 1650:

*CARACAS-E/JANUARY  PANAMA-L/JANUARY  PL. BAYLIS--L/JANUARY*

The principles of fencing:

FENCING & SWORDPLAY:

- **Basics of control:**
  - **Step on the screen and your opponent is on the left:**
  - **To attack:** Push joystick left, toward the enemy. Push high for a high attack, horizontal for a mid-level attack, low for a low attack.
  - **To parry:** Don’t push left or right. Just push up to parry high attacks, leave centered for mid-level parries and push down to parry low attacks.
  - **To retreat:** Push joystick right away from enemy. You parry while retreating, and like normal parries, these can be high, mid, or low, depending on joystick level.
  - **To pause:** Press space bar/press again to resume play. (This applies everywhere.)

- **Choosing your weapon:**
  - **Rapiers** are a short, thin, flexible weapon with a sharp point. They can be maneuvered easily and thrust into a target with accuracy. They have a longer reach than any other weapon but cause less damage.

- **Cutlasses** are a short, heavy, curved cleaver with a mean edge but short reach. Cutlass hits can be devastating (twice as damaging as a rapiers) making it a popular weapon among untutored fighters.

- The longsword is a classic weapon of medium length. Its attacks do more than a rapiers but less than a longsword.

- The principles of fencing:
  - A hit occurs whenever an attack connects shown by a flash of blood (red) each hit decreases your health and lowers your followers moral...eventually causing victory when they all panic!
  - Retreat move off of the right of the screen, your saved but lose your rep!
  - Panic and surrender whenever a leader in panic is hit this occurs, also in lg battles when a leader’s forces are reduced to only one man, then he’s hit!
  - Leadership in battle: (causes outcome of battles)
  - Only a few of your battles are man to man duels. Most of the time you’re leading your starmar crew against the enemy. As you duel the enemy leader, your crewmen are also fighting.

- Morale: your hits against the enemy leader, and his against you, change the morale of each side in battle. Morale levels run from mild (the best) downward to strong, firm, angry, shaken, and finally panic.

- Information: party status: shows men’s morale (happy, pleased, unhappy, angry) when they are angry.

- Personal status: shows your standing with each nation, and personal details about your age, height, wealth and rep! If your health is poor you will be forced to retire soon! Ships log: recaps your activities!
MAPS: IS A FILE OF YOUR MAP FRAGMENTS, TO FIND BURIED TREASURE OR YOUR LONG LOST SISTERS WHEREABOUTS, YOU MUST FIND THE REMAINING FRAGMENTS TO SEARCH FOR THE DESIRED GOAL. WHEN YOU DO FIND YOUR SISTER YOU WILL START LOOKING FOR THE INFAMOUS INCA TREASURE!!! YOU MUST DUEL CERTAIN SPANISH SWINES TO GET THE MAPS NEEDED, ALTHOUGH YOU CAN BUY FOR 500GP TREASURE MAPS AND THE REMAINING PIECES IN DIFFERENT TAVERNS AT DIFFERENT PORTS. WHEN YOU THINK YOU KNOW EXACTLY WHERE THE TREASURE OR SISTER IS GO TO THE ABANDONED ISLAND OR WHATEVER (THERE DOESN'T HAVE TO BE A TOWN THERE) AND GO TO INFO. AND SEARCH!

CITIES: PROVIDES NECESSARY INFO. ON ALL THE CITIES, SOMETIMES YOU WILL NEED TO BUY INFO. ABOUT A PARTICULAR CITY IF YOU HAVE NO INFO. ON FILE FROM A TRAVELLER IN THE TAVERN, OR YOU CAN PERSONALLY TRAVEL THERE.

TAKE A SUN SIGHT: ALLOWS YOU TO SPEND THE DAY PLOTTING YOUR POSITION W/ THE ASTROLABE. SEARCH: FOR SISTER OR TREASURE ON SPECIFIC ISLAND YOU ARE AT.

SAVE GAME: ONLY IN TOWNS TO SAVE GAME AND CONCLUDE AT A LATER TIME! GETTING AROUND TOWN:

VISIT GOVERNOR: HE TELLS YOU HIS NATIONS WARS WITH AND ARE ALLIED WITH. YOU MAY BREET HIS DAUGHTER (PREETY ONES ARE HARD TO MARRY) I usually try and be dutch and MARRY AN UGLY GIRL WHO EACH TIME I VISIT TELLS ME WHERE THE TREASURE FLEET AND SILVER TRAIN ARE AT, CURACO IS CLOSE TO WHERE THEY USUALLY ARE. ALSO, IF YOU FIGHT SOME OF THAT CERTAIN GOVERNERS ENEMIES HE WILL REMARD YOU MONEY, LAND AND HIGHER LEVELS OF RANK. VISIT A TAVERN: FOR LATEST NEWS AND INFO. ALSO FOR MORE MEN! OR A TREASURE MAP! VISIT A MERCHANT: FOR REPAIRS, SELLING OF SHIPS OR BUYING AND SELLING OF GOODS.

NOTE: HAVING DAMAGED SHIPS SLOW YOU DOWN ALSO YOU CAN ONLY CARRY UP TO 255 OF GOODS AND SUGAR AND AROUND 170 FOOD NO MATTER HOW MANY SHIPS YOU OWN!

DIVIDE UP PLUNDER: TO END GAME OR START WITA FRESH AND HAPPY CREW!

DO THIS BY HAVING OVER 300 MEN AND ATTACK ANY ENEMY PORT BY LAND IF YOU HAVE MORE MEN THAN THEY DO YOU AUTOMATICALLY SCALE THE WALLS AND ALL YOU NEED TO DO IS KILL THE ENEMY LEADER THEN CHANGE GOVERNOR TO WHATEVER NATIONALITY YOU WANT!

WRITTEN ON: 3-8-27 THIS TOOK ME: OVER 3 HRS STRAIGHT TO DO SO ENJOY!!

LEAVE ALL INFORMATION AS FOUND IN THIS SEQ. FILE!

WRITTEN BY: THE PERPLEXER (MARYLAND #1)

STARTING OUT: - Hit 'ESC' to start the game from the title page.

-Jump, press button 0.

-To exceed, press button 0.

-To catch a balloon, push the left button to jump. Move controller left or right to float left or right. To speed up, push controller forward; to slow down, pull controller back.

-DANGERS:
KEEP AWAY FROM FROGS, BATS, CONDORS, EELS, AND ALBINO SCORPIONS. TOUCHING ANY OF THEM WILL SET YOU BACK!

-White crosses:
Whenever Pitfall Harry succumbs to a danger, he is magically transported back to the last white cross he touched. So, be sure and touch each of these mystical Incan healing centers as you encounter them.

-REWARDS:
You start out with 4000 points. Thereafter, you receive:
-5000 points for every white gold bar.
-15000 points for the cave rat.
-20000 points for the Raj diamond
-10000 points for Rhonda
-10000 points for Quickclaw
Touching dangerous creatures or falling unintentionally
loses points.

P.L.E DOCUMENTATION

ENTERED BY JUDIE MAC

LOADING/RUNNING P.L.EDITOR

IF YOU OWN AN APPLE II PLUS SYSTEM THAT DOES NOT HAVE AN INTEGER BASIC
FIRMWARE CARD, THE PROGRAM LINE EDITOR WILL NOT BE RUN WHEN THE
SUPPLIED DISK IS BOOTED. THIS IS BECAUSE THE GREETING PROGRAM IS AN
INTEGER BASIC PROGRAM. SO, THE FOLLOWING STEPS MUST BE TAKEN IN ORDER
TO ALLOW THE PROGRAM LINE EDITOR DISK TO BOOT PROPERLY IN APPLIESOFT.

1. REMOVE THE WRITE PROTECT TABS FROM THE EDGE OF THE INCLUDED DISK.
2. INSERT AND BOOT THE DISK.
3. UNLOCK PROGRAM LINE EDITOR
4. UNLOCK PLE.FP
5. RENAME PROGRAM LINE EDITOR, PLE.INT
6. RENAME PLE.FP.PROGRAM LINE EDITOR
7. LOCK PROGRAM LINE EDITOR
8. LOCK PLE.INT
9. REPLACE THE WRITE PROTECT TAB.
10. REBOOT THE DISK

AFTER THIS IS DONE, JUST BOOT THE DISK NORMALLY. SOON, A DISK CATALOG
WILL APPEAR, LETTING YOU KNOW THE PLE IS UP AND RUNNING.

WHEN THE PLE HAS BEEN RUN, YOU SHOULDN'T NOTICE ANYTHING UNUSUAL ABOUT
THE OPERATION OF YOUR APPLE. IN FACT, EVERYTHING IS THE SAME, EXCEPT
FOR ALL OF THE NEW COMMANDS AND FEATURES DESCRIBED IN THE FOLLOWING
PAGES.

NOTE:
WHEN THE PLE IS UP AND RUNNING, DOS WILL SET HI-MEM:1536 BYTES LOWER
THAN NORMAL FOR YOUR SYSTEM.

THERE ARE TWO NEW COMMANDS ADDED TO BASIC THAT ALLOW YOU TO EDIT
EITHER A PROGRAM LINE OR THE LAST LINE OF CHARACTERS TYPED AT THE
KEYBOARD. THESE ARE CTRL-E (EDIT) AND CTRL-W

ENTERING EDIT MODE:
CTRL-E AND CTRL-W

THIS IS THE COMMAND USED WHEN YOU WANT TO EDIT A LINE IN YOUR
PROGRAM. TO TYPE CTRL-E, JUST PRESS THE CTRL KEY AND HOLD IT DOWN
WHILE YOU HIT THE E KEY. AFTER THE WORD "EDIT" APPEARS, TYPE THE LINE
NUMBER OF THE LINE YOU WANT TO EDIT. THE LINE WILL APPEAR, WITH THE
CURSOR AT THE BEGINNING OF THE FIRST STATEMENT IN THE LINE. THE LINE
EDITOR REMEMBERS THE NUMBER OF THE LAST LINE EDITED, SO, IF YOU WANT
TO EDIT THE SAME LINE AGAIN LATER, SIMPLY TYPE CTRL-E AND A PERIOD

HERE ARE A FEW THINGS TO WATCH FOR WHEN USING CTRL-E TO ENTER EDIT MODE:

1. CTRL-E MUST BE THE FIRST CHARACTER TYPED ON A LINE.
2. DON'T TRY TO EDIT LINE 0 OF AN APPLESOFT PROGRAM.
3. CTRL-E IS DISABLED DURING INPUTS AND MONITOR.
4. BACKSPACING INTO THE WORD EDIT BEFORE TYPING THE LINE NUMBER MAY DISABLE CTRL-W (RESTART) IN EDIT MODE.
5. IF YOU INADVERTENTLY TYPE THE ESCAPE KEY BEFORE TYPING CTRL-E, TWO WARNING BELLS WILL SOUND AND YOU WILL NOT ENTER EDIT MODE. IF A LINE NUMBER IS TYPED AFTER THE WARNING BELL, HITTING RETURN MAY DELETE THE LINE.
6. IF A LINE IS LONGER THAN THE MAXIMUM BASIC LINE LENGTH (128 FOR INTEGER BASIC, 239 FOR APPLESOFT), IT WILL BE AUTO-PACKED, REMOVING ALL EXTRANEOUS SPACES FROM THE LINE.

CTRL-W THIS IS THE COMMAND TO USE WHEN YOU HAVE TYPED A LINE IN INTEGER BASIC AND RECEIVED A "**SYNTAX ERROR MESSAGE, JUST TYPE CTRL-W AND THE LINE WILL INSTANTLY REAPPEAR. CTRL-W WORKS DURING INPUTS, AND IT WILL RECOVER AND RE-EXECUTE IMMEDIATE COMMANDS. THIS COMMAND CAN ALSO BE USED TO RECOVER LINES CANCELED WITH CTRL-X. CTRL-W ACTUALLY WORKS TWO WAYS, DEPENDING ON WHEN IT IS TYPED. IF IT IS TYPED AS THE FIRST CHARACTER ON A LINE, IT WILL CAUSE THE LAST LINE TYPED FROM THE KEYBOARD TO REAPPEAR. IF IT IS TYPED WHILE ENTERING A LINE, CTRL-W RETYPES THE LINE AND ENTERS EDIT MODE.

HERE ARE SOME THINGS TO BE CAREFUL OF WHEN USING CTRL-W:

1. CTRL-W DOES NOT WORK WHEN ENTERED AS THE FIRST CHARACTER OF AN APPLESOFT LINE.
2. VERY LONG LINES MAY BE AUTO-PACKED, REMOVING ALL EXTRANEOUS SPACES.

CTRL-E IS THE FIRST CHARACTER OF EACH COMMAND'S NAME IS THE SAME AS (OR SOUNDS LIKE) THE COMMAND ITSELF. THIS IS AN EASY WAY TO REMEMBER THESE COMMANDS. NOTICE THE FIRST CHARACTER OF EACH COMMAND'S NAME IS THE SAME AS (OR SOUNDS LIKE) THE COMMAND ITSELF. THIS IS AN EASY WAY TO REMEMBER THESE COMMANDS.

EDIT MODE COMMANDS

CTRL-I INSERT - THIS COMMAND ALLOWS YOU TO INSERT CHARACTER INTO THE LINE. NON-CONTROL CHARACTERS TYPED AFTER A CTRL-I WILL BE INSERTED IN FRONT OF THE CURSOR, AND THE REST OF THE LINE WILL SPREAD TO MAKE ROOM. ALL FOLLOWING CHARACTERS TYPED WILL BE INSERTED UNTIL A CONTROL CHARACTER IS TYPED (SUCH AS <-, ->, OR ANOTHER EDIT MODE COMMAND). TO INSERT CONTROL CHARACTERS, SEE OVERRIDE.

CTRL-F FIND - FOLLOWED BY A CHARACTER TYPED N TIMES, FIND WILL MOVE THE CURSOR TO THE NTH OCCURRENCE OF THE CHARACTER IN THE LINE. FOR EXAMPLE, TO POSITION THE CURSOR ON THE THIRD COLON (:) IN A LINE, TYPE CTRL-F : : :. NOTICE THAT YOU ONLY NEED TYPE CTRL-F ONCE. TYPE ANY OTHER CHARACTER TO TERMINATE FIND.

CTRL-Z ZAP - THIS FUNCTION DELETES ALL CHARACTERS UP TO A SPECIFIC CHARACTER. A CTRL-Z FOLLOWED BY A CHARACTER TYPED N TIMES WILL DELETE ALL CHARACTERS UP TO THE NTH OCCURRENCE OF THAT CHARACTER (MUCH LIKE FIND). FOR EXAMPLE, TO DELETE THREE STATEMENTS FROM A LINE, TYPE CTRL-Z : : :. TYPE ANY OTHER CHARACTER TO TERMINATE ZAP. IF YOU ZAP A LITTLE TOO FAR, YOU CAN RESTORE THE ORIGINAL LINE WITH RESTART.

CTRL-O OVERRIDE - THIS COMMAND FUNCTIONS EXACTLY LIKE THE INSERT COMMAND EXCEPT THAT THE FIRST CHARACTER INSERTED MAY BE A CONTROL CHARACTER. AFTER THE FIRST CHARACTER HAS BEEN INSERTED, OVERRIDE BEHAVES EXACTLY LIKE INSERT THAT IS, INSERTION IS TERMINATED WITH A CONTROL CHARACTER. INSERTED CONTROL CHARACTERS ARE DISPLAYED IN INVERSE VIDEO IN EDIT MODE. YOU CAN USE OVERRIDE TO INSERT CTRL-D'S INTO PRINT STATEMENTS FOR DOS COMMANDS. YOU MIGHT ALSO WANT TO EXPERIMENT WITH OTHER CONTROL CHARACTERS SUCH AS THE FOUR PROGRAMMABLE CURSOR CHARACTERS (CTRL-A, CTRL-E, BACKSPACES, AND CARRIAGE RETURNS).

CTRL-R RESTART - THE RESTART COMMAND IS USED TO RE-EDIT THE ORIGINAL LINE, REGARDLESS OF ANY CHANGES OR DELETIONS YOU MIGHT HAVE MADE (A LIFE SAVER). RESTART DOES NOT WORK IF YOU ENTERED EDIT MODE WITH A CTRL-W.

CTRL-P PACK - THE PACK COMMAND ALLOWS YOU TO REMOVE EXTRANEOUS SPACES IN EDITED LINES THAT WOULD OTHERWISE CAUSE A *** TOO LONG ERROR. CTRL-P WILL RETYPE A LINE WITH ALL SPACES REMOVED EXCEPT THOSE WITHIN QUOTES. PACK CAN ALSO BE USED WHEN YOU HEAR THE BELL WARNING YOU THAT YOUR LINE IS TOO LONG. TO PROTECT REMARK LINES FROM BEING PACKED, ENTER A QUOTE AS THE FIRST CHARACTER OF THE REMARK.

CTRL-C CONVERT - THE CONVERT COMMAND IS USED TO QUICKLY CONVERT UPPER CASE TEXT TO LOWER CASE, OR VICE VERSA. CTRL-C CONVERTS THE CHARACTER UNDER THE CURSOR TO THE CURRENT CASE SET BY THE CTRL-A/CTRL-S UPPER-LOWER SHIFT LOCK, AND ADVANCES THE CURSOR.

CTRL-B BEGIN - THIS COMMAND MOVES THE CURSOR TO THE BEGINNING OF THE LINE. IT IS USEFUL FOR REPOSITIONING THE CURSOR BEFORE USING THE FIND COMMAND, AND FOR REMEMBERING LINES.

CTRL-M RETURN - TYPING A CARRIAGE RETURN WILL EXIT EDIT MODE AND SAVE THE LINE EXACTLY AS IT APPEARS ON THE SCREEN THIS IS THE USUAL WAY OF LEAVING EDIT MODE.

CTRL-X CANCEL - CTRL-X IS USED TO CANCEL THE LINE BEING EDITED, AND EXIT EDIT MODE.
MODE. A LINE CANCELLED WITH CTRL-X CAN BE RECOVERED WITH CTRL-W.

THE BACKWARD AND FORWARD ARROW KEYS WORK JUST AS THEY NORMALLY DO,
MOVING THE CURSOR BACKWARD OR FORWARD ONE SPACE. THESE ARE ALSO
INVOKED WITH CTRL-H AND CTRL-U, RESPECTIVELY.

CTRL-A, CTRL-S
THE UPPER AND LOWER CASE SHIFT LOCK KEYS ALSO WORK IN EDIT MODE.
CTRL-A IS UPPER SHIFT LOCK, AND CTRL-S IS THE LOWER SHIFT LOCK. (SEE
CONVERT)

STOP LIST ESC OR
CTRL-S
TEMPORARILY STOP, I.E. PROGRAM LISTINGS OR CATALOG, HIT CTRL-S OR
ESC. EXIT COMMAND, HIT ANY KEY.

CANCEL LIST
CTRL-C
TO TERMINATE LISTING ENTIRELY AND RETURN TO BASIC

FLUSH LIST
CTRL-L
TO QUICKLY SKIP THROUGH LONG LISTINGS. TO RESUME OUTPUT TO SCREEN
CTRL-F

NOTE: ESC AND CTRL-S:
DURING INPUT BE CAREFUL. THE ABOVE COMMANDS S, C, F, ESC, WORK ONLY
WHEN CHARACTERS ARE ACTUALLY BEING PRINTED ON THE SCREEN.

CURSOR CONTROL
CTRL-H - LEFT
CTRL-I - RIGHT
CTRL-J - DOWN
CTRL-K - UP

THESE CHARACTER ALLOW YOU TO CONTROL THE POSITION OF THE CURSOR FROM
WITHIN PRINT, REM, OR INPUT STATEMENTS.

EXAMPLE:
A PRINT STATEMENT WITH AN ASTERISK FOLLOWED BY FIVE CTRL-K'S AND
ANOTHER ASTERISK WILL PRINT AN ASTERISK ONE SPACE AHEAD AND FOUR LINES
ABOVE THE OTHER.

ESCAPEFUNCTIONS

NOTE:
THE ESCAPE FUNCTIONS ARE NOT AVAILABLE DURING EDIT MODE!

ESC ø, A-G
THESERENORMALAPPLEESCAPECOMMANDS. THEY WORK AS IS IN MANUAL.

ESC P
TYPOING ESC-P/ SAME AS ESC SHIFT-P, EXCEPT DON'T USE SHIFT KEY.

ESC I, HJ, K, M
SIMULATE AUTOSTART ROM ESCAPE EDITING. SAME AS ESC A, B, C, D.

ESC T
THISTYPES TEXT AND RETURN, AND THEN POKE -16300,0 RETURN, WHICH
RETURNSTOYOUTEXTPAGE 1.

ESC L
TYPE LIST AND A CARRIAGE RETURN.

ESC O AUTOMATICALLY TYPES CALL-936

ESC 1, 2 ESC 1 WILL CATALOG THE DISK IN DRIVE 1
ESC 2 WILL CATALOG THE DISK IN DRIVE 2
ESC / USE IN PLACE OF WORD PRINT

ESC: THIS DOES A CALL-151 NOTE THAT A "": IS A LOWER CASE ";" THE
MONITOR PROMPT CHARACTER WHEN EXECUTED ALL THAT IS SEEN IS "MON"

ESC < - > PERFORMS EIGHT <- AND ->. TYPING ESC -->---> WILL COPY
AN ENTIRE LINE FROM THE APPLE SCREEN WHILE ESC <= <= WILL FAST
BACKSPACE SIXTEEN TIMES.

ESC Q
THIS FUNCTION WILL BRING THE VALUE OF THE CONTENTS OF ANY TWO MEMORY
LOCATIONS. TO USE, YOU MUST FIRST SET THE VARIABLE A EQUAL TO THE
ADDRESS OF THE LOCATION OF THE TWO-BYTE NUMBER. (THIS IS DONE BY
TYPOING A=N, WHERE N IS AN INTEGER) NEXT JUST TYPE ESC Q. THIS FUNCTION
IS ROUGHLY EQUIVALENT TO PRINT PEEK (A) + PEEK (A+1) * 256, EXCEPT
THAT VALUES GREATER THAT 32767 ARE PRINTED AS NEGATIVE NUMBERS. IN
INTEGER BASIC SETTING A=74 WILL PRINT THE CURRENT VALUE OF LOMEM: AND
A=76 WILL PRINT THE ADDRESS OF HIMEM: IN APPLESOFT USE A=105 AND A=73
RESPECTIVELY, TO PRINT THE VALUE OF LOMEM: AND HIMEM: THIS FUNCTION
IS NOT PRINTED ON THE SCREEN DURING EXECUTION.

ESC M
WILL CALCULATE THE START ADDRESS AND LENGTH OF THE MOST RECENTLY
BLOADED DISK FILE ON 48K SYSTEM. YOU MUST CHANGE THE CONSTANTS WITHIN
WHEN CHARACTERS ARE ACTUALLY BEING PRINTED ON THE SCREEN. THE

ESC P
TYPING ESC-P/ SAME AS ESC SHIFT-P, EXCEPT DON'T USE SHIFT KEY. ALSO  NOTICE ESC CTRL-E IS DEFINED AS TWO BELLS AND A CTRL-X. THIS CAN
BE A LIFE SAVER IF YOU USE ESC KEY FOR STOP LIST AND YOU  ACCIDENTALLY
ESC I, HJ, K, M HIT THE ESC KEY AFTER THE LISTING HAS STOPPED. THE NEXT KEY WILL BE
PROCESSED AS AN ESCAPE FUNCTION AND YOU WILL NOT ENTER EDIT
MODE.

ESC T
THIS TYPES TEXT AND RETURN, AND THEN POKE -16300,0 RETURN, WHICH
RETURNSTOYOUTEXTPAGE 1.

ESC L
TYPE LIST AND A CARRIAGE RETURN.

ESC O AUTOMATICALLY TYPES CALL-936

APPLE II COMPUTER DOCUMENTATION RESOURCES (A2_DOCS_DOCUMENTATION.MSW)
DOCUMENTATION FOLDER -- WWW.TEXTFILES.COM/APPLE/ -- 18 SEPTEMBER 2000 -- 786 OF 1262
B. LOAD PLE
C. INSERT YOUR OWN DISK.
D. CATALOG YOUR DISK TO FIND OUT THE NAME AND FILE TYPE OF ITS EXISTING GREETING PROGRAM.
E. SAVE HELLO. YOU NOW HAVE REPLACED THE OLD GREETING PROGRAM WITH PLE.

GREETING PROGRAMS:
A. LOAD PLE
B. DEL 10,30
C. ENTER YOUR PROGRAM.

INTEGER: THE LAST STATEMENTS EXECUTED IN YOUR PROGRAM MUST GOSUB 32767: PRINT "<CTRL-D>INT"
APPLESOFT: THE LAST STATEMENT EXECUTED MUST BE GOSUB 63999:PRINT "<CTRL-D>FP"
BECAUSE THE FINAL INT AND FP IMMEDIATELY TERMINATES THE PROGRAM AND CLEARS PROGRAM MEMORY, IT IS NOT POSSIBLE TO RUN ANOTHER PROGRAM FROM YOUR GREETING PROGRAM. BRUN CATALOG AND EXEC ETC., ARE ALLOWED
D. INSERT YOUR OWN DISK.
E. SAVE HELLO.

IT IS POSSIBLE TO INIT A NEW DISK WITH A PLE GREETING PROGRAM.

ENTERING BASIC FROM APPLE MONITOR
TO RETURN TO BASIC AFTER HITTING RESET OR CALL-151, TYPE CTRL-Y AND HIT RETURN. IF YOU USE 3DG0 TO REENTER BASIC THE PLE WILL BE DISABLED UNTIL BASIC IS REENTERED WITH CTRL-Y. IF YOU HAVE AUTOSTART ROM, HITTING RESET WILL ALWAYS RETURN YOU TO BASIC WITH THE EDITOR UP AND RUNNING.

THE PLE IS MUCH CONNECTED TO THE APPLE LIKE A PRINTER OR OTHER PERIPHERAL. THEREFORE WHEN YOU USE PR# IN# THE PLE IS TEMPORARILY DISABLED AND MUST BE RECONNECTED. IN APPLESOFT CALL-1013 OR SIMPLY AN & IN YOUR PROGRAM OR FROM THE KEYBOARD. INTEGER DOESN'T HAVE A STATEMENT YOU MUST USE CALL-1013 TO RECONNECT THE PLE.

MEMORY CONFLICTS; TO TRANSFER TO ANOTHER DISK
A. LOAD REMOVE PLE
B. SAVE REMOVE PLE,A3300,L33A

**DOCUMENT plunder**

**INTRODUCTION**

PLUNDER! is a game of chance and daring for 2 to 4 players of any age. Any or all of the players can be run by the computer. It is written in ORCA Pascal, which uses the speed, the stereo sound, and the advantages of GSOS 5.0.2. The program contains over 500K of digitized sound and graphics files, packed into a single file for ease of use.

This game is Reliefware -- very similar to Shareware. Please try it out for a week. If you enjoy it, please pay for it by sending $15 to: Ken Franklin 5603 81st St E Puyallup, WA 98371

***IMPORTANT!!!*** ALL money received for this game will be given to charities working for homeless relief. I intend to choose charities that show a good record of truly benefiting homeless families. I do NOT intend to keep any of the money. If you enjoy having a roof over your head and a computer within it, please consider paying the Reliefware fee.

If you don't enjoy it, or don't want to pay the $15, then please delete it or pass it on to a friend. This is NOT public domain software, and may not be sold without my written permission. It may be distributed freely on bulletin boards or to friends, as long as this complete documentation file accompanies it.

Your honesty and constructive criticism are appreciated.

**LEGAL STUFF**

This documentation and software are Copyright 1990 by Ken Franklin. I give permission to distribute copies of the package ONLY AS A UNIT (documentation, program, and icon file) and ONLY FOR FREE. I do not give permission for the sale of copies of this package. All other rights are reserved. I make no guarantees that this program will make your dog behave, or raise your computer's consciousness. If you don't want it, toss it.

User groups who want to distribute this package for a small "copying fee" can get permission by contacting me by mail, or by EMail (America Online "Dr Ken FP"); GENie KEN.FRANKLIN.

This program contains material from the ORCA/Pascal Run-Time Libraries, copyright 1987-1988 by Byte Works, Inc. Used with permission.

**OBJECT OF THE GAME**

In PLUNDER!, you and your competitors find yourself in the treasure room of a dungeon, filled with various packages. You know that most of the packages contain treasures ranging in value from $100 to $15000; but two of the packages contain mystery surprises, and one contains a bomb that will destroy everyone in the room.

In each room, each of you has a choice: open a package, or escape through the door. If you escape, you get your share of all treasure found (minus 4 percent for panic). If you stay, whatever you find goes into the treasure. Naturally, if you stay and others leave, your share will grow faster. But if you stay TOO long, you'll get nothing.

After each "explosion", everyone gets a new life, and a new room of packages. Once someone reaches the Goal score, the others get one last room (with the leader locked out) to try to pass the leader. The game is over when the leader retains his/her/its lead.

In each room, the first player is selected randomly. The number of packages is determined by the number of players. With 2 players, each room has 9 packages; with 3, there are 12; and with 4, there are 16.

**THE MENUS**

THE APPLE MENU provides access to NDAs, as well as the shareware notice. THE EDIT MENU is provided for NDA junkies. This game doesn't use it. THE GAME MENU has four options: SETUP, BEGIN GAME, ABORT GAME, and QUIT.

Taking these in turn:

SETUP opens a dialog box. You can enter the names of up to four players by typing them in; use TAB to move from one to the next. The radio buttons on the left select for 2, 3, or 4 players. The radio buttons under each name select the player.
3. You can estimate your risk by keeping track of the size of each treasure. Every round starts off with one bomb, two surprises, and one "artifact". The breakdown of other treasures is based on the number of players. In a 2-player game, it is 2 small, 2 medium, and 1 large; with 3 players, it is 4 small, 3 medium and 1 large; and with 4 players, the breakdown is 6 small, 4 medium and 2 large. The small treasures are worth $100-$300; the mediums $500-$1000; the larges $2500-$5000; and the artifacts, $7500-$15000.

TECHNICAL NOTES
PLUNDER! was designed while Karl Kerchief and I were jogging one day — we were searching desperately for distractions from the pain. It is based on a quote by Martin Gardner, which goes something like this: "You face a thousand boxes. All but one contain a dollar bill; one contains a nuclear warhead that explodes on opening. How many boxes will you open?"

The artifacts are tributes to some of my favorites in the game world. The Scrabble Sapphire, of course, honors the classic Selchow & Righter game. The Brunswick Pearl looks sorta like a bowling ball (I hope). The Golden Cubes add excitement to most games. The Crown of Sackson commemorates American game inventor Sid Sackson. The Ravensburger Ruby is for European game producer Otto Maier Verlag Ravensburg.

The sounds for PLUNDER! were dressed up using Sound Shop, a utility included with Roger Wagner's Hyperstudio. The graphics were painted with Activision's Paintworks Gold and Electronic Arts' DELUXE PAINT II. The programming was done using Byte Works' OXCA Pascal. The entire project took the evenings of two weeks. The program itself is only 32K of the file; the remainder is in the "resource fork". For the programmers out there, there are four custom resource types: $0BA6 = digitized waveforms in pure, unlabelled form $0BA7 = index of LocInfo for graphics resources $5BA6 = digitized waveforms in pure, unlabelled form $5BA6 = an array of size/speed/volume data for the $2BA6 resources

If you're interested, the number $8BA6 was used because the hex digits correspond to position of the letter in the alphabet. 

Brunhilda the Big-Boned is available for singing engagements at birthday parties and weddings. Contact the author for booking arrangements.

Enjoy. —Ken Franklin

POOL OF RADIANCE
 INTRODUCTION

Welcome to the official ADVANCED DUNGEONS & DRAGONS computer product, Pool Of Radiance, a FORGOTTEN REALMS fantasy role-playing epic. This adventure game is based on the rules and background created by TSR, Inc. with a storyline created especially for this game. The Pool Of Radiance adventure begins in the ruined city of Phlan on the northern shore of the Moonsea, where adventurers from the civilized nations are trying to rebuild this once-proud city. Your adventurers start out as beginning characters at the first level of experience and can advance to higher levels as they help bring back Phlan to its former glory.

WHAT COMES WITH THIS GAME:
In addition to the game disks, you should find four other items in your game.

THE RULE BOOK
This is what you are reading. If you have game play questions during the course of the game, refer to this book.

THE ADVENTURER'S JOURNAL
This contains background and introduction to the Forgotten Realms and the scenarios, plus maps, rumors, and stories that may be true or false. It also contains Appendices, tables and reference information, to help speed game play. You will confirm the true rumors and expose the false ones during the game.

THE QUICK START CARD
This explains how to start the game, make menu choices, and indicate items using your computer. It also lists the English letters that you need to get right into the game without having to read through the rules.

THE TRANSLATION WHEEL (SPHINX NOTE: Wheel not included)
As your characters progress through the Forgotten Realms, they will occasionally find Dethk (Dwarvish) and Espruar (Elvish) runes. The wheel is a method of translating those runes into English words so you can understand them. The Translation Wheel has four parts:

Espruar (Elvish) Runes. Around the outside rim are the elvish runes.
Dethk (Dwarvish) Runes. Just inside the elvish runes are the dwarvish runes.

Three Paths. Spiraling out from the inside are three parts identified graphically as:

......
-----

Six Rings. Six numbered rings, each with three holes showing letters, are located inside of the dwarvish runes.

USING THE WHEEL
You can get many kinds of information from the wheel:

Five or Six Letter Code Words. The computer displays 2 runes and a path. Match up the two runes and read the letters from rings 1 through 6. If the first character is a number, ignore it and read the letters from rings 2 through 6.

Three Letter Code Words. The computer displays 2 runes and a ring number. Match up the two names and read the letters on that ring clockwise from the ...... Path.

Translate Elvish (Espruar) to English or Dwarvish (Dethk). The computer displays a list of Elvish runes. Match the Translate Espruar Tab to each Elvish Rune, one at a time. Read the English letter in Ring 1 of the ...... Path. Read the Dwarvish rune at the Translate Dethk Tab.

Translate Dwarvish (Dethk) to English or Elvish (Espruar). The computer displays a list of Dwarvish runes. Match the Translate Dethk Tab to each Dwarvish Rune, one at a time. Read the English letter in Ring 1 of the ...... Path. Read the Elvish Rune at the Translate Espruar Tab. Some Dethk runes have more than one translation; try each when translating words.

GETTING STARTED QUICKLY:
You can get right into playing Pool Of Radiance by using the instructions on your Quick Start Card and using the characters provided. If you have any questions as you play, refer back to these rules for a complete description.

THE RULE BOOK:
This book is divided into sections describing how to manipulate the game by using the menus on the screen. The menus are lists of commands that you choose according to the instructions on your Quick Reference Card.

Central to the game is the concept of the 'active character.' The active character is highlighted on the character display. Any command that affects a single character affects the active character. Commands that affect the whole party do not require an active character.

In combat the active character is picked automatically according to the characters initiative. From other menus the active character may be changed before choosing any commands.

All commands are menu based. If a command affects the whole party, indicate the command as listed in your Quick Reference Card. If the command affects one character, indicate the character and then the command.

Example: To look at a character's items, indicate the character, choose View, and then choose items. The computer displays a list of the character's items and the items' readied status for combat.

Menus are displayed either vertically or horizontally. Vertical menus are used to make a choice of someone to act, such as a member of an adventuring party, or something to act upon, such as one item out of several carried. If there are more choices than will fit on the screen at once you can change pages using Next and Prev commands (or the Pg Up and Pg Dn keys.)

Horizontal menus are lists of commands giving the options of what the character can do or what you can do to the character. When space permits, each horizontal menu is preceded by the menu title. This is set off by a colon and is not an option on the menu. Menus are shown with their title and each command in the rules. As an example, the Encamp Menu contains commands for Save, View, Magic, Nest, Alter, Pool, and Exit. It is shown as:

Encamp Menu:

ENCAMP: SAVE VIEW MAGIC REST ALTER EXIT

Unless otherwise specified the Exit command on any menu returns you to the next higher level menu. On many computers the Escape key acts as an Exit command from any menu.

WHAT ARE CHARACTERS?
You create characters to accomplish quests in the Forgotten Realms. Characters are differentiated by their Race, Ability Scores, and Class. Several characters are needed to accomplish the missions presented here. These characters make up a Party. For maximum flexibility, you should have a balanced party with characters of different classes and...
races.

THE SIX PLAYER RACES IN Pool Of Radiance

Dwarf. This is a cunning race of sturdy workers and craftsmen. They have no magic of their own, but are resistant to magic. Dwarves can advance up to 9th level as fighters, and any level as thieves. They can be fighters and thieves at the same time. Dwarves can see in the dark using infravision.

Elf. This is a long-lived race. As tall as humans but slimmer, they can be fighters, magic-users, thieves, fighter/magic-users, fighter/thieves, magic-user/thieves, and fighter/magic-user/thieves. They can advance to 7th level as fighters and 11th level as magic-users, and any level as thieves. Elves also have a better chance of finding hidden objects and can see in the dark using infravision.

Gnome. Members of this race are shorter and slimmer than their cousins the dwarves. They can go up to 6th level as fighters, and any level as thieves. They can be fighter/thieves.

Half-Elf. These hybrids have many of the virtues of both humans and elves. Like elves, they can be more than one class at once, though they can advance only to 8th level as magic-users and 8th level as fighters. Like humans, half-elves can be clerics, and unlike humans, combine that class with other classes.

Halfling. These folk are about half the size of a human, hence their name. They have little ability with magic, but are resistant to its influences. They can be fighters, thieves, and fighter/thieves. They are limited to becoming 6th level fighters but have no limits as thieves.

Humans. This is the most common player-race in the Forgotten Realms. They have unlimited progression as fighters, magic-users, clerics, and thieves.

ABILITY SCORES

The computer randomly generates the ability scores that every adventurer has. There are six ability scores; all have some effect on the play of the character. Ability scores are based on a range from 3 (low) to 18 (high). Each Character Class (see below) has a Prime Requisite ability score. A Prime Requisite of 15 or more increases the amount of Experience (see below) the character gets from adventures.

Strength (Str). This is the means of how much a character can carry and how much damage he can do in a fight. The Prime Requisite for fighters is strength. Fighters with an 18 strength also have a percent value from 1 to 100 (listed as 01-00), denoting the highest possible natural character strength.

Intelligence (Int). This is the measure of how much a character can ultimately memorize. The Prime Requisite for magic-users is intelligence.

Wisdom (Wis). This is the measure of a character's ability to understand the ways of the world and interact with it. The Prime Requisite for clerics is wisdom.

Dexterity (Dex). This is the measure of a character's ability to택, skill, and quickness; an 18 Dexterity also has a percent value from 1 to 100 (listed as 01-00), denoting the highest possible natural character dexterity.

Constitution (Con). This is the measure of the overall health of a character. It influences both Hit Points (see below) and the character's chance of surviving the effects of a raise-dead spell.

Charisma (Cha). This is the measure of how well the character interacts with other characters. It is sometimes a factor when the character has an encounter with Non-Player Characters, usually called NPCs.

Each character also has two other important values: Hit Points and Experience Points.

Hit Points (HP). This characteristic is derived from a character's constitution (he gains a bonus to his Hit Points per level if his constitution is over 14), his level, and his character class (see below). Every time a character is hit in combat, he loses HP. A character with many HP can survive far longer in combat than one with few HP. When a character reaches 0 HP, he is Unconscious and may be killed. He can recover only from unconsciousness; a character with no HP dies. It is possible for a character to die even with lots of HP.

Experience Points (XP). As a character has adventures, kills monsters, and accumulates treasure, he gains Experience Points. When he has enough XP he can increase in level, becoming more proficient in his class. The computer keeps track of XP. Every character starts at first level with 0 XP.

CHARACTER CLASSES

An adventurer must be at least one of the following character classes. A human adventurer can only be one class, non-humans can combine classes. A character with combined classes has more playing options, but he advances more slowly in his profession because he is doing more than one thing at a time and his XP are divided up among his classes.

Cleric. The cleric is a holy crusader who fights for the causes of his religion. Due to religious restrictions, he cannot use a cutting weapon that draws blood, such as a sword or an arrow, but can use any form of armor or use crushing weapons, such as a mace. He casts holy spells that can heal and support his friends and also uses his natural holy power to drive away undead. Some magic items are actually holy objects that only a cleric can use. A cleric gains 1-4 HP with every advance in level to 9th level, plus any constitution bonus. From 10th level on, he adds 2 HP per level, without constitution bonus.

Fighter. The fighter can use any form of armor or weapon including magic ones, but most other magical items, and all magical spells, are beyond his reach. He gains 1-10 HP plus his experience bonus with each advance in level through 9th level. With the 10th level, he gains 3 HP per level without constitution bonus.

Magic-User. The magic-user is potentially the most powerful character class, but he starts out weak. Initially, he has very few HP. In addition, he cannot memorize many spells, and must carefully husband his few spells until he gains more through advancement in level. The beginning magic-user is given four first-level spells in his magic book. He can add one additional spell to his magic book every time he advances a level. He can also scribe spells into his magic book from scrolls he finds in his course of adventures.

In this game, magic-users cannot use any form of armor or any weapon other than a dagger or staff. However, there are many magic items only a magic-user can use. A magic-user gains 1-4 HP with every advance in level through 11th level, plus constitution bonus. At 12th level and beyond he gains only 1 HP per further level.

Thief. This is the thief of the sagas, who uses trickery and misdirection instead of brute force to win his objective. thief is the only profession in which half-humans may climb as far as any human. Indeed, halflings and elves are especially adept in this craft. To be a proficient thief, a character must have a high dexterity.

Thieves must stick to leather-based armor and have a restricted list of weapons. A thief gains 1-6 HP with every advance in level, plus constitution bonus, through 10th level. They gain 2 HP, without constitution bonus, per level thereafter.
Multiple Classes. Non-human races can sometimes be a combination of classes. When a character is more than one class, his HP per level are averaged among the classes involved. However, his experience is split between the two classes even when he cannot further advance in one of them. He gains all the benefits of both classes in regard to weapons and equipment.

ALIGNMENTS
Alignment is the philosophy a character lives by. While the actions of a character are under your control, the character's alignment can affect how NPCs in the game view him. The computer provides all the possible Alignments for a character and you can choose any of those you wish.

Lawful Good. Followers of this alignment strictly interpret law and order, but they use these principles to bring all the benefits to the society.

Lawful Neutral. Followers of this alignment view regulation as all-important, taking a middle road between good and evil.

Lawful Evil. Followers of this alignment believe in the rulership of the strong and the enslavement of the weak.

Neutral Good. The follower of this alignment believes there must be some regulation in combination with freedoms if the best is to be brought to the world.

True Neutral. A follower of this alignment believes that everything must be kept in balance—law and chaos, and good and evil—to maintain world harmony.

Neutral Evil. The follower of this alignment considers law and chaos to be minor considerations as long as evil is brought to the world.

Chaotic Good. Followers of this alignment value randomness and freedom, but also value life and individual welfare.

Chaotic Neutral. Followers of this alignment value randomness and disorder over either evil or good.

Chaotic Evil. The Chaotic Evil character disdains laws and order, kindness and good deeds. He seeks positions of power, glory, and prestige in a system ruled by his own whims.

STARTING EQUIPMENT
Each character is assumed to have starting equipment including clothes, boots, backpack, money pouch, food, water, tinderbox, and flint and steel. The character's on-screen list of items only includes important items such as weapons, armor and magic items.

PLAYING THE GAME
To play Pool of Radiance you need a party of characters. You can use the party of characters provided or you can create your own.

CREATE NEW CHARACTER
This is the opportunity to build an adventurer from scratch. This leads you through a series of menus to help you define the character.

Pick Race Menu. This gives you the choice of the six races a player-character can be in the Forgotten Realms.

Pick Gender. After you pick a character's race, you pick their gender. Gender affects the possible strength of a character and what sort of portraits you will have to choose from to represent the character.

The computer randomly generates the ability scores that every adventurer has. Once you have seen the ability scores, you may have the computer roll again and it will randomly generate a different character. Otherwise, you may accept the rolls, and take the character as generated.

If you accept the rolls, you still have the opportunity to alter the character to match your own character from the AD&D game by using the Modify Character command described later.

Pick Character Class. This gives you the choice of the class or classes your character is qualified for based on his race and ability scores.

Pick Alignment. From this menu the computer provides all the possible Alignments for a character. You can choose the one you wish.

Name Character. Your choice of name for a character is entirely up to you. You cannot use more than 15 letters in a name.

The computer displays the complete character screen and gives you a chance to save the character. If you save the character, it is written to the save game disk to become one of the regular characters you play. At this time the computer generates a portrait of your character. You can choose both the head and body of your characters portrait. You then choose the weapon, head, and colors for your character's combat icon (the figure that represents the character in combat). Refer to the Encamp section for instructions on how to alter combat icons.

Exit. From any of these menus this command brings you back to the Party Creation Menu.

DROP CHARACTER
This command is only used when you never want to play with a particular character again. It eliminates the character's record from the save game disk and leaves a space in which you can create a new character to fit.

MODIFY CHARACTER
You may bring your favorite beginning AD&D character into the Pool of Radiance. Create a character of the proper race and class and then
modify it to match your non-computer AD&D character. You can adjust the created character's ability scores and HP. The character must start at 0 XP and with no items beyond those he can buy with his initial gold allowance.

**TRAIN CHARACTER**

This command allows you to select a character to the save game disk and then substitute another with the Add Character To Party command. The saved character will replace the previous entry for that character on the save game disk.

**LOAD SAVED GAME**

This command brings up a previous adventuring party from the save game disk.

**SAVE CURRENT GAME**

This command puts the group you are currently constructing onto the save game disk for future reference. Then versions will allow you to exit the game.

**BEGIN ADVENTURING**

When your party is ready to go, use this command to return to the game. Follow the on-screen messages to get back into the game and you are ready to go with your new party of adventurers.

**NON-PLAYER CHARACTERS (NPCs):**

In the course of a game, the party can run into many characters controlled by the computer. They may talk to the party, attack the party, and even offer to join the party. These are known as Non-Player Characters, or NPCs.

There are three kinds of NPCs: those you can hire at the Training Hall to adventure with your party, filling in the two slots possible in a party that you cannot fill with party characters, those who volunteer to join the party for a specific mission or quest, and those who won't join the party but will give either information or a fight.

**WHAT YOU CAN DO WITH NPCs**

NPCs that want to join you are treated like your player characters, with a few differences. Remember that you can only have room for 2 NPCs if you have a party of 6 player characters. During an adventure you may find NPCs that you want to add to your party. You should seldom have more than 7 characters in your party or there is room to add the NPC.

The computer commands NPCs in battle. They have Morale. If things are going badly for the party, they may run, even if you don't want them to.

You can give NPCs treasure, which may help their morale, but you cannot trade their items to other characters. If they die, however, you can use the Trade Items function to take their items.

**LOYALTY**

NPCs can also be traitors insinuated into your party, depending on the way the adventure goes. They can spy on you and give information to your enemies, and even turn on you in battle. NPCs can be a big help, but don't trust them in every situation.

**VIEWING A CHARACTER**

**THE CHARACTER SCREEN:**

The character screen displays the character’s name, race, and age. It also displays his alignment, character class, and ability score. The current wealth of the character is also shown. Initially, the computer generates a random number between 30 and 180 in gold pieces, which the character can use in buying his equipment. Later, as the character accumulates wealth through his adventuring, there are several entries on the screen showing the copper pieces (cp), silver pieces (sp), electrum pieces (ep), gold pieces (gp), platinum pieces (pp), gems, and jewelry. The value of coins are listed in the Appendices, the value of gems and jewelry vary and are found when they are appraised.

The character's current level, his earned XP, and his current HP. If the HP are highlighted, the character has taken damage, that has not been healed. The number shown is his current HP, not his normal HP. Once the character has healed all the damage, the number reverts to normal.

The Armor Class is shown as AC; the lower the AC number, the better the armor. Then it shows the character’s Ready weapon and what armor he is wearing. This is followed by the character's THACO. The lower the character’s THACO, the better fighter he is. This is followed by the damage the character does, which depends on his strength and the weapon he has ready.

The last entry is the Character Status. This is an indication of the current health of the character. The Character Status can be:

**OK**

The character has positive HP and can move and fight normally.

**UNCONSCIOUS**

The character has exactly 0 HP. He cannot move or fight, but is in no danger of dying.

**DYING**

The character will die in a short period of time unless the character is bandaged or healing magic is applied. If the character is bandaged his status changes to Unconscious. Healing magic will make him OK again. In the course of a combat, a character who is Dying has a chance of becoming Dead unless he is bandaged (see Combat). A character who survives a combat in Dying status is automatically assumed to have his wounds bandaged after combat and becomes Unconscious.

**DEAD**

The character has died. He will be brought with the party (assume he is set down during any combat) and can possibly be resurrected with a raise dead spell from an NPC cleric. The character’s actual chance of being raised when the spell is used depends on his constitution.

**FLYED**

The character fled from the previous battle. After a battle is over, he can join the party as if nothing had happened, and regain his previous status.

**GONE**

The character has been destroyed by dragon flame, a disintegrate spell, or some other form of total destruction. He cannot be Raised.
from the Dead.

VIEW OPTIONS
To inspect the active character choose the View command. This brings up the View Menu:

View Menu

VIEW: ITEMS SPELLS TRADE DROP EXIT

ITEMS
Using this command allows you to see what items the character is carrying. The character's items and their combat ready status are displayed. An item that is not Ready cannot be used. Not all commands in the Item Menu are always available.

Item Menu

READY USE TRADE DROP HALVE JOIN SELL ID EXIT

Ready. If you want to ready or unready an item, you can use the Ready command to change the status of the weapon, armor, or other item. A character has several restrictions on what he can use. Basically, he cannot use more than two hand-held items at once. Thus, he cannot have ready a sword, a shield, and a bow at the same time. Arrows are assumed to be in a quiver and can be Readied at all times, though they cannot be used unless a bow is Readied as well.

Use. This command means the character is going to use an item. In Combat, you will be asked to indicate the target (see Combat for targeting) and proceed back to the Combat Menu.

Trade. If you use this command, the screen switches to the Party Screen and asks which character you are trading with. Indicate the character, and the screen switches back to the Items Screen. Indicate which item (you can trade multiple items in one transaction) is to go to the other character and the item disappears from the trading character's list and reappears on the item list of the receiving character. Remember that an NPC, does not give up an item once he has it, unless he is dead.

Drop. If this command is used on an item, the item is gone. It cannot be retrieved. Do not use this if you want to give the item to someone else, that's what the Trade command is for.

Halve. Multiple items such as arrows are often combined onto one line, such as 42 Arrows. Halve creates two lines, each with half the number of items; such as two lines each with 21 Arrows. Only items like arrows, that are shown as several items on one line, can be halved.

Join. This is the opposite of Halve. If you have several lines of arrows or a similar item on the Items screen, you can use this command on one line and all similar lines are joined with it. The number of items shown is the total of the numbers in all the former lines. No more than 250 of an item can be joined on one line. NOTE: The Ready status (Yes or No) of the item depends on the line that all the others are joined with.

Sell. This command is described under the Shop Menu.

ID. This command is described under the Shop Menu.

 Spells. This is a listing of what spells a magic-user or cleric has memorized and is ready to cast (see Magic Menu).

TRADE
This command is used when you want to transfer money from one character to another. Indicate which character you are trading with, and then indicate which coins and how much are to go to the other character. The coins disappear from the trading character's list and reappear on the money record of the receiving character.

DROP
If this command is used on money, the money is gone. It cannot be retrieved.

After you create your party, you appear in the civilized section of Phlan. The party is ready to begin adventuring.

MISSIONS:
Phlan is a very dangerous place. The civilized nations are only now gaining a foothold. You can either wander around town and run across dangerous situations, or report to the City Council of Phlan. They will assign the party missions and give rewards when the missions are completed. Initial missions are local in nature, later ones are more ambitious to match both your increased expertise and their opinion of you. Phlan is split into two sections; the civilized section is controlled by the settlers and the uncivilized section is controlled by monsters. After you clear all the monsters from a block, settlers move in and it becomes civilized.

POINTS OF VIEW:
As you move around the town and the wilderness, there are three different points of view: 3-D, Area, and Wilderness.

3-D
This appears with the Adventure Menu any time you are in town, underground, or in any other built-up area. It shows a view of the surrounding area as seen by the party. It only shows one direction at a time, so you must rotate the party using the directional controls (see Adventure Menu) to see in each direction. At the same time, the screen shows what compass direction the party is facing and the coordinates of their location in their current block.

AREA
This option is given in the Adventure Menu when the 3-D view is shown on the screen. This view shows the position of the party and an overhead view of the surrounding area. It can only be obtained in a 3-D view, it does not appear in the Wilderness. There is no real detail, just the position of all major obstructions such as walls, trees, water, etc. A cursor shows the position of the party.

WILDERNESS
This screen shows when the party is traveling in the Wilderness. It displays an image of the party moving through a map-like wilderness. It shows the area around the party for 2 moves in each direction. If there is an encounter in the wilderness, an image of the encountered monster appears next to the icon showing the location of the party. You will be given all the usual options for the encounter (see Encounters).

BLOCKS
Most adventures take place in one or more blocks of 16 squares by 16 squares. The party moves from block to block by moving into a long corridor with a low ceiling. Stairs and caves with low ceilings may also move the party from one block to another.

TYPE AND THE PARTY
From the moment the party begins its adventures in Phlan, the clock is ticking. The longer it takes a party to complete a mission, the harder it becomes.

MOVING AROUND:
The first thing a new party must do is equip itself from the Shops. Then it has to get to the scene of its adventures. There are two ways of doing this.
TOUR TRAVEL
You can walk the party to in-town missions, having encounters along the way.

WILDERNESS TRAVEL
Some missions involve locations away from Phlan. The party travels in then Wilderness Point of View until they reach the location of the mission. The computer keeps track of the time traveled.

CIVILIZATION:
The civilized section of Phlan contains a number of locations of interest to the party. In the civilized section the party can find out information, train, rest and heal, and buy and sell equipment.

THE CITY COUNCIL
This is where the characters meet the Council and receive missions and news.

THE DOCKS
The party may catch a boat at the docks to take them to otherwise inaccessible blocks and into the wilderness.

THE INNS
These give a safe haven in which to Rest. (using the Encamp Menu). Each stay at an Inn costs money, but once you begin your stay you can rest as long as you like.

THE TAVERNS
These are rowdy places full of gossip, stories, and information.

THE TRAINING HALL
This is where the characters can receive training from NPCs of higher level and add starting PCs. This displays the Party Creation Menu so that you can use the Train Character command.

THE SHOPS
Here the characters can buy their initial equipment and later sell some of their treasure and upgrade their equipment. When you enter a Shop, you are presented with the Shop Menu.

Shop Menu
BUY VIEW TAKE POOL SHARE APPRAISE EXIT
Buy. If you use this command, the computer displays a list of items available and their cost. If you try to buy something you do not have the money for, the computer tells you so. If you try to buy something that will overload you, the computer tells you that too.

View. This is the same screen as shown for this command in other menus with the addition of the Appraise command in the View Menu, and the Sell and ID commands in the Items Menu.

Sell. Use the cursor to highlight any item you want to sell. The Shop will make an offer and you can either sell or not. If you decide to sell, the screen asks you one more time to be sure, then the item is gone.

The shops in Phlan are very busy; no item sold to a merchant remains on the Quick Reference Card provided with the game for your computer.

The Party Creation Menu so that you can use the Train Character command.

ID. This command is used to get a magical evaluation of a magic item. The shop charges you for the service of identifying the magic on an item.

Take. If you have left money through the Pool or Drop commands, you can use this command to pick it up again. Indicate that you want to take money and who will take it. The computer then displays each type of coin available and how many of the coins take all the character takes. One character can take all of the coins if he has the strength to do so, or you can allow each character to take a share.

If you try to pick up more than the character can carry, the screen displays a message saying 'The character is overloaded' and will not let any more coins be put on the character. Remember, carrying lots of coinage slows a character down in combat.

Pool. This command makes all the party members drop all of their money into one pool of money. All purchases made at the shop come out of this central pool. Anything left over can be picked up again using the Take Menu.

Share. This command picks up all the money in the pool, divides it into shares, and distributes it among the characters.

Appraise. This is used in Shops to get an appraisal of any gems and jewelry the character has. The computer asks what gems and jewelry are to be appraised, and offers a price on the indicated gem or jewelry. Once you have received a price, you may take it and the item is sold. The money is immediately put in your money record. If you do not want to sell immediately (gems and jewelry are a lot easier to carry then coins), the gems and jewelry become items and go from the money record on the Character Screen to the Items list, and can be sold off of that list like any other item.

THE TEMPLES
The temple will cast clerical healing spells for a price. When you enter the temple, the Temple Menu is presented. Except for Heal, the commands on the Temple Menu are the same as those on the Shop Menu.

Temple Menu
HEAL VIEW TAKE POOL SHARE APPRAISE EXIT
Heal. This command displays a list of the healing spells the clerics will cast. Indicate the spell you want cast. The computer displays the cost and asks you to confirm that you still want them to cast the spell. The cost of a spell may vary depending on the recipient and circumstances.

ADVENTURE MENU
The Adventure Menu allows access to all of the main functions in the Pool Of Radiance. This menu shows either the current 3-D picture of the area in front of the party and the status of the party (if in a town adventure), or the area around the party (if in the wilderness). If any party members are injured, their hit point numbers (showing how many they have now) are highlighted for easy recognition. There are several commands available to you from this menu.

Adventure Menu
MOVE VIEW CAST AREA ENCAMP SEARCH LOOK
MOVE:
This is the command to move the party. How the party moves is shown on the Quick Reference Card provided with the game for your computer.
In 3-D travel, the Party can move forward, move backwards, turn right, or turn left. Normally, each movement forward or back puts the party into another square and takes one minute of game time. Turning keeps the party in the same square and takes no game time. If the party has Search on, moving one square takes 10 minutes.
In the Wilderness, the party can move in any of eight directions. Moving one square takes a half a day of game time. Search mode has no effect in the wilderness.
VIEW:
This displays the Character Screen, as described in Viewing a Character.

CAST:
This command sends you to the Cast Menu so your active character can throw a magic spell. See the section on Magic for a description of how to cast spells and their effect.

AREA:
This shows an overhead view of the area around the party. If the party is lost or in unfamiliar territory this command may not be available.

ENCAMP:
This command sends you to the Encamp Menu. This is a very important part of the game, and is described in detail in its own section.

SEARCH:
A party can move in Search Mode, which takes 10 minutes of game time per move. This allows the party to carefully search the area they are passing, but also gives wandering monsters a greater chance to find them. You only need to hit the Search command once to start the party moving at Search speed, then hit the command again later to reset them to normal movement. You do not need to hit Search for every move.

In Search you are assumed to be checking for secret doors, mapping, moving as silently as possible, hiding in any available shadows, and generally being as careful as possible.

If you never go to Search mode, you will run into fewer wandering monsters (because you are moving faster) but have much less chance of finding concealed treasures or traps before they are sprung.

LOOK:
This command is used to look at a square more closely, as if your party moved into the square again. If the party is moving at normal rate, then a Look command treats that particular square as if the party moved into it in Search mode.

REST:
One of the most important aspects of the Encamp Menu is the chance to rest. Characters catch their normal sleep without having to go to camp. However, to memorize spells or heal naturally, specific rest time is necessary.

For every 24 uninterrupted hours of resting in camp, every wounded character regains one hit point above and beyond any recovery gained from healing magics. The initial resting time is established by anyone who is memorizing spells. The screen will show the days, hours, and minutes necessary for the spell-using members of the party to memorize (or pray for) the spells they want to memorize. Memorizing any spells at all takes a minimum of four hours. Third level spells take a minimum of six hours. See the Magic Menu for further description of memorizing spells.

REST can be interrupted by any random encounter. Only take long rests in safe places, such as inns, hideouts, or secure buildings.

MAGIC:
Magic is a very important part of Pool Of Radiance, and is described later under its own heading. Magical Spells can only be memorized while the party is in camp.

RENT:
This command is used in several menus to take time off and try to rebuild characters and the party. It is used to handle day-to-day functions such as saving the game, resting to heal, or memorize spells (described under Magic Menu), and changing game items such as game speed or party order.

ENCAMP Menu

SAVE:
This command saves the characters and game as they are. Check the Quick Reference Card for any system specific details of how to save your game.

VIEW:
This displays the View Menu, as described under Viewing a Character.

ENCAMP:
In camp, this does not display the Sell Item or ID commands.

MAGIC:
This command is used to learn or unlearn spells.
ALTER:
This command is used to change the basic makeup of both the party and the characters who are part of it. You are given the following menu:

Alter Menu:
ALTER: ORDER DROP SPEED ICON PICS EXIT

ORDER
This command allows you to reorganize your characters for combat. You can place characters in the first or second rank. The first four characters are in the first rank, where they will meet enemies hand-to-hand, the rest are in the second rank, where they can use spells and missile weapons.

The computer asks who takes position number 1, etc., and reforms the group, with position #1 on top, when all the choices are made. Position of NPCs can be changed with this command.

DROP
This command allows you to permanently drop a character or NPC from the party. Once dropped, the character is gone from the party and his current version will not be saved if you then use the Save command to save the game.

SPEED
This command controls the speed of messages presented on the screen. If you are having trouble reading messages before they disappear, use the Slower command. If messages seem to take forever to get off the screen, use the Faster command. Note that once you have used this command, it affects all subsequent messages, and you may have to re-use the command if later messages are too fast or too slow.

Speed Menu:
SPEED: SLOWER FASTER EXIT

ICON
When a character is created, he is given a combat icon. When the party is in Combat, each party member's icon designates his position and general facing on the screen.

The Icon command is used to change the character's icon. You can customize this icon to represent the character's favorite weapons, armor, and colors. You may want to do this when the character picks up a new weapon.

Icon Menu:
ICON: PARTS COLOR SIZE EXIT

Parts: You can alter the weapon (which controls the rest of the body shape) or the head of the icon. You are shown both the Ready Icon character and the character's Action Icon (which shows the character attacking).

When you are done choosing the weapon and head, you can reject the new form or accept it. The screen shows you the new and old versions of the Ready and Action Icons.

Parts Menu:
PARTS: WEAPON HEAD EXIT

Color. You use Color to alter the color of virtually every part of the Icon, as shown on the screen. Some of the areas you can alter on the Icons do not correspond to the terms given in the menu. For instance, changing the shield color for a character with a bow or crossbow actually changes the color of the arrows or quarrels. Play with the Icons commands until you get a feel for how these variables work.

Color Menu:
WEAPON BODY CAP HAIR SHIELD ARM LEG EXIT

Size. Large size Icons are usually used for humans, elves, and half-elves. Small size Icons are usually used for dwarves, gnomes, and halflings.

Size Menu:
SIZE: LARGE/SMALL EXIT

Exit. When you are done, use this command. The computer will ask you to confirm any changes to your icons. Make your choice and the computer returns to the Alter Menu.

PICS
This command governs when character and encounter pictures will be displayed.

Pics Menu:
PICS: CHARACTERS ON/OFF MONSTERS ON/OFF EXIT

ENCOUNTERS
When a party comes across NPCs of any kind, there is an encounter. The computer provides a quick glimpse of who the party has encountered, then asks what you want to do.

The computer determines whether both parties see each other, the NPCs surprise the party, or the party surprises the NPCs. If the party surprised the NPCs, the party can attack immediately, getting a free round to attack in which the NPCs cannot retaliate. This opportunity must be taken at once or surprise is lost. If hostile NPCs surprise the party, the NPCs can attack immediately and get a series of attacks in without retaliation by the party.

If the NPCs do not surprise the party, the computer offers these commands.

Encounter Menu:
ENCOUNTER: COMBAT WAIT FLEE ADVANCE/PARLAY

COMBAT:
The party attacks the NPC's. Who goes first is decided on the basis of initiative, which is explained in the Combat section.

WAIT:
This command allows the NPCs to decide what to do. They may wait, combat, flee, advance (if more than a square away) or parlay (if in the same square).

FLEE:
If you see NPCs you think your party cannot fight successfully, use this command to run away. If successful, you may flee wildly, risking getting lost. If unsuccessful (because the NPCs can move faster than you do) you go to combat.

**ADVANCE:**
If the NPCs are far away use this command to approach them. Once the NPCs are adjacent to the party the Advance command will be replaced with the Parlay command.

**PARLAY:**
Use this command to speak with NPCs that are adjacent to the party. Choose a character to speak for the party who you think will make the best impression on the NPCs. Then, choose one of five possible attitudes for dealing with the NPCs.

Parlay Menu:

- PARLAY: NAUGHTY
- PARLAY: SLY
- PARLAY: MEEK
- PARLAY: NICE
- PARLAY: ABUSIVE

**HAUGHTY**
You try to demonstrate your superiority to the inferior creatures you are making do with. Some encounters only respect an air of superiority and are impressed enough to cooperate; this is also a good way to make them resentful and attack.

**SLY**
You try to get information out of the NPCs without them realizing you are doing so. Some NPCs will realize you are trying to get something out of them and will become hostile.

**MEEK**
You are mild and unassuming in hopes that the NPCs will think you are not worth attacking. Of course, some attack meek opponents, because they are easy pickings.

**NICE**
You try to be friendly in hopes the NPCs are friendly to you. Some NPCs do not choose to be friendly to anyone.

**ABUSIVE**
You try to browbeat information out of the NPCs. It is best not to do this unless you have the power to back up your threat.

The computer assumes you are as effective as possible in the attitude you call for.

**COMBAT**
In many adventures the party will have to fight to defeat the enemy. In combat the computer determines which characters (both player characters and NPCs) have initiative (i.e., which goes first) and depicts that person and his nearby compatriots. If the character is a PC then the player will control his actions. If the character is an NPC, or a PC under computer control using the Quick command, the computer determines his actions.

**HITTING THE TARGET:**
The ability of an attacker to hit a target with a melee weapon (such as a sword, spear, or fist) or a missile weapon (such as a bow or crossbow) depends on the chance the attacker has of hitting the Armor Class of the target. This is represented by a number called the THAC0. The lower the THAC0 the better the chance to hit. A target's defense is his Armor Class, or AC. This is influenced by the armor worn, plus the dexterity of the target and any benefit various magic spells may have. (Magic has another method of hitting a target; see the Magic rules). The lower the Armor Class number, the better the armor.

The number needed for an attacker to hit a target is the attacker's THAC0 minus the target's Armor Class. The attacker hits if a random number from 1-20 is greater than this number. Thus, a person with a THAC0 of 18 needs a 14 or more to go hit Armor Class 4. Armor classes can go into negative numbers, so the same character trying to hit Armor Class -1 would need to get a 19 or better.

In a combat, the first and second attackers strike at the defender's front. The third attacker strikes at the defender's rear, unless all the attackers are adjacent. The fourth and any additional attackers strike at the defender's rear. The defender's AC is substantially reduced against rear attacks.

A thief forms the only exception to the automatic facing rules. If the thief attacks from exactly opposite the first attacker, he can backstab. A backstab has a better chance of hitting the defender, and does additional damage when it does hit.

**USING MISSILE WEAPONS:**
A character may not use a missile weapon if he has an opponent next to him. If he has no opponent next to him, he can fire a missile at anyone in his line of sight. The Next and Prev commands will only aim at targets in the attacker's line of sight.

**EXECUTING COMBAT:**
When a combat begins, the screen shows the area around the character with the highest initiative. The entire party may not be on the screen at the same time, and one can rarely see all of the monsters at one time. The computer indicates the active character and lists his name, current condition, armor class, and current ready weapon. Characters and NPCs move according to each character's dexterity and a random number generated by the computer. This is called an Initiative Number and changes with every combat round. Usually higher dexterity characters move before lower dexterity characters.

You may use the following commands to handle your side of the battle. If a character cannot use a command (such as Turn for a non-cleric or Cast for a fighter or thief) it does not appear. Check your Quick Reference Card for the commands used on your system.

The Combat Menu:

- MOVE VIEW AIM USE CAST TURN QUICK DONE

**MOVE**
This is used to move a character and to attack. You attack by moving the character into an enemy's square. You can even attack party members, but the computer gives you a chance to abort such an attack. If you disengage an enemy, he gets a free attack at your back, as do others you move by.

**ADVANCE**
A character may have multiple attacks in one turn.Bow get two attacks per turn. High level fighters get two attacks every other turn. All of a character's attacks are taken against his first target. If the first target goes down with the first attack, you may aim the remaining attack at another enemy.

**FIGHTING**
Fighters may make a special form of multiple attacks called a sweep. A sweep may attack several weak targets with a single blow each. Refer to your Quick Start Card to find out how to move the character with your particular computer. The number of spaces a character can move is reduced by the weight carried. A character weighted down with coins or extra armor and weapons cannot move as fast as he could without the items. Bulky armor can also reduce movement.

A character who is faster than any enemy can run away from the right, eventually running from the battlefield. A character who is as fast as the fastest monster, only has a 50% chance of getting away.
{otherwise he must remain until the end of the fight}. A character who is slower than any enemy cannot run off the edge of the fighting area. A character who has run away is no longer part of the fight. He returns after the fight is over.

**VIEW**

This is essentially the same command used any time you wish to see a character. Using this, you can ready appropriate weapons to meet the fight in progress. Some options, such as Trade, are not available in the middle of combat. The use command shows up under items to allow you to use an item, such as a wand, in combat.

**AIM**

This command is used to aim an attack using the following options.

**Aim Menu:**

- **AIM:**
- **NEXT:**
- **PREV:**
- **MANUAL:**
- **TARGET:**
- **EXIT**

**Next.** Use this command to look at all possible targets, starting with the one closest then going to the next closest. The computer looks at ALL possible targets, including other party members; don't shoot without looking. (However, the computer confirms your order first, before shooting at a teammate.)

**Prev (Previous).** This is the opposite of the Next command. Use this command to look at the possible targets starting with the one farthest away and working back toward your character. Usually this is a good way to find a good target without working your way through all of your PCs first.

**Manual.** This command lets you aim anywhere on the map. It is especially useful for finding opposing leaders and targeting spells with area effects.

**Target.** If your character has a ready ranged weapon, or an item prepared with the Use command, this command shoots at the target you selected.

**USE**

This command allows the character to use any non-weapon item. The command brings up the same screen and menu as the Items command under the View Menu.

**CAST**

This is only available to magic-users and clerics when they still have spells available. Using this command brings up the Cast options of the Magic Menu (see that description of the Magic Rules). If hit recently, the character's concentration may be broken and you won't be given the Cast option.

**TURN**

Clerics can sometimes destroy undead monsters or turn them away from the party. This has no effect on any other form of monster. See the Appendices for a cleric's minimum level to affect various forms of undead.

**QUICK**

This command turns over control of the character to the computer. It is a good way to handle fights against hordes of less powerful opponents. Once you have established computer control for a character, the computer controls him in future fights until you interrupt it.

The computer uses ready melee or missile weapons and available spells, switching between them to the most appropriate in the situation. The computer plays a very aggressive game.

**DONE**

This command is used when a character has finished his turn.
Apple II Computer Info

Memorize Menu:

Find the page with the spell you want to memorize. Select the memorize command. Then select the spell to memorize it. The 'pages' here are the pages of the magic spell book, rather than just the list of already memorized spells.

Picking a spell to memorize does not mean that the spell is memorized. Learning a spell takes 15 minutes (game time) per level of spell, plus a period of relaxation before starting to memorize one or more spells. See the Rest command in the Magic Menu. Once one spell may be learned at a time, though the spellcaster need only relax once before learning several spells. The learning time must be uninterrupted. You have to go to the Rest command and spend the time to memorize the spell. If you have only been in camp long enough to memorize some spells, those are learned and the others lost. The spells are memorized in the order you pick them.

On a Scroll:

A spell written on an enchanted scroll can be read by a cleric or magic-user, depending on the kind of spells on the scroll. A magic-user must cast the spell read magic to understand the spells a scroll contains. Once he has done that, he can read the spell aloud at any time to cast it. A cleric does not need a read magic spell to read a clerical spell on a scroll, but only a cleric can read the spell. Once any kind of spell has been cast or scribed from a scroll, the spell disappears.

A magic-user may scribe the scroll spell into his spell books for future memorization. This erases the spell from the scroll. Spellcasters can get a list of their memorized spells from the Cast option of the Magic Menu or from the Spells option of the View Menu. They can get a list of their spells on scrolls from the Scribe option of the Magic Menu. If all you want is a list of available spells, be sure to exit before you actually cast or scribe the spell.

The Magic Menu:

CAST MEMORIZE Scribe DISPLAY REST EXIT

Memorize. For a character to learn a spell, use this command, which only appears in the Encamp Menu. The computer displays a page from the active character's spell book (or a list of possible clerical spells) and you are offered the following commands. Remember that if a magic-user or cleric has the ability to learn more than one spell at a level, he can learn the same spell more than once.

Memorize Menu:

MEMORIZE NEXT PREV EXIT

Once cast, a spell is gone and until it is memorized again.

Once cast, a spell is gone and until it is memorized again.
**FIRST LEVEL CLERICAL SPELLS**

Bless. This spell can only be used in camp or combat, and it only affects those characters not in melee. It gives a bonus of one to their THAC0 for six rounds and raises the morale of friendly NPCs by 1. Use it in camp only if you know you are going into combat immediately afterward.

Curse. This reversal of bless affects enemies not in melee and modifies their THAC0 and their morale by 1. Usable only in combat and lasts 6 rounds.

Cure Light Wounds. This can be used any time. The caster must be next to the target. It heals 1-8 points of damage.

Cure Light Wounds. This combat-only spell causes 1-8 points of damage to one adjacent target touched by the caster.

Detect Magic. This is similar to detect evil but only lasts 1 turn. It detects the presence of magic in a 1 square by 3 square area, but gives no details on the type of magic.

Protection from Evil. This spell can be used in combat or in camp when you expect to go into combat shortly. It adds 2 to the AC of the character against evil attackers. Any saving throws caused by attacks of such monsters are at +2. This spell lasts 3 rounds per level. The caster must touch the target (which can be himself).

Protection from Good. This is essentially the same as protection from evil, but it protects against the attacks of good creatures.

Resist Cold. This spell protects the recipient against cold, providing absolute protection against cold up to 0 Fahrenheit and an additional saving throw against cold-based attacks. The duration is 1 turn per level of the caster, and the caster must touch the target.

**SECOND LEVEL CLERICAL SPELLS**

Find Traps. This must be cast in camp. It makes any traps in the direction the character if facing visible to the character. The spell lasts for 3 turns.

Hold Person. This combat only spell holds immobile from 1-3 (cleric's choice) creatures of roughly human shape and size. The duration is 4 rounds plus 1 round per level.

Resist Fire. This is identical to resist cold, but it works against heat and heat attacks.

Silence 15'. Radius. This is a combat spell. It silences any spell casting or discussion in the radius. If cast on a person, the radius follows him around for the duration of the spell unless he makes a saving throw. If cast on an area, the spell affects everything in that area for the duration of 2 rounds per level of the caster.

Slow Poison. This spell can be used in camp or combat. It revives a poisoned person for 1 hour per level of the caster. The target of the spell then dies unless a neutralize poison (a high-level spell only used by NPCs) is cast on him.

Snake Charm. This spell can be cast in combat only. It influences as many hit points of snakes as the cleric has hit points. The snakes cease all activity for 5-8 rounds.

Spiritual Hammer. This is a combat spell which creates a temporary magic item, automatically Headed. It can strike at any range and does normal hammer damage. It strikes monsters that only magical weapons can affect. This lasts for 1 round per level of caster.

**THIRD LEVEL CLERICAL SPELLS**

Animate Dead. This spell can be used in combat or camp. It turns a
dead human person into a zombie to help the spellcaster. In combat, the zombie fights for the spellcaster, though controlled by the computer. This spell is permanent until the zombie is destroyed. If created to work with the party, a zombie becomes an NPC and there must be room for him in the party (remember, the limit is 8 characters) or he cannot be taken along.

Cure Blindness. This touch-only spell is used in combat or camp to cure the blinding effects of the cause blindness spell.

Cause Blindness. This touch-only spell can only be used in combat. The victim gets a saving throw. The duration is permanent until negated by cure blindness or dispel magic.

Cure Disease. This spell can be used in camp only. It cures the diseases caused by mummies and the cause disease spell.

Cause Disease. This is a combat spell with a touch range. There is a saving throw. If a character is afflicted with a disease, over time he loses HP and Strength Points until he is down to 10 percent of his normal values. This disease is cured by a cure disease or dispel magic spell.

Dispel Magic. This spell can be used either in combat or camp. In combat, it affects every magic spell and item in an area. In camp it affects every person and item you select. There is a percentage chance of success with this spell depending on the level of the caster and level of the originator of the spell to be dispelled. If successful, the target magic is permanently eradicated.

Prayer. This is a combat spell that lowers all THAC0s and saving throws for friendly combatants by 1 and raises them by 1 for all unfriendly combatants. It has a 60 degree radius and lasts 1 round for each level of the character.

Remove Curse. This can be used in camp or combat and allows the target to be rid of a curse (as from a curse or bestow curse spell) or put down a cursed object. The range is touch.

Bestow Curse. This spell has a duration of 1 turn per level and is used in combat. It has variable effects determined by the computer.

FIRST LEVEL MAGIC-USER SPELLS

Burning Hands. This touch-range combat spell causes fire damage of 1 point per level of the caster. There is no saving throw.

Charm Person. This spell makes a humanoid creature the caster’s friend and ally. Any action of the caster will be seen in the most favorable light possible. The target gets a saving throw when the spell is thrown and again days or weeks later, depending on its Intelligence. You can never be sure the effect is permanent. For the moment, the charmed creature can become an NPC (if there is room in the party roster) under the command of the caster.

Detect Magic. This spell is the same as the clerical spell its duration is 2 rounds per level of caster.

Enlarge. This spell can be used in camp or combat and lasts for 1 turn per level of the caster. The living target increases in size by 20% per level of the caster. It makes the humanoid target into an ogre or giant in size and strength for combat purposes. A target can only be under the effect of 1 enlarge spell at a time. Unwilling targets get a saving throw against this effect.

Reduce. This is the opposite of enlarge, and can be used to negate enlarge. Unwilling targets get a saving throw against its effect. If the saving throw is unsuccessful, the target is reduced in size and loses effective strength and movement.

Friends. This combat only spell affects everyone in a sphere that increases with the level of the magic-user. Everyone within that sphere failing a saving throw thinks the caster has 2-8 more points of Charisma. Those who make their saving throw think he has 1-4 less points of Charisma. The effects last 1 round per level of caster.

Magic Missile. This is a combat spell that does 2-5 points of damage to the target, no saving throw. For every 2 levels, the magic-user gets 1 missile, so magic-users of the 3rd and 4th levels get 2 missiles, and those of the 5th and 6th levels get 3 missiles. All must be fired at once.

Protection from Evil. Like the clerical spell of the same name, but it lasts for 2 rounds per level of caster.

Protection from Good. Like the clerical spell of the same name but it lasts for 2 rounds per level of caster.

Read Magic. This is only used in camp and allows the user to read any magical (not clerical) writing. It lasts for 2 rounds per level of caster. Once you use this spell to read a scroll you can cast the spells off of the scroll.

Shield. This spell is a combat spell that improves the targets armor class and saving throw, and negates the effect of the magic missile. The spell lasts for 5 rounds per level of caster.

Shocking Grasp. This combat spell does 1-8, +1 point per level of caster, electrical damage to a target the caster touches.

Sleep. This spell puts up to 16 targets to sleep for 5 rounds per level of caster. The least powerful targets are affected first, and the bigger the monster, the fewer of them are affected. Monsters above a certain power are not affected at all. No saving throw.

SECOND LEVEL MAGIC-USER SPELLS

Detect Invisibility. This can be used in camp or combat and lasts for 5 rounds per level of caster. This has a range of 20 feet per level of caster.

Invisibility. This makes the target (touch range) invisible to normal and infravision until he ends the effect or attacks someone.

Knock. This spell is used to open locked doors or chests. It can be used in camp or while moving.

Mirror Image. This combat spell creates 1-4 illusory duplicates of the magic-user. If a duplicate is attacked, it disappears. The spell lasts 2 rounds per level of caster.

Ray of Enfeeblement. This combat spell has a saving throw. If the target does not make the saving throw, he is weakened (he does less damage for 1 round per level of caster).

Stinking Cloud. This affects a 2 square by 2 square area. Anyone in the cloud gets a saving throw. If unsuccessful, he is helpless for 2-5 turns. He can move out of the cloud, but he is still helpless. If he makes the saving throw, he is helpless only as long as he is in the cloud and for 1 round afterwards. The cloud lasts 1 round per level of caster.

Strength. This spell is only used in camp. It raises the strength of the target by a variable amount depending on the class of the target. The duration is 6 turns per level of caster.
THIRD LEVEL MAGIC-USER SPELLS

Blink. After casting this spell, the caster can seldom be targeted because he is blinking in and out of the area. The spell lasts for 1 round per level of caster.

Dispel Magic. This is just like the clerical spell of the same name.

Fireball. This area effect spell does 1-6 points of fire damage per level of caster to each target in the area. A successful saving throw cuts the damage in half. Outdoors, a fireball has a 2 square radius. Indoors, in a constrained area, it has a 3 square radius.

Haste. This combat spell affects 1 person per level of caster. Everyone affected moves twice as far and attacks twice with melee and missile weapons, but they do not throw any additional spells per round. It lasts for 3 rounds plus 1 round per level of caster.

Hold Person. This is like the clerical spell, but 1-4 people can be affected. The duration is 2 rounds per level of caster.

Invisibility, 10' Radius. This is like invisibility but affects everyone within 10 feet of the caster when it is cast. Everyone affected stays invisible, and comes out of it normally, but if the caster ends his invisibility, it ends for everyone.

Lightning Bolt. This affects everyone in its path. It does 1-6 damage points per level of caster, a successful saving throw cuts this damage in half. A lightning bolt is 4 or 8 squares long in a line away from the caster. The bolt will rebound off walls to reach its full length.

Protection From Evil, 10' Radius. This is just like protection from evil, but it affects everyone within 1 square of the target as long as they stay there.

Protection From Good, 10' Radius. This is just like protection from good, but it affects everyone within 1 square of the target as long as they stay there.

Protection From Normal Missiles. This keeps the target (touch range) from being harmed by non-magical missiles for 1 turn per level of caster.

Slow. This combat spell affects 1 person per level of caster. Unwilling targets get a saving throw. Targets move at 1/2 their normal distance each round, and their number of attacks per round is halved. If they only have 1 attack, then they have 1 attack per every other round. This can be used to negate haste. Its duration is 3 rounds plus 1 round per level of caster.

The new Phlan City Council is leading the fight to free their captive city. Heroes are retaking the city block by block from the evil hordes.

**RICHES & FAME!**

The council is looking for soldiers and rogues, mages and clerics, heroes of all kinds, to come to New Phlan. The wealth and land of an ancient city await those willing to reach out and take it.

**GLORY!**

Legends will be written about the heroic struggle to free New Phlan! Ships to New Phlan depart twice monthly. When you arrive, see the New Phlan City Council for the latest news and information.

**MAKE YOUR FORTUNE IN NEW PHLAN!**

**WHAT IS THE ADVENTURERS JOURNAL ALL ABOUT?**

The Adventurers Journal is your guide to *Pool of Radiance*. It includes fliers, maps, and information that your adventurers would know before beginning their quest. It also includes information that your adventurers will discover during their quest.

The journal is divided into several sections. The cover shows a recruiting announcement that tempted your adventurers to come to New Phlan. The next sections are a history of Phlan and a bestiary of the monsters in and around Phlan. This is information your adventurers should already know, so read it carefully. The answer to Phlan’s current plight may lie in its history.

The next three sections of the journal are information that the adventurers will come across during their quest. Such items include announcements from the city council (Proclamations), information collected during an adventure (Journal Entries) and tales Overheard in Taverns (Tavern Tales).

*Adventurers Journal*

*POOL OF RADIANCE*

*FREE NEW PHLAN!*

The council is looking for soldiers and rogues, mages and clerics, heroes of all kinds, to come to New Phlan. The wealth and land of an ancient city await those willing to reach out and take it.

**THE ANCIENT CITY OF PHLAN**

Phlan was the first great city of the Moonsea, reaching its peak some thousand years ago. In those days, the Moonsea was better known as the Dragon Sea, named for the large numbers of great Wyrms that inhabited it. The River Liss, flowing past the shadowed battlements of Zhentil Keep; the Myrmow, a cold stream flowing from the east; the Dusthammer, also called the Evenflow, beginning deep in the heart of the Elven Court and flowing north; and the Barren River which flows out of the Dragonspine Mountains and into Phlan. The River Lis carries the waters from the Moonsea south to the Inner Sea.

The Moonsea itself is an odd combination of abyssal deep spots, ship-flatting shoals, and rich fresh-water reefs. Despite this, travel across the Moonsea is generally safer than making the journey on land, so that most of the major merchant activity is by water.

The Moons are generally more powerful than their landed cousins. Regions of the Moons are recorded as being haunted, and there have been numerous sightings of ghost ships.

**Trade**

Trade between the powerful elves, the wild humans, and merchant-dwarves was a great success for all sides. Soon Phlan was the most powerful city on the Moonsea, outshining its only rival, the Elven Court and flowing north; and the Barren River which flows out of the Dragonspine Mountains and into Phlan. The River Lis carries the waters from the Moonsea south to the Inner Sea.

**THE MOONSEA REACHES**

The Moonsea Reaches are defined by sages as being those lands bordering on the Moonsea and its major contributing rivers. These major rivers are the Tesh, flowing past the shadowed battlements of Zhentil Keep; the Myrmow, a cold stream flowing from the east; the Dusthammer, also called the Evenflow, beginning deep in the heart of the Elven Court and flowing north; and the Barren River which flows out of the Dragonspine Mountains and into Phlan. The River Liss carries the waters from the Moonsea south to the Inner Sea.

The Moons are generally more powerful than their landed cousins. Regions of the Moons are recorded as being haunted, and there have been numerous sightings of ghost ships.

**The elves**

The elves, the legend says, first discovered the Pool of Radiance. Its description has varied through the passage of the years. Many wise sages have declared it a myth and a con-man’s gambit. The location of the Pool changes from tale to tale. Sometimes it is deep in the heart of an eternal wood, sometimes on an island circled by great Wyrms, and sometimes in the heart of a huge solitary peak that rises above all others in the Dragonspine Mountains. It is said that the pool glows with its own energy. Those that approach it feel new power within their bones, while an unreal melody

---

"A HISTORY OF PHLAN AND THE MOONSEA REACHES

A Discourse on This Area and its Problems"

by Jeff Grub

To most inhabitants of the lands of the Inner Sea, the Moons and its cities represent the border between civilization and barbarism. The Moonsea sits like a great plug straddling the territory between the Mountains of Vaasa and the Nomad Steppes, protecting the southern territories from the incursions of savage Northern peoples. To the south of the Moonsea lie the civilized lands of Cormyr and Sembia. To the north lay hundreds of square miles of cold and unforgiving waste. Even when the southern kingdoms are themselves besieged by orcish hordes, dragons, and fell monsters, they take comfort in the fact that, “It’s worse around the Moons.”

The Moonsea sits like a great plug straddling the territory between the Mountains of Vaasa and the Nomad Steppes, protecting the southern territories from the incursions of savage Northern peoples. To the south of the Moonsea lie the civilized lands of Cormyr and Sembia. To the north lay hundreds of square miles of cold and unforgiving waste. Even when the southern kingdoms are themselves besieged by orcish hordes, dragons, and fell monsters, they take comfort in the fact that, “It’s worse around the Moone.”

The Moons are generally more powerful than their landed cousins. Regions of the Moons are recorded as being haunted, and there have been numerous sightings of ghost ships.

**The elves**

The elves, the legend says, first discovered the Pool of Radiance. Its description has varied through the passage of the years. Many wise sages have declared it a myth and a con-man’s gambit. The location of the Pool changes from tale to tale. Sometimes it is deep in the heart of an eternal wood, sometimes on an island circled by great Wyrms, and sometimes in the heart of a huge solitary peak that rises above all others in the Dragonspine Mountains. It is said that the pool glows with its own energy. Those that approach it feel new power within their bones, while an unreal melody
holds them in a rapture. Legends say that the Pool’s power created the Great Hammer of Tyr, called Phlan’s ‘Isle to appear. The Pool is said to bring great power to the worthy, and death most horrible to the unworthy. Some tales say that the Pool should drink from it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it. The abilities of the Pool change according to the needs of the tale-spinner. In any event, a trader or adventurer who encounters a sudden windfall or great riches is said to be brought to the Pool, and he is given the Pool’s power.

The Pool is real or some literary invention, the First City of Phlan (also called Archaic Phlan) survived in peace for many generations. When the Pool of Radiance reappeared, it was a major event for the Moonsea region. The Pool was built on the ruins of the old city, and it was said to be the largest temple of good in the entire North. The city as abundant harvest returned to Phlan. But the harvests were never to be as great as before, nor the fruit from the orchards as sweet. Whatever

By 750 DR the temple complex has been finished. In its day, it was the largest temple of good in the entire North. The city as abundant harvest returned to Phlan. But the harvests were never to be as great as before, nor the fruit from the orchards as sweet. Whatever

The Famine of the Red Plants passed after three seasons, and an invasion of orcs and goblins from the Great Grey Land of Thar, which are today called ogres, began gathering into large hordes, and horrible undead things lingered in the swamps and in the passes through the Scouring Forest. Hilsifar retained its elven ties and flourished even as Phlan’s power was deteriorating, growing from a small town into a large prosperous city. The foundations of Phlanel Keep and Mulmaster were laid while Phlan lay in ruins. Small towns such as Melvaunt, Thentia, and Elmwood were started during this period. The inland city of Yulash, Keeper force was turned back through a massive payment to their ruling heads of Phlan negotiated to spare the city. In the end, the city of Zhentarim, which would increase in power over the next 300 years. Zhentarim, which would increase in power over the next 300 years.

The Pool is said to bring great power to the worthy, and death most horrible to the unworthy. Some tales say that the Pool should drink from it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it. The abilities of the Pool change according to the needs of the tale-spinner. In any event, a trader or adventurer who encounters a sudden windfall or great riches is said to be brought to the Pool, and he is given the Pool’s power.

The newcomers built on the ruins of the old city, often not checking what was beneath their curious souls. The Pool of Radiance, and caused the Sorcerer’s Isle to appear. The Pool is said to bring great power to the worthy, and death most horrible to the unworthy. Some tales say that the Pool should drink from it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it, or throw coins into it. The abilities of the Pool change according to the needs of the tale-spinner. In any event, a trader or adventurer who encounters a sudden windfall or great riches is said to be brought to the Pool, and he is given the Pool’s power.

The Valjevo Princes, their blood thin indeed, continued for another

The Valjevo Princes, their blood thin indeed, continued for another
That should have been the end of Phlan's story, but it is not so. Once was and could yet be again.

THE REEMERGENCE OF PHLAN

For many years, Phlan was a walled city, strong and formidable. It stood as a beacon of civilization in a land of darkness and savagery. But one day, the city fell victim to the same fate as many others in its region. It was pillaged, burned, and left in ruins.

The city was not forgotten. People from all around came to help rebuild it. They worked tirelessly to restore the city to its former glory. The result was a beautiful city, filled with temples, palaces, and markets.

However, the city's troubles were not over. Dark things continued to lurk on the borders of Phlan. The city was attacked by raiders, and even by dragons. But the people of Phlan were not easy prey. They fought back with all their might.

THE FALL OF PHLAN

The city of Phlan was built on the ruins of an older city. But even the new city could not withstand the attacks of powerful enemies. The city was destroyed, and its inhabitants were forced to flee.

Yet dark things continued to lurk on the borders of Phlan. The city was attacked by raiders, and even by dragons. But the people of Phlan were not easy prey. They fought back with all their might.

THE REEMERGENCE OF PHLAN

Phlan was destroyed, but its spirit lived on. People from all around came to help rebuild it. They worked tirelessly to restore the city to its former glory.

The city was not forgotten. People from all around came to help rebuild it. They worked tirelessly to restore the city to its former glory. The result was a beautiful city, filled with temples, palaces, and markets.

However, the city's troubles were not over. Dark things continued to lurk on the borders of Phlan. The city was attacked by raiders, and even by dragons. But the people of Phlan were not easy prey. They fought back with all their might.

THE REEMERGENCE OF PHLAN

That should have been the end of Phlan's story, but it is not so.

Many remember the tales of Valjevo, who brought the first city of Phlan back from its ruins. Adventurers, smugglers, and small traders visited the region and brought back tales of Phlan under control of its evil masters. Many of the buildings were burned, but many others were spared. The city's survivors began to rebuild it, and the city was once again a bustling center of trade.

THE REEMERGENCE OF PHLAN

The city of Phlan, built on ruins upon ruins, is a city at war. It is divided between the human forces of the Council, and those evil forces that hold a great deal of the city under their sway.

The human territories of Phlan are nestled behind a strong stockade, with its rival more often. Piracy, or rather privateering, was on the rise, a situation that continues to this day among the city-states.

The city was once again a bustling center of trade. Adventurers, smugglers, and small traders visited the region and brought back tales of Phlan under control of its evil masters. Many of the buildings were burned, but many others were spared. The city's survivors began to rebuild it, and the city was once again a bustling center of trade.

Many remember the tales of Valjevo, who brought the first city of Phlan back from its ruins. Adventurers, smugglers, and small traders visited the region and brought back tales of Phlan under control of its evil masters. Many of the buildings were burned, but many others were spared. The city's survivors began to rebuild it, and the city was once again a bustling center of trade.
The natives of Phlan are a mixed group, including descendents of the families of Valjevo's day and returnees who seek to reclaim lands and treasure lost to the dragon horde fifty years ago. The city is also filled with adventurers seeking new fortunes and traders hoping to re-establish the old trading lines. Orcs and other generally evil humanoids are viewed with alarm within the city, though evil humans come and go un molested with the ships. It is said that spies from the other cities of the Moosene make regular calls with the ships, overseeing the progress of the Council in re-establishing the city. If the Council is too successful, some say, then sabotage may be in order to prevent Phlan from returning to its former power.

The lands beyond the civilized stockade are wild ruins controlled by whatever local faction or tribe holds that piece of land. Control lasts only as long as the reach of claw or sword. Petty bands of orcs, goblins, and men vie for power, some led by more sinister monsters.

Much of Phlan's ruined greatness can be found in the Old City. The main sights include: the forgotten riches of the wealthy old noble's houses; Podol Plaza, the center of the old trading district; and the Old Temple, now dedicated to the dark god Bane. Valjevo Castle has been refortified and is being used as a headquarters for one faction leader or another.

Phlan remains now, as it has ever been, a city with the greatest of potential. In the cycles of its rise and fall, legends have arisen before. In engineering New Phlan's renaissance, new legends are sure to emerge.

THE PHLAN AREA BESTIARY

This is a list of some of the monsters found in and around Phlan and the north shore of the Moosene. Most monsters can strike fear into the hearts of men, but some are more powerful than others. The monster's reputation is reflected in its monster level, listed as a Roman numeral after its name. Level I monsters are less powerful than a well-equipped beginning fighter. A Level VIII monster may be more powerful than several heroes.

Anhkeheg (VI): Large burrowing insects with great mandibles. These creatures have been known to spit a powerful acid.

Basilisk (VII): A giant eight-legged lizard. One of the most dangerous creatures in the realms because their gaze can turn creatures to stone!

Bugbear (IV): Hideous giant sized goblins who stand over seven feet in height. Bugbears look clumsy but are strong, quick fighters with great stealth.

Centaur (IV): These good creatures are half men and half horse. They are capable fighters and can be valuable allies.

Displacer Beast (VI): These creatures are large, black puma-like creatures with two tentacles sprouting from their backs. These creatures can appear several feet from their actual location.

Drider (VI): These creatures resemble a cross between a drow elf and a giant spider. They are powerful spell casters.

Efretti (VI): These large powerful jinn are from the elemental plane of fire. They are very arrogant and will only serve a powerful master.

Ettin (VII): These creatures look like giant two-headed orcs. They have great strength and usually wield two spiked clubs that inflict terrible damage in combat.

Fire Giant (VIII): These evil giants have flaming red hair and are immune to all fire. They usually attack with giant two-handed swords.

Giant Frog (III): These are giant carnivorous frogs. They are fast, dangerous predators who may be poisonous.

Giant Lizard (IV): These are the giant cousins to the common lizard.

Giant Mantis (VII): These are the giant version of the common mantis. These creatures are fast, strong, and have good armor.

Giant Scorpion (VI): These are the giant version of the common scorpion. Its poisonous tail can kill a man.

Giant Snake (V): These are giant poisonous snakes.

Ghoul (III): These are evil undead whose touch may paralyze a man in combat. They feed on corpses and attack all living creatures on sight.

Gnoll (II): These creatures are hyena-headed humanoids who stand over seven feet tall.

Goblin (I): These are small humanoids common in the Realms.

Hill Giant (VII): These are one of the smaller, more stupid giants, but they are still tough opponents. They usually carry large clubs.

Hippogriff (III): These magnificent creatures have the forelimbs and head of an eagle and the body and hind legs of a horse.

 Hobgoblin (II): These are human-sized, intelligent relatives of the goblin.

Kobold (I): These are small, cowardly humanoids who delight in killing and torture.

Lizardman (III): These are lizard-like humanoids. They are omnivorous but they have a particular fancy for human flesh.

Medusa (VI): These are hideous women with snakes for hair. They can turn a man to stone with their gaze.

Minotaur (VI): These are strong bull-headed humanoids. They are cruel man eaters, commonly found in mazes.

Mummy (VII): These are powerful undead with great strength. The mere sight of one has been known to paralyze a man in combat. The touch of the mummy causes a strange rotting disease.

Nymph (V): These are extremely beautiful creatures that appear as ever-young females. They usually inhabit wild lakes and streams.

Ogre (IV): These are large, foul-tempered, ugly humanoids. They are strong fighters.

Orc (I): These are evil, pig-faced humanoids.

Phase Spider (VI): These are giant poisonous spiders with the ability to phase in and out of this dimension. Usually they only 'phase in' to attack, then 'phase out' again.

Quickling (IV): These are small, fast-moving creatures. Because of their great speed they are invisible when they move.

Skeleton (I): These are the least of the undead. These animated skeletons are usually controlled by some evil force.

Spectre (VII): These are one of the most powerful of the undead. Their touch can drain the life out of men.

Hippogriff (III): These magnificent creatures have the forelimbs and head of an eagle and the body and hind legs of a horse.
Stirge (II): These are small, blood-sucking birds.

Thri-kreen (VI): These are intelligent, carnivorous insect-men who live in burrows. They have four arms and a poisonous bite that paralyzes their foes.

Tiger (VI): These are noble beasts who are both strong and silent. Though their normal prey are animals, they have been known to become "man-eaters."

Troll (VI): These are large, strong, ugly humanoids. They know no fear and can regenerate wounds.

Vampire (VIII): These are one of the most dreaded undead in the Realms. They can drain life levels, are strong fighters, and are sometimes powerful magic users.

Wardog (III): These are large, strong dogs, trained to kill. Orcs, goblins, and other humanoids are known to use them.

Wight (VI): Evil, undead humans whose touch can drain the life out of a man.

Wild Boar (IV): These creatures are the wild relatives of the pig.

Wraith (VI): These creatures are non-corporeal undead. Their touch can drain the life out of a man.

Wyvern (VI): These creatures are distant relatives of dragons. They attack by biting and using the poisonous sting in their tail.

Zombie (IV): Magically animated corpses controlled by an evil force. Zombies always fight back until destroyed or turned.

THE PROCLAMATIONS OF THE CITY COUNCIL OF NEW PHLAN

These messages are posted on the wall of the City Hall. They represent messages that the City Council wants to relate to the citizens and adventurers in New Phlan. When you go to City Hall the game will refer to the posted proclamations by number. Each proclamation begins with:

From the City Council of New Phlan to all brave and hearty adventurers:

PROCLAMATION LIX
Be it known that the council is interested in reclaiming the remaining blocks of the city of New Phlan. To reclaim said blocks they must be first cleared of monsters, vermin, and other uncivilized inhabitants. To this end the council is offering a reward to any person or group who is responsible for clearing any block of the old city.

PROCLAMATION LXIV
Be it known that the council is interested in acquiring information as to the disposal of various formerly-living entities rumored to be haunting the citizens in the vicinity of Valhigen Graveyard. A reward is offered to any person who shall travel to said graveyard and return an eye-witness account.

PROCLAMATION LXXVII
Be it known that the council is offering a reward to any person or persons who can provide information as to the disposition of several council agents who have been sent to investigate the unseemly happenings in the vicinity of Valhigen Graveyard.

PROCLAMATION CI
Be it known that the council, knowing that commerce is the life's blood of New Phlan, has decreed that Sokal Keep is to be cleared of all unlawful inhabitants. A reward is offered to the person or persons who successfully carry out this commission. All interested in applying for said commission shall present themselves to the clerk of the council.

PROCLAMATION CIX
Be it known that the council is offering an inducement to any individual who shall serve in the rescue force for the mercenary band of Taimalig-the-Invincible which has disappeared inside Valhigen Graveyard.

PROCLAMATION CX
Be it known that the council is seeking a hearty band to undertake a mission of particular sensitivity. Any brave and clever band of adventure seekers who are not adverse to earning a large reward should present themselves to the council clerk for a special commission.

PROCLAMATION CXIV
Be it known that the council is offering a special reward for the safe return of the heir to the House of Bivant. Said minor was carried off during a buccaneer attack on the merchant ship in which he was sailing. Apply to the council clerk for the council's commission and additional information as to the abduction.

PROCLAMATION CXX
Be it known that the council has decreed that the threat of the pirates who plague eastern shipping to New Phlan will be eliminated. The council offers a generous reward for the exact location of the pirates stronghold in the Twilight Marsh. An even greater reward is offered for the elimination of the pirates as a threat to shipping. Apply to the council clerk for a commission.

PROCLAMATION CXXVI
Be it known that the council is offering a reward for all books and tomes containing information about the fall of Phlan. The amount of said reward to be dependent upon the value of the information provided.

PROCLAMATION CXXIX
Be it known that the council has decreed that the foul poisoning of the river formerly known as Stojanow is to be brought to an end. Accordingly, a reward is offered to any group which shall travel up the river currently known as Barren, locate the source of its poisoning, and eliminate said source. A commission may be obtained from the council clerk.

PROCLAMATION CXXXIV
Be it known that the council has declared those individuals who have taken up residence in the mansion of the former Koval Family to be traitors and thieves. Be it further known that a reward has been offered for the elimination of these outlaws. A commission to rid the city of this blight may be obtained from the council clerk.

PROCLAMATION CXXXV
Be it known that the council has proclaimed a generous bounty for each undead killed. Be it also known that in addition to said bounty, the council is willing to provide a special enchanted item, useful in the destruction of undead, to any group of adventurers who accepts the commission to cleanse Valhigen Graveyard. Apply to the city clerk for said commission.

PROCLAMATION CXLIV
Be it known that the council is seeking a hearty band to undertake a mission to rescue the Duchess of Melvaunt. The duchess is supposedly being held by a band of ogres to the northeast of Phlan. A generous reward is offered for the safe return of the duchess. Apply to the council clerk for commission and additional information concerning the abduction.

PROCLAMATION CLXX
Be it known that the council is offering a special reward for the safe return of the duchess. The duchess is supposedly generous reward is offered for the safe return of the duchess. Apply to the council clerk for commission and additional information concerning the abduction.
JOURNAL ENTRIES

These entries include items which the adventurers might copy or file in their journal as they travel. During the game these entries are referred to by number. When the game refers to a journal entry read the specific entry and place a checkmark in the margin to keep track of which entries have come up in the game. Do not read ahead to other journal entries; some entries are false and may lead your adventurers astray.

JOURNAL ENTRY 1:
A loud voice coming from a magic mouth cast on a stone tablet.
"I am Yarash the Sorcerer!"
"Be known that for every living giant insect you return to Sorcerer's Island I will pay a generous bounty, including a weapon empowered by magic. I will pay for giant insects such as thri-kreen, giant mantis, and ankheg. The insects may be bound by magic but dead insects are of no use to me.
"Bring any bodies to the northern river mouth on Lake Kuto. Call the name of 'Yarash' loudly three times and I shall come. Do not call unless you have something for me. I shall be very angry if I am disturbed without cause!"
"I am Yarash the Sorcerer!"

JOURNAL ENTRY 2:
Told in a painful whisper.
"I never liked pain. Let me go an I'll tell ya of the kobold treasure horde. We attacked a gold shipment once -- we took it by surprise. Thirty times my weight in gold pieces were taken. We knew if we were RAID we'd lose the stuff in the treasure room. So we hid it behind a secret door in the warrens -- that's where we keep the womenfolk. They tossed me in here ta die, so it don't do no harm to tell ye. Find it and good riddance."

JOURNAL ENTRY 3:
An old leather-bound book, written with a small, firm hand.
"The hordes came again last night. Their coordination was frightening. Under the cover of darkness, goblins and kobolds pushed bundles of sticks to within bow range. These bundles formed a wall that protected the small ones from our archers. Once the wall was erected our archers took up safe positions there and begin pelting the castle walls with arrows.
"We tried shooting flaming arrows at the wall of sticks to set it afire. Monsters are normally afraid of fire. But these monsters showed no fear. They simply scooped dirt on the flames to put them out. Before all the fires were out they had resumed firing at us. Surely, some unnatural force must have been at work to weld these garrulous beasts into an organized fighting force.
"I do not know if we can combat the monsters onslaught much longer. We lost 12 more men last night. The monsters seem to have an unlimited number of reinforcements. The Last Priest of Tyr, Ferran Martinez, says he has a way to protect the keep, but he says that it's so terrible that it may only be used as a last resort. Unless we receive reinforcements shortly, Ferran Martinez is our only hope."

JOURNAL ENTRY 4:
A roughly drawn cloth map.

APPLE II COMPUTER INFO

Fact: Joran Alberach is a special envoy, from Zhentil Keep, to the City Council of New Phlan.

Strong Rumor: Here to negotiate a military assistance agreement between Zhentil Keep and New Phlan.

Rumor: Zhentil Keep wants an ancient powerful artifact in return for their military cooperation.

Rumor: The New Phlan City Council has such an artifact that was found in the ruins of a recently reclaimed building.

Vague Rumor: Joran Alberach wants the artifacts for himself, not for the rulers of Zhentil Keep.

JOURNAL ENTRY 5:
A small piece of parchment folded into the spine of a family's holy book.
"The family treasures are buried in the tunnels beneath Auto's Well. 
Climb down the well and search for a secret passage. In the passage there is a dangerous trap. Search the walls until you find the lever to disarm the trap. Then proceed through the passage into an adjacent chamber. The treasures are buried in the southwest corner."

JOURNAL ENTRY 6:
"Show the Boss's Seal to the thri-kreen guards. Be careful, they are wary of outsiders. Keep your hands away from your weapons no matter what they do.
"With the seal you should gain safe passage in to see the Queen. She will give you the artifacts in exchange for the seal and the treaty. Do not do anything to get her mad, the bugs would just as soon kill you as look at you. Once you have the artifacts, get out of the stinking burrow and get back to the castle."

JOURNAL ENTRY 7:
"Fountains and pools hold great power that can only be reached by performing proper ceremonies. Most sure of these is immersion, for in this way the bather surrenders himself to the spirit of the water. That spirit, or some portion of it, enters into the bather, whereby he gains great powers. Now to the weak willed whose spirits are sure to be consumed by spirits that even the strong at great risk. Yurax holds that the Falls of Ixue are greatest of all these. Morden writes that the Pool of Radiance is greater still."

Later in the book.
"Places of magical power are not necessarily tied to one physical location. Power often moves from plane to plane along the path of least resistance. The termination of the path determines the place's location on this plane. Volatile upheavals between physical planes may lead to a change in the path of least resistance. This can change where the path terminates on this plane, thus moving the place of power.
"Whoever wields strong supernatural forces can bend the path like an engineer damming a river. When the path is bent, it can terminate in a new location, moving the place of power on this plane. If the supernatural force that bent the path is removed, the path will snap back to its original form and the place of power will return to its original location. Such disruption can have violent and unpredictable results.
"Thus, inter-planar upheavals and directed supernatural forces may hold the answer to the seemingly ever-changing location of places of power, such as the Pool of Radiance."

JOURNAL ENTRY 8:
"Ten days ride north of the Varm is a barren and dead country called the Leewai, land-in-pain or land-of-caused-pain. Further to the south this place is known as the Tortured Land. It is said to be an evil place, shunned by the Riders. They speak little of this land. But, yearly, during Ches, they make a trip into its heart. There they go to praise the spirit of a glowing spring. This they have done for ages and so shall they do for years to come."

JOURNAL ENTRY 9:
"Several pieces of paper with highly organized writing.

APPLE II COMPUTER DOCUMENTATION RESOURCES (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 SEPTEMBER 2000 -- 809 OF 1262
JOURNAL ENTRY 14:
Several pieces of paper with highly organized writing.

Fact: Porphyrys Cadorna is the last known surviving member of the Cadorna Clan.

JOURNAL ENTRY 15:
A clean map drawn with exact lines.

JOURNAL ENTRY 16:
Told in a proud, haughty voice.

JOURNAL ENTRY 17:
A quick note on an often used piece of paper.

JOURNAL ENTRY 18:
A ratty piece of parchment with large writing on one side.

JOURNAL ENTRY 19:
A black bound tome written in a strange halting hand.

JOURNAL ENTRY 20:
Told in a pained voice.

JOURNAL ENTRY 21:
A crumbling old book; one of a massive series.

JOURNAL ENTRY 22:
A new folded cloth map drawn in waterproof ink.

JOURNAL ENTRY 23:
Several pieces of paper with highly organized writing.
Fact: Ulrich Eberhard is old, hard headed in every sense of the word, leader of the initial expedition to retake Phlan. If it truly’s sahuagin you could end up with 10,000 gold pieces. But beware, I will know any forgeries, and I will punish any attempt at deception. For now we have no choice. We will evacuate the city by ship on the morrow. And the accursed child shall come along. I swear that he smiles every time there is an explosion, or anytime you hear a man scream. Saints preserve us all from this demon child.

"I have charted this maze as closely as I can. My way is blocked by both stone and mystic death traps. Yarash must have used his magic to escape this place. I can find no other way out."

"Possessed is the one called Porphrys. When the spirit of evil is in him you can see the fire in his eyes. When he is possessed, the ground trembles with his power and the nearby plants wither as if exposed to a great heat.

"None of the servants will go near the child any more. I think he should have been drowned at birth. But his mother is blind to his possession. She guards him like a tigress protecting a kitten. I think he has ensorcered her."

"For now we have no choice. We will evacuate the city by ship on the morrow. And the accursed child shall come along. I swear that he smiles every time there is an explosion, or anytime you hear a man scream. Saints preserve us all from this demon child.

JOURNAL ENTRY 25: An official-looking notice.

"The number of undead creeping out of the Valhingen Graveyard is increasing. These undead have disrupted training, destroyed property, and killed many of our troops. Patrols have been sent into the graveyard to reconnoiter and determine the source of the undead. None have returned. Under your responsibilities as a priest of Bane in the city, you must help combat the menace.

"Lead a group of acolytes into the graveyard with the purpose of discovering the source and leader of the undead. If your group can engage and defeat the leader, or destroy the source, do so. If your group is outmatched, return with your information so that we can form an assault group with clerics and troops. Upon completion of this mission you will be in line for promotion to the next higher rank in the hierarchy of the temple of Bane in Phlan."

"Bring your specimen to the shore of Lake Kuto and build a fire as a signal. Your specimen will be examined. If it truly’s sahuagin you could end up with 10,000 gold pieces. But beware, I will know any forgeries, and I will punish any attempt at deception."

"So, capture a live sahuagin, bring him to Lake Kuto, and walk away a rich man!"

Signed
Yarash the Sorcerer

JOURNAL ENTRY 26: A small bound book.

"None of the servants will go near the child any more. I think he should have been drowned at birth. But his mother is blind to his possession."

"I do not know when Yarash intends to do when he completes his hideous experiments. But I must assume that he will turn his abominations loose on the world. To these creatures Yarash will be their creator, perhaps even their god! The idea of Yarash as a god to anyone sickens me. I must find a way to stop him."

JOURNAL ENTRY 27: An impressive announcement.

Bounty of 10,000 gold pieces for a live sahuagin! I will pay 1,000 gold pieces for a recently dead sahuagin in good condition. I need a specimen of this man-like salt water aquatic creature for my studies.

JOURNAL ENTRY 28: A clean map with exact lines.

--- JOURNAL ENTRY 29:

A crude map burned into an animal skin.

JOURNAL ENTRY 30: Carefully prepared notes.

Note 1: "Tyranthraxus is definitely a produce of immersion in the Pool of Radiance. His extraordinary brilliance, vigor, charisma, and powers of command must be a direct result of exposure to the effects of the Pool.

Note 2: "The Pool of Radiance may grant special magical abilities. Tyranthraxus exhibits a fiery aura, obviously magical. He also seems to have extraordinary means of obtaining information. Special magical powers granted by the pool would explain both the aura and the extra information gathering capability."

Note 3: "Tyranthraxus tells stories about moving down from the north. Though he never mentions the Pool, I gather that it is northwest of the Dragonspine Mountains. Strangely, he occasionally lets slip that he is never far from the Pool, but that must be a parenthetical reference."

JOURNAL ENTRY 31: Told in quiet, hissing speech.

"Thank you for saving my children from the Mutilator Yarash. In return I will aid you in what way I can, though that may not be great."

I have lost much of my following to young Drythh who listens to the false promises of Tyranthraxus... that if he brings troops to invade Phlan, he will rule the riverbanks.

So, Drythh and his followers have been proving themselves in raids upon the kobold caves to the southwest and the hobgoblin caves to the south.
"For some time my followers have been disappearing. But, when you freed my children from the clutches of the evil Yarash my status was increased. Drythh kept quiet for a time, but once again the young warriors listen to him and not to me."

JOURNAL ENTRY 32:
An announcement on rugged paper written in large clear symbols.

"Be it announced that Mace, the former cleric of our lord Bane, is hereby ejected from the church. His crimes include refusal to follow temple dictates, unauthorized performance of major miracles, and the great heresy of placing other gods above our almighty lord Bane. All loyal followers of lord Bane must report Mace's presence on sight. He is to be captured, brought before a loyal tribunal for fair and just judgment, and then burned at the stake."

JOURNAL ENTRY 33:
An official looking notice.

Yarash, "The time has come for you to add your power to the growing legions of my followers. Come and supplicant yourself to me and I will reward you as an important officer in my magical forces. You will serve as the advisor to the cohort of soldiers to be based at Sorcerer's Island. Resist and you shall be crushed before my almighty power. I expect your positive reply within the week."
Signed,
The Boss

JOURNAL ENTRY 34:
Told in halting speech.

"Thank you for freeing us: Yarash has been experimenting on our people, changing them in horrible ways. Every night we carry off another lizard man with his chest burst open or his head mangied. Yarash say he make us like Sa-Hag-An. He always say that he make us stronger, better hunters. But all he make us is dead."

"We were not allowed to speak when Yarash was around. These marks were passed down to us and remind us of home. They represent the friend word used between lizard men of different tribes. If you meet lizard men on the outside, this word may help you."

The lizard men carefully scratches marks into the dirt. You recognize the marks as two runes and a path symbol.

JOURNAL ENTRY 36:
Carefully prepared notes.

Note 4: "He has fooled me. All this time he has called himself Tyranthraxus the Flamed One. He exhibited his flame, and spoke of deeds attributed to Tyranthraxus. But today, while he did not know I was around, he revealed his true identity. He spoke into the great pool in his lair. I think he spoke to Lord Bane himself. And he referred to himself as Maram. Maram, he of the great spear, is also a servant of Bane."

"Why should my leader use a false name? He hides his identity from the world, so that they do not research his past and discover his weaknesses. What if he also hides his identity from his closest advisors, so that they also cannot know his true abilities and weaknesses. Anyone who attacked him, thinking to utilize the weaknesses of Tyranthraxus, would be destroyed by the different powers of Maram of the Great Spear."

"My research into Tyranthraxus is now useless. I must scour my GATE OF WEALTHY STOJANOW TEMPLE OF Tyranthraxus, would be destroyed by the different powers of Maram of weakness. Anyone who attacked him, thinking to utilize the weaknesses MANSION of Tyranthraxus, would be destroyed by the different powers of Maram of weakness. What if he also hides his identity from his closest VALHINGEN GRAVEYARD Advisors, so that they also cannot know his true abilities and WEALTHY weakness."

JOURNAL ENTRY 38: Several pieces of paper with highly organized writing.
Fact: Werner Von Urslingen is a retired captain turned business man.
Strong Rumor: mostly interested in the military aspects of the reconquest of Phlan.
Rumor: fought in a mercenary unit hired by The Boss early in his career.
Rumor: hates Zhentarim because he fought in a unit against them several times.
Rumor: has strong contacts with other mercenaries and some ruffians in town; none of our information confirm such contact.
Vague Rumor: Von Urslingen’s unit was wiped out by enemy magic users; he was the only survivor; he retired and now secretly hates magic users.
JOURNAL ENTRY 39: A preserved parchment covered with giant script.
"I am writing to you to describe my further inquiries into the legend of the Pool of Radiance. It seems the pool has moved several times. Long ago, at least one wise wizard actually moved the pool into his abode for a period of time to study it. However, the pool seems to return to its ancient location after every move. I am now watching the dry hole that is the pool's natural location. When it returns I will be ready. I truly believe that the Pool of Radiance is the key to the secret wisdom that I seek.
Yours in wisdom
Sorasar

JOURNAL ENTRY 40: A quick note on an often used piece of paper.
"Both kobolds and hobgoblins exist in large numbers to the east, Experiments show neither makes good breeding material."

JOURNAL ENTRY 41: A clean map drawn with exact lines.
TYPISIT NOTE: This map intentionally left out by me.

JOURNAL ENTRY 42: A sketch drawing.
TYPISIT NOTE: Not included due to illustrations.

JOURNAL ENTRY 43: A loosely wrapped scroll.
"Aramalg-the-Good, paladin and brother of Taimalg-the-Invincible, and Sarasim of Teshwave, the high priestess of Sune, attacked the denizens of the Valhingen Graveyard with a holy vengeance. They came in search of Taimalg and his mercenary band, who assaulted the graveyard and did not return.
"Sarasim used her holy power to dissipate and turn the undead that confronted them. Aramalg wielded his vorpal sword and slew the few that fought her power.
"Together, Aramalg and Sarasim penetrated the graveyard to an evil marble crypt. They found and splintered an empty coffin, blessing the remains and sprinkling it with holy water. Then they confronted the owner of the coffin, a creature of great evil and the leader of the undead in Valhingen, an ancient vampire. The three began a furious melee.
"The vampire was swayed by Aramalg and Sarasim's power, but would not be turned. The vampire shouted, 'I have defeated Taimalg and his warriors, I will defeat the brother of Taimalg as well!'
"The vampire summoned an army of rats and tried to charm Sarasim to his side, but to no avail. Sarasim resisted his charm and Aramalg charged through the massed vermin. The vampire fell before the mighty blows of Aramalg's holy sword and Sarasim's enchanted mace.
"Defeated, the ancient vampire dissolved into gas and fled to his coffin. Finding the coffin destroyed he returned to solid form and screamed. Seizing the moment Aramalg grabbed the vampire and held him with all of his strength. Sarasim ran up and drove an oaken stake through the vampire's heart.
"Aramalg and Sarasim performed the proper rituals to banish the vampire forever. Then, wounded, Aramalg and Sarasim left Valhingen Graveyard. It was beyond their power to completely cleanse the evil place, but they had extracted proper vengeance for the death of Taimalg and his troops."

JOURNAL ENTRY 44: A cleanly written note on standard paper found on the body of a dead trader.
Aleram,
"Hello my good friend. I hope you and your brood are well. I am tired; tired of trekking through unspeakable swamps and over unclimbable mountains to take my meager wares to ungrateful customers. Only one event has saved this year’s sales. I found a castle full of happy folk, who were very good customers. They wanted rare goods and news from the outside world. And well they should be, their castle was in the middle of a small forest, and the forest was in the middle of a swamp! These people seemed to know nothing of recent events. They still spoke of Phlan as if it were in its full flower. And they paid in old Phlan Gold Sovereigns, double the weight of the newer gold coins! Though they were out of date, they were very friendly and prosperous. I saw more than one gem glitter in the sun, and several swords showed a flash that made me think they were magic. I am willing to dodge the vermin of the swamp I would add this castle to your trading route. Speed to your horse, strength to your arm, and skill to your trading."
Your Friend,
Burach

JOURNAL ENTRY 45: Told in perfect, stylized common.
"Generations ago, flesh things were fewer and we hard-shelled beings ruled the shores of Lazara, what flesh things call the Moonsea. We gathered much gold and platinum, plus many gems for decoration and to appease our own gods. We are quite adept at finding such trinkets as we make our home by burrowing with our own mandibles. We know the earth like none other can.
"When flesh things began to multiply, we did not look on them as intelligent. They could not decipher our glorious language of sounds and movement and we could not fathom intelligent communication limited to their feeble squeaks and grunts.
"As we assumed the flesh creatures were unintelligent we looked on movement and we could not fathom intelligent communication limited to their feeble squeaks and grunts.
"We only venture to the surface to guard our lands and to find food less..."
If you or your troops make any move toward Sorcerer's Island I shall send an army of my unstoppable aquatic creations down the Barren River and sink your precious castle. Until now you have been beneath my notice. If you value your empire, let us keep it that way.

Signed
Yarash, the Sorcerer

JOURNAL ENTRY 46:
Told as jaunty, after dinner conversation.
"This is an old story that I first heard while serving at the Citadel of The Raven. Dirg was the usual barbarian hero -- the type able to snap five men's backs with his bare hands, wrestle and tame the cloud horses, pierce a man with a javelin from many miles away, and other equally preposterous things.

"The story goes that Dirg and his band of men found a pool of unfrozen water while wandering in the snowy wastes. Dirg's little pet lizard Jezma got too close to the pool and discovered that not only was the water not frozen, it was boiling hot; so hot that it cooked the skin right off of Jezma.

"Dirg was so angered he thrust his spear into the pool and roiled the waters. The demon of fire that inhabited the pool was disturbed and roared out of the pool to do battle. The demon leapt from man to man, consuming them in a single touch.

"But the demon of fire could not defeat Dirg. Neither could Dirg find a weapon strong enough to withstand the creature's fire. After battling for an entire day, Dirg finally called upon his totem god for aid. With this magical aid, Dirg was able to trap the flaming demon in a triangle of power where supposedly he is even to this day."

JOURNAL ENTRY 47:
A small wrinkled parchment with roughly scratched notes.
"Hobgoblins transferred out of Valjevo Castle. Now replaced by giants and trolls. Sounds very tough.

"Stojanow Gate guarded by bugbears and ettins. Heard ettins didn't like light. Must be charmed or controlled. Sounds tough!

"Some smugglers sneak supplies through Stojanow Gate to The Boss. Must check it out.

"Overheard hobgoblins say a dragon scared them into leaving a nice lair in the mountains out east. Couldn't happen to a nicer bunch of creeps."

JOURNAL ENTRY 48:
Several pieces of paper with highly organized writing.
Strong Rumor: The Boss is a dragon or is a human who can take the form of a dragon.

Vague Rumor: The Boss is a metallic dragon. Not considered likely as metallic dragons are 'good'.

Fact: The Boss holds audiences in Valjevo Castle. Castle is guarded by groups of big stupid monsters, with occasional smart human leaders.

Rumor: The Boss doesn't spend full time at Valjevo Castle.
Fact: maze inside castle wall; passwords are needed to get past castle gates.

Rumor: The Boss has been sending out messengers to the tribes of monsters in the area to recruit new units.
Vague Rumor: The Boss is recruiting new units in preparation for an assault to retake the civilized sections of Phlan."

JOURNAL ENTRY 49:
A letter on clean white paper in a strong hand.
To:
The Boss
Valjevo Castle, Phlan
Sir,
"I categorically reject your demand that I submit my island and my powers to your control. I am a free man and I will remain free. No petty tyrant can order about a true mages.
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 815 of 1262

DOCUMENT pool.5

JOURNAL ENTRY 50:
An official looking notice.
"Assemble a group of at least 30 of your followers. Meet up with a
hobgoblin assault force at the small docks to the west of town. You and
your group will be under the command of the hobgoblin leader. Follow
his orders. Upon completion of the mission you will be rewarded with
food, treasure, and many slaves."
Signed,
The Boss
Scribbled on the back of these orders is Norris the Gray’s unsent
reply to The Boss
"I will never follow the orders of a hobgoblin. I don't go on
missions unless I know exactly what we're supposed to do. And I don't go
on missions for an unknown amount of food, treasure and slaves'. I do go
on missions where I am in command; where I know exactly what the
target is; and where I know exactly how much I’ll get paid. Don't send
me another order until you can meet my terms."
Signed,
Norris the Gray

JOURNAL ENTRY 51:
Several pieces of paper with highly organized writing.
Fact: Bishop Braccio is the highest ranking religious leader in
Phlan. Runs small temple in civilized section of city.
Vague Rumor: Braccio is actually a front-man for a powerful high
priest who never leaves the small temple.
Strong Rumor: Braccio is under fire to 'do something' about the
undead problem. So long as the undead were causing the monsters more
trouble than the settlers, he had other, more pressing, problems.
Rumor: Braccio is under fire to 'do something' about the
undead problem. So long as the undead were causing the monsters more
trouble than the settlers, he had other, more pressing, problems.

JOURNAL ENTRY 52:
Delivered in chillingly clear tones.
"Hear us in our hour of need!" the nomad witchdoctor cries, "This
night we fight a great battle. By the breaking of dawn either our
enemies will be dead or we will have been destroyed.
"Accept the sacrifice of these outsiders and give us the strength to
defeat the hordes of our enemies. Fill our limbs with your fury, and
fill our minds with your fury. Let us vanquish our enemies just as we
vanquish these invaders who have come among us."

JOURNAL ENTRY 53:
A crumpled discarded piece of paper, full of rub outs and scratch
overs.
Priests: 1
Acolytes: 4
Ogres: 1
Hobgoblins: 40
Ogres: 1
Goblin Slaves: 20

JOURNAL ENTRY 54:
A page from an unknown diary.
"They stole my map to the Pool. Somehow they knew when I was
coming and exactly what to look for. They didn't even bother to kill
me; they said I wasn't worth killing. They just crippled my legs, took
the map, and rode away laughing.
"After the attack and the rigor of my trek all I remember is that the
Pool is in the Dragonspine, north and west of Sorcerer's Island. It
shines just like they said it would. You can feel the power flowing out
of it. Kings and generals have searched for the Pool, and I had a map
that led right to it.
"If I ever get back the use of my legs I'll go after them. I'll get
back my map. I'll get to the Pool. And this time I'll bathe in its
power. Then I'll teach them. I'll teach them all."

JOURNAL ENTRY 55:
Delivered as you sit around the campfire.
"You must beware of the many dangers in this region. Several days
walk to the west there is the pyramid of evil. It has been long avoided
by all sensible men. To the southeast is a lair of many ferocious
hobgoblins. The areas to the southwest, are inhabited by evil men—
buccaneers, marauders, and soldiers of an evil empire far to the west.
And all good folk avoid the swamps to the east. Nothing but danger
grows in the swamps."

JOURNAL ENTRY 56:
An unsent note written on sturdy parchment.
"An active dragon has made its home in the Dragonspine Mountains to
the northwest. Keep search parties away from the area so as not to
catch the dragon's attention."

JOURNAL ENTRY 57:
A ratty piece of parchment with large writing on one side.
"Our spies in the city inform us that a party of invaders will
to Sokal Keep to free it. To combat these invaders, assemble a
force of no less than three squads. Travel by boat from the small docks
at the west of town to Sokal Keep. Find the adventurers in or around
Sokal Keep. Kill them before they can return to the city council with
information about the true situation at the keep. Return with the
invader’s heads as proof of completion of your mission. Upon completion
you will be rewarded with food, treasure, and many slaves."
Signed,
The Boss

TAVERN TALES

The taverns of New Phlan are filled with scoundrels, con-men, adn
adventurers - every one a liar and a gossip. The following tavern tales
represent such rumors and lies.
When you are in a tavern, you may be referred to a particular tale
by number. Find and read that tale. If you really think of your
adventurers as rumor mongers, read all the tales.
Some of these tales are true, some are based on truth, and some have
never been corrupted by a hint of truth. Even when a tavern tale is
referred to by number, it might be false.

TALE 1: Far to the northeast, in the midst of a vast swamp, lie the
uninhabited ruins of a powerful wizard’s castle.

TALE 2: A drunk bard sits in a corner of the tavern spinning a
seemingly endless tale, but no one is listening.
TALE 3: Wells throughout the city often provide access to hidden dens and underground passages.

TALE 4: An Anglo-Saxon lord commandeers one corner of the bar to lecture on the ultimate range of his adventurers. The crowd ignores him.

TALE 5: To the east of Phlan lies a gleaming castle of gold that shifts its location from time to time.

TALE 6: A weird looking wizard, dressed all in black, sits alone and mumbles into his beer, "I'll return next time and show them all!"

TALE 7: Great treasures are to be found on the banks of the Barren River as one ventures northward.

TALE 8: The graveyard is controlled by a very powerful and clever undead creature.

TALE 9: A puzzled patron with a limited vocabulary questions everyone he comes across about how to complete a manuscript dated 1977. Unfortunately, no one can help him.

TALE 10: To the west lives a tribe of insect-men who worship normal men and give valuable gifts to all who visit them.

TALE 11: The Dragonspine Mountains are inhabited by a race of evil dragons who lure travelers to their lairs and slay them.

TALE 12: A bedraggled adventurer decrees, "There was a man called turtle, walls that aren't there, living daggers; I never did figure out what was going on!"

TALE 13: A master thief has set up a hidden training ground deep in the old city, right under the noses of monsters.

TALE 14: Ogres who live to the east of Phlan are holding captive a princess for whom a huge reward has been offered.

TALE 15: The merchants of Zhentil Keep are setting up a trading base far to the west of Phlan. They're hiring caravan guards for good wages.

TALE 16: Buccaneers operate a slave auction out of a hidden camp near Stormy Bay.

TALE 17: An old sage sits in a corner with a dark wizard. "You're right," laughs the sage, "they'll do anything I tell them to, no matter how silly or phantastic."

TALE 18: Off to the east of Phlan roams a tribe of marauding nomads. They have been pillaging villages in the plains with the help of a powerful artifact they have discovered.

TALE 19: Mighty tribes of wild dwarves, thousands of them, roam the Dragonspine Mountains, destroying villages and killing travelers.

TALE 20: "I was totally confused; it was like being lost in the darkness," sighed the overwrought adventurer. "Rabbits, hats, bowling balls? Where in the realms was I?"

TALE 21: The monsters in Phlan are led by one of the generals who sacked the city a generation ago. The general has used great magic to make himself immortal.

TALE 22: A vast fortress of kobolds dominates the western tip of the great swamp. These normally weak creatures grow to great size and have extraordinary powers here.

TALE 23: An ancient Silver Dragon still lives up in the Dragonspine Mountains. The dragon is not evil and will help travelers who battle evil.

ARMOR LIST

| Armor Type       | Weight in gp. | AC Movement* | Maximum
|------------------|---------------|--------------|--------
| None             | 0             | 0            | 0      |
| Shield, Small#   | 50            | 9            | 9      |
| Leather          | 150           | 8            | 12 squares |
| Padded           | 100           | 8            | 9 squares |
| Studded          | 200           | 7            | 9 squares |
| Ring             | 250           | 7            | 9 squares |
| Scale            | 400           | 6            | 6 squares |
| Chain            | 300           | 5            | 9 squares |
| Splint           | 400           | 4            | 6 squares |
| Banded           | 350           | 4            | 9 squares |
| Plate            | 450           | 3            | 6 squares |

*A character carrying many objects, including lots of coins, can be further limited in movement to a minimum of 3 squares per turn.

# A Shield subtracts 1 AC from any armor it's used with.

TABLE OF EXPERIENCE PER LEVEL
The following shows the amount of experience a character must earn to gain a level in his character class. All experience earned by multiple-class characters is divided by the number of classes. When a character has earned a gain in level for one class but not another, the Show command shows his highest level. Thus, a character who is a fighter-thief and has earned 1,800 experience points in each class (a total of 3,600 XP), will be shown to be 2nd level because he has earned that level as a thief, though not as a fighter. His fighting abilities are still based on his being a 1st level fighter.

**GLOSSARY OF AD&D GAME TERMS AND COMPUTER TERMS**

ABILITY SCORES. These are numbers that describe the attributes of the characters. There are six ability scores: Strength, Intelligence, Wisdom, Dexterity, Constitution, and Charisma. For the most part, the range of numbers runs from 3 to 18, the higher the better.

ADVENTURER. This is a term for one of the characters you play in this game.

ALIGNMENT. This is the basic philosophy of a character. See Alignment in the What are Characters? section of the rule book.

CHARACTER. This is another name for one of the persons you play in the game. A party consists of several characters.

COMMAND. A one or two word option in a menu. Activating the command allows you either to view another menu or have your characters perform an action.

ENCOUNTER. This is what happens when a party meets a monster. You are given a menu of choices of how you want to handle the situation.

ENTER. The act of giving a command to the computer. How this is done varies depending on the computer.

EXPERIENCE POINTS (XP). Every encounter the characters have yields experience points for every character depending on how successful the encounter was for the party. A character who gains enough XP can...
advance a level if he has enough gold for training.

FACING. In combat, a character faces a certain direction. An attack from the direction he is not facing has a greater chance of doing damage. A character will always face an opponent if he has only one opponent.

HIT POINTS (HP). This is a measure of how healthy a character is. Damage from weapons subtracts hit points from the characters total. When he has lost all of his hit points, he is unconscious and dying. If his wounds are bound by another party member, he is simply unconscious.

ICON. This is the small picture of a monster or a character seen in the initial stages of an encounter and during combat. Character icons can be altered using the Alter command in the Camp Menu.

INITIATIVE. This is a semi-random determination of which character in a combat acts first. The characters with higher dexterityes have a better chance for a higher initiative.

LEVEL. This describes the power of a number of different items. The power of characters, dungeons, monsters, and spells are all described with levels.

CHARACTER LEVEL. This is a determination of how much experience a character has. The higher the level, the more experienced and important the character is. High-level spellcasters can cast high level spells.

DUNGEON LEVEL. This is a measure of how far down in the earth a dungeon is. For the most part, the further down one is, the more ferocious the monsters. Thus, a high-level dungeon refers to either how deep it goes or the relative toughness of the monsters.

MONSTER LEVEL. This is a measure of how powerful monsters are. The higher the level, the more powerful the monster.

SPELL LEVEL. Spells come in degrees of difficulty. The higher the level of the spell, the difficulty. Only very experienced magic-users and clerics can learn high level spells.

MAGIC. This term covers spellcasting, enchanted items, and any other application of the supernatural.

MELEE COMBAT. This is hand-to-hand combat with weapons such as swords, spears, and fists.

MISSILE COMBAT. This is ranged combat with weapons such as bows and arrows, crossbows and quarrels, and slings and slingstones.

MONSTER. This term actually includes human and other player races as well as such creatures as ogres and dragons. In general, if it isn't part of your party, it's a monster. Monsters are not necessarily hostile. Some may be helpful. That's what the Parlay command in the Encounter Menu is for.

NON-PLAYER CHARACTER (NPC). This is a member of a player character race who is not controlled by the party. Some NPCs can be brought into a party.

PARTY. The group of adventurers you form to perform the missions you are given. A party can be reformed for each adventure, and even altered during the course of an adventure.

PLAYER CHARACTER (PC). This is a member of a player character race who is controlled by the player. The characters in your adventuring party are PCs.

SPELL. This is a magic incantation that can alter the nature of reality. Both magic-users and clerics can cast spells after memorizing them. If the spell is cast, it is gone from the user's mind and must be re-memorized.

SPELL BOOK. The book a magic-user carries his spells in. If he doesn't have a magic book, he can have no spells to memorize.

WEAPON LIST

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 818 of 1262
Introduction:

Pool of Radiance is Strategic Simulations Inc.'s first Advanced Dungeons & Dragons Computer Role-Playing Epic set in the Forgotten Realms game world. Pool of Radiance is a huge game, with over two dozen different individual missions and adventures. It is designed to mirror the kind of connected adventures that form the basis of the AD&D role-playing game.

Pool of Radiance does not rely on obtuse puzzles or unfathomable word games to create challenges. Instead, Pool of Radiance relies on challenges that arise from within the scope of the adventure. Each adventure centers around solving a mystery, defeating an enemy force, or discovering the true allegiance of the mysterious groups you meet.

You are sure to have questions as you adventure through Pool of Radiance. First, read the rule book and Adventurers Journal that come with the game. These books will answer most of the questions that come up. Second, you can refer to this clue book for answers. Third, you can look into the many AD&D books for background on the game. The AD&D Players Handbook and the AD&D Dungeon Masters Guide provide the basis for the rules in Pool of Radiance. The Forgotten Realms Campaign Set and Ruins of Adventure module provided the background material for the storyline. These sources should tell you all you need to know about Pool of Radiance.

Keep your current objective in mind while you play through each mission in Pool of Radiance. Each mission has a specific goal that is given in the city council proclamation and in the council clerk's description of each mission. In some missions you simply have to hack your way through everything in front of you. In other missions you must simply survive. Stay true to your objective as each mission unfolds.

Finally, remember the overall goal of your quest, the liberation of Phlan from its evil oppressor. It is not necessary to clear every block, defeat every evil, or even complete every mission to free Phlan. As soon as the Boss That controls Phlan is defeated, the undirected monsters that were under his control will fall like wheat to the scythe. Always remember that the defeat of the Boss is your final goal. Good Luck!

SELECTING HEROES

With differing ability scores, classes, class combinations, and races you can create many different kinds of characters in Pool of Radiance. You can win the game with almost any combination of characters, but some will make it easier than others.

You will need a party with a balance of fighting ability, clerical spell use, and magic-user spell use. You will also want a character with thieving abilities in your party and at least one character with an extraordinary strength.

You will need to balance each characters race against the class of...
characters you need. Human characters can excel at any single character class and characters can have several sets of capabilities at once. But, mixed class characters advance more slowly than single class characters. They will generally be one or two levels behind a single class character of the same age. Human characters can have up to the maximum number of spells allowed in Pool of Radiance. At 6th level a cleric is much more powerful than non-human characters because he can wear the best weapons, nor is their HP, THAC0, or number of blows limited by their size.

Non-human characters have a maximum possible level in each class (except thieves). Because of these limits human characters will always achieve higher level than non-human characters after sufficient adventuring. So, non-human characters should play to their strong points and be mixed class and let humans be the single class characters.

Human fighters can be the best fighter in the game because of their high maximum strength and unlimited maximum level. Non-human characters can help with the fighting as mixed class fighter/thief, fighter/magic-user, fighter/mage/ magic-user cleric, etc. The higher level they have the more powerful their abilities. Non-humans have lower max level and have limited max level. Human clerics can also help with the fighting but they cannot have exceptional strength, use the best weapons, nor is their HP, THAC0, or number of blows limited by their size.

Clerics are especially useful in your party, they have the second fastest advancement and get the most spells of any spell using class. The cleric's bless, cure light wounds, detect magic, hold person, and prayer spells are very useful. Only two races can add clerical abilities to your party, humans and half-elves. Human clerics can reach the maximum 6th level allowed in Pool of Radiance. At 6th level a cleric is much more powerful than non-human characters because he can wear the best weapons, nor is their HP, THAC0, or number of blows limited by their size.

Thieves have the fastest advancement of any class. They also have special abilities that allow them to open locks, find and remove traps, climb walls, and many other tricks. Unfortunately, thieves are almost as defenseless in combat as magic-users in combat, they have only a few HP and the heaviest armor they can wear is leather. Luckily, all races have unlimited advancement as thieves and all the non-human races can be mixed class fighter/thieves. Dwarves and half-elves make the best fighter/thieves because of their high maximum strength and their high maximum strength and their high maximum fighter level.

Some kinds of characters are at a disadvantage because of their ability score or max level limits. Female characters are at a disadvantage as a fighter or fighter mixed class character because of their reduced maximum strength and other types of characters, especially magic-users and mixed class cleric/magic-users, they function just as well as male characters. Their lot is actually better than that of halflings and gnomes, neither of which excels at any particular class.

Each character's capabilities are built around his ability scores. Since it is possible for the computer to roll a set of scores, it is no crime to roll a few times until you get a character whose ability scores match what you want. You can also modify a character ability scores after he has been built, but not after he has gone up a level.

If you want your characters to have the maximum fighting efficiency they will need impressive ability scores. Fighters need the highest possible strength to get the maximum number of spells allowed in the game. Magic-users need an intelligence of at least 16 to get their experience bonus. Clerics need a wisdom of 17 or better to get the maximum number of spells. All characters need to have at least 11 of adventuring dexterity before the game gives you the best chance to move before your opponent. A +1 AC for each point of dexterity over 14, a +1 THAC0 for each point of dexterity over 14, +1 for each point of dexterity over 18. All characters need a constitution of 16 or better, and fighter types need a constitution of 18, to get the maximum bonus to their HP. The party's spokesman needs a charisma of 18 to get the maximum reaction bonus.

A balanced party needs at least four characters with good fighting capabilities, at least two characters that can throw clerical spells, at least two characters that can throw magic-user spells, at least two characters who are equipped with bows, and at least one character who has thieving abilities. As this is more than six characters, some of the characters will have to have multiple capabilities. Once you have these bases covered, mix and match the party’s capabilities to match your style of play.

Here are some important concepts that you will need to understand to play Pool of Radiance to the fullest capacity.

**Definitions and Concepts**

**Block:** A 16 square by 16 square area that is displayed from a 3D point of view. Unless the party is lost, or it is impossible to find one's way, the X 0,0 is in the northwest corner; 15,15 is in the southeast corner.

**Commissions:** The city council awards commissions as a way to direct your party towards awaiting adventures. The party does not have to accept a commission. As they may inform the party of a mission that they undertakes. If the party completes a mission while exploring on their own they may also get the reward, even though they have never formally received word of the mission.

**Drain and Restoration:** Powerful undead such as wights, wraiths, and vampires can drain levels from a character when they hit him in combat. The character loses his level or levels along with the additional HP, improved THACO, and other advantages of his level. His XP will be reduced to the minimum for his new level. A cleric can cast a restoration spell of a scroll to restore one drained level. The character will regain his HP, THACO, and other advantages of his level. But, his XP will be raised only to the minimum for his restored level.

**Maps:** Page 25 and 26 of the Adventurers Journal contain three accurate maps of the city of Phlan, the area near Phlan, and the Moonsea. The city map shows the locations of the different blocks within the city. The area near Phlan map shows the extent of the wilderness in Pool of Radiance. The Moonsea map shows where Pool of Radiance occurs in relation to other areas in the Forgotten Realms game world. Other AD&D computer products may be set in the same area. When the computer loads a character who has saved the game, the character has the ability to roll a set of eight dice, and then choose the head roll.
CONCENTRATE your attacks by having a single character attack some of the enemy's weak spots. If the party's characters have lost HP it is cheaper to go to an inn and rest for a full day than to have the temple throw cure spells.

Your character's choice of spells is also important if you use Magic On in Quick Combat. Avoid spells with large areas; the computer normally aborts an offensive spell if the computer sees an ally in the target area. Offensive spells such as magic missile, hold person, and stinking cloud are useful because they are single target or have a small area of effect. Large area spells, such as sleep or fireball, are very useful under manual control, but may often be aborted in Quick Combat. Healing and detect spells have little use in Quick Combat, though bless and prayer are sometimes useful.

Your character to memorize, or your character can memorize no more spells. Choose spells until you have indicated the spells you want your character to memorize, or your character can memorize no more spells. Choose exit from the list and from the memorize menu. The computer displays the list of spells you have chosen. Confirm that this is the list of spells you want your character to memorize. Repeat this process for all of your spell casters.

The computer will display each spell as it is memorized. Then the temple need only to throw a neutralize poison to bring the character back to life. If a character has been killed by poison, the temple can neutralize poison (to remove the poison from the system) and then raise him from the dead. If the party has a third level cleric, they can use the slow poison spell to make the poisoned character 'alive' when he goes into the temple. Then the temple need only to throw a neutralize poison to bring the character back. If the party's characters have lost HP it is cheaper to go to an inn and rest for many days than to have the temple throw cure spells.

COMBAT

Your characters will be fighting along in Pool of Radiance. Monsters and Human enemies abound. Learning to fight well, and to fight smart will make the game go faster and make it much more enjoyable. There can be alot of details to successful combat, but most of them are common sense and will become second nature after a few fights.

To fight effectively you must understand your own group's capabilities. Does your group have ranged weapons? Does your group have mass attack magic spells such as sleep or fireball? How heavily armored is the front line of your group? Your magic is also important. All of these details change which tactics your party can apply effectively.

You should also understand your enemy's capabilities. The basic information about ranged weapons, mass attack spells, heavy armor, and speed still apply. Monsters also often have unusual capabilities that you'll want to be aware of.

Finally, you need to understand the terrain where you are fighting. Are you inside a building where space is limited or are you in an open field with unlimited room to maneuver? Are there choke points, such as doorways, that you can use to your advantage? Are there large pieces of terrain, such as a tree or a wall, that you can anchor your flanks on?

Taking full advantage of terrain will multiply your fighting strength. Whether you outnumber the enemy or he outnumberes you will decide your opening tactics. If you outnumber the enemy, move up your toughest fighters and pin them in place. Then move other troops around the enemy's flanks to get attacks from behind. A shot from behind can hurt even to most unstoppable monsters. If you are at least as strong as them and they can gang up on you, concentrate your attacks by having a single character attack some of the enemy and have many characters gang up on the remainder to eliminate them as
quickly as possible.

If the enemy has as many or more troops than you have, then make the
shortest possible line without giving the enemy a way around your flank;
doorways and advantageous are good defensive locations. Don't just attack the
enemy in front of you, mass as many attacks against each target as possible
to get quick kills. If your tactics are successful, you will soon outnumber
the enemy and you can surround and move in for the kill.

An important tactical consideration is whether one side and/or the other
has ranged weapons such as bows, crossbows, slings, and ranged attack magic.
If neither side has significant ranged weapons, your side should quickly move
to the most advantageous terrain and prepare to meet the enemy. If only you
have ranged weapons then try to begin the battle at the longest possible
range. Keep a front line of clerics and fighters without bows to protect your
archers as long as possible. Magic-users with flasks of oil have a short range, and are only useful once both sides are in
contact.

If both sides have ranged weapons then the enemy archers and spell
casters should be your primary targets. An enemy who is turning your flank or
who can get back shots on your front line is also a good target. Don't shoot
at enemy front line fighters unless you are trying to disengage your front
line to maneuver or retreat.

If only the enemy has ranged weapons the close as soon as possible. Once
you get adjacent to an enemy, it's much harder for him to use his bow or
magic against you. Try to use terrain to block the enemy archer's line of
sight and limit his targets to your troops with the heaviest armor.

Magic has the capability to change defeat into victory into defeat. Tactically, one of the enemy's first actions will be to use their magic
spells and magic items act very much like bows or thrown weapons. The more devastating spells are the ones that can
incapacitate an entire group of troops in an instant. These mass attack spells include: sleep, hold person, stinking cloud,
and fireball. These spells can turn the tide of battle in an instant.

More often than not, you will have magic and your enemies will not. If
you have magic-users or magic items guard them with your life. Magic-users
are very fragile in combat; they wear little armor and don't stand up well to
being hit. Keep them behind the lines and safe, even if they have thrown all
of their spells for this battle. The magic-user you save this battle may save
you next battle.

Magic need not kill the enemy to be useful in combat. Sleep, hold
person, and cloud can make the monster enemy useless for a short radius. Another tactic is to make the front ranks of the enemy helpless, thus blocking his
melee attacks and making your own shots sure kills. You can even retreating
behind the enemies helpless front line troops and safely engage the others
with ranged attacks.

If the enemy has mass attack magic, you may have to modify your tactics.
Defensively, try to keep your troops spread out; most mass attack magic
operates at a very short range. Keep some fighters unengaged in reserve, so
that they can run up and fill any holes in the front lines caused by an enemy
magic attack. Be careful not to concentrate important targets like magic
users or archers together behind your own lines; such concentration invites
attack.

Offensively, you should concentrate magic spells and bow fire on enemy
game-users. Even if a bow shot doesn't kill a magic-user, it can disrupt his
ability to cast a spell. Magic Missile is very good for this because it
always delivers as few points of damage as an enemy magic-user from casting for the rest of the turn. Proper use of magic, both offensively and
defensively, is often the key to your victory and the enemy's defeat.

Some monsters have abilities that might as well be magic. Dragons often
have breath weapons that can do great damage over a wide area. Your
characters should spread out to avoid several being attacked by a single
attack. Phase spiders cannot be affected by any attack until just as they
move. Your characters should choose Guard or Delay and then attack as the
Phase Spiders advance or after they move. Dragons know spells as well as
any spell caster in Pool of Radiance. Your characters should spread out, just
as if they were fighting an enemy magic-user.

One of the most important things to get for your heroes is the best
possible Armor Class. A good AC is always useful, but it is especially
important against mass attack by wed or monsters. High dexterity, heavy
armor, rings of protection, bracers of defense, magic shields and armor all
can contribute to giving your heroes the lowest possible AC. Your front line
fighters go in first, retreat if it is at all possible and then the archers and magic-users, make
sure they have the best AC in the party.

When fighting a heavily armored foe, flanking, swarming attacks, magic,
and the backstab take on increased importance. Tactics that multiply the
number and effectiveness of your attacks, and reduce the value of the enemy
armor are worthwhile.

Soldiers often forget that mobility is as much a weapon as a sword or
spell. If you are more mobile than your opponent, you can remain disengaged
and fire arrows. You can choose to retreat or stay for battle. You can occupy
the best defensive terrain and force the enemy to come to you. Be careful not
to get your troops spread out if they have differing movement rates.

If the enemy is equal or superior in mobility, it multiplies their
effective numbers. You must worry more about flank security and keeping your
front line secure. Fast enemy's will also try to run away when
their morale breaks. Once the enemy's morale has broken, use archers to bring them
down. Even a fleeing foe can be dangerous if cornered and forced to
fight.

One of the most potent weapons in the hero's arsenal is the ability of
to their opponents for extra damage. Thieves of level 1-4 do
double damage when they hit with a backstab. Level 5-8 thieves do triple
damage when they hit with a backstab. Level 9+ thieves do quadruple damage
when they hit with a backstab. Thieves of level 1-4 do double damage when they hit with a backstab. Level 5-8 thieves do triple
damage when they hit with a backstab. Level 9+ thieves do quadruple damage
when they hit with a backstab. Thieves of level 1-4 do

when they hit with a backstab.
The first part of any successful retreat is disengagement. Flankers, archers, spell casters, and reserves can normally disengage from the enemy simply by moving away. But the front line has a more difficult problem. To disengage the front line, concentrate your attacks on a few units to create holes in the enemy front line. When your front line troops each have a few enemies still engaged, turn and begin the retreat. Retreat as far as you can to protected positions that minimize the enemies ability to flank you. Stay on guard so you can strike at the enemy if they pursue. Do not retreat the flanks, archers, and spell casters so fast that they cannot support the retreating fighters. If the enemy is swift and aggressive, you may have to repeat this maneuver several times to completely disengage.

If the enemy is faster then the character, then that character will not be allowed to exit the combat area. A character can often increase his movement by unbranching his heavy armor. When your movement is equal to the enemy’s, you have an even chance to exit the combat area. If your movement exceeds the enemy’s or you can automatically exit the combat area.

The worst time to decide to retreat is after some of your characters have fallen. Even if your retreat is successful, the troops that have fallen are lost forever. Even worse is cleanly retreating almost all of your heroes, only to see the final character pinned by the enemy and overwhelmed. Do everything in your power to avoid such a situation. When all else is said and done here are some rules to live by...

Keep a straight line: Your forces are the least vulnerable and provide each other the most support when they are in a straight line.

Anchor your Flanks on terrain features: Keep the enemy from flanking or overwhelming your troops by anchoring your flanks on impassable terrain.

Put your most Heavily Armored troops in the front line: Front line troops take the greatest number of attacks from the enemy. Heavy armor will increase their chance of survival.

Thieves should only backstab when you outnumber the enemy: Thieves trying to backstab must be behind enemy lines. Their light armor makes them vulnerable. Onset send the thieves around the flanks to backstab when the enemy is outnumbered so that he can’t concentrate attacks on the thieves.

Spell Casters are High Priority Targets: Enemy spell casters have the greatest capability to quickly turn the tide of battle against you. Target them with archers, friendly spell casters, and flankers.

Don’t Panic: Even when the situation seems impossible, trust in your troops. The enemy is probably not as powerful as it seems. Many things can happen to turn the tide of battle yer way. The enemy morale may break, you may make a lucky shot, or the enemy may be weaker than you realize. Keep fighting and stay alive.

SPELLS

In Pool of Radiance, the efficient use of spells, both in combat and in camp, makes the game much easier. Some spells are useful in ways that are not obvious from their description. Here are some ‘tricks’ to the efficient use of some of the spells.

Unless otherwise specified, all spells have saving throws. In general, damage spells do half damage if the target makes its save; non-damage spells have no effect if the target makes its save.

Clerics get more spells per level than magic-users. Detect Magic, Protection from evil<good>, hold person, and Dispel Magic are available to both clerics and magic-users. So, if you want these spells in your party your clerics should make them instead of your magic-users.

Offensive spells are of two types, damage causing spells that cause hit points, and restraining spells that make a target helpless. A single melee or missile attack can kill, once a target is helpless. The best offensive spells are:

Hold Person: The most powerful clerical offensive spell. You can aim at three<clerical> or four<magic-user> targets and make them helpless...

Charm Person: This spell makes one target fight on your side in the battle. When the charmed enemy changes his form he becomes a spy within the enemy's lines and absorbs some enemy fire. If you attack a charmed enemy then NPC's in your party will turn on you <you are attacking an ally, after all>. If the charmed enemy is not killed in the fight then you won’t get his treasure.

Magic Missile: Useful because it is low level, because the target gets no saving throw, and because it is fast and cannot be interrupted. This is a good spell to throw at spell casters before they have cast a spell and at undead, who ignore many other attacks. It is also useful if you fight under computer control because it has no chance to catch heroes in an area damage spell.

Sleep: The magic-users most powerful low level spell. Sleep can make a whole horde of low level monsters helpless, and it has no saving throw. But it is useless against larger monsters such as Trolls. Remember that sleep has a comparatively short range, and that its variable effect can sleep your heroes if you target the spell too close to your own front lines. Once your heroes reach 5th level, they are immune to sleep and you can throw sleep spells with great abandon.

Stinking Cloud: A powerful spell that makes targets in a 2 square area helpless. Its very short range, but exact area of effect, make it useful only after the enemy has closed to melee your front lines.

Fireball: The classic attack spell. In a closed area a fireball has a 3 square radius and affects almost every character on the screen. In an open area, fireballs have a 2 square radius. Try to get as many enemies in the fireball as possible, and be sure to keep your characters out of the radius of effect.

Lightning Bolt: This is often considered the poor cousin to the fireball, because it does the same damage but in a more limited area. But lightning bolt is best when you have to fight in a closed area. Properly used, you throw a lightning bolt into a melee or a line of heroes, and still hurt your enemies. Also, if the enemy is near a wall you can throw the bolt to attack the target, bounce off the wall, and then attack the target a second time. Remember that a lightning bolt always rebounds toward the caster; it does not follow the angle of the wall.

Some spells are useful in preparing for combat. If you know your party is in for a tough fight, you can prepare before combat. Encamp immediately before triggering the combat. Throw as many preparatory spells as you have ready on your characters, then immediately return to the Adventure menu and advance directly into the combat. If you can’t prepare before combat, many of these spells can be effective when you throw them in the first round of combat. Many of these spells can be reversed and thrown on the enemy to make him more vulnerable to your attacks. The best preparatory spells are:

Bless: this spell affects all heroes in a 5x5 area that are not adjacent to the enemy. Bless is especially useful later in the game against monsters with very low AC’s.

Protection from Evil: This spell only protects one person, but it improves your AC and saving Throws by 2 against attacks from evil monsters.

Prayer: This spell is great because it can be thrown in combat and it
improves your THAC0, Damage, and Saving Throws by 1, while hurting your enemies values by a like amount. It can also be thrown after combat has commenced.

Enlarge: This spell makes a weak character strong, though it doesn't help a character who is already strong. A first level magic-user makes his target's effective strength 18. Each additional level adds one column to the characters effective strength, until at 6th level the target has an effective strength of 18(20).

Strength: This spell adds 1-8 points to a characters effective strength, depending on his class. For every point of strength over 14, 2% is added to his exceptional strength percentage.

Some spells are handy to have memorized for use out of combat, these include:

Cure Light Wounds: This spell is everyone's best friend. Use it after each battle to make sure that everyone gets back to their full HP. You can also use cures during combat to keep a character from going down. Also, if a character is wounded at the beginning of a wave of combats, you can 'Continue Combat' and cure characters to get them ready for the next encounter.

Detect Magic: Use this spell in the Treasure Menu to pick out the magic items from the trash.

Knock: Use this spell to open locked doors and chests.

Invisibility 10' Radius: Use this spell while moving through dangerous territory. This keeps the enemy from finding your party until one of characters attacks in combat. Use your enemies confusion to get all your characters in position for 'backstabs', bouncing lightning bolts shots, and sweep attacks. Then have all your characters choose delay, let the enemy take his turn and guard, and then have all your characters attack at once.

Some spells should only be memorized when your party needs them; these spells include: slow poison, cure disease, remove curse, and read magic....

--------------------------------------------------------------------------

Pool of Radiance Quick Start

---

Typed by : lord Slasher

Central Axis Exclusive (614) 239-7621

---

BEFORE BEGINNING PLAY: You should back up both sides of all four game disks with the copy option on side 1 or a commercial copy program. Put the originals away and play off of the copies.

TO LOAD THE GAME: Connect your computer, monitor, and disk drive. If you use a joystick, plug it into the joystick port. Set the Shift Lock key off and do not press shift when typing in text. Turn on the monitor, place side 1 into disk drive 1, and then turn on the computer.

First you will be prompted to copy a disk. Type "Y" to make a backup disk or type "N" if you have already node backups of your masters. Next type "Y" or "N" if you wish to have the sound on. After pressing "Y" or "N" for sound, you will have the option of using a joystick by typing "Y" or "N" to use the keyboard. Next, you will have the option to run your machine in Fast mode, type "Y" if your machine has an accelerator card or /GS board, otherwise type "N".

Firstly, the computer prompts you to change disks, place the correct disk in the drive and press Return. Press any key to pass the title screen. After the credits, press Return to play the game, or if you are using a joystick you will now calibrate your joystick for play. Once your joystick is calibrated, press Return to play the game. Two symbols and a path are displayed. Find the first symbol on the outside of the translation wheel, and the second symbol on the inside ring of the wheel. Match the two symbols and read the word under the path from inside to outside. After typing the translation, the game will load and display the Party Creation Menu.

HOW TO MAKE CHOICES: Pool of Radiance is controlled by using menus. One each menu one item is highlighted. To indicate the command you want, use the joystick or cursor keys to highlight the command. Press the joystick button or Return to select your choice. For example, to look at an overhead view, highlight the Area command in the Adventure Menu, and press the joystick button or Return key.

Some commands, such as View, act only on a single character. Use the joystick or cursor keys to highlight the character you want to be active for the command. Then, highlight the command and press the joystick button or Return key. For example, to view a character's ability scores, highlight the character's name in the character list, highlight the View command in the Adventure Menu, and press the joystick button or Return key.

Some commands toggle the program between two states. When you select one of these commands, the name on the screen changes to reflect the new state of the program. For example, if you select the Characters On command in the Pcs menu, it will change to Characters Off. From then on the character's portrait picture is not displayed when you view the character.

HOW TO MOVE AROUND: In 3D travel the party can move forward, turn right or left, or move backwards. In the wilderness or in combat you can move in any of eight directions. You may use the joystick or keyboard interchangeable to move in any mode. If you have a problem in making a diagonal move with a joystick in combat or the wilderness, use the 2, 4, 6, or 8 keys instead.

JOYSTICK MOVEMENT:
TO BEGIN PLAY QUICKLY: A pre-rolled and pre-equipped party of adventurers are stored as a saved game on disk side 4. Choose Load Save Game from the Party Creation Menu. Insert disk side 4 in the drive when the game disk is requested. After the saved game is loaded choose Begin Adventuring. You will get a tour of the main street of the civilized section of New Phlan. When the tour is over choose the Move command from the Adventure menu.

If you want to start the overall quest, turn around, go back to the city council building and obtain a commission. If you want to try out the game, walk forward into the slums. Once in the slums you won't have to go looking for danger, danger will look for you!

TIPS ON SUCCESSFUL EARLY ADVENTURING: If you build your own party you will need equipment before your adventure into the slums. A shop selling arms and armor is located at 8, 11. Pool your money. Buy fighters banded mail, a shield, and a broad sword. Buy clerics banded mail, a shield, and a flail. Buy thieves leather armour, a broad sword, and a sling. Buy your magic users a staff and a couple of darts. You may want to buy your fighters short bows and some arrows or a two handed sword instead of a shield.

Make sure you have at least 10 gold left over to pay for your lodging. Use the View, Items, and Ready commands to prepare all your characters' equipment for battle. Once you have bought everything you need, use the Take command and have one character pick up all the money.

Go to the inn at 4,12, pay the money, and memorize spells. Clerics should memorize cure light wounds spells. Magic users should memorize sleep spells. Rest to memorize spells.

Keep Search "off" while you move through the slums, you don't want to attract monster encounters. After you clear the monsters from a room you can put Search "on" and check for treasure. Try the Area command to get a birds-eye view of the slums. The slums are 16 squares by 16 squares.

In many parts of the slums it is unsafe to rest. But after you clear the monsters from some rooms, the rooms become safe to rest in. Clear out your first safe room in the building at 13,1. Here your party can rest to regain hit points and memorize spells. Adventure deeper into the slums, clearing other safe rooms where your party can rest. Whenever your party is low on sleep and cure spells or hit points, return to the nearest safe room to rest up.

Once your characters have enough experience points and money, they should return to the civilized area and train in the training grounds. Before you train, go into a shop and make sure each character is carrying at least 1000 gp. Remember to Share your money after you Pool it to buy items. If you find a particularly difficult location to clear, go to the training hall in the civilized area and hire a NPC to help. Once your party clears the slums they should go to the city council and get their reward. Then take a boat to Sokal Keep and clear it.

After you successfully complete each mission, return to the city council for your reward and news of any other commissions available. Once the council clerk has read you a commission, it's yours! Carefully note the messages, proclamations, journal entries, and other clues you get for the best chance to solve the mysteries of Phlan. Good luck!

RULES ERRATA: Wilderness encounters replace your party's icon, they do not appear adjacent to it. Charmed characters will not join your party, but they will fight on your side for one battle. Evil clerics Turn undead, they do not charm them onto your side.

DIFFERENCES IN APPLE II VERSION: The Apple II version of Pool of Radiance is slightly different than the rules. These differences include:

- Pressing the <ESC> key is the same as choosing the Exit command in a menu. While moving in combat, the <ESC> key will "take back" your current move, but it will not erase any damage taken during the move.

The Monster Portrait On/Off isn't used on the Apple II version.

The "<" and ">" keys can be used for menu cursor up and down.

There is no Exit to DOS on the Party Creation Menu. Turn your computer off and then on to run other programs. A character's portrait picture is only shown in the civilized area. Some items can only be Readied in combat or in camp. If you try to ready these items in other places, the computer responds "NOT HERE."

The following commands can be given at the Combat menu or while a party character is moving under computer control. Press the key to execute the command.

C : Sets all characters to computer control.

<Space> : Resets all characters to manual control.

M : Toggles magic on or off for characters set to Quick.

Characters set to Quick will always use Readied Magic Items. Characters with Readied arrows will use bows if no enemy is adjacent.
Second Level Magic-User Spells

- Detect Invisibility
- Invisibility
- Knock
- Mirror Image
- Ray of Enfeeblement
- Stinking Cloud
- Strength

Third Level Magic-User Spells

- Blink
- Dispel Magic
- Fireball
- Haste
- Hold Person
- Invisibility, 10' Radius
- Lightning Bolt
- Protection from Evil, 10' Radius/Protection from Good, 10' Radius
- Protection from Normal Missiles
- Slow

* - A character carrying many objects including lots of coins, can be further limited in movement to a minimum of 3 squares per turn.
# - A Shield subtracts 1 AC from any armor it’s used with.

TABLE OF EXPERIENCE PER LEVEL

The following shows the amount of experience a character must earn to gain a level in his character class. All experience earned by multiple-class characters is divided by the number of classes. When a character has earned a gain in level for one class but not another, the Show command shows the highest level. Thus, a character who is a fighter-thief and has earned 1,800 experience points in each class (a total of 3,600 XP), will be shown to be 2nd level because he has earned that level as a thief, though not as a fighter. His fighting abilities are still based on his being a 1st level fighter.

This is the basic philosophy of a character. For the most part, the range of numbers for the ability scores runs from 3 to 18, the higher the better. Monsters are not necessarily hostile. Some may be friendly or neutral.

Some may be friendly or neutral.

Alignment: This is a term for one of the characters you play in this game. An adventurer is another name for one of the persons you play in the game. A party consists of several characters.

Command: A one or two word option in a menu. Activating that command allows you either to view another menu or have your characters perform an action.

Encounter: This is what happens when a party meets a monster. You are given a menu of choices of how you want to handle the situation.

Experience points (XP): Every encounter the characters have yields experience points for every character depending on how successful the encounter was for the party. A character who gains enough XP can advance a level if he has enough gold for training.

Facing: In combat, a character faces a certain direction. An attack from the direction he is not facing has a greater chance of doing damage. A character will always face an opponent if he only has one opponent.

Hit points (HP): This is a measure of how healthy a character is. Damage from weapons subtracts hit points from the character's total. When he has lost all of his hit points, he is unconscious and dying. If his wounds are bound by another party member, he is simply unconscious.

Icon: This is the small picture of a monster or a character seen in the initial stages of an encounter and during combat. Character icons can be altered using the Ailer command in the Camp Menu.

Initiative: This is a semi-random determination of which character in a combat acts first. The characters with higher dexterityes have a better chance for a higher initiative.

Level: This is a measure of how powerful monsters are. The higher the level, the more experience and important the character is. High-level spellcasters can cast high level spells.

Monster level: This is a measure of how powerful monsters are. The higher the level, the more powerful the monster.

Spell level: Spells come in degrees of difficulty. The higher the level of the spell, the higher the difficulty. Only very experienced magic-users and clerics can learn high level spells.

Magic: This term covers spellcasting, enchanted items, and any other application of the supernatural.

Melee combat: This is hand-to-hand combat with weapons such as swords, spears, and fists.

Missile combat: This is ranged combat with weapons such as bows and arrows, crossbows and quarrels, and slings and slingstones.

Clerics vs. undead

A good or evil cleric (not a neutral one) has a certain influence on undead. He extends this influence by using the Turn command in the Combat Menu. His level determines how many undead and what kind he can influence. Evil clerics can make undead either neutral of friendly to the party. Good clerics can drive the undead away and may be able to destroy them if the cleric is of a high enough level and the undead are of a low-enough level.

The following is a list of undead in increasing order of power and what minimum level of cleric a character has to be to have any influence over them. Low level clerics generally have a chance, not a certainty, of affecting undead.

Minimum

Undead type Level of cleric

Skeleton 1st
Zombie 1st
Ghoul 1st
Wight 1st
Wraith 3rd
Mummy 4th
Spectre 5th
Vampire 6th

Glossary of AD&D game terms and computer terms

Ability scores: These are numbers that describe the attributes of the characters. There are six ability scores: Strength, Intelligence, Wisdom, Dexterity, Constitution, and Charisma. For the most part, the range of numbers runs from 3 to 18, the higher the better.

Alignment: This is a term for one of the characters you play in this game.

### SPELL BOOK: The book a magic-user carries his spells in. If he doesn't have a magic book, he has no spells to memorize.

### SPELL LIST:

- A magic incantation that can alter the nature of reality. Both magic-users and clerics can cast spells after memorizing them. If the spell is cast, it is gone from the user's mind and must be remembered again.

### PARTY:
The group of adventurers you form to perform the missions you are given. A party can be reformed for each adventure, and even altered during the course of an adventure.

### PLAYER CHARACTER (PC):
This is a member of a player character race who is controlled by the player. The characters in your adventuring party are PCs.

[Apple II Computer Info](http://www.textfiles.com/apple/)
You've probably used your Apple GS computer for a lot of different things. For work or homework. For organizing home business information. For games. Maybe even for creating other types of letters or cards. But you've probably never used your micro to create anything as wacky (and fun!) as the kinds of things you'll create with POSTCARDS.

POSTCARDS gives you everything you need to create your own original, far-out postcards. For starters, you get the craziest assortment of creative clipart ever compiled. There's a bikini-clad warthog. A platypus. A UFO. The Mona Lisa. Insects of all sizes and scariness. And scads more.

Then, you get a wide array of postcard backgrounds. Like a beach, farm, desert, cityscape, and even a moonscape. So you can mix and match the most ridiculously unique combinations.

Put a one-eyed, three-antenned alien at a busy downtown penguin crossing. Or show a giant tarantula crawling out from behind an erupting volcano. There are thousands of possible possibilities.

Thus, POSTCARDS comes with catchy captions as well as clipart alphabets, for your own writing. It only takes about five minutes to make your first postcard.

SIX EASY STEPS TO MAKING A POSTCARD

1. PICK OUT THE SCENE. Open the SCENE1 file and, using the SAVE AS command, give it a new name, like BIRTHDAY, and save it on your work disk. Then CLOSE the file.

2. PICK OUT THE ART. Open the PEOPLE2 file. Use the lasso with the COPY command to select the guy in the Hawaiian shirt, or any other image, to put on your postcard. Then CLOSE the file.

3. PLACE THE ART. Open your BIRTHDAY (or whatever name you used) file. Using the PASTE command, position your guy in the Hawaiian shirt in the bottom right hand corner of the beach. The CLOSE and SAVE your file.

4. PICK OUT A MESSAGE. Open the LETTERS file. Use the lasso with the COPY command to select "HAPPY BIRTHDAY" and put it on your postcard as described in steps 2 and 3 above.

5. PRINT. Just click on your PRINT command.

6. CUT AND GLUE TO CARD STOCK. Loosely cut out your postcard and glue it to a standard US Postcard. Blank stock can be purchased from Activision.

Here's a list of the clip art on the POSTCARDS disk, along with the file name and number where you'll find each image.

**DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 831 of 1262**
Prowling right along...

"STARTING NUMBER"... "ENDING NUMBER" (Guess what these are...)
"INCREMENT OR [R]ANDOM" (Type either the numerical wardialing number increment, or enter "R" (no quotes) for Random Dialing.)

...We interrupt this discussion for a word from our author...

The Random Dialing option is useful for wardialing touchy prefixes. (Police numbers, military bases, phoneco test prefixes, etc.) I once knew a (somewhat short) pirate who left his wardialer running on the prefix of a large broadcasting corporation one night. He awoke the next day only to find that every dialing attempt had bombed due to 'no dial tone'. He checked his tone, and found it completely dead. Somehow someone had gotten in the line and made a complaint to the operator at the broadcasting corp. during the night. She said they explained that it had been disconnected for a 'security violation' or something of that sort. The phone pigs (commonly known as "phigs") said that they had received a complaint from an operator at the broadcasting corp., during the night. She said she noticed the fones ringing through the building and suspected a computer break-in attempt. (She'd seen "WarGames" too many times, no doubt.) The pirate managed to bluff a story of computer illiteracy and convinced them that he had been trying to call a friend with his new modem and had left it unattended. He said he (read the following out loud with nose firmly plugged for proper effect) "had no idea how it possibly went out of control dialing all those numbers." Luckily the phigs were comparably stupid, and he got his tone reconnected.

...now back to our program...

If you select Random dialing, the Prowler asks for "RANDOM DIALING BLOCK LENGTH". To dial randomly, yet avoid skipping any numbers, the Prowler dials the numbers in random "blocks" of varying size; i.e. if you selected a Block Length of 20, the Prowler will shuffle the next 20 numbers, dial them randomly, and then move on to the next block of 20 numbers. A random block of 99 would be even less detectable, but impractical to do at all.) With Random Dialing, the default STARTING NUMBER takes the value of the first number in the current block. So if you have been hacking a prefix randomly and load the info from a datafile into the Prowler, the default at the "STARTING NUMBER" prompt will be the first number in the current block - NOT NECESSARILY THE NEXT NUMBER TO DIAL!

Finally the Prowler asks you if you still believe all that you entered, "CORRECT?" If you type "Y", you will be placed back at the initial "SLOT OF MODEM" prompt.

The next screen opens with "TIME TO WAIT FOR CARRIER". If you need to, you can press [ESC] to back up to the previous screen. Otherwise enter a value from 1 to 255 seconds. The default value of 20 is equivalent to about 2 standard rings. Then it's "TOUCH TONE SPACING". Enter a value between 30 and 255. This value represents the duration and spacing of the dialing tones in milliseconds. Values below 50 cause the modem to dial so quickly that the access code may be skipped due to busy signals (on the Promodem), and those marked with an inverse 'N' were skipped with the 'N' command explained below:

You may type 'N', you will be placed back at the initial "SLOT OF MODEM" prompt.

Next question: "WARDIALING AREA CODE". (if you are not using an alternate long dist. service, enter 'Y' before the area code is the one in which your wardialing prefix lies. If you plan to prowl a local prefix, hit RETURN alone to specify no area code.)
Apple II Computer Info

R: Redial current number (useful if your modem lacks automatic busy signal redialing)
Q: Quit and save datafile (if one is used)
G: Pop up Graphics Page 2. Useful if mommy walks in to see if you are learning anything with your expensive toy.
T: Text screen (use to get back to the text display after the 'G' command)
I: Signal the Prowler that the current number has answered with a carrier and flag it as a successful connect.

An army helmet for your telephone is suggested, but not required.

Happy Warring.

AUTOMAN

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 833 of 1262
"Autopilot". The campaigning segment will take 45-60 minutes w/o any player input required. You regain control when the election returns begin.

[> The Game <]

The campaign is nine weeks [turns] long. Each week players receive a poll that shows the national popular vote with a 2% error margin [on rare occasions the error may be greater]. The individual states have a 4% margin of error. For a state to be considered likely to vote for a candidate the polls must show the candidate leading by over 4%. For a state to be considered solidly in support of a candidate the candidate must be leading by over 8%. During the campaign the candidates try to improve their positions through the expenditure of campaign funds on overhead, advertising, campaign stops, and foreign travel.

[Overhead]
Overhead is unavoidable, for major candidates overhead starts are $500 units a week and increases by $100 units each week. It does not contribute directly to swaying votes, but is essential is running a campaign. Overhead is variable for Third-Party-Candidates.

[Advertising]
There are three kinds of advertising, each serving a different purpose.

1) National advertising covers the entire nation. Dollar-for-dollar it sways the most net votes; however, it is not focused and is not the most effective way to swing particular states.

2) Regional advertising is more effective in swaying states, but only in the area chosen.

3) Individual state advertising is excellent for swaying large states where the voting is close, but it is a very expensive way to buy votes. To select a state, enter its two-letter postal code shown on the map.

[Campaign Stops]
Each candidate may make appearances in the states/regions of his choice. Costs are incurred when entering a region, when entering a given state, and for each stop made. Fatigue effects occur after a given number of stops and no more given stops may be schedule for a single week. Stops have diminishing marginal effectiveness in a given week, but have a gradually increasing effectiveness each week [Ex. 2 stops in 3 weeks is more effective than 6 stops in 1 one week, but is also more expensive]

[Foreign Visit]
In the first week only, all candidates decide whether or not to take a trip, and if so who will go, where they will go, when, and for how long. Trips are pure gamble; sometimes they help, somtimes they hurt.

All players receive an intelligence report at the end of the campaign phase, showing estimate of each candidates’s dollar expenditures in each state. Also shown are the number of stops made by each candidate in each state.

Each week the players are offered the opportunity to debate, if they are willing. Agreement come only through the mutual consent among potential debaters on who will debate and how many question will be asked.

At the end of each week, strengths are adjusted based on the decisions of the candidates and the events that have transpired. Each new week begins with a new poll.

[> Election Night <]

After the ninth week, result of the election are given and a winner is declared. The election night may be stimulated in real time [4-6 hours] or votes may be tailed in less than 15 seconds. The players are given the opportunity to decide how to resolve the election night.

Introduction

T I S A T I M E O F D A R K N E S S. W H I L E T H E S U L T A N I S O F F F I G H T I N G A
foreign war, his Grand Vizier Jaffar has seized the reins of power. Throughout the land, the people groan under the yoke of tyranny, and dream of better days.

You are the only obstacle between Jaffar and the throne. An adventurer from a foreign land, innocent of palace intrigues, you have won the heart of the Sultan's lovely young daughter. And in so doing, you have unwittingly made a powerful enemy.

On Jaffar's orders, you are arrested, stripped of your sword and possessions, and thrown into the Sultan's dungeons. As for the Princess, Jaffar gives her a choice, and an hour to decide: Marry him—or die.

Locked in her room high in the palace tower, the Princess rests all her hopes on you. For when the last sands drain from the hourglass, her choice can bring only a throne for the Grand Vizier...a new reign of terror for his long-suffering subjects...and death for the brave youth who might have been...Prince of Persia.

To play PRINCE of PERSIA, you will need an Apple IIe, IIc, or IIGS with two 5.25" disk drives. If you are using an Apple Ile, it must be equipped with an extended 80-column card. A joystick and color monitor are recommended, but not required.

Joystick Control

If you use a joystick, it should be the self-centering kind. The joystick buttons can be used interchangeably.

When you boot the disk, the program automatically calibrates itself to match your particular joystick. During play, if your joystick starts to behave strangely, you can recalibrate it by pressing CONTROL-J. If this doesn't fix the problem, try adjusting the joystick's trim controls, and pressing control-J again.

Whenever you press Control-J, make sure the joystick is in its center (released) position.

Running, Jumping, and Climbing

To run: Push the joystick in the direction you want to go (left or right). ------ Release the joystick to stop.

To take careful steps: Hold down a joystick button and push the joystick in the direction you want to go. You can use careful steps to move right up to the edge of a pit or a suspicious-looking floor section.

To jump up: Push the joystick straight up.

To jump forward: When you are standing still, push the joystick up diagonally in the direction you want to jump.

You can jump farther with a running start. For a running jump over a chasm, back up at least two full strides from the edge. Push the joystick forward to start running, then up to jump. Don't be afraid of pushing the joystick up too early; your character will wait until the last possible moment to jump.

To climb up onto a ledge: Stand facing the ledge and push the joystick straight up. If necessary, use careful steps to position yourself up onto the ledge, push the joystick up.

To hang from a ledge: Press a joystick button and hold it down. To let yourself drop, release the button. To pull yourself up onto the ledge, push the joystick up.

Any time you jump or fall within reach of a ledge, you can grab onto it by pressing a button. Remember—when you release the button, you let go of the ledge.

To climb down from a ledge: Step up to the edge, turn around, then push the joystick down. To hang from the ledge, press a joystick button and hold it down.

To duck: Step up to the edge, turn around, then push the joystick up. ------ Release the joystick to stop.

To pick something up: Stand in front of it and press the button.

Fighting

When you come face to face with an armed opponent, release the joystick. You will automatically draw your sword—if you have one—and go en garde. In this stance, the controls are somewhat different.

To strike: Press a joystick button.

To advance: Push the joystick in the direction you're facing (towards your opponent).

To retreat: Push the joystick away from your opponent.

To block your opponent's strike: Push the joystick up just as your opponent is striking. It may take some practice to get...
To stop fighting: Push the joystick down. Once you have put away your sword, you are free to run, jump and climb as usual. Be careful, though—when you are off guard, a single sword blow can kill you. To draw your sword again, press a joystick button.

In keyboard mode, use the following keys in place of the joystick:

<table>
<thead>
<tr>
<th>Movement</th>
<th>Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left</td>
<td>J</td>
</tr>
<tr>
<td>Right</td>
<td>L</td>
</tr>
<tr>
<td>Up</td>
<td>I</td>
</tr>
<tr>
<td>Down</td>
<td>K</td>
</tr>
<tr>
<td>Jump Left</td>
<td>U</td>
</tr>
<tr>
<td>Jump Right</td>
<td>O</td>
</tr>
</tbody>
</table>

Action button: Open-Apple or Closed-Apple

**Hints**

* To get the maximum distance from a standing jump across a chasm, use careful steps to move right up to the edge of the pit before you jump.

* If you jump a chasm but fall short, you may still be able to grab on to the opposite ledge by pushing a button. Remember, when you let go of the button, you let go of the ledge.

* Every time you block an opponent's sword strike, the force of the blow pushes you back slightly. If you adopt a defensive strategy, you will find yourself steadily losing ground. Try following up a successful block with a strike.

* Test for loose floor sections by jumping up and down.

* You can knock out a loose floor section by standing directly beneath it and jumping up. Try not to be there when it lands.

* There are two kinds of pressure-activated floor plates. One kind raises gates, the other lowers them. With experience, you can learn to distinguish them from ordinary floor sections and from each other.

* Learn to recognize different kinds of potions by sight.

* You can cross a bed of spikes safely by taking careful steps.

* A two-story drop will hurt you. A three-story drop will kill you.

* You never know what you'll find in a dungeon. Don't be afraid to explore, and to experiment. After all, you've got nothing to lose except your life, the Princess, and the entire Kingdom.

**Life and Death**

The row of red bullets in the lower left corner of the screen indicates your current strength. Every time you get hurt, you lose one unit of strength. When the last of your strength disappears, you die.

You start the game with three units of strength. (Later on, you may be able to increase your strength beyond this limit.)

Things that cost you one unit of strength include a blow by a guard's sword, two-story falls, and having a section of the floor collapse on your head. Other, more serious accidents can kill you outright.

An opponent's strength is indicated by a row of blue bullets in the lower right corner of the screen. To kill an opponent, you need to take away all his strength units.

**Adventuring**

Although this is your time inside the Sultan's palace, you do have some general information that may help you:

* The Princess is imprisoned in the high tower of the palace. To reach her, you must find your way out of the dungeons, through the palace's main building, and up to the top to the tower.

* Generally speaking, the guards on the dungeon duty tend to be the dregs of the Sultan's corps. The more capable ones are usually assigned to the palace's main building. The very best of them—the deadliest swordsmen in the Sultan's employ—are kept for the elite honor guard in the tower, where they are responsible for the personal safety of the Princess and of the Grand Vizier.

* Since your arrival in the city, you have heard some strange rumors. It is whispered that the Grand Vizier Jaffar is a magician, a master of the black arts of enchantment; that his powers are more than mortal. Knowing, as you do, that much of what passes for magic is mere trickery and superstition, you are reluctant to take these stories too seriously. Nevertheless, they don't do much for your peace of mind.

**Death and Continuation**

When you die, the message "PRESS BUTTON TO CONTINUE" will appear on the screen. Press a joystick button to return to the beginning of the current level.

If you don't press a button, the message will remain on the screen for about 20 seconds, then start to flash in warning, accompanied by a chime. After ten chimes, the game will end and you will be returned to the title sequence.

If you get yourself into a situation where you can find no way out, press CONTROL-A to restart the level.

You can continue the game as many times as you want without penalty. Remember, though, the sands in the hourglass are draining away....

To see how much time is left, press the SPACE BAR.

**Disk Access**

At the end of Level 2, the message "TURN THE DISK OVER" will appear. When you see this message, take the PRINCE OF PERSIA disk out of the drive and put it
back in with the back side facing up. Close the drive door, and press a joystick button or any key to continue the game.

You will not need to turn the disk over until you end the game and return to the title sequence.

Saving Your Game

Once you have reached Level 3, you will have the option of saving your game to disk and continuing it later. To save your current game, press CONTROL-L at any time during play. The program will briefly access the drive, then continue with the game.

The next time you boot the PRINCE of PERSIA disk, instead of pressing a joystick button or any key to start a new game, press CONTROL-L. The game will resume from the beginning of the level you were on when you last saved it.

Special Keys

Esc...............Freeze frame. Press again for single frame advance. Press any other key to resume play.

Control-J..........Selects joystick control. Also recalibrates the program to match your joystick. Make sure that when you press this key, the joystick is in its center (release) position.

Control-K..........Selects keyboard control.

Control-R..........Ends the game and returns you to the title sequence.

Control-A..........Restarts play from the beginning of the current level.

Control-S..........Turns off all sound. Press again to turn the sound back on.

Control-N..........Turns off the music. Press again to turn the music back on.

Control-G..........Saves the current game to disk.

Control-L..........Resumes the last saved game. (Press during the title sequence.)

Control-X..........Flips the vertical axis of your joystick.

Control-Y..........Flips the horizontal axis of your joystick.

Space Bar..........Press to see how much time is left.

About the Author

Jordan Mechner, 25, is the author of the award-winning computer game Karateka. Hailed by Games magazine as "a software landmark," Karateka broke new ground in the use of cinematic techniques to tell a story within a computer game, and has sold over 400,000 copies worldwide.

To achieve the extraordinary realism of the animation in PRINCE of PERSIA, Jordan studied hours of live-action footage, including swordfighting sequences from classic Hollywood swashbuckling films of the Thirties. Two years in the making, PRINCE of PERSIA is the culmination of a lifelong fascination with animation, and ten years of hacking on the Apple II.

A native New Yorker and a 1985 graduate of Yale University, Jordan now lives in San Francisco.

About the Music

The Music for PRINCE of PERSIA uses a "leitmotiv" approach in which each theme is associated with a specific character or idea. The basic themes are: Prince, Princess, Jaffar, Danger, Sword, Shadow, Death, Time, and Magic.

Secret Keys

While searching through memory in my kracking quest, I came across some strange code that turned out to be a check for a series of keys. I discovered that if you hold down both Apple keys (or Apple and Option on the //gs) and press one of the following keys during boot-up, you will get a keen treat. Here is a summary of what each secret key does (I won't tell you exactly what they do so that it will be as much a pleasant surprise for you as it was for me).

(Remember to hold down both Apple keys for each key)

DELETE - Press the arrow keys (works only on the //gs)
RETURN - Neat-o
! - Message from authors (press any key after this one for something else)
@ - Pretty cool
$ - Move your joystick around for this one

Also, use a sector editor to view Track $00, Sector $F for a quaint message. They folks at Broderbund sure know how to please. Get ready for one kick-ass game.

|-- Coming soon --: 
Ok, to start off with this is one EXCELLENT program, and all you need is an APPLE II+/IIe/IIc with at least 48k of memory or APPLE III in emulation mode. Optional equipment is as follows. Joystick, Koala pad and color ribbons and paper. To start just put boot up the disk and you come to a menu. You can use either the joystick, cursor keys or the Koala pad to move to the proper program.

Obviously if this is your first time you will choose SETUP. Now tell it what type of printer you have, what slot and type of printer interface and how many drives you have. You can use Print Shop with only one drive, but once you start making your own designs you will need two. At this point, to test your printer setup, make sure your printer is ready and type return. You should see ‘WELCOME TO THE PRINT SHOP’ print out. If it does we’re ready to go!! Oh, one last thing, to use the KOALA PAD plug it in BEFORE you boot up. Also the buttons may be used as RETURN and ESCAPE.

### Greeting Card

To make a Greeting card highlight it on the menu and press return. You have a choice of ‘Ready Made’ or ‘Design your Own’ if you choose design your own, just follow the step by step instructions. First you’ll design the FRONT then the INSIDE. You’ll be asked to choose a border, graphic, graphic size, graphic layout, font. There are 3 graphic sizes: smal, medium and large. The staggered graphic layout will evenly space 13 (small) or 5 (med) sized graphics. The tiled layout will place small graphics side by side on the whole page. Note that the CUSTOM, TILED or STAGGERED layout can’t be used with the large graphic. The Custom layout lets you choose how many SMALL or MEDIUM graphics will be printed. Use the arrow keys or koala pad to the different positions and hit return to select. When done just move to the DONE box and hit return. Choose a FONT and we will type a message. You will now see a box. On the right the ‘C’ means centered. By pressing ‘P’ (CTRL=P) you can change it to Flush Left/Right. On the left side you will see small boxes. You can change the Font being printed to be SOLID (preset) OUTLINE or 3-D. By pressing ‘S’ will change this. You can also set the print to be larger or smaller by pressing ‘S’. You will not be able to JUDGE the outcome until AFTER your done. When you done just hit return and now you’ll go to the INSIDE card design. This is done exactly the same way. When done with the inside you will be at the print menu. Just position your paper at the perforations and go! The system will pause with ‘THINKING’ on the screen and then print. Congratulations on your first card! One last note, using graphics #51-60 in the TILE mode will print nice backgrounds.

### SIGN

The SIGN mode will let you print full page signs. These can be of any graphic supplied or one of your own, that you designed with the Graphics Editor. The procedure is the same as for the front page of the GREETING CARD.
In LETTERHEAD we design the top first. Choose a graphic or no graphic. If you choose graphic, you will now see a way to position them. The options are shown as you move the highlighter up and down. Select one and you will now have to choose the FONT. This is the same as for the GREETING CARD with the exception of not being able to alter the size. Just type in your message. You can use ^F/P as before also. If you want your address printed the line will wrap around the screen but will be printed on one line if your message is too long. If you don't want your address just hit return. For that extra touch you can have a horizontal line your name from the rest of the page. Choosing a graphic for the bottom is the same as the top. When you have finished designing go to the print menu and VIOLA? Nice eh? You can also print multiple copies to use for your word processing needs.

BANNER
Highlight 'BANNER' then return. Choose a FONT that you want, return and now choose either solid or outline printing. Type your message on the two lines. If your message doesn't fit, you'll have to edit your message. Only one line can go on the banner even though you type your message on two. You can also 'CHAIN' two banners or graphic pictures. By doing this you can get different fonts or graphics on one banner. The graphic choices are done the same as in the GREETING CARD. Choose the positions of the graphics and just print.

SCREEN MAGIC
Screen Magic is a very powerful SCREEN PRINTING program. It will print different shades of grey as well as printing the whole screen. The menu has five choices. They are: See Kalaidescopes, Draw text on screen, Get screen, Save screen and Print screen. Let's highlight KALAIDESCOPIES first and then go on to the others. Kalaidescope will let you see 12 different screens. By pressing RETURN you can advance to the next one. Hitting ESCAPE will freeze the present screen. When you hit ESCAPE the screen will be put into memory and you will go back to the menu. Kalidescope 2 will start out like 1 but has only one starting point and return will not work. Hitting ESCAPE will though and also put the screen in memory. NOTE that you can only have one screen in memory at a time. DRAW ON TEXT will let you do just that with the screen in memory. Just choose a FONT and type. The number of lines and characters differs with the font size. Also ^F will toggle between solid and outline as 3-D is not available. Now center your text. It can be done from top to bottom if desires. If you want to get a different screen that you previously saved, type in the name and drive #. Hit return for a catalog of RETRIEVABLE screens. Only screens created with the screen editor are valid. Save screen is just that. It will ask you if you want init disk. If you dont have a init disk get a SCRATCH and just follow the directions. Print screen will print the screen in memory. You can choose between normal or reverse. Reverse meaning that all the BLACK areas of your screen will be printed. You will also be asked if you want a border around the screen. This is a single black line and is not like on the GREETING CARDS. The print menu is like the others with the exception of 'PRINT TOP HALF OR BOTTOM HALF?'. This is if you want to fold the paper in 1/2, as the PRINT SHOP works only on 8 1/2 x 11 paper.

GRAPHIC EDITOR
Last but not least is the Graphic Editor. This will let you edit ANY an ALL graphics CREATED or USED by the PRINT SHOP. The menu to the right of the drawing screen is really self explanatory (so is the whole program so why this big text file?) but, the one thing you should know about is the ^D device. This is NOT for a drive selection!!! This will let you reactivate the KOALA PAD if it was not on the system when you booted up. The buttons on the joystick and koala pad act as 'D' for draw and 'E' for erase. NOTES: before you can edit the original PRINT SHOP graphics the must be save to another disk. As I stated before ONLY graphics created with PRINT SHOP can be used.

Print Shop suggests that if you have a serial printer to set it at 9600 baud. Try this if your printing is erratic. For those of us that have the OKIDATA will not get as good graphics as the other printers. This is because the graphic resolution is only 72x72. The others are 160(120)x72. Who cares, we get better print quality anyway.

CHAPTER 1

INTRODUCTION:

Printrix is a typesetting system which allows you to control the arrangement of text on the paper, and the fonts used. You may also insert graphics into the text.

Printrix functions by taking a text file which you have already created, applying a format or page design to that text file, and printing the result. The text file is created with a word processor. The page design is called a "layout file," and is created with Printrix. There are three components to a layout file: text format, font library format, and graphics format.

Printrix is a ProDOS program. The Printrix system provides ProDOS fonts and 25 clip-art graphics for you to use. You must provide the text files and any additional graphics. Text files from AppleWorks, AppleWriter, Word Juggler, and WordPerfect may be used directly. Other text files may be used if they are saved in standard ASCII ProDOS format. If your text file is saved in DOS 3.3 format, you must convert it to ProDOS or re-enter it using a ProDOS word processing program. If you are a Fontrix user (Fontrix is the sister program to Printrix), you probably have Fontrix fonts and graphics in DOS 3.3 format. These may be converted to ProDOS format following the instructions in Appendix A.

WORKING DISKS

The Printrix program contains two disks, and uses both sides of each disk. The first disk is the Program Disk. Its flip side is the Printrix Configuration Disk. The second disk contains fonts on both sides. These disks are named /PRINTRIX, /CONFIGURE, /FONTS1, and /FONTS2.

/PRINTRIX contains the Printrix program and lessons files. /CONFIGURE contains the configuration utility, a Graffile conversion utility, and 25 clip-art graphics. The font disks contain 43 fonts for use with Printrix. See Appendix A for information on the Graffile conversion utility, Appendix C for a listing of fonts, and Appendix D for a listing of clip-art graphics.

The disks are not copyright protected. Please make back-up copies of all four sides, using four separate disks for convenience. Then label the working copies and put the original disks in a safe place. See your Apple Systems Manual for copying information.

Hard Disk

You may use Printrix from a hard disk. We recommend that you create a subdirectory named /TEMP. Copy all four Printrix original disks to this subdirectory, then rename the subdirectory to /PRINTRIX. Then, when you use Printrix, set the prefix to /my hard drive/PRINTRIX, and all fonts, layout files, and graphics will be loaded automatically.

As you develop a library of files, you may want to separate layout files and text files according to their application.

3.5 Inch Disks

You may copy all four Printrix original disks to a 3.5 inch disk, using the copying program from your Apple Systems Utilities. We suggest that you name the disk /PRINTRIX.

CONFIGURATION/RECONFIGURATION

"Configuration" means telling Printrix about your system. It needs to know what computer you're using, how it's connected to the printer (interface card and slot, printer port or modem port and baud rate), what word processor, and what printer.

The Printrix Program Disk is preconfigured for the Apple Imagewriter and an ASCII soft word processor. The lessons have been designed for this configuration, and the lessons text files are in ASCII Soft word processor form. If you plan to work through the lessons, change the printer configuration if necessary, but reenter ASCII Soft as the word processor. Then, when you're ready to typeset your own text files, reconfigure your word processor.

Floppy Disk

To configure from floppy disk, insert the Printrix Program Disk in Drive 1, and Press Open-Apple CTRL RESET. When the screen gives the option, press ESCAPE.

This boots the system and loads Apple BASIC. Now insert the Printrix Configuration Disk in Drive 1, and set the prefix by entering PREFIX/CONFIGURE. At the prompt, enter -CONFIGURE. The Configuration utility appears on screen.

1. The first question on screen asks which Apple computer you are using: Apple /e, /c, or /1gs. Enter the appropriate number, and press RETURN.

a. If you answered /e or /1gs, the next question concerns interface cards. Enter the numbers which corresponds to the manufacturer and type of interface card you are using, then enter the slot/port number. Press RETURN after each input.

b. If you answered /c, the next question concerns ports. You may be printing through the printer port, or modem port Type A or Type B. Enter the appropriate information. If you're using a modem port, respond to the question on baud rates. Press RETURN after each input.

2. The next series of questions identifies your printer by manufacturer and model number. Enter the correct codes, pressing RETURN after each.

3. Finally, enter the number corresponding to the word processor you use, and press RETURN.

Printrix now displays all configuration information on screen. If you wish to change any entries, press R and the configuration menus will return. If the settings are correct, replace the Configuration Disk with the Printrix Program Disk, and press RETURN. The configuration file will be copied to the Program Disk.

Thereafter, you will need the Configuration Disk only when you need to change the configuration settings. To reconfigure, insert the Configuration Disk in Drive 1, boot the system, and go through the same sequence, entering the new information.

To run Printrix from this point, insert the Program Disk in Drive 1. You may either press Open-Apple CTRL RESET, which boots the system and loads Printrix automatically, or you may set the prefix to the Printrix disk by entering PREFIX/PRINTRIX and pressing RETURN, then entering -PRINTRIX. Either method is fine.

Hard Disk, 3.5 Inch Disk

To configure Printrix from hard disk or 3.5 inch disk, set the prefix to /diskname/PRINTRIX, type -CONFIGURE, and respond to the on-screen questions as described above. When the screen prompts you to insert your /PRINTRIX disk, press RETURN, since you're already working from that disk. (Or, if you're working from another disk which contains the /PRINTRIX subdirectory, enter the pathname in response to the screen prompts.) Then, to run Printrix, enter -PRINTRIX and press RETURN.

CHAPTER 2 - LESSONS

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 841 of 1262
This chapter contains two lessons which introduce you to the Printrix menus, the Printrix embedded commands, creating and saving layout files, and moving files through the system.

Lesson One is a simple business letter, containing some of the more common formatting commands. We recommend that all Printrix users work through this lesson.

Lesson Two contains four special applications: mailing labels, tables, graphics insertion, and printing in columns. Select the applications you need from this lesson, as you need them.

LESSON ONE - Business Letter

In this lesson, you will learn how to use a standard layout file and a few embedded commands to produce a typical business letter. Formatting features include margin changes, font changes, boldface, italics, and tabs.

To Begin:
To begin this lesson, you should already have ready Chapter 1 and configured Printrix for your printer. We suggest that you also read through Chapter 3 for a quick overview of Printrix.

Assumptions:
We’re assuming that you are using an ImageWriter, or printer of similar resolution (with print densities between 120-200 dots per inch). The fonts used in this lesson have been chosen accordingly. If your printer is either above or below this range, the print will be a little large or a little small, respectively. Either ignore it for the time being, or load new fonts in the appropriate sizes. See Chapter 6 for instructions on loading fonts, and Appendix C for information on the fonts available.

The sample text files have been created in ASCII Soft, so use the text files we’ve provided, with Printrix configured for ASCII Soft. Then, when you’re ready to typeset your own text files, you’ll reconfigure Printrix for your word processor.

The lessons are written for people running from a floppy disk. If you’re using a hard disk, the prefix will be /diskname/PRINTRIX for all fonts and layout files.

Step One: Prepare the Text file
Load your word processor and input the text to be typeset. (Since this is a lesson, we’ve already created a text file for you. It’s on the Printrix Program Disk, under the filename TXT.LETTER.) We’ve deliberately included several common formatting commands to show you how they’re used.

Text file:
```
"TAB"TAB June 15, 1987
Andrew Andrews, President
Primo Professionals
1494 High Street
Tampa, FL

Dear Mr. Andrews:

"TAB"I couldn’t resist writing to let you know that Ace Associates will soon be taking over your business.

"ML=1"MR=1"TAB"I’ve got this "FI=WITHOUT"FH=0 that allows us to typeset all our letters, invoices, literature, anything, "FH=WITHOUT"FH=0 going to a typesetter, and "FH=WITHOUT"FH=0 paying through the teeth, and "FH=WITHOUT"FH=0 waiting. We just do it ourselves, here on our Apple II and our office printer."ML=1"MR=1

"TABSO" we’re saving lots of money, lots of time, and "F=LOOKING GOOD!"F=1

"TAB"been nice knowin' ya.

Ta ta,

Lucius "Lucky" Long
V.P. Capitalism
```

Step Two: Load a Layout File
Insert the Printrix program disk in Drive 1 and press Open-Apple CTRL RESET. You’ll see the Main Menu appear on screen. (See Fig. 1 - Main Menu.) From the Main Menu, press L to enter the Layout Document work area. (See Fig. 2 - Layout Document Menu.) Press L again to load a layout file.

We’ve created a layout file for you named LAY.LETTER. It’s on the Program Disk, so enter /PRINTRIX for the prefix, and LAY.LETTER for the filename, and confirm. The fonts are on the same disk, and they will be loaded automatically.

Take a look at this layout file. Press T to examine the text settings. (See Figure 3 - Text Format Menu.) Note that we’ll be typesetting on 8.5 x 11 paper, with a top margin of 1.5 inches, side and bottom margins of 1 inch. The justification is set to Fill. Font 1 is active. No page numbers, one copy of the letter. The tabs are set to .5 inches and 4 inches. Then press ESCAPE to return to the Layout Document Menu.

Now press F to look at the font library. (See Fig. 4 - Font Library Menu.) There are two fonts loaded: 1 and 2. Font 1 is active (note the asterisk), so typesetting will begin with that font. (This duplicates the Active Font information on the Text Format Menu.)

This is your opportunity to load new fonts, if you like. You may also examine the font options by pressing C, but don’t change any settings right now. You may also look at the Graphic Format Menu by pressing G from the Layout Document Menu.

Now, press ESCAPE from the Layout Document Menu to return to the Main Menu.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 843 of 1262

Apple II Computer Info

LESSON ONE - Text and Font Manipulation

The following combination of text file and layout file allows you to print names and addresses on mailing labels which measure 3.5 inches horizontally and 1 inch vertically. These labels are arranged vertically (a long strip of labels). The 1 inch vertical measurement is the distance from the top of one label to the top of the next.

Step One: Create the Text file

Step Two: Design and Save the Layout File

Step Three: Print a Document

You may use all, any, or none of these commands, as you like. For details on each command, see Chapter Seven.

In this lesson, you will learn how to set up layout files and text files for mailing labels, for tables, for printing a graphic with your letter, and for printing in newspaper-style columns (only possible with selected printers).

LESSON TWO - Special Applications

We assume that you've already worked through Lesson One and are comfortable with its contents. The assumptions about your printer are still in effect.

The following combination of text file and layout file allows you to print names and addresses on mailing labels which measure 3.5 inches horizontally and 1 inch vertically. These labels are arranged vertically (a long strip of labels). The 1 inch vertical measurement is the distance from the top of one label to the top of the next.

Step One: Create the Text file

Step Two: Design and Save the Layout File

Step Three: Print a Document

Print the text file, TXT.LETTER, on the Program Disk, so enter /PRINTRIX and TXT.LETTER to the on-screen questions, and confirm the choice.

The Print Document Menu appears on the screen, giving you a final chance to change the text settings or to return to the Layout Document Menu. This menu is a duplicate of the Text Format Menu, except for the print options at the bottom. Make sure your printer is on-line, and press RETURN to begin typesetting.

That's it - your letter is ready to mail.

Explanation of the Embedded Commands

Take a look at the typeset letter, and notice the effects of the embedded commands. Following is a brief explanation of each:

*TAB Jumps typesetting to the next tabstop
*ML=+1 Adds one inch to the current left margin value
*MR=+1 Adds one inch to the current right margin value
*Fi=Y Turns Italics on
*Fi=N Turns Italics off
*FH=1 Sets horizontal boldface to 1
*FH-0 Sets horizontal boldface to 0
*ML=-1 Subtracts one inch from the current left margin value
*MR=-1 Subtracts one inch from the current right margin value
*F=2 Switches to Font 2
*F=1 Switches to Font 1

It may have looked complicated, but now you see how simple it is. You may use all, any, or none of these commands, as you like. For details on each command, see Chapter Seven.

LESSON TWO - Special Applications

In this lesson, you will learn how to set up layout files and text files for mailing labels, for tables, for printing a graphic with your letter, and for printing in newspaper-style columns (only possible with selected printers).

We assume that you've already worked through Lesson One and are comfortable with its contents. The assumptions about your printer are still in effect.

Mailing Labels

The following combination of text file and layout file allows you to print names and addresses on mailing labels which measure 3.5 inches horizontally and 1 inch vertically. These labels are arranged vertically (a long strip of labels). The 1 inch vertical measurement is the distance from the top of one label to the top of the next.

Step One: Create the Text file

The following text file, TXT.MLABEL, is on the Program Disk.

Text file:

James Jones
1235 Peachtree Avenue
Atlanta, VA 23535

NPAmy Anderson
394 Harrison Way
Santa Ana, Ca 07836

NPWilliam Wilson
74614 Paseo Doble
Houston, TX 73573....and so on

Step Two: Design and Save the Layout File

The *NP command at the beginning of each new line causes Printrix to jump to the top of the next page (defined by the layout files as the top of the next label).

Step Three: Print a Document

Press the *NP command at the beginning of each new line causes Printrix to jump to the top of the next page (defined by the layout files as the top of the next label).

Press T to enter the Text Format Menu. Here, enter new settings for Form Size

<ESC> Exit this Menu

ENTER CHOICE:

-----------------------------------------------------------------------------

Figure 2. Layout Document Menu

-----------------------------------------------------------------------------

Figure 3. Text Format Menu

-----------------------------------------------------------------------------

Figure 4. Font Library Format Menu

-----------------------------------------------------------------------------
(3.5 in. x 1 in., HxV). The margins also have to be changed; set each margin to .1 inch. Everything else on this menu is fine as it is, so press ESCAPE to return to the Main Menu.

If you want to change fonts, press F to enter the Font Library and load as in Lesson One.

Again, no graphics, so skip the Graphics Format Menu.

Back at the Layout Document Menu, press S to save the layout file. Save it to the Program Disk under the filename LAY.MLABEL by entering /PRINTRIX and LAY.MLABEL. Now press ESCAPE to return to the Main Menu.

Step Three: Print

Load your printer with mailing labels of the appropriate size. If you don't have any, just print on regular paper and use your imagination. From the Main Menu, press P, specify TXT.MLABEL, and print.

That's it.

Tables

Tables, or columns of numbers, are frequently part of a report. They are not difficult, but they do require some special font and tab commands.

Most of the Printrix fonts are set to proportional spacing, which looks good for text but makes it impossible to line up columns. The following layout file has a font specially adapted to table printing.

Step 1: Create the Text file

We've put the following text file on the Program Disk under the filename TXT.TABLE.

Text file:

```
^F=1January^F=3^TAB$ 4926.96^TAB2633.33^TAB$ 1039.52
^F=1February^F=3^TAB$ 26047.58^TAB$ 368.11^TAB$ 3463.85
^F=1March^F=3^TAB$ 2356.06^TAB$ 1357.07^TAB$ 34764.47
```

Font 3 is defined by the text file for use with columns. The tab commands jump the typesetting to the correct columns; spaces are used within the figures to align the decimal points.

Step 2: Create and Save the Layout File

```
Begin by Loading LAY.LETTER as before. The text settings are fine, so we'll go straight to the Font Library by pressing F.

Load Font 1 into Position 3, through the following procedure.

1. Press 3 to make Position 3 active.
2. Press L to load a font into that position.
3. The font we'll use is SET.CASLON25, on /PRINTRIX, so enter that information.

Now, we need to adapt this font. Press C to change font parameters. The Change Font Parameters menu appears on screen (See Fig. 5).

1. Set the font to non-proportional spacing by pressing P.
2. Set the spacebar width to equal the horizontal cell size. Look at the top of the screen for that value, then press W and enter the number (here, it's 26).
3. Set the character spacing gap to -9. This causes the character cells to overlap when printed. (The ~g value is arrived at by experimentation: different fonts and different printers require different settings. As a rule of thumb, start with a figure that is the horizontal cell size divided by three, then make that cell negative).

Again, there are no graphics, so return to the Layout Document Menu to save this layout file under the filename LAY.TABLE.

Step Three: Print

Return to the Main Menu, load your printer with regular paper, enter the Print Document area, specify TXT.TABLE, and print.

CHANGE FONT PARAMETERS

```
Font Name : SET.CASLON25
Cell Size : 26 x 25
<P> Proportional : Yes
<3> Spacing Gap : 5
<L> Linefeed Gap : 4
<W> Space Bar Width : 13
<H> Baseline : 20
<T> Italics : No
<X> Horizontal Boldface : 0
<Y> Horizontal Magnification : 1
<Z> Vertical Magnification : 1
<ESC> Exit this Menu
```

GRAPHIC FORMAT:

```
<H> Horizontal Magnification : 1
<V> Vertical Magnification : 1
<X> Horizontal Placement (L.C.R.) : Center
<C> Color Printing : No
<F> Fit Text to Graphic (B.F.O.) : Break
<3> Separate from Text (inches) : 0.25
<ESC> Exit this Menu
```

Graphics Insertion

This ability to insert graphics into your document can be used in many ways: printing a letterhead with the letter, printing a logo on a card or letter, adding a chart or illustration to a report, or just adding some design interest to a letter, invitation, or greeting card.

To insert a graphic, you must have already created the graphic in one of the three formats Printrix accepts: Fontrix Graffile, single hi-res screen graphic, or "Print Shop style" clip art graphic. For this lesson, we've provided a single-screen graphic (created by Fontrix), named PIC.DRAGON on /PRINTRIX. The
text file which calls the graphic is a postcard-sized invitation.

Step One: Create the Text file

The following text file calls the graphic and causes it to print on the second line of text. It is located on /PRINTRIX under the filename TXT.INVITE.

Text file:

```
^GPS="PIC.DRAGON"
^F=1 You Are Invited
to the Twenty-Third Annual
Open House
^F=2 At Pickens Elementary School
3135 Westwood Drive
Bloomington, IN
^F=3 Refreshments
The embedded command to call the graphic is located on the first line of text. Note that this invitation also uses an embedded command to change justification, and to change fonts.

Step Two: Design and Save the Layout File

Load LAY.LETTER as before. Since this invitation will be photocopied onto 3x5 postcards (3 in. vertical, 5 in. horizontal), we must reset the margins to create a 3x5 printing window. We must also position the graphic on the page.

Press T to enter the Text Format Menu. Reset the margins as follows: Left - 1, Right - 1.5, Top - 4, Bottom - 4. (The horizontal form size [8.5 in.] minus the horizontal dimension of the printing window [5 in.] leaves 3.5 in., which is allocated between the left and right margins. A similar process gives the top and bottom margin values.)

Exit the Text Format Menu and press G to enter the Graphic Format Menu. (See Fig. 6) Here, set Horizontal Placement to R. Nothing else is necessary, although you may experiment with the parameters as you like.

Exit the Graphics Menu and press F to enter the Font Library Menu. The text file uses three fonts. Look at the text file to see which fonts are used where. Then, load fonts accordingly. Load SET.OLDENG30 into Position 1, SET.HELVET30 into Position 2, and SET.CASLON25 into Position 3. All of these fonts are on the /PRINTRIX disk. When you've loaded SET.CASLON25, press C to change its parameters, and set italics to Yes (just a design whimsy).

Return to the Layout Document Menu and save this layout file under the filename LAY.INVITE.

Step Three: Print

Return to the Main Menu, and press P to Print a Document. Specify TXT.INVITE on /PRINTRIX, press RETURN, and print.

Two-Column Printing

On certain printers with reverse linefeed capabilities, such as the Imagewriter, Printrix can typeset in two newspaper-style columns. This means that text runs down the first column, then back to the top of the second column.

You may control columns from the menu or with embedded commands. An embedded command to end two-column printing takes effect on the next printed page. An embedded command to begin two-column printing takes effect on the current printing line or the following line, depending on the placement of the command.

This example shows the interaction of menu and embedded commands to center a headline across a page, then begin two-column printing.

Step One: Create the Text file

The following text file is located on /PRINTRIX under the name TXT.ARTICLE.

Text file:

```
^C=Y^J=F^F=2 Late last March, two teenagers were strolling along a beach in Southern California, watching the sunset and generally taking it easy. Something glinting in the last rays of sun caught their eye, and they picked up a bottle, awkwardly corked with palm leaves and appearing to have a message inside.

The message read: "To whomever finds this bottle - please send rescue mission as our supplies are running low and our health is bad." It went on to give details of the stranded travelers' location; they are on an island several hundred miles from shore.

"NP"The message had been typeset with Printrix, a new typesetting program which offers unparalleled clarity and diversity in fonts and page design. Said one of the teenagers, "As soon as we saw the graphic excellence of the message, we knew we had to act." So they contacted the local Coast Guard.

The rescue was quick and efficient. Five yachtsmen were brought in from their stranded yacht the next day, treated for minor health problems, and released. According to Wendell Walker, the yacht's owner and captain, "I don't know what we'd have done if we hadn't had the resources to attract someone's attention. Not just any written message is effective these days - we used Printrix to make sure.

The columns command is positioned first on the printing line. The "NP" command in this text file moves the typesetting to the top of the next column.

Step Two: Design the Layout File

The following text file is located on /PRINTRIX under the name TXT.ARTICLE.
The embedded commands are part of the text file, entered by the user through the word processor. If the text file was created by a supported word processor, Printrix reads both the word processor's standard embedded commands for page design, and special Printrix-style embedded commands which supplement the word processor's capabilities.

If the text file was created by an unsupported word processor and converted to standard ASCII, there are no word processor embedded commands. All formatting must be done through Printrix-style commands or through the layout file. Embedded commands take effect within a document at the time Printrix reads them. They give "local" control of formatting.

Layout Files

The layout file consists of a set of Printrix menus grouped together to control all aspects of a typeset page. Three main menus control text, graphics, and fonts. A layout file may be designed by the user for specific documents, and saved to disk for reuse at any time, with the same or different text files. Commands from a layout file affect the entire document, unless an embedded command changes the setting or a new layout file is loaded. Layout files offer "global" control of formatting.

Fonts

Fonts, like type, are complete sets of letters, numerals, and punctuation of a particular design.

Printrix's fonts exist as files on disk. These font files were created using Printrix's sister program, Fontrix. Font files are loaded from disk into your computer's memory in order to be used for typesetting. Printrix can use a maximum of four fonts in typesetting any one line. An unlimited number of fonts may be used in a document.

The Printrix fonts are "bit-mapped," meaning that they are formed by arrangements of dots in a rectangular grid. When Printrix reads a text file, it automatically converts the numerical code for each character in the text file into the corresponding bit-map. The individual bit-maps are composed into lines of type. Each line of type is then sent to your printer as a unit.

Graphics

Computer graphics are files on disk which contain illustrations, charts, graphics, art, or other images stored in a bit-mapped format. Printrix accepts and prints three types of graphics: the standard single hi-res screen, the Fontrix Graffile, and the four-sector Print Shop compatible graphic.

A Graffile is a graphic image of varying size, created by Fontrix. It may contain fonts and other images in any combination.

A single hi-res screen can be created by Fontrix or by a number of Apple graphics programs.

A four-sector clip art graphic can be created by Print Shop or by a number of Apple graphics programs which are compatible with Print Shop.

Output to the Printer

Since the Printrix fonts are bit-mapped, or arrangements of dots, they are printed in graphics mode. This means that the information sent to your printer is a stream of dots. The capacity to insert graphics into text is a consequence of this feature.

The alternative to printing in graphics mode is printing in text mode. This means that the information sent to your printer is the ASCII code for the character in the text file. The printer then converts the code into the corresponding character in the printer's native fonts. Word processors utilize text mode. This requires them to depend on the native fonts of the printer, and prevents their merging of text and graphics.
Consequences of Graphics Mode

As mentioned above, printing in graphics mode allows Printrix to merge graphics into the text, since the text is also graphic. Printing in graphics mode also allows much more flexibility in page design, linefeed advance, and font choice.

Graphics mode and text mode vary in printing speed: text mode is almost always faster since less information is being sent to the printer.

Finally, printing in graphics mode means that the size and proportion of the output is dependent on your printer's resolution and aspect ratio.

Printer Resolution

---

Printer resolution, or print density, refers to the number of printer dots per inch. Resolution is measured for both horizontal and vertical dimensions. Most printers offer several choices of resolution. Low-resolution printers may print 60-100 dots per inch; medium-resolution printers may print 120-180 dots per inch; high-resolution printers print 300 or more dots per inch. In general, the higher your printer's resolution, the better the quality of print from Printrix.

Since Printrix fonts exist as bit-maps, with horizontal and vertical dimensions measured in dots, a given font will produce output of different sizes when printed on printers of different resolutions. High-resolution printers will produce smaller output; low-resolution printers will produce larger output. Printer resolution should be taken into consideration when selecting fonts.

Aspect Ratio

---

Aspect ratio is the relationship of horizontal resolution to vertical resolution (width to height). Some printers have a "square" aspect ratio, in which the horizontal and vertical values are equal. Other printers have a "non-square" aspect ratio, in which the horizontal and vertical values are significantly different.

If you create a square on screen, with each side measuring 100 dots, a printer with a square aspect ratio will print a square, 100 dots per side. A printer with a non-square aspect ratio will print a rectangle, also measuring 100 dots per side. The proportions of the rectangle depend on the printer's aspect ratio.

This same principle applies to graphics and to the Printrix fonts. Depending on your printer, a given font may appear elongated, compressed, or normal when printed. Again, aspect ratio should be considered when selecting fonts.

You may like the effect of aspect ratio on the appearance of your output and choose to accept it. Alternatively, you may use the magnification commands to counteract the effects of aspect ratio. When magnifying a font, be sure that the original font is small enough so that when you magnify it, the result is the size desired.

The Apple ImageWriter has two print modes. The first has a non-square aspect ratio, 161x72 dpi, and produces tall narrow print. The second, quad density, has a near-square aspect ratio, 160x144 dpi, and produces print of normal proportions.

CHAPTER 4 - CONVENTIONS

This chapter covers the conventions used by Printrix. These conventions include syntax for both menu input and embedded commands. Covered here are filenames, file locations, use of the wildcard, letter values, number values, and relative vs. absolute values. The exact form or code used for input is called "syntax."

Menu Input
disk automatically as long as there is room on the disk. To load files, and to locate graphics and text files, you must enter the appropriate prefix.

Letter Values

Letter values, such as L, R, and C (for Left, Right, and Center) are entered by pressing the letter corresponding to the parameter, such as W for Horizontal Placement. The letter value on screen will change to one of the other options. Continue pressing H until the desired option appears.

Numerical Values

Numerical values, in response to menu options, are entered as absolute values, meaning that the number on screen is based on the zero point for that parameter. In some cases, the value may be negative (e.g. character spacing gap may be set to -8).

Wildcard Use

Wildcards are a method for scanning a list of files and selecting the one you want. If you enter a wildcard in response to a Printrix menu, Printrix will display on screen a list of all the files that match the wildcard, in the specified location, and allow you to answer Yes or No to each file. Wildcards may be used only in response to menu questions.

The wildcard used by Printrix is the asterisk (*). The asterisk replaces any character or string of characters. Therefore, if you were trying to load a layout file, you could enter

LAY.*

and all files on that disk which begin with LAY.* would be displayed on screen, one at a time. You have the Yes/No option after each file.

Wildcards may be used only for filenames. They may not be used for pathnames.

Embedded Command Syntax

Embedded commands may be used for formatting or for graphics insertion. The commands are typed directly into the text file, in the forms given in the reference section. All embedded commands begin with a carat (^), followed by one to three letters which identify the parameter. In some cases, the command continues with an equals sign (=) and then adds the value, which may be a number or a letter. Letters in embedded commands may be in either upper or lower case. The letters used in embedded commands match the letters used in the menus, for easy remembering.

Examples: ^ML=3, ^GH=C, ^J=F

Filename and File Location

Printrix contains two embedded commands, the graphic print command and the load layout file command, which require you to enter filename and file location in the text file.

Filename and file location are input as they are for menus, with the addition of quotation marks to set the prefix and filename off from the rest of the text file. Wildcards may not be used with embedded commands.

Example:

As shown in ^GPG=/prefix/gfl.topo"the illustration.

If the prefix is absent from the text file, or if its location information is incorrect, Printrix will pause during printing and display a message asking you to enter the correct location of the file. You may search as many locations as necessary, or you may omit the graphic and continue printing. However, you may not change the name of the graphic while printing.

Letter Values

Embedded commands which require letter values are entered into the text file by typing the embedded command and the desired value.

Examples: ^GH=C, ^GH=C, ^J=F

Numerical Values

Embedded commands which require numerical values are entered into the text file by typing the embedded command and the desired values. The range of accepted values and the form for entering them varies according to the parameter. For each parameter, acceptable values and forms are specified in the reference chapter.

Positive and Negative Values

In some cases, the numerical value must be positive. For example, linefeed gap may be set to 0 or any positive integer, but cannot be less than 0.

In some cases the numerical value may range from negative to positive, such as with the character spacing gap.

When using a parameter which accepts negative values, the minus sign (-) always means a negative value, NOT a relative value.

Relative and Absolute Values

In some cases, the numerical value is absolute only. For instance, you may set a page number to any positive integer, but you must specify the integer directly.

In some cases, numerical values may be entered as either relative or absolute values. There are two ways of defining a numerical parameter (such as margins, linefeed gap, etc.). Absolute values are calculated from a constant point, such as the edge of the paper. Relative values are calculated from the previous value of that same parameter.

Relative values are entered as numbers with a plus (+) or minus (-) sign. Absolute values are entered as numbers, WITHOUT a plus or minus sign. If you are using a parameter which expects relative values, the minus sign (-) always means "subtract from previous value," NOT a negative value of the parameter.

Examples:

^ML=1 sets the left margin one inch from the edge of the paper (absolute value).

^ML=1 adds one inch to the current left margin value (relative value). If the left margin had been 1.5 inches, the new setting is 2.5 inches.

^FL=6 sets the linefeed gap to six dots (absolute value).

^FL=6 subtracts six dots from the linefeed gap of the current font (relative value). If that value had been 10, the new setting is 4.

Relative values are convenient for two main reasons:

Experimentation. If you are trying out several possible formats, you can use relative values within the text file, and change the starting values by menu...
command. This means that you will not have to re-open the text file to change
settings.

Convenience. If you forget the original value of a parameter, but you know how
much you want to change it, you may use relative values and save yourself the
trouble of looking up the original value.

Isolating Command Values from Text
---------------------------------------------------------------------
If you use embedded commands, you may occasionally find that the numbers which
are part of the command are adjacent to numbers which are part of the text file
to be printed.

   Example: Our new telephone number is "F=2383-4862.

Printrix interprets the entire string of numbers as a font number. When it
can't find a font numbered 2383, it continues printing in the previous font and
ignores the numbers. The result is the absence of those numbers from the
printed text.

To avoid this, enclose the numerical part of the command in parentheses:

   Example: Our new telephone number is "F=(2)383-4862.

If the command contains an = or - sign, enclose it in parentheses as well:

   Example: "ML=(.5)2001 has become a film classic.

CHAPTER 5 - WORD PROCESSORS

Printrix accepts several types of text files for typesetting. Some preparation
may be necessary depending on the type of text file and the amount of
formatting desired. Preparation may involve a special save processor or
addition/substitution of embedded commands. This chapter covers the types of
text files which you may use, and the preparation process.

Overview
-------------------------
Text files fall into two basic categories: formatted and unformatted.
Formatted text files are also called "native" text files. Unformatted text
files are also called "standard ASCII" or "generic ASCII" text files.

Formatting refers to the process of inserting special codes into the text file
to control its printing. These codes do everything from sending carriage
returns and form feeds to the printer to changing fonts.

All word processors insert some commands into the text file. Some codes are
standard across word processors, while others vary greatly. A text file which
contains only standard codes can usually be read and processed only by the word processing program
used to create it, and other programs which contain special adaptations for
those unique codes.

Printrix will accept any unformatted text file, and formatted text files from
certain word processors: AppleWorks, AppleWriter, Word Juggler, and
WordPerfect.

ASCII Text files
-----------------
These files contain only carriage return/linefeed commands. Some word
processors can convert native text files into ASCII files by stripping out the
nonstandard commands. If you use an unsupported word processor, see its manual
for an ASCII conversion process. If this is possible in your word processor, you
may typeset ASCII files for typesetting through Printrix.

You must find out through experimentation whether your ASCII file is Hard or
Soft Return. These two types of files differ in the type of carriage return
commands they contain.

Hard Return
-----------
ASCII Hard Return files contain carriage return commands ONLY at the ends of
paragraphs. When viewed on screen, the line of text extends off the screen to
the right. Word wrap is not in effect.

To use these files with Printrix, merely add any formatting commands that you
like, make sure that you're configured to ASCII Hard, and print.

Soft Return
-----------
ASCII Soft Return files contain two types of carriage returns. Hard returns
are placed at the ends of paragraphs, AND soft returns are placed between lines
of a paragraph, where the word processor has wrapped the text. Most or all of
a paragraph may be seen on screen at once.

Since Printrix will re-wrap the text depending on the font and margin settings,
the soft returns in the text file must be converted to spaces so that
typesetting may continue on the current line.

Printrix performs this conversion automatically. However, the hard carriage
returns must be kept operative, to allow you to begin a new paragraph, force a
new line, etc.

Because the same code may be used for both hard and soft carriage returns,
Printrix has a special convention for distinguishing between them. Any single
carriage return is interpreted as a soft return and converted to a space,
allowing typesetting to continue ON THE SAME LINE. Any PAIR of carriage
returns is interpreted as one hard return, and forces typesetting to continue
ON THE NEXT LINE.

Accordingly, to use ASCII Soft Return files with Printrix, move through the
text file and add carriage return as necessary. For example, if you want to
double-space between paragraphs, the text file must contain four carriage
returns in that location. If you want to single-space the lines of an address,
there must be two carriage returns between each line. Be sure that the
carriage returns actually occur in pairs, with no intervening spaces or other
invisible characters.

Finally, add any Printrix formatting commands that you like, make sure that
you're configured for ASCII Soft, and print.

AppleWorks
---------
Printrix can read AppleWorks files, interpret some of the embedded commands,
and filter out the rest.

If your AppleWorks files contain formatting commands, refer to the chart in
Chapter 5 to see if those commands are supported. If they are, you may print
the text file without alterations. If they are not, you must insert the
equivalent Printrix commands. You may also add other Printrix commands to
expand the formatting possibilities. Then, make sure that you're configured fo
AppleWorks, and print.

AppleWriter
-----------
Printrix has a special AppleWriter adaptation which automatically ignores the
AppleWriter codes. Therefore, you may use native AppleWriter text files. To
AppleWriter, and Word Juggler, insert ^TAB in your text file. If you’re using AppleWorks, AppleWriter, and Word Juggler, insert "TAB in your text file. If you’re using a processor’s embedded command is not supported, and you must use the Printrix function is automatically supported by Printrix. If a cell is blank, the word processor’s core formatting commands and ignores the rest. This means you may use the native text files from Word Juggler.

If these files contain formatting commands, refer to the chart in Chapter 5 to see whether or not the specific command is supported by Printrix. If it is, no action is required. If it is not, insert the equivalent Printrix command. You may also insert other Printrix commands, to expand the formatting and typesetting possibilities. Make sure that you’re configured for Word Juggler, and print.

WordPerfect

Printrix also has a special adaptation for WordPerfect files, interpreting and carrying out some of the common formatting commands and ignoring the rest. This means that you may use the native text files from WordPerfect.

If these files contain formatting commands, refer to the chart in Chapter 5 to see whether or not the specific command is supported by Printrix. If it is, no action is required. If it is not, insert the equivalent Printrix command. You may also insert other Printrix commands, to expand the formatting and typesetting possibilities. Make sure that you’re configured for WordPerfect, and print.

Word Processor Commands Supported by Printrix

An "X" in a cell indicates that the word processor's embedded command for this function is automatically supported by Printrix. If a cell is blank, the word processor's embedded command is not supported, and you must use the Printrix form of the command. For example, to utilize tab characters in AppleWorks, AppleWriter, and Word Juggler, insert "TAB in your text file. If you're using WordPerfect, the tab key is sufficient.

CHAPTER 6 - PRINTRIX MENUS

Printing in Printrix is controlled by a combination of menu commands, seen on-screen in Printrix, and embedded commands, inserted into your text file from your word processor. The embedded commands are covered in detail in Chapter Seven. This chapter introduces you to the Printrix menus - their interaction within Printrix, how they control your location within the program's work areas, and the individual commands which are contained in each menu.

First Time in Printrix

To enter Printrix for the first time, boot the Printrix Program Disk by inserting it into Drive 1 and pressing Open-Apple CTRL RESET. Then press ESCAPE, insert the Printrix Configuration Disk and follow the configuration procedure described in Chapter 1.

Thereafter, when you load Printrix, you will enter at the Main Menu. To do this, boot the Printrix Program Disk by inserting it into Drive 1 and pressing Open-Apple CTRL RESET, or set the prefix to /dirname/PRINTRIX and enter -PRINTRIX.

Printrix Main Menu

When you enter Printrix, a layout file name LAY.PRINTRIX is automatically loaded. The screen displays the process, and may ask you for assistance in locating the fonts. Printrix then moves to the Main Menu. See illustration in lesson two.

The Main Menu is a crossroads between the two work areas of the program: printing and page design. You choose your first task from this menu. After you've finished that task, return to the Main Menu to move to another work area or to exit. (There's one exception: for speed and convenience, you may move directly between the Print Document Menu and the Layout Document Menu.)

To move to a work area from the Main Menu, enter the corresponding letter. To return to the Main Menu from any of its three branches, press ESCAPE. If you are several branches down in one of the work areas, you may need to press ESCAPE several times. To exit Printrix from the Main Menu, press ESCAPE.

See lesson two, figure 1, to see the format of the Printrix Main Menu.

Layout Document Menu

Pressing L from the Main Menu brings up a set of menus which allow you to load an existing layout file from disk, to save the current layout file settings to disk, and to design the printed page, including text, graphics, and fonts.

To load an existing layout file, press L from the Layout Document Menu, and enter the prefix and filename of the desired layout file.

If you wish to save the current page and font settings as a layout file, press S from the Layout Document Menu. Enter the prefix and filename. You may write over the current layout file by saving the new file to the same location under the same filename, or you may create a new layout file by entering a different location or a different filename. The layout file will contain all settings from the Text Format Menu, the Graphics Format Menu, the Font Library, and the font parameters.
To enter the Font Library, the Text Format Menu, or the Graphics Format Menu, press the corresponding letter from the Layout Document Menu. When you have completed your work in the Layout Document Menu, press ESCAPE. Printrix will return you to your previous location (the Main Menu or the Print Document Menu).

See Lesson Two, Figure 2, to view the format of the Printrix Layout Document Menu.

Text Format Menu

Pressing R from the Layout Document Menu brings up a new menu, the Text Format Menu, which lists all options for controlling the placement of text on the page, and related commands. Included are such parameters as font size, margins, text justification, page numbers, numbers of copies, etc.

You may accept the default values, or change as many as you like by pressing the corresponding number key. This menu responds to the parameter to be changed. If the parameter calls for a numerical or text value, enter the value desired. If the parameter offers a set of delimited options, pressing its menu letter will automatically cause the value to change. (For example, press J for Justification. F will change to L, to R, to C, and back to F, as you continue pressing J. When all parameters are set as desired, press ESCAPE to return to the Layout Document Menu.

See Lesson two, Figure 3, to view the format of the Printrix Text Format Menu.

Graphics Format Menu

Pressing G from the Layout Document Menu brings up the Graphics Format Menu, which displays all options for controlling the printing and placement of graphics in the document. Included are such parameters as magnification, horizontal positioning, and relationship of text to graphics.

You may accept the default values, or change as many as you like by pressing the letter which corresponds to the parameter to be changed, and either entering the desired value or continuing to press the menu letter until the desired value appears on screen. When all parameters are set as desired, press ESCAPE to return to the Layout Document Menu.

See Lesson two, Figure 6, to view the format of the Printrix Graphic Format Menu.

Font Library Format Menu

Pressing F from the Layout Document Menu brings up a sequence of three menus. The first menu displays the fonts that currently are loaded for use in typesetting. Each font is assigned a number. These numbers are used to identify fonts for manipulation by menu and by embedded command. An asterisk by the number indicates the current active font.

If you wish to load one or more new fonts, select the number into which the new font will be loaded by pressing the corresponding number key. Then press L from the list of commands displayed at the bottom of the screen. A question appears on the screen, asking you to identify the desired new font by prefix and filename. Enter the necessary information, pressing RETURN after each entry. Press RETURN alone to accept the default values. Repeat this process for any other new fonts.

If you wish to delete one of the fonts currently loaded, select the corresponding number, and press D to empty that position.

If you wish to change the parameters of one of the current fonts, select that font, then press C. A new menu will appear on screen, listing all possibilities for font manipulation. Change as many as you like, and press ESCAPE to return to the previous menu.

A final option from the Font Library Menu allows you to reload a group of fonts from a specified area. See Chapter Seven for details on this function.

When all fonts and font parameters are set as desired, press ESCAPE to return to the Layout Document Menu.

See Lesson two to view the format of the Printrix Font Library Format Menu.

Print Document Menu

Pressing P from the Main Menu brings up a sequence of two menus. The first menu allows you to specify the text file to be printed, with the prefix information necessary to locate the file on disk.

The second menu displays the current printing parameters, as determined by the layout file in use. The settings include margins, form size, justification, color, page numbers, etc. You may accept the parameters as they stand, or change any or all of them. See Chapter Seven for details on each parameter.

This screen is a duplicate of the Text Format Menu. Any changes here will be reflected there, and vice versa. If you want to change any font or graphics parameters, or if you want to save any changes made to the page design from the Print Document Menu, you must enter the corresponding menu from the Layout Document Menu.

For convenience, you may move directly from the Print Document Menu to the Layout Document Menu, without returning to the Main Menu. Press L, as displayed on screen. When you have finished your work in the Layout Document Menu, press ESCAPE. If you entered the Layout Document Menu from the Print Document Menu, you will return to it. If you entered from the Main Menu, Printrix will return you there.

When all parameters are set as desired, press RETURN to accept them and begin the printing process. When printing is complete, Printrix will return to the Main Menu. You may halt printing at any time by pressing ESCAPE. Printrix kills the print job and returns to the Main Menu.

CHAPTER 7 - REFERENCE

This chapter gives detailed information on Printrix commands, including menu commands and embedded commands.

This chapter is organized into four sections: layout file parameters, text format parameters, font library parameters, and graphics format parameters.

The function of each command is defined. Then, all acceptable options or settings for the commands are given, along with the correct form of response. Any special considerations are included. These may include the command's interaction with other commands and by environmental factors which affect the command's operation. When necessary, examples are given for the best use of commands.

Finally, some commands may be used for particular typesetting effects. These special uses are defined and demonstrated.

Save Layout File

This option creates a disk file that records the current setting of all printing parameters from the Text Format Menu, the Font Library Menu, and the Graphics Format Menu. This includes all font settings from the Change Font Parameters Menu such as italics, boldface, etc.

Once you've saved a layout file, you may load it again at any time, for use with the same text file or with a different one. The layout file will restore the previously saved values of the printing parameters, overriding the values it finds in memory, or in the font files.

NOTE: If you want to change the name of a layout file, do not use the ProDOS
"Rename" function. Instead, load the layout file into Printrix, then save it again under the new name.

Location:

Layout Document Menu (menu command only)

Procedure:

1. Set the printing parameters to the desired values, using the Text Format Menu, the Font Library Menu, and the Graphics Format Menu. Then return to the Layout Document Menu.

2. Choose option S.

3. In response to Printrix's screen prompts, enter the prefix and filename specifying the disk where the file will be located, and the name of the new file. Use the LAY.filename form for layout files.

If you accept the default filename, the new layout file will be written over the old file. If you want to keep old files, enter a new filename.

Create a "Default" Layout

When Printrix is booted, it automatically looks for and loads a layout file names LAY.PRINTRIX. If you use Printrix for one application a majority of the time, you'll probably have a standard layout file. You can load those values automatically, every time you load Printrix, by naming this layout file LAY.PRINTRIX.

Load a Layout File.

This menu option lets you recall a layout file that has been previously saved to disk. Loading a layout file will restore the printing parameters to the values current at the time of saving.

A layout file also reloads the fonts, in the same order as they were saved, so that they may be referred to by the same numbers. Their individual parameters are also restored to the values specified by the layout file.

You may load as many layout files as you wish within a document. When the document has finished printing, Printrix automatically reloads the original layout file, which it had previously saved to disk in a temporary file called LAY.TEMP.

Location:

Layout Document Menu

Embedded Command

^LL="/prefix/filename"

Procedure - Menu Command

1. From the Layout Document Menu, choose option L.

2. Respond to the program's screen prompts by entering the drive and prefix where the desired layout file is located.

3. Answer Y, and Printrix asks for the directory in which the layout's fonts may be found and loads the layout. Or answer N, and Printrix continues to search.

Procedure - Menu Command

At the desired point in the text file, insert the load layout command:

^LL="/prefix/filename"

You may include or omit the location. If the location is included, Printrix searches that area. When it finds the specified file, that set of parameters and fonts is loaded. If the file is not found in that location, or if you do not specify that location, Printrix will pause typesetting and display a question on screen requesting the necessary information.

In Use

Loading a layout file by embedded commands will cause Printrix to begin a new line of print. Therefore, we recommend that you position the command at the beginning or end of a paragraph, or between paragraphs.

Font Files

When you save a layout file, Printrix stores information obtained from the Font Library about the fonts' parameters and order. The actual font files are not saved to disk with the layout file.

When you load a layout file, you should have the necessary font files available for Printrix to access. It is more convenient, although not necessary, to have all fonts together on one disk or one path. If the fonts are in different locations, switching between fonts by embedded command will cause Printrix to pause typesetting and request you to input the location for the new font.

TEXT FORMAT PARAMETERS

Form Size

This parameter defines the absolute horizontal and vertical dimensions (in inches) of the form you're printing on.

A printing window, the space on which you may print, is a smaller rectangle within the form size. The printing window is defined by the margin settings.

Range:

Horizontal: .01 to 14.00 inches
(.01 to 8.50 for narrow cartridge printers)
Vertical: .01 to 99.99 inches

NOTE: On some laser printers, the vertical size of the printing window is limited by the printer's graphic buffer. See Appendix B for specific information on your laser printer.

Margins

A margin is a blank space at the top, bottom, left, or right of the form. Margins are measured from the edge of the form inward, in hundredths of an inch. You may define each margin separately.

Margins are not included in the printing window, but the inner rectangle formed by the four margins is the printing window, or space
on which you may typeset. If you're printing on standard 8.5x11 inch paper, a left margin of 1 inch and a right margin of 1.5 inches results in a line length of 6 inches. A top margin of 1.5 inches and a bottom margin of .75 inches allows you to print on 8.75 vertical inches of paper. The printing window, then, is 6.6875.

Range: 0.00 to max

max = form size minus opposite margin value

(In other words, the left and right margins together cannot exceed the horizontal form size: the top and bottom margins together cannot exceed the vertical form size.)

* EXCEPTION:

Some printers are not capable of printing all the way across a page. If you try to set the left or right margin to a value which exceeds your printer's horizontal printing capacity, Printrix will automatically reset that margin to your printer's best value. If both right and left margins are out of bounds, Printrix will adjust both margins to center the printing window on the page.

Location: Print Document Menu

Embedded Command

ML=n
MR=n
MT=n
MB=n

n is a number within the accepted range

Timing:

Embedded commands to change margins take effect at different times, depending on their positions. A command to change the left or right margin will take effect on the current line if nothing has yet been printed on that line. If the command is found while Printrix is in the middle of a line, the margin commands will take effect on the following line.

Embedded commands to change the top and bottom margins take effect on the following page, no matter where they occur on the printed page.

Relative Values Apply:

When you change margins using the embedded commands, you may set the new values either by absolute distance from the edges of the form, or by relative distance from the previous margin values.

Absolute margin values are calculated in the same way that the menu command margin values are. Do not use a + or - symbol when using absolute margin values.

Relative margin values are added to or subtracted from the previous value of the margin. Relative values are indicated by using a + or - in the command. Relative values are convenient when you've forgotten the starting value of the margin, or when you want to change starting values from the menu, but keep the relationship between the margins the same.

Examples:

ML=1,MR=1This paragraph will have left and right margins of one inch, for all lines in the paragraph.

This paragraph ML=5 will have the preset margin values on the first line. All following lines will be indented .5 inches on the left, to produce a "hanging paragraph."

prints as:

This paragraph will have the preset margin values on the first line All
In most practical settings, you'll avoid confusion by first clearing all old tabstop settings before issuing new ones. Use the ^TC for this purpose. Then use the ^TS command to set new positions, one position at a time. You may enter up to eight. Printrix will ignore all tabstop settings to the right of the eighth position.

Example:

```
^TC^TS=.5^TS-1.5^TAB
This paragraph will be indented .5 inches on its first line. The word "paragraph" will be positioned 1.5 inches from the left margin.
```

prints as:

```
This paragraph will be indented .5 inches on its first line. The word "paragraph" will be positioned 1.5 inches from the left margin.
```

Oops!

If your text file contains a tab character which falls to the right of the rightmost tabstop on the line, Printrix is unable to position it correctly, and will begin a new line instead. If this occurs, either remove the tab character from the text file, or set a new tabstop.

JUSTIFICATION
---------------
Justification is the horizontal arrangement of words on the printing line.

Printrix offers four justification styles:

Left:
lines of text have even left edges and ragged right edges.

Right:
lines of text have ragged left edges and even right edges.

Center:
lines of text are centered between the current left and right margins.

Fill:
lines of text have even left and right margins. Printrix uses "microjustification," adding space between words and between letters as needed, for the best visual effect.

Location:
Print Document Menu
------- Embedded Command
Left ^J=L
Right ^J=R
Center ^J=C
Fill ^J=F

Timing:
Embedded commands to change justification take effect on the current printing line. If the line contains more than one justification command, and there are no tab characters on the line, the last justification command takes precedence.

Correct:
```
^J=CThe Gettysburg Address
^J=F
Fourscore and seven years ago....
```

Incorrect:
```
^J=CThe Gettysburg Address^J=F
Fourscore and seven years ago....
```

ACTIVE FONT
-------------
Printrix keeps track of four fonts for use during a single typesetting line. Of these four fonts, one is "active" at any given time. The "active" font is the font currently in use, either being acted upon through menus or being used for typesetting.

Printrix uses the number keys to control the active font. You may change active fonts from the menu or from embedded command.

Range: 1-4

Location:
Print Document Menu
Font Library Menu
------- Embedded Command
^Q=n
n is a number between 1 and 4

Timing:
An embedded command to change fonts takes effect immediately, even within a word. All text following the command will be typeset in the new font until another font change command is found. You may change fonts within your document as often as you like.

All font enhancement commands apply only to the current active font.

In Use:
Printrix begins typesetting a document in the active font specified from menu. This font will remain active until an embedded font change command is found. If your document begins with or contains several blank lines, the vertical gap on paper depends on the current active font.

LINEFEED ADVANCE
----------------
This parameter allows you to select single, double, or triple-spacing between lines of text.

When lines are single-spaced, the distance from the baseline of one line to the baseline of the next is equal to the vertical cell size of the largest font on the line plus that font's linefeed gap. Double-spacing and triple-spacing are twice and three times that distance.

The linefeed advance command affects all fonts and all text in the document.

Range: S, D, or T

Location:
Print Document Menu (menu command only)

Fine-Tuning
-----------

If you want more precise control over distance between lines than you can achieve with Linefeed Advance, use the Linefeed Gap command. This is a font parameter, which can be changed for each individual font, and allows you to specify distances measured in dots.

QUALITY OF PRINT
-----------------
This command allows you to control the blackness of print. Single-strike mode, in which the printhead makes one pass over the line of print, is lightest. The maximum setting is 5, which causes the printhead to make five passes of the line of print, striking every dot five times.

Range: 1 - 5

Location:
Text Format Menu
------- Embedded Command
^Q=n
n is a number within the accepted range

In Use:
Quality of print affects all print on a line, both text and graphics.
Since print quality operates on a printing line, it can change only between lines. When an embedded command to change print quality is found, the actual change takes place on the current line, affecting even previous text on that line. You may want to place the print quality command only at the beginning of a paragraph or on a line by itself.

**PAGE NUMBERING; POSITION; START**

This group of commands controls the automatic printing of page numbers on each page of your document. The first command turns page numbers on or off. The second command, Position, selects top or bottom of the page. The third command, Start, allows you to begin numbering, with any positive integer. All page numbers are printed in the font loaded into Position 1.

Ranges: Yes/No; Top/Bottom; 0 - 999

**NEW PAGE**

This command instructs Printrix to begin a new page immediately. Typesetting breaks off at the point where the new page command is found, and resumes at the top of the following page, in single-column printing, or at the top of the next column, in two-column printing.

**TWO COLUMN PRINTING**

This command allows you to print in newspaper-style columns. Printrix prints the first column, then uses the reverse linefeed capability of the printer to return to the top of that page and print the second column.

Ranges: Yes/No

Check Your Printer

If you use the embedded command to be in two-column printing (^C=Y), Printrix stops the current printing line immediately, moves to the next line, and resumes printing on that line, in two columns. We suggest you insert this command at the beginning or end of a paragraph or on a line by itself.

When you are printing in two columns, the ^NP command immediately breaks the current column and moves printing to the top of the next column, whether that is on the same page or the following page.

If you use the embedded command to end two-column printing (^C=N), Printrix finishes the current page in two-column mode, then begins the next page without columns. You may want to use this command in conjunction with the ^NP command.

Check Your Printer

If you have one of these printers (Apple DMP, ImageWriter, ImageWriter II; Canon Print Document Menu Itoh 8510, 8510 SCP; Fujitsu DL2400, DL2600; NEC 8023, 8025, CF-6, CF-7, P5, P5XL, P6, P7; Texas Instruments 855, 857, 865; Toshiba 1340, 1351, P351, P351C), Printrix automatically utilizes a reverse linefeed capacity to return to the top of the page between columns.

If your printer was not listed above, you must return to the top of the page manually. To do this, set Wait at End of Page to Yes. Then, when the printer pauses, turn it off-line, roll the paper back, turn it on-line, and press the spacebar to resume printing.

**NEW PAGE**

This command pauses Printrix between every page of typesetting, allowing you to change paper stock, adjust the paper position, etc. You may not change the Printrix settings or the text file during these pauses.

Range: Yes/No

**NEW PAGE**

This command pauses Printrix between every page of typesetting, allowing you to change paper stock, adjust the paper position, etc. You may not change the Printrix settings or the text file during these pauses.

Range: Yes/No

Location: Print Document Menu (menu command only)

Special Use: Two-Column Printing
This command may be used to allow two-column printing on printers which don't have reverse linefeed capabilities. Set Wait to Yes and Two-Column Printing to Yes. When the printer pauses at the bottom of the first column, manually roll the paper back to the top of that page, and press the space bar to resume printing.

NUMBER OF COPIES
----------------
This command allows you to print multiple copies of a document.

Range: 1 - 999

LOCATION: Print Document Menu (menu command only)

PRINT LITERAL CHARACTER
------------------------
This command is used to print a Printrix embedded command as part of your document. Use it to tell the program to print, rather than interpret, a command.

Range: one character, the carat (')

LOCATION: Embedded Command Only

Examples:
The text string "L=ML=2 will be typeset as "ML=2.
The text string "ML2 will result in setting the left margin to a value of 2.

In Use: The "L= command is needed only when you want to print a Printrix command. In all other uses of the carat, when the following characters do not match a Printrix command, they will be printed automatically. This command does not allow you to pass an escape sequence to the printer.

UNDERLINING
-------------
Two embedded commands work together to produce underlining in your document. The first turns underlining on, the second turns underlining off. All text, numerals, punctuation, spaces, and tabs between the commands will be underlined.

LOCATION: Embedded Command Only

Start Underline "US
End Underline "UE

Timing: The underline commands take effect immediately, even between the characters of a word.

Special Uses: Tabs
Tab commands and underlining work well together to draw horizontal lines. This feature is useful in creating forms, designing tables, etc.

Examples:
"TC"TS=1.2"TS=3.5NAME"TAB"US"TAB"UE
ADDRESS"TAB"US"TAB"UE
"TAB"US"TAB"UE
PHONE"TAB"US"TAB"UE
will print as:
NAME

APPLE II COMPUTER INFORMATION

ADDRESS

TELEPHONE

"TC"TS=3
Chapter One "US"TAB"UE 3
Chapter Two "US"TAB"UE 8
Chapter Three "US"TAB"UE 21
Chapter Four "US"TAB"UE 35

will print as:
Chapter One 3
Chapter Two 8
Chapter Three 21
Chapter Four 35

FONT LIBRARY PARAMETERS

Select Active Font

Use the number keys, 1 through 4, to select an active font from the group of fonts in the current layout file. Here, the active font is the font or font location which you wish to operate on.

On the screen, an asterisk denotes the currently selected active font.

Range: 1-4

LOCATION: Font Library Menu (menu command only)

Load Font from Disk

This command lets you load a font from disk into the currently specified active font location (indicated on screen by an asterisk).

LOCATION: Font Library Menu (menu command only)

Procedure:
1. Select the active font location by pressing a number key.
   (Note: There may already be a font associated with that location. You may load a font anyway; Printrix will first delete the current resident, then load the new font.)
2. Press L.
3. Enter the prefix and filename which locate and identify the font you want to load. Press RETURN. Printrix looks at the specified area. If it finds a file of the specified name, it will display the file and ask for confirmation.
   (Note: If you press RETURN without entering a prefix or filename, Printrix will search the default area for any file with a SET.filename form. You may accept any of the fonts it finds there.)
   If you answer Y, that font is loaded. If you answer N, Printrix continue to search the area. If Printrix cannot find a font with the specified name, the screen will display a message and wait for further instructions.

Delete Font from Memory

This Font Library option deletes the active font from the current layout file. Use it to make room for loading other fonts. Delete Active Font does not disturb any font files on disk, or change the layout file on disk unless you resave it without the deleted font.
Location:
Font Library Menu (menu command only)

Procedure:
1. Select the active font location by pressing a number key.
2. Press D.

Reload Font Library
-----------------------
This option lets you load an entire new library of fonts in one fell swoop. Printrix will load into the current layout file the first four fonts it finds in a specified prefix, until it runs out of memory space. The fonts are loaded in the order they are found on disk, with the font parameters which are saved with the font. The layout file's font specifications are overwritten. However, this font information will not be saved with the layout file for reuse UNLESS you perform the Save Layout File operation.

Location:
Font Library Menu (menu command only)

Procedure:
1. Press R.
2. Enter the prefix where the desired fonts are located, and press RETURN.

The screen will display the font loading process.

Font Sub-Directories
---------------------
If you have a certain group of fonts that you generally use for one application, and another group that gets used for a different application, etc., you may find it convenient to keep the fonts on separate disks or on separate paths. You can then use the Reload command to load an entire group of fonts quickly.

Change Font Parameters:
This command causes Printrix to display a new menu, from which you may change the printing parameters of the active font.

Location:
Font Library Menu (menu command only)

Embedded Commands Override
-----------------------------
Each of the nine font parameters has a corresponding embedded command which may be inserted in your text file. The menu parameters define the starting form of the font; embedded commands change the font for special purposes within the text file. Within one printing job, the embedded commands control the font appearance. After the document has finished printing, the fonts are reset to their original parameters for new print jobs.

Font Name and Cell Size
-----------------------
These two parameters may not be altered, either from the menu or from text file. They are displayed on the Change Font Parameters menu for information purposes.

The font name identifies the current font. It is the filename with which the font was saved to disk in Fontrix. To change a font name, load the font in the Fontrix Font Editor, change its name, and resave it. The ProDOS renaming function is not effective.

Cell size refers to the font character frames - imaginary rectangles which contain the characters. The cell size is the same for all characters of the font, even though the characters within each cell may be of different heights and widths. The cell dimensions are measured in dots.

Proportional Spacing
---------------------
This parameter allows you to select proportional or nonproportional character spacing for the active font. If a font is printed in its nonproportional form, each character gets a preset amount of horizontal space, independent of the width of the character. If a font is printed in its proportional form, each character receives a horizontal space determined by its width. The excess space is shaved off the right edge of the character cell.

Range:     Yes/No
Location:  Change Font Parameters Menu
Embedded Command
          ^FP=Y or ^FP=N

In Use:   For most printing, proportional spacing is preferable because it produces text that is evenly spaced to the eye, while nonproportional spacing can leave distracting gaps between characters.

For some applications, however, nonproportional spacing is required. For example, you may wish to print columns of numbers which are vertically aligned. If this is the case, you will need to set the Spacebar Width equal to the horizontal cell size of the font you are using, and give the font a negative Character Spacing Gap, so that the character cells overlap when printed. Some experimentation may be required to find the best setting for your font; start with a negative value that is one-third the horizontal cell size. Character Spacing Gap and Spacebar Width are other font parameters, covered later in this chapter. For a more extensive explanation of nonproportional printing, with examples, see Lesson Two.

Character Spacing Gap
---------------------
This parameter determines the amount of space Printrix issues between characters in a font. Spacing gap is measured in dots (pixels). This space is inserted between the character cells, whether the font is set for proportional or nonproportional printing.

Range:     -99 to 99
NOTE: In this case, the - symbol means a negative value. It does NOT mean that the new character spacing gap is relative to the previous value. Do NOT use a + symbol for positive values of the character spacing gap.

Location:
Change Font Parameters Menu
Embedded Command
          ^FS=n
n is a value within the accepted range

Special Uses: Kerning, Nonproportional Printing

The ability to set the spacing gap to a negative value is useful for nonproportional printing, as explained in that section, and in Lesson Two.

The ability to change the spacing gap in either direction allows you to fine-tune your printing. This is especially important with large fonts, and in headlines or captions. The most frequent application is kerning.

Kerning refers to adjusting the spacing gap between particular pairs of letters to keep the overall appearance of the text even.

In the following example, the kerned text was created by adjusting the character spacing gap between the letters T/o, F/a, V/A, T/A, A/G, L/Y, and Y/C. After each adjustment, the character spacing gap must be reset to its original value for the other letters in the word.
When printing columns of numbers or characters, the font in use must be set for nonproportional spacing, a negative character spacing gap, and a spacebar width equal to the horizontal cell size. For a more complete discussion, see Lesson Two.

Baseline

The baseline is an imaginary horizontal line which positions the font upon the page. Letters such as "g" and "y" rest their bodies upon the baseline, while their descenders rest below it. When you change fonts, each font is aligned on the same baseline for continuity across the page (the common baseline). Changing a font's baseline value will move the font vertically with respect to the common baseline. If you increase a font's baseline value, characters will be printed above the common baseline. If you decrease the font's baseline value, it will be printed below the common baseline.

The baseline value is measured in dots. The top row of dots in a character cell is zero, and the bottom row is the vertical cell size of that font.

This parameter is used to set the amount of space between lines. It is measured in dots (pixels). When there is more than one font on a line, the linefeed gap of the largest font is used for the entire line.

Relative Values Apply

You may define the embedded command for linefeed gap in either absolute or relative values. Absolute values are entered WITHOUT + or - symbols, and they determine the number of dots between the bottom of one line and the top of the next.

Relative values are entered WITH a + or - symbol. The value is then added to or subtracted from the previous linefeed gap value.

In Use:
The linefeed gap parameter may be used for fine-tuning the space between lines, or "leading." However, the command applies only to one font at a time (the active font), so be sure to change the linefeed gap values for as many fonts as needed for your format requirements.

If you want to double- or triple-space an entire document, you may either change the linefeed gaps of all fonts, or use the linefeed Advance parameter (discussed earlier in this chapter). However, if you want to use a combination of single-, double- and/or triple-spacing, use the linefeed gap commands.

Spacebar Width

This parameter defines the amount of space left blank between words. It is measured in dots.

Range: 0-99

Location:
Change Font Parameters Menu
Embedded Command
^FW=n

Relative Values Apply

When using the embedded form of the spacebar width command, you may define the width in either absolute or relative values. Absolute values are entered WITHOUT + or - symbols, and determine the number of dots between the last character of the previous word and the first character of the following word.

Relative values are entered WITH a + or - symbol. The value is then added to or subtracted from the previous spacebar width value.

In Use:
Tables/Vertical Alignment

When printing columns of numbers or characters, the font in use must be set for nonproportional spacing, a negative character spacing gap, and a spacebar width equal to the horizontal cell size. For a more complete discussion, see Lesson Two.
Change Font Parameters Menu
Embedded Command
"FI=Y" or "FI=N"

Horizontal Boldface
This parameter allows you to increase the weight of vertical lines in the active font.

Range: 0 - 4
Location: Change Font Parameters Menu
Embedded Command
"FH=n"

n is a value within the accepted range

Relative Values Apply

When you use the embedded form of the boldface command, you may enter either an absolute or a relative value.

Absolute values determine the amount of weight added to the font. They are entered WITHOUT a + or - symbol.

Relative values are added to or subtracted from the previous boldface value. They are entered WITH a + or - symbol.

Font Magnification
The horizontal and vertical magnification parameters may be used together or separately to increase the printed size of a font. The horizontal magnification factor increases a font’s width; the vertical magnification factor increases its height. You may double, triple, quadruple, etc., a font; you may not decrease it or enlarge it by a noninteger factor such as 1.2 or 2.75.

Range: 1 - 99
Location: Change Font Parameters Menu
Embedded Command
"FX=x" (horizontal magnification factor)
"FY=y" (vertical magnification factor)

x and y are values within the accepted range

Relative Values Apply

You may use either absolute or relative values with the embedded form of the magnification command. Absolute values are entered WITHOUT + or - symbols, and determine the size of the font directly.

Relative values are entered WITH a + or - sign, and are added to or subtracted from the previous magnification value. In other words, if a font’s current horizontal magnification value is 2, and your text file contains the command "FX=+2", the result will be a font printing at four times the original width.

In Use:
With magnification factors of 1, Printrix prints one dot at the printer for each dot in the original font. With a magnification factor of 2, Printrix prints two dots at the printer for each dot in the original font. If you use large magnification values, the resolution (its smoothness) of the font when printed will decrease.

You may use magnification to produce the extended and compressed versions of existing fonts. You may also use magnification to compensate for non-square aspect ratios of printers. (See Chapter Three for a discussion of aspect ratio in relation to graphics printing.)
The following embedded command would print a Graffile named gfl.skyscape, which is stored in a subdirectory named Graffile.

`GPR="/diskname/graffile/glf.skyscape`  

The following embedded command would print a clip-art graphic called art.santa. Since no location is given, Printrix will first search its default directory, then ask you for directions.

`GPA="art.santa"`

Timing:  
A graphic called by these commands will begin printing on the line immediately following the current printing line, if there is room remaining on the page. If the graphic call is encountered near the bottom of the page with insufficient space remaining before the bottom margin, Printrix will hold the graphic until the next page.

If you call a graphic while another graphic is printing (if the second call comes too soon in the text file), the second command will be ignored.

Watch Your Margins
-------------------  
If you try to print a graphic that is larger than the printing window (the rectangle defined by the four margins), Printrix will automatically move the graphic to the left margin, then crop it on the right and/or bottom edges to fit the available space. To prevent this, reset your margins to accommodate the graphic size BEFORE calling the graphic. If you call a graphic before inserting the margin change command, the new margin values will be put on hold until the graphic has finished printing.

GRAPHIC MAGNIFICATION
----------------------  
Two commands control graphic magnification - one for the horizontal dimension and one for the vertical dimension. You may set them to the same or different values, as you choose.

To print a graphic in its original size, use the default magnification values of 1 and 1. To double its size, set both dimensions to 2. Only integer values may be used (in other words, Printrix will not accept a magnification value of 1.5).

A graphic magnification setting will apply to all graphics in the text file, unless changed by a subsequent embedded command.

Remember that the size of the graphic when printed depends not only on the original size of the graphic but also on the resolution of your printer.

Range: 1 - 99  
Location: Graphic Format Menu
Embedded Command `GXM=x`  
`GYM=y`  

x and y are values within the accepted range

Note: As you move from magnification factors of 1x1 to factors of 2x2, you are essentially causing the printer to print a 2x2 block of dots for every dot in the original graphic. This increases the size of the print-out, and also decreases the apparent resolution of the graphic - diagonal lines and curves will exhibit the "stairstep" or "jaggy" effect. Therefore, magnify only when necessary.

Special Uses: Correcting for Non-Square Aspect Ratios

Many printers have different print densities for the horizontal and vertical dimensions. (The relationship of horizontal to vertical resolution is called aspect ratio.) When printing graphics, this results in distortion of the graphic - stretching in one direction or the other. Circles on screen are printed as ellipses, etc. You may use the magnification commands to correct for non-square aspect ratios by setting the horizontal and vertical dimension accordingly.

For example, many Epson printers have a horizontal resolution of 120 dpi (dots per inch) and a vertical resolution of 75 dpi. Unmagnified, a graphic will print tall and thin. To correct, set the horizontal magnification factor to 3 and the vertical to 2. This results in a horizontal resolution of 40 dpi and a vertical resolution of 37 dpi, accurate enough for most purposes. Of course, the graphic now has increased in size and decreased in resolution, so weigh all these factors against each other and design the page or the graphic accordingly.

Negative Image
-------------  
This parameter allows you to print a graphic as a negative image of itself. Like a photographic negative, dark and light areas of the picture are reversed. If the graphic is in color, pairs of colors will be reversed.

Range: Yes/No  
Location: Graphic Format Menu
Embedded Command `GN=Y` or `GN=N`

Caution: If you have a dot matrix printer, be careful about printing large areas in solid black - you may overload the printhead element and shorten the life of your printer. If you have an inkjet or laser printer, don't worry.

Horizontal Placement
---------------------
This parameter allows you to position a graphic against the left margin, against the right margin, or centered between the margins.

Range: L, R, or C  
Location: Graphic Format Menu
Embedded Command `GH=L`  
`GH=R`  
`GH=C`

Relationship to Text
---------------------
The relationship of text to graphics is controlled by two parameters, Horizontal Placement and Fit Text to Graphic, described later in this section. If a graphic is positioned left or right, you may command the text to "flow" around the graphic - "graphic run-around." Lines of text are full length above and below the graphic, and are shortened beside the graphic to fill the space between the graphic and the opposite margin. If a graphic is centered, no run-around is possible, and text will break above and below the graphic.

Graphic Color Printing
-----------------------
This parameter allows you to enable or suppress color printing of graphics.

Range: Yes/No  
Location: Graphic Format Menu
Embedded Command `GC=Y` or `GC=N`

Fit Text to Graphic
-------------------
This parameter allows you to position a graphic against the left margin, against the right margin, or centered between the margins.
This parameter allows you to select between three arrangements of text around an inserted graphic: Break, Flow, and Overlay.

Break: holds text typesetting while the graphic is being printed. When the graphic has finished, typesetting resumes.

Flow: performs a "graphic run-around" in which any remaining space to the size of the graphic is filled with short lines of text. Flow is operative ONLY when the graphic is positioned left or right. If the graphic is centered, you must choose either Break or Overlay. If you forget and set the parameter to Flow, Printrix will ignore the command and execute a Break. (Left, right, and center are controlled by the Horizontal Placement parameter, discussed earlier in this section.)

Overlay: allows you to print text directly on a graphic.

Separate from Text

This parameter controls the amount of space left blank between a graphic and the surrounding text. Included are the areas above, below, and to either side of the graphic. These areas are sometimes called "gutter space."

Range: 0.00 to max

max = length of printing line, or distance between the left and right text margins

Location:
Graphic Format Menu (menu command only)

APPENDIX A: FILE CONVERSION

All files used by Printrix must be in ProDOS format. This includes text files, fonts, and graphics. Your text files and graphics may already be in ProDOS format. However, if you want to use Fontrix Graffiles, fonts from the Fontpaks, or any DOS 3.3 text files and graphics, you must convert those graphics according to the following procedure.

ProDOS Conversion: Text files and Single-Screen Graphics

Apple provides two utilities to perform the DOS 3.3-ProDOS conversion. They are located on the ProDOS System Utilities Disks. CONVERT comes with the older Apple II computers. CHANGE DISK'S FORMAT comes with the Apple //c and newer Apple II computers.

To use either program, follow the procedures described in your Apple manual.

ProDOS Conversion: Graffiles

Fontrix Graffiles require special conversion procedures. A conversion utility is proved for you on the /CONFIGURE disk.

To convert a Fontrix Graffile to ProDOS format, set the prefix to /CONFIGURE and insert the /CONFIGURE disk (or, if you're running from hard disk, set the prefix to the appropriate subdirectory). Then input -PX.CONVERT. A menu appears, from which you may specify the source disk and file, catalog the contents of a disk, and begin the conversion. An on-screen counter keeps track of the conversion process.

ProDOS Conversion: Fonts

All Printrix fonts were created by Printrix's sister program, Fontrix, in DOS 3.3 format. The fonts contained on the Printrix disks /FONTS1 and /FONTS2 have already been converted for use with Printrix.

However, if you own Fontpaks, which were created using Fontrix, or if you have created Fontrix fonts for your own use, these fonts must be converted before you may use them with Printrix.

The font conversion is a two-step process. First, the file structure must be changed to ProDOS. Second, three font parameters must be added to the font file.

To convert the file format to ProDOS, follow the procedure described earlier for conversion of text files and single-screen graphics.

Then, set the prefix to /CONFIGURE disk and insert the /CONFIGURE disk (or, if you're running from hard disk, set the prefix to the appropriate subdirectory). Type -FONT.SETUP. Enter the prefix and filename of the font you're converting. Printrix now goes to a look-up table to read the font size. From this it calculates the three parameters of spacebar width, character spacing gap, and baseline. The results are displayed on screen. You may change any of these values, or accept Printrix's suggestions. Press RETURN to save the font with the new parameters.

Feel free to experiment with these settings. You may find it convenient to set up particular fonts to use in super/subscripting (change the baseline value), or nonproportional printing (change the spacebar width and character spacing gap).

APPENDIX B: Printers

If you read Chapter 3, you know that Printrix prints in graphics mode, which makes the size and proportion of the print dependent on the printer's graphics resolution and aspect ratio.

Consult the technical manual for your printer to determine the dip switch settings and resolution (dots per inch) of your printer.

APPENDIX C: FONTS

Printrix comes with 43 fonts, which are contained on the Printrix disks, for your use. They are ready to be loaded and used. Additional fonts are available on Fontpaks.

APPENDIX D: ART.GRAPHICS

A number of four-sector graphics are contained on the Printrix Configuration Disk. They may be used with the Printrix ^GPA command.

DOCUMENT printrix.tutor

Printrix Tutor II
original article by Bill Portenberry
Apple Fontrix/Printrix Club Newsletter
August 1987*

CONFIRMATION Some people have had trouble configuring Printrix. Configuration is necessary so Printrix will know what printer and word processor you are using. Here is how to configure Printrix. On versions 1.01-1.09, when you first boot Printrix, press the ESC key as soon as the disk starts to spin. After a while you should see a flashing cursor and the ] prompt. Put the Configuration disk in the drive and type PREFIX/CONFIGURE [CR] and then run CONFIGURE [CR].

If you are using a version over 1.01 then you would boot the program disk, put in the configuration disk and type [C].

The first screen asks for you keyboard type. Type "1" if you have a IIe, "2" if you have a IIc, or a "3" if you have a GS. Next you are asked for the manufacturer of your printer interface card. Find the manufacturer on the list and type the number to the left of their name. Next you will see a list of printer interface cards made by that manufacturer. Select the one you want by number. Then specify what slot the card is in. Normally the slot is one. If you are using the GS printer port, the slot is one. Now you will get a list of printers manufacturers. Find the manufacturer of your printer and select it by typing the number to the left of the name. Next you get a list of their printers. Find yours and select it by number. Some printers may offer more than one printing resolution. If yours does, pick the one you want to use. If one of the options for your printer is followed by (Quad Density), I would recommend you use that option. Quad density will be covered in an upcoming newsletter in more detail, but "in a nut shell" it gives you better printouts. With a few printers, the resolution is so high that Printrix doesn't have enough storage space to use it all. If you see a number, in parenthesis next to your printer, such as *(5.8 max)*, it means your documents can only be 5.8 inches wide.

Now comes your word processor. Printrix supports native files from AppleWorks, Apple Writer, Word Juggler and Word Perfect. If you don't use one of these word processors, you will have to use a text editor. All ASCII file has a RETURN character at the end of each line, and two RETURN characters at the end of a paragraph. A hard ASCII has a single RETURN character at the end of each paragraph. You will have to consult your word processor's manual to see which type of text file it will create. If you intend to print the tutorial files on the Printrix disk, configure Printrix for your interface card and printer, but set the word processor to ASCII soft.

After you select your word processor, you will see a recap of everything you configured for. Check it over. If it is correct, remove the configuration disk, insert the Printrix disk, and press RETURN to save the configuration info to disk. If you need to reenter anything, press R. To abort the configuration altogether, press ESC.

PROCDS PATHNAMES ProcDOS allows files to stored in a tree like structure. This allows you to store similar files together. It's also important for managing a large number of files on a mass storage device. ProcDOS implements this tree structure through volume names and subdirectories. The combination of the volume name, any subdirectories and the filename is called the pathname. This is the path ProcDOS must follow to retrieve the file contents. Many Apple users call the name of the volume (or disk name) the "Prefix", the subdirectory information and "Pathname" and then of course the "Filename" the name of the program. Others call the Prefix everything up to the filename and don't use the term pathname. For our examples, the term "Prefix" will be the volume name, subdirectories, and the filename. The term "Prefix" will be the volume name and subdirectories, without the filename.
When you format a ProDOS disk with the system utilities you are asked for a volume name. The volume name is the first step in the pathname. The newly formatted disk is called a volume and it is given the name you supplied. This volume also has a main directory. A volume directory is a special type of file. It contains the information ProDOS needs to find other files on that volume. You can see some of that information by cataloging the volume with the system utilities. There can only be 51 entries in a volume directory. The volume name can be pretty much anything within some limits. The name cannot be longer than 15 characters. The first character must be a letter. The first character you can use any combination of letters, numbers and periods. Normally a volume name will reflect the contents of the volume and a slash (/) will precede the volume name. For example, the volume Printrix is supplied on is named /PRINTRIX.

At this point you can start storing your programs in the main directory. But if you have a 3.5 disk, or a hard disk, the directory can fill up fast. What's needed is a way to group files together in logical groups. ProDOS provides this function through subdirectories. Subdirectories are the intermediate steps in and type new information, or delete characters with the [DELETE] key and type new characters as needed.

Finally is the filename. The filename is subject to the same naming rules as volumes and subdirectories and is the final step in the pathname. Printrix limits the entire pathname and filename to 79 characters, including all slashes. If you're starting to get confused, think of a big oak tree. The volume name is the trunk of the tree. Each branch is a subdirectory. A branch may have another branch growing out of it, which could also have a branch growing out of it, etc. The leaves are the filenames. A large tree can have a lot of branches and leaves.

Let's say you have Printrix set up on an 800k disk. The volume name is /PRINTRIX. There are two subdirectories called FONTS and CLIP.ART. All the fonts are stored in the FONTS subdirectory. The pathname for SET.CASLON25 would be /PRINTRIX/FONTS/SET.CASLON25. Notice the slashes. The pathname always starts with a slash and slashes separate the volume name, subdirectory names and the filename.

If you have a lot of subdirectories, pathnames can get long, and typing them can be tedious. To get around this ProDOS supplies the prefix. The prefix is a pathname that is always placed on front of the filename to make the complete pathname. Using the example from the last paragraph we could set the prefix to /PRINTRIX/FONTS/. Then we could get to caslon.25 by typing set.caslon.25. To get to a file in another directory, we would have to change the prefix.

To help manage prefixes, there is a bonus program on the Printrix configuration disk. To use it, boot Printrix and press ESC immediately. When you see the j and flashing cursor insert the configuration disk and type LOAD/CONFIGURE/DEFAULT.PATHS [CR] and then put in the program disk and type PREFIX.PRINTRIX [CR]. When the cursor is again ready, type RUN [CR]. "default.Paths" doesn't mince words, the prompts are short and to the point. When you see LAYOUT and a question mark, type prefix for the location of your layout files. Don't forget the starting slash. At the next question mark, enter the location of your fonts. Finally enter the location your text files. Before pressing RETURN insert the Printrix program disk, Printrix will use these prefixes as defaults, but you can always override these prefixes from within Printrix.

EDITING KEYS Printrix has some editing functions that are available anytime you are asked for a prefix or filename. Here's a short summary of the editing keys.

When typing path and filenames you are always inserting characters. Any characters to the right of the cursor will slide right to make room for the new characters. If the cursor is on the first character of a line, the first character pressed (other than a special control, tab, or open-apple character) will erase the line.

7 - The question mark will scan all your disk drives and show you the volume names mounted in those drives.

< - > The arrow keys move the cursor to the right or left.

OA-Y - T Holding down the open-apple key and pressing [Y] deletes the characters from the cursor to the end of the line. Characters to the left remain intact.

DELETE - The delete key deletes characters to the left of the cursor, one at a time. Characters to the right slide of the left to fill the gap.

OA-DELETE - Holding down the open-apple key and pressing DELETE removes the character under the cursor. The characters to the right slide of the right.

TAB - The TAB key jumps to the next slash. This makes it easy to add a subdirectory to a prefix. Sometimes it is faster to tab to the end of a line and type new information, or delete characters with the [DELETE] key and type new characters as needed.

Control A - Holding down the control key and pressing A will move the cursor to the start of the line.

Control Z - Holding down the control key and pressing Z will move the cursor one past the end of the line.

Control X - Holding down the control key and pressing X will home the cursor and delete the line.

Next month in Printrix tutor we'll get back to covering the Printrix menus. See you next month.
If a Prodos compatible clock is detected in the system the time is displayed in 12-hour format at the menus.

If no clock is available the ability to set the system DATE is provided so the user can at least date stamp his output files.

Basic system is protected by PROARC, therefore all normal Prodos commands are available to the user within PROARC.

Floppy drives MUST be running out of Slot 6. Drive 1 or 2 may be selected for DISK archival/unarchival.

All file accesses follow the normal Prodos file hierarchy.

At the menu screens, CONTROL-A will toggle upper/lower case screen output.

Program exits through Prodos's normal Quit code.

Please distribute this program as freely and fluently as possible. Let's campaign for widespread Prodos-based BBS's.

Thank's,

Software Encryption Analysts of South Texas

PROARC is a Prodos based utility designed to provide the user the ability to "archive" his 5.25 disks to a Prodos file in a compressed format. A secondary function gives the user the ability to read an input Prodos file and generate a corresponding compressed output file. When archiving disk data, the resultant output file will be of the following format:

Filetype = $F7  Filename format = XXXX.DSK

When archiving a file, the resultant output file will be of the following format:

Filetype = $F8  Filename format = XXXX.ARC

This output filename (XXXX) may contain up to 11 characters, not counting the 4 character filename extension (.DSK/.ARC). The extension may be entered manually by the user or the program will automatically append the proper extension for him.

These resultant files can then be placed on a mass-storage device for archival purposes or uploaded to your favorite BBS for disk/files transfers. The degree of compression realized from archiving a disk or file will vary according to the source data. In case of disk archival, the output disk file can be minimized if the source disk is not too fragmented. Fragmentation results from repeated file deletions and allocations. The user can "defragment" a normal DOS 3.3 or PRODOS disk by copying all the files off to a freshly formatted disk. The resulting defragmented disk is then archived by PROARC to achieve minimal output file size. Certain file types will realize significant file size reductions when archiving them, especially text files. In any case, any file size reductions will affect transfer times in BBS uploads/downloads.

The user can then "de-archive" these resultant files back to their original forms. When converting a DISK file back to a floppy, a low-level format is automatically performed on the output disk. In the case of an archived file, the original file's attributes are internally saved so the unarchived file will be identical to the original file.

Minimum system:

Any Apple II series computer with at least 64k and one 5.25 floppy drive.

Some other features:

The PROdos ARCHival Utility for 5.25 floppy disks and Files.

Programmed by The Freebooter

Software Encryption Analysts of South Texas
INTRODUCTION

Propagannihilate visits the asteroid Xirxoman, where the Game of Life (as written up in a cover story in Scientific American many years ago) is played out in real life.

This game was written on the Apple //GS using Orca/C. It can be played by one or two players. It's not an action thriller, but it can be exciting in its own way -- kind of the way chess is.

GETTING STARTED

Click on the PROPANN application icon. Read the introduction. This IS REALLY IMPORTANT STUFF! Click on "next page" to turn the page, or click on the "skip game" to skip directly to the game.

PLAYING THE GAME

There are three ways of playing PROPAGANNIHILATE, corresponding to the three major models of the origin of life. They are:

  DARWIN     CREATION     DIVINE INTERVENTION

In all these three, the playing area is populated by two species: “bluons” (represented by blue arrows), and “maruons” (represented by red arrows). They propagate, mutate, and compete for territory, with the inevitable conclusion being that one species survives while the other is annihilated.

Start the game by clicking on one of the three model options.

DARWIN MODEL

The Darwin model says that the origin of life was an accidental freak of nature. But once life was established, species propagate according to physical and natural laws, with the fittest surviving.

In the game, four seed cells appear at random locations in the colony. They propagate until one species is annihilated. There is no input at all from the players. Sounds fascinating, doesn't it?

CREATION MODEL

The Creation model holds that there was in fact some kind of purpose to the origin of life, but life is still bound by laws of nature that we maybe can understand but certainly can't change.

First, elect to have two players, or one player against the computer. The first player always plays red; the computer or second player play blue.

In the game, the player or players are asked to place four seed cells, two of each species, by clicking on empty cells in the playing area. Then you sit back and watch to see how wisely you chose as they spread out over the colony until, again, one species is annihilated. The nice thing is that you can go check the turkey, take a shower, whatever, and not lose any playing time!

DIVINE INTERVENTION

The Divine Intervention model maintains that God's will dictates not only the origin of life, but also every major event in our collective lifetimes.

PROPAGATION RULES

Here are the rules that govern the birth, death, reproduction, and mutation of both bluons and maruons. These rules may be different from the "Life" rules you are familiar with in other games.

* Each individual is represented by an arrow pointing left or right. Fertile individuals are represented by colored arrows; infertile individuals are represented by white arrows in a colored background. A fertile individual can give birth to children in adjacent unoccupied cells in an upward, downward, and forward direction. No child can be born in a vacant cell that is behind the fertile cell. If two or more members of the same species are adjacent to a vacant cell, regardless of whether they are fertile or infertile, no child of that species can be born into that cell.

* When a vacant cell is bordered by exactly one fertile cell of each species, and the cell is not behind either fertile cell, then the species with current "priority" successfully reproduces into that cell. Priority alternates with each generation.

* The two species are "invisible" to each other. Thus, if the species with priority was not able to reproduce into a vacant cell because it had two or more adjoining members, the other species can still reproduce into that cell if it has one and only one adjoining fertile cell.

* The original individuals in the colony, and their children and immediate descendents, have a life span of two generations, with a fertility span of one generation.

* When a child is born into the farthest column in its direction of propagation, it mutates. Its life span is increased by two generations, its fertility span is increased by one generation, and its direction of propa-
gation reverses. No original individuals (or newly created individuals in the Divine Intervention model) can be placed into this column.

* When a new individual is created in the Divine Intervention model, it assumes the same life span, fertility span, and direction of propagation as the highest level of mutation yet to have appeared for that species.

Welcome to the wonderful world of ACOS! I would like to introduce you to ProTALK, a GBBS compatible Bulletin Board System (BBS) running under the ACOS environment. ProTALK is a complete BBS package with auto-networking abilities to boot! What is the price of ProTALK you ask? It is absolutely free!

The only thing I ask is you register, so we can keep tabs on who’s ready for an upgrade, or who would like to be in the network. We may also ask you to beta-test any future updates, so it would be in your best interests to register! You merely call the ProTALK support board, the information on it is given at the end of this file.

Finally, before I begin with an explanation and instructions on how to setup ProTALK, a word to the reader. I have worked countless hours on this product, in hopes of bettering the Apple II BBS community. I do not wish to receive mail asking why I let this into the public, or how bad I wrote code. I wrote it, unless you have something constructive to say, don’t say anything at all. I am releasing this publicly mainly so I do not have to maintain the hassle of validating systems and such, but also maybe BBS users can appreciate how much work SysOps really do. It seems a current trend that users DEMAND the highest technological advancements from the poor sysops, who must struggle to keep up with such demands if they wish to have any users. It becomes a extremely large power play. Just stop and think about your BBS, whether you are running it for yourself anymore, or for boosting your ego by saying you have the biggest mass storage device in town...

With that deep, philosophical question in mind, let us continue!
"hacker" types who will want to dig through every bit of the source code so I won't delve into the inner workings!

I'll just insert that it is an easy to use, fully configurable BBS without too many hassles! It comes with its own configuration program, so you don't have to become too deep a hacker!

**NOTE**  You must follow these directions if this is your first time.

| Part III | ---> Installation |

|   Part IV   | ---> Configuring a New BBS |

|   Part V     | ---> Transferring GBBS to ProTALK |

** NOTE **
If you have previously run ProTALK, the only thing you need to run is the file CONVERT.S. If you have any questions, feel free to contact me, there are only 15 or so of you so it should not be much of a problem. Read the documentation however for technical aspects of ProTALK not yet revealed!

So you've decided to actually boot up/run ProTALK, eh? Good for you! The installation is quite simple. First, you must own a hard drive, or some other mass storage device. Second, you must configure your hard drive as such for optimal performance. Note the drivemap, where VOLUME stands for /YOUR VOLUME NAME/ (eg, HARD1, CMS, etc, etc)

```
A:/VOLUME/BBS
  ---- will contain ACOS, ACOS.OBJ, and all the .S (segment) files
B:/VOLUME/DATA
  ---- will contain all the menus, help files, and data files
C:/VOLUME/DATA
  ---- not used by ProTALK
D:/VOLUME/DATA
  ---- not used by ProTALK
E:/VOLUME/DATA
  ---- not used by ProTALK
F:/VOLUME/BOARD
  ---- Where Message Base Files are stored
G:/VOLUME/MAIL
  ---- Mail/networking Storage areas
H:/RAM
  ---- temporary FAST-ACCESS data area
I:/VOLUME/DATA
  ---- not used by ProTALK
J:/VOLUME/DATA
  ---- not used by ProTALK
K:/VOLUME/DATA
  ---- not used by ProTALK
L:/VOLUME/AE/VOL.
  ---- SuperTAC data files
```

A: is where all the .S files will go, and also your copy of ACOS and ACOS.OBJ will go. This is where you will always boot up your BBS.

B: is where all the data files will go. These include any help files you make, and all the menus and data files generated by ProTALK.

F: is where all the message base files (BL1,BL2,BL3,etc) are stored.

G: is where your mail files and networking temporary files are stored.

H: is a area used by ProTALK for fast-access data storage/recall. It's crucial this area be on some sort of ram drive, as if it wasn't the BBS could slow down heavily.

L: is where SuperTAC stores all its data files. Read the documentation packaged with SuperTAC for more information.

If you currently run a BBS, please skip to part V.

If you have previously run GBBS, the only thing you need to do is => BACK UP YOUR HARD DRIVE <= I cannot guarantee something unexpected will happen, and if it does, you will lose your old BBS and be stuck with nothing! So Back that sucker up first!

Ok, now that it's all backed up, delete ALL your segments. I would suggest also following the guidelines in the DRIVESPEC MAP in Part III, but its up to you. Go into your GBBS Master CONFIG area, and reconfigure RAM:

| Part VI | ---> Modifications Needed |

Now unpack ProTALK.BQY and copy over all the segments (.S files) to the A: drivespecifier. On A: there should only be ACOS, ACOS.OBJ, and the segments.

Now unpack ProTalk2.BQY and copy over the help files and menus to your B: drivespecifier.

Now reboot the GBBS MASTER DISK, and answer "N" when it asks if you wish to configure your BBS from scratch. It'll ask for the pathname of your ACOS file. Enter /VOLUME/bbs =not= the /GBBS.PRO subdirectory but the subdirectory where ProTALK segments are contained!

Reconfigure all the drivespecifiers to meet the pathname standards, and make sure you make H: as /RAM.

Now, finally, boot up the ACOS on the /VOLUME/bbs drive. Enter for a starting segment "GEN.CONFIG".

After this segment has compiled, you must answer "Y" to "Configure BBS from scratch?".

Follow the online prompts, and your BBS is now ready to run! You may wish to add boards of course, use the "E" command in system segment...

First, create the directories as specified in Part III. Now, you must get ahold a copy of a master GBBS disk. Now boot up the GBBS disk, and install GBBS onto your hard drive. Now, go in with a copy utility such as ProSel (tm) or Copy II+ (tm) and copy ACOS and ACOS.OBJ to the A: drivespecifier as mentioned in the above pathname map. Copy the rest of the /GBBS.PRO subdirectory onto your B: drivespecifier. Copy over BL1 to your F: drivespecifier.

Now unpack ProTalk.BQY and copy over all the segments (.S files) to the A: drivespecifier. On A: there should only be ACOS, ACOS.OBJ, and the segments.

I'll just insert that it is a easy to use, fully configurable BBS with- as ProSel (tm) or Copy II+ (tm) and copy ACOS and ACOS.OBJ to the A: drivespecifier as mentioned in the above pathname map. Copy the rest of the /GBBS.PRO subdirectory onto your B: drivespecifier. Copy over BL1 to your F: drivespecifier.

Now unpack ProTalk2.BQY and copy over the help files and menus to your B: drivespecifier.

Now reboot the GBBS MASTER DISK, and answer "N" when it asks if you wish to configure your BBS from scratch. It'll ask for the pathname of your ACOS file. Enter /VOLUME/bbs =not= the /GBBS.PRO subdirectory but the subdirectory where ProTALK segments are contained!

Reconfigure all the drivespecifiers to meet the pathname standards, and make sure you make H: as /RAM.

Now, finally, boot up the ACOS on the /VOLUME/bbs drive. Enter for a starting segment "GEN.CONFIG".

After this segment has compiled, you must answer "Y" to "Configure BBS from scratch?".

Follow the online prompts, and your BBS is now ready to run! You may wish to add boards of course, use the "E" command in system segment...

Ok, this is for all you SysOps who currently run GBBS Pro v1.3 and wish to convert to ProTALK. If you are starting from scratch or do not wish to convert your BBS, please read PART IV.

The VERY, VERY, VERY first thing to do is => BACK UP YOUR HARD DRIVE <= I cannot guarantee something unexpected will happen, and if it does, you will lose your old BBS and be stuck with nothing! So Back that sucker up first!

Ok, now that it's all backed up, delete ALL your segments. I would suggest also following the guidelines in the DRIVESPEC MAP in Part III, but its up to you. Go into your GBBS Master CONFIG area, and reconfigure RAM:

Now unpack ProTalk.BQY and ProTalk2.BQY into your BBS subdirectory(s). Boot up ACOS. Enter "GEN.CONFIG" as the starting program.

Wait until the segment compiles, and answer "N" to "Configure BBS From Scratch?".

Follow the online prompts, and you should be ready to go! Read Part VI however for modifications that you will have to do...

There are many modifications that will be required to get ProTALK to custom-fit your needs. There is about 15 minutes of work to get it up and running correctly however after configuring it all. You must
merely load each segment, and do a FIND/REPLACE the following...

THE APPLE REBEL BBS  = YOUR BOARD NAME
THE REBEL           = YOUR HANDLE/NAME
SLEDDOR            = YOUR COSYSOPS NAME
916/457-0624        = YOUR BOARDs NUMBER

There are about 7 segments that must be modified, however, it would be wise to check every segment. The fastest way is to use an Apple IIgs, Diversi-Key, and the ProTERM editor, you merely make four macro's that just automatically find/replace the above.

At any rate, after these modifications, you merely load up ACOS, hit <RETURN> at the SEGMENT TO LOAD: prompt, and after compiling, and a wait, you should see the logon screen. DO NOT WORRY if you get a msg stating "SCANNING VOLUME [xx]", or if you get a BAD DRIVE SPECIFIER after SCANNING VOLUME [xx], it just means that the BBS is making a master directory automatically and could not find one of the drivespec automatically, it will hang for about 3 minutes and reset itself with ease.

Now, you must go manually compile each segment so your users don't have to wait while they're online (you are, after all, a nice sysop!). After testing out various features, and doing whatever pleases you, go to the system segment. You may have to run the NEW MESSAGE FIX, the command is "M" from the SYSTEM LEVEL. The reason is that not always are the number of new messages converted due to quirks in ACOS and compression routines. Logon as a few users and see if the number of new messages is correct. This is only applicable if you converted your old GBBS board of course!

Now you must go in, create boards, edit boards, and change any menu's you see fit. eg, you are just making cosmetic changes before you open up for the general public!

The hardest part comes now. Boot up the idle-time-screen, turn off the monitor, and go watch TV or exercise. After all, 24 hours in front of a CRT screen is dangerous!

Part VII --> Segment Descriptions

Herein is a list of all segments and short descriptions of each...

LOGON.SEG.S  = Non Proterm logon, also boots up the board and is a very important and heavily used segment...
LOGON2.SEG.S = ProTERM Logon segment, is basically the same thing as LOGON.SEG.S but is very glitthy!
MAIN.SEG.S   = Main subroutine of the BBS, its basically the shell where users execute the main commands
MAIN2.SEG.S   = ProTERM version of MAIN.SEG.S, glittery as usual
MSG.SEG.S     = Message base for Non-ProTERM users
MSG2.SEG.S    = Message base for ProTERM Users
MSG3.SEG.S    = Aux segment for MSG2.SEG.S, contains routines that would not fit!
SYSTEM.SEG.S  = System level, for SysOps only! Contains run-time commands that help you run your BBS...
SYSTEM2.SEG.S = Exact replicate of SYSTEM.SEG.S, kept in case you wish to make a glittery version

MAIL.S        = Mail segment
MAIL2.S       = Same thing as MAIL.S, just kept in case you wish to make a glittery version
SUPERTAC.S    = File transfer Segment, PROTERM Version
SUPERTAC.SYS.S = SuperTAC System Level Segment
SUPERTAC.AUX.S = Contains various routines for SuperTAC, PT Spec
SUPERTAC.AUX.S = Contains File Transfer routines of SuperTAC, PT Spec
STAC2.S       = Non-ProTERM Version of SuperTAC
STAC2.AUX2.S  = Contains File Transfer routines of SuperTAC, PT Spec
STAC2.AUX.S   = Various routines, Non-ProTERM version
STAC2.AUX.S   = Various routines, Non-ProTERM version
NEW.USER.S    = Non-ProTERM Version of segment that handles new users
NEW.USER2.S   = ProTERM version of segment that handles new users
GET.STATS.S   = Converts old users to new upon their logon
CHECK.BYE.S   = Segment that basically checks whether the user really wants to terminate or not in ProTERM Spec
TERMINATE.S   = Segment that handles termination on ProTERM Spec
VOTE.S        = Vote Segment
VOTE2.S       = Held in case you want to make a glittery version
STATS.EDITOR.S = Segment that holds routines in case the user wants to reconfigure certain statistics
STATS2.EDITOR.S = Same as STATS.EDITOR.S but glittery
HOME.S        = Segment that contains routines for clearing the screen in ProTERM Special
EDITOR.S      = Segment that contains the editor used by most of the BBS
EDITOR2.S     = Segment that contains the editor used by the message base
UP.S          = Segment that allows SysOps to upload to A: - L: drivespecifiers
NEW.MSG.FIX.S = Called by System Segment whenever a SysOp wants to reset the number of new messages
BOARD.EDIT.S  = Segment that is called by the System Level when a sysop wishes to edit a message base
VAR.EDITOR.S  = Segment that allows global var changes, called by System Level
GEN.CONFIG.S   = Configures the BBS for the first time
NET.CONFIG.S   = Contains the Config for the NetWork

Well, there you have it...a list of the segments in ProTALK v2.1!
Apple II Computer Info

--- Technical Information

Here are the bytes, flags, variables, and nibbles used by ProTALK v2.1...

---

**Flags**

0  - Unvalidated User
1  - Validated User
2  - Message Base Access
3  - SuperTAC access
4  - 10 Pieces of Bulk Mail sendable in EMAIL
5  - Video Width
6  - Users Time Limit (minutes divided by 10)
7  - Calls Made Today
8  - 50 Pieces of Bulk Mail sendable in EMAIL
9  - SuperTAC Entry/Privileged User status on Messages
10 - Download Access in SuperTAC
11 - Copy-Incoming Access in SuperTAC
12 - View Files Access in SuperTAC
13 - Upload Access in SuperTAC
14 - Elite in SuperTAC
15 - Super Elite in SuperTAC
16 - Super-Super Elite in SuperTAC
17 - SuperTAC File Manager
18 - Elitist Scum status on Messages
19 - Demigod status on Messages, Unlimited Pieces of Bulk Mail Sendable
20 - SYSOPS/COSYSOPS only

---

**Variables**

- BP = Bulletins Posted
- TC = Times Called
- CL = Time Allowed Daily TOTAL (in minutes)
- PV = UNUSED
- UL = Uploads
- DL = Downloads
- U1 = High Byte Blocks Uploaded
- U2 = Low Byte Blocks Uploaded
- D1 = High Byte Blocks Downloaded
- D2 = Low Byte Blocks Downloaded
- U3 = UNUSED
- D3 = UNUSED
- PT = UNUSED (may be used for a point system)
- DO = Days Online
- AY = Whether the user needs to be converted (NEVER change)
- LR = Last Message Read
- S1$ = Birthday
- S2$ = First Name
- S3$ = Computer
- S4$ = Sex
- S5$ = Group
- S6$ = UNUSED
- S7$ = UNUSED
- S8$ = UNUSED
- S9$ = UNUSED

---

**Nibbles**

- 0  - Video Width
- 1  - Users Time Limit (minutes divided by 10)
- 2  - Calls Made Today
- 3  - 50 Pieces of Bulk Mail sendable in EMAIL
- 4  - SuperTAC Entry/Privileged User status on Messages
- 5  - Download Access in SuperTAC
- 6  - Copy-Incoming Access in SuperTAC
- 7  - View Files Access in SuperTAC
- 8  - Upload Access in SuperTAC
- 9  - Elite in SuperTAC
- 10 - Super Elite in SuperTAC
- 11 - Super-Super Elite in SuperTAC
- 12 - SuperTAC File Manager
- 13 - Elitist Scum status on Messages
- 14 - Demigod status on Messages, Unlimited Pieces of Bulk Mail Sendable

---

**Bytes**

0  - Nulls used
1  - Low Byte of New Message Counter
2  - High Byte of New Message Counter
3  - Time Spent Online (minutes)
4  - Low byte1 of Bytes Posted
5  - High byte1 of Bytes Posted
6  - Low byte2 of Bytes Posted
7  - High byte2 of Bytes Posted
8  - SuperTAC Protocol
9  - Number of boards online
10 - Days BBS has been online
11 - System Uploads
12 - System Downloads

---

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 869 of 1262
First off, I modified SuperTAC to allow one more level. I describe the entire setup as...

Flag(20) = User has access to all public volumes
Flag(25) = User has access to privileged volumes
Flag(26) = User has access to elite volumes (does NOT show up in logs)
Flag(27) = User has access to another level of elite volumes (again, does NOT show up in download/upload logs)
Flag(28) = User is a board manager

I have it setup so that Public Domain utilities are setup for flag(20), then files for trade between higher level users are (25), and then files I have written are for flag(26), and finally ProTALK SysOps get flag(27).

Second off, if you have any trouble modifying ProTALK, getting it up and running, <ONLY> contact me on The Apple Rebel BBS. Sorry, but I do not want to waste long distance phone bills answering any more questions on how to get ProTALK up. I will gladly answer questions of any kind on the BBS though, so feel free to get an account.

The number again is posted at the end of this file.

Thirdly, ProTALK locks out 300 baud users, if you do wish to retain them, remove the line:

if info(2)=1 gosub lockout

from LOGON.SEG.S.

Lastly, you may be interested in the way ProTALK keeps the users time statistics in order. It has two sets, one to count how much time is allowed per CALL, and one to set how much time is allowed per DAY. There is no calls/day limit, just time limits.

time = Number of minutes allowed DAILY
nibble(5) = Number of minutes allowed per CALL (option #F on Sys Edit)

A good setting is 40 minutes per CALL, and 1 hour per DAY.

ProTALK contains two main external routines, they are named X.WAIT and X.CALL respectively. Both are available in the general public, and the documentation is available.

VOTe is a complete vote module, it requires very little work, once you boot it up (by either having the force vote option, or entering "V" at the main prompts) you are prompted with a SYSTEM MENU, enter "S" for GENERATE FILES, it'll automatically generate the files, and now you can proceed normally, by letting your users add questions or adding a few questions yourself.

There is a file called PROSCRN included with ProTALK. I did NOT write it, so don't give me undue credit for this great mod. It allows syssops to view ProTERM Special locally, to use it, copy it over to the prefix where your ACOS.OBJ is, boot up AppleSoft ProDOS Basic, and then enter the following commands:

|________________| _____________|______|____________________| B$ = Last User To Upload
|              | B$      = Last User to Upload
|              | Y6      = Flag(27) Access High Volume
|              | X6      = Flag(28) Access High Volume
|              | Y5      = Flag(28) Access High Volume
|              | X5      = Flag(27) Access Low Volume
|              | Y4      = Flag(26) Access Low Volume
|              | X4      = Flag(26) Access Low Volume
|              | Y3      = Flag(25) Access Low Volume
|              | X3      = Flag(25) Access Low Volume
|              | Y2      = Normal Access Low Volume
|              | X2      = Normal Access Low Volume
|              | Y1      = SysOp Access High Volume
|              | X1      = SysOp Access Low Volume
|              | W1,W2,W3
|              | Z1,Z2,Z3

SuperTAC only uses one data file, L:STAC.DATA (L: can be replaced by whatever drivespecifier you use). It contains the following lines...

X1, Y1, X2, Y2, X3, Y3, X4, Y4, X5, Y5, X6, Y6
A5, B5, C5
W1, W2, W3
Z1, Z2, Z3

Any volume that is above the one defined by FLAG(25) [Y3] is NOT shown in the system logs, such as DOWNLOAD, UPLOAD, and ABOUTs files. This means if you DO have special volumes setup you do not want your normal users to see, you should set up flag(26) or (27) [this allows two sets of elite volumes] to point to the high volumes, and then set up flags for your users accordingly.

The segment AUTODIR.S automatically creates a master directory every night. You must NEVER create a master directory yourself, just link to AUTODIR if you have to create one for reasons unknown.
The segment BOARD.EDIT.S allows you to edit your boards without having to boot up your GBBS Config program. I did not write this program; I merely modified it to keep it compatible with GBBS, it may have bugs for all I know, it does work fine when editing message bases however, and that is all I recommend you use it for.

If you have remote sysops who would like to download segments or such from your A: - L: drivespecifier, get them into your system level, and use the "S"egment Work. You will be able to upload, download, and catalog any of the drivespecifiers, the protocol is set to Batch Ymodem automatically.

Next, for those SysOps who currently run games, I would be VERRRRRRRRRY careful with them, some of them will definitely conflict with ProTALK. I have included TURBO.RUN.BQY in its own game module for your users entertainment, I did not write this fine segment, I am merely distributing it.

Also, there is a segment called DIAL.S. It is a beta-test dialing segment I wrote when testing X.CALL, just use it for the heck of it, it doesn't really serve any purpose, it will call out fine, but when you are online things look very strange, with carriage returns not being served properly. My aim was not to write a terminal program, just to test out X.CALL.

There is a segment called VAR.EDITOR.S included with ProTALK v2.1. It lets you to globally effect changes. It is called by typing "V" from the system level, you then select FLAG, BYTE, NIBBLE, or VARIABLE. You can change any of the variables that is specific for each user (a list is presented somewhere above) except AY, since this variable should never be changed.

You merely enter the flag/nibble/byte/variable to globally change, enter the new value, and then enter the starting user number and ending user number. The system will work for awhile, and the variable will have been globally changed!

The system also prints the time in the idle time state, if you have any problems with the board with X.WAIT, please contact me and we can work out something.

X.WAIT also kicks into a slow-wait routine sometimes, you will see the screen print something along the lines of...

RETURNING TO IDLE TIME STATE IN

and the 60 will vary from 1-60. Don't worry, this is a function I had to insert to keep the integrity of the board. It will return to the idle state within 1 minute.

SuperTAC allows multiple drivespecifiers to be online, to accomplish this three segments must be changed. They are:

SUPERTAC.S
STAC2.S
AUTO2IR.S

At the beginning of each segment, you will find a line something along the line of...

V15="L":V25="":FV=0

To use 2 drives/volumes, change FV to the highest volume of the first drive, and v25="K" or whatever other drivespecifier you wish. An example is:

/CMS/TRANSFER/AE/VOL.1
  2
  3
  4
/CMS.2/TRANSFER/AE/VOL.5

<= These are your L: drive specifiers
<= previously defined
<=
<= These are the transfer volumes on your second drive. They MUST be numbered sequentially "AFTER" the
<= all those on the first drive (eg, 5-8)

After changing these lines, whenever a user logs to volume 5 for example, SuperTAC checks to see if it indeed is above the first drive, and if so, it changes the drivespec to K: + x, where x represents the volume number. Remember, the second drive must NOT be numbered 1-20 or whatnot, but 20-40.

Note: This was a built in feature of SuperTAC, I did not write it!

Finally, if you wish to network, please read the accompanying NET.DOCS and call the Apple Rebel BBS as the instructions state. Networking is an exciting, innovative technology coming into full swing for Apple II BBSs, and I have designed cheap alternatives to calling direct, such as PC Pursuit, but these updates are only available on the Apple Rebel BBS.

Part XI

----> Wrapping it Up...

Well, I guess you've got ProTALK up now, eh? I wish the best of luck for you, and I sincerely hope you join in the network. Its SysOps who do that make it all worth it, and keep my faith in the Apple II Community alive. Feel free to drop me a note on the Apple Rebel BBS anytime, I'm available on other BBSs but more and more infrequently with other programming projects.

Lastly, I ask you to PLEASE register with the Apple Rebel BBS, I sincerely want to keep track of who's running this sucker. It may be nice to keep a running list or whatnot.

Thank you all for your time, and may God be with you, and your system, which will definitely need him...

:-)

Parik Rao

ProTERM Special Editor v1.4c= Documentation
program & docs by: Ron Mercer/The Dungeon Master

Call: The Mist // 216/974-1153 70megs, 9600bps (YES IT'S BACK!)

Updates

v1.0 : The CTRL-R (repeat) option was modified, thus making it easier to use that command.
      A Spinning Cursor option was added (Open Apple-C). v1.4c: There was a slight problem with the Repeat Character command. (If you exceed the max length of 126 then what was sent to the buffer was really fucked. This has been fixed.)
      The Open Apple-C (clear) option was changed to CTRL-K.
      The Open Apple-E (erase) option was modified, thus making it easier to use the command.

v1.0a: There was an error in the Spinning Cursor option (would jump back two spaces). This has been fixed.
      The Editor will now display the current time (if you have a ProDOS compatible clock). The Open Apple-C (clear) option was changed to CTRL-K.
      A Spinning Cursor option was added (Open Apple-C). v1.4a: Slight problem that MY program isn't exactly 100% compatable with CONTROL-Z

v1.1 : There was a MASSIVE error in the "buffer", (would crash if you entered in more than 5000 bytes). This has been fixed (took me long enough)

v1.1a: There was a small error in the Clear Buffer option. (would print a lower case "k" after you cleared the buffer, and would keep the current screen position)
      A few "tiny" bugs were fixed. (the bytes free were not always updated on a few commands (like Repeat))
      Some small things were added. You will notice them when you use the program.

v1.2 : Well I thought I fixed the storage error in V1.1, but it seems that I didn't.... WELL... It's been fixed in this version... I've taken the program through MANY EXCRUCIATING tests to see if it was working this time. (the error was that you couldn't make files that were greater than 3500 or so bytes long)
      A "Quit" option was added by the request of Tempus Thales

v1.2a: The Spinning Cursor has been sped up a bit.

v1.3 : A LOAD FEATURE HAS NOW BEEN ADDED.  Yes, the highly requested command has been added to the program. (lets you LOAD text files up so you can edit them)
      A KeyClick option was now added so you can create the illusion of someone actually "typing" something out.
      A help option was added. This was requested by Ivan Drago. It will give you a mousetext chart, and a control character chart. (when you pull up the help option, the SPACEBAR, RETURN, and ESC keys will get you back to your file)

v1.4 : There was a MASSIVE error in the Tucking/Untucking routines I wrote (to store and retrieve the text pages). The screen would sometimes fill up with garbage after an old screen was restored. This has been fixed; I RE-WROTE the routines in ML and I changed them around a bit. (the CPU LOOK! (speed wise))
      There were a lot of bugs in the Repeat Character option, they've all been fixed. Plus the Repeat Character command has been modified a little (the screen is now restored when you hit RETURN or abort the repeat... thus any EXTRA characters that were on the screen cuz of repeat command—or any characters that got deleted while scrolling over them—will be brought up.)
      I added a small text files that is a type of "Credit" file that I will give you a mousetext chart, and a control character chart. (when you pull up the help option, the SPACEBAR, RETURN, and ESC keys will get you back to your file)
      The Editor will now display the current time (if you have a ProDOS compatible clock)
      The KeyClick option wasn't accessible by you (cuz I fucked up). Now it can be (plus it Clicks so YOU can hear it!)

v1.4a: Slight problem that MY program isn't exactly 100% compatable with ProTERM Special (at least the way that THAT OTHER GUY (that wrote it) thinks it should be). I've taken a step forward in fixing this problem, but haven't TOTALLY fixed it. V4.3 WILL have it ALL fixed.
      Some small screen margin bugs were fixed
      Some small screen margin bugs were fixed
      Some small screen margin bugs were fixed

v1.4b: Well.. After alot of testing, I've found that my program is about 98% compatable, (I say this because, whenever I write a file and view it the files are fine, except on a few occasions.. All I can say is the guy that wrote ProTERM Special is really fucked.
      A help option was added. This was requested by Ivan Drago. It will give you a mousetext chart, and a control character chart. (when you pull up the help option, the SPACEBAR, RETURN, and ESC keys will get you back to your file)

v1.4c: There was a slight problem with the Repeat Character command. (If you exceed the max length of 126 then what was sent to the buffer was really fucked. This has been fixed)

v1.4d: Well.. After alot of testing, I've found that my program is about 98% compatable, (I say this because, whenever I write a file and view it the files are fine, except on a few occasions.. All I can say is the guy that wrote ProTERM Special is really fucked.
      A help option was added. This was requested by Ivan Drago. It will give you a mousetext chart, and a control character chart. (when you pull up the help option, the SPACEBAR, RETURN, and ESC keys will get you back to your file)

** THIS IS THE LAST RELEASE UNTIL V2.0 (ML) **
(unless I find some massive bugs that need to be fixed)

Editor commands:
Open Apple-C Spinning Cursor. Adds a spinning cursor to your file. ProTERM Special. Spins the cursor around on the screen. Easiest way to move around.
Open Apple-E Turns recording ON/OFF. If ON then all characters are recorded. If OFF then you may move around freely and characters are not recorded: when you hit Open Apple-E again the new cursor position will be recorded and recording will continue.
Open Apple-K KeyClick (adds a tone into your file which sounds like the pressing of a key)
Open Apple-L Load file into Buffer
Open Apple-S Save current file
Open Apple-Q Quit to the Viewer part of PSVIEW
Open Apple-<DEL> Clear Buffer (memory)
Open Apple-? Editor Help Menu (includes MouseText and Ctrl-Char Charts)

CONTROL-A Jump to beginning of current line (column 1)
CONTROL-B Delete current character and shift the chars to the right of the cursor to the left
CONTROL-D Delete current character and shift the chars to the right of the cursor to the right.
CONTROL-F Insert space and move characters to the right of the cursor
CONTROL-G Beep speaker (bell)
CONTROL-H Backspace (left arrow key)
CONTROL-I Tab (jump forward 8 spaces / nondestructable)
CONTROL-J Down one line (down arrow key)
CONTROL-K Up one line (up arrow key)
CONTROL-L Clear screen
CONTROL-M Carriage return... Jump down one line and go to column 1
CONTROL-N Enter NORMAL text display mode
CONTROL-O Enter INVERSE text display mode
CONTROL-P Enter MOUSETEX text display mode
CONTROL-R Repeat character. When CTRL-R is hit you must hit the character you want repeated, then use the ARROW KEYS to select how many times to repeat it.
CONTROL-T Tone generator. Waits for 3 characters which specify which tone to play
CONTROL-U Move right character (right arrow key)
CONTROL-V Insert a blank line and push text down one line
CONTROL-W Clear screen from cursor to bottom of screen
CONTROL-X Move to column 1 (in status bar)
CONTROL-Y Clear current line from cursor to the right
CONTROL-Z Delete current line and suck text under one line
Welcome to NetWorks, a networking environment for ProTALK! NetWorks supports the following features...

- Networking Message Bases
- Networking Mail
- Security Modes
- Checking Modes
- Macro Functions (v1.1)
- Configurable Networking Message Bases
- Many, many, many more features!

NetWorks is constantly expanding, I am already planning regional centers if the needs demand, which would mean the NetWork Bases would expand and you could find possibly a closer NetWork Base or be a NetWork Base yourself!

NetWorks is simple to configure, you must first call The Apple Rebel BBS and receive a net password and message number. Please leave mail to user #4 once you have been validated on The Apple Rebel BBS stating you would like to participate in the network, with a voice number I can reach you at. I will discuss terms of service (no costs), and give you a network password, message number, and board names in the network, you may of course choose which ones you desire.

After these two things have been received, run the program NET.CONFIG from the SYSTEM LEVEL [(B)ridge Segments], and answer all online prompts to the best of your abilities. When it is finished configuring, hit CONTROL_RESET and reboot the board. Networking is now installed, it is all automatic and you don't need to do much!

Notice how I said MUCH. There is one thing you will be required to do. That is forward any mail sent to you. The problems I discovered was that I could not obviously maintain a global NetWork user listing, as replicates would start to appear! Instead, the name of the user is entered. The Networked mail is sent, if that user does NOT exist on your board, the mail is sent to you. The mistake may be due to a typo. If the user still does not exist on your board, merely delete the message. Otherwise you will have to <FOR>ward your mail towards the correct user.

You are also strongly urged (eg, required) to call the Apple Rebel BBS for updates to the segment. For the next few weeks, updates will be quite regular, as there may be bugs, or enhancements to be made (such as a full macro-type language to allow scripts), and this is the only BBS these will become available.

Thanks for participating in the network, and I hope your users enjoy it!

--- IMPORTANT UPDATE ---

NetWorks has now evolved, I am currently writing a daisy chain/tree structure network, at the suggestion and with the help of Ram Chip. There will be an update to the network, only available at the Apple Rebel BBS. If you wish this update, please call the Apple Rebel BBS @ 916/457-0624. Thanks for your support....
Well, that's that. Now, for a few bug reports.

Proterm 3.0 Quick Reference/Short Cut Keys
Written by Excalibur 11-20-91/23:53 to 11-21-91/00:43

Golly gosh, Proterm 3.0. How ironic; new terminal program, no new wares to use it with. Anyway, its quite a change from 2.2, although I've noticed its still got a few bugs which I'll mention later (I don't profess to know ALL of them... just the ones I've come across).

Anyway, while online the other day, I accidentally hit a key combination (if you are one of insatiable curiosity, I'll tell you that it was option-L) and something happened. So, I hung up and tried hitting a bunch of keys and that's how I got around to writing up this file. The thing about Proterm 3.0 is that a lot of the apple key combos aren't shown in the pulldowns. This one happened to be for launching a program.

Anyway, all of the option-key combinations, as I later found out, are defined in the global macro on the Proterm disk. You can change the macro file to suit your needs. It'd be nice if we had some macro docs. I've noticed that the macros (both global and logon) are a bit different from Proterm 2.2. Maybe some kind soul whose bought the program would be willing to type up some short reference docs for the macros... but then again, probably not.

Almost all of the apple-key combos are shown in the pulldowns, but there are a few that are not. I'll list them all here for sake of completeness. I'm sure that there are some folks out there who are just getting used to Proterm for the first time and would appreciate it.

Option-key combos (for neophytes: hold the option key down while hitting the appropriate letter.... for //e users, that'd be the closed apple key)

A - autosave toggle (receive ascii)
K - clear editor
L - launch application dialog
M - execute dialing list conversion macro
P - dunno... someone explain this to me... it went so fast I couldn't follow
S - send ascii directly from editor
T - toggle between online/offline
V - short cut to view file
W - extended show time connected dialog
X - do formatted xmodem-text upload
Z - read global macros

Apple-key combos (for neophytes: hold down the apple key while hitting the appropriate letter.... for //e users, you got the same thing us GS'ers do)
B - send break (seriously, have you ever used this? What is it good for?)
C - turn copy buffer on/off
E - enter editor
H - hang up
I - install hardware (and you DON'T lose scrollback in this version!)
L - set online parms
N - autolearn macros (for logons and such)
P - printer echo toggle
Q - quit (duh)
R - receive file
S - send file
U - enter unattended mode
V - paste to modem (haven't tried this yet)
W - show time connected (do NOT leave this on!)
Z - enter scrollback (you can also use apple-arrow keys... just like in 2.2)

I've been told by Mr. Atoz that the Zmodem send is STILL fucked up. I haven't had too much trouble... except on his board and on Talisman. I have used Zmodem DOWNLOAD successfully, and Mr. Atoz, with his technical point of view, says it functions flawlessly. Let's give a hand to InSync for FINALLY getting it right... at least 50% anyway.

Now, when I first saw that online cost function, I thought it was really cool. Yah, ReadyLink had it, but ReadyLink sucks. Well, it's a 50-50 bummer here. The thing works fine once you are OFFLINE. However, if you are ONLINE, and chose, in the individual board entry, to have that function on while you are online, the program will crash BIG TIME. My screen went into crazy 640 graphics mode and it looked like it jumped into 50 Hz. If anyone tries this out and DOESN'T have it happen, let me know. I'd like to know how you get around it. Anyway, the least they could have done was to do the damn thing RIGHT... like set up pars for "First minute" and "each additional minute". You know how fucked up the phone company bills. Not important to most, though. Just a personal gripe of mine.

I had lots of trouble with 2.2 crashing during disk swapping (mostly after I installed my Zip). I've noticed that Proterm 3.0 handles this problem better, but I still can't get away from that occasional crash.

Check out the new transfer segments. I think these are much better than the old ones. Another cool thing is that after the transfer, you can see the results, including CPS. Proterm has grown up a bit.

Overall, I'd say the program is a pretty good improvement. However, all this fucking mousetext in the editor is enough to make someone sick. Hopefully, they'll release some additional emulations as they said they would. That would be interesting to see. AND they need a new ANSI BBS emulation. Ack.

If I think of anything else <not likely in my current state> that needs to be said, I'll type it up and append it or just send around volume two or whatever.

PS: how many of you think that 2.2 was less cumbersome and a little quicker? Hmm... maybe 3.0 just needs some getting used to.

Call these boards.... before they go down.

Silver Tongue /708-759-1916/ 2400 80 megs
The Hellfire Club /212-860-2794/ FAST lotsa megs
Talisman /414-933-1617/ FAST lotsa megs/FTA/USA/etc USA base
Base Cochise /718-454-7490/ 2400 lotsa megs

-eof-
THE FIVE STEPS TO DESKTOP PUBLISHING

More information for PUBLISH IT!

Written by the JAZZMAN.

There are several preliminary steps in creating any document for the first time. The file should be named, and a number of program settings should be checked. Fortunately, none of these steps requires you to memorize anything. Each step is on a pull-down menu, and the help menu can lead the way if you get stuck.

THE HELP MENU

When you choose one of the options from the help menu, an informational Dialog Box appears. Click on OK to return to your document.

ACTIVE MENU OPTIONS

There is a strong interaction between the Toolbox and the menus in Publish it! When you first enter the screens Work Area and the arrow is selected as a default, the EDIT, FONT and FORMAT menus are dimmed, showing that they are inactive and not available for use. Pull down one of these menus, and you'll see that the menu items are also dimmed.

Items within the active menus are also effected by the tool you've chosen. If you pull down the FILE, PAGE and OBJECTS menus, you can see the highlighted commands and functions which are available as well as those which cannot be selected at this time.

When a menu is selected, you should also notice that some items have keyboard equivalents (Quick Keys) listed to the right of the function name. Once you've learned Publish it!, you can save time by using the Quick Keys. There are Quick Keys for a number of menu functions. At the beginning though, the program is easier to learn by using the pull down menus.

As you experiment with the powerful features of Publish It!, the program will be your best teacher. The process will soon become intuitive.

SELECTING YOUR DATA DRIVE

Choose Select Data Drive ...from the File menu to tell Publish it! where your data drive is located. Your choice will depend on your hardware and configuration of your system. Notice that you can use PRODOS pathnames.

SAVING YOUR SETTINGS

This option saves your default settings for any option that was active at the time you chose SAVE SETTINGS, including settings for your data drive, the page size, line, pen and fill choices. IT DOES NOT SAVE YOUR DOCUMENT...

OPENING A NEW FILE

Publish it! provides a default document name of "Untitled". If you wish to name your document before starting it, or you wish to abandon the current document you are working on, choose the New File...option from the File Menu. A box will appear with a blank line for the file name. Type a short word (not more than 15 characters) which quickly describes the theme of your document. Use letters, numbers and the period, but must begin with a letter.

To return to your document, click on OK.

SAVING FILES

The Save File option saves your document under the current file name. If you save frequently, another way to do it is to press O-Apple-S, the save file Quick Key. On single drive systems, you will be prompted to insert your data disk. If you want to use a different name, choose the Save File As... option.

SAVING A FILE WITH A NEW FILE NAME

This option allows you to save the current document under a new name. Choose Save File As... from the File menu. The ability to save a document to a different file name can be useful in a number of ways. For example, if you want to save a layout to use in designing other documents, you can save your current document under more than one name so that you can preserve the current document and still have copies available for use in creating other layouts. You can also save the document in various stages of development under different names.

A dialog box will appear with the current file name to change, type in a new name. To save the file and return to your current document, click on OK.

DELETING FILES

To permanently remove a file from your data disk, choose Delete File...from the File menu. You can only delete one file at a time. A dialog box will appear with a list of file names. Select the one you want to delete and click on delete. A second Dialog Box will appear asking you to confirm your decision.

CHECKING AVAILABLE MEMORY

From time to time you will want to check the memory available for your document. Pull down the Apple menu and select Status...for information on your computers current memory availability and information on how many objects you have remaining to use (the maximum allowed is 65). If you run out of memory, the program will notify you. To return to your document, click on OK.

Now lets start to produce a document.

While it is possible to start your document anywhere, with design, art work or words, and to move back and forth among these three parts of your documents whenever you wish, I will present these ideas starting with the page layout, continuing with the text possibilities, then graphics and finishing with the printing.

Objects are such an important part of the program that they bear some discussion. With the Toolbox,you can create six types of objects.they are:

- Graphic frames [x]
- Text columns [T]
- Horizontal or vertical lines [l-]
- Rectangles [ ]
- Round-cornered rectangles [ ]
- Circles [O]

(Note: these symbols are not perfect, but as close as I can produce.)

Only one tool can be selected at a time. Select the tool by clicking on it. Tools are deselected automatically when you choose another. Selecting one of the tools will activate some menus and menu options and deactivate others.

To create an object, first click on the desired tool and then move to the spot on the page where you want to place the upper left hand corner of the object. Press the mouse button and drag to where you want the lower right corner, then release the button. Several objects drawn on a single page may overlap each other. Each object is actually on a single plane, with the most recently created on the top.

DESIGN GUIDES

To make designing your pages easier, we provide a guide system that helps...
position your objects quickly and accurately on the page. Although these guide appear on the screen, they will not be printed on your document. A check mark next to Snap To Guides, indicates this option is active. Snap To Guides works when creating text, columns and graphics, not when moving or resizing. If you overlap a guide when drawing it, your object will snap to the outer edge of those guides.

To use this feature, select the page guides you want to use with the Select Guides option. The page can be divided into rectangular regions composed of 1 (1x1), 4 (2x2), 9 (3x3), 16 (4x4) equal parts or no guides if you do not want guides to appear on your display. The guides you choose will remain in effect until you change them or until you quit Publish It! To save a guide setting as a default, set your guides and then choose Save Settings from the O-Apple menu.

You may change or remove guides at any time. If the Snap To Guides are on, when you create a text column, graphic or graphic frame, it will automatically be aligned with the nearest page guide.

SHOWING THE COLUMN OUTLINES

This option from the SPECIAL menu allows you to turn the display of text column outlines on and off. It does not effect the text within the defined areas or the text columns themselves or printing, since column outlines are never printed. Choosing Show Column Outlines from the SPECIAL menu toggles this option on and off. A check mark next to Show Column Outlines indicates that the option is active.

SELECTING OBJECTS

AN OBJECT MUST BE SELECTED BEFORE IT CAN BE MANIPULATED. Click on the desired object with the arrow (or pointer). Selecting a new object deselects any other object on the page. A newly created object is selected until you click on another object, to select it. To deselect an object without selecting another, Click in a blank section of the work area. When an object is selected, it may be dragged by the lower right handle to resize it. Objects may overlap each other on the page. You may also change the order in which the objects are stacked by selecting objects with the arrow and choosing either Move To Front or Move To Back from the objects menu.

WARNING......If the object you are moving to the back (bottom) is smaller than the other objects, it may be hidden by other objects.

GROUPING OBJECTS

You can drag several objects around by using the grouping feature. Using the arrow, drag the arrow pointer from a point above and left of the target objects to a point below and right. Be sure to start dragging from a point that has no objects. As you drag, you will see the outline of a box being drawn, almost as if you were creating another object. When you release the mouse button, the box will disappear, and every object that inside the box will become selected. You may now drag any one of these selected objects and all the rest will follow. Other functions for grouped objects are: delete, change fill patterns and change line weights.

NOTE...some object menu items are not available for groups. They will appear dimmed.

SPECIFYING OBJECTS

Objects can be moved or resized with the arrow. For more precise work, you can choose Show Specifications... from the OBJECT menu. With this option you can determine and modify the exact size of a selected object.

Specifications sheets vary with the type of object selected, but all have Left Start and Top Start coordinates.

What the Dialog Box displays:

LEFT START...
Shows where the objects left edge starts relative to the left edge of the page (in a measurement determined by the UNIT MEASURE option in the SPECIAL menu.

TOP START...
Shows where the selected objects top edge starts relative to the top edge of the page.

WIDTH...
How wide the selected object is.

HEIGHT...
How high the selected object is.

You may resize and reposition the selected objects with precision by changing any or all of the four selections in the Dialog Box. For some objects, not all four will be available. For example, There is no width option shown for a vertical line, because width is determined by the line weight selected when the line is drawn.

Click on the box with the value you want to modify and type in the change. When you finish, click on OK. The selected object will be adjusted according to your changes.

COPYING, CUTTING AND PASTING

When working at the object level with the pointer (arrow) tool, if you want to duplicate an object, use the arrow to select the object, then choose Copy (O-Apple-C)from the objects menu to copy the object to the programs internal clipboard. The object will not disappear from the screen, but a duplicate will be held in a buffer (clipboard) until you are ready to use it. Choose PASTE from the objects menu, or O-Apple-V. A copy of your graphic will appear in the center of your screen. Use the arrow to drag it to a new position. Once an object has been copied to the clipboard, the original object can be moved or deleted without effecting the size or position of the copy in the clipboard. cutting an object works the same as copying except the original is removed from the screen.

DELETING OBJECTS

You can remove objects using one of two methods. The DELETE key or the CUT method. To delete an object using the DELETE key, select it with the arrow, then press DELETE. The object is permanently erased from the screen.

The CUT option on the OBJECTS menu also deletes objects. Unlike the above method, cut objects are placed in the clipboard and can later be recalled with the Paste option, providing nothing else has been cut or copied to the clipboard. The clipboard can only hold one object at a time; cutting or copying will replace any previously cut or copied objects.

SETTING THE PAGE SIZE

Before you start your layout, you must tell the computer which page size you want to use. Select the SET PAGE SIZE option on the PAGE menu.

Selecting this option allows you to choose your page size from four U.S. and international standard page sizes. The choices are: U.S.LETTER, U.S.LEGAL, A4
LETTER and B5 LETTER. These last two are approximately 8 1/4 x 11 2/3 inches and 7x10 inches respectively.

The two choices under each of these are for the width of paper your printer uses. Only wide carriage printers can handle a full 8 1/2 inch line width. DO NOT SELECT 8 1/2 inch IF YOU HAVE A STANDARD SIZE PRINTER.

A Dialog Box will appear with four clearly defined page sizes. Select the page size for the paper you have loaded in your printer (or a page size you plan to use for this document or publication). Click on the page size you want to use, then click on OK. What do you do if the page size you want is not listed? For example, you want to layout a business card or an 11x7 flyer. For the smaller page sizes, use the on-screen rulers to insure that your design stays within the size you want for your business card. When the page is printed, you will only use the section of the page you want.

For a larger page, like an 11x7 sheet, you could work with two 8 1/2 x 11" pages and paste them next to each other.

**SELECTING PAGES**

You select pages by clicking on the left arrow and right arrow in the lower left corner of the display. The current page number is shown after the document title.

**ADDING AND DELETING PAGES**

To add pages to a document, choose the Insert Page option on the Page menu. Selecting this option will cause a new page to be inserted before your current location. The page you are working on and all subsequent pages will be renumbered.

To append pages at the end of the document, click on the left arrow until you reach the last page. If you click on the left arrow again, you will be asked if you want to add a page. Click on OK to do so.

To delete a page, select the Delete Page option on the Page menu. Selecting this option will delete the current page. All subsequent pages will be renumbered and moved up one page in your document. You will be given a chance to reverse your decision to delete a page. If you decide not to delete the page, click on CANCEL or press RETURN.

NOTE...Delete Page erases text columns and reflows your text through the remaining chain. Text will not be lost, if any linked columns remain. Text that is not part of a chain on another page will be lost.

**VIEWING PAGES**

Publish It! lets you work on a document in four different views. To change to a different view, choose a size from the SPECIAL menu. You will be able to edit text, define graphics, or use the arrow to move and resize objects in any view as shown later.

1. With the SHOW FULL SIZE option, you can see text and graphic elements on the display in the size they will appear on your print-out. However, you can only view a portion of the page at a time.

2. The SHOW HALF SIZE option shows the page at about half the size that it will print out. You will view the page in full width, but will be able to view only a portion of the length.

3. SHOW DOUBLE SIZE is like a close-up. Use for fine tuning your text or graphic elements. Use the scroll arrows and scroll boxes on the sides of the screen's work area to move the page up, down and from side to side so you can view different sections of it. As you move, the rulers on the top and sides will follow you and display their location on the page.

4. Use the SIZE TO FIT option if you would like to view the whole page at once. You may not see the text clearly because of its reduced size, but you can see what your layout looks like. Your page will appear on the left half of the screen.

In all views except Full Size, imported bit maps (graphics) will be represented as grey shaded boxes. When in FULL SIZE, the picture itself will be visible.

WARNING...You cannot print anything you place outside the page area in the SIZE TO FIT view. If you can use that area to try out ideas and then move them to the left half of the screen. Anything on the right side will be saved, even though it will not be printed.

**WHITE SPACE**

When laying out your page, keep in mind that the absence of objects is important too. The space left over after you have everything in place, in fact, becomes as much a part of the page as the elements you inserted. This is called white space. Used properly, it adds pleasing contrast to the art and text on the page.

So, when you're reviewing your page layout, take a moment to review the size of the margins, the amount of space between the lines of text, the amount of space around the art work, and the distances between the headlines and the body copy. White space adds to a crisp, clean looking page. Avoid, however what is called negative white space, that is, white space surrounded by art or text. This white space is considered undesirable because it resembles a doughnut hole on a page.

**AESTHETIC CONSIDERATIONS**

All page layouts should consider the audience. Obviously, the audience for an advertising flyer is not expecting something that looks like a wedding invitation. A greater proportion of black to white may be perfectly acceptable in an ad, but very unacceptable in a poetic greeting card. As you design each document, try to put yourself in the readers shoes. If you're writing for senior citizens, for example maybe you don't want 9-point text. Perhaps 12-point is a better choice.

**CHOOSING MEASURING UNITS**

Choosing measurement units for the on-screen rulers is as simple as choosing Select Unit Measure from the Special menu. With this option, you are free to choose the unit of measure with which you want to work. Inches, Centimeters, or Picas (6 Picas = 1 inch).

NOTE...In publish It!, picas will be both the horizontal and vertical unit of measurement, even though the type fonts will be measured in points. A point is 1/12th of a pica (1/72 of an inch).

The default settings are in inches. The units of measure chosen here affect the on-screen rulers and other measurements, especially in the FORMAT, PAGE and OBJECTS menus.

**SETTING THE ON-SCREEN RULERS**

Rulers help place items and size them on the page with reasonable precision. Two indicators, one on each ruler, show the position of the mouse pointer at any time. As you scroll the page, the rulers change to reflect the current position.

The Show Rulers option toggles the horizontal and vertical rulers on and off. Rulers are very helpful when laying out a page, but as you work on text, you may want the extra screen space that is made available by turning off the rulers.

Now that you understand the concepts of objects, let's talk about specific ways you can use them, beginning with your text.
Move the pointer to [T] in the tool box and click on the Text tool. Notice how this tool is now highlighted and arrow is deselected. You are ready to create a text column.

Simply move the mouse into the work area. As long as the [T] tool is active, every drag in the work area will start a new column.

A text column is a defined region on the screen which resembles an empty box or frame (if you have the column outlines turned on). The program displays a rectangle to indicate the border of the new text column, so you can judge its size and shape as you create it. If you move the pointer past the window boundary, the corner of a text column, the window scrolls automatically.

Release the mouse button when the column is the right size. If a guide is visible and SNAP TO GUIDES are selected, your text column will snap to the nearest guide.

Text may be entered from the keyboard or imported from another file to a particular text column or to a specified series of columns.

To enter text, select the I-BEAM tool and click on the I-BEAM pointer on the nearest guide. The text insertion point will appear and you can begin typing. As you type, all text within a column is treated separately. If you delete text, you need to create a text column as explained before.

To enter text, select the I-BEAM tool and click on the I-BEAM pointer on the next nearest guide. The text insertion point will appear and you can begin typing. As you type, all text within a column is treated separately. If you delete text, you need to create a text column as explained before.

To delete a column, double click on the column you want unlinked. For example, you can double click on file names to open them.

The files do not have to be just word processing files. If they are ASCII files, you can import data base and spreadsheets too.

When importing files, the program only looks for the files on the disk drive currently selected as the disk drive. Make sure you have the correct disk in the drive.

NOTE...At least one column must exist before you can enter or import text. Furthermore, Publish It! will not allow text to be placed outside of the text column. Two or more text columns must exist before you can link them for the flow of text.

SETTING TABS

To set tabs on your page, select the TABS...option on the PAGE menu. A Dialog box will appear. Click on the first input box and type in the tab setting you want. You do not have to enter the tabs in order. They will be put in order for you. You can set up to six tab stops per page. Tabs are measured in inches, centimeters or picas, as set in the SET UNIT MEASURE...option of the SPECIAL menu. To move the text insertion point to a tab location, press the TAB key on your keyboard.

THE TEXT TOOL AND ENTERING TEXT

There are two ways to enter text: either use its built-in word-processor or import text from your own word processor or other programs. Before you can enter any text, you need to create a text column as explained before.

To enter text, select the I-BEAM tool and click on the I-BEAM pointer on the next column in which you want to work.

The text insertion point will appear and you can begin typing. As you type, words wrap automatically at the end of the line. Text will fill the column and any overflowed (extra) text will be indicated by a double width border at the bottom of the text column (assuming Show Column Outline is on). The appearance of your text input depends on the font you're using and on the size of your screen objects. The default font is Deerfield 12 point. Text layout within the column depends on the settings for FORMAT and PAGE.

SELECTING TEXT

You must select [I] before you can select many of the text functions. You can change fonts, type sizes or styles (special effects) for text already entered. Drag the I-BEAM pointer [I] over the text you want to change to highlight a text block. Then, select a new font or style from the FONT menu.

IMPORTING TEXT

Text columns may also be filled with text imported from other documents. Publish It! reads documents created by Appleworks and Bank Street Writer directly and most other word processors if the files are in standard ASCII.
There are some rules to linking that you must observe:

1. Selecting the linking tool (looks like one page on top of another), you will see a small hook on the bottom of the linking tool. The first click of linking tool establishes the start of a chain (or insertion into a chain) and moves the hook to the top of the linking box. Subsequent clicks on different columns create the links. Clicking on linking tool in the tool box ends the chain.

2. Columns selected with the pointer can be deleted by the delete key, but the text remains and is distributed to other columns, if any remain in the chain. If no columns remain, the text in the deleted column is lost. A Dialog box will appear giving you a chance to change your mind.

3. Columns selected with the pointer are removed completely from a chain by CUT. All linking information will be lost.

4. Paste does not insert a column into a chain. Use the linking tool to link columns.

5. A column can only belong to one chain at a time.

6. Double clicking with the linking tool unlinks a text column from a chain.

7. Linking is not permitted to a previous page.

8. Editing text is the same as in any word processor. Following is a discussion on how to delete, cut, copy and paste text.

9. Deleting Text.....

First be sure the I-Beam is selected from the tool box. To delete a section of text from within a text column, highlight the text by dragging, then press the delete key or choose CUT from the EDIT menu (O-Apple-X). Delete erases text permanently. CUT moves text to the clipboard where it can later be recovered with Paste. The text to be cut can be as little as one character or as long as about 1000 characters.

10. Cutting and Pasting Text.....

Highlight the text you wish to move. Pull down the Edit menu and choose CUT or O-Apple-X. The selected text will disappear from the screen and be stored on the clipboard. Choose a new insertion point with the I-Beam and select Paste from the Edit menu (O-Apple-V). Paste retrieves the text from the clipboard and places it at the new insertion point. You may continue to paste the cut text as many times as you want until you cut or copy again.

11. Copying and Pasting Text.....

Use copy to place selected text in the internal clipboard while leaving it on the screen. To copy, highlight a text range and choose Copy from the Edit menu, or use O-Apple-C. The selected text will not disappear from the screen (but will be held in the clipboard until you are ready to use it). Point and click at the position you want to place it (on the same or another page). Choose Paste from the Edit menu or O-Apple-V. You can repeat the last two steps if you want to insert the selected text in more than one location.

12. Finding Text.....

Publish It can search your text for a particular character, word or phrase and replace it with something else. Once a character, word or phrase has been entered in the Dialog box of the Find feature, any occurrence can be found in the same page by using the FIND NEXT option. To repeat the search, select FIND NEXT or press O-Apple-F. NOTE...You must use Find before you can use FIND NEXT.

13. Replacing Text.....

To replace a text string in your document, use REPLACE from the EDIT menu. This command enables you to find a character, word or phrase and replace it with another. It is especially useful when editing large amounts of text within Publish It. Since the program remembers the last used find and replace string, you can easily change either string in the Dialog box. To use this option, move the I-Beam to the first character in the text column you want to search. Click and a text insertion point will appear. Choose REPLACE from the EDIT menu. A dialog box will appear. Click on the top box and type in the character, word or phrase, you want to find. Move to the next box, click (or use the TAB key), and type in the replacement text. Click on FIND. You'll be informed if the string is not found.

14. Number Spaces.....

When creating tables of numbers in the program, you will find that all digits introduce uneven spacing, since spaces are considered alphabetic characters. To solve this dilemma, we have included the tab key, hyphen (-) and a sticky space has been entered, it will treat the group of words as one. If the group is too long to fit at the end of a line, Publish It moves the whole group together to the next line. To use Sticky Space, put the I-Beam between two words and press O-Apple-Spacebar. Repeat as often as necessary.

15. Sticky Spaces.....

If you have a phrase or name that you don't want to split between two lines, use the Sticky Space option. Bill Johnson, Sticky Spaces and Replace, for example, could all use sticky spaces. When Publish It wraps words from one line to another, every sticky space has been entered, it will treat the group of words as one. If the group is too long to fit at the end of a line, Publish It moves the whole group together to the next line.

16. Hyphens.....

If a word is broken at a point you don't like, you can change it. Click on the word at the point you would insert a hyphen should the word need to be broken. Press O-Apple-Dash (-). As the text flows, if that word is broken, Publish It will insert a hyphen at that point. Later, as you make changes in text and the column rewraps, that hyphen will disappear if the word no longer needs to be broken and reappear later if needed. You can place as many soft hyphens in a word as necessary.

17. Soft Hyphens.....

If you have more than one character, word or phrase to find, and a replacement has been defined in the Dialog box under REPLACE, you can repeat the sequence throughout the entire page. Choose REPLACE and FIND from the EDIT menu (O-Apple-R). Use O-Apple-F to find the next occurrence without replacing.

18. Automatic Runaround.....

If you have completed columns of text and then decide to drop in an object, Publish It automatically flows text around the new object.
the entire page. Select these options from the PAGE menu to do so. These options require that the I-BEAM be selected before you select them.

**NOTE:** Most of the settings in the page menu become the default settings for the options in the FORMAT menu, unless you decide to specifically change a setting for a particular document. The sections below give you details on using the Justification, Spacing and Margins/Indents options on the FORMAT pull down menu. Use the same procedures for these options on the PAGE pull down menu.

Justifying Paragraphs......
You can align text in the paragraph you are currently working in using the FORMAT menu. You can justify text left or right, aligning text on the left or right column margin, leaving the other margin ragged or uneven. Two other choices are Full and Center. Full justification will make the paragraph look like a newspaper or book column, aligned on both sides. Center will make the column ragged on both sides by centering each line. Justification can be applied to a single paragraph, selected paragraphs or the whole page. To change the justification characteristics of an individual line, click on any line in the paragraph line you wish to work on with the I-BEAM. Then pull down the FORMAT menu and choose Justification.

**NOTE:** The Use Page Standard selections refer to the values entered in the Margins/Indents option on the PAGE menu.

A Dialog box will appear. Click on the options you want to use. (You must click the Use Page Standard setting off if you want to change the justification of this paragraph or group of paragraphs).

The similar options on the PAGE menu affect all the text on the entire page. Those options will not be available if you have highlighted a block of text.

Justification can apply to groups of paragraphs; simply highlight the paragraphs you want to kern and click. The text insertion point will appear between the letters, words, lines and paragraphs. To change any of this type of spacing, click at a point in the paragraph where you want to work. Then select the Spacing option on the FORMAT menu and a dialog box will appear. Click on your letters and choose Spacing from the FORMAT menu. When the Dialouge box appears, enter the desired spacing in points. The value you specify represents the distance, in points, added between the lines of text.

Paragraph Spacing......
Paraphrarg spacing is the amount of spacing between paragraphs. Normally, spacing between paragraphs is the same as between lines. Paragraph spacing is changed by selecting a range of paragraphs, choosing Spacing from the FORMAT menu, and typing a new value in the dialog box, followed by clicking on OK. The program then adds the point value as extra space before the paragraph. Click on OK to return to your document.

Margins and Indents......
Choose Margins/Indents to set or change your left or right margins and paragraph indents. Use the I-BEAM to select a paragraph, then select Margins/Indents option on the FORMAT menu. A dialog box will appear. Enter the left, first line and right margins, then click on OK. To make your paragraphs hanging, that is, with the first line set out from the remainder, set the left margin indent to a value more than 0 and click on Hanging. Use the right margin specification to tell the computer the distance from the right edge of the text column to the right edge of the text. Set both left and right margins for a paragraph, as for long quotations. The first line is for typical, non-block style paragraph indentation.

Kerning....
Spacing between letter pairs is controlled by the defined width of each character. In certain cases you may wish to change the spacing on a character-by-character basis. With Publish IT you can reposition individual characters, moving them closer together using KERN from the FORMAT menu. A typical situation where a change in character spacing is warranted, is with certain combinations of letters like AV, that show too much space between them. To move the letters AV together, place the I-BEAM between the two letters you want to kern and click. The text insertion point will appear between the letters. Choose KERN from the FORMAT menu and a Dialog box will appear. Type in the number of points you want to remove in the selected space. When you click on OK, the spacing between the letters is reduced by that number of points. The larger the number, the closer together the two letters move. (you must repeat this sequence each time you want to reduce the space between letter pairs).

**NOTE:** Sometimes text on the screen may appear to need kerning because the on screen representation of the text does not exactly match what will be printed out. We suggest that you do a test print-out before deciding to kern.

To increase space between two characters, Place an extra space between them and then kern.

Fonts, Faces and Special Effects.....
Text font, size and style are chosen from the font menu. As with other text options, these are assigned by selecting a text range and then choosing the appropriate menu options. Publish IT! automatically chooses Deerfield 12-point as the start-up text font. To change to a new font, select block of text, or just click on I-BEAM and then select Font from the font menu, or C-Apple-W. A scrolling dialog box will appear with all the available fonts and sizes. Click on the font size you want to use. Then click on OPEN. The text you have selected will convert to this font and size.

Style (special effects) options are selected from the font menu also. Style choices include Plain, Bold, Italic, Underline, Outline, Shadow, Superscript and subscript. If you establish a new text type (font, size and style) without selecting a block of characters, the text insertion point takes on the chosen text type, so any characters typed from that point on will be in the new type.
Apple II Computer Info

To quickly cycle through the different type options, pull down the font menu and you will see these options:

NEXT SIZE...(O-Apple-N)  
NEXT TYPE FACE...(O-Apple-T)

Highlight a block of text and then press O-Apple-T or select the Next Type Face option from the font menu. The block you have marked will automatically change to the next type face available in the same size. If you press O-Apple-T again, it will change again. Keep pressing and it will cycle through to the original type face again.

Press O-Apple-N or select Next Size option to cycle through the available type sizes for the current font. This is a convenient way to view alternatives right on the computer display.

Plain Text.....

Use this option to return to the basic (plain) style of a type face if you have been using, for example, Bold or Italics. Select a range of text, then choose Plain from the Font menu, or O-Apple-P. This will erase all the attributes (bold, Italics, etc.) of the selected text.

Bold Face.....

Choose Bold for a more dramatic (thicker) style of type face. Select a range of text, then choose Bold from the Font menu, or O-Apple-B.

Italics.....

Choose Italics to make a word or phrase stand out (slanted) from the rest of the text. Select a range of text then choose Italics from the Font menu, or O-Apple-I.

Underlining Text.....

Choose underline as another way to make a word or phrase stand out from the rest of the text. Select a range of text, then choose Underline from the Font menu, or O-Apple-U.

Outlined Faced Lettering.....

Outline is a Graphic style of a font. Each letter looks like a frame. It should be used sparingly for such things as announcements, invitations or brochures. Select a range of text, then choose Outline from the Font menu.

Shadow Faced Lettering.....

Like Outline, shadow should be used sparingly for special effects. To use this option, select a range of text, then choose Shadow from the Font menu.

Superscript.....

Superscript and subscript are used mostly in technical publications (i.e., footnotes in a mathematical, medical article). Choose Superscript to set text a half line above the other text. Select a range of text, then choose Superscript from the Font menu, or O-Apple-A.

Subscript.....

Same as Superscript, except sets type a half line below the other text. Select a range of text, then choose Subscript from the Font menu, or O-Apple-L.

Combining Styles of a Type Face.....

You can combine all styles of a type face (bold, Italics, underline etc.) except Superscript and Subscript for special effects or emphasis. To combine styles:

1. Select a range of text, then choose the first style (i.e., Bold) from the Font menu to select and you are returned to the screens work area.

2. Pull down the Font menu. You will see a check mark next to Bold, which indicates it has been selected.

3. Select the next style and you are returned to the screens work area.

4. Repeat steps 2 and 3 as many times as you want. If you click on a style again, the check mark will disappear, and that style will no longer be active. You will be in the combined style until you select another style or face.

Creating your Graphics.....

There are two ways to include graphics in your publications.

1. Create graphics with the drawing tools included in the program. These tools can be used to draw simple objects such as lines, circles, boxes, etc.. You can add lines, rectangles, circles and round cornered rectangles to your pages using a variety of line types, widths and patterns. Publish It! provides four graphic object tools: line, rectangle, round-cornered rectangle, and circle. Use [1-] to create either horizontal or vertical lines (rules) by dragging up or down, left or right. Select [ ] to create a square or rectangle with right angle corners. Select [ ] to create a square or rectangle with rounded corners. Select [O] to create circles. All these types of objects may be moved, overlaid, underlayed, resized or deleted by using the arrow (pointer). You can create interesting visual effects by experimenting with the pen patterns for borders and fill patterns.

A moving rectangle indicates the size of the object being drawn. If the cross hair pointer leaves the window area, the window scrolls automatically. You can also use guides and the Snap to Guides option.

Line Weights and Pen Patterns....

The program provides a large assortment of widths and styles for borders and lines. You can choose from six solid line widths and 24 pen patterns, including eight user defined pen patterns. Change the width or style of a selected line with Set Line Width, or the outline, of a filled box or circle with Set Pen Pattern on the Objects menu. To change a line weight or pen pattern, select the object by clicking on it with the pointer and, selecting this option from the Objects menu.

Selecting Fill Patterns.....

The program features 24 fill patterns that can be used for the interiors of graphic objects and offers the ability to create your own pattern with Define Pattern. To choose a fill pattern, select a graphic object, then select the Set Fill Pattern option on the Objects menu. A selected pattern fills the interior of any selected object. The selected pattern becomes the default until you change it. To change a fill pattern, select the object, then select this option. Click on the fill pattern you want. Then, click on O-Apple.

Defining a New Pattern.....

Design your own or modify any one of up to eight existing patterns. Selecting this option will bring up a Dialog box with eight pen or fill patterns which you can define. Click on a pattern and select it. The currently chosen pattern is shown in a close-up cell at the right. The Work Area is at the bottom left. Clicking on a cell in the 8 X 8 matrix shown in the dialog box, will toggle it black or white. Choose Define Pattern from the Special menu. All dialog box will appear. Click on a pattern to select it. To design your own pattern, a work area is provided at the bottom left of the dialog box. Your new design will be stored.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 882 of 1262

on disk when you click on OK.

Importing Art work

Publish It! lets you add graphic elements to your documents, lending them a professional appearance. Before you can insert pictures on a page, you must create graphic frames to house the art work. Graphic frames are created with the graphic frame tool [X] from the tool box. Position the [X] in the area where you want to insert the picture and drag it across the page to define the size of the graphic frame. If you have the Snap To Guides on, the block will snap to the nearest grid boundaries automatically. Graphic frames appear as shaded boxes on the screen. this provides a visual way of distinguishing the from text columns. Graphic frames are objects, they can be moved, resized, cut, copied, pasted and deleted like any other object.

NOTE....You cannot create a graphic frame that is larger than the importing screen--- about 4 2/3" X 2 2/3". Publish It can directly access Dazzle Draw, MousePaint, and Beagle Graphics files or any other pictures in Apple standard high res or double high res format.

To Import Art work....

1. Insert the disk containing the art file into the drive you have designated for data.

2. Select a graphic frame by clicking on it with the pointer and choose Import Picture from the File menu.

3. A dialog box appears, listing all the picture files on the data drive. If necessary, scroll the list to locate the picture you wish to import. Click on the file name, then click on OK. The picture will appear in full size on the display.

4. A box is shown along with the picture to indicate the size of the graphic frame in your document. Drag this cropping box until it is around the part of the picture you want. You may change the size of the cropping box with the O-Apple key and the arrow keys. You may also use the arrow keys to move the box. When you are satisfied, press return.

You will return to your document with the picture in the graphic frame you have selected.

NOTE.......You will only be able to view the picture in the Show Full Size display. When you are in other viewing modes, bit maps are represented with a shaded box. The art work you cropped will print out completely, and be the proper size. If you import a small piece of a bit mapped picture, and subsequently enlarge the graphic frame, the extra area is shown as gray shading, because the area shown outside the crop box, is discarded when you return to your document. If you find you need a part of the bit map that fell outside the crop box, you should resize the frame and import the picture again.

Adding the Finishing Touches.....

The difference between an OKAY looking document and a GREAT looking document is often nothing more than a slight adjustment here and there and one more pass through the printer. So, consider your first print-out a draft. Look it over and see what you can do to make it better. Don't be afraid to experiment. With practice, each draft will be better than the one before.

Printing Your Documents.....

Printers are an integral part of your desktop publishing system. Most dot matrix printers produce output at a resolution of 120 dots-per-inch horizontally by 72 vertically, well suited for inter-office memos, newsletters, and other documents you'll produce with this program. You should find this print resolution easy to read and suitable for most of your publishing needs. For extra contrast, you can choose the Double Strike option from the Print dialog box (on the File menu) when its time to print.

To print your document on a laser printer, you will need to use Timeworks Publish It Laser Pack. Instructions are included with this program.

The Page Numbering Tool....

Selecting [$] from the tool box enables you to create a page number up to 100, for the page you are currently working on. Just click on [$], then click anywhere on your document. An object containing a "$" will be created. This object cannot be resized, but can be repositioned.

After you have defined the page number, you may change it by clicking on the pointer to reposition it. The page will be given a sequential number during printing. To change the font, select the page number object [$] on your page and change the font size using Select Font from the Font menu.

How To Print.....

To print a document, choose Print from the File menu. A dialog box will appear. Normally you'll want to print all the pages of a document, but a number of possible choices are available:

ALL---
All the pages of the current document are printed.

FROM/TO---
Lets you pick a range of pages you want to print. Click on the radio button, then type in the numbers of the first and last pages you want printed.

COPIES---
If you want more than one copy, type the number you want.

START PAGE # at PAGE---
If you have page numbers, enter the page number from which you want to start printing. This is useful when printing multi-page documents that are stored in several different disk files.

DOUBLE STRIKE---Select this if you want your copies to appear darker.

PAUSE FOR PAGE---Choose this option to make the printer stop at the end of each page to allow you to hand feed another sheet.

The OK and CANCEL buttons let you begin printing or cancel. Printing can be canceled or momentarily suspended at any time by pressing the appropriate key shown in the dialog box that appears while the program is printing the document.

Exiting Publish It!

Use Quit to exit Publish It! Just choose Quit from the File menu or O-Apple-Q. A dialog box will appear and ask for confirmation. To exit the program, click on OK. If you have a program selector installed (such as ProSel or Catalyst), Quit will return you to your selector.

Appendix....There are a few more chapters in the manual, but these appear to be the same as the Mini- manual which was uploaded earlier. There are some pictures in the manual which I cannot reproduce for you so, I tried to explain it all with words. I am sure you can learn to run the program very expertly from the instructions. To load the program on a hard drive, load all the files from the program disk as you normally would. Include all the font files and art files, then set it up in your program selector. (such as ProSel, or the one that you have installed yourself. Be patient with the program, and read all the instructions. Everything you need to know has been covered here.

~END~
This month's puzzle is an expanded version of a classic. With lower levels being very easy and the upper levels offering a major challenge, this is sure to keep you going for a while!

After the opening screen, you will be prompted for the size of your puzzle. Start easy, choose a 3 x 3 grid. The puzzle will randomize itself before your eyes, press [RETURN] to stop it.

The object of the game is to get all the numbered tiles re-arranged to their starting positions, i.e. sorted numerically like so:

```
  1  2  3
  4  5  6
  7  8  9
```

To accomplish this, simply press the appropriate direction key (I, J, K ,M, or the arrow keys) to move the tile of your choice into the empty location (where “9” would be in the example above). Only the legal moves are shown on the screen, to help remind you of your choices. The game checks for the correct solution after each move, and will acknowledge your accomplishment when you solve the puzzle, as well as reporting how many tries it took you.

If you get tired of playing a game, press the [ESC] key to exit. You will be given the choice of playing another game or exiting to the UPTIME menu.

When first starting, try the 3 x 3 grid until you get the hang of it. Then experiment. Strange arrangements (7 x 4 for example) will play much differently than the classic arrangements.

If you really want to impress someone with your 'skill', press [RETURN] immediately after pressing the second number key of your choice matrix (it's most impressive with the 8 x 8 matrix). This will stop the randomization process after only one tile has been moved, and thus you can solve any puzzle in only ONE move!!!

Please Note:

- At least 768k, but preferably 1 megabyte, of free memory is required if you want to load QIX from the Finder. One megabyte of expansion memory is required to run QIX under Finder 5.0.2
- If your GS has less free memory than required, you will only be able to boot directly from the supplied disk.
- If you want to boot directly from the QIX disk, with the disk in the drive, reset the computer in the usual manner and the game will load automatically.

DISK LOADING INSTRUCTIONS

Turn on the computer (duh!). Insert the game disk into drive 1 with the label facing upwards. The game will load automatically using the GS/OS residing on the QIX diskette.

If the GS Operating System is already up, insert the game disk into the drive. Clock the mouse pointer twice on the QIX icon when it appears. The game will load automatically.

Please Note:

* IMPORTANT * Plug the joystick into the appropriate port before turning on the power.

GAME CONTROLS

This game is played with a joystick or keyboard.

* IMPORTANT * Plug the joystick into the appropriate port before turning on the power.

After the game has loaded:
Press any key to display the input device screen.
Press "J" to select the joystick. Press "K" to select the keyboard.

JOYSTICK
The joystick must be calibrated to ensure accurate game play. When the calibration screen appears, please follow the on-screen instructions carefully.

When the player selection screen appears:
Move the joystick up or down to select a ONE-player game, TWO-player game, or a ONE-player PRACTICE game.
Press the fire button to begin play.

During game play:
Move your STIX up/down/left/right with the joystick.
Press and hold down the FIRE button to begin a SLOW draw.
Releasing the FIRE button starts a FAST draw.

KEYBOARD
When the player selection screen appears:
Use the UP/DOWN arrow keys to select a ONE-player game, TWO-player game, or a ONE-player PRACTICE game.

During game play:
Press the 2 key to move the STIX up.
Press the 3 key to move the STIX left.
Press the 6 key to move the STIX right.
Press the 8 key to move the STIX down.
You can also use the I/J/K/M keys to move the STIX.
Press and hold down the OPTION key to begin a SLOW draw.
Releasing the OPTION key starts a fast draw.
You can also use the OPEN APPLE key to begin a SLOW draw.

VALID KEYS during game play:
Control + R Restarts game.
Control + Q Reboots the game. If the game was launched from Finder, this option will return you to Finder.
Press ESC to PAUSE the game; press the FIRE button or OPTION key to resume play.

HOW TO PLAY
The QIX is an evil and terrifying computer virus. Nobody knows where it comes from (yeah, right!). Your mission: immunize the system against this insidious infection! But the QIX is intelligent; it learns from its mistakes. It also breeds lethal subviruses that can quickly spread and infect your system.

Each player starts with three lives. Fill in sections of computer memory without becoming infected. A level is completed when the required section of memory is immunized against the QIX. For example, you must immunize 65 percent of level one to proceed to level two. The percentage increases as your progress.
A life is lost if the QIX touches an incomplete line, or if the marker is attacked by a FUSE, SPARX, or SPRITZ.

STATUS AND SCORING
The status panel on the right side of the screen shows the current number of lives, required claim, completed claim, and current level. The SPARX timer is located above the game screen. It begins to shrink during play. Two SPARX are created each time the line disappears. On higher levels, the SPARX will follow you up your line once the alarm rings.

Player scores are located at the top of the screen. Points are awarded for filled section of memory. A SLOW draw earns twice as many points as a FAST draw. A player earns 1,000 bonus points for each percent over the required claim.

Trapping a SPRITZ virus inside a filled section is worth 500 points. All FAST fills will now generate SLOW points until you die. Splitting two QIX from each other multiplies the point value for each new FAST and SLOW fill. An extra life is awarded every 50,000 points.

HIGH SCORE SCREEN
Enter your name in the QIX Hall of Fame by using the keyboard to enter your initials. Press RETURN to return to the title screen.

STEREO CARDS
This game supports several stereo cards, such as the SUPERSONIC(tm) from MDIdeas. When this type of card is installed, QIX provides rich stereo sound for your listening enjoyment.

HINTS AND TIPS:
• QIX has no time limit; plan your strategies carefully.
• Build allis to guide the QIX into a position where you can trap it.
• Try and split a pair of moving QIX as often as you can; your score will multiply.
• Keep moving; the SPARX are always looking for you.
• Second guessing the QIX isn’t recommended.
Your Quest: (As told by Merson, The Great Wizard)

*Though you have completed your quest to save the land of Questron from the crazed magician Mantor and his Evil Book of Magic, the book itself still exists. The book is so evil that it cannot be destroyed by normal means. Its very presence, anywhere in our continuum, poses the threat of corruption and doom to all civilizations. You must journey back in time to ensure that this abomination is never created.*

*I will send you back through time and space to Landor, where Mantor has enticed six mad sorcerers to create the Evil Book of Magic. I have bent my power to allow communication with Landor through the "Hall of Visions". An important early step in your quest is to search out the hall so that I can lend you my guidance. Through the hall I have learned a few scraps of information concerning the situation on that troubled world. Within these parchments I pass information on to you.*

*You have never existed on Landor, so there you will not have the title and standing you have earned on Questron. My transportation spell is limited to sending only you and a few items. You shall take along the Evil Book of Magic, for we would trust no other to guard it, and the glittering gold key. Beyond these items I can send you only the barest of equipment. Also, the temporal transition will cause the loss of some of your Questron-renowned power.*

*When you get to Landor you must quickly gain equipment to improve your chances of survival. Talk to many, for you will have much to learn about the land and its situation. Regain your fighting prowess and equipment as soon as possible, for Landor is at least as dangerous as Questron. Learn how to survive in cities, as well as the wilderness. Visit the cathedrals and learn their secrets. Venture carefully into the castles. And be ready for the dangers of the tombs and dungeons. To stop the six mad sorcerers you will have to brave the perils of all these locations.*

*Your victories on Questron prove you are the only one we can send on mission. You are our last, best hope of destroying the Evil Book of Magic. Go now; the future of all people rides with you into the depths of the past.*

Theory and Practice Of Time Travel

(As told Morle the Magician in his text "Magic for the Masses")

*Moving through space you accept without question. Moving through time you find impossible to believe. This is understandable, but foolish. To a wizard, time and space are but different sides of the same coin. Just because your experience forces you to see events occurring from past to future, do not be fooled into believing the grand plan operates in that way.*

*Among wizards, time travel is a common phenomenon. Yet it is often misunderstood. The fabric of time is self-repairing. Going back in time to prevent an event can do nothing to alter the years between the event and the moment you move back through time. Only the future after your departure will be altered. The past is but an elusive shadow - only the future can truly be changed.*

The Six Mad Sorcerers (As chronicled by Lady Myrando, Historian to His Majesty, King Kelfar of The Realm of the Sorcerers.)

*For decades the Council of Seven Sorcerers jointly ruled The realm of Sorcerers, for no mortal king could challenge their magic and no king was allowed to be a*
wielder of spells. In the beginning the council’s rulings were fair, but harsh. But longer they ruled unopposed, the more despotic their decisions became.

As the council rulings became more self-serving and forced greater and greater cruelty upon people, one member of the council was revolted by the misuse of power. Kelfar was a junior member of the council, but he understood that the council members’ vanity and suspicions were their weaknesses. He secretly gained the confidence of the common people, and dug to discover every vulnerability of the other six members of the council.

When Kelfar was finally prepared, and the rest of the council was in total disarray over a minuscule dispute, he renounced his sorcerers ways and took up sword to become one with his followers. With the common people behind him and the scattered despots at their weakest, Kelfar struck down the power of the council members and banished them as one from the civilized areas of the realm. His joy claimed his His Majesty, King Kelfar, Lord of The Keaim of the Sorcerers!

His Majesty's rule was wise and fair, but his mercy in banishing, and not eliminating, his former comrades has cost the realm dearly. For in banishing them as one, His Majesty has provided the sorcerers with a common purpose. The sorcerers have hidden themselves somewhere in the realm and even now work to being down His Majesty's rule.

The Evil Book of Magic

Sire,

My Sorcerers eyes and ears have been very active searching out the activities of the Six Mad Sorcerers. We know some thing of their plans, but of late their mystic defenses have become much stronger. The plague of monsters that has nearly over-run the realm is but a by product of the hideous creatures they create to protect themselves.

What I have learned is that The Six labor as on to create a great magic tome. They continue to siper of an Evil Book of Magic and of an other-dimensional leader who binds the group together. The name Mantor is spoken when the group believes it is alone. The Six fear Mantor, and his power, but they see him as the means to gain their revenge upon you. I fear they are nearing completion of whatever vile project they attempt.

Given your political position as the leader of your people (and the renunciation of your sorcerers powers) and my creeping infirmity, neither of us is properly equipped to challenge the six Mad Sorcerers and their other-worldly leader. None of our own knights have been successful in finding, let alone circumventing, their monstrous power. I fear, your majesty, that without a hero believes it is alone. The Six fear Mantor, and his power, but they see him as the means to gain their revenge upon you. I fear they are nearing completion of whatever vile project they attempt.

None of our own knights have been successful in finding, let alone circumventing, their monstrous power. I fear, your majesty, that without a hero of mystical proportions, your reign, and our realm are doomed. Heroes have come unto the land before, and we must pray that one comes to us again.

Monsters

Traveling Creatures
--------------------
Sovan Priest - The Members of this ancient religious order are always willing to help out fellow travellers, for but a small contribution. These tall, robed figures are not well trained in the art of battle, but are as adept in dodging physical attacks as they are at dodging theological attacks, when provoked. Use large weapons

Gypsy Imp - Although it will act as if it's your friend, the Gypsy Imp's true character can be seen by looking at it. It is short, hoofed, devil-like creature who will sell you anything for the right price, but beware, the knife he sells you may be used to stab you in the back.

Hull Bore - The Hull Bore is also known as the "Unicorn Sea Serpent". This creature punches holes in your vessel.

Spiner - Not much is known about this creature, no one has survived to tell.

Grassland Creatures - --------------
Mavin, Snooper Slink, Slasher Boar, Antisaur, Grub Snuffer, Vipod, Ramdart

Forest Creatures - ---------------
Swine Swallow, Boll Rot, Tangler, Hornet Cloud, Baboon

Swamp Dwellers - ------------------
Ball Slime, Carrion Creeper, Jelly Nymph, Giant Cockroach, Stink Worm

Grassland Creatures - --------------
Hurler, Ice Urchin, Cloud Creeper, Spiker, Venom Ant

Spiner - Not much is known about this creature, no one has survived to tell.

Monsters

Ocean Dwellers
--------------
Wave Slapper - The Wave Slapper is best disguised on a stormy day when the sea is turbulent. Long, light maneuverable blade is best to fight these creatures.

Muant Carp - This fish looks like a deformed, overgrown carp. It has four long tentacles which protrude against this abomination.

Hull Bore - The Hull Bore is also known as the "Unicorn Sea Serpent". This creature punches holes in your vessel.
**Game speed** - this affects how long messages are on the screen.

**Magic missile** - this is a single target damage spell.

**Fight** - attack creatures with your armed weapon. Spell individually. The spells are:

**Exit** - leave an area without having to walk out. Doesn't work in tombs, or once the guards are trying to kill you.

**Climb** - move up and down in dungeons on ropes, ladders, and such.

**Arm** - grab a weapon from your inventory. A weapon won't help you in combat until you are armed.

**Inventory** - view your inventory list. Objects you are wearing or armed are highlighted.

**Load game** - reload a saved game

**Loot** - grab or steal items from people, chests, etc.

**Magic** - use a magic spell. Certain spells only work in some areas.

**Speak** - converse with others nearby. In some cases it is better to speak than fight.

**Use item** - use an item from your inventory. Some items only work in the right place or time.

**Wear** - wear your armor. Armor doesn't provide protection until you wear it.

**Examine** - examine the world around you for useful information. For example, you use "examine" in the dungeons To search for and avoid traps.

**C. Combat:**

The wise player learns to pick and choose his battles. While you will have to fight to win the game, it is wise to attack potential friends. There are times when cutting and running is better than standing and dying. Your success in combat depends on your attributes (strength, stamina, and agility), the weapons you're armed with, the armor you're wearing, and the strengths and weaknesses of the creature you're fighting. During battle you decide which direction to attack (if necessary) and then you see if you how much Damage you do. You also see the monster you're fighting, how often they hit and how much damage they do.

**Your character**

A. **Attributes and status**

Your characters status is listed on the screen in the following values:

- **Hp or hit points:** This represents how much damage you can take before you are killed. If your hit point reaches zero, You die.
- **Food:** This is the number of days of food you have.
- **Gold:** This represents how much money you have to buy things with. You can also have money in the bank that is not shown here. If you take an inventory of your character's possessions you will also see your characters attributes and other status information. The status values include:
  - **Level:** This name represents how far along you are in your quest. You begin as a plebe.
  - **Time:** This measures how long since the beginning of the quest. As it gets later your enemies get more powerful and the politics of landor begin to change.

The characters attributes represent how fit he is in a number of areas. The attributes include:

- **Charisma:** This helps you bargain for better prices on goods.
- **Strength:** This helps determine your ability to land blows and to avoid the return blows of your opponents.
- **Intelligence:** This helps determine how reliable your magic spells are. Only a highly intelligent character can use magic well.

B. **Magic** - You can buy 4 different kinds of spells. You pay for each use of a spell individually. The spells are:

- **Magic missile:** This is a single target damage spell.
**Apple II Computer Info**

---

**Fireball:** this is a more powerful single target damage spell. Sonic whine: this is the spell that attacks all adjacent enemies.

Time spells: this spell slows the enemies sense of time to “Freeze” them.

C. Your inventory

All of your equipment is divided into three categories: Weapons, armor, and items. Weapons add to the damage you do and occasionally have other uses. Use the "arm" command to get a weapon from your inventory or change weapons. Use the "fight" command to strike at an opponent. Armor reduces the Damage you'll take from opponents' blows. Use the "wear" command to get armor from your inventory or change armor. Items include everything else you carry. The "use item" Command activates an item if the item is useful in your current situation. When you begin, your choices of arms and Armor are very limited. As you become more powerful you will have the chance to obtain better arms and armor. In general, the more expensive the item the better it is. You can also accumulate many valuable items necessary to complete your quest.

**Landor**

A. Creatures

Over 60 different creatures inhabit Landor. Each type of creature looks different, reacts differently, and is best attacked with certain weapons. Some should never be attacked at all! By listening to rumors, reading the questron ii History booklet and through bloody experience you’ll learn how to deal with each different type of creature.

B. Outdoors

Outdoor adventure is shown on a vast scrolling overhead map. While outside you’ll notice different types of terrain, as well as different symbols of towns, buildings, and other places of importance. Be sure to check out any symbols on the map by moving onto them. This allows you to visit places and board transportation. You can also learn about the terrain types by "examining" them as you walk through. Each type of terrain has its own characteristics and unique monsters.

C. Towns, cathedrals, and castles:

While outdoors, any town, cathedral, or castle can be entered by walking onto its symbol on the outdoor map. When you enter, the scale will expand and you’ll be able to walk from room to room and building to building.

Towns offer a place to rest, gamble, buy goods, rob stores and otherwise partake in the joys of civilization. Your tongue will be useful as your sword as you seek out rumors, gossip, and other information of import.

Cathedrals are magical places controlled by holy ones. Nothing is obvious in a cathedral; there are both traps and rewards. But you will have to discover their secrets to complete your glorious quest.

Castles are important centers of government in Landor. Here you can find important people, information, and items to help you on your quest.

D. Tombs are secret labyrinths of corridors and rooms filled with danger, treasure, and magic. You’ll have to find the Tombs and brave their depths to gain information and power.

Dungeons are evil places, shown in three dimensional perspective. You will need to be very powerful to survive the rigors of the dungeons. The deeper one delves into the dungeon, the more powerful the monsters and traps become, but, the greater the rewards you'll find in chests, vases, coffins, and other magical devices.

When you first enter a dungeon, take a moment to become familiar with the three dimensional view. When you turn left or right you don’t actually move, you just change your facing. If you stand next to an object and turn you’ll always keep the object in front of you as you “Circle” it.

A legendary scroll can help you navigate in the dungeons. The scroll remembers every step you take to create a “map” as you stalk the halls. The map disappears after you leave the dungeon.

< QUICK-DRAW ADVENTURE MAPPER >

Softdocs written by: --> Sherlock Apple
Program cracked by: --> Sherlock Apple & Silicon Scorpion

"IF YOU BUY A LICENSE, YOU CAN LEGALLY MAKE A COPY OF QUICK-DRAW ADVENTURE MAPPER WITHOUT GUILT, SHAME, BEING CALLED A PIRATE, OR THE FEAR OF THE F.B.I. BREAKING DOWN YOUR DOOR AT 2 AM."

*A license is obtained by purchasing Quick-Draw Adventure Mapper or by paying $14.95 (Visa/check/MC/MO) to:

TELLUS SYSTEMS INC.
P.O. BOX 96588
HOUSTON, TX. 77213
(713) 455-2191

Please enclose your name and address and state that the money is for a Quick-Draw Adventure Mapper license."

PS: Other sysops are welcome to use this file on their boards providing they don't change anything.

Section 1

INTRODUCTION:

After a fun-filled day of adventuring, Quick-Draw Adventure Mapper accepts your hard earned data and makes a high-resolution map on your printer. This map is the starting point for your next outing. Your Quick-Draw map grows along with your knowledge of your adventure.

The Quick-Draw Adventure Mapper is a companion to any adventure game. It supports the following features:

1. Prints a high-res map showing all rooms and their connections.
2. Draws each room showing the room title, the room #, or both.
3. Shows which room connections are "one-way".
4. Adds new rooms and information at any time.
5. Stores the mapping data for 4 adventures.
6. Prints a summary of all adventure information.

HARDWARE REQUIREMENTS:

An Apple []([]/[])[e with 48K or 64K of memory and a single disk drive are required. A dot matrix printer is required for to print the maps and information summaries.

Included in this file is a list of printers and interfaces supported by Quick-Draw Adventure Mapper. Appendix I shows how to configure Quick-Draw Adventure Mapper for other printers and interface cards.

LOADING THE PROGRAM:

Place the diskette in drive 1 and turn the computer on. The first time it is loaded, Quick-Draw Adventure Mapper will automatically run the configuration program which will allow you to change several default settings and to specify your printer and interface.

From then on, when QDAM is booted, it will begin with your selections. If you wish to change them in the future, or if someone else configured your copy, hit <ESC> immediately after booting. This will run the configuration program.

CONFIGURING THE SYSTEM:

During configuration, QDAM will ask you 7 questions, as follows:

[3] The slot your printer's interface is in.
[4] If your interface uses a second slot, the number it is in.

For items [1] and [2], you select your printer and interface from the list of supported peripherals. If your printer and/or interface is not shown, then see Appendix I on how to customize QDAM for your printer and/or interface card. The 3rd item is the slot your printer interface is in (usually Slot 1). The fourth item is only required for certain interface cards, such as the Versa-card, which use 2 slots.

For the last 3, "Numbers", "Yes", and "Single" would be good choices until you are familiar enough with QDAM to decide you want anything changed. Their purposes are fully explained in section 7.

MENUS:

QDAM accepts commands from the menu on the bottom line of the screen. Typing the first letter in the command's name is all that is required to specify that command. Many of the commands will bring up more detailed menus.
ROOM PLACEMENT:
---------------
QDAM uses a grid that is 19 rooms across by 13 rooms down for a total of 247 rooms per map. Rooms can be positioned anywhere on that map.

Infocom games, considered the most advanced have the following #'s of lowest available number is always used.

\[
\begin{array}{ccc}
[01] & \text{Zork I} & 110 \\
[02] & \text{Zork II} & 086 \\
[03] & \text{Zork ///} & 089 \\
[04] & \text{Enchanter} & 074 \\
[05] & \text{Sorcerer} & 084 \\
[06] & \text{Starcross} & 086 \\
[07] & \text{Suspended} & 063 \\
[08] & \text{Planetfall} & 105 \\
[09] & \text{Deadline} & 051 \\
[10] & \text{Witness} & 031 \\
[11] & \text{Infidel} & 077 \\
\end{array}
\]

NOTE: This list does not include SeaStalker or Cutthroats. The numbers here may also be deceiving. The # here are the # of internal rooms in the programming, many of which, in some cases, can not be entered by the player.

As you can see by the above list, 247 rooms is plenty for almost all adventuring needs.

MOVING THE CURSOR:
------------------
The room selection cursor is positioned in the upper left corner when the program is first booted. The cursor can be moved anywhere on the upper portion of the screen. The table below shows the keys that move the cursor:

|
| U | I | O |
| J | * | K |
| N | M |

The arrow keys may also be used on a /e.

ADD:
----
The ADD command places a room at the current cursor position. As soon as you press the "A" key, the screen should flip to the room information entry display. The ADD command automatically moves you to this new screen and menu since you will usually want to enter room information as soon as you add the room. For now, press the L key to LEAVE and go back to the previous menu.

There are 3 things you should now notice:

1. There is a colored box in the center of the screen, representing the room you just added.
2. The "SELECTED" area displays blanks instead of the flashing message: "* * * EMPTY * * *". It is really displaying the title of that room, but since we haven't entered a title yet, there are only blanks there. The "ROOM" number shows "1".
3. The menu is now different. The ADD command is now gone, and in its place are DELETE, EDIT, and VIEW.

Since there is a room at the current cursor position, we can't add one. We can DELETE it, EDIT its information, or VIEW its information.

The XTRAS command calls up another menu containing special features that will be explained later.

VIEW:
-----
The VIEW command displays all of the information entered about the currently selected room.

EDIT:
-----
The EDIT command displays the same information as the ADD command and allows you to change any or all of it.

LEAVE:
-----
The ADD, EDIT, or VIEW commands all bring up new menus. All of these new menus have a LEAVE command, which returns you to the previous menu.

TEXT EDITING:
-------------
Most of the information entered into QDAM consists of text such as:
- Room titles
- Items found in rooms
- Pathways or connections between rooms
- Comments about a room
- File titles for saving your information

The text editing commands are explained below. In the following section, you will have many opportunities to practice them.

BASIC CONCEPTS:
-----------------
Text editing is always performed within a rectangular area of the screen, whose position is dependent on the information being supplied. This area can consist of a portion of a single line or encompass several lines on the screen. When multiple lines are involved, a word
that is too long to fit in the remainder of the line is automatically moved down to the next line.

----------------- - Title of the room
EDITING COMMANDS: - Items found in room
----------------- - Comments
----------------- - Pathways to other rooms

Only upper case characters can be accepted. Newly typed characters replace those that previously occupied their positions. Some special command characters are recognized:

RETURN: -Signals the completion of all editing. The contents of the current editing area accepted as displayed.

ESC: -Initiates a mode that allows the cursor to be moved within the current editing area. In this move, the "I" key will move the cursor up one line (or the beginning of the current editing area), the "M" moves the cursor down one line (or to the end of the editing area) and the "J" and "K" keys move the cursor one space left or right, respectively. Any other key exits this mode.

Arrow keys: -Moves the cursor one character in the direction of the arrow.

Control-D: -Deletes the character at the current cursor position. All text to the right of the cursor is shifted one space to the left. If you deleted the item. Apple 2e users can use the DELETE key and it will function the same as Control-D.

Control-I: -Inserts characters at the current cursor position. All characters to the right of and including the cursor are shifted one character to the right. The new character is placed to the left of the cursor.

Control-R: -Restarts the editing session with the original text. This allows you to recover what you started with if you make extensive editing errors.

Control-N: -Blanks the current editing error. If you want to replace everything in the editing area, it's easier to start with a clean screen.

Control-B: -Moves the cursor to the first character in the area currently being edited.

Control-E: -Moves the cursor to the last character in the area currently being edited.

If you are not familiar with entering control characters, it's really very easy. To type the CTRL-D command, hold the CTRL key down while pressing the "D" key.

When you add or edit a room, you get the same display. For each room, you can enter:

- Title of the room
- Items found in room
- Comments
- Pathways to other rooms

The first three are covered in this section. The next section discusses pathways.

TITLE: 

The TITLE command allows the 18 character room title to be modified. When a room is added, the title is initially blank. Practice using all of the text commands now.

After entering the title, press the "L" key to return to the highest level menu to verify that the title you entered is displayed as the selected room.

COMMENTS: 

The COMMENTS command allows the comments area of the screen to be modified. Notice that the comments area is located in a multiple line text editing area. Enter some comments and observe how the words are placed in the area.

ITEMS: 

Up to eight items per room can be entered. Each item name can be 11 characters long. The ITEMS command calls up one of three new menus:

- If the items area is blank: ADD LEAVE
- If there is at least one item, but less than eight: ADD EDIT DELETE LEAVE
- If there are eight items: EDIT DELETE LEAVE

The ADD command adds a new item to the end of the list. The arrow keys are used to position to a particular item. The DELETE command deletes the currently selected item. The EDIT command allows the currently selected item to be modified.

Practice adding, editing, and deleting items.
Apple II Computer Info

The PATHWAYS command provides the mechanism to define the connections between the rooms in your adventure. Up to eight connections can be defined between rooms. The PATHWAYS command calls up one of the three menus as the ITEMS command. The reasons for calling a particular menu and the basic function of the ADD, DELETE, and LEAVE commands are the same as the ITEMS command. The only real difference is the information to be recorded.

PATHWAYS:

When you add a pathway, the cursor will go to the left side of the screen under the word "PATHWAY". For each connection, a fourteen character pathway can be entered to define the direction that must be taken in order to move to the connecting room. Some typical examples are:

NORTH, SOUTHEAST, UP, FOLLOW PATH, GO DOOR, CLIMB TREE, LAUNCH BOAT

CONNECTING TO ANOTHER ROOM:

After you have edited your pathway and hit return, the cursor will move to the right side of the same line under the word "ROOM". At this point, all you have to do is enter the room number of the room you want to connect it to. You have just made a room connection.

What did you say? You don't remember the room number? Read on.

SELECTING YOUR CONNECTION:

Instead of entering the room number, just press the "RETURN" key. The display will change to show the map grid. The room you are currently editing will be shown in a different color with the cursor around it.

Move the cursor, using the normal room cursor movement commands, to the room you wish to connect to. The "SELECTED" area will update to display the titles of the rooms as you move the cursor through them. Once your cursor is properly positioned, press the "RETURN" key to establish the connection between the rooms.

REVERSE PATHWAYS:

So far, you have established a single direction pathway from the room you're editing to the room you've selected. Since most connections run both ways, when a room is initially added, you are given the opportunity to establish the other connection. This feature is not implemented for the edit command.

After you have defined the connection, you will return to the room editing display. The second line from the bottom will display the question:

REVERSE PATHWAY?

If you hit "RETURN", a single direction pathway will be established from the current room to the selected room. If you want to define a two way path later, position to the other room and define another one way path back to the room you are now editing. If, in response to the question, you type in a pathway, a two way path will be defined.

For example, you can enter a path from room 1 east to room 2. If you type "WEST" when asked for a reverse pathway, then a path exists from room 2 west to room 1. It should be emphasized that establishing a path with a reverse path, is exactly equivalent to establishing two one-way paths between rooms.

PATHWAYS TO NOWHERE:

If you do not know where a particular exit goes, you can enter a "?" as the room number. The room title will be shown as question marks and exit indicators will be printed on the map for each pathway to nowhere. You can enter the correct destination later, as you get further along on your adventure.

PATHWAY ABBREVIATIONS:

The more common pathway directions receive special handling. They can be entered as abbreviations but will be automatically expanded to their full form for presentation.

The pathway entries that are recognized are:

<table>
<thead>
<tr>
<th>Pathway</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NORTH</td>
<td>N</td>
</tr>
<tr>
<td>SOUTH</td>
<td>S</td>
</tr>
<tr>
<td>EAST</td>
<td>E</td>
</tr>
<tr>
<td>WEST</td>
<td>W</td>
</tr>
<tr>
<td>UP</td>
<td>U</td>
</tr>
<tr>
<td>DOWN</td>
<td>D</td>
</tr>
<tr>
<td>NORTHWEST</td>
<td>NW</td>
</tr>
<tr>
<td>NORTHEAST</td>
<td>NE</td>
</tr>
<tr>
<td>SOUTHEAST</td>
<td>SE</td>
</tr>
<tr>
<td>SOUTHWEST</td>
<td>SW</td>
</tr>
</tbody>
</table>

Enter some of the abbreviations above as pathways to observe their automatic expansion into their full form.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 892 of 1262
Quick-Draw Adventure Mapper uses data disks that are the same disk format as DOS 3.3, but organized differently. This means that:

1. Any disk initialized with standard DOS 3.3 can be used as a data disk.
2. Any data previously on the disk will be lost when used with Quick-Draw Adventure Mapper.
3. There are no files on the disk that can be recognized by any file oriented utility. Therefore, a program like APPLE's FID will not operate on the data disks.
4. Any program (such as APPLE's COPYA) that copies the entire disk can be used to back-up your data disks.

When you select the XTRAS command from the highest level menu, you will be presented with the following options:

DISK PRINT MOVE BOOT NEW RAM LEAVE
Select DISK and the screen should display a new menu:
FILES SLOT/DRIVE INIT CATALOG LEAVE
The various menu commands are explained below.

--------
SLOT/DRIVE: --------
Press the "S" key and you can change slot and drive numbers that all other commands will operate from. The default is set to the drive that you booted Quick-Draw Mapper from.

-----
INIT: ----- If you don't have an initialized disk, this is the command for you. This command produces fully compatable DOS 3.3 disks. Until you save Quick-Draw Adventure Mapper files on it, the disk is the same as that produced by APPLE DOS's INIT command.

-------
CATALOG: -------
A single Quick-Draw Adventure Mapper disk can hold four different data sets. This command will read the disk in the current slot and drive and display the titles of the four files. Missing files are displayed as blanks. The titles are displayed under the "FILE TITLE" heading on the screen.

------
FILES: ------ A disk catalog is performed and a new menu is called up with the following functions:
SAVE RESTORE PURGE LEAVE
When you press the "S" key to begin the SAVE command, the disk's catalog will be displayed and a flashing indicator will be placed in the left most column of the title display area. You can use the arrow keys to position the indicator.

-----------
MAP OPTIONS: -----------
Selecting the OPTIONS command from the PRINT menu calls up still another menu:
NUMS TITLES BOTH SHOW OMIT 1 2 LEAVE
These commands control the map printing options and can be set in the configuration program:
NUMS
Only the room numbers are printed
TITLES
Only the titles are printed
BOTH
Both the room numbers and the titles are printed
SHOW
The entry/exit path indicators, explained below, are shown on the map.
The entry/exit indicators are removed from the map.

1. Prints the map in single density graphics.
2. Prints the map in double density graphics (not available on all printers).

The entry/exit indicators let you see which paths enter and exit a room. A path leaving a room has a small line drawn perpendicular to it on the outside of the box representing the room. The line is drawn inside the box if the path enters the room. If a path enters and exits a room, BOTH lines are drawn.

You should print out maps using the various combinations to determine your own individual preference.

REARRANGING ROOMS:

- ROW
  - Consider a square whose upper corner is the cursor and whose lower right corner is the lower right corner of the screen. The ROW command will move that square down one row. The ROW command will not work if the bottom row of the square contains any rooms.
  - COLUMN
    - Consider the same square. The column command will shift it one column to the right. It will not work if the right column of the square contains any rooms.
  - HORZ.
    - All rooms in the same row as the cursor that are at or to the right of the cursor position are shifted one column to the right. There cannot be a room in the rightmost position of cursor row.
  - VERTICAL
    - All rooms at or below the cursor position that are in the same column as the cursor are shifted down one row. There cannot be a room at the bottom of the cursor row.

INSERT AND DELETE:

These commands allow you to move many rooms at one time. Selecting one of them indicates whether you want to insert or delete space and brings up the following menu:

- ROW COLUMN HORZ. VERTICAL LEAVE

These commands will move the existing rooms as explained below. None of the commands will allow you to shift rooms off of the map. You should practice the room moving commands until you are comfortable using them.

INSERT DETAILS:
QuickLaunch was written by Steve Stephenson and is fully copyrighted by Seven Hills Software Corporation, 1991-1992. Seven Hills Software has allowed Apple to include QuickLaunch on the Apple IIgs System Software v.6.0 Golden Master CD to help show off some of the potential power of Finder extensions under System 6.0.

QuickLaunch allows users to add the names of their favorite applications to the "Extras" menu of the System 6.0 Finder. Those applications can then be launched simply by selecting them from the "Extras" menu!

More information on how to use QuickLaunch can be found by installing it (copy it into your boot disk's "System:System.Setup" folder and reboot) and then selecting "QuickLaunch List..." from the "Extras" menu in the Finder. QuickLaunch has a complete online help system built into it (nice touch, Steve!). Please take a few minutes to read the help given under the topic of "General".

Enjoy!

Seven Hills Software
4/92

Quit-To is a "program switcher" for the Apple IIgs. It is a Classic Desk Accessory which allows you to jump directly from any application (either ProDOS 8 or GS/OS) to any other application (ProDOS 8 or GS/OS) without going back to the Finder (or other launcher). That is, it lets you "quit to" another application, rather than quitting to the Finder and launching the new application there. Generally, if you do much switching between applications, this will save you a lot of time. Quit-To is the first and ONLY universal program switcher for the IIgs; Quit-To works with virtually ALL ProDOS 8 and GS/OS programs. Other IIgs program switchers only work from within GS/OS desktop applications.

Quit-To is in freeware. You are welcome to keep it, use it, and to distribute it freely to anyone. Don't expect much in the way of user support, however. No further updates to Quit-To are planned.

New Stuff

For those familiar with earlier versions of Quit-To, here is a list of the new features added since version 1.0:

1.1: Applesoft BASIC programs can now be selected for launching.
2.0: Works from within GS/OS applications as well as ProDOS 8. Run-List Sort option added. System 6 supported (but not required). Other technical changes.
2.01: Reports error if attempt is made to quit to an application in the Run-List and that application has been moved, renamed or deleted. New information in docs.
2.02: First-letter keypress file selection now cycles around to the start of the list. The number of volumes Quit-To can display is no longer limited to seven.

Using Quit-To

As with all CDA's, Quit-To is installed by copying it to your SYSTEM/DESK.ACCS folder, and rebooting. Quit-To requires that you boot your system with GS/OS; you can't use the utility "P8CDA" to install Quit-To on a ProDOS-booted system. (Note to beginners: to access the CDAs installed in your system, press OpenApple, <control> and <esc> simultaneously.) Quit-To gives you two different methods for selecting the program that will be launched when you quit from your current program. I'll refer to these as Selector mode and Run-List mode. When you use Quit-To for the first time, you will be in Selector mode. I'll explain this mode first, and Run-List mode later.

When you choose Quit-To from the CDA menu, you will see a title screen with a file-selection dialog box. This dialog box is used to select the application which you would like to go to when you quit from the program you are currently using. As the prompt "buttons" note, this dialog uses the standard key-commands for text based file selectors: The arrow keys move the highlight bar. <esc> closes the current folder, <return> opens a highlighted folder, <tab> allows you to select a different disk, and OpenApple-period cancels the selection, exiting you from Quit-To. Only SYS (ProDOS application), BAS (Applesoft BASIC programs), S16 (GS/OS application) and DIR (folder) files are shown in the file dialog's list. Press <return> with the application you want highlighted, and you will be returned to the IIgs' CDA menu. Exit from this menu to return to the program you were using, and go on about your business. Everything will appear to be the same.

However, when you quit from that application (exactly HOW you quit depends on the application, of course), Quit-To will do its thing. Instead of going back to your launcher, you go directly to the application you selected in Quit-To. When you quit from THIS program, you will go back to your launcher as usual, unless you use Quit-To a second time to select yet another application.

Run-List Mode
Rails West! Simulation Game Short Rules

Docs Written by: The Kid
Edited by: Wile Coyote

Note: These are the "Short Rules" provided by Strategic Simulations. It is the bare bones necessary to play the game. To really understand the game and get some hints about strategy you will need the longer docs. These will be provided in a separate file.

(A color monitor is highly advisable.)

Number of Players: 1-8, up to 4 can be controlled by the computer

Length of Game: Long Scenario lasts 31 turns (1870-1900) Short Scenario lasts either 6 turns (1890-95) or 11 (1890-1900)

Object of Game: Accumulate cash, stocks, and bonds and control viable transcontinental railroads. A transcontinental runs between one or more of his western terminals (Seattle, Portland, San Francisco, LA, or Mojave) and one or more eastern terminal (St. L, MISSING TEXT)

The Map: There are 33 cities connected by 68 potential/actual rail lines. Potential lines are white. Other colors represent efficiency levels. Violet=low, Orange=medium, Green=high.

Phases of a Turn

1) Operations: Various economic indicators are calculated at this point. Interest on call loans is collected, bad call loans are called, some randomly selected loans are called and companies are declared bankrupt as necessary. Action points are determined.

2) Computer/Player Phase: With difficulty set at 1 or 2, the computer goes first. Difficulty set at 3, first move is randomly selected and on difficulty 4 the player(s) go first.

3) Computer Action Phase: Computer-run player moves displayed, hitting a rock will pause it (slight delay in reacting to it).

Player Action Phase

There are two menus (Player Action Menu and RR ACTION Menu, reached by selecting RR ACTION). Most actions cost 1 action point. Free actions are: Read Map, Read Account, RR Statistics, and Read Account (on RR ACTION menu). A bankrupt player or one with no

Player Actions

BUY/SELL SECURITIES: Made in blocks of 1000 shares or bonds. Any purchase or sale results in the shock price being recalculated, bond prices are not affected.

SELL STOCK: The public never buys stock at less than 3 and buys only as much as it already owns, a minimum of 1000-4000 shares.

BUY STOCK: A player must buy with cash. The public never offers all its stock, it offers fewer (Minimum: 1000 shares) higher priced shares and more lower priced shares.

SELL BONDS: The public won't buy bonds selling for less than 101.

APPLY FOR LOAN: The maximum loan equals the net worth in cash and securities minus previous loans.

START NEW RAILROAD: If less than 20 exist, players may start a new RR corporation, acquiring control and 100,000 shares of stock for a minimum payment of $300,000. The new RR must charter a line during the turn or be eliminated.

READ ACCOUNT: Your cash balance, call loans, numbers of stocks and bonds.

CONTROL RAILROAD: Player must own at least 10% of the RR's shares and more than any other player trying to gain control.

RECALL RR LOAN: Player recalls all or part of any loan. To repay, the RR must have the cash and not owe interest on its bonds.

REPAY LOAN: Obvious

READ MAP: " "

RR STATISTICS: " "

RR ACTION: Can only be taken for a RR you control.

Railroad Actions

SELL/BUY STOCKS/BONDS: Same as for Player companies except: 1) A RR may buy/sell from player's company or the market, 2) the cash a RR gets goes to paying off call loans, and 3) RRs are not allowed to own securities from other RRs.

REPAY BANK LOAN: Repays call loans that result from building or from raising efficiency.

RESIGN CONTROL: Do so to save action points.

READ ACCOUNT: See how much cash the RR has, how much it owes in call loans, how many unissued stocks and bonds it has. Bankruptcy is shown in negative bank balances.

CHARTER LINE: A RR must charter (cost: $300,000) a line segment before it can build on it. May only have one unfinished line at a time. The new line must connect to an existing one, if one exists. It must be completed within a time limit (with exceptions).

RAISE EFFICIENCY: The RR does not need cash but must not be bankrupt or owe bond interest to do this. The new color is drawn, several financial operations occur.

BUILD NEW LINES: RR must have an unfinished chartered line and can only do this once per turn on any line. Do not need cash but must not be bankrupt or owe bond interest. Cost is based on economic level with a premium for more than 15 dots (and a maximum

CHANGE DIVIDEND: Set rate between 0 and 25.

PAY INTEREST: If the RR passed up paying its bond interest at some point, it may pay 1 year's back interest. May be performed more than once (to pay off older interest). Must have enough cash.

FLOAT SECURITIES: RR may float its own securities through an investment banker. The banker may offer free stock to encourage purchases. Banker's charge=10%. These bonds are not subject to the same market forces as stocks.
INTRODUCTION

As NATO and Warsaw Pact tanks battled for control of the West German plain, an elite Soviet Para Assault Regiment, flying at night from airfields in Soviet Central Asia, seized the strategic Saudi Arabian airfield at Dhahran. Soon huge Antonov.22 transport planes were landing at Dhahran, unloading T-72 tanks, BMP Infantry Combat Vehicles, artillery, and BM-21 "Katyusha" rocket launchers. By morning, a large part of a Motor Rifle Division, veterans of desert combat in Afghanistan, was on the ground. By the end of the day, the most important Persian Gulf oilfields were in the Soviet hands.

Within hours, C-141 Starlifters carrying the paratroops of the United States Rapid Deployment Force took off from their airfields in Egypt. In the United States, C-5 Galaxies began taking on cargoes of armored personnel carriers and self-propelled guns. In the Indian Ocean, a U.S. Navy Task Force, carrying RDF armor and helicopters, set a course for the Persian Gulf.

RDF 1985, the second of when Superpowers Collide scenarios, is a battalion-level simulation of the resulting battle. The rules are essentially the same as those in Germany 1985. This booklet describes the exceptions and the special conditions of desert combat that only apply to RDF 1985.

PLAYING THE FIRST GAME:

*You will now begin a solitaire game, in which you are the American commander, and the computer plays the Soviet commander.

When the game options display appear, hit 3 twice to reduce the strength of the Russian force and to expose all of the Soviet units to view. The Russian units are already in place.

Press the spacebar, and the game will begin with an American airdrop onto the desert.
1.1 THE MAP
Each hexagon of the 39 x 28 hex map represents 2.5 miles. On your screen, you will see one-twelfth of the total battle field. A number or a letter will tell which sector you are seeing. At the beginning of the game, all oilfields, villages, towns and airfields are Russian owned. If an American unit moves into them, they will be American owned, and the symbol will change. They can change ownership any number of times during a game. For their importance, see RDF victory conditions (11.0).

1.2 MOVING THE CURSOR
To move the blinking cursor around the map, type the command keys pictured in the diagram below:

```
/ 1  
/ 6  
/ 2  
/ 3  
/ 5  
/ 4  
```

1.3 MOVING UNITS
Press escape to move the cursor to the first unit and to enter its movement phase, then use the command keys to move that unit. When you've used up the movement allowance of that unit, the cursor will find the next movable unit. When you have moved all of your units, the cursor will blink. Press control and E, and then E to end your turn.

1.4 THE SOVIET MOVE
The computer will move all of the Soviet units. During the Soviet move, you can stop the computer by typing escape. While the move is paused, you can use any of the special keys (12.0). To resume the Soviet move, press any key. When the Soviet move is finished, the cursor will begin to blink, indicating that the first four-hour turn is over. Press escape to move your first unit again.

2.0 MOVEMENT
------------
2.1 THE MOVEMENT DISPLAY
The RDF movement display shows the word smoke; if it is highlighted, the moving unit is in a smoke-filled hex. M(MINE) and N(NUCLEAR) contamination are not shown, since they play no part in this scenario.

2.2 AIR CAVALRY
Air cavalry uses one movement point (MP) per hex. In addition to this, air cavalry units will use:

- 2 extra MP's to enter a smoke-filled hex
- 1 extra MP for each sighting enemy unit (SEU)
- 1 extra MP if the enemy has air superiority, and the air cavalry is in the trans mode.

Air cavalry units cannot enter enemy-owned oilfield, village, town, or airfield hexes.

2.3 UNITS IN TRANSPORT MODE
*Can only travel through town, village and airfield hexes, or along the roads.
*Cannot enter enemy-owned oilfields, towns, villages and airfields.

2.4 BRIDGING
Due to an exceptional lack of water in Saudi Arabia's rivers, no bridging is necessary in this scenario. Engineer units have no special functions.

2.5 TERRAIN
The effects of different types of terrain upon movement are detailed in the terrain effects table in the appendix.

3.0 MODES
--------
3.1 SPECIAL MODE RULES
Engineer units are allowed to re-organize. No unit can enter river mode.

4.0 THE ORDER PHASE
-------------------
Naval units cannot use strategic movement. They can only be moved with the move ment keys.

5.0 AIR POWER
-------------
5.1 THE AIR POWER DISPLAY
Hit CTRL A at any time to see an air power display like this:

```
NATO:3:RUSSIAN:1: ALCS:KEYS (A)IR SUPERIORITY:SPARE:9:0 :0-9 TACTICAL AIR SUPPORT:16:
```

In this sample, the highlighted side, NATO, has three-to-one air superiority during this turn. The NATO player may allocate up to 9 spare points toward air superiority by typing any number up to 9. The NATO player may call in up to 6 tactical air strikes during this turn.

5.2 CALLING AIR STRIKES
If its side has air superiority, and the air power display shows available tactical air strikes, any unit can call for a supporting strike by:

- Typing (O) for its order phase
- Typing (S) for support fire

If a player does not have air superiority, he cannot call for tactical air strikes during that turn. If the U.S. player has air superiority, he will have between 2 and 7 available air strikes. A Russian player with air superiority will have between 0-5 strikes.

5.3 AIR SUPERIORITY
*The U.S. player has air superiority during the first 2 turns.
*The Russian player starts the scenario with no spare air points, and he receives fewer points than the U.S. player each turn. It will take 5 or 6 turns before he has enough to challenge the U.S. player.

6.0 COMBAT
-----------
Russian units on coast hexes can attack or fire on U.S. naval units, but the naval units cannot fire back at them.

6.1 ARTILLERY DAMAGE
Para units, like BMP, tank, and APC units, suffer greater damage from artillery if they are in Trans, attack or reor mode.
6.2 Retreating Units
Naval units that are forced to retreat after combat will suffer increased losses instead.

7.0 Reorganization
In addition to the normal rules the U.S. player may use a friendly airfield instead of its HQ (whichever is closer) for re-organization purposes.

8.0 Hidden Units
Para units will be exposed during the turn they land, even if the hidden game option has been chosen. They may be hidden in later turns.

9.0 Mines and Nuclear Contamination
Mines and nuclear contamination play no part in this scenario.

10.0 Reinforcements
Both sides are scheduled to receive reinforcements during the turns shown on the RDF data card.

Russian reinforcements arrive at the hexes shown on the data card.
*Para units arrive within 3 hexes if the drop zones selected by the computer, or by the NATO player, has used the drop zone placement option (11.3).
*Para units cannot land on enemy-owned hexes, or on the western third of the map (sectors 1, 4, 7 or A).
*If a drop zone is too close to the sea or the edge of the map, para units may be unable to land; the error signal will sound. If the para drops on turn 3 and turn 4 will be delayed one turn if the Russians have air superiority.

U.S. reinforcements arriving by airplane (turns 7, 8 and 9) will land on available friendly airfields. No more than two units will arrive at any field (one unit at night). Friendly units on these airfields will hinder the landing of reinforcements. Russian air superiority will delay all air-landing reinforcements for one turn.

10.1 Naval Units
A U.S. task force, carrying reinforcements for the RDF, arrives in the Persian Gulf during turns 12, 13 and 14.
*Naval units are moved the same way as conventional units, with the direction keys.
*At sea, naval units cannot engage in combat, change mode, use the order phase or supply supporting fire.

*Naval units are assumed to be in trans mode. Their movement is reduced if the Russians have air superiority, and by the presence of sighting enemy units.
*Russian units on coast hexes can fire on or attack U.S. naval units, but cannot be attacked in return.

10.2 Landing Naval Units to Land, a naval unit must end its movement phase adjacent to the coast where it intends to land. Any unit which moves at sea cannot land until the next move. At the beginning of the next move, the unit will be able to move ashore.

*Naval units cannot land on enemy occupied hexes or enemy-owned town or village hexes.

10.3 Naval Units on Shore
Once ashore, naval units convert into conventional units, with a reduced movement allowance for the first turn. Upon landing units change automatically to norm mode (artillery changes to fire).

11.0 Victory Conditions
The game will end after 21, 22, or 23 turns, at the discretion of the computer. The computer will then compare each player's point total and will declare a winner. Points are awarded as follows:
1 point for each enemy unit eliminated (enemy units which exit the board do not count)
1 point for each oilfield hex owned
2 points for each town or village owned
A player with 10 or more points than his opponent has won a decisive victory.

12.0 Special Keys
The special keys can be used during your own turn when the cursor is flashing, or by pressing escape during the computer's move.
*If the hidden option was chosen when you set up the game, you cannot use the D (highlight division) or the F (strategic map) keys during the computer's move.

13.0 Game Options

13.1 Saving the Game
A game may be saved at any time on a second disk by hitting control B and following instructions. RDF games may be saved on the same disk as Germany 1985 or other scenarios.

13.2 Restarting a Game
To restart a game saved on another disk, hit the number of that game option and follow instructions. The names of games available for play will be shown normally. Highlighted names show games that belong to other scenarios, which cannot be played with the RDF disk.

13.3 Drop Zone Selection Option
To select the drop zones for the U.S. Para units, hit 9 when the option display is shown, so that placement is highlighted. As the computer directs, move the cursor to the desired drop zone and press return.

*Para units will land within 3 hexes of the selected drop zones. *Drop zones cannot be located in the western third of the map (sectors 1, 4, 7, or A).

14.0 Strategy and Tactics
The key to winning RDF is taking and holding oilfields, and even more important, airfields. The Soviet player has the advantage of numbers. The U.S. player has the advantage of superior air support, especially on the first day, and the superior training and equipment of the Para units.

When playing against the computer, remember that the computer side always has enhanced airpower and greater ability to reorganize, to
COMPENSATE FOR ITS LACK OF FLEXIBILITY.

IT IS ADVISABLE TO AVOID A BATTLE OF ATTRITION OR HURRIED, UNCOORDINATED OFFENSIVES, AND TO CONCENTRATE ON SHARP, WELL-SUPPORTED ATTACKS TO ELIMINATE ENEMY UNITS.

IN EFFECT, WHEN YOU PLAY AGAINST THE COMPUTER, YOU ARE PLAYING AGAINST A WELL-EQUIPPED AND WELL-TRAINED ENEMY, WITH LITTLE IMAGINATION AND A TENDENCY TO GO STRICKLY BY THE BOOK, A TYPE OF SOLDIER PLENTIFUL IN BOTH THE U.S. AND RED ARMY.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 901 of 1262
The new GS/OS Driver I have written for the RAM Disk is designed to be a companion to RAM Disk Manager, however it will run just as well without the RDM CDA installed. On my computer I get nearly 3x the speed out of my RAM Disk.

What you have is a DEMO of the GS/OS driver. The "real thing" is part of the ROM package but you get it only after paying for RDM. $10 isn't too much to ask for such a useful utility. See the CDA documentation for information on how to pay for RDM.

This DEMO is just like the "real thing" except in one respect: You cannot write to the RAM Disk. This is just enough to tease you, and make you want to send me money. The fully functional driver is available immediately.

With this demo you can play around with benchmarking programs and try things while at the same time it is counterproductive to try to use this for normal work. Use a ProDOS 8 program to copy files onto the RAM Disk and test it under GS/OS. Or whatever makes you happy.

One last thing. The driver is NOT being distributed under the shareware concept. It is available ONLY to registered users of RAM Disk Manager, with the exception of this demo. Remember, a measly $10 gets you both the CDA with the P8 driver and the GS/OS driver.

INSTALLATION: Put it in your DRIVERS directory. You're done. When the demo gets on your nerves, delete it. Simple. The file to copy is called "RDM.GSOS", or in the case of the demo, "RDM.GSOS.DEMO". When you install the release version be sure you delete the demo first!

* FEATURES *

- ROM 1 machines only. It's a feature until I can do something about it. That should be very soon, actually.
- 2-3x speed improvement. Fast! <1 millisecond access time. (Benchmark: ProSel-16 w/7 M62 TransWarp)
- Smartport independent. That is, if Slot 5 is set to "Your Card", the driver is smart enough to install itself as a slotless device and you can access the RAM Disk anyway.
- Device independent. The driver will work even if you boot from the RAM Disk. One driver fits all.
- Fully Functional. Supports virtual RAM Disks. Transparent to the user with exception to the speed improvements. Works with RAM Disk Manager's CDA flawlessly.

That's about all I can think of right now. Read the other documentation file to see how to get a fully working version of the driver.

--Jeff
And to the Red October’s crew: do your duty. There are no small jobs on the RO; the responsibility for the success of this mission lies with every man, from the highest officer to the lowest seaman. Follow orders, be diligent, and make the homeland proud of you.

END ORDERS

Admiral Yuri Yurch Padarin

YIP/tj

As commander of the nuclear-powered sub, Red October (RO), you’re in charge of one of the most powerful weapons on earth—difficult to detect, swift to strike.

You’ve been entrusted to test the latest in Soviet naval technology: a revolutionary “Caterpillar" Drive that will make the RO practically undetectable. Unfortunately for Mother Russia, they’ve trusted the wrong man. You plan to defect to the US and hand over the Red’s new technology.

You’ve handpicked your officers, men who will risk their lives for your plan. The enlisted men suspect nothing and this must not change. Your mission orders (faked, of course) will help keep your crew in the dark.

The defection plan is cunning. Your engineering officer fakes a leak in the nuclear reactor. Radiation! The boat must be abandoned! A “convenient” American vessel is on hand to rescue your crew. The RO will be scuttled and the world will believe that the pride of the Soviet fleet has been destroyed like the Red October from slipping through to the open special event (message, riddle, etc.). The OMother commands available should be selected through the keyboard equivalents NLlisted on the preceding pages, or by selecting the commands from the actual Inenuens.w$@Keyboard Control$\rangle Movement Meaning

Arrow FiringMK I Up W J + K ->

Left + Right <- A + S3 M Down

2word alternate keypad movement:

American vessel is on hand to rescue your crew. The RO will be scuttled and the world will believe that the pride of the Soviet fleet has been destroyed instead of falling into capitalist hands. But it won’t be true. Through nautical slight-of-hand, the US Navy will sink an old sub in place of the RO and steal away with the Soviet boat.

Playing The Game

You may use the cursor keys, a mouse, or a joystick for gameplay. When the game loads, hit a cursor key to use the cursor keys; click the mouse button to use the mouse; or press the firebutton to use the joystick. To use a different gameplay option (eg, the mouse instead of the joystick), reload the game, then make your selection.

If you’re using the keyboard, the arrow keys direct the RO and number keys 1-5 select the options shown to the right of the Main Display Window (sonar, engines, etc.). If you’re using the mouse, click the mouse button to accept commands. If you’re using a joystick, press the firebutton to accept commands.

HUNT FOR RED OCTOBER
A Soft-Sect production

Documentation originally by:
The Dirtbag

Mission Documents
(Orders)

-----------------------------------------------------------------------------

COURSE: Proceed W by NW, 2-9-0 degrees.

ULTIMATE DESTINATION: Cuba

ROUTE: Usual evasive track through Reykjanes Ridge. Head west past the north cape of United State's imperialist puppet state, Norway. Proceed to usual southwest massing point (same point used for North American nuclear attack simulations) and turn towards open Atlantic. Maneuver per standard procedures.

SEA TRIALS: You are to push RED OCTOBER to her limits. Every element of RO's design must be tested and evaluated, especially the Caterpillar Drive.

STRATEGY: To thoroughly evaluate the RO and the Caterpillar Drive, you must elude all naval vessels from all nations (friend and foe alike). This evasion must be treated with utmost seriousness by the entire crew.

Naturally, United States and NATO naval patrols will try and trace your every move. The Soviet navy will also engage in a major exercise to find and water. Following the Red October.

COMMUNICATION: This is a clandestine mission. Strict communication silence must be maintained to avoid being tracked by United States or Soviet sensors.

BACKGROUND: Some improvisation in navigation may be necessary in order to avoid detection. You are hereby officially notified that such improvisation is permissible for this mission.

Upon crossing the Atlantic, you will skirt down the North American seaboard from Virginia, south to Cuba. If you are successful, you will be the first Soviet sub to arrive at the secret sub base which is under construction near Cuba's Santa Cruz del Sur in the Golfo de Guacanayabo. A submarine replenishment vessel will rendezvous with you there. The exact rendezvous coordinates are in the boat's computer (priority access-key sequence). The RO's design must be tested and evaluated, especially the Caterpillar Drive.

A week of rest and relaxation awaits you on the most beautiful beaches of Cuba. Shore leave will not take place, however, if your trek to Cuba is discovered. We presume this discovery will not occur. When the shore leave is complete, follow the same Sea Trials and Strategy on your return trip.

CLOSING: Every time a Soviet vessel puts to sea, it is protecting the sovereignty of our beloved socialist homeland. This is the most important naval technological test we have ever undertaken. The Caterpillar Drive should allow us to move through the world's waters with complete stealth, avoiding the aggressive sensor devices deployed by the West. We will at last have naval superiority!
MAIN DISPLAY WINDOW - This area is where all Maps, Periscope Views, Ship Recognition Charts, and Battery Power are displayed. Battery Power is always visible as a readout next to the battery icon above the Main Display Window. When the readout is completely green, you're fully charged. When it's completely red, you need to surface and recharge the batteries.

MESSAGE WINDOW - Text information appears in the Message Window. This includes crew responses to orders, plus other information, including Sonar contacts, Electronic Surveillance Monitor message interceptions, damage control reports, etc. Messages can be scrolled up and down by clicking on the up and down arrows at the left of the window.

The Message Window also doubles as the Sonar Information and Fire Control System Window when you click on the box between the up and down arrows. Information is a sub commander's lifeline. The data displayed in this window is vital for the success of your mission.

MAIN CONTROL PANEL - This panel allows instant control over the major navigational functions.

Speed Indicator - When you want to change speed quickly, click on the area of this gauge corresponding to the speed level you want. Click upper end to slow you down and the lower end to speed up. Each marker on the gauge indicates 5 knots.

Speed Readout - This shows your current speed in knots. If you set the Speed at 0 knots, you're also giving the order for total silence (used when trying to avoid detection). Use the fine-tune arrows to increase speed in multiples of 1 knot.

Compass - Click on a Compass heading to change directions quickly.

Heading Readout - This shows the exact compass Heading. The direction the sub's bow is pointing at any given time is the heading (the direction it needs to point to to reach a target is called a Bearing). Use the fine-tune arrows to change heading in multiples of 11 degrees.

Depth Gauge - When you want to change depth quickly, click on the area of this gauge that corresponds to the depth you want. Click on the top end to surface and the bottom end to dive; each marker on the gauge indicates approximately 60-70 meters.

Depth Readout - Use the fine-tune arrows to adjust depth in multiples of 10 meters. It's important to keep your Depth above the safe pressure level of 405 meters and to be sure that the Depth is appropriate for the sea bed terrain.

Clock/Calendar - This shows you the time of day and the date. You can accelerate the game (about twice as fast) by holding down the solid-apple key. Be cautious since it's dangerous to speed up the clock in areas where navigation is complex; you run the risk of grounding and sinking the Red October.

CONTOUR/DISPLAY CONTROL - Click on this to turn the Contour Map ON or OFF in the Main Display Window.

SONAR DISPLAY CONTROL - Click on this to turn the Sonar Map ON or OFF in the Main Display Window.
Info on a ship represented by the letter A shows up in the Sonar Information Window next to the letter A. Click on the box between the up and down arrows at the left of the Message Window to get the Sonar Information Window (click on the box again to return to the regular Message Window).

The Bearing shows the direction from Red October to the sonar contact; the Range is the distance in nautical miles. Depth is shown if the contact vessel is another submarine. The sonar contact's approximate Heading (the direction it's going) and the Speed in knots are also given.

This information is updated sonar. It may be necessary to verify the data with visual sightings (use the periscope).

When there's a large number of sonar contacts on-screen, the Sonar Information data can be scrolled up and down by clicking on the up and down arrows at the left of the Window.

Active - Click the icon for an Active Sonar signal. (The word "Ping" will appear in the message window to let you know that active sonar is enabled). This gives an accurate sonar picture for assessing targets.

Warning: Active Sonar tells the ships on the receiving end of your signal that you are in range. Be sure to get a good bearing on the contact ship before using active sonar.

Terrain - Click on this icon to get a small window that shows you a cross-section of the sea bed. This Terrain Map is valuable in that it can help you to avoid unpleasant collisions with the ocean floor. Keep in mind, when viewing the Map, that you are seeing it as though you were outside the Red October. Using the mini-icons to the right of the Terrain Map will allow you to magnify the view.

Note: If you hit the ocean floor, you will incur damage to your sub (and may give those ships a fix on your Bearing!).

Hydrophonics - Click on this icon to see the Hydrophonics Windows. Hydrophonics work best when the sub is stopped. It won't work well if you are using the Propeller Drive, since you'll keep picking up your own engine noises. Click on a target ship's data (A, B, etc.) in the Sonar Window to get a picture of it's sonar signal in the Hydrophonics Window. Use the up and down arrows to match the target ship's signal with one from your library signals.

Exit - Click here to return to the previous level of icons.

ENGINES

Click on this icon to select the Red October's propulsion method.

Nuclear - Nuclear power gives you the fastest speeds. However, after game day 12, the nuclear power plant is shut down (this is part of the defection plan).

Diesel - Diesel power is noisier than nuclear; but, after you lose the nuclear power plant, diesel is all you have.

Caterpillar Drive - The Caterpillar Drive uses impellers rather than the propellers. The sub sucks water in through the bow and the impellers eject it from the stern, thereby moving the boat very quietly, but also very slowly.

Propeller Drive - Propellers drive the boat faster than the Caterpillar Drive does. When the propellers turn at high speed, they develop an area of low pressure behind the trailing edge of the blade. This low pressure area collapses, water rushes forward against the blade, and lots of noise results (you're leaving a trail for hunters).
is being attacked, an event which is quite likely.

And don't forget not to raise the suspicions of the crew. To journey too far from the course outlined in the mission "orders" will cause concerned questions from your navigation officer and may result in your being relieved of command (mutiny!).

**NAVIGATION**

Figuring out how to get from Iceland to the Eastern Seaboard of the United States is your navigational challenge. Do you head directly south, or do you go north, first, to throw your pursuers off track? It's up to you.

The North Atlantic Map shows approximate positions of all fleets in relation to the RO.

The Contour Map helps you negotiate the complex valleys of the Reykjanes Ridge, the main route for Soviet Ballistic Missile subs heading for the open Atlantic. This Ridge is where Red and US attack subs constantly lurk.

You can superimpose the Sonar Map over the Contour Map for a more complete picture of who's in the area.

Using these three Maps together, you can plan the safest route to your objective.

**Evasion**

Both the U.S. and the Soviet navies have sophisticated sensing devices. There is a way to avoid these (or at least confuse them): sail through obstacles which block the devices' sensors: rocks, ranges, and reefs.

Note: The RO's hull is extremely sensitive, so be careful not to run into anything! After five collisions with the ocean floor the RO is sunk!

Despite the RO's new hull design and the anechoic (noise-absorbing) tiles, it is not immune from sonar (even with the Caterpillar Drive on). Ships and aircraft carry sophisticated beacons that can find the most silent sub. And these vessels, planes, and choppers are also armed with the means of destroying whatever their sonar finds.

Hint: Because of the limitations of passive sonar, it's possible a sub could track RO without your realizing it. How do you check for silent tails? The "Crazy Ivan" is the best method. The Crazy Ivan is a 360 degree turn which lets your passive sonar pick up on practically anything within sonar range.

**Under Attack**

Typical Anti-Submarine Warfare (ASW) engagements have several stages.

First, the hunter seeks his quarry. It's likely that the search will be confined to passive sensors, aided by satellite or sea bed sensors. Once contact is made, your sub's classification is determined. The acoustic signature of the target (e.g., sub type, defense systems, etc.) is compared with those in the hunter's data banks. The hunter then moves into an attack position (within about six miles — roughly half a torpedo's range).

If the attack is a success, you're sunk. If not, you can run for it, play "possum", or return fire.
USUAL ATTACK WEAPONS

One of the oldest anti-sub weapons is the torpedo. Aircraft, surface ships, and other subs carry these. The RO (or any other nuclear sub) can outrun torpedoes if there’s enough time to react. Some torpedoes don’t give much warning, however. These torpedoes are delivered to the target via rocket-launchers. After parachuting into the sea, these “fish” quickly home in on their targets.

You can use electronic decoys to fool torpedoes. These simulate prop and general sub noise and are towed about 400 yards behind. Hopefully, the torpedo will hit the decoy instead of you.

A riskier proposition is to head for the torpedo! This only works if your within 1000 meters of the launching vessel. A fish doesn’t have time to arm itself within that distance. Thus, if you ram it, it won’t explode.

Another traditional anti-submarine weapon is the depth-charge. They’re very accurate! If you find yourself under depth charge attack, take evasive action immediately (leave!).

Ship-launched missiles are another threat, though they’re not as accurate as torpedoes and depth charges (unless, of course, you’re on the surface) in which case you’re a sitting duck. The best defense against a missile attack is to dive deeper.

There is also danger from mines. The hydrophonics officer keeps you posted of mine fields.

The threat from the air can be the most dangerous since aircraft are hard for subs to detect or defend against. Jets, helicopters, and prop planes carry plenty of search AND destroy equipment.

ON THE OFFENSIVE

RO’s defenses are limited to four torpedo tubes. Her torpedo range is 10-12 nautical miles, though chances of a hit are best at about six miles. While acoustic torpedoes can be targeted via sonar bearings from the Fire Control Computer, you can also carry out traditional periscope-view assaults. If torpedoes are set for manual override, you’ll have to guesstimate the target vessel’s course in relation to the trajectory of the torpedo.

Hint: Try a “noisy sprint” at a target, followed by a silent drift. This may sneak the RO into a good strike position.

Note: If you attack a US ship, naturally, they’ll sink you! If you fire on the Soviets or they fire on you while you’re in range of US vessels, the US may join the Reds in a seek-and-destroy mission against you, thinking you’re a renegade ship with the potential for instigating a nuclear war.

END OF THE GAME

Whether the Red October is destroyed or you succeed in your mission, you’ll get a news report on your computer screen that lets you know exactly what happened.

Be sure to call...

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 907 of 1262
The objective of the mission is to rescue as many stranded pilots as you can without getting obliterated. Also, try to blow up every enemy craft and installation that is possible.

The mission profile is as follows: Boot up your flight disk and board your spacecraft. Once aboard, you'll be facing a screen that shows what level you have selected. Use the arrow keys to change it, the range is 1-16. Then press the space bar to return and launch out to a planet. You'll see the screen split in two. Seconds later you are shot into space. The computer finds a suitable planet and then begins a short re-entry sequence. That only takes a few seconds too. You are now skimming the planet and looking for stranded pilots. Pay close attention to your two scopes, they are very useful and always reliable. When you see an enemy, blow him out of the sky with your photon cannons. When you spot a pilot's ship get ready to land near it. You should reduce speed to around 3-10 miles per hour and fly close to ground, heed the warning. The micro-alimeter in quadrant 1. Look at your range display and make sure it is less than 3 units for the distance to the ship. If not, the pilot won't run that far. When it reads 2 you should start the landing sequence. If you are too high the computer won't land the ship. Upon a successful landing shut down your systems and wait for the pilot to run out of any of these you can replenish your supply by returning to your own base and landing on the platform.

Your ship is durable, but try to avoid crashes and brush-bys, they drain energy. If your mission was well done you'll be able to record your name. ESC) Shows score and pauses game.

Your Status:

Every so often you may wish to refer to your status display. You do this by pressing the 'C' key. At the top of your screen will appear your status. You will first see a row of money bags, you will see a number of large and small bags (four small bags equals one large). As you buy more items your money supply diminishes. After a quick pause it will show you how many bombs you have aboard. Then it will show you many missiles you have, how many men you have aboard (if any) and how many helicopters remaining. There is also a radar at the top of the screen. It's basically self-explanatory, the only thing you may want to know is that the large white squares are helicopters. When you hit

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
"C" you will see directly below the radar your fuel line. Check this occasionally because your fuel diminishes quickly. Remember that if you run out of anything you can always replenish your supply.

Purchasing Items:
-----------------
To buy an item, any item, just press the letter you wish at any time. Obviously as you buy more items you lose more money. You should always keep track of how much money you have.

Description of items:
---------------------
**Armored Vehicles**-
These have one guided missle on them and use it as soon as the enemy helicopter comes within range. Although the missle doesn't always hit the enemy you stand a good chance. The problem with these is that they can only be used once each.

**Demolition Vans**-
You need to get one of these to the enemy's base to win. Make sure that you have plenty of tanks around it because they can be destroyed by anything.

**Electricians**-
They are exactly like men, but if you let them walk to one of your turrets, they will repair it as long as they are not attacked while they are doing it.

**Men**-
Men are deployed in groups of five and then can be picked up by landing near them and letting them walk into your helicopter. Then by hitting the space bar while in the air you can make them parachute out. (Note: You may only carry five men at a time and when you release them some may not open their parachute).

**Tactical Stations**-
These stations lie on six different parts of the screen. The first three are yours and the others are the enemy's. These act like exterior defenses in such that if the enemy's helicopter crashes into one of your stations it explodes. The same thing happens if you crash into his. To take over a station drop off one of your men and he will enter the station. To simply destroy it shoot the balloon-like object a couple of times or simply blow up the building with plenty of bullets or bombs.

**Tanks**-
Probably the most effective item that you have but you can only have five on the screen at once.

**Turrets**-
There are four of these on the screen two belonging to you and the other two to him. You must destroy these before your helicopter can get past. Tanks are the only things that can destroy these so send them out first.
When you boot the Ringside Seat disk you will be given the following options:

(P) PLAY A GAME  (E) ENTER/REVISE/LIST FIGHTER DATA  (I) INITIALIZE A DISK FOR SAVING FIGHTERS

Selecting option P will first prompt you for the mode of play. You may have the computer manage either, neither or both boxers. Apple owner may choose either the keyboard or paddle inputs. If you have selected any other item than demo mode the computer will next ask you to enter the name-division of the two contestants (the name and division for each fighter can be found by using option E). The division is a two-letter code representing the weight class of the fighter. Be sure to separate the name and division of each fighter with a dash (-).

As an example you might enter Louis-HW. After you have selected the two fighters you will be asked to enter the number of rounds you wish for the current fight. Enter a number between 3 and 15 inclusive. Should either fighter have the ability to fight as either a boxer or slugger, you will be prompted for the style you wish the fighter to use during this fight (once a style is selected it cannot be altered during the fight). You will then be asked if you prefer to have the cumulative judges' scores displayed while the fight is in progress (either or the judges' round by round scores will be given upon the conclusion of the fight).

Playing the game

In the game, both managers select their fighter's strategy each round. Once a strategy for a round is selected, that strategy is employed for the entire round with one exception:

A fighter may opt to cover up during a round in order to avoid being knocked out (following a devastating punch or a knockdown, the fighter being hit may not cover up until the aggressor's "following up" sequence is completed). If you wish to cover up, and paddle control has been requested (Apple only), push the button until the cover up strategy is displayed. If the keyboard is being used, pressing the "2" for fighter #1 or the "/" for fighter #2 will cause the fighter to cover up.

Once both managers have selected the strategy for their fighter, the round bell will ring and the two fighters will approach ring center.

The display

Displayed on the screen while the fight is in progress are the fighters' names, the round clock, the strategy of each fighter, the round number, the cumulative judges' scores if selected, the percentage of stamina remaining, and a representation of the boxing ring. The top of the screen is used to announce the beginning of each round, and also to describe any ring movement of the fighters. The bottom half is used for color commentary and a description of the blow-by-blow action taking place in the ring.

The scoring section, based on the "18 point must" scoring system, shows the cumulative round-by-round scores by judge 1 (J1), judge 2 (J2), and judge 3 (J3). The cut, injury and condition section shows any cuts, injuries or other conditions sustained by the fighters during the fight. The boxing ring display provides a visual indication of the position of the fighters throughout the fight.

Displayed above each fighter's name before the bout begins are two numbers (e.g. 2/1). The first number indicates his ability vs a boxer and the second number indicates his ability vs a slugger.

The strategy selection inputs for each fighter will appear at the bottom of the screen at the beginning of each round. Immediately following each strategy is a number representing how well a fighter employs the particular strategy (this number may be reduced as stamina is used up, and a fighter begins to tire). Selecting a strategy by paddle is done by turning the paddle knob until the desired strategy is displayed. Pushing the paddle button locks in the choice, and that is the strategy used during that round. Selecting a strategy by keyboard is done by typing the number associated with the desired strategy:

1 - Flat Footed
2 - Cover Up
3 - Charge In
4 - Stick & Move
5 - Stay Away
6 - Go For KO
7 - Protect Cuts

Pressing the [RETURN] key will lock in the choice as the desired strategy for the upcoming round.

Strategy actions

The following is a description of each of the seven strategies available to each fighter each round:

1 - Fight Flat Footed

Fight flat footed allows a fighter to rest during a round. His ability to control the fight, his aggressiveness, and his defense all suffer and he becomes a much easier target while using this strategy.

2 - Cover Up

Cover up is usually used after sustaining considerable punishment. This is the only strategy which may be changed during the round (see playing the game). Cover up considerably reduces the fighter's ability to land a punch and to control the action. It can also cause the opponent's punches to be partially blocked. Use this strategy if you fear a knockout is imminent in the round, or if you want the opponent to punch himself out.
3 - CHARGE IN

CHARGE IN IS USUALLY USED IN AN ATTEMPT TO INFlict UNUSUAL PUNISHMENT, AND SCORE POINTS QUICKLY. THE DEFENSE OF A FIGHTER USING THIS STRATEGY IS REDUCED, AND THEREFORE MAY MAKE HIM EASIER TO HIT. ONCE CONTROL OF THE ROUND IS GAINED, IT IS MORE EASILY MAINTAINED. USE THIS STRATEGY EARLY IN A FIGHT TO WEAR THE OPPONENT DOWN. IT IS ALSO SOMETIMES USED IN LATE ROUNDS IN ORDER TO CATCH UP AND SATISFY THE CONDITION THAT ALLOWS THE USE OF "CHANGE IN" FOUR MORE TIMES IN A ROW. NOTE THAT USING "COVER UP" WHILE A ROUND IS IN PROGRESS DOES NOT SATISFY THE CONDITION THAT ALLOWS THE USE OF "CHANGE IN" FOUR MORE TIMES.

4 - STICK & MOVE

STICK & MOVE IS USED WHEN TRYING TO MAINTAIN RING GENERALSHIP, WHILE AT THE SAME TIME AVOIDING THE OPPONENT'S POWER AND REDUCING HIS CHANCE TO SCORE. THIS ADDED DEFENSE IS ATTAINED AT THE EXPENSE OF PUNCHING POWER. USE THIS STRATEGY EARLY IN A FIGHT TO AVOID THE OPPONENT'S POWER WHILE HE IS WELL RESTED, OR AFTER A ROUND IN WHICH YOU SUFFERED MODERATE PUNISHMENT. THIS WILL ALLOW YOU TO RECOVER SOME STRENGTH WHILE NOT LOSING MUCH CONTROL. A FIGHTER MAY NOT USE THIS STRATEGY IF HE HAS NO STAMINA REMAINING. THIS STRATEGY MAY NOT BE USED MORE THAN FOUR TIMES IN SUCCESSION (REFER TO "CHANGE IN" FOR RESTRICTIONS REGARDING THIS RULE).

5 - STAY AWAY

STAY AWAY USUALLY IS USED WHEN ULTIMATE DEFENSE OR COUNTER-PUNCHING IS DESIRED, THIS STRATEGY CAUSES THE FIGHTER'S PUNCHES TO LAND WITH MUCH LESS STING, BUT IT ALSO REDUCES THE CHANCE OF BEING KNOCKED DOWN. USE THIS STRATEGY AFTER A PUNISHING ROUND NOT QUITE BAD ENOUGH TO DICTATE COVERING UP. ALSO USE THIS STRATEGY IN LATE ROUNDS WHEN YOU ARE WAY AHEAD IN POINTS.

6 - GO FOR THE KO

GOING FOR THE KO IS USED IN AN EFFORT TO GET THE FIGHT OVER EARLY, OR TO PUT AWAY THE OPPONENT AFTER A GOOD OFFENSIVE ROUND, OR LATE IN THE FIGHT WHEN NO HOPE IS LEFT FOR A DECISION. THIS STRATEGY, WHEN USED EARLY, GIVES THE FIGHTER A MUCH GREATER CHANCE TO SCORE. WHEN USED LATE IN A FIGHT, THE FIGHTER'S CHANCE FOR A KO IS SOMewhat IMPROVED, WHILE AGAIN INCREASING THE OPPONENT'S CHANCE TO LAND A PUNCH, AND TO SCORE A KNOCKDOWN OF HIS OWN. USE THIS STRATEGY EARLY, IF THE FIGHTER HAS A GOOD KO PUNCH RATING, AND LATE TO TRY TO SALVAGE VICTORY FROM AN OTHERWISE SURE LOSS.

7 - PROTECT CUTS

PROTECT CUTS IS USED WHEN TRYING TO PROTECT CUTS WHICH COULD BE BAD ENOUGH TO STOP A FIGHT (YOU WILL HAVE TO USE YOUR JUDGEMENT ON WHEN YOU THINK THEY ARE VERY BAD). THIS STRATEGY CAN ALSO BE USED TO TRY AND PREVENT CUTS FROM GETTING ANY WORSE. THIS STRATEGY CAUSES HEAD BLOWS TO BE BLOCKED MORE EASILY, BUT AT THE SAME TIME OPENS UP THE FIGHTER FOR MORE SHOTS TO THE BODY. YOU WILL ALSO LOSE SOME ABILITY TO CONTROL THE ACTION IN THE ROUND.

NOTES ON STRATEGIES

REMEMBER THAT AS STAMINA DECREASES, SO DOES THE ABILITY TO UTILIZE STRATEGIES. SOME STRATEGIES ARE NOT USEABLE IF A FIGHTER BECOMES TOO TIRED. IF THE FIGHTER CAN MANAGE TO REST DURING A ROUND, HE MAY BE ABLE TO REGAIN SOME STAMINA. IF HE REGAINS ENOUGH, HE MAY ALSO REGAIN SOME OF HIS ABILITY TO USE HIS STRATEGIES. EMPLOYING A STRATEGY WHEN THAT STRATEGY RATING IS LESS THAN 2 May BE MORE OF A HINDERANCE THAN A HELP.
WILL ALLOW YOU TO REMOVE A FIGHTER FROM YOUR DISK IF YOU NO LONGER WISH TO KEEP THE FIGHTER'S PARAMETERS.

WHEN ENTERING DATA FOR A NEW FIGHTER YOU WILL BE PROMPTED FOR EACH ENTRY REQUIRED. THIS DATA CONSISTS OF THE FOLLOWING:

NAME
A FIGHTER'S NAME REFERS TO HIS LAST NAME. THIS CANNOT EXCEED 10 CHARACTERS.

OVERALL RATING THIS ENTRY INDICATES THE FIGHTER'S OVERALL ABILITY ON A SCALE OF 1 TO 10, 10 BEING THE BEST (7 = AVERAGE).

DIVISION
THIS IS THE DIVISION THE FIGHTER FIGHTS IN. THIS IS USED AS THE DIVISION WHEN ENTERING FIGHTERS FOR A FIGHT.

VALID DIVISIONS ARE:
BW - BANTAMWEIGHT
FW - FEATHERWEIGHT
JL - JUNIOR LIGHTWEIGHT
MW - MIDDLEWEIGHT
LH - LIGHT HEAVYWEIGHT
HW - HEAVYWEIGHT

FIGHTER STYLE - THIS ENTRY INDICATES WHAT STYLE A FIGHTER USES. VALID STYLES ARE B FOR BOXER, S FOR SLUGGER, B/S FOR BOXER OR SLUGGER. A BOXER IS NORMALLY AT SUCH THINGS AS STICKING & MOVING AND DEFENSE, WHEREAS A SLUGGER IS USUALLY STRONGER AND BETTER AT CHARGING IN.

ABILITY VS BOXER - THIS ENTRY REFLECTS HOW WELL THE FIGHTER EMPLOYS HIS PARTICULAR ABILITIES VS A BOXER STYLE FIGHTER ON A SCALE OF -3 TO +3: +3 BEING THE BEST, -3 BEING THE WORST, AND 0 SHOWING NO DISTINCT ADVANTAGE OR DISADVANTAGE.

ABILITY VS SLUGGER - THIS ENTRY WORKS THE SAME AS ABILITY VS BOXER EXCEPT IT APPLIES TO A SLUGGER STYLE FIGHTER.

ABILITY TO FOLLOW UP - THIS ENTRY REFLECTS HOW WELL A FIGHTER Follows up, AND ATTEMPTS TO PUT HIS OPPONENT AWAY AFTER HURTING HIM. IT IS BASED ON A SCALE OF 1 TO 11, 11 BEING THE BEST (7 = AVERAGE).

ABILITY TO CUT HIS OPPONENT - THIS ENTRY IS AN INDICATION OF HOW MUCH A FIGHTER CUTS HIS OPPONENT ON A SCALE OF 1 TO 10, 10 BEING THE MOST (4 = AVERAGE).

ABILITY TO CHARGE IN - THIS ENTRY INDICATES HOW EFFECTIVE A FIGHTER IS AT USING HIS CHARGE IN STRATEGY. IT IS BASED ON A SCALE OF 1 TO 5, 5 BEING THE BEST (3 = AVERAGE).

ABILITY TO STICK & MOVE - THIS ENTRY WORKS EXACTLY LIKE ABILITY TO CHARGE IN EXCEPT IT APPLIES TO STICK & MOVE.

ABILITY TO COVER UP - THIS ENTRY WORKS LIKE THE ABOVE EXCEPT IT APPLIES TO COVER UP.

ABILITY TO STAY AWAY - THIS ENTRY WORKS LIKE THE ABOVE EXCEPT IT APPLIES TO STAY AWAY.

ABILITY TO GO FOR THE KNOCKOUT - THIS ENTRY WORKS LIKE THE ABOVE EXCEPT IT APPLIES TO GO FOR THE KO.

ABILITY TO PROTECT CUTS - THIS ENTRY WORKS LIKE THE ABOVE EXCEPT IT APPLIES TO PROTECT CUTS.

ABILITY TO TAKE A PUNCH - THIS ENTRY INDICATES HOW WELL A FIGHTER STANDS UP UNDER A DEVASTATING PUNCH OR A BARRAGE OF LIGHTER PUNCHES ON A SCALE OF 1 TO 5, 1 BEING THE BEST (3 = AVERAGE).

ABILITY TO TAKE A PUNCH WHEN ALREADY HURT - THIS ENTRY INDICATES HOW WELL A FIGHTER STANDS UP UNDER A DEVASTATING PUNCH OR A BARRAGE OF PUNCHES IF HE HAS ALREADY BEEN HIT, ON A SCALE OF 0 TO 5, 0 BEING THE BEST (2 = AVERAGE). THIS NUMBER IS INDEPENDENT OF ABILITY TO TAKE A PUNCH.

ABILITY TO AVOID BEING KNOCKED OUT - THIS ENTRY IS REFLECTIVE OF HOW EASILY THE FIGHTER IS KO'D ON A SCALE OF 1 TO 10, 1 BEING THE HARDEST TO KO (4 = AVERAGE).

ABILITY WHEN TRAPPED - THIS ENTRY INDICATES HOW A FIGHTER IS AFFECTED WHEN HE IS TRAPPED AGAINST THE ROPE OR IN A CORNER. IT ALSO REFLECTS HIS ABILITY TO WORK HIMSELF FREE FROM ONE OF THESE SITUATIONS. IT IS BASED ON A RANGE OF 10 TO 34. THE FIRST DIGIT INDICATES HOW GOOD HE IS AT GETTING FREE: 3 BEING VERY GOOD, 2 BEING FAIR, AND 1 BEING POOR. THE SECOND DIGIT REFLECTS HIS ABILITY WHILE TRAPPED: 0 BEING EXCELLENT, 1 BEING GOOD, 2 BEING AVERAGE, 3 BEING POOR, AND 4 BEING VERY POOR.

ABILITY TO ABSORB PUNISHMENT - THIS ENTRY INDICATES HOW MUCH PUNISHMENT A FIGHTER CAN TAKE OVER AN EXTENDED PERIOD OF TIME, BASED ON A SCALE OF 1 TO 5, 1 BEING THE BEST (3 = AVERAGE).

ABILITY TO NOT GET CUT - THIS ENTRY REFLECTS HOW EASILY A FIGHTER IS CUT BASED ON A SCALE OF 1 TO 10, 10 BEING THE MOST (4 = AVERAGE).

STRENGTH RATING - THIS ENTRY INDICATES HOW STRONG THE FIGHTER IS, AND HOW HARD HE TAKES PUNCHES BASED ON A SCALE OF 1 TO 12, 12 BEING THE STRONGEST (7 = AVERAGE).

QUICKNESS RATING - THIS ENTRY IS AN INDICATION OF THE FIGHTER'S REACTION TIME, DEFENSE ABILITY, AND COORDINATION BASED ON A SCALE OF -9 TO +9, -9 BEING THE QUICKEST (0 = AVERAGE).

STAMINA RATING - THIS ENTRY INDICATES HOW LONG A FIGHTER CAN GO BEFORE TIRING OUT. AS HIS STAMINA IS DEPLETED, HIS ABILITY TO UTILIZE HIS STRATEGIES BEGINS TO DETERIORATE. STAMINA IS BASED ON A SCALE OF 1 TO 125, 125 BEING A FIGHTER WITH TREMENDOUS STAYING POWER (97 = AVERAGE).

AGGRESSIVENESS RATING - THIS ENTRY REFLECTS HOW TENACIOUS A FIGHTER IS ON A SCALE OF 1 TO 11, 11 BEING THE MOST TENACIOUS (7 = AVERAGE). THE HIGHER THE NUMBER, THE BETTER CHANCE A FIGHTER HAS OF TRAPPING HIS OPPONENT. THIS ENTRY WILL CHANGE THROUGHOUT THE FIGHT DEPENDING ON THE STRATEGIES CHOSEN AND MOMENTUM.

PERCENTAGE OF TIME PUNCHES LAND - 40 TO 45 IS AVERAGE, WITH 75 BEING THE MAXIMUM ALLOWED ENTRY.

PERCENTAGE OF TIME PUNCHES MISSED - 25 TO 35 IS AVERAGE, WITH 87 BEING THE MAXIMUM ALLOWED FOR THE TOTAL OF PUNCHES Landed AND PUNCHES MISSED.

PERCENTAGE OF TIME FIGHTER CLINCHES OPPONENT - 10 IS AVERAGE, WITH 94 BEING THE MAXIMUM ALLOWED FOR THE TOTAL OF PUNCHES LANDED PLUS PUNCHES MISSED PLUS CLINCHES.
PERCENTAGE OF TIME FIGHTER EMPLOYS RING MOVEMENT - 10 IS AVERAGE.

THE ABOVE FOUR CATEGORIES PERTAIN TO THE PERCENTAGE OF TIME THAT A FIGHTER DOES EACH ACTION. THE TOTAL OF THE FOUR PERCENTAGES MUST ADD UP TO 100.

PERCENTAGE OF TIME FIGHTER LANDS A PARTICULAR PUNCH (5 CATEGORIES) - THERE ARE FIVE TYPES OF PUNCHES WHICH A FIGHTER MAY LAND: JAB, HOOK, CROSS, COMBINATION, AND UPPERCUT. THE PERCENTAGE OF TIME A FIGHTER LANDS EACH TYPE OF PUNCH MUST BE ENTERED, AND THE TOTAL FOR ALL FIVE PUNCHES MUST EQUAL 100.

PERCENTAGE OF TIME PUNCHES LAND WITH EXTRA STING - THIS IS THE PERCENTAGE OF PUNCHES A FIGHTER THROWS THAT LAND WITH EXTRA EFFECT (50 = AVERAGE).

EFFECTS OF MANAGERS' DECISIONS

A FUNDAMENTAL CONSIDERATION IN THE DESIGN OF RINGSIDE SEAT WAS TO PERMIT EACH FIGHTER'S MANAGER TO BECOME INVOLVED AS MUCH AS POSSIBLE IN DETERMINING THE OUTCOME OF THE GAME THROUGH THE DECISIONS HE MAKES. THE EQUATIONS USED TO COMPUTE THE OUTCOME PROBABILITIES OF ALMOST EVERY ACTION MAKE EXTENSIVE USE OF THE VARIOUS STRATEGIES WHICH ARE UNDER THE MANAGER'S CONTROL.

Welcome to the battlefield of the future! It is the year 2002. Wars still rage, but finally, they have been officially declared hazardous to human health. Now, the only warriors are robots - built in secret and programmed to fight each other to the death!

Your country has just developed the most efficient battle robot to date. It should be unbeatable - but part of its micro-computer "brain" is still blank. Only when a strategy is programmed into its memory will the robot be able to fight.

The task set before you is to program a robot that no other robot can destroy.

RobotWar is a fascinating and highly competitive game where robots battle each other to the death! RobotWar is not a game using manual dexterity, instead the robots are controlled by pre-programmed strategies and highly spectator interest.

As well as providing hours of entertainment, RobotWar is designed to teach and sharpen the skills of creative computer programming. Whether you are a beginner or an accomplished programmer, RobotWar will prove to be fun and challenging.

Robot war players design and write robot programs. The program is written with the help of a text-editor, and then translated by an assembler into robot-understandable instructions. The program can then be tested on a simulated robot to make sure it is working properly. Once the player is assured that the program is running as planned, it is installed in a battle robot and sent out to do battle with the other robots.

From the main menu, several options are selectable. These options are described below:

Option 1
This will access the Battle branch where the player can setup and execute one robot battle. See "robots and robot battles".

Option 2
This will access the robotwar assembler and testing branch where the programs are translated and checked for errors, or tested on a simulated robot. See "the assembler" and "the test bench".

Option 3
This will access the text-editor where an existing program can be edited or a new program can be written. See "writing and editing source code".

Option 4
This is a simple control that turns the battle sounds on or off. Pressing the 4 key will change the position of the sound switch.

Option 5
This will access the disk storage branch where a disk can be initialized for storing robot code. See "storing robots on auxiliary disks".

Option 6
This will cause the computer to exit from the robotwar program to applesoft basic.

Option 7
This will access the match scheduling branch where the player can...
Robots earn points in the following manner. During a battle, every time a robot is destroyed, 1 point is earned by all of the survivors. Thus in a five-robot battle, the first to be destroyed receives 0 points. For outlasting that first robot, all other robots on the battlefield earn 1 point. For outlasting 4 other robots, the winner of a 5-robot battle earns 4 points!

Controlling Robots
A robot computer contains 34 registers. The 34 registers are divided into three categories:

1. Memory registers which are used to contain numbers for latter recall.
2. Input/Output (I/O) registers which are used to monitor and control specific robot functions.
3. The Index/Data pair of registers which are used to access the other registers by their numbers instead of their names.

1. Memory Registers
There are 24 memory registers used to store numbers. The memory registers are named A through W and Z. (X and Y are not included—they are input registers as described below).

2. Input/Output Registers
There are nine I/O registers that allow the computer to control the robot’s actions. Each controls or monitors a specific robot function as described below:

a) The X register:
The X register is used to monitor the horizontal position of the robot. It always contains the current horizontal position of the robot on the battlefield, as a number from 0 to 256. o is at the extreme left of the battlefield and 256 is at the extreme right.

b) The Y register:
The Y register is used to monitor the vertical position of the robot. 0 is at the top of the battlefield and 256 is at the bottom.

c) The AIM Register:
The AIM register is used to monitor and control the angle at which the robot’s gun will turn to that angle. 0 aims the gun due north, 90 aims it due east, etc. The AIM register always contains the current angular position of the gun.

d) The RADAR register:
The RADAR register is used to control the radar unit on top of the robot and monitor the results of the radar beam. Storing a number from 0 to 359 in the AIM register, the robot’s gun will turn to that angle. 0 aims the gun due north, 90 aims it due east, etc. The AIM register always contains the current angular position of the gun.

e) The SHOT register:
The SHOT register is used to fire the robot’s gun and monitor the state of readiness of the gun. Storing a new number in the SHOT register, sets the timer on the shell so that it will travel that number of meters before exploding, and then fires it. After a shot is fired the SHOT register will contain the state of the gun’s cooling process. When the SHOT register contains a zero the gun is ready to be fired again.

f) The DAMAGE register:
The DAMAGE register is used to monitor the amount of damage detected by the damage sensors. The DAMAGE register starts at 100 at the beginning of each battle and decreases towards 0 as damage is incurred. When the register reaches 0, the robot is completely destroyed and will disappear from the battlefield. The DAMAGE register always contains the current extend of damage.
g) the SPEEDX register:
This register is used to control and monitor the horizontal speed of the robot. The number stored in the SPEEDX register can range from -255 to 255 and controls the direction and speed of the robot. A negative number moves the robot to the left at that many decimeters/second, and a positive number moves the robot to the right at that many decimeters/second. If a zero is stored in this register the robot will stop moving in the horizontal direction. The SPEEDX register always contains the horizontal speed of the robot.

h) The SPEEDY register:
Acts the same as the SPEEDX register, only in the vertical direction. A positive number is in a downward direction and a negative number is in an upward direction.

i) The Random register:
This register is used to control the random number generator. Storing a number in the RANDOM register sets the limit for the generator. Then, each time the RANDOM register is accessed, it will contain a different integer (whole number) between 0 and the random number limit which was previously set.

3. The index/Data Registers
The robot registers are usually referenced by their names. The Index/Data pair allows registers to be accessed by number instead of name.

Storing a number from 0 to 34 in the INDEX register causes the corresponding register to be used whenever the DATA register is referenced.

For example, assume the INDEX register contains 27. When the DATA register is referenced in an instruction, register #27 (AIM) will be substituted for DATA.

The Language of Robots

Robot programs are written in source code and then translated by the assembler into robot-understandable object code. Source code is composed of comments, labels, and instructions.

1. Comments:
Comments are used for documenting the source code. Comments can appear anywhere in the program as long as they are preceded by a semi-colon.

   ] A TO B ;This stores a in b
This is an example of a comment on the same line as an instruction.

2. Labels:
A label is a reference point used to identify sections within a program. Labels are used in instructions to change the order of execution of the program.

A label is composed of a group of 2 or more alpha-numeric characters immediately following a RETURN symbol (]). A label must start with an alpha character (A to Z) and must be less than 32 characters long. A label can not be the same as any of the register names or command words.

3. Instructions
Instructions are used to control the robot's micro-computer brain. Instructions may contain register names, command words and numbers (-1024 to +1024)

Command words: a) 'TO' stores a value in a register
b) 'IF' compares two values and alters program flow. use these conditions:
   = equal
   # not equal
   < less than
   > greater than
c) 'GOTO' jumps to a label in the prog.
d) 'GOSUB' calls a subroutine
e) 'ENDSUB' returns from a subroutine
f) math operators
   + adds two values
   - subtracts two values
   * multiplies two values
   / divides two values

Restrictions:
a) no parentheses allowed
b) use only integer numbers between +1024 and -1024
c) you must use a condition sign when using an 'IF'
d) you may store negative NUMBERS in a register, but you can't store negative REGISTERS in a register.

e) all math operations are done from left to right

The TO command
The TO command is used to store a value in a register.

   ] 240 TO A
This example line of source code causes the computer to load the accumulator with a value of 240 and the store it in the A register.

   ] B TO A
This example causes the computer to load the accumulator with the contents of the B register and then store it in the A register.

   ] 0 TO SPEEDX TO SPEEDY
This example causes the computer to load the accumulator with 0 and store it first in the SPEEDX and register and then in the SPEEDY register. This could be used to stop a robot's movement.

NOTE: Negative numbers can be stored as in the following example:

   ] -240 TO SPEEDX
But, you CANNOT store the negative of a register in that manner. For example:

   ] -B TO A
Will NOT store the negative of B in A. To store a negative of a register subtract the register from zero. For example:

   ] 0 -B TO A

Arithmetic commands (+ - * /)

Arithmetic operations can be performed on a value stored in the accumulator. Whenever the program encounters one of the arithmetic signs it performs the calculation using the contents of the accumulator and the value that follows. It then stores the results of the calculation in the accumulator.

   ] 240 + 100 TO A
This example loads 240 into the accumulator, adds 100 to it, and stores the result (340) in the A register.

The IF command
The IF command is used to compare a value with the contents of a register. It can test to see if a register is less than (<), greater than (>), equal to (=), or not equal to (#) a value. If the comparison is true the computer executes the next TO, GOTO, GOSUB or ENDSUB command. If the comparison is false the computer skips the next TO, GOTO, GOSUB or ENDSUB commands.

The GOTO command
A GOTO command causes the program to change its sequence of execution by going to a designated label and continuing its execution from there. A GOTO instruction must always be followed by a label.

The GOSUB command
Another way to change the execution sequence is to use a GOSUB command. A GOSUB instruction is similar to a GOTO command. GOSUB must always be
followed by a label. GOSUB will cause the program to go to the
designated label and continue the execution until it reaches an ENDSUB.
When it encounters the ENDSUB, the program will then return to the next
instruction after the GOSUB.
Caution:
Some illegal statements will be translated by the assembler, but then
will do odd things when executed.
Programming a Robot
In order to make a robot perform, you must construct a program using the
RobotWar language and your own strategy. This chapter gives examples of
how instructions can be constructed, using registers, numbers, and
commands, and how those instructions can be labeled and sequenced to
create program routines.
Movement
Moving about the battlefield is an action a robot performs. To start a
robot moving, store a value in the speedx or speedy register.

| 20 to speedx |
| 250 to speedy |

would start the robot moving down and to the right. However, the robot
would continue to move in those directions, and would eventually hit a
wall. Therefore, you must stop it at some point, by storing a zero in
the speedx and speedy registers.

| 0 to speedx |

A robot can only accelerate or brake at 40 decimeters/second. Even
though 120 is entered into speedx register, it takes 3 seconds of
acceleration to obtain that speed. Conversely, if your robot is
travelling at 120 decimeters/sec it takes 3 seconds to stop the robot,
after storing 0 in the speedx register.

A movement routine can be established, by incorporating the starting and
stopping procedures into a test loop.

| 256 TO SPEEDX |
| MOVEX1 |
| IF X > 230 GOTO STOP |
| STOP |
| 0 TO SPEEDX |

Moves the robot to the right until it's X position is tested to be
greater than 230 and then it stops.

Monitoring Damage
Monitoring damage is vital to a robot's survival. When a robot detects a
hit, it usually moves to avoid being repeatedly hit by the enemy. By
using the DAMAGE register, a damage detection routine can be
established. This routine is usually nested inside another routine's
loop so that the robot can be checking for damage while it is performing
some other action.

| DAMAGE TO D |

Saves current damage in register D.

When any damage is incurred, the DAMAGE register will change, but
register D will not. Therefore, any difference between the two registers
will indicate that the robot has been hit. In this example any
difference will cause the program to go to the label MOVE.

Scanning
Another important action a robot performs is scanning. When a robot
scans it is using it's radar beams to detect the location of other
robots and walls. To emit a radar beam, store a number, between 0 and
359 in the RADAR register.

| 90 TO RADAR |

Will send a radar beam in the 90-degree direction, and when the beam
returns, it's value will be stored in the RADAR register. A routine to
determine if the robot has spotted another robot is:

| LOOK |
| AIM + 5 TO AIM |
| AIM TO RADAR |
| IF RADAR < 0 GOTO SHOOT |
| GOTO LOOK |

When the program executes this routine, it first encounters the label
LOOK and goes on to the next instruction. This instruction (AIM + 5 TO
AIM) increments the angle in which the gun is aimed, five degrees. The
next instruction (AIM TO RADAR) aligns the angle of the radar to the
angle of the gun, emits a radar beam in that direction, and then stores
the results of that beam in the RADAR register.

The next instruction (IF RADAR < 0 GOTO SHOOT) analyzes the results
of the radar's findings. If the RADAR register contains a positive number,
there are no robots in that direction and the comparison will be false.
Since the comparison is false, the next command will be ignored and the
program will go on to the next command (GOTO LOOK). This command will
cause the program to go to the label LOOK. This completes the loop and
the scan routine will continue until a robot is found.

If the RADAR register contains a negative number, After the beam
returns, the comparison (IF RADAR < 0) will be true. Therefor, the next
command (GOTO SHOOT) will be executed. In this case the program sequence
would branch to the instruction following the label SHOOT.

Shooting
It is usual procedure to execute a shooting routine when an enemy is
spotted.

| SHOOT |
| 0 - RADAR TO SHOT |
| GOTO LOOK |

Is an example of a simple shoot routine. Since a robot has been spotted
by radar, a negative number is presently stored in the RADAR register.
The enemy robot is that number (ignoring the negative sign) of meters
away. In order to obtain a positive number of the distance, the program
subtracts RADAR from 0. This new positive number is then stored in the SHOT register. Storing the number in the SHOT register causes the gun to fire a shell that has been set to explode at that distance, in the direction indicated by the contents of the AIM register.

Random Number Generation

The RANDOM register is used to generate random numbers. A few examples of random number routines are:

| 100 TO RANDOM          | RANDOM TO A

This routine stores 100 in the RANDOM register, which sets the limit for the generator. The generator then returns a random number from 0 to 99 and stores it in the RANDOM register. That value is then stored in A by the TO command. From then on each time the contents of the RANDOM register is stored in a register, the generator will return a different number. The limit of the generator will only change when a new value is stored in the RANDOM register by using the TO command.

B + 1 - A TO RANDOM

This routine stores a random number between A and B into the C register.

A Sample robot in source code

;SAMPLE ROBOT 'RANDOM'

| 250 TO RANDOM          | INITIALIZE RANDOM -- 250 MAXIMUM
| START                  | DAMAGE TO D ;SAVE CURRENT DAMAGE
| SCAN                   | IF DAMAGE # D GOTO MOVE ;TEST -- MOVE IF HURT
| AIM+17 TO AIM          | AIM+17 TO AIM ;CHANGE AIM IF OK
| SPOT                   | AIM TO RADAR ;LINE RADAR WITH LAUNCHER
| IF RADAR<0 GOTO SCAN  | 0-RADAR TO SHOT ;CONVERT RADAR READING TO
| 0-RADAR TO SHOT        | DISTANCE AND FIRE ;LINE RADAR WITH LAUNCHER
| IF RADAR>0 GOTO SCAN  | GOTO SPOT ;CHECK IF ROBOT STILL THERE
| IF RADAR<0 GOTO SCAN  | GOTO SPOT ;CHECK IF ROBOT STILL THERE
| 0 TO SPEEDY            | GOTO SPOT ;CHECK IF ROBOT STILL THERE
| GOTO START             | GOTO Start ;START SCANNING AGAIN

Robot and Editing Source Code

Robot programs are entered into the computer using a text editor.

Text Editor Procedure

When you first enter the text editor, you will see a blank screen with some numbers at the bottom and a flashing square at the top. The numbers at the bottom show the length of the text, and the file name under which it is stored. The flashing square is called the cursor, and is the computer equivalent of a pen for writing characters. As you use the text-editor you will be operating in two modes; the add mode and the cursor mode. The add mode is used to delete text at the cursor, move the cursor around in the text, adjust the position of the text on the screen, load source code files from the catalog, and save source code files to the catalog.

The blank screen indicates that the current text-editor file is empty. At this point there are two available options. One option is to begin writing a new source code, and the other option is to edit a robot that has already been stored.

Ctrl-A to enter the add mode. The letter "A" will appear in the lower right corner of the screen. You can now create a new source code file.

Esc Esc exits you from the add mode.

Ctrl-S to save the file on the disk. The word "SAVE" will appear on the left side of the screen.

Ctrl-L loads a file from the disk. The word "LOAD" will appear on the left side of the screen.

Cursor Mode

You are now ready to perform the second available option when the text-editor has been loaded, which is editing the source code file. When editing source code you will use the cursor mode to delete text at the cursor, move the cursor around in the text, adjust the position of the text on the screen, load source code files, and save source code files. These functions are described below:

1. Cursor Movement

The cursor can be moved to any location in the file by using the five keys on the right side of the keyboard.

A) The RETURN key moves the cursor up one line
B) The left and right arrow keys.
C) The slash (/) key moves the cursor down one line.

To move the cursor all the way in any direction on the screen, press the Esc key and then the direction key.

Once you have positioned the cursor where you want it, there are several options. Either exit to the add mode, and write some text or stay in the cursor mode and use a cursor function.

NNN
2. Moving Text

There are also methods of moving the text itself, when in the cursor mode. The direction, in which the text moves, is set by pressing the '+' key (a forward direction) or the '-' key (a backward direction) prior to pressing the L, P, or A keys.

A) The L key will move the text up or down one line.

B) The P key will move the text up or down one full page.

C) The A key will set the text in continuous scrolling motion.

You can move to the beginning or end of the text by pressing the Esc key first and then the '-' key or the '+' key respectively.

3. Deleting Text

This function deletes text from the screen and the memory if the Apple, but not from the disk. There are three methods of deleting text:

A) Ctrl-D Any character may be deleted by positioning the cursor over the character and pressing Ctrl-D.

B) Ctrl-G Any line, or portion of a line, may be deleted by positioning the cursor over a character and pressing Ctrl-G. This will delete the character and the rest of the line that follows it.

C) Esc Ctrl-Z All of the text, presently in the text-editor may be deleted by pressing Esc and then Ctrl-Z. You will have to confirm the command by pressing the # key. This protects against accidental erasures.

4. Block Operations

This function allows you to mark a portion of the current source code, and then manipulate that block to another place in the file. You must designate the beginning and the end of a block by placing block markers at those two points. To insert a block marker immediately after the cursor, press Ctrl-V to mark the beginning and end of the block, and it will be represented on the screen by a flashing ')' sign. Only one block can exist in a file at any one time and any attempt to insert a block mark when a block has already been defined will result in the error message "BLOCK ALREADY MARKED".

When a block is marked, press Esc V and the block options will be displayed on the bottom of the screen. They are Copy, Delete, and Unmark.

To copy a block, move the cursor to the location in the file where you want to insert the copy of the block and press C. This is a non-destructive copy.

To delete a block. Pressing D will remove the block and the block markers from memory.

To unmark the block press U. You may also remove markers with normal delete commands. Remember, these changes only exits in the memory and not on the disk.

5. Find Operations

To find all occurrences of a word or phrase in a file, use the find function.
command. Press Ctrl-F and you will be prompted with the "FIND:" message. At this point, type in the word or phrase you wish to locate and press return.

The first occurrence of the word or phrase will be displayed in the center of the screen. To find all subsequent occurrences press Ctrl-F and Return.

You need not enter the word each time, the search will always begin at the current cursor location and search in the direction that the indicator in the lower left corner of the screen shows.

6. Printing Source Code Files

To print the source code on a printer, press Ctrl-P. The screen will prompt you to type in the printer slot number. Once this has been done, and the RETURN key has been pressed, the text will print out.

7. Adding Text

Position the cursor to where you want to begin adding text and enter the add mode by pressing Ctrl-A. To return from add mode to cursor mode, press Esc twice.

8. Loading files

To load a file into memory which was previously saved on disk press Ctrl-L. The loading operation works similar to loading any other file.

9. Saving Files

To save a file on disk, press Ctrl-S. Use the space bar to select the file name from disk, or type one in. Press RETURN when done.

10. Entering the Assembler

To save the current robot program and enter the assembler, press Ctrl-R. This will save the text as it appears in the memory on the disk, and then exit the text-editor to the assembler. Before a robot can be assembled, it must have been given a name by being saved to disk.

The Assembler

The Assembler translates source code programs into robot-understandable object code. It also checks for errors in the source code and displays a message if one is found.

The assembler can be entered from the Main Menu by selecting option 2, or from the editor by pressing Ctrl-R. If the assembler is entered from the editor, a robot source program is loaded and ready to assemble.

It is possible to assemble a robot from source code on the disk, or load an assembled robot from disk to test. There is also an option to print the assembled robot on the printer.

Assembly Errors

There are eight errors that the RobotWar assembler can detect. When the assembler detects an error it will display a message such as:

NO DATA FIELD IN LINE 27
10 + TO C
^  

The error message indicates the type of error, the program line number and the position in the line (^) where it occurred. Following are the possible error messages:

1. NO DATA FIELD - There is no register or number after a command.
2. UNKNOWN ITEM - You have tried to use a register or a label that is not defined.
3. LARGE NUMBER - You have tried to store a number greater than 1,024, or less than -1,024 into a register.
4. PROGRAM TOO LONG - Program is too big for the allotted program storage area. Programs have a maximum length of 256 object code instructions.
5. FATAL JUNK - You have included something that the computer cannot understand, like an illegal statement.
6. STORE IN NUMBER - You have tried to store a value in a number instead of a register.
7. RESERVED LABEL - You have tried to use a register name as a label.
8. NO PROGRAM CODE - There are no instructions in the program.

Object Code Exercise

The following pages list the object code's commands and registers and the translation of the sample robot's source code. Using the list and the two codes for the sample robot, compare and identify the source code and it's object code translation. It will be very useful to understand the object code when learning to use the text bench in the next chapter.

List of Object Code Instructions

Instruction Action

,  Load accumulator with next data item
IF Load accumulator with next data item
+  Add next data item to accumulator
-  Subtract next data item from accumulator
*  Multiply accumulator by next data item
/  divide accumulator by next data item
=  Skips the next command unless the accumulator is equal to next data item
>  Skips the next command unless the accumulator is greater than the next data item
<  Skips the next command unless the accumulator is less than next data item
#  Skips the next command if the accumulator is equal to next data item
TO  Store accumulator in next dat item
GOTO  Branch to the address given
GOSUB  GOSUB to the address give
ENDSUB  Return from a subroutine

Assembly of Robot Sample

The error message indicates the type of error, the program line number and the position in the line (^) where it occurred. Following are the possible error messages:

1. NO DATA FIELD - There is no register or number after a command.
2. UNKNOWN ITEM - You have tried to use a register or a label that is not defined.
3. LARGE NUMBER - You have tried to store a number greater than 1,024, or less than -1,024 into a register.
4. PROGRAM TOO LONG - Program is too big for the allotted program storage area. Programs have a maximum length of 256 object code instructions.
5. FATAL JUNK - You have included something that the computer cannot understand, like an illegal statement.
6. STORE IN NUMBER - You have tried to store a value in a number instead of a register.
7. RESERVED LABEL - You have tried to use a register name as a label.
8. NO PROGRAM CODE - There are no instructions in the program.
Tracing Registers

The trace is used to check the contents of registers not normally displayed on the test bench. Press the T key to access the tracer. The test bench will stop, and the following question will be displayed:

"NAME REGISTER TO TRACE?" Enter the name of the register you want to trace and press RETURN. The test bench will continue, with the contents of the traced register displayed on the line above "X POSITION".

The Esc key will exit from the test bench.

Storing Robots

There is a limited amount of space on the RobotWar disk to store robot files. However, robot files can be transferred to and from auxiliary storage disks.

Auxiliary storage disks are used only to store robot files. Robot files on auxiliary disks must be transferred back to the RobotWar program disk before they can be tested, assembled, edited, or battled.

There is a utility in the menu to initialize a data disk. Only disks initialized by RobotWar can be used as data disks.

To save or load a robot to or from a data disk simply remove the RobotWar disk after entering the robot name and before pressing return. After the file is loaded, swap the disks back again before continuing with the program.

To delete a robot from a disk, exit to basic, and delete the file with the DOS 3.3 command DELETE filename and press RETURN. When done, enter PR#6 to re-start RobotWar.

Summary of Editor Keys Cursor Mode:

Moving keys

+    Set forward direction
-    Set backward direction
Esc +    Move to end of text
Esc -    Move to beginning of text
A    Sets text in continuous scrolling motion
RETURN    Move cursor up one line
Esc RETURN    Move cursor to top of page
/    Move cursor one line down
Esc /    Move cursor to bottom of page
<-    Move one space left
->    Move one space right
Esc ->    Move cursor to right end of line
Esc <-    Move cursor to left margin
P    Move up or down one full page
L    Move text up or down one line

Text deleting keys

As the test bench runs the program, each instruction (in object code) will appear on the left side of the screen as it is executed. On the right side of the screen are displayed the robot's position and register contents. Also shown are the instruction number being executed (program counter) and the accumulator.

Controlling the Test Bench

The test bench can be interrupted by pressing the space bar. Press the space bar again to execute one more instruction. This can be useful when analyzing a program to see if it is acting as you had planned. Pressing RETURN will start the test bench running again. To change the speed of the test bench, press a number from 0 to 9.

Simulating Radar

Pressing the R key will cause the radar display to light up and the RADAR register will display a negative number to simulate an enemy robot in view. This will allow your program to go into its "enemy spotted" routine.

Simulating Damage

Each time the G key is pressed, a random amount, up to 10% will be subtracted from the DAMAGE register. This allows the program the opportunity to use its damage detection routine. The DAMAGE register will also indicate damage if the simulated robot crashes into a wall. The test bench will automatically stop when the DAMAGE register reaches 0.

key...

X.....means there is oxygen in that room. I tried to put it as close to where it is in the room as possible.

^.....means it is an 'up'. The disk loads in the next 3 sections when you go up. note: You can't go back down once you go up these!

> or <.....means you can go out the direction the arrow is pointing, but can't come back that way. You must go another way to get back to the room you just left.

......in the room means it is an ele- vator in the room. These go up and down and you must hop on them for them to bring you up.

note: Sometimes it is not as easy as level looks. You must follow certain paths through something similar to a maze.
For the Russians, a partial chain of command might run as follows: organizing and moving troops. Each Korps or Army, depending on the type, German Korps, while the German Armee is equivalent to the Russian Front. Army size units for the Soviet. These are your basic formations for unit of combat and maneuver is the Army, which is equivalent to the The military forces at your command are Korps size units for the Axis and Front commands 1 to 6 Armies. The theatre of operations. Or again, you may choose to combine the roles and command a number of positions. The choice is yours. Your computer will control those forces not assigned to human hands.

1. INTRODUCTION

Russia is a simulation of the greatest military struggle in the history of mankind. Almost 50 million fighting men participated in the four-year conflict and more than 20 million of them were casualties.

You may take the role of supreme commander for either the Axis or Soviet forces or you may choose to accept a subordinate role and command a single theatre of operations. Or again, you may choose to combine the roles and command a number of positions. The choice is yours. Your computer will control those forces not assigned to human hands.

2. WHATS IT ALL ABOUT?

Before asking you to go through the introductory tutorials, we recommend that you read the next two chapters.

The German war effort in Russia was directed by the OKH (Oberkommando des Heeres) which, as the war progressed, and his distrust of generals grew, increasingly came to mean Hitler himself. Its Soviet counterpart was STAVKA (formally Stavka Glavnovo Komandovaniya or Headquarters High Command), which was always run by Stalin, who trusted no one.

OKH and Stavka form the strategic level of play in Russia. The decisions made at this level include allocation of reserves and reinforcements and issuing directives to the subordinate Army Groups and Theatres. The strategic turn occurs once per month.

Of course, neither Hitler or Stalin were able to restrict themselves to the lofty plane of strategic command, and interfered constantly in operational matters. You will be able to do likewise.

Operational command in Russia is represented in weekly turns and consists of decisions made at three levels of military hierarchy.

Directly controlled by the OKH are three Army Groups, known for most of the war as Army Group North, Army Group Centre and Army Group South. Each Army Group can command 1 to 6 Armies and each Army can command from 1 to 6 Corps. The armies under each Army Group are written in the German Armee, to avoid confusion with Russian formations of a different level. Thus a partial chain of command for the Germans might run as follows: Army Group North - 4th Panzer Armee - 41st Panzer Korps. For the Germans, the Korps is the unit represented on the map and doing all the fighting.

For the Russians, the commands immediately below Stavka are called Theatres A, B and C. Each theatre commands from 1 to 6 Fronts and each Front commands 1 to 6 Armies. You will notice that for the Russians the unit of combat and maneuver is the Army, which is equivalent to the German Korps, while the German Armee is equivalent to the Russian Front.

For the Russians, a partial chain of command might run as follows:

3. HOW A SCENARIO PLAYS

This chapter should be read before starting the scenario tutorial.

A scenario (not a campaign game) of Russia goes something like this.

While the Korps/Army is the basic formation for organizing and moving troops, each Korps is actually composed of a number of divisions. These divisions never appear on the map and are always either included in a Korps/Army formation or held in a HQ reserve. There are three basic types of divisions: Infantry, Motorised and Armoured.

In the campaign game the player can choose to play OKH/Stavka and/or any of the Army Group/Theatre commands. Playing an Army Group/Theatre involves directing all of its subordinate formations.

In a scenario, there is no strategic command (i.e. No OKH/Stavka) and only one Army Group/Theatre per side.

There are three scenarios included in the game. They cover the initial drive of Army Group North to capture Leningrad in the summer of 1941, the Axis attempt to capture Stalingrad and the subsequent Soviet counter-attack in 1942 and the climactic armour clash, and its aftermath, at Kursk in 1943. The Leningrad scenario, being the smallest, is used as an introductory tutorial to make you familiar with operational decision making.

The campaign game covers the entire conflict from June 1941 until May 1945 or until a conclusion is reached whether it be in 1943 or 1947! The opening months of the campaign game are used as an introductory tutorial to give you some experience with the strategic decisions you will have to make in the course of the war.

Furthermore, the powerful Game Design Kit we have developed will allow you to customize any of the set scenarios or the campaign game. You may even create entirely new scenarios of campaign games, beginning them any time between 1939 and 1945!

SPECIAL NOTE:

Russia actually involves four levels of military hierarchy. For the Germans, they are OKH/Army Group/Theatre/Armee/Korps. For the Russians, they are Stavka/Theatre/Front/Army. In order to avoid confusion we will use the German terms throughout these rules. Unless otherwise stated, a rule which describes a German formation will be applicable to the corresponding Soviet force. For example, the statement that two corps can not occupy the same hex at the end of movement should also be read as meaning that two Armies may not do so either.

3. HOW A SCENARIO PLAYS

This chapter should be read before starting the scenario tutorial.

A scenario (not a campaign game) of Russia goes something like this.

Choose the scenario you wish to play. Experienced players may wish to vary an existing scenario or to create an entirely new one.

Choose a handicap level for the game. Handicap levels in Russia act as a multiplier on the points accumulated by either player. They do not affect the artificial intelligence or the combat performance of the protagonists.

Choose whether the game will be played between two humans, one human (either Axis or Soviet player) or no humans.

Each scenario lasts for a number of turns; up to 31. Each turn represents about one week of real time so that the maximum scenario length is 8 months.

The military forces at your command are Korps size units for the Axis and Army size units for the Soviet. These are your basic formations for organizing and moving troops. Each Corps or Army, depending on the type,
will contain several infantry, motorized and/or armoured divisions.

In a scenario there will be only one Army Group and Theatre involved.

Each Korps/Army will contain a variable number of divisions, based on
availability, the type of Korps and its current order. A divisional
reserve is maintained at each Armeo/Front as well as a variable number of
ground support assets (artillery, anti-tank etc.) and air support assets.

These assets are apportioned out each turn to those Korps/Armies in need of
them. A further reserve of divisions and assets are maintained at Army/
Group/Theatre level. Finally, a replacement pool is available to both sides
to rebuild depleted divisions in the field provided they meet the eligibility
criteria. Korps (Armies) are defined by type (E.G. SS Panzer, GDS Tank,
Siberian, etc.) and these ratings, together with their current order, largely
determine their exact divisional composition.

The battlefield on which you fight is a field of hexagons divided into
blocks of 9x9 hexes. The campaign map is composed of twelve of these blocks.
A scenario map will use some of these. The ground scale is approximately
40 miles per hex. Different types of terrain are represented by different
terrain icons. Railways and cities are shown and victory points are awarded
for control of the latter.

It is your job as Army Group/Theatre commander to use this time, these
forces and these conditions to capture and hold as many cities as you can,
to destroy as many of the enemy formations as you can get your hands on and,
of course, to prevent your opponent from doing this to you. The player who
has scored the most number of points by the end of the scenario is the
winner.

Your interface with the game is a structured set of menus which become very
easy to use. These menus and deploy your
formations, to send them into battle and to refit and reorganize them when
necessary. Each Armeo, (Front) has its doctrine specified however, and
individual Korps (Armies) may be given orders relating to their current tactical
situation. Ground and air assets are allocated to Korps (Armies) in contact
with the enemy.

Only one Korps/Army can occupy a single hex at the end of a turn. This
does not prevent them from moving through each other when executing your
orders.

Railways play an important part in supplying troops and the rail nets
in the game are differentiated into Axis and Soviet gauges (I.E. Narrow
and Wide gauge).

You have only limited control over the positioning of individual Korps/
Armies. The orders given to Armeos/Fronts will determine the response of
their component Korps/Armies.

You can examine a variety of reports, including area weather conditions
and terrain icons. Railways and cities are shown and victory points are awarded
in previous menu.

All orders are issued before any action takes place. Combat between
opposing forces is resolved and described by a short report. Other orders
are then executed.

This manual contains a short briefing for each scenario which will give
you some idea of what must be accomplished in order to win.

On average you can expect a scenario of four months length to take 60
minutes to finish in solitaire mode; a little longer if your opponent
is human. Thats the preliminaries over with. Were just about ready to play.

Victory Points (VP's) are accumulated weekly in a scenario.

A scenario is won by the side with the greatest number of VP's on the
final turn. Note that an automatic victory is awarded in a scenario when
the city containing the enemy's Army Group HQ (Theatre) is captured.

4. PLAYING YOUR FIRST SCENARIO

As a warm up to your adventure in Russia, we invite you to spend the next
forty minutes reliving the first frantic months of the German drive to
capture the vital Baltic Port of Leningrad. You will take the role of General
Von Leeb and command Army Group North in its dash to reach Leningrad before
the combination of Soviet reinforcements and bad weather can stall your
offensive. You have only twelve weeks (turns) to get the job done! You cant
afford to waste a moment!

STARTING UP

Start up your computer. Menu A (Start-Up menu) appears to the right of
the title page. As is the case with every menu in the game, you use the
arrow keys to locate your choice from the menu, and then type [RET] to
select it.

If you select the wrong menu, dont worry. Type [ESC] to go back to the
previous menu.

SELECTING THE LENINGRAD SCENARIO

Before we can start play, we have to select the Leningrad scenario,
tell the computer to control the Russian forces and decide whether
we wish to use a handicap.

Use either arrow key to locate the <GAME> line and type [RET] to go to
menu B (Location Select).

Use an arrow key to locate the <SCENARIO> line and type [RET] to go to
menu C (Scenario Menu). Apple owners will have to turn the disk to the
scenario side.

Use an arrow key and locate the <LENINGRAD> line and press [RET] to go to
Menu E (Edit Utility). The scenario briefing screen is displayed to the
left of the menu window.

Use an arrow key locate the <EDIT> line and type [RET] to go to menu
F (Handicap Utility). We must now decide whether to use a handicap. Lets
give ourselves all the help we can get. The handicaps below the <NO EFFECT>
line benefit the Soviet Player; those above benefit the Axis Player.

Use the arrow keys to select the <MAJOR> Axis line and type [RET] to go
to Menu G (Player Select). You must assign human or computer control to
each player in the game. The pane above the menu window displays the name
of the command position. You will be asked to assign control for
<AG NORTH>. This is you, so use the arrow keys to locate the <HUMAN> line
and type [RET]. You will now be asked to assign control for Theatre A (The
Soviet Command). Use the arrow keys to locate the <COMPUTER> line and press
[RET].

Once all the command positions have been assigned, the cursor is thrown
to the title page. As is the case with every menu in the game, you use the
arrow keys to locate your choice from the menu, and then type [RET] to
select it.

If you select the wrong menu, dont worry. Type [ESC] to go back to the
previous menu.
game will run. Below the menu window is a small weather summary map. Each of the twelve map sections is clear. Its the middle of summer. There is a chance that the more northerly map sectors will have some mud remaining from the previous winter. The map area displayed is the Riga Sector. The Riga Sector is the second from the left of the top row.

The <SOVIET> and <RUN 5> lines in the menu have been overprinted with a solid bar to show that you can not access them. The solid bar will disappear from the <RUN 5> line after the <AXIS> line has been accessed. This is to guard against accidentally entering the RUN5 option before issuing your orders. The <SOVIET> line will always be overprinted in this game (due to the fact it is a solo game) the computer does not want you to see what it is doing.

Locate the <AXIS> line and type [RET] to bring up menu 2 (Operations Master). This map is updated by the addition of the axis gauge rail net (I.E. Narrow gauge). Date, turn number and current victory point total are displayed below the menu window.

HISTORICAL NOTE: In case you are wondering why the Axis rail net extends into Russia, here is the explanation. In 1939, in conjunction with the Axis-Soviet dismemmberment of Poland, the Soviet Union annexed the Baltic States of Latvia, Lithuania and Estonia as well as a large hunk of eastern Romania. The rail systems of these countries were, by and large, compatible with europe rather than Russia. By the time of the Axis invasion, only a small part of these rail nets had been converted to the wider Soviet gauge. Once Axis forces capture these narrow gauge rail hexes, they can be used immediately for transportation.

Before issuing any orders to our men, we will review our forces and the environment in which they will have to fight.

The four Axis units in the bottom left hand corner of the map are ours. They are opposed by three units from the Soviet Baltic Front immediately to the right.

Select the <REPORTS> line from menu 2 and type [RET] to bring up menu 4 (General Reports). This is just a branch menu. Select the <STATUS> line to bring up menu 5 (Unit Status).

The map has been replaced with a full screen display showing the condition of every unit under your command. There are two pages to this report. Type [RET] to bring up page 2. The length of the report is determined by the size of your force.

Look at the first page. The top line identifies Army Group North, displays the date and the number of pages in this report.

There are 4 Armees attached to AG North; 4 Pz, 18th, 16th and 9th Armees. Note that Armees was historically part of AG Centre. For the purposes of this scenario, however, it has been detached to AG North.

Four Korps are attached to 4Pz Armees; 10 (Inf), 39 (Pz), 56 (Pz), and 41 (Pz). Only 41 Pz begins the game deployed on the map. The other three arise as reinforcements at specified times. Type [ESC] to exit this report.

Dont worry about memorizing all the information on this screen. As you become familiar with the game, you'll get more and more use from it.

Return to Menu 4 and select Menu 6 (Map Walk). This menu contains a variety of information which we can have a brief look at. At the moment the cursor will be flashing on the map. You may use the arrow keys, the 1 - 6 keys or the U,R,M keys to move the cursor over the map. The map will scroll when you reach the edge. You may type (0) to centre the screen on the cursor. This works on any screen where the cursor is flashing.

Position the cursor over the Axis armour unit at the bottom of the screen. An arrow flashes alternately with the unit symbol to indicate the targeted enemy unit. A unit must be adjacent to an enemy unit to be targeted. The right hand corner of the screen displays the identity and condition of the friendly unit.

Position the cursor over an enemy unit. You are told the units Front and Army designation and its level of activity in the previous week.

Position the cursor over the city of Riga. Now move the cursor to Pskov. Pskov is the trigger city for an off-board region. That region is named and the bonus VP's awarded for its capture are displayed above the city data. It's not necessary to worry about the details now; read chapter 8 when you have finished the tutorial for a complete description of the Map Walk routines.

Type [RET] to move on to the menu window.

To turn on a display, use the arrow keys to select which piece of information you wish to examine. Type [RET] again and the cursor will return to the map and the screen will display the information requested.

To turn off a display, type [RET] to move the cursor to the menu window, select the display you wish to turn off and type [RET].

While more than one display can be on at any time, very often information from one display will be concealed by another display. For this reason we recommend you examine one display at a time; at least for your first few games.

The <CITIES> options work slightly differently. They allow you to examine any city on the map. Select <NAME> and a box containing a square cursor will appear above the menu window. Type in the name of the city you wish to go to. As soon as you have entered enough characters for the computer to recognize the city, the screen will center on it and information concerning its stauts will appear to the right of the screen. Type [RET] to go back to the menu window. Select <CYCLE> and the cursor will move to the nearest city on the map. Use the arrow keys to examine each city in turn. Type [ESC] to exit the cycle routine.

Type [ESC] to exit the menu. All displays will automatically be turned off.

<CONTROL> allows you to examine which side controls each hex on the map.

<CLEAR MAP> allows you to examine the terrain uncluttered by units. For example, to examine cities occupied by units, you must first switch on the <CLEAR MAP> routine before positioning the cursor over the chosen city.

<RAIL NET> superimposes a full display of all rail lines, regardless of gauge or control.

<CHEMUNS> superimposes the communication value of each hex. Basically, communications affect the performance of your logistic net. Have a look at the communications map on the reverse of the terrain map. What this means is that it is much harder to supply your forces in the wilderness.

<WEATHER> superimposes an icon representing the current sector weather in each hex.

All of these reports and displays are fully explained in chapter 8 (The Game Menus Described).

Have a look through them for a few minutes, then type [ESC] until you get back to Menu 2 (Operations Master).

THE WEATHER AND ARMY GROUP SUMMARY

The next item in the menu is the weather report. Return to Menu 2 and select <WEATHER>. There are five separate displays on this screen. Below the menu window is an active map display. Map sectors in play are identified by a
We will set the doctrine and objectives for each Armees in our command. Locate the <DOCTRINE> line and type [RET] to select Menu 9 (Select Armee). The 16 Armees display appears on the right of the screen and only those Korps belonging to the 16 Armees are represented by their specific symbol. 16 Armees has 1 Korps attached (a second Korps will arrive on the next turn) normal doctrine, its HQ is in Tilsit, a line of supply is open to the AG HQ, supply and admin are 7.3 GSFs are available, 16 ASPs may be drawn upon and two infantry divisions are in reserve.

Note that since Axis ASPs are allocated from the Army Group HQ rather than an Armee, an Armees can call upon the Army Group pool of ASPs.

Use the arrow keys to cycle through the three Armees attached to AG North. The 9 Armees will appear on turn four. Dott worry about the orders displayed for Armees and Korps; they are default values and well soon sort them out.

Locate the 4 Pz Armees and type [RET] to go to Menu 10 (Select Doctrine).

In order to advance upon an enemy held objective, an Armees must have Main Effort doctrine. Select <MN EFFORT>. The cursor has been thrown into the map and we have been asked to select an objective. I prefer to send the tanks to Dvinsk initially and leave Riga to be captured by the Infantry Armees. Use the arrow keys to select Dvinsk and type [RET]. You have been thrown back to Menu 9 (Select Armee). The doctrine for 4 Pz Armees now reads <MN EFFORT> and its objective is Dvinsk.

Use the arrow keys to locate 18 Armees, type [RET] and set it to <MN EFFORT> with Riga as its objective. Put 16 Armees on <MN EFFORT> with Vilna as its objective. Type [ESC] to go back to menu 8. The Army Group activity is now high.

CHOOING KORPS ORDERS

Locate the <ORDERS> line and type [RET] to select Menu 13 (Select Korps). The arrow keys will cycle you through every Korps. The top four lines of text repeat the Armees doctrine; all other information refers to the Korps currently identified by the cursor. Locate the 41 Pz Korps. You are told the Korps designation, its type, its last order (a default value in this case) its status (experience, fatigue and losses) a LOS is open to the 4 PzA HQ, supply and admin are 7. GSFs and ASPs are not allocated as yet and the Korps contains two armoured and one motorized division.

The cursor alternates between the specific Korps symbol and a directional arrow showing the Korps' intended target. The computer determines which enemy unit each Korps will target upon; the factors which influence its decision are listed in Chapter 10 (Game Mechanics and Tactics).

The 41 Pz Korps will have either the enemy unit north or north-east of itself as its target. Type [RET] to bring up Menu 16 (Allocate Ground and Air Support). Were going to attack. Allocate all the GSFs and one-third of the ASPs. Once this is done, Menu 17 (Contact Orders) will appear. Select <ASSAULT>. You will be returned to Menu 13 and the updated Korps display will confirm the orders you have just issued. A description of the target and the condition of the target appears in the top panel of information. Wherever possible, confine your attacks to vulnerable targets.

Give the 17 Korps half of the 18 Armees GSFs, half of the remaining ASPs and an <ASSAULT> order. Give the 28 Korps the other half of the 18 Armees GSFs, all the remaining ASPs and an <ASSAULT> order. Finally, give the 1 Korps an <ADVANCE> order. Korps not adjacent to enemy units cannot use GSFs or ASPs and there is no mechanism for you to give them any. Thats everything you need to do to complete the turn. The invasion surprise flag is in effect so that you can confidently expect to hand out a thorough thrashing to the enemy arrayed against you.

Go back to Menu H (Game Master) and select <RUN 5>. Each battle is...
identified and described by a report. Press the <SPACE BAR> to examine the outcome of the next battle. Once all battles have been resolved, the computer will execute the movement orders of each unit.

Its a little hard to predict where each unit will end up; even which units will still be around. Fight as hard as you can for Riga; the sooner you control it the better. Once you have reached an objective, the Armee doctrine will change to normal. You will not be allowed to go to main effort again until the sum of the Armee supply and admin is at least eight, nor is it a good idea to do so unless the objective is undefended. For an enemy city to be a legitimate objective, it must be within 7 hexes of the Armee HQ. This distance is reduced to 4 to 5 hexes in mud and snow weather respectively. Armee with normal orders can transfer their HQs to friendly controlled cities within 7 hexes. Armee may only go on rest in supplied cities.

Play through the rest of the scenario and dont worry if certain orders are denied you at times or if things happen you dont understand. What you are attempting to do is capture Pskov as quickly as possible. An attack on Leningrad itself is impractical from any other jump-off point. When you finish the scenario read through chapters 8 and 10 and then have another go at the scenario.

You may also like to play a scenario a third time taking command of the Russian forces.

Please dont start playing the campaign until you have played all the scenarios; the wait will be worthwhile and youll enjoy it all the more.

End of Part 1 of Part I

TO PLAY:

1) RUSSKI DUCK

DURING GAME, TYPING 'CTRL C' WILL DISPLAY THE GAME CONTROLS AND YOU CAN MODIFY THEM AS YOU PLEASE

OBJECT:

This program requires an Apple IIgs or an enhanced //e or //c WITH a 65802 or 65816 microprocessor. A 65802 chip can be bought for around $20 and can easily be inserted in place of the 65C02 in the latter two machines.

This program is "virus medicine". It will read your system files (and any other types you specify) and create a data file that contains information on these files. At any time, you can run it in check mode and it will report any of these files that have been altered. For obvious reasons, I am not going to detail exactly what sort of data the program saves, but suffice it to say that it is virtually impossible to change any of these files without detection by this program and it would also be very difficult to either alter this program or the data file it creates without detection.

The program makes an effort to protect itself and its data file from modification. It encrypts itself and resaves itself whenever it is used to write a new data file. However, despite these safeguards, the safest way to use it is to keep this program and its data file on a separate dedicated 3.5" disk, which you use only for running this program.

THE PROGRAM NAME

If you do not keep this program on a separate dedicated disk then you should change its name, so that a viral program specifically looking for this program cannot easily find it and modify it.

THE DATA FILE

The name of the data file defaults to RX.FILE. This name is kept in the STARTUP position of the program. If not kept on a dedicated disk, then its name too should be changed using BLOCK.WARDEN from ProSel. Unless you give it a full pathname, it will be kept on the same disk as the program.

THE VOLUME NAME

The program must be told what volume to check. This defaults to /HARD1, but this can be changed via the Change defaults function in the program.

FILES CHECKED

The program has two means of deciding which files to check. (Ordinarily, pure data files need not be checked, only programs.) The first way it decides whether to check a file is by a list of file types it keeps. It will check all files whose file type is in this list. The list presently contains only SYS (type $FF) and S16 (type $B3) types. You should add the NDA, CDA and TOL types ($B8, $B9 and $BA) and the tool setup type $B6. There is an option in the program for modifying this list. For example, you could add type $06 for BIN files, or type $FC for BAS files. Since many BIN files are data files, however, it is probably best to use the second option for them.

The second way it decides is by a list of "special files". This list presently contains the file PROSEL. Again, there is an option in the program for adding to and deleting from this list. Note that if you have a file name in this list and the file cannot be found, then a program error will be reported and the program will abort. In such a case, you must remove that file name from the list.

It is suggested that you either add the type $F1 to cover the CD.EXT file, or add that file to the name list.
Whenever you add a program file to your system, you should run Apple.Rx in check mode to make sure things are now ok, and then rerun it in Create mode to revise the data file to include the new program file. You should run this program in check mode at frequent intervals, perhaps every day, to quickly determine if a problem exists before it has a chance to spread further. In particular it is a good idea to run a check before backing up a hard disk.

PASSWORD

To protect itself somewhat, the program requires a password when you enter it. The initial password is APPLEAPPLEAPPLE (passwords are not case sensitive) and one of the first things you should do is to change it with the built in facility to do that. A password must be at least 12 characters long, and when it is changed the program will encrypt most of itself and resave itself to disk. After that point you MUST remember your password. Recreation of the password from the encrypted file is virtually impossible unless you have the facilities of the CIA. It is in the nature of the encryption that even knowing the encryption algorithm, and having both encrypted and decrypted files at one's disposal will not, without gargantuan effort, yield the password that was used to drive the encryption. You can change the password any time you want, but you must know the old password to access the program in order to make that change.

Some functions, including changing the password, are disabled and payment of the shareware fee will bring enabling instructions.

WHAT THE PROGRAM CANNOT DO

The program only checks that files have not been changed (by a virus or whatever). It cannot prevent damage by a program that does not change other files; for example, a program that just starts erasing a disk at a certain date. Only well kept backups can protect from that. Even backups cannot protect against a virus that invades other programs, however, and that is the purpose of this utility.

DISEASE PREVENTION

Nothing can be 100% protection against viruses. You should practice diligence and prevention. Do not ever download (and use) a program from a pirate board. (I can imagine and understand a software publisher uploading an infected program onto such boards, in sheer retribution.) Never use, in a susceptible environment (such as a hard disk), any program downloaded by or otherwise received from someone you do not know or in whom you do not have confidence.

COPYRIGHT

This program is copyrighted 1988 by Glen Bredon. It is expressly forbidden to give this program to anyone else or to upload it to any bulletin board. If the program was not uploaded by me to a major service then you should not use it. These restrictions are to make it more difficult for a look-alike contaminated program to be distributed.

The program is SHAREWARE for $20. When you pay your fee, you should indicate where you got the program, so I can warn you if it is not legitimate. (Of course, this notice is unlikely to appear in a non-legitimate copy.)

Just clip and mail:

To: Glen E. Bredon
521 State Road
Princeton, NJ 08540

Glen:

Enclosed is my check for $20 in payment for Apple.Rx. I obtained

the program from: Compuserve
(or)

Enclosed is my check for $25, for which please send me the Apple.Rx program on a 5.25" disk. I understand that you will not distribute the program in this manner during the months of June, July and August.

I understand that the payment entitles me to receive instructions on how to enable the disabled functions, and to receive a warning if my source for the program is not legitimate, and that I may download any future updates from the same source with no further payment, or obtain a revision from you for a P&H fee of $5. I further understand that it is not possible to have 100% sure protection against software viruses and that no such implied warrantee is given.

I agree to abide by the copyright and to not distribute any copies of the program to other people or services.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 930 of 1262
What is SAP?

SAP is an animation program. If you have ever used Take-1 (c) Baudville, or Art & Film Director (c) Epyx, then you are already familiar with this program. To put it simply, SAP lets you create movies and put together animations on your GS. This program was somewhat modelled after Take-1, so if you have used this program you shouldn't have much problem adapting to SAP.

Originally, I envisioned SAP as an acronym for "Simple Animation Program." However, once you look at the program, you will see that this is quite a misnomer! The program sports my patented user-hostile interface, and it may take a while to get used to. But please stick with it! Once you master the myriad of commands, it all becomes very simple. In any case, if you feel that "Simple" doesn't apply to this program, feel free to substitute your favorite "S" word in its place (e.g. Stupid, Slick, Sweet, Slow, Silly, etc).

This program is distributed as "Show-Ware". This means that you are free to distribute or copy the program as you wish. However, if you create any nifty animations, then i'd like you to show it to me! This is all I ask. Of course, if you want to send any money or something for some strange reason, I won't turn you away! My address and contact number is listed at the end of this file.
I strongly recommend a hard drive. Currently, SAP only recognizes certain directories. If you don’t have a hard drive, you’ll be stuck with working on the floppy that SAP comes on, and there isn’t much extra disk space. Consequently, if you do own a hard drive then first create a subdirectory on your hard disk called */SAP* and then copy all the files and directories from the SAP disk to the SAP directory. Your hard drive directory should look something like:

```
*/SAP
  /SAP.DATA
  /MOVIES
  /SCENES
  /ACTORS
  /PICTURES
  /SOUNDS
```

and the files PROJECTOR, SCENEEDIT, and ACTOREDIT should be in the */SAP* directory. There will be various files in the other directories.

If you have unpacked directly to a hard disk, then all is fine. If you unpacked onto a floppy, just copy everything to the hard drive.

Terminology:

**BACKGROUND:** A $C0 Apple Preferred picture. This picture comprises the background scenery for your animation.

**PICTURE:** A $C0 Apple Preferred picture. This is the same as "Background," but the term "Picture" is used to refer to a picture containing shots of actors (see below) rather than background scenery for animation.

**ACTOR:** An actor is any object which will be animated on the screen. This includes pictures of people, text, or anything else. Currently, all actors are bit mapped graphics. An actor is comprised of SHOTS, described below.

**SHOT:** A shot is one "still shot" of an actor. For example, if you have an actor which is a talking face, this actor may be composed of three shots. The first might be the face with the lips closed, the second is the face with the lips partly open, and the third the face with the lips fully open. When displayed in succession, it will appear that the face is "talking."

**SOUND:** A standard digitized sound file.

**FRAME:** A frame is a just like a frame in a regular movie. It is a snapshot in time containing shots of actors overlaid on a background. A collection of frames makes up a SCENE.

**SCENE:** A scene is a complete animation all on a single background. It is composed of frames containing shots of actors and sounds.

**MOVIE:** A bunch of scenes played back-to-back to create a movie.

Brief description of the programs:

**ACTOREDIT** - Use to load up $C0 pictures and "cut" out the shots of the actor.

**SCENEEDIT** - This program is where most of the work comes in. You put together your animation/scenes with this program.

**PROJECTOR** - Simply plays back movies, which are just a bunch of scenes.

Description of Directories:

SAP recognizes only certain directories. Files must be copied into the right directory for SAP to work correctly.

```
*/SAP
  /SAP.DATA
  /SOUNDS
  /PICTURES
  /ACTORS
  /SCENES
  /MOVIES
```

The following outlines the general process you follow to create a movie.

1. Envision in your mind what you want the scene to look like. THIS IS VERY IMPORTANT! You must know exactly how your scene will fit together before you create it. This is because SAP works well when you create your scene going forward, but if you have to jump around and do a lot of editing, then SAP becomes EXTREMELY difficult to work with. In the future I plan to implement cut and paste features which will make things much easier.

2. Create shots of your actors and background picture with your favorite paint program. I did not include a paint program with SAP since there are already so many good paint programs on the market, such as Dream Graphix (stick to 16 color palette though).

   Make sure that the background color in your actor picture is color 0. This is normally black. Color 0 will always be "transparent," that is, any color in the background picture will "show through" color 0 in an actor.

3. Using the ACTOREDIT program, chop out your actors from the $C0 picture and save them on the disk in actor format.

4. Using the SCENEEDIT program, put together your actors and sounds onto a background picture. This takes the most work. Save your scene.

5. Repeat steps 1-4 to create more scenes.

6. Using a text editor, create a file with the name of the scenes you wish to play in your movie in the order that you want the scenes to appear. Make the last line "0" to make the movie end, or make it "1" to make the movie loop. Save this file in the MOVIES directory. If you name the movie file "AUTORUN" then this movie will automatically run when the PROJECTOR program is launched.

7. Use the PROJECTOR program to play back your movie.

This tutorial will walk you through the creation of some simple scenes. It should give you a good idea of how to create your own movies. I advise you to print out this section and follow along with the program as you read.

First, let's make a ball bounce on the screen.

To get an idea of what is going on, the best place to start is with the SAP programs, but with your paint program. So if you own a hard drive, then after you copy all the SAP files to the hard disk, launch your favorite paint program.

1. Create Your Actors

Normally, you will have to create your own actors in the paint program.
You should see two circles with the centers colored black, and several figures of a running man. Each figure will become what I call a "shot" of an "actor." What normally happens is that you create your actors with your paint program, and then you will cut out the actor from the picture for use in SAP. Later we will make the man run across the screen by showing consecutive shots of the actor, one after the other, and it will look like he is running.

After you've checked out the picture, take a look at the palette. Notice that there are TWO blacks! Why is this? Well, the first (color #0, the black on the palette) is TRANSPARENT in SAP. The transparent colors will "show through" color #0 in any actor. All other colors will be copied directly to the screen. This means that the other black, which is not color #0, won't have the background show through.

The red circle is filled in with color #0 in the center. When this is animated on the screen, it will look like it has a "hole" in the middle.

The blue circle is filled in with a different color black (not #0) in the center. When this is animated on the screen, it won't have a hole but instead a center colored black.

If this is unclear, it will make more sense when we animate the circles on the screen.

You should make sure that the background color of the picture you are going to cut the actors from is color #0. If it is not then you may get funny looking rectangular shapes in your animations.

2. Cut Out Your Actors

Now, exit your paint program and launch the file ACTOREDIT. After it has finished loading you should see a mosetext screen with several numbered options.

Choose option 1), Load Picture, by pressing "1". Another screen will show the directory of file names in the SAP/PICTURES directory. Use the arrow keys to select the file named "TUTORIAL.PIC" and press return.

The picture will load and be displayed on the screen. Click the mouse or press any key to make the picture go away and you will be returned to the main menu.

At the bottom of the screen should be displayed "shot : 0 (empty)". This means that shot 0 is empty; you have no current shots.

Choose option 3), Cut Actor From Picture. A message will be displayed about selecting the upper left corner of the actor. Click the mouse or press any key to make this message disappear. Now, move the mouse. You should see a pair of crosshairs move on the screen in tune with your mouse. Notice that you can only move the crosshairs by two pixels in the horizontal direction - more on this later. Move the crosshairs to the upper left corner of the red circle. You can only cut out rectangular areas, so make sure that the red circle is below and to the right of the white lines. Click the mouse once when you have maneuvered to the right point. Only click once! DO NOT hold down the mouse button and attempt to drag. You only click once!

Now, when you move the mouse, a rectangular box will grow or shrink. Move the box until it contains the entire red circle, and click the mouse. Try to get as close to the circle as possible; the smaller your selected area, the faster SAP will run and the more memory and disk space you save. The area under the "line" will also be included as part of your actor. Finally, you will be shown another message box about saving or discarding your selection. Click or press a key to make the message go away. Now, if you are satisfied with your selection, click the mouse. If you messed up and want to try again, press the spacebar and your selection will not be saved.

You will be returned to the main menu. If you clicked the mouse to save the shot, the bottom of the screen should now say "shot : 1 (empty)". Shot 0 now contains the red circle.

Repeat the previous step, but this time select the blue circle instead of the red circle.

The main menu should now display "shot : 2 (empty)" at the bottom. You may use the left and right arrow keys to move between the currently selected shot. For example, if you move back to shot 0 and press "4" for Delete, the red circle will be deleted and shot 1 (the blue circle) will become shot 0.

However, don't delete anything right now!

Instead, let's see what you've done so far. Press "6" to view the current actor. A message box will be displayed instructing you to use the left and right arrow keys. Press any key or click the mouse to make the message go away.

You should now see the current shot in the upper left corner of the screen. Use the arrow keys to move among your different shots. In the lower right corner of the screen, the current shot number will be displayed. Press spacebar to return to the main menu.

Notice that the shots are superimposed on the old display screen. If you like, you can clear the SHR screen to color #0 by pressing "8", and then try viewing the shots again with option "6".

Congratulations! You have just created an actor composed of two shots, a red circle and a blue circle. This actor could very well have included shots of the running man as well, but it usually makes more sense to save this as a different actor.

To save this actor, select option 7. You'll be asked for a filename for your actor (it must be less than 15 characters) and it will be saved in the ACTORS directory. Type "CIRCLES" for the actor filename, and press return.

Before moving on to the scene editor, let's also cut out shots of the running man while we are in the ACTOREDIT program.

If you have cleared the screen, then once again use the load option "1" to load in the picture "TUTORIAL.PIC". Now, this time you won't have to cut out each shot from the picture like you did for the circles. I've already done some of the work for you! I've chopped out 6 of the 8 shots and saved it to disk. It's up to you to cut out the rest.

To load in the saved actor, press "2". The file menu will come up and show a directory of all files in the ACTORS directory. Use the arrows to select the file named "RUNNER" and press return.

Take a look at the actor you've loaded by pressing "6", View Actor. Use the left and right arrow keys to toggle among the different shots. When you are finished, press spacebar to return to the main menu.

Now, the bottom of the screen should read "current shot : 0". If you cut from the picture into the current shot, you will erase whatever is in shot 0 now. Press the right arrow key six times until the screen reads, "current shot : 6 (empty)". At this point, whatever we cut will be placed in the sixth slot, which is now empty.

Next, use option "3" to cut the shot from the picture. The running man you want to select is in the right hand column and three rows down from the top. Cut this single shot red circle, and move the process and cut out the man in the lower right hand corner into shot #7.

Once you have finished, you may again use the View Actor option to make sure everything looks okay. If it does, then congratulations! Save this actor (with option 7) and call the file "RUNNER.2US".

If something went wrong, then use the left and right arrow keys on the main menu to select the shot which is messed up, press "4" to delete that shot, and...
try cutting from the picture again into that shot.

You may use this process whenever you want to edit an actor which you have already created and saved on disk.

3. Create the Scene

Next, we will do the fun (and hardest) part - creating the animation! If you are still in the ACTOREDIT program, type "G" to quit. Now, run the SCENEEDIT program.

Once the program loads, you should be presented with a screen similar to the main menu of the ACTOREDIT program. The first thing you should do is type "1" to load a background screen for your scene.

After choosing option 1, you will again be presented with the directory of pictures. Choose the picture called "STUFF". This is a fairly simple picture with a bunch of boxes and lines all over the place.

IMPORTANT NOTE: Make certain that the background picture and the picture that you created your actors in (in this case, "TUTORIAL.PIC") SHARE THE SAME PALETTE. If they do not, your actors will be the wrong color when animated on the screen! The program will use the palette stored with the background picture as the colors to use when drawing the actors.

Now, we need to load in an actor. Type "2" to load in a saved actor. You will be presented with a list of filenames; these are the actors which you saved from the ACTOREDIT program. Select the "CIRCLES" actor. When you are returned to the main menu, you'll see the "CIRCLES" displayed in the upper right hand corner showing that this actor has successfully been loaded.

Okay, you've loaded a background picture and an actor - the minimum requirements to begin shooting a scene - so let's start! Type "6" to shoot the scene and begin the adventure.

The graphics screen will come up and display a picture with a lot of lines and some boxes. This is the picture "STUFF" that you loaded for your background. In the upper left hand corner is the number 0001 indicating this is the current frame. Frame 0 is the first frame. At this point, you may get a list of commands by typing "?". Do it now. A somewhat imposing list of commands will be displayed on the screen. Take a look at them, and see if it makes sense. If it does, then great! If not, they will make sense shortly, so don't panic or give up hope. When finished, press a key to return to the graphics screen.

The first thing you need to do is C)ast an actor. Type "C" now. This will add a new actor to the current frame. You should see your red circle in the upper left hand corner. Move the mouse - the red circle will move along with the mouse. You can use the mouse to place the circle wherever you want on the screen. Remember, moving it off the screen - the circle will be "clipped" so you can have actors smoothly cruise off any edge of the screen.

Notice that the red circle appears to have a hole in the middle! The background shows through. This is because you filled the center with color #0, the transparent color. Let's switch to the other circle, the blue one, which was not filled with color #0. To switch to the next shot of the current actor, press the up or down arrow. Since you only have two shots, the up and down arrow will "toggle" between the blue and the red circle. With the blue circle activated, try moving it with the mouse. You'll notice that the center is filled in black, and the background does not show through. Recall that earlier, the circles were filled in with different numbered blacks.

Switch back to the red circle, and move it to the middle of the left hand side of the screen. Now, watch the number in the lower right hand corner of the screen and click the mouse or press return (they both do the same thing). What happened? The number should have turned into 0001, but aside from that, nothing else should have changed on the screen.

However, something did happen! A new frame, frame 0001, was created, and frame 0000 was copied into frame 0001. Then, you were moved to frame 1. Since the previous frame was copied into this frame, the location of the actors is identical and everything looks the same. However, if you change the location of the circle, you'll be able to see the difference.

With the mouse, move the circle a couple of centimeters to the right and a couple of centimeters down.

Press the left arrow. This takes you back one frame, to frame 0000. The ball is back in its original position. Press the right arrow to bring you back to frame 0001. The ball moves slightly to the new position. Make sure you are in frame 0001, and press return or click the mouse. Now, frame 0002 is created and frame 0001 is copied into frame 0002. We want to move the ball diagonally down again, but as you may have noticed, sometimes it is hard to make precise control with the mouse. In this case, you can use the keyboard for "fine tuning." The 8,4,6, and 2 keys move the circle just slightly in the respective direction on the numeric keypad. The W,A,S, and D keys move it a little more. Try pressing "D" twice and "S" twice to move the circle diagonally down and to the right.

Repeat the process until the circle reaches the bottom of the screen.

Let's take a look at what you've done. Type ESC to quit back to the main menu, and then type "P" for the scene projector. You should see the red circle slide over toward the bottom of the screen! Press any key to return to the main menu when it is over.

Time to add a little more to the animation. How about we make the circle "bounce" back up, diagonally and to the right. From the main menu, type "6" to return to the "shoot scene" portion of the program.

You can use the arrow keys to move to the last frame, but it is easier to use the "J)ump" command. Type "J" and then "L" for last frame, and the program will jump to the last frame you created.

You may want to check the previous (second to last) frame to see if it is identical to the new frame. It is common to have the last frame repeated twice, if you pressed return but didn't change anything. If the last frame is the same as the previous frame, then move to the last frame. If not, then go to the last frame and press return to create a new frame.

Now, press the up arrow key to switch to the blue circle. Press the "D" key twice and the "W" key twice to move the circle right and up.

Repeat the process, creating new frames and moving the circle up and to the right until it goes off the edge of the screen. When you're done, press ESC to return to the main menu.

Choose an intro effect for your scene by pressing "7". Choose any option you like. Do the same for the exit effect by pressing "8".

View your creation through the projector. "P"!

Assuming everything looks okay, save your scene via the save scene option, "5". Call the scene "CIRCLE.BOUNCE"

4. More Advanced Scenes

The last scene you created contained only one actor. This time, lets make a new scene with three actors and we'll also add some sound. We'll use the circles in addition to the runner.

Currently, there is no clean way to wipe out the current scene from memory, so you should use one of the following methods:

1) Quit the sceneeditor and re-run it
2) Select "4" to load a saved scene, but instead of choosing a scene...
press ESC to abort. The current scene will be erased, except for the
previous picture.

Use one of the above techniques to start fresh. Using the commands you have
previously learned, load in the background picture "STUFF", the actor
"CIRCLES", and finally the actor "RUNNER".

Additionally, use option "3" to load a digitized sound. The familiar screen of
file names will appear. Select the sound "NICESOFTWARE". When prompted
for the playback speed, type in "200". The playback speed determines how
fast the sound will be played back; 2000 would be quick, and 10 very slow.

Of course, this all depends on the original digitization frequency.

Type "5" to begin shooting the scene. Type "C" to cast a new actor; you
should see the red circle in the upper left hand corner. Move the circle
to the middle of the screen. Type "C" again to cast another actor. Another
red circle will appear. Now, type "N" to change this actor to a new one
—in this case, the runner. The runner should appear in the spot where the
red circle was. If you type "N" again, it will change to the next actor,
which would make it turn into the red circle again. For now, leave it as
the runner and move it just to the left of the red circle. Type "C" one more
time to cast yet another actor. Another red circle will appear. Type the
up arrow to change the red circle to a blue circle. You have changed the
shot to a different one, but you haven’t changed the actor. Move the blue
circle to the right of the red circle.

Okay, right now you should have the runner on the left, and right next to it a
red circle and then to the right of it a blue circle. You are going to make
the runner run across both of these circles and you will see a very interesting
thing.

As you’ve noticed, you can only control one actor on the screen at a time.
To select a different actor, press the spacebar. The newly selected actor
will blink for a moment so you know which one it is. Press the spacebar until
the runner is the selected actor.

Press return to create a new frame. Frame 0000 will be copied into the new
frame. Run the scene. The runner should still be the selected actor. We’re
going to try and make him run to the right. The trick is to watch the feet.
You want the feet to line up as we switch to the next shot of the runner.
So, with your eyes on the feet, press the up arrow key to change the runner to
the next shot. Now, use the "D" or "6" key to move the runner slightly to
the right so that the feet are near to where they used to be, but the runner
is still moving towards the right.

Repeat the process until the runner has moved to the right side of the screen.
The basic procedure is:

Press return to copy/create a new frame
Press up-arrow to switch to the next shot
Use the A,D,4,6 keys to position the runner a little to the right of
his previous position

While moving the runner, it may appear that the runner goes over the red
circle and over the blue circle. However, when using the projector, this
will not be the case! In the editor, the selected actor (in this case, the
runner) is always brought to the foreground. In the projector, ACTORS ARE
DRAWN IN THE ORDER THEY WERE CAST. This means that the runner will run
OVER the red circle, since the runner was cast AFTER the red circle. However,
the runner will move AFTER the blue circle, since the blue circle was cast
AFTER the runner. See for yourself! Press ESC to exit the editor, and type
"P" to view the projection. The runner will move over the red, but
behind the blue. This can be a very useful tool in making actors appear
to go behind or over things.

Once this has been understood, return to the main menu and back to shooting
your scene, option "6". We also want to add some sound in here. Lets make it
start at frame 5. Use the JJump command to get there, or press the right

arrow 5 times to get to frame 5. Next type "P" for "Play Sound". You will be
presented with all of the loaded sounds; since you’ve only loaded one, choose
sound 1. Now, when frame 5 comes up, the sound will play! Try it out.
Press ESC to go back to the main menu, and run the projector again to check it
out.

Of course, it is also possible to animate more than one actor simultaneously.
From the main menu, select option 6, and use the JJump command to jump to
the last frame. Move the selected actor to some random spot on the scene.
Press spacebar to select the next actor. Move it to some other random spot. Press
return to create a new frame. Repeat the process -- move the actor to some
random spot, press spacebar to select a new actor, and move it to some random
spot, etc. Now, when this is played, after the man runs across the screen
you should see actors pop up at various locations on the screen. You can also
edit existing frames by going there with the arrow keys or the jump command,
selecting the actor you want, and moving it. When you leave the frame, any
changes you have made will be saved.

Feel free to play around some more with the scene; when you are finished with
your creation, add some intro and exit effects, and save this scene under
the name "RUNNER.CIR".

5. The Projector

The final step is making a movie. A movie is merely the linking together of
various scenes. We’ll make a miniature movie consisting of your first scene,
the circle bouncing around, and the second scene, the man running across it.

To do this you will need to enter your text editor. The proterm editor, Orca
editor, or any word processor will do (as long as you save the file as text).

Run your word processor and enter the following:

CIRCLE.BOUNCE
RUNNER.CIR
0
END

Save this file in the */MOVIES directory under the filename "TUTOR.SAP". What
will this do? As you might guess, it will first run the scene named
"CIRCLE.BOUNCE" and then the scene named "RUNNER.CIR". These are the names
that you used to save your previous scenes. The "0" means that the projector
should quit after running the scene "RUNNER.CIR". If you had used a "1"
instead, then the projector will re-loop the entire movie. The last line
should always contain the word "END".

As another example, if you had instead created the following movie file:

CIRCLE.BOUNCE
CIRCLE.BOUNCE
RUNNER.CIR
1
END

Then upon running the movie, you would see the circle bounce scene twice, the
runner, and then the whole thing would repeat indefinitely until ESC is pressed
to abort the movie.

To run your movie, launch the PROJECTOR file. The familiar file menu will
appear. Simply select the movie you’ve just created "TUTOR.SAP" and it will
run. Abort at any time by pressing ESCAPE. Any other key will pause the movie
at the current frame until another key is pressed.

6. Copying Movies To A Floppy

If you wish to copy your creation onto a self-contained floppy disk, there
are a few things you need to do.

First, create the subdirectories PICTURES, SOUNDS, MOVIES, SCENES, ACTORS,
SAP SCENEEDITOR Command Reference

The most complicated commands are in the SCENEEDITOR while shooting the scene. The following is a command summary.

**C** - Cast new actor on the screen. This creates a new actor and adds it to the current frame. You may not have more than 15 actors on the screen simultaneously.  

**N** - Changes the currently selected actor to the next loaded actor.  

**SP** - Spacebar selects a different actor on the screen.  

**Up** - Up Arrow switches to the next shot of the currently selected actor.  

**Dwn** - Down Arrow switches to the previous shot of the currently selected actor.  

**R** - Remove the currently selected actor from the frame.  

**I** - Insert new frame in front of the current frame. The current frame is copied to this new frame.  

**K** - Delete the entire current frame.  

**J** - Jump to a different frame.  

**<-** - Left arrow moves to the previous frame.  

**->** - Right arrow moves to the next frame.  

**CR** - Creates a new frame if currently on the last frame. Otherwise, it moves to the next frame (same as right arrow). Clicking the mouse has the same effect.  

**P** - Play a loaded digitized sound  

**O** - Other options to take effect on the current frame  
- Turn off transwarp/zip chip for speed dependent animation. This is useful if animating in tune with music or sound, so everything will be synchronized for those with and without accelerators.  
- Wait for a key to be pressed.

Spatial Transition:  
- Pause for a certain amount of time. This time is based on the GS's clock, so it doesn't matter of an accelerator is running.  
- Soundsmith options  
- Screen Transitions  
- SAP Comments and Addendum

A single shot of an actor cannot be bigger than half the screen.  

Maximum of 20 actors on the screen at once. This means you can only use the "C"ast command a maximum of 20 times for one frame.  

Maximum of 15 actors may be loaded at one time in the SCENEEDIT program.  

Maximum of 5 digitized sounds per scene.  

Maximum of 200K combined sound per scene. The combined memory of the 5 allowable digitized sounds must not exceed 200K or great chaos shall erupt.

Perhaps the greatest limitation is in moving/cutting out the actors. You may notice that in moving horizontally, you can’t move by 1 pixel. You have to move 2 pixels at a time. This can be a problem if you have an actor you would like to line up with something on the background, but you can’t do it because you will be off by 1 pixel. In this case, you’ll have to edit your background with a paint program and move the background over 1 pixel. The reason for this is that SAP uses byte addressing, whereas each byte contains two pixels of color.

**Speed** - SAP is kind of slow.

Despite stack screen updating, SAP can still be slow due to a large amount of overhead and C code. You can do the following to increase speed:  

1) Keep actors small.  
2) Keep actors close together. In particular, keeping the vertical distance between actors will speed things up. Two men, running horizontally on the top and bottom of the screen will be slower than two men running horizontally one right on top of the other.

Additionally, I am aware of the following additions which need to be made:  

1) Cut and Paste features in the Sceneditor. This will make it much easier to do editing.  
2) Ability to remove actors and sounds in the sceneditor. Currently you have to erase everything and start all over even if you want to just delete an actor or sound.  
3) A built-in editor for the projector, so you don’t need to load up your text editor.  
4) General improvements to the user interface.  
5) Perhaps a simple paint program in the ACTOREDIT program to make quick and minor adjustments.

When System 6.0 and Apple’s animation toolset comes out, I may rewrite SAP.
Please give me feedback about this program! If I don't get much response, then I WON'T WRITE ANY NEW VERSION. This may sound familiar - I had done the same thing with Columns Beta and Columns 1.0. However, the response to both was very positive and I continued to work on Columns 2.0. SAP can also grow, but it won't if nobody cares for it.

A brief summary of the editor's commands appears on SCLU's title page. Here is a full description of the SCLU editor:

Control-N: Moves the cursor to the beginning of the next line; doesn't effect the content of either line.

Control-P: ("Push/Pull") Enter insert mode; text to the right of the cursor will be inserted, and then text to the left of the cursor will be erased after each key press. (II+ users can use control-D in place of the <delete> key. Deleting text will be pulled back. This mode is usually off, and will be turned off by using "(Push/Pull)")

Control-Z: A "GET G$" will be executed at the cursor's position. This will appear on the screen as an un-blinking cursor character. Only one Control-G is allowed on a page.

Control-A and Control-T ("C" for "Commands" and "T" for "Title Screen"). Either of these control keys will do the same thing: display the title screen with its list of editor commands to jog your memory. You can then press <return> to return to the screen you were working on.

There are two control key options for this command to make it harder to forget. (I couldn't use Control-H, because a Control-H is a backspace.)

<Esc>: Quit the editor. You will be prompted with "DONE? Y/N".

The SCLU "translator":
When you exit from the editor, SCLU prompts you for the starting line number for the program. The SCLU program will translate the text you've created into lines of BASIC code. These lines of BASIC are written into a text file that you can then EXEC to enter them into any BASIC program. SCLU lets you experiment with a variety of screen layouts, without having continually to "round trip" between editing and testing your program. SCLU is useful for designing more-or-less elaborate "title page" screens, and for situations that call for one or a few screenfuls of neatly formatted text.

The SCLU editor:

A brief summary of the editor's commands appears on SCLU's title page. Here is a full description of the SCLU editor:

Control-N: Text entered will be normal.

Control-I: Text will be inverse; only upper case can be entered (the 40 column mode firmware doesn't allow lower case inverse).

Control-F: Text will be flashing; upper case only.

Control-A: ("A" for "Apple"). Text will be MouseText. Note that the 40 column firmware doesn't allow both flashing and MouseText characters on the same screen.

Arrow keys: Move the cursor; II+ users will have to use control-K/control-J in place of the up/down arrow keys.

<Return>: Moves the cursor to the beginning of the next line; doesn't effect the content of either line.

Control-P: ("Push/Pull") Enter insert mode; text to the right of the cursor will be inserted, and then text to the left of the cursor will be erased after each key press. This mode is usually off, and will be turned off by using any arrow key or <return>. Because SCLU is in BASIC, it's pretty slow while in insert mode.

<Delete>/Control-D: Delete character to the left of the cursor; with pull-back if the control-P insert mode is active. II+ users can use control-D in place of the <delete> key. Deleting resets the text mode to normal.

Control-B: ("Beginning") Cursor jumps to the left-hand side of the screen.

Control-E: ("End") Cursor jumps to the right of the last character on the line.

Control-S: ("Shorten") All text to the right of the cursor is erased.
Screen Blanker GS v2.2
by: Ron Mercer (aka. The Dungeon Master)
Call: The Mist // 216/974-1153 70megs, 9600bps

[ A Parasitic Presentation ]
[ This is just ONE of the wares that I plan on releasing today: My Birthday ]
< This one has NO bugs >
< This one does not lock up if an invalid key is pressed >
< This one detects keypresses better >

This USE file for ACOS will take over the answering of your modem, thus allowing for many features (suggestions please?). The screen will be blanked while awaiting a call; to reduce wear on the monitor (character imprints on your screen). While awaiting a call you can toggle the screen (back to normal or back to black) with the spacebar.

To give credit where credit is due, Xor Blade came to me with his problem, so it is for him that this file was written.

Installation is easy; copy the file SCR.BLANK to whatever spec you want it on, then modify your LOGON.SEG (or whatever seg has the MODEM(0) command in it) so instead of a MODEM(0) you have:

use *x:scr.blank*:edit(0)

(where spec "*x:" is a drivespec of your choosing)

Commands Available:
SPACEBAR = toggle screen (black/normal, normal/black)
Q = quit to prodos
G = sysop login
A = pick up phone

Enjoy

Aug18/1988
The script language consists of these commands:

- **DO**
- **TERM**
- **GOTO**
- **HOME**
- **PRINT**
- **SPEED**
- **ECHO**
- **DIAL**
- **CONNECT**
- **RETURN**
- **WAIT**
- **IF**
- **SEND**
- **HANGUP**
- **SENDFILE**
- **GETFILE**
- **BREAK**
- **PAUSE**
- **DISK**
- **RUN**
- **END**
- **PRINTER**
- **EMULATE**

Each command is described next.

**DO label**

Causes script execution to begin executing instructions at a certain label. When a RETURN instruction is encountered, program flow resumes with the next instruction following the DO command. This is just like a GOSUB in Applesoft BASIC.

**TERM**

Temporarily pauses script execution and puts you into TERMINAL mode. When you press Escape to exit terminal mode, script execution continues.

**GOTO label**

Diverts script execution to a certain label. This is like GOTO in Applesoft.

**HOME**

Clears the screen and puts the cursor in the upper left corner.

**PRINT "text"**

Displays text on the screen, but is not sent to the modem.

**SPEED bps**

SPEED will set the bits per second rate for use with IT. Values for "bps" are 300, 1200, 2400, and 9600.

**ECHO mode**

Sets up local or remote echo modes for terminal mode. Arguments for "mode" are ON and OFF. ECHO ON is half duplex (local echo). ECHO OFF is full duplex (remote echo).

**DIAL number**

Dials a phone number. See \&CALL in the manual for details.

**CONNECT**

Attempts to connect with a host computer after dialing out. Use of the IF statement is useful after executing CONNECT to determine if connection was successfully established.

**RETURN**

Causes script execution to RETURN to the line following the corresponding DO instruction.

**WAIT "text"**

Halt script execution until "text" has come in through the modem. This is used for handshaking on incoming data. Use the IF instruction to determine whether or not the string to handshake on was found.

**IF condition GOTO label**

IF is used to test the most recent function performed by the script, such as attempting to connect with a host computer, sending or receiving a file, or handshaking on incoming text. Example conditions for use with IF are:

- if FOUND goto ...
- if CONNECT goto ...
- if FAILED goto ...
- if TRUE goto ...
- if FALSE goto ...
- if YES goto ...
- if OK goto ...
- if GOOD goto ...
- if BAD goto ...
- if SUCESS goto ...
- if NO goto ...
- if SUCCESS goto ...

Placing NOT or NO in front of a condition will test for a negative condition, such as IF NOT FOUND GOTO label. The word THEN can be used in place of GOTO if you desire, although both GOTO and THEN are totally optional. If the condition tested is true, the script will attempt to GOTO to the label name which is at the very end of the IF instruction line. So if you had a label called "Stop" you could do this: IF NO CONNECT Stop

**SEND "text"**

Works just like PRINT, except this will send text to the modem and not to the screen. Remember, if you need to send a carriage return, use "\^M" (caret followed by the letter M).
 disconnects the modem with the host, and hangs up the phone.

SENDFILE file options

Prepares to send the "file" using special "options." If "option" is

PROTOCOL, XMODEM will be used to send the file. Example:

SENDFILE FOOBAR.COM PROTOCOL

If "options" is not PROTOCOL, the file is sent as a regular text file, line

by line. You must specify two "option" arguments: an interline delay value,

and a character which to use to handshake on each new line. Example:

SENDFILE BLETCH.TXT 7 :

This will send the file "BLETCH.TXT" line by line, with an interline delay of

7, and will wait for a colon from the host before each line of the file is

sent out.

GETFILE file PROTOCOL

Gets a "file" from the host computer using XMODEM protocol. (Sorry, text

receive-to-disk is not implemented).

BREAK

Sends a modem break tone. (see &BREAK in the ModemWorks manual)

PAUSE seconds

Causes script execution to pause for so-many seconds, then execution will

resume.

DISK command

Allows the script to execute a ProDOS BASIC disk command. Examples:

DISK prefix /profile/mail
DISK delete /ram/temp
DISK cat,s6,d2

RUN script

Lets you run a different script file from within a script.

END

causes a script to stop running. If you're online, you're taken right to
terminal mode.

PRINTER mode

Specifies whether any output which is shown inside the terminal mode window

will be sent to the printer or not. Values for "mode" are ON and OFF.

PRINTER ON sends output to the printer, while PRINTER OFF does not.

EMULATE terminal

Initializes terminal emulation for the named terminal template file. If the
template does not exist in the current prefix, you should specify a fully

qualified pathname to the file. Terminal template files are those with a

file type of $00 on the ModemWorks disk.

FILES

On disk, you'll find a sample script source file named SCRIPT.SRC. Use

SCRIPT.SRC as an example of a typical "dial up and log-in" script.

The program named COMPILE is the actual script compiler. It can be invoked

using the [C]ompile command from within IT, or from BASIC.

BUGS

The COMPILE program will not catch duplicate labels declared in a script

file. Be careful.
Karl Bunker                          The Court
freeware, by the way). It was really a bored-hot-summer-night kind of a                |              In Europe              |

It is here that you will spend your gold to equip and provision your expeditions. As your experience grows, learn to choose effectively among the ways you can invest your wealth. Do you plan to trade? How many goods will you need? Do you aim to conquer? What size army must you assemble? Can you find food? How much should you take? Find the answers that fit your style of exploration. Or prepare yourself for an unhappy relationship with the Court and for expeditions barely able to survive—hardly the marks of explorers destined to become Viceroyos.

Player Tip

Food is bought and bartered for in relation to the number of men in your expedition. Decide on the number of men you want first, then on how many weeks’ worth of food you want for them. To get a feel for this relationship, play around with the two quantities the first few times you’re given the opportunity.

The Pub

Wise conquistadors will stop by here after every trip to record their maps and discoveries. Losing also all the maps and discoveries you made on your last three trips is heartrending.

The Voyage

When you leave port, mark well the indications of your voyage and how they continually change. On the screen window, north is always at the top, west to the left. At the top of the screen you see the month and year and the number of vessels still in your expedition. To the left is the size of your army and the number of weeks you can feed that many mouths with the food on hand. To the right is the ledger of your cargo of goods and gold. At the bottom is your speed and the depth of the water.

Your ship’s cartographer can help you but little on this part of your search. Choose the “view map” option to learn your latitude and pay attention to the passage of time. By such dead reckoning you will learn to cross the ocean with the least expense of food and life.

There are many perils in the uncharted waters beyond Spain. Men die of scurvy or of storms in which no one can hear their last cries for help. Those same storms can blow you far off course and cost you vital time. Your supply of food dwindles as you ply your way across the vast ocean. Wander too long in search of landfall, and you will surely perish.

From the Historical Record

Columbus' critics were right. If there had been no American continent, no Spanish fleet of that era could have completed the ten thousand mile expedition across the Atlantic to Japan. They couldn't carry enough food.

The food they could carry was no treat—a grim mixture of tough salt mat, hardtack, and dried vegetables. Meals were cooked in a wooden firebox embedded in a heap of sand on deck. Sour wine and stale water completed the repast.

Discovery and Exploration

Brig your ships into safe mooring carefully and learn from your costly mistakes. Resolve not to lose more ships by inattentively running around or to the same shoals or shallows. Remember also that if you leave your ships unattended while you set off on long journeys, the sailors who man the ships (who are not included in your roster count) just might sail away before your return.

As you move over the land think of all who will bless your name for your discoveries. The Court and merchants want gold and trade; sailors, other explorers and scholars will be eager to see your maps. Others in the Universities will be anxious to hear of the surface of the land and of the people who live in it. And the Holy Church is ever solicitous to save unenlightened souls.

The Church has a powerful ally in your need for food and someone to help carry it. Unless you find and learn to deal with some local inhabitants, you're not going to get very far in your quest for the fabulously wealthy cities you hope to find.

Playing Tips

1. Imagine a world without roads and you'll begin to grasp the impronture of rivers to the to the explorers in the 16th Century. Your own progress also depends on your use of rivers—a moderate pace on a river moves you as fast as a reckless pace on land.

2. Your computer will build maps for your as you go. Consult them frequently. (Your positions is always approximately in the center.) You want to build pictures in your head and perhaps even keep journal notes of what happened where. Your goal is to be able to find your way back to useful places and avoid dangerous ones. (one screen measures 120 miles on a side on the exploration surface and 960 miles on a side on your maps.)

Making Contact with the Natives

In any new region, where the natives live will not be visible (save to the novice) unless you take the time to stop and look for signs. When you have spotted a signal and move to enter a village, think also of what signal you mean to send as you go in. Reckless aggression? Cautious friendliness? Open-handed generosity? The decision is yours alone. And its implications and consequences are yours alone to bear.

There will be considerable variety in the natives you encounter. Some will be more populous, some more credulous, some more hostile, and some more complex combinations of those attributes. If you would survive and prosper, learn to use your ears and eyes for clues to the natives' moods and the patterns in their responses to your actions and combinations of actions.

Trade or Conquest

Both approaches are available to you. Both, if successful, bring valuable bearers as well as goods. To trade, as the natives will be quick to tell (if your gait and perhaps your generosity seem suitable), you must deal directly with the chief, He always stands in the center of the village until and aggressive threat causes him to vanish or yield in despair.

Conquest is quick, but it consumes lives and leaves bitter memories. Trading is safer, but it is also slower and requires many goods. Take whatever actions your heart and mind tell you to take—and attend to what you learn about yourself in the bargain. And harken. None but novices should always believe everything their bearers tell them—
especially bearers far from home on an expedition whose food is going stale. And consider that the natives remember long and well what
treatment they receive at your hands. Let your future dreams temper your present schemes.

From the Historical Record

On his final voyage, Columbus found himself stranded in Jamaica. At first the natives supplied food; but the voracious appetites of the explorers—15 to 20 times as much food as the natives did themselves—soon put them out of favor. The Spanish were slowly starving.

Columbus devised a stratagem. His almanac predicted a total eclipse of the moon on the last night of February 1504. Columbus summoned the native chief and announced that Almighty God was displeased with their treatment of His chosen emissary. If food was not brought to the Spanish, the Lord would darken the moon forever.

The eclipse began at moonrise. Soon the entire village ran howling to Columbus’ ship, imploring him to halt the destruction. Columbus waited in his cabin until the full eclipse phase had passed, then emerged and took credit for a successful intercession on their behalf. Columbus and his men enjoyed an ample food supply for the duration of their journey.

Establishing Forts and Missions

Both trade and conquest can bring you the opportunity to establish more than a thinly manned fort, and how few to avoid and over galvanize an area. You will depend on the size of the native population at the site. Let the pictures signifying fort and missions be your guide. And let experience tell you how eager the conquered are to throw off their yokes during your absence.

From the Historical Record

At times the natives were only too willing for the Spanish to establish armed garrisons in their own land. Gudcanagari, chief of a Haitian tribe, understood this and gave Columbus to establish a colony so that Spanish guns could help him defeat his rivals on the island. Columbus had his own reasons for wanting to found such a colony. Thus was Villa de la Navidad (Christmas Town) the first settlement and first armed fort in the New World.

Playing Tips

1. Pay attention to the time of year and to your latitude. Toward the far north and south, the effects of climate become visible in the fall, winter and spring. And, since how much food you’ll find in a village depends on when the last harvest was, you’ll find paying attention to the seasons materially rewarding as well as aesthetically pleasing.

2. Don’t underestimate native communications. Some can spread word of your activities to cities you haven’t visited yet. And bearers can show you the location of other settlements—and of treasures, if you pause long enough to listen to them.

3. A mission can supply nearby ships and cause the sailors to wait patiently for the return of the landing party, provided care has been taken to inform the mission inhabitants of the location of the ships.

1540 and Beyond

Within 50 years of Columbus’ first voyage, the Spanish had conquered the New World’s most advanced civilizations and had begun to consolidate one half of the territory into a colonial empire. Center stage began to pass from the Spanish Conquistadors to the traders and settlers of many nations who followed.

You may continue your explorations after 1540 if you wish, but you will receive no more titles from the Court or other recognition for your efforts. If you wish to see the complete map of the territory you’ve been exploring, you can begin anew with a New World, see the reference card section of this doc file.

Notes on the World Maker

Calling brand new New Worlds "random continents" conveys something of the variety and variability, but it doesn’t do justice to the sophistication of the program that produces them. New Worlds are not simply drawn willy-nilly. They conform to geological and cultural principles built into the program code.

There is, for instance, a plate tectonics model consulted for each creation. Mountain ranges are generated where the plates bump into each other. And secondary ranges (like the Allegheny mountains on the historical map) may be created as well.

The program also consults a cultural dissemination model for its work. The influences of major civilizations are presumed to spread outward. Consequently, pueblo dwellers generally will be found between coast-states and primitive agriculturists. The model will allow for variations in level of this influence and can thus produce occasional continent arrangements which have no Incan level civilizations. Alternately, it can make a very rich and powerful arrangements, ones which, like 16th-Century Japan, are highly civilized from coast to coast.

Competitive Play

Though only one player may use and save a position on a particular map disk, competitive opportunities may be achieved by using 2 of the program disk to make multiple copies of a map disk. Several different players might then explore the same terrain, comparing progress periodically or simply declaring the winner to be the player with the highest totals and title by some agreed upon date. (Note: You can start a new game with a map disk without disturbing a game previously saved to that disk, but you cannot save more than one game on any given disk.)

quantities of the highlighted item from column to column. The price of items and the amount of gold or goods you have to spend appears at the bottom of the screen. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process. If you are simply transferring resources and not buying or bartering, holding the button down will speed up the process.
want to go. Study the screen border for information about the passage of time and your status. Note to novices: Set your course due west when leaving Europe and you will soon come to a very interesting island.

Sail in close and press the button. Use the joystick to move the highlight over "Drop Stuff Off" and press the button again. Now use the joystick to transfer men, food, and goods from the ships to a land expedition. (To move all of an item, hold the button down as you move the stick to the right or left.) When you're ready, move the stick up until "leave" appears and press the button.

On land and in villages, pressing the button while moving changes your speed, pressing it while at rest produces an options menu. If you choose the view map option, your position on the map is approximately in the center.

Villages are marked for novices. At other levels, you must stand still and look for the blinking light that signifies a village location. (Go inside, look for the chief who does not move) in the village center, being careful not to bump into too many inhabitants unless you want to fight. If you get to trade, look on the bottom of the screen for information about prices and how many goods you have.

Try the court for rewards, your home for a status report, the outfitters for new men and supplies, the pub to save what you've accomplished, then set sail again.

Start up the program as though you were going to play, then select "Create Another World" and follow the instructions as they appear on the screen. The creation process can take as long as ten minutes.

[D] - Discovers everything, if you press while in your home in Europe.

[SPACE BAR] - Pauses and resumes the game.

[CTRL-R] - To restart game.

[CTRL-S] - Turns sound ON/OFF

Before selecting your band form among the many visitors at the Inn, pause and consider the importance of assembling a balanced and able group of adventurers. Up to twenty different characters may be registered with the innkeeper, and form this gathering you will create a band of nine, all who must harmonize and support each other.

As you register your team, the proprietor will ask a series of questions about each member, questions that concern their race, profession, and gender. As the details are recorded onto the register, the resulting attributes of each individual are open for your inspection.

Many years ago, an evil began to spread across the land. It was centered in the Shadowkeep, the home of powerful wizard, Nacomedon. The demon, Dal'Brad, had imprisoned Nacomedon in a crystal and held his captive deep in the tower while he wrought the evil madness.

This evil spread until it reached the borders of the four races of to Earth. Roos, Thalidars, Zhis'ta and Humans alike were threatened by the wretched evil that was spreading from the tower. A few brave adventurers were sent forth from each civilization, determined to put a stop to the evil and perhaps acquire a small fortune at the same time.

Roos, hardy explorers of great physical endurance; Thalidars, masters of the ancient art often known as magic; Zhis'ta, agile and shrewd warriors from birth; and Humans, intelligent leaders with a knack for getting into trouble -- all banded together to fight the demons in the Shadowkeep.

Alas, it was not enough. Each was defeated in turn. There was no time for just one more group of brave adventurers. One more party of heroes was needed to topple the cruel and heartless obelisk that was the Shadowkeep. We call on you, our last and most able chance, to accept the challenge -- to assemble your party, approach the Keep, and if your spirit is able, rid the tower of its malicious tenant.

II. FINDING YOUR ADVENTURERS Here at the Lonely Inn, the mysterious proprietor will greet you and ask your name. He is a friendly sort, curious about your band of adventurers and eager for your business. He has run this Inn on the edge of the Shadowkeep for many years, unexplainedly protected from the evil of Dal'Brad that lurks so close to his door.

Before selecting your band form among the many visitors at the Inn, pause and consider the importance of assembling a balanced and able group of adventurers. Up to twenty different characters may be registered with the innkeeper, and form this gathering you will create a band of nine, all who must harmonize and support each other.

As you register your team, the proprietor will ask a series of questions about each member, questions that concern their race, profession, and gender. As the details are recorded onto the register, the resulting attributes of each individual are open for your inspection.
Characters may have any name, in length up to twelve letters, and with no spaces or numerals....
The four great races of Roo, Thalidar, Zhis'ta, and Human each possess their own qualities and quirks. Within each race, males are stronger than females, though the females of a race possess greater dexterity....
Adventurers are trained in one of the five professions:

WARRIORS:
-sturdy masters of the mace and broadsword; at least four per party is a sound grouping

MONKS:
-wise and insightful, agile and vigorous

RUNE MAGES:
-possessors of the Runes of power; can decipher glyphs that baffle others

SHADOW MAGES:
draw their power from shadow

NECROMANCERS:
-seek power over what is most feared: death....

The innkeeper records the background of each adventurer in his log. It is acknowledged that race, gender, and profession determine a character's attributes. But, of course, all individuals bring strengths and weaknesses that exceed those of their positions. The proprietor thus allows extra value to be distributed among any adventurer's attributes, in any or all of the six areas:

STRENGTH:
-How much an individual can carry, and the amount of damage he can inflict in combat.

INTELLIGENCE:
-How many spells a character can learn, and how quickly he can learn new ones.

DEXTERITY:
The agility of a character -- the ability to move quickly and leap out of (or into) danger. The most dextrous individual moves first in a fight.

POWER:
The ability to focus magical energies. Power is drained by magic, restored by rest. A character with no power will not live.

LEADERSHIP:
-Force of personality. The character with most leadership will be declared leader of the party. HIT POINTS:
The ability to withstand physical damage. Hit points are restored by rest or healing arts, and, as with power, are necessary in order to live.

Once new adventurers have been registered, review or rename veteran characters from past adventures.

Also, recreate any whose souls were saved on the Save Disk. Select this option from the list, name the character whose life and spirit should be restored. Welcome the adventurer back into the party.

Finally, gather the party, selecting up to nine of the most able and ready. The mission ahead is not for the dull of mind or the frail of spirit.

III BEGINNING THE QUEST The adventurers must prepare for the journey to the Keep. They may give equipment and supplies to each other, and through other means prepare themselves. They may also visit Raddath. An enigmatic, pan-dimensional creature, Raddath will offer his wares and wisdom to the party. He has felt the evil of the Keep and thus will give his aid in any way he can. Raddath buys and sells magic and goods, and can heal damage, drain poison, and even revive a character killed while in the Keep. He is not, however, given over to charity. Raddath has no aversion to acquiring a fortune while helping destroy the Keep.

FURTHER NOTE:
While Raddath is skilled in magic, he offers no guarantees of the effectiveness of his cures. No refunds.

The final preparation may be to order the party. Sound organization is essential within the confines of the Keep. Take this opportunity; it may be your last.

The road to the Keep is short, but it wears long on the soul of the hero who walks it....

(OP COURSE, IF YOU HAVE BECOME FAINT OF HEART, NO ONE WILL STOP YOU FROM ABANDONING THE QUEST NOW. IF YOU LEAVE THIS PLACE, YOU MAY NEVER SEE IT AGAIN...)

IV WITHIN THE TOWER While approaching the Keep, and within it, instruct the adventurers with precision and clarity.

RALPH GET THE TORCH
EZEKIEL CAST THE LUMINANCE SPELL
NAOMI GET THE TORCH AND GIVE IT TO REBB
REBB LIGHT THE TORCH AND PREPARE THE SWORD
NAOMI WEAR THE ARMOR THEN PREPARE THE MACE
DAGMAR PUT THE WAND OF TRAVEL IN THE CHEST

Any command not directed to a certain character will inspire the leader of the party to respond.

The party as a whole will move following basic commands.

F or FORWARD
L or LEFT (to face left)
R or RIGHT (to face right)
B or BACKWARD (to step back without turning)

Explore the Keep thoroughly, and exercise caution.

OPEN DOOR, CLOSE DOOR, LISTEN

Inhabitants will occasionally allow you to address them, which you should do in either of the following ways. Try to do so before they lop your head off.

ASK SILDRA WHERE THE GOLD IS "SILDRA WHERE IS THE GOLD"

From time to time, assess the damage inflicted on fellow
adventurers.

LOOK PARTY (gives members' power, hit points)

STATS

ROLE CONDITION (substitute C for Condition)

LOOK NAOMI

Magical healing is possible through the aid of Raddath. If a visit to him is impossible, characters may use any magic they possess, but at the expense of some power.

The adventurers can investigate and acquire objects while in the KEEP.

SEARCH (some characters will find hidden objects more quickly than others)

LOOK SCROLL

MORDOR GET SCROLL

FANNIE GET ALL BUT TORCH ZOORA GET ALL GET GREAT SWORD AND READY IT

If an adventurer has too heavy a load, something will need to be dropped. The amount they can carry depends on their strength.

DROP THE BASTARD SWORD

DROP ALL BUT THE TORCH

MERCER DROP ALL

Or, the adventurer might simply give the object away.

MYRA GIVE ROBERT THE GEM OF CHANGE GIVE THE SOGGY STICK TO BILL

You might wish to let one object hold another.

OPEN THE BOX AND

PUT THE GOLD INSIDE

CLOSE BOX

PUT ROCK IN HOLE

PLACE GOLD ON THE TABLE

Find out what an object can do by using or examining it.

USE THE FUNNY ROCK

EXAMINE THE FUNNY ROCK

If you have a particular use in mind, and a certain target, state those.

SMASH THE ALTAR WITH THE BREAKER BAR

ATTACK THE CORD WITH THE GREAT SWORD

Light is required to explore the dark, dank Keep. Without a lit torch (or an appropriate light spell), searching will be impossible. (Combat will be possible but difficult; there would be no warning at the approach of monsters.) Any illumination will serve but will eventually extinguish, becoming a soggy stick or used up spell. It is advisable to have several sources of light at any given time.

LIGHT TORCH

ZEKE CAST THE LUMINANCE SPELL

V MAGIC:

Rely on the power of magic; above all else, it will be your key to success.

Though all may cast spells within the Keep, many have the capacity to learn no more than a scant two or so. Power and training determine one's triumph while using this ancient art. Mages, with exceptionally learned backgrounds, begin the journey with knowledge of a small number of spells. Raddath has acquired many others, which he makes available for sale to the hopeful adventurer.

As all may cast spells, so will all feel the effects of the task. After casting a spell, even the most powerful magician weakens, and eventually must restore powers with sleep. Monitor the losses of power, thus avoiding the loss of an adventurer.

Up to two spells or magical artifacts may be active at any one time.

INVOKE RING OF LIFE AND CAST THE FORTRESS SPELL

Discover more about spells you acquire by reading or learning them. READ BOOK OF DARKNESS, LEARN DEATH SPELL GET HEAL SCROLL, LEARN IT, CAST IT

A scroll that is successfully learned becomes a spell that may be cast. The scroll will vanish once it has been learned.

Mere mortals are limited in the number of spells they may know. When one's memory is full and the spell cannot be learned, a spell must be forgotten. FORGET DEATH SPELL

Once a spell has been forgotten, only another scroll will grant a new opportunity to acquire the spell. Ready the magical artifacts as you prepared other weaponry. READY SOULEATER SWORD

Learning magical spells is sufficient preparation for use.

Watch for podiums while in the Keep. Through these devices you and your band of adventurers may quickly transport to another level of the Tower. The incantations needed to operate these mysterious devices are always changing.

Finally, the halls of the Keep are laced with spells that bind, hide, or hinder. Doors are often sealed with spells of warning, released only by the timely use of magical words discovered by those who made the journey before you. The passwords that are known: SAFETY, LAIR, PASS, FRIEND, HOME

Be apprised of the possibility of other passwords; and hope that if you are unsuccessful in vanquishing the demons from the Keep that you will at least return your successors what you learned.

VI COMBAT:

Successful warriors approach combat with weapons, equipment, and magic in readiness. An adventurer would do well to have equipment prepared for both Attack and Parry, and to wear the armor.
At a sign of combat, the party will, at your command, negotiate, flee, or remain to fight. When you mobilize the ranks and determine the course of action, you may assign each member to attack, parry, cast spells, change places prepare equipment, or, of course, do nothing.

When assigning adventurers to their tasks, consider the skill that they might possess due to heritage and profession. These skills might cause them to perform some tasks better than others. Before combat, gain information on a member's skill as such:

EXAMINE ELLA

THE SKILLS:

ATTACK: Skills necessary to land a blow on an enemy.

PARRY: Success with which a character can avoid or deflect a blow.

MAGIC: Technical proficiency in casting magic.

OPEN:
The ability to open sealed or locked objects.

SEARCH:
The aptitude for finding hidden objects.

If combat has worsened the condition of the party, change positions to preserve life and limb. Enter: ORDER

And, as weariness sets in, allow the few remaining good spirits in the Keep to restore your band's energy. Rest for up to ten hours, then resume the journey. One hit point and a unit of power is restored to each character for every hour of sleep. SLEEP FOR 3 HOURS

Beware:
Monsters can sense when a party is asleep and unprepared for attack. A blow while asleep can be far worse than the extremes of combat. Consider the use of certain spells that will conceal the sleeping party from marauding monsters. Or, perhaps choose a safer course: sleep outside the confines of the Keep.

VIII ADDENDA: LORE USEFUL TO THE SERIOUS ADVENTURE

A. MAP-MAKING
Let your mind be occupied by the fight itself, and not with trivia of your where-abouts. Have at hand numerous sheets of gridded parchment, for map-making.

On these sheets, record the halls, the rooms, the stairs and floors of the Keep. Mark every step, and note the local conditions. Beware that the monsters are devious, and may cause walls to shift and doors to vanish. Do not be baffled or hindered, but merely reorder your party and press on.

B. WEAPONS & EQUIPMENT
Able adventurers will make use of a variety of weapons, but will choose wisely from the lot, knowing the characteristics and powers of each piece.

ATTACK WEAPONS AND EQUIPMENT
AXE:
Battle axes such as this, far larger than those for chopping wood, are also far more destructive.
BASTARD SWORD:
So named for its middling size, it reaches four feet.

BREAKER BAR:
Fry open chests, closed doors, and other obstacles that require sturdy leverage.

BROAD SWORD:
Commonly seen, and measuring three feet.

GREAT SWORD:
Stretching a full six feet, few enemies escape death when struck by this instrument.

KINSLAYER SWORD:
A deadly weapon because of its enchantment. One uses this at the price of some power.

MACE:
Of classic proportions, the deadly spiked ball is attached to the stout handle.

QUARTER STAFF:
Tough wooden poles, four and a half feet tall, fend of aggressors from the user.

SOGGY STICK:
The remnants of a torch that has extinguished; a crude but often effective weapon.

SOULSLAYER SWORD:
Delivers injuries that devastate the victim. One uses this weapon at the price of some power.

TORCH:
One torch will provide sufficient light for the entire party, and will last for several moves.

VALKHAM SWORD:
Will fell a monster in a single blow. Immensely powerful, but at the cost of power to the user.

DEFENSIVE EQUIPMENT

MEDIUM SHIELD:
This rectangular shield of half the height of a human tapers to a point at the bottom.

GREAT SHIELD:
Nearly of a warrior's stature, the sides curve out slightly and protect well.

ARMOR

LEATHER ARMOR:
The simplest and lightest form of armor, made of sturdy sewn leather.

PLATE MAIL:
The wearer must be of great physical strength to wear the heaviest of mail, but will be protected for the effort.

RUNCIC ARMOR:
Magical armor of plate construction which augments a user's defenses.

STUDDED MAIL:
Heavier leather is reinforced with studs of metal, more protective for the wearer.

SCALE MAIL:
Metallic links overlap, lending a reptilian look to the garment. Protection is greater than from the studded mail.

CHAIN MAIL:
Interven metal loops afford better coverage than the scale mail.

SILVER ARMOR:
The most protective of armors, having absorbed so much magic from prior wearers.

C. MAGICAL SPELLS

ATTACK SPELLS

FLAME:
Torch a single creature.

THRUST:
Attacks a creature as does the Flame, but is more effective and of a higher price.

FIREBALL:
Brings effect upon an entire group, thus is quite useful.

SUNBURST:
A spell with exceptional power, it can work against entire groups and can slay Demons as well.

FREEZE:
Locks its single target into inactivity, for a short time.

STASIS:
Like the Freeze spell but for groups of the enemy.

DEFENSE SPELLS

PROTECT:
Defends its caster from an enemy's blows.

GUARDIAN:
Cousin of the Protect spell, but stronger.

BARRIER:
This invisible shield stands between the party and its attackers.

SANCTUARY:
More powerful kin to the Barrier spell.

WARD:
Protects the caster from the enemy.

FORTRESS:
Of similar type as the Ward spell, yet protects the group.

ENHANCEMENT SPELLS

LUMINANCE:
A magical torch.

REVEAL:
Akin to Luminance, but of longer duration.

HEAL:
Apple II Computer Info

**Soothes and heals those who receive its application; hit points are restored.**

**HASTE:**
Heightened dexterity is the gift, for a short time.

**SPELLS OF THE COLLEGE OF NECROMANCY**

**ZOMBIE:**
Animates a dead adventurer, restoring double the hit points but rendering the individual severely disabled. If such a character leaves the Tower, he will dissolve and can never return.

**DEATH:**
The victim will be drained of life when this potent spell is cast.

**DECAY:**
A group of enemies will suffer dreadfull at the hands of this unpleasant magic.

**DISSOLVE:**
Excises a single foe from this reality.

**MAIM:**
Wholly unpleasant, and to be cast against a group of opponents.

**REVIVE:**
Returns to life an adventurer killed within the Keep.

**SPELLS OF THE COLLEGE OF RUNE MAGIC**

**CANTRIP:**
This spell doubles the potency of objects, but only for a price.

**CURE:**
Damage to a character will be cured no matter how grim the condition.

**FEAR:**
Plunges a foe into paralyzing fear for a short time.

**FIRE:**
Ignites a group of monsters.

**PERCEIVE:**
Cast this spell to obtain a clue about the surroundings.

**SAY:**
Destroys creatures outright.

**SPELLS OF THE COLLEGE OF SHADOW MAGIC**

**DARKFIRE:**
Inflicts damage on any creature.

**ILLUSION:**
The target of this spell will ignore the entire party.

**MOONFIRE:**
The spell will blind the foe in its path, and thus render it less dangerous.

**SHIFT:**
Instantly transports the group to a safe place.

**STARFLARE:**
A huge and terrifying ball of flame which annihilates all creatures in the way.

**TWILIGHT:**
Causes monsters to become blinded to the presence of the adventurers, and pass by without noticing them.

**D. MAGICAL ARTIFACTS**

**AMULET OF EVIL:**
Single foes may be attacked by the magic of this black necklace.

**BLACK CRYSTAL:**
Protects the user from the blows of the enemy.

**BLACK RING:**
Passed down from the Necromancers, this is endowed with the power to transform a creature into a zombie.

**BOOK OF DARKNESS:**
One who reads this tome will know the dark, and everything it contains.

**BOOK OF NOTES:**
Perhaps the notebook of Nacomedon himself, the reader will glean an answer or two.

**BOOK OF OPENING:**
Its powers can open those things that are closed and locked.

**CHALICE OF AWE:**
A young enchantress once owned the chalice, and used it to rescue those who were caught in the Land of Darkness before their time.

**CULDRUM'S WAND:**
The namesake of the wizard Gorwyther's aggressive apprentice, this wand will attack numerous enemies at once.

**DEVIL'S GEM:**
Perhaps the storehouse for the soul of a Great Demon (such creatures commonly safekept their souls in gems).

**ELDRITCH STAFF:**
The user of this slender pole may seek advice from the gods.

**FUNNY ROCK:**
With a rock such as this, dexterity can be a trait of even the clumsiest Roo.

**GEM OF DARKNESS:**
When invoked, an able shield against an enemy's blows.

**GLOVES OF COLD:**
These strength-giving articles were fashioned inside a volcano and thus will withstand great heat.

**HAMMER:**
Powers to enchant came to this tool through its creator, a goblin Master Smith and mage.

**RAGGED CLOAK:**
Remain hidden from monsters while wearing this garment.

**RING OF LIFE:**
Will resurrect a fallen adventurer.

**ROD OF POWER:**
The user may enhance his magical abilities through the use of this article.
FOUL FROND:
This green plant-like creature has a bite of poison that can lay flat an adventurer in quick order. When its enemy succeeds in cutting it down, it may leave behind a silver rose.

GARGOYLE:
Short, repelled by bat-like wings, and possessing a spiked tail, spurred elbows, and a horned head. The gargoyle is physically tough, with rough, stone-like skin. Its magical powers are keen, though the creature is not well-armored.

GHOST:
Quick and troublesome, the residual life force of a once living creature, ghosts can be bitter about their plight and thus quite unpleasant. An unfortunate death from before may have bound this creature to a single spot.

GOBLIN:
Puny and dirty, ugly and irritating. Goblins often dress in tattered, cast-off clothing and have little to distinguish them.

HUMAN:
The best of traits can turn the most sour. A small number of these adaptable bipeds have turned to evil, and have used their knowledge of armor and civilization to aid the realm of Dal'brad. Humans can adopt a negotiative stance, but be wary of traitors and falsehood.

VENOMOUS SHEEP:
Small and innocent in appearance, these mindless, fanged creatures can inject a powerful poison which has no antidote. They display great aggression.

OGRE:
Physically strong but unmagical, the ogre is second cousin to the Troll. Its dark skin coloring is tinged with red.

RED CAP:
Evil creatures that thrive when residing on sites of great bloodshed. Their terms of service allow them to wet their caps with the blood of their victims.

STOOR WORM:
A large, slow, python-like creature with a dragon's head may often be found keeping guard over treasures. After constricting an adventurer's armor and shattering it, the Worm will batter its victim.

TROLL:
A weaker relative to the Ogre, but nonetheless tough in battle. This hideous humanoid has dark, scaly skin and misshapen eyes. They dislike sunlight; the dark has invaded their core and has made them cunning and evil.

WIGHT:
Like the Ghost, often has an unearthly tie to a grave. They are slow to act, possibly due to the rotting corpses they inhabit. Their great magical power makes them difficult adversaries.

ZHIS'TA:
A hatred of evil has turned into a love of it. When Zhis'ta becomes part of the evil realm, their cunning and agility take on a keeness that is hard to overcome. However, these traitors, like the Humans that have come into the Keep, have a weakness that can be turned to advantage at the hands of an able warrior.

### Apple II Computer Documentation Resources

- **DOCUMENTATION FOLDER**: www.textfiles.com/apple/
- **18 September 2000**: 953 of 1262
- **Apple II Computer Documentation Resources**: a2_docs_documentation.msw
is the numerical value or means by which the target is effected.

POWER:
shows the cost in power to use the spell or object.

TARGET:
either a single individual is affected, or a group.

WEIGHT:
is the object's weight, in a relative value.

This is my second cheat now, following my Ultima IV cheat which I wrote a couple months ago. The game itself looks good (though I've only played it a small time), including the graphics... who would ever think SSI could come out with a game with good graphics? From what I've seen, the play system is good, and the "plot" of the game is interesting. An Ultima clone, granted, but different in subtle ways. Anyway, on to the cheat.

Use a sector editor, such as the one found in Copy //+, and scan the disk for your character's name. Once you've found the track and sector that located in (probably track $1A), you can use the following info.

First off, your character's name will be located in bytes $00-$09 in the file. The name can be edited freely with no harm being done.

NOTE: To have your character's name appear changed on the roster, you must hunt around 'till you find his old name in track $01. Somewhere in there will be a list of characters' names. This is the list of names that appears when you hit "List" from the Character Utilities. If you don't change the name here, the name will appear unchanged on the roster, but not on the character itself. Example: You change your character Fred so that his name is Rob. On the roster his name would remain Fred. But if you chose Fred and took him into an adventure, his name would be Rob. Understand? If you don't, forget it. Just change the name in both locations.

Ok, now for the rest of this stuff:

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 954 of 1262
Following are the bytes that determine which skills you possess. The bytes are the same for either class, but the skills differ. A $00 in the byte means you do NOT have that skill, and a $01 indicates that you DO.

**Skill:**

- **Fighter Byte**
  - Sword: $19
  - Axe: $1A
  - Mace: $1B
  - Karate: $1C
  - Dark Vision: $1D
  - Tactics: $1E
  - Armored Skin: $1F
  - Berserking: $20
  - Hunting: $21
  - Persuasiveness: $22

- **Wizard Byte**
  - Fire Runes: $19
  - Metal Runes: $1A
  - Wind Runes: $1B
  - Ice Runes: $1C
  - Spirit Runes: $1D
  - Weapon Lore: $1E
  - Potion Lore: $1F
  - Item Lore: $20
  - Monster Lore: $21
  - Priesthood: $22

**$23-$25**

- Experience points

**$26-$27**

- 65535 Counter (When you exceed 65535 Experience points, this goes to $01, when you achieve another 65535 Experience points, it goes to $02, and so on.)

**Items**

The Items are even more screwed up than the Skills. The bytes $29-$32 determine what you hold in each of your ten item positions. Each value placed in the byte designates an item. I know they go down to $00 and up to at least $38... here is a list of $30-$38... I’ll update this file when I have time to figure out the rest of them.

**NOTE:** The column of titles in quotes are the real names of the items. The names in the first column are those before the items are identified.

Remember: these are the VALUES, not the bytes.

- $30 Lantern
- $31 Iron Key
- $32 Copper Key
- $33 Silver Key
- $34 Gold Key
- $35 Iron Coin
- $36 Bloody Head
- $37 Crystal Bar
- $38 Paper Dove

A couple more values I deciphered in my tinkering:

- $0A Huge Axe
- $0B Huge Sword
- $12 Scale Mail
- $14 Suit/Armor
- $16 Violet Vial

When I get the rest of them figured out, I’ll post an addition to this file with the completed list, as well as replacing those <Unknown>s with their real functions (one of them has to be health status... I’ll probably figure out which one as soon as I re-send this to CYG...)

About These Instructions

Most users of ShrinkIt will be interested in unpacking files they have downloaded from a Bulletin Board Service or Information Service. Others will also be using it to pack files that they want to upload to such a service. In these instructions I will first describe how one uses ShrinkIt to unpack archives, and then how to create a new archive file. Finally I will give an explanation of each of the options available in ShrinkIt's Main Menu, and fill in certain other details about ShrinkIt's functioning. If you are ONLY interested in how to unpack a file which you have downloaded, you can just read the section entitled "Unpacking an Archive", and skip the rest of this file. I will attempt to make these instructions understandable to the relatively new computer-user; if you are unfamiliar with any of the terms used, or become generally confused, you may want to consult the instruction manual to your telecommunications software, or a magazine article on telecommunicating with the Apple II.

System Requirements

ShrinkIt requires a 128K enhanced IlE, a IIc, IIc+ or IlGs. Versions of ShrinkIt for the Apple IIE and unenhanced IlEs are also available. ShrinkinG and UnShrinkinG functions have been split into two different programs for these older machines. These programs are called IIPLUS.SHIRNKIT and IIPLUS.UNSHRINK, and they will run on any 64K Apple II, using the 40-column screen. More information on alternate versions of ShrinkIt will be given towards the end of these instructions.

ShrinkIT-GS

These instructions are for the 8 bit version of ShrinkIt. A IlGs version of ShrinkIt is also available. Archives that have been created with ShrinkIT-GS can be unpacked with version 3.0 or later of the 8 bit ShrinkIt, provided that none of the files being extracted from the archive is an "extended" GS/GS file (also known as 'files with resource forks'). Since ProDOS-8 can't handle extended GS/GS files, someone who doesn't own a IlGs would probably have no reason to extract such a file. If you open an archive containing extended files with the 8 bit ShrinkIt, these files will be marked "forked" in the file list.

Distribution and Copyright Info

ShrinkIt is a Freeware program. This means that you are under no obligation to pay the author anything for it, but the copyright is retained by him. You are encouraged to distribute this program to whomever you please.

Launching ShrinkIt

ShrinkIt can be launched using standard program selectors such as Bird's Better Bye, Squirt, ProSel, or the IlGs Finder. (Some versions of ProDOS-8 can't launch ShrinkIT; an update to the latest version of ProDsE fixes this.) ShrinkIT is too large to be directly launched from the BASIC prompt ("*"). However, a small SYS file called SHRINKIT.SYSTEM is distributed with ShrinkIT. SHRINKIT.SYSTEM can be launched from BASIC, and it, in turn, will launch ShrinkIT.

Some Terms Defined

In the Apple II telecommunications community, there are a number of different file- and disk-packing formats which have been used over the years. Most of these formats have been superseded by ShrinkIt and its NuFX format; others are still used. These various formats are usually denoted with a three-letter suffix appended to the file's name (as in "MY.FILE.BNY"). Here are some of the suffixes you are likely to encounter, with brief descriptions of their related file formats:

.BNY: Binary II format. Though not a true archive format, a Binary II "envelope" will preserve a file's attributes through a download or upload. ShrinkIt can unpack .BNY files, and they can also be automatically unpacked during downloading by many telecommunications programs.

.BQY: "Squeezed" (i.e., compressed with a different algorithm than the one used by ShrinkIT) files within a Binary II envelope. Created with the utility BLU, these files can be unpacked with ShrinkIT.

.QQ: If you remove the Binary II envelope from a .BQY file, the squeezed files it contains will have the suffix .QQ, or sometimes .SQ. These files can be unsqueezed with ShrinkIT.

.ACU: The archive format used by America Online (formerly GEnie or America-OnLine: shrinkit) the archive is an "extended" GS/GS file (also known as 'files with resource forks'). Since ProDOS-8 can't handle extended GS/GS files, someone who doesn't own a IlGs would probably have no reason to extract such a file. If you open an archive containing extended files with the 8 bit ShrinkIT, these files will be marked "forked" in the file list.

.SHK: NuFX format; can be created and unpacked with ShrinkIT.

.BNY: A NuFX archive within a Binary II envelope. This is the format...
currenty required for new uploads to the Apple II libraries ofohenie and Compose. .BXY files can be communicated and unpacked with ShrinkIt. Although this "envelope within an envelope" format may seem redundant, it has several advantages. Ideally, the Binary II envelope will be entirely "transparent" to end users -- it will be automatically added by telecommunications software during uploading, and automatically removed during downloading. As more telecommunications programs come to support automatic Binary II packing and unpacking, this ideal will be increasingly realized. Thus, if you use telecommunications software which supports automatic Binary II unpacking during downloading, you can turn your on when downloading a .BXY file. Doing this will give you a "bare" NuFX archive.

Thanks to the Binary II envelope, this file will automatically be given the correct name and filetype.

Unpacking an Archive

ShrinkIt starts up with a display of its Main Menu. The options in this menu are selected by using the arrow keys to highlight an option and pressing <return>, or by pressing the letter associated with the option you want.

When you have downloaded a file with one of the suffixes given above, you will want to process this file through ShrinkIt to unpack it and get at the files or disks it contains. It doesn't matter which of the packing formats your download is in; ShrinkIt will automatically recognize the format and handle the file accordingly.

To unpack an archive, you select "O-Open Archive" from the Main Menu. This will send you to a display called the File Dialog. Similar File Dialog displays are used for many of ShrinkIt's functions; the one you see after selecting Open Archive will show the title "Open Which Archive?" and the "Select Current" prompt, so you can select the disk and folder you want to use. This is the case to select which archive file to "open", or unpack.

Most of the File Dialog screen is used to display a list of the files in the currently open folder. On the right side of the screen are a list of the key-commands you can use at this point:

- **TAB** to change disk drives.
- **RETURN** to open a highlighted folder, or open a highlighted file.
- **ESC** to close the current folder.
- **OA** (Open Apple-period) to cancel this operation.
- **SPACE** to select a file for opening.

Below this list of key-commands you will see this notation:

- **OA-G or RETURN does function**
- **? does tree search**

Thus, if you only want to select a single file in the File Dialog, you can just press <return> with that file highlighted. If you want to select several files to be opened in sequence, you can select the files you want with <space>, and then press either <return> or OA-G (Open Apple-G).

The "tree search" function is a very powerful feature which will be especially useful to hard disk owners. By pressing "?", you will be sent to a "directory tree display" -- a display of all the folders within the currently open folder. You can then select the folder you want to open simply by pressing the arrow keys to highlight that folder. Press <return> and you will be back at the File Dialog screen with the selected folder open. The tree search will not function on volumes which are on an AppleShare network.

At the bottom of the "Open Which Archive?" File Dialog, there is the prompt:

**Showing ARCHIVES (OA-S)**

This indicates that ShrinkIt is currently displaying only folders and files that it has identified as archive files. ShrinkIt uses two methods to decide whether a file is an archive: It checks the attributes of the file (its filetype), and it checks to see if the filename has an appropriate suffix. When a file is downloaded, its attributes may not be preserved through the download. If your telecommunications software during uploading, and automatically removed during file as an archive. If you don't see your archive file listed (after you've opened the appropriate folder), try pressing OA-S. The prompt will change to "Showing ALL FILES (OA-S)", and indeed, the File Dialog will show all of the files in the current open disk.

Press <return> to open the archive file you have selected, and ShrinkIt will display a list of the "items" -- the packed files or disks -- contained in that archive. This is a "bare" NuFX archive, and it's a way to select which items you want to extract. Usually you will want to extract all of them, but you have the option of extracting only one or a few. You can select individual items by pressing <space>, or all of them with OA-A.

When the items you want are selected, press <return>. Another File Dialog will be displayed, this one entitled "Name of Archive to Create?". You use this to choose which disk and folder you want to put the new, unpacked files in. With this variation of the File Dialog, only folder (DIR) files will be displayed, and the words "Select Current" will be seen at the top of the list of files in each folder you open. Open the folder you want, and then press <return> with "Select Current" highlighted. The archived files will now be unpacked and saved to your disk.

Occasionally, you may want to have the different files within an archive unpacked into different destination disks or folders. If you press OA-space to select an item, that item will be unpacked "with prompting"; before the item is extracted, you will be prompted again to select a new destination folder for it. You can select ALL of an archive's files to be extracted with prompting by pressing OA-P.

If your archive file screen is displayed, ShrinkIt will prompt you to select a "device" (disk drive) for the archived disk to be unpacked to.

Creating an Archive

As you might expect, creating an archive is somewhat more involved than unpacking one. However, in many ways the procedure is similar to unpacking. First you will select "N-New Archive" from ShrinkIt's main menu. You will be prompted with:

**Archive What?**

**Files** Disk Cancel

Archiving files will be examined first. Press <return> with "Files" highlighted, and you will be sent to the File Dialog display described above. This File Dialog screen is entitled "Archive Which Files?" and naturally, is used to select what files you want to put into your archive. Again, use <space> to select the files you want, and when done, press <return> or OA-G to go to the next step in creating the archive. If you press <space> with a filename highlighted, that file and all of its contents will be archived.

Next, press <return> or OA-G, yet another File Dialog screen will appear, this one entitled "Name of Archive to Create?". At the bottom of this File Dialog screen you will see a prompt for "Filename:______________". Using the key-commands described above, you can first open the disk and folder you want your new archive to be saved to. Then type in a filename for the archive file you are about to create. You should choose a filename that is correct suffix for your filename. Straight NuFX archive should have the suffix ".SHK", and NuFX-within-Binary-II archives should be suffixed ",BXY". After entering the filename, press "return", and the archive will be created.

There is one very important point to note at this stage: If you want the new archive to be a .BXY (NuFX-within-Binary-II) archive, you must press OA--<return> (Open Apple--<return>), rather than simply <return> after typing in the filename. There is a brief notation to
the right of the "Filename:" prompt to remind you of this.

The fast way to create a .BXY file is to use ShrinkIt to make a
.SHK file, and then let your telecommunications program add the outer
Binary II envelope during uploading. However, not all
telecommunications programs can do this. ShrinkIt does not allow you to
add new items to a .BXY archive after it has been created. This can
only be done with "bare" NuFX archives. For this reason, if you are
using ShrinkIt to make a .BXY file, you must start out with all of the
files you want to archive in the same folder, so you can select and
pack them all at once. If the archive is simple NuFX, you can add a packed file or disk
to it after it has been created. This is done by selecting "A-Add to
Archive" from ShrinkIt's main menu. You will first be prompted to
select the files (or disk) you want to add, and then to select which
archive you want the new items added to.

To create a new archive from an entire disk, select "N-New
Archive" from the main menu, and then select "Disk" from the "Archive
What:" prompt. Disks to be archived may be either 800k 3.5" or 140k
5.25" disks, and may be ProDOS, DOS 3.3, CP/M or Pascal. Some
non-standard, "customized" operating systems can also be handled. For
most purposes, creating archives from individual files will be more
efficient, and preferable. Disk packing is intended primarily as a
means of handling data on the older operating systems.

ShrinkIt's Main Menu

The above instructions describe ShrinkIt's two main functions:
creating and unpacking archives. ShrinkIt can perform a number of
other functions, however. This section reviews each of the options
available in ShrinkIt's main menu, in the order in which they are
listed.

Q-Quit: Exits you from ShrinkIt and returns you to your program selector.

N-New Archive: Create a new archive.

O-Open Archive: Open an existing archive to unpack it, or simply to see a list
of its contents.

A-Add to Archive: Add new items -- either packed files or a packed disk -- to an
existing archive.

C-Catalog: Display a catalog of a disk or folder. The folder or disk to be
cataloged is selected using the File Dialog screen described above.

R-Rename Files: Allows renaming of files.

X-Copy Files: Copy files from one disk or folder to another. After selecting
this function, two File Dialog screens will appear. The first
will ask "Copy Which Files?", and the second "Destination
Folder?"

D-Delete Files: Deletes files.

T-Type Files: This option allows you to read TXT (ASCII text), AWP (AppleWorks
Word Processor), and WPF (WordPerfect Word Processor) files. A
File Dialog is used to select the file or files to be "Typed", and then the contents of the file are displayed on-screen.
Pressing <space> moves you through the file one page at a time;
<return> will exit you from the current file and display the next
one you selected (if any). Either <esc> or OA-. (Open Apple-
period) will return you to the main menu.

-/Create Folder: Allows you to create a new folder. A File Dialog is used to
choose where to put the new folder and what to name it.

F-Format Device: Format (initialize) a 5.25" or 3.5" disk. If you are using a IIgs
and an Apple 3.5 drive, you will be prompted for an option called
"Fast-Format and Skew 2:1". This is a high-speed disk formatter
which forgoes a little error checking for the sake of rapidity.
(Users of ProDOS programs can do this, if you'd rather do a slower, safer formatting, select "Cancel" at
this prompt.

E-Erase Device: Erase the contents of a ProDOS disk.

Z-Zero ProDOS Disk: Erase the contents of a ProDOS disk.

OA-A: Select all files in the open folder, or all items in the open
archive.

OA-<space>: Select an archive item to be extracted (unpacked) with
separate prompting for a destination folder.

OA-P: Select all items in an archive to be extracted with prompting.

OA-E: In the File Dialog, eject the current 3.5" disk.

OA-O: In the File Dialog, display a list of online volumes.

/: In the File Dialog, instead of selecting a pathname by opening the
correct disk and folder(s), you can also type it in; just press /* to
start the full pathname. If you type the pathname of a folder, that
folder will be opened and displayed in the File Dialog. If you type
the full pathname of a file, the operation you have selected (Type,
Open Archive, etc.) will be performed on that file.

U: If, for some reason, you want to archive a file without compressing
it, you can do so by pressing "U" to select it instead of <space>.

OA-U: You can select all of the files in the open folder to be
archived without compression by pressing OA-U.

OA-B: When scrolling through the list of items in an open archive,
this will send you to the beginning of the list. When "Typing" a file,
OA-B sends you to the beginning of the file.

/.: At most points in ShrinkIt, you can simply press "." (period) to
cancel an operation, rather than OA-. (Open Apple-period).

ShrinkIt for the []+: and unenhanced //e
As mentioned earlier, if you are using an unenhanced //e or a
[]+, you will have to use alternate versions of ShrinkIt. ShrinkIt for
these machines is broken up into two programs: IIPLUS_SHRINKIT for
creating archives and IIPLUS.UNSHRINK for unpacking archives. To an extent, the above instructions apply to the IIPLUS ShrinkIts, but there are some important differences.

In general, the IIPLUS ShrinkIts are simpler than the standard version. The 40 column screen is used, so the on-screen information is minimal. None of the utilities, such as copying files, are available; these programs only create or unpack archives.

The Open Apple (OA) key is not used. Some of the OA key commands are replaced with Control key commands, but others, such as OA-A (select all) are not implemented. To select an archived file to be extracted with separate prompting, press "P" (instead of OA-cpase). In the File Dialogs of the IIPLUS ShrinkIts, instead of pressing <esc> to close the current folder, you must press <return> with the words "Parent Directory" highlighted.

For More Technical Information...

If you want to know more about data compression:

If you want to know more about the NuFX ("nu-eff-ex") archive format, please consult the Apple Filetype Technote for $E0/$8002.

In the File Dialogs of the IIPLUS ShrinkIts, instead of pressing <esc> to close the current folder, you must press <return> with the words "Parent Directory" highlighted.

Hints
=======

Shogun contains on-screen hints! If you ever get stuck, just type HINT and follow the instructions on your screen. The hints generally progress from a gentle nudge to a complete answer. Don’t let the presence or absence of hints on a particular subject affect your thinking. In fact, fake hints have been added to prevent this.

We strongly recommend that you look at only one hint at a time. Avoid the temptation to use the hints too often; this inevitably spools, or at least lessens, the fun of solving a puzzle.

If you don’t have the will power to stop looking at the hints you can type HINTS OFF. This will deactivate the on-screen hints (unless you RESTART or RESTORE to an earlier point).

Special Commands
================

- This repeat your previous input. For instance, typing TURN THE WHEEL TO PORT then typing AGAIN would be like turning the wheel to port twice in a row. You can abbreviate AGAIN to G.

BRIEF
- This command tells Shogun to fully describe a location only the first time you enter it. On subsequent visits, Shogun will tell you only the name of the location in BRIEF mode, and remain in BRIEF mode unless you use the VERBOSE or SUPERBRIEF commands. SUPERBRIEF tells Shogun to display only the name of a place you have entered, even if you have never been there before. In this mode, Shogun will not even mention which objects are present. Of course, you can always get a full description of your location and the items there by typing LOOK. SUPERBRIEF mode is meant for players who are already familiar with the geography. The VERBOSE command tells Shogun that you want a complete description of each location, and the objects in it, every time you enter it, even if you’ve been there before.

*COLOR
- If you are playing Shogun on a computer with a color monitor, you can type COLOR to change the colors of the text and background on your screen. This command works only on computers which support a color display.

*DEFINE
- This command allows you to change the settings of the function keys. See the “Function Keys” section above.

DIAGNOSE
- Shogun will give you a report of Blackthorne’s (ie: your) physical condition.

*HINT
- If you have difficulty while playing the story, and you can’t figure out what to do, just type HINT. Then follow the directions at the top of your screen to read the hint of your choice.

INVENTORY
- Shogun will list what Blackthorne is carrying and wearing. You can abbreviate INVENTORY to I.

LOOK
- This give you a full description of your location. You can abbreviate LOOK to L.

*NOPASS
- Normally in Shogun, the game will notify you when your status changes. You can turn on this notification feature by using the NOTIFY command. Typing NOTIFY a second time turns the feature back off.

*COPS
- If you mistype a word, such that Shogun doesn’t understand it, you can correct yourself at the next prompt by typing COPS and the correct word. For example, if you typed ATTACK
THE NINAJ WITH THE SWORD and were told "[I don't know the word 'ninaj']!" you could type OOPS NINJA rather than retyping the entire sentence. You can abbreviate OOPS to O.

QUIT
- This lets you stop. If you want to save your position before quitting, follow the instructions in the "Starting and Stopping" section below. You can abbreviate QUIT to Q.

*REFRESH
- This command clears your screen and redraws the display.

RESTART
- This stops the story and starts it over from the beginning.

RESTORE
- This restores a previously saved position. See "Starting and Stopping" below for more details.

SAVE
- This puts a "snapshot" of your current position on you save disk. You can return to a saved position in the future using the RESTORE command. See "Starting and Stopping" below for more details.

SCRIPT
- Tells your printer to begin making a transcript of the story. A transcript may aid your memory, but is not necessary, and will work only on certain computers.

SCORE
- This command will show your current score and a ranking which is based on that score.

SUPERBRIEF
- Tells Shogun to give you the sparest level of description. See BRIEF above.

*UNDO
- You can use this command to "back up" one move. Suppose, for example, that you found a package but didn't know what it was. You might type OPEN THE PACKAGE and be told "The package explodes as you open it, destroying all your possessions." You could then type UNDO, and you would "back up" one move. Your possessions would be intact, and you could try giving the package to an enemy, or leaving it alone, or something else.

UNSCRIPT
- This tells your printer to stop making a transcript.

VERBOSE
- This command tells Shogun too give you the wordiest level of description. See BRIEF above.

WAIT
- This causes time in the story to pass. Since nothing happens until you type a sentence and press RETURN, you could take a nap, eat dinner, then return to the story to find that nothing has changed. You can use WAIT to make time pass in the story without doing anything. For example, if you saw two soldiers arguing, you might WAIT to see what they'll do; if you were aboard a ship, you might WAIT to see where it goes. You can abbreviate WAIT to Z.
You quickly turn the helm to starboard just avoiding the red buoy. The Dek Twintig responds, veering back towards the center of the channel.

>LOOK AT THE CHANNEL
The channel surrounds you on both sides about twice as wide as your ship. The lookout yells, "Channel turning starboard, Captain!"

>STRAIGHTEN WHEEL
You quickly straighten the wheel and the ship immediately centers herself in the channel.

>LOOK AT THE CHANNEL
The channel surrounds you on both sides, about twice as wide as your ship. You remember your recent close call as you hear the lookout yell, "Green buoy sighted, Captain!"

>TURN THE WHEEL STARBOARD
You turn the wheel to starboard, expertly following the center of the channel.

>STRAIGHTEN THE WHEEL
You straighten the wheel holding the Dek Twintig to the center of the channel. The lookout yells, "Anchorage dead ahead, Captain."

>LOOK AT THE CHANNEL
The channel surrounds you, about twice as wide as your ship. The channel opens up into Goro bay about two hundred yards ahead.

>WAIT
Time passes...
You enter the harbor under full sail, a tribute to English seamanship. The anchorage is just a hundred yards away now.

>CREW, LOWER THE SAILS
The crewmen, who had been taking in the first sight of Goro, snap to and scurry up the riggings and smartly lower the sails and the Dek Twintig coasts majestically to the anchorage. You notice a small boat being launched from the shore and heading your way.

>TELL THE FIRST MATE TO LOWER THE ANCHOR
Seersucker orders three men forward to lower the anchor. Presently, you hear a splash and first part of your voyage is complete. The small boat is getting closer.

>LOOK AT THE BOAT
The small boat, now coming up beside the Dek Twintig, is manned by a crew of twelve. They are dressed in strange but beautifully wrought clothing. Some of the men look like warriors.

>SEERSUCKER, LOWER THE LADDER
With the help of Hornung and Shalle, Seersucker lowers the ladder over the side.

>WAIT
Time passes...
Four heavily armed men board the ship and position themselves around the top of the ladder. After a few moments a fifth man climbs the ladder. His manner and dress set him apart from the others, he is obviously their superior.

>INVENTORY
You are carrying official letters of introduction from the Dutch government, a sword, and a box containing a present to the people of Goro from Prince William of Orange. You step forward to address the leader. Immediately the four armed men jump forward, drawing their swords. You quickly step back.

>BOW TO THE LEADER
The leader takes a much more relaxed stance. His guards relax but eye you warily.

>PLACE LETTERS
You hand the letters of introduction to the leader. He looks at them but doesn't comprehend their meaning.

>PLACE BOX
The leader takes the box and opens it. Inside is a globe of Europe and Japan outlined in precious stones. The leader runs his hand over the European portion of the globe letting it come to rest on the purposely unadorned country of Spain. You feel uncomfortable with his choice of resting place.

>WAIT
Time passes...
The leader closes the box and speaks to one of the guards. The guard goes to the side of the ship yells down to the men remaining in the small boat. Another man, obviously of Spanish decent, climbs the ladder and boards the ship. Eyeing you suspiciously, he approaches and introduces himself. "I am Dario Glaz. This man," he points to the leader, "is Admiral Sukata, commander of the port of Goro. He wishes to know who you are?"

>I AM CAPTAIN WICKS
Upon hearing your name, Glaz becomes livid with rage, turns to Admiral Sukata and angrily says something to Sukata. Instantly, Sukata yells something to his men and then to Glaz. The guards on deck come to a fighting posture while those remaining in the small boat begin to scurry up the ladder. Glaz faces you and says, "Captain Jeremiah Wicks, I hereby place you under arrest in the name of Admiral Sukata for the crime of piracy." As he speaks the guards move towards you.

>I AM NOT A PIRATE
The guards continue their advance. Your crew is not sure what to do.

>I AM CAPTAIN ALEXANDER WICKS
You hurriedly explain to Glaz that Jeremiah Wicks is your half-brother, a scourge to all men and an enemy of England and all nations of Europe. You speak once more to Sukata, Sukata listens intently then orders his men to stop.

Starting and Stopping
On your screen, you will see a description of the opening location of the story, Bridge of the Erasmus, followed by the prompt (>), indicating that Shogun is waiting for your first input. There are a few inputs for you to try at the first several prompts. After typing each input, don't forget to hit the RETURN key.

>INVENTORY
>TAKE THE WHEEL
>SIT IN THE CHAIR
>TURN THE WHEEL TO STARBOARD
You should now have a feel for interacting with the story. You decide what to do next.

Sampling and restoring: It will probably take you several days to complete Shogun. Using the SAVE feature, you can continue the story at a later time without having to start over from the beginning, just as you can place a bookmark in a book you are reading. Even if you aren't about to stop playing, it's useful to SAVE before (or after) trying something dangerous or tricky. That way, even if you get lost or "killed" in the story, you can return to your saved position.

To save your place, type SAVE at the prompt (>) and then press RETURN. Using a disk with data on it (other than for Shogun saves) may result in the loss of that data, depending on your computer. You can save your position as often as you like by using additional...
blank disks. Any time you want to return to a saved position, just type
RESTORE at the prompt (>), and hit RETURN. You can then continue
the story from your save.

Quitting and restarting: If you want to start over from
the beginning, type RESTART and press the RETURN key. (This is usually
faster than re-booting.) Shogun will ask you to confirm this
command. If you want to stop entirely, type QUIT and press RETURN.
Once again, Shogun will ask to make sure this is really what you
want to do. Remember: when you RESTART or QUIT, you must SAVE if you want to
return to your current position in the story.

===================
Interactive Fiction

In Shogun, you type your commands in plain English each time you
see the prompt (>). Most of the sentences that Shogun will
understand are imperative sentences. See the examples below.

When you have finished typing your input, press the RETURN key.
Shogun will then respond, telling you whether your request is
possible at this point in the story, and what happened as a result.
Shogun recognizes your words by their first nine letters, and
all subsequent letters are ignored. For example, Shogun would not
be able to distinguish between DEMONSTRATION, DEMONSTRATIVE, and
DEMONSTRATOR.

To move around, just type the direction you want to go.
Directions can be abbreviated: NORTH to N, SOUTH to S, EAST to E,
WEST to W, NORTHWEST to NW, SOUTHEAST to SE, SOUTHWEST to SW, UP to U, and DOWN to D. IN and OUT and PORT,
STARBOARD, FORE and AFT will also work in certain places.
Shogun understands many different kinds of sentences. Here are
examples, using objects and characters that don't necessarily
appear in Shogun:

> WALK TO THE NORTH
> EAST
> DOWN
> TAKE THE APPLE
> OPEN PANEL
> READ THE RUTTER
> LOOK AT THE COMPASS
> TURN WHEEL TO PORT
> LIFT THE SWORD
> TEAR THE CLOTH
> STEER TOWARD BAY
> GIVE THE CHOPSTICKS TO THE WOMAN
> CLIMB INTO THE PIT

You may use lower-case letters and words like A and THE if you
wish. Shogun doesn't care one way or the other.
You can use multiple objects with certain verbs if you separate
them by the word AND or by a comma. Some examples:

> TAKE THE PISTOL AND THE BAG
> DROP THE SWORD, THE COMPASS, AND THE TOWEL

You can include several sentences on one line if you separate
them by the word THEN or by a period. Each sentence will be handled
in order, as though you had typed them individually at separate
prompts. For example, you could type all of the following at once,
before pressing the RETURN key.

> TAKE THE PISTOL AND THE BAG
> DROP THE SWORD, THE COMPASS, AND THE TOWEL

You can include several sentences on one line if you separate
them by the word THEN or by a period. Each sentence will be handled
in order, as though you had typed them individually at separate
prompts. For example, you could type all of the following at once,
before pressing the RETURN key.

> TAKE THE ROPE. GO UP THEN TURN THE WHEEL TO PORT

If Shogun doesn't understand one of the sentences on your input
line, or if an unusual event occurs, it will ignore the rest of you
input line.

The words IT and ALL can be very useful. For example:

> EXAMINE THE APPLE. TAKE IT. EAT IT
> CLOSE THE HEAVY METAL DOOR. LOCK IT
> TAKE THE KIMONO. PUT IT ON
> GIVE ALL BUT THE PISTOL TO THE PRIEST

The word ALL refers to every visible except object those
inside something else. If there were an apple on the cabinet and an
orange inside the cabinet, TAKE ALL would take the apple but not the
orange.

There are various kinds of questions that Shogun understands.
Examples include: WHERE IS {someone}, WHERE IS {something or someone},
and WHAT IS {something}. For example:

> WHO IS TORANAGA?
> WHAT IS A SAMURAI?
> WHERE IS OSAKA?

When you meet other people in Shogun, you can talk to them by
typing their name, then a comma, then whatever you want to say to
them.

> PRIEST, HELLO
> YABU, TELL ME ABOUT THE PLAN
> MARIKO, GIVE ME THE DAGGER

Sometimes Shogun "knows" you mean to answer a question posed by
another character. In these situations you can omit the name and
comma. For example if Mariko asked, "What's your favorite color?"
you could answer.

> YELLOW

You can also ask questions of characters by using the form ASK
{someone} ABOUT {something}. For example:

> ASK OCHIBA ABOUT THE SAMURAI
> ASK OMI ABOUT ISHIDO
> ASK YABU ABOUT THE PLAN

Keep in mind, however, that most people don't care for idle
chatter, you should listen to others and answer their questions.
Often your actions will speak louder than your words.
Shogun tries to guess your intention when you give incomplete
information. When it makes a guess, it will tell you. For example:

> UNLOCK THE DOOR
(with the key)
The door is now unlocked.

If you command is ambiguous. Shogun will ask you to clarify.
You can answer these questions simply by supplying the missing
information at the very next prompt. For example:

> GIVE THE PROCLAMATION
Who do you want to give the proclamation to?

> THE QUEEN
The queen smiles as she accepts your gift.
Tips for Novices

---

1. Draw a map. It should include each location, the connections to adjoining locations, and any interesting objects there. Remember, there are 10 possible directions (NORTH, SOUTH, EAST, WEST, NORTHEAST, NORTHWEST, SOUTHEAST, SOUTHWEST, UP AND DOWN) plus IN and OUT, PORT, STARBOARD, FORE and AFT.

2. EXAMINE all objects you come across in the story.

3. TAKE as many things as you can carry. Most objects that you find are important for solving the puzzles that you'll run into.

4. SAVE your place often, so that if you mess up or get "killed", you won't have to start over from the beginning.

5. Read the story carefully! There are often clues in the description of locations and objects.

6. Try everything you can think of. Even strange or dangerous actions are fun and may provide clues; you can always save your position first. Here's a silly example:

   >GIVE THE BROKEN COMPASS TO TORANAGA
   Toranaga scornfully refuses your offer. He continues to look in the bushes for his dagger.

   Thus, you discover that maybe giving something else to Toranaga (perhaps your dagger?) might be better.

7. There are many possible routes to the end of Shogun. If you get stuck on one puzzle, move on to another. Some puzzles have more than one solution; other puzzles don't need to be solved at all. Sometimes you will have to solve one puzzle in order to obtain the item(s) or information you need to solve another puzzle.

8. Play Shogun with a friend! Different people may find different puzzles easy and can often complement each other.

9. If you really have difficulty, you can type HINT. The screen will then show you a list of questions to which you can get answers. (Simply follow the instructions at the top of your screen to see the hint of your choice.) You don't need to use the hints to enjoy the story, but it will make solving the puzzles easier.

10. Read the sample transcript above to get a feel for how interactive fiction works.

11. You can word a command in many different ways. For example, if you wanted to stop the ship, you could type in any of the following:

   >DROP THE ANCHOR IN THE WATER
   >THROW THE ANCHOR IN THE WATER
   >PUT ANCHOR IN WATER

   If you type a sentence that Shogun doesn't understand, try rephrasing it or using synonyms. If Shogun still doesn't understand, you're probably trying something that isn't important for completing the story.

---

Common Complaints

---

Shogun will complain if your input confuses it completely. Shogun would then ignore any further sentences on your input line. (Certain events, such as attack, will also cause Shogun to ignore any additional sentences on your input line, since the event may have changed your situation drastically.) Here are some of Shogun's complaints:

[i don't know the word _______.]

That word is not in the story's vocabulary. It may help to use a synonym or rephrasing the command; more likely, you're just barking up the wrong tree. Shogun uses many words in the descriptions that it will not recognize in your inputs. So, you might read, "The moon casts violet shadows across the crater," but discover that Shogun doesn't know the words MOON or SHADOW or CRATER in your input. When this happens, you can assume that you don't need to refer to those things to complete the story; they are there only to create a more vivid image of your location.

[i think there's a verb missing in that sentence!]

Unless you are answering a question, each sentence must have a verb (or one of the special commands). Among the most important verbs that Shogun understands are TAKE, DROP, PUT, GIVE, LOOK, READ, EXAMINE, OPEN, CLOSE, ENTER, EXIT, EAT and WEAR. There are many more. Remember, you can use a variety of prepositions with your verbs. (For example, LOOK can become LOOK AT, LOOK INSIDE, LOOK BEHIND, LOOK UNDER, LOOK THROUGH, and so on.)

[i can't understand that many nouns with _______.]

Shogun recognized your verb, but it can't understand so many noun "phrases" with it. For example, Shogun may recognize SKIP but not SKIP THIS PART.

[i can't see any _______ right here!]

The object you referred to is not visible. It may be somewhere else, or it may be present but in a closed container.

[i can't use more than one object at a time with _______.]

You can use multiple objects (that is, nouns or noun phrases separated by AND or a comma) or the word ALL only with certain verbs, such as TAKE, DROP, and PUT. For example, EXAMINE will not work with multiple objects; you couldn't say EXAMINE ALL or EXAMINE THE BOWL AND THE SWORD.

[i there isn't anything to _______.]

You used the word ALL, but there aren't any appropriate objects visible.

[i sorry, but I don't understand. Please that another way, or try something else.]

The syntax (sentence structure) you used is not among the hundreds of syntaxes that Shogun recognizes. For example, SIT UNDER THE TREE and SKIP AROUND THE MAYPOLE are syntaxes that Shogun wouldn't recognize. There's a limited amount of space in the program, so syntaxes that are less common or not useful aren't included. Try rephrasing the sentence.

[i beg your pardon?]

You pressed the RETURN key with typing anything.

---

If you are interested in supplying new //e or //gs wares to Soft-Sect, please leave mail to The Crasher or El Cid on:
THE SCENARIO: DEVICE ZX88B - mistakenly activated during a moment of feverish international tensions - is about to trigger twenty DOOMSDAY Bombs from a series of enemy satellites encircling the Earth! The world holds it's breath as you are assigned to disarm the device before it detonates the bombs.

Device ZX88B is a sophisticated failsafe system designed to resist tampering. It can't be turned off. It can't be destroyed. The twelve microchips within it are designed to send detonation pulses to the enemy satellite network within minutes of activation. The source of these pulses is the microfuse built into each of the twelve microchips.

Game Play:

Motherboard: The Motherboard within DEVICE ZX88B represents all twelve microchips and shows you which are available for entry at any given time. Enter a microchip by typing its number. As long as the game lasts, you will always have a choice of at least two microchips to enter. The game evaluates your play on each chip, and awards a greater number of choices after a well-played screen. If a chip defeats you, you may choose to re-enter it immediately, or re-enter it later in the game.

Microbatteries: You must use the power stored in each of the microbatteries to OVERLOAD, and disarm each microchip. You must go to a battery to transfer power to each of the other two batteries on each microchip. You continue to go to a battery and send charges to the other two until one of them becomes overloaded and begins to flash. At this time the flashing microchip is vulnerable and so are you. You must reach the overload without being hit. This causes the circuit to blow. You then begin a "Lightning Run" for bonus points. The "charge" on the overloaded battery becomes the amount of time available to you for the lightning round.

Neutrons, Double Neutrons, and Photons: Avoid being hit by these foreign particles that pulsate throughout the microchip. Contact with any of them will drain power from the batteries and alert THE DEVICE of your intrusion. FIVE hits will cause the system to eliminate you and make micro fuse contact.

Microspark: Microsparks usually appear in dead ends and contact with them will send a power surge throughout the circuit, further charging the batteries.

Microfuse: The microfuse is the heart of the microchip. Do not let the left and right sides connect. If connection is made a detonation pulse will result. Polarity on the fuse can be flipped by making contact with it, thus slowing it down.

Lightning Run: During the lightning round you can run up your score and get revenge on the neutrons and photons by running over as many of them as you can.
Lightning: During the lightning round the spark becomes lightning and acts as a point multiplier. Each time you contact it point values for the neutrons and photons double.

Vacuum: The vacuum roams the wires of the microchip during the lightning round. Contact with it will bring the lightning round to an end.

The Twelve Micro-chips:
1. Bouncing Neutrons - slow
2. Quicker Neutrons - medium fast
3. Neutron Chambers - normal
4. Photon Chamber - Beware of the flashing electron guns that fire Photons.
5. Chamber Maze - Travel through the walls of the maze instead of the wires.
6. Double Cross Chamber - Where you enter determines if you travel in the walls or in the wires.
7. Magnetic Chamber - The walls draw you from side to side, changing without warning.
8. High Speed Micro-chip - Batteries drain faster and microfuse makes contact in half the time of a normal chip.
9. The Short Circuit - Short circuit moves quickly, timing is crucial to jump through it.

A. Photon Wire Maze - Beware of the One Way wires.
B. Photon Walls - Combine all your talents to jump wires and move through the chamber walls.
C. Photon Diamonds - Maneuver the diamond maze and skillfully jump through the short circuit.

The Controls:
- Space Bar - Begins Game
- CTRL-J - Joystick
- CTRL-F - JoyPort
- 1-9,A-C - Select Micro-chip
- Button 0 - Jump
- CTRL-S - Toggle sound
- CTRL-A - Restart
- ESC - Pause

TO RUN SIDeways you will need an Apple ][, +, or c COMPUTER with AT LEAST 48K, AT LEAST ONE DISK DRIVE, A PRINTER INTERFACE CARD, AND A DOT-MATRIX PRINTER WITH DOT-ADDRESSABLE GRAPHICS CAPABILITY. FOR A LIST OF CURRENTLY SUPPORTED PRINTERS AND PRINTER INTERFACE CARDS, SEE THE SECTION ENTITLED 'INSTALLATION GUIDE'.

WHAT'S ON YOUR DISK

A. Photon Wire Maze - Beware of the One Way wires.
B. Photon Walls - Combine all your talents to jump wires and move through the chamber walls.
C. Photon Diamonds - Maneuver the diamond maze and skillfully jump through the short circuit.

WHAT YOU NEED

TO RUN SIDeways you will need an Apple ][, +, or c COMPUTER with AT LEAST 48K, AT LEAST ONE DISK DRIVE, A PRINTER INTERFACE CARD, AND A DOT-MATRIX PRINTER WITH DOT-ADDRESSABLE GRAPHICS CAPABILITY. FOR A LIST OF CURRENTLY SUPPORTED PRINTERS AND PRINTER INTERFACE CARDS, SEE THE SECTION ENTITLED 'INSTALLATION GUIDE'.

WHAT'S ON YOUR DISK

- SIDeways SOFT-DOX
- THE SOUTH POLE...([312] 677-7140)

YOUR SIDeways DISK CONTAINS THE FOLLOWING FILES:

- SIDeways.......this is the Sideways program
- Install.........this program allows you to set-up Sideways for your hardware configuration (printer model, interface card, slot number)
- Sample.PRF.......this is a sample spreadsheet, which can be used immediately to demo sideways printing.

INSTALLING THE PROGRAM

BEFORE YOU CAN USE THE SIDWAYS PROGRAM, YOU MUST TELL IT THE TYPE OF PRINTER YOU HAVE, THE TYPE OF INTERFACE CARD YOU HAVE, IN WHICH SLOT THE INTERFACE CARD IS LOCATED, AND THE NUMBER OF DATA BITS PER BYTE THAT YOUR PRINTER WILL ACCEPT (NORMALLY 8).

1. PUT YOUR SIDeways DISK IN DRIVE 1 AND TURN ON THE COMPUTER.
2. WHEN THE SCREEN TITLE APPEARS, TYPE THE CHARACTER "I" (FOR INSTALL). BE SURE TO DO THIS BEFORE THE MAIN SIDeways MENU APPEARS.
3. THE "INSTALL" PROGRAM WILL TELL YOU HOW SIDWAYS IS CURRENTLY INSTALLED, AND WILL PRESENT A MENU FOR CHANGING THE INSTALLATION. SELECT WHICHEVER ITEMS NEED TO BE ALTERED; THE PROGRAM WILL LEAD YOU THROUGH THE VARIOUS OPTIONS IN A SERIES OF MENUS.
4. WHEN YOU HAVE MADE ALL THE NECESSARY CHANGES, USE THE "TEST INTERFACE" OPTION TO DO A PRELIMINARY CHECK OF THE SYSTEM. THIS WILL SEND A LINE OF TEXT CONTINUOUSLY, INSURING THAT YOUR SELECTION OF PRINTER INTERFACE CARD AND AND SLOT NUMBER WERE CORRECT.
Now use the "Exit" option to leave the Install program and start the newly installed Sideways program.

Check out the system by printing the sample spreadsheet that we've included on your Sideways disk when the Sideways screen comes up, type in "Sample.prg", followed by <Return>.

If you buy a new printer, or otherwise change your configuration, make sure you keep Sideways abreast of new developments by repeating the above procedure.

Refer to the section entitled "Installation Guide" for information on particular printers and interface cards, and how they should be installed.

## Starting up the program

---

Put your Sideways disk in drive 1 and turn on your computer first, a title screen will appear, followed, after a few seconds, by the Sideways menu.

What you see are all the current settings of the formatting and printer options. You may alter any of these options, save the new setting to disk, select a file for Sideways printing, or exit to a different program.

The cursor always points to a highlighted field; initially it points to the print field, use Ctrl-E and Ctrl-X to move the cursor around the screen to different fields (on an Apple IIe use Up-Arrow and Down-Arrow). If you would like to alter the value of a field, simply position the cursor to that field and re-enter it.

For most of the fields, you would simply enter the new value and terminate your entry with <Return>, or Ctrl-E or Ctrl-X. You can use Left-Arrow or delete to delete the last character you typed, or <Esc> to delete your entire entry. If your entry is invalid, you will get an error message, and the field you just entered will revert itself to its previous value.

The rest of the fields are "toggle" fields: you can change their contents simply by striking any alphanumeric key (such as the Space Bar). These fields include horizontal form size, character font, and double strike.

## Selecting a file to print

---

To print a file, position the cursor to the print file field and type in the name of the file you want to print. Terminate by hitting <Return>. Enter the file name in normal DOS format:

```
filename[,Sn][,Dn][,Vn]
```

(S, D, and V are slot, drive, and volume. As indicated by the brackets, the are optional parameters.)

Once printing has begun, the following is displayed:

```
Strike "P" to stop printing
```

If you do strike "P", the printer will stop printing at the current line and do a form feed.

After your file has been printed, you may once again alter the option settings, enter a new file name for printing or exit to another program.

## Setting paper dimensions:

HORIZONTAL FORM FEED refers to your paper width. It will toggle between 8 inches and 13 inches. If you have a narrow carriage printer,
YOU SHOULD LEAVE IT SET TO 8 INCHES.

VERTICAL FORM FEED IS THE DISTANCE BETWEEN PERFORATIONS OF YOUR PRINTER PAPER. WHENEVER SIDEWAYS IS DONE PRINTING A PAGE, IT FORM FEEDS TO THE NEXT MULTIPLE OF VERTICAL FORM SIZE. IT IS NORMALLY SET TO 11 INCHES.

SETTING THE STYLE OF THE PRINTOUT:

DOUBLE STRIKE IS A TOGGLE FIELD WHICH MAY BE ON OR OFF. IF IT'S ON, EACH LINE WILL BE PRINTED TWICE, FOR ADDED PRINT DENSITY.

CHARACTER FONT IS A TOGGLE FIELD WHICH GIVES YOU A CHOICE OF VARIOUS TYPE SIZES, FROM TINY TO EXTRA LARGE. ON THE RIGHT OF THE SCREEN, THE DIMENSIONS OF THE "DOT-MATRIX" - THE VERTICAL AND HORIZONTAL PRINT DOTS THAT ARE USED TO MAKE UP EACH CHARACTER IN THE SELECTED FONT ARE SHOWN.

CHARACTER SPACING IS THE DISTANCE BETWEEN SUCCESSIVE CHARACTER COLUMNS, MEASURED IN TERMS OF THE VERTICAL DOT DENSITY OF THE PRINTER. YOU CAN CROWD CHARACTERS TOGETHER, OR SPREAD THEM APART, BY MAKING THIS NUMBER SMALLER OR LARGER--THE RESULTING NUMBER OF CHARACTERS PER INCH IS DISPLAYED AT THE RIGHT.

LINE SPACING IS THE DISTANCE BETWEEN SUCCESSIVE PRINT LINES, MEASURED IN TERMS OF HORIZONTAL DOT DENSITY OF THE PRINTER. YOU CAN CROWD LINES TOGETHER OR SPREAD THEM APART BY MANIPULATING THIS VALUE--THE RESULTING NUMBER OF LINES PER INCH IS DISPLAYED AT THE RIGHT.

YOU MAY SET A DIFFERENT CHARACTER AND LINE SPACING FOR EACH CHARACTER FONT; WHEN YOU CHANGE FONTS, YOU AUTOMATICALLY REVERT TO THE CHARACTER AND LINE SPACING ASSOCIATED WITH THE NEW FONT.

SETTING THE FORMAT OF THE PAGE:

LEFT MARGIN CONTROLS THE AMOUNT OF WHITE SPACE BETWEEN TOP-OF-FORM AND THE LEFTMOST SIDEWAYS PRINT COLUMN.

TOP MARGIN CONTROLS THE AMOUNT OF WHITE SPACE BETWEEN THE RIGHT EDGE OF THE PAPER AND THE 1ST SIDEWAYS PRINTED LINE.

BOTTOM MARGIN CONTROLS THE AMOUNT OF WHITE SPACE BETWEEN THE LAST SIDEWAYS PRINTED LINE AND THE LEFT EDGE OF THE PAPER.

THE AMOUNT OF SPACE AVAILABLE FOR PRINTING IS DETERMINED BY SUBTRACTING TOP MARGIN AND BOTTOM MARGIN FROM HORIZONTAL FORM SIZE. THE PROGRAM AUTOMATICALLY COMPUTES THE NUMBER OF LINES THAT WILL FIT ON EACH PAGE, AND DISPLAYS THIS ON THE RIGHT HAND SIDE OF THE SCREEN.

OTHER OPTION:

STARTING PAGE ALLOWS YOU TO SKIP OVER THE INITIAL PAGES OF A PRINT FILE; IT IS NORMALLY SET TO 1.

SAVING OPTION SETTINGS TO DISK

-----------------------------

ONCE YOU HAVE SET UP THE SIDEWAYS OPTIONS AS YOU LIKE THEM, YOU CAN SAVE THEM TO DISK BY TYPING CTRL-S, AND RELOAD THEM FROM DISK BY TYPING CTRL-L.

YOU CAN ALSO SAVE THE OPTION SETTINGS TO THE SIDEWAYS DISK ITSELF. IF

YOU HAVE DONE SO, THEY WILL BE RELOADED EVERY TIME YOU BOOT SIDEWAYS, AND YOU WILL NOT NEED TO USE CTRL-L.

IF YOU HAVE ONE STANDARD SET OF OPTION SETTINGS THAT YOU USE MOST OF THE TIME, IT MAKES SENSE TO SAVE THEM TO THE SIDEWAYS DISK. IF YOU HAVE DIFFERENT OPTIONS SETTNGS USED FOR DIFFERENT PRINT FILES, YOU MIGHT WANT TO SAVE EACH OF THE VARIOUS SETTINGS TO A DIFFERENT DISK, AND USE CTRL-L TO READ THEM IN.
The actual playing of the game is very simple since Silent Service is almost totally mouse controlled. What I will be doing is giving a description of each command and its uses.

**Scenarios:**
This is the first option you will see when booting up the game.

- **Torpedo/Gun Practice:** This option places you outside the American base at Midway Island. Four ships are anchored here all you have to do is blow them up.
- **Convoy Actions:** Here you have an actual fight. You have to destroy all the ships. Watch out for destroyers because they attack back.
- **War Patrols:** This is comprised of several convoy actions. In this option you must find the ships. Here you have a limited amount of fuel (55 days). When finished return to base.
- **Difficulties:** After choosing a scenario you will be taken to another menu. This menu has options that affect the game difficulty.
  - **Skill Level:** Range: 1-4; 1 = Midshipman, 2 = lieutenant, 3 = Commander, 4 = Captain. The levels affect accuracy of torpedos, damage from depth charges, skills of enemy lookouts and periscope operators as well as other factors.
  - **Reality Levels:** These also control difficulty and also amke the game more realistic.
    1. **Limited visibility:** If selected ships that are beyond sonar and radar range will not appear on maps
    2. **Convoy Zig-Zags:** Convoys will change course at regular intervals if selected.
    3. **Dud Torpedoes:** Torpedos will launch but don't explode.
    4. **Port Repairs only:** Once something is destroyed it may not be repaired.
    5. **Expert Destroyers:** Certain enemy convoys will be escorted by expert destroyers.
    6. **Convoy Search:** Convoys won't always appear in radar range. Convoys can be sighted by doing a 360 degree periscope/binocular sweep of the horizon.
    7. **Angle-On-Bow Input:** The computer will no longer calculate the angle for torpedo shots. You must enter the angle yourself based on periscope observations. This option is for experts only!

**Terminology**
- **Port:** The left side of the ship
- **Starboard:** The right side of the ship
- **Bearing:** The direction you are looking
- **Heading:** The direction your ship is going

**The Game:** After choosing all the levels you will be taken to the actual game. It will eventually take you to an inside view of the submarine. From this option page you can select your next move by moving to the mouse to certain locations on the graphic. The options are: go to bridge (can only be done if surfaced), examine maps and charts, quartermaster log, damage reports, instruments and gauges. You can also continue patrol in the war patrol option and quit to main menu in the other modes.

- **Bridge:** From the bridge you can fire torpedoes and the gun. You can also vary the speed of the sub from full reverse to full forward. The sub can dive from this screen. You can also change the direction of the sub and use the binoculars and also change the time mode. You can also identify the enemy ship when it is in your binocular or periscope sights on target (the ship is on target the sight turns white). To identify the target move the mouse pointer the large box and click the mouse.

- **Periscope:** This option is the same as the bridge options. The periscope can be used up to 44 feet below the water. When under water the gun can not be used. It can also not be used at night.

- **Maps:** This option allows you to navigate the sub. You can also use three zoom levels to locate ships. The time mode is very important for speeding up the process of approaching ships. Time mode 1 is normal (one minute game time takes 15 seconds). Each increase in time scaling doubles the speed. Time mode 4 is 32 game time.

**Special Commands and Descriptions**
- **Torpedo:** Your sub has 24 torpedos, 14 foward and 10 aft(back). A torpedo is fired by clicking the mouse on the torpedo graphic. A torpedo has an most effective range between 0 and 4000 yards. After firing several torpedos. Only 4 torpedos can only be used when surfaced. If a ship is approaching you want to decrease the gun deflection. "-" decreases gun deflection, the "+" key increase gun deflection. Use the the if the distance is increasing. Each time you press the key the deflection increases or decreases 25 yards. Example: If a destroyer is moving towards you at 18 knots at a distance of 4000 yards it will move over 200 yards before the projectile would hit it. Therefore a deflection of -200 to -250 yards should be selected before firing. When the ship is 2500 yards away the deflection should only be a 100 yards.

- **Deck Gun:** The deck gun has an effective range of 8000 yards. You start with 80 shells. The main purpose of the gun is to destroy damaged ships. The gun has almost no effect on destroyers, but work quite well on tankers and troop transports. The gun can only be used when surfaced. If a ship is approaching you want to decrease the gun deflection. "-" decreases gun deflection, the "+" key increase gun deflection. Use the the if the distance is increasing. Each time you press the key the deflection increases or decreases 25 yards. Example: If a destroyer is moving towards you at 18 knots at a distance of 4000 yards it will move over 200 yards before the projectile would hit it. Therefore a deflection of -200 to -250 yards should be selected before firing. When the ship is 2500 yards away the deflection should only be a 100 yards.

- **Battery:** The sub's battery is capable of running for 1 hour at flank speed when under water and several hours at lower speed. The battery recharges when the sub is surfaced.
Blow Emergency Tanks: Control E does this. You use this option only when you sub is in a fatal dive. This will usually bring you to the surface. You can use this only once per battle. Once used you will not be able to dive again.

Release Fake Debris: "?" accomplishes this. This also can only be used once. This used to fake destroyers into believing that the sub was destroyed.

Volume: As you all know the volume can be controlled through the control panel. You can also use the "v" key. This will allow you to select low, medium, high, or off for the volume.

Convoy Action Scenarios: These scenarios have various types and amounts of ships to fight. Some are harder than others.

Plunger in the Inland Sea: (day/submerged) You will fight an escorted cargo ship. You will be fighting moving ships. They will also change direction.

Wahoo vs. Convoy: (day/surfaced) You will have to destroy an unescorted group of ships, but time is of the essence because a destroyer is on the way.

Hammerhead at Borneo: (night/radar) In this scenario you will be introduced to night combat. Avoid being as long as possible. Approach at moderate speeds.

Searaven at Toagel Mlingui: (endaround) You are in a bad position against a convoy. You must maneuver around the enemy to get a good attack.

Tautog at Night: (radar/visual night) Here you can approach the convoy but more care must be taken since there is good visibility this night.

Grayback in the China Sea: (submerged radar) A very difficult scenario. Three radar equipped destroyers are guarding the convoy. The best plan of attack is to use your periscope in a dawn or dusk attack.

SHIP IDENTIFICATION: THESE DIAGRAMS ARE NECESSARY TO PLAY THE WAR PATROL OPTION.

This is the A ship

This is the B ship

shit, this is taking way too long I'm just going to tell the minor variations so you can play this option.
Sinbad and the Throne of the Falcon

THE QUEST

The Caliph of Damaron was a powerful ruler in his youth; but now he's an old man and, pretending to be, he's plotting to further his own selfish ends in the kingdom. Princess Sylphani, the Caliph's beautiful daughter, has been urging her father to name a successor before it is too late.

The morning our story opens, Sylphani, as was her custom, was the first to enter the Caliph's chambers. But instead of her father, she discovered a Falcon on his bed. The Caliph was no longer human.

The princess immediately summoned the royal physicians, but instead of there supposed knoledge, they had no answer's. However, the wise men were able to agree on this: if the transformation was the result of a conjurator's spell, it would have to be broken soon. Otherwise, the Caliph might be trapped as a foalson forever.

Princess Sylphani realized she needed a hero. She remembered the orphaned boy who was raised at the palace by her own mother - the boy who had left to become a sailor when she was only ten years old. She had made him promise to return if ever she needed him, and she couldn't imagine a greater need than this.

You, the mighty Sinbad, receive the summons from your childhood playmate, and immediately hasten to Damaron. Overwhelmed at what a beautiful young woman Sylphani has become, you silently take a vow to do anything she requires.

The task is formidable. You must marshal the Caliph's forces to guard the city; you must undertake a great voyage to learn how the Caliph can be saved; and, above all, you must keep Princess Sylphani under your constant protection.

ON THE TRAIL

At the crossroads, you see a signpost showing potential destinations. Click on a city to go there. At the top of the screen on the right side is an INFORMATION BAR that contains, from left to right, a Location Box, a Restart Box, and a Music Box. The Location Box tells you where you are. Click on the Restart Box to begin your quest anew; click on the Music Box to toggle the music on and off.

Plan your travel's by clicking on the map on Sinbad's belt. Check the precious time left to you by clicking on the Thersanill Stone next to your map. The Time is represented by an hourglass; as you undertake your journeys, the sand fills the bottom of the glass. When the last grain of sand passes from the top, the Caliph's doom is sealed. You also use the hourglass to send orders to the armies of Damaron (see war is hell later) and check your progress on the quest.

If you are lucky enough to find a Genie, he grants you three wishes, and stays with you until you use all three. Click on his bottle to confer with him. You may choose any number of wishes; if the one you see does not satisfy your desire, click on the bottom of the screen to see another. When you decide to accept a wish, click on the scroll.

Your odyssey will take you on ocean voyages as well as overland treks, and all the tools listed above are available to you in your cabin aboard the Sabaralus as well. To travel on the high seas, you may click on any of the destinations listed on the right page of the log book. (coming up later). To land on your current location click on the left page.

On the left side of the screen at the crossroads, and in your cabin aboard the Sabaralus, is the strength bar. If your strength is low, click on the strength bar for a rest for a day.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 973 of 1262

--- Apple II Computer Documentation Resources (a2_docs_documentation.msw) ---

**apple II computer info**

**skate.die**

---

**Document Skate.Die**

You can use the mouse, joystick, or the keypad to control your skater. The joystick gives the best control of your skater though.

**Keys:**

- **S**: sound on or off.
- **A**: abort current event and return to Rodney’s Skate Shop.

**Rodney’s Shop**

You start out in Rodney's where you need to register before you skate. Just click on the “Sign-In” clipboard and then type in your name. To remove a name click over it. Move the pointer around the shop to make any further selection. After leaving Rodney’s just skate in the direction of the event of your choice. Push the joystick forward to move in the direction that you’re facing. Push left or right to go in one of those directions. Pull back to slow, or stop completely.

**Events**

**Downhill Jam**: You fight time and your buddy (if you ain’t got one we supply Lester) to reach the main street first. Careful though, there’s a reception party waiting. The controls are like Downhill Race with Regular and Goofy foot options available. Also, clicking while leaning the controller does the clobbering stuff. Click and lean into the direction you’re facing to punch, either high, middle or low depending on where you’re leaning the controller.

Click and lean away from the directions you’re facing to kick, either high, middle or low. No bonus points if you skate longer than 4 minutes.

**Downhill Race**: Moving the controller forward with a click is a jump and back is a duck. Click and left/right does a slide turn. There are no bonus points if you skate longer than 4 minutes.

**High Jump**: While your in the ramp, move the controller rapidly in any direction you want to build speed. You get a maximum of five passes on the right side where the height marker is. To go for it and record your attempt, click the button at the highest point of your jump.

**Pool Joust**: You get five passes to to get your opponent, then he takes the boffing stick and gets a chance to slam you. The first one to get three slams wins, but you have to win by two.

**Freestyle Ramp**: There’s a hundred feet of wood and steel, carved into a wide smooth U-shape. You start on the left platform, move the controller forward or back to choose your entry point. After you drop in, you’ll have ten passes through the ramp, executing tricks at the left, right, or both ends. As you make a pass, click the button in the pump zones to increase your speed and to select a certain trick. Also, lean the controller into or away from the direction your going.

**Trick**

<table>
<thead>

</tr>
</tbody>
</table>
Move the joystick right and left to turn the plane.
Move it up and down to change altitude.
Press and hold down the second joystick button to engage the afterburners for quick thrust.
Release it to return to your pre-thrust speed.

Tank Training 1-
You are launched flying due east toward three consecutive waves of tanks.
When you destroy the last one, you will automatically be returned to base.
Launch again to face even more tanks.
Use your overhead radar scanner to spot your targets.

Tank Training 2-
You will be launched onto the tail of an enemy plane.
Shoot fast or it will circle and attack you.
The forward scanner shows planes which are in range and will help you determine whether they are above or below you.
(The space bar toggles between forward and overhead scanners.)
Try your guided and heat seeking missiles.
(Press G or H to arm and the joystick button to launch.)
Succeed and you can re-launch against successively more planes.

Plane Training 2-
Launches you nose to nose with the enemy.
The slow don't live.

Plane Training 3-
Like tank training 2, but with planes.

High/Low Training-
Alternate waves first of tanks, then of planes.
You'll automatically be returned to base after each success.

Combo Training-
Move the joystick right and left to select SCENARIOS and forward and backward to select RANKS (skill levels).
Press the joystick button when you have the ones you want.
There are 15 SCENARIOS. 377-6929 (Press G or H to arm and the joystick button to launch.)
Succeed and you can re-launch against successively more planes.

Getting Started
--------------- Launches you nose to nose with the enemy.

Choosing Ranks (Skill Levels) And Scenarios
------------------------------------------
Press the joystick button to begin.
(Note: A Mockingboard plugged into a |+ or |e will dramatically improve game sound effects and music.)

Launching A SkyFox Fighter
--------------------------
After you choose rank and scenario, the base computer will appear on the screen.
To launch automatically against the nearest targets, press the joystick button to enter the launch tube.
If necessary, then use the joystick to select low (for launching against tanks) or high (for launching against planes).
Press the button again to launch. Your launch speed depends on your rank.

Flying A SkyFox Fighter
-----------------------
Press the main joystick button to fire the laser cannons.
Press H on the keyboard to arm a heat seeking missile and G to arm a guided one.
Press again if you want to disarm an armed missile which you haven't yet fired. Press the main button to send an armed missile against an enemy target.
You must be pointed toward a target visible on your on-board radar scanner.
Guided Missile Count-
Press G to arm and G again to disarm and the joystick button to fire. You must be facing a target on your radar scanner to fire.

Clock- shows elapsed time since invasion.

Fuel Indicator-
Fuel consumption increased with speed. Using afterburners for thrust boosts 9 with the second joystick button and climbing to fight planes are especially expensive. Land at home base to refuel. Running out of fuel in flight is fatal.

Speed Indicator-
In Miles Per Hour.
Press a number on the keyboard to set a new speed.
0 Stops, 1 Sets at 10% of maximum, 2 at 20%, etc.
Ground maximum is 1500 mph.
High altitude maximum is 3000 mph.

Control S- Toggles sound on and off.
Control B- Restarts The Game.
Control F- Pauses The Game.
Esc- Gets help when you are at the base or flying with the computer map up.

Radar Scanner Display-
The space bar toggles between overhead and forward radar screens.
Overhead radar shows installations as well as enemy targets.
Enemy targets blink. Watch for messages to appear here.

Auto Pilot Indicator-
Press H to arm and H again to disarm and the joystick button to fire. You must be facing a target on your radar scanner to fire.

Shield Indicator-
When all the blue is gone so are you. Land at home base to recharge.

Altitude Indicator-
Above the rank of cadet, hitting the ground hard costs some shield strength.

To Land:
1) Enter the sector containing your base;
2) Reduce your speed to zero by pressing zero on the keyboard;
3) Reduce altitude to zero by pushing forward on the joystick.

Special Thanx To:
Disk Destroyer, Ghost Rider, And The Saint For Helping With The Dox, the title pages and keeping me awake so I could put this ware out the same day I got it. Also I would like to thank Late Night With David Letterman, Budweiser, My Mom And Dad For Moral Support, Ronald Reagan, My Local Radio Channel, M-TV, My Dog And My Cat, And No Doze.

Special Thanx To Michael Jackson, My "HERO".

These Docs Typed By: The Time Lord <-> Club X Rules!
Plane Controls

The plane controls are accessed when flying in your plane. All controls must be typed in upper case!

[Button 0] fire button
[Button 1] thrust
[Both] auto pilot
[space] switch scanner
[G] guided missile
[H] heat seeking missile
[0-9] speed
[A] auto pilot
[C] computer

There are certain charts you will need to have memorized or by you when playing Skyfox. Of course these charts can be obtained by pressing [ESC] when in the computer, but that is a real pain in the ass!

For information on what all these functions do, check out my article by the name of Skyfox charts

This article is (c)opyright 1984 by the Wyvern. It is not to be changed nor used on any other bbs without the Wyvern's permission. The Wyvern (me) can be reached on the temple of doom.

The Computer Commands

Computer commands can be reached by pressing the [C] key when flying your plane. The [C] must be typed in upper case!

[ESC] help
[Z] zoom
[T] tactical display
[I,J,K,M] move cursor
[A] auto pilot to cursor
[S] score
[R] installation report
[0-9] Speed: Increases your speed from not moving at all to going 9000 miles per hour. 0 being the lowest & 9 being the highest (speed).

[C] Computer: Activates the computer.

---

**Skyfox Charts Explained**

by: the Wyvern/T-men

---

The Temple of Doom.....[805] 682-5148
The South Pole..........[312] 677-7140
Adventurers Tavern.....[514] 538-3103
The Outpost............[312] 441-6957

---

**Computer Commands**

[ESC] help: This will give you a display much like my charts telling you the useable commands in Skyfox.

[Z] zoom: This will display a zoom screen where you can look around and really get to see the sectors.

[T] tactical display: Displays the tactical display, showing what is going on in every sector.

[I,J,K,M] move cursor: Move the cursor to where ever you want it on the tactical map.

[A] auto-pilot cursor: Will activate the auto-pilot to take you to the sector your cursor is in.

[S] score: Will show your score, and all the stuff you did to get it, and a brief status.

[I] installation report: Gives you a report on what is going on with your installations.

**Plane Controls**

---

[Button 0] Fire button: Allows you to file your regular laser blasts, or if armed a heat seeker/guided missile.

[Button 1] Thrust: Puts thrust in to your jets carrying your plane at a must faster pace.

[Both] Auto pilot: Activates the auto pilot.

[space] Switches from map scanner to attack scanner.

[G] Guided missile: Arms a guided missile which can be launched with the press of button 0. Hit 'G' again to disarm the missile.

[H] Heat seeking missile: Same as the above but all applies to the comm- and 'h' and we are dealing with a heat seeking missile.
The scanner is displayed at all times of flight. It is the little screen type thing rite in front of your face there. By pounding the spacebar type thing rite in front of your face there you can toggle it from map to attack mode or visa versa.

You say, map, attack? What is this loon talking about!? Well let me explain this subject a little more!!!

Map mode would be the mode where you can see squares and your small little plane there, and your loser enemies (that we hope to terminate) are dis-played as dots.

Attack mode would be the mode where you can see like a 3-d type mini display. The lanes come up looking like planes you can hardly see, and your plane is not displayed as in map mode.

Map mode should be used when you are just flying around, that way you have a better view of what is going on, where your enemies are, and if you go out of the colony then you will know just how to get back!

Attack mode should be used when you are in battle, that way you can direct yourself better, have a better attack type view of your opponents and thats all you really need it for when attacking!

---

Attacking

In Skyfox attacking is the most important thing. Why, you say? Well in Skyfox attacking and wining the battle is the way you score.

So obviously we will want some kool attacking tips from the Wyvern, right? well I dont care what you answered to that question because I am about to torture you with them anyways!

When attacking your scanner should always be in the attack mode as I call it. The attack mode is the mode that does not show your enemies as dots, it shows them as sorta like real far away planes you can hardly see.

The reason you will want your scanner in attack mode is because, it is much easier to catch your enemies and as the term goes "blow the hell outa the losers!". Once you have all of that set up you will want to reduce your speed and get ready to kill 'em! Now if there is lots of these evil faggot planes out there we will want to launch a nuke at them, but the great god of games didnt supply us with nukes, but he did give us heat seekers and guided missiles! So we want to load in a few seekers and waste most of them before they kill us! Then just use regular fire on the rest!

Now when palying with a mother ship it is better to save heat seekers and maybe waste your reg. laser bursts & guided missiles.

Now for the patient people out there not in the mood of fucking up fighters all day, we have the "patient person technique"!! here is how it works.

You go to some nice deserted area where you can stretch out, order a pizza and sip that coke. Set the speed to 0, load a heat seeker, and let it hover there. Soon some fighter planes will come along, as you spill the coke all over your shirt and throw the pizza on the ceiling! Now you must use your brains for once instead of relaxing! So you just fire away!!!!!!! Be sure to use that heat seeker that you loaded wisely or it may come back at you and you wont hafta worry about scraping the pizza off the ceiling!

[3] once the cursor is on the blue base box, hit 'A' for auto-pilot who will fly you there.

[4] once in the base sector reduce your speed to 0 as soon as the auto-pilot stops, that way you won't go flying out of the sector.

[5] push joystick up, until your height (shown to the very right on your plane instrument panel) is to 0, and poof, you are in the base!

If by any chance you did not enter the base, check the computer for your sector and make sure your on the blue box, make sure your speed & height is 0. If all that is right and it still is not working, you must have a bad copy!

(The Auto Pilot)
---------------

The auto pilot is like attacking a very important part of the game. The pilot is important for it allows you to set it to travel to enemies and it is also programmed when not set by you to seek out the nearest enemy and fly you to it.

Obviously most of us do not use the auto pilot much because we don't fully understand its capabilities. It took me a while to figure out how important the auto-pilot really was.

We can use our auto-pilot for two things. Those two things are, having it fly us to a set destination that we program in or just have it fly us to the nearest enemy.

First of all I will be talking about using it to take you to your very own set destination. In order to do this we will have to pull out our computer with the [C] command. If it says your computer is discharged you might as well forget about having anything to do with it and go on with just your gun and missiles. Once we have the computer, a tactical map will appear in front of us. On the side it will tell you what all the little colored squares represent, use the I, J, K, M keys to find a place you want. You may want to zoom in on an area to make sure that what's there is what you want to go to. Then just hit [A] and we are off!

Secondly we can use it to just take us for a cruise to check out the nearest enemy. To do this all you have to do is press 'A' while in the flying plane process and it will take you there!

(The Base)
---------

The base is represented by a blue checkered square on your tactical map. When you first start out you are in the base.

We all know that us Skyfox fighter pilots have a hectic time, so they even put an alpha invaders in the base for us! All ya gotta do to play is hit CTRL-G from the tactical map.

You return to the base, if you fly there, if your plane gets bombed and you have to get a new one or when you start over.

At the base you are refueled and the damage on your plane is fixed, sorry but no more missles of any kind are given out so use them wisely!

To return to the base in simple steps from anywhere you may be do this:

[1] activate computer and tactical map.

[The Auto Pilot]
---------------

The auto pilot is like attacking a very important part of the game. The pilot is important for it allows you to set it to travel to enemies and it is also programmed when not set by you to seek out the nearest enemy and fly you to it.

(The Plane Speeds)
------------------

Your plane can travel from 1000-9000 miles per hour. This is represented by 1-9 on your keyboard. When pressing one, that speed will be selected.

The speed 0 is like a plane break that will stop your plane completely.

The speed 0 should be set when you are fooling around with the computer so you don't go flying out of the colony or run into some enemies!

The 9 speed should be used with turbo when wanting to 'get away.' Turbo is accessed with the 1 button on your joy stick, and can be used at any time.

I would select a 5-6 moderate speed when just flying around.

(The Zoom Feature)
------------------

When in the tactical map you have the option of zooming in on a certain place.

When you select the 'Z' command it will put you on a blank map. You can see where your going by the x,y coordinates on the right of your screen.

When you run into something it will be shown so you know what it is (deep, really fuckin' deep).

The mother ship looks like a flying saucer, the plane looks like a small plane, same with the tank, and so on. The installation looks like two hexagon saucers chained together.

(Getting Away)
-------------

Well getting away is very simple actually but there are some things and techs you may want to know.

The easiest and most common way of getting away is putting the speed on 9, the thrusters on and burning out!

The other way is auto-piloting away.
When using the auto-pilot method if it says discharged, switch to map mode and look where your enemies are. Fly out of that sector and then auto pilot.

(Firing Techniques)

As soon as you hit a sector with some enemies, get ready to fire!

The tanks are by far the easiest, because they all come in a row. The smaller they are the more you should move the target up and fire, the larger they are the more you should move the target down and fire.

The planes are usually alone and hard to hit. Just keep on their tail and fire away.

I really see no need to use your 10 missiles (seekers & guideds). Unless you get scared you really don't need to use them. I got to a score of 45,000 without using the missiles once on the corners scenario and found your missiles don't really do much good.
-------

ProDOS 8 -- the disk operating system for 8-bit Apple computers

Firmware -- built-in software that is present at all times in a computer; usually controls the hardware attached to the computer.

Slots -- connectors in the //e, //+, or IIgs into which cards can be plugged that allow control of various devices, including disk drives, printers, and modems. In the //c or IIc+, these slots are simulated by the firmware.

Smartport -- the name Apple gave to the built-in software that controls any disk device (except for 5.25 drives) plugged into the disk port on the back of the //c, IIc+, or IIgs.

Chaining -- attaching several disks to the same disk port by plugging one into another.

Booting -- the process of starting up a disk operating system by reading progressively larger segments off of a disk into memory, until the entire system is loaded.

Primary Boot Disk -- the disk usually used to startup the ProDOS 8 disk operating system. On a //c or IIc+, this would be the internal disk drive.

Secondary Boot Disk -- the disk to which SMARTBOOT transfers control from the actual boot process. Like any ordinary ProDOS boot disk, it must have in the main directory the file PRODOS (the true one, not a renamed SMARTBOOT as goes on the Primary Boot Disk) and at least one SYS file whose name ends in "SYSTEM" (such as BASIC.SYSTEM).

Unit -- the disk device at a particular position on a Smartport chain. The first disk device is Unit #1, and so on. On the IIc+, the internal 3.5 drive is Unit #1 on the Slot 5 Smartport.

Mirrored Disks -- disks that appear to be in a slot other than the one they are physically plugged in to. This is necessary when there are more than two devices attached to a slot, as ProDOS 8 can only understand two per slot.

In these cases, the third and fourth are "mirrored" to an unused slot, usually slot 2.

Volume Name -- a unique name given to a disk by ProDOS, allowing it to tell the difference between disks. It is given a name that is preceded by "/" (such as /MYDISK).

Device Name -- a name given to specific devices on a Smartport chain.

Boot 0 -- the first block on any disk; for ProDOS disks, this contains a short program that looks for the file PRODOS, loads it, and transfers control to it (see "Booting").

WHAT IT DOES

Let's take the examples of two Apple systems:

SYSTEM A: a fully loaded Apple //c with (ProDOS Disk Name)

Slot 4 = Ramdisk, 1 Meg (/RAM4 )
Slot 5, Unit 1 = Unidisk 3.5 #1 (/DISK.A)
Unit 2 = Unidisk 3.5 #2 (/DISK.B)
Unit 3 = Unidisk 3.5 #3 (/DISK.C)
Unit 4 = Chinook CT-20c hard drive (/CT )
Slot 6, Drive 1 = Internal 5.25 drive (/DISK.D)

SYSTEM B: a minimally loaded Apple IIc+ with

Slot 5, Unit 1 = Internal 3.5 drive (/DISK.E)
Unit 2 = Chinook CT-20c hard drive (/CT2 )

With this setup, an ONLINE call to ProDOS will return the following:

SYSTEM A:

Slot 6, Drive 1 = (/DISK.D) Internal 5.25 drive
Slot 5, Drive 1 = (/DISK.A) Unidisk 3.5 #1
Slot 5, Drive 2 = (/DISK.B) Unidisk 3.5 #2
Slot 4, Drive 1 = (/RAM4 ) Ramdisk
Slot 2, Drive 1 = (/DISK.C) Unidisk 3.5 #3 (mirrored to this slot by ProDOS)
Slot 2, Drive 2 = (/CT ) Chinook CT-20c (mirrored to this slot by ProDOS)

SYSTEM B:

Slot 5, Drive 1 = (/DISK.E) Internal 3.5 drive
Slot 5, Drive 2 = (/CT2 ) Chinook CT-20c hard drive

Ordinarily, if you turned the computer on with ProDOS disks in all drives it would boot the 5.25 internal disk on System A, and the 3.5 internal disk on System B. If you removed the disk from the internal drive on System A, the computer would automatically try the first device in slot 5 (the Unidisk 3.5 #1, /DISK.A in this case). You would NOT be able to boot directly to the hard disk on either system.

Enter SMARTBOOT. Run the Basic program SH.INSTALL, and follow the instructions to install SMARTBOOT or SMARTBOOT.TINY. If you selected the Slot 5, Unit 4 device as the Secondary Boot Disk for System A, or the Slot 5, Unit 2 device as the Secondary Boot Disk for System B, you would be able to boot almost immediately to the hard disk when starting up the computer at power-on, or when restarting by pressing Control-Open-Apple-RESET.

PROGRAM DESCRIPTION

SMARTBOOT (SYS file)

This is the full-featured version of the program. It replaces the file PRODOS on the Primary Boot Disk. When executed, it transfers control to the slot and unit numbers specified at relative bytes 7 and 8 in the file.

If the slot contains a Disk II controller card, it will ignore the unit number and simply boot drive 1 on that card.

If the slot contains a Smartport card (such as slot 5 on the //c, IIc+, and IIgs), it will check to see if the disk device is online. If there is an error, it will continue checking that device until it IS online. For instance, if the selected device is a 3.5 disk drive, it will wait until a disk controller card has been plugged into the slot, and the device is online. If the selected device is a CT-20c hard disk, SMARTBOOT will continue checking until the "NO DEVICE CONNECTED" (28 hex) error is gone (that is, until the drive has come up to speed and is ready to use.)

If the disk device is not ready to boot, the error message returned by the Smartport firmware is displayed. (The other bytes displayed refer to the place in the program where the Smartport call was made, and is primarily for debugging purposes.) A "clock" will be displayed that advances approximately once per second until the Secondary Boot Disk is ready.

If you manually patched the slot and unit numbers into SMARTBOOT (see "HOW TO USE SMARTBOOT" below) and selected a slot and/or unit that does not contain a disk device, an error messages is displayed and the program halts with a "*" prompt and a cursor. From there you can switch to an ordinary boot disk and try again (and reconfigure your SMARTBOOT program to select a slot that really contains a disk device).

SMARTBOOT.TINY (BIN file)

This is the brief version that is loaded from Block 0 of the Primary Boot Disk. (It is less then 256 bytes long, so will load properly even from a 5.25 disk.) It does not do as much error checking as regular SMARTBOOT, and...
will fail with almost any ordinary error that would cause a "Check Disk Drive" error on a //c. It is not sophisticated enough to wait for a hard disk to come up to speed (as SMARTBOOT will). If you don't need all the error checking, or don't want to replace the file PRODOS on the Primary Boot Disk, this is the version you should use.

SB.INSTALL (BAS file)

This is an Applesoft program that installs either of the two above programs, and makes a small alteration to Block 0 on the Secondary Boot Disk to ensure that the boot will work for Units 3 or 4 on a Smartport. This patch should not affect ordinary booting; however, should there be a reason that it needs to be removed, SB.INSTALL will remove the patch and restore the original code (as any good patch program should -- thanks for teaching that to me, John Link!) The patch to Block 0 DOES take into account the two different versions of the Block 0 boot code for ProDOS that exist.

HOW TO INSTALL SMARTBOOT

The Applesoft program, SB.INSTALL, expects to find itself running from the Primary Boot Disk. That disk can contain any files you wish it to, but must also contain SB.INSTALL and either SMARTBOOT or SMARTBOOT.TINY. These files must not be in a subdirectory.

Use FILER or the Apple System Utilities Disk to transfer the files SB.INSTALL and either SMARTBOOT or SMARTBOOT.TINY to the Primary Boot Disk.

If installing SMARTBOOT, you must manually change the name of the program to PRODOS. To do this, launch BASIC.SYSTEM and at the "I" prompt insert the Primary Boot Disk. If PRODOS already exists on this disk, type DELETE PRODOS

or

RENAME PRODOS,PRODOS.OLD

Then, type

RENAME SMARTBOOT,PRODOS

If installing SMARTBOOT.TINY, just make sure that PRODOS is either absent from the disk or is the true PRODOS (and not a renamed SMARTBOOT).

Start the SB.INSTALL program by typing

RUN SB.INSTALL

and follow the prompts. You will need to have ProDOS disks in all online disk devices in order for the program to properly identify the disks in the Smartport devices.

HOW TO USE SMARTBOOT

SMARTBOOT.TINY can be used only by booting through a power-on (cold boot), by Control-Open-Apple-RESET (warm boot), or from Basic by PR#6 (if slot 6 drive 1 holds the Primary Boot Disk.)

SMARTBOOT can be used the same way, plus can be invoked from Basic by typing

-PRODOS

It can also be started from various program selectors:

PROSEL (by Glen Bredon)

Set up your menu entry like this:

Screen title:  SmartBoot  (or whatever)
Prefix:  /PRIMARY  (use your Primary Boot Disk name)
Pathname:  PRODOS
Startup:  <empty -- but see below>

SMARTBOOT will support the ProDOS convention for accepting a startup string. If the startup position above contains the slot and unit numbers, SMARTBOOT will replace the default values set by SB.INSTALL and use the new numbers to do its booting. This would allow you to boot to several different devices on a Smartport chain with the same SMARTBOOT file (renamed, of course, as PRODOS). For example, to boot to Slot 5, Unit 3:

Screen title:  SmartBoot
Prefix:  /PRIMARY
Pathname:  PRODOS
Startup:  53

Be sure if you want to do this for Unit 3 or 4 on a Smartport chain that you have a patched Block 0 on the disks in those drives. This could be done with SB.INSTALL; just run it once for each drive you want to patch, finishing with your usual Secondary Boot Drive. Also, you can do this with BLOCK.WARDEN by reading Block 0 off a patched disk and writing it to a non-patched disk.

Also notice that you may use BLOCK.WARDEN to change the startup slot and unit in SMARTBOOT (renamed as PRODOS, you recall) just as it can change a startup file name. (See BLOCK.WARDEN documentation for details.)

DAVEX (by Dave Lyons) / ECP-8 (by Don Elton)

SMARTBOOT can be started from DAVEX by typing:

/PRIMARY/PRODOS 53

at the prompt to boot the disk in slot 5, unit 3. I am not as familiar with ECP-8, but it should work the same from that ProDOS 8 shell program.

FOR THOSE INTERESTED...

After running SB.INSTALL, even if you don't actually install anything, exit to Basic by selecting [3] from the main menu. Then type

GOTO 20000

and you will see the full list of disk devices that are online when SB.INSTALL was run. "S" refers to Slot, "D" to Drive, "T" to the true (actual) slot, and "U" to Unit. "Dev" refers to the ProDOS device code.

FINAL COMMENTS

If you downloaded this file from GEnie, it should be bug- and virus-free. If you got it from any other info service or BBS, there is a chance that it could have picked up a virus somewhere. If there is any doubt, as usual for downloaded software, MAKE SURE YOU HAVE A BACKUP before you commit your disks to it. As mentioned above, SB.INSTALL does do writing to Block 0 of the Secondary Boot Disk (and to the Primary Boot Disk if using SMARTBOOT.TINY). If that makes you nervous, make a backup before you commit yourself to using SMARTBOOT.

This program is FREEMIRE. If you have any problems or suggestions for improvements, send me E-mail on GEnie (S.WEYHRICH) or directly to the address below.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 982 of 1262
OBJECTIVE: THE SNAKE IS TO EAT ALL THE APPLES IN THE ROOM (LEVELS) AND THEN EXIT THE DOOR AT THE TOP OF THE SCREEN. EACH TIME AN APPLE IS EATEN THE SNAKE GETS LONGER AND MOVES FASTER. IF THE SNAKE BUMPS A WALL YOU LOSE IT. THERE ARE 10 APPLES PER MAZE. 3 APPLES PENALTY IF YOU TAKE TOO LONG TO EAT AN APPLE.

SCORING: THERE ARE 28 LEVELS (ROOMS) PER GAME AND YOU START OUT WITH 3 SNAKES. GAME STARTS ASKING HOW MANY PLUMS. IF SNAKE HITS PLUM WITH ITS HEAD DEAD ON YOU LOSE IT. THE MORE PLUMS YOU PLAY WITH THE MORE XTRA POINTS YOU GET EACH TIME AN APPLE IS EATEN.

DOCUMENT snoopy2rescue

Snoopy to the Rescue
(c) 1984 by Random House, Inc.

Cracked By:
Creative Cracker
High Technology

Call:
Sherwood Forest [(914)359]1517]
Sherwood Forest /// [(914) 352 - 6543]

The Game:

Woodstock is missing! Snoopy, the Super Sleuth, knows who's responsible. The feline fiend, Professor Morehairy, has kidnapped Woodstock.

Can the Super Sleuth rescue Woodstock from Morehairy's castle of danger? Can he escape from the traps and treacherous robots lurking in every room? Read on and become part of Snoopy's spell-binding tale of mystery!

<< THE CONNECTION >> is an action-packed, two-sided adventure game. There are six challenging levels to play on each side of the disk. Help Snoopy climb to the top of the castle on Side 1. Help him try to capture Morehairy on Side 2. You can begin with either side. But watch out! Side 2 is far more dangerous.

On every floor, challenges await you - flying carpets, magic lamps, trap doors, moving floors and, of course, Morehairy's robot guards!

Warm Up:

To play SNOOPY TO THE RESCUE you need:
* an Apple ][ or //e with 48k
* one Apple Disk Drive
* a monitor, (color monitor preferred)
* a joystick (recommended)

To begin playing either side, follow these steps:
* Make sure the computer is off and the monitor is on.
* Lift the disk drive door.
* Insert the disk. The side facing up is the side you will play.
* Close the disk drive door.
* Turn on the computer and the program loads.

Here's the Strategy....

In order for Snoopy to escape safely from a level, he must:
* Select numbers from each of Morehairy's tricky number boxes to add up to the level's challenge number.
* Pass by the robot guards and deactivate them with one of Morehairy's magic keys.
* Avoid all other traps and snares.

Matching Morehairy's Challenge Number:

Morehairy has booby-trapped his castle. Each level has a challenge number. Watch it appear at the top of your screen. Unless Snoopy matches it, he cannot leave the level.

Along the game path are 5 boxes. In each box, numbers appear and change. 1, 2, 3, 4,... Snoopy's mission is to reach each box and choose a number from it. The chosen numbers must add up to the challenge number above. If Snoopy fails to freeze a number from each box or adds incorrectly, he must start the level over with one less chance to save his friend.

Freezing a number:

-JOYSTICK: Position Snoopy over the box. When the number you want appears, press the top button on the joystick. The number freezes.

Ready, Set, Go!

To guide Snoopy, you can use:

-JOYSTICK: Move the joystick in the direction you want Snoopy to go. Press the lower button to make him jump.

-KEYBOARD: Press the left and right arrow keys to guide Snoopy. To make him stop moving press the SPACE BAR. Press the Z key to make him jump.

Be on the lookout for trap doors and drop-away bridges. Magic lamps shoot Snoopy to higher floors. Guide him carefully onto flying carpets and moving floors or he'll fall off.

A Special Tip about Jumps:

When approaching a jump, guide Snoopy slowly and stop him when he reaches the edge. Then make him jump. Completing some jumps requires that a portion of Snoopy's foot hangs over the edge. Be careful and look before he leaps!
-KEYBOARD: Use the arrow keys to guide Snoopy over a box. To stop Snoopy at the box, press the SPACE BAR key. To freeze a number, press the RETURN key.

Watch out for Green Robots:
=====================================

If Snoopy runs into a green robot, he loses a turn and must begin the level again. But if Snoopy reaches a magic key, the robot guard will turn red temporarily. Snoopy can safely deactivate the robot when it is red.

Count your Chances:
=====================

Snoopy has only five chances in each game to climb to the top of or escape from the castle. He gains an extra chance after completing skill level one. You can keep track of how many chances he has left by counting the small figures at the top left of the screen.

Be careful! Snoopy loses a chance every time he meets a green robot, falls too far, slips into the moat, or fails to match Morehairy's challenge number.

Practice Makes Perfect:
=======================

You can practice a level before you play it in a game. Begin play and when the first level appears, press the CONTROL (CTRL) and N keys at the same time. Keep pressing the keys until you reach the level you want to practice.

Success is... Beginning Again:
=================================

What happens when you've completed all 6 levels on one side and Snoopy has some chances left? You get to begin again, but the play is harder and faster. The 6 levels on each side can be repeated as many as 4 times.

Special Features:
==================

Play ends when Snoopy runs out of chances or when you choose to end the game. To end the game, press the SHIFT and * keys at the same time.

The initials of the top 20 players can be added to the scoreboard along with their scores and the number of levels completed. To erase the scores, type 911 at the Score Frame.

-SOUND: You can play with or without sound. To play the entire game without sound, type 911 at the Random House screen before you press RETURN.

-PAUSE: To pause during play, press the ESC key. Press any key to resume play.

-EARLY OUT: To end the game early, press the SHIFT and * keys at the same time.

-PRACTICE LEVELS: Press the CONTROL (CTRL) key and the N key until you reach the level you want to practice.

-FAILING TO EQUAL THE CHALLENGE NUMBER: If you realize you cannot match the challenge number, press the CONTROL (CTRL) key and the Q key.
SnowTerm, version 2.05 16-Dec-90

Copyright 1990  By John F. Snow
Snow Software

Introduction

SnowTerm is a communications program for the Apple IIGS computer. Version 1 of SnowTerm was essentially just a VT100 terminal emulator. In the documentation for version 1 of SnowTerm, I promised that SnowTerm would be expanded to become a communications program. This release of SnowTerm, version 2, is the first step towards fulfilling that promise.

SnowTerm emulates the Digital Equipment Corp. VT100 and VT52 terminals. SnowTerm runs in the super high resolution graphics mode of the Apple IIGS and uses the desktop user interface. SnowTerm uses the graphics and color capabilities of the Apple IIGS to accurately emulate the VT100 terminal including bold and blinking character attributes, the line drawing character set, and double high and double wide characters. Although the VT100 implements a subset of the ANSI standard, the VT100 and SnowTerm do not implement the (so-called) ANSI color graphics used by some IBM-oriented bulletin boards.

SnowTerm is not free software and it is not in the public domain; it is shareware. You may try it free for 10 days after which you must either become a registered user or discontinue use of the software. To become a registered user, send a check for $20 to:

Snow Software
PO Box 58621
Salt Lake City, UT 84158

In return, you will receive the latest version of SnowTerm on 3.5" disk, a manual, and technical support via email. Orders outside of North America please add $5 per copy for shipping. Due to the increased size of the Apple IIGS system disk, the system disk is no longer shipped as part of SnowTerm unless you specifically request it. Add $3 to receive the Apple IIGS system disks (two 3.5" disks).

The SnowTerm disk includes a font editor that allows you to customize the fonts used by SnowTerm. It also includes, by permission of the authors, several public domain and shareware programs that complement SnowTerm.

Once you are a registered user, you may download and use updated versions of SnowTerm for no charge or you may order updated versions for a minimal shipping and handling fee. Currently registered users of SnowTerm may order an update from Snow Software. Several upgrade options are available:

SnowTerm v2, manual, and latest IIGS System Disk .... $10
SnowTerm v2, manual, no System Disk .................... $7
SnowTerm v2 disk only, no manual or System Disk ...... $3
SnowTerm v2 manual only, no software ................... $5

These prices are in US dollars and include all shipping and handling charges for destinations in North America.

You may give a copy of SnowTerm to other users or post it on electronic bulletin boards for other users to evaluate, as long as this documentation is included. Distribution of SnowTerm without this documentation and using SnowTerm after the 10 day trial period without becoming a registered user are considered copyright violations.

System Requirements

To run SnowTerm you must have an Apple IIGS computer with a minimum of 768K of system RAM. A color RGB monitor is also recommended. This version of SnowTerm will work with an external modem connected to the built in GS Modem port, the GS Printer port, or to a Super Serial card compatible interface plugged into one of the slots. It also will work with internal modem cards that are Super Serial card compatible.

This version of SnowTerm requires GS/OS version 3.0 or higher (GS system disk version 5.0.2 or higher). It is recommended that you obtain and use System Disk 5.0.3. Since SnowTerm uses resources, a new feature of System Disk 5, SnowTerm will access the program disk more often during the operation of the program. For this reason, it is recommended that SnowTerm be used on systems with at least two disk drives or a hard drive.

Installation

WARNING: The SnowTerm executable file contains both a resource fork and a data fork. Many older copy utilities cannot copy such extended files. Therefore, you should only copy SnowTerm with copy utilities that you know work correctly with extended files, such as the System Disk 5.0.3 Finder. If the size of the SnowTerm file decreases when you copy it, the copy utility you used did not copy the resource fork.

If you downloaded SnowTerm from a communication service or BBS system then SnowTerm will be packed into a .BXY format file which must be processed with ShrinkIt or ShrinkIt/GS.

After processing with ShrinkIt, there will be several files, one of which is called SnowTerm.Single. This file must be processed further to obtain the SnowTerm executable file. There are two methods that may be used to process SnowTerm.Single. If you are using ShrinkIt/GS, you may open the SnowTerm.Single file just like any other archive file and select the SnowTerm file that is packed in the archive and extract it.

If you are not using ShrinkIt/GS, then you must use the program UNSINGLEST (which is included in the SnowTerm archive) to convert SnowTerm.Single into an extended file. Make sure that UNSINGLEST and SnowTerm.Single are in the same directory (folder). You can launch UNSINGLEST with the Finder or other program launcher. You will need about 200 free blocks on the disk in order to unpack SnowTerm.

Again I emphasize, DO NOT copy the SnowTerm executable file with a copy utility that does not handle extended files.

Hardware Configuration

Important: If you are using the built in modem or printer port, you must use the Apple IIGS control panel to configure the port with the correct connected parameter set to "Modem". Currently the desk top Control Panel does not allow you to set the device connected parameter. You must do this from the "Classic" control panel.

You may also need to set the following serial port parameters using the control panel:

Device Connected: Modem
The modem init string and the printer init string are "Control strings" -- a general purpose feature of SnowTerm which allows the user to enter an ASCII string with special sequences which specify control characters to be embedded within the string. When you are entering strings in dialog boxes, various control characters pressed on the keyboard perform editing operations and thus cannot be used to directly specify characters to be embedded in a string. Thus, a control character language of sorts has been developed.

Control strings allow control characters to be specified by two different means. Control characters can be specified by a two character sequence consisting of a caret (^) followed by an upper case character in the range A-Z, (, [, ], ^, and _.

For example, the sequence ^A would result in a control-A character ($01) being embedded in the control string.

The second method of entering control characters will be quite familiar to C language programmers because it is essentially the C escape sequence method of specifying character values. A C escape sequence begins with a back slash character (/). After the back slash there are several options for specifying the desired character.

First, you may use one of several single character mnemonics. For example, the \r sequence will generate a carriage return. SnowTerm recognizes the following mnemonic characters, most of which are the same as defined by C:

- b backspace (BS) - hex 08
- e escape (ESC) - hex 1B
- f form feed (FF) - hex 0C
- l line feed (LF) - hex 0A
- n new line (NL) sequence (CR + LF) - hex 0D 0A
- r carriage return (CR) - hex 0D
- t horizontal tab (HT) - hex 09
- v vertical tab (VT) - hex 0B
- D DEL character - hex 7F
- \ back slash -- interpreted as a single back slash
- ^ caret -- allows a caret to be included

Notice that a double back slash inserts one back slash character into the string and a \ combination will insert a caret character which would otherwise be used to indicate a control character. For example, \"A\" would generate a caret character followed by an A instead of inserting a control-A.

Besides using a mnemonic character after the back slash, SnowTerm allows octal, hexadecimal, or decimal numbers to be used to specify the ASCII value of the control character (actually any ASCII value between 0 and 255 may be specified).

To specify the ASCII value with an octal number, a THREE digit octal number must follow the back slash. C programmers take note that, unlike C, you cannot specify the octal number with just one or two digits. For example, \74 would generate a caret character followed by an A instead of inserting a control-A.

To specify the ASCII value with a decimal number, precede the THREE digit decimal number with a \ or \0d (both 'd' and 'D' are accepted). The decimal number must be exactly three digits long. For example, the sequence \123 would specify the ASCII character 'S'.

To specify the ASCII value with a hex number, you have two options. First, the standard C method which is to precede the TWO digit hex number with a \ or \0x (both 'x' and 'X' are accepted). The hex number
must be exactly two digits long. Optionally, you can precede the two digit hex number with a \$. For example, the sequences \0X41, \x41 and \$41 all specify the ASCII character 'A'.

Control strings may freely mix normal ASCII characters, caret prefixed control characters, and C style escape sequences together in one string. For example, the following sequence would set an ImageWriter II printer into 15 cpi printing mode and slashed zeros mode.

```
^q}D1000\$01
```

This sequence is interpreted as ESC q ESC D CTRL-8 CTRL-A. For illustration purposes, I used two methods of specifying the ESC character, '^' and \x.

Note that when mixing ^ symbols and \ symbols, the order in which they appear determine how they will be interpreted. For example, \^ is interpreted as control-\ while \x is interpreted as ^x.\\ is interpreted as control-\\.

**NOTE:** Any printable ASCII characters in the control string are sent with the MSB cleared (low ASCII). The only way to specify high ASCII characters is by using one of the numerical escape sequences with a value greater than 127.

Running SnowTerm
-----------------

SnowTerm can be launched by the Finder or other program launcher.

**Special Keys**

SnowTerm treats the numeric keypad of the Apple IIGS just like the VT100 keypad. Thus, under some conditions, the keypad keys will send escape sequences rather than the ASCII codes for the characters shown on the keypad. This allows SnowTerm to work correctly with the VMS operating system.

A break character can be sent using the Send Break menu command or its key equivalent, command-B. Previous versions of SnowTerm sent a break when option-B was pressed. This still works in version 2, but may not work in future versions as the option keys get assigned to other uses.

The DELETE key will send either a delete character (hex 7F) or a backspace character (hex 08), depending on the selection made in the character sets like the VT100 will. However, SnowTerm will not switch between the US and UK character sets like the VT100 will.

SnowTerm cannot correctly combine the bold and blink character attributes on the same character. Characters which have been assigned both the bold and blink attributes will appear as either bold or blinking, but not both. The user may select whether such characters appear as bold or blink using the Terminal dialog box.

SnowTerm does not contain a UK character set. The REGFONT and SPECTFONT file contains only the US character set. Registered users also receive REGFONT.UK and SPECTFONT.UK which can be used instead of the normal fonts to provide a UK character set. However, SnowTerm will not switch between the US and UK character set and the recording buffer is set to work with the UK character set only.

**Recording buffer**

The recording buffer is a facility that allows received text to be captured and then saved to disk, listed on the screen, or printed to the printer. The % display on the left side of the menu bar indicates how full the recording buffer is and whether it is currently capturing data or not. If it is RED, data is being captured. If it is black, data is not being captured.

The buffer preferences dialog allows you to specify features related to the recording buffer. It is recommended that you ALWAYS use the "filter control chars" mode which prevents control characters from being captured. Since the printer port and the list window both get very upset by control characters, you should always leave the filtering on.

The "Expand tabs" mode will convert tab characters into enough space characters to move to the next tab stop. It is recommended that this mode be used as well.
If "Auto save" is on, the contents of the recording buffer will be automatically saved to disk when the buffer becomes full. Normally, this data is saved in a file called ST.CAPBUF in the same directory as the SnowTerm file. You may change the path and file name for the autosave file by using the "Set Autosave file..." command.

If "Auto save" is turned off and the buffer becomes full, recording will be disabled.

The "Recording at start" control specifies whether the recording buffer is on or off when SnowTerm first started.

The "¾ display on" and "¾ position" controls allow control over buffer status display in the menu bar. You can turn it on and off and position it within the menu bar. The position is relative to the right edge of the menu bar.

The scroll bar allows you to adjust the size of the recording buffer. Note that you may set a size that can't be allocated due to memory fragmentation. In this case, SnowTerm will not resize the recording buffer.

When listing the recording buffer to the screen, a Text Edit control is used. This allows rapid scrolling through the data, but also uses lots of memory because the Text Edit control keeps its own copy of the recording buffer. If there is insufficient memory to create the Text Edit control, you may need to reduce the size of the recording buffer.

You may edit the text in the Text Edit control, however any editing done is not reflected back to the actual recording buffer contents. If you cut or copy data from the Text Edit control, it will be placed in the system clipboard and can be read by other programs such as AppleWorks or GS. A Select All command in the Edit menu makes it easier to copy all of the text in a window into the clipboard.

Any font may be used to display the text in the Text Edit control. However, you may want to use a fixed width font rather than a proportional font. Since most computer terminals use fixed center fonts, most screens and listings produced by computers don't look right when viewed with a proportional font. The Monaco and Courier fonts are two fixed width fonts that work well in a Text Edit control. If find the Monaco font more readable and have made it the default font. You are free to choose whatever font you want to use by using the "Choose Font" button in the Buffer Preferences dialog box.

Sending Files
-------------
Currently SnowTerm can only send text files and receive text files (using the recording buffer facility). XMODEM and other protocols will be added in future releases.

After choosing a file to be sent, a "Text File Send Options" dialog box allows you to set several options. The Prompt Character option allows you to specify a single character that SnowTerm will look for before sending the next line. This prompt character is useful when uploading to an ASCII oriented remote machine. This allows the file transfer to be paced by the receiving machine so that the next line is not sent before the receiving machine is ready for it.

The prompt character is entered as a SnowTerm control string. Thus, you may directly enter an ASCII character or may use one of the control string escape sequences to enter any ASCII value from 0 to 255. Note that if the control string you enter evaluates to more than one ASCII character, only the first character is used as the prompt character.

If you are uploading to an editor that does not issue a prompt character but does echo the text back, you can use a carriage return as the prompt character and SnowTerm will wait until the remote computer finishes echoing the line before sending the next line. I have found that some screen oriented editors, like LSE on VAX computers, do not issue a carriage return to move the cursor to the next line. Instead they send an escape sequence. I've found that setting the prompt character to ESC ("\" or \e) works very well with such editors.

The Character Delay and Line Delay options allow you to specify a delay to be inserted between characters and lines so that text is not sent faster than the receiving machine can accept it. These delays are specified as numbers from 0 (no delay) to 9 (max delay).

The "Add SP to blank lines" option will add a space character to any blank line. Since some message editors on remote machines detect that you are finished entering text by the presence of a blank line, this option allows blank lines to be uploading without erroneously ending the upload.

You may abort the sending of a text file by pressing the command key (open Apple) and the period key ("."") simultaneously. You can tell if a file is still being transferred because the File menu will be highlighted in the menu bar during the file transfer. A "peep" will announce the successful completion of a text file transfer.

While a text file is being transferred, any characters received through the serial port will be displayed on the SnowTerm terminal screen. This allows you to watch the progress of the text file transfer if the remote computer is echoing the text back. If you have recording buffer enabled when you start sending a text file, recording is turned off while the file is transferred and turned back on when the transfer has been completed.

Listing and Printing Text Files
-------------------------------
SnowTerm v2 contains commands to list and print text files. The list facility uses a Text Edit control just like the List Buffer command. All line feed restrictions that Buffer Text Edit control apply to the List File Text Edit Control. The same font is used.

The Open command in the file menu is used to list the contents of a file. Only one file may be listed at a time. If a file listing window is open when you select the Open command, the current window will be closed.

You may also print a text file to the printer.

The use of Text Edit controls will be expanded in future versions of SnowTerm to provide file editing, multiple file windows, etc.

Echo Received Characters to Printer
------------------------------------
Received characters can be echoed to the printer. All control characters will be filtered. This features follows the printer options supplied in the Hardware Configuration dialog box. It also follows the "Echo Received Characters" option in the Buffer Preferences dialog box to expand tab characters into spaces if the option is set.

Reset commands
-----------------
SnowTerm provides two different reset commands. One resets the serial port and the other resets the terminal emulation. Both of these are provided mainly to recover from line noise which may cause problems with either the terminal emulation or the serial port.

One common error mode occurs when line noise causes the receipt of a
XOFF handshaking character when the remote computer did not send an XOFF character. The XOFF character will prevent any further transmissions from your computer to the host computer until the host sends a XON. Since the remote computer didn’t send the XOFF, it won’t send a XON. So there you sit, pressing keys and nothing happens. If you have a modem with transmit and receive lights, you will notice that pressing a key does not cause the transmit light to turn on.

The reset serial port command was made to solve this problem. It will reset the serial port software so that it no longer knows that a XOFF was received.

Another common failure mode is the erroneous receipt of the control character which switches the VT100 emulation into special graphics mode. All lower case characters received are displayed in special graphics mode. The reset terminal emulation command will reset the VT100 emulation to its normal state and solve this problem.

New Preferences
----------------
Version 2 has two new controls in the Preferences dialog. The first, Confirm Quit, specifies whether or not an Alert box will pop up to ask you to confirm that you really want to quit.

The second new control, Std Colors for NDAs, allows control over a new feature which will change the screen colors to the standard desktop colors whenever a NDA is the top window on the screen.

INET: esunix!jsnow@cs.utah.edu

Revision History
Version 2.00
-------------
Initial release of version SnowTerm v2.

Version 2.01
------------
Fixed a bug that caused the desktop colors to not change to the standard colors when a NDA was moved and activated.

Changed the hardware dialog box to select printers by GS/OS character device names rather than by slot number.

Version 2.02
------------
Fixed a bug that caused the Recording On/Off to be in the wrong state if "Recording at Start" option was selected.

Version 2.03
------------
Fixed serveral bugs dealing with serial port initialization. First, the modem init string was being sent to the modem before the baud rate specified in the defaults file was set. SnowTerm now correctly sets the serial port parameters before sending the modem init string. The "Reset Serial Port" command was resetting the serial port but not restoring the serial port parameters specified by the defaults file.
DOCUMENT solo.flight

SOLO FLIGHT

Cracked by:
The Wombat / The Gonif / Dr. Micro
[THE PPG]

Doc file by The Wombat

IMPORTANT READ CAREFULLY

After completing your first landing since loading the game, you will be asked to enter a landing fee credit code (an attempt at piracy protection). To determine the correct response, read the account # displayed by the computer when it asks for authorization code. Then go to the authorization code table (found at the end of the doc file) and locate the account # given by the computer. Located directly beneath the account # is the authorization code response. Type the authorization code into the computer and press 'return'.

OPTIONS

Use the 1 key to select practice FLYING or the MAIL PILOT game. The 1 key also selects which of three states you wish to fly in. (Kansas, Washington, or Colorado). Use the 2 key to choose difficulty level. During flying practice you may select clear weather (for touch and go practice in the local area), landing practice (places the aircraft on short final for landing), windy conditions, or ifr (instrument flight rules-low clouds). When playing then mail run game, you may select from the student pilot, private pilot, senior pilot, or command pilot difficulty levels. Press 3 to continue.

BASIC FLYING

Two controls are used for the most basic flying - the control stick or yoke & the throttle. The joystick (yoke) changes the altitude and direction of your aircraft; the throttle affects your speed. Use the joystick to make your plane turn, climb and dive. Holding the stick to the right causes the plane to bank to the right; when the plane is banked right it will turn right. Note that when you center the joystick the plane will remain banked and continue turning. Bring the plane back level by pushing the stick in the opposite direction of bank. Pushing forward on the stick will cause your nose to go down and the plane will dive.

Pulling back on the stick will bring your nose up. The throttle controls the amount of power generated by your engine. Maximum power is required when taking off and climbing, somewhat less power is needed for cruising, and low power is generally sufficient for landing.

Remember that there is a relationship between the pitch altitude and the amount of power required for level flight. At low speeds, significantly more nose up is required for level flight.

VIEW

The top half of the flight screen shows your plane and local terrain highlights. If you are at a low altitude your shadow will be visible on the ground. Airports are black, VOR towers, farms and mountains are white. If you fly into or above the clouds, ground objects will not be visible. Generally the view is to the front; you may look to the side or behind you using the appropriate commands.

INSTRUMENTS

The bottom half of the flight screen contains your flight instrumentation. The large red dial on the left is your altimeter. Each mark on the dial is 1000 feet for the small hand and corresponds to a complete revolution of the large hand. The large dial on the right is your speed indicator which goes from 0 to 180 knots. The small circle in the middle is your artificial horizon/altitude indicator which idicates your altitude relative to the horizon. The vertical strip in the center is your throttle indicator. Maximum power is at the top, zero power is at the bottom. The four digital indicators at the lower left are very important. The first value is pitch, positive values indicate your nose is up, negative values means nose down. The next number is the degrees of flaps that are extended. The next value is a digital and alpha directional compass reading. Zero degrees is due North; 90 is East, 180 South, and 270 is West. The bottom indication is your Vertical Velocity Indicator (climb). Positive values indicate you are gaining altitude, negative values indicate you are losing altitude. Your fuel guage is on the lower right. The indicator light center left is your temperature warning light. It will flash if your engine is overheating. The two status lamps center right indicate that your landing gear is down and your brakes are applied when illuminated. Your navigational instruments are at lower right. The two VOR readouts indicate the directional bearings from the VOR stations. The ILS system shows wether your landing approach is high, low, or on the runway. Your elapsed time is displayed at the upper right.

FLIGHT CONTROLS

In addition to control via the joystick, a number or commands may be entered through the keyboard.

THROTTLE: The numbers '0' to '9' control your throttle. Zero is no power, 9 is maximum power.

NOISE: Press 'M' to turn on/off the engine noise.

LANDING GEAR: Press 'L' to raise or lower the landing gear.

BRAKES: Press 'B' to apply or release the brakes.

FLAPS: Press 'F' to control the flaps. You may use 0, 20, or 40 degrees of flaps.

VIEW: Use the left and right arrow keys to look out the right and left windows. Use the down arrow to look behind you. To return to the front view, use the up arrow key. (for II/II+ users: W-front, A-left, Z-right, S-back)

PAUSE: Press 'P' to pause the game. Press any other key to continue.

RESTART: Press 'ESC' to restart.

EMERGENCY: If you wish to create an emergency equipment failure for practice purposes, press the 'E' key.

SLIP: Bank your aircraft and press joystick button to put your plane into a sideslip. This maneuver, usually performed by crossing the
rudder and ailerons, allows you to slip your plane into the wind to lose altitude without changing heading.

**JOYSTICK ADJUST:** Center your joystick and press 'J' to adjust the game to your joystick.

**MAIL PILOT**

The mail pilot game tests your flying skill and judgement. Your task is to deliver five bags of mail to their destinations in the least amount of time. Once you have selected the Mail Pilot game, a map will be displayed. Press START to continue to the Mail Pilot screen. On the mail pilot screen use the 1 key to load mail. The destination(s) will be displayed on the screen under 'MAIL FOR.' You may load up as much mail as you like. However, each bag adds to the weight of the plane and increases the difficulty of flying. One or two bags is recommended. You may load up on fuel by pressing the 2 key. Fuel also adds weight but be sure to load enough to make it to your destination.

To begin your journey, press the 3 key. Then be sure to study the map to decide a flight plan. When you are ready to take off, press 3 again. If you wish to return to the main map at any time, press 1.

When you arrive at your destination airport and stop your aircraft, your landing points are calculated. Points are gained for slow landings with gentle touchdowns. Delivery points are also accumulated based on difficulty level. Next you will be shown a map and your route will be displayed. Press 3 to go on to the Mail Pilot screen. Any mail for this airport is automatically unloaded and added to your score. You may now load additional mail or fuel and continue the game. The game ends when five bags have been delivered or when you crash.

As the game progresses, the weather will gradually deteriorate. Winds will get stronger, clouds may come in, and turbulence may develop. At the higher difficulty levels your plane is also prone to mechanical and instrument failure. Your engine may overheat and various instruments may become inoperative. This is not due to a bad crack! All malfunctions are repaired when you land at an airport.

If the disk is not write protected, high scores will be recorded on the disk.

**EMERGENCIES**

At the more advanced difficulty levels your aircraft is prone to instrument and mechanical failure. If the temperature light begins to blink, your engine is overheating and will cut out shortly. Find a place to land. Your altimeter, airspeed indicator, and VOR indicators may also malfunction and register zero readings. The artificial horizon could also cease functioning. Landing at any airport will repair your aircraft. Multiple use of the 'E' key will cycle the program through all emergencies possible in the simulation.

**WEATHER**

The current weather conditions are displayed at the bottom of the screen: wind direction and speed, cloud ceiling in feet, and visibility in miles. Under windy conditions, landing your aircraft becomes tricky, especially if the wind is blowing across the runway. Use less flaps, higher airspeeds, and aircraft slips to compensate for winds. Low clouds often require instrument flying, although you may choose to fly above the clouds.

**STATE MAPS**

Kansas: Kansas is a nice flat state, ideal for novice flyers. Wichita and Kansas City have airports with long, wide runways. There are also many nice cornfields and mysterious Indian pyramids to fly over. VOR 1/VOR2 bearings for Kansas are:

Washington/Oregon:

Washington has a mountain range separating the coastal cities from Yakima. Some of the mountains are up to 4000 feet high, although the two mountain passes can be traversed at 2000-2500 feet. Three of the of the Washington airports are also elevated.

Colorado:

Flying between the small airstrips nestled in the Rocky Mountain Valleys of Colorado is the ultimate challenge for a mail pilot.

**CAUTIONS**

Take heed of the following cautions, especially at the advanced difficulty levels.

1. Don't make sharp or high-speed turns while taxiing. Your landing gear struts are delicate and are liable to ground loop.

2. Don't lose your airspeed and stall when attempting a slow landing. Use your flaps to lower stall airspeed.

3. Plan your route on the map before taking off. A sudden lowering or an emergency may hide familiar landmarks or require immediate landing.

4. Don't run your engine at full power for too long; overheating is likely to occur.

5. Don't overload the aircraft. With a heavy mail and fuel load, your aircraft will be very sluggish. The aircraft will have a hard time taking off from elevated Colorado airports, and will require longer landing distances.

**VOR NAVIGATION**

VOR navigation is based on a series of ground stations that send out radio signals. These signals are received by instruments in the cockpit and decoded and read as bearing to a particular VOR station. There is no range information associated with VOR navigation. In Solo Flight, each airport is defined as a radial intersection. (A radial bearing is a number 0 to 360 that if the aircraft was turned and flown on a heading of 180 degrees from the radial bearing, the flight path would be inbound to the VOR station).

North of the VOR station is radial 360, East is 90, South is 180, and West is 270. To find a particular airport, the pilot should determine its radial intersection from both VORs. He should then intercept a radial, fly from one of the VORs and fly until the cross radial from the other radial is reached. For example, in the Kansas map, the Kansas City airport is located on the 36 degree radial of VOR 2 with
the end of the main runway on the end of 67 radial of VOR 1. To find the airport in the weather, the instrument pilot could establish himself on the 36 degree radial of VOR 2, heading 36, and descend to missed approach altitude until crossing the missed approach radial, the 67 of VOR 1.

- 9    a pair of old boots
**Apple II Computer Info**

Only you can guide Space Ace, and his weak alter-ego Dexter, to rescue Kimberly and defeat Borf. But watch out, many dangers and deadly beasts await as you travel throughout the galaxy chasing Borf from space station to planet and back again! Survive Borf’s monsters, rescue Kimberly and finally confront Borf himself in deadly hand to hand combat all before the Earth is enslaved forever!

---

**GAME INSTRUCTIONS**

Before loading Space Ace, make a backup copy of each of the Space Ace disks (yeah, right!) and put them aside in case anything should happen to your original disks.

After booting your Apple IIGS with a system disk or autobooting from a hard drive, insert the Space Ace Disk One into the disk drive and double click on the "Space Ace" icon to begin the game.

**STARTING THE GAME**

After the game has loaded the demo mode will automatically begin. The demo runs through scenes from the first disk and then returns to the title screen and credits. To start playing the game simply press the zero (0) on the keypad at any time. You will know the game has started when the player score screen appears. This screen shows your score and the number of lives you have remaining. The first scene will then load automatically.

**PLAYING SPACE ACE**

You do not directly control all of Ace’s actions, rather you control his reactions to the events that happen around him. As you watch the animation, you must decide in which direction Ace should move on the screen and when.

To finish a scene successfully you must make a move or press the fire button (zero (0) on the numeric keypad) when Ace is in danger. Timing is very critical and often you may make the correct move but at the wrong time. Also, more than one move. If you are having trouble, watch the animation carefully and move Ace in the safest direction or if no direction is safe press the fire button to use Ace’s laser gun or laser staff.

If you’re sure you have the correct move try varying the time when you make the move, a little sooner or a little later. Don’t be surprised if Ace doesn’t move immediately after you have made a move. You must wait for the animation to finish and if you made the correct move(s) you will continue on to the next scene.

Don’t be surprised when you see Dexter in one scene and Ace in another. Ace has been hit by the Infanto Ray once already and he transforms back and forth between some of the scenes. You have three lives and the game will end if you lose all of your lives or when you have completed all of the scenes on the disks.

From time to time it will be necessary to change the disk in the drive. After that will come a screen with credits for the guys that did Space Ace, just press * 0 * again.

There was no copy protection on this, so we don’t understand why it is doing this. It also does this on the original copies that we have.

**INTRODUCTION**

The evil Commander Borf is attacking Earth! With the help of his dreaded weapon, the Infanto Ray, Borf will reduce all of humankind into infants and CONTROLS

For some unknown reason Space Ace will crash if you let it go through the demo and then try to start the game, so just press * 0 * after you see the Space Ace title screen. After that will come a screen with credits for the guys that did Space Ace, just press * 0 * again.

INTRODUCTION

The evil Commander Borf is attacking Earth! With the help of his dreaded weapon, the Infanto Ray, Borf will reduce all of humankind into infants and take over the planet.

Only two people have the courage and strength to stop Borf and save Earth, the beautiful Kimberly and the heroic Space Ace. But as they approach Borf’s stronghold Ace is hit by the Infanto Ray, changing him into a weakling, and Kimberly is kidnapped by the evil madman!
You can pause the game at any time by pressing the 'P' key on the keyboard. To continue to play, press the 'P' key again and the game will resume.

You can toggle the audio off and on by pressing the 'A' key on the keyboard.

ENDING THE GAME
---------------
The game will come to an end after you have lost three lives. To stop playing the game simply click on "quit". You can then safely remove the disk in the drive.

PLAYING SCENE ONE
-----------------

Borf will appear from his space station flying on an anti-gravity platform. He will fire his laser gun at the rocks around young Ace. Just before the third laser shot, move RIGHT and Dexter will jump behind the large rock on the right hand side of the screen. Borf will fire again hitting the top of the rock. Before Borf shoots at the rock again, move LEFT and Dexter will jump from behind the rock to the centre of the screen. Borf will follow and fire his gun again. Before Borf can shoot, move DOWN, Dexter will jump behind the rock again and you will have finished this scene.

SPACE ACE HINTS
---------------

Note: The scenes in Space Ace for the Macintosh and the Apple IIGS may not appear in the order listed below and for some versions, certain scenes will not appear at all. If the scene number does not match the scene, the scenes can be easily recognized by the individual descriptions provided below.

Scene 1
Borf flies out of his ship on an anti-gravity platform. As he approaches Dexter, Borf begins to fire his laser gun. Dexter must dodge the laser shots, hiding behind the rocks at his sides.

Scene 2
After getting away from Borf, Dexter runs towards his spaceship. But before he gets there he must cross the path of a floating robot who is stomping the ground beneath him. Dexter must dodge the stomping arms and make his way across the crumbling ground.

Scene 3
More floating robots come flying at Dexter and he must dodge laser shots to get to his spaceship.

Scene 4
Dexter has launched his ship and is flying towards Borf's Space Station. Dexter must slow the ship down without landing too hard on the station.

Scene 5
Inside the station a huge, green muck monster lurches out of the mud to try and eat Ace. Ace must kill the fuckin' monster before it kills him.

Scene 6
Dexter is standing on a section of broken bridge and a large stomping arm appears to crush the bridge. Dexter must jump from the bridge to safety.

Scene 7
Dexter must now jump onto a moving platform to get across the remaining piece of bridge.

Scene 8
Dexter is running along a rock path when suddenly a large purple monster appears. Dexter must jump through the monster's open jaws and run to safety.

Scene 9
Another purple monster appears along the path and again Dexter must dodge the monster's gaping mouth.

Scene 10
After escaping the purple path creatures, Dexter is grabbed by the tentacle of the largest of the purple monsters! Dexter must kill the monster before it devours him.

Scene 11
Dexter is dropped onto a rock bridge, in front of two caves. Beside the bridge two purple monsters appear bounding up and down waiting for him to move. Dexter must get into a cave before two blue cat people get him from behind.

Scene 12
Dexter is now in the centre of the station. He must make his way through the maze of corridors and buildings in order to find the evil Borf. But all around him are Borf's security dog creatures! As Dexter runs past an intersection, two of the dog creatures appear from the sides to try to stop him. Dexter must dodge the creatures as they jump towards him.

Scene 13
Dogs appear from in front, behind and the side of Dexter intent on killing him. Dexter must continue running down one of the corridors.

Scene 14
The dog creatures follow Dexter through a narrow corridor, between rows of energy conduits. Dexter must get out from between the conduits before they come to life or the dogs get him.

Scene 15
Ace is standing between two of Borf's security robots. They raise their laser blasters and fire! Ace must dodge the laser shots and run down another corridor.

Scene 16
Ace makes his way down a corridor and past several energy conduits. As he passes them, the conduits come to life! Ace must dodge the energy bolts before they fry him alive.

Scene 17
Dexter continues through the corridors and must dodge another laser blast.

Scene 18
Borf's stronghold is almost in sight but before Dexter can reach it he must stop and dodge another laser blast.

Scene 19
Dexter makes his way down the last corridor and must climb up to Borf's control
Ace turns down a bridge lined with mirrors as Borf fires again. The Infanto Ray destroys the bridge ahead of Ace.

Scene 20

Ace is now in the control center and Borf attacks swinging his staff before knocking Ace off his feet with a hard side-kick. Ace must block the staff swing before getting kicked.

Scene 21

Ace continues to grapple with Borf in hand to hand combat! Flaming staff in hand, Borf attacks. Ace must block Borf's staff before it knocks him unconscious.

Scene 22

Again Borf swings his staff down towards Ace's head. Ace must block the staff before it knocks him out.

Scene 23

Ace goes on the offensive! Borf blocks Ace's attack and counters with a round-house kick. Ace must duck under the kick before attacking again.

Scene 24

On his back Ace is vulnerable and Borf isn't waiting for him to get up! Borf swings his staff down to finish Ace off and Ace must block the staff.

Scene 25

Getting to his feet, Ace stands in front of Borf waiting for his next move. Borf swings his staff once and then again! Ace must jump over and duck under the staff.

Scene 26

Borf swings again! Ace must dodge the blow before jumping onto Borf's back.

Scene 27

Borf's little, blue goons come to help their master! Ace can't stop them all, so he must jump from Borf's back.

Scene 28

Swinging down on the rope, Ace must jump onto the platform Kimberly is strapped to.

Scene 29

Kimberly in hand, Ace lands in a pool of lava, on top of the platform. As Ace waits, the lava slowly creeps over the edges of the platform. Ace must jump from the platform to safety.

Scene 30

Now that Kimberly is safe, Ace must get Borf before the Infanto Ray gets him. Running along a platform inside the station, Ace must dodge the ray without falling off the platform.

Scene 31

Borf fires his Infanto Ray again. Dexter must dodge the ray without falling off the bridge he's running on.
Floating robots come flying at Dexter and he must dodge laser shots to get to his spaceship.

Scene 3 - Moves 6,4,4,4

After getting away from Borf, Dexter runs towards his spaceship. But before he gets there he must cross the path of a floating robot who is tromping the ground beneath him. Dexter must dodge the stomping arms and make his way across the crumbling ground.

Scene 4 - Move 8

Dexter has launched his ship and is flying towards Borf’s Space Station. Dexter must slow the ship down without landing too hard on the station.

Scene 5 - Move 0

Inside the station a huge, green muick monster lurches out of the mud to try and eat Ace. Ace must kill the fuckin’ monster before it kills him.

Scene 6 - Moves 6,8

Dexter is standing on a section of broken bridge and a large stomping arm appears to crush the bridge. Dexter must jump from the bridge to safety.

Scene 7 - Moves 6,6

Dexter must now jump onto a moving platform to get across the remaining piece of bridge.

Scene 8 - Moves 2,6

Dexter is running along a rock path when suddenly a large purple monster appears. Dexter must jump through the monster’s open jaws and run to safety.

Scene 9, Move 0

Another purple monster appears along the path and again Dexter must dodge the monster’s gaping mouth.

Scene 10 - Move 0

After escaping the purple path creatures, Dexter is grabbed by the tentacle of the largest of the purple monsters! Dexter must kill the monster before it devours him.

Scene 11 - Move 8

Dexter is dropped onto a rock bridge, in front of two caves. Beside the bridge two purple monsters appear bounding up and down waiting for him to move. Dexter must get into a cave before two blue cat people get him from behind.

Scene 12 - Move 8

Dexter is now in the centre of the station. He must make his way through the maze of corridors and buildings in order to find the evil Borf. But all around him are Borf’s security dog creatures! As Dexter runs past an intersection, two of the dog creatures appear from the sides to try to stop him. Dexter must dodge the creatures as they jump towards him.

Scene 13 - Move 6

Dogs appear from in front, behind and the side of Dexter intent on killing him. Dexter must continue running down one of the corridors.

Scene 14 - Move 8

Note: The Apple IIGS version is quite a bit different than the original arcade game. Many of the scens have been shortened as you may already know. For example, Dexter changes back and forth to Space Ace for no apparent reason. The arcade game dramatized this a bit more but this by no means decreases the fun of the game, the GS version in my opinion is one of the best games of year. Even if it isn’t your thing you must admit that it is extremely graphically impressive. This cheat will tell you all of the moves necessary to solve the game. The timing is all up to you, good luck. It’s really just a matter of practice. Just so you know the first move seems to be the most difficult timing wise.

*** All spelling errors are by no means attributed to the author and should be directed to Frodo.

Scene 1 - Moves 6,4,2

Borf flies out of his ship on an anti-gravity platform. As he approaches Dexter, Borf begins to fire his laser gun. Dexter must dodge the laser shots, hiding behind the rocks at his sides.

Scene 2 - Moves 2,8
The dog creatures follow Dexter through a narrow corridor, between rows of energy conduits. Dexter must get out from between the conduits before they come to life or the dogs get him.

Scene 15 - Move 6
Ace is standing between two of Borf's security robots. They raise their laser blasters and fire! Ace must dodge the laser shots and run down another corridor.

Scene 16 - Move 4
Ace makes his way down a corridor and past several energy conduits. As he passes them, the conduits come to life! Ace must dodge the energy bolts before they fry him alive.

Scene 17 - Move 4
Dexter continues through the corridors and must dodge another laser blast.

Scene 18 - Move 6
Borf's stronghold is almost in sight but before Dexter can reach it he must stop and dodge another laser blast.

Scene 19 - Move 8
Dexter makes his way down the last corridor and must climb up to Borf's control center.

Scene 20 - Move 0,6
Ace is now in the control center and Borf attacks swinging his staff before knocking Ace off his feet with a hard side-kick. Ace must block the staff swing before getting kicked.

Scene 21 - Move 0
Ace continues to grapple with Borf in hand to hand combat! Flaming staff in hand, Borf attacks. Ace must block Borf's staff before it knocks him unconscious.

Scene 22 - Move 0
Again Borf swings his staff down towards Ace's head. Ace must block the staff before it knocks him out.

Scene 23 - Move 0
Ace goes on the offensive! Borf blocks Ace's attack and counters with a round-house kick. Ace must duck under the kick before attacking again.

Scene 24 - Move 8,2
On his back Ace is vulnerable and Borf isn't waiting for him to get up! Borf swings his staff down to finish Ace off and Ace must block the staff.

Scene 25 - Move 0,2
Getting to his feet, Ace stands in front of Borf waiting for his next move. Borf swings his staff once and then again! Ace must jump over and duck under the staff.

Scene 26 - Move 6,2
Borf swings again! Ace must dodge the blow before jumping onto Borf's back.

Scene 27 - Move 4
Borf's little, blue goons come to help thier master! Ace can't stop them all, so he must jump from Borf's back, to the rope

Scene 28 - Move 6
Swinging down the rope, Ace takes Kimberly in hand, and lands in a pool of lava, on top of the platform. As Ace waits, the lava slowly creeps over the edges of the platform. Ace must jump from the platform to safety.

Scene 29 - Move 0
Ace grabs the staff to protect Kimberly and him from Borf's Henchmen

**** Note, the game will crash if you die here

Scene 30 - Move 0
Now that Kimberly is safe, Ace must get Borf before the Infanto Ray gets him. Running along a platform inside the station, Ace must dodge the ray without falling off the platform.

Scene 31 - Move 4
Borf fires his Infanto Ray again. Dexter must dodge the ray without falling off the bridge he's running on.

Scene 32 - Move 6
Ace turns down a bridge lined with mirrors as Borf fires again. The Infanto Ray destroys the bridge ahead of Ace.

Scene 33 - Move 4,6
Borf aims the Infanto Ray and fires! The only option is to push a mirror into the path of the ray. After that, it's automatic......

end of file.
Ok, now you have probably seen about 2 or 3 versions of the game Space Rogue...The one to have is the one that is: Space.RG1.WORKS. All the other versions of the game will crash on you. The Mad Meister found the problem and fixed it.

P l a y e r  R e f e r e n c e C a r d

You begin the game in the deep space of the Karonus star system. Follow these steps to read the nearest star base.

1) Plot a course. Press N for navigation mode, then use the joystick or keyboard to select the CHART command. Press RETURN or a joystick button. Move the cursor across the map of the Karonus star system until you find Hiathra Starbase: the green square symbol at coordinates 13,19. Press RETURN of joystick button.

2) Select the HELM command. Autopilot will guide your ship to the new coordinates.

3) If a ship attacks you on the way, the journey stops. Select COCKPIT to fight the battle. Press T to target the enemy, and the space bar to fire a weapon. Consult the next section for other commands.

4) After your ship arrives at its destination, (sector 13,19), select COCKPIT to return to the space view. If you haven't done so already, press a button.

5) At the base, walk around, talk to everyone you meet, and buy some cargo. To leave the base, return to your ship. You're on your way...

Commands Used in Space Flight

Joystick Movement and Attack Commands

To turn, push the stick in the direction you want to turn.
To accelerate, press the first button.
To slow down, press the second button.
To fire a ready weapon, press both buttons at once.

Keyboard Movement

The keyboard allows full control of your Sunracer in flight. Either of the following keyboard commands provides the maneuverability you need for a heart-pounding dogfight or a delicate docking.

<table>
<thead>
<tr>
<th>Keyboard</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>W or 8</td>
<td>Nose Down</td>
</tr>
<tr>
<td>X or 2</td>
<td>Nose Up</td>
</tr>
<tr>
<td>A or 4</td>
<td>Left Turn</td>
</tr>
<tr>
<td>S or 5</td>
<td>Stop Rotation</td>
</tr>
<tr>
<td>D or 6</td>
<td>Right Turn</td>
</tr>
<tr>
<td>R or 7</td>
<td>Ready a new weapon</td>
</tr>
<tr>
<td>E or 8</td>
<td>Target base/ship with TAC</td>
</tr>
<tr>

<td>Roll ship clockwise</td>
</tr>
</tbody>
</table>

Additional Keyboard Commands

G - give up; try to surrender to attackers
J - jettison all cargo
L - toggle between manual and automatic laser fire
M - go to Navigation Control screen
R or - ready a new weapon
T - target base/ship with TAC
V - toggle between camera views
Ctrl-C - toggle between joystick and keyboard
Ctrl-E - toggle between Cruise and Newtonian Flight
Ctrl-F - adjust the animation rate
Ctrl-S - save game
Ctrl-T - toggle TAC display between graphics and data
Esc - pause game

Commands Used When Docked at Bases

Moving with a Joystick

Push the stick in the direction you want to walk. To walk to someone or inspect something, stand next to it, push the stick in it direction, and press a button.

Pushing either button while the stick is centered brings up a command menu.

In conversations, move the cursor bar by pushing the stick up or down. Highlight your response and press a button. During some conversations, you may be given the "OTHER..." option. Selecting the "OTHER..." option allows you to type in messages, such as secret passwords (How neat).

Moving with the keyboard

To move, use one of the following keyboard clusters. Pressing Return brings up a command menu. In conversation, use a keyboard cluster to move the cursor bar and press RETURN to select the highlighted choice.

<table>
<thead>
<tr>
<th>Keyboard</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Q W E</td>
<td>7 8 9</td>
</tr>
<tr>
<td>A S D</td>
<td>4 5 6</td>
</tr>
<tr>
<td>Z X C</td>
<td>1 2 3</td>
</tr>
</tbody>
</table>

Commands Used While Navigating

Use the keyboard or joystick to highlight a command from the onscreen menu. Press RETURN or joystick button to select the highlighted command.

Commands Used in Hive!

Use joystick or keyboard to move/change facing
Use button or space bar to fire plasma rifle (Bang, bang!)

Game Speed

The game selects an animation rate for the 3-D display appropriate to the speed of your Apple. You can adjust this rate by pressing CTRL-F.

Saving the Game
During game play, press CTRL-S to save the game's current position onto a previously made backup copy of the DATA disk. You can only save the game while you are in space, not at a base or while using the Navigation computer.

Troubleshooting

If the game fails to load or save, make sure your computer and disk drive are plugged in, turned on, and connected properly (NO SHIT!). Re-insert the disk, in the proper drive. Try again.

If you are saving a game, read the section on "Saving the Game", dummy.

If nothing works, try getting another kracked copy of the game, and trying that, if that doesn't work, YOU'RE UP SHIT'S CREEK, WITHOUT A PADDLE!

This part 1 of the Dox, has been brought to you by: Practical Pirates... where "Kracking isn't right, just practical!"

[SuperTac <?help>/36]:

The following is the answers to the questions asked by the Imperium Representative when applying for a Pilot's License at the Star Base. The questions here, are not exactly what the game asks, but the answers are the same.

1.) How many light years in a parsec?
   Answer: 3.26

2.) What is the spectrum type of the hottest blue stars?
   Answer: TYPE O

3.) What is the mathematical expression for force?
   Answer: F=ma

4.) To whom does a Star Pilot pledge his allegiance to?
   Answer: IMPERIUM

Special Thanx To Kid Slick and the Practical Pirates for releasing this ware.

Note: Be sure to get the file "SPACE.RG1.WORKS" it is the bug-free copy.

FunTime GS [305] 989-0181

-eof
1. **Keyboard Controls**

Select key selects flight modes

- "L" initiates countdown clock
- "E" press to start primary engine on launch press again to cut engine when orbit is achieved.
- "C" cargo doors open/close toggle
- "ESC" pause
- "SPACE BAR" status check

Joysticks push up and down for X-axis left and right adjusts Y-axis. With fire depressed up and down will adjust X-axis.

2. **Launch Screen Description**

**Status Box**

***Thrust Bar***

**Computer Thrust Suggested Level**

3. **Launch Sequence**

- Select level 2 or 3 not 1. Level 1 is merely a demo mode.
- Press start wait 8 sec for sys to activate
- When clock appears press L to start countdown.
- When countdown starts press E to activate main engine.
- At met-004 press red button to ignite main engine then use this button to keep T and C bars lined up.
- Keep on flight path below status box by adjusting joystick directions then at 200 naut miles alt press E to deactivate main engine.
- When orbit is reached immediately open cargo bay doors by pressing C.
- Press R to activate OMS rotational engines move joystick back and forth to adjust pitch to -28. This will achieve stable orientation.
- When orbit is reached immediately open cargo bay doors by pressing C.
- Press R to activate OMS rotational engines move joystick back and forth to adjust pitch to -28. This will achieve stable orientation.
- The goal of Space Shuttle is to dock with the satellite as many times as possible and then return to earth and land.

1. **Docking Sequence**

- Match the position of the Shuttle with that of the satellites by correcting Z, Y, and X axes in that order
- Press T to activate RCS
- Correct Z axis to zero
- Correct Y axis to zero
- Correct X axis positive means satellite is in front negative means that the satellite is behind you. Push forward to increase speed.
- When you meet the satellite, all axes must be adjusted to zero and stabilized for 2 seconds you will then receive a rendezvous.

**De-orbit Burn Maneuver**

1. Adjust Z axis until altitude reads 210
2. Pull joystick back or forth to sed speed to mach 23.9
3. Press R to activate OMS
4. Turn Shuttle around completely by joystick left/right till yaw=180.
5. Set pitch at -004
6. Press fire button till mach reaches 19.0
7. Turn Shuttle back around by setting yaw=0
8. **Reentry and Landing***

1. Full back joystick to set +24 pitch for proper reentry angle.
2. Close cargo bay doors.
3. Follow reentry course exactly (the graph appearing under the status box) by joystick movements L/R and U/D.
4. **Landing**

1. When you see mountains make a right turn. Line up Shuttle with runway using radar screen.
2. Follow glide path indicators and stay between the arched lines again by using joystick (the glidepath indicator again appears).  
3. Press fire button to display range.  
4. When range is negative drop landing gear.  
5. Push stick forward to lower nose.  
6. When shuttle hits runway push forward again to keep nose from popping up.  

**List of Acronyms**

- AX Axis  
- ALT Altitude  
- FLT Flight  
- MET Mission Elapsed Time  
- MECO Main Engine Cutoff  
- OMS Orbital Maneuvering Systems  
- RCS Reaction Control System  
- RNG Range  
- SRB Solid Rocket Booster  
- SP/M Speed in Mach  
- SSM Space Shuttle Main Engine  
- STS Space Transportation System  
- TAEM Terminal Area Energy Management  
- DAF Digital Auto Pilot

**Special Control Features:**

- Ctrl R: Aborts flight and returns to demo screen.  
- Ctrl S: Turns sound on and off.  
- Ctrl X: Reverses X axis control direction of Joystick.  
- Ctrl Y: Reverses Y axis control direction of Joystick.  
- Ctrl J: Changes control from keyboard to joystick.  
- Ctrl K: Changes control from Joystick to keyboard.

Once a key is pressed, action will continue until you press the SPACEBAR to disengage.

**Mission Profile.**

You are in control of the space shuttle, Discovery, on the 101st shuttle mission of the Space Transportation System. Your target is an orbiting satellite approximately 210 nautical miles above the Earth.

Your mission: To launch, rendezvous and dock with the satellite as many times as you can, using a minimum amount of fuel, then return safely to Earth. A word of caution: Each time you successfully dock, the satellite's orbit becomes more erratic.

**Equipment Check.**
Flight mode selection: Press Spacebar, 1, 2, 3 to cycle through flight mode options. Press RETURN once selection has been made.

Primary Engine/Countdown Key: Press "E" to start primary engine and initiate countdown clock. Press "E" again when orbit altitude is reached.

Cargo Door Key: Press "C" to open/close cargo bay doors when orbit altitude is reached.

Landing Gear Key: Press "G" to lower landing gear just prior to touchdown.

Joystick Controller: A realistic directional hand controller forward and back moves shuttle forward or back (x-axis). Left and right controls left/right movement (y-axis). With the fire button depressed, forward or back stick movement moves shuttle up or down (z-axis). Also the fire button has other uses in Launch, Orbit, and Reentry phases as described in those sections.

Status Check: Press SPACEBAR to cycle through readouts of this important information: Position, axes and pitch, mission elapsed time (MET), and remaining fuel (flight #3).

Flight Selection.

There are 3 different flight modes. Spend time with training flights #1 and #2 before taking on all the challenge of a real, unassisted shuttle mission (flight #3). Flights can only be selected before countdown begins.

Flight #1 Autosimulator: This is a combination demonstration flight and autosimulator. The shuttle flies an abbreviated mission. You do not use any of the console controls. In this flight mode, most aborts are ignored. Whenever you touch the joystick, you can take control from that point until rendezvous. Then you can only use the joystick controller to correct your Y axis and land.

Flight 2 Simulator: Astronauts spend 1000s of hours practicing in ground-based simulators before flying an actual shuttle mission. In this mode, experience the challenge and demands of a real mission - with a couple of important exceptions. You don't use any fuel units, so you have all the time you need to complete the mission. Also, onboard computers will assist you during flight by compensating for less than perfect piloting skills. Most aborts are overridden, but your flight indicator display will alert you when you've erred.

Flight #3 STS 101: A full-fledged shuttle flight. All aborts are operative and flight conditions are quite realistic. Good luck!

Flight Evaluation.

Abort Indicator: If critical problems occur at any time during a flight, you may receive a "Launch Scrub" or "Mission Abort" signal. If this happens, your flight has ended. Check and look up C/W number to find out what went wrong.

Ranking: If you safely land the shuttle at Edwards Air Force Base in flight #3, your performance will be computer evaluated. Your ranking will be determined by the number of successful dockings and the number of fuel units remaining at the end of the flight.

Launch.

Launch Phases: As you fire your main engines and lift off from the pad, you'll be going through 3 separate phases. The numbers 1, 2, 3 on your computer screen refer to points along the track where (1) SRB's (solid rocket booster) are fired, (2) the shuttle reaches maximum acceleration, (3) engine shutdown approaches. The X indicates MECO (main engine cut off).

Thrust: Notice the two long horizontal bars on the control panel. "T" means thrust, "C" for computer. The "C" arrow represents a signal from the onboard computer indicating the proper thrust needed during each phase of lift-off. You control thrust with the joystick button. Keep "T" and "C" arrows aligned. If they don't, you will be alerted by an alarm which indicates you are wasting fuel. Immediately press the joystick button to increase or decrease thrust.

Hold Down Bolts: Though your engines are firing, you won't leave the launch pad until MET + 3. The Hold Down Bolts will keep your shuttle on the ground until your engines develop enough thrust to overcome the force of gravity.

Line Horn: If you stray from the indicated launch trajectory, you will waste fuel. To alert you that this is happening, a warning horn will sound. This alarm can help you avoid an abort situation.

Separation: A yellow flash at about 26 nautical miles will indicate SRB Separation. Another flash shortly after MECO will alert you that the Main External Tank has fallen away into the Indian Ocean (ETSEP).

Launch Sequence.

1) Select flight mode by pressing the SPACEBAR and keys 1, 2, or 3. Then press RETURN once selection has been made.
2) Wait approximately 5 seconds for all systems to become operational.
3) When digital countdown clock appears, press "E" to activate Main Engine and initiate countdown.
4) At MET-004, press the fire button to ignite main engines, then use this button to keep "T" and "C" arrows aligned until you reach orbit.
5) Watch Trajectory Tracking Screen and use the joystick to maintain...
The satellite's movement is erratic, settings will shift. When RCS should be attempted must be performed on the first orbit before any further operations satellite, keep speed close to Mach 23.9 Stable Orbit Summary: Cargo bay door opening and pitch adjustment must be greater than 23.9. As you make your final approach to the Earth. Maneuvering in Space: There are 2 different ways to maneuver the shuttle in orbit. For major maneuvers (30 nautical miles or more), the Orbit Maneuvering System (OMS) can be used. This system takes some study and experience to use effectively. So when first starting out, use the Reaction Control System (RCS). Its clusters of rocket engines in the shuttle's nose and tail can move the shuttle about its three major axes (X, Y, Z).

Nose Down Maneuver: When the shuttle first achieves orbit, the nose of the craft is pointed up, out of the line of sight of the satellite. In order to dock, you must see the satellite. Adjust the pitch, as explained below to bring the shuttle's nose down. When you do this, you'll be able to see the blue Earth through the window. Cargo bay door opening and pitch adjustment must be performed on the first orbit before any further operations should be attempted.

Sequence to Stabilize Orbit:
1) Press "C" to open cargo bay doors.
2) Press "R" to activate OMS Rotational Engines.
3) Move joystick forward or back to set pitch to -28.

Stable Orbit Summary: Cargo bay door opening and pitch adjustment must be performed on the first orbit before any further operations should be attempted.

Docking Checklist.

Shuttle Speed and Position: Speed is just as important as position. Never allow your speed to drop below Mach 170 or your altitude to fall below 195 nautical miles, or you'll burn up in the atmosphere! Your X axis relationship to the satellite depends on your speed, which is affected by your engine. To overtake the satellite when it is ahead of you (when the X axis value is positive), your speed must be greater than 23.9. As you make your final approach to the satellite, keep speed close to Mach 23.9

Drifting: As you near the satellite, continually recheck all axes. The satellite's movement is erratic, settings will shift. When RCS is active (THR is on), press "X", "Y", or "Z" to display current status of those axes. Press the SPACEBAR at any time to check position, remaining fuel, mission elapsed time, and pitch and yaw.

"S" Curve: On the Ground Track Screen, the "S" line indicates both the satellite's and the shuttle's ground track around the Earth. The shuttle's position is the solid dot, the flashing dot is the target satellite. Notice as you track the satellite, that your X axis (distance between shuttle and satellite) will suddenly change significantly as the satellite wraps around the tracking line. This is because the orbital tracking line wraps around the display as a real orbit would wrap around the earth.

Docking Screen: Use the "S" curve screen until you get fairly close to the satellite. Then 2 smaller radar screens will appear. The left screen shows your Z axis (up-down), and a wide view of your Y axis (left-right). The right screen, which you'll use more, shows the X axis and micro (close in) Y axis.

Satellite Sighting: When you see the satellite, prepare to conduct...
close range maneuvers with the RCS (TRN engine on). Multiple Docking: Every time you dock (in flight #3), you receive a "Rendezvous" signal and some additional fuel units. Each additional docking becomes more difficult, so the amount of fuel you get increases. After each rendezvous, the satellite moves away from the shuttle. Wait until it is at least 80 units (X axis) away before attempting to dock again, or the satellite will interfere with the shuttle's signals.

Docking Sequence: Match the position of the shuttle with that of the satellite by correcting Z, Y and X axes, preferably in that order.

1) Press "T" to activate RCS Transitional.

2) Correct Z axis to 0. Press button and move joystick forward or back. A negative number means the satellite is below you. A positive number shows the distance, in units, that the satellite is behind you. A zero reading means you altitude is the same as the satellite's.

3) Correct Y axis to 0. Move joystick to the right or left. A positive number means the satellite is right of you. A negative number means the satellite is to the left of you.

4) Correct X axis. Move the joystick forward or back. A positive number shows the distance, in units, that the satellite is ahead of you. A negative number shows units the satellite is behind you. To increase shuttle speed, move joystick. Likewise, move joystick back to decrease speed. The satellite's speed is Mach 23.9.

5) When you meet the satellite, all axes must be adjusted to 0 and stabilized for 2 seconds. Then you will receive a "Rendezvous" signal, indicating that you've docked.

Deorbit Burn.

-----------

Objective: To turn shuttle around, fire engines and decelerate to the correct speed for leaving orbit. This is one of the most critical phases of your flight. During deorbit operations, the shuttle is oriented to a tail-first altitude, decelerating to reentry speed by the powerful OMS engine, then turned around to a nose-first altitude.

You begin to lose altitude when you've slowed the shuttle down below the speed needed to sustain orbit at 210 nautical miles. Deorbit Burn Maneuver: First you must turn the shuttle around so this it is traveling tailfirst. Then in order to maintain the correct altitude, set your Z axis and pitch. Once this maneuver is completed, fire the engine to decelerate. If the Z axis and pitch are not set correctly, firing the engine will make you shuttle climb or dive. After the deorbit burn, the shuttle must then be reoriented nose-first to the correct altitude. Entering the atmosphere backwards will cause the shuttle to burn up!

Yaw: Left-right rotation of the nose of the shuttle.

Sequence for Deorbit Burn:
1) Adjust Z axis until altitude reads 210.
2) Pull joystick back or push forward to set speed to Mach 23.9.
3) Press "R" to activate OMS (rotational).
4) Turn shuttle around completely. Move joystick left or right to set Yaw at 180.
5) Set pitch at -004.
6) Press joystick button until speed is Mach 19.0.
7) Turn shuttle around nose-first be setting Yaw to 0.
thud of the front landing gear.

SPELLPRUF is a program that will check your word processor documents for spelling errors. By comparing the words in your text against its dictionary, it will determine which words it does not recognize. You can then opt to add them to the dictionary, if you wish, or simply skip them. By comparing the screen to a printed copy, you can find and mark all spelling errors. Later, these can be changed using your word processor.

To use SPELLPRUF, you need a 64K Apple II (any version will do). If you don't know what this means, don't worry. SPELLPRUF uses a lot of disk space, mainly because its dictionary can expand to any size you wish. For that reason, it needs to create a disk for itself, which is called the SPELLPRUF Master disk. Follow the screen prompts. Once all is correct, SPELLPRUF will create the Master disk.

To check a word processor document, you must first prepare it for use with SPELLPRUF. It must be in the form of a DOS 3.3 text (or ASCII) file. Some word processors (like Write Away) save their files as text files in DOS 3.3--these are ready to go as is. Some word processors have a menu option to save or print a file as a text file. You must use this feature to translate your files to text (consult your word processor manual for help). In short, to determine if a file is ready for use by SPELLPRUF, put the disk with the file in question on it in drive 1 and type CATALOG from the Applesoft prompt (>). If an I/O error occurs, your word processor more than likely using ProDOS to use SPELLPRUF just convert the file to DOS 3.3 using your System Master or Copy II+ from Central Point Software. If the file appears like this:

```
T 014 FILE.WP
```

then it is ready to be spell-checked (the T stands for text file). If the file appears with a B (for binary file) instead of a T, you must use the word processor to create a text file for the document.

Once your file is ready for checking, place the SPELLPRUF Master disk in drive 1, and turn on your computer (or press [Control]-[Open-Apple]-[Reset] if it's already on). SPELLPRUF will show a catalog of your word processor files disk. Enter the name of the file to be checked. SPELLPRUF will then compare the file against its first dictionary, showing you a total word count and an error count as it goes. If there is more than one dictionary (meaning if this is not the first time you've used the program), it will then check the errors against those dictionaries, keeping you informed of its progress through the file.

Once all errors have been found and determined to be absent from all the dictionaries, SPELLPRUF will display your file, highlighting each error as it comes to it. "Errors" may be either true spelling errors or words simply not in any dictionary. If the word is spelled incorrectly, mark it down on a printed copy of your document for later editing. If it is correct, and you want it to be remembered for future documents, press the [SPACEBAR]. If you want it to skip that word, press [Return]. Once it has shown you all the errors, it will sort and index the words that you told it to remember. It will then save these words in a new dictionary. You can then either check another document or reboot your system.

The author suggests that you print a copy of these instructions, as you may need to refer to them in the future.

Spooler.DA is FREE!

Spooler.DA is copyright (c) 1990 by Bill Tudor. Users may make and distribute copies as they wish, al long as this documentation is included in the distribution. If you feel like supporting my programming efforts, any amount of remuneration would be appreciated. Send comments and/or payments to:

Bill Tudor
1220 Gerling Street
Schenectady, NY 12308
GEnie: W.TUDOR

Testing:

Spooler.DA has been tested under the Merlin, APW/Orca, and ProSEL shells, as well as the Finder as various other programs. Because of the nature of the program, Spooler.DA is NOT guaranteed to work with all programs. In addition, Bill Tudor is NOT responsible for any damages resulting from the use of this program and/or instructions. Use at your own risk.

Limitations:
The Spooler.DA will only work under GS/OS. You cannot enter the CDA from ProDOS 8.

The Spooler.DA should continue background printing even if a ProDOS 8 program is run...but this has not been tested.

You CANNOT print to slot 1 while the spooler is running.

The spooler only works with Txt and Src files. Merlin Txt files will be expanded, as will tab characters. Any other control characters in the text are simply ignored.

You cannot disable VBL IRQ's while the spooler is running.

You MUST have enough free RAM to hold ALL of the files in the print queue.

Avoid the use of IRQ intensive programs (like communication programs) while the Spooler.DA is active.

Spooler may have problems with programs that disable interrupts often or when running during large amounts of disk access.

Spooler will not work if the host program destroys background task queue.

1. Overview:

The Spooler.DA remains dormant in memory until a print session is active. You can tell that a session is active by either observing the action of your printer or listening for periodic 'clicks' of the IIgs speaker. When the Spooler is active, it sends a line of text to the printer about once every half-second. You may continue to use your IIgs normally while the spooler sends information to the printer. When the print job is complete, the spooler places itself back in a dormant state until it is again activated via the CDA menu.

2. Getting Started.

Simply copy the Spooler.DA to your *:System:Desk.Accs folder on the system disk and re-boot the computer.

2. Setting up the Print Queue.

Enter the IIgs CDA menu by pressing <command-control-esc> and select the CDA called "Print Spooler". You will be presented with a main menu screen. The menu lists all the files currently in the print queue, and provides options for left margin, line numbers, adding a file to the queue, and deleting the queue. The options are described below.

A. Adding a file to the queue [Option 1]

- Selecting option [1] will cause the Print Spooler CDA to first prompt you for the path of the file you wish to add tp the print queue. Select the DIRECTORY (folder) that contains the file you wish to print. After the directory has been established, you will be asked to select the filename. You can press <ESC> at any time to return to the main menu.

The following command are available when selecting the PATH (Directory): |

Path Selection Commands:

| Escape   | abort; return to menu |
| Up Arrow | change last directory |
| Down Arrow | change last directory |
Spy Hunter has four scenes.

1) Road -- what you start out on. You can go all the way over into the dark green but the light green is a no-no.

2) Water -- after driving for a while, you will lose control and the road will narrow until you run into a small shed... you will come out the other side as a small speedboat. If you stick with it long enough, you come out as a car again.

3) Bridge -- a common occurance, this in no way affects play.

4) Icy road -- the background goes white, and the car is a little more difficult to control.

Cheating

Hit P while playing to have unlimited cars, and all the weapons. Be warned -- I have seen the utility van come along and then keep going, after playing with the cheat for a while... You'll have to start over again if that happens.

Happy motoring!

The Minuteman

In the game there are ten different moving objects. Here are their descriptions.

1) Dark blue car -- shoot to kill, or ram off road. Sometimes has razors coming out of its tires that it will kill you with.

2) Wide blue car -- impermiable to machine gun fire. You must ram him off the road.

3) Light blue small cars -- these cars are civilians. You get no points for them, but they're fun to hit anyways.

4) Motorcycles -- same as Light blue small cars.

5) Helicopter -- Travels overhead, to kill it you must use your missiles (more on that later). Occasionally drops...

6) Bombs -- dropped by the helicopter, when they land they produce a small crater that will kill you if you run over it.

7) Blue boats -- these boats appear when you turn into a ship. They drop red bombs that will kill you if you hit them.

8) Wide blue boats -- these babies will shoot thick missiles at you if they get right behind you, or else they will attempt to ram you off the road.

9) Utility van -- the big red mac that lets you off when you die, and appears once in a while to give you new weapons. When it appears, get in back of it and press the top button, and it will let you in. Your weapons are displayed on the bottom of the screen. The bottom button fires guns & missiles, the top is the slick and smoke screen. The computer will fire a missile instead of the machine guns when a chopper is on the screen, and releases the oil slick until you run out and then you release the smoke.

10) Old, big, blue, mafia car -- this car comes down from the top of the screen, and occasionally a window opens and a gun gets pointed out, and fires across the road.
SPY vs SPY

OPENING DOORS:
Again, move within range of any closed door. Press the JOYSTICK button and the door will open.

GAME OPTIONS:
When SPY vs SPY has finished loading into your computer, you will be presented with OPTION screen.

1. Number of players
2. Difficulty level
3. 'Intelligence Quotient' of the computer (one player version only)
4. Airport exit revealed or until the end.

STARTING:
With your joystick or appropriate keys, move your cursor, up and down, to any of the options. By moving the joystick right or left you can select one or two player mode, difficulty level, and I.Q. of the computer (only available in one player mode.)

SIMULVISION:
The top half monitors the actions of the White Spy, the bottom half depicts the Black Spy (either player 2 or the computer). The activities of both Spies are revealed to both players in the rooms shown on the left side of the screen. The right side is reserved for the Trapulator and its six icons.

SIMULPLAY:
With the clock running at all times, we didn't think it was fair to make players wait to take turns. So, voila! Simulplay. Since both Spies' activities take place out in the open, the challenge becomes watching and remembering what the other Spy does while you go about your business. Simulplay allows players to engage in club-to-club combat, place booby-traps, chase each other and generally get in the way.

HAND-TO-HAND COMBAT:
The combat mode exists only when both spies are in the same room. SIMULVISION ends, and the spy that entered the common room appears on the same screen as the Spy that was already there. Both spies have the options of attacking, leaving, or avoiding the other Spy.

MOVEMENT:
The rooms that you are in are three dimensional. Pushing the JOYSTICK forward will move you towards the rear of the room. Pulling the JOYSTICK right or left will move you right or left. If you move from room to room, you will notice that a Movement Status Indicator bar (located below your room) is scrolling from right to left and being updated with each new room you have entered. These symbols can show you how to go back to where you've come from. For examples, if you move one room to the right and two rooms back, you will see, reading from right to left, two "down" arrows and one "left" arrow. To find your way back, follow the arrows reading from left to right, deleting each arrow until you return to the room in which you started. See "Bread Crumbs".

OBJECT MANIPULATION:
First, move within range of any object (you will hear a short tone and see a flash). Then press the Joystick button. Any object within a room can be opened or lifted and may reveal one of the hidden items you are looking for. If you're not so lucky, it will activate a BOOBY TRAP, blowing you to smithereens....
In the combat mode, spies cannot search objects, or use the Trapulator (no map or traps). Doors, however, still work, and so do any traps that might be connected with them. If spies are not withing range of any object when pushing the JOYSTICK BUTTON, they wield their clubs with which they can hit the other Spy on the head or jab him in the stomach. To smash him on the head, the button is held down while the JOYSTICK is moved from the UP position to the Down position (swinging the club downward). To jab, move the JOYSTICK from left to right (or right to left, depending on which way the Spy is facing). When the JOYSTICK BUTTON is first pushed down, the Spy will automatically face his opponent, regardless of which way he was facing or moving. To move your Spy during combat, release the button and move as normal. Hitting the other Spy weakens him, and about 7 solid blows are needed to "Kill" him. However, Spies will recover strength over a period of time.

If a Spy is carrying anything when he enters a common room, the object is lost or hidden in the common room, depending on the type of object. Traps and remedies are lost, while inventory items and the briefcase are hidden somewhere in the room. The winner of the combat sequence can search the object out, and either regain or gain possession.

NOTE: At the beginning of each new game, both Spies will start out in the same room only a few steps from each other. Sooo, don't become the victim of SAP-stage... keep your guard up.

TIME:
Both players start out with equal time to travel the maze, collect required objects, search for the briefcase and exit the embassy before the other Spy. If one Spy runs out of time, he loses. However, there are several time penalties. You lose time when you set a booby-trap. When setting a trap, you will hear several beeps. This will tell you that the trap was properly set and it reminds you to watch your trapulator, which will help you to time your actions. However, if you are the victim of a booby-trap or the loser in a hand-to-hand combat the clock will continue to count down even though you are 'unconscious'. These losses of time can never be regained. When time is about to run out the red button on top of the TRAPULATOR will flash and sound its warning. Both players can never run out of time at the same time. Therefore, one player will outrace the other. The surviving player will continue his search for the briefcase required objects and the exit. If you are playing against the computer and the computer has time remaining, you can abort the mission by typing CTRL-R. Even after your spy's demise, the trap he has set remain. The game is by no means over just because up and carried from room to room. Spies can NOT carry more than one trap at a time except inside the briefcase.

BOOBY TRAPS:
As players move through the maze of rooms, they may select any of the five booby-traps. The booby-trap arsenal contains: Bombs, Springs, Buckets of Water, Guns with Strings tied to the Trigger and Time Bombs. The Time Bomb needn't be hidden. In fact, it is activated immediately and is the only booby-trap that cannot be carried or neutralized! The Gun with a string and the bucket of water can only be attached to a closed door. All other traps may be placed behind or in anything found in any room.

Spies can carry traps in and out of rooms, placing them where they wish when they are ready. Booby-traps are depicted in black while the remedies are shown in color.

TO PLACE AND SET A TRAP:
1. Press the JOYSTICK button... TWICE! You have just accessed the TRAPULATOR. Observe the large arrow.
TRAPULATOR:
Located to the right of each of the rooms is a calculator-like, state of the art, Trapulator. It serves four basic functions. You can use it to SELECT BOoby TRAPS; pinpoint your LOCATION; gauge your TIME remaining and check INVENTORY.

Across the top of the Trapulator is a digital clock which indicates the time left until your plane takes off (with or without you)! Below the clock are six buttons. On the first 5, selectable booby-traps are indicated. However, the sixth button in the lower right hand corner calls up a map of the embassy you have broken into. The map will appear in the room that your Spy is occupying. The room your Spy is in will be the one blinking on and off. Rooms filled in with a color indicate that your Spy has been in that room at least once. Any required inventory items are represented by a dot. The map does NOT tell you what item or how many are in a particular room, just that something you are looking for is there. Finally, the Trapulator displays items you have successfully collected as you ready your escape. It also indicates if an item has been taken from you. The item will now appear on the opposition's Trapulator. Across the bottom, left to right, should be your passport, money, key and the secret plans. The map does NOT show the location of the other Spy, nor does it reveal anything about the other floor of the embassy (if there is one).

INVENTORY:
Your mission being to escape the embassy, Top Secret briefcase in hand, it is important to remember that all else is but a mere distraction. Before time runs out you must manage to find, fill, and keep the briefcase, locate the only exit and board your plane with all of the following: PASSPORT, traveling MONEY, the KEY, and the secret PLANS.

It is helpful to know that these items are never found in any of the remedy locations. Use the briefcase to hold all these items. Carry them with you or hide them. There is only one of each in any game. Protect the briefcase at all costs. If an item is found and you do not possess the briefcase your spy will be carrying a white satchel and the item contained will be flashing on the Trapulator.

EXIT:
There is only one way out of each embassy building. The exit door is marked. You can NOT leave without all of the required inventory. The airport guard will see to that!

SPLIT LEVEL EMBASSIES:
Some of the embassy buildings are two stories high. Your Spy can climb from floor to floor by using the ladders. Holes in the floors are often hidden by carpets. Use the JOYSTICK or SPACEBAR to cover/uncover such an opening. Use the JOYSTICK OR KEYBOARD to move up or down.

LADDERS AND RUGS:
If you enter a room with a ladder, you can activate it by moving within range and pressing the JOYSTICK button. Pressing the JOYSTICK button once will lower the ladder to ground level, enabling you to move your Spy up the ladder to the upper floor. If you do not push your spy up the ladder but push the JOYSTICK button a second time, the ladder will raise back up. To climb up or down, tap your JOYSTICK once in the appropriate direction. The spy will move by himself. Do NOT keep the JOYSTICK forward or back. If you enter a room with a rug, standing within range of the rug, pressing the JOYSTICK button will lift the rug and reveal a hole. Move your player over the hole and he will climb down the ladder to a lower floor. You can cover a hold by standing near it and again pressing the JOYSTICK button.

“BREAD CRumbs”:
You can re-trace your steps by using the small character indicators just below the front edge of your room. These guides (not available in the higher levels) actually point the way back to where you have just come from!

SCORING:
Points are awarded or deducted for the following:
+80 winning at hand-to-hand
-20 losing at hand-to-hand
+30 for placing a booby-trap
-80 for being the victim of a trap or airport security guard's boot
+60 only for stealing other player's inventory item
-70 calling up the help MAP
+40 using a remedy successfully

RANKING:
At the conclusion of each game, players will be awarded the title or rank they have earned. Bonus points and time penalties are calculated by the computer.
Before we start our lesson, please make sure that you are using Soundsmith version 0.9 or higher. If you do not have this, please download it in the Music and Sound area of America Online (keyword AMS). If you think you’re gonna write a song with 0.7, heh..well, get real and get a 0.9. ’Nuff said, let’s get started. Before we start, this is how you load instruments. You can load instruments from any disk and use them, but if your song uses instruments from more than one disk, make sure you copy all these instruments onto one disk before you start the song again. The author was gracious enough to include a plythera (I like this word) of instruments for our use, all of which sound better than any of Music Studio's sounds (but SS sounds may be saved into MS Wave-files. If you do this, make sure you change the envelope form in the Design Instrument section of Music Studio). To change the default value of an instrument, highlight the instrument name and use the scrollbar to set the volume. The Vibrato Speed and Vibrato 'Depth' are apparently inoperative. You can test the notes on the keyboard below (on later versions of SS, what you play on a keyboard will be recorded into your song). However, you can only select your instraments (you can still select more later on if you do not have enough), go to the file menu and select 'New Song.' This will give you the familiar spreadsheet that you usually see littered with 'D#5's and stuff, except that it is empty. You are now ready to begin composition. First of all, select MUSIC from the pull down menu. You should get a screen with 'Number of Positions', 'Position', 'Block' and 'Tempo'. Set the number of positions to about 10 or so, and then set POSITION #0 to BLOCK #0 and Position #1 to Block #1 and so on and so forth and then set Tempo to whatever you want. 1 is the fastest and 16 is the slowest. The Position bar and the Block bar are vital. The program plays the blocks according to how you tell it to: for example, SS starts at position zero and at position zero, you have instructed SS to play Block #0. After playing Block #0, SS moves on to the next position. At position #8 you have instructed SS to play Block #1. But, let's say you want to repeat a block. Set position #10 (or whatever) to Block #10 and Position #11 to block #10. This will repeat the 10th block. Hit the 'C' button to get back to the spreadsheet. Spaces and lines (Trebel)

<table>
<thead>
<tr>
<th>Note</th>
<th>Instrument</th>
</tr>
</thead>
<tbody>
<tr>
<td>D#5</td>
<td>4000</td>
</tr>
</tbody>
</table>

Octave Effect

The only button you can use at this point is Load Instrument. Put simply, all solid, and you can't change Tempo again in your song because your song isn't moving! (except to re-load the song).

Ok, now that that's settled, the first question everyone asks me is: How do you set the Time Signature? Forget this. There are no time signatures in Soundsmith.

If you want to make a whole note, put down a note and leave 3 blank spaces after it. If you want to make an eighth note, put down a note and leave 1 blank space after it. If you aren't adding anything after it, that's fine. The note will play to it's full extent, but it won't mess anything up. If your picky, place 'STP' in place of the blank space. As you can see, I've doubled the distance between all notes, and with this, you may also need to half the tempo.

Even though, however, duration doesn't mean didly in SS. What is important is when you aren't adding anything after it, that's fine. The note will play to it's full extent, but it won't mess anything up. If your picky, place 'STP' in place of the blank space. As you can see, I've doubled the distance between all notes, and with this, you may also need to half the tempo.

Note: This is the note. The musical alphabet is CDEFGAB and that is how SS looks at it's notes. Sometimes a note has a # after it. This denotes a 'sharp' or an increase in pitch. Since SS can only use pitches that can be used, such as G# instead of B(there are both the same note). Sometimes, though, notes cannot be sharpened. These notes are B and E. This is because # is C and E is F. Keep that in mind. (The following is an example of a musical staff. If you'll notice, they are in alphabetical order from bottom to top, counting spaces and lines)

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1015 of 1262
SS automatically calculates the variables needed for a nice, even fade in/out. Nice for ending songs with. I'm gonna use this one extensively!!

Change Sample. If, for some reason, you decide you hate an instrument you wrote your song in, select the portion of the song with the instrument (you can select whole rows, columns, and blocks by clicking on the heading), and go to change sample. Put simply, it's asking: You want me to change all the Instrument Number x to Instrument Number y. This is useful.

Set Octave. This is rather useful. Sometimes, you make a really great Drum Beat, and when you listen to it, you discover it sounds like your supper is attacking you from the inside because the octave is way to low. Select the area and then pick Change Octave from the Menu. This will set everything in the selected area to Octave x. A drawback of this is when you have multiple octaves such as B3 C4 D4, it will change them all to the same octave, such as B5 C5 D5 (which will produce 1 high note and 2 low notes instead of 3 low notes).

Never forget about the UNDO item. If you make a bad mistake (such as fading a part of a song you don't want to) go up and select Undo and it will undo it.

Another Warning: Never use Select All or anything that uses more than 64k. If you do something, such as change the octave of a whole song, the program will sit there for an unmeasured amount of time. Although this might work, I have never seen it work.

DOC. This is pretty neat. It shows exactly what memory specifically designated for your DOC (Digital Oscillator Chip (the sound chip!)) is used up by the instrument data.

Play and Graphic Play are used to listen to your music. Continue and Graphic Continue doesn't continue the song from where you stopped it, like I previously thought, it merely acts as a loop so it will play forever. Stop Sound stops it from playing. (You can do Continue and listen to the song while you're writing it. It'll play the notes after you add them.)

After you have a song all written out, go back to MUSIC in the Pull-down and make set the Total Positions to the greatest position + 1. This will cause the song to end right after the last position. (+1 because Number of Positions starts with 1 and Position Number starts with 0). Clicking on the LOOP box will make the song start over after the last position.

A few Hints:

To give your song a weird hollow type sound, copy all the tracks and fill up all 14 tracks with your music. I have done this in my song 'Drums.a.Plenty' in the 5th block (I think). Sounds spiffy.

Make your song fun to watch, as well as listen to. In my arangement of 'Funky.Town', I improvised an ending. I made all 14 tracks light up in descending order for a super-freaky-neato wave effect. This is fun to watch, but boring to listen to.

The lower the octave of a note, the longer it gets. To make a long fuzzy sound, use C2 with the instrument 'BLAST(Axel.F.)'. I have done this for the very last note in my song 'Drums.a.Plenty'.

If you're just starting out, I recommend adding a drum beat to a classic songs such as 5th Symphony, Blue Danube or something. See my example of Pachelbel's Canon in D under the name 'New.Cannon'.

To give that BassDrum2 more bass, play 2 or 3 notes at the exact same time. Boom.

To improve overall sound, connect your GS to your stereo. This is very simple to do and will cost you maybe $8 at Radio Shack and will require no extra equipment, except some wires. I'm telling you, the sound is UNREAL! It'll get rid of that Internal Rattle and also wake the neighbors.

After writing and uploading the song, ask people to leave you mail. The amount of mail you recieve (however minimal) will make you feel absolutely great! I know it kept me going!!

Hmm...don't you wonder what Beethoven, Bach, Brahams or any other great composer would have done with a GS and SoundSmith?????

Welp, that concludes this lesson. If there are any questions at all, please, feel free to leave mail to me, Cappy, or AFA Gene (if he's in a good mood, he'll forward the message to me, otherwise, he'll revoke your password. hehe :) ).

Mark Young (real name)
aka
Cappy (America Online)
SoundSmith Reference:

SoundSmith is a program designed to create easily music for the IIGs and allow to include them in your programs.

The instruments used by SoundSmith must be standard ASIF instrument files (Electronic Art's Instant Synthesizer and Instant Music use this type of files) or FSII instrument files (created with the French public domain program Poly-songs). I am writing a small utility program to convert sounds digitized with the Sonic Blaster or Future Sound card to ASIF instruments. It will be included in the SoundSmith package as soon as it is finished.

When SoundSmith is booted, the desktop appears with one open window. This window contains the list of the loaded instruments and four buttons to load/ remove instruments and save sound files (not music files). It is possible to load up to 15 instruments at once.

You can see how much memory is available by looking the size of the largest free block at the bottom of the window. However, this value does not represent always the size of the largest loadable instrument because the IIGs handles his DOC Memory in a very special way (that is why other music programs don't allow you to use more than four instruments at once, like Instant Music or don't allow you to choose your instruments like Music Studio to avoid problems). I cannot explain here how everything works but you can find more information in the Apple IIGs Hardware Reference. Using the DOC Memory option from the Information menu lets you see a map of the DOC Memory.

When an instrument has been loaded, two other windows appear. The first one gives you some information about the instrument selected in the instrument list. The vibrato speed and vibrato depth parameters are not used by SoundSmith (but the user may want to change the values of these parameters before saving a Music Studio sound file).

The keyboard window allows you to hear the selected instrument. In the next version of SoundSmith, playing on the keyboard while the music is running will record the notes.

The Open Music option of the File Menu allows you to load a music. After loading the instruments and the music, a new window will appear. This window should look familiar to everyone used to work with Appleworks GS spreadsheet.

You can edit the music by selecting any zone (clicking the mouse on the block number selects the whole block, on a line number selects a line, on a track number selects the track) and using the Cut, Paste, Copy and Clear commands. The selected zone can be extended by holding the Shift key down while pressing the mouse button. When a single case is hi-lighted, you can move around by using the arrow keys. These commands are identical to the ones used by AppleWorks GS spreadsheet.

To enter a new note, you can enter the values in the three editable boxes on the music window (a single case must be selected) and pressing RETURN or use the keyboard short-cuts:

- To change the Octave press 1-7 on the numeric keypad.
- To change the Instrument press 1-F on the main keyboard.
- To enter a note using the current instrument, effect and octave press:

<table>
<thead>
<tr>
<th>Key</th>
<th>Effect/Instrument</th>
<th>Octave</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>C</td>
<td>0</td>
</tr>
<tr>

</tr>
<tr>
<td>T</td>
<td>B</td>
<td>6</td>
</tr>
</tbody>
</table>

SoundSmith will first play line 00. This means that it will play a C#3 note using the first sample. Then it will play line 01. To do this, it will first stop to play the C#3 note and then play the E3 note, using the second sample. This means that if the first sample is long, you will not hear it completely. If you want to continue to play a note, you must do what I have done on line 02. You can repeat this many times if your sample is very long. The instrument will continue to be played until the end of the wave is reached or a new note is played. If you want to stop a note without having to play another one, you must enter a STP command instead of a note (line 04).

SoundSmith gives you total control over the stereo effects. There are two different ways to select on which channel a note will be played. The first one is used by all the IIGs music programs. Each instrument has a stereo parameter that indicates on which channel it will be played. To use this method you must select for each instrument the stereo channel that you want to assign to that particular instrument. Then you must go to the Tracks option from the Information menu and click on the Use Instrument data button.

The other way to use the stereo is much more powerful. You assign a stereo channel to each track. This means that an instrument will play on the right or left channel depending on which track it is played. This is very interesting because it allows to create incredible effects. This option is activated by clicking on the Use Channel/Track data button on the Tracks dialogue box.

The Music option from the Information menu allows to set some important parameters like the length of the music, the tempo, etc. The length of the music is given in number of blocks. If the music is for example four blocks long, you must tell the program which four blocks to play. This is necessary because you may want to repeat some blocks. You can play blocks 0,1,2 and 3 or 0,1,0,1 or 2,4,6,8, etc. Imagine that you want to play the following sequence: 0,1,2,2. Set position 0 to 0 and then block number to 0. Then set position 2 to 0 and then block number to 2. On the Music data dialogue box there is also a check button. If you click on it, the music will loop.

The Preferences option from the Information menu lets you set some important parameters. The volume scroll bar sets the main volume (this is the same value that you set on the control panel). The Keyboard translation scroll bar is set to the keyboard octave (if the keyboard translation is 2, the first note of the keyboard will be C2).
The sound file format buttons allow you to select the type of file that will be used when saving a sound file (not a music file!). When the sound file format is set to Music Studio, SoundSmith will save two files, a wavebank and a sound file. These files can be loaded by Music Studio. This allows you to use new instruments with this popular program (even if I believe that SoundSmith is much better...).

The SoundSmith binary file has the following structure:

- Number of instruments: 2 bytes
- DOC Memory: 64k
- Instrument Definition: 92 bytes

The Play options from the Play menu does not need to be explained. When using the Graphic Player option you will see that you can move a cursor that looks like an electric guitar. Use it to select the active tracks and the ones that are displayed on the screen. Attention, since no more than four tracks can be displayed at once, you must first unselect a track to be able to select another one. The Continue and Graphic Continue options use the value of the Position scroll bar (on the music data dialogue box) to know where to start to play the music.

Now, I think that this should help you to understand how SoundSmith works and how to compose music. I am really sorry for my bad english but I am doing my best. This manual covers all the important functions of this program but I know that some points could have been better explained. However, since I had to send you this manual, I could not spend more time on it. I will rewrite it and include it on the next version of SoundSmith.

CREATING A NEW KNIGHT
---------------------

The five traits - virility, intellect, holiness, agility, and initial hits - describe a basic character. They signify as follows:

**VIRILITY:**
fighting strength, ability to carry gold and perform tasks that require strength

**INTELLECT:**
effectiveness in casting magical spells and performing other magic.

**HOLINESS:**
your ability to use clerical spells for such matters as examining objects that are unrecognizable.

**AGILITY:**
quickness and cleverness in getting out of the way of danger, skill at picking locks and other actions that require nimble feet and fingers.

**INITIAL HITS:**
your life index. As you are injured, your hit index declines until it hits 0. At 0 you will die. These points can be restored by finding your way out of the dungeon or using spells.

**COMMANDS USED WHILE EXPLORING**
-----------------------------------

D)rop:
Allows you to drop anything you do not want or need. Most things will stay where you dropped them except for gold, which everyone knows, will most likely be taken by monsters and others that inhabit the dungeon.

E)nd and save game:
If you wish to end the game at any point in the dungeon, do so with this feature. Note: If the machine is turned off your knight will perish. Perished knights may be reincarnated but at a heavy cost in gold, magic and experience points. Make sure to end the game with this command and not the "OFF" switch!

R)est:
Allows your knight to breathe easy for a while, to recover from temporary blindness or the like. Beware though, monsters do not rest and will still attack you if you are resting.
Each of these spells inflict varying amounts of damage depending on
the nature of the enemy.

PEACEFUL SPELLS
-----------------

Passwall:
allows you to pass a wall in front of you, but be careful: if there is
not a corridor or room beyond the wall, you will be embedded in solid
rock!

Light:
This spell cures blindness. The more severe the blinding, the more
Light spells will need to be cast before you are cured.

Strength:
This spell temporarily increases your strength. This can be good for
carrying more gold or fighting better.

Invisibility:
This spell allows you to make yourself invisible to most monsters.
Eventually this spell wears off. More than one may be cast if longer
Invisibility is desired.

Cure Paralysis:
This spell makes your limbs healthy again.

Heal wounds:
Restores some of your hit points each time this spell is used.

Divine Guidance:
Similar to praying. When this spell is invoked, the gods may help you
or they may not.

Neutralize Poison:
Removes the effects of poison.

Bribe:
Monster may be bribed with gold or magical items
(potions, scrolls...). Monsters on the higher (upper) levels usually
are satisfied with gold, but as you trek deeper into the dungeon, the
monsters demand more.

Fight:
When greetings or bribes fail you must fight. Be victorious!!
You have one more option at your disposal and that is to try and run.
Since you cannot run forward (the monster is blocking your path) you
must turn around or left or right.

Remember, spells may kill an entire group of monsters or do sufficient
damage to easily kill them with a swordstroke, but some spells can
also backfire.

1) Fireburst and 2) Lightning Bolt:
These spells inflict damage in proportion to your experience points.
The fireball is rather potent but can be used but once during a single
adventure trip. Lightning Bolts are weaker than firebursts but may be used
whenever magic spells are available to you. Beware: these bolts have a
good chance of backfiring! The more experienced you are, the less chance there is of the spell backfiring.

3) Sleep, 4) Kitchen Sink, 5) Charm, 6) Flaming Arrow, 7) Light Candle, 8) Pray, 9) Hold, 10) Dispell, and 11) Datspell:
Chests:
Though a chest is not magical itself, it is almost always protected by magic. Chests should be ransacked for their gold and other magical items.

Books:
Books are rare but they have the incredible ability to change your basic characteristics or may give you experience points. Books cannot be carried. They must be used or not. If you do find one and not decide to use it, it will stay where it’s at unless some other adventurer finds it. Books may be used but once.

Rings:
You can only wear 2 rings at once. If a third ring is found and you wish to pick it up, one of the other rings must be dropped. Rings bring many things.

Helmets and Shields:
These are always lucky finds, for they are never cursed and always protect the wearer.

Swords and Armor:
These can help you in attacking monsters and defending yourself, but if they are cursed they shall weaken you sorely. Cursed items may not be dropped but they may be exorcised at an Oasis. No expense should be spared in removing a cursed item from yourself. Be alert for the famous sword Excalibur and the wondrous Mithril Armor. They would be lucky finds for your quest.

OASES
Oases are refuges for weary knights. Here you can heal your wounds without using precious spells (very costly) or you may decide to participate in a game of chance or bet on some races.

EXORCISING A CURSED WEAPON

Whatever the price is, a weapon that is cursed should be exorcised at any price. Exorcising is also done at an Oases.

THE GOAL: THE GRAIL

Your ultimate goal is to discover the Grail that the evil Kormath has stolen.

DUNGEON MASTER OPTIONS

From the main menu, choose Play the Dungeon Master and observe your choices:

C)lean Up the Knight File:
Allows you to remove unwanted characters.

R)e-initialize the Dungeon:
Completely clean the labyrinth and redistribute magic and monsters as it cleans.

E)dit Password:
Allows the Dungeon Master to keep his/her own password safe from prying eyes.

P)urge Old Messages:

destroy all old notes that are scattered about the labyrinth which are not addressed to living characters.

*** NOTE *** TAKE SPECIAL CARE NOT TO ELIMINATE A KNIGHT CARRYING THE GRAIL. IF THIS HAPPENS THE GRAIL WILL BE LOST COMPLETELY. REINITIALIZING THE DUNGEON WILL BE THE ONLY RE COURSE.

OTHER OPTIONS

From the main menu:

L)ist all the characters:
useful for recalling who exists and how many experience points each knight has required. Hall of Fame members will be displayed in inverse video. The list may contain up to 16 knights at once.

D)isplay the Hall of Fame:
Shows Kormath’s Hall of Fame, containing all who have successfully retrieved the Grail.

FROM THE SPECIAL OPTIONS MENU

Before you enter the dungeon, certain things can be changed:

R)ename:
change your character’s name

U)pdate password:
re-disguise your password.

E)xterminate:
If the shame of failure has overwhelmed you, you may remove your character here.

S)ound:
toggle on/off, either play in silence or with the pleasure of hearing groans and walls.

C)ontinuous Update:
toggle on/off unless you wish to venture forth in ignorance of your condition, do not use this option.

K)ey:

MORE SOFTDOCS SOON FROM THE PENGUIN!

THE PENGUIN

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1020 of 1262
4. To Re-Start a game press CONTROL-RESET
5. If you choose to play a GAME, a new menu will come up when you press ‘3’:
   1 HOME CURVES-LIERS
   2 VISIT HEAT-SLUGERS
   3 PLAY BALL
6. The HOME team uses the 1 key to select its starting team and pitcher.
   The LINERS hit for average; the SLUGGERS hit for the fences
7. The VISITOR team uses the 2 key to select its starting team and pitcher.
8. Both teams can have the same combinations if you choose. When playing solo against the computer, the scoreboard and menus will read COMP in place of HOME
9. When both teams have made their selections, press the 3 key to PLAY BALL!

Welcome to Gamestar Stadium

Congratulations. You’re in the middle of a tight pennant race and momentum is on your side. But everyone’s out to beat you, especially the hard-hitting computer team. So if you want to win the pennant, please read this official program. When the right combination of pitching, hitting and strategy, you may even become a Star Leaguer! Have Fun.

The Scouting Report

You get to choose your starting pitcher in Star League Baseball, as well as bring in a reliever. Here’s the latest scouting report:

*Heat* Muldoon --

Overwhelming fast ball.
Good screwball and slider.
Tendency to miss the strike zone when he goes for the corners.

*Tendency to miss the strike zone when he goes for the corners.*

Tires quickly if fastball used too often.

*Curves* Cassidy --

Great curve ball and an incredible sinker.
Excellent control and good stamina.
Clearly the most balanced pitcher in the league.

*Knuckles* Flanagan --

“Liveliest” knuckleball this side of the Rockies.
Good control and stamina.

Only used for short-term relief work.

Pre-Game Ceremonies

1. Press the ‘1’ key on the computer console to choose between playing a GAME or taking BATTING PRACTICE.
2. Press the ‘2’ key to select between a 1 PLAYER or 2 PLAYER game.
3. Press ‘3’ key to go to the NEXT MENU or PLAY BALL when you choose the BATTING PRACTICE option. If you take BATTING PRACTICE, you will face “Heat” Muldoon in a series of random pitches until you press the ‘1’ key.

Play Ball

As in real baseball, your goal in Star League Baseball is to outscore your opponent in 9 innings (extra innings if necessary). If you beat the computer team, consider yourself a Star Leaguer!

Pitching & Holding Runners

1. Each half inning begins with the pitcher stating in the PITCHING MODE. This mode allows you to pitch to the batter and is indicated when the pitcher bends over to look for a “sign” from the catcher.
2. To designate a pitch press and hold Button #0 on the joystick. The pitcher will move upright, pause position.
3. Move the joystick to pitch:

**Running**

---

1. Once the ball is hit fair, the batter automatically runs to 1st base.

2. To move him AHEAD, push and hold the joystick to the LEFT. To STOP the runner on or between bases, return the joystick to the CENTER position (just release it).

3. If there are runners on base, you control the LEAD runner; the other runners will run automatically if forced. As soon as your LEAD runner scores or is put out, control QUICKLY shifts to the next LEAD runner. Don’t daydream or your new LEAD runner may wander off base and be tagged out.

**Fielding**

---

1. After the ball is hit FOUL or a HOMERUN is hit, the ball is returned to the catcher. You must throw it back to the pitcher (Press Button #0 twice) and go into the PITCHING MODE (Press button again TWICE to continue pitching).

2. When the ball is hit FAIR, the player nearest the ball's PATH becomes eligible to field it.

3. Use the joystick to move your eligible fielder to the ball.

4. A ball with a shadow is a FLY ball; a ball without a shadow is a GROUNDER. FLY balls can be CAUGHT for an out; GROUNDERS require you to take some action to force an out (throw to base, tag runner, etc.).

5. To catch a FLY ball, keep your eye on the ball's SHADOW. As the ball descends, position your outfielder so he’ll collide with the ball’s SHADOW. If you miss the ball, move your fielder to pick it up.

**Batter**

---

1. Press an HOLD Button #0 on the joystick right BEFORE the pitch is thrown to BUNT Release the Button BEFORE the ball reaches the plate to "take" the pitch - if you try to bunt and miss, it’s a strike.

2. Press the red button AFTER the pitch is thrown to SWING AWAY

*Note*

The joystick is used for all functions when playing against the computer. When playing against another person, the joystick is used for fielding and pitching only. Batting and base running are controlled by the keyboard. Players should alternate between keyboard and joystick depending upon whom is at bat.

---

4. To get out of PITCHING MODE to pick off a runner, just RELEASE Button #0 BEFORE moving the joystick. You can then throw to any base as follows:

3rd Base

---

1st Base

---

Home

---

2nd Base

---

5. Press button #0 TWICE to return the ball to the pitcher from any player. Press Button #0 TWICE again to go back into PITCHING MODE. The pitcher will now bend over and look to the catcher for a sign. YOU MUST BE IN THE PITCHING MODE FOR A NEW BATTER TO COME UP AFTER A HIT OR AN OUT.
1. Press and RELEASE button #0 on the joystick controller to DESIGNATE a throw.

2. Move the joystick to THROW to a base; press Button #0 again to THROW to the pitcher.

The positions on the joystick are set up just like the bases on the screen - throwing from base to base will soon be like second nature to you.

3. If a runner tries to steal HOME you must MOVE your catcher to TAG the runner coming home, if you don't MOVE your catcher the runner will run by you and score.

Scoring

1 STRIKE - pitch that crosses home plate between batter's shoulders and knees. Three strikes result in an out.

2 BALL - pitch that is high or low outside of strike zone. Four balls result in a walk.

3 OUT - catching fly balls, striking out batters and forcing tagging runners results in an out. There are three outs per half-inning.

4 BATTING ORDER - visitors bat top of inning; home or computer bats bottom of inning.

5 RUNS - score runs by moving runners around the bases and home. Team ahead after 9 innings wins game. If score is tied after 9 innings, extra innings will be played until one team wins. HOME or COMP doesn't bat at the bottom of the 9th or extra innings if it is ahead.

As the game progresses, the starting pitchers "tire" They'll begin to lose their "stuff" and/or start missing the strike zone. Between the 7th and 8th innings there will be a 7th inning stretch, complete with music. A menu will come up for you to change pitchers. When both teams have made their selections press to re-start the game.
You have a choice of two missions, diversion or assault. In the diversion scenario you attack units for a specified time period and then exit the map to the south at recall. In the assault scenario you must locate and destroy your objective. At present, I don’t know how to end this scenario.

You also may select one of three standard suits or have one made up to order. For a custom suit, you are given a certain number of points and each option costs a varying number of points. The leftover points are used for powering the suit.

The EXINIT environment variable can be used to modify the default values on startup as in:

setenv EXINIT="set sm ts=4"

The 'backup' parameter, if set, causes the editor to retain a backup of any files that are written. During file writes, a backup is always kept for safety until the write is completed. At that point, the 'backup' parameter determines whether the backup file is deleted.

In environments (e.g. OS/2 or TOS) where lines are normally terminated by CR-LF, the 'return' parameter allows files to be written with only a LF terminator (if the parameter is cleared).

The 'lines' parameter tells the editor how many lines there are on the screen. This is useful on systems like the ST where various screen resolutions may be used. By using the 'lines' parameter, different screen sizes can be easily handled. On the Amiga system window resizes are atomatically detected and acted upon. It is suggested that one's window be larger than 2 rows and 5 columns.

Several of the normal 'vi' colon commands are supported by STEVIE. Some commands may be preceded by a line range specification. For commands that accept a range of lines, the following address forms are supported:

addr
addr + number
addr - number

where 'addr' may be one of the following:
a line number
a mark (as in 'a or 'b')
% (entire file)
. (the current line)
$ (the last line)

The Global Command

A limited form of the global command is supported, accepting the following command form:
g/pattern/X

where X may be either 'd' or 'p' to delete or print lines that match the given pattern. If a line range is given, only those lines are checked for a match with the pattern. If no range is given, all lines are checked.

If the trailing character is omitted, 'p' is assumed. In this case, the
trailing slash is also optional. The current version of the editor does not support the undo operation following the deletion of lines with the global command.

The Substitute Command
------------------------
The substitute command provides a powerful mechanism for making more complex substitutions than can be done directly from visual mode. The general form of the command is:

`s/pattern/replacement/g`

Each line in the given range (or the current line, if no range was given) is scanned for the given regular expression. When found, the string that matched the pattern is replaced with the given replacement string. If the replacement string is null, each matching pattern string is deleted.

The trailing 'g' is optional and, if present, indicates that multiple occurrences of 'pattern' on a line should all be replaced.

Some special sequences are recognized in the replacement string. The ampersand character is replaced by the entire pattern that was matched. For example, the following command could be used to put all occurrences of 'foo' or 'bar' within double quotes:

`1,5s/foo|bar/"/g`

The special sequence "\n" where 'n' is a digit from 1 to 9, is replaced by the string that matched the corresponding parenthesized expression in the pattern. The following command could be used to swap the first two parameters in calls to the C function "foo("

`1,5s/foo(\1,\2)/foo(\2,\1)/g`

Like the global command, substitutions can't be undone with this version of the editor.

The Delete Command
-------------------
`:range]d` will delete the range of lines.

File Manipulation Commands
--------------------------
`:w` write the current file
`:wq` write and quit
`:x` write (if necessary) and quit
`ZZ` same as "x"
`:e file` edit the named file
`:e!` re-edit the current file, discarding any changes
`:e #` edit the alternate file
`:w file` write the buffer to the named file
`x,y w file` write lines x through y to the named file
`:r file` read the named file into the buffer
`:n` edit the next file
`:p` edit the previous file
`:rew` rewind the file list
`:f` show the current file name
`:f name` change the current file name
`:ta tag` go to the named tag
`^)` like ":ta" using the current word as the tag

:help display a command summary
`:!cmd` execute the 'cmd' via a system() call

The "!" command can also be invoke with the <HELP> key on the Atari ST or the Amiga. This actually displays a pretty complete summary of the real vi with unsupported features indicated appropriately.

The commands above work pretty much like they do in 'vi'. Most of the commands support a '! suffix (if appropriate) to discard any pending changes.

String Searches
-----------------
String searches are supported, as in vi, accepting the usual regular expression syntax. This was done using Henry Spencer's regular expression library without modification. Tony Andrews added code outside the library to support the '<' and '>' extensions and code inside the library to support the ignorecase option.

Operators
--------
The vi operators (d, c, y, <, and >) work as true operators.

Tags
----
Tags are implemented.

System-Specific Comments
------------------------
The following sections provide additional relevant information for the systems to which STEVIE has been ported.

Atari ST
--------
The editor has been tested in all three resolutions, although low and high res. are less tested than medium. The 50-line high res. mode can be used by setting the 'lines' parameter to 50. Alternatively, the environment variable 'LINES' can be set. The editor doesn't actively set the number of lines on the screen. It just operates using the number of lines it was told.

The arrow keys, as well as the <INSERT>, <HELP>, and <UNDO> keys are all mapped appropriately.

UNIX
-----
The editor has been ported to UNIX System V release 3. It's hard-coded for ansi-style escape sequences and doesn't use the termcap/terminfo routines at all.

OS9
---
The editor has been ported to OS9 version 2.2.

OS/2
-----
Make sure 'ansi' mode is on (using the 'ansi' command).
The OS/2 console driver doesn't support insert/delete line, so STEVIE
bypasses the driver and makes the appropriate system calls directly. This is all done in the system-specific part of the editor so the kludge is at least localized.

The arrow keys, page up/down and home/end all do what you'd expect. The function keys are hard-coded to some useful macros until I can get true support for macros into the editor. The current mappings are:

F1 :p <RETURN>
F2 :n <RETURN>
F3 :e # <RETURN>
F4 :rew <RETURN>
F5 []
F6 ]
F7 <<
F8 >>
F9 :x <RETURN>
F10 :help <RETURN>
S-F1 :p! <RETURN>
S-F2 :n! <RETURN>

MSDOS

STEVIE has been ported to MSDOS 3.3 on an AT using the Microsoft C compiler, version 5.10. The keyboard mappings are the same as for OS/2.

The only problem with the PC version is that the inefficiency of the screen update code becomes painfully apparent on slower machines.

BSD 4.3

This port was done so it could be worked on in a main-frame environment.

Amiga

The arrow keys and the help key are supported, as is window re-sizing. It is strongly suggested that you not try to type in console commands (alt-esc in some keymaps, plus the appropriate other keys) since STEVIE captures all console input. If you do type alt-esc then typing ']' will return you to STEVIE. If you have ARP installed, then you can use wildcards on the command line, in the :e command and in the :r command.

If you 'run stevie' it will first attempt to open a window that is 640x200; if this doesn't work then it tries to open a window that is 480x200; if this fails it gives up.

NOTE: that you can't use :!cmd on BCPL programs.

Missing Features

1. Macros with support for function keys.
2. More *set* options.
3. Many others...

Known Bugs and Problems

1. The yank buffer uses statically allocated memory, so yanks of more than 5K of text will fail. If a delete spans more than 5K, the program asks for confirmation before proceeding. That way, if you were moving text, you don't get screwed by the limited yank buffer. You just have to move smaller chunks at a time. All the internal buffers (yank, redo, etc.) need to be reworked to allocate memory dynamically.

2. If you stay in insert mode for a long time (around 5K's worth of characters, including newlines) the insert buffer can overflow. When this happens you lose your ability to automatically undo the text just inserted and the redo/undo/(undo of undo) buffers are reset to the current position.

3. Several other less bothersome glitches...

Character Function Summary

The following list describes the meaning of each character that's used by the editor. In some cases characters have meaning in both command and insert mode; these are all described.

^@ The null character. Not used in any mode. This character may not be present in the file, as is the case with vi.

^B Backward one screen.

^D Scroll the window down one half screen.

^E Scroll the screen up one line.

^F Forward one screen.

^G Same as ":f" command. Displays file information.

^H (BS) Moves cursor left one space in command mode. In insert mode, erases the last character typed.

^J Move the cursor down one line.

^L Clear and redraw the screen.

^M (CR) Move to the first non-white character in the next line. In insert mode, a carriage return opens a new line for input.

^N Move the cursor down a line.

^P Move the cursor up a line.

^U Scroll the window up one half screen.

^V Indicates that the next character is should be treated as entered and not modified (used to enter control characters, etc.).

^Y Scroll the screen down one line.

^[ Escape cancels a pending command in command mode, and is used to terminate insert mode.

^] Moves to the tag whose name is given by the word in which the cursor resides.

^` Same as ":e #" if supported (system-dependent).

SPACE Move the cursor right on column.

$ Move to the end of the current line.

% If the cursor rests on a paren '()', brace '[]', or bracket '[]', move to the matching one.

Used to move the cursor to a previously marked position, as in 'a or 'b. The cursor moves to the start of the marked line. The special mark '' refers to the "previous context".

</tbody>
</table>
Beagle Bag Instructions

General Information

Beagle Bag is a disk full of games for your Apple computer. You may be surprised to find that it is a NORMAL DISK, just like ones you have initialized yourself. Most other game disks on the market are "locked up" and won't respond to everyday DOS commands. Not Beagle Bag - you can CATALOG it, LOAD from it, SAVE to it, DELETE and RENAME programs...ALL that good stuff. Even ctrl-Reset works "normally" (almost) instead of causing a memory-scrambling reboot. Most software manufacturers lock their disks to (try to) prevent piracy. Beagle Bros trusts you and leaves programs unlocked to make them more friendly and more usable. We appreciate your support; don't pirate our disks, and we won't pirate yours.

The first thing you should do with Beagle Bag is BACK THE DISK UP using one of the "Copy" Programs from your System Master disk (or any other Apple copy program). Store the copy or master in a safe place, away from prying magnetic fields.

If you're not using one of the two Menu programs on the disk you can RUN a Beagle Bag game just like any other Applesoft program- Type "RUN" followed by the program name and hit Return. ENDING programs follows standard procedures too- type CTRL-C (sometimes ctrl-C/Return) or hit ctrl-RESET. You will usually be given the option of re-running the program or returning to Short Menu.

Short Menu

BOOTING* the Beagle Bag disk is a good idea, because it installs Apple's normal Disk Operating System in your Apple "cursor" to the left of the top file name. To move the "cursor" use the Left and Right Arrow keys. If you move the "cursor" to the left of the first or last file name on the screen, the program will "take a memory-scrambling reboot. Most DON'T DISPLAY it. In the example above, Sector-numbers to the left of each file name WILL be displayed (S=1); Applesoft files WILL be displayed (A=1); Binary, Integer and Text files will NOT be displayed (B=0, I=0 and T=0); and Unlocked files will NOT be displayed (U=0). For almost ALL practical purposes, you should LEAVE VARIABLES B AND T SET EQUAL TO ZERO.

Change Line 100 to fit your needs, and SAVE the program before you run it by typing "SAVE BEAGLE MENU" (return). Of course, if you want, save it under the name "HELLO" or "N" or even "VISI CALC"; I don't care. "N" is nice, because you can simply type "RUNN" to run it. There is a handy program called "Master Create" (on your System Master disk) that you can USE to change the name of a disk's "Greeting Program", the program that automatically runs when you boot that disk.

When Beagle Menu is Run, it will first "read" the disk that is in the drive and then "catalog" it. If and when the screen is full (every 20 names), the program will "take a picture" of that "page" and store it in memory, then proceed to the next page of 20 file names.

You will then see Page 1 on the screen with an inverse "cursor" to the left of the top file name. To move the "cursor", use the Left and Right Arrow keys. If you move the "cursor" beyond the first or last file name on the screen, Beagle Menu will look for another page to display. Play with it and you'll see what I mean.

Pressing Return will execute the program at the cursor. Applesoft or Integer files will be RUN; Text files will be EXEC'd (probably inappropriate from a menu program, come to think of it.); and Binary files will be BRUN. You must remember (or learn now) that many Binary files are NOT MEANT to be BRUN, but BLOADed instead. If your BRUN a stored picture-file, for example, you will "crash" into the monitor, giving you an asterisk-prompt and a flashing cursor.

Typing "L" will LOAD an Applesoft or Integer file (wiping out Beagle Menu, of course), or BLOAD a Binary file. A BLOAD won't necessarily be obvious; for example, BLOADing a hi-res picture won't SHOW you the picture, it will just load it into memory. But then that's another subject.

Typing "H" will display the HELP Page. "Help" pretty much explains the rest of Beagle Menu's functions, so I won't cover them here.

In response to the comments I have had so far on this...
program-

Q. Why don't you display Free Sectors all of the time?
A. Because free sectors are a fact you don't usually need to know when you are running a menu program. The less information on the screen, the better, especially for beginners or non-computerists (a good reason not to display sector-numbers).

Q. Why not include other "housekeeping" commands, like Lock, Unlock and Rename?
A. I'll leave that for you to do. It kind of seemed like over-engineering to me, maybe best included in some other program.

Q. Is this a Public Domain program?
A. Heck NO!

BUZZWORD

BUZZWORD is a word substitution game that's good for at least a few laughs. Running it will produce a menu with Options 1-6.

Options 1-5, "Computer's Stories": Buzzword places five stories in memory. Select one of them and read along. The story will be automatically typed except for the missing "buzz words". You select the word by pressing any letter key, A-Z. The computer will then supply a word that begins with the letter you typed. Try any letters you like. Use different sequences (for example, your name, A-B-C...,etc.) for different results.

Option 6, "Type Your Own Story": Select 6 from the menu and you can type your own Buzzword story. The computer will supply a buzzword whenever you press a NUMBER key. If you want a number as part of your story, press the * key. This will spell it out. The chart at the top of the screen indicates the part-of-speech of the buzzword. If you don't like the word the computer gives you, back-space over it and request a new one. You must save or load a story to or from disk by typing an "A$". To erase your story and go back to the menu, type two asterisks.

To Put your own computer stories (for Options 1-5) in memory, look at program Lines 9000-9600. All text is entered as an A$ string. When a NUMBER is encountered in A$, a buzz word is inserted-

1: PERSON 5: VERB
2: PLACE 6: PAST-TENSE VERB
3: THING 7: ING VERB
4: ADJECTIVE
5: VERB

To view Buzzword's vocabulary by category, exit the program and List Lines 10000-10100. For alphabetical listing, Run the program, exit, turn on your printer (probably with printer switching) and request a new buzzword. With "PR#1", and type *GOTO 22222* (return). Change any words on Lines 10000-10100 (keep the NUMBER of words the SAME), and "Save Buzzword Version #2".

ELEVATORS

ELEVATORS is a real-time action game played with 12 keys plus the Space Bar. When you run the game, you will see a 10-res building with four elevators, the numbers "00" on the left and "5:00" on the right. To start the game, press Return.

Three keys operate each elevator car. Car #1, the car on the left, is controlled by the 1, Q & A keys; Car #2 by 2, W & S; Car #3 by 3, E & D, and Car #4 by 4, R & F. Notice that these four groups of keys are in four vertical columns on the keyboard. The TOP row of keys (1,2,3,4) make elevator cars 1,2,3 and 4 go UP. The BOTTOM row of keys (A,S,D,F) makes cars 1,2,3 and 4 go DOWN. The MIDDLE row of keys (Q,W,E,R) makes the cars STOP and pick up passengers.

The object of the game is to pick up as many carloads of passengers as possible between 5:00 (game starts) and 5:30 (game ends). The number of passengers you have delivered is indicated by the graphics number on the left of the screen.

The time is shown on the right.

Random lights will appear on various floors of the building. These lights represent passengers wanting to get out of the building. Any elevator car may respond to any light. To pick up the passengers, simply send any elevator car UP (1,2,3 or 4 key) to the lit floor and STOP (Q,W,E or R). Passengers will get in the car ONLY if it is UNOCCUPIED. If you stop an empty car at a lit floor, the floor light will go off and the car itself will light up. It is now FULL. You must now send the elevator DOWN (A,S,D,F) to the ground floor.

To Put your own computer stories (for Options 1-5) in memory, look at program Lines 9000-9600. All text is entered as an A$ string. When a NUMBER is encountered in A$, a buzz word is inserted-

1: PERSON 5: VERB
2: PLACE 6: PAST-TENSE VERB
3: THING 7: ING VERB
4: ADJECTIVE
5: VERB

To view Buzzword's vocabulary by category, exit the program and List Lines 10000-10100. didn't think so. For two players or more, one player can enter a secret word or words for others to guess. For one player, hit Return-only and the computer will "think" of a word or words for you to guess. To change the computer's words in the program, List Lines 10000-10140 and replace any words you want, but keep the total at 150. The program decides which of the 150 words to pick in Line 9000.

MAGIC PACK
--- --- ---
MAGIC PACK consists of four tricks: PLENTY QUESTIONS, 21 NUMBERS, NEXTWORD and CARD SCANNER. Select them all from Magic Pack's menu. Plenty Questions and Card Scanner are not meant to be run by anyone other than a "magician" (you?) who has PRACTICED with these tricks.

1. PLENTY QUESTIONS
--- --- ---
PLENTY QUESTIONS involves some "computer magic", and you are the magician. YOU MUST PRACTICE THIS TRICK several times to get the hang of it (it's worth it; audiences really enjoy a slick presentation of this trick).

The object of Plenty Questions if for the computer to guess the audience's secret word by asking certain "Yes or No" questions.

Tell someone to think of an object (in this case, any word or words that can follow the word "a" or "an"). You must be sure that the secret word is 16 characters in length or less (12-or-less is better), containing only the letters A through Z, spaces, hyphens and/or apostrophes. NO PERIODS allowed.

When you see "Hit Any Key When Ready", pretend as though you are hitting just ANY key, and casually (but carefully) hit ctrl-A (the CTRL key, then the A key; holding both down at the same time). You are now in the "Magic Mode". If any OTHER than ctrl-A is hit first, the trick WILL NOT WORK (see "Non-Magic Mode" below). The computer will now ask a random question and wait for a Yes or No answer.

The first character you type before each answer WILL NOT APPEAR on the screen. This is the big secret of Plenty Questions! Your job as the magician is to carefully spell the secret word, one letter at a time, one question at a time, with an INVISIBLE SECRET LETTER before each answer.

The computer's questions and your answers are irrelevant. You should type mostly "Yes" and "No" answers with an occasional "Sometimes" or "??" to make the trick more believable. Other answers such as "Never" or "No Way!" are appropriate too.

The best time to type the secret letter (remember, no one must know you are doing it!) is WHILE the computer is typing out its question. At this time, all eyes will be on the screen and not on you or the keyboard. You can even read the question out loud to distract everyone from any sound or movement from the keyboard. After you type your secret letter and your Yes or No answer, press the Return key. You will know each secret letter has been entered into the computer's memory when the question "I" in "PLENTY QUESTIONS" at the top of the screen changes to a number i (one).

To finish a secret word, type a PERIOD as your invisible secret letter. For example, if the secret word is "Cow", your answers could be "(C)Yes", "(O)No", "(W)Maybe" and "(I)Sometimes" (the "Sometimes" key is held down). After you type an invisible period and a Yes or No answer and hit Return, the computer will finish with an "I've Got It!", followed by "It's a Cow!" whatever the secret word is.

If you make a mistake and have not yet typed your Yes or No answer, hit Return, and type a new secret letter. If you have already typed an incorrect secret letter and answer AND hit Return, enter a Left Arrow (backspace) as your next secret letter. This will ERASE the previous secret letter. In the confusion, you may wonder if you are misspelling the secret word. Don't worry too much; who says a computer is supposed to be able to spell?

If you want to start the secret word over, type a Slash, and all of your previous secret letters will be erased from memory.

To delay the computer's guess, enter a Right Arrow as your secret letter. The computer will ignore this character and let you answer another question. This is a handy feature when the secret word is very short and you want to see a few more questions.

If you don't know the secret word or if you need an escape because you are confused, type an invisible Comma before your answer, and the game will end with the computer guessing a random word. It doesn't hurt to have the computer guess wrongly occasionally. After all, he (she) is only human...

There are two built-in default words. The computer will guess "LIGHT BULB" whenever you type a secret Semi-Colon. It will guess "TUNA SANDWICH" if you enter a secret Period after only one question. You can set the audience up with one of these two words if you think they have figured things out. You can change these two words in program Lines 1460 and 1500. Be sure to include a period at the end of the words, like this: SS="WORDS."

Non-Magic Mode: Sooner or later, one of your audience members will insist on typing th answers themselves, or they will refuse to tell you the secret word. If this happens, you have shown the trick once too often. Let the skeptic take over anyway. He will hit "any key" (not ctrl-A) when asked to do so, and now the computer will NOT look for secret characters. Instead, it will ask 17 questions and then make a random (and undoubtedly incorrect) guess. Explain that the computer is probably tired, and go on to the next trick. If you are experimenting with the Non-Magic Mode and wish to end before 17 questions, end any Yes or No answer with a Period, and the questions will stop.

PLENTY QUESTIONS COMMAND SUMMARY
--- --- ---
MAGIC MODE (invisible):
Secret Letters: Enter one per question before answering the question. The letter "i" in "Plenty Questions" at the top of the screen changes to a number "i" when the secret letter is entered.
Period: End secret word. Computer will guess secret word.
Comma: End questions. Computer will guess random word.
Slash: Erase all previous secret letters. Continue questions.
Left Arrow: Erase previous secret character.
Continue.  
Right Arrow: Delay secret letter input until next question.  
Semi Colon: End questions. Computer will guess “Light Bulb”.  
Period (as first secret letter): End questions.  
Computer will guess “Tuna Sandwich”.  
NON-MAGIC MODE: After 17 questions: Questions end. Computer will guess a random word.  
Period (visible after answer): Questions end. Computer guesses a random word.  

2. 21 NUMBERS  
21 NUMBERS is another trick where an audience member can control the keyboard. Just follow the instructions on the screen.  
3. NEXTWORD  
Just follow the instructions on the screen. Hit Return after each word. The secret? We're not telling...  
Well, I suppose we could tell YOU. The computer starts his next word with the LAST LETTER of your word and expects you to do the same. If you're into reprogramming this, you could make his word start with the SECOND letter of your word, or the next-to-last letter, etc., etc.  
4. CARD SCANNER  
You're the magician again. Your Apple, with some help from its "Advanced Video Scanner" (people really BELIEVE this!), will read a randomly-selected playing card through the video monitor. The trick here is, first of all, to know what the card is yourself. Then, when the computer says to type "MUM", you pretend to, but you DON'T. Instead, you type the initials of the card's identity, and NO MATTER WHAT YOU TYPE, the letters R-U-N-N- WILL APPEAR ON THE SCREEN.  
First key ("R" appears)- A or 1: ACE 
2 through 9: NUMBER-CARD, 2 through 9 flash on the screen. One will stay for a couple of seconds 
0 (zero): 10-CARD with the words "FIRING SYMBOL" under it. You must remember 
J,Q or K: JACK, QUEEN OR KING this symbol! The next time you see it, you must press your 
Second key ("U" appears)- C,D,H or S: CLUBS, DIAMONDS, HEARTS or SPADES 
Third key ("N" appears)- N: (insignificant). 
For example, to indicate King of Spades, type "KSN", and hit a free shot at you (and he won't miss!). All bullets will 
If you type an illegal code or "Run", the computer's answer will be "Playing Card", which is indeed a correct answer! 
As with any magic trick, don't overdo it! On about the third performance, people will be watching your fingers, and it's probably then time to switch to another trick where THEY control the keyboard (21 Numbers or Nextword).
SUB SEARCH

SUB SEARCH is a real-time search for a group of invisible enemy "submarines". Your job is to seek out these subs and capture their fuel supplies before your fuel and oxygen run out. When you run Sub Search, your Apple will decide how many subs you are to find and determine your oxygen and fuel supplies. Press return when ready to begin your search.

Five keys control the movement of your sensor on the screen:
- To move UP & DOWN, press the A and Z keys.
- To move LEFT & RIGHT, press the Arrow keys.
- To JUMP 15 SPACES (at a cost of only 10 units of fuel), press the Space Bar.

Each of these five direction keys only needs to be pressed once to cause movement in the appropriate direction. It's a good idea to keep your fingers on these keys during the game.

Data regarding fuel supply, oxygen supply and number of subs will be updated on the lower section of the screen.

The SCANNER is activated with an S keypress. Missing subs will be temporarily revealed with "blips" in the horizontal and vertical bars on the screen. Using the scanner will cost you 40 units of fuel, so activate it sparingly. After the scanner is used, press a direction key to continue searching.

The EQUALIZER converts fuel to oxygen and vice versa. Hitting Q will trigger the equalizer and prolong your search.

OXYGEN: Your oxygen will decrease at an erratic rate whether you are moving or not. The only way to obtain more oxygen is to use the Equalizer (Q).

FUEL: Your fuel supply will decrease one unit for every unit you move on the screen. Locating an enemy sub will increase your fuel supply by 40 units. Using the scanner (S) will cost you 40 units.

FINDING SUBS: Besides using the scanner (S), invisible subs may be found by searching with your sensor, using the direction keys (A, Z, and Arrows). Your sensor will leave a trace pattern where you have searched. This trace will be erased if you use the scanner. If you encounter a sub, you will notice it in your trace pattern. You will also notice your trace pattern slowly disintegrating as you move. Do not confuse the "holes" in the pattern with the subs you are looking for.

You must land PRECISELY on a sub to capture it. Once captured, a sub will become visible, and you will hear one or more beeps. The number of beeps tell you how many subs you have NOT yet been located. This information also appears on the lower right of the screen.

The game ends when you have found all of the subs OR when you have run out of fuel or oxygen. You will be given a final score based on the percentage of subs found times 1000, plus the amount of fuel and oxygen you have left.

TEXTTRAIN

by Bert Kersey & Jack Cassidy

TEXTTRAIN is a real-time race against a "train-time" clock. You will keyboard-control a text-format "freight train" whose "engine" and "cars" appear on your monitor as text characters. The engine is an inverse asterisk/plus, and the cars are inverse and normal letters. You control the motion of the train (Forward and Reverse); the five turnouts or track Switches; and the Coupling and uncoupling of the cars.

The object of TextTrain is to couple together a pre-defined series of freight cars and pull them to the Check Station at the top of the track layout in the fastest possible time.

At the start of the game, you will be asked to type a word. This word must be from one to nine letters in length and contain no non-alphabetical characters and no letter "P" (explanation later). This word or series of letters will be the "train" you must create during the game. If you're a beginner, start with a two-or-three-letter word. After you type the word, hit Return, and the game will start.

Your Apple will draw a track layout, scramble the letters of your word, and place them, along with several random letters on the layout as freight cars. Notice that the clock starts running immediately from time 0:00. The clock runs quite fast to make up for the small scale of the train (as good an explanation as any!). Above the clock is a representation of the train you must create. On the track, you will see the engine, always an inverse two-character car. The front (asterisk) of the engine flashes while it is idling. The plus-sign is the back of the engine onto which are coupled a few cars (letters). The Freight On Board (F.O.B) Chart at the left shows what's in the cars.

While the train is idling, you are in the "Command Mode". The commands available to you are displayed at the bottom of the screen. The F, R, C and S keys are the only keys that will do anything in this mode, except the asterisk option is not displayed on the screen.

FORWARD and REVERSE motion is initiated by pressing F and R. Try it. To STOP the train, hit any key except F and R. The SPACE BAR is the most easy-to-find "brake" key. It is permissible (and often very efficient) to hit ANY of the Command Mode keys (F, R, S or C) to stop the train.
As the train travels around the track to the top straightaway, its string of cars will read backwards. The order of cars you will be concerned with is FROM THE ENGINE BACK. Notice that the trains **H**ARVET and **Y**ERVAH**H** are the same.

SWITCHES are thrown by first pressing the S key. When you hit S, all five switches will light up with numbers. To throw a switch, simply press the appropriate number key. If the switch is "open", it will "close" and vice versa. Any key other than 1, 2, 3, 4 or 5 will put you back in the Command Mode. If a car is on or near a selected switch, you will be warned and returned to the Command Mode. Keep an eye on the switches as your train moves. Your train will DERAIL, thus ending the game, if it encounters a closed switch!

COUPLING and UNCOUPLING are initiated with a C keypress. After hitting C, you will be asked how many cars you want behind your engine. This must be a number from 0 (engine-only, no cars) to 9. No train longer than nine cars (plus engine) is allowed. You MUST enter a proper one-digit number to get out of the Coupling Mode. To couple cars onto your train, you must BACK YOUR TRAIN into them. Your train will automatically stop, and you will be put in the Coupling Mode.

YOU CANNOT COUPLE CARS ONTO THE FRONT OF THE ENGINE. An attempt to do so will derail the train and end the game! The same misfortune will occur if you forward OR reverse into the siding bumper (just under the clock). You must stop BEFORE you reach the bumper, or you crash!

The Freight-On-Board (F.O.B) Chart identifies the cars the engine is coupled to. Each car's letter stands for the cargo of the car- B for Boxes, K for Kites, etc. If the cargo word on the F.O.B. Chart. If you want, change the set of words in the TextTrain listing (Lines 2070-2110) to suit yourself.

To successfully finish a game, you must drive your completed train COMPLETELY INSIDE the Check Station and STOP. You also may drive THROUGH the Check Station or stop there anytime you want.) If you do stop, your train will automatically be inspected for a modest fee. If your train consists of the correct freight cars IN THE CORRECT ORDER, your time will be noted and compared with the best time so far for the current set-up. From the second repeat game on, the best time so far will be posted under the clock. When a game ends, you will be given three options. An asterisk playing against yourself! Before the game starts, some probing questions will be asked of you. Type your answers and hit Return after each.

Why no P's in TextTrain trains? It's pretty technical, but if you're interested, the program uses Applesoft's SCRN() function to look for clear track (spaces) in front of the engine as it moves ahead. If no space is found, it's derail time. The letter "P" just happens to be the same lo-res color (O-Black) in it's upper half as the space character. To distinguish a "P" from spaces, the engine would have to keep a running total of the colors on each line it's on. This would slow things down considerably (I know; I tried!). So no P's, ok? One Beagle Bros Tip Books (I can't remember which One) explains more about colors and Apple text characters. The "Railroad Regulations" explanation in the game (if you try to enter a "P") might make more sense.
"beginning" and no "end" to the maze. After you enter a legal keyword, the Apple will place its letters in random maze positions and place the first three letters of each player's name in the upper left corner. These three letters are the player's "men".

The computer will decide who goes first—let's say George. "GEO" will flash in the maze, and the computer will print "George's Turn—Which Direction?", or "Which Gate?". You, George, must respond accordingly before the timer reaches zero. Assuming time doesn't run out, on each turn you will move at least one gate AND move your piece at least once, but NOT NECESSARILY IN THAT ORDER.

WHICH DIRECTION? To move your man in the Wowzo maze when you are asked "Which Direction?", press a key-

To move Left or Right, press an Arrow key.
To move Up or Down, press the A or Z key.

Your man will move in the direction chosen until it encounters a maze wall OR keyword letter. In either case, it will automatically stop. If you land on a letter, whether you need the letter or not, you get another turn. If you hit a wall without encountering a letter, your turn is over unless you haven't moved a gate...

WHICH GATE? Any gate may be moved on any turn. When the computer asks "Which Gate?", press a gate letter. The appropriate gate will pivot 90-degrees. Don't press Return.

COMPUTER GATES: After each player's turn, just to make things more interesting, the computer will move two randomly-selected gates.

When you land on a letter, the following happens: a. You will be credited with the letter on the scoreboard (if you don't already have the letter) b. The computer will replace the letter somewhere else in the maze. c. You will get a BONUS TURN; another GATE and MOVE.

If time runs out during your turn, you will be sent, via Air Mail, to the upper left corner of the maze, and your turn will end. Period.

Wowzo Strategy: The most obvious defensive strategy is to use the gates to seal off your opponent about ten miles from the nearest letter that he needs. Also, use already-landed on letters for extra mileage via bonus turns AND to remove a letter from your opponent's path. Try to line up with several letters and grab them all in one turn. A game of Wowzo can end abruptly this way!

PLUS

---

Some of these programs have been gathering dust around here for years (a couple of them probably should have STAYED here). Some of these relics won't appear in the Short Menu until you catalog the disk.

DATE SEARCH is my favorite, I suppose. Even though it isn't really a game, people get a kick out of it. The only good thing I can say for CROSS WORD is that it lives up to its name. CROSS WORD is explained fully on page 13. If you use one of the names from BABY NAMES for your kid, please contact our lawyers (Legal Brothers) concerning royalty fees.

PACK MY BOX is a challenge that will probably never be met, but let us know if you do! POLY-DICE is fun if you're a statistics nut. You may want to expand it to roll more dice (how about all night long?). I can't BELIEVE how long people will play NAME GAME. See page 13 for more details. Every Apple owner should have a copy of TEST PATTERNS (although it could get expensive). And PLEEEEEEASE don't phone the Beagle Building saying your copy of NAKED CITY doesn't work; it's SUPPOSED to do that! Secretly load it into a friend's Apple, and stand back and watch...

Apple II Computer Info

RUN TASC

THE NEXT TWO PROMPTS ASK YOU FOR THE NAMES OF THE SOURCE AND OBJECT FILES:

SOURCE FILE BALL
OBJECT CODE FILE: (DEFAULT BALL.OBJ) <RETURN>

THE SOURCE FILE IS A APPLESOFT PGM NAMED BALL THAT EXISTS ON THE DISK.
THE OBJECT FILE IS THE MACHINE LANGUAGE BINARY FILE THAT IS CREATED BY
THE COMPILER. THE OBJECT FILE NAME DEFAULTS TO THE ORIGINAL FILE NAME
WITH THE EXTENSION .OBJ ADDED, SO THAT THE OBJECT FILE PRODUCED FOR
THE BALL.OBJ. THE DEFAULT IS SPECIFIED BY ENTERING <RETURN>. THE
SOURCE FILE IS ASSUMED TO BE LOCATED ON THE SAME DRIVE AS THE COMPILER
LESS YOU SPECIFY OTHERWISE. THE OBJECT FILE DEFAULTS TO THE SAME
DISK THAT THE SOURCE IS ON. DIFFERENT SLOTS OR DRIVES CAN BE
SPECIFIED USING THE NORMAL ,S<SLOT NUMBER> AND ,D <DRIVE NUMBER>
SYNTAX. COMPILATION IS USUALLY SLIGHTLY FASTER IF ONLY ONE DRIVE IS
USED. DISK COMMANDS CAN BE EXECUTED BY TYPING <CTRL-D> FOLLOWED BY
THE COMMAND AND <RETURN> THE NEXT TWO PROMPTS ASK YOU WHETHER YOU WANT
DEFAULT VALUES FOR ALL OTHER COMPILATION OPTIONS. SINCE MOST
COMPILATIONS ARE PERFORMED WITH THE SAME SET OF OPTIONS, YOU SHOULD
ENTER <RETURN> AFTER EACH PROMPT TO SPECIFY THE DEFAULT VALUES.

MEMORY USAGE:
DEFAULT CONFIGURATION <RETURN>
OPTIONS:
DEFAULT CONFIGURATION <RETURN>

IF YOU HAD REJECTED THE DEFAULT CONFIGURATIONS ABOVE, YOU WOULD NEED TO
EXPLICITLY SPECIFY THE VALUES OF SEVERAL COMPILATION OPTIONS. THE
ACTUAL COMPILATION PROCESS STARTS WITHOUT FURTHER INPUT SINCE YOU HAVE
SPECIFIED THE DEFAULTS ABOVE. WHEN COMPILATION BEGINS, THE DISK IS
ACCESSIBLE ALMOST CONSTANTLY TO EITHER READ THE SOURCE FILE OR TO WRITE
THE OBJECT FILE. THE COMPILER LISTS THE SOURCE PROGRAM ON YOUR
CONSOLE AS IT IS BEING COMPILED AND GENERATES APPROPRIATE MESSAGES IF
IT ENCOUNTERS ANY ERRORS. THEN THE SOURCE STOPS LISTING, THE FIRST PARTS
CHAPTER 1- INTRODUCTION OF COMPILATION IS FINISHED, AND THE COMPILER PRINTS:
*****BEGINNING PASS2

THE SECOND PART OF COMPILATION ALSO USED THE ??? EXTENSIVELY. TO
INDICATE THAT IT IS STILL Compiling, THE COMPILER PRINTS A PERIOD ON
THE SCREEN EVERY FEW SECONDS. WHEN IS IS FINISHED, THE COMPILER
PRINTS:
*****CODE GENERATION COMPLETE

AT THIS POINT, THE ACTUAL Compilation PROCESS IS COMPLETE, SO THAT YOU
WILL RECEIVE A LISTING OF Compilation INFORMATION, ANSWER "Y" OR "YES"
TO THE NEXT PROMPT, COMPILATION INFORMATION AND LINE NUMBER REFERENCE TABLE YES
THIS INPUT ALSO ACCEPTS <CTRL D> DISK COMMANDS. IF YOU WANT TO LIST
THE Compilation INFORMATION ON A PRINTER, YOU CAN FIRST TURN ON YOUR
PRINTER BY ENTERING:<CTRL-D>PR#(PRINTER SLOT>

TASC PRINTS OUT THE DESIRED INFORMATION, DISPLAYS THE FOLLOWING
MESSAGE, AND THEN RE-ENTERS THE INTERPRETER:
*****COMPILATION COMPLETE

THE INCREASE IN THE BALL PROGRAMS EXECUTION SPEED IS QUITE APPARENT
WHEN COMPARED TO THE SAME PROGRAM RUNNING UNDER THE INTERPRETER.
COMPARE SPEEDS BY FIRST RUNNING THE INTERPRETED PROGRAM:

RUN BALL
INTERPRETED PROGRAMS

Debugging for some possible solutions.

The interpreter must create a new entry for it. This procedure also slows if a compiled program does not run correctly, see error messages and desired variable. If the variable is not present in the list, the interpreter searches from the beginning of the list to find the using a list, too. When it encounters a reference to a variable, the compilation translates the program into machine language,creates an executable binary file that is the machine language equivalent of the source. Catalog lists the names of AppleSoft source files with the letter "A" preceding the size of each file.

OBJECT FILE -

TASC translates source files into machine language object files. The object file is the output file created by the compiler. The object file is an executable binary file that is the machine language equivalent of the source. Catalog lists the names of TASC object files with the letter "B" preceding the size of the file.

COMPILATION -

Runtimetime -

The time during which the compiler is translating a source file into an object file.

Runtimetime -

The time during which a compiled program is executing. By convention, runtime refers to the execution time of a compiled program and not to the execution time of the compiler.

Runtime library -

A collection of machine language routines that are used by compiled object programs. These routines all reside in the file names runtime. Run time must be loaded into memory before an object file can be executed.

Compilation vs interpretation:

Since the microprocessor in the apple can execute only its own machine instructions, it does not execute AppleSoft program statements directly. Instead, statements must be simulated by machine language routines that perform the operations specified by the basic statement.

INTERPRETATION:

The interpreter translates AppleSoft source statements line by line at run time. Each time the interpreter executes an AppleSoft statement, it must analyze the statement, check for errors and call machine language routines that perform the desired function. When statements must be executed repeatedly, as must those with a for/next loop, the translation process must be repeated each time the statement is executed.

In addition, basic line numbers are stored in a list. Goto's and gosub's force the interpreter to search this list to find the desired line. This search is quite slow when the needed line is near the end of a long program. The interpreter keeps track of variables using a list, too. When it encounters a reference to a variable the interpreter searches from the beginning of the list to find the desired variable. If the variable is not present in the list, the interpreter must create a new entry for it. This procedure also slows interpreted programs.

Compilation:

A compiler, on the other hand, takes a source program and translates it into a machine language object file. This object file consists of a large number of machine language calls to routines in the runtime library and to routines in the AppleSoft interpreter. TASC assures close language compatibility with the interpreter. In contrast to the interpreter, the compiler analyzes all statements before runtime. In addition, absolute memory addresses are provided for variables and program lines. These addresses eliminate the list searching that occurs while an interpreted program executes. TASC, unlike the interpreter, implements true integer arithmetic and integer loop variables in for/next loops. In comparison, the AppleSoft interpreter converts all integers to real numbers before operating on them. These conversions make interpreted integer arithmetic relatively inefficient. In addition, the interpreter forbids use of integers as loop control/variables in for/next loops.

PROGRAM DEVELOPMENT

1. Create and edit AppleSoft source.
2. Run and debug source with the interpreter.
3. Compile source, creating a binary object file.

Debugging with the AppleSoft interpreter:

Debugging a program intended for compilation is a two step process that involves:

1. Creating the source program and
2. Running the program under the interpreter to check for errors.

Creating a source program:

An AppleSoft source program requires the use of the editor available within AppleSoft. Programs are created by simply entering AppleSoft statements within AppleSoft. Once a program has been created, it can be saved to disk with save. TASC can only compile AppleSoft soft disk files.

Running a program with AppleSoft:

Programs should be debugged using the AppleSoft interpreter before being compiled. If the program to be compiled uses TASC features that are not available in the interpreter, it may be necessary to debug the program with the compiler.

TASC is highly compatible with the AppleSoft interpreter. This compatibility allows the AppleSoft interpreter to function as the primary debugging tool. The interpreter provides much better debugging facilities than a compiler, since it includes features such as trace.

There are some drawbacks to debugging with the interpreter: Statements that are only executed under special circumstances may never be examined, and the interpreter halts execution when it encounters the first error in a program.

Debugging with the compiler does not suffer from these drawbacks since the compiler examines every statement in a program, and can continue the compilation even if it encounters errors.

In general, compiling a program is an effective way to check for syntax errors; however, program logic errors are more easily tracked down with the interpreter.

Compilation:

Note:

If a compiled program does not run correctly, see error messages and debugging for some possible solutions.
OPTIONS:

The demo run showed only the most basic type of compilation. TASC includes several options that can be used to control compilation more closely. The requested options control memory allocation and compilation. To explicitly specify the values for these options, simply answer "NO" when the compiler offers the default values.

MEMORY USAGE:

The memory used by the compiled code at runtime is divided into three areas:

1. Runtime
2. Object program
3. Variables

TASC allows the location for each of these blocks to be specified separately. The memory allocation features can be used to protect machine language programs, shape tables, the HiRes screens, or any other important part of memory.

The default allocations order, library, program, variables. The library is allocated lowest and program and variables follow. The library begins at location 2051, or $803.

Alternate addresses for the blocks are simple to specify. The new location for the library is entered as a number and defaults to $803. Addresses can be specified in either hexadecimal or decimal. Hex must have ($) after.

The library must be loaded before a compiled program can be run. By default the library is loaded at $803. When a program is compiled to expect the library at a different address, the library must be loaded in at the correct address by using "A" option with the BLOAD command. Moving binary files, with adr utility.

The beginning address for the object code may be specified with:

1. The word HGR1
2. The word HGR2
3. A decimal or hex number
4. <RETURN>

HGR1 and HGR2 set the beginning of the program above the appropriate HiRes screen. Then 4K runtime library defaults to the space below the first HiRes screen. This default locations is suggested for pgms of HiRes.

VARIABLE SPACE may be specified explicitly or allowed to default. The beginning of variable space defaults to the end of the object code.

Compiled pgms use the normal himem pointer to determine the top of available string space, and strings grow downward from there.

COMPILATION OPTIONS:

Compilation Listing: Yes
Pause on Errors: Yes
Integer Arithmetic: Yes
Integer Constants: Yes
Resume/Debug Code: No

Answering "NO" or "N" to the default option prompt provides a change to turn each of these options on or off.

The compiler normally lists the source file. Turning the listing option off suppresses the listing. Errors, warning, and special messages are printed as usual.

Pause on Errors Option:
Errors normally halt compilation and allow the user to abort or continue compilation. Turning the pause option off suppresses the pause after any error message are printed.

Integer Arithmetic Option:
TASC includes a full integer arithmetic package. True integer arithmetic allows operations on integers to be performed in about half the normal time. Including the option substantially increases the speed of pgms that use integers.

Integer Constants:
Constants in a compiled program can be treated as integers or floating point numbers. Selecting the integer constants options allows constants that are used as integers to be stored in integer format. If a constant is needed in fp it includes both.

Integer constants take up two bytes in the object file; fp takes five. The integer constants option should normally be left on.

Resume/Debug Code Option:
Turning on the resume/debug code option causes code to handle the resume statement to be included in the object pgm. The resume in AppleSOFT allows an error trapping routine to resume execution at the beginning of the statement that caused the error. TASC also fully supports onerr goto. The compiled version of onerr goto traps all runtime errors, including those that occur within routines from the AppleSOFT interpreter.

Including the resume/debug option requires the compiler to generate extra code at the beginning of each statement that may generate an error. Selecting resume/debug code option causes the object code to be larger and somewhat slower.

Turning on the resume/debug code option has the advantage that any runtime error messages include the object code address. Normally, only some of the errors generated by the runtime library include an object code address. The resume/debug option can be useful for debugging with the compiler. However, including it does debase the speed and increase the length of the compiled code. The resume/debug option should be left off unless it is absolutely needed. If the option is turned off the compiler will ignore all resume statements.
TERMINATING COMPILATION

The compiler runs in machine language so CTRL-C would normally be ignored and reset would be necessary instead. To terminate:

CTRL-C IF USED STOPS COMPILATION, BUT ALSO DELETES THE OBJECT FILE IF COMPIATION IS ABORTED. TASC MODIFIES DOS, SO BY USING CTRL-C OR RESET THEN DOS MUST BE REBOOTED. CORRECTLY EXITING THE COMPILER RESTORES DOS TO ITS NORMAL STATE.

COMPILING LARGE PROGRAMS

Large programs may display a symbol table full error. One way to correct this message is to turn off the integer constants option. If constant is needed later it can be a FP, and entered into the symbol table. The integer entry takes five locations, FP entry takes eight locations. With integer constants option off, constants are stored in FP form. Turning off the option saves five locations for every constant that is referenced as FP value.

TURNING OFF THE INTEGER CONSTANTS OPTION ALSO SLOWS DOWN THE OBJECT CODE, SO THE OPTION SHOULD BE LEFT ON WHENEVER POSSIBLE.

#2 SEPARATE PROGRAM INTO PARTS:

Use the COMMON command and try to split the program into parts as natural divisions as possible. Programs without natural divisions may present a problem so you must make artificial divisions. The technique of splitting a large program into smaller programs that run in sequence can solve almost any problem with program size. Passing values with COMMON makes separating programs a manageable problem.

EXECUTING A COMPILED PROGRAM*****

1. Interpreted programs are stored as AppleSoft files indicated by a "A". These files are executed by a RUN command.

2. Compiled programs are stored as binary "B" and must be executed by a BRUN command. The normal sequence for executing a compiled program is:

  BLOAD RUNTIME
  BRUN <FILE NAME>

Compiled programs will only work in AppleSoft language not "integer basic".

Using the Ampersand(&):

Once the compiled PGM has been loaded and executed, it can be re-executed by typing an (&) followed by <return>. Using (&) is much more convenient that having to call the code.

HALTING EXECUTION OF COMPILED PGM:

<RESET> FOLLOWED BY NEW

NEW;

NEW CAUSES THE INTERPRETER TO RESET POINTERS, BUT NOT CLEAR THE PROGRAM SPACE. THEREFORE THE PROGRAM CAN BE SAFELY RE-EXECUTED IF NO PROGRAM LINES HAVE BEEN TYPED IN AND STORED INTO THE PROGRAM SPACE.

IMMEDIATE COMMANDS:

NONE

STATEMENTS NOT IMPLEMENTED:

THE FOLLOWING COMMANDS ARE \ NOT \ INCLUDED IN TASC

CONT DEL LIST
LOAD SAVE LOMEM:
& RECALL NOTRACE
SHLOAD STORE TRACE

THE FOLLOWING COMMANDS ARE SUPPORTED WITH SOME LIMITATIONS:

DEF FN DIM <CTRL-C>

DEF FN:

In the interpreter, a DEF FN does not define a function until the DEF FN statement is actually executed at runtime. The compiler, on the other hand scans all functions definitions at compiletime. Therefore function DEF can be located anywhere within the source file. The source cannot contain more than one DEF for a given function, even if identical.

DIM:

Executing a DIM statement in which the specified dimensions are constants sets aside the same amount of storage for the array each time the PGM is run.

Executing a DIM statement in which the specified DIMS are arithmetic expressions sets aside space for the array depending on the computed value of the expression.

DEFAULT DIM- IF AN ARRAY REF IS ENCOUNTERED BEFORE A DIM STATEMENT, THE ARRAY IS GIVEN THE DEFAULT MAX VALUE OF 10 FOR EACH DIM OF THE ARRAY. APPLESOFT ALLOWS THE USE OF 0 AS AN ARRAY SUBSCRIPT, SO AN ARRAY DIMED AT 10 IS ACTUALLY 11 (0-10)

CTRL-C:

Typing CTRL-C during input halts the PGM.

IF THEN:

The compiler supports its use, but an IF/THEN statement with a STRING expression is flagged as an error during compilation.

GET:

Works fine

READ:

Works fine

ONERR GOTO:

Used with RESUME/DEBUG NEW, END, STOP:

NEW-ERASES THE CURRENT PROGRAM
STOP-PRINTS THE MESSAGE "BREAK IN ####"
END- TERMINATE EXECUTION

GARBAGE COLLECTION:

Each time GC is necessary, the program simply suspends execution while the GC routine house-cleans.

LANGUAGE ENHANCEMENTS:

INTEGER:

CHR$ COLOR$ DRAW
FOR HCOLOR$ HLIN
HPOKE HTAB IN$
LEFT$ LET MID$
ON GOSUB/TO PDL PLOT
POKE(2) PR$ RIGHT$
NOT= SCALE$ SCR$
THE ABOVE OPERATIONS EXPECT INTEGER VALUES.

INTEGER ARITHMETIC PACKAGE:

- ADDITION
- MULTIPLICATION
- SUBTRACTION
- NEGATION
- TAB
- VLIN
- VTAB

THE FOLLOWING OPERATIONS EXPECT INTEGER VALUES.

- FIRST PASS, PERFORMS SYNTAX ANALYSIS AND GENERATES MOST OF THE CODE.
- ALSO COLLECTS INFO ABOUT VARIABLES, LINE NUMBERS, AND STORES IT IN SYMBOL TABLE.

SECOND PASS:

- USES INFO FROM FIRST PASS AND USES THE SYMBOL TABLE TO STORE INFO. ALSO DECIDES HOW MUCH STORAGE SHOULD BE ALLOCATED.

SYNTAX ANALYSIS:

- LEXICAL-PRINT, FOR BECOMES UNDER LEXICAL TOKENS

ERROR MESSAGES AND DEBUGGING:

- DECLARATION:
  - INTEGER OR COMMON DECLARATIONS OUT OF SEQUENCE OR NOT AS BEGINNING OF PROGRAM DECLARED AS COMMON MORE THAN ONCE.
  - INCOMPLETE: EXPRESSION MISSING RIGHT PARENTHESES IN EXPRESSION

DEFCOMMON AND USECOMMON STATEMENTS ARE DESIGNED FOR CREATING LARGE SYSTEMS OF PROGRAMS THAT COMMUNICATE WITH EACH OTHER.

- FIRST SUBSCRIPT MISSING DIM NOT AN INTEGER CONSTANT DIM NEGATIVE OR GREATER THAN 32767 MORE THAN 88 SUBSCRIPTS DIFFERENT NUMBER OF SUBSCRIPTS THAN IN FIRST USAGE

THE DEFCOMMON AND USECOMMON STATEMENTS ARE DESIGNED FOR CREATING LARGE SYSTEMS OF PROGRAMS THAT COMMUNICATE WITH EACH OTHER.

- FUNCTION DEFINED MORE THAN ONCE SPECIFIED ARRAY DIM DIFFERENT THAN THE FIRST DIM SPECIFIED

- EXPRESSION TOO COMPLEX OBJECT CODE OR VARIABLE EXTEND PAST 48K

- UNDEFINED LINE NUMBER OR FUNCTIONS PRODUCE FATAL ERROR AT THE BEGINNING OF SECOND PASS.

- SELF-MODIFYING PROGRAMS:
  - PHONE LIST ON APPLE DEMO THIS PROGRAM WILL NOT COMPILE PROPERLY. MUST BE RE-WRITTEN IN STRAIGHTFORWARD METHODS TO BE COMPILED.

- PRINTS OUT THE DECIMAL BEGINNING ADDRESS AND LENGTH OF THE MOST RECENTLY LOADED FILE. MUST USE THIS INFO WITH "A" AND "L" PARAMETERS TO BSAVE THE M.L. PROGRAM.

- THE NORMAL PROCESS FOR MOVING A PROGRAM IS:

  - BLOAD <FILE NAME>
  - EXEC ADR
  - BSAVE <FILE NAME>, A<ADDRESS>, L<LENGTH>

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1040 of 1262
CREATE ADR: TO TRANSFER ADR TO ANOTHER DISK
1. LOAD CREATE ADR FROM TASC DISK
2. REMOVE TASC DISK
3. INSERT DISK FOR NEW COPY
4. TYPE RUN

CONVERTING 3.2 TO 3.3:
USE MUFFIN ON DOS MASTER

DOCUMENT tele.porter

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

************ ALERT *******
THIS COMMAND WILL RING THE BELL ON THE REMOTE APPLE.

************ ANSWER *******
SETS THE COMMUNICATOR TO ANSWER THE PHONE WHEN IT RINGS. THE APPLE WILL ANSWER ANY PHONE CALL WHICH COMES IN ON THE LINE THE APPLE IS CONNECTED TO. THIS MAY ONLY BE USED WITH THE HAYES MICROMODEM AND THE NOVATION D-CAT. INVOKE BY TYPING A OR ANSWER. WHILE IN ANSWER MODE, THE MESSAGE 'WAITING FOR CALL' WILL APPEAR IN THE COMMAND WINDOW.

WHEN THE PHONE RINGS THE MESSAGE 'RING DETECTED, WAITING FOR CARRIER' WILL APPEAR IN THE COMMAND WINDOW. IF CARRIER IS DETECTED, THE MESSAGE 'CONNECTED' WILL APPEAR AND YOU WILL BE RETURNED TO COMMAND LEVEL.

IF NO CARRIER IS DETECTED, THE MESSAGE 'NO CARRIER, LINE DISCONNECTED' WILL APPEAR IN THE COMMAND WINDOW AND IT WILL RETURN TO ANSWER MODE.

************ BOOT *******
THIS COMMAND WILL RE-BOOT FROM THE DRIVE USED TO BOOT TELE-PORTER.

THE BOOT COMMAND WILL BOOT ANY OPERATING SYSTEM (DOS/PASCAL) OR PRODUCT SO THAT USER PROGRAMS CAN PROCESS DATA TRANSFERED WITH THE TELE-PORTER.

THIS MAY BE INCLUDED IN AN EXEC FILE TO RUN ANOTHER PROGRAM UNATTENDED AFTER COMPLETION OF DELAYED TRANSFERS. YOU MAY THEN PROCESS WHAT WAS JUST RECEIVED.

************ CALL *******
THIS ALLOWS YOU TO ORIGINATE CALLS TO A REMOTE APPLE USING TELE-PORTER. INVOKE BY TYPING CALL. RESPOND TO NUMBER: WITH THE TELEPHONE NUMBER. YOU MAY USE SEPARATORS SUCH AS ( AND - IN THE PHONE NUMBER. AN * SIGNIFIES TO PAUSE 2 SECONDS BEFORE CONTINUING. A +, ON THE NOVATION ONLY, WILL INDICATE TO WAIT FOR A SECOND DIAL TONE. FOR EXAMPLE; NUMBER:1-(203)327-3204 THIS IS ONLY VALID FOR THE HAYES MICROMODEM AND THE NOVATION D-CAT. WHEN CARRIER IS DETECTED, THE MESSAGE 'CONNECTED' WILL APPEAR IN THE COMMAND WINDOW AND YOU WILL BE RETURNED TO COMMAND.

IF CARRIER IS NOT DETECTED WITHIN 30 SECONDS, THE MESSAGE 'NO CARRIER, LINE DISCONNECTED' WILL APPEAR IN THE COMMAND WINDOW AND YOU WILL BE RETURNED TO COMMAND.

************ CATALOG *******
THIS ALLOWS YOU TO PRODUCE A CATALOG OF ANY DISK ON THE LOCAL APPLE. INVOKE BY TYPING CAT OR CATALOG. RESPOND TO LOCAL: WITH A DOS FILE NAME OR A WILDCARD, FOR EXAMPLE;
**** LOGON ****

THIS COMMAND WILL TURN ON THE SYSTEM LOGGING FACILITY. RESPOND WITH A VALID DOS FILE NAME. BE SURE TO TURN THE LOG OFF BEFORE EXITING THE FILE TRANSFER. THE SYSTEM LOG CAN BE PRINTED WITH THE APPLESOFT PROGRAM "LOG LISTER" SUPPLIED ON THE TELE-PORTER DISK.

**** DELAY ****

THIS COMMAND WILL DELAY FOR THE NUMBER OF MINUTES SPECIFIED AND THEN EXECUTE AN EXEC FILE. YOU WILL SUPPLY THE TIME IN MINUTES AND THE EXEC NAME TO RUN.

THIS ALLOWS YOU TO DO UNATTENDED OVERNITE TRANSFERS WHEN THE PHONE RATES ARE LOWER, EVEN IF YOUR MACHINE DOES NOT HAVE A CLOCK CARD.

**** END ****

THIS WILL TERMINATE THE FILE TRANSFER AND RETURN YOU TO THE MAIN MENU.

**** EXEC ****

THE EXEC COMMAND ALLOWS YOU TO STORE ANY COMMANDS IN A STANDARD DOS EXEC FILE TO BE EXECUTED VIA THE EXEC COMMAND. INVOKE BY RESPONDING E OR EXEC TO THE COMMAND PROMPT. RESPOND TO THE LOCAL: PROMPT WITH THE EXEC FILE NAME SX DX. IF NOT ENTERED, SX WILL DEFAULT TO S6 AND DX WILL DEFAULT TO D1.

EACH LINE OF THE EXEC FILE MUST CORRESPOND EXACTLY TO WHAT YOU WOULD HAVE TYPED IF YOU HAD ISSUED THE COMMAND IN RESPONSE TO THE COMMAND PROMPT.

AN EXAMPLE OF AN EXEC FILE TO CALL A TELEPHONE NUMBER:
CALL 1-203-357-8002

**** HANG ****

THIS COMMAND WILL HANG UP THE PHONE UPON COMPLETION OF THE CURRENT SESSION. THIS COMMAND IS ONLY VALID FOR THE HAYES MICROModem AND THE NOVATION D-CAT.

INVOKE BY TYPING HA OR HANG. THE MESSAGE 'DISCONNECTED' WILL APPEAR IN THE COMMAND WINDOW.

**** HELP ****

ALLOWS YOU TO GET A MORE DETAILED EXPLANATION OF ANY COMMAND. INVOKE BY TYPING HELP. RESPOND TO THE PROMPT FOR WHAT COMMAND WITH THE COMPLETE NAME.

**** INIT ****

THIS COMMAND ALLOWS YOU TO INITIALIZE DOS COMPATIBLE DISKS. THE INIT COMMAND WILL NOT PRODUCE A BOOTABLE DISK.

NOTE: BECAUSE DOS IS NOT STORED ON A DISK INITTED BY THE TELE-PORTER THEY WILL HOLD APPROXIMATELY 6% MORE DATA THAN STANDARD DOS DISKS.

**** LOGOFF ****

THE LOGOFF COMMAND WILL TURN OFF THE SYSTEM LOG AND CLOSE THE LOG FILE.

THE LOG MUST BE Turned OFF BEFORE YOU EXIT THE FILE TRANSFER.

**** MLOG ****

THIS COMMAND WILL TERMINATE THE FILE TRANSFER AND RETURN YOU TO THE MAIN MENU. THIS COMMAND WILL SWITCH TO THE MESSAGE LOG SCREEN THAT SHOWS THE LAST 24 LINES OF MESSAGES EXCHANGED BETWEEN BOTH USERS.

THE MESSAGES FROM THE REMOTE APPLE WILL APPEAR IN INVERSE VIDEO.

YOU WILL RETURN TO THE TELE-PORTER SCREEN WHEN RETURN IS PRESSED.

**** RCATALOG ****

THIS COMMAND ALLOWS YOU TO DO A CATALOG COMMAND FOR ANY DISK ATTACHED TO THE REMOTE APPLE.

THE REMOTE CATALOG COMMAND ACTS JUST LIKE THE CATALOG COMMAND EXCEPT THAT IT TAKES A LITTLE LONGER DUE TO DATA TRANSMISSION DELAYS.

**** RECEIVE ****

THIS COMMAND WILL GET A COPY OF A FILE OR A COMPLETE DISKETTE FROM THE REMOTE USERS DISK ONTO YOUR DISK. INVOKE BY TYPING R OR RECEIVE.

RESPOND TO LOCAL: WITH THE NAME YOU WANT TO CALL THE FILE ON YOUR LOCAL APPLE. YOU MAY Optionally FOLLOW THE NAME WITH ,SX DX TO SPECIFY SLOT AND DRIVE. IF THAT NAME EXISTS ON THE SPECIFIED DISK, IT IS DELETED. RESPOND TO REMOTE: WITH THE NAME OF THE FILE WHICH RESIDES ON THE REMOTE USER’S DISK THAT YOU WANT TO COPY. SIMPLY PRESS RETURN IF NAME SX DX IS THE SAME AS GIVEN TO LOCAL;. AN * IN THE NAME WILL ALLOW YOU TO CHANGE SLOT/DRIVE. IF THE LOCAL NAME IS BLANK, THE ENTIRE DISK WHICH RESIDES IN THE SPECIFIED DRIVE IS RECEIVED. THIS IS SIMILAR TO DOING A COPY OF A DISK TO CREATE A BACKUP, EXCEPT THAT THE COPY IS DONE BETWEEN THE TWO SYSTEMS. YOU MAY Optionally FOLLOW THE NAME WITH ,SX DX TO SPECIFY SLOT AND DRIVE THAT THE FILE CURRENTLY RESIDES ON. IF SX IS NOT SPECIFIED, IT WILL *** GARBAGE STARTS HERE ***

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1043 of 1262
behind the wheel looking out through the windshield of the car. In the no ordinary highway. The perspective you have is that of a person sitting under the hood. It will not be as simple as plying a lead foot, because this is not just a matter of shifting, but rather knowing when to shift. When you do shift gears, there is a window that opens in the lower right corner of the dashboard displaying the gearshift and the gear you are currently in. There are also two indicators on the dashboard, one for the current mph and another for rpm. The mph indicator simply displays your current speed, while the rpm indicator tells you how much faster you can go without blowing your engine in the current gear.

The most important device on your car is the radar detector (never leave home without it). This device is located in the upper left part of the windshield, attached to your sun visor. When the red lights start flashing on the radar detector, it means that a radar gun has been detected, so slow down. It is safe to speed up when the red lights turn to green.

### The Pit Stop

Once you have completed the stretch of road, your car automatically pulls over into one of four gas stations (time to take a leak). Here you are given your average speed, the time it took for you to complete the stretch of road and your total points so far. If your score is low, the dealership will have called ahead and told the gas station to send you back.

### Winning The Game

If you are successful and do complete the mountain road four times, your car will automatically pull over into the dealership for the surprise of your life. Inside the glove compartment is the title to a brand new yugo!!!(ha ha ha) just kidding, anyway, inside you will find the title to your car, which the dealership has signed over to you. The game will now prompt you for your name (if your score is high enough) in order to put you in the top drivers hall of fame.

### Some Hints and Tips

When you first get the game, start out with something that does not have as much zip as the 173 mph lamborghini. The porsche is one of the best all-around cars for beginners (if you have the dough). It combines good speed and handling along the mountain road to help you get the "feel" of the game.

When your rpm indicator gets in the red area, it means that a radar gun has been detected, so slow down. It is safe to speed up when the red lights turn to green.

### Choosing A Sports Car

The screen is now split in half, showing one of the five sports cars that you may test drive and the specifications of the current car. To cycle through the different cars, press the joystick up or down. This will cause the top portion of the screen to scroll, displaying a different sport car, and the bottom portion to display specifications. The cars from which you may choose are: lamborghini countach, ferrari testarossa, porsche 911 turbo, lotus turbo esprit, and the chevrolet corvette. Each car performs just like in real life, including speed and handling.

You had better bring along your swiss bank account money, because you're going to need it. For instance, the lamborghini has a top speed of 173 mph, mid-engine/rear drive handling and a price tag of (woops!) $135,000. While the corvette has a top speed of 154 mph, front/rear handling and a price of only $35,000. To select your car, press the fire button.

### Seeing What's Ahead

Now that you have selected a sports car, let's take a look at what lies ahead. The object of the game is to drive as fast as you can along a mountain road, while avoiding obstacles such as sunday drivers, on-coming traffic, pot holes, water slicks and, most of all, the fuzz. Whoops, I almost forgot the little bird that flies over and shits all over your windshield (it's just not the car that has real-life performance).

In addition to this, you must keep your car on the road without crashing, which is no simple task when you're going 160 mph. The game ends after you have crashed your car five times or you rear-end an officer of the law. (those assholes!!)

### Game Play, How to Play, etc

Now, it is finally time to see what this fancy european or american car has under the hood. It will not be as simple as plying a lead foot, because this is no ordinary highway. The perspective you have is that of a person sitting behind the wheel looking out through the windshield of the car. In the top-middle of the windshield, you have a rear view mirror which is very detailed, showing the cars you have passed and the distance they are behind you.

The mountain route you must drive has a nice perspective to it and makes you feel like you are actually driving on the road. To accelerate push the joystick up, to decelerate push down, and to shift gears, press the fire button while pushing the joystick up or down. It takes a lot of practice to shift gears, because it's not just a matter of shifting, but rather knowing when to shift. When you do shift gears, there is a window that opens in the lower right corner of the dashboard displaying the gearshift and the gear you are currently in.

A couple additions to the "Test Drive Docs" file...

### About TEX

This program is **FREEWARE**. You can distribute TEX freely, just don't sell it. I do ask that you make sure that this doc file is made available with the program. You are under no obligation to pay anything for TEX.

However, if you like this program and want to show your appreciation I do accept gratuities. If you send me $10.00 I will send you the latest version of TEX and some of my other programs that I have written. **PLEASE** tell me what version you have so I can determine whether or not I should send you a disk right away. The $10.00 will also entitle you to 1 free update that will be AUTOMATICALLY mailed to you when I update TEX again. This way I make a little money and you do not have to spend the money downloading the update.

My address is:

Floyd Zink, Jr.
P.O. Box 060069
Palm Bay, FL  32906

I repeat **YOU ARE UNDER NO OBLIGATION TO PAY ANYTHING FOR TEX**, but if you want me to continue to provide programs in this manner than support the cause and send in the $10. Thanks.

### Features

- 1) Catalogs disks
- 2) Types files
- 3) Appends files together
- 4) Deletes files
- 5) Renames files
- 6) Strips linefeeds and "$'s from files
- 7) Removes carriage returns from files

### Program Selectors

TEX supports a start-up pathname. If you enter a start-up pathname from a program selector like PROSEL or ECP8 the program will use that pathname and strip the linefeeds from it and then exit by the quit code. If there is no start-up pathname then TEX will display the menu and you can go on from there.

### The Menu

You can select a menu item by either the first letter in the item or by using the arrow keys to move the inverse bar to your selection and then pressing return. You will be returned to the menu after all processing is done.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1045 of 1262
Selecting Files To Be Processed

After making your menu selection you will be prompted for a source directory name and where necessary a destination pathname or target directory. You can use the TAB key to skip to the next '/' in the pathname shown or OA-TAB to back up to the previous '/'. The DELETE key will delete characters and the <-- --> keys will backspace and move the cursor forward. When prompted for a destination pathname be sure and enter a pathname for a file not a directory.

After the directory(s) are selected a catalog of the source directory will be displayed. Using the up and down arrows will move the bar accordingly. The left arrow will unselect an item if it was selected otherwise it will move the bar up. The right arrow will select an item if not already selected otherwise it will move the bar down. Pressing the space bar will toggle a selection also. In addition a OA-space or a control-a ('A') will toggle all the items. Pressing return will implement the selected task using the just picked filenames.

Filename Queue
------------

The files selected are put into a linked list. This means you can select the files in the order you want them processed. This is particularly handy for the APPEND function.

Using The Mouse
---------------

If you have a mouse TEX will find it and allow you to use it instead of using the arrow keys and you can use the mouse button to select files though you still have to press return to start the process after the files are selected.

The sensitivity of the mouse is at location $204B when the program is in memory. This is the $4B byte after the beginning of the program. It is currently set at $08. This means the mouse must move 8 increments to move inverse bar. If you want to change this use a block editor or from the basic prompt enter:

CALL-151 ;enter monitor
BLOAD TEX,TSYS,A$2000 ;load file
204B:XX ;XX being the new value. Higher value=lesser sensitivity. BSAVE
TEX,TSYS,A$2000 ;save file "C"

Type Files
----------

When typing files pressing any key will pause the display. Pressing any key again will start the typing again. Pressing ESC will jump to the end of the current file and pressing ESC again will exit back to the main menu. Pressing a 'p' or 'P' will toggle the paging option. When paging is on the file will be displayed a screen full at a time and will wait for a keypress between each page.

Append Files
------------

This feature merges text files that you have selected into one file. After the merge you will be asked if you want to delete the original separate files.

Strip Linefeeds
---------------

The linefeed stripper creates a temp file with an '.S' extension. When it is done processing it renames the original file with an '.ORG' extension and renames the temp file to the original file name. Before processing the files you will be prompted for some settings as follows:

1) From the 'Minimum line length' prompt you can use the up and down arrow keys to change the default length. The purpose of the minimum line length is to try to maintain formatting in short lines. If you use the default of '60' TEX will not remove the carriage returns in lines of less than 60 characters. DEFAULT = 60

2) Removing a space immediately before a CR. If 'Yes' then TEX assumes this space is extraneous and removes it. If 'No' then TEX leave this space in. DEFAULT - Yes

3) Removing CR when followed by only ONE space. If 'Yes' then TEX assumes this space is not for formatting and removes the CR. If 'No' then TEX assumes it is for formatting and leaves the CR in. DEFAULT - Yes

4) If prompting for settings is answered 'Yes' then you will be prompted for all the settings between every file. If 'No' then you are only prompted the one time. DEFAULT - No

When you press return to select the files to be processed if you hold down the open-key then the above defaults will be used and you will not be prompted for any of them.

Deleting Files
--------------

TEX will not delete files that are locked. I have to draw the line somewhere, TEX can't do everything <grin>!

Renaming Files
---------------

When you choose the rename feature you will be prompted for the files as usual and then the files will be displayed one at a time with the cursor over them to allow you to rename them. Pressing escape will skip that file and go to the next one.

Final Words
---------

If you encounter any bugs or come up with any suggestions for improving the program please let me know. I will consider all reasonable suggestions for improvements.

You can get support from me on the following systems:

AppleLink PE - AFL Floyd (Apple II Utilities Forum Leader)
CIS - Floyd Zink, Jr. 73147,2717
GENie - FLOYD.ZINK
Floyd Zink, Jr.
g

The carriage return remover creates a temp file with an '.R' extension. When it is done processing it renames the original file with an '.ORG' extension and renames the temp file to the original file name. Before processing the files you will be prompted for some settings as follows:

1) From the 'Minimum line length' prompt you can use the up and down arrow keys to change the default length. The purpose of the minimum line length is to try to maintain formatting in short lines. If you use the default of '60' TEX will not remove the carriage returns in lines of less than 60 characters. DEFAULT = 60

2) Removing a space immediately before a CR. If 'Yes' then TEX assumes this space is extraneous and removes it. If 'No' then TEX leave this space in. DEFAULT - Yes

3) Removing CR when followed by only ONE space. If 'Yes' then TEX assumes this space is not for formatting and removes the CR. If 'No' then TEX assumes it is for formatting and leaves the CR in. DEFAULT - Yes

4) If prompting for settings is answered 'Yes' then you will be prompted for all the settings between every file. If 'No' then you are only prompted the one time. DEFAULT - No

When you press return to select the files to be processed if you hold down the open-key then the above defaults will be used and you will not be prompted for any of them.
b = build.
You begin with a patrol in your capitol city. You can build another possession in your capitol city or in any area adjacent to an area with one of your possessions in it. An adjacent area is one which is horizontal, vertical, or diagonal to an area. You can also build new possessions anywhere you you already have. The other's possessions look like yours, but they are black letters on a white background. Type t, the possession you want to build (d,p,b,c) and the area number you want to place it in. 'bd31' will build a driller in area 31.

r = run mixer.
You make money by mixing fuels. To mix fuels, press the space bar repeatedly. Continue pressing the space bar to continue mixing. When you are done mixing, press return.

t = tank repair.
A leaky tank wastes fuel. To repair a leaky tank, type t and type of fuel in the tank. 'tg' will repair the green fuel tank.
i = inspection.
You can inspect the areas which contain any of your possessions. Type i and the area number you wish to examine. 'i20' will view area 20. To add bricks to the bridge, you must inspect the bridge in area 28. a command of 'i28' will take you to the bridge where you can add bricks, one at a time, by pressing b on the keyboard.
p = prospecting.
A prospector looks for rare fuel on the other side and reports back in time, by pressing b on the keyboard.

n = number sheet.
The number sheet displays the costs and values of all the actions and items available to you. To look at the number sheet, type n.
e = exchange.
You can exchange a possession you own for half of its original value. To exchange a possession for cash, type e, the possession you wish to exchange (d,p,b,c), and its location. 'eb53 exchanges a bomb you have in area 53 for cash.
a = attack.
An attack by your patrol will destroy the other side's patrol or bomb in that area. It also allows you to take over their driller if one was present. Your patrol must be right next to the possession you are attacking. A bomb attack destroys everything in a target area and releases contamination. To attack with a bomb you must have already built one (although not necessarily in or near the area you wish to attack). To attack, type a, specify the possession with which you intend to attack (p or b), and the area you wish to attack. 'ab48' will launch a bomb toward area 48. If you have built more than one bomb, your C.A.D. will select which one to launch.
f = fuel gift.
Giving fuel to the other side can be helpful, but it costs you money to transport it across the frontier. To give fuel from your storage tanks, type f, the type of fuel (o,g,b), and the number of gallons you wish to send. 'fgo' will send 15 gallons of green fuel to the other side. Transportation costs for the fuel will be deducted from your cash.
m = money gift.
Money giving to the other side can also be helpful, but there are transfer charges you must pay. To give money, type m and the amount of money, plus transfer charges, will be deducted from you cash.
c = cease fire zone.

The world of the other side consists of three parts-one side, your side, the other side and an unclaimed frontier that separates and surrounds the two sides. Each side has clearly defined borders that are visible on the map. The entire world has been divided into 55 areas. In the middle of this world (in area 28) there is a large chasm separating the two sides. The goal of the game is to construct a bridge spanning this chasm. Each team adds to the bridge brick by brick. Each brick costs more as you build toward the other side.
For a fee, an area can be declared neutral to allow visits or building by the other side which will not alarm your side's C.A.D. To declare a cease fire zone, type 'c' and the number of the area you wish to make neutral. 'c30' will make a cease fire in area 30. Each side can only have 1 at a time.

u = underground.

By setting off a bomb underground, new fuel resources may be released. It may contaminate the fuel. First build the bomb then type 'u' and the area number. 'u8' will explode a bomb underground in area 8.

Placing a possession in an area

When building you will see a close up of the area where you are placing the possession. To place to object using (i,j,k,m). patrols must be right next to objects they are either protecting or attacking.

Breaking C.A.D. code

C.A.D. your computer assisted defense system, if your cash gets too low or if the other side makes moves which seem agressive, C.A.D. may step in and take over your moves. When it takes over, it acts swiftly and directly. The only way to stop it is by typing in the appropriate three-letter code (combination of a,b,c) which will turn it off. you can get the code if the code breaker machine appears with C.A.D. this code will only work during the year in which it was bought. To use the code breaker, press return when the amount of money you wish to spend appears. Type in the three letter code when C.A.D. appears again during this turn.

Beyond your control

Occasionally events will occur that are completely beyond your control. C.A.D. may take over or your country may experience a national strike. A strike depletes your sides cash by 500 and causes you to loose your turn.

Year end report

Watch this it tells all about your fuel and the condition of your fuel tanks, the actions of the other side and the results of the prospectors explorations. Also note the contamination levels as they increase leaking from your tanks.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1048 of 1262
When you start playing the game, you'll see a gridwork of lines with scoring and status information above it. You control the Snapper, directing it about the grid; the Snapper starts in the exact center of the grid. In this game, you will see 4 bases, a number of blots in 2 different colors, 2 whirlers which start near the top corners of the grid, and a Gamma-Field moves at random over the display. The whirlers and the Gamma-Field move about and are controlled by the Apple; the whirlers move on the grid lines (like the Snapper) and the Gamma-Field moves at random over the display. The bases stay fixed, and the blots also stay fixed until eaten by the Snapper.

The scoring and status area above the grid displays on-going information about the game. The top line indicates the total score for each player, the number of shields available (yellow X's) and the number of lives left (Snapper symbols). The next two lines are organized into 3 boxes. The center box gives you the amount of time left in this round; you'll lose your Snapper if time runs out. (The normal game sounds will change at 10 and 5 counts left, as an audible warning that time is running out.) The left-hand box shows the current values for each of the two colors of blots; each time that you eat a blot, these values will increase. The right box gives the accumulated round score, plus the player's current score multiplier. You don't get the round score added to your total score until you touch one of the 4 bases. An extra line below the 3 boxes is used to send messages to the player.

You score points by guiding the Snapper to eat blots which are scattered about the grid. You don't actually get the points for eating the blots, however, until you touch one of the 4 bases. Since the blots increase in value for each blot eaten, but are restored to their original values when the round ends (when you touch base or die), you're encouraged to get as many blots as you can before touching base. Also, as the game progresses, you'll find that you must get a minimum number of blots in the round before you are permitted to touch base. (This is indicated in the 'special message' section of the score area.)

Your Snapper is killed if you run out of time or if it touches either a Whirler or Gamma-Field. You have a limited number of shields available; a shield is activated by either pressing down (not holding down) the first joystick button or if using the keyboard by either pressing the shift key while pressing one of the direction keys or by pressing '/'. You'll get one shield for each new round, up to a maximum of 3. The shield is on when the Snapper is yellow. It will protect you from the whirler, but not from the Gamma-Field (which must simply be avoided). The shield can also be used to prevent you from touching base, should you desire not to do so, but can't avoid going over it.

At the outset, the grid lines show in purple. However, as you progress to higher rounds, more and more of these lines will turn blue-green in color. Such lines are slicks; whenever the Snapper turns onto a slick, it will move twice as fast as usual. However, the Snapper can't turn off the slick until it reaches the end of that slick. When the Snapper reaches the end of the slick it may immediately turn back onto the same slick by reversing direction; if this is done, the Snapper will continue at double speed, but it may now turn off onto any available path along the way. At the uppermost rounds available in the game, every path is a slick.

The Whirlers travel along the grid lines (and aren't affected by the slicks) in addition, they occasionally remove grid lines, preventing the Snapper from going over such removed lines. These lines are restored at the next round if the Snapper is killed, or if you get a ring.

After every 10 blots or so that you get, you will have a chance to get a ring. The ring appears in the center of the grid, and is signalled by an extra audible tone. The ring only stays up for a fixed amount of time and will flash when it starts to disappear. You'll want to get the ring whenever possible because your multiplier will be increased by one (to a maximum of 49) and the new multiplier affects the end value of the round score which is added to your total score. The grid lines that have been removed will be restored, and after every fifth ring you get an extra life. You may have up to 12 total lives as a result of extra lives, but only 6 lives (your Snapper on the grid plus 5 more next to your score) will be shown.

When 2 players play, they share the keyboard or joystick in turn. If you end your round by touching base, it will remain your turn for another round. If your Snapper is killed, however, then it becomes the other player's turn, unless he has no more lives.

You may restart the game at any time by pressing 'ESC'; when the game ends press 'ESC' to restart, the game won't restart itself.

The game begins by asking you a series of questions; if you make a mistake, press 'ESC' to start over. When you select a 2 player game you can choose a different skill level for each player.

J = Joystick
K = Keyboard

The joystick has 8 different directions. The four diagonal directions cause the Snapper to alternate left and right turns. If the joystick position is near the center, then the Snapper will continue in the same direction. While the joystick control is rather unusual and takes some getting used to, it also provides for quick and sure response for the advanced player, and was chosen with that in mind.

With the keyboard, there are 4 directions.

N = Up
M = Down
, = Left

The Snapper will not change direction if the key is just held down (unless holding repeat too)...it will continue in the same direction till the next key press.

After every 10 blots or so that you get, you will have a chance to get a ring. The ring appears in the center of the grid, and is signalled by an extra audible tone. The ring only stays up for a fixed amount of time and will flash when it starts to disappear. You'll want to get the ring whenever possible because your multiplier will be increased by one (to a maximum of 49) and the new multiplier affects the end value of the round score which is added to your total score. The grid lines that have been removed will be restored, and after every fifth ring you get an extra life. You may have up to 12 total lives as a result of extra lives, but only 6 lives (your Snapper on the grid plus 5 more next to your score) will be shown.

When 2 players play, they share the keyboard or joystick in turn. If you end your round by touching base, it will remain your turn for another round. If your Snapper is killed, however, then it becomes the other player's turn, unless he has no more lives.

You may restart the game at any time by pressing 'ESC'; when the game ends press 'ESC' to restart, the game won't restart itself.
Your assignment is vital. Three couriers headed to a top-secret conference in Brussels are missing. Each was carrying a crucial component of the NATO non-nuclear defense plans. Now two are dead and the third -- last seen in Berlin -- has vanished. You must find the three critical components (a computer chip, a floppy disk, and a CPU) before the NATO meeting -- and before they fall into the wrong hands.

You know what's at stake. This time it isn't surveillance. It isn't a drop. It isn't data farming. This is the majors, and you've just been called up. And there's only one rule in this game: don't trust anymore.

Fly to Berlin and await further instructions. Outside of occasional electronic contact, you're on your own. But then, you've always liked it that way.

HOW TO CREATE YOUR AGENT

There's a small matter regarding your cover. Field Operatives are allowed to select their own now. After hiring a few Human Resource Psychologists the Company was convinced morale would improve if you had a hand in selecting your new profile.

Create Your Profile

You can have up to four different agents on file at any one time.

To create a new agent identity:

1. Position the cursor on Create Agent and press the button (or press C).
2. Type in the name you want to use for your new identity. (up to 23 characters)
3. Press Enter.
4. Click on Next Page (or Press N) to continue when you've completed the first page.

Character Traits

On page two of the dossier, you are assigned Character Traits based on the information you provided on page one of the dossier. The numerical values beside Character Traits are indicators of your particular abilities relative to the best agents of all time. (the scale runs from 0 to 99, the highest number being the best, 0 the worst.)

Personality Traits

These are additional characteristics that affect your character's abilities. As you gain more experience, more of your character's idiosyncrasies will be revealed to you. You will learn one more positive and one more negative aspect of your character's personality with each level you gain.

Experience Points

Experience points are gained by playing the game. You gain points by exploring, encountering other characters, finding objects and by solving problems. Promotions are based on your accumulated experience.

---

HOW TO LOAD THE GAME

1. Turn on your computer, insert Disk 1 into the drive, and the game will auto-boot. Mech Insert : Press Space Bar at the Factus Screen).
2. Follow the prompts for switching disks.

HARD DISK INSTALLATION

1. Boot up your hard drive.
2. Create a new folder and name it COURIER.
3. Insert Disk 1 into your disk drive.
4. Double click on the 'Disk 1' icon.
5. Copy the following files into the COURIER folder on your hard drive (you can select multiple files by holding down the shift key when you click on each icon):
   a. Title.res
   b. Map.res
   c. Control.res
   d. Fonts.res
   e. Shot.snd
6. Open the system folder on Disk 1 and copy the files START into the COURIER folder on your hard drive.
7. Close all windows for Disk 1 and remove it from your drive.
8. Insert Disk 2 into your disk drive.
9. Copy all the files from Disk 2 into the COURIER folder on the hard drive.
   o Double click on the Disk 2 icon to open it, the use the 'SELECT ALL' option from the 'SPECIAL' pull-down menu to select all the files and drag them into the COURIER folder.

HOW TO RUN FROM A HARD DRIVE:

1. Boot up your hard drive.
2. Open the COURIER folder.
3. Double click on the START icon.

THE THIRD COURIER

Moondancer:
Grade Level

Indicated your progress. No matter how good you may be now, everyone starts out as Sleuth. As you advance (gain experience points), you graduate to higher levels: Agent, Resident Agent, Spy, and finally, Master Spy. You attain these levels based on the following expedience points:

<table>
<thead>
<tr>
<th>Level</th>
<th>Expedience Points</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>25,000</td>
</tr>
<tr>
<td>Resident Agent</td>
<td>40,000</td>
</tr>
<tr>
<td>Spy</td>
<td>60,000</td>
</tr>
<tr>
<td>Master Spy</td>
<td>75,000</td>
</tr>
</tbody>
</table>

How To Change Your Mind

If you're satisfied with your character, you have two choices:

1. Select Activate and start the game
2. Click on Done or Press D and return to the Agent Selection Screen.

However, unlike life, if you don't like your character profile you can start over again. Just click on Prev Page (or press P) and fill in the dossier with new information.

How to Activate an Agent

After you create an identity (you can create up to 4), you can activate it at will from the agent file disks.

1. Click on Select Agent (or press S), then click on (or use the arrow keys to move the cursor to) one of the four file disks.
2. Click on Activate Agent (or press A). You will begin in your apartment or wherever you last saved the game.

How to Terminate an Agent

If you wish to create a fifth identity, you must first "retire" one of your other agents.

1. Click on Select Agent (or press S)
2. Choose one of the four file disks by clicking on it or moving the cursor to it and pressing Enter.
3. Click on Terminate Agent (or press T). You will be asked if you want to delete this Agent. Press Y or N. If you terminate, he's gone.
4. Go back and create a new agent as you did in Create Your Profile.

How to Review an Agent's File

Allows you to review the dossier and current statistics of any your saved agents.

1. Click on Select Agent or press S.
2. Choose one of the four file disks by clicking on it or moving the cursor to it and pressing Enter.
3. Click on Review File (or press R). You will be taken to the second page of the dossier. When finished reviewing the file, click on Done (or press D) and you will return to the Agent Select Screen.

How to Quit the Game

To return to DOS, follow these steps:

1. Click on Quit Game (or press Q). You will be asked if you want to save the current status of your agent.
2. Select Y, NB, or ESC (ESC returns you to the menu). Selecting Y saves your agent's status and returns you to DOS. Selecting N does not save your agent's status and returns you to DOS.

KEYSTROKES

In The Third Courier, you can use a mouse, joystick or keyboard to control your movements.

In you are using the keyboard, simply press the appropriate key for the desired action. With a mouse or joystick, highlight the desired option and press the mouse button or fire button.

The directional movements works as follows: Select a direction, such as North. You will now be facing north. To continue moving north, continue to click on North or press N on the keyboard. In other words, the first selection turns you in that direction. NOTE: If using a mouse or joystick notice that the direction you are facing will rotate to the top of the on-screen compass.

* With certain actions, the Inventory Menu allows you to take or drop more than one time. When you finished, press the space bar to close this menu.

Keyboard Shortcuts

Here are some keyboard hot-buttons that will help speed up your actions as you explore Berlin.

1. To use the hot buttons, press the letter key (e.g. A]ction, I]nventory, P]lace) to open the menu you want.
2. When you menu opens, highlights an option by pressing its first letter. If more than one option shares a first letter, press the first letter again to highlight the next possibility; continue to press that letter until the option you want is highlighted.
3. To register your selection, press Enter.
You'll be staying at a Knesebeck Strasse apartment building where most CIA people stay. If you venture beyond the Berlin Wall, prepare yourself for a trip into the past. Where West Berlin is alive with technicolor brilliance and sparkle, East Berlin still has the look of a forty-year-old black and white WWII movie. Nothing has changed. It has only aged. Little reconstruction, no modern services. The trains still carry wooden seats, the cars with their two-piston engines sound like noisy motorcycles, and the air is thick with the smell of cheap, burnt motor oil. A cloud of despair hangs over the city, making the shadows grayer and the faces longer.

Mech Insert: West Berlin is within the Wall, East Berlin is on the outside.

**HOW TO NEGOTIATE THE MAIN ACTION SCREEN**

Your apartment is the first place you'll see in Berlin. We trust you'll find it comfortable -- and quite secure. Your apartment is furnished with a computer and an answering machine. The computer is the only way The Company can contact you.

**Dialog Box**

Displays critical conversation and information.

**View Window**

All the people you meet, the weapons you carry, the city streets, the building you enter, the taxi, the U-Bahn, and the border crossings will be displayed here.

**Status Box**

Indicates your current location, weapon in hand, and available ammunition are displayed here. As you explore the city, icons representing types of establishments you are passing will appear on either the right or left side of the status box. Their positions indicate which side of the street they are on.

If you turn in the direction of the icon, you will be facing the entrance to the building represented by the icon. The building may or may not be open to you. Remember that most businesses have set hours. Most in West Berlin open about 6 a.m.

**Character Information Display Unit (C.I.D. Unit)**

The C.I.D. Unit on the right of the screen has multiple functions. You will use this handy device to access special menus, keep track of your character's statistics and the time of day, move around the city and make split second decisions in encounters.

**Menus: Action, Inventory and Places**

The options contained inside these menus are your modes of action. They are dynamic menus, which means that certain options are only available when they are applicable to the situation at hand. To operate these Menus:

1. With a mouse or joystick, position the cursor on the appropriate selection and press the button (or Press Action, Inventory, or Place on the keyboard).
2. The menu will open up & the available options will be displayed in black type (options are not available at the present time are show in grey).
3. With a mouse or joystick, position the cursor on the appropriate selection and press the button (or use the up and down arrow keys from the keyboard to highlight your selection and press enter).

**Action Menu**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arm</td>
<td>Arms you and also unarms you when you are armed. Allows you to change weapons during an encounter.</td>
</tr>
<tr>
<td>Bribe</td>
<td>Offers money to people you encounter. Because you're street wise, you always bribe the correct amount.</td>
</tr>
<tr>
<td>Buy</td>
<td>The Shopping command.</td>
</tr>
<tr>
<td>Drop</td>
<td>Removes an item from your inventory. Be careful; once you leave the location where you drop something, it's gone forever.</td>
</tr>
<tr>
<td>Hail Cab</td>
<td>A speedy way to get around town. But it costs.</td>
</tr>
<tr>
<td>Listen</td>
<td>Try to pick up some interesting dialogue -- or hear someone approach.</td>
</tr>
<tr>
<td>Search</td>
<td>Examine a location or an object.</td>
</tr>
<tr>
<td>Sell</td>
<td>Sell items you acquire.</td>
</tr>
<tr>
<td>Sneak</td>
<td>Allows you to surprise foes by moving furtively.</td>
</tr>
<tr>
<td>Stake Out</td>
<td>Watch a particular location over a period of time.</td>
</tr>
<tr>
<td>Take</td>
<td>Adds available objects to your inventory.</td>
</tr>
<tr>
<td>Use</td>
<td>Lets you use a particular object.</td>
</tr>
<tr>
<td>Save</td>
<td>Saves your game at the current location.</td>
</tr>
<tr>
<td>Restore</td>
<td>Returns you to your last saved position.</td>
</tr>
<tr>
<td>Quit</td>
<td>Takes you back to the Agent Creation screen; from there you can choose.</td>
</tr>
<tr>
<td>Quit Game</td>
<td>Exits you to DOS.</td>
</tr>
</tbody>
</table>

**Inventory Menu**

This menu lists all the items you have in your possession at the time you open it. In certain locations, such as Mission Control or your apartment or in a restaurant, it will list the objects that are available to you there. At these locations, the Inventory menu will open automatically when you select options from the Action menu such as Buy or Take.

**Place Menu**

When hailing a cab (option from the Action Menu), this menu opens to reveal the places you can get to by taxi. As you uncover more important locations at Berlin, these locations are added to the place menu.

**Dynamic Character Traits**

Your character's traits reflect the choices you made on the dossier. They are represented as bar graphs on the C.I.D. Unit. Each graph fluctuates as you move, have encounters and gain experience. Watch these stats as you play. They affect how well your character can react to different situations.

- **Intelligence**: It is affected by your experience, solving problems and your health.
- **Strength**: Increases due to successful combat and decreases bases on the amount of damage your character has taken. Health also affects your strength.
- **Knowledge**: Increases as you uncover facts and gain proficiency with new items and weapons.
- **Intuition**: Changes as a result of encounters with other characters.
Experience Points

This figure represents the points you accumulate as you move toward accomplishing your mission. Certain discoveries you make will increase experience points faster.

Time and Day

The digital readout provides you with the time of day (represented in military time). Many places in the city at 0600 hours and close at 1800 hours. The number of day represents the day elapsed since the beginning of your mission. Remember you have only 7 days to accomplish your mission.

Compass

You may only move in the compass directions that are highlighted. To leave your apartment, for example, N is your only possibility. To move, position the cursor over one of the compass points and press the button, or press the appropriate letter key: East, North, West, South.

ENCOUNTER OPTIONS

When you meet someone, applicable Encounter Options will appear. To select an option, position the cursor over the appropriate option and press the button or press the appropriate letter key.

Encounter Options

Chat

A good way to get information; chat with everyone unless, of course, they're ready to swing an ax in your direction.

Fight

Combat goes in rounds between you and the other guy. The outcome will be determined by your strengths and weapons and your opponent's strengths and weapons. You can be wounded in combat, which will affect some of your character traits. During combat you may arm or change weapons by opening the Action menu and selecting Arm.

Your inventory menu then opens so you can select the weapon you wish to be armed with. Combat continues until one of your is defeated or one of you runs. If you win, you can now search your opponent. if you lose your are Terminated... dead. But if you open the Action menu and select Restore, Moondancer is returned to the last "saved" position. So it may be prudent to save the game often.

Chat

A good way to get information; chat with everyone unless, of course, they're ready to swing an ax in your direction.

Run

If your health or strength is down, you might want to let your feet do their stuff. A word of warning, however. When you run, you have no control over where you go. You are dropped randomly in the city.

Threaten

Threaten is an aggressive action that evokes different responses from the people you meet. Some will run, some will fight, some will call the police, and some will call you names.

Search

If you happen to eliminate an opponent, be sure to frisk them. They may be carrying vital info.

FIELD OPERATIONS BEGIN

To begin your assignment you'll want to use some of the equipment in your apartment. Try logging onto your computer or using your answering machine. Remember, aside from the contacts you make on the street and in shops, these two machines will be your only sources of information. Check them periodically.

Know Your Password

You'll need to enter a passcode when you log on to your Computer the first time each game session. To decipher the password:

Mech Insert: What Password?

Once in the computer you can check your mail and the dossiers of the important people with whom you will deal throughout your mission. The dossier list is dynamic and new names will be added as you meet these people and make use of your Photo-Fax. Only people Langley has a dossier on will show up in this list, which can be found under Name Check. When you're finished using the computer, Clock Log Off.

DENIZENS OF BERLIN

Our intelligence has told us that there are some contacts and informants in Berlin who will be helpful to you during the mission. However, specific information as to their identities died with the two couriers. Don't forget to use your Photo-Fax -- Langley most likely has dossiers on some of those people.

We also know that in many large cities, there is a flourishing black market. Usually, these operations are fronted by normal-looking businesses. Check out the local merchants. You may locate some sources for specialized items.

Due to the nature of this particular situation, we have reason to believe that counter-espionage activity will be very heavy in Berlin. Watch your back.

And watch your front. Reports from the field indicate that the streets of the city have become more dangerous, especially at night.

Good lock, Moondancer, we'll support you in the mission however we can. But as always, you are alone out there and will have only your quick wits and clever ways to see you through.

WEAPONS

Small Arms

Many forms of handgun exist with slightly different characteristics. Here are a few known to be carried by Mission Support and some of the locals.

Air pistol

Derringer 25

Beretta M92SB

AK 47

AR-15

AR-18

CZ 85

Walther PPK

Browning BDA-9

S&W Model 10

Charter Arms Bulldog

S&W Model 629

Colt Agent

S&W Model 65

Colt Python

Walther P5

Markarov

SAS Model

Walther PPK

Derringer 25

M16

Nato Car 15

Uzi Carbine

RUNS AND STREETS

During combat you may arm or change weapons by opening the Action menu and selecting Arm.

Your inventory menu then opens so you can select the weapon you wish to be armed with. Combat continues until one of your is defeated or one of you runs. If you win, you can now search your opponent. if you lose your are Terminated... dead. But if you open the Action menu and select Restore, Moondancer is returned to the last "saved" position. So it may be prudent to save the game often.

Threaten

Threaten is an aggressive action that evokes different responses from the people you meet. Some will run, some will fight, some will call the police, and some will call you names.

Search

If you happen to eliminate an opponent, be sure to frisk them. They may be carrying vital info.
Submachine Guns

Hopefully you won't meet anybody carrying one of these, but rumor has it that someone has been supplying submachine guns to some of the locals to prevent people like you from doing their job correctly.

- K-50K
- Mil
- MPL

Close Combat Weapons

A little refresher here from your school days might be in order on some of these, so we'll include descriptions.

- Bali-Song: A short, flat-bladed knife, commonly called a 'butterfly knife'.
- Billy Club: A short, hard-wood stick to hit people with.
- Stiletto: A thin-bladed knife, longer and thinner than a Bali-Song.
- Sykes-Fairbairn: A heavy, military knife which can be fixed into a bayonet if need be.

GIZMOS

There are some items at Mission Support that may be of value. Occasionally check with Murphy in Supply to see if he has any of these devices available.

(Note: that some devices will only be available as you gain certain levels).

Electronics

- Bomb Sniffer: Standard issue C.A.N.I.N.E. class explosion detection device capable of detecting even minute traces of explosive compounds at range of up to 50m.
- Bug Finder: The Super Sentry Speakfree Bug Finder, which, when used in conjunction with the Super Sentry Bug Eradicator, (q.v.) allows the most secure local bug protection on the market today.
- Bug Killer: The Super Sentry Bug Eradicator, a single use device which not only destroys local covert listening devices, but doubles as a handy aerosol stain remover as well.
- Bug Recorder: Located in your apartment, this device records any Super Bugs you have activated.
- Ferat: Infrared through Ultraviolet wave detection device keyed to hormonium compound used to coat NATO defense plans. Will emit a beeping sound when within 10m. of said plans.
- Photo-Fax: A photographic facsimile machine which will allow you to send pictures to suspected contacts and agents to Langley from anywhere in the world. (q.v.) allows the most secure local bug protection on the market today.
- Super Bug: An extremely small and powerful covert listening device designed to blend well into any number of art-deco and neo-modern backgrounds.

Protective Gear

- Gas Mask: For those awkward moments when breathing just won't do.
- MK1 Vest: Although never field tested, this vest is said to be "near entirely bulletproof at 100m." RAD is working on improved models and some are rumored to exist on the black market.

Amyl Nitrate and Tannic Acid: If Moondancer is unlucky enough to ingest poison, these can be antidotes.

Tools

- Lock Picks: Come on, you're supposed to be a super agent.

Flashlight: Used in dark places, like underneath buildings, so that you can see the vermin you're sliming around with.

BERLIN TOUR GUIDE FOR NON-GERMANS

Whenever visiting a new city, it's always a good idea to bring along a good guide book. It increases the pleasure of your wanderings -- and you never know what interesting nuggets of information you might pick up. Here's a brief description of some of Berlin's notable districts.

WEST GERMANY

The Park District: To the south of and east lies the great Berlin park, a place of scenery, beauty and enchantment. For centuries, lovers have strolled hand in hand through these woods, enthralled by their pastoral beauty. Many forms of entertainment abound herein and, of course, public restrooms are provided.

The Place District: North and east is the home of the famous Charlottenburg Palace, the largest mansion in Berlin and bastion of German culture. Surrounding the palace are some of the finest restaurants and bars Berlin has to offer. Be sure to sample the beer.

The Templehoff District: Smack in the center of Berlin lies the Templehoff business district, home of Berlin's thriving international trade community. Experience the hustle and bustle of a truly dynamic economy at work, and perhaps see the city from a new perspective -- high atop the Templehoff building itself.

The Dairy District: The mere mention of Germany immediately conjures up images of good food. Beer, pretzels, and of course, wurst are as German as bagpipes are Scottish. This south-western district is the home of these rural delights. The farmers and merchants, known for their biting wit and rural wisdom, are always glad to exchange pleasantries with foreign travelers.

The Industrial District: What city could survive without the working man? Berlin is no exception. North and west lies the home of the proletariat and his pleasures. here you will be staying in some of the most affordable housing in all of Europe.

EAST GERMANY

Max Engles Plaza: Wide open space and open air cafe's mark this plaza, the largest in East Germany. Here, it is said, old friends may meet and relive happier times.

Cultural District: Traveling east from the plaza along Unter den Linden, one encounters the home of German culture. If one is careful, one might almost be able to see the effects of such German immortals as Beethoven, Mozart, and Wagner as their music drifts out from the opera house.

Government District: Between Friedrichstrasse and Otto Grotewohl along Unter den Linden sits the center of international government in East Berlin. Travelers who encounter troubles may wish to consult their embassy, located along this stretch of road.

Brandenburg Gate: Of all of the beauties of Germany, one of the greatest must be the gates of Brandenburg concerti. It was once said of these gates:
"If I could choose, from all of life's pleasures, my last sight, it would be of the gates at Brandenburg."

Official Listing of [Factus] Boards

Mission Briefing-

Moondancer:

Your assignment is vital. Three couriers headed to a top-secret conference in Brussels are missing. Each was carrying a crucial component of the NATO non-nuclear defense plans. Now two are dead and the third, last seen in Berlin, has vanished. You must find the three critical components (a computer chip, a floppy disk, and a CPU) before the NATO meeting—and before they fall into the wrong hands.

You know what's at stake. This time it isn't surveillance. It isn't a drop. Or data farming. This is the majors, and you've just been called up. And there's only one rule in this game: don't trust anyone.

Fly to Berlin and await further instructions. Outside of an occasional electronic contact, you're on your own. But then you've always liked it that way.

Other Stuff-

Other than that, the manual doesn't say a lot else that is not obvious, or at least easy to figure out. Here is a list of stuff that may not be apparent.

- USE the photo-fax to send a picture of a person to Langley, and if they have a dossier on that person, you can access it through your computer at your apartment.
- FERAT is a device that let's you know when you are near a part of the plans.
- Amyl Nitrate and Tannic Acid- these can be antidotes to poison.

Some Hints-

- You should probably make a street map as you go along. The game comes with one, but it is just a simple map- there's nothing special on it except the location of your apartment, which is on Kneesebeck st., between Berliner and Hohenzollern. By the way, Berliner runs north and south.
- You can ARM during an encounter, which comes in handy considering that the local police seem to get upset when you walk around with your 'piece' hanging out!

That's about all I can think of that you might need, after all, the manual doesn't tell you much else. The map will be coming out soon.

Call These Boards:

The LookOut ......... [403] 457 - 0114
Private Storage ..... [215] 745 - 0495
Brave New World ..... [707] 938 - 2997
OBJECTIVE: SHOOT OBJECTS THAT FLY AND DROP BOMBS ON YOU

JOYSTICK:
LEFT TO RIGHT MOVEMENT ONLY

SPACE BAR:
ENGAGES WARP DRIVE

BUTTON 0:
FIRES LASERS

KEYBOARD:
(F) SHIP TO LEFT
(G) STOPS SHIP
(H) SHIP TO RIGHT
(0) OR (1) FIRE LASER
SPACE BAR - ENGAGE WARP DRIVE

NOTE:
EXTRA SHIP GIVEN AT 50,000 POINTS AND EVERY 100,000 POINTS THEREAFTER. MISSION IS COMPLETE WHEN LAST GROUP OF ALIENS ARE DESTROYED.

[ESC] - SHUTS OFF SPEAKER
[S] - SUSPENDS PLAY
[B] - WHEN HIT AT PROMPT FOR

PADDLE OR JOYSTICK SUSPENDS STAR BACKGROUND DURING PLAY.
YOU ARE THE CLOUDSHIP IN THE MIDDLE OF THE SCREEN. YOUR JOB IS TO BLOW AWAY THE ENEMY SHIPS ON EITHER SIDE OF YOU. NO MATTER HOW MANY ENEMY SHIPS YOU HIT, HOWEVER, THERE WILL ALWAYS BE REPLACEMENTS UNTIL YOU HIT THE DRONE-CLONE REPLENISHERS THAT APPEAR OCCASIONALLY ON THE EXTREME RIGHT & LEFT OF THE SCREEN.

ONCE YOU HIT BOTH REPLENISHERS ON A LEVEL, THE ENEMY SHIPS WILL NOT REAPPEAR ONCE YOU HAVE SHOT THEM. CLEAR ALL THE ENEMY SHIPS FROM A LEVEL & YOU MOVE ON TO THE NEXT, TOUGHEST LEVEL.

YOU ARE AWARDED AN EXTRA SHIP FOR EVERY 2,000 POINTS YOU ACCUMULATE. HOWEVER, A MAXIMUM OF 9 SHIPS IS ALLOWED AT ANY ONE TIME.

CONTROLS:

JOYSTICK:
THE JOYSTICK CONTROLS YOUR VERTICAL MOVEMENT.

BUTTON 0 FIRES TO THE RIGHT
BUTTON 1 FIRES TO THE LEFT.

THE SPACEBAR WILL STOP YOUR MOVEMENT ALTOGETHER.

ATARI JOYSTICK- UP/DOWN- LEFT & RIGHT FIRES.

KEYBOARD:

A & Z = UP & DOWN

ARROWS = FIRE

V = VIEW HISCORES

[ESC] = PAUSE

CTRL-S = SOUND
may distribute this program freely with the stipulation that users of the program are advised of the shareware nature of this product. I ask that if you use this program that you send me $30 to help support me in writing programs like this. Given that competitive products for the Apple generally sell for twice this amount I think this is a fair thing to ask. In return for the $30 you get a nice manual, technical support, update notices, and a good feeling inside for helping to keep down the high cost of quality apple software. If this product gets you a better user support via the shareware agreement then it will continue to be updated with new features, largely at the suggestions of users. Shareware distribution has the potential of being a great way to distribute great apple software at minimal prices because of the minimal distribution costs. Help keep a good thing going and send your check today to:

Don Elton
3207 Berkeley Forest Drive
Columbia, SC 29209-4111
803 776 3936 (300-2400 baud)

If you'd like to make any comments or suggestions concerning TIC please feel free to send them to me at the above address.

Commissions:

Oh yeah, new idea. The copy of TIC that you are using has a Serial number affixed to the title screen. This is the serial number of the user who registered the copy you are using. If this serial number is 0 then you get this copy directly from me. When you register TIC you should list the serial number of the copy of TIC you were using so I can send a $5 finder's fee to the person who actually registered the copy you first tried out. This will work the same for you too... This means that if you give 10 copies of TIC away to friends and all 10 of them register the program by paying the $30 shareware fee then I'll mail you a check for $50.

If you upload the program to a bulletin board and 100 people register and give your serial number with their order then I'll mail you $500. Just another incentive for you to register the program yourself and to encourage others to do the same. Thanks for your support.

Terminal Emulation:

------

TIC can now do screen emulation of many popular terminals. This is accomplished by the loading of special termcap definition files which contain the necessary translation tables to do the particular emulation. The default is TTY (no emulation). You must specify the termcap definition file you want to use from the OAM menu. From this entry (9) you enter the pathname required to reach the termcap file assuming that the prefix is set to the root directory. You may optionally use a full pathname at this entry. You may also specify a termcap file using the EMULATE statement from a command file. Note that ZOOM mode is only available from TTY mode.

You may use the supplied DEFTERM basic program to define your own terminals. You need to have some idea of what makes up a terminal emulation to use this program so do so at your own risk.

Note that TIC can only emulate terminals that are based on binary codes. This leaves out the VT-100/VT-200 series since they are based on ascii codes. They may be supported in a future version of TIC.

Command File Documentation:

----

Talk is Cheap (TIC) versions 0.27 and above support a powerful Command file feature that allows a user to automate most functions internal to TIC. This document is a supplemental user's guide to describe how the Command file feature works and to specify the syntax used within Command files. There are also several new features, not related to Command files that have been added to TIC as a result of user suggestions.

Note: OA-X refers to the Open Apple plus "X" key combination. CA-X refers to the Closed Apple plus "X" key combination. Note that the newer Apple IIgs and /e keyboards substitute "OPTION" for the Closed Apple key.

TIC now supports powerful Command files. These Command files, if properly named, are automatically executed when you press the Closed Apple key together with a letter key or they may be specified manually using the OA-X command described above. If the user presses the CA-A combination then TIC will look for a file named "TIC.KEY.A" to execute as a command file. Command files that are executed as keyboard Macros are called Macro Command Files. In order for TIC to find its Command files, TIC keeps up with the concept of a Root directory. The Root directory is the directory that TIC resides in when it is run. All Macro Command Files must reside in the Root directory.

At startup time, if a file named "TIC.STARTUP" is found in the Root directory then TIC will execute it as a Command file automatically. If you are using a program selector such as the Extended Command Processor (ECP) then you may specify an alternate startup Command file at run-time by specifying the alternate file name after the TIC file name:

:tic <file>

The above would start TIC and force TIC to execute <file> as the startup Command file.

In order to invoke Macro Command files, you must have a text file named TIC.MACROS in TIC's Root directory. Each line of this file should begin with the letter of a valid Macro key. i.e. if you start a line in TIC.MACROS with "A" then you should have a file named "TIC.KEY.A" in the same directory with TIC. The remainder of the line should start immediately after the letter identifier and should be the name of the service associated with the particular Macro key. An example TIC.MACROS file might contain:

aApple BBS
bCommercial BBS
cMy BBS
dYour BBS

Most Command file operations can be aborted by pressing the ESC key. There may be a short delay in aborting certain Command file functions.

TIC Command file Syntax:

- TIC Command files are text files created by any text editor. They consist of lines of text with a single command per line. Blank lines are ignored as are leading and trailing spaces which may be included in the file to improve readability. Upper and lower case characters are allowed and will not affect parsing. TIC does not check the file type of Command files.
- Command List:

# This is the comment character. It is a command that is ignored. One or more blank characters must follow the # symbol. Labels are defined as the first word following the # symbol. Thus to encode the label 'start' in a Command file you would use the following:
# start <-- this is a label. "Start"

BUFFER ON

Turns on the recording buffer.
Apple II Computer Info

BUFF OFF
  Turns off the recording buffer.
BUFF CLEAR
  Erases the recording buffer.
BUFF SAVE
  Saves the recording buffer to the autosave file.
BUFF WRITE <file>
  Saves the recording buffer to <file>.
DISPLAY <string>
  The <string> is displayed to the CRT. <string> may contain imbedded control characters or you may encode them by prefixing a letter key with the "^" symbol. Thus, "^C" is Control-C. Use "^^" to encode a single "^" character literally. Note that the characters displayed are sent to the CRT using the communications console driver so carriage returns and line feeds must be encoded separately as "^M^J". Either single or double quotes are required if <string> contains imbedded blanks.
DO <label>
  Calls a subroutine that begins with the line following <label>. See also, RETURN. Note that only one DO procedure may be active at one time.
EMULATE <pathname>
  Emulate the terminal defined in the termcap file found at <pathname>. Specify TTY for no emulation.
GOTO <label>
  Transfers control to the statement following <label>.
HANGUP
  Hangs up the telephone connection.
IF EXISTS <path> <statement>
  If <path> exists then execute <statement>. Otherwise, execution continues with the statements that follow this statement.
IF FAILED <statement>
  If the previous statement failed (i.e. a WAITFOR statement didn't find its target before the time limit expired) then <statement> is executed. Otherwise, control passes to the next statement and <statement> is ignored.
IF KEYBOARD <CHAR> <LABEL>
  If the most recently pressed keyboard character matches <CHAR> then continue execution with the statement following <LABEL>.
PAUSE <seconds>
  Execution pauses for the duration specified in <seconds>. If <seconds> is omitted then execution will pause for approximately one second.
PRINT INIT <string>
  Sets the printer initialization string as specified. Control characters can be encoded just like DISPLAY.
PRINT OFF
  Turns off online printing.
PRINT ON
  Turns on online printing.
PRINT SCREEN
  Prints the current screen.
QUIT
  The ProDOS QUIT MLI call will cause TIC to shutdown and exit to the selector program.
RECEIVE <file>
  Receives <file> from a host computer using Xmodem, Ymodem, or ProDOS xmodem protocol.
RETURN
  This statement returns control back to the next line following the last executed DO statement.
SEND <file> PRODOS
  Transmits <file> to a host computer using ProDOS Xmodem protocol.
SEND <file> TEXT
  Transmits <file> to a host computer using Ascii protocol using the previously defined prompt, line delay, and character delay.
SEND <file> XMODEM
  Transmits <file> to a host computer using Xmodem protocol.
SEND <file> YMODEM
  Transmits <file> to a host computer using Ymodem protocol.
SET APPEND ON
  This determines whether automatic buffer saves are appended to the original autosave file. The default is SET APPEND OFF which means that when each buffer save is done, a new autosave file is created with a higher number appended to the end of the file name. This limits you to 10 autosave files of about 16K each. If you SET APPEND ON then all buffer saves will be appended to the end of the current autosave file creating a single large file.
SET AUTOSAVE <file>
  This sets a new autosave file. The <file> name should be at least 3 characters in length.
SET BAUD 300
SET BAUD 1200
SET BAUD 2400

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
Apple II Computer Info

SET BAUD 4800
SET BAUD 9600
SET BAUD 19200

Sets the Baud rate as indicated.

SET BINARY2 AUTO
SET BINARY2 MANUAL

AUTO is the default. This determines whether TIC will automatically unpack Binary II files as they are downloaded.

SET BUFFER AUTO
SET BUFFER MANUAL

AUTO is the default. This determines whether TIC will automatically turn its copy buffer on and off upon receipt of the Control-R and Control-T signals from the host. To disable this feature, use the SET BUFFER MANUAL statement within a command file.

SET CODELAY <0-9>
SET LODELAY <0-9>

Sets the Character or Line delay timer for Text file uploads. These settings default to 0 if you do not set them and remain set until you reset them or re-run TIC.

SET DFORMAT 8N1
SET DFORMAT 7E1
SET DFORMAT 7E2
SET DFORMAT 7O2

Sets the data bits, parity, and stop bits for the serial port.

SET DUPLEX FULL
SET DUPLEX HALF
SET DUPLEX CHAT

Sets Duplex to full, half, or chat for terminal mode.

SET ECHO ON
SET ECHO OFF

Enables or disables the display of Command file statements as they execute. These statements are used primarily to debug Command files.

SET PADCR ON
SET PADCR OFF

Enables or disables TIC adding a space character to blank lines during text mode uploads. The default value is ON.

SET PORT SSC
SET PORT IIGS

Sets the communications driver to Super Serial Card or IIgs internal port. This command overrides the initial card identification routine in TIC.

SET PREFIX <path>

Sets the ProDOS prefix.

SET PROMPT <character>

Sets the handshaking prompt for text uploads.

SET SLOT <1,2,4,5,6,7>

Tells TIC where to find your Super Serial card (or clone) that you wish to use for the communications port. Has no effect when used with an internal port on the Apple IIgs since its port is fixed at slot 2.

SET TIMER <seconds>

Sets the time limit for WAITFOR searches.

STOP

The Command file is terminated if this command is encountered. No error message is displayed.

VIEW <file>

<file> is displayed to the CRT.

WAITFOR KEYBOARD

Execution will pause until a key is pressed at the keyboard or until the time limit expires. If time expires then FAILED becomes true and can be tested by the IF statement.

WAITFOR STRING <string>

Execution will pause until <string> is received over the serial port or until the time limit expires. If <string> is omitted then execution pauses until any character is received over the serial port. Note that <string> may contain imbedded control characters just like the DISPLAY command.

WAITFOR TIME '00:00'

Execution will pause until the specified time matches the ProDOS system time. You should not use this command if you do not have a ProDOS compatible clock installed. Note that the time string must be exactly 5 characters long and must be encoded in 24 hour format.

XMIT <string>

The <string> is transmitted out the serial port. Note that imbedded control characters may be encoded in <string> just like with the DISPLAY command.

Turbo Xmodem:

---------

Turbo Xmodem is a means of speeding up xmodem or ymodem downloads. It works by pre-acknowledging incoming blocks of data to eliminate the delay that slows down xmodem transfers between blocks of data. On the down side, a single data error will result in an aborted transfer. In addition, you can only use this mode when downloading to a ram disk. This file transfer protocol can speed up xmodem downloads by as much as 100% but has limited utility because of the limitations noted above. It is included by popular demand.
The Icon Menu Display is used to select an Icon for editing, delete an Icon, add more Icons, or save all the Icons in memory to disk. The Icons in memory are shown in the center of the display. At the bottom of the display, brief instructions for this display, the total number of Icons in memory, and the number of free bytes left for Icon image data are shown.

To edit an Icon, use the Up and Down arrow keys to move the cursor to the desired Icon and press Return. You will then be asked which aspect of the Icon you wish to edit. Typing F or S will show the Icon Edit Display and allow you to edit either the Full-sized or Small version of the Icon. Typing E will allow you to edit the Extended Parameters attached to the Icon.

To delete an Icon, move the cursor to the desired Icon and press D. If you delete all of the Icons in memory, the File Menu Display will be shown and you must select another file for editing or exit the program.

To add more Icons, press A. The File Menu Display will be shown and you may either set the prefix (by selecting Folders), select an Icon file to add to memory, or return to the Icon Menu Display. As said in the previous section, a maximum of 40 Icons can be contained in memory at one time.

To save the Icons in memory to disk, press S. The current prefix will be shown and you will be prompted for a FileName. The name of the Icon file last read is the default. You may either use the prefix and type just the filename or you may type the full pathname of the file you wish to save the Icons in. The Icon file must be in a folder called ICONS in the root directory of the disk in order to be recognized by Finder. It is recommended, although not required, that you attach .ICONS to the end of the Icon file's name.

To exit the program press Escape.

When editing the Extended Parameters:

- The Name field can be no longer than 15 letters, numbers, periods, and asterisks. Use the asterisk as a wildcard character. If an asterisk is entered as the Name, it will match all FileNames.

- The FileType field can either be entered as a decimal number or the code seen in the Icon Menu Display under "Typ" (i.e., 4 or TXT, 182 or 86, etc.). ALL (or 0) may be entered in order to match all FileTypes, however, this field is the best way to match Icons to files and normally should not be set to All. The FileType field can also indicate that the Icon is a hardware device. If you wish to make an Icon represent a hardware device, enter one of the following codes instead of a normal FileType:
  
  - 265: 5.25" Drive
  - 266: RAM/ROM Disk
  - 267: 3.5" Disk
  - 268: 5.25" Disk
  - 269: Hard Drive
  - 270: Full Trash
  - 271: Empty Trash

- The AuxType MUST be entered as a decimal number from 0 to 65535. If this number is zero, it will match all AuxTypes.

- The Application field can be no longer than 63 characters and must be a FULL pathname. This field indicates to Finder what application to launch if this Icon (usually a document) is opened. It may be blank and should be so if this Icon represents an application.

The Icon Menu Display is shown in the center of the display. At the bottom of the display, brief instructions for this display, the total number of Icons in memory, and the number of free bytes left for Icon image data are shown.

To exit this display, press the Escape key. If no Icons have been read, TIE will end. Otherwise, the Icon Menu Display will be shown.

Once an Icon file has been selected and read, the Icon Menu Display is shown.
Icon. The color of each pixel can be selected by you to create the final image
and shape. In the text area of the display, the Icon number and aspect of the
Icon are displayed. Available commands and the current color are also shown
here.

Each aspect of the current Icon is normally bordered in grey, but if the Icon is
too big for TIE to display (more than 36 pixels wide or high) then either the
bottom or right sides (respectively) of the display boxes will be drawn in red.
If this condition does happen, you may still edit the part of the Icon that is
shown.

The left hand box contains the Icon Image and may be edited using 16 colors. The
right hand box contains the Icon Mask associated with that Image and may only
be edited with two colors, black and white. Each white pixel in the Mask will
allow the corresponding pixel in the Image to be displayed in the Icon. When
editing the Mask, the current color has no effect.

NOTE: For the most part, the colors that TIE uses to display Icons correspond
with the actual colors used on the Finder screen. However, some colors do
not match what is seen in Finder.

To change a pixel, select a color by pressing the corresponding key shown below
each color at the bottom of the screen (Hexadecimal number: 0 - F). The name of
the current color will show up in inverse. Then move the cursor to the pixel you
wish to change with the arrow keys and press the space bar. If you make a
mistake, just press the space bar again and the pixel will be restored to its
original color.

To edit the Icon Mask, press the backslash key (\) and the cursor will switch
eight boxes. Now follow the instructions for changing a pixel, except that color
need not be selected (when a pixel is changed in the Icon mask, it is toggled
between black and white). Press backslash again to continue editing the Icon
image.

When your Icon is finished, press Escape or Return to exit the Icon Display.

-----------------------------------------------

TIE Internals

TIE is written in AppleSoft BASIC and poor old Dr. BASIC is really pushed to
his limits.

- BASIC simply cannot handle the amount of raw data involved with storing Icons
in memory, so I wrote my own variable storage routines (mostly in BASIC, but
they do include a short ML subroutine) for the Icon image data.

- The Icon Edit Display, if you will notice, is done on the Double Lo-Res
Screen using a little known trick that Uncle-DOS (aka Tom Weishaar) reported
in Open-Apple magazine on page 43 (June '85 issue). It was found in the //c
ROM, but it seems that Apple used the same trick in the IIGS! It also seems
that Apple didn't correct the bug that Uncle-DOS found! Maybe if we all bug
Apple, they will fix it. If you don't know what I'm talking about, bug Tom
Weishaar to "reprint" the article online! (Or maybe I will if he gives the
go-ahead)

- If you look carefully at the Initialization code in the beginning of the
program, you will notice that the program relocates itself in order to make
room for a File buffer and Icon storage. If you rename the program, you must
also change the name used in the statement that relocates the program or else
it WILL crash! (change the :::: PRINT D$;"-TIE" to
::: PRINT D$;"-<New.Name>"**)

-----------------------------------------------

The Icon Editor is copyright (c) 1988 by ACE Software
TimeMaster IIgs is an Apple IIgs time correction utility. It calls atomic time standard services using the system modem and adjusts the time of the Apple IIgs internal clock to within 1 second. TimeMaster IIgs maintains a log of time corrections in an ASCII text file and provides a graph plot of long term clock drift trend analysis. TimeMaster IIgs uses this drift analysis to allow you to predict an update of your IIgs clock without calling the time service! Two time services you can call are the U.S. Naval Observatory in Washington, D.C., (202) 653-0721, and one in Toronto, Canada, (416) 445-9408. The call lasts about 25 seconds. This only costs $0.15, calling Washington from St. Louis after 6pm.

Installation
------------------------------------------------------------

TimeMaster IIgs consists of the following files:
1. TimeMaster.IIgs The executable TimeMaster IIgs utility. Launch this file from the GS/OS Finder desktop, or another program launcher.
2. TimeMaster.Pref This contains Setup Preferences in text format. It is created in the same directory as 1 above when you select the Save Preferences menu.
3. TimeMaster.Log This is a text file log that is created the first time you call a time service. It contains results of each time correction (whether by an actual call, or due to a predicted correction) with the date, time and seconds adjusted.
4. TM.read.me This documentation file as an ASCII text file.
5. TM.read.me.awp This documentation file as an AppleWorks word processing file.

The TimeMaster.IIgs file (file 1 above) executable file is the only one you need to run this application. It can be placed in any directory on your disk. Be sure to have some extra space on this disk, because the TimeMaster.Pref and TimeMaster.Log files (2 and 3 above) are created in this same directory.

TimeMaster IIgs Startup

TimeMaster IIgs execution is initiated by launching the application file named "TimeMaster.IIgs" from the GS/OS Finder by double-clicking the "TimeMaster.IIgs" file's icon, or by using another GS/OS program launcher.

Apple II Computer Info

TimeMaster IIgs is now active on the desktop. All menus may be used. The display at the bottom of the screen shows the current date and time being maintained by your Apple IIgs. The center bottom shows the current setting for the time zone difference in hours. This can be changed, along with several other parameters, using the Setup menu.

Menu Descriptions
------------------------------------------------------------

Apple Menu ----

About TimeMaster IIgs...
Displays revision & shareware information.

Help... Generates an online help display. This covers 5 pages, so click the 'OK' button to turn the pages.

Credits... Displays copyright credits for ORCA/C, the Apple IIgs, Serial I/O and Dialog routines used by TimeMaster IIgs.

File Menu ----

Setup Use the Setup Menu dialog to alter the modem initialization string. It is set for an external, Hayes-compatible modem by default.

Phone number may be changed to accommodate calling any prefix, phone number and suffix that may be needed to dial the time service.

Change the time zone difference to adjust for your time zone. This number must be -23 to +23 hours. For St. Louis during winter time, this is -6 when calling a Greenwich Mean Time service, such as the U.S. Naval Observatory.

Select Touch-Tone or Pulse Dialing.

Select Disable Timeouts if you are in an area that has slow phone service. This makes TimeMaster IIgs wait forever for calls to connect and the time service modem to respond.

Any changes are temporary for this call, unless you use the Save Preferences Menu. Use Cancel to ignore changes made in the dialog box. Use Undo to reset changes made. Use OK to accept changes.

Save Preferences

This Menu saves all items in the Setup Menu dialog to a file named 'TimeMaster.Pref' on your disk. This is read on startup, if present. You may delete this file to restore the original TimeMaster IIgs settings.

Delete Preferences

This Menu deletes the file named 'TimeMaster.Pref' from your disk, restoring the original TimeMaster IIgs settings.
You are asked if this deletion is okay before the file is deleted.

Delete Time Log

This Menu deletes the file named 'TimeMaster.Log' from your disk, which eliminates all record of previous calls to time services. You are asked if this deletion is okay before the file is deleted.

Quit

Exits TimeMaster IIgs to the calling system (e.g. Finder, or other program launcher).

Edit Menu

---

Cut

All Edit functions may be used for entry or change of text information (e.g. in the Setup dialog), using keyboard equivalents.

Copy

open-apple-X = cut

Paste

open-apple-C = copy

open-apple-V = paste

TimeMaster Menu

---

Dial

The Dial Menu causes TimeMaster IIgs to call the time service, set the Apple IIgs clock, and the difference in seconds. It then displays a continuously running clock in the lower left screen area of the Time Service's time and date. It updates your Apple IIgs clock recorded based on TimeMaster IIgs predictions (via the Predict Time Menu).

Hangup

The Hangup Menu simply tells your modem to hang up the phone, and provides statistics on the screen for the Apple IIgs time, correct time, and the difference in seconds. It then displays this information on the screen, and logs this prediction to the time log file 'TimeMaster.Log'.

Plot Clock Drift

This Menu displays a graph of your Apple IIgs clock drift history and characteristics. Up to two years of recorded clock corrections are plotted.

Blue '+' symbols indicate clock corrections in seconds that were recorded in the TimeMaster.Log file based on actual calls to the time service (via the Dial Menu).

Light Blue '+' symbols show corrections to the IIgs clock recorded based on TimeMaster IIgs predictions (via the Predict Time Menu).

A Green line shows the running average clock drift per month (in seconds per month). Over time, this should be fairly constant for your Apple IIgs, however each computer is unique.

Red '+' symbols show the future monthly projection of clock drift (in seconds) if you do not correct the clock by Dialing the time service or use the Predict Time Menu.

Predict Time

This Menu uses the analysis of the Plot Drift function to predict how far your Apple IIgs clock has probably drifted since your last actual call to a time service. It then predicts a correction to the IIgs clock, sets the IIgs clock to this updated time, and logs this prediction to the time log file 'TimeMaster.Log'.

Predict Time can be used in between time service calls to keep your IIgs clock as up to date as possible. While this is certainly not as accurate as a time service correction, it does update your clock fairly accurately without a phone call.

Select all three menu items under the desktop Apple in the menu bar and review the information displayed for About TimeMaster IIgs..., Help..., and Credits. This gives vital information on this application, and provides an address to send your $1 contribution for this shareware utility. Please do so now!

Select the "Setup" item under the File Menu. This displays the current settings for the modem initialization string, phone number, time zone difference, tone/pulse dialing and disable timeout selections. Use the mouse to position the cursor to make any changes to this information with the keyboard. The modem initialization string is set for an EXTERNAL, Hayes-compatible modem, connected through the IIgs modem port. (Internal modems, or modems connected to serial cards just will not work properly.) Refer to your modem documentation to determine if you need to change this. If you don't know what any of this means, then don't mess with this string.

Please note, TimeMaster IIgs does need to have the "Q0" and "V1" parameters included in this string. These parameters tell your modem to return results codes to TimeMaster IIgs so it can monitor the call's progress, and to send these results in words, not codes.

The phone number can be changed since your needs for dialing may differ. You may add prefixes like "9-" if going through an office PBX phone system. You can also add suffixes to accommodate telephone service access codes, and the like.

Be sure to update the Time Zone Difference for your time zone. This is the number of hours to be subtracted from the time service to set your Apple IIgs clock. It is initially set at -6 since I live in St. Louis, its not Daylight Savings Time yet, and I call the Greenwich Mean Time service maintained at the U.S. Naval Observatory in Washington, D.C. This entry must be from -23 to +23.

Select the radio button for Touch-tone or Pulse dialing, depending on your local phone service.

Finally, use the checkbox to select, or not, the Disable Timeout function. Selecting this checkbox disables all timeouts during call processing. It is useful for areas that have very slow telephone service.

Exit the Setup dialog by selecting the "OK" button.

Now, to call the time service, use the "Dial" item under the TimeMaster Menu. TimeMaster IIgs will display calling progress information as it initializes the Apple IIgs serial port to 300 baud, initializes the modem, dials the time service, connects with it, and receives the correct time. If the service is busy or not answering, you will be notified. The call lasts about 25 seconds after connection. This only costs 15 cents for me to call the Washington service from St. Louis after 6pm.

If you forget to power on your modem, TimeMaster IIgs could appear to freeze at this point. If Timeouts are enabled, control will be returned with an appropriate message in a few seconds. If Timeouts are disabled, just press the ESC key, and control will return to you.

After TimeMaster IIgs has received the correct time from the service, it hangs up the phone, and provides statistics on the screen for the Apple IIgs time, correct time and the difference in seconds. It then displays a continuously running clock in the lower left screen area of the Time Service's time and date. It updates your Apple IIgs internal clock in accordance with the Time Zone Difference.
TimeMaster IIgs will create an ASCII text file called 'TimeMaster.Log' in the same directory as the application is located. It is created the first time your clock is corrected. It contains a log entry of the date and time called, and the difference in seconds. This file is then added to each time you call the service or use the Predict Time Menu to update the IIgs clock. This file can be deleted using the Delete Time Log item, under the File Menu.

Use the Plot Clock Drift Menu to display a graphic plot of the drift in your Apple IIgs clock over time. This shows all clock updates for a two year period, calculates and plots an average drift per month, and a projection of monthly drift.

After you have called a time service with TimeMaster IIgs a few times, this should set a trend for clock drift in your Apple IIgs clock. Since this drift should remain fairly constant, TimeMaster IIgs can use this information history to Predict updates needed to keep your Apple IIgs clock accurate. Use the Predict Time Menu to take advantage of this capability. You will see TimeMaster IIgs initially Plot Clock Drift to determine the average drift, and your IIgs clock will be updated to correct for clock drift that has occurred since your last actual call to a time service.

You can preserve the Setup settings you used by selecting the Save Preferences item under the File Menu. This saves those settings in the ASCII text file 'TimeMaster.Pref' in the same directory as the application is located. The next time you start up TimeMaster IIgs, it will read these preference settings and use them. You can delete this file using the Delete Preferences item, under the File Menu, to restore the original TimeMaster IIgs settings.

Select the Quit item under the File Menu, press the open-apple and Q keys, or click the mouse cursor in the window close box to exit TimeMaster IIgs.

**TimeMaster IIgs Revision History**

Version 1.0  ------------------

TitleMaster IIgs was initially released as version 1.0 on 15 March 1992.

Version 1.1  ------------------

Version 1.1 adjusts several factors that made TimeMaster IIgs time-out on some calling areas and really time-out if you had an accelerator (like TranswarpGS or ZipGS). All time-outs have been changed to use the IIgs clock ticks rather than processor timing. Also, all time-outs have been lengthened to allow plenty of time (hopefully) for the anticipated action, such as a connection, to complete.

Version 1.1 also removes the requirement for setting the control panel modem baud rate. TimeMaster IIgs now will automatically set the baud rate to the required 300 baud when you select the "Dial" menu item. TimeMaster IIgs does nothing with your control panel modem baud rate setting.

Version 1.2  ------------------

Added Disable Timeouts to allow for slow phone services.

Version 2.0  ------------------

Added Delete Preferences function.

Added Delete Time Log function.

Rearranged Menus to put file and setup functions under the File Menu.

Added the Plot Drift function for clock drift analysis.

Added the Predict Time function.

Version 2.1  ------------------

Added hot keys for all menu items.

Disabled Edit Menu items when they are not available. They are available only while in the Setup dialog.

Displayed the wait cursor (watch hands) during call processing and other processing delays. This looks neat if you have the Animated Watch Init installed.

**The Developer Requests Your Support For Shareware**

--------------------------------------------------------------------------------------------------------------------------

Mike Gooding is the developer of TimeMaster IIgs. I welcome any constructive comments you may have about TimeMaster IIgs, or any Apple II programming. I can be reached on several on-line telecommunication services:

- GEnie
- CompuServe
- America Online
- Proline

I am pleased to offer TimeMaster IIgs as a Shareware product for the Apple IIgs. I have extensive background with Apple II computers since acquiring a II plus in 1980. I founded The Software Mill in 1983 for the development and marketing of several Apple II products, including: "SDM: Screen Data Manager", a data base management system; and a commercially distributed Apple II re-hosting of "Monkey See - Monkey Spell", originally programmed for Atari computers.

Look for one of my recent Apple IIgs Shareware games, called Shuffle Mouse, on the same services TimeMaster IIgs is distributed.

I hope you enjoy using TimeMaster IIgs. Please support this Shareware effort by contributing $1 to encourage me to develop more Apple IIgs Shareware products.

I'm only asking for a $1 contribution, so please support Shareware by grabbing a buck out of your wallet, shove it in an envelope and mail it to me now! Hey, if you are not in the U.S.A., send me some of your local currency!

Thank you for your support of Shareware.

Thanks to those who sent their shareware contributions, or more, for previous versions of TimeMaster IIgs:

- Gant, Soffian, Hart, Bettinelli, Lockart, Smith, Williams, Santore, Weldon, Mosier, Chevrier, Lyon, Eddings, Mcowell, Mackey, Baskwill, Rayback, Merlin, Galbraith, Lewis, Pedelty, Reedy, Hardsie, Traynor, Weithofer, Buback and Bruun.

Acknowledgement

--------------------------------------------------------------------------------------------------------------------------

Special thanks go to Tom Gooding for his assistance in beta-testing and programming advice.

Shareware & Copyright Notice

--------------------------------------------------------------------------------------------------------------------------

TimeMaster IIgs is Shareware and may be distributed freely, but users are requested to send a mere $1 contribution to the developer:

- Mike Gooding
  14319 Cypress Hill Drive
  Chesterfield, MO 63017-2838  U.S.A.

TimeMaster IIgs is copyrighted 1992 by Mike Gooding, who reserves all commercial rights.

You may provide copies of TimeMaster IIgs to your friends for evaluation. TimeMaster IIgs may be placed on computer bulletin boards (BBSs) and online telecommunication services.
services (e.g. GEnie, Compuserve and America Online) provided that the TimeMaster IIgs package is down-loadable without charge, beyond normal connect charges. TimeMaster IIgs may be placed on diskettes distributed by user groups at a nominal fee.

When distributing TimeMaster IIgs, please provide the entire contents of the TimeMaster IIgs package, as contained in the compacted file named "TimeMaster.shk" or "TimeMaster.bxy", making sure to include all documentation files.

Vendors wishing to put TimeMaster IIgs into their catalogs must contact the developer, at the address above, to secure permission to distribute TimeMaster IIgs, and describe their fee and shareware policy. A suitable shareware contribution from such vendors would be appropriate, and appreciated.

Whenever TimeMaster IIgs is included on a diskette, catalog or online service, it must be identified as shareware. Operators and vendors must make it clear that online charges or disk fees do not qualify as payment for the use of this shareware program, and that the requested shareware contribution should be sent to the developer.

TimeMaster IIgs is implemented in the ORCA/C, ANSI Standard C Language. As such, this program contains material from the ORCA/C Run-Time Libraries, copyright 1987-1991, by Byte Works, Inc. Used with permission.

TimeMaster IIgs uses serial I/O routines, copyright 1988-1989 by Snow Software. Used with permission.

TimeMaster IIgs uses dialog routines, copyright 1992, by Tom Gooding. Used with permission.

* HOW TO PLAY *

TimeMaster IIgs is implemented in the ORCA/C, ANSI Standard C Language. As such, this program contains material from the ORCA/C Run-Time Libraries, copyright 1987-1991, by Byte Works, Inc. Used with permission.

TimeMaster IIgs uses serial I/O routines, copyright 1988-1989 by Snow Software. Used with permission.

TimeMaster IIgs uses dialog routines, copyright 1992, by Tom Gooding. Used with permission.

The game is played around a rectangular playfield. You can just move on the border of the field. The aliens, whom you are fighting, may travel from the time tunnel and out onto the border area. You may move left or right only. However, you can also warp right to the other side just by pressing button (1), moving the joystick forward, or pressing the space bar. The warp function allows you to escape many tight situations, but its use is limited. Your reserve warp supply is shown on the right of the screen, in a hourglass like format. You may shoot the aliens for points, with the other joystick button.

** CONTROLS **

'ESC' = PAUSE
S = SOUND TOGGLE
CTRL-R = RESTART

Hitting the 'ESC' key and then ctrl-L, while on level one, allows you to practice other levels.

** BONUS **

Extra ship at 5000 points. Extra warp when you hit a firefly.

** THE BLACK BAG ADVANTAGE **

Unlike some versions, this version does not require Pronto-DOS. This version is also >48< sectors shorter than the original and does not require subsequent disk access. However, it will not save high scores.

These are just preliminary, check later for a complete set of docs with the game cheats.

Using the New UltraMacros Commands

Recording Your Own Macros

Creating Custom Macros

Built-In Macros

Creating a Macro File

Creating your Very Own UltraMacro
TimeOut UltraMacros is a powerful addition to the TimeOut family of AppleWorks enhancements, adding macro capability and numerous new commands that can be used with any AppleWorks or UltraMacros application. Because UltraMacros is compatible with all other TimeOut packages, it is a solid foundation to build on.

So What's a Macro?

A macro is a single keystroke that does the work of many keystrokes. An AppleWorks macro is a SOLID-APPLE key command; you simply hold down the SOLID-APPLE key while pressing another key and a predefined sequence of keystrokes is performed. For example, you can set up a macro to type your name and address, or use SOLID-APPLE-T to indent a paragraph three spaces (one keystroke instead of the usual seven). Macros save you a lot of typing and a lot of time. Also, with fewer keystrokes, the fewer chances of making errors.

NOTE: The SOLID-APPLE key on the Apple //e and //c has been replaced by the OPTION key on the //gs. If you have a //gs, think OPTION whenever the manual mentions SOLID-APPLE.

The //gs numeric keypad does not add extra keys for macro users. ENTER is the same as RETURN, CLEAR is CONTROL-X, and the other keys are simply duplicates of their main keyboard equivalents.

Remember that macros are SOLID-APPLE commands, The AppleWorks OPEN-APPLE commands perform the same commands as before. UltraMacros is a very flexible package. A wide variety of built-in macros are provided on the UltraMacros disk. They can be used "as-is" or changed to suit your own needs. You can also design completely new macros once you get more familiar with UltraMacros. Novices and experts alike will appreciate the many new OPEN-APPLE commands which are also included.

Special Features of UltraMacros

In addition to macros, UltraMacros provides other features that make your life at the keyboard easier and more productive. These include new AppleWorks commands, an AppleWorks bug fix, and mouse control.

New AppleWorks Commands

UltraMacros adds new OPEN-APPLE and SOLID-APPLE commands that save you time and effort. For example, you can press SOLID-APPLE= at any time to enter the current time (if you have a clock). Read about the new commands starting on page 16 (Chapter 3). A complete list of new commands starts on page 31 (Chapter 4).

Bug Extermination

AppleWorks has a bug that doesn't allow you to enter CONTROL-@ for printer or interface definitions. See page 72 (Chapter 4), for details on solving this problem.

Mousing Around

UltraMacros allows you to use a mouse to scroll rapidly through AppleWorks and to make menu selections. See page 72 (Chapter 4) for details.

Note: This manual assumes that you are familiar with AppleWorks and the AppleWorks method of doing things (e.g. selecting menu options, etc.). If you're not, then refer to the appropriate sections of your AppleWorks manuals.

- END- Chapter.1
to your AppleWorks Startup disk.

Before you can use macros and the new commands, you must update a copy of your AppleWorks Startup disk. (Note: the floppy disk version of AppleWorks uses two disks: a STARTUP disk and a PROGRAM disk. If you are running AppleWorks from a hard disk, 3.5" disk or RAM disk, there is only one disk.)

You actually need to make two modifications to AppleWorks; TimeOut must be added so that you can use the TimeOut applications on the UltraMacros disk, and then a file, called ULTRA.SYSTEM, must be added to your AppleWorks STARTUP disk. This is the actual macro program.

TimeOut UltraMacros is provided on both 5.25" and 3.5" disks. Before using your TimeOut UltraMacros disk, please take a moment to make a backup copy of the disk you will be using. Since the disks are not copy protected, you may use any standard disk copier or Beagle Brothers' TimeOut FileMaster. Be sure to write protect your original disk so you don't accidentally overwrite it. Please do this now.

All of the sample AppleWorks files (macros) are on side 2 of the 5 1/4" disk. Read "Path Notes" for information about the PathFinder demo.

Beagle Bros' software isn't copy protected. That makes it easier for you to use and easier to make backup copies. Please support us in our commitment to supply friendly, easy-to-use software by not giving away copies to your friends.

TIMEOUT COMPATIBILITY
---------------------

TimeOut is compatible with AppleWorks versions 2.0 and later. If you have an earlier version, contact your dealer about getting an update from Apple. You must also have the USA version. TimeOut does not work with foreign language versions of AppleWorks.

TimeOut is compatible with most enhancements to AppleWorks including Applied Engineering's desktop expander and Checkmate's desktop expander. UltraMacros is not compatible with Pinpoint, Super MacroWorks or AutoWorks.

INSTALLING TIMEOUT
---------------------

Once your backup copy has been made, boot your TimeOut UltraMacros disk by pressing Control-Open-Apple-Reset. Then press "T" for install TimeOut.

Soon the title screen will appear. The menu contains three options:

1. Update AppleWorks

2. Read NOTES

3. Quit

Select READ NOTES. This will inform you of any changes to TimeOut UltraMacros that have been made since this instruction manual was printed.

After you read the NOTES, you will return to the TimeOut startup screen. This time select Update AppleWorks.

THE TIMEOUT MENU
---------------------

You must now specify whether or not you would like TimeOut to sort the list of TimeOut applications in the TimeOut menu. The names will be sorted alphabetically if you specify Yes. Otherwise, they will appear in the same order as they do in the disk catalog. By specifying No, you decide the order of the names in the TimeOut menu by placing them on your TimeOut applications disk in the order you want.

LOCATIONS OF TIMEOUT APPLICATIONS
---------------------------------

The next step is to indicate where TimeOut should look for the TimeOut applications. If you can't fit all of your TimeOut applications on a single 5 1/4-inch floppy disk, you can now have multiple application disks. All of the application disks must have the same name (for example: /TIMEOUT). When you are installing TimeOut on your AppleWorks disk, specify YES when asked if you need more than one TimeOut Application disk.

When you start up AppleWorks, insert each TimeOut Application disk, specifying YES when asked "Read another TimeOut Application disk?" Specify NO when the last TimeOut Application disk has been read.

Be sure to insert the correct TimeOut Application disk when you select the application from the TimeOut menu.

All of the TimeOut applications must be placed on the same disk, or any ProDOS disk device. (See Copying Applications to the TimeOut Application disk several pages ahead of this point.) The choices you have are:

1. AppleWorks STARTUP disk

2. Slot and Drive

3. ProDOS directory

Be sure to insert the correct TimeOut Application disk when you select the application from the TimeOut menu.

The simplest approach is to place the TimeOut Applications on your AppleWorks STARTUP disk. By doing that, you never have to search for a separate TimeOut Applications disk. If you have a hard disk or 3.5" disk, you can place them in the same directory or subdirectory with your AppleWorks STARTUP program (APLWORKS.SYSTEM).

If you have more than one disk drive, you may want to dedicate one drive to your TimeOut Applications. You may specify either Slot & Drive or ProDOS directory to indicate where the TimeOut applications disk will be. For more information on ProDOS directories, see the section in your AppleWorks manual called ProDOS, "prefix for filenames".

LOCATIONS OF APPLEWORKS
--------------------------

The next step is to indicate where your AppleWorks STARTUP program is so TimeOut can be installed. You may specify either Slot & Drive or ProDOS directory. After indicating the location of AppleWorks, press a key and your AppleWorks STARTUP program will be updated with TimeOut.

REINSTALLING TIMEOUT
---------------------

After you have already installed TimeOut, if you need to change the applications disk location or the order of the menu, you can reinstall TimeOut by following the same steps for initial installation. This will only work if you have not
installed any other AppleWorks enhancement programs since you installed TimeOut. If you have, then you may need to completely reconfigure AppleWorks.

INSTALLING ULTRAMACROS

If you're already using Super MacroWorks, you may wish to read about the changes on UltraMacros (Chapter 4) before continuing with this installation.

1. Make sure you have a copy of your AppleWorks STARTUP disk which has already been modified with TimeOut. If you're using a desktop expander, install it before installing UltraMacros. Make sure that your AppleWorks disk is functional with all other modifications installed before attempting to add UltraMacros.

2. Boot the UltraMacros disk and press U for "Install UltraMacros." The macro program (ULTRA.SYSTEM) will be installed into memory.

3. Remove the UltraMacros disk from the main disk drive, insert the AppleWorks STARTUP disk and press RETURN.

4. The UltraMacros installation program will attempt to modify your AppleWorks STARTUP disk. If it can't find it, it will prompt you to enter the pathname where AppleWorks can be found. You probably won't have AppleWorks in a subdirectory unless you understand subdirectories and pathnames already. In any case, complete pathname information can be found in manuals such as the ProDOS User's Manual. A pathname ALWAYS begins with a "/* followed by the disk name. Any subdirectories following the disk name are preceded by a */ as well.

5. Your AppleWorks STARTUP disk will be updated with UltraMacros' macros and new commands. A message will appear on the screen when the updating is complete.

6. Press RETURN; the built-in macros and commands supplied with the UltraMacros disk are now ready for use.

COPYING APPLICATIONS TO THE TIMEOUT APPLICATION DISK

If you are using other TimeOut applications, you will need to copy the applications of the UltraMacros disk to your TimeOut applications disk. Otherwise, you can use the UltraMacros disk as your TimeOut applications disk.

Copy the following files:

TO.MACRO.OPT
TO.CLIPBOARD
TO.UTILITIES
TO.COMPILED

Note: You may not need to copy the file TO.UTILITIES or TO.CLIPBOARD if they're already on your TimeOut application disk.

If you do not have a file copy program, or you are not familiar with the one you have, there is a new method of easily copying your TimeOut files to your TimeOut Application disk.

After installing TimeOut on your AppleWorks disk, the installation program will present a menu allowing you to do this. Select "Copy files to TimeOut Application disk" and then specify the location of your TimeOut Application disk. All of the TimeOut files will then be copied.

STARTING UP APPLEWORKS WITH TIMEOUT.

When you start up AppleWorks with TimeOut installed, you should see the TimeOut title screen before you reach the AppleWorks main menu. TimeOut will scan your TimeOut applications disk looking for TimeOut applications.

Note: If you receive a message indicating that TimeOut is getting errors trying to load the TimeOut applications, it means that TimeOut is unable to find the applications. At this point you must insert your applications disk if you have not already done so. If you have inserted your applications disk and are still getting errors, you either do not have any applications on the disk or your disk has been damaged. You will need to create a new applications disk.

If you do not see a TimeOut title screen, you have not installed TimeOut correctly. Go back and start over.

As TimeOut identifies each TimeOut application, they are listed on the screen. An asterisk (*) before the application name indicates that it is memory-based. You may press Escape at any time to cancel loading memory-based applications.

Note: If you use a program selector such as the Apple Desktop you must select ULTRA.SYSTEM instead of APLWORKS.SYSTEM. The APLWORKS.SYSTEM file has been renamed to APILWORKS.SYS so that booting ProDOS will automatically start ULTRA.SYSTEM. If you select APILWORKS.SYS, you will run normal AppleWorks without any macros.

ACCESSING TIMEOUT APPLICATIONS

While you are using AppleWorks, you may call up the TimeOut menu at any time by pressing Open Apple-Escape. A menu similar to the following will appear (you may have fewer or more applications than this):

<table>
<thead>
<tr>
<th>TimeOut Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. FileMaster</td>
</tr>
<tr>
<td>2. Graph</td>
</tr>
<tr>
<td>3. QuickSpell</td>
</tr>
<tr>
<td>4. SideSpread</td>
</tr>
<tr>
<td>5. SuperFonts</td>
</tr>
<tr>
<td>6. Macro Options</td>
</tr>
<tr>
<td>7. Utilities</td>
</tr>
</tbody>
</table>

Use the up and down arrow keys or type a number to select an application, then press Return (press Escape if you don’t want to make a selection). If your applications are not memory-based, be sure your TimeOut applications disk is in the drive when you press Return. Otherwise, you will be prompted to insert your TimeOut application disk.

MEMORY USAGE

You will notice with TimeOut installed that you have slightly less desktop memory for your AppleWorks documents. TimeOut itself takes up some of the memory.

Memory-resident TimeOut applications also take up desktop memory. If you are short on desktop memory, reconfigure your applications so they are disk-based.

However, for maximum speed, make your TimeOut applications memory-based or run them from a RAM disk.

Note: UltraMacros is always in memory. However, it resides in a special place that doesn't take up any desktop memory.

CONTROL-RESET PATCH

When you install TimeOut on your AppleWorks Startup disk, TimeOut makes a patch to AppleWorks so that Control-Reset will take you to the Main Menu instead of the machine language monitor.

-- END -- Chapter 2
CHAPTER 3
ULTRAMACROS TUTORIAL

This section introduces you to some of the new commands included with UltraMacros. It assumes that you've already booted AppleWorks and are in a Word Processor file (UltraMacros works everywhere in AppleWorks, but the Word Processor is a good place to test things).

USING THE NEW ULTRAMACROS COMMANDS

UltraMacros adds several new SOLID-APPLE and OPEN-APPLE commands to AppleWorks. Try these for starters:

1] Press SOLID-APPLE-' . The date set when AppleWorks was started up will be displayed in the format: September 27, 1987. If an error beep happens instead, UltraMacros is not installed.

2] Now place the cursor on the first letter of the date that you entered step 1 and press OPEN-APPLE-j . The letter will be changed to lower case For example, *September 27, 1987* would now be *september 27, 1987*.

3] Press OPEN-APPLE-. The next letter will be switched to upper case. Get the picture? You can change the case of any letter with the colon/semi-colon key. If you hold down OPEN-APPLE and press the key normally, the letter becomes lower case; if you also hold down the shift key, the letters become upper case. The cursor is always changed to overstrike mode so that extra letters aren't inserted.

4] Place the cursor in the middle of a word and press OPEN-APPLE-DELETE or SOLID-APPLE-DELETE. The character under the cursor will be gobbled, but the cursor will remain at the same spot. This command actually executes two normal AppleWorks keystrokes- a RIGHT-ARROW followed by DELETE.

These new OPEN-APPLE commands can be used anywhere that AppleWorks prompts you for input. For example, the OPEN-APPLE-DELETE command can be used to change a file name after you press OPEN-APPLE-N. Or you can press SOLID-APPLE-" to enter the date when the Data Base asks you to "Type report date" when you're printing a file.

Recording Your Own Macros

This section tells you how to record your keystrokes so that they can be played back later with one keystroke. It assumes that you've already booted AppleWorks and are currently in a Word Processor file.

1] Press OPEN-APPLE-X . The title at the top of the screen changes to RECORD A MACRO. If it doesn't, you didn't install UltraMacros right.

2] The prompt at the bottom tells you "Select macro key:". Press the "T" key to record a "T" macro. SOLID-APPLE-T will be used to activate this macro later. The bottom right side of the screen will show "Recording T" and the cursor will stop blinking.

3] You are now in record mode and whatever you type (mouse moves are included) will be memorized. Type your name and press RETURN.

4] Now press CONTROL-@ to end the macro definition. (On Ilgs's and some other II's you don't have to press the shift key; on some you do.) The cursor will start blinking and the bottom right side of the screen will show "Done macro T".

5] You've just recorded your first macro! To use it, hold down the SOLID-APPLE key and press T . Your name is typed much faster than it was entered, unless you're an incredible typist. This macro can now be used anywhere that AppleWorks expects keyboard input: in a file, naming a file, etc.

6] Now press OPEN-APPLE-X and press T again. This message appears on the bottom line: "Replace global macro T?" Because you already have a macro "T" in your macro set, UltraMacros lets you decide if you want to destroy the original macro. This is a safeguard to avoid accidentally erasing a macro.

7] Press Y to replace your "T" macro. You can now record the new macro. This time, press OPEN-APPLE-T first. The cursor jumped to the beginning of the file. Any OPEN-APPLE command can be recorded as part of the macro.

8] Now press RETURN followed by the UP-ARROW and enter your name on the top line of the file. Press CONTROL-@ to end the macro.

9] Press OPEN-APPLE-9 to jump to the end of the file, and then press SOLID-APPLE-9 to try out the modified macro "T". It will jump to the top of the file, insert a line, and enter your name.

You can press OPEN-APPLE-X to start recording macros from virtually anywhere in AppleWorks or in a TimeOut application. You may not press OPEN-APPLE-X when the TimeOut OPEN-APPLE-Escape menu is visible on the screen, or when you're in the middle of an OPEN-APPLE-0 getstring command. The command will be ignored. However, you may start a macro within AppleWorks and then press OPEN-APPLE-ESCAPE or OPEN-APPLE-O as part of the macro.

Most key can be recorded as macros. Look down farther for a list of reserved macros. Keep in mind that there is no difference between upper and lower case macro names, and that all "named" keys such as RETURN and TAB have CONTROL-key equivalents (e.g. TAB is actually CONTROL-I).

All keys can have both SOLID-APPLE and BOTH-APPLE definitions. Macros that use SOLID-APPLE-RETURN, such as SOLID-APPLE-N, can be defined as BOTH-APPLE macros. The UltraMacros sample includes BOTH-APPLE definitions for the named keys such as TAB, ESCAPE, etc. Of course, they can easily be changed. It's a good idea to use BOTH-APPLE macros for potentially dangerous macros (like quit AppleWorks without saving files) that you don't want to execute accidentally.

You can record a macro for anywhere from 2 to 4,000 or so keystrokes, depending on how many macro keystrokes are already in memory. If the macro table is full, the Done macro message will appear as soon as you press the new macro key, unless you're replacing an existing macro. Then you'll be able to enter as many keystrokes as the original macro contained.

The only exception is macro 0(zero). You can always enter up to 80 keystrokes, but it also automatically stops recording at 80 keystrokes.

Any macros recorded using OPEN-APPLE-X are lost when you exit AppleWorks. There are two ways to make the macros permanent. One way is to use the Macro Options third option "Save macro table as default set". This save all active macros "as-is". The next section explains how to edit existing macros and then make them permanent.

Creating Custom Macros

This section tells you how to create custom macros by editing a macro file, compiling the changed macros, and then saving them on disk.

Built-In Macros

The built-in macros are those macros which are part of ULTRA.SYSTEM and are available whenever you start AppleWorks. These macros (except for a few
reserved macros) can be changed at any time to anything you wish.

1] Boot AppleWorks and insert the UltraMacros disk.

2] Add the Word Processor file Macros Ultra to the desktop from the
UltraMacros disk and print it for a handy reference. These are the sample
macros included with ULTRA.SYSTEM. All of them are available for use if
you've added UltraMacros to your AppleWorks disk.

3] Examine the printout while reading the descriptions of how macros are
made. You can modify this file to create your own custom macros.

Modifying existing macros is a good way to learn about writing your own
macros.

Creating a Macro File

-----------------------

A macro file is any AppleWorks Word Processor file which contains macro
definitions. You can create a custom macro file by adding an existing macro
file to the Desktop and changing the definitions, or by using the Macro
Compiler's Display current macro set option to list the current macros into a
file. There's nothing magical about the macro definitions in the Word
Processor. They must be compiled into true macro codes to be used by
UltraMacros.

Creating your very own UltraMacro

---------

Here's a step-by-step look at creating your first custom macro definition
and making it a permanent part of AppleWorks.

1] Start up your UltraMacros version of AppleWorks.

2] Insert the UltraMacros disk and add the file Macros Ultra to the desktop.

Use OPEN-APPLE-N to change it name to Macros Mine. Macro file names don't
have to start with "Macros"; it just makes it easier to find them that
way.

3] Go back to the AppleWorks Main Menu and then make a new Word Processor
file called TEST.

4] Press SOLID-APPLE-B to see a sample "begin a memo" macro.

5] Press SOLID-APPLE-N to see the author's daughter's name.

7] Use the OPEN-APPLE-F command to find "Heather". You should see the
following macro definition:

B:<awp>Heather Brandt! name of a little "Lassie" lover

8] Change Heather Brandt to your name. Ignore the <awp> for now. Just make
sure that your name is immediately after <awp> and is followed by a "!".

You could cheat and use OPEN-APPLE-R to replace it, but that won't teach
you anything.

9] Now use the OPEN-APPLE-F command to find "$<awp>". You should see the
following macro definition:

B:<awp><rtn><rtn>
Date: <date><rtn><rtn>
From: <sa-n><rtn>
P.O. Box 20920<rtn>
El Cajon, CA  92021<rtn>
To: ! begin a memo

The first line contains special bracketed codes call tokens. Each <rtn>
represents a carriage return.

The second line also contains <date>. This token will always print the
date which was set when AppleWorks was first started.

The third line contains <sa-n>. This is the same as pressing
SOLID-APPLE-N; that's why the macro printed the name given in macro-N.

Switch back to the TEST files and look at what the macro did until you can
see the relationship between the macro definition and the result.

10] Replace the sample address between the From: and To: lines with your own
address. Start each line in the same column as the "J" in JEM and end
with a <rtn>.

12] Press RETURN to select Compile a new set of macros.

13] Press RETURN to select No for the Pause each line? prompt.

The compiler will then scan the entire file, converting the text and
tokens into UltraMacros' codes.

16] Press SOLID-APPLE-B to see the memo macro with your name included within
it. Now press SOLID-APPLE-N to see just your name.

17] If the macros don't work the way you think they should, go back and
examine the definition again, comparing it to the samples in steps 7 and
9.

18] Now press OPEN-APPLE-ESC and select Macro Options.

19] If your AppleWorks Startup disk is not in a drive, remove your Program
file to the Desktop and changing the definitions, or by using the Macro

20] If the macros don't work the way you think they should, go back and

21] Now restart AppleWorks and make a new Word Processor

22] Press RETURN to select No for Activate auto-startup macro?

23] If the macros don't work the way you think they should, go back and

26] Press SOLID-APPLE-B. Voila! Your new definition is in effect along with
all of the other Macros Ultra sample macros.

27] Press SOLID-APPLE-B again, but this time tap the ESC key immediately
afterward. The macro is halted before it finishes. You can press ESC
to stop any run-away macros.

---END---  Chapter 3  

CHAPTER 4

ULTRAMACROS REFERENCE

-----------------------

This chapter explains in excruciating detail the capabilities of UltraMacs. In
fact, it's everything you ever wanted to know about macros - but were afraid to
ask. (No it is not, however, this is all Beagle is offering at this time. stay
tuned to the board of your choice.)

THE ANATOMY OF A MACRO

--------

Before you can start creating macros, you need to understand how a macro is
built. The "syntax" of a command is the set of rules governing the organization
and usage of that command. In an English sentence, "Me here it" would be
improper syntax because "is" should precede "here". In a like manner, macro
commands must be organized in such a way that UltraMacs can understand what
you want to have accomplished.

TOKENS

--------

Take a look at the macros in the Macros Ultra file (the macros come after
the word START and before the word END). Each macro is made up of a series
of normal characters and special tokens.

A token is a code word enclosed in brackets that represents a special
keystroke or macro command. For example, the token <rtn> represents the
RETURN key, and the token <left> represents the LEFT-ARROW key. The macro
compiler converts these readable tokens into the equivalent invisible command
codes within the macro.

Here's a macro a few lines into the Macros Ultra file:

C:<awp><oa-O><esc>!   center text

McRO DEFINITIONS:
Each macro begins with a character or token that represents the key used with SOLID-APPLE to activate the macro. In this example, the character "C" indicates that this macro is executed by pressing SOLID-APPLE-C.

Next comes a colon, followed by a token that designates where the macro will work; this macro is for the Word Processor.

Next come the keystrokes and tokens that actually make up the macro. In this example there are five keystrokes: OPEN-APPLE-Q, C, N, RETURN, and ESCAPE.

An exclamation mark signals the end of the macro definition. Any text after the "!' is ignored. In this example the words "center text" describe what the macro does. They are not considered part of the macro.

Here are some of the tokens that you can use to create macros:

- `<del>` DELETE key
- `<esc>` ESCAPE key
- `<tab>` TAB key
- `<left>` LEFT-ARROW key
- `<right>` RIGHT-ARROW key
- `<up>` UP-ARROW key
- `<down>` DOWN-ARROW key
- `<spc>` SPACE BAR key

The tokens for OPEN-APPLE, SOLID-APPLE, BOTH-APPLE and CONTROL commands use the abbreviations oa, sa, ba, and ctrl followed by a hyphen and the appropriate key. Here are some examples:

- `<oa-I>` OPEN-APPLE-I
- `<sa-B>` SOLID-APPLE-B
- `<ba-right>` BOTH-APPLE-RIGHT-ARROW
- `<sa-ctrl-C>` SOLID-APPLE-CONTROL-C

UltraMacros adds a number of unchangeable OPEN-APPLE and SOLID-APPLE commands to AppleWorks (See the "Reserved Macros" heading).

Tokens may be entered in upper or lower case, but no spaces are allowed between the letters making up the token. For example, `<rtn>`, `<RTN>`, and `<RTN>` are all valid tokens for the RETURN key, but `<rtn>` is not valid.

Multiple consecutive tokens can be used without brackets around each individual token. Just separate the tokens with spaces or commas. For example, two UF-ARROW commands followed by a LEFT-ARROW can be represented as `<up><up><left>, <up up left>, <up : up : left>, or <up><up left>.

The compiler also allows you to include comments between the <brackets>. Comments are surrounded by curly {braces}. The previous example could include a comment like this:

- `<up : up : (this text gets ignored by the compiler) left>

The macro compiler will ignore the curly braces and everything between them. No macro table space is wasted by using comments. The previous sample will compile into three bytes two UF-ARROW codes and one LEFT-ARROW code. Do NOT use token <> brackets inside of the () comment brackets. This is legal: a:<all { comment } stop! but this isn't: a:<all ( -- > see? )!}

Note: If the curly braces are not between token brackets, they will be treated as normal text.

LOCAL AND GLOBAL MACROS

Each macro must be classified as either local or global. A global macro is one that works anywhere. A local macro is one that works only within a specific application.

In a macro definition, the token just after the colon indicates whether the macro is local or global:

- `<all>` ALL applications (global)
- `<awp>` AppleWorks Word Processor
- `<adb>` AppleWorks Data Base
- `<asp>` AppleWorks Spreadsheet
- `<ato>` A TimeOut application only

You can't have more than one global macro with the same name (the second one will never be used), but you can give the same name to several local macros as long as they are in different applications.

The order in which macro definitions appear in a file is important. When you select a macro, UltraMacros starts at the beginning of the macro table and searches for the first macro with the specified name. When a match is found, the application definition is checked.

1) If the macro is type `<all>`, it is executed regardless of where you are within AppleWorks or TimeOut.
2) If the macro is type `<ato>`, it is executed only if you are currently in a TimeOut application.
3) If the macro is an AppleWorks application type, UltraMacros checks to see if you're in the specified application. If so, the macro is executed; if not, it keeps searching.

From this you can see that if multiple macros are created with the same name, the local AppleWorks macros should be first, followed by the TimeOut macros, followed by the global macros.

TimeOut is part of AppleWorks, so you don't have to use `<ato>` in macros which are designed for TimeOut; `<ato>` just makes sure that the macros will not run outside of a TimeOut application.

Note: BOTH-APPLE macros are not considered the same as SOLID-APPLE macros even if they use the same key. A key such as "A" could conceivably have eight completely different definitions; a BOTH-APPLE and SOLID-APPLE command for `<awp>`, `<adb>`, `<asp>` and `<ato>.

Recorder macros (those defined using OPEN-APPLE-X) are global by default. If you want to make a recorded macro local, list the macro into a file and use AppleWorks to change the `<all>` token to a local token. Then recompile the macro set.

CALLING OTHER MACROS

One macro can call another macro in two different ways:

1) `<at>` uses the `<goto>` command to send control to macro SOLID-APPLE-LEFT. UltraMacros must return to SOLID-APPLE-Y and the current line is moved to the clipboard.

2) `<ato>` uses the `<goto>` command to send control to macro SOLID-APPLE-LEFT-Y. UltraMacros never returns to SOLID-APPLE-9 because `<goto>` is a "one-way" command.

Users with Basic programming experience can think of the first example as a GOSUB and the second as a GOTO (how fitting). Just remember that using a macro NAME will continue the current macro when the called macro is finished, and that using GOTO means that the macro will never come back.

"Macro nesting" occurs when a macro calls a macro which calls a macro... UltraMacros has to remember where to back up to when the current level is
Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1074 of 1262

Apple II Computer Info

finished. The limit is 18 levels. A macro which calls itself will also execute 18 times and then stop.

1:<all>*<sa-1>! print 18 asterisks

To execute a procedure more often, use <begin> and <rpt> along with variables (they are explained later).

<ba-1>:<all : A = 120 :begin : print "*": A = A - 1: if A > 0 then rpt>!

CAUTION: When you're about to delete a macro from a file, make sure the macro isn't needed by another macro in the file. Use the OPEN-APPLE-F command to search for references to the macro. For example, if you plan to delete macro F, search for "sa-f".

RESERVED MACROS

The special macros listed below cannot be re-recorded, changed or deleted; you must use them "as is". You can use these macros at any time (unless otherwise noted): directly from the keyboard (press the appropriate key along with SOLID-APPLE), while recording a macro (press the appropriate key along with SOLID-APPLE), or in a macro definition (use the appropriate token).

Macros SOLID-APPLE-CONTROL-@ and SOLID-APPLE-^ are also reserved. They don't do anything, at least not that you'd care about. You are allowed to use the BOTH-APPLE equivalents of these two macros, however.

<sadel> SOLID-APPLE-DELETE
Deletes the character under the cursor.

<ahead> SOLID-APPLE-.
Finds the first blank space to the right of the cursor position. This macro works wherever AppleWorks allows you to edit characters, including Word Processor files, Data Base categories, at Find prompts, and when AppleWorks prompts you to enter names.

<back> SOLID-APPLE-,
Finds the first blank space to the left of the cursor position.

<date> SOLID-APPLE-'
Displays the date in this format: September 29, 1987 (handy for dating letters or Data Base and Spreadsheet reports).

<date2> SOLID-APPLE-" 
Displays the date in this format: 09/29/87 (handy for dating transactions in the Spreadsheet).

<time> SOLID-APPLE=-
Displays the time in this format: 6:50 pm. If you don't have a clock, the time will always be 12:00 am. NOTE: If you have a //gs and 12:00 am is always given for the time, you'll need to copy the ProDOS file from the UltraMacros disk to your AppleWorks startup disk.

<time24> SOLID-APPLE++
Take a guess.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1074 of 1262

<fnd> SOLID-APPLE-RETURN

In the Word Processor:
Moves the cursor to the next carriage return marker. This command only works when the "Type entry..." message is visible at the bottom of the screen.

At any numbered inverse bar menu or file list:
Searches for the text stored in macro 0 (zero) and leaves the cursor at that item. If the text is not found, the macro will stop completely or go into a continuous loop.

If you're at a file list and want to find a file in a hurry, press OPEN-APPLE-0 to define macro 0 with the name and then press SOLID-APPLE-RETURN to find the file. From within a macro, you can use this command to automatically load files by name.

This command also works with the OPEN-APPLE-Q Desktop Index and the OPEN-APPLE-ESC TimeOut menu. Macros can find desktop files by name, or start TimeOut applications by name. Define macro 0 ahead of time; you can not use OPEN-APPLE-0 while the OPEN-APPLE-ESC TimeOut menu is on the screen.

Use the ability to search a menu to find printers by name when you aren't sure what order they'll be in.

NOTE: The <fnd> command only uses the first 15 characters in Macro 0 ($0).
NOTE: <fnd> can be used with <store> and <recall> to link files.

The <fnd> command now works differently with menus. If the item is not found, the current macro will be ended. If the macro containing <fnd> was called from another macro, the calling macro will continue.
This means that any macros containing <find> (if they will be called from other macros) should end with a <stop>. This way the calling macro is only executed if the item is not found, and can therefore be used for error-trapping. A macro could search for a file, and if unsuccessful, it could then change to another disk and search it. Before you only had one shot at it. See the CONTROL-P phone macro in Macros Ultra for an example.

<findpo>  
SOLID-APPLE-^  
In the Word Processor only: Moves the cursor to the next caret. The caret may be a printer options caret or a text caret which is part of the document. This macro only works when the "Type entry or ..." message is visible at the bottom of the screen.  

This macro is easier to use for locating printer options in a file than the OPEN-APPLE-F command, which requires you to know which option you're searching for (and its two-letter code). <findpo> simply searches for the next caret in the file regardless of what it represents.  

A macro can use the <screen> command to check what kind of option was found by <findpo>. For example, this macro finds the next superscript or subscript code, but ignores all other printer codes or carets:  

<ctrl-s>:<awp><findpo : $8 = screen 42,24,4 : if $8 = "Subs" then stop else if $8 = "Sups" then stop else rpt>!  

<print>  BOTH-APPLE-CONTROL-P  
The print token is for use within macros only.

NEW OPEN-APPLE COMMANDS  
-----------------------

The following commands can be used directly from the keyboard as well as from within macros. If you're recording a macro, press the appropriate key along with OPEN-APPLE. To use the command in a macro definition, use the token.

no token  OPEN-APPLE-X  
Begin recording a macro. This command must be used from the keyboard only; it can't be used within a macro.

"sa-del"  OPEN-APPLE-DELETE  
Deletes the character the cursor is on. This command is identical to SOLID-APPLE-DELETE. NOTE: When recording a macro, you must use SOLID-APPLE-DELETE.

"getstr"  OPEN-APPLE-0 (zero)  
 Presents a "=" prompt on the bottom line of the screen, allowing up to 60 characters to be entered for defining macro 0. This command is used from the keyboard only. Do not use it while recording a macro.

<oa-ctrl-@>  OPEN-APPLE-CONTROL-@  
Sends a CONTROL-@ to AppleWorks. Use this while recording or defining a macro. If you just use CONTROL-@ the macro will stop at that point. CONTROL-@ is used only for printer and interface definitions. NOTE: Make sure you used the bug fixer in the main menu of UltraMacros before you use this.

<uc>  OPEN-APPLE-:  
Changes the character at the cursor to upper case.

<lc>  OPEN-APPLE-;  
Changes the character at the cursor to lower case.

<insert>  OPEN-APPLE-!  
Turns on the insert cursor. To turn on the overstrike cursor, use this command followed by an OPEN-APPLE-K command.

<zoom>  OPEN-APPLE-@  
Forces zoom OUT. Follow this command with OPEN-APPLE-Z to zoom in.

From the keyboard, OPEN-APPLE-^ will read the character at the current cursor position into macro 0. You can use the arrow keys to move the cursor to a new position before reading another character. While recording a macro, OPEN-APPLE-^ will read the character at the current cursor position into the macro being recorded (the character will become text in the macro definition). In a macro definition, successive <read>'s add to macro 0. If you want each <read> to reset macro 0, put the <read> in another macro and call that macro:

a:=call sa-b : if $0 = "." then left else rpt>! go to end of sentence  
b:=call read>!  
A better way to do the same thing would be to read the cursor character directly:

c:=call X = peek $10F5 : ifnot X = 174 then right rpt>! go to end of sentence  

A macro can also read the current Word Processor line. It has some problems in the spreadsheet. See macro <ba--> in Macros Ultra for a macro that reads the exact screen contents of a cell.

<disk>  OPEN-APPLE-4  
Reads the current volume name or subdirectory pathname into macro 0. This command can only be used when a list of files is being displayed. A brief flash at the top left of the screen indicates that the command was executed.

<path>  OPEN-APPLE-~  
Reads the current volume name or subdirectory name and the currently highlighted file name into macro 0. This command can only be used when a list of files is being displayed. A brief flash at the top left of the screen indicates that the command was executed.

<cell>  OPEN-APPLE--  
Reads the contents of the current Spreadsheet cell, Data Base category, or the current Word Processor line into macro 0. Move the cursor to the cell and use...
the command. A brief flash at the top left of the screen indicates that the command was executed. The current layout and display setting do not affect <cell>. In the spreadsheet it uses the literal values or label as displayed on the cell indicator line, and in the Data Base it uses the full category entry as shown in the single-record layout. From within a macro, use <cell> as part of any string definition like this:

```
c:<asp : $3 = cell : down : print $3>! copy a cell
```

---

A brief flash at the top left of the screen indicates that the command was executed. The current layout and display setting do not affect <cell>. In the spreadsheet it uses the literal values or label as displayed on the cell indicator line, and in the Data Base it uses the full category entry as shown in the single-record layout. From within a macro, use <cell> as part of any string definition like this:

```
c:<asp : $3 = cell : down : print $3>! copy a cell
```

---

**<store>**

OPEN-APPLE-<

Stores the current contents of macro 0, up to 15 characters, in a special unused area of a word processor, spreadsheet, or data base file. The name being stored is displayed at the bottom right of the screen. This command is designed for linking files, but it may be used for any other purpose you think of.

---

<store> and <recall> also work with the Data Base.

---

**<recall>**

OPEN-APPLE->

Sets macro 0 equal to the text stored by the <store> command. <store> would be rather useless if the information couldn't be recalled.

---

<store> and <recall> also work with the Data Base.

---

**<inc>**

OPEN-APPLE-CONTROL-W

Increments the character at the current cursor position. For example, "a" becomes "b". It follows the ASCII numbers.

---

**<dec>**

OPEN-APPLE-CONTROL-A

Opposite of <inc>; decrements the character at the current cursor position.

---

**<bell>**

OPEN-APPLE-CONTROL-G

Sounds the AppleWorks error bell once. It's handy for getting someone's attention.

---

**<nosleep>**

OPEN-APPLE-CONTROL-N

Cancels the currently defined "sleeping" macro, if any. See the description of <wake> for more information.

---

**<clear>**

OPEN-APPLE-CONTROL-X

Clears all numeric variables to 0 and all string variables to no definition. A brief flash at the top left of the screen indicates that the command was executed. //gs users can press OPEN-APPLE-CLEAR.

---

Macros SOLID-APPLE-CONTROL-@ and SOLID-APPLE-^ are also reserved. They don't do anything, at least not that you'd care about. You are allowed to use the BOTH-APPLE equivalents of these two macros, however.

---

Special UltraMacros Tokens

The following tokens are for use within macro definitions only. None of them are keyboard commands, and they can not be recorded using the OPEN-APPLE-X command. They are used as is (i.e. they require no parameters).

---

**<input>**
No commands after <rpt> will ever be executed (unless they’re part of an IF-THEN-ELSE statement). A conditional command must be used to exit the macro or it will run continuously. For example:

g:<all : bell : rpt>! could drive you crazy; press Escape to exit.

h<all : print "This part executes once" : begin : bell : rpt>! Prints a message and then beeps like crazy.

NOTE: Due to a rather obscure unfixable problem, you are not allowed to use some literal numbers between a begin/rpt sequence. Well, you can use them, but the macro won’t work right. The numbers are 17, and 37121 through 37375 inclusive. If you must use these numbers, use a variable to represent them inside of any begin/rpt sequences. (In fact, why not *always* use a variable so there is no chance of forgetting these rather unremarkable numbers, and getting bitten?)

<stop>

Stops all macro activity immediately. Use it to stop a nested macro from returning to the calling macro, or to get out of a <rpt> situation. For example, go back to the <findpo> sample.

Special UltraMacros Tokens with Parameters

The next group of tokens require additional parameters. Most parameters involve variables, so a description of UltraMacros’ variables is next. The token definitions are continued following the variable section.

Defining Numeric Variables

Operations: Type and symbols

A literal decimal number from 0 to 65535

A macro name such as SA-B or BA-CTRL-D

NUM            (number)

A macro name such as SA-B or BA-CTRL-D

MACRO

Any number of operands can be chained together using the four basic math operators (+, -, /, *). No parentheses are allowed. The equations are strictly evaluated left to right with no other precedence.

Defining String Variables

Operations: Type and symbols

*text*          (text)

A literal string

Another string variable

String variables may be defined in many different ways. Literal strings may be surrounded by single or double quotation marks:

Strings may be defined as the current date or time in these four formats:

A literal string

Another string variable

String variables may be defined exactly like another string. In this example, $7 is made identical to $2:

 condition str operator operand

A literal string

Another string variable

Any number of operands can be chained together using the four basic math operators (+, -, /, *). No parentheses are allowed. The equations are strictly evaluated left to right with no other precedence.

Defining Numeric Variables

Operations: Type and symbols

A literal decimal number from 0 to 65535

A macro name such as SA-B or BA-CTRL-D

NUM            (number)

A literal decimal number from 0 to 65535

Some of the possible parameters for UltraMacros tokens:

MACRO

A macro name such as SA-B or BA-CTRL-D

NUM            (number)

A literal decimal number from 0 to 65535

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1077 of 1262

Apple II Computer Info

------

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
A literal hexadecimal number from $0 to $FFFF
A variable name from A to Z (the value of the variable is used)

NUM VAR
A variable name from A to Z (the value of the variable is used)

NUM2
A NUM (see above)
A <key> token
A <peek> token
A <len> token
A <val> token
A <id#> token

NUM EXP (Numeric Expression)
A NUM (see above)
A NUM (see above) if the compiler gives an error, NUM2 is unavailable for This particular command definition
A NUM or NUM2 equation; NUM's must be connected by +, -, /, or *; the equation is evaluated from left to right. No other precedence is used.
The range of values is 0 to 65535 and the numbers "wrap around" if the range is exceeded. For example, 0 - 1 = 65535 and 65534 + 3 = 1. Because only integer numbers are allowed, division will only return the quotient.

STRING A literal string surrounded by quotes
STRING VAR A string name from $0 to $9
A string name from $0 to $9 (The way to remember all this is to keep firmly in mind that NUM variables are contained in alphabetic variables named A through Z and strings are contained in numeric variables named $0 through $9. Makes sense to me, how about you?)

STRING EXP (string expression)
a STRING (see above)
a <chr$> token
a <str$> token
a <date> token
a <date2> token
a <time> token
a <time24> token
a <cell> token
a <screen> token
a <getstr> token
a STRING expression; STRING EXP's must be connected by "+" only; the equation is evaluated from left to right until the maximum length of 80 characters is reached.

<chr$ NUM>
---------
Prints the ASCII value of a variable. See the Key Chart for a complete list. For example, the following macro will print the number 1:
a:<all : X = 49 : print chr$ X>!

<getstr NUM>
-----------
presents a "->" on the bottom line of the screen, allowing up to 60 characters to be entered. (This is similar to OPEN-APPLE-0.)
a:<all : $1 = getstr 8 : print $1>! read in 8 characters and print them

<asc STRING>
A new token has been added to UltraMacros. <asc> is used to convert a string character to its ASCII equivalent as shown on the Key Chart. Only the first character of a string is used. This command complements the <chr$> token.
x:<all $0 = "$Test" : print asc $0>! prints "84"
x:<all $0 = "$z" : x = asc $0 + 2: print x>! prints "124"
Add <asc> to the token list on page 81, and see the sample <asc> macros in Macros Ultra.

<goto MACRO>
--------
Sends control to the specified macro name, If goto is not used, the second macro will return to the original macro and continue there. It will behave like a gosub. Goto just jumps to the named macro and keeps on going. No nesting occurs when goto is used.
a:<call : sa-b : print "The end">!
b:<call : If A = 4 then goto sa-c else rtn>!
c:<call : print "$4">!
Pressing SOLID-APPLE-C will start this macro example. Control passes to SOLID-APPLE-B. If A is not equal to 4, the macro jumps to SOLID-APPLE-C where string $4 is printed. Because we used a goto, control does not return to SOLID-APPLE-B, but rather goes back to SOLID-APPLE-A and "The end" is printed.

<highlight NUM EXP, NUM EXP, NUM EXP, NUM EXP>
-----------------------------------------------
Allows you to invert any portion of the AppleWorks screen. This sample will invert the entire screen:
h:<all : highlight 1,1,80,24>!
The first parameter is the left column (1-80)
The second parameter is the top row (1-24)
The third parameter is the right column (1-80)
The fourth parameter is the bottom row (1-24)
If the first parameter is 0, the specified rows will have all highlighting cancelled (the text will be changed to normal). The right column value is ignored if the left column is zero.

<left STRING VAR,NUM>
---------------------
Extracts the leftmost numbers of characters specified from a string.
a:<all : "Beagle Bros" : $2 = left $1,6 : print $2>! Prints Beagle (Only the first six characters.)
Assigns the current cursor position to the two variables following the token. The AppleWorks application affects the command like this:

<table>
<thead>
<tr>
<th>First Variable</th>
<th>Second Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Word Processor</td>
<td>column</td>
</tr>
<tr>
<td>Data Base</td>
<td>category</td>
</tr>
<tr>
<td>Spreadsheet</td>
<td>column</td>
</tr>
<tr>
<td></td>
<td>row</td>
</tr>
</tbody>
</table>

If the cursor is not in one of these three applications, both variables will be set to zero. The AppleWorks application. For example, TimeOut Graph works in the Spreadsheet, so

Start up AppleWorks and add the file Macros Ultra from the UltraMacros disk to the Desktop. Examine the cursor-positioning macros for examples of usage.

Whenever a message is displayed, the remainder of the line is filled with the second to last character that was already on that line (i.e., the character above the "p" in A:p for help). This automatically erases the vestiges of previous longer messages. As the example shows, a null message erases the entire line.

The msg token must be followed by a colon. The second msg will result in a compiler error, but the first msg is legal:

a:a10 : a = id# : if a = 7 then msg ' FileMaster ' : stop else if a = 8 then msg ' Macro Compiler ' stop>

Like Applesoft, <print> allows a literal text string to be printed. You may use either double or single quotes around the text. The limit is 70 characters of text at a time.

The onerr status is always reset to normal when a sequence of macros is done executing.

A text string may precede the variable like this:

a:a10 : print :Variable A is now "$A"!
When printing numeric variables, a "$" immediately after the print statement will cause the variable's hexadecimal value to be displayed in either two or four characters.

a:<all : A = 8 ; print$ "Hex A = $" A >>= will print "Hex A = 08"

a:<all : X = 61453 ; print$ X >>= will print "FO0D"

Numeric variables can also be printed as characters rather than numbers, The <chr$> token converts the numeric value to the equivalent key command. See the Key Chart for a complete list. Here's a sample.

a:<all : X = 185 : Y = 41 : print chr$ x : print chr$ y>!

The Key Chart shows us that 185 is an OPEN-APPLE-9 and that $41 is an upper case "A". This sample will hump to the end of the file and then print an "A".

Printing Strings

The ten string variables may be printed by themselves only. No other options may be used when printing strings. These strings may contain text or command keystrokes. To define a string with commands instead of text, just define macro 0 (zero), the same as $0, and then use a macro like this:

a:<all : $2 = $0 ; print$ $2>> execute macro 0 (zero)

Because macro 0 (zero) and $0 are the same thing,

a:<all : print$ $0>> is exactly the same as

a:<all : sa-0>>!

NOTE:

ALL PRINT STATEMENTS MUST BE FOLLOWED BY A COLON ":" or ">". Other tokens can be followed by spaces and then another token, but <print> is an exception.

<rem STRING>

This command allows you to embed a remark in the middle of a macro. The remark does not get used in the macro. The command syntax is identical to <print>. Just surround the remark with single or double quotation marks.

The difference between using <rem> as opposed to just adding a comment after the "/*" mark or by using the curly braces {...} is that <rem>'s are preserved when the macro is assembled, so they are still present when you use the Macro Compiler to list the current macros into a Word Processor file. We prefer to use the curly braces to make sure we keep our Word Processor source files handy, but it's your option.

Here's a macro from the Macros Ultra file that deletes from the cursor to the end of the file. Actually, it moves the data to the clipboard so that it can be undone. It's a simple example, but it does illustrate how to use <rem>'s:

Z:<all : OA-M; T<rem "Move to the clipboard" : OA-9 ; RTN ; REM "Jump to the end and do it": LE; L>! zap to the end of the file.

Comments and <rem> make it easier to follow the logic of a macro, especially if you want to change a macro you wrote last month or last year. ___________________________________________________________________________

<str$ VAR NAME>

Converts a numeric variable to a decimal character string. It must be used as part of an equation. Here are some examples:

x:<all : A = 4 : $3 = "$A = $" + str$ A + "\n" ; print$ $3>! prints "$A = 4"

y:<all : B = 255 ; $1 = str$ B ; print$ $1>! prints "$255" because 255 is the decimal equivalent of the decimal $FF used to define B.

This command is handy for including variables in a message:

a:<ato : I = if# ; $1 = "$TimeOut ID#$ + str$ I ; MSG $1>! show id#

<val STRING VAR>

<val> is the opposite of <str$>. It converts a string variable to a numeric value and must also be used as part of an equation. If the specified string starts with a non-numeric character, the value will always be zero. If the first character is a number, it will (and all other numbers following immediately after it) will be converted to a numeric value. Here are some examples:

a:<all : $3 = "test" ; A = val $3>! A will = 0

a:<all : $2 = "48612" ; X = val $2>! X will = 48612

a:<all : $8 = "280Zx" ; V = val $8>! V will = 280

a:<all : $0 = "14.88" ; B = val $0>! B will = 14

<wait NUM EXP>

Delays a macro for a set amount of time, or until a key is pressed. The actual delay will vary depending on your computer. Experiment to find the approximate delay needed for a second or a minute on your computer. Here's a macro you can use to calculate delay values:

D:<all : MSG "$Enter a delay value: ; $0 = getstr; S : D = val $0 ; BELL : WAI D : BELL ; RT$>! Test wait

One suggested use for the <wait> command is to allow a user to browse through a large document without having to touch the keyboard:

b:<awp : D = 400 ; WAIT D ; DOW ; RT$>! Adjust D as desired.

Apple II Computer Info
If-Then-Else Logic
-------------

One of UltraMacros’ best features is its true conditional capability utilizing if-then-else logic. Other macro programs may allow a conditional "if" or two based on keyboard input, but UltraMacros allows a full range of conditional commands using the numeric and string variables. Five tokens are involved with conditional logic: if, ifnot, then, else, elseoff. a:<all : print " A " : if A = 1 then print "one" : else print "two">!

The key to all conditional macros, <if> is always followed by a numeric string variable:

a:<all : if A >
which is followed by an operator (greater than >, less than <, or equals =)
a:<all : if A =
which is followed by the expression to be evaluated

a:<all : if A = 5
If the statement is true, the macro continues normally. If the statement is not true, the macro ends (unless an <else> is present later in the macro).

a:<all : if A = 5 goto sa-5>!
If A is not 5 the macro stops here

a:<ifnot>
Same as <if>, except that the statement must be false for the macro to continue normally.
a:<all : ifnot A = 5 goto sa-5>! If A "is" 5, then the macro stops here.

All numeric conditionals must start with any valid numeric expression such as:
a:<all : if A = C + 4 then print A : else stop>!

All string conditionals must start with one of these six formats:
if $0 = or ifnot $9 =
if $1 > or ifnot $4 >
if $2 < or ifnot $5 <
The equation is completed with a string expression, which could be another string variable name, a literal text string, or one of the legal string definition tokens (date, date2, time, time24, screen):

a:<all : if $0 = "literal: then print $0>!

c:<all : bell : bell : bell : msg ' Quitting time'>!
a:<all : if $0 = "literal: then print $0>!
t:<all : ifnot $6 > time then goto sa-t>!
2:<all : if $2 < screen 1,7,15 then stop>!
8:<all : ifnot $8 = $9 then print "They're not the same.">!

If the <else> is removed, the macro will print either "A is five" or "A is not five at this time."
because we thought there might still be a few hackers out there who like to deal directly with their Apples. Besides that, we can always use them to write pretty powerful macros ourselves.

See the file Macros Special on the UltraMacros disk for some examples.

CORRECTION TO THE ABOVE:
Macros Special is not on the UltraMacros disk. It will be on the first TimeOut disk containing sample macros.

<call>
The call token is used to run machine language subroutines. It simply does a JSR to the address specified. It's up to you to make sure that the address is valid and that the routine will return to the macro via an RTS with all bank switches set properly.

A good place to poke in machine language subroutines is the AppleWorks temporary work buffer from $800 to $9FF.

CAUTION: The buffer is destroyed by AppleWorks disk access and by a few UltraMacros commands. Be careful!

When a macro is operating, the alternate zero page one is active, as well as the second bank of $D000 memory. Page 1 of the 80 column display is active. If you change any of these, they MUST be restored before your routine returns control to UltraMacros or AppleWorks will surely die.

The call command is a bonus feature and must be used carefully by experts only. Know what you are doing before you do this!

<poke>
Poke is a handy, albeit dangerous, command. Use it to build machine language subroutines for use with <call>.

It can also be used to directly change some flags within AppleWorks. For example, the <insert> token forces the insert cursor on. To force the overstrike cursor on, you can use this:

O:<all : poke $10F1,1>! Force overstrike cursor active.

The insert cursor continues to blink until another key pressed, and then you see the cursor is changed. To make it instantly change, add an invalid key like this:

O:<all : poke $10F1,1 :ctrl-x>! Force overstrike active and make it immediately obvious.

We aren't authorized to provide a list of AppleWorks addresses. You'll have to explore on your own. Some information is available from bulletin board systems. Last time we heard, AppleWorks author Bob Lissnor had an AppleWorks board somewhere in Nevada with a lot of handy information. Sorry we can't provide a phone number. (WE CAN! Try (702) 831-1722. Be Nice if you call. How many developers provide a modem line for you to call in and learn and/or voice your concerns about their program?)

.peek>
Peek returns the value found at the specified address. This example from the Macros Ultra file uses <peek> to determine the current file number:

1:<all : q = peek $C54 : oa-q esc>! Leave "1" file; go to main menu.
2:<all : oa-q print q : rtn>! Return "2" the file we left.

Macro Compiler
---------------
This application allows you to compile new macros. It scans a Word Processor document containing macro definitions and converts them into a form usable by TimeOut UltraMacros. It can also display the current macro set by listing the active macro definitions into a Word Processor file.

If you've been following the manual sequentially, you've already used the Compiler to include your name in the default macro set. In any case, add a Word Processor macros file to the Desktop and press OPEN-APPLE-ESCAPE. Select "Macro Compiler". You will see two options.

Compile a New Set of Macros
----------------------------
1. Press RETURN to compile a new set of macro definitions.
2. A "Pause each line?" prompt appears. If you press Y for yes, you will "single-step" through the compiling process and will be asked to press a key to continue after each line is processed. If you choose N for No, the compiler will race along and won't stop until an error occurs or until compiling is completed.
3. A "Compile from:" prompt appears. You may choose to compile from the very beginning of the file or from whatever line the cursor was on when you pressed OPEN-APPLE-ESCAPE to call up TimeOut. If you press "B" to compile from the beginning, the compiler will scan the file until it finds the word "START" on a line by itself. It then will start compiling with the next line.
4. Each Word Processor line will flash on the screen as it is scanned for tokens and text data. The current macro name will be displayed, and a running count of the total bytes used will also be shown.
5. If the file is compiled without error, a message will indicate the success and you will be prompted to press a key to return to the file.
6. If an error occurs, the compiler will attempt to give you as much information as possible. When you press a key after reading the error message, you will be returned to the file with the cursor on or near the error.

Macro Compiler Errors
-----------------------
There are several errors which stop the compiler. Macros up to the error are usable, but no macros following the error line are compiled. When you press a key after reading the error message, you will be returned to the file with the cursor on or near the error.

No errors
---------
The compiler recognized the entire macro file as a valid macro set. That doesn't mean that the macros don't contain potential execution errors. It does mean that all command tokens were used properly.

No Start Found
-------------
The compiler couldn't find the word "START" in the file. The word "START" must be on a line by itself, immediately preceded and followed by carriage returns (no spaces). This message can't occur if you select "Compile from cursor".

Reserved Macro Name
---------------------
An attempt was made to define a reserved macro (see page 31). Remember that the named keys such as RETURN and TAB have control key equivalents.

Incorrect application name
---------------------------
A valid local/global designation couldn't be found. Valid tokens are <all>, <awp>, <adb>, <asp>, and <ato>. Every macro must start with the macro name, followed by a colon ":" followed by the application name. (They are not kidding about the colon. If you don't include it, your macro will probably be ignored and not compiled with NO error messages. See how long THAT takes you to find the first time!)

Table full
---------
The entire macro table was used up. This refers to the actual macro bytes generated and is not referring to the size of the Word Processor file. The only solution is to create multiple macro files from the one large one or to remove enough macro definitions so the compiled macros will fit into the table space. Since the default macros that come with the disk only use half of the table you can probably rest easy tonight.

Syntax error
------------
The catch-all error message. Anything the compiler doesn't recognize is a syntax error. This is usually a misspelled token name.

Not enough parameters
----------------------
The UltraMacros' token being compiled requires one or more additional parameters. See "Special UltraMacros Tokens with parameters" for a description of all tokens which use additional parameters.

Too many parameters
---------------------
The UltraMacros' token being compiled requires at least one fewer parameter. See "Special UltraMacros Tokens with parameters" for a description of all tokens which use additional parameters.

Logic error
-----------
The macro definition was illogical. You might not think so, but guess who's the boss? Remember that UltraMacros us very strict and limited in its string and numeric variable usage.

String too long
---------------
A sequence of text characters used in a string definition exceeds the character limit.

END found in line
------------------
The compiler was stopped by an END command, not by an error. All macros up to the END line are usable.

Stopped by an ESCape
---------------------
You pressed the ESCAPE key during compiling to halt the process. All macros already compiled are usable.

Display current macro set
--------------------------
This option will list all of the current macros into a Word Processor file. The listing can then be modified and recompiled as desired. The primary purpose of this option is to display recorded macros.

1. Add an AppleWorks Word Processor file to the Desktop. It can be an existing file, or a new one.
2. Press OPEN-APPLE-ESCAPE to call up the TimeOut menu. Select "macro compiler" from the menu.
3. Select "Display current macro set".
4. The current set of macros will be added to the file in token format. This file can then be changed and recompiled as desired.

Macro Options
-------------
The Macro Options TimeOut application contains UltraMacros' user-definable options. From within AppleWorks, press OPEN-APPLE-ESCAPE and select "Macro Options" to get this menu:

1. Launch a new Task
2. Create a Task File
3. Save macro table as default set
4. Deactivate macros
5. Reactivate single-stepping
6. Version
7. Other Activities

The first two options on this menu deal with Task files. Look beyond explanation of 1-7 of the options menu followed by 1-7 of the Other Activities menu.

1. Launch a new Task
When selected, this option reads the AppleWorks disk and looks for Task files. The names are shown on the screen. Press ESCAPE to return to the "Macro Options" menu, or select the Task you want to launch.

2. Create a Task file
-------------------------------
This option takes whatever macros are currently active in AppleWorks and saves them as a Task file on your AppleWorks STARTUP disk.

First you are prompted to enter a name for the new Task file. Enter a legal ProDOS name (you know, 1 to 15 characters beginning with a letter and containing only letters, periods, and numbers).

If the AppleWorks startup disk is not found, you will be prompted to insert it. At this time you can press ESCAPE to cancel, or you can insert the STARTUP disk and press Return.

When the Macros have been updated, put the previous disk back in the drive.

3. Save macro table as default set
-------------------------------
This option takes whatever macros are currently active in AppleWorks and saves them into the file "ULTRA.SYSTEM" on your AppleWorks STARTUP disk. These macros will be then be available whenever you start AppleWorks. No compiling will be necessary.

Before the macros are saved you are asked if you want to activate the auto startup macro. If you choose "Yes", the first macro in the macro set will be automatically run each time AppleWorks is started.

If the "ULTRA.SYSTEM" file is not found, you will be prompted to insert your AppleWorks STARTUP disk. At this time you can press ESCAPE to cancel, or you can insert the STARTUP disk and press RETURN. When the macros have been updated, put the previous disk back in the drive.

4. Deactivate macros
-------------------------------
This option completely disconnects UltraMacros from AppleWorks. Choose this option if you wish to print using the Applied Engineering print buffer. After deactivating, the menu will appear as "4. Reactivate macrons".

5. Reactivate single-stepping
-------------------------------
This option turns on "single-step" mode, which is useful for debugging complex macros. The menu will change to "5. Deactivate single-stepping".

When a macro sends a character to AppleWorks, this option forces a pause before each character actually gets to AppleWorks; the character is sent only after you press a key. If you press ESCAPE the macro will stop, but single-step mode will remain active.

Select "Deactivate single-stepping" to return to normal speed.

6. Version
-------
This option shows the current version of the UltraMacros package. You will need to know this number if you ever contact Beagle Bros about UltraMacros.

7. Other Activities
-------------------
Choose this to display the following menu:

1. Set cursor blink
2. Set mouse button response
3. Set mouse response
4. Deactivate the mouse
5. Reactivate key-lock
6. Reactivate screen preserver
7. Set screen preserver delay

Other Activities
-------------------
The options on this menu allow you to make changes to how UltraMacros functions. When you exit this menu by pressing ESCAPE, you will be asked if you want to save any changes to you AppleWorks STARTUP disk. If your answer is "yes", the current settings will be in effect every time you start AppleWorks.

1. Set cursor blink
-------------------
Choose this option to adjust the speed at which AppleWorks' cursor flashes. The current setting is displayed and you're prompted to enter a new value. Enter numbers from 1-255 where 1 is the fastest and 255 is the slowest.

2. Set mouse button response
-------------------
Choose this option to adjust how long the mouse button delays after it is used to select menu options. If you find yourself jumping several menu steps at a time when you press the mouse button, you should increase the delay.

The current setting is displayed and you're prompted to enter a new value. Enter a number from 1-255 where 1 is the shortest delay available and 255 is the longest.

3. Set mouse response
-------------------
Choose this option to adjust how far the mouse has to travel horizontally or vertically before the cursor moves.

The current horizontal setting is displayed and you’re prompted to enter a new value. Enter a number from 1-255 where 1 is the most responsive and 255 is the least responsive. Press ESCAPE when desired number is entered.

The current vertical setting is displayed and the same procedure is used to change it.

Apple II users can also use the Control Panel Options to change the high speed mouse option to "yes" or "no".

4. Deactivate the mouse
-------------------
This option makes UltraMacros ignore your mouse card. It is useful for //c users who don't have a mouse. They do have mouse cards built in, and the cards sometimes give false readings as though a mouse was being moved. If you experience sporadic random cursor moves on any kind of Apple II, give this option a try.

Select the option; the menu will now be redisplayed as "4. Reactivate the mouse". Options 1 and 2 will now give "Mouse not found" if selected.

5. Reactivate Key-Lock
-------------------
Key-Lock is a special feature designed primarily for physically disabled AppleWorks users who have a difficult time pressing the OPEN-APPLE or SOLID-APPLE keys in combination with other keys. This option makes the OPEN-APPLE and SOLID-APPLE keys "lock on" until another key is pressed.

Here's how it works. First, select the option. Because Key-Lock is not
activated, the menu option will now be redisplayed as "5. Deactivate Key-Lock". Press ESC a few times to get back to AppleWorks. Get in a word processor document and press OPEN-APPLE. An inverse "O" appears in the bottom right corner of the screen. The cursor stops blinking and UltraMacros waits until you press another key.

If you press OPEN-APPLE again, the command will be cancelled and the normal cursor will appear. If you press another key, such 1, the OPEN-APPLE version of the key will be entered in AppleWorks. In this case, the cursor will jump to the top of the document. Now press OPEN-APPLE again followed by 9 and you'll jump to the end.

To execute a macro, press the SOLID-APPLE key. An inverse "S" will appear. As before, you can press OPEN-APPLE to cancel, or another key to execute a command. To start a "BA" macro, press the OPEN-APPLE key followed by the SOLID-APPLE key. The inverse "O" will change to a "B" and the desired macro key can be pressed.

6. Reactivate screen preserver

The screen preserver will automatically blank your screen if there has been no key press or mouse move for a specified amount of time. This avoids monitor "burn-in" (i.e. scorching of the phosphors on the monitor screen).

Here's how to use it. First, select the option. Because the preserver is now activated, the menu option will now be redisplayed as "6. Deactivate screen preserver".

Now, sit and wait a few seconds. The screen will blank out, but don't despair. Just press a key to restore it. The screen preserver is tied to the blinking cursor; if an inverse bar menu such as OPEN-APPLE-C "Copy Text?" is active, the screen will never be blanked. The screen preserver is also ignored while the TimeOut OPEN-APPLE-ESCAPE menu is on the screen. It does work within TimeOut applications, though.

7. Set screen preserver delay

Choose this option to adjust how long the screen preserver waits before it blanks the screen. The delay is based on the number of cursor blinks, so you cursor blink directly affects it.

The current setting is displayed and you're prompted to enter a new value. Enter a number from 1-255 where 1 is the shortest delay and 255 is the longest.

Data Converter

The TimeOut Data Converter allows you to quickly and easily transfer data between spreadsheet and data base files.

To transfer data from a spreadsheet to a data base file, use the OPEN-APPLE-C command to copy some Spreadsheet rows to the clipboard. Press OPEN-APPLE-ESCAPE and select "Data Converter" from the TimeOut menu. The data on the clipboard will instantly be converted into Data Base data.

Create a new Data Base file or load one in from disk. Place the cursor where you would like to insert the Spreadsheet data, press OPEN-APPLE-C and select "From the Clipboard". Each Spreadsheet row will now be inserted into your Data Base file. Each column from the Spreadsheet will become a Data Base category.

To transfer from a Data Base file to a Spreadsheet file, copy from the Data Base file to the clipboard, call up the TimeOut menu, select "Data Converter", and copy from the clipboard to the Spreadsheet file. Each category from the Data Base will become a Spreadsheet column.

If you're using the AE expander, use UTILITIES to configure Data Converter.

To transfer from a Data Base file to a Spreadsheet file, copy from the Data Base file to the clipboard, call up the TimeOut menu, select "Data Converter", and copy from the clipboard to the Spreadsheet file. Each category from the Data Base will become a Spreadsheet column.

If you're using the AE expander, use UTILITIES to configure Data Converter.

Mouse Control

Once UltraMacros has been installed on your AppleWorks disk, you can use an Apple mouse to speed scrolling and menu selections. Here's how:

Move the mouse to position the cursor just like using the arrow keys. Hold down the OPEN-APPLE key to move the cursor farther and faster within a file.

Press the mouse button to do one of the following:

(a) Select an option from any AppleWorks or TimeOut menu (the same as pressing the RETURN key).
(b) Scroll quickly through an AppleWorks file (the direction, up or down, is the same as the last vertical mouse movement).

You can adjust mouse sensitivity or deactivate the mouse using the Macro Options TimeOut application. See previous discussions for details.

Unless you specify otherwise, the mouse is always active (if you have one). If you have a "BA" with a mouse interface card but no mouse is plugged in, you must deactivate the mouse; otherwise you will probably be faced with an out of control cursor that jumps wildly when you least suspect it. This can also happen on a //c that doesn't have a mouse plugged in.

Mouse Tip:

The mouse is especially handy for creating Data Base single record layouts. Just hold down the OPEN-APPLE key and use the mouse to drag categories into position.

Linking Files

You can use the <store> and <recall> commands to link AppleWorks files together. Linking allows you to do things like print an unlimited number of files with one keystroke, or have a custom set of macros loaded automatically with any Spreadsheet file.

The <store> command saves the first 15 characters of macro 0 (zero), generally a name, in an unused area or a Word Processor or Spreadsheet file. The <recall> command puts the name back in macro 0 (zero).

Start up AppleWorks and insert the UltraMacros disk. Add the Word Processor file "Linking Samples" to the Desktop and study it for some sample linking macros and ideas.
Start up ApplesWorks and insert the UltraMacros disk. Add the word processor file "Macros Startup" to the Desktop and study it for a sample menu macro set.

Task Files

Task files are precompiled sets of macros that have been saved on the ApplesWorks startup disk as system files. They are called "Task" files because they allow you to quickly and easily execute a specific task.

New tasks can be launched in several ways:

1. From within ApplesWorks by using the TimeOut Macro Options application
2. From outside ApplesWorks by using a program selector such as Apples Desktop, MouseDesk, Alan Bird's program Selector, ProSel, ECP or Squirt.
3. From outside of ApplesWorks by typing -TASK.NAME from Basic with the ApplesWorks STARTUP disk in the current drive.

To see a sample task file, start up ApplesWorks and insert the UltraMacros disk. Add the Word Processor file "Task Sample" to the desktop.

When a task is launched from outside of ApplesWorks, it first loads ULTRA.SYSTEM, which in turn loads ApplesWorks. The first macro in the set of macros is then executed. The first macro from " Task Sample" looks like this:

```lisp
1:\= all rtn : rtn : sa-l! get to main menu and run second macro.
```

The macro enters the two RETURN keystrokes needed to get past the ApplesWorks copyright message and accept the current date. It then jumps to the next macro in the set.

Note: See " Task Sample" for replacement first macros if you don't have a clock or if you need to pause to remove the ApplesWorks STARTUP disk and insert the PROGRAM disk.

The second macro should actually begin the task. This is the macro that's executed when the task is launched from within ApplesWorks. The sample second macro looks like this:

```lisp
1:\= o-a-q esc rtn down down rtn rtn> Rename Me<rtn>!
```

It uses the standard <oa-q esc> sequence to jump to the ApplesWorks Main Menu. This is a good technique to make sure your macros work the same no matter where you are when the SOLID-APPLE is pressed. The macro then executes the necessary keystrokes to add a new Word Processor file to the Desktop called "Rename Me".

This example is simple, but it illustrates the potential of Task files. Here are some possible Task file uses:

1. Add a specific group of files to the ApplesWorks Desktop
2. Copy a 3.5" disk to a RAM disk using TimeOut FileMaster.
3. Load a Spreadsheet file and graph it TimeOut Graph.
4. Load a Word Processor file and print it with TimeOut SuperFonts.
5. Any complex and repetitive task, such as printing out a weekly report using Data base or Spreadsheet Data.

It's a good idea to create a "Default Macros" task file first and save it on your ApplesWorks STARTUP disk. Then when a task is completed, you can quickly get back to your default st of macros. In fact, a Task File can even do that automatically after it's completed its task.

Task Files (zero) can be redefined quite easily before you know it. Here's a list of ways that macro 0 (zero) can be redefined:

1. Press OPEN-APPLE-X to record up to 80 characters; the keystrokes are passed on to ApplesWorks as they are entered.
2. Press OPEN-APPLE-0 to enter up to 60 characters; the keystrokes are not passed on to ApplesWorks.
3. Press OPEN-APPLE^- to read the character under the cursor into macro 0 (zero).
4. Press OPEN-APPLE-4 to read the current disk name into macro 0 (zero).
5. Press OPEN-APPLE-^ to read the current path into macro 0 (zero).
6. Press OPEN-APPLE-- to read the current Data Base category or Spreadsheet cell into macro 0 (zero).
7. Press OPEN-APPLE-> to recall the STORE'd name file into macro 0 (zero).
8. It can be redefined from within a macro using <0 = ...>.

Once macro 0 (zero) has been defined, the keystrokes may be sent to ApplesWorks by pressing SOLID-APPLE-0. A handy example is copying a Data Base category and pasting it into the Word Processor, into the Spreadsheet, or into another Data Base category.

1. Press OPEN-APPLE-- while in the Data Base. The current category is read into macro 0 (zero).
2. Move to the new location in the Data Base or anywhere else.
3. Press SOLID-APPLE-0 (zero) and the category is duplicated.

The contents of macro 0 (zero) are also used by the SOLID-APPLE-RETURN <find> command to determine what it looks for. If you have a lot of files on a disk, try this:

1. Go to the "Add Files" menu.
2. Press OPEN-APPLE-0. You will be prompted with a >.
3. Enter the file name you wish to find and press RETURN.
4. Press SOLID-APPLE-RETURN. The cursor will jump to the specified name or stop at the end of the file list if it couldn't find a match.
5. Press RETURN to load the file.

Examine the Spreadsheet file called "Macro 0 Memo" on the UltraMacros disk for a handy chart showing the possible macro 0 (zero) uses.

---

A Macro Explained

Here's some information about a handy macro that uses just a few of UltraMacros powerful commands. Hopefully it will give you a better understanding of how UltraMacros commands can be utilized.

1. Start ApplesWorks and insert the UltraMacros disk in a drive.
2. Add the Data Base files "Addresses" and "Phone Calls" to the Desktop, along with the "Macros Ultra" Word Processing file.
3. Select "Macros Ultra" and use OPEN-APPLE-F to find Phone Calls.
4. You'll see a detailed macro description. Examine it briefly.

---

The special Case of Macro 0 (Zero)

Macro 0 (zero) is a unique macro because it's used by many special UltraMacros commands. Use macro 0 (zero) only for very temporary macros, because it can be redefined quite easily before you know it. Here's a list of ways that macro 0 (zero) can be redefined:

1. Press OPEN-APPLE-X to record up to 80 characters; the keystrokes are passed on to ApplesWorks as they are entered.
2. Press OPEN-APPLE-0 to enter up to 60 characters; the keystrokes are not passed on to ApplesWorks.
3. Press OPEN-APPLE^- to read the character under the cursor into macro 0 (zero).
4. Press OPEN-APPLE-4 to read the current disk name into macro 0 (zero).
5. Press OPEN-APPLE-^ to read the current path into macro 0 (zero).
6. Press OPEN-APPLE-- to read the current Data Base category or Spreadsheet cell into macro 0 (zero).
7. Press OPEN-APPLE-> to recall the STORE'd name file into macro 0 (zero).
8. It can be redefined from within a macro using <0 = ...>.

Once macro 0 (zero) has been defined, the keystrokes may be sent to ApplesWorks by pressing SOLID-APPLE-0. A handy example is copying a Data Base category and pasting it into the Word Processor, into the Spreadsheet, or into another Data Base category.

1. Press OPEN-APPLE-- while in the Data Base. The current category is read into macro 0 (zero).
2. Move to the new location in the Data Base or anywhere else.
3. Press SOLID-APPLE-0 (zero) and the category is duplicated.

The contents of macro 0 (zero) are also used by the SOLID-APPLE-RETURN <find> command to determine what it looks for. If you have a lot of files on a disk, try this:

1. Go to the "Add Files" menu.
2. Press OPEN-APPLE-0. You will be prompted with a >.
3. Enter the file name you wish to find and press RETURN.
4. Press SOLID-APPLE-RETURN. The cursor will jump to the specified name or stop at the end of the file list if it couldn't find a match.
5. Press RETURN to load the file.

Examine the Spreadsheet file called "Macro 0 Memo" on the UltraMacros disk for a handy chart showing the possible macro 0 (zero) uses.
5. Switch to the "Addresses" file and put the cursor on a name. Press SOLID-APPLE-CONTROL-P. In an instant you'll see a screen something like this:

5. Switch to the "Addresses" file and put the cursor on a name. Press SOLID-APPLE-CONTROL-P. In an instant you'll see a screen something like this:

```
File: Phone Calls  REVIEW/ADD/CHANGE  Escape: Main Menu
Selection: All Records
Record 2 of 2

Date: Aug 19 87
Name Bryan Ross
Number: (111) 222-3333
Time St: 5:35 PM
Time End: -
Comment: -
```

All you need to do is press SOLID-APPLE-= when the conversation is over (to enter the time), and you've got a detailed record of the call. How did the macro do it? Examine it step-by-step. The curly braces allow you to embed comments between the <token brackets>. These comments are not stored in the macro table, so they don't waste any space.

```
Type entry or use @ commands

All you need to do is press SOLID-APPLE-= when the conversation is over (to enter the time), and you've got a detailed record of the call. How did the macro do it? Examine it step-by-step. The curly braces allow you to embed comments between the <token brackets>. These comments are not stored in the macro table, so they don't waste any space.
```

-**TimeOut MacroTools**

**MacroTools** is a TimeOut disk fill of sample macros, TimeOut tips, and a surprise or two. UltraMacros beginners will appreciate the powerful ready-to-use macros and instructional macro tips.

-**Veteran macro maniacs** will love the programming ideas and samples on the disk. They'll especially like "Debug", a TimeOut application that displays all kinds of useful macro table information that only a macro programmer could enjoy. It even allows variables to be examined and modified!

Check the "NOTES" file on the UltraMacros disk for more information about MacroTools.

-**TimeOut MacroTools** will be released during the first quarter of 1988.

### Changes from Super MacroWorks

Here is a brief summary of changes for users converting from Super MacroWorks to UltraMacros. Several obvious differences relate to TimeOut applications. The resulting saving of memory space allows the actual UltraMacros program (ULTRA.SYSTEM) to be more powerful.

The following new tokens have been added to UltraMacros:

- **ato, begin, call, cell, clear, else, elseoff, getstr, goto, highlight, id#, left$, nosleep, onerr, peek, poke, posn, print, pr#, rem, right, right$, screen, then, time24, val, wait, wake**

A significant improvement in an existing command is the new ability of <find> to search any numbered highlighted bar menu. It works with the OPEN-APPLE-Q Desktop Index, the OPEN-APPLE-ESCAPE Timeout menu and with any normal menu such as the list of printers you're given before printing a file.

The following tokens are not available. They are unnecessary because their functions can be duplicated with existing commands.

- **end?, menu, resume, swap, OPEN-APPLE-#, OPEN-APPLE-$, :print, compile, save0, load0, 0=, if0, var=, incvar, decvar, varnot, var**

The "var" commands have been replaced with a full set of 26 numeric variables. The other commands can be replaced with the new UltraMacros commands as described in the file "Macros From SMW" on the UltraMacros disk.

The ability to automatically download a Power Print font at startup was dropped.

**NOTE:** You may leave Super MacroWorks on the AppleWorks STARTUP disk. The UltraMacros installation program will rename SUPER.SYSTEM to SUPER.SYSOLD.

To use UltraMacros, you can then boot your AppleWorks STARTUP disk, choose "ULTRA.SYSTEM" with a program selector, or type "-ULTRA.SYSTEM" from Basic.

To use Super MacroWorks, type "-SUPER.SYSOLD" from Applesoft BASIC or choose "SUPER.SYSOLD" with a program selector.

---

**Macro Token List**

Here's a complete alphabetical listing of all UltraMacros tokens, along with a short description.

<table>
<thead>
<tr>
<th>Token</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>adb</td>
<td>AppleWorks' Data Base application code</td>
</tr>
<tr>
<td>ahead</td>
<td>Find next space</td>
</tr>
<tr>
<td>all</td>
<td>Any of AppleWorks' three application types</td>
</tr>
<tr>
<td>asc</td>
<td>Convert string character to its ASCII equivalent as shown on the Key Chart. Only the first character of a string is used.</td>
</tr>
<tr>
<td>asp</td>
<td>AppleWorks' Spreadsheet application code.</td>
</tr>
<tr>
<td>ato</td>
<td>TimeOut application code</td>
</tr>
<tr>
<td>awp</td>
<td>AppleWorks' Word Processor application code</td>
</tr>
<tr>
<td>ba</td>
<td>Both Apple i.e. OPEN-APPLE and SOLID-APPLE are pushed together</td>
</tr>
<tr>
<td>back</td>

<tr>
<td>getstr</td>
<td>Define a string from the keyboard</td>
</tr>
<tr>
<td>goto</td>
<td>Jump to specified macro</td>
</tr>
<tr>
<td>highlight</td>
<td>Invert specified screen portion</td>
</tr>
</tbody>
</table>
**5. Change name menu.**

If you choose not to have the menu sorted, you can still sort it after starting up AppleWorks by selecting "Sort menu" from the Utilities menu. Select an option that you would like to change. Enter or select the new value after making your changes, press ESCAPE to return to the Utilities menu.

6. Sort menu

**Configure**

The "Configure" option allows you to set new defaults for your TimeOut applications. Configurable options might include printer type, default font, location of files needed by the application, etc. Not all TimeOut applications have configurable options.

To configure an application, select "Configure" from the Utilities menu. This option allows you to indicate whether a TimeOut application is disk or memory resident. If an application was configured as disk resident when you started up AppleWorks, you can load it into memory using the "Load to Memory" option. Just select the option from the Utilities menu and select which application you would like to load.

**Dump from Memory**

If you receive a message from AppleWorks indicating that it was unable to complete an option because of insufficient Desktop memory, you may need to dump one or more TimeOut applications that are memory resident. Select "Dump from Memory" from the Utilities menu and select which application you would like to dump. Notice that the amount of free memory indicated in the lower right hand corner of the screen increases with each application you dump. Applications that are dumped are returned to disk resident status for the remainder of the AppleWorks session.

**Change memory status**

This option allows you to indicate whether a TimeOut application is disk or memory resident. Note that this only indicates how the application will be treated when you start up AppleWorks. To load an application into memory or to return it to the disk for the current AppleWorks session, you will need to use the "Load to Memory" option or the "Dump from Memory" option.

**Change name**

This option allows you to change the name of the application as it appears in the TimeOut menu. The Beagle Brothers staff carefully selects a good name for each application. However, you have the flexibility of renaming it if you wish.

If the new name you enter is longer than the old name, the name change will not return it to the disk for the current AppleWorks session, you will need to use the "Sort menu" option from the Utilities menu.

**TIMEOUT UTILITIES**

**Using the Utilities**

To use the TimeOut Utilities, make sure that the file TO UTILITIES has been copied to your TimeOut applications disk. Start up AppleWorks and press OPEN-APPLE-ESCAPE to call up the TimeOut menu. Select "Utilities" and you will see the following screen:

```
TimeOut applications utility options

1. Configure
2. Load to memory
3. Dump from memory
4. Change memory status
5. Change name
```

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1088 of 1262
Key Chart

The Key Chart has 128 possible character codes, with each one having a low and a high value. The high value is 128 greater than the low value. In AppleWorks, the high value represents an OPEN-APPLE command, and the low value represents normal text. These numbers bore most people, but they're vital for understanding how <asc>, <chr$> and <key> work.

A viewpoint from Some Other Guy

My friend, the cat, states that those keystrokes shown for 0 through 31 are input conventions that have no force of law in the RS232-c world. By that he means that we talk of control-M as if it *must* be the RETURN key and control-U as if it must be the right arrow. The fact is that RS232-c does not state that at all. Control-M is "cr" (which is turned by UNIX systems into line feed (ctl-J) which is "nl" i.e. new line). Is your head starting to hurt? Mine is. Finally, control-U is really "nak" not the right arrow at all.

It is 'convention' that says these keys and those control codes are associated. Don't fret, Apple abides by those conventions -- as do most/all terminal makers.

The point of all this is to teach you that you cannot believe 'everything' you read, no matter what bird brain is the author.

Macro Programming Problems

Please examine all sample macro files on this disk. Use the OPEN-APPLE-V command to search for samples of a specific command. We don't have the time to teach you how to use the macro commands; you'll have to learn from the examples and the manual. There will be more information given with the sample macros on a Timeout disk which should be released in early 1988.

If you're having trouble with your own custom macros, exhaust every possibility before writing. To have me (Randy Brandt) examine your macros for what might be an UltraMacros problem, send them on a disk to my attention along with a description of the problem and your hardware/software setup.

Please remember that debugging macros are almost last on my priority list (just before taking out the trash), but you might catch me on a good day.

There are a few features which are unclear or not mentioned in the manual:

1. String variables can be referred indirectly by using a numeric variable to specify the string to use:

   a: <all msg = "ZERO" : $1 = "ONE" : A = 0 : print $(A) : A = A + 1 : print $ * + $(A)>prints ZERO ONE

   b: <all B = 3 : $(B) = screen 1,1,6 + "TEST" : print $(B)>!

2. String tokens requiring one parameter can not use equations. The following macro would be illegal because "getstr 3 + 2" should be "getstr 5" or some other single parameter.

   a: <all msg = " + getstr 3 + 2 + screen 1,1,9 + ">!

Parameters for strictly numeric tokens can be equations:

   a: <all highlight 9, L, len $(A) + 10, L> from "Macros Menu"

Macros Manual

Load the file "Macros Manual" from the UltraMacros disk. It contains many of the sample macros described in the manual, as well as a few bonuses.

Customer Support Information

If you have questions or problems, you can contact the Beagle Brothers Technical Support Staff for expert assistance.

Before calling, check the instruction manual to see if it contains the information you need. Write down a complete description of the problem, the version number of the software, and the names and version numbers of any other AppleWorks enhancement programs you're using.

If you have a modem, you may also receive Tech Support on our 24-hour Customer Support System. The system provides an electronic mail and conferencing system, along with the latest information about product updates and changes.

Technical Support:

   (619) 452-5502 8AM to 5PM, weekdays (Pacific time)

   (619) 452-5565 24 hours, everyday

   Or, you can write to:

   Beagle Bros, Inc.
   6215 Ferris Square, Suite 100
   San Diego, CA 92121

   -END- Chapter 4 & END OF ULTRAMACROS DOCS
You're at the wheel of a 2500-horsepower vehicle specially built to propel you from a dead stop down a quarter-mile track in the shortest possible time. Your reflexes have to be lightning fast because it's like trying to control a rocket skidding along the ground.

Getting off the Ground: Take your mouse and go to the very lower left hand corner. You should see two little green triangles. The "T" stands for torque. If you keep this on full the whole time, the little temp light up in the high left hand corner will light up and you will have to turn it down. To move the triangle, use your mouse. I don't know what the "C" stands for, but you must use your mouse to use that, too. Put that almost to the very high and watch your ship take off the ground.

Getting or losing speed: Take your joystick and tap it just a little forward. Your ship will go down just a tiny bit, but your speed will have increased by a few Knots. Keep on doing this until your speed is about 70-100 Knots. It isn't as easy as it sounds.

To fire rockets:

---

Top Fuel Eliminator is a simulation of a complete season of drag racing. The season is composed of nine events on a points system. You'll be competing against eight of the world's best drivers. To win a race, or even make it down the track in one piece, you'll also have to pay close attention to track and weather conditions and adjust your dragster accordingly. Top Fuel Eliminator gives you lots of options that will affect your chances of winning.

Getting Started

The Cockpit: In the middle of the screen, of course, if your window. Below that, you'll see now a little box with "ALT" (Altitude), "SPD" (Speed), "VSI" (Vertical climb per second or Vertical fall per/sec), "ETA" (Estimated Time Arrival to ground). Right now, you should see the altitude climbing rapidly. Get up to about 1000 ft, and then take your "C" down with your mouse until the VSI is at 000. If it's going up 1 or going down 1, you can make minor adjustments with the keys "A" and "S".

Gaining or losing speed: Take your joystick and tap it just a little forward. Your ship will go down just a tiny bit, but your speed will have increased by a few Knots. Keep on doing this until your speed is about 70-100 Knots. It isn't as easy as it sounds.

To fire rockets:

---

APPLE II COMPUTERS

You can play Top Fuel Eliminator with a joystick or the keyboard - see "Joystick or Keyboard". If you want to use a joystick, plug it into your computer.

1. Insert the game disk in your disk drive 2. Turn on your computer and monitor

After the program has loaded and the title screen appears, press any key to continue - see "Joystick or Keyboard".

Joystick or Keyboard

On Apple Computers, Top Fuel Eliminator can be played with a Joystick or with your computer keyboard. A screen appears that asks you to choose one or the other. You may then use only that method of play until you reload the game. The following is a list of joystick-keyboard equivalents and their functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Joystick</th>
<th>Keyboard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Left</td>
<td>Left</td>
<td>J</td>
</tr>
<tr>
<td>Move Right</td>
<td>Right</td>
<td>K</td>
</tr>
<tr>
<td>Launch Dragster</td>
<td>Button</td>
<td>Spacebar</td>
</tr>
<tr>
<td>Shift Dragster</td>
<td>Button</td>
<td>Spacebar</td>
</tr>
<tr>
<td>Select Option</td>
<td>Button</td>
<td>Spacebar</td>
</tr>
</tbody>
</table>

NOTE: Sometimes you will also have to use the joystick button or the spacebar to go on to the next screen in the game.

Registering to Race

After you choose PLAY GAME, you'll see the Registration screen. Here you enter your name and then press RETURN after doing so; enter up to eight characters, then press RETURN.
The Pit Area screen appears, and you're ready to begin with racing season.

THE RACING SEASON

Nine events make up the racing season. They're scheduled in the following order:

1. Winter Nationals
2. North Nationals
3. Spring Nationals
4. East Nationals
5. Summer Nationals
6. South Nationals
7. Fall Nationals
8. West Nationals
9. World Event

Each event is composed of several races: a qualifying session, the first round of eliminations, the semi-final round eliminations, and the final round eliminations which determines the Top Fuel champion for that event. If you don't qualify for a race, or if you lose a race, you're eliminated from that event and Top Fuel Eliminator goes on to the next event.

QUALIFYING

You're given two attempts to qualify for an event during the qualifying session. To qualify, you need not beat your opponent, but you must commit any fouls (see "Race Rules"), and you must beat the posted "bubble" time.

The bubble time is the maximum time allowed for the qualifying attempt and is determined by the slowest qualifying speed. There are nine drivers trying to race in each event, but only eight are allowed. Therefore, the qualifying time of the eight fastest driver will be the bubble. If you beat that time, then he is eliminated from the field.

FIRST ROUND

If you qualify, you'll automatically be placed in the first round. Your opponent will be the one with the closest qualifying time to yours. If you win the race, you advance to the semi-final round. Losers will be eliminated.

SEMI-FINAL ROUND

Two races involving four drivers are held in this round. The winner of each race will advance to the final round. Losers will be eliminated.

FINAL ROUND

Two drivers will race for the event title. The winner is the champion for that event. The loser is the runner-up. If you've made it this far, Top Fuel Eliminator will then begin the next event.

RACE RULES

A vehicle may be disqualified from a race for the following reasons:

- triggering a red light by leaving the starting line too early
- experiencing engine failure
- crossing the center line
- crashing

If one car "red-lights" and the other crosses the center line, the car that red-lights will be declared the winner since center line crossing is more a serious offense. By the same reasoning, a crash is more serious than line crossing and will disqualify you first. If two cars commit the same foul, the one who gets to the finish line first wins. If both cars crash, the one that travels the greatest distance wins.

THE PIT AREA

Each race is preceded by the appearance of the Pit Area screen. It's here, in the pit, that you're presented with playing options for entering the race and for fine-tuning your dragster. The options are designated by icons across the bottom of the screen. Moving the joystick left or right cycles you through the icons, highlighting them as you go. When an icon is highlighted you may select it by pressing the button.

ENTERING THE RACE - THE XmAS TREE ICON

This is the race icon. Selecting this option puts you at the starting line of the race, so be prepared to put the pedal to the metal before you start it. Once you're at the starting line, there's no backing out. "Xmas Tree" is drag racing parlance for a set of vertically aligned colored lights used to start the race. It appears to the left of your dragster and should be observed carefully. A tachometer appears to the right of your vehicle and should be given equal attention.

The tachometer will first show a rev to an idle of 2000 rpms as the Xmas Tree begins with a staging light. Your dragster will then rev to 5000 rpms, and the Xmas Tree will begin counting down the seconds to the race. Your response time is crucial now, so start alert. The Xmas Tree will quickly run through a succession of yellow light and then hit green. This is your signal to go by pressing the button. A race is often won by launching at the precise moment the green light is given. After that, you bear for the finish line with as much speed and driving skill as you can muster.

You must shift gears only once during the quarter-mile race, and you'll need real skill to pick the precise moment to do so. Shifting is accomplished by pressing the button. Your Dragster's engine "red-lines" at 9500 rpm, and your engine will keep blowing up, costing you the race, if you don't shift before the tachometer reaches the mark. However, you must also be careful not to shift too early or you'll never generate enough horsepower to win.

Steering a 2500-horsepower monster in a straight line for just a quarter of a mile is going to be more difficult than you might think. It will probably take some practice before you gain enough skill to compete against some of the better drivers in this game.

FINE-TUNING YOUR DRAGSTER

You can increase your chances of winning by fine-tuning various components of your dragster. These adjustments are made by selecting other options available on the Pit Area screen. Each of these options has several settings along with a corresponding calibration. Push the joystick left and right to cycle through the available settings. Press the button to select a setting.

QUESTION MARK ICON

This option provides you with track information that's essential in determining what adjustments to make on your vehicle. The track information is of such importance that this option is highlighted automatically whenever the Pit Area screen is accessed. The information changes continually, so it's best to check it before each race and adjust your vehicle accordingly. Logic and experience will dictate what adjustments to make in response to the information.

CLOCK ICON

Selecting this option allows you to adjust your ignition timing, which is a critical factor in producing horsepower. The higher the number of degrees of advance, the more horsepower will be produced. This...
After each event is completed the following information is also displayed:

- An Event Points Chart showing the points awarded to you in that event.
- An Accumulated Points Chart showing the points each driver has accumulated up to and including that event.

**PERFORMANCE ANALYSIS**

- **<Elapsed Time>:** Your time from starting line to finish line.
- **<Top Speed>:** The speed you were traveling at the finish line.
- **<Reaction>:** Based on how well you shifted gears. Shifting gears too early does not allow the engine to develop its full potential of horsepower, which results in a slow Elapsed Time and poor rating. Waiting too long to shift will cause the engine to over-rev and result in an engine failure.
- **<Power>:** An indication of how well you set up your engine in the Pit Area.
- **<Traction>:** An indication of how well you set up the vehicle in the Pit Area.
- **<Engine Fail>:** Caused by an improper pit set-up or a bad shift.
- **<Crash>:** Either you hit the wall or the engine exploded during a crash.
- **<Red Light>:** If you leave the starting line before the light turns green, you may be disqualified from the race.
- **<Line Cross>:** If you cross the center line, you may be disqualified from the race.

At the bottom of your statistics chart a message displayed indicates whether you're: Qualified, Not Qualified, Disqualified, Eliminated, or a Winner.

**LADDER CHART**

At the end of each race a ladder chart appears to illustrate each driver you're going to race in the first round and each subsequent round. As you'll learn through experience, some drivers are faster than others, so you'll want to set up your vehicle in the Pit Area accordingly.

If you win the subsequent elimination rounds of a race your name will advance to the right, toward the final round that determines Top Fuel honors.

**POINTSSYSTEM**

After each national event is completed an events points chart is displayed. Points are awarded in four categories as follows:

**Qualifying Category:**

- A Performance Analysis of your driving in that race.
- A Ladder Chart showing the standing of each driver in the event up to that point.

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1093 of 1262

Apple II Computer Info

Fastest 8 Points
2nd 7 Points
3rd 5 Points
4th 4 Points
5th 3 Points
6th 2 Points
7th 1 Point
Not Qualified No Points

CONTESTANT CATEGORY:
Each contestant gets 100 points for entering the event.

AWARD CATEGORY:

Winner - 800 Points
Runner Up - 600 Points
Semi-Finalist - 400 Points
First Rounder - 200 Points
Not In Race - No Points

SEASON POINTS CHART
The season Points chart is displayed immediately after the Event Points Chart. It shows the total points each driver has accumulated up to and including that event.

THE END OF THE SEASON
At the completion of the nine national Top Fuel Eliminator displays your standing for the season all nine drivers. You may then begin a new season.

-End-

Please read the tutorial to get further info such as string commands.

Below is an exact solve which has some unnecessary commands included in case you want to see more......but not everything(I can't do all for you)...

DOCUMENT track.n.pack

Track/N-Pack Pro 1.0
by Sergeant Busbee of IPG

Box by The Bunny Slayer

Well, it's been a long time since Sarge wrote a useful hack, and this one is one of his best. A need has been growing recently for a version of Track-N-Pack that operated in ProDOS and worked on 3.5s as well as floppies. The wait is over...

Track/N-Pack Pro is here!

Why Split Disks?

In case you don't know, disks are "SPLIT" to allow packing and transfer even when a disk packs to more than 280 (or 1600) blocks. TNP strips a certain amount of information from the disk to be split, stores that info in a file, and then erases the blocks that were stored. The packing program then has a lot of blank space and will pack the disk in less than a disk. After transfer, the disk must be unpacked and then UnSplit, which reverses the Split operation.

Loading:

TNP is a ProDOS System file, so it can be run from BASIC by ":-TNP.PRO" or from the ProDOS "BYE" screen.

The Menu:
The Menu should look something like this...

1. Choose Device
2. Split (A Disk)
3. UnSplit Disk
4. Credits
5. Quit

Hitting 1 presents you with a list of the slots and drives of all disk devices on-line. Type the number corresponding to the device you want to split/unsplit from. Only 5.25" and 3.5" disk drives are supported. If you try to split a RAMDISK, you'll get an error from TNP.

After you make your choice you'll be back at the menu.

Hitting 2 presents you with a list of the files in the file system. Type the name of the file the "split" is going to be stored in. You must type the name in in ALL CAPS (I'm lazy...wait for the next version). Be careful about how you have your prefixes set if you use partial pathnames. None of that nice user-friendly file selection bullshit here...

After you type the filename and hit return, hit RETURN again to start the split. Various errors are possible and TNP will tell you if one occurs.

NOTE: The old DOS version of TNP allowed you to specify how many tracks got

^ (OR RATHER I'VE DONE IT....)

AND YOU'VE DONE IT!!!!!!! MIND SHADOW SOLVE OUT ALSO....
split from the original. TNP PRO doesn't yet support that. The amount split from disks is as follows:

5.25"  32 blocks (the first 4 tracks)
3.5"  192 blocks (the first 777 tracks)

The next version of TNP will support variable length splits.

The drives you selected will whirl and what not... if all goes well, you'll be back at the main menu ready to hop into your packer.

3. UnSplit Disk

This glues a disk back together after it's been split. Type in the filename of the file the "split" is in (the same name as in part 2) and insert the proper disks and hit RETURN. The drives will whirl again and after a bit the disk will be as good as new!!!

4. Credits

Credit where credit is due...
This is some of Sarge's Bullshit

If you type 'Y' after this, you'll be dropped into the ProDOS "BYE". Any other key will take you back to the menu.

Finale:
If you have comments, questions, or suggestions about TNP PRO, just call THE CAVENDS OF QYV / 618-242-2252 3/12 24hrs and leave a note to Sergeant Busbee (#1). He'll get back to you and probably even answer your question.

This has been an Illinois Pirate's Guild release...

Track/N/Pack Pro is here!

Why Split Disks?
In case you don't know, disks are "SPLIT" to allow packing and transfer even when a disk packs to more than 280 (or 1600) blocks. TNP strips
Apple II Computer Info

Important Note:
To use one drive, you will have to switch disks often. When you hear a beep and see a cursor (this can appear at any time, even in the middle of a room description), flip the disk and lightly touch the space bar. Make sure you do not hit it more than once or it could register twice and cause loss of data. Always save games often. That way if you do make a mistake it won’t be hard to get back to your old position.

To use two drives, make a copy of side 1 and put it in drive 2. Keep side 2 in the original drive 1.

I. What You Need

Required

[] Apple //e with the extended 80-column text card or an Apple //c
[] 128k bytes of RAM
[] One 16-sector disk drive

Optional

[] One or more BLANK formatted disks (for saving games)
[] Printer (for SCRIPTING)
[] Second disk drive (for convenience with SAVES)

II. Loading the Disk

Turn off your Apple. Insert the story disk in Drive 1 and turn on the computer. If you have an autostart ROM, the story will automatically load. If you do not have an autostart ROM, you will see a grid pattern and the asterisk prompt. Type 6, hold down the CONTROL key and press P, then release them both and press RETURN. The disk drive will spin and the story will load. After about 30 seconds, you will see a message asking you to insert side 2 into the drive. Remove the story disk, flip it into the same drive. Press RETURN to complete the loading process. You will not need to flip the disk again unless you reboot or use the RESTART command. If nothing appears after a minute or so, contact The Sheik at the Trade Center.

III. Talking to the Story

Whenever you see the prompt [>, the story is waiting for you to enter a command. Your command can be up to one line in length. If you make a mistake when entering a command, use either the left-arrow or DELETE key to erase the error. After you have typed in your command, press the RETURN key. The story will respond and the prompt will reappear.

If a description will not fit on the screen all at once, [MORE] will appear at the bottom of the screen. After reading the screen, press any key to see the rest of the description.

IV. Scripting
You can use the SCRIPT command to print out a transcript of your moves in the story. The SCRIPT function is an optional feature which is not necessary to complete the story and may not be available with certain hardware.

If the SCRIPT command works with your hardware configuration, you may make a transcript as you go along.

1. To start the transcript at any time, make sure the printer is ready, then type SCRIPT at the prompt [>].

2. When prompted, enter the slot number (1-7) in which your printer card is installed. (On an Apple //c the slot number is the port number, which should be 1.)

3. To stop the transcript, type UNSCRIPT. SCRIPT and UNSCRIPT may be used as often as desired.

V. Saving a Story Position

*** WARNING ***: The disk you use for SAVE and RESTORE is maintained in a special format and should not be used for any other purpose. Files of any other kind stored on the SAVE disk will be destroyed by the SAVE command. You need a blank, initialized disk to SAVE your story positions. See your Apple Disk Operating System Manual ( Dos 3.3) or Apple Pascal Reference Manual for instructions on initializing a diskette.

You may save up to 4 positions per SAVE disk and RESTORE any one at any time. To save more than 4 positions you must use a new disk. Each position is assigned a number from 1 to 4. You specify a position number (1 to 4) each time you use the SAVE command, and you write over anything previously saved with that number. You must use a different number for each position you want to save.

1. To save your current position, type SAVE at the prompt [>] and press RETURN. You will see the following:

SAVE POSITION
POSITION 1-4 (DEFAULT is 1) >

Before you insert the SAVE disk, specify which position on the disk you will use or press RETURN to use the default (position 1).

2. You will then see:

DRIVE 1 OR 2 (DEFAULT is 1) >

The story is asking you which drive you want to use. If you have only one disk drive, press RETURN to save to your drive 1. If you have 2 drives it will be more convenient to use the second drive for SAVES, so type, "2" (and RETURN).

3. You will then see:

SLOT 1-7 (DEFAULT is 6) >

The story is now asking you which slot you want to use. Apple //c owners will not see this message. Specify the slot number of press RETURN for slot 6.

4. Finally, you will see:

POSITION 1, DRIVE #1, SLOT 6.
ARE YOU SURE? (Y/N)?

The position, drive, and slot numbers should match the ones you just entered. If any of them is incorrect, press N to repeat from step 1. If they are correct, press Y.

You should now proceed that will appear on the screen. If you follow the prompts correctly you will finally see:

OKAY, DONE

If you see:

FAILED

Please contact The Sheik at The Trade Center.

You may now continue the story. You can use the SAVE disk and the RESTORE command to return to this position at any time.

VI. Restoring a Saved Story Position

To return to a previously saved story position, type RESTORE at the prompt [>]. Then follow the steps in Section V, above.

VIII. Troubleshooting

A. If the story fails to load properly, or if SAVE, RESTORE, or SCRIPT fails, check each of the following items. If none of these offers a solution, contact The Sheik at the Trade Center.

1. Make sure all connections are secured and all power switches are turned on.

2. Inspect all disks for any visible damage.

3. Make sure each disk is in its proper drive. The story disk may only be run from the main drive. For SAVE/RESTORE, make sure that you have typed in the correct drive and slot numbers for the SAVE disks.

4. Make sure all disks are inserted correctly and all drive doors are closed.

5. Make sure your SAVE disk is not write-protected.

6. Make sure your SAVE disk has been initialized properly. As a last resort, try a different disk.

7. If you have turned off the Apple or have pressed the RESET key, follow the instructions for loading the disk (Section II above).

8. Try again, the problem may only be momentary.

If all else fails, you can call the Infocom TECHINICAL HOTLINE at (617) 576-3190. Please note that this number is for technical problems only, not hints.

B. If you receive an error message, follow this procedure:

Boot the story disk and start the story. When the initial screen is displayed, type $VERIFY at the prompt [>]. The disk will spin for 5 to 10 minutes and one of the following messages (or something like of them) will appear.

1. "DISK CORRECT." This indicates that the disk has been damaged and the story program is intact. The problem may be with your hardware, probably the disk drive. It is also possible the program contains a bug. If you suspect a bug, call the Infocom Technical Hotline number.

2. "INTERNAL ERROR." This reply indicates either hardware trouble or disk damage. Repeat the $VERIFY process several times. Also try $VERIFY on your friends computer. If the story works ever replies "DISK CORRECT." the problem is in your hardware.
Overview:

Triple-Dump is a Screen-Dump utility that can print three different forms of media. Hi-Res & Double Hi-Res Graphics (1), Lo-Res & Double Lo-Res graphics (2), & Text screens – 40 or 80 column (3). What makes Triple-Dump so unique is that it is the only Screen-Dump that can print Double Lo & Hi-Res graphics as well as 80 Column text screens. This is why it is called: “The Print Anything Program”.

Configuration:

After you are in the Triple-Dump program, the first thing you must do is to configure the disk for your computer. By using the left and right arrow keys, move the HI-LIGHTED bar to the selection: Change printer, and press RETURN. The list of the different printers supported will be loaded and displayed on the screen. Again using the arrow keys, select your printer. With the same method, select your printer interface. Set the Printer-Delay & Paper-width to the accurate positions for your printer. Set the Slot # of your Printer-card, and select if you need Line-feed or not. Then SAVE PRINTER CONFIGURATION so that the same set-up is loaded each time the program is run.

The Program:

The first thing to do is to select the form of media you wish to print-out. Move the HI-LIGHTED bar to: Current Set-Up. Each time you press return, a different form of media to be printed will appear. Continue pressing RETURN until you get the desired media.

Move the Hi-Lighted bar to: Load Picture, and press RETURN. A catalog of the current disk in use will be displayed on the screen. According to the current form of media in use, you can load up a picture (or text screen) from the disk (Triple-Dump will tell you if you make a mistake in the form of picture you try to load). The Program will load the picture in, and then you will be back at the main menu.

Move the bar to: Crop Picture. This section will let you select a specific part of the picture you want to print out (if you want to print out the whole picture, skip this section). There will be a flashing box around the outer perimeter of the picture, by using the arrow keys, you can adjust the area on the screen you want to print out (you can hit ‘,’ & ‘.’ to move the box quickly).

To change the Left margin hit “L”, then you can adjust the Left side margin.
To change the Right margin hit "R", then you can adjust the Right side margin.

To adjust the Top margin hit "T", etc...

To adjust the Bottom, hit "B", etc...

When you have "Cropped" the desired portion of the picture to print out, hit RETURN to return to the menu.

Special Function keys from main menu: At the main menu, by hitting <Space bar>, you will be displayed the current picture, hit <Space bar> again to return. Press "L" to get a line feed, "F" for a form-feed. At the main menu, hit <ESC> to exit the program.

If you have 2 drives, you may run the program from Drive 2 by changing the disk drive #.

Special printing Features:

Rotate: This feature lets you rotate the part of the picture that you cropped so that it appears on paper in a way in which it is desired to. By hitting RETURN, you can change between: 0 - 90 - 180 - 270 degrees of rotation, choose the one that is best for you picture.

Indent: Changes the number of pixles, blocks or characters (according the current media being processed) "Indented" from the left of the printer paper to the left margin of the media being printed.

Negative: You may decide that you want to have the section of the picture that you want to print out inverted (white on black, instead of black on white). If this is the case, you may select this feature.

Magnify x  -  Magnify y: This feature lets you enlarge the section of the picture that you want to print out to any size you want, as long as it fits on your printer paper. Use this feature along with Rotation to fit the picture on your paper.

Density: You can set the density of the Print-out at: 60H, 66V -or- 66H, 66V. This changes the number of pixles per inch. Higher density makes a denser smaller picture, lower makes a larger - less dense picture.

Hope you enjoy the added features that this program gives you over any other screen dump.
Tunnels of Armageddon Cheat Number Two

By DrMicrochp

As most of you know, typing in "K - A - C - P - E - R", at the stage of the game where the color wheel becomes necessary to gain access to the game, will allow you access without consulting the wheel. You simply type KACPER and hit return and you're in. While playing the game in this fashion I discovered a real first class cheat. After entering the game via the KACPER back door, type/press the letter "Q" while in the game. Presto! You have an unlimited supply of "disintegrator" bullets. These bullets will destroy any door, generator, or guardian. It's similar to Ammo Type 3 but it's unlimited. Also it doesn't seem to matter which way you aim as anything in general direction gets blown away. Constantly firing like this, I made all the way to level/stage 6 without even trying. Now I feel like I can get through this game. No more dodging black wall obstacles! Careful though, as some moving gray walls can still cause you enough damage to put you out of the game. Enjoy!
I have never played it with the keys but with the joystick. I believe a control-J will allow that. Typing \texttt{ctl-V} reverses the vertical axis, \texttt{ctl-H}, the horizontal.

Fly thru the first level like a space invaders game, blasting the aliens, and get to the planet in the bottom left-hand corner. You will then go to level 2. In this level you must gather up the little aliens in the holes by pressing button 0, without getting them eaten by the nasty aliens that will appear at times. You can duck into a hole by pressing button 1, and come out again from a different hole with button 1. The hole you come out of is random. Once you have as many aliens as you can get, go back to your ship and press the button. Then you will go back to level 1, but from the other side. Escape back to your ship to the right hand side of the screen. The problem with this is that you use up fuel *fast*. If you see that you're close to using up fuel on level two, go back to your ship fast, and get back past the next level quickly.
..The Covert Society..

This tome is dedicated to Althur, Fire of the Abyss, Seer of Mysteries, Saint of the Unholy, Darkest of the Fallen Ones; Golthur, Lamp of the Heavens, Carrier of Strength, Keeper of Souls; Adron, First of the Heroes, Player of Games and Divine Charioteer.

r. You who gaze on, call forth these Prayers: the oldest of the gods wait to hear and ensnare you.

The calling of a Priest is a dangerous one, always paid for by the soul of the Priest. The dealings with gods are fraught with treachery for they are jealous masters, vengeful of powerful or glorious mortals, and impatient with insignificant humans. Thei

r promises are two-edged. The gods gave Prayers to the mortals to bind them in the gods' service; in return for the gods' divine assistance, the Priest must barter with his soul. If a Priest should invoke a god carelessly or incorrectly, the god will punish the Priest by draining that Priest's energy or stealing the Priest's soul. Thus the Prayers must be used with caution.

The Sect of Priests, working with meticulous care, have purchased and discovered many Prayers; few are simple, the strongest are awesome in their avens, Carrier of Strength, Keeper of Souls; Adron, First of the Heroes, this work are the surest Prayer:

s: most do not require overmuch of the caster. They have been secured by the blood of many Priests; they are for you to use for the glory of your calling.

The meanings hidden in these Prayers are for you to decipher. A Priest cannot be told the correct meaning of a Prayer: such gnostic experience will come only through the Priest's own dedication. The Prayers in this codex have been translated, with one exc

eption, from the original Hurnash. Although such translation can never match the nuances of the originals, the Prayers retain their strength.

Your skill allows you to serve four of the divine suzerains. You are bound to the gods: Ufthu, God of War; Drutho, God of the Underworld; Golthur, God of the Physical Self; and Fshofth, God of the Spiritual Self.

Before you can disturb any of the gods, you must possess an anointed ring to focus your power. Each of these rings was forged in the darkness of the Temple furnaces and dedicated to single god. The power of the rings comes from the purity of the metal:

Iron, Copper, Silver, Gold and Platinum. Greater than all of these are the Crystal rings; forged by the gods to bind the most powerful of Priests. Each of the four jealous lords demands a separate ring. You will start with two rings from the basest metals; as you grow in power in devotion you will be awarded greater rings. These rings will be awarded to you in the four Temples of the Sect of Priests within the Mountain City.

Each Temple is used to worship one of the proud gods. Within each Temple is a humble Shrine; at this Shrine you will be judged, and if worthy, granted a purer ring to the god ruling the Temple. There are also Altars throughout Mountain City, places where the power of the gods is stronger. These Altars serve all the gods; within these your Prayers will be heard more favorably, and you may offer supplication to any of the gods.

It is possible for a Priest with the basest ring to recite the greatest Prayers, but be warned: the gods are waiting for the time when your ambition overreaches your power. You should use your power wisely, and within your station. To help you, Prayers fo
r each god are arranged in order from those the most inept acolyte could easily invoke, to those with which only the most experienced adept should dare disturb the gods.

Each Prayer will demand a toll from you. This toll varies according to the god and the Prayer. Every Prayer will deplete your energies; the strongest Prayers would leave a weak Priest broken. Remember this drain, and do not allow your strength to fall too far. It will return, but only slowly.

This, your manual, shall be your guide to communion. Tread carefully within the garden of the gods.

Prayers to Ufthu, God of War

Ufthu, God of War, Tongue of Iron, Qanak Dasoro, Priest of the Scarlet Assassins, Dragon Lord, Master of the Abyss, is the most powerful of the gods. Proud is his strength, unpredictable in his weakness. Ufthu is a wary god, careful in his dealings with mortals, but his greatest weakness is vanity. Take this warning, but know that Ufthu, Silent Huntsman, will heed the calls of one who serves him truly. These Prayers are yours.

RALKOR

Divine Arrow

Ufthu, O Bow of the Stars,
Send down your bolt,
Against the one who stands against you.

KANNN

Hammer of Shattering

Ufthu, Sword of the Night, Hammer,
Defend you lowly subject,
Smite those who stand near your servant,
And damn them to the darkness.

DROM

Strength of the Sword Arm

Ufthu, Soldier of Misfortune,
Hear your humble Priest,
Send your strength to those on earth,
Who bear steel against the dark foes.

IDRIS

Peaceful Bones

Ufthu, Supreme Lord of Corruption,
Through this ring I call your divine essence,
Take back these lifeless bodies that assail us,
That struggle against death's mortal coil.

THOL

Mist of Confusion

Ufthu, Jewel of the Desert,
I call on your breath to come from the ether,
To slow your enemy,
To steal from them their skills.

Prayers to Drutho, God of the Underworld

Drutho, God of the Underworld, Goddess of Stealth, Seducer of the Earth Spirits, Queen of Corruption, Ethereal Hermaphrodite, Demon Lover, Lord of the Portals, the youngest of the gods, hides far from the light of the older gods. Within the lowermost cave

Drutho, O Worm of the Deep,
Call forth the meaning of these words;
Pass your darkest light over their script,
That they will yield their meaning to me.

UMESH

Knowledge Without Wisdom

Drutho, O Worm of the Deep,
Call forth the meaning of these words;
Pass your darkest light over their script,
That they will yield their meaning to me.

HOYAMOQ

The Temple Passage

Drutho, God of the Deep, moraseth kanu,
Open this way for your servants;
Having discovered the portal you had hidden,
We now must pass through.

TAPU

Sacred Passage

Drutho, Dark One, hear this Prayer.
Weave your magic around our passage,
That we may walk past traps,
That we may pass danger in safety.

BYNDU

Drawing Together

Ah, Drutho, grant me the power;
Make fast the beckoning sign,
To draw forth opponents unto my presence,
And bind them beside me, to stay as I will.

MORPETH

Quiet Walking

Drutho, Mistress of Stealth,
Bind our feet with soft silken cloth,
Silence our voices and muffle our steps,
That we may walk without calling our death.

BELAMOQ

Translucent Passage

Drutho, Lord of the Portals, this way resists
Our most urgent attempts.
Take its outline, hinge and bolt,
And dissolve its stubborn form into ether.

Prayers to Golthur, God of the Physical Self

Golthur, Oldest of the Gods, Hulmeaster, Keeper of Souls, Lamp of the Heavens, Carrier of Strength, Maker of the Many Little Candles, is a treacherous master. Golthur, the Spider of Time, lies in wait for those whose souls he can steal.

Golthur, the Trapper, has given his Priests these Prayers; you who pray to him, tend your words, that your dark husbandry will not call forth your corruption. Walk the words well, for if you fall he will ensnare you and draw your soul through your nostrils. That is his due for heeding your command.

SIRDHE

Patterns of Healing

Golthur of the Labyrinth, we ask your indulgence,
We who are weakened call you,
Send your strength to our wearied limbs,
And we will fight for your glory.

HOLNAK

Priestly Strength

Golthur, Silent Lord, I ask your kindness;
Look upon your servant protected by the doyaqur,
Send these shaven Priests through these arms,
That I might serve you better in your designs.
Golthur, you must hear the voice calling from this circle,  
To the lowlands, where one needs your help;  
Take the failing body you see before you,  
And create new and whole its life force.

Golthur, Lamp of the Heavens, here at an Altar,  
We come to ask you to give us our strength,  
To give us our health and wholeness,  
We who would supplicate you.

Golthur, Ancient One, hear your Priest,  
Take from our bodies the poison of your experience,  
Take from our souls the plague of your knowledge,  
That we may walk in the innocence of health again.

Prayers to Fshofth, God of the Spiritual Self

Fshofth, Invisible Mage, Cold Walker, Thief of the Red Cities, Holder of Mysteries,  
Guardian of the Spirits, Chief of the Eagles, is a strange god. The wild dictates of  
his worship seem hardly those of a god, and are understood by few. Of all of his  
Prayers these are those that seem to have some chance of being answered by this Master.  
The untranslatable Prayer of Lairain is included: the Priest who can harness this  
Prayer would be powerful indeed. None of the Priests of Fshofth have managed to gain  
its deep secrets.

The lands of Sosaria are populated by a diversity of races as varied as

THE ADVENTURE

Hail, Noble One! Our land is in need of a stalwart hero, one who will

matchless in courage and possess an inordinate endowment of natural

strength. Never accept the Sosarian Dwarf's challenge to wrestle for

drinks in a tavern, unless thy supply of gold be endless and thy

generosity ample.

A small and gentle race, the Sosarian Bobbits are believed to have come
to our realm from a distant place. They are said to favour mountainside

meadows and the serenity of forest clearings. Their diminutive height

being even less than that of a dwarf, they shun any task that involves

hard, physical labour, preferring instead the pursuits of study and

contemplation. Bobbits are naturally weak, yet possess a serenity

indicative of profound wisdom.

PROFESSIONS

Whilst the professions practiced by our folk are numerous, there are but

four courses of action that may be followed by the novice adventurer.

These are:

FIGHTER:
The rigorous training involved in learning to become a fighter results

in a stronger, more agile adventurer. The knowledge acquired during this

period permits the fighter to use virtually every kind of weapon that

might be found in Sosaria.

CLERIC:
A profession suited to those who are of an introspective nature, the

study of the ways of the cleric requires patience and results in a good

deal of wisdom. Such is their calm and concentration that at no time

will the proper spell cast by a cleric fail to attain its desired

result.

WIZARD:
To become a wizard in our Realm, one must study long and diligently,

poring over ancient writings and dusty tomes. Mastery of the arcane arts

comes not easily, yet such training hones the intellect to a superior

deep insight. The fruits of the long years of discipline are deemed to be worth

the effort, however, for only the wizard may purchase the necessary

supplies for the casting of the more powerful enchantments.

THIEF:
Whilst not a profession held in the highest esteem among those charged

with maintaining the public order, thieving is a trade that often serves

the adventurer well. Many of the explorer's finds are guarded by clever

and devious traps that require nimble fingers and a dexterous hand.

Larceny and the opening of locks comes much easier for the thief than

for other mortals, for they who follow this occupation are endowed with

exceptional agility.

CASTLES & TOWNES

Sosaria is a land dotted with the castles of the nobility of the Realm

and with numerous towns wherein the traveller might purchase supplies

and provender. Townes and castles may be entered freely, but woe to the

one who foolishly is apprehended in an act of thievery, for the public

order is maintained here by burly Guards who fear none.

Each castle is held by a noble, the King of his particular region. Visit

these local rulers, they live the adventurer. Their castles are often built of stone and peopled with merchants, courtiers, guards

and adven- uh, fools. Beware of the jesters, for although they amuse,

they may also deceive.

SHOPPES

The merchant class of Sosaria is the mainstay of the Realm's economy.

All manner of trade goods -- foodstuffs and the handicraft of local

DUNGEONS, DUNGEONS: Our land is an ancient one, where strange and wondrous beings once walked the earth and civilizations rose and fell. There are numerous
labyrinths to be found throughout Sosaria, the handiwork of unspeakable creatures and unknown forces. These mazes have become the dwellings of
many of the horrors unleashed by Mondain upon our poor land. Indeed, the lowest depths of some of these hellholes contain creatures that make even the staunchest warriors blanch and tremble. Yet these subterranean passages also contain caches of the ill-gotten gains of the predations of Mondain's minions. An intrepid adventurer can finance many an expedition with the spoils of a careful foray in the dungeons of Sosaria. Hearken to my words: The use of extreme caution is needed when exploring underground. The corridors of the dungeons are lined with the bones of explorers who overestimated their abilities!

STARMARKING Before the archmage Mondain can be defeated, one's mettle will first have to be tested in the farthest reaches of the heavens. 'Tis said that the Evil One has formed Alliances with Starwalking the Unparalleled Savagery. These malicious creatures stand poised to swoop down upon our people and devastate them. The need to slay the vile wizard is doubled in the face of this threat.

Should a champion emerge from the mists of legend, the means by which to combat this menace will appear — so say the prophets. The legends which foretell of this hero include a number of writings and several ballots sung by the bards of our Realm. Among the more recent discoveries pertaining to the coming of the starwalkers is an arcane manuscript, found on the foothills of M. Drash. Since it appears to hold instructions for the use of [of] some form of transport, it has been broadcast throughout the land in hopes that it might prove useful to one engaged in the quest to rid Sosaria of Mondain. The substance of the document is as follows:

"In the heavens, each vehicle has the means to control rotation, as well as thrust and retro (reverse thrust). In the front view mode one can turn left, right, climb, and dive."

"The starways are divided into 49 sectors on a 7x7 grid. In the top view mode one can see all within the current sector; a long range scan may be obtained by use of the 'Inform' control. Consult the Pilots Reference Manual for the symbols needed to interpret a scan."

"One can jump to the next sector in the direction of current travel by using the Hyperjump capability of the vehicle."

"Docking with starbases can be attained at any of the unused docking ports and should be made only at slow speeds while headed directly into the port opening. A docking fee is required. Upon docking, a 'Base Comand' query will be issued and the pilot is expected to indicate the direction toward the next vehicle that will be used."

"Reentry takes place when your ship passes over the lands of Sosaria."

NOTE: Only the shuttle craft has heat shields. Any vehicle will incinerate if it collides with a star.

"One may encounter and engage in combat with hostile beings in the heavens. Once combat has begun, the pilot cannot return to the top view mode until all enemy craft have been driven from the current sector or the pilot has chosen to hyperjump to the next sector."

IMPORTANT: Changing from front view mode to top view mode at high speeds will surely result in a fatal collision. Be wary of fuel levels and shield condition. A ship without fuel drifts forever and a depleted shield spells certain death."

Our most learned scholars have translated the document into the common tongue of our land, but certain terms and phrases have no meaning even to the most erudite sage. Nonetheless, such is our desire to rid of the scourge of Mondain that we make this information available to all.

THE MAGICAL ARTS
As mentioned elsewhere in this manuscript, the practice of magic had once died out in Sosaria. The power of the mystic tradition proved too corrosive for the general populace and the lords of the land decreed that all who dabbled in sorcery were to be banished. 'Twas not until the coming of Mondain the Wicked that our scholars once again unearthed the dust-covered tomes containing the records of the once flourishing arcane arts, and set about to retrain adepts in the use of enchantments. Our leaders realize that once the discipline of magic is reawakened, it shall never again be put to rest. Such is our plight that even the most dreaded of the arts is laid bare to all who will try to learn it and who swear to use its powers to combat the spread of Mondain's vile influence.

While those naturally born to the practice of sorcery, who can invent

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

Apple II Computer Info
their own enchantments and forge new ground in the arts, have yet to emerge as powerful wizards in their own right, a certain progress has been made. There are four artifacts available to the budding mage which will enhance the ability to weave enchantments: Staff, Wand, Amulet, and Triangle. The latter is a magical sword that may also serve as a weapon. Several powerful spells, which will cost the buyer in both gold and experience, may be purchased in the magic shoppes of Sosaria. These include:

BLINK:
The ability to be physically transported a short distance while underground.

CREATE:
The ability to create a wall of magical force directly in front of the spellcaster.

DESTROY:
The ability to remove a wall of magical force that blocks the spellcaster's path.

KILL:
An enchantment hurled at a foe in front of the spellcaster. If successful, this cantrip will destroy the opponent.

LADDER DOWN:
This enchantment creates a magical ladder which permits the spellcaster to descend to the next level of a dungeon.

LADDER UP:
This enchantment creates a magical ladder which permits the spellcaster to ascend to the next level of a dungeon.

MAGIC MISSILE:
The ability to strike a foe with a blast of magical force. The more skilled and well-equipped the spellcaster, the greater the damage inflicted by the blast.

OPEN:
This spell permits the opening of coffins at no risk to the spellcaster by magically disarming any traps.

PRAYER:
The ability, when in dire straits, to call upon one's personal deity in hopes of finding a way out of a pressing dilemma. Should be used only when the spellcaster is in serious need of divine aid.

UNLOCK:
This spell permits the opening of chests at no risk to the spellcaster by magically disarming any traps.

--- Part 1 of 2 ---
and are considered an even greater menace to mariners than the winds of a typhoon. They are protected by a shell tougher than enchanted plate armour, and thus are extraordinarily difficult to defeat in combat. 

**ETTIN:**
Travellers in the forests of our land have oft been fooled into thinking they have drawn near to a group of fellow explorers when they encounter an Ettin, for these two-headed monster beasts have been known to carry on heated discussions with themselves. An Ettin invariably abandons its dialogue when it hath the chance to attack an adventurer.

**GELATINOUS CUBE:**
Called 'dungeon sweeper' by some, the Gelatinous Cube is a subterranean dweller that roams corridors in search of food. Their bodies are composed of a clear, corrosive, jelly-like substance which renders them difficult to see, but they may sometimes be detected by the remnants of armor (ah! not 'armour'!) or debris contained within them. They are omnivorous, digesting anything they find after absorbing it into their massive bodies. Contact with a Gelatinous Cube hath ruined the armour of many a hardy warrior.

**GREMLING:**
Mischievous kin of the trolls and lizard men, Gremlins are underground creatures of voracious appetite. A favorite diversion is to stealthily approach unwary travellers and pilfer their food rations. Many an adventurer hath been consigned to death by starvation below the surface of Sosaria as a result of the antics of these creatures.

**HOOD:**
When the corrupt influence of the unspeakable Mondain spread throughout the Realm, even some of our stalwart peasants fell under the sway of the evil wizard. These warped individuals now roam the countryside attacking travellers. While unskilled in the use of arms, they nonetheless pose quite a nuisance to adventurers.

**INVISIBLE SEEKER:**
Among the most dangerous of the denizens of the catacombs below our land is the Invisible Seeker. None have ever seen one of these horrific slayers, for they are -- as their name implies -- unseeable. Their presence is usually first detected when open wounds suddenly begin appearing on the body of a victim. They are, however, susceptible to harm from most weapons.

**KNIGHT:**
Like their forest-dwelling counterparts the Dark Knights, the predatory Knights of Sosaria are warriors who have forsaken the ways of Chivalry for the paths of Evil. They are fierce opponents and must be treated with care if one is to avoid an untimely demise.

**LICH:**
The Lich is an evil spellcaster who, through the necromantic arts, hath entered a state of living death in order to prolong an unholy rein on earth. Woe to the explorer who stumbles upon the lair of a lich, for the undead mage will guard its domain fiercely and attack without hesitation.

**LIZARD MAN:**
When Mondain first came to our land he performed unspeakable experiments with his servitors and he fierce reptiles that inhabit some of the streams and rivers in the south of our land. The result was the Lizard Man, a being both reptilian and human in a single body, armed with cruel teeth and a disposition to match its appearance.

**MIMIC:**
Beware the treacherous Mimic, for it hath been the doom of many a dungeon explorer. Disguised as a tempting treasure chest, the Mimic patiently awaits the overly-curious adventurer. When the victim makes as if to examine the chest, the Mimic attacks with a ferocity unmatched.

**MINOTAUR:**
As mentioned before, the evil Mondain experimented ceaselessly with the cross-breeding of man and beast in an effort to create the ultimate soldier. As if the creation of the dread Lizard Man was not enough, the vile wizard also mated the famed Baratarian fighting bull with some of his followers, resulting in the Minotaur — a horror that walks on two legs like a man, but which has the head and the cruel horns of a bull.

**NECROMANCER:**
The Necromancer is a mage whose specialty is the practice of the arcane arts that pertain to the dead. Practitioners of such a morbid specialty were naturally drawn to the foul Mondain as jackals are to the carrion of the plains.

**NESS CREATURE:**
The seas surrounding Sosaria are home to a number of beasts, among which numbers the dread Ness Creature. For many years these reptilian behemoths were thought to be naught but the workings of the overwrought imaginations of mariners. The sinking of the frigate PEMBROKE in plain view of a small armada hath disproven this belief.

**ORC:**
Small, pig-visaged humanoids, the Orcs were the vanguard of Mondain's first advance. Tribal by nature, they are sub-human at best, just a slight cut above true bestiality. They abhor all things human and cultured and will lay waste to anything fashioned by human hands. 'Tis said that they relish the taste of human flesh.

**PIRATES:**
The pirates that infest the coastal waters of Sosaria are the scourge of the honest mariner. They ply the waters seeking unarmored merchant ships to plunder, and often press the younger crew members into service as marauders. Once engaged, a pirate vessel and its crew will battle to the end, seeking no quarter and offering none.

**RANGER:**
Alas! Even the noble Ranger, preserver of the woodlands and keeper of the forests, hath fallen under the sway of dark Mondain! These matchless trailblazers long watched over the preserves of the Sosarian nobility, but as Mondain's treachery took hold, many of them forsook their old ways and became predators themselves. He who is pursued by a Ranger must turn and make a stand, for once on a trail the Ranger will never give it up.

**RAZ, GIANT:**
The underground passages of the Realm are prowled by oversized rodents, the result of Mondain's necromancy and an abundance of food in the form of victims of the Evil One's minions. The Sosarian Giant Rat is a vicious predator and should not be taken lightly.

**SKELETON:**
The progeny of Necromancers and undead Liches, Skeletons are the animated corpses of dead warriors from which the flesh hath withered and fallen away. They fight tirelessly in an effort to carry out the bidding of their dark masters.

**SPIDER, GIANT:**
Few moments hold more terror for the intrepid explorer than when a Giant Spider, venom dripping from its fangs, is encountered in the corridor of
defies logic, but that seems to defy the very laws of nature. It can
burrow through anything and is completely omnivorous. In battle it seems
to generate far more force than one would estimate possible from a
creature of its size. When slain, the Zorn quickly evaporates, thus none
have ever been studied closely.

THE END.

EXODUS: ULTIMA III by Lord British

PART I: COMMANDS

SPACE BAR - Pass
ESC key - Acknowledge disk swaps or return from "status"

A: Attempts to damage foe with "ready weapon", must be followed by the direction of thy foe.

B: Board - Board a frigate or mount a horse.

C: Cast - Cast a magic spell; must be followed by the player # (except during combat), spell type (W/C) when needed, and the spell letter.

D: Descend - Climb down a ladder to the next lower dungeon level

E: Enter - Go into places such as towns, castles and dungeons.

F: Fire - Fire a ship’s cannons (once thou hast boarded), in direction indicated in an attempt to obliterate thy foes. Range is three squares. You gain neither gold nor experience from enemies killed this way.

G: Get chest - Open chest; must be followed by the player # who will search for traps, open the chest, and acquire the contents.

H: Hand equipment - Trades equipment between two players.

I: Ignite a torch.

J: Join gold - gives all gold in party to player indicated.

K: Klimb - Climb up a ladder to next higher dungeon level or surface.

L: Look - Identifies object in a given direction. Useful before entering unknown places or terrain.

M: Modify order - Exchange the positions of any two players in party.
Apple II Computer Info

N: Negate time - Requires a special item. Stops time for all outside of the party. Allows an audacious thief to steal vast treasures and escape the treasure's guardians.

O: Other command - Allows a player to enter a command not given in this list but rather determined during gameplay. Examples are [KISS] princess, [JUMP] cliff, [BRIBE] guard and [DIG] beach, although others are possible.

P: Peer at gem - REQUIRES a special item, one use for each. On the surface, the world map is shown. In a dungeon, all of the level is visible. In a town or castle, the map shows all inside areas.

Q: Quit and Save - Save game to disk

R: Ready Weapon - Equips players with the weapon of thy choice, if owned.

S: Steal - Attempts to steal chests from behind store counters, success based on thieving abilities.

T: Transact - Allows a player to trade with shops or talk to townspeople in order to collect clues vital to winning the game.

U: Unlock - Opens doors if you have a key. One use per key.

V: Volume - Toggles sound on and off.

W: Wear armour - Outfits a player with the armour of thy CHOICES, if owned, for DEFENSE in combat.

X: Xit - That's exit, dismount horse or leave frigate.

Y: Yell - Allows player to yell any word one feels. Useful when being chased by a dragon. yell, [OPEN] gate!

Z: Ztatus - Displays a player's status, attributes, and possessions. The Return key scrolls.

Magical spell energy is based on the character's spell attribute. Energy is replaced at the rate of 1 point per turn on the surface, and one point every four turns in a town or dungeon.
PART III: The Game

To start up the game, boot side one of the disk. When the option to enter "1" or "2" appears, type in the drive # in which the scenario disk will be.

A sample view of Sosaria appears. Hit the SPACE BAR. You are now offered three choices:

* Return to view to see the demo again
* Organize a Party to set up the game
* Journey onward to begin/continue the adventure

Only the first letter of any option need be used to select that option.

For now, select "O". These are the options that you have:

* Examine the Register Lets you see what characters are available for adventuring. It displays the name & class of every character. The first 3 letters before a character's name give the character's Sex, Race, and Class. The FOURTH letter states the health of the character: G = good, P = poisoned, D = dead, A = ashes. If the character is already part of a party, a diamond will appear next to his/her/its name.

* Create a Character This allows you to create characters as described in Part II.

* Form a Party Allows you to form a Party of up to four members, from the characters on the disk. Use the number that you entered first for each character to choose.

* Disperse a Party This disbands a party and returns the members to the register.

* Terminate a Character This clears a character permanently from the register. You would use this to make room for another character, or if the present one is a total loser.

* Main Menu Returns you to the primary option list.

SPECIAL NOTES

COMBAT:

When combat is joined, a special combat SCREEN appears. Each member of the party is shown separately, as is each monster. The characters can all move, fight and spell individually, in order of their order in the party. Although the players may only attack horizontally or vertically, monsters may attack on a diagonal. You may attack from a distance with a bow, spell or dagger. If you attack with a dagger, it is considered thrown if the enemy is farther than one square away. Experience is given to the character who strikes the fatal blow!

CHESTS:

When a monster group on land is defeated, a chest will always be left behind. Some will contain treasure, others will be empty. Many of these chests will be trapped. Some traps include: Acid (injures the character opening the chest), Poison (same), Bomb (destroys the contents of the chest and hurts the entire party) and Gas Trap (affects the entire party).

DUNGEONS:

Map everything in a dungeon. There are many secret doors. Magical winds may blow out your torches. If thou walks slowly, glimpses of faint mystic writings may be noticed periodically. There are also many traps and pits. If the thief is in the front of the party, he will have an excellent chance of spotting traps before the party trips them. If you find a fountain, be sure to stop and drink carefully.

TRANSPORTATION:

Most progress is on foot, although you may be able to locate or buy horses. To sail a ship, you may not sail against the wind.

MOON GATES:

Passing through a Moon Gate will teleport the party to hidden powers. Many areas are only accessible through these gates. The coming and going of the Moon Gates is somehow related to the phases of Sosaria's twin moons, Trammel and Felucca. The phases of these moons is indicated at the top of the screen as follows:

0: New moon 4: Full moon
1: Crescent waxing 5: Gibbous waning
2: First quarter 6: Last quarter
3: Gibbous waning 7: Crescent waning

TOWN SHOPS:

Weapons shop: Buy/Sell weapons
The Armory: Buy/Sell armor
The Grocery: Buy food
Guild Shop: Buy thieves' equipment
The Pub: Gold may loosen a tongue...
The Healers: Restorative healing
The Stable: Buy horses
The Oracle: Buy knowledge & insight

SPECIAL MONSTERS:

(There are three types of monster for each reference here, but as they differ only in name, they are not listed.)

Thief:
Can steal any weapon or armor that is not equipped.
Pincher:
Can poison
Daemon:
Can hurl magic attacks
Dragon:
Can attack from three spaces away, even when not in the combat mode!
Devil:
Can hurl poisoned magic bolts!
Pirates:
Can fire cannon at all members of party
Sea Serpents:
Can hurl magic across water.
Man-O-Wars:
Can poison/hurl magic!

PART IV: Magic

A spell will cost you a certain amount of magical energy to cast, as follows:

Apple II Computer Documentation Resources (a2_docs_documentation.msw)  
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1112 of 1262
A: 0 pts

D: 15 pts  
(P and so on, up to...)  
P: 75 pts

THE BOOK OF AMBER RUNES (sorcery)  
-------------------------------

A) REPOND - 0  
When Orcs, Goblins or Trolls attack the party, cast this Rune. Thou shall be attempting to dispel the magic which is a part of their inner being.

B) MITTAR - 5  
Hurl this talisman towards thine enemy. A shimmering sphere of light will spring from thy hand, and will strike with a force depending on the skill and concentration invested.

C) LORUM - 10  
A warm, soft, magical light of short duration will be produced when this spell is cast.

D) DOR ACRON - 15  
When this spell is cast, the mage and his companions will be transported to the next lower level of the dungeon.

E) SUN ACRON - 20  
As the words of this spell are chanted, the party will be lifted to the next higher level of the dungeon.

F) FULGAR - 25  
A fireball will infallingly strike thy foe when this spell is invoked, with a force strong enough to kill most common men and cause great damage to beasts of greater strength.

G) DAG ACRON - 30  
This spell will randomly teleport you from one spot to another on the Sosarian surface.

H) MENTAR - 35  
A blue ball of screaming horror will fly toward thine enemy when this spell is incanted. It will invade his mind, and irreperably corrupt his mental process in direct proportion to thine own intelligence.

I) DAG LORUM - 40  
When this spell is cast, an enduring and shimmering light will appear.

J) FAL DIVI - 45  
This spell will allow you to cast any of the spells normally accessible only to Clerics.

ADVANCED SPELLS:

K) NOXUM - 50  
As this spell is spoken, it will catch flame and rush at thy foes, thwarting each with a devastating blow.

L) DECORP - 55  
When the song of Decorp is sung, the air shall shake. Upon whomsoever thou indicated, the Magic shall descend, and their life shall be extinguished — always and completely!

M) ALTAIR - 60  
When this spell is cast, time will slow and finally stop, allowing the party to move freely in the suspended state.

N) DAG MENTAR - 65  
Cast this spell, and thy foes will be struck with a savage blow with damage directly related to thine intelligence.

O) NECORP - 70  
When the need arises, throw this spell above the heads of thine enemy. It will shatter, and they will quickly be transformed into putrid vestiges of their former beings.

P) 75  
This spell is never called by name, save when invoked. All does who hear the UTTERANCE are completely and permanently destroyed.

THE ANCIENT LITURGY OF TRUTH (prayer)  
----------------------------------------

A) PONTORI - 0  
This will allow you to turn undead, and Skeletons, Ghouls and Zombies will be dispelled from their being.

B) APPAR UNEM - 5  
This will allow you to open a chest with no risk to the party.

C) SANCTU - 10  
Lay thy hands upon one who is wounded, and he will be healed. In the beginning, thy power will be limited, but thy capacity as a healer will grow and be strengthened with experience.

D) LUMINAE - 15  
Cast this upon an object, and it will glow with a soft blue light, temporarily lighting your way.

E) REC SU - 20  
The floor shall become translucent and thy party shall float up one level in a dungeon.

F) REC DU - 25  
The floor will become translucent, and they party shall sink down one level in a dungeon.

G) LIB REC - 30  
This shall cause you to fade away from one location in a dungeon, and reappear in another.

H) ALCORT - 35  
With thy touch, the poison coursing in the veins of thy companion shall be transformed into a life-giving fluid.

I) SEQUITU - 40  
If thou raiseth thy ankh into the air and cryest out the name of this invocation, thee and thy companions shall rise forth from the depths of a dungeon to the surface.

J) SOMINAE - 45  
Thine entire self will radiate with a light, that can be sustained indefinately, as it draws forth from thine own inner force.

K) SANCTU MANI - 50  
Anoint the wounds of thy companion with an oil, and his flesh shall be restored and blood flow through his veins, although he lies quivering on the threshold of death.

L) VIEDA - 55  
If thy should lose thy way, meditate on this spell, and a vision of thy surroundings shall come to thee.

M) EXCUUN - 60
By speaking the name of this great miracle, thou can direct the pure light of truth at a foe, causing his life to cease.

N) SURMANDUM - 65
It is now within thy power to recall one from the realm of death. Step into the shadow of death, and lead thy companion back to the world of light. If, however, his strength of will is not strong enough to make the return journey, the backlash from this failed miracle will turn his body to ashes.

O) ZXKUQYB -70
Speak softly the words represented by these letters, and most of thy foes will be struck down with a force so strong it will end their lives.

P) ANJI SERMANI - 75
Beseech the One who is Truth and Wisdom, and thy friend's life shall be forever restored.

Note that these tips on how to solve are no solution. These are not accurate in any way.
1. Format a party, transfer all food and weapons to one member. Leave the town to save game, reboot, delete empty character shells, and create three more. Go to town and buy these front line men with bow. 
2. Consider making a cleric for you'll need his healing power. 
3. You can get 550 hit points by (T)ransacting with the king, if you have enough experience. 
4. With these points, go to dungeon in northeast corner of the island, in the blackened area. You'll recognize it by its waterway and protecting ship. 
5. In first two levels, you should find two "plates" which you should touch. One is Mark of King, other is Mark of Fire. With the Mark of King you can get 2550 hit points with enough experience. 
6. When you leave castle, go west 8 steps and south 34. When moons are in 0,0 conjunction, the Town of Dawn will appear below you. In it are better arms and armor as well as keys, powders and gems. In the lower right hand corner are two chests. You should have four chests of Exotic weapons. After leaving, try to find a ship. Try digging on the two-square island near the island town.
7. Make your way to the island on the east side of the Mainland. You'll notice it by bribable guard before locked gate. You can save $100 fee and key by entering the maze south of the entrance. Go north at that first place you can, then straight east as far as you can, and then north inside gate. Go west to the locked gate. Use a key. Go south to on the entry on the left side of the screen. Go south to the first reach possibly, west to the next south possibly, and west again. This should put you next to a guard. Brie. West lies a treasure area, good for about $1,100 (about $2,000 if you have Mark of Force). It's good to have thief who can grab chests, and cleric who can heal him. Repeat this process until you have it all, say about $13,00 or so. Be careful you don't Combine your gold hoard, give it all, say, to your second or third man, and use both your Thief and Wizard's spells to collect the loot.
8. Loaded with gold and at least four keys, get in your ship, find a whirlpool somewhere at the mouth of it. You'll be cast on the shore of an island in the dark area (to the right and north of landing point) work your way southeast and slightly east. Ignore the next locked gate you see. Shrine of Dexterity is in the southwest corner of the island. You can get 2550 hit points with enough experience. After entering the dark area (to the right and north of landing point) work your way northeast.
9. Near initial entry into this area you'll be able to go south. Following that track gets you to the south shore of the Island, where you must capture a Pirate ship. Using another key, sail through the locked gate to the west and into the passing Whirpool in order to get back to the point where you first entered the Whirlpool. Several trips between Death Gulch and Shipwreck Island should bring up your attributes up to a fairly impressive level, and will certainly make your life easier.
10. Now you should have at least two marks and all four Cards. You'll find Mark of Snake on the third level of the dungeon on the left side of the main area. Another Mark appears on that level. If it isn't the Mark of Force, you'll find it in the west end of level 8 in the dungeon surrounded by lava in the dark mountain area at the southeast end of the island. Lastly, if you want to find the Lord of Time, look in the northwest corner of level 8 in the dungeon locked in by mountains (which you can reach by the Moon Portals). You'll have 2,500 hit points and all eight Marks and Cards, you're ready for Ultima. *Ready* all of your party with exotic weapons and sail up to the Sanke in the center of the island on the northeast corner of the mainland. <Insert> cards into Exodus. 
11. Once you have 2,500 hit points and all eight Marks and Cards, you're ready for Ultima. *Ready* all of your party with exotic weapons and sail up to the Sanke in the center of the island on the northeast corner of the mainland. <Insert> cards into Exodus.
Here are the sides of Ultima V with their corresponding sizes. Make sure you get the correct boot disk, Ctc released two versions of the first (boot) side. The first (200 block) version had some errors in configuring the sound to work with a mockboarding; the correct (198 block side) corrects this problem.

**Side 1**
- Disk 1: Program (198)
- Disk 2: Britannia (151)
- Disk 3: Towne (206)
- Disk 4: Castle (200)

**Side 2**
- Side 1:
- Disk 1: Dungeon (191)
- Disk 2: Underworld (162)
- Disk 3: Dwelling (189)
- Disk 4: Keep (204)

**GETTING STARTED**

Insert Disk One, the Ultima V program disk, label side up into your disk drive. Turn on your computer and monitor. You will see the opening graphics. Press the SPACE BAR to exit this view and bring up the main menu. Use the arrow keys and RETURN to select an option.

The first time you play Ultima V, select "TRANSFER FROM ULTIMA IV" if you want to use your character from that game, otherwise, select "CREATE A CHARACTER". From this point, you should follow the on-screen instructions. Remember to use the ESC key to acknowledge all disk swaps. When creating or transferring, you will return to the main menu.

Next, select the "INTRODUCTION" option in the main menu before continuing to the main part of the game. After completing the introduction sequence, select "JOURNEY ONWARD" to proceed to the main part of the game.

In all subsequent sessions, you may skip both the transfer/create character step and the instructions sequence by either selecting "JOURNEY ONWARD" from the main menu or pressing the "J" key while the disk is booting.

If you have at least 128K of memory and a Passport Systems MIDI interface, Phasor, or a Mockingboard that you wish to use, see "MUSIC WITH ULTIMA V".

**MOVEMENT**

Except in dungeons or while engaged in combat, your party is represented by a single figure. During combat, each party member is shown and allowed to act independently. Pressing the following keys will move your party or party member in the designated direction:

- North: Up arrow or 1 or RETURN
- South: Down arrow
- West: Left arrow or ;
- East: Right arrow or ' (quote)

In dungeons, the period key will turn you around.

These keys are also used to indicate direction when attacking and casting spells.

**MENUS**

In a game menu, use the directional keys to move the cursor bar and highlight your choice.

When you are satisfied with your selection, press the SPACE BAR. To leave a menu without making a choice, press the ESC key. If you are selecting a member of the party from the party roster, you may alternatively indicate your choice by typing in the number of the player's position in the roster.

A arrow symbol just below a menu indicates that the list extends to include more items in one or both directions.

**COMMANDS**

Here is a list of commands that are executed by pressing the designated key:

- **A** /Attack/
  Attempt to engage a person or creature in combat. Must be followed by a direction. In combat, you can aim the weapons in any direction, at any target within the weapon's range by using the direction keys to move the crosshair on top of the target. Press <A> again or the SPACE BAR to fire.

- **B** /Board/
  Board a frigate, skiff, or other conveyance, or mount a horse. If you board a ship from a skiff, the skiff will be stowed and kept ready for later use.

- **C** /Cast/
  Cast a spell. Must be followed by the first letters of the spell's syllables. Only works when the proper reagents have already been mixed and the spellcaster has enough Magic Points remaining. Some spells require additional information (direct or target).

- **E** /Enter/
  Enter towns, castles, and other structures. Party members must be standing directly on structure to enter.

- **F** /Fire/
  Fire cannons. Must be followed by a direction. Ship cannons may only fire when the ships broadsides are facing the target.

- **G** /Get/
  Take possession of gold, food, and other items you find. Must be followed by a direction.

- **H** /Hole Up/
  In dungeons and wilderness, hole up and camp once a day to rest, heal wounds, and recover magical strength. In cities, hole up in an unoccupied bed to quickly pass time. On sea, hole up to make minor repairs to your ship.

- **I** /Ignite a Torch/
  Light a torch, if you have one, to see at night or in dungeons.

- **J** /Jimmy Lock/
  Unlock most doors and safely open chests with a skeleton key. Keys are re-usable, but often break if the person jimmying is not nimble enough.

- **K** /Klimb/
  Climb up or down ladders in buildings and dungeons, down steel grates, or over small rockpiles, fences, and other objects.

- **L** /Look/
  Identify any object or terrain feature or read signs one step away. Must be followed by a direction. May allow further interaction with some objects, such as wells and fountains.

- **M** /Mix/
  Prepare spell reagents for later use. Enter the first letters of the spell's syllables, then select the appropriate reagents from the menu. Press <M> again to mix.

- **N** /New Order/
  Exchanges the positions of any two party members, excluding the leader. Select the two members to be exchanged from the roster menu with the cursor bar.

- **O** /Open/
Opens an unlocked door or chest. Opening a locked chest will set off a trap if the chest has one.

P /Push/
Allows small objects, like tables and chairs, to be moved around the room. May be used to block doors.

Q /Save Game/
Save the current game status. If you do not use this command to end a playing session, any progress made since the last save will be lost.

R /Ready/
Equip a party member with personal items from the party's stores. Use the arrow keys and space bar to select or de-select an item in the menubar. Press ESC when finished.

S /Search/
Search the location or object in the direction indicated. Searching may detect traps on chests, concealed doors, dungeon floor traps, or reveal hidden items. Use the south direction key to search the immediate area in the dungeon halls.

T /Talk/
Converse with merchants or townsfolk in the direction indicated. Conversation is possible over counters, tables, fences, through windows, and doors with windows.

U /Use/
Use a potion, spell, or other special item found during the game.

V /View/
Displays the status and attributes of your party members, including several screens of information such as supplies, weapons, and spears. Use the East and West directional keys to change pages. Pressing the ESC or SPACE BAR will exit the Z /Stats/ screen views.

1-6, 0
Several commands require that one party member be designated to perform the action. When this is required, an illuminated cursor bar will appear over the names of your party members. Use the directional keys to highlight the name of the character you wish to designate and press RETURN. Or, abort the command by pressing ESC. Instead of designating which party member is to perform a command each time you invoke it, you may set any living player as the "active player". Until you select another party member or disable this feature by pressing 0, this player will be the default player for those commands which require a single party member for execution (i.e., Jimmy, get, search, etc.). This player will not serve as the default during combat although you may separately assign a party member to be the active player during combat. To assign a player as the active player, press the number key from 1 to 6 representing that player's position in the party roster.

<Space Bar>
Pass a turn, allowing time in the game to proceed. Also aborts any command requiring a directional key.

Apple II Computer Info

The documentation refers to pictures in the manual. Most of it is common sense, and stuff for beginners. So, we'll skip it.

Music with Ultima V
Warriors Of Destiny includes over a dozen musical compositions ranging from willage dances to castle fanfares. To hear the music, you need an Apple IIe with 128K of memory and any of the following boards:

SWEET MICRO SYSTEMS
A. Mockingboard A
B. Sound I
C. Mockingboard C
D. Sound II
E. Sound / Speech I
To start the music, select "ACTIVATE MUSIC" from the Title Screen menu. From the Music Configuration menu, select "CHANGE MUSIC CONFIGURATION."

For each of your music boards, place a letter (from the list above) under the number of the slot in which the board is installed. Only one MIDI board can be used, and the total number of voices for all other boards cannot exceed twelve. Press RETURN after making your music board selections.

To save your settings for later recall, select "SAVE MUSIC CONFIGURATION". To exit from the Music Configuration menu, select "RETURN TO THE GAME."

Note 1:
In the translation for O, the 'F' shape has a little 'Notch' in the two lines in the 'F' shape. The F is smooth-pointing up.

Note 2:
The "TIE" shape for the letter 'D' has two open spaces in the middle. The "TIE" shape for the letters 'ST' have just a long space in the middle.

Note 3:
In the "A" shape in the letter 'V', the top segment is all filled in.

The 'o' is used as a spacing mark in Britannian writing.

/- /\

-End-

In the translation for O, the 'F' shape has a little 'Notch' in the two lines in the 'F' shape. The F is smooth-pointing up.

Note 2:
The "TIE" shape for the letter 'D' has two open spaces in the middle. The "TIE" shape for the letters 'ST' have just a long space in the middle.

Note 3:
In the "A" shape in the letter 'V', the top segment is all filled in.

The 'o' is used as a spacing mark in Britannian writing.

Unify - A Unidisk Checksum Utility version 1.1

Well this new Unify 1.1 has several errors corrected in it and also some needed improvements.

The main function of this program is to be able to check and make sure that the disk you have received (via modem) is exactly like the original that was sent to you. Although Unify 1.0 was not used often, I hope that this one fairs better as I have had many, many bad transfers - if I would have had a UNI.CHK.xxxx file then I would have been able to find this out after unpacking and then get the "bad blocks" over again.

New features:
-------------
- Fully supports multiple drives, and auto-ejects disks for single drive users.
- Now has the capability to Save and Patch a range of blocks, simply specify the starting and ending and Unify will do the rest, including prompting you for disk swaps if necessary.  
- Now a "SYS" (SYSTEM) file.
- Faster in speed and also now has the option do not display the blocks and checksums to even further the speed. Approximately three times faster.

Options:
--------
The following documentation will describe, in detail, how to operate Unify.

Main Menu options:

[S] Save a Block
[P] Patch a Block
[U] Unify a disk
[A] Auto-Unify a disk
[C] Change slots, drives
[Q] Quit

Save a Block:
-------------
Upon selecting this option you will be asked if you wish to [S] Save Selected Blocks or a [R] Range of Blocks. If you only wish to save single blocks or non-consecutive blocks then select "S", if you want to save a consecutive range of blocks (ie: from 100-110) then select "R" to save a range. After choosing an option you will be prompted for the block number to save (or the starting block number and the ending block number for a range). Unify will then read in the block you specified from the source drive and save it under the name of UNI.BLK.xxxx where xxxx is the block number on the target drive.

Patch a Block:
-------------
Upon selecting this option you will also be asked if you wish to [S] Save Selected Blocks or a [R] Range of Blocks. The Selected Blocks and Range of Blocks are exactly as mentioned in the Save a Block option. After choosing an option you will be prompted for the block number to patch (or the starting block number and ending block number...
The hyperdrive is used to travel between start systems. It is not accurate with Diversi-Cache for speeding up disk access. Just about all versions of ProDOS (including ProDOS 8) and also works everything will then be formatted for uppercase only. Unify works with you cannot display lowercase simply press ^A at the main menu and unifying the disk. Auto-Unify a disk:

---------- This is perhaps the most important option of Unify, it allows you to Unify a disk and then save a file UNIFY.name which holds all of the checksums for each block of the disk. This is done so that you can upload the UNIFY.name file along with the ware and when people download it they can use Unify to check to see if their copy matches your copy (Auto-Unifying). If you do not want to save a UNIFY.name file then press ESCAPE. When selected Unify asks you if you wish to output the blocks and checksums to screen, if you select yes then each block and corresponding checksums will be printed out on your screen, if you select no Unify will tell you to please wait and will Unify the disk without printing any blocks or checksums to screen (selecting no will speed up Unifying the disk).

Auto-Unify a disk:

---------- This option is for checking a disk against a UNIFY.name file. If you suspect you have a bad copy then use Unify to Auto-Unify your disk against the UNIFY.name file and Unify will notify you of any non-matching blocks (or if you're copy is perfect). If there are some bad blocks then you may print them out to any slot or your screen (slot 0) by pressing the slot to dump to. The output is formatted for 80 column printers, and can also print out to an 80 column card as well.

Change slots and drives:

---------- This option allows you to change the slots and drives Unify is set up for. SRC denotes the source and TRG denotes the target, the source is always the first asked for disk. A RAMdrive works fine with Unify, but Unify does not support subdirectories. All files, being saved or loaded, must be on the main root directory (ie: not within any subdirectories).

Quit:

---- Well this is pretty self-explanatory, when selected Unify will either exit into BASIC (if BASIC.SYSTEM has been loaded) or will exit via a ProDOS quit call if BASIC.SYSTEM has not been loaded.

Closing Comments:

---------- Unify works on ALL Apple's which can handle ProDOS, if you cannot display lowercase simply press ^A at the main menu and everything will then be formatted for uppercase only. Unify works with just about all versions of ProDOS (including ProDOS 8) and also works perfect with Diversi-Cache for speeding up disk access.

-END-

Apple II Computer Info

The hyperdrive is a propulsion system that allows travel at faster-than-light speeds by pusing the spacecraft into an alternate dimension-set called hyperspace. Once in hyperspace, the spacecraft is no longer subject to the rules which govern motion in normal space. Due to the chaotic nature of hyperspace, the aiming system used in reentry is only accurate enough to return the user to a particular star, not a particular planet.

Application:

The hyperdrive is used to travel between start systems. It is not accurate enough to use for interplanetary travel. Hyperdrive motors are equipped with a special feature, overload. Overloading the hyperdrive will destroy any other ships within a 50,000 meter radius. It should only be used for emergencies, since it severely damages your hyperdrive.

Warnings:

Never attempt to operate the hyperdrive with an orbital radius of less than 20,000 kilometers or damage may result.
Never attempt to make trips of less than 1 light-year; i.e., 0 light-years, as damage may result.

Theory of Operation:
The sub-light drive comes in several different forms. Some depend on ejecting matter at very high velocities while others use controlled gravity to drive the ship forward in space. Due to the speed of light being an absolute limit on anything traveling in normal space, a trip between even the closest of starsystems would take years using sub-light drive.

Applications:
The sub-light drive is used for travel between planets in the same starsystem and maneuvering between objects in orbit about a planet.

Theory of Operation:
The docking adapter is used to transfer goods and personnel to be conducted without the need of breaching equipment.

Applications:
The docking adapter is used to transfer boarding troops into a target ship and transfer captured goods back to the attacking ship. It is automatically used when you are boarding another spacecraft in the Weapons section.

Theory of Operation:
The bridge is the section of the ship where the captain resides.

Applications:
The bridge is not actually featured in the game except that it is assumed the captain is in it while giving commands.

Warning:
The ship is destroyed and the game ends if bridge damage goes below 1 damage point.

Theory of Operation:
The accumulators are the intermediate storage area between power generation and consumption. They are nothing more than high-efficiency large-capacity batteries. Converters can only provide a slow, steady current while some application, such as using the hyperdrive, require brief bursts of enormous power. The accumulators can provide this capability by storing power over a period of time and releasing it instantly.

Applications:
Power flow through the accumulators is automatic.

Theory of Operation:
The converter transforms Ore IV (a radioactive isotope of hydrogen) into electrical energy.

Applications:
The converter operates automatically any time the power leve in the accumulators is less than the power required for a particular job. When the converter is running, it produces a low "whirring" sound. If there is not enough Ore IV for the amount of power required, the computer will beep rapidly and fail to complete its current job. The converter will automatically deplete your Ore IV supply.

Warning:
The ship is destroyed and the game ends if converter damage goes below 1 damage point.

Theory of Operation:
The resource scanner is used to scan planetary surfaces for traces of Ores I-IV and indicate optimum mining sites.
Application:
The resource scanner is automatically switched on when the user begins mining sites and displays ore concentration, natural hostility, and population sophistication data on each one. This enables you to select the site with the best danger of payoff ratio.

Theory of Operation:
The high definition scanner uses a large part of the electromagnetic spectrum in order to produce a highly detailed picture of an object and an account of the spacecraft's most probable configuration.

Application:
The high definition scanner can be used to determine whether a particular target presents a threat. It can also be used to find choice targets to board and plunder.

Warning:
If the missile rack is destroyed, all your ship's missiles will be lost.

Theory of Operation:
The missile launcher launches the missiles and provides primary course guidance.

Application:
Operation of the missile launcher occurs automatically as firing is requested.

Theory of Operation:
The lasers used as weaponry are the flexible-aperture micropulse type. They emit entense beams of coherent light to blind or puncture enemy targets.

Application:
The laser can be used for defense or offense against targets in orbit. Note that the laser cannot be aimed at ground targets (it diffuses and becomes ineffective) or at drydocks (programmed inhibition).

Theory of Operation:
Electronic warfare dates back to the late Twentieth Century (Common Era) and the basic elements are still the same. Electronic countermeasure, or ECM, is the process of jamming your opponent's tracking radar and missile guidance systems. This dramatically reduces the odds of an incoming missile hitting your ship.

Application:
The ECM will automatically jam missiles as they come in.

Warning:
Assault capsules are electro-gravitically driven space shuttles used to land troops on the surface. They are heavily armoured and contain two or more VoigtEffect cannons.

Application:
The assault capsule is used to clear a hostile area prior to deployment of ore processors.

Theory of Operation:
Crew armor is used to protect the crew from injury and supply additional speed and payload capacity during boarding or ground assaults.

Application:
The computer will automatically ask you for armor when it is needed. You may have only one unit of armor per crew member.
An ore processor is a giant mining platform that can land on the surface of habitable and airless worlds. It has no defense capability and its mining lies
id.

Theory of Operation:
The cargo hold stores up to eighty (80) items of varying size in an atmosphere controlled environment.

Application:
Cargo is automatically stored in the cargo hold.

Warning:
If the cargo hold is destroyed, all the cargo inside is lost.

Cryogenic Vault

Theory of Operation:
The cryogenic vault is a low-temperature (98 degrees K) storage area for passengers and prisoners. Putting non-essential personnel into suspended animation greatly reduces operating costs and accommodations size. A person entering the vault is pumped full of cryo-protectant and his body temperature is reduced to that of liquid nitrogen. The thawing process is rapid and a certain percentage of revivals fail.

Application:
The cryogenic vault can be used most profitable to carry emigrants to other worlds. Many planets need hard-working immigrants. Underpopulated worlds encourage immigration with kickbacks to transport captains such as yourself. Passengers are placed into the cryogenic vault automatically after returning from a Starport or completing a ship-to-ship boarding in Weapons.

Note:
To find the loading status of the cryogenic vault, check the miscellaneous section of Report Status and look under the heading of "passengers."

Orbital Shuttle

Theory of Operation:
The orbital shuttle is an electro-gravitic transport used for starport-to-ship operations.

Application:
The orbital shuttle is used to carry cargo, migrants and ore to and from starports.

Warning:
Orbital shuttles have extremely limited range, usually less than 1500 kilometers. It is necessary to maneuver your spacecraft in an extremely low orbit to facilitate their use.

Autodoctor

Theory of Operation:
The autodoctor is a complex medical computer/robot able to diagnose and treat a myriad of illnesses and injuries.

Application:
The autodoctor is used to heal boarding casualties only. It will operate automatically whenever you are running the Boarding section of Weapons.

Ore Storage

Theory of Operation:
Ore storage is the series of compartments where ore is stored on your ship.

Application:
Ore is automatically placed and removed in the section of the ship.

Crew Quarters

Theory of Operation:
The crew quarters are the section of the ship which contain the sleeping, food preparation, recreation, and sanitary facilities for the crew.

Application:
Crew usage of these facilities is automatic.

Rescue Pods

Theory of Operation:
Rescue pods are a collection of 50 to 200 small plastic spheres, each with a 2 hour air supply.

Application:
Rescue pods are used for mass personnel transfer without the need for a docking adapter.

Computer

Theory of Operation:
A machine which processes data using predefined instructions which are provided by the programs kept in mass storage.

Application:
The computer is used to control many of the systems on the ship. A particular program is required for a particular system.

Warning:
The ship is destroyed and the game ends if computer damage goes below 1 damage point.
Warning:
The ship is destroyed and the game ends if computer damage goes below 1 damage point.

The area of space containing the Local Group is divide into a cubic volume of space 200 light years on a side. Appendix A contains a list of stars and their coordinates within this cube. Note that the home star of the Local Group, Hope, lies at the center of the cube.

Navigation from star to star is accomplished using hyperspace. The X, Y, and Z coordinates of your destination are fed to the hyperspace navigation program and the rest is handled by the computer. A hyperspace jump, regardless of the distance, takes 6.8 days.

Navigation within a solar system is accomplished using sub-light engines. In order to move from planet to planet, you need to feed the sub-light navigation program the current coordinates of the planet. Since planets move, their locations cannot be presented in a table. Rather, the current coordinates of a destination planet can be obtained from the solar scan in the sub-light drive section. The coordinates for a planet are given in spherical coordinates, with one slight modification.

When arriving at a planet, you are placed into a standard orbit which is to be defined as an orbit with a radius four times the radius of the planet. All other coordinates for the orbit are zero.

Changing planetary orbits are also accomplished using sub-light engines. For planetary orbits, it is necessary to feed the sublight navigation program the coordinates for the new orbit.
The computer system aboard your ship consists of a computer processor and a mass storage unit. These units work together to perform all computer activities aboard your ship. The mass storage unit stores the programs, while the computer processor executes them.

There are ten computer programs that you may purchase to run on your computer. Two of these programs, sub-light navigation and hyperspace navigation, are absolutely essential to operate your ship. The following is a description of each of the ten programs:

- **Weapon**
  - Controls the loading and aiming of missiles and lasers.
  - This program is not currently implemented.
- **Amphibious Assault**
  - This program controls the descent and deployment of assault capsules. It must be running for assault capsule use.
- **Defense**
  - The Defense program causes systems aboard your ship to emit random radio-pulses in an effort to confuse incoming missiles.
- **Resource**
  - Controls scanning of a planet surface for valuable ores. Must be used to land ore processors.
- **Docking**
  - Performs all computations necessary in order to dock your ship with either another ship or a drydock. Docking attempts will not be allowed if this program is not running.
- **Shuttle Control**
  - Controls the ascent and descent of orbital shuttles. Must be running to land orbital shuttles.
- **Sub-c Navigation**
  - Performs all computations necessary in order to execute a sub-light maneuver. In addition, this program actually controls the ship attitude and engine thrust to make the maneuver totally automatic. If this program is not running, no sublight maneuvers will be permitted.

- **Hyperspace Navigation**
  - Performs all computations necessary in order to execute a hyperspace jump. If this program is not running, no hyperspace travel will be permitted.
- **Market**
  - Analyzes the cargo aboard your ship to determine the category (i.e., food, narc, arti) of each piece. If this program is not running, you will not be able to determine the category of each piece of cargo.

Each of these programs has a characteristic called timeshare. This is the amount of time-space the program occupies in the computer processor and mass storage. Appendix D contains a list of programs and their timeshare values. For instance, the resource program takes up two timeshare units. From Appendix C, under processors, you can see that the Alkis 2 processor can hold up to 12 timeshare units. This means that the Resource program consumes 2/12 of the processor space. Also from Appendix C, under Mass Storage, you can see that the Skandis unit can store up to twenty-five timeshare units. Thus the resource program consumes 2/25 of the storage space. It is important to note however, that processor space is only used when program is running. Storage space on the other hand is used regardless of the run state of the program.

A program in mass storage has three characteristics: Status, Load State, and Priority. All three of these characteristics can be viewed or changed by you at any time in the Program Control section.

The status of a program may either be "run" or "halt". If the status is read or set to "run", the program is in operation and uses up processor space. A "halt" condition suspends execution and frees up processor space. The status condition does not affect storage space.

The load state of a program may either be "auto" or "manual". If a program is set to manual, the status of that program can only be changed by you. A program in auto can have its status changed by the computer itself. For instance, if the hyperspace navigation program were in a halt status with auto load, the computer could begin executing that program if needed. If you attempt to plot a hyperspace jump, the computer will run the program automatically without your having to change the status manually.

The priority value of a program is only meaningful if the program is set on auto load. Priority values range from zero to nine, with nine having the highest priority. If the computer encounters the need to run a program which is set to auto load, it will first check if there is enough free space in the processor. If there is, it will simply go ahead and execute the program. If not enough free space exists, the computer will attempt to halt another auto load program. The only auto load program the computer will halt are programs with the same or lower priority than one it is trying to run. If the computer cannot free up enough space, it will abort the attempt.
The process of mining ore is very dangerous and tedious. The worst disadvantage for the beginning merchant is the enormous start-up cost. The equipment required for a reasonably profitable mining expedition comes to well over 50,000 credits.

Mining is a fairly straightforward way of earning or actually producing money. It requires at least one ore processor, a resource scanner, a resource program for your computer, and many crewmen. In addition, depending how intent you are in your pursuit of ore, you may need a few assault capsules and their various operating paraphenalia.

Once the ore has been mined and refined, you bring it to a starport money exchange where it is converted into credits.

The disadvantages of mining are numerors. The success of a trip out to a mining world depends on how rich the deposits ore are. The process of mining ore is very dangerous and tedious. The worst disadvantage for the beginning merchant is the enormous start-up cost. The equipment required for a reasonably profitable mining expedition comes to well over 50,000 credits.

A Starport will offer products only within the range of numbers that have the same ten digit as the port's sophistication. Example, if Grotto's starport has a sophistication of 76, it will offer products that range in sophistication from 70 to 79 (notice these all start with the same tens digit).

The value of a product is based on its sophistication and its base price (a value you will never know exactly). If the product has a base price of 7000 and a sophistication of 73, on Grotto it would sell for approximately 6500 credits. Contrariwise, if a product has a base price of 7000 and a sophistication of 79, it would sell for about 7500.

Other merchants at a starport will buy products that are up to 9 sophistication points greater than the starport's sophistication at 85, merchants at the Grotto starport will buy it.

The best method of trading is to buy products with a sophistication slightly less than the sophistication of the starport of the starport you are at. For example, merchants on Grotto are trying to get rid of a product with a sophistication of 73, because Grotto it's not current technology. You buy that product for a reduced price and bring it to the Stowe starport (sophistication = 67) where it's suddenly the latest thing! Plan on making a 250% profit.

You must take into account a planet's culture as well as its sophistication. On Rouvchorra (culture = 4 Formation f Aristocratic States), for example, many product types are illegal and will be confiscated if you try to bring them down to the starport. Consult Appendix G to make sure none of the types of products you bring down to a planet are illegal.

Some planets in the Local Group have a surplus of people. Other planets are rapidly expanding and need all the manpower they can get. The object of passenger transport is to take people from a planet in the former category and take them to a planet in the latter.

Planets offering emigrants will actually pay you to take people away. Planets that need people will pay you for immigrants. The problem is that many cultures do not accept transportees and all of them want people who are at least 1 and no more than 10 sophistication points greater that of the planet.

Transport captains can expect over 1000 credits per passenger on a well-planned run.

In orbit above many of the planets, complete anarchy is the rule. Properly armed, you can profit from this situation. To capture another spacecraft, however, is a long and dangerous process. You must carefully analyze your target and be able to outmaneuver it into a forced docking. Your troops must be stronger and better equipped than your target's to successfully capture it. Once captured, though, the

Trading

The object of trading is to buy an item on a world where it is commonplace and relatively inexpensive and bring it to a world with a slightly lower sophistication and run the price up 250%. Multiply that by the 80 products you can carry at a time and you can see the amount of profit involved in a successful trip.

In the Local Group, the basic currency is the credit. The credit is fixed by the Interworld Trade Commission as being equivalent in value to one unit of Ore IV. This frees the interstellar trader from the problems of barter and exchange difficulties usually found between currencies. Since Ore IV is a common substance but tedios to refine, it provides a stable monetary base.

One of your primary goals, as an interstellar merchant, is to earn money. The four major sources of revenue available to you are: mining, trade in products, passenger transport, and piracy.

Mining

Mining is a fairly straightforward way of earning or actually producing money. It depends at least one ore processor, a resource scanner, a resource program for your computer, and many crewmen. In addition, depending how intent you are in your pursuit of ore, you may need a few assault capsules and their various operating paraphenalia.

Once the ore has been mined and refined, you bring it to a starport money exchange where it is converted into credits.

The disadvantages of mining are numorous. The success of a trip out to a mining world depends on how rich the deposits ore are. The process of mining ore is very dangerous and tedious. The worst disadvantage for the beginning merchant is the enormous start-up cost. The equipment required for a reasonably profitable mining expedition comes to well over 50,000 credits.
ship's entire crew are your prisoners, all their credits and ore are yours, and all
their cargo. But only if you live.

Using Menus

The Flight and Starport disks are "menu drive. This means that all sections
are accessed by selecting the section from a menu (or list) of sections on the
screen. When a menu is displayed on the screen, you will see a pointer that points to
one of the sections on the menu. This pointer may be moved from section to section by
pressing the option key. To run a section, you must first use the option key to move
the pointer to that section. Pressing the select key will then run the section. To
exit a menu and return to the previous menu (if any), press the start key. This
procedure is used for all menus in the game.

Sound Effects and their Meanings

There are several sound effects that are used throughout Universe. These are
detailed as follows:

Ship Under Attack

If your ship is hit by an enemy weapon, you will hear a sound that resembles an
explosion. When this sound occurs, one of the parts aboard your ship may take some
damage or be destroyed. Upon hearing this noise, you should either transfer to a
different orbit (in an attempt to escape the attacker) or fire back.

Ore Converters in Use

Whenever the ore converters run, you will hear a whirring sound. This sound
will last from a few seconds to as long as a minute, depending on how much ore is
being converted. A few short beeps will occur if you run out of ore during the
conversion process.

Here is where the game begins. In order to purchase a ship and supplies, you
need money. Since stealing is out of the question (morals are assumed here), you must
take out a loan. The Central Bank of Axia, so you hear, is the easiest to borrow
from. In fact, they don't even do a credit check!

Mortgage, Buying a Ship

Mortgage

The back, being located at the commercial center of the Local Group, sees a lot
of your type looking to buy a ship. Thus, they have devised a load called the
"Merchant's Loan Package". The total value of this package is 300,000 credits and
includes the following:

<table>
<thead>
<tr>
<th>Part #</th>
<th>Sys #</th>
<th>System Name</th>
<th>Type</th>
<th>Quan</th>
<th>Cost (Units)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>00</td>
<td>Hyperdrive</td>
<td>Quantum Div</td>
<td>00001</td>
<td>35,000</td>
</tr>
<tr>
<td>04</td>
<td>01</td>
<td>Sub-Light Div</td>
<td>Ion</td>
<td>00001</td>
<td>20,000</td>
</tr>
<tr>
<td>11</td>
<td>02</td>
<td>Bridge</td>
<td>Xorconn</td>
<td>00001</td>
<td>03,500</td>
</tr>
<tr>
<td>14</td>
<td>03</td>
<td>Accumulators</td>
<td>Alkis Group</td>
<td>00008</td>
<td>08,000</td>
</tr>
<tr>
<td>17</td>
<td>04</td>
<td>Converter</td>
<td>Fuel Cell</td>
<td>00001</td>
<td>10,000</td>
</tr>
</tbody>
</table>
You find yourself in the drydocks of Axia, talking with Zefrep, the sales manager. He will lead you over to a terminal from which you can view the current selections of ten ships. It is important to remember that these ships are merely flexible, however. You may choose any period between five and sixteen years.

Payment of the load is done entirely at the end of the period. The bank officer will tell you what year the load is due based on your decision. If, for instance, the officer informs you that the load is due in 112, 007, you must pay the load between 112.00 and 112.99. Since you are paying interest on the loan, the longer the payback period you select, the more credits you will eventually have to pay. The bank officer will give you the current interest rate and the amount that will be due at the end of the load period.

The goods will be sent to the Axia drydock where you can later place them on your ship. When you have finished obtaining your loan, you will be ushered over to the drydock to select a ship design.

### Buying a Ship

<table>
<thead>
<tr>
<th>Implementation</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once you have secured a loan from the bank, it is time to purchase a ship. You may use part of the 127,000 credits remaining from your "Merchant's Loan Package" to pay for the ship.

### Package Cost

- Total Cost (if purchased separately): 223,000
- Package Cost: 173,000

The part number and system number of the item in the package are given so that you may use appendix C to look up the specifics on the parts listed.

You must, of course, eventually pay back the load. The payback period is flexible, however. You may choose any period between five and sixteen years.

A menu of ship names will appear on the screen. To obtain information on one of the designs, type the number corresponding to the name and then press the return key. The terminal will go blank for a few seconds while it accesses the proper information, then display the first of several screens of information on the ships. The top half of the screen will give you an angled view of the ship. The bottom half will relate the specifications of the ship. The specifications are defined as follows:

- **Visibility**: The overall visibility of the ship (this is a number between 0 and 99; the higher the number, the more visible the ship is to other ships.)
- **Integrity**: The overall structural integrity of the ship (this is a number between 0 and 99; the higher the number, the more structurally sound the ship is.)

When you are finished reviewing the data, press the return key and the computer will access the next screen information. The last screen of data is a ship overview.

You can obtain additional information on the ships from Appendix H. This will list the size and visibilities for each section on the ship. Ships are divided into maximum of eight different sections. Each section is capable of holding a particular number of hulls. Hulls are the main measure of a parts size. The larger sections will be able to hold more hulls, therefore more parts. Sections also have visibility.
factor. This is a measure of how visible the individual section is to another ship. This is a value between one and ten inclusive. The higher the value, the more visible the section is. The more visible sections have the greatest chance of being hit by enemy fire. A good strategy is therefore to place vital parts in the section with the lower visibility factors.

Once you are finished reviewing ship designs, you may purchase a ship by pressing the select key when at the selection menu. Zefrep will then ask you which ship you want to purchase. To do this, press the number corresponding to the ship you want, then press the return key. The cost of the ship will automatically be deducted from the credits you have. The ship will be moved from the storage area to the drydock area so that you will later be able to place your hulls and parts aboard your ship.

Calibrating the Drive System

While Zefrep is moving your ship into the drydock area, he will ask that you assist the computer in creating the player disk. You will be asked to remove the construction disk from the disk drive, then press the return key.

You will need a black disk to use as the player disk. The computer will ask you to place this disk in the disk drive and press the return key to begin formatting. The format procedure will take almost a minute. If the format is successful, the computer will ask you to replace the construction disk. The format may fail if the disk proves to be defective. In this case, the computer will allow you to place a different disk in the drive and try again.

When you get a successful format and have replaced the construction disk, the computer will then begin the process of moving data onto the player disk. Simply follow the instructions the computer gives for inserting disks. Several disk insertions will need to be made during this process. Above all, be patient! Universe is a complex game that requires over three quarters of the space on the player disk for data.

Zefrep will inform you when the process is complete. At this point, your ship, parts, and hulls are in position and you are ready to boot the computer with the flight disk.

After booting the flight disk, you must proceed DIRECTLY to docking control (this is a section on the docking control menu). This section will allow you to place the parts included in the load onto your ship, after placing the parts, you must select purchase items (also on the docking control menu). Here, you will need to hire at least 10 crew members (you may wish to hire at least 15 if you plan to use orbital shuttles) and to purchase enough provisions to last them until you return to a drydock.

This procedure must be followed in the given order. If you fail to do so, you may find yourself sitting in your ship with no parts or crew. This will end the game rather abruptly.

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1145 of 1262
coordinates here by moving the starsystem pointer up to the annual entry line (use the up arrow key).

After positioning the starsystem pointer, you may then jump to or obtain data on that system. At the far right hand side of the screen you will see a "visited" indicator that is set to "Y" if you have been to that system before, or an "N" if you have not. If the indicator is set to "N", you may obtain data on the planets orbiting that star by pressing the option key. The planetary data will include the planet name, the sophistication levels of the drydock and starport (including of course whether or not the planet has a starport drydock), and the type of planet. You may return to the starsystem list by pressing the start key.

You may select a star as your destination by pressing the select key. If the starsystem pointer is on the manual entry line, it will first be necessary to enter the proper coordinates. To do this, press the option key and a small cursor will appear after the "X". Enter the X, Y, and Z coordinates, pressing return after each. Then you may press the select key to select those coordinates as your destination.

You will now see the Local Group map as the hyperspace navigation program plots the appropriate coordinates. The source coordinates will be displayed on the left, while the destination is displayed on the right. The distance between the two locations is given at the center of the map, measured in light-years. The amount of energy needed for the jump is displayed at the bottom of the map.

To make the jump, push the select key. To abort the jump, push the option key and you will return to the starsystem list. If the computer beeps when you push the select key, the hyperspace navigation program has rejected the jump due to insufficient energy or an illegal jump distance.

Once the hyperspace navigation program has accepted a valid jump, the computer will begin calculating, fueling, and sequencing for the jump. Don't be alarmed if you see strange patterns of light on the screen. This is simply sensory distortion due to the hyperspace effect, providing you obeyed the orbital radius minimum for a hyperspace jump, you will find yourself at the destination. If you were too low in the orbit of the planet (less than 20,000 kilometers), you will find that you did not move. You may also have damaged your hyperdrive.

To return to the drive system menu, you must first have the starsystem list displayed on the screen. Pushing the start key from this point will return you to the drive system menu.

After selecting a destination, the sub-light navigation program will compute the appropriate computations. At the bottom of the screen you will see the following information:

| Time...........Time in minutes needed for the transfer |
| Ore...........The amount of Ore IV needed |
| Energy.......The amount of energy needed |

Push the select key to begin the transfer, or the start key to abort. If the computer beeps after pressing the select key, the sub-light navigation program has rejected the transfer. This is due to either insufficient energy, ore, or the number of gravities of thrust needed for the maneuver is too great. During the transfer, time will be speeded up to approximately 500 game minutes per 1 second of real time. After the transfer, you will return to the select scale mode.

If you select the planetary scale, the computer will begin by doing an orbital scan, then a planetary scan. A polar view of the planet will appear at the center of the display. If your ship is within the range of the orbital beacon for the type of orbital scanner you have, one or more dots will appear, indicating objects in orbit. The computer will switch to the destination select mode and a cursor will appear in the "rho" coordinate. You are now in the destination select mode, and the computer is waiting for you to enter the coordinates of your destination.

The coordinates are as follows: rho, epsilon, theta-epsilon, and theta. To enter the coordinates, simply type in the numbers, entering all angles in degrees. A radius or angle that is too small or large will be rejected. The minimum radius will be 5% greater than the radius of the planet. For example, the minimum orbital radius around Axia would be 6615 kilometers. The maximum radius will be around ten times the radius of the planet. You may hit return for the radius without entering a number if you do not wish to manually enter coordinates. If you have entered coordinates, you may press the select key to select the current object as your destination. Otherwise, you may press option to display the coordinates of the objects in orbit. You may select an object as a destination by pressing select when the object's data is at the bottom of the screen. Due to the limitations of sub-light engines, you will not be able to select a destination whose orbital radius is within 500 kilometers of your ship's orbital radius.

Objects other than an orbital drydock or your ship appear with the description "HRS#". This is a hi-resolution scanner section and enter the appropriate contact must be within range of the scanner, so you may wish to first transfer to the contact's location.

In order for your orbital scanner to pick up other objects in orbit, you must be within range of the orbital scanning beacon. The beacon is a ring of satellites surrounding the planet at an orbital radius equal to five times the radius of the planet. To be within range, the difference between your orbital radius and that of the beacon must be less than the maximum range of your orbital scanner.

After selecting a destination, the sublight navigation program will compute the course and resources needed. The following data will be displayed:

| Time...........Time in minutes to |

---

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1146 of 1262
If you now press the option key, a "V" will appear at the end of the status line indicating that the transfer will be "visual". This means that you will be able to watch the maneuver on the screen. This will be interesting to watch since the transfer uses real formulas, however it will take considerably longer than a "non-visual" transfer. To select a non-visual transfer, press the option key again. This will turn off the "V" on the screen. At this point, you may press select to begin the transfer. After the transfer, you will return to the select scale mode.

---

**INTRODUCTION**

THE STORY SO FAR...

*History*

During the latter part of the First Stellar Expansion, it became evident that the technology from planets in the Home Cluster could not support the ever expanding colonization effort.

The hyperdrive had opened an era of fast, economical travel between the stars. Journeys that used to consume decades could be made in a matter of days. However, the hyperdrive was not without its problems. Its unfueled maximum range was a major limitation. After 3 or 4 hyperjumps, the ship would be completely out of the inhabited regions, with nowhere to refuel. Its fuel capacity was also part of the second hinderance: the so-called "Mass Limit." Stated simply, it sets a severe limit on the maximum size of a spacecraft that can enter hyperspace. Because of these problems, the experts were predicting an end to the rapid expansion that had previously characterized Earth's emergence as an interstellar civilization.

In 2105, a research ship traveling through the far reaches of the Tau Ceti starsystem discovered a huge alien artifact. Entire scientific communities came to study the artifact and, several years later, the purpose of the great machine was discovered. It was a hyperspace booster. It had the capability to "push" spacecraft not tens but thousands of light-years. Since the booster itself did not enter hyperspace, ships up to the mass limit could travel a thousand lightyears with minimal power.

Years of research continued. Why had the aliens abandoned the booster? Where had they gone? The scientists were unable to say. The booster contained a mapping system depicting millions of stars, but very few of them had recieved any special mention.

Finally, the control system was deciphered and test flights were made. They proved the machine to be fully functional and technician's knowledge of the control system, adequate enough to allow regular use.

The Second Stellar Expansion started.

You are in a cluster of stars known as the Local Group. It is impossible to communicate with Earth because travel using the booster is strictly one-way. Up until 40 years ago, small capsules containing the latest news and technical examples used to arrive every month from the Home
Clusetr. Then one day they stopped. There was no indication that there was anything wrong in the Home Cluster. The ensuing panic and fear in the Local Group nearly destroyed civilization; as it is, the LG has been divided into two mutually hostile governments, set on the brink of war. Fortunately, 20 years ago, a second hyperspace booster was discovered at the planet Diftalpa, right in the Local Group. The second booster is currently being towed to Cetus Amicus, where it will be studied in greater detail. It is hoped that in the near future there will be two-way communication between the Local Group and the Home Cluster ... if the Local Group doesn't destroy itself first.

*Who You Are*

The Local Group has been divided into two governments, the Federated Worlds (FW) and the United Democratic Planets (UDP). Although trade and travel continue between the two governments, the situation is deteriorating rapidly. Almost 8 years ago, you "retired" from the Federated Worlds Special Forces (FWSF), an organization whose function is to gather intelligence data and perform covert operations within the United Democratic Planets. Now you carry the persona of a free trader from Vrommus Prime. Your cover is quite airtight. Occasionally, the FWSF provides you with money and special equipment, but only to send you out on missions. Not all of your crew is even aware that you are anything else but a trader. So during your travels and missions, you're going to have to earn a living.

******** GETTING STARTED ********

Apple //e with a 128K 80 column board or Apple //c, 2 disk drives, optional Apple Mouse.

*Starting Omnitrend's UNIVERSE II*

Universe II is distributed on five disk sides labeled A,B,C,D, and E. To run Universe II, place disc A into drive 1 and turn on the computer. Disk A must not be write protected.

The 128K 80 column board must be enabled so that the double hi-resolution graphics are active. See the 80 column text card manual for more information on enabling the double hi-resolution graphics.

*Using the Menus With a Mouse*

If you have a mouse connected to your computer, you can use it for selecting menu entries. To display a menu, point to its name on the white bar at the top of the screen and press the mouse button. Hold the button down and move the pointer to highlight the entry you wish to select. Once the pointer is positioned correctly, release the button.

You may often see a window on the screen in which there will be one or two buttons. A button is a rectangle with a word in it such as "Continue". You may click that button by pointing to it with the mouse and pressing the button.

*Using the Menus Without a Mouse*

Too use the menus without a mouse, press the ESC (escape) key in the upper left corner of the keyboard. This will enable you to use the arrow keys to select the items in the menus. To move the pointer in a certain direction, just use the four arrow keys. When the item you want is highlighted, press the RETURN key.

You may also use the key equivalents to select menu entries in the game. When you pull down a menu, you will see the apple character followed by a letter next to every menu entry. To select an entry, press either apple key (located on either side of the space bar) and the letter for
that function. The apple key works in the same way that the shift key works, so you should press the apple key first and hold it down while you press th letter. It is not necessary to pull down a menu to use the key equivalents.

You may often see a window on the screen in which there will be one or two buttons. A button is a rectangle with a word in it such as "Continue". To press a button with the keyboard, just press the key that corresponds to the first letter of the word in the button. For example if the word is "continue" the button is "Continue" the you may press the "C" on the keyboard to press it. Note that buttons override menu entries, so if a menu function's key equivalent was "C" and the button "Continue" were on the screen, pressing "C" would "click" the button instead of selecting the menu function.

You may use either upper or lower case letters when using the keyboard.

*Making Backups*

We suggest that you make backups of disk sides B,C,D, and E. The disk with side A is copy protected, so you will needed to. (get a cracked copy, (I left out the mailing instructions, etc.) For those of you with Unidisks, you may want to consider buying this program... |

Omnitrend Software is offering a free game update for Unidisck 3.5 owners. When your original game disks have been received, we will mail you a 3.5" version of the game, which fits entirely on one disk.

<| more mailing instructions that I left out... |>

PLAYING TIPS

These are a few playing tips to help you get started with Universe II.

* Check the vidscomm frequently. * Many of your assignments and clues will come from listening to vidcomm messages. Don't forget that the government affiliation of the planet you are orbiting will determine which vidcomm messages you receive.

* There is a drydock nearby. * When you are starting the game, take advantage of the drydock above Axia to obtain additional supplies and parts.

* There is a starport nearby. * When you are starting the game, go down to the Axia starport and pick upsomse products. Check the planet chart and the mixture chart so you will know what products to buy and where to bring them. Hint: Zeath is a good place to bring products from Axia.

* Be patient. * It takes some time to become familiar with Universe II.

* Use the Save & Continue feature. * By frequently backing up your game, you can see whether a particular story works before committing yourself to it.

* Check your ship's status frequently. * Go into C&S every so often and check your ship's damage levels, supplies and crew. Chances are someone will get a promotion.

* Check if anyone is locked-on. * When you are orbiting a planet and ready to send shuttles or ore-processors down to the surface, you are rather vulnerable to enemy attacks. Make sure that no one is shooting at you before launching landers.

* Talk to people. * It's a good idea to talk to everyone you meet in a starport.

* Check in. * Check into the FWSF headquarters on Vromus Prime every so often. Admiral Bresheliah may have something important.

* Plan ahead with crew. * You may find that it will save you money to purchase low grade crew early in the game, so that when you need high grades, you won't have to send anyone to expensive technical school.

* Don't purchase too quickly. * When you are at a starport waiting to buy something, watch a single brand of product to get an idea of what a good price is. Many times, buying the first product you see won't yield much profit, especially when you are paying premium price for it.

* Check part requirements. * When purchasing a complicated system such as an ore processor, make sure that you have all of the accessories for using it (ex., pilots, marines, energy, resource scanner, programs, etc.) before leaving the drydock. This will eliminate many unnecessary trips.

* What to do first. * When you begin the game your Agora class spacecraft is in the Hope starsystem, but not around any planet in Do. Do a solar transfer to Axia, get into a low orbit, take the orbital shuttle down to the starport, get products and passengers for the planet Zeath, and then go there. From there, it's up to you!

*Damage Points (DP)* -

This is a measure of the amount of damage that a part can take before it is destroyed. The higher the damage point level, the more likely the part will survive an attack. Damaged parts can be brought back to their original damage point level by an enginner or by the repair crew at a drydock.

*Size* -

The measurement of a part's bulk. The larger the part, the more room it will take to fit it in a section.

*Visibility* -

This is the measurement of how likely a part is to be his during an attack. This is based upon two factors: the part's size and the visibility modifier of the spacecraft section the part is inside. To calculate the part's visibility, the appropriate section's visibility modifier is added to the part's size. For example, if you have a hyperdrive of size 5 in an Angora class spacecraft, its visibility would be 3, because the visibility modifier for the drive section is +2. This means that the drive section is concealed enough so that anything inside of it "appears" smaller to the outside than it really is and thus presents less of a target. The actual visibiliy of a part may never go below 1.
This is the same as the sophistication of the drydock where the part was purchased. Only high-grade engineers and high sophistication drydocks can repair the most sophisticated parts. Typically, the sophistication parts are the best (and costliest).

In addition, some systems have the following characteristics:

*Partial operation* - Any system marked as such will operate at a fraction of its normal efficiency if damaged. The percentage of efficiency is calculated by dividing the current dp level of the part by its maximum dp level. For example, if a sub-light drive with 15 dp maximum and 500 gravities of acceleration is reduced to 11 dp, then its top acceleration is reduced to 367 gravities (11/15 = .734 and .734 * 500 = 367). Note: partial operation will affect all of a part's functions adversely.

*Constant drain* - If a system has the note "constant drain" in the Parts List, it will consume power even if it has been severely damaged, although it will stop draining if it is removed or destroyed.

** Drive Systems **

Hyperdrive - Used for interstellar travel. The only way to move from one starsystem to another is to use the hyperdrive. The hyperdrive is too inaccurate to use for moving from planet to planet.

Sub-light Drive - Used to travel between planets within a starsystem. Unable to propel your spacecraft faster than light, the sublight is too slow to be used for moving between starsystems.

Gravity Generator - Generates gravity for environmental and protective purposes. The gravity generator will also protect you from acceleration caused by the sub-light drive.

** Energy Systems **

Converter - A power generator that transforms Ore IV into energy units.

Accumulators - Store energy units made by the converter. This system is primarily used when another system, such as the hyperdrive, requires a large amount of energy at a rate much faster than the converter can produce. Essentially a large collection of batteries.

Ore Storage - Holds the 4 different types of ore (I-IV).

** Command and Support Systems (C&S) **

Bridge - The command center of your ship. If the bridge is destroyed, the game ends.

Crew Quarters - The living quarters and off-duty stations for your crew.

Computer - The central computer for your spacecraft. It is very powerful, but not a true machine intelligence.

Autodoctor - An automatic medical repair unit used for raising you and your crew's health percentage.

Hibernaculum - A cold-storage unit for transporting passengers. The process is dangerous and you should expect to lose a certain percentage of the passengers upon revival.

Vidcomm - The video communications device for your spacecraft. In this game it is limited to receive only. Messages are stored by repeater units in orbit around all of the habitable planets, so you won't miss any messages that you might need.

Cargo Hold - Stores cargo that you purchase down at the starports or that you capture from enemy vessels.
Running a complex starship of the 24th century requires the aid of many skilled technicians. Although you are initially provided with a few crewmen, as you expand your ship you will find the need to hire more. Each crewman has a number of characteristics on which they should be judged. Hiring the right crewman can make the difference between winning and losing.

The characteristics for each crewman are:

Health - A measurement of a crewmember's ability to perform his duty. If the health percentage reaches 0, the crewmember dies. Reduced health may result from battle damage, injury when moving dangerous cargo, and changing watch. A crewman with a health percentage of less than 70% may die of untreated injuries during any watch. This is especially true for older crewmen.

Age - In the time period that Universe II depicts, a crewman's age runs from 20 to 130. All crewmen automatically retire when they reach 130. On a dossier, the promotion date is also the birthdate. Age primarily determines a crewman's ability to resist death from injuries. Older crewmen are more likely to die from untreated (below 70% health) injuries.

Specialty - Every crewman has a specialty, which they may not switch. They are:

- Captain - The supreme authority on a spacecraft. Captains are invariably assoniagenated and technically always on duty.
- Astrogator - The person responsible for getting the spacecraft from one place to another. An astrogator's grade is especially important for hyperspace jumps. The higher grade astrogators will break the ship out of hyperspace much closer to the habitable zone of a starsystem, thus saving a great deal of time and energy.
- Gunner - The gunner is an expert on all the various forms of weaponry that your ship may carry. A superior gunner has a greater accuracy with missiles and more skill in using ECM's.
- Pilot - The pilot is the person who flies the orbital shuttles, ore processors, and the assault capsules. All higher-grade pilots will break the ship out of hyperspace much closer to the habitable zone of a starsystem, thus saving a great deal of time and energy.

Atmospherics - The environmental control for your spacecraft. If this system is destroyed, everyone on the spacecraft will die.

** Scanning Systems **

Solar/Planetal Scanner - Scans the starsystem that you are in or the planet that you are currently orbiting.

Resource Scanner - Scans the surface of habitable or airless planets for the best available mining site.

High Definition Scanner - Provides a detailed scan of any spacecraft within your range.

** Lander systems **

Orbital Shuttle - Used to travel to and from starports, which are found on the surface of almost all of the habitable planets.

** Weapon Systems **

Missile Launcher - Every crewman has a specialty, which they may not switch. They are:

- Missile Rack - The system of racks and conveyors used to store missiles and load them in the Missile Launcher.
- Enhanced Beam Weapon (EBW) - A type of highly destructive particle-beam weapon.
- Shield Generator - Generates a sphere of disruptive gravity waves around your spacecraft, lessening the effects EBW or missile hits upon your spacecraft.
- Docking Adaptor - Used only for docking and boarding an enemy spacecraft. It will adhere to the other spacecraft's hull and, if marines are deployed, burn a breach right through the outer hull.
- Electronic Countermeasure (ECM) - A variety of jamming equipment which renders your ship invisible to enemy scanners.
- Assault Capsule - A lander used on habitable planets with a population sophistication of 40 or greater when you wish to mine ore illegally. The capsules are similar to the orbital shuttles, but they carry marines, are covered with armor, have a cannon mounted on top, and can land almost anywhere.

** Mining Systems **

Ore Processor - Another lander, this one greatly resembles a flying off-shore oil rig of the 20th century. Used to mine ores on habitable and airless planets.

- Ramscoop - A recently invented device which allows you to collect ore IV directly from the atmosphere of a gaseous planet.

CREW: USE AND MAINTENANCE

The environmental control for your spacecraft. If this system is destroyed, everyone on the spacecraft will die.

** Scanning Systems **

Solar/Planetal Scanner - Scans the starsystem that you are in or the planet that you are currently orbiting.

Resource Scanner - Scans the surface of habitable or airless planets for the best available mining site.

High Definition Scanner - Provides a detailed scan of any spacecraft within your range.

** Lander systems **

Orbital Shuttle - Used to travel to and from starports, which are found on the surface of almost all of the habitable planets.

** Weapon Systems **

Missile Launcher - Every crewman has a specialty, which they may not switch. They are:

- Missile Rack - The system of racks and conveyors used to store missiles and load them in the Missile Launcher.
- Enhanced Beam Weapon (EBW) - A type of highly destructive particle-beam weapon.
- Shield Generator - Generates a sphere of disruptive gravity waves around your spacecraft, lessening the effects EBW or missile hits upon your spacecraft.
- Docking Adaptor - Used only for docking and boarding an enemy spacecraft. It will adhere to the other spacecraft's hull and, if marines are deployed, burn a breach right through the outer hull.
- Electronic Countermeasure (ECM) - A variety of jamming equipment which renders your ship invisible to enemy scanners.

Ore Processor - Another lander, this one greatly resembles a flying off-shore oil rig of the 20th century. Used to mine ores on habitable and airless planets.

- Ramscoop - A recently invented device which allows you to collect ore IV directly from the atmosphere of a gaseous planet.
transport, mining, and orbital piracy. sophistication of the destination from your current starport.

Your primary goal, as an interstellar merchant, is to earn money. The planet to planet. Equipped with a hibernaculum, you can carry these stable monetary base. At every starport in the Local Grou there are people waiting for flights Meeting of 2167, as being equivalent in value o  one  unit  of  Ore  IV. ** Passenger Transport **

In the Local Grooup, the basic unit of  currency  is  the  credit.   The credits. COMMERCE IN THE LOCAL GROUP The disadvantages of mining are numerous. High concentrations of ore are

the number of provisions by the current number of crew. starport, where it can be exchanged for credits.

before they starve. To calculate the number of provision/days, divide Once the ore has been collected and refined, it is brought to a

in terms of days, that is, with the current complement of crew, how long before they starve. To calculate the number of provision/days, divide

Watch -  Watch determines which part of the day the crewman is on duty. The day is broken up into three 8 hour watches. Astrogators and gunners stand regular watches. Pilots, miners, marines, and engineers have special watches: They only work when their duties are needed. You as the captain, have undergone a process called asomnigenation. Asomnigenation alters the body's chemistry and makes it unnecessary for you to sleep. Astrogators and gunners can also be asomnigenated. Anyone who is asomnigenated is on a "full" watch and are always available.

**Provisions**

One provision includes enough food, water, etc. to keep one person alive for one day. Usually it is convenient to think of the provisions supply in terms of days, that is, with the current complement of crew, how long before they starve. To calculate the number of provision/days, divide the number of provisions by the current number of crew.

COMMERC IN THE LOCAL GROUP

In the Local Group, the basic unit of currency is the credit. The credit has been fixed by the Interworld Trade Commission, at the famous Meeting of 2167, as being equivalent in value o one unit of Ore IV. Since Ore IV is a common substance, but tedious to refine, it provides a stable monetary base.

Your primary goal, as an interstellar merchant, is to earn money. The four sources of revenue available to you are: trading, passenger transport, mining, and orbital piracy.

** Trading **

The object of trading is to buy an item on a world where it is commonplace and relatively inexpensive and bring it to a world whose sophistication is from 1 to 10 points lower. Suddenly, your product becomes state-of-the-art and highly desirable. Multiply your profit times the 10 products you can carry per trip and you have a sizable amount of credits.

Certain products are even more marketable. Not only will food/spice, lifeforms, narcotics, and jewelry sell at a starport 10 sophistication points lower than the price of purchase, they can be sold at starports up to 10 sophistication points higher than the point of purchase. This reflects the fact that these product types have a more universal appeal and that they are not as dependent on local technology.

Products have several characteristics. They are:

Name - This is the product's brand name.

Type - The product's classification. Almost every culture has product types which are illegal to import. In the appendix is a list of the cultures and their illegal product types.

Cargo Size - A measurement of the product's bulk.

Sophistication - A measurement of the product's complexity. This figure is always the same as the product's planet of origin. At best, products appeal to a range of 20 sophistication points. This reflects the fact that products too simple for the buyer have been out-moded (no one buys grindstones anymore) and products that are too complex do not have the other supporting technologies required (an ancient Egyptian would not have any use for a television set).

Price - The value of a product is based upon its sophistication and its original manufacturer's price (a figure you will never know exactly). Note that products up for sale at their planet of origin or on planets outside of the sophistication's range of appeal will be worth 0 credits.

** Mining **

Mining is a fairly straightforward way of earning money. It requires at least one ore processor, a mining squad, a resource scanner, a scanner program, and patience. In addition, depending on how intent you are in the pursuit of ore, you may need some assault capsules and their paraphernalia.

Once the ore has been collected and refined, it is brought to a starport, where it can be exchanged for credits.

The disadvantages of mining are numerous. High concentrations of ore are difficult to find. Landing on airless worlds is usually very dangerous. The start-up costs in mining are very high, typically above 50,000 credits.

** Passenger Transport **

At every starport in the Local Grou there are people waiting for flights to other planets. You, as a merchant, are continually hopping from planet to planet. Equipped with a hibernaculum, you can carry these people for a fair amount profit, which is based on the distance and sophistication of the destination from your current starport.
** Orbital Piracy **

In many of the less-developed star systems, complete anarchy in orbit is the rule. Properly outfitted, you can profit from this situation.

Capturing another spacecraft, though, is not a simple process. You need to select a suitable target, scan it, and destroy its entire complement of crew and marines, all without destroying the ship. If it isn't possible to destroy all of the marines, you will have to send over some of your own and hope the can secure the ship.

Once the target ship is captured, you will be able to take all of the credits, ore, and products on board... if you survive.

THE ON-BOARD COMPUTER

In order to operate, your spacecraft must be equipped with an on-board computer. The computer controls many of the other systems on your ship.

The speed of the computer is measured in "tevops per minute" (trillions of operations per minute). Program size is measured in the number of operations which must be executed in a complete run. So, to find the amount of time it takes for a program to completely run, divide the program's size (tevops) by the computer's tevops per minute figure. This will give you the time in minutes.

The following is a list of the programs available for your computer:

Hyperspace Navigation -
Calculates the course, energy, time, and distance required to make a hyperespace jump. This program must be available for the hyperdrive to work.

Normalspace Navigation -
Calculates the course, energym and time required to move your ship anywhere within a starsystem. This program must be available for the sub-light drive to work.

Autodoctor -
Controls the autodoctor. This program must be available for the autodoctor to work.

Hibernaculum -
Controls the freezing and thawing of passengers in the hibernaculum. This program must be available for the hibernaculum to work.

Solar/Planetal Scanner -
Interprets the data gathered by the solar/planetal scanner. This program must be available for the solar/planetal scanner to work.

Resource Scan -
Interprets the data gathered by the resource scanner. This program must be available for the resource scanner to work.

High Definition Scan -
Interprets the data gathered by the high definition scanner. This program must be available for the high definition scanner to work.

Shuttle Guidance -
Controls the ascent and descent of orbital shuttles. This program must be available to launch orbital shuttles.

Ore Processor Guidance -
Controls the ascent and descent of ore processors. This program must be available to launch ore processors.

Assault Capsule Guidance -
Controls the ascent and descent of assault capsules. This program must be available to launch assault capsules.

Missile Track -
Aims and launches missiles at a target object. This program must be available to launch missiles.

EBW Track -
Aims and fires the EBW at a target object. This program must be available to fire the EBW.

ECM -
Controls the ECM unit. This program must be available for the ECM to function.

Athena IRS -
The information retrieval system program. This program contains hundreds of important facts and figures which can be recalled by typing a key word.

When you sell a computer, all of the programs you have purchased for it will be lost. Once a program has been purchased, there is no way to remove it short of selling the computer.
=-==-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=

VIET CONG

-==-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=

VC---Viet-Cong is a static simulation of a field commander in Vietnam. You are the commander and you move your ARVN units around and try to kill as many commies as you can. The game is played like this:

**Defence factor:**

- arvn units: r1, r2, r3...r9
- helicopter: u1
- artillery: u2

Move your arvn units around by telling which one you want to move, and you bomb the commies with your artillery by telling what square to bomb (you have 3 shots with your artillery).

You move your helicopter by telling what square you want it to go to, and you bomb the commies with your artillery by telling what square to bomb (you have 3 shots with your artillery).

DATA ENTRY

Data can be entered in label or value form. A Label consists of text used for headings and other static information on the worksheet. A Value consists of numbers and formulas. While entering data you may press [Escape] or [Closed Apple][Escape] to return to Ready mode. Pressing [Return] will post the entry to the worksheet. Edit mode is entered if an error is detected while keying data.

**Labels:**

A label is initiated using a letter, a label prefix or an otherwise unused punctuation mark. A label prefix adds special meaning to the label, or allows characters usually used as values to be used as labels. The Worksheet Global Label-prefix and Range Label-prefix commands control defaults.

- The Label prefixes are: ' Left justified ^ Centered " Right justified \ Repeating label

**Values:**

A value is a cell entry which contains the numbers, operators, cell references, and functions fundamental to your sheet.

The characters which begin a value entry are:

- 0-9, , +, -, (, @, #, and $
The commands available which set the display format for values are /Worksheet Global Format and /Range Format. Specification of a variety of cell layouts is possible.

A Formula may consist of the above values and operations including cell references and @functions. They are covered further in the next section.

A Formula may consist of values and operations including cell references and @functions. Examples are: 3+B7, $sum(C2..D9), @MAX(T3,B4^7). The rules for calculation are as follows:

1. Parenthesized groups are calculated first.
2. An order of precedence takes place among operators. This means operands of operators of higher precedence are evaluated first.
3. All else being equal, operators are taken from left to right.

Plus and minus signs should ideally be used to begin each formula.

<table>
<thead>
<tr>
<th>Operator</th>

</table>

Edit mode is entered when an error in data entry is detected, when you decide to edit an entry, or when you are prompted for information.

To edit a cell, select the cell and then select edit, either by pressing [Open Apple] [2] or by clicking on the Status Line in the Control Panel. When you do this, the entry will appear on the Edit line with the cursor at the end of the entry.

There are several commands which can be used in the edit mode:

-[Closed Apple][Up] First character of entry
-[Closed Apple][Down] Last character of entry
-[Open Apple][Right] Move 5 characters right
-[Open Apple][Left] Move 5 characters left
-[Right arrow] Move 1 character right
-[Left arrow] Move 1 character left
-[Delete] Erases character before cursor
-[Open Apple][Delete] Erases character under cursor
-[Escape] Cancels editing or formula
-[Open Apple][9] Changes formula to result

@functions perform a variety of useful time saving tasks. They are introduced with an '@' character and can be typed in either upper or lower case. Be sure to use the correct number of arguments.

-@COUNT(range) ....Counts the number of items in the range members
-@SUM(range) ...........Adds the items in the range
-@AVERAGE(range) ...........Finds the average of range members
-@MIN(range) ............Finds the minimum value of range members
-@MAX(range) .............Finds the maximum value of range members
-@STDEV(range) ............Finds the standard deviation of range members
-@VAR(range) ..............Finds the variance of range members

Math functions:
-@ABS(value) .......Yields absolute value
-@EXP(value) .......Yields value raised to exponential power
-@INT(value) .......Yields the integer portion of value
-@LN(value) .......Yields the natural logarithm of value
-@LOG(value) .......Yields the base 10 logarithm of value
-@SQRT(value) .......Yields the square root of value
-@MOD(value-1,value-2) .......Finds remainder after division of the values
-@ROUND(value,places) ....Rounds value to left or right places of the decimal

-@COS(angle in radians) ...........Yields the cosine of angle
-@SIN(angle in radians) ...........Yields the sine of angle
-@TAN(angle in radians) ...........Yields the tangent of angle
-@ACOS(angle in radians) .......Yields the arc cosine of angle
-@ASIN(angle in radians) .......Yields the arc sine of angle
-@ATAN(tangent of angle in radians) .......Yields the arc tangent of angle
-@ATAN2(first value, second value) .......See manual for differences.
-@PI ..................Yields the value of PI
-@RANDBETWEEN ............Yields a random number distributed between 0.0 and 1.0

Logic functions:
-@TRUE .............Always true (1)
-@FALSE .............Always false (0)
-@ISBLANK(value) ....True if the value is not available, otherwise false
-@ISERR(value) ...........True if value is undefinable, otherwise false
-@IF(condition, value-1, value-2) .......Returns the first value if condition is true, else the second value.

Financial functions:
-@PV(payment,interest,number-of-terms) Future value of ordinary annuity
-@PMT(principal,interest,number-of-terms) Calculates mortgage payment per term for an ordinary annuity
-@TODAY .....................Changes today's date to serial format
-@DATE(Year,Month,Day) ...........Converts serial format to calendar format
-@IRR(best-guess,cash-payment-series) Calculates approximate internal rate of return for cash payments made at regular intervals using your guess at the answer
-@NPV(initial-payment,interest-rate,series-of-future-cash-flows) Calculates net present value of a cash flow series

Special functions:
-@NA .........Yields not available "NA"
-@ERR .........Yields error "ERR"
-@CHOOSE(x,set-of-values) ....Tests logical expressions or performs lookup
-@LOOKUP(x,range,offset) ...........Performs horizontal table lookup
-@VLOOKUP(x,range,offset) ...........Performs vertical table lookup

Database functions have the format:
-@function(input-range[arg1], offset[arg2], criterion-range[arg3])
-@COUNT([arg1],[arg2],[arg3]) ....Counts selected items
-@SUM([arg1],[arg2],[arg3]) .......Adds selected items
-@AVERAGE([arg1],[arg2],[arg3]) .......Finds average of selected items
-@MAX([arg1],[arg2],[arg3]) .......Finds greatest value of selected items
-@MIN([arg1],[arg2],[arg3]) .......Finds least value of selected items
-@STDEV([arg1],[arg2],[arg3]) .......Finds standard deviation of selected items
-@VAR([arg1],[arg2],[arg3]) .......Finds variance of selected items

These functions convert between serial and date calendar formats. A Serial date is a count of the number of days since 1-1-1900; useful for calculations. The result would then be converted back to calendar format.

-@DATE(Year,Month,Day) ...........Converts serial format to calendar format
-@TODAY( ) ...........Changes today's date to serial format
-@DAY(serial-date) ...........Yields the calendar day from a serial date
-@MONTH(serial-date) ...........Yields the calendar month from a serial date
-@YEAR(serial-date) ...........Yields the calendar year from a serial date

Macros are user-programmed commands created with key sequences. Values, labels, functions or commands may be included. For example:

/\x commands give you

changes the column-width of the current cell to fifteen.
the ability to program VIP Professional. Auto-execute macros are built by attaching the macro to the digit zero. Each time you reload the worksheet, the macro is automatically executed.

Entering macros:
1. Construct the macro in an empty worksheet starting with a label-prefix.
2. Name it with Range Name Create, using [Backslash] and a letter, e.g.: \Q.
3. Use it by pressing [Open Apple] and letter of macro, e.g.: [Open Apple][Q].

Keyboard commands are entered in macros enclosed in braces as shown:

{Up}.....Up one cell  {Down}.....Down one cell
{Right}.....Right one cell  {Left}.....Left one cell
{Name}.....Move Name  {End}.....Move to End of data
{PgUp}.....Pages up  {PgDn}.....Pages down
{Del}.....Deletes  {Esc}.....Escape
{B}s}.....Backspaces  {Edit}.....Edit function
{Name}.....Name function  {Abs}.....Absolute function
{GoTo}.....Express function  {Window}.....Window function
{Query}.....Query function  {Table}.....Table function
{Calc}.....Recalculate function  {Graph}.....Graph function
{Return}.....Pauses for input until [Return] is pressed

/X Commands:
/X1(condition)- Uses if-then condition
/X2(location)- Goes to a location and continues macro
/X3(location)- Goes to a location and calls subroutine
/XR Returns from subroutine. Used with /XC
/XQ Quits macro execution
/XX(location)- Displays prompt and processes a user-defined menu
/XL(message)~(location)- See /XN
/XN(message)~(location)- Displays prompt in the control panel, accepts a label or number from keyboard & puts it in location

Ranges are specified using an anchor and a free cell. Ranges are always rectangular in shape.

With movement keys:
1. Move the cell indicator to the start cell of the range and press [.].
2. Move the cell indicator to the end cell. Use any movement key.
3. Enter the range.

Explicit addressing:
Type the cell address of the anchor cell. Type [.] then the address of end cell. Enter the range.

With Range Names:
In response to a command prompt, type in a range name. Press [F3] to choose from a list of existing range names.

Changing the Start Cell:
Press [.] to rotate the start cell to the next corner in a clockwise direction.

[Delete], [Escape] and [Closed Apple][Escape] may be used during range creation to backstep the process. [Escape] "unexpands" the range and returns to the anchor cell. [Delete] unexpands the range and returns to the current cell. [Closed Apple][Escape] ends ranging.

These commands are used to rearrange your worksheet once some data has been entered. Copy duplicates the contents of one cell or range to others and is useful for proliferating data through the sheet. Move rearranges sheet data.

bels and formulas. Copying labels or plain values is the most straightforward. First a "From" (source) range or cell is specified followed by a destination "To". It is important to note that Copy erases the previous contents of the cell. When copying formulas you should be aware of absolute, relative and mixed cell addresses. If you use an absolute cell address the formula is transferred to the new cell still referencing the same locations. With a relative cell address the formula values change according to their new location. Mixed cell addresses in a formula are a combination of absolute and relative references. The absolute part of a mixed cell address remains the same and the relative part changes.

Move transfers the contents of a cell or range to a new location. Moving cell entries is just like picking them up from one location and placing them at another. Remember the destination will be overwritten. These are powerful commands and should be used with care.

The menu is organized in a hierarchy of commands. Start by typing []. Menu commands may be chosen by either using the arrow keys then [Return] or by typing the first letter of a select. To retreat to the previous menu level press [Esc]. To exit directly type [Closed Apple][Escape]. The Professional's most powerful commands are accessed through the menu tree.

Worksheet              Governs large-scale changes affecting the worksheet
Global               Affecting entire worksheet
Format               Sets default display for worksheet values
Label-prefix          Sets for worksheet labels
Column-width         Sets column width for all worksheet columns
Recalculate          Controls calculation sequencing
Protection           Enables protection of worksheet cells
Default               Sets default values for directory and printer
Directory            Sets current Directory
Printer              Sets Print configurations
Update               Saves updated Default commands
Status               Displays status of Default commands
Insert               Inserts columns or rows
Delete                Deletes columns or rows
Column-width         Changes the width of one column
Erase                Erases worksheet contents and goes to initial settings
Titles               Creates or erases worksheet titles
Window               Splits or clears split window
Status               Displays worksheet settings and available memory
Range               Governs Range menu and range-specific commands
Format               Sets display format for range values
Label-prefix         Sets default alignment for range labels
Erase                Erases contents of range cells, keeps formats
Name                  Governs range naming
Labels                Names one-celled ranges using label cells
Justify              Sets ragged right margin for a set of labels
Protect              Protects range cells when global protection is enabled
Unprotect           Turns off protection of range cells
Input                 Limits movement to input cells which are unprotected

File Names and Disk Prefixes:
VIP stores files by combining the prefix specified in the Worksheet Global Default Directory command with pathname entered. To save a file to another path ignoring the default prefix, precede the filename with a slash "/". For example, /Budgets/Data saves the file DATA.WKS to the volume /Budgets ingoring the default prefix. Filenames may consist of letters and numbers.

Three types of files are created: Print, Graph and Worksheet. When a file is saved, a file name extension of the appropriate type is added.
A file ending in ".prn" contains printer ready information, ".gph" a graph, ".wks" a worksheet.

Retrieve
Retrieves a worksheet file
Save
Saves a worksheet file
Combine
Combines Entire-file or Named-range of saved worksheet
Extract
Extracts and saves a portion of current worksheet file
List
Lists all files of a specified type on disk
Import
Brings standard ASCII print files to current worksheet
Directory
Changes current disk and directory (prefix)

These commands allow for the controlled printing of a worksheet and the saving of a print file. Printing of graphs is done separately by the GraphPrint program.

Printer
Sends prepared copy to printer
File
Saves prepared copy in a print file
Range
Selects a range for printing
Line
Adds a line between printings
Page
Adds the rest of a page between printings
Options
Governs print options
Header
Creates a header
Footer
Creates a footer
Margins
Sets margin widths
Borders
Selects rows and columns from the worksheet as borders
Set-up
Adds control characters to manage printing
Page-length
Sets the number of lines per page
Other
Commands for documentation and formatting
As-Displayed
Prints worksheet as is
Cell-formulas
Prints the cell contents of all non-blank cells

Options
Formatted
Prints according to the options chosen
Unformatted
Prints without headers, footers or page breaks.
Clear
Selectively cancels print specifications
Align
Informs VIP that the paper is aligned in the printer
Go
Executes the print of print file save

Graphics are featured on the VIP Professional making use of the Apple II's colors and screen resolution. Here are the tools available to create your picture of a thousand words:

Type
Select Bar, Stacked-Bar, Pie, Line or XY Graph style
X
Specifies the X range
A-F
Choose data ranges
Reset
Selectively cancel graph settings
View
Draw most recent graph on screen
Save
Save graph in graph file
Name
Governs commands for naming graph settings
Create
Names a group of graph settings
Use
Retrieves and draws a graph using named graph settings
Delete
Cancels one group of named graph settings
Reset
Cancels all groups of named graph settings
Options
Govern commands for graph options
Legend
Creates legends
Format
Sets format for XY and Line graphs
Grid
Displays or removes grid lines
Color
Uses color for contrast between data ranges
B&W
Uses patterns to contrast data ranges
Data-labels
Chooses a range to act as labels for data points
Titles
Choose main, X or Y axis titles for a graph
Scale
Sets scale to automatic or manual, chooses a skip factor
Format
Chooses format for scale numbers

These commands govern database creation and use. Common operations used in conjunction with a database are query, sort and statistical analyses.

Fill.................Fills a range sequentially given a set increment
Table.............Creates tables to show affects of changes in input cells
Query............Uses criteria to search for information in database
Sort.............Sorts database using primary and/or secondary key fields
Distribution....Finds frequency distribution for a range of values

/I MOVES AN ENTIRE ROW OR COLUMN TO A NEW POSITION.
Lines 600-630 call a machine language routine that takes a userid such as WAP001 and converts it to the record number in the USERS file. Line 610 opens the USERS file to read. Line 620 reads 80-10 set R to the desired record number before opening Messages or Users.

The ROUTINES (in order of line number):

- **Line 1000** begins the "WAITING CALL" routine. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. If you enter SYSOP, you can change the STARTUP file, look at the "TO SYSOP" file, and check on the number of callers. This routine, at line 3000, will return you to the "COMMAND?" level.

- **Line 100** performs a Z = VAL(A$) function that prevents errors that would be inevitable if a user entered "1999" in response to a request for numeric input. Since WAPABBS does not use negative numbers, this routine returns only absolute values.

- **Line 1000** begins the "awaiting CALL" routine. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. If you enter SYSOP, you can change the STARTUP file, look at the "TO SYSOP" file, and check on the number of callers. This routine, at line 3000, will return you to the "COMMAND?" level.

- **Line 100** performs a Z = VAL(A$) function that prevents errors that would be inevitable if a user entered "1999" in response to a request for numeric input. Since WAPABBS does not use negative numbers, this routine returns only absolute values.

- **Line 1000** begins the "Awaiting CALL" routine. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. If you enter SYSOP, you can change the STARTUP file, look at the "TO SYSOP" file, and check on the number of callers. This routine, at line 3000, will return you to the "COMMAND?" level.

- **Line 100** performs a Z = VAL(A$) function that prevents errors that would be inevitable if a user entered "1999" in response to a request for numeric input. Since WAPABBS does not use negative numbers, this routine returns only absolute values.

- **Line 1000** begins the "Awaiting CALL" routine. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. If you enter SYSOP, you can change the STARTUP file, look at the "TO SYSOP" file, and check on the number of callers. This routine, at line 3000, will return you to the "COMMAND?" level.

- **Line 100** performs a Z = VAL(A$) function that prevents errors that would be inevitable if a user entered "1999" in response to a request for numeric input. Since WAPABBS does not use negative numbers, this routine returns only absolute values.

- **Line 1000** begins the "Awaiting CALL" routine. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. Garbage is collected (line 1000), and all variables are initialized: the cursor is set so that DOS will allow the user to type commands, CKMASK is set equal to 0 so that deferred-execution commands are not checked, CKMASK is set so that ctrl-C and ctrl-K cannot interrupt execution, SPEED is set to the maximum, the modem is turned on, all files are closed, delay after Returns is turned off, lowercase-to-uppercase translation is turned on, drive 1 is selected, the "Knowledgable User" flag is cleared, 80-column mode is activated, and WAPABBS waits for a call. Once a call has been received, the CALL INLINER line has been satisfied and the ONEWLINE vector is erased if the user is operating. If you enter SYSOP, you can change the STARTUP file, look at the "TO SYSOP" file, and check on the number of callers. This routine, at line 3000, will return you to the "COMMAND?" level.
The user is also asked for the file type, which will affect how the program is downloaded. The actual uploading process is done by line 10120. When the user sends a line consisting of (* End of file) uploading ends. A line having a length of *1 character (i.e., shorter than the shortest valid BASIC language program line length) is ignored. Each valid line is written to disk as it comes in, so that it need not be stored in memory. When the upload is completed, the file is sent whether or not lines are written (the second is as a safety precaution) and upload is concluded.

Downloading (lines 11000-11120) is automatic for a user with an Apple and a Micromodem. After offering the use of files available (note that the first record of UPLOAD2 is the number of files available for downloading). Line 11060 actually begins the downloading process. A ctrl-R is sent to the user's Micromodem to initiate the "**" routine. The program then sends the first message. A message has an "INT" sent to clear memory and select the proper language. After a short pause in case Applemust be loaded off a disk, the file is sent out. Downloading is terminated when a null line is received by the Micromodem. A null line at the outset will not terminate downloading. The "POKE PEEK ..." line is used by the Micromodem to select full duplex so that the ctrl-T sent thereafter will return the user's ABBS to the proper state. The user is then sent an instruction on how to save the file.

OTHER ROUTINES:
Line 19000 prints a sign-off message prior to hanging up the telephone. Lines 22000-22060 print a message to people who fail to sign-on successfully after three attempts. You should change this program to suit your situation. Line 22060 allows up to 9 messages to be sent to you by people without passwords. This is necessary to keep from overwriting the first character of the first message to you. (Also, without a limit certain unpleasant people might try to fill up your disk space with garbage.)

Lines 28000-28510 (***) are a security section. In order to access remotely certain system data, a caller must know your password, but even then they must first run the gauntlet of three or so questions to which you AND ONLY YOU should know the answers. I have set up 10 questions; you should use your own. If the answer is wrong, control passes to line 28550, which allows one wrong answer but may make you answer three more questions. The second wrong answer disconnects the caller.

The system information, which can be accessed remotely by "S" or directly from the keyboard by PEEK(34), is described in two parts: the STARTUP file and housekeeping. The first part walks you through the STARTUP file, in the order of date (which is actually done by a routine at 4410),bulletin date, Upload password, T1$, and T2$. The second part tells you how to change the current entries. If any changes were made to STARTUP, they are recorded and the user is given the full message summary. The bulletin date can be changed by line 30090. You may delete these messages to clear the file for additional messages. You are then shown the number of free bytes. This is not done by the PEEK(0) command, which is used to display the value of a variable. Instead, the number of free bytes is obtained by calculating the length of a string. This value is the amount of free space prior to doing any housecleaning. You will then see the number of people who have signed on, and you may clear this number if you wish. The bulletin date is updated if an error occurs, so that if an error occurs you may request that the ABBS's screen be printed on your remote terminal. You may then have the option of rebooting the entire ABBS system. You should do this if an error has already occurred and you do not want the next error to shut the system down. If an error occurs on your remote terminal, you may be asked to reboot the system. You may wish to have the system reboot itself, because quite often the error will have been caused by a random glitch in memory, which can be cured by reloading DOS and WAPABBS.

Line 45000 is used as an exit by the part of ABB51.OBJ3 that freezes up the system if program execution ends. Whenever the flashing asterisk appears, a ctrl-C from
the keyboard will cause a jump to line 45000, which shuts down the modem and returns to BASIC.

AND IF YOU NEED HELP
If you require further assistance with this program, write to:
Thomas S. Warrick
ABBS SYSOP
c/o International Apple Core
908 George Street
Santa Clara, California 95050
You may also try writing me through Washington Apple Pi at Post Office Box 34511, Bethesda, Maryland, 20817, although this address may change in the future. In either case, please enclose a self-addressed, stamped envelope. (If you are a member of Washington Apple Pi, you will get our journal, which will have our current address. Membership will also entitle you to use our ABBS, which will allow you to send messages to me directly.)

SELF-IMPROVEMENTS
This program is intended to be tinkered with and improved upon. If you make any improvements or modifications, please pass them on to your fellow Apple users through the address above. An IAC member club using WAPABBS should send its name and address, its SYSOP’s name, and the club ABBS phone number so that you can be informed of updates and revisions of this program as they become available.

DOCUMENT war.in.russia

---------------------------------------
WAR IN RUSSIA
BY: DOS TOYEVSKI AND PALANTIR COMPUTING
---------------------------------------
THIS IS A COMPLICATED PROGRAM AND MANY OF THE ALGORITHMS TAKE MUCH TIME TO COMPLETE. IF THE SCREEN GOES BLANK DURING ANY STAGE IN THE GAME FOR AN UNSEEMING AMOUNT OF TIME, DON’T WORRY. IF YOU ARE THE CURIOUS TYPE, FROM THE MAIN PAGE, PLAY A SAVED GAME, THEN CAT WITH THE ORIGINAL DISK IN THE DRIVE. CHOOSE ALL YOUR OPTIONS THEN HIT <SPACE> TO PLAY.

ADJUSTMENT PHASE
1. DIVIDE GROUP:TAKES UNIT AND SPLITS IT AS ORDERED INTO TWO GROUPS.
2. TRANSFER GROUP:FORMS A LARGER GROUP BY COMBINING TWO SMALLER GROUPS WITHIN THE SAME HEX.
3. TRANSFER AIR:FERRY STRENGTHS BETWEEN LUFTFLOTTE GRUPPES IN THE IMMEDIATE AREA.
4. CHECK MAP:TACTICAL DISPLAY WITH SCROLLING OVER THE ENTIRE FIELD WITH UNIT IDENTIFICATION IF DESIRED.
5. CHECK STRATEGIC MAP:STRATEGIC DISPLAY OF THE ENTIRE PLAYING FIELD.
6. BUILD FACTORY:WHAT IT SAYS;YOU GET A LIST OF CITIES AND SUPPLIES WITH WHICH TO WORK.
7. BUILD UNIT:CITIES HAVE FACTORIES AND MEN; HERE YOU CHOOSE THE OUTPUT TO PUT INTO ACTION IN THE FOLLOWING PHASE.
N. NAVAL MOVEMENT:I HAVEN'T SEEN IT VALID YET.
ONCE YOU HAVE FORMED YOUR COMBAT GROUPS THEN IT IS TIME TO PLOT YOUR MOVE.

AXIS MOVE

DEPOT SUBMOVE

AUTO MOVE:
WATCH IT GET THE SUPPLIES TO THE NEXT LOCATION FOR YOU

MANUAL MOVE:
YOU GET THE SUPPLY PACKET THERE YOURSELF

DISTRIBUTE:
SUPPLIES ALL UNITS IN THE PRESENT HEX

TERRAIN:
SHOWS THE TERRAIN UNDERNEATH ALL UNITS ON THE BOARD

SUPPLY SCAN:
YOU GOT ME

BUILD A RAIL:
EXTEND A PRESENT RAIL NETWORK
MOVE COMBAT SUBMOVE

1-6:
MOVE THE UNIT IMMEDIATELY

GET UNIT:
MOVE THE UNIT ON WHICH THE CURSOR IS POSITIONED

REPLACE:
REFORM PREVIOUSLY SPLIT UNITS INTO A MORE POWERFUL, LARGER GROUP.

TAC PLOT:
MOVEMENT PROGRAMMING FOR THE UPCOMING COMBAT PHASE

XRAIL:
MOVE BY RAIL IMMEDIATELY

ABORT:
CLEAR ALL DECISIONS AND START FRESH WITH THIS UNIT

NEXT UNIT: FINISHED WITH THIS UNIT, CONTINUE

STATUS INDICATORS:
S->SU UNIT NEARBY
M->MOVED IN THIS PHASE
N->NO MORE MOVES ALLOWED
U->UNCOMMITTED, NO SU UNIT NEARBY
QUIT:
END MOVE WITH ALL UNITS AUTOMATIC ENTRENCHMENT OF ELIGIBLE UNITS

AIR OPERATIONS SUBMOVE

1-6:
FLY IN THAT DIRECTION IN PREPARATION FOR A FURTHER ACTION, RANGE IS 4 HEXES

BOMB CITY:
ONLY AN ENEMY CITY

GROUND ATTACK:
AGAINST ENEMY SU UNITS

ABORT:
START THIS LUFTWAFFE UNIT'S MOVE FRESH
QUIT:
DONE WITH ALL LUFTWAFFE UNITS

COMPUTER PROCESSING OF COMBAT

THIS IS AN INCOMPLETE DOCUMENT, IF YOU COME ACROSS ANY IMPROVEMENTS PLEASE POST A REVISED VERSION. IT WILL BE APPRECIATED. I WILL IMPROVE IT AS TIME GOES BY.

DOS TOYEVSKI CALL SATAN'S HOLLOW---> 409/744/6477

SAVE/RESTORING GAMES & CHARACTERS

TO SAVE A GAME IN PROGRESS, TYPE THE COMMAND SAVE. YOU WILL BE ASKED IF YOU WANT TO SAVE THE GAME (G) OR ONLY THE CHARACTER (C). YOU MIGHT WANT TO SAVE ONLY THE CHARACTER SO THAT IT COULD BE LOADED INTO ANOTHER WARRIOR OF RAS GAME, SUCH AS DUNZHEIN OR WYLDE.

CHOOSE A # FROM 1 TO 5: THAT IS THE NUMBER YOU WILL USE TO RESTORE THAT GAME OR CHARACTER.

TO RESTORE, SIMPLY FOLLOW THE PROMPTS WHEN YOU BOOT THE DISK.

BEGINNING THE ADVENTURE

THE FIRST THING YOU WILL WANT TO DO IS (B)UY SUPPLIES. YOU START OUT WITH 2000 SILVER COINS (OR, IF PLAYING AN OLD CHARACTER, WHATEVER TREASURER YOU HAVE COLLECTED). FOR 1800 SILVER COINS YOU CAN BUY A STANDARD PACK, WHICH CONSISTS OF A SUIT OF CHAIN MAIL, THREE ORDINARY SWORDS, 10 TORCHES, 15 MEALS WORTH OF FOOD AND WATER, A CROSS, A FLINT & STEEL, THREE ROPES, TWO DIRKS, A PICK AND A MIRROR. TO BUY THIS, ENTER A "@" INSTEAD OF AN ITEM NUMBER.

THE (S)TASH AND (R)ETRIEVE COMMANDS ARE USED TO SAFELY STORE TREASURE. SINCE EVERY POUND YOU CARRY SLOWS YOU DOWN, IT IS IMPORTANT TO LEAVE BEHIND TREASURE THAT YOU DON'T NEED.

(E)NTER THE KAIV, WHEN YOU ARE READY. THE OBJECT OF KAIV IS TO FIND A GREAT TREASURE, SOMEWHERE IN ITS FARTHEST REACHES.

COMMANDS

THE FOLLOWING COMMANDS ARE AVAILABLE. ALL CAN BE ABBREVIATED TO ONE LETTER, ALTHOUGH SOME WILL REQUIRE AN OBJECT OR A DIRECTION AS WELL. FOR A LIST OF THE ABBREVIATIONS, USE THE HELP (Q) COMMAND.

AIM (A):
ALLOWS YOU TO TAKE CAREFUL AIM AT YOUR OPPONENT. YOU MUST ALSO ENTER THE BODY PART THAT YOU ARE AIMING AT. YOU LOSE ONE BLOW TO TAKE AIM.

BRIE (K):
OFFER SOME OF YOUR TREASURE TO YOUR OPPONENT, IN HOPES THAT IT WILL LET YOU PASS. YOU MUST KNOW HOW MUCH TREASURE YOU HAVE BEFORE YOU USE THIS COMMAND.

CLIMB (C):
CLIFFS (MARKED ON YOUR MAP) CAN BE CLIMBED USING THIS COMMAND. HAVING A ROPE INCREASED YOUR CHANCES, BUT YOU WILL LEAVE THE ROPE BEHIND IF YOU USE IT.

DISUSE (V):
STOPS THE EFFECT OF THE USE COMMAND (SEE BELOW).

DRINK (D):
USED TO DRINK WATER, WHEN YOU ARE THIRSTY, OR TO DRINK POTIONS, IF YOU
DECIDE TO TRY THEIR EFFECTS.

DROP (B): USED TO DROP ITEMS THAT YOU NO LONGER WANT. IF YOU WISH TO FIND IT AGAIN, YOU MUST REMEMBER WHERE YOU DROPPED IT. YOU CANNOT FIND ARMOR OR SHIELDS IF YOU DROP THEM.

EAT (E): USED TO EAT FOOD, WHEN YOU ARE HUNGRY. EATING AND DRINKING ARE VITAL AND DAMAGE WILL RESULT IF YOU IGNORE HUNGER AND THIRST.

EXTINGUISH (Y): PUTS OUT A LIT TORCH. A TORCH MUST BE OUT IF YOU WISH TO STORE IT IN YOUR PACK.

FACTS (ESC): THIS SHOWS INFORMATION ABOUT YOUR CHARACTER, SUCH AS LEVEL, EXPERIENCE, AND TREASURE. MOST IMPORTANTLY, IT LISTS YOUR VITAL SPOTS AND HOW MUCH DAMAGE THAT PART CAN TAKE. IF A PART OF YOUR BODY IS HIT FOR MORE DAMAGE THAN IT CAN HOLD, YOU WILL BE KILLED.

FETCH (F): TRANSFERS AN ITEM FROM YOUR PACK TO YOUR HANDS. IF BOTH YOUR HANDS ARE FULL, YOU WILL HAVE TO PUT SOMETHING YOU ARE CARRYING IN YOUR PACK.

FOOTSTEPS (NO ABBR): TURNS OFF THE SOUND YOU MAKE WHEN YOU WALK.

FORCE (X): IF YOU USE THIS COMMAND, YOU WILL SWING WITH GREATER STRENGTH. HOWEVER, YOU WILL ALSO BE MORE LIKELY TO MISS YOUR TARGET COMPLETELY.

GET (G): PICK UP AN ITEM FROM THE FLOOR OF THE KAIV. IT WILL PICK UP THE 1ST ITEM FOUND. IF THERE ARE SEVERAL OBJECTS, YOU WILL HAVE TO USE SEVERAL GET COMMANDS, OR YOU CAN USE THE NAME OF THE ITEM YOU DESIRE (SUCH AS GET SWORD). GET PUTS THE ITEM IN YOUR PACK.

HELP (Q): LISTS ALL ABBREVIATIONS AND CHOICES OF TARGETS ON MONSTERS.

HIDE (H): ALLOWS YOU TO HIDE FROM FOES. IF SEEN, YOUR FOE GETS A FREE SWING.

HIT (H): FOR FIGHTING, IT ALLOWS YOU TO HIT ANY TARGET ON THE FOE, BUT YOU MUST SPECIFY WHICH TARGET. NOT ALL CREATURES HAVE ALL TARGETS - FOR EXAMPLE, FIGHTERS DON'T HAVE FORELEGS.

INVENTORY (@): SHOWS ALL OF THE ITEMS YOU ARE CARRYING.

LIGHT (L): LIGHTS A TORCH, IF YOU HAVE BOTH A TORCH AND A FLINT & STEEL.

MOVE (M): FOR MOVEMENT. YOU MUST ALSO SPECIFY A DIRECTION (N, S, E, W). IF YOU WISH TO MOVE MORE THAN ONE STEP, ENTER THE # OF STEPS TO MOVE AS WELL.

PICK (P): IF YOU HAVE A PICK, YOU CAN USE THIS TO DIG A PATH THROUGH A WALL. THIS IS USEFUL IN CASE OF A CAVE-IN.

QUIT (NO ABBR): USED TO END THE GAME. NOTHING WILL BE REMEMBERED, UNLESS YOU USE THE SAVE COMMAND FIRST.

REMOVE (O): TAKES OFF WORN ITEMS, SUCH AS ARMOR OR RINGS, AND STORES THEM IN YOUR PACK. IF YOU ARE WEARING MORE THAN ONE ITEM, YOU SHOULD SPECIFY WHICH YOU WISH TO REMOVE.

RUN (R): USED TO ATTEMPT TO ESCAPE FROM A FOE. REGARDLESS OF WHETHER OR NOT IT WORKS, THE OPPONENT GETS A FREE STRIKE.

SAVE (NO ABBR): ALLOWS YOU TO SAVE A GAME OR CHARACTER (SEE ABOVE).

SOUND (NO ABBR): TURNS OFF ALL SOUND EFFECTS.

STORE (S): PLACES AN OBJECT IN YOUR PACK. YOU MUST SPECIFY WHICH ITEM.

SWAP (J): EXCHANGE THE CONTENTS OF YOUR RIGHT AND LEFT HANDS.

USE (U): ACTIVATES MAGIC RINGS AND WANDS. SEE THE DESCRIPTION OF MAGICAL ITEMS, BELOW.

WEAR (N): PUT ON ARMOR OR RINGS.

TO SPEED UP THE PACE OF THE ADVENTURE, HIT THE RIGHT ARROW (--> KEY.

HAZARDS

INVENTORY (@): SHOWS ALL OF THE ITEMS YOU ARE CARRYING.

LIGHT (L): LIGHTS A TORCH, IF YOU HAVE BOTH A TORCH AND A FLINT & STEEL.

MOVE (M): FOR MOVEMENT. YOU MUST ALSO SPECIFY A DIRECTION (N, S, E, W). IF YOU WISH TO MOVE MORE THAN ONE STEP, ENTER THE # OF STEPS TO MOVE AS WELL.

PICK (P): IF YOU HAVE A PICK, YOU CAN USE THIS TO DIG A PATH THROUGH A WALL. THIS IS USEFUL IN CASE OF A CAVE-IN.

QUIT (NO ABBR): USED TO END THE GAME. NOTHING WILL BE REMEMBERED, UNLESS YOU USE THE SAVE COMMAND FIRST.

REMOVE (O): TAKES OFF WORN ITEMS, SUCH AS ARMOR OR RINGS, AND STORES THEM IN YOUR PACK. IF YOU ARE WEARING MORE THAN ONE ITEM, YOU SHOULD SPECIFY WHICH YOU WISH TO REMOVE.

RUN (R): USED TO ATTEMPT TO ESCAPE FROM A FOE. REGARDLESS OF WHETHER OR NOT IT WORKS, THE OPPONENT GETS A FREE STRIKE.

SAVE (NO ABBR): ALLOWS YOU TO SAVE A GAME OR CHARACTER (SEE ABOVE).

SOUND (NO ABBR): TURNS OFF ALL SOUND EFFECTS.

STORE (S): PLACES AN OBJECT IN YOUR PACK. YOU MUST SPECIFY WHICH ITEM.

Apple II Computer Info

WINDS:
WILL MERELY BLOW OUT YOUR TORCH, WHICH CAN BE EASILY RE-LIT WITH A FLINT & STEEL.

THE GHOST:
OCCASIONALLY, YOU MAY HEAR A GHOSTLY VOICE SAY "GO AWAY!" YOU WILL BE TELEPORTED TO ANOTHER PART OF THE KAIV.

THE LADY:
YOUR LUCK CAN TURN BAD OR BE IMPROVED AT THE WHIM OF THIS VOICE, WHO WILL TELL YOU IF SHE LIKES OR DISLIKES YOU.

MAGIC CREATURES:
SOME OF THE FOES YOU ENCOUNTER WILL HAVE THE ABILITY TO PARALYZE YOU, TURN YOU TO STONE, OR DRAIN EXPERIENCE LEVELS. IF YOU SEE THE WORD "SAVE" WHEN FIGHTING ONE OF THESE CREATURES, YOU MUST HIT A KEY AND HOPE FOR THE BEST.

DENIZENS OF THE KAIV:
THIS IS A LIST OF THE CREATURES THAT YOU MAY ENCOUNTER. THEY ARE LISTED ROUGHLY IN ORDER OF THE LEAST TO THE MOST POWERFUL.

GHOULS:
NOT VERY POWERFUL, BUT THEY CAN PARALYZE.
ZOMBIES:
QUITE WEAK IN SOME PLACES, BUT OTHER PARTS OF THEIR BODIES CAN ABSORB GREAT PUNISHMENT. THEY ARE ALSO SLOW.
WOLVES:
OFTEN APPEARS IN PACKS.
SKELETONS:
DANGEROUS FIGHTERS, BUT WITH BRITTLE BONES.
FIGHTERS:
MALICIOUS BANDITS & RUFFIANS.
DWARVES:
DISLIKE HUMANS. THEY CARRY AXES AND WEAR LEATHER ARMOR.
ELVES:
QUICK MOVING AND GOOD SWORDSMEN, AND ALSO CRAFTY BARGAINERS.
LIONS:
FAST AND POWERFUL.
HARPIES:
CAN PARALYZE VICTIMS WITH ITS SCREECH, BUT NOT A POWERFUL FIGHTER.
GARGOYLES:
CAN PARALYZE, AND HAVE A THICK, LEATHERY HIDE.
OGRES:
STUPID, BUT VERY DANGEROUS.
WARRIORS:
WEARING HAUERKS AND CHAIN MAIL HELMS, AND CARRYING FINE SWORDS, THEY ARE LESS TREACHEROUS THAN THE FIGHTERS, BUT THEY TAKE WHAT THEY WISH.
GOBLINS:
CARRY MACES AND WEAR LEATHER ARMOR.
COCKATRICES:
CAN TURN TO STONE THOSE WHO FEEL THEIR BREATH OR BITE.

DIRECTORY:
FAST AND DEADLY.
GORGONS:
CAN TURN YOU TO STONE, BUT CAN BE AVOIDED IF YOU HAVE A MIRROR.
GRIFFONS:
HUGE AND VERY DEADLY.
WYVERN:
SIMILAR TO DRAGONS, BUT NOT AS CRAFTY. IT HAS HARD SCALES FOR ARMOR.
LORDS:
MAGNIFICENT FIGHTERS, ARMED WITH LEGENDARY SWORDS AND WEARING PLATEMAIL AND WAR HELMETS.
TROLLS:
TOUGH ARMOR. THEY HATE ALL NON-TROLLS.
MANTICORAS:
EXTREMELY QUICK, WITH DELICATE WINGS.
CAVEBEARS:
ALWAYS HUNGRY.
WRAITHS:
CAN DRAIN ONE EXPERIENCE LEVEL
VAMPIRES:
CAN DRAIN TWO LEVELS, AND FEAR NOTHING BUT THE CROSS.
MAGICAL ITEMS & THEIR EFFECTS:
P/FIGHT:
INCREASES ATTACK VALUE BY 4
P/WASTE:
INCREASES YOUR MOVEMENT
P/HEALTH:
HEALS ALL WOUNDS INSTANTLY
P/HIDING:
MAKES YOU INVISIBLE
P/IRONSKIN:

SOFTWARE - JANUARY 1984

PRINT
Prints all of your characters' statistics.

START
Starts the game. You're asked "Use last saved game (y/n)?" Choose Y if you want to start where YOU last saved the game with the Save command. Choose N and you'll start where the COMPUTER last saved the game (Which happens anytime you answer "yes" to "Enter new location?"). With either choice, you'll be prompted to insert one or more disk sides. If you're new to the game, you'll start in the Ranger center.

IMPORTANT: Wasteland is a dynamic game, and it's very important that you understand how it keeps track of and saves the game. As you play, the game constantly changes, and permanently updates those changes to the disk. Once you change something, it's changed forever! If you pick up an item from a spot, you can't return to that spot and find it there again. If you kill the wrong person, you can't go away and then come back hoping to find him or her alive.

The game is divided up into many locations. Any one of the following could be a location: a floor in a building, a section of a desert, a path in a sewer. In the course of your adventure, you'll often be asked "Enter new location (Y/N)?" If you answer "yes," the game will save and changes to that location, and your party's status. If you switch to another location by viewing a disbanded party, the statuses for all the parties are saved on whatever disk side you end up on.

If you use the Save command, your location and party status is saved to side 1. The next time you load Wasteland, and answer "yes" to "Use last saved game?" and
pick up where you left off. However, if you or your computer shuts down before you can use Save, then answer "no" when asked "Use last saved game?" The program will search for the place where it was last saved. This way, you're unlikely to lose any important items you've acquired.

What can you do if a character dies? Don't save the game, shut the computer off and reboot. Answer "no" when asked "Use last saved game?" Your characters will now come back alive, but without the items they acquired since the last time you saved.

**Time and Distance**

The maps in Wasteland vary in scale. The large desert map contains the various city maps, which, in turn, contain building maps or whole underground levels of sewers and hideouts. In combat, distances may seem a bit off for the map you're on, but these are tactical distances and are valid in combat only.

Because of the difference in scale of the maps, time passes differently on them. Though a single keystroke on the computer will move you one space north in both the desert and in a building, the amount of time that each move takes is different. The game takes this into account for healing and deterioration purposes. Remember that time passes for characters in the main party as well as for any disbanded characters who are not moving. If you disband a character and send him off to find a doctor to help a wounded comrade, the seriously-wounded character will still bleed away.

If you want time to pass without moving your party, press <ESC>.

**Selecting Options**

Whenever you need to select an option, just press the first letter in that command (The one exception is unEquip, in this case press E.)

Whenever you're selecting from a menu that appears along the bottom of the screen, you have two choices:

1) press the first letter of the command, or
2) use the left or right arrow keys to highlight the command, and press <RETURN>.

Whenever you need to select an item, skill or attribute from a list, simply enter its number. To scroll through a list, you have three options: Use the up and down arrows, left and right arrows, or I and K keys. An item or skill number with a "_" next to it (i.e. "6_*"), marks the end of the list. Movement Commands

Use the following commands to move your party around:

- **I**: Move up
- **J**: Move left
- **K**: Move down
- **L**: Move right
- Spacebar: Toggles view of party roster on and off

**Ranger Center**

When you're in the Ranger Center, you see the following options at the bottom of the screen:

- Create: Creates a character.
- Delete: Deletes a character.
- Start: Starts you outside of the Ranger Center.

**Non-Combat Commands**

At any time, except during combat, you can use the following commands by pressing the first letter of the option:

- **Use**: Use a skill, item, or attribute.
- **Enc**: Encounter - call up combat commands.
- **Order**: Establish a new party Order.
- **Disband**: Disband - break up the party in two or more groups. This command is also used to permanently dismiss a Non-Player Character from your party.
- **View**: Switch the View between two or more groups.
- **Save**: Save the game. Refer above for an explanation of saved games in Wasteland.
- **<SHIFT>-#**: Call up the Use command for a specific character.
- **<CTRL>-S**: Use the first skill listed for the character in the first party slot.
- **<CTRL>-R**: Reorder a character's skills or possessions. You must first select a character from the roster and view either the skill or possession menu before using this command.

**Combat Commands**

- **Run**: Move party or individual character one space.
- **Use**: Use a skill, item, or attribute.
- **Hire**: Hire a Non-Player Character to join your party.
- **Evade**: Evade an attack.
- **Attack**: Attack an enemy.
- **Weapon**: Change weapons.
- **Load/unjam**: Unjam and/or Load a weapon.
- **<CTRL>-A**: Show list of encounter groups to attack. Will only work with player characters, not hired NPC's provided your foes are within range of your weapons.

To speed up the combat message scrolling rate, press the up arrow or <CTRL>-K. To slow it down, press the down or <CTRL>-J.

**Viewing Characters**

Enter a number from 1 to 7 to view that character's statistics. Here are some options that you can use while in this mode.

- **Pool**: Pool cash. Pools all the party's loot and gives it to the character you're viewing.
- **Div cash**: Divide cash. Divides the cash evenly among the characters.

From the first screen:

- **Non-Combat Commands**

- **Create**: Creates a character.
- **Delete**: Deletes a character.
- **Start**: Starts you outside of the Ranger Center.

From the second (Item) screen:

Enter any item number for the following choices: (When prompted Y?N, the Y will be highlighted. Press <RETURN> to accept the option).

WAR IN MIDDLE EARTH - tips on playing the game

The following is from a post on the Lexicon Exchange - 213-690-6326

****

The object:  Defeat Sauron and his forces.

How to do it:  Move your characters around, and avoid the baddies.  Drop the Ring in Mount Doom if possible.

You can send your people to different locations on the map, and in some places you'll meet other character (Go to Buckland and meet Merry.. go to Rone and gain Aragorn.. go to the forest and meet a couple elves, get to Rivendell and gain Gandalf, Legolas, Boromir, Gimli..

You can also get special objects which are located in locations here and there around the game.  This is the tough part of the game.  Send a character (or group, in case they get attacked) to the location and then zoom in so you have a closeup (Seeing the characters walk).. this part is slow and a pain, but then you can pick up items.  Get more items, and you can start controlling forces of humans, rangers, calvary, dwarves, and elves.

I found a way to get going fairly well.  Send your hobbits straight to Buckland and get Merry.  While they're travelling, have the two forces of yours to the far south (Faramir and 200 rangers, Eomer and a bunch of Calvary) come up and join with your hobbits.  After you've given the commands, hit the hourglass and turn stuff up to "very hasty".  When your hobbits get to Buckland and get Merry, go sit in the middle of the forest there (in the square east of Buckland there is a nice staff whcih someone can use as a weapon).  Have them sit and wait in the middle of the forest (so the Nazguls don't get you) until your Rangers and Calvary come up from the south.  Join them togethr, go get Aragorn, and head east to the forest.

By this time, the Nazguls have all vanished.  When you exit the forest and cross the river before Rivendell, they will re-appear, and will wipe out your party under most circumstances.  This is where your Farramir/Rangers and Eomer/Calvary come in.  Use the combat command to have all your characters "withdraw", while you let the calvary "Charge" and the rangers "Engage" or "Charge".  nine nazguls are no match for 300+ battle troops.  I lost about 17 altogether.

From that point, things get a bit easier.  You can walk around without fear of the Nazguls and locate some objects to get some troops.  Look in these locations for some helpful objects:

South of Ost-In-Edhil (South of Buckland)
North of Erebor (far east, where the Dwarves are parked).  Dwarven hammer.
South of Mt. Gram. (north of Rivendell).  Mithril Armour, Red Arrow, Black flask.  Red Arrow is important, as it gets humans in on the action.
North of White Towers (east of Buckland/Hobbiton).  Healing potion.
Forlond (Northwest of Hobbiton).  Palantir, which tells you where to find other things.  South of Forlond.
West of Annunimas (due north from Hobbiton).  Gold Sceptre, gets more humans in on the action.

Also look at Michel Delvins, Tuckborough, Grey Havens, Belegost, and there is also a dagger west of the Barrow Downs (east of Buckland).

It is an enjoyable game if you can get into it, and have something to read for the slow parts of the game.  The word protection doesn't pop up too often, but is a pain in the ass.  I modified my game to work on a hard drive to speed
things up.

The Byter

To instruct your people to go to a location, get to the small map (not the big, overall one). Use the red arrow (click on it), then point and click on the character group you want to redirect, and point and click to the location you want them to go to.

When you get into combat, the combat options will appear.

As you get into combat, the combat options will appear. There are 3 different screen levels. The top level shows the whole map of Middle Earth. This game is icon oriented. The 3 icons to the side are:

- orb - tells status off all forces on map
- load/save - loads/restores saved game
- magnify - allows you to go to the next map level down
- hourglass - changes rate at which time goes by

At the middle level, the icons go as follows:

- orb - tells status of selected party
- map - goes to top map level
- magnify - allows you to go to the next level down
- hourglass - changes rate at which time goes by

At the scene level, the icons are:

- orb - tells status of party on the screen
- map - goes to middle level map
- hand/bottle - gets.puts things down

I assume as I haven't seen the dox is to get the ring to Mt. Doom. To do so, you have all the good forces at your disposal. The blinking forces are yours to do as you wish. The non-blinking ones are either your enemies or neutral forces. Neutral forces go under your command at different times of the game or when you get certain magical objects to those groups.

The best way to learn how to play is just dive in. At first be careful of the Nazgul. They'll kick yer ass quickly if they get to Frodo. You would be best going to Bree first via Bombadil's house.

To see what a certain place is, just click on it. If it is important at all, the game will tell you so. You can play the game militarily forgetting the books altogether, or you can play it following the book (which is probably safest at first).

At some point in time, the protection scheme will ask you for coordinates to a particular place. What follows is a list of places and what I believe to be their coordinates:

<table>
<thead>
<tr>
<th>Place</th>
<th>Coordinate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Harad Road</td>
<td>G7</td>
</tr>

When the Emperor designated him as court alchemist, the inquisitive Shen Jang, was still lucid. Later experiments with unholy chemicals wrought delusions in his mind. He went mad. But his insanity, a cunning variety, let him simulate correct action. So, against Emperor Choa Ti's strict instructions, he pursued secret researches into the forbidden subject of astral demonology. When Zhurong returned from Nubia, the Warlord found a willing ally in the alchemist. Shen Jang evidently cares nothing for the occupant of the Nightingale Throne. He only wishes to unleash the results of his demented researches. Zhurong cards just as little for spiritual matters, and so he allows Shen Jang his insanity.

Kuafu, the Jailer

All too many an unfortunate soul has been placed under the custody of Kuafu, the pitiless jailer of the Imperial Prison. However, though quick to brag on how escape-proof his prison is, Kuafu's vigilance is often in question considering his penchant for long naps punctuated by shrill snoring.

Imperial Guards

Chao Ti's esteemed Palace Stewards, heirs to the traditions of hundred generations, now work the jade mines along with other protesters. In their stead Zhurong hired dozens of ragtags, scoundrels, vagrants, and failed farmers as his thugs. This rabble now guards the Celestial Palace.

Concubines

Though these lovely ladies remain loyal to the Emperor, Zhurong has made them his love-slaves. They are trained in the gentle arts of song, formal dance, and conversation. The concubines serve, unofficially, as central coordinators for gossip and rumor in the court.

The Nubian Princess

Formerly the Ivory Princess of the kind of the distant land of Nubia, she now leads the life of a captive, kidnapped by the deceitful Zhurong during his recent mission of conquest to her homeland. Few can learn from her since she only speaks her native tongue and refuses to learn the language of Khantun.

People of Devout Ways

Priests

These monks have devoted their lives to maintaining a holy shrine. Skilled in ritual and serene in outlook, they can bless the incense you use to send your prayers skyward. But beware of priests possessed by Shen Jang's evil spirits. You must exercise these spirits to heal the priests and restore harmony.

Monks

In the Monastery of the Enlightened Khisa, monks devote much effort to copying the scrolls of past ages. Their monastery library holds the lore of ancient scholars.

Shamans

These animist magicians seek truth through contact with nature. By protracted study of the laws of the wilderness these wizened men and women deduce ways to influence natural law -- in other words, they learn the ways of magic.

Medicine Men

Practitioners of the arcane rites of alchemy, these respected tradesmen prepare elixirs, healing balms, and potions that fortify the spirit or cleanse the digestive system. With proper study they can prepare antidotes to many poisons and drugs. The rarity of their ingredients forces them to change high prices for their services.

Fortunetellers

For a nominal fee these seers interpret the mystic I Ching, or Book of Changes, to predict your fate. Cast three coins six times and the fortuneteller will divine the timeless wisdom of the ancients.

People of Humble Ways

Farmers

These peaceful folk pray in the shrines each morning, farm their rice fields all day, and sleep on straw mats at night. Their lives, though strenuous, were happy until Zhurong took the throne. They gladly offer their dwellings as safe shelters for an honorable disciple who seeks rest.

Fishermen

Simple folk like farmers, the fisherman trawl for shrimp in small boats. They take long trips over the Boundless Ocean to many different parts of Khantun. Travellers, impressed with the fisherman's profound knowledge of the waters, often follow his boat to interesting places.

Merchants

In these trying times goods are short, quantities small, and prices high. Merchants try as best they can to maintain sticks of useful items. Merchants in Khantun maintain high integrity and refuse to sell their goods to those of imperfect honor.

Beggars

By the Harmonious Emperor's decree, blind people received the charity of the state. Under Zhurong's rule, the blind have been driven to beggary. In their humiliating circumstances they deserve respect and compassion from those more fortunate. Though deprived of sight, beggars retain keen hearing. They often hear information others might miss.

People of Dishonorable Ways

Thieves

Cowardly skulkers, these vagabonds prey upon the unwary. They seldom present much threat to the disciple of clear mind and purpose. But beware of the thief's dagger, often thrust toward the midriff in a rapid assault. If you fall to a thief, take consolation that they often steal belongings but leave your alive -- so that the thieves may steal from you again, another day.

Assassins

Among his many other atrocities, Zhurong has recruited the deadly ninja, the cult of assassins, to carry out his ruthless deeds. These black-clad fanatics attack with shuriken - throwing stars - and deadly fists. Much legend surrounds these people of the night, making it difficult for me to advise you.

Beasts and Monsters

Khantun's varied wildlife includes white herons, sea turtles, and other harmless creatures. Enjoy their beauty. The Life Force shapes itself in many forms, and the enlightened person takes joy in them.

More dangerous to your mission are the giant water beetles that rend travellers in their jaws. (Fishermen sometimes use the jaws of dead beetles as scaling knives.) Beware also of the sea dragons, monstrous lizards of titanic power. Do not venture too close to these creatures of the deep, lest they strike at your by surprise.

Last and deadliest come the monsters from beyond this realm, the dark beings summoned by the mad alchemist. The oni, a giant horned demon of poisonous claws and equally poisonous cruelty.

The fire elemental, a spectral form whose touch imparts burning pain.
And the astral demon, a malign demigod of profound cunning and limitless contempt for truth. These demons are possessing and desecrating the shrines of Khantun. You must exorcise them from those who they possess. I will explain how momentarily.

Objects of the Realm

Do not neglect the details of correct living, for your mission tests your resourcefulness as well as your prowess. In the form of a fisherman, you will require money to purchase food and supplies. You may earn money by procuring goods a merchant desires, or as a reward for heroism. If fortune smiles upon your venture, you may also discover wooden chests of money and belongings. These may be washed ashore on beaches or hidden in the depths of caverns.

The currency of Khantun, a small brass coin, also purchases other important items:

- Health elixirs that can heal all bodily damage.
- Incense for prayers of restoration.
- Other potions of various natures.
- Parchment, ink, and heron-quill pens, useful for copying scrolls.
- Maps of Khantun and environs.
- And the sextant, a navigational instrument that uses the position of the sun, stars, and landmarks to determine your position. The sextant serves no purpose indoors.

Boats and Ships

Khantun is a land set upon the water. The Boundless Ocean provides food, travel, commerce, and defense from invaders. Several kinds of ships ride its waters.

Fishing Boats

A fisherman will spend three quarters of his life on one of these humble vessels hewn from sturdy pine, with no more than a single mast and linen sail. As your test begins, you stand in Xiang Loh near your own boat.

Large craft with hulls of weathered oak and mighty sails, these noble ships may encounter fishermen at sea. If you hail their boats, they can offer directions and even sell you supplies.

Pirate Skiffs

At sea as on land, scurrilous rogues wait to plunder the innocent. These skiffs, no larger or sturdier than the fishing boats they rob, travel outside normal fishing lanes.

Aboard pirate skiffs ride merciless thieves and assassins. They assault their victims first with a barrage of shuriken, the dishonorable throwing star of the ninja. Assassins even leap overboard and swim over to attack you.

If you can defeat a pirate crew, you may take control of their vessel and use it as your own. But no disciple on the path of honor may use their lethal shuriken.

Imperial Warships

Large craft with hulls of weathered oak and mighty sails, these noble ships now serve the tyrant Zhurong. Their iron cannons fire metal spheres whose impact can break bones and send the passengers of the target vessel flying into the cold waters upon which they sail.

Zhurong's guards serve as crew. Setting forth from the Celestial Palace, they search the Boundless Sea for resisters. Try to elude these warships if you wish to avoid struggle.

THE WORLD ABOVE

(Hexagram 20: Wind above, Earth below.)

Contemplation. As the wind moves over the earth, so the ancient rulers travelled the world. They visited its regions and contemplated its many cultures. Observe and explore new ideas. - I Ching

I have found that in all people of good intent dwells the need for enlightenment. That pursue it in many ways, some ordinary, some curious. Through the very act of searching, each finds some part of the truth behind all material things.

Yet recall the tale of the six blind men who found an elephant. One, feeling its side, said the elephant was like a wall; another, feeling the tail, argued that it was like a rope; a third, feeling the ear, contended that the elephant seemed much like a sail; and so on.

In the same way seekers of truth cannot grasp its infinite diversity. They treasure their small parts of it, and they elaborate it with ritual and doctrine. Each true in its way, non captures the whole Truth.

Do not hold them in contempt, disciple. Rather, delight in their humanity as I do, and contemplate the many aspects of truth they reveal. All can help you in your quest for enlightenment.

Khisanism

Those of this faith follow the path of their enlightened founder, who passed from this existence centuries ago. Followers achieve enlightenment through contemplation, meditation, prayer, and fasting in moderation. The devout monks of the Sanctified Order guard the knowledge of times past.

Study this lore as they do, with clear mind and pure desire for enlightenment. You can copy their scrolls freely, so long as you have parchment, ink, and a quill pen.

You may even take the vow of silence and attempt to join the Sanctified Order. By joining the monks in their daily devotions, you show commitment to their principles. If you are able to prove your mastery of self, you may earn the marks of their Order, the silk robe and the oaken staff.

The founder's serene form adorns many shrines around Khantun. In these shrines you may read the Order's Holy Script and learn useful prayers for renewed energy. Devotions to the founder's memory take the form of incense, burned in a censor. The benevolent priests of the Order can bless this incense for you. Thereafter, when you burn it, your prayers will ascend Heavenward and be answered, whether or not you are in a shrine.

Certain prayers are known by all who practice the Khisan way. Though the specific words to the prayers are inscribed in the Holy Script, their purposes are thus...

- Physical healing
- Spiritual restoration
- Forgiveness and renewed honor

In these troubled times, the mad alchemist Shen Jang has summoned evil spirits on new moon nights to possess the priests of the shrines. A special prayer of exorcism allows you to cast a fiery trace of demonic influence from the possessed.

Shamanism

Shamans seeks truth through nature. They study the ways of animals and the physical realm. Attuned to the rhythms of the world, these solitary teachers have discovered that work on the physical realm.

The enchantments rely on talismans and on mantras, chants the improve concentration and activate the realm's magic. All such enchantments drain the spirit in casting, so that only an adept can maintain them for long.

Having discovered their spells, shamans typically retreat to caves and meditate on them. Since this retreat often lasts all their lives, many spells are lost when they pass from this realm. Only a new enchantments are currently known, and their mantras are closely guarded. You must seek the mantras in the lore of ages past.

Shamans create talismans that embody their enchantments. But to use a talisman, you must have the shaman bind it to your spirit. This requires a ritual of divination, wherein the shaman examines marks on the shell of a sea turtle. Reasonably enough, shamans refuse to carry these shells with them, so you must provide one. Special care must be taken by the practitioner of talismanic magic that he not let his Spirit become drained to depletion. A depleted Spirit will surely result in death.

Levitation sends the caster high in the air to gain a brief overview of his surroundings. The caster cannot move laterally while levitating, so the spell's use is limited. However, it can be useful to know who -- or what -- awaits you around the next turn.

Invisibility renders other insensible to the caster's presence.

Water-walking allows the caster to travel across the sea as though walking on dry land.
MAKING YOUR WAY IN THE WORLD

Journeying

You will travel by land, where you may either walk or run; and on the sea, where you may swim or sail. Do not attempt to board another's boat, unless it be a dishonest pirate ship whose pilot has fled. Not that by exertion you can speed your normal passage over land or water. But be moderate in this, for it saps your strength.

Remember to eat at least once a day. A simple handful of rice and fish cakes can sustain you. Sleep well, for it is vital to your health. Further, you can retreat into sleep when you want time to pass quickly.

But be careful where you sleep, for dishonorable persons seek to plunder helpless sleepers. And other menaces lurk by lack of spirit sleepers may not befriend the common people will be less friendly, and your task will grow more difficult. The successful disciple strives to maintain perfect honor.

Karma, the spiritual consequence of your actions, is represented by the symbol of yin and yang. The ancient glyphs show that good and evil, the positive and the negative, are intrinsically related. In this text karma shows how many times I allow you to fact the Spectre of Death. Each time your body or spirit perishes, I shall steal you away from the Spectre and restore your life -- but a karma bead slides down the wire.

If all of your karma beads come to rest away from the yin-yang symbol, you have failed this test. The Spectre of Death passes you on the taunting demons of Mirror of Truth. I dare not reveal the fate they plan for you.

Progress and good fortune through correct persistence. - I Ching

Travel. Illumination upon the tranquil mountain makes conditions favorable for travel. The enlightened person is clear-minded and not detained by disputes.

Here I summarize the cardinal virtues of my disciples. If all of your karma beads come to rest away from the yin-yang symbol, you have failed this test. The Spectre of Death passes you on the taunting demons of Mirror of Truth. I dare not reveal the fate they plan for you.

I Ching
Though the enlightened person respects privacy, a healthy curiosity about one's surroundings is correct. Enter buildings that offer open doorways. Examine the scrolls, cabinets, and shelves that you find. You cannot know whether one may hold something that aids you in your mission.

**Defending Yourself**

The enlightened disciple never attacks. However, you will certainly need to defend your life and honor in combat. Herewith, my advice.

**Training**

Before being your test, I offer you the chance to train your defensive skills. First unarmed, then with a staff, you will face some of the opponents you will encounter in the world: thieves, assassins, guards, and yet more dangerous foes. Be aware, though, that those whom you will train against may be far less aggressive than those whom you will defend against in the world.

Full practice yields you achieve honorable victories in a full cycle of training before you being your test, I shall grant you early advancement in my Order. The enlightened person takes every opportunity to gain self-knowledge. Learn well your defensive maneuvers and your opponents' patterns of aggression before you venture forth.

**Unarmed Defense**

Master the four blows: punch, high kick, front kick and roundhouse kick. The punch and front kick are quickest to land, but the other kicks are deadly and can stagger your opponent. Some masters follow a high kick with a punch for doubled effectiveness.

Blows aimed at the opponent's head yield best results, but these are the hardest to land. Strikes to the midriff prove more practical in close quarters. The opponent seldom expects these adroit maneuvers. You can escape a deadly thrust, or close within the foe's guard to deliver a thrust of your own. The handspring itself is an attack, as well.

At all times strive to time your attacks with suddenness of the falcon. Strike after opponent has completed his attack, and before he can prepare another.

**Defending with a Staff**

The staff, symbol of spiritual transcendence, served also as protection for your physical form. With its long reach you may strike from a safe distance.

Master the three staff blows: the high swing, the low jab, and the front thrust. You can also fruitfully employ all the kicks described above.

Concentration; Intuition

The disciplined mind can shut out distractions. Employing concentration, you may sharpen your perceptions so that each exchange of blows seems to proceed at your chosen pace.

In this state of concentration you may gauge the situation and choose your next maneuver when you are ready. The opponent has not time to make more than a single move in response. By careful consideration you may suit each maneuver precisely to the requirements of combat.

But the trained fighter also knows that value of surrendering to the moment. Replying on your intuition, you let your ch'i, your inner spirit, guide your blows. This method is practical when your confidence is your defensive skill is high and provides great internal satisfaction to the intuitive one.

**Reflecting on your Experience**

In the flurry of combat one seldom musters the perspective needed for learning. I grant you the ability to review each combat after it is completed. If you reflect on your experience, you may learn your strengths and avoid repeating your mistakes. The enlightened person reflects on his experience in combat. Try to discern the techniques each enemy employs, and develop your own maneuvers to counter them.

**Your Opponents' Fighting Styles**

You will discover during your training, or soon after you being your test, that your opponents fight with different techniques and patterns. For example, the clever thief often feigns a high, swinging stab, then suddenly turns it into a short thrust.

*Note also the different time and effect their maneuvers require. A rabbit punch or jab falls as quickly as the lightning. But a long sword stroke takes much longer.*

Use this information about your opponent to your advantage.

**Fleeing Combat**

In desperate straits you may flee combat. Flight from a fair battle brings dishonor upon you. You will suffer a blot upon your honor, and a bead will slide to the right on the abacus of your abilities.

---

**THE ORDERS OF ENLIGHTENMENT**

(Hexagram 19: Lake below, Earth above.)

Promotion. The receptive earth about reflects in the lake beneath. So it is the enlightened person willing to teach and learn from others. Exceptional progress through persistence. - I Ching

I mark my disciple's degrees of enlightenment by these ranks, called orders. You will achieve greater enlightenment through persistent effort, generosity toward others, defeat of injustice, and achievement of your goals.

I shall reward you spiritual growth with greater prowess in the world below. Recall the abacus of your abilities. As the enlightened life grows rich, so each bead upon the abacus gains in value according to your Order. Thus. when you are hurt or cast magic, the beads slide away less often than before. Take pride in your increases only as they increase you pursue your path with more confidence. The Way is not pride, but humble regard for one's fellows and harmony with all.

Remember, there are many things I have not told you. They are there for you to learn, as part of your test. Now Process! The path of the disciple lies before you.

**The Order of the Windwalker**

**Author's Afterword**

Since the release of MEGABUS, the predecessor to WINDWALKER, I've given much thought as to the direction of scope the WINDWALKER should take. Always foremost in

---

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1174 of 1262
my mind has been the desire to provide the player with both pleasurable and intellectually stimulating experience. In such a way, I have sought to share, in part, the personal joy that I take in the quest for knowledge and understanding about the world around us and the inhabitants therein.

A common theme woven into WINDWALKER's story involves the interaction of the player character with persons of differing viewpoints and experiences from his own. Perhaps lessons about living in our own real world may be drawn from these game experiences, though just having fun and high adventure are worthy rewards alone to the imaginative mind. If 'story morals' are transparent to the player, so too might be the other hidden lesson to be found in WINDWALKER, i.e. that expanding one's awareness of the world around us should be a source of great personal pleasure and a challenging end goal within itself.

Finally, though the player character in WINDWALKER is given 10 karma beads, or game lives, within which to accomplish the story objectives, we can only be sure of one opportunity to fulfill our own personal dreams in this world. So, whether you are 13 or 30, just starting your life quest, or already well along the path, seek to increase your awareness of the intricate beauty and diversity that this life and the people you meet in it have to offer. There is no greater treasure to be found, no any greater source of both amusement and entertainment!

Training

You may also press the ESCAPE key to go back and enter a different name.

4) Moebius will welcome you and offer you the choice of Training or Venturing Forth. Should you make a mistake, press the ESCAPE key to clear your name and reenter it.

Moebius greets you, he will ask you your name. Type your name and press RETURN.

3) Once in his presence, press any key to rouse him from his meditation. After presence of Moebius.

When ready to process, press any key to bypass the title sequence and enter the computer.

2) After a short wait, the Windwalker title page and opening sequence will appear. (See Special Options). NOTE: To Apple II GS owners: The system speed be set to "FAST" when playing Windwalker.

Diskettes

Windwalker diskettes are labelled to indicate Side 1,2,3, and 4. They are referred to as "Magnetic Scrolls" within the game.

Selecting Options From Lists

Whenever you are presented with a list of options during play, press the UP or DOWN arrows or the SPAC BAR to select an option. When your desired selections is highlighted, press RETURN to accept it. If you wish to exit the list without selecting an option, press the ESCAPE key.

In Case of Difficulty

Refer to the section on Troubleshooting should the game not perform in accordance with these instructions.

TO BEGIN PLAY

Start Play

1) Put Magnetic Scroll 1 into your disk drive, label side up, and turn on your computer.

2) After a short wait, the Windwalker title page and opening sequence will appear. When ready to process, press any key to bypass the title sequence and enter the presence of Moebius.

3) Once in his presence, press any key to rouse him from his meditation. After Moebius greets you, he will ask you your name. Type your name and press RETURN. Should you make a mistake, press the ESCAPE key to clear your name and reenter it.

4) Moebius will welcome you and offer you the choice of Training or Venturing Forth. You may also press the ESCAPE key to go back and enter a different name.

Select TRAIN if you want to practice your combat skills. Refer to the sections on Combat for more details instructions. Should you wish to stop training during combat, press the RETURN key. This will return you to the presence of Moebius.

Venturing Forth

Select VENTURE FORTH when you wish to begin an adventure in the world of Khantun. If there is an adventure in progress previously saved under a different player's name, you will be given the option to abandon it and begin a new adventure using your name. Otherwise, you will continue the adventure in progress. Any previously saved adventures must be abandoned before a new adventure can be started. Refer to Special Options for assistance.

PLAYING THE GAME

The Adventure Display

When adventuring, the following display is shown:

Its Mech, interrupting because of a picture...

Boot the game

When in an adventure there is the background that is called the Travel Window. That face is you, which is known as the Player Character (PC) Icon. Where your name is displayed is known as PC's Name. That Blank Black Bar on the bottom of the Travel Window is for System Messages. The first set of beads on the top right is the PC's Body attribute. The second set of beads on the top right is the PC's Spirit attribute. The third set of beads on the top right is the PC's Honor attribute. The fourth set of beads on the top right is the PC's Karma attribute. Right below the fourth set of beads is the PC's Current Order of Enlightenment.

Moving About in the World

To move over land or water, press one of the direction keys listed below. Note that there are two indentical sets of directions keys for either right or left-handed play.

The arrow keys may be used in place of the North, South, East and West keys. To rest in place for one turn, press the PASS key.

In Case of Difficulty

Refer to the section on Troubleshooting should the game not perform in accordance with these instructions.

TO BEGIN PLAY

Start Play

1) Put Magnetic Scroll 1 into your disk drive, label side up, and turn on your computer.

2) After a short wait, the Windwalker title page and opening sequence will appear. When ready to process, press any key to bypass the title sequence and enter the presence of Moebius.

INTERACTING WITH THE WORLD

Your Possessions
Whenever you wish to examine or use one of your possessions, press RETURN, following by the PASS key (S or L). You will be presented with a list of the items that you currently possess. Select the item you wish to examine or use. For example, when you wish to sleep, you should select the Straw may from your possessions, when you are hungry, you may eat by selecting Food.

Inhabitants of Khantun
When you wish to interact with an inhabitant of Khantun, press the RETURN key followed by the direction to the person or creature you wish to interact with. When speaking to people, you may discuss different topics. Listed under these topics are the keys words you know. When you ask someone about a key word and you hear a chiming sound, you have had another key word added to one of your topic lists. It is advisable to occasionally converse with persons you have spoken with before, using the new words you learn -- they may have new things to tell you.

Inanimate Objects
To interact with or examine an object in the world, move up to the object and "bump" against it. If the object is something that can be examined, a message will appear telling you what you have found. For example, bumping into a scroll on a table will result in the scroll being opened and its contents revealed. Bumping into a doorway will cause you to pass through the door into or out of the building. When you wish to board a sailing vessel that you own or have taken in battle, bump into the front end of the craft. When you wish to disembark from the craft, you can drop anchor by selecting that from your inventory.

SPECIAL OPTIONS

Special Options List
While travelling in Khantun, press the ESC or TAB key to display the Special Options list. The options are:
- Save - This will save the adventure in progress for later recall.
- Recall - This will recall the adventure from the previous save.

Save and Quit - This command will automatically save the game and prepare the computer to be turned off. This command must be issued to end your game session. Failure to use this command will cost the PC one karma bead on the next recall/restart.

Abandon - This will abandon the adventure in progress and erase it permanently, allowing a new adventure to be started.

Sound on/off - This will switch the game sound on or off.

TROUBLESHOOTING

If the game fails to start properly, perform the following sequence:
1) Turn the computer off.
2) Make sure the computer and its parts are properly installed.
3) Reinsert the WINDWALKER disk, side 1, label-side up, into the drive.
4) Turn the Computer on.

If this sequence fails to start the game, you probably have either a hardware or software problem. If possible, try starting the game on another computer to verify the problem, or, consult your software dealer for assistance, or try dl'ing it again, may be a bad download.

"Check the Magnetic Disk" message
If during play you get a "Check the Magnetic Disk" message on your screen, make sure that you have the correct disk properly inserted in the disk drive when the drive door is closed. All characters information is saved to Magnetic Disk 4, which can be copied to permit the play of more than one simultaneous games.
425

Apple II Computer Info

Just as you clear the edge of the carrier's deck, stall the plane to allow it to drop so that its "arrester hook" can catch one of the four arresting cables on the deck.

Landing an airplane on the deck of a carrier requires a great deal of skill and nerves of steel. It may take you a few practice runs before you feel comfortable, but this practice will pay off later. When the heat is on and you have to land under fire.

Once you have landed safely, taxi your plane to the elevator. Then, push the joystick button to activate the elevator and lower your plane for repairs, refueling and a new load of weapons. If you taxi too far and miss the elevator, simply turn your plane around and position it over the elevator again.

**HELLCAT WEAPONS**

---

**Machine Guns**

Your Hellcat is equipped with three .50 caliber machine guns on each wing. These guns can be fired while in flight by pressing button 0. Use your machine guns for shooting down enemy planes and strafing islands.

**Bombs**

Equipped with thirty 100 lb. bombs, your Hellcat can do heavy damage to barracks and machine gun dug-outs on enemy islands. After selecting "bombs" from the Weapons menu, you can drop bombs while in flight by pressing button 1.

**Rockets**

Designed for use on more substantial targets such as large anti-aircraft guns. 15 of these 5 inch rockets can be carried by your Hellcat. Once you've selected "rockets" from the Weapons menu, you can fire rockets while in flight by pressing button 1.

**Torpedoes**

Once an enemy ship's guns have been disabled you'll be able to make a torpedo run on the ship in an attempt to sink it. After selecting "torpedoes" from the Weapons menu, you can release the torpedo by pressing button 1.

**CONTROL PANEL**

Your Hellcat's control panel with its various instruments and gauges is displayed at the bottom of your screen.

*Weapon counter:* indicates what type of weapon you are carrying and how many you have left.

*Hellcat counter:* how many Hellcats left. You earn an extra plane each time you are promoted in rank.

*Oil pressure guage:* indicates the condition of your engine. When your Hellcat is damaged by gunfire, the engine will begin to smoke. The more damage your plane sustains, the more smoke it will emit and the lower the oil pressure will drop. When oil pressure begins to get critically low, a red light will blink on the guage. If the oil pressure drops too low, the engine will

seize and you will crash. Each time you return to your carrier and descend into the hold, your plane will be repaired, restoring oil pressure to full.

3-D view: provides a three dimensional view of the world from your cockpit. This view is especially helpful when attempting to gauge the distance between your Hellcat and an oncoming ship, plane of other target.

In the center of the view is a flashing white cursor which serves as an artificial horizon indicator. This indicator is useful for sighting targets and landing on your carrier.

Fuel gauge: indicates how much fuel you have left. When the fuel level begins to get critically low, a red light will blink on the gauge. If the plane runs out of fuel in flight, you will crash. Each time you return to your carrier and descend into the hold, your plane will be refueled, restoring the level to full.

Score counter: take a guess!

Enemy plane counter: take another one!

**FLYING THE MISSIONS**

You start the game with three Hellcats. You will receive one additional Hellcat every time you earn a promotion in rank.

**Mission Objectives**

You will be briefed on each mission's objective before you begin it. Bonuses will be awarded as each objective is accomplished. An additional bonus will be awarded upon successful completion of an entire mission.

The two major objectives that a mission may entail are:

**ISLANDS**

Targets on islands include barracks, soldiers, machine gun dug-outs and large anti-aircraft guns. For an island to be neutralized, all barracks, soldiers and guns must be destroyed.

**SHIPS**

Enemy ships must be sunk to be neutralized.

During some missions, you will also encounter the following:

**FIGHTER PLANES**

It is not necessary to shoot down all fighter planes in an area in order to complete a mission.

**TORPEDO PLANES**

To defend your carrier, it is necessary to either shoot down torpedo planes or destroy their torpedoes once dropped (with bullets, bombs or rockets). When a torpedo plane is sighted, an arrow will appear in the 3-D view indicating its position relative to you.

**HIGH SCORES**

Once you have finished the game, you will have the opportunity to save your score to disk if your score is among the top ten. You will be prompted to enter your name. Your rank will be recorded automatically.

---

**SPECIAL KEYS**

Esc - Pauses game
CTRL-R - Restart game
CTRL-S - Turn sound on and off
CTRL-D - Display high scores
CTRL-C - Clear high scores, press ctrl-d first.
CTRL-F - Flips vertical control on joystick.

Salvation-Wings\Late News & User's Guide Update (1 Dec 90)

Please make a point of reading through the Salvation-Wings User's Guide at least once before you go 'exploring'. Salvation-Wings is a very large and capable program, and you may miss—or even misuse—some of its many features if you don’t know all the details.

We recommend most strongly that you use the Installer program on the Supreme.B disk to install Salvation-Wings, MiniWings, and/or MicroWings. There are some Wings-specific files that must be in the correct folders in order for things to work correctly. The Installer scripts on the Supreme.B disk will assure that everything is copied to where it should be.

Also, please be aware that Salvation-Wings and MiniWings make extensive use of 'resources', which are special parts of certain files. You must use a GS/OS-based copy utility in order to be sure that files with resources are copied correctly. Salvation-Wings does this perfectly, and so does the Finder. Please, do not use any ProDOS 8-based copy utility to handle any Salvation-Wings files!

[End of update.]
WERE TIGERS - POISON YOU.

#### WIZARDRY #3 MONSTERS

The following is a list of monsters. The words in parenthesis show the state of the monster when it is not clearly seen. The list goes in the order of hardness. (Larger number = harder monster)

#### LEVEL 1

<table>
<thead>
<tr>
<th>Segment</th>
<th>NRCS</th>
<th>STREC</th>
<th>BLKNG</th>
<th>LENGTH</th>
</tr>
</thead>
<tbody>
<tr>
<td>GUARDIAN RAIDER (CORSAIR)</td>
<td>1</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>GUARDIAN GUARD (CORSAIR)</td>
<td>2</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>POLTERGEIST (UNSEEN ENTITY)</td>
<td>3</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>GUARDIAN PRIEST (CORSAIR)</td>
<td>4</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>DUSTER (SHADOWY FIGURE)</td>
<td>5</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>GIANT SLUG (SLIMY THING)</td>
<td>6</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>GUARDIAN CAPTAIN (CORSAIR)</td>
<td>7</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
</tbody>
</table>

---

#### LEVEL 2

<table>
<thead>
<tr>
<th>Segment</th>
<th>NRCS</th>
<th>STREC</th>
<th>BLKNG</th>
<th>LENGTH</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOBGOBLINS</td>
<td>1</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>GOBLINS</td>
<td>2</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>NINJA (MAN IN BLACK)</td>
<td>3</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
<tr>
<td>DARK STEED</td>
<td>4</td>
<td>0</td>
<td>6</td>
<td>06</td>
</tr>
</tbody>
</table>

**NOTE:** 95% of Level 3 monsters exist on Level 2; therefore, those monsters have not been listed in the Level 2 category.

#### LEVEL 3

<table>
<thead>
<tr>

**ADOPTED**

THIS EDITOR IS USED TO RE-CREATE CHARACTERS IN THEIR TRUE IMAGE. THESE IMAGES ARE STORED IN THE "MAGE.GEM" FILE ON TRACKS A-E WHICH IS WHERE THE COPY PROTECTION IS IN FULL FORCE.

CHARACTERS CREATED FROM SCENARIO ARE STORED ON AN EASY ACCESS FILE, AND BACKED UP ON ANOTHER FILE WHICH IS PROTECTED AGAINST ACCIDENTAL MODIFICATION. IT IS FROM THIS FILE THAT THIS EDITOR READS, SO BE CAREFUL!

**SPELLS:**
A SPELL CREATION ROUTINE IS INCLUDED IN THIS EDITOR, BUT DUE TO COPYRIGHT PROBLEMS, YOU THE USER WILL NOT HAVE ACCESS TO THIS INFORMATION UNTIL THE TIME COMES WHEN MR. WOODHEAD WISHES TO MODIFY THE SPELLS IN A LATER SCENARIO NOT FORESEEN AT THE PRESENT DATE.

**NOTE:**
FILE 5 INCLUDES ALL OF THE CLAUSES AND BY CLAUSES WHICH APPLY TO THE USERS GROUP IN Respect TO THE EDITOR AND MARKETING OF SCENARIOS CREATED BY THE EDITOR. (SEE FILE 5 CLAUSE 2A)

**B-MONSTERS**

**Pertinent Information:**

"QMAGIC":
# OF MAGICAL SPELLS A MONSTER CAN CAST IN A CERTAIN ENCOUNTER:
(MONSTERS CAN CAST ALL SPELLS TO BE DEFINED ONLY BY DICE ROLL)

"HCLER" :
Apple II Computer Info

# OF CLERICAL,'PRIEST' $SPELLS A MONSTER CAN CAST IN AN ENCOUNTER:

"IBID"

"M-RES": MAGIC RESISTANCE (RESISTANCE TO PLAYER-CAST SPELLS"

"CHUMNUM": NUMBER OF COMPANIONS IN MONSTER PARTY

"CHUM-PROB": PERCENTAGE CHANCE OF A SIN SINGLE MONSTER (OR A GROUP WHERE APPROPRIABLE) OF NOT ATTACKING (GOOD ONLY!)

"PIC ": PICTURE TO BE DISPLAYED WHEN MONSTER APPEARS (SEE CHART FILE 1)

"ENCS ": NOT USED (RESERVED FOR LATER SCENERIOS WITH DIFFERENT DATABASE MANAGEMENT)

NOTE: IT IS REASONED THAT ALL OTHER INFORMATION IS SELF-EXPLANATORY WITH RELATION TO THE MONSTER EDITOR.

WIZARDRY SCENERIO EDITOR ERRATA SHEET # 3 DATED: 4.14.81 THANKS TO THE BIG M

C-ITEMS

EXPLANATION OF INPUT PROMPTS:

"SPECIAL ": SET SPECIAL TO BE FOUND IN MAZE. (USING MAZE EDITOR, SET ITS POSITION IN THE MAZE).

"DECAY ": THE NUMBER OF TIMES THAT THE SET SPECIAL POWER OF ITEM CAN BE USED (100%=ONCE, 1%=100 TIMES ETC.)

"BREAKING": NUMBER OF TIMES OBJECT CAN BE EQUIPPED TO A CHARACTER BEFORE "BREAKING"

"SPELL": SPELL ITEM CAN CAST (PART OF SPECIAL POWERS)

SPECIAL POWER= HEALING, INCREASED DAMAGE, SPELL, OR PROTECTION

NOTE: OPTION 'N' FROM THE PROTECTIONS EDITOR (PROTECT AGAINST ENCHANTED) IS NOT USED IN ANY CURRENT SCENERIO. WHEN IT IS, THAT OPTION WILL BECOME OPERATIONAL.

ALL OTHER INFORMATION ON THIS SUBJECT IS FELT TO BE SELF EXPLANATORY, AND THEREFORE NOT EXPLAINED HERE.

D-TREASURE TABLES

EXPLANATION OF INPUT PROMPTS:

"INBOX": DETERMINES IF TREASURE IS TO BE FOUND IN A CHEST

"TRAPS": EDIT POSSIBLE TRAPS IN THE CHEST (IF MORE THAN 1 SELECTED TRAP CHOSEN AT RANDOM, IF ALL SELECTED, CHEST WILL BECOME A MIMIC) (SEE BELOW & LIST IN FILE 1)

"ITEM": COMPARES INPUT TO ITEMS LIST, AND SELECTS TREASURE (0=RANDOM), (IF A MARKED SPECIAL IS SPECIFIED, BE SURE TO INCLUDE LISTING IN MAZE EDITOR!)

ITEMS (1-9): DETERMINES HOW MANY ITEMS CAN BE FOUND IN CHEST, AND WHAT ITEMS ARE IN CHEST

MIMIC:

A MONSTER TYPE (ENCHANTED) FORMATTED TO DATA BASE. A MIMIC WILL APPEAR ONLY IF SPECIFIED IN: MAZE EDITOR, TREASURE EDITOR, MONSTER EDITOR (SET ACTUAL MONSTER TO APPEAR TO "ENCS 10" (MIMIC CAN NOT BE MODIFIED BY THIS EDITOR, BUT CAN BE LINKED IN TO MONSTER TABLES BY PRESSING "*" FROM MAIN MENU AND USING LINK AND COMILING ROUTINES).

E-EXPERIENCE

(SEE FILE 1 BLOCK 3 FOR EXAMPLE)

NUMBER OF EXPERIENCE POINTS NEEDED TO MOVE FROM ONE SPECIFIED LEVEL TO ANOTHER SPECIFIED LEVEL.

"MORE": FOR LEVELS OVER 13, A CONSTANT NUMBER OF POINTS IS NEEDED TO MOVE TO EACH NEXT LEVEL. THIS NUMBER IS SPECIFIED AFTER THE PROMPT, AND (TURN TO FILE 1 HARDCOPY) 1 LEVEL WILL BE GAINED WITH THE ACCUMULATION OF THAT AMOUNT OF POINTS.

F-MAZE EDITOR

EXPLAINED IN FILE 1)

IT IS NESCERSSETARY TO SET CORRIDORS AND ROOMS. GO INTO OPTION 1 AND SET WHICH MONSTER GROUPS MAY APPEAR ON A SPECIFIED LEVEL. OPTION 5 IS USED TO QUICK DRAW A MAZE (BASIC OUTLINE) AFTER WHICH PESSING "B" WILL BUILD WHAT YOU HAVE DRAWN. (PRESSING #S 1-9 HAS NO EFFECT UNLESS LINKED IN FROM THE PASCAL DATABASE EDITOR ("*" OPTION FROM MAIN MENU). MESSAGE EDIT (-2 FROM SPECIALS EDITOR) IS SELF EXPLANATORY AND THEREFORE NOT EXPLAINED HEREIN) (30 BLOCKS PER LEVEL)

G-MONSTER IMAGES

EXPLANATION OF INPUT PROMPTS:

? > SEE COLOR BLOCK CURRENTLY IN USE
N > SKIP TO NEXT COLOR BLOCK
P > SKIP TO PREVIOUS COLOR BLOCK
! > SAVE PICTURE
/> " UNFINISHED FEATURE "
> DELETE ANY PATTERN (PICTURE BLOCK) THAT DATAM CURSOR PASSES OVER
+ > CURSOR MOVE MODE (DATAM CURSOR CAN MOVE WITHOUT EFFECT USING Q, W, E, A, S, D, Z, X, C KEYS)
S > DRAW MODE (WHEN DATAM CURSOR IS MOVED, IT WILL DRAW IN THE SPECIFIED COLOR BLOCK).

: MUST LOAD IN PICTURE BY TYPING IN NUMBER FROM SECONDARY SOURCE MENU.

Scenario #1

Proving Grounds of the Mad Overlord is the first Wizardry scenario and is designed to introduce you to Wizardry, give you practice playing, and allow you to "build" characters up to 7th level or so.

The evil wizard Werdna has stolen a valuable item from the treasure rooms of the mad overlord Trebor. He has placed it somewhere deep in the dungeons of Trebor's castle, and left fearsome monsters there to guard it. Your mission is to develop characters powerful enough to explore the deeper levels of the dungeon and recover the item.

It is rumored that a "control center" exists somewhere in the dungeon, and that this control center allows explorers easy access to the deeper levels of the dungeon where the item may be found. Thus a logical first step would be to find this facility.

Good Luck, and may your Gods be with you!

Welcome to the World of Wizardry

Wizardry is unlike any other game you have played on your Apple II computer. Using all the power and sophistication of the Pascal language, we have been able to create the most challenging fantasy war game available for any personal computer.
Wizardry is a huge program - in fact, at 14,000 lines of code, it may be the largest single micro-computer game ever created. The entire Wizardry game system, including the programs used to create the extensive Wizardry databases, comprises almost 25,000 lines of code, and is the result of over one man year of intensive effort.

The result is a game that simply could not have been written in BASIC. Wizardry lets you create a control a number of adventurers, who go on expeditions in search of loot and glory. The more successful a character or group is, the more powerful they become. Each character is specialized. Some are good fighters, some can cast magical spells of many types, and some are good at defeating the many traps that guard the goodies. As a character becomes more powerful, he may gain some general abilities, but in all cases, cooperation is the key to success.

From one to six players can adventure at a time, with each one controlling one or more characters. Over the course of many, many adventures, the characters may be able to fully map out the maze and wrest from it the arcane items that are carefully guarded in the more inaccessible depths. However, this can take quite a lot of playing. Fortunately, additional SCENARIOS with greater perils and rewards are available, you may explore caverns, crumbling ruins, or even chart out the unmapped and unknown mysteries of the huge world of Wizardry.

NOTES

A FEW WIZARDRY FEATURES

Multi-Player:
Wizardry allows up to six characters to adventure at a time, and many more can be stored on diskette.

Complete Castle:
All adventures start and end in the Castle. Features provided include Tavern, Hotel, Temple, and Trading Post.

Specialized Characters:
All Wizardry characters are unique individuals. They can be of five races and eight "classes", have differing abilities, cast spells, fight, etc.

50 Spells:
Spells are used to invoke supernatural aid. There are 50 that can be cast, and they vary in power and effects. Certain characters can learn certain spells, and certain magic items can also cast spells.

Hundreds of Magic Items:
Magic Items and mundane items can be bought, sold, or found in the maze. Many cast spells, or give the user special abilities. Magic items can have over 100 different attributes, such as who can use them, who they can be used against, who they protect the user from, and so on.

Hundreds of Monsters:
Monsters travel in groups, like characters do, and in many cases have similar abilities, like spell casting. Monsters also guard treasures, and may be found with other, compatible monsters. For example, a lair might contain a Frost Dragon, 4 evil Bishops and 9 Bushwackers.

3D Maze:
The maze is displayed in 3D perspective, just as you would see it if you actually were in a maze looking in a particular direction. Many tricks and traps are to be found in the maze, such as Stairs, Pits, Chutes, Dark areas, Rotating Rooms, Elevators, Teleportors, and even areas where Magic does not work.
Special Goodies:
In certain places in the maze unusual events and objects, unique in themselves, may be found. The adaptable nature of the database allows us to program "specials" which may only happen once! What they are, we aren't saying.

This manual is designed to teach you how to play Wizardry. Only rarely, however, will we reveal information about the internal workings of the Wizardry game system. This is in direct contrast to other game systems where all the rules are visible. Part of the fun of Wizardry is experimenting to find out the best methods for handling various situations.

The best way to learn how to play Wizardry is to go through the manual in order and actually try out the options described. With this idea in mind, get out your Wizardry diskette and we will start the game.

You will notice there are labels on both sides of the diskette. This is because Wizardry is such a large program that we have to use both sides of the diskette. However, you only have to flip the diskette once each time you turn on the computer.

Place the diskette with the label marked "BOOT THIS SIDE" facing up into the disk drive. Turn on your computer. If you have one of the older Apples without the autostart ROM you will have to boot by entering a 6 CTRL-P or PR#6 command. Otherwise, the disk will start and in a few seconds the Logo Page will appear.

Press RETURN to continue. You will then be presented with three options:
6)Start the Game.
U)tility Options.
T)itle Page.

To select an option, press the letter of the desired option. Option T will just reprint the title page. Option S starts the game proper. Option U is used to access two special facilities described below.

Assuming you pressed S, the disk will hunt around for a few seconds and then you will be presented with a message that says:

PUT SCENARIO IN DRIVE 1, PRESS RETURN

This is when you flip the diskette. Open the drive door, take out the disk, flip it so the label that says "SCENARIO" is up, carefully place it back in the disk drive, close the drive door, and press RETURN.

If this is done correctly, the disk will whirl for a few seconds and then the "CASTLE" will appear. You are now in the game proper. If something goes wrong, the INSERT message will be repeated.

Congratulations, you have just completed the first step towards hours, days, months, even a lifetime of challenge and adventure!

SPECIAL UTILITY OPTIONS

First of all, we suggest that you read the rest of the manual before you read this description of the utility options.

Pressing U for Utility Options presents you with a page containing five more options:
1)recover accidentally lost characters.
T)ransfer characters to a new scenario.
B)ackup characters.
Ch)ange character names.
L)eave utility options.

If something awful happens while playing a game that causes the Apple to crash, such as a power failure, it is possible that the current party of adventure's might be lost in the maze. Option R lets you recover these characters. Pressing R will prompt you to flip the diskette and will then search for lost characters and restore them. However, since it is possible to cheat by turning off the Apple if the party is in trouble, using this option adds 10 years to the age of any character restored by it.

After you have conquered the initial scenario you will probably want to move on to another. Option T lets you move characters from one scenario to another. You will be asked to flip the diskette and a list of all the characters on the diskette will be displayed. Choose a character by pressing its letter. If it has a password you will have to enter it. It will then be removed from that scenario.

Next, you will be asked to put in the scenario side of another Wizardry diskette. This done, that character will be placed on that scenario if there is room for him and if there is not already a character of that name on that scenario disk. If he cannot be placed then you will be asked to put the original scenario back so that he can be restored.

Note that some powerful magic items will only work on one scenario. When you try to move a character with these items, you will be told what they are, and you will not be able to transfer the character. If this happens, either sell or give away the items and then try the move again.

B)ackup characters lets you make a record of your characters status by transferring them to any scratch disk you may have. The scratch disk must be either a DOS 3.3 or Pascal formatted disk, and any data on it is destroyed. If your Wizardry disk ever becomes unreadable, you can return it and the backup for regeneration. See the inside back over of the manual for details.

Ch)ange character names lets you rename your character. The main use for this option is to prevent name conflicts when transferring characters between scenarios.

GET...READY

Once you have started the game, you will be placed in the Castle, which will be discussed later. However, if this is your first time in the game you will have to create some characters to play with. To do this, you will need to get to the training grounds.
Thieves require an agility of 11. Thieves get better hit points than mages, can use daggers or short swords as weapons, can wear leather armor and use a shield. Thieves are very good at circumventing the noxious traps that may be between a party of players and some loot. Thieves may not be of Good Alignment.

Bishops:
Bishops are a combination of priest and mage, and have advantages and disadvantages of both. Bishops have hit points intermediate to both, can wear leather armor and use priests' weapons. They use both magical and priestly spells, although they do not learn them as fast as the other classes. While they start learning mage spells immediately, they must reach the fourth level of ability before priest spells and the ability to dispell becomes theirs. Bishops also have the ability to identify the nature of magical items, thus not requiring them to pay the hefty charge levied for that service in the castle. However, there are some disadvantages to having a bishop inspect an item. If the bishop is not very careful, he may touch the item by accident. This will cause an E)QUIP to be done, and if the item is cursed, the bishop will be forced to use it. Like priests, bishops may not be Neutral.

Samurai:
Samurai are fantastic fighters, and can use all fighter weapons and armor. Their hit points start out better than a fighter, but in the long run a fighter will have better hit points. At the fourth level of ability they slowly begin to acquire magical spells. Samurai cannot be of Evil Alignment.

Lords:
Lords are a combination of fighter and priest. They have the hit points and abilities of fighters but at the fourth level of ability they gain priestly spells, and the ability to dispell. Lords must be of Good alignment.

Ninjas:
Ninjas are inhuman fighting machines. They can use any weapons or armor, but work best without any! When fighting without protection with their bare hands, they can cause havoc and destruction, and may even kill the strongest opponent with a single blow. Their great training gives them a lower and lower Armor Class as they reach higher and higher levels of ability. However, they get hit points as does a Thief and gain no spells. Finally, they must be Evil.

There are many other statistics and abilities you must be aware of. These are:

**ALIGNMENT:**
Alignment describes your character's outlook towards the world, and his general ethical status. The possibilities are GOOD, NEUTRAL, or EVIL. Note that some classes have alignment restrictions and be aware that GOOD characters will not be allowed to adventure with EVIL characters. Thus Lords and Ninjas will never adventure together, but a NEUTRAL Samurai could go with either. Alignment must be chosen when a character is created and cannot be changed through any normal process. Thus, you should be careful in choosing it.

**EXPERIENCE POINTS and LEVEL OF ABILITY:**
Experience points are awarded for killing monsters, each survivor gets some experience points. When the total reaches a certain value, you attain the next level of ability when you rest up in the next inn. The higher level you are, the more you need to earn to get to the next level, up to level 13 when it...
becomes a constant amount. The amount needed varies depending on your class.
Each time you make the next higher level, you gain more hit points, you may
gain new abilities or better old ones (like fighting ability) and you six
characteristics may change. Usually they will go up, but sometimes they will
decline. The older you are, the more chance of a decline! If you are able to
throw spells, you may learn new ones and you will probably gain the ability to
cast more of them. Since your characteristics are generally rising, you will
probably get them high enough to qualify for a better class.

ACE:
Age is simply how old you are! After 50 you start getting more and more feeble.

Gold:
The amount of gold you have to spend.

Equipment:
The items you have. These may be mundane armor and weapons, or magical items of
some sort. You can buy or sell them, trade them to others, use them, or find
them in the maze.

Armor Class:
It is a measure of how well protected you are. This measure includes armor and
other things like hinderance and AGILITY. Bare skin is AC 10. A Sherman tank is about
AC -10. The abbreviation AC is often used to denote Armor Class.

Hit Points:
The amount of damage you can sustain before death. Each time you are hurt, a
certain number of hit points are deducted. You can recover lost hit points, up
to your maximum, by resting in the castle, or by the means of magical spell, potion
or device. The abbreviation HP will often be used in place of hit
points.

Spell Books:
These are a set of small books each player has in which he records the spells    he knows.

Spells Left:
These tell you how many spells of each LEVEL OF POWER and class (magical or
priestly) you can throw. There are seven LEVELS OF POWER, and the higher the
LEVEL, the more devastatingly effective the spell is. Resting up in the Inn
will restore a player so that he can cast all the spells he is entitled to.
Thus, the smart spell caster rests up after each expedition.

Status:
This records what the player's status is. Most often he will be OK. However, he
could be ASLEEP, AFRaid, PARALYZED, POISONED, STONEd, DEAD, ASHES, or LOST
FOREVER, to name a few, When a character is not ok, he can be cured either by
application of a spell or by hauling him back to the castle and paying for the
service at the temple.

There are many more characteristics which are stored but you never see. Now
that you know what a character is all about, you can start creating one. The
main page of the TRAINING GROUNDS has three options:

First Training Ground Option
You can type in the name of a character you know does not exist. The computer
will search for it, and when it does not find it, it will ask you if you want
to create it. Press Y to do so.

A new page will plot with various information. You will be asked for a password
for your character. Type in a short, easily remembered, word or words. As you do,
a line of X's will appear in the password area. After you press RETURN to
signal that you have entered the password, the X's will disappear and you will
be asked to type in your password again, just to make sure you did not make any
spelling errors! If you do not want to use a password, just press RETURN.
Please see inside of back cover for password deletion notice.

Next, you will be asked what race and alignment you wish to be. For each, a
list of possibilities, with a letter but each will be plotted. Press the letter
of your choice. For example, when you have the options of:
A) GOOD
B) NEUTRAL
C) EVIL
You can press A, B, or C.

Now, in the rows marked STRENGTH, etc., a series of numbers will appear. Each
row corresponds to one of your basic characteristics. STR=STRENGTH, and so on.
These numbers are the base numbers for your race in each of the statistics. You
will also see that you have some BONUS points. You can use these in any of your
characteristics to raise them. Generally, you will want to add to one of the
first rest in VITALITY. You will note that an arrow "<-----" is pointing to the STR
number. At this point you can:

-Press RETURN to move the arrow down to the next number. If you go off the
  bottom, the arrow will move back to STR.
-Press + to add a point to the current number
-Press - to subtract a point that you had added from the current number

As you press + and -, your scores qualify you for a class, and the name of that
class will appear on the right. When you have allocated all your points, and
you qualify for one or more classes, press ESC (the key above CTRL) to choose
one. You must then enter the letter of the class you want.

Finally, you will be asked if you really want to keep this character. If you
do, press Y. If not N. After that, your character will be placed on diskette,
and you will be returned to the main options page of the Training Grounds.

Second Training Ground Option
Now, by typing in the name of your character, or that of any other character
you have created, and pressing RETURN, you will be able to inspect that
character. If the character has a PASSWORD, you will have to type it in to gain
access. When you type in a password, a number of X's are displayed to disguise
your typing. If you type in the name of a character who is not already stored
on diskette, you will have the option of creating him (which really means you are back at the first option, silly goose).

Once you have gained access to a character, you may do any of the following:

D)DELETE:
eradicates your character.

R)ROLL:
is equivalent to deleting and then creating character again.

C)CHANGE CLASS:
lets you change your character into a character of another class. You will be told which classes you qualify for, and you may press a letter to switch to that class. If you do so, the character becomes a first level character of the new class with zero experience points, but he gets the following advantages:

- he keeps his maximum hit points
- he keeps the knowledge of the spells he may have learned in the previous class, and may cast one spell for each spell he knows. Additionally, he may learn new spells of levels in which he already knows one or more spells, but not any spells of other levels. The net effect is to give him some of the abilities of his previous class(es).

S)ET NEW PASSWORD:
lets you alter the password of the character. You'll be asked to enter the new password twice to make sure it is correct.

I)NSPECT:
lets you see all of your character's statistics and abilities. You will be shown the character's class, level, alignment, characteristics, hit points, gold, experience, spells left and items, and you will have the option to look at his spell books. This page of information can be reached from many places and will let you do different things when displayed from different places. The only option available from the Training Grounds is the ability to R)EAD SPELL BOOKS. Pressing R lets you choose if you want to read M)AGE or P)RIEST spell books. Pressing either will then display the names of the spells of that class that your character knows. Programs to print these spells will be available in the future.

Options available in other areas include:

T)RADING:
lets you trade items and gold to members of the party your character is adventuring with. Pressing T will display a list of the characters in the party, and prompt for the number of the character you want to trade with. Then you will be asked how much gold you want to give. You can enter an amount or press RETURN to skip giving gold. Then you will be asked which item you want to give. Again, you can press RETURN or enter the number of one of your items. The process of giving items will repeat until you press RETURN.

E)QUIPPING:
lets you decide what of your characters possessions he will wear. A list of your weapons, armor, shields, and so on, will be displayed, and you may choose which, if any, you want to wear. Note however, that if you have found a cursed item you will be forced to wear it if you equip. That's why it is a good idea to have items I)dentified.

CASTING S)PELLS
lets you cast various spells useful to the party. Some, like curative spells that restore hit points, ask what party member is to receive the spell.

U)SE AN ITEM:
lets you use items to cast spells.

I)DENTIFYING is done only by Bishops and lets them attempt to divine the true nature of an item.

L)EAVE returns to wherever you were before you inspected.

Third Training Ground Option
There is one last option in the Training Grounds. Type in *ROSTER and press RETURN. You will display a list of all the existing characters. Displayed are name, class, alignment, hit points and status (dead, alive, etc.). You must press L to L)EAVE this page.

Lastly, by just pressing RETURN on the main page, you can move to the castle. (This is really an option so they lied; there are four options.)

GET...SET
The castle is the starting and ending point of all expeditions. There you can rest, create parties, get help from the gods, buy and sell equipment, or go to any other part of the game.

There are five main options in the castle. These are:

THE A)DVENTURERS INN
G)IGAMESH'S TAVERN
THE TEMPLE OF C)ANT
R)OLTAC'S TRADING POST
THE E)DGE OF TOWN

To enter any of these, just press the first letter of the name of the place you want to go.

Normally, the first stop at the beginning of a session is always G)igamesh's Tavern, where you can create a party. At the top of the screen there is a display of the current party, with space for six players. Displayed are position number, name, Alignment, and Class, Armor class (AC), Current Hit Points, and Status of each character. Alignment and class are displayed in the form A-CCC where A is the first letter of the character's alignment (G, N, or E) and CCC are the first three letters of the character's class. If the character is OK, then the status area will display his maximum hit points.

In the tavern you may:
A)DD A MEMBER TO THE PARTY
R)EMOVE A MEMBER FROM THE PARTY
#)TO INSPECT A MEMBER
or PRESS RETURN TO EXIT

A)DD:
will ask you to enter a character's name and password and will add him or her to the party. Characters cannot be added if they are marked on expedition (see below) or if they are of incompatable alignment. Characters who are not OK can be added so that they can be taken to the maze where spells can be cast on them.

R)EMOVE:
asks you for the number of the person and removes him from the party.

#): means you can press any valid player # to inspect that player. A page full of information about that character will be displayed, and you will be able to:
R)ead his spell books, E)quip him with armor and weapons, T)rade items and gold to other characters, or L)eave and return to the Tavern.

Finally, just pressing RETURN takes you back to the marketplace of the castle where you can go anywhere else.

Important Note:
When your character joins a party, his record on diskette is marked as "On Expedition." Normally, when you leave an expedition, are lost forever, or just leave the game, the mark is changed back to "Available." However, if you turn off the computer, or RESET it, all knowledge of things that have happened to your character since you joined the party will be lost, and the computer will think he is still out on an expedition. The only way to recover a character like this is to use the Utility functions recovery program previously mentioned. The reasons for marking characters is that it:

1. Prevents cheating by Reset when you run into some monsters you don't think that you can handle
2. Provides compatibility with versions of Wizardry for multi-Apple networks, such as that provided by the Corvus Constellation.

An accidental power failure or RESET press will happen once in a blue moon, and you should never have to worry about this at all.

A)DVENTURER'S INN:
is a place where any weary adventurer can get a place to rest and recover from his exertions, and all for a modest charge. When you enter, you will be asked for the number of the character who wishes to enter the Inn, or you may press RETURN to leave the Inn.

Once inside, a character may rest in the stables overnight, or use one of several types of rooms. Overnight resting allows the character to regain his spells, but does nothing to restore hit points. The other rooms let you regain hit points at a certain rate per week, and the more expensive the room, the faster the rate of healing. Remember, AGE is important in this game, so you do not want to spend too much time in a bed! As you rest you will see a week by week plot of your hit points going up and your gold supply going down. It will end when you are fully healed or when your gold runs out, or if you press any key.

After using the Inn, a check is make to see if you have attained the next level of ability. If you do, then your Maximum hit points will increase, your characteristics may change, and you may learn new spells and gain the ability to cast more of the older spells. If you have not made the next level, you will be told how many points you need to get there.

Whenever a party brings back characters who are dead, paralyzed, or otherwise unfit, they are removed from the party by the castle guards and taken to the TEMPLE OF C)ANT. The sole exceptions are POISONED characters who will get well on their own, and characters that are LOST forever, who will be buried. Upon entering the temple (press "C") you will be asked who you want to help, and if the priests of the temple can help him, they will tell you what donation is required, and ask who will pay. If a party member can afford the fee, then the sycophants will go to work. If the character is anything but dead or blown to ashes, success is assured, but otherwise there is a chance that the temple's best efforts will be to no avail! A good VITALITY usually means that they will be able to succeed, but old, infirm, characters may be in big trouble. Dead characters who fail to be raised from the dead are reduced to ASHES! There is still hope because for a larger fee, it is sometimes possible to resurrect a person from ashes, but if this attempt fails, the character is dead forever and can never be restored by any means!

The commercial center of the castle is owned by a friendly dwarf named Boltac. However, like all dwarfs, Boltac likes gold and will sell you your own armor if he can. Also, since he is a monopoly, he tends to do pretty well. Press B to enter his trading post. After you have indicated who is to enter (by pressing a number), you will be able to:

B)UY AN ITEM
S)ELL AN ITEM
have an item U)NCURSED or I)DENTIFIED, or L)EAVE.

B)UYING an item lets you see a list of items for sale and their prices.
You can scroll F)ORWARD or B)ACKWARD through the inventory.
P)URCHASE an item by entering a number after pressing P
return to the S)TART of the list -- or --
L)EAVE the shelves.

If you attempt to buy something that the character cannot use (for example, a mage buying plate mail) you will be asked to confirm the purchase.

S)ELLING an item will display the items you have, along with the price that will be paid for it, which is generally half the buying price. Unidentified items are only worth one gold piece.
YOU can do it three times, and YOU can cast your third-level spell one time. Above that is a short list of your option keys, and between the maze display times. Since YOU know only one second-level spell YOU can throw only it, but...combination. YOU have the ability to cast any of your first-level spells five light.

You can inspect any character by pressing his number, just like in the Tavern. disbanded characters are still alive and retain all of their possessions.

Assuming that you know how to cast, and that you have a spell point left to use to cast it. Remember that for each level of power of spells for both magical and priestly spells, you are given a number of spells you can cast. Say you have five first-level, three second-level and one third-level priestly spells. If YOU know (have in your spell books) three first-, one second- and one third-level spell, that means that YOU can cast any of your three first-level spells five times, or two once and one three times, or any combination. YOU have the ability to cast any of your first-level spells five times. Since YOU know only one second-level spell YOU can throw only it, but you can do it three times, and YOU can cast your third-level spell one time.

DISBANDING the party is useful if your party is totally lost or so weakened that YOUR chances of getting to the castle are remote. Disbanding your party essentially leaves your characters in the maze waiting until a new party can rescue the disbanded members. The status of disbanded characters is similar to characters who have been slaughtered in the maze. The difference is that disbanded characters are still alive and retain all of their possessions. Additionally, there is no chance the monster will snack on them. Disbanded party members can be located using the KANDI spell and rescued when found by inspection. The INSPECT area option is described later on in the manual. Your disbanded characters will age 1/2 year as the have to wait around for someone to come and get them.

Note that it is possible to be able to throw spells of the second or higher level, but not know any spells of that level!

For many of the camp spells, especially curative spells, you will be asked who is to be the object of the spell. The characters and their numbers will be displayed and YOU will press the number of the character who is to receive the spell.

Some magic items, such as scrolls or wands, can cast magic or priestly spells as well. By USING those items YOU can cast the spell at no cost to YOU. Again, YOU may be asked who is to receive the spell. Also, there is a chance that the item will lose its magic powers. Scrolls are only good for one application, but a wand may last for 20 or 30!

The other options in the camp are: EQUIP THE ENTIRE PARTY, REORDER THE PARTY, and LEAVE THE CAMP.

EQUIP does the same as the equip that YOU can do in the inspect page, but it does it for everyone in the party. It is very handy the first time YOU go into the maze.

REORDER lets you select the order in which the players will march through the maze. When fighting monsters, only the first three characters can attack with weapons, and in turn be physically attacked by monsters. Thus, it is a good idea to have the weaker and less armored characters in the rear. You will be asked for the number of the character who is to go into first position, the number of the character who is to go in the second position, etc.

D)isbanding the party is useful if your party is totally lost or so weakened that YOUR chances of getting to the castle are remote. Disbanding your party essentially leaves your characters in the maze waiting until a new party can rescue the disbanded members. The status of disbanded characters is similar to characters who have been slaughtered in the maze. The difference is that disbanded characters are still alive and retain all of their possessions. Additionally, there is no chance the monster will snack on them. Disbanded party members can be located using the KANDI spell and rescued when found by inspection. The INSPECT area option is described later on in the manual. Your disbanded characters will age 1/2 year as the have to wait around for someone to come and get them.

LEAVE lets you break camp and go into the maze. This is where the real adventure begins.

Once in the maze, a Hi-Resolution graphics display is used. The information about your characters is at the bottom of the screen. In the top left corner is a 3D Hidden Surface display of where you are in the maze. To the right of it is information about which spells are active at the time, such as protection or light.

Above that is a short list of your option keys, and between the maze display and the status information is a blank area where messages may appear. At some
locations you will find special objects such as messages, pits, stairs, etc. When you move onto one of those squares a message to that effect will appear. When you enter the maze from the city, you are at the bottom of a set of stairs.

Wizardry uses a 3D perspective plot of the maze as you would see it if you were actually there. You will see the walls of the maze extending into the distance. By using a spell such as MILLWA you can light up the maze so that you can see further, and also see secret doors.

Try to get a good idea of the relationship between a top view (a map) and the 3D perspective view. Mapping is an essential part of Wizardry, and the use of the 3D display makes it more challenging and interesting.

While moving around, your options are:

- F - moves you forward a step in the direction you are facing
- L - turns you left
- R - turns you right
- K - lets you kick through a door if it is right in front of you
- S - updates the status area
- C - enters the camp
- T - lets you change the display delay time. This is the time the game waits to let you see some message in combat. A delay of 1 lets messages flash with no delay. A delay of 5000 will leave messages on the screen for about five seconds.
- Q - lets you toggle quick plotting of the maze. See the LOMILWA spell description for more information.
- I - lets you inspect the current area you are in for dead bodies. See below for more details.

As an aid to quick movement, the W-A-D cluster of keys can be used in place of the F-L-R arrangement. If you place your left hand above the S key you will see that your middle three fingers fall onto the W-A-D cluster. To move in any direction, press with the finger that points to that direction. To turn left, press the leftmost finger (A). To turn right, press the rightmost finger (D). And to go forward, press the center (W). With a little practice you will find this arrangement to be very handy and natural, as you can keep the fingers of your left hand on the keys at all times, and use the leftmost two fingers of the right hand to press K.

As you move through the maze you may find many interesting things, and messages and questions may appear. You may also encounter monsters, in which case, combat may ensue.

It is a good idea to keep a map of the maze. This lets you get back to the exit. Also, be aware that there are secret doors which you rarely see, but you can get through by trying to Kick it. If there is a door where you Kick, you’ll go through. Otherwise, you’ll stub your toe!

As was mentioned above, the Inspect option lets you search the maze for the bodies of slain adventurers. When an entire party is wiped out (no one makes it back to the castle and the cemetery is displayed) the bodies may or may not be eaten by the monsters. The most likely consequence is that a body will be stripped of some gold and equipment and left where it fell. Less likely is that it may be dragged to another location in the maze, perhaps even lower down. Least likely, but an increasing chance the deeper you are in the maze, is that the body will be devoured. The RANDD spell may be used to locate dead adventurers.

When you Inspect, a search is made for all dead bodies in the same area as the party. A body is in the same area if you can get to it without going through a door. So, it must be in the same room or corridor as you are. If bodies are found, they will be displayed with a number to the left. You can press "P" to pick up or "L" to leave. When you press "P", you will be asked for the number of the character to pick up. When a character is picked up he is added to the party, and so if the party is six strong, you cannot pick up any more party members.

Once back in the castle, the normal Temple donations can be used to obtain the correct spells for revival of the characters.

A direct consequence of this is that any character you don’t want any more because he died and is lost somewhere in the maze, has to be deleted via the Training Grounds. If you do not delete him, space will be wasted on disk and may not be available to others. Also, since the dead characters are taken away from the party by the guards when the party returns to the castle, it is a good idea to strip them of items of gold before returning to the castle. If the character cannot be raised from the dead, and is dead forever, the Temple will sacrifice all he has to the gods, because he obviously did something to deserve not being restored.

Combat...

Without some sort of challenge, Wizardry would just be a game of mapping. And after all, who gathers all the money in the maze together so that characters can get it all in nice packages? That’s right, it’s the job of the hardworking, and hopefully luckless, monsters. Thus, every so often your party will encounter monsters. They may be wandering around like you, or they may be inhabitants of a room that you have just entered. In any case, since monsters do not generally like the habits, morals, and taste in armor and weaponry of characters, and because they really do like the smell and taste of a good “leg of adventurer”, it is likely that a fight will take place.

When you have encountered monsters, a message to that effect will appear. In a few seconds that will be replaced with a display of the monsters that are opposing you, as well as a full color picture of the monsters.

For each group of monsters, and there can be four of them, you will be told the group number of the monsters, how many there are, what they appear to be, and, in parentheses, how many are able to attack the party.

It is interesting to note that you do not always know exactly what the monsters are! Most of the time you will be told what they look like, and later on in the melee you will find out what they really are. There is a small chance that if your party is of GOOD alignment (no evils and at least one good character), the monsters you meet may be friendly and will invite you to pass. If not, however, combat will ensue. Combat consists of a series of rounds, during which each
character and monster can do a single activity. First, the computer decides what the monsters are going to do. You may notice monsters moving forward in order to attack you. Monsters in group 1 are the closest to you, so they have the best chance of being able to physically attack you, and physical attacks by characters have a better chance of hitting them. Spells can be cast without penalty by any monster in any group which has the ability to cast spells, thus spell casting monsters will generally hang back, where it is harder for your fighters to attack them. Similarly, the first 3 characters in your party automatically defend the second three (if any). This means that the second three cannot be attacked physically. It also means that they cannot physically attack the monsters.

COMBAT OPTIONS

After the monsters have made their decisions, it is time for you to select the activities your characters will engage in. In the area where the active spells were displayed, a list of options will be presented for each character. Just as in other areas of Wizardry, options can be selected by pressing a single key. The options are:

F - Fight a monster. If more than one group of monsters oppose the party, you will have to press the number of the group you want to fight.

P - Parry. You use your weapon as a tool of defense. Makes you harder to hit.

S - Spell. You enter the spell you wish to cast and if you can cast it, you may be asked which group or person you wish to cast it on.

U - Use an item. A list of items that can cast a spell are displayed and you can use an item by pressing the number of the desired item. Or, you can press RETURN to try another option. You may be asked the further questions needed to direct the spell to the proper recipient.

R - Run! Using this option causes the entire party to try to run. There is a chance your party won't get away, which is dependent on depth in the maze, party size, etc. If you don't get away, the monsters may chase you through several rooms, so running can get you lost!

D - Dispell. This option is only available to Priests, and high level Bishops. You enter the spell casting monsters will generally hang back, where it is harder for your fighters to attack them. Similarly, the first 3 characters in your party automatically defend the second three (if any). This means that the second three cannot be attacked physically. It also means that they cannot physically attack the monsters. When all this is done, the computer will mediate the combat. Actions as they occur will appear in the message area. It may be that your character will be killed or incapacitated before he has a chance to do what you wanted him to. At the end of the round the statuses are replotted. Dead or incapacitated characters are shifted to the back of the marching order. Monster groups totally destroyed will disappear and the other groups will shift up. If you are fighting three groups and you kill off group 1, then the second and third group would shift up to become the first and second group.) Remember that the number after the monster name in parentheses is the number of live monsters that are active. For example:

<table>
<thead>
<tr>
<th>Group</th>
<th>Name</th>
<th>Level</th>
<th>Hit Points</th>
<th>Movement</th>
<th>Special Ability</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>BUSHWACKERS</td>
<td>4</td>
<td>100</td>
<td>Fast</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Wraiths</td>
<td>6</td>
<td>150</td>
<td>Slow</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Skeletons</td>
<td>5</td>
<td>120</td>
<td>Average</td>
<td></td>
</tr>
</tbody>
</table>

You can select a group to fight or press RETURN to go back and see the other groups. If you press RETURN the computer will mediate the combat for you. At this point, you can press RETURN to commence fighting out the round, or press "B" to go back and re-enter the activities all over again.

When you are ready to select activities for your characters, you will have to press the number of the group or person you wish to fight. Reminder:

Dead or Incapacitated characters are not left in the maze, but are automatically carried by surviving party members. Only when the entire party is slaughtered are characters strewn about the maze. It is these unfortunate who can be searched for via the I)nspect option and the Kandi spell.

The experience each character gets will be plotted where the monsters named were listed, and the gold and items found, if any, will plot in the message area.

However, there might be one slight problem! The treasure may be in a chest, which you will have to open. And there may some sort of trap in the chest.

However, chests can hold a lot more loot.

If a treasure chest is found, you will have to try to open it. A chest will be displayed, and you will have the following options. Each will ask you who is doing the action, and you will have to enter the number of that person.

O - Open the chest. If you think the chest is not trapped, then just open it!

I - Inspect the chest. There is a chance that inspecting the chest will set off the trap (if there is one), but the chance is much lower for Thieves. If you inspect you will be told what you think the trap is. But it may not be that at all! Each person can inspect only once.

C - CALFO spell. This spell is a priestly spell that determines the correct trap 95% of the time. Only a character that knows the CALFO spell, and has the spell points to cast it may use this spell.

D - Disarm the trap. You will have to enter what trap you think it is, and had better not make any spelling mistakes. If you enter the wrong trap name, and the trap goes off, you may be in big trouble.
Apple II Computer Info

I - Leave the chest alone. You don't get the loot but you don't set off any traps either.

After the chest has been opened, the loot will be distributed evenly between surviving characters, and any items found will be distributed randomly. It is a good idea to leave one or two of your item slots open so that you get your fair share.

After the combat, it may be a good idea to CJAMP and cast a few restorative spells if anyone got hurt. Otherwise, it's onward, ever onward!

TIPS FOR BEGINNERS

- Balance your party. When first starting out, have a party of 2 fighters, a priest, a thief, and 2 mages. This is the strongest party you can make out of level 1 to 3 characters.

- Remember that "Discretion is the better part of Valor." A good motto for beginning adventurers might be "He who lives to quits and runs away, lives to fight another day." It is inevitable that you will eventually meet a group of monsters tougher than you are. If party members start dropping right and left, run for it.

- Use your spell casters wisely. When fighting monsters, have them use *KATINGO* to knock out the opposition so you can slit their throats. Of course, this may not work against some monsters, and these you should run from until you are more powerful.

- If anyone gets hurt, or if you use any spells, get out of the maze as fast as you can and recuperate. The best way to build up character is to dash into the maze, fight one encounter and run out again.

- Make accurate maps, and check them constantly. Be wary of nasty tricks designed to create inaccurate maps. Maps are especially useful if you are running away from monsters a lot.

-END- 1 of 2

MAGIC...

The acquisition and use of magic items is of paramount importance to the successful adventurer. A good magic item can be worth any price in certain situations.

Magic items range from one-use potions and scrolls to some of the most powerful artifacts known. Some are available in the Trading Post, but most of the really important ones can only be found in the depths of the maze, usually guarded by fearsome monsters.

Magic items may do many things. Generally they will do one or more of the following:

- Cast a spell
- Alter armor class
- Alter fighting ability
- Protect against certain monsters
- Work better against certain monsters
- Give the user special abilities
- Be useable only by certain characters

There are some magic items that will do other things. These capabilities will only come to light when they are used.

When magic items are first found in the maze, their true nature is not known. Only Bishops or the Trading Post can identify them. Even so, some items may have hidden attributes. Some items are Cursed. When you have a cursed item in your possession and you equip, you will be forced to use it! This usually has detrimental consequences, especially when your sword decides not to fight anymore!

When a Bishop inspects an item, he takes a chance that he will touch it. If this happens he is forced to equip, and if it is cursed, too bad.

While some items can cast spells, most spell casting is done by Mages, Priests and the like. There are 50 spells, divided into Mage and Priest categories. Each category is further divided into seven levels of power. The higher the level of the spell, the more potent it is. Each spell has a "power word" required to cast it, and when asked what spell is to be cast, this word must be entered. Following is a complete description of all the spells. For each spell, the name, translation, level, type of spell and area of effect are given. The type of spell refers to when the spell can be cast (Combat, Camp, or anytime).

PRIEST SPELLS

LEVEL 1 PRIEST SPELLS

<table>
<thead>
<tr>
<th>Spell Name</th>
<th>KALAKI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Translation</td>
<td>BLESSINGS</td>
</tr>
<tr>
<td>Spell Level</td>
<td>1</td>
</tr>
<tr>
<td>Spell Type</td>
<td>COMBAT</td>
</tr>
<tr>
<td>Area of Effect</td>
<td>THE PARTY</td>
</tr>
</tbody>
</table>

KALAKI reduces the AC of all party members by one, and thus makes them harder to hit.

<table>
<thead>
<tr>

<td>1 PERSON</td>
</tr>
</tbody>
</table>

DIOS restores from one to eight hit points of damage from a party member. It
will not bring dead back to life.

**Spell Name**: BADIOS  
**Translation**: HARM  
**Spell Level**: 1  
**Spell Type**: COMBAT  
**Area of Effect**: 1 MONSTER

BADIOS causes one to eight hit points of damage to a monster, and may kill it. It is the reverse of DIOS. Note the BA prefix which means "not".

**Spell Name**: MILWA  
**Translation**: LIGHT  
**Spell Level**: 1  
**Spell Type**: ANY TIME  
**Area of Effect**: ENTIRE PARTY

MILWA causes a softly glowing light to follow the party, allowing them to see further into the maze, and also revealing all secret doors. See also LOMILWA. This spell lasts only a short while.

**Spell Name**: PORFIC  
**Translation**: SHIELD  
**Spell Level**: 1  
**Spell Type**: COMBAT  
**Area of Effect**: CASTER

PORFIC lowers the AC of the caster considerably. The effects last for the duration of combat.

**LEVEL 2 PRIEST SPELLS**

**Spell Name**: MATU  
**Translation**: BLESSING & ZEAL (?translation uncertain)  
**Spell Level**: 2  
**Spell Type**: COMBAT  
**Area of Effect**: ENTIRE PARTY

MATU has the same effects as KALKI but at double the strength.

**Spell Name**: CALFO  
**Translation**: X-RAY VISION  
**Spell Level**: 2  
**Spell Type**: LOOTING  
**Area of Effect**: CASTER

CALFO allows the caster to determine the exact nature of a trap on a chest 95% of the time.

**Spell Name**: MANIFO  
**Translation**: STATUE  
**Spell Level**: 2  
**Spell Type**: COMBAT  
**Area of Effect**: 1 GROUP OF MONSTERS

MANIFO causes some of the monsters in a group to become stiff as statues for one or more melee rounds. The chance of success, and the duration of the effects, depend on the power of the target monsters.

**Spell Name**: MONTINO  
**Translation**: STILL AIR  
**Spell Level**: 2  
**Spell Type**: COMBAT  
**Area of Effect**: 1 GROUP OF MONSTERS

MONTINO causes the air around a group of monsters to stop transmitting sound. Like MANIFO, only some of the monsters will be affected, and for varying lengths of time. Monsters and Party members under the influence of this spell cannot cast spells, as they cannot utter the spell words!

**LEVEL 3 PRIEST SPELLS**

**Spell Name**: LOMILWA  
**Translation**: MORE LIGHT  
**Spell Level**: 3  
**Spell Type**: ANY TIME  
**Area of Effect**: ENTIRE PARTY

LOMILWA is a MILWA spell with a much longer life span. Note that when this spell, or MILWA are active, the Q option while moving through the maze is active. If QUICK PLOTTING is on, only the square you are in, and the next two squares will plot. Normally, you might see five or six squares ahead with LOMILWA on. Quick Plotting lets you move fast through known areas. Note that it will be turned off when you enter camp or combat mode.

**Spell Name**: DIALKO  
**Translation**: SOFTNESS/SUPPLE (? exact translation difficult)  
**Spell Level**: 3  
**Spell Type**: ANY TIME  
**Area of Effect**: 1 PERSON

DIALKO cures paralysis, and removes the effects of MANIFO and KATINO from one member of the party.

**Spell Name**: LATUMAPIC  
**Translation**: IDENTIFICATION  
**Spell Level**: 3  
**Spell Type**: COMBAT  
**Area of Effect**: ENTIRE PARTY

LATUMAPIC makes it readily apparent exactly what the opposing monsters really are.

**Spell Name**: BAMATU  
**Translation**: PRAYER  
**Spell Level**: 3  
**Spell Type**: LOOTING  
**Area of Effect**: ENTIRE PARTY

BAMATU has the effect of MATU at twice the effectiveness.

**LEVEL 4 PRIEST SPELLS**

**Spell Name**: DIAL  
**Translation**: HEAL (MORE)  
**Spell Level**: 4  
**Spell Type**: ANY TIME  
**Area of Effect**: 1 PERSON

DIAL restores 2 to 16 hit points of damage, and is similar to DIOS.

**Spell Name**: BADIAL  
**Translation**: HURT (MORE)  
**Spell Level**: 4  
**Spell Type**: COMBAT  
**Area of Effect**: 1 MONSTER

BADIAL causes 2 to 16 hit points of damage in the same way as BADIOS.

**Spell Name**: LATUMOFIS  
**Translation**: CURE POISON  
**Spell Level**: 4  
**Spell Type**: ANY TIME  
**Area of Effect**: 1 PERSON
LATOMOFIS makes a poisoned person whole and fit again. Note that poison causes a person to lose hit points steadily during movement and combat.

- Spell Name: MAPORFIC
  - Translation: SHIELD (BIG)
  - Spell Level: 4
  - Spell Type: ANY TIME
  - Area of Effect: ENTIRE PARTY

MAPORFIC is an improved PORFIC, with effects that last for the entire expedition.

LEVEL 6 PRIEST SPELLS

- Spell Name: LORTO
  - Translation: BLADES
  - Spell Level: 6
  - Spell Type: COMBAT
  - Area of Effect: 1 GROUP

LORTO causes sharp blades to slice through a group, causing 6 to 36 points of damage.

- Spell Name: MADI
  - Translation: HEALING
  - Spell Level: 6
  - Spell Type: ANY TIME
  - Area of Effect: 1 PERSON

MADI causes all hit points to be restored and cures any condition but death.

LEVEL 5 PRIEST SPELLS

- Spell Name: DIALMA
  - Translation: HEAL (GREATLY)
  - Spell Level: 5
  - Spell Type: ANY TIME
  - Area of Effect: 1 PERSON

DIALMA restores 3 to 24 hit points.

- Spell Name: BADIALMA
  - Translation: HURT (GREATLY)
  - Spell Level: 5
  - Spell Type: COMBAT
  - Area of Effect: 1 MONSTER

BADIALMA causes 3 to 24 hit points of damage.

- Spell Name: LITOKAN
  - Translation: FLAME TOWER
  - Spell Level: 5
  - Spell Type: COMBAT
  - Area of Effect: 1 GROUP

LITOKAN causes a pillar of flame to strike a group of monsters, doing 3 to 24 hit of damage to each. However, as with many spells that effect entire groups, there is a chance that individual monsters will be able to avoid or minimize its effects. And some monsters will be resistant to it.

- Spell Name: KANDI
  - Translation: LOCATION
  - Spell Level: 5
  - Spell Type: CAMP
  - Area of Effect: 1 PERSON

KANDI allows the user to locate dead bodies of other characters. It tells on which level, and in which rough area the dead one can be found.

- Spell Name: DI
  - Translation: LOCATION
  - Spell Level: 5
  - Spell Type: CAMP
  - Area of Effect: 1 PERSON

DI causes a dead person to be resurrected. However, the renewed character has but one hit point. Also, this spell is not as effective or as safe as using the Temple.

- Spell Name: KADORTO
  - Translation: LOCATION
  - Spell Level: 5
  - Spell Type: CAMP
  - Area of Effect: 1 PERSON

KADORTO restores the dead to life as does DI, but also restores all hit points. None can escape or minimize its effects.

- Spell Name: MALIKTO
  - Translation: THE WORD OF DEATH
  - Spell Level: 7
  - Spell Type: COMBAT
  - Area of Effect: ALL MONSTERS

MALIKTO causes 12 to 72 hit points of damage to all monsters. None can escape or minimize its effects.

MAGE SPELLS

LEVEL 1 MAGE SPELLS

- Spell Name: HALITO
  - Translation: LITTLE FIRE
  - Spell Level: 1
  - Spell Type: COMBAT
  - Area of Effect: 1 MONSTER

BADI gives the affected monster a coronary attack. It may or may not cause death to occur.
HALITO causes a flame ball the size of a baseball to hit a monster doing from 1 to 8 hit points of damage.

**Spell Name:** MOGREF
**Translation:** BODY IRON
**Spell Level:** 1
**Spell Type:** COMBAT
**Area of Effect:** CASTER

MOGREF reduces the casters AC by two. The effect lasts the entire encounter.

**Spell Name:** KATINO
**Translation:** BAD AIR
**Spell Level:** 1
**Spell Type:** COMBAT
**Area of Effect:** 1 GROUP

KATINO causes most of the monsters in a group to fall asleep. KATINO only affects normal animal or humanoid monsters. The chance of the spell affecting an individual monster, and the duration of the affect is inversely proportional to the power of the monster. While asleep, monsters are easier to hit and successful strikes do double damage!

**Spell Name:** DUMAPIC
**Translation:** CLARITY (difficult to translate)
**Spell Level:** 1
**Spell Type:** CAMP
**Area of Effect:** NOT APPLICABLE

DUMAPIC informs you of the party's exact displacement from the stairs to the castle, vertically, and North and East, and also tells you what direction you are facing.

**LEVEL 2 MAGE SPELLS**

**Spell Name:** DILTO
**Translation:** DARKNESS
**Spell Level:** 2
**Spell Type:** COMBAT
**Area of Effect:** 1 MONSTER GROUP

DILTO causes one group of monsters to be enveloped in darkness, which reduces their ability to defend against your attacks.

**Spell Name:** SOPIC
**Translation:** GLASS
**Spell Level:** 2
**Spell Type:** COMBAT
**Area of Effect:** CASTER

SOPIC causes the caster to become transparent. This means that he is harder to see, and thus his AC is reduced by four.

**LEVEL 3 MAGE SPELLS**

**Spell Name:** MAHALITO
**Translation:** BIG FIRE
**Spell Level:** 3
**Spell Type:** COMBAT
**Area of Effect:** 1 MONSTER GROUP

MAHALITO causes a firey explosion in a monster group, doing 4 to 24 hit points of damage. As with other similar spells, monsters may be able to minimize the damage done.

**Spell Name:** LAKANITO
**Translation:** SPARK STORM
**Spell Level:** 3

LAKANITO causes sparks to fly out and damage about half of the monsters in a group. Three to 18 hit points of damage are done with no chance of avoiding the sparks.

**LEVEL 4 MAGE SPELLS**

**Spell Name:** MORLIS
**Translation:** FEAR
**Spell Level:** 4
**Spell Type:** COMBAT
**Area of Effect:** 1 MONSTER GROUP

MORLIS causes one group of monsters to fear the party greatly. The effects are the same as a double strength DILTO spell.

**Spell Name:** DALTO
**Translation:** BLIZZARD BLAST
**Spell Level:** 4
**Spell Type:** COMBAT
**Area of Effect:** 1 MONSTER GROUP

DALTO is similar to MAHALITO except that cold replaces flames. Also, 6 to 36 hit points of damage are done.

**LEVEL 5 MAGE SPELLS**

**Spell Name:** MAKANITO
**Translation:** DEADLY AIR
**Spell Level:** 5
**Spell Type:** COMBAT
**Area of Effect:** ALL MONSTERS

MAKANITO is similar to MORLIS, except that all monster groups are affected.

**LEVEL 6 MAGE SPELLS**

**Spell Name:** LAXANITO
**Translation:** SUFDOCATION
**Spell Level:** 6
**Spell Type:** COMBAT

LAXANITO is an improved DALTO, causing 8 to 64 hit points of damage.
Area of Effect : 1 MONSTER GROUP

All monsters in the group affected by this spell die. Of course, there is a chance that some of the monsters will not be affected.

Spell Name  : ZILMAN
Translation : DISPEL
Spell Level : 6
Spell Type  : COMBAT
Area of Effect : 1 MONSTER

This spell will destroy any one monster that is of the Undead variety.

Spell Name  : MASOPIC
Translation : BIG GLASS
Spell Level : 6
Spell Type  : COMBAT
Area of Effect : 1 MONSTER

This spell duplicates the effects of SOPIC for the entire party.

Spell Name  : HAMAN
Translation : CHANGE
Spell Level : 6
Spell Type  : COMBAT
Area of Effect : VARIABLE

This spell is indeed terrible, and may backfire on the caster. First, to even cast it, you must be of the thirteenth level or higher, and casting it will cost you one level of experience. The effects of HAMAN are random, and usually help the party.

LEVEL 7 MAGE SPELLS

Spell Name  : MALOR
Translation : APPORT
Spell Level : 7
Spell Type  : COMBAT and CAMP
Area of Effect : ENTIRE PARTY

This spell's effects depend on the situation the party is in when it is cast. Basically, MALOR will teleport the entire party from one location to another. When used in melee, the teleport is RANDOM, but when used in camp, where there is more chance for concentration, it can be used to move the party anywhere in the maze. Be warned, however, that if you teleport outside of the maze, or into an area that is solid rock, you will all be lost forever, so this spell is to be used with the greatest of care. Combat use of MALOR will never put you outside of the maze, but it may move you deeper in, so it should be used only in panic situations.

Spell Name  : MAHAMAN
Translation : GREAT CHANGE
Spell Level : 7
Spell Type  : COMBAT
Area of Effect : ENTIRE PARTY

The same restrictions and qualifications apply to this spell as do to HAMAN. However, the effects are even greater. Generally these spells are only used when there is no other hope for survival.

SYSTEM REQUIREMENTS:
1 APPLE COMPUTER
1 DISK DRIVE W/DOS 3.3 IN SLOT 6
1 APPLE COMPATIBLE PRINTER (IN ANY SLOT)

WIZIPRINT ESSENTIALLY PRINTS OUT THE ENTIRE STATISTICS OF ANY WIZARDRY CHARACTER OR AN ENTIRE ROSTER OF ANY SCENARIO.

TO BEGIN USING WIZIPRINT, YOU MUST FIRST ADAPT IT TO YOUR COMPUTER.
BOOT UP THE DISK AND A TITLE PAGE WILL APPEAR, PRESS [RETURN] TO CONTINUE.

AFTER HITTING [RETURN] THE NEXT SCREEN SHOWS THE CURRENT VALUES OF THE FIVE SYSTEM PARAMETERS. EACH PARAMETER MUST BE MODIFIED TO YOUR SYSTEM. THE DEFAULT VALUES MAY BE USED BY HITTING [RETURN].

THE FIVE PARAMETERS ARE AS FOLLOWS:

A: SELECTS THE SLOT IN WHICH YOUR PRINTER INTERFACE RESIDES. SELECT THE SLOT IN WHICH YOUR PRINTER CARD IS IN. DO NOT WORRY ABOUT WHAT TYPE OF PRINTER CARD YOU HAVE, AS THE PROGRAM SUPPORTS MOST APPLE COMPATIBLE Printers.

C: SOME PRINTER AND PRINTER CARDS NEED SPECIAL CODES TO PROPERLY OPERATE WITH YOUR COMPUTER. THESE CODES TELL THE PRINTER TO DO CERTAIN THINGS, SUCH AS 80 COLUMN PRINTING. THIS OPTION HAS A DEFAULT OF [CTRL-180N]. IT IS RECOMMENDED THAT THE FIRST TIME YOU USE WIZIPRINT, YOU LEAVE THE DEFAULT ALONE. IF YOUR PRINTER DOES NOT COOPERATE WITH THE PROGRAM THEN CHANGE THIS OPTION TO A BLANK FIELD. THIS IS DONE BY HITTING [SPACE BAR] THEN [RETURN]. IF THIS ALSO DOES NOT WORK THEN CHECK YOUR PRINTER AND PRINTER CARD MANUALS FOR THE NECESSARY CONTROL CODES AND REBOOT. MANY OF THESE CODES CANNOT BE DIRECTLY TYPED ON AN APPLE KEYBOARD, SO THEIR DECIMAL EQUIVALENTS (CHECK MANUALS) ARE USED. WIZIPRINT USES \[SHIFT-N\] ON THE APPLE II+ AND \[SHIFT-6\] ON THE IIE TO CONTAIN DECIMAL EQUIVALENTS. THIS IS ALL EXPLAINED IN THE PRINTER OR PRINTER CARD MANUAL. CONSULT THEM FOR ANY

PROBLEMS. IN CASE IT ISN'T OBVIOUS TO YOU, THE PRINTER MUST BE SET UP FOR 80 COLUMNS.

D: ALLOWS YOU TO CUSTOMIZE YOUR PRINTOUT BY INCLUDING YOUR NAME. THE PROGRAM ACCEPTS NAMES UP TO 40 CHARACTERS IN LENGTH.

E: THIS FEATURE NOTES THE CURRENT DATE. USING THE DATE FEATURE IS A PRETTY GOOD IDEA IF YOUR TEAM IS ENTERING THE DUNGEON EVERYDAY AND CONSTANTLY CHANGING STATISTICS. THE PROGRAM ACCEPTS STRINGS UP TO 9 CHARACTERS IN LENGTH. FOR ONCE A DAY EXCURSIONS, IT MAY BE BEST TO USE THE DAY-MONTH-YEAR (09-APR-84) FORMAT. FOR VETERAN PLAYERS, IT MAY BE BEST TO USE THE DAY-MONTH- FORAY STRUCTURE.

AFTER THE PARAMETERS ARE CHANGED, THE PROGRAMS OFFERS THE OPTION OF SAVING THE FORMAT TO DISK AS NEW DEFAULT VALUES. IT IS RECOMMENDED THAT THIS BE DONE EACH TIME, AS IT HELPS KEEP TRACK OF THE FORAY NUMBER.

THE MAJOR OPERATIONS

ONCE YOU HAVE SELECTED ALL THE PARAMETERS, THE PROGRAM WILL ASK YOU TO INSERT ANY WIZARDRY SCENARIO DISK IN DRIVE 1. FIRST, REMOVE THE WIZIPRINT DISK AND PUT IT AWAY. INSERT THE WIZARDR DISK WITH THE SCENARIO SIDE UP, INTO DRIVE 1 AND PRESS [RETURN]. WIZIPRINT WILL AUTOMATICALLY LOAD ALL THE CHARACTERS ON THAT DISK INTO MEMORY AND SORT THEM IN ORDER OF THEIR LEVELS. THE FULL ROSTER WILL BE LISTED ON THE SCREEN. DESIMAS EACH CHARACTER NAME WILL APPEAR A LETTER FROM A TO T. FOUR OPTIONS MAY NOW BE SELECTED:

[*]: TO PRINT OUT THE ENTIRE ROSTER

[LETTER]: TO PRINT OUT A SPECIFIC CHARACTER'S STATISTICS. AFTER THE CHARACTER IS SELECTED, IT'S NAME IS TOSSED INTO THE RIGHT COLUMN. A GOOD TECHNIQUE IS TO SELECT THE CHARACTERS IN THE SAME ORDER AS THEY NORMALLY APPEAR IN THE ADVENTURE PARTY. THIS MAKES FOR QUICK & EASY REFERENCING.

[RETURN]: HITTING THIS KEY PRINTS OUT ALL THE STATISTICS OF THE CHARACTERS LISTED IN THE RIGHT HAND COLUMN, IN THE ORDER THEY WERE SELECTED.

[ESCAPE]: ALLOWS YOU TO CHANGE SCENARIO DISKS, THEN LOAD A NEW ROSTER FOR PRINTOUT.

*** NOTE ***

WHILE WIZIPRINT IS RUNNING IT FREQUENTLY ACQUIRES THE DISK TO RETRIEVE THE VITAL STATISTICS OF EACH CHARACTER. DO NOT REMOVE THE SCENARIO DISK FROM DRIVE 1 UNTIL, WIZIPRINT IS COMPLETELY FINISHED PRINTING.

Apple II Computer Info
Docs for Woggle 0.9b --

Note that this program is Shareware. Those using and enjoying this program are required to send $15 to

William Gulstad
1704 Cliff Drive
Columbia MO 65201.

Now, on with the fun stuff. This is a fractal display program. It handles both Mandelbrot and Julia sets, and can do magnifications/offsets to your heart's content. The math routines are based around the multiplication of 32 bit integers, and the graphics have absolutely nothing to do with SlowDraw, except for the pointer, which I was too lazy to do myself.

The program is text based (you use a modified version of my Conch Shell command line), with commands to switch to and from the graphics screen. The mouse is used only for specifying points on the set. Both 320 and 640 modes, and dithering are supported, though the latter format still needs work.

The following are commands specifically related to fractal generation. Note that the program begins in graphics mode, so if you need to see to type, you must use the GRAFOFF command to get the text screen.

\begin{verbatim}
SSAVE filename   save just the picture
SLOAD filename   load just the picture
SAVE filename    save picture and parameters
LOAD filename    load picture and parameters
QUIT             exit the program
FREAK            does something freaky
WEIRD            does something weird
BOZO             starts drawing
CD               clears the screen
GO               starts drawing for dweeb
RESUME [x y]     resumes, with optional coords
MAXWELL [num]    sets or prints the maximum dwell
ESCAPE [num]     sets or prints the escape radius
MUSE              makes the pointer visible and waits
MAG [num]        magnifies around the last point
JULIA            switches to Julia mode
MANDEL           switches to Mandel mode
TRIGGER [num]    don't fiddle with this
320              sets 16-color mode
640              sets 4-color mode
PAL num          selects from 16 palettes
DITHER [0 or non 0]     turns dithering on/off
\end{verbatim}

Notes:

1) "MAG 0" resets the default view; "MAG num" means magnify num times around the last point specified (with the mouse) or the last point drawn.
2) Dwells are the number of iterations before the equation (Z <- Z+C) grows beyond the escape radius. Defaults are: Escape = 4 (2 squared); Maxwell = 100.
3) Saving without parameters makes it so the program will not know where a picture came from (the coordinates, magnification, mode, etc.) when you load it again.
4) Palette 5 is the dithering palette. It still needs work.
5) Resume does not resume the first stage of a drawing if you interrupt it.
6) You can stop drawing any time by pressing escape.
Apple II Computer Info

CD .. same as CD.. CREATE <FILENAME> [FTYPE] create FILENAME of type FTYPE
MKDIR <FILENAME> [FTYPE] same as CREATE

notes:

<Filename> is any legal filename
[FTYPE] is one of many supported three letter file types or a hex constant beginning with $ the default value is DIR
[ATYPE] is a SRC subtype (CCOM, etc.) or a hex constant starting with a $

Wildcards, by the way, are legal. More precisely, the use of the = sign as a wildcard is allowed. Do not use the Unix * as it has a different meaning in the GS/OS environment. You should only use the * to mean the boot volume name.

Also, in the CD and PREFIX commands, you can use the double dot (. ..) form, though normally its use will lead to an error.

Other than that, experiment. Bug reports are appreciated. Also, remember that in the future I will be releasing new and better versions of Conch Shell, but only if you send me monetary incentives. Otherwise, I will write the new versions, and give them to my friends, but I sure as hell won’t distribute them among the general public.

Note to major software houses --

This product is currently Shareware. However, if you are interested in including it in any bundled software package, you must first contact me and agree on a one-time-only fee or a percentage of profits deal, perhaps both. Please remember that more and more current and powerful versions of this program, with more and more unix-like commands, will be forthcoming. If you would like to market my program commercially under your label, I could provide you with a substantially improved version than that is generally available, thus making the product saleable. If the price is right, of course. I’m not greedy, but....

THE SOUTH POLE.........(312) 677-7140

***** Castle Wolfenstein II Maps *****

Here are the maps for Castle Wolfenstein II
They only tell you how to get where you are going and not what is in the rooms because it changes in every castle.

Written by T H E P E E L E R
The object of this brain teaser is to find all the smaller words in the title words.
Sounds easy, but for most of us it won't be. If you can't figure out all the words in one sitting, don't worry. The program saves your progress each time you play.

Further documentation is available in the program.

Happy word hunting!

EDITOR'S NOTE: There is the possibility that you will get a DISK FULL error on this program when it attempts to save data to disk. When UpTime is pieced together we put as much information as possible on the disk. If you should get a DISK FULL error copy the UpTime disk onto another disk and delete some of the files (not the ones listed below).

Files needed:

WORD FAIR
MARGARINE.SAV
RECRUITMENT.SAV
---

The Snatch Method-
[] To bend down and grasp the bar, pull the joystick BACK.
[] To begin lifting the bar, push the joystick FORWARD.
[] During the lift, pull the joystick BACK to drop underneath the bar and "snatch" it over your head.
[] To stand up from the squatting position, push the joystick FORWARD.
[] When two or more judges' lights in front of the platform turn WHITE, pull the joystick BACK to lower the weights back down to the floor.

The Clean Jerk-
[] To grasp the bar, pull the joystick BACK.
[] To begin lifting the bar, push the joystick FORWARD.
[] During the lift, pull the joystick BACK to "clean" the bar and drop into a squat with the bar resting on your chest.
[] To stand up from the squatting position, push the joystick FORWARD.
[] To "jerk" the bar above your head, pull the joystick BACK again.
To straighten your legs and complete the lift, push the joystick FORWARD one more time.

When two or more judges' lights in front of the platform turn WHITE, pull the joystick BACK to lower the weights to the floor.

Scoring: The winner is the lifter who successfully lifts the greatest weight. At least two of the judges must give white success lights for a lift to be considered successful. The judges vote on the accuracy of your timing. Two "hesitant" white votes mean your timing was poor. Three quick white votes mean your timing was perfect.

Timing: As the weight increases, timing becomes more critical. The right moment to clean the bar to your chest is easy to judge at lower weights, but extremely difficult as the Clean and Jerk approaches 200kg. After you clean the bar, wait the right amount of time to gather your strength for the final lift. Too short and the lifter isn't ready, too long and his strength gives out. The key to learning the timing is practice.

Strategy: The key to strategy in weightlifting is knowing when to increase the weight—and how much to increase it. Know your limits and those of your opponents out of the competition—but make sure you can lift the weight before you take the gamble!

Barrel Jumping:
-------------

To choose the number of barrels to jump, move and hold the joystick LEFT or RIGHT. Press the FIRE BUTTON to continue.

Your skater appears on the ice ready to start. Press the FIRE BUTTON to begin skating.

To move the skaters legs, move the joystick LEFT and RIGHT alternating in rhythm with the movement of his legs.

To skate faster, maintain your joystick movements in rhythm with his legs.

To jump, press the FIRE BUTTON. The green flag indicates a good take-off point for most jumps.

To prepare for landing, pull the joystick BACK.

Each player is allowed three attempts.

Scoring: The winner is the skater who clears the greatest number of barrels in one of their attempts with a successful landing.

Strategy: Build up as much speed as possible before jumping. The length of the jump depends on the speed at take-off. The timing of the jump is also important. If you jump too soon, you may not clear the last barrel—but if you jump too late, you may crash into the first barrel.

Cliff Diving:

To select the height of your dive, push the joystick FORWARD or pull BACK. Press the FIRE BUTTON to prepare for the dive.

Your diver will appear on the ledge you selected. Press the FIRE BUTTON to start the dive.

To arch your back during the dive, push the joystick FORWARD.

Before you enter the water, pull the joystick BACK to straighten out and complete the swan dive.

To avoid hitting the bottom surface under the water, move the joystick LEFT immediately after entering the water.

Each player is allowed three attempts.

Scoring:
Each diver is scored on the style and height of his dive. Smoothly executed swan dives score the highest style points. The highest scores are obtained with perfect swan dives from the highest ledge on "La Quebrada," while barely missing the rocks at the foot of the cliff.

Wind:
The wind velocity for each dive is indicated by the length of the arrow at the top of the screen. The stronger the wind, the longer you must keep your diver arched back arched to avoid the rocks.

Strategy:
The Depth of the water varies as waves go in and out. Try to time your dive in order to enter the water at its maximum depth. To achieve a better score, try to barely miss hitting the rocks near the foot of the cliff by arching your back as long as necessary during the dive. Also remember, that holding the joystick LEFT, RIGHT, FORWARD, or Back at the time of your leap adds extra velocity in that direction.

Slalom Skiing:
-------------

To start skiing down the course, press the FIRE BUTTON.

Control your skier's turns by moving the joystick LEFT or RIGHT to turn in that direction.

Press and hold the FIRE BUTTON as you move the joystick to increase your speed and turning sensitivity.

Complete the course by passing through each gate. A gate is two flags of the same color—you must pass between each pair of flags.

The gates alternate colors, so you must ski between blue flags, then red flags. Missing a gate adds a five second penalty.

Scoring: The winner is the skier who successfully completes the course with the fastest time. You will be disqualified if you fall. If you collide with a gate head on, you'll "wipe-out." Strategy: Sharp turns slow you down. Try to use moderate turns as often as you can, timing each turn to position yourself for the next gate. As you pass through one gate, you should be setting up your approach for the next gate down the hill.

Log Rolling:

.............

You may compete against another person or the computer.

When "Press your Fire Button" appears on either half of the screen, the player whose name appears on that half must press the joystick FIRE BUTTON. The next player does the same. This begins the event.

To move the lumberjack's legs, move the joystick LEFT and RIGHT. Stay in rhythm with the log or you may lose your balance.

To slow the rolling of the log from forward or backward, and change its direction, press the FIRE BUTTON while running.

Each player gets three attempts.

Scoring: The winner is the last lumberjack to remain on the log. A scoring bonus is awarded to the winner based on the balance of the two contestants. A balance meter is displayed at the bottom of the screen. You score points whenever your balance is better than your opponent's. Scoring also depends on the length of...
Sumo Wrestling:

Balance:
Establish rhythm with your lumberjack's legs; if you don't build speed at the correct rate he may lose his balance. The computer keeps balance meter for both players. When a lumberjack is off-balance, his arms extend to help him recover.

Strategy:
Make your opponent lose his balance by stopping the log, then changing the direction of the log's rotation quickly back and forth. Finish off your opponent by rolling the log rapidly n the direction that will cause him to fall off.

Bull Riding:

[] To choose which bull you want to ride, move the joystick FORWARD or BACK. The bulls are named (from easiest to hardest) Ferdinand, Elmer, Bob, Tornado, and earthquake.
[] Press the FIRE BUTTON to start the event.
[] To respond to the bull's movements, move the joystick as follows: BUCK: If the bull is bucking, move the joystick LEFT or RIGHT, in the direction that the bull is moving. SPIN: Pull the joystick BACK to stay on the bull when it is spinning. HALT: Move the joystick LEFT or RIGHT in the opposite direction that the bull is moving.

Scoring: Scoring is based on the style and length of the ride. The length of a ride is eight seconds. Riding harder bulls is worth more points. For the highest scores, ride Earthquake..if you dare.

Strategy:
Try to anticipate the bull's moves correctly. Quick response to each move is the key to finishing a ride. The practice mode allows another player to control the bull's actions. Use this to develop a fast response to all of the moves a bull can make.

Controlling the bull with the joystick in practice mode:

FORWARD: 360 Degree spin.
FORWARD WITH FIRE BUTTON Pressed: 540 degree spin.
CENTER JOYSTICK: The bull bucks and runs.
BACK: The bull halts suddenly. Guaranteed to throw the toughest hombre.

Caber Toss:

[] To run with the caber, move the joystick LEFT and RIGHT in rhythm with the athlete's feet. To gain speed, increase the temp of the rhythm smoothly.
[] To plant your feet and throw the caber, press and hold the FIRE BUTTON.
[] As the caber pivots in your hand, release the FIRE BUTTON to complete the throw. If you release too soon or too late, the caber may not flip correct.

Scoring: The caber must flip over completely for a legal toss. The toss that travels the farthest distance wins the event.

Strategy:
The secret to longest throws is building up your speed before the toss, while conserving as much energy as possible. The player who learns how to reach top speed the fastest will usually win the event. Be careful not to run any farther than necessary to build up your speed—long runs with the heavy caber will sap your strength.

Sumo Wrestling:

The secret to longest throws is building up your speed before the toss, while conserving as much energy as possible. The player who learns how to reach top speed the fastest will usually win the event. Be careful not to run any farther than necessary to build up your speed—long runs with the heavy caber will sap your strength.

Balance:
Establish rhythm with your lumberjack's legs; if you don't build speed at the correct rate he may lose his balance. The computer keeps balance meter for both players. When a lumberjack is off-balance, his arms extend to help him recover.

Strategy:
Make your opponent lose his balance by stopping the log, then changing the direction of the log's rotation quickly back and forth. Finish off your opponent by rolling the log rapidly in the direction that will cause him to fall off.

Bull Riding:

[] To choose which bull you want to ride, move the joystick FORWARD or BACK. The bulls are named (from easiest to hardest) Ferdinand, Elmer, Bob, Tornado, and earthquake.
[] Press the FIRE BUTTON to start the event.
[] To respond to the bull's movements, move the joystick as follows: BUCK: If the bull is bucking, move the joystick LEFT or RIGHT, in the direction that the bull is moving. SPIN: Pull the joystick BACK to stay on the bull when it is spinning. HALT: Move the joystick LEFT or RIGHT in the opposite direction that the bull is moving.

Scoring: Scoring is based on the style and length of the ride. The length of a ride is eight seconds. Riding harder bulls is worth more points. For the highest scores, ride Earthquake...if you dare.

Strategy:
Try to anticipate the bull's moves correctly. Quick response to each move is the key to finishing a ride. The practice mode allows another player to control the bull's actions. Use this to develop a fast response to all of the moves a bull can make.

Controlling the bull with the joystick in practice mode:

FORWARD: 360 Degree spin.
FORWARD WITH FIRE BUTTON Pressed: 540 degree spin.
CENTER JOYSTICK: The bull bucks and runs.
BACK: The bull halts suddenly. Guaranteed to throw the toughest hombre.

Caber Toss:

[] To run with the caber, move the joystick LEFT and RIGHT in rhythm with the athlete's feet. To gain speed, increase the temp of the rhythm smoothly.
[] To plant your feet and throw the caber, press and hold the FIRE BUTTON.
[] As the caber pivots in your hand, release the FIRE BUTTON to complete the throw. If you release too soon or too late, the caber may not flip correct.

Scoring: The caber must flip over completely for a legal toss. The toss that travels the farthest distance wins the event.

Strategy:
The secret to longest throws is building up your speed before the toss, while conserving as much energy as possible. The player who learns how to reach top speed the fastest will usually win the event. Be careful not to run any farther than necessary to build up your speed—long runs with the heavy caber will sap your strength.

Document: world.gs

//%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
//
// World Games Documentation (Apple GS)
//
//%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%

Typed By: High Voltage
Presented by: Digital Gang

[Note]: Apple GS docs differ from those of the //e.

OPTION I: Compete in events
Select your name by typing it on the keyboard. To select your country move the joystick and hit the fire button or use the (I,J,L,M) keys to move up down, left right.

Keyboard Commands
U=NE I=W O=SW L=E ,=SE M=S N=SW J=W K=W
Same goes for the keyboard. with 8 being north and 2 being south.

WEIGHT LIFTING

In practice rounds, select the type of lift by moving the joystick forward or back (or pressing I,M) Press fire or return key to begin.

In competition, you must complete the snatch before competing in the clean and jerk.

To select the weight move joystick left or right and press fire button (or use the j or k and return key)

A total of three attempts at each type of lift are allowed for each player in the weightlifting competition.

The Snatch

Several up and down joystick movements are necessary to complete a successful snatch, and each must be made at the right moment.

To bend down and grasp the bar push joystick back or press (M) To begin lifting the bar, push joystick forward (press I)
During the lift, Full the joystick back (pressM) to drop underneath the bar and snatch it over your head.
To stand up from a squating position push the joystick forward (press I)

When two or more judges' lights in front of the platform turn white, Full joystick back, (M) to lower weights back down to the floor

The Clean and Jerk.

to grasp the bar pull joystick back (M)
to begin lifting the bar, push joystick forward (press I)
During the lift, pull the joystick back (M) to clean the bar and drop into a squat with the bar resting on your chest.

To stand up from the squating position push joystick forward (I) To jerk, the bard above your head, pull the joystick back again (M)
When two or more judges' lights in front of the platform turn white pull joystick back (M) to lower the weights to the floor.

Scoring: The winner is the lifter who successfully lifts the greatest weight. At least two of the judges must give white success lights for a lift to be considered successful. The judges vote on the accuracy of your timing. Two hesitant white votes mean your timing is poor. Three what quick votes mean your timing was perfect.

Timing: As weight increases, timing becomes more critical. The right moment to clean the bar to your chest is easy to judge at lower weights, but extremely difficult as the clean and jerk approaches 200kg. After you clean the bar, wait the right amount of time to gather your strength for a final lift. Too short and the lifter isn't ready, too long and his strength gives out. The key to timing is practice.

Strategy: The key to strategy in weightlifting is knowing when to increase the weight-and how much to increase it. Know your limits and those of your opponents. A sudden 60kg increase may knock your opponents out of the competition -- but make sure you can lift it before you gamble!

BARREL JUMPING

To choose the number of barrels to jump, move and hold the joystick up or right and press the fire button. (or press j - k then return key)
Your skater appears on the ice ready to start. Press the fire button (return key) to begin skating.
To move the skaters legs move the joystick left - right (or J-K) altering in rythum with the movement of the skaters legs.
To skate faster, maintain your joystick movements or keystrokes in rythum with his legs.
To jump, press the fire button (or Return) key. The Flag indicates a good take-off point for most jumps.
To prepare for a landing, pull the joystick back (M)
Each player has 3 attempts

SCORING: The winner is the skater who clears the largest number of barrels in one of his attempts and lands successfully.

STRATEGY: Build up as much speed as possible before jumping. The length of your skaters legs depends on the speed at take-off. The timing of the jump is also important. If you jump too soon, you may not clear the barrel -- but if you jump too late you may crash on the first barrel.

CLIFF DIVING

To select the height of your dive, push forward or pull back (I,M) Press the fire button (or return) to prepare to dive.
Your diver will appear on the ledge you selected. Press the firebutton (return key) to start the dive.
Before you enter the water, pull the joystick back (M) to straighten out and complete the swan dive.
To avoid hitting the bottom surface under water, move the joystick left (J) immediately after entering the water.
Each player is allowed 3 attempts

SCORING:
Each diver is scored on the style and height of the dive. Smoothly executed swan dives score the highest style in points. The highest scores are obtained with perfect swan dives from the highest ledge on "LA QUEBRADA" while barely missing the rocks in front of the cliff.

WIND
The wind velocity for each dive is indicated by the length of the arrow at the top of the screen. The stronger the wind, the longer you have to must keep your divers back arched to avoid the rocks.

STRATEGY:
The depth of the water varies as waves go in and out. Try to time your dive in order to enter the water at maximum depth. To achieve a better score, try to barely miss the rocks near the cliff by arching your back as long as necessary during the dive. Also remember that holding the joystick forward, left, right, or back (I, J, K, M) at the time of your leap adds extra velocity in that direction.

Salom Skiing
To start skiing down the course, press the fire button (or Option key). When you see "PRESS YOUR BUTTON" (appears on either half of the screen) press and hold the fire button (option key) before moving the joystick. The player whose name appears on that half must press the joystick fire button (option key) to begin the event. The next player does the same.

To move the lumberjacks legs, continuously move the joystick left right (J, K) while running. If you collide with a gate head on you will wipe out.

LogRolling
You may compete against another person or the computer. When you see "PRESS YOUR BUTTON" (appears on either half of the screen) the player whose name appears on that half must press the joystick fire button (option key) to begin the event. The next player does the same.

To move the lumberjacks legs, continuously move the joystick left right (J, K). Stay in rhythm with the log or you may lose your balance.

To slow rolling of the log from forward or backward and change its direction, press the fire button (option key) while running. Each player is allowed 3 attempts

Scoring: The winner is the skier who successfully completes the course with the fastest time. You will be disqualified if you fall. If you collide with a gate head on you will wipe out.

Strategy: When you start out, the caber will be tilting forward. As it continues to rotate forward, walk towards the white line, keeping the caber tilted forward a bit. When you are close to the white line, start running maximum speed until the caber is almost in a vertical position. Before the white line, plant your feet and let the caber rotate forward a little again, then release the fire button (or release the option key)

Caber Toss
To run with the caber, move the joystick left and right (J, K) in rythym with the athletes feet. To gain speed, increase the tempo of the rythym smoothly. Avoid running past the white line. If you do you drop the caber and are judged a fault.

To throw the caber press and hold the fire button (option key) to begin the event. The next player does the same.

Scoring: A toss is measured from the white line to the tip of the caber that touches the ground first, and the caber must completely flip over for a legal toss. The toss that travels the furthest distance wins the event.

Strategy: When you start out, the caber will be tilting forward. As it continues to rotate forward, walk towards the white line, keeping the caber tilted forward a bit. When you are close to the white line, start running maximum speed until the caber is almost in a vertical position. Before the white line, plant your feet and let the caber rotate forward a little again, then release the fire button (or release the option key)

Sumo Wrestling
Press the fire button (option key) to begin the event and go into the crouch.

Control your wrestler by repeatedly moving or pressing the keys as indicated for the wrestling moves (indicated below).

The computer maintains stamina and balance factors for each wrestler.

Press the fire button (option key) to let go of your opponents belt.

The first wrestler to leave the ring or touch any part of his body with the ground loses the match.

CONTROLS
[ no fire button ]
Up(I) = forarm right(K) Forward push S.E.(I,) Forward slap South(M) Slap S.W. (N) Backward slap West(J) Backward push.
[ holding fire button/option key ]

To run with the caber, move the joystick left and right (J, K) in the direction the bull is moving.

SPIN: Pull the joystick back (M) to stay on the bull when its spinning around.

HALT: Move joystick left or right (J, K) in the opposite direction the bull is moving (i.e., if the bull faces left move joystick right (K))

Scoring: Scoring is based on the style and length of the ride. The length of a ride is eight seconds. Riding harder bulls is worth more points. For the highest scores ride earthquakes. (if you dare!)

Strategy: Try to anticipate the bulls moves correctly. Quick response to each move is the key to finishing each ride. The Practice mode allows another player to control the bulls actions. Use this to develop a fast response to all moves a bull can make.

To run with the caber, move the joystick left and right (J, K) in rythym with the athletes feet. To gain speed, increase the tempo of the rythym smoothly. Avoid running past the white line. If you do you drop the caber and are judged a fault.

Caber Toss
To run with the caber, move the joystick left and right (J, K) in rythym with the athletes feet. To gain speed, increase the tempo of the rythym smoothly. Avoid running past the white line. If you do you drop the caber and are judged a fault.

To throw the caber press and hold the fire button (option key) to begin the event. The next player does the same.

Scoring: A toss is measured from the white line to the tip of the caber that touches the ground first, and the caber must completely flip over for a legal toss. The toss that travels the furthest distance wins the event.

Strategy: When you start out, the caber will be tilting forward. As it continues to rotate forward, walk towards the white line, keeping the caber tilted forward a bit. When you are close to the white line, start running maximum speed until the caber is almost in a vertical position. Before the white line, plant your feet and let the caber rotate forward a little again, then release the fire button (or release the option key)

Sumo Wrestling
Press the fire button (option key) to begin the event and go into the crouch.

Control your wrestler by repeatedly moving or pressing the keys as indicated for the wrestling moves (indicated below).

The computer maintains stamina and balance factors for each wrestler.

Press the fire button (option key) to let go of your opponents belt.

The first wrestler to leave the ring or touch any part of his body with the ground loses the match.

CONTROLS
[ no fire button ]
Up(I) = forarm right(K) Forward push S.E.(I,) Forward slap South(M) Slap S.W. (N) Backward slap West(J) Backward push.
[ holding fire button/option key ]
UP(I)=Utchari  East(K) Forward GRab S.East(,) Trip Right south(M) snatch
23
SWest(N) Trip Left West(J) Backward pull

Scoring: Scoring is based on reaction time - both yours and that of your
opponent. The player who can execute moves the quickest will get the highest
scores. If you throw your opponent to the ground or throw him out of the ring
you will receive enough points to win. The shorter the match the higher the
score.

Strategy: Timing is important to success in the sumo ring. When you preform a
move with the fire button(return key) pressed, be sure to release the button (or
press the return button) at the proper time to complete the move successfully.
You can learn the timing through practice. Also keep in mind that the Utchari
is a good strategic move. Try using it when your about to be pushed out of the
ring.

---

Events:
-------

Weightlifting- RUSSIA
Barrel Jumping- GERMANY
Cliff Diving- MEXICO
Slalom Skiing- FRANCE
Log rolling- CANADA
Bull riding- UNITED STATES(#1)
Caber toss- SCOTLAND
Sumo wrestling- JAPAN

Weightlifting:
------------

The Snatch Method-
[] To bend down and grasp the bar, pull the joystick BACK.
[] To begin lifting the bar, push the joystick FORWARD.
[] During the lift, pull the joystick BACK to drop underneath the bar
and "snatch" it over your head.
[] To stand up from the lifting position, push the joystick FORWARD.
[] When two or more judges' lights in front of the platform turn WHITE,
pull the joystick BACK to lower the weights back down to the floor.

The Clean Jerk-
[] To grasp the bar, pull the joystick BACK.
[] To begin lifting the bar, push the joystick FORWARD.
[] During the lift, pull the joystick BACK to "clean" the bar and drop
into a squat with the bar resting on your chest.
[] To stand up from the squatting position, push the joystick FORWARD.
[] To "jerk" the bar above your head, pull the joystick BACK again.
[] To straighten your legs and complete the lift, push the joystick FORWARD.
one more time.
[] When two or more judges’ lights in front of the platform turn WHITE, pull the joystick BACK to lower the weights to the floor.

Scoring: The winner is the lifter who successfully lifts the greatest weight. At least two of the judges must give white success lights for a lift to be considered successful. The judges vote on the accuracy of your timing. Two "hesitant" white votes mean your timing was poor. Three quick white votes mean your timing was perfect.

Timing: As the weight increases, timing becomes more critical. The right moment to clean the bar to your chest is easy to judge at lower weights, but extremely difficult as the Clean and Jerk approaches 200kg. After you clean the bar, wait the right amount of time to gather your strength for the final lift. Too short and the lifter isn't ready, too long and his strength gives out. The key to learning the timing is practice.

Strategy: The key to strategy in weight lifting is knowing when to increase the weight—and how much to increase it. Know your limits and those of your opponents to out of the competition—but make sure you can lift the weight before you take the gamble!
-------------------

Barrel Jumping:

[] To choose the number of barrels to jump, move and hold the joystick LEFT or RIGHT. Press the FIRE BUTTON to continue.
[] Your skater appears on the ice ready to start. Press the FIRE BUTTON to begin skating.
[] To move the skaters legs, move the joystick LEFT or RIGHT alternating in rhythm with the movement of his legs.
[] To prepare for landing, pull the joystick BACK.
[] Each player is allowed three attempts.

Scoring: The winner is the skier who clears the greatest number of barrels in one of their attempts with a successful landing.

Strategy: Build up as much speed as possible before jumping. The length of the jump depends on the speed at take-off. The timing of the jump is also important. If you jump too soon, you may not clear the last barrel—but if you jump too late, you may crash into the first barrel.

Cliff Diving:

[] To select the height of your dive, push the joystick FORWARD or pull BACK Press the FIRE BUTTON to prepare for the dive.
[] Your diver will appear on the ledge you selected. Press the FIRE BUTTON to start the dive.
[] To arch your back during the dive, push the joystick FORWARD.
[] Before you enter the water, pull the joystick BACK to straighten out and complete the swan dive.
[] To avoid hitting the bottom surface under the water, move the joystick LEFT immediately after entering the water.
[] Each player is allowed three attempts.

Scoring: Each diver is scored on the style and height of his dive. Smoothly executed swan dives score the highest style points. The highest scores are obtained with perfect swan dives from the highest ledge on "La Quebrada," while barely missing the rocks at the foot of the cliff.

Wind: The wind velocity for each dive is indicated by the length of the arrow at the top of the screen. The stronger the wind, the longer you must keep your divers back arched to avoid the rocks.

Strategy: The depth of the water varies as waves go in and out. Try to time your dive in order to enter the water at the top of the wave. The higher your score, the better score, try to barely miss hitting the rocks near the foot of the cliff by arching your back as long as necessary during the dive. Also remember, that holding the joystick LEFT, RIGHT, FORWARD, or BACK at the time of your leap adds extra velocity in that direction.

Slalom Skiing:

[] to start skiing down the course, press the FIRE BUTTON.
[] Control your skier’s turns by moving the joystick LEFT or RIGHT to turn in that direction.
[] Press and hold the FIRE BUTTON as you move the joystick to increase your speed and turning sensitivity.
[] Complete the course by passing through each gate. A gate is two flags of the same color—you must pass between each pair of flags.
[] The gates alternate colors, so you must ski between blue flags, then red flags.

Scoring: The winner is the skier who successfully completes the course with the fastest time. You will be disqualified if you fall. If you collide with a gate head on, you’ll "wipe-out."

Strategy: Sharp turns slow you down. Try to use moderate turns as often as you can, timing each turn to position yourself for the next gate. As you pass through one gate, you should be setting up your approach for the next gate down the hill.

Log Rolling:

[] You may compete against another person or the computer.
[] When "Press your Fire Button" appears on either half of the screen, the player whose name appears on that half must press the joystick FIRE BUTTON.
[] The next player does the same. This begins the event.
[] To move the lumberjack's legs, move the joystick LEFT or RIGHT. Stay in rythm with the log or you may lose your balance.
[] To slow the rolling of the log from forward or backward, and change its direction, press the FIRE BUTTON while running.
[] Each player gets three attempts.

Scoring: The winner is the last lumberjack to remain on the log. A scoring bonus is awarded to the winner based on the balance of the two contestants. Each player is allowed three attempts. 

To jump, press the FIRE BUTTON. The green flag indicates a good take-off point for most jumps.

To skate faster, maintain your joystick movements in rythm with the log's rotation quickly back and forth. Finish one more time.
[] To select the height of your dive, push the joystick FORWARD or BACK Press the FIRE BUTTON to prepare for the dive.
[] Your diver will appear on the ledge you selected. Press the FIRE BUTTON to start the dive.
[] To arch your back during the dive, push the joystick FORWARD.
[] Before you enter the water, pull the joystick BACK to straighten out and complete the swan dive.
[] To avoid hitting the bottom surface under the water, move the joystick LEFT immediately after entering the water.
[] Each player is allowed three attempts.

Scoring: Each diver is scored on the style and height of his dive. Smoothly executed swan dives score the highest style points. The highest scores are obtained with perfect swan dives from the highest ledge on "La Quebrada," while barely missing the rocks at the foot of the cliff.

Wind: The wind velocity for each dive is indicated by the length of the arrow at the top of the screen. The stronger the wind, the longer you must keep your divers back arched to avoid the rocks.

Strategy: The depth of the water varies as waves go in and out. Try to time your dive in order to enter the water at the top of the wave. The higher your score, the better score, try to barely miss hitting the rocks near the foot of the cliff by arching your back as long as necessary during the dive. Also remember, that holding the joystick LEFT, RIGHT, FORWARD, or BACK at the time of your leap adds extra velocity in that direction.
Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1210 of 1262

Apple II Computer Info

Scoring: Scoring is based on the style and length of the ride. The length of a ride is eight seconds. Riding harder bulls is worth more points. For the highest scores, ride Earthquake...if you dare.

Strategy: Try to anticipate the bull's moves correctly. Quick response to each move is the key to finishing a ride. The practice mode allows another player to control the bull's actions. Use this to develop a fast response to all of the moves a bull can make.

Controlling the bull with the joystick in practice mode:
- FORWARD: 360 Degree spin.
- CENTER JOYSTICK: The bull bucks and runs.
- BACK: The bull halts suddenly. Guaranteed to throw the toughest hombre.

Caber Toss:

- To run with the caber, move the joystick LEFT and RIGHT in rhythm with the athlete's feet. To gain speed, increase the tempo of the rhythm smoothly.
- As the caber pivots in your hand, release the FIRE BUTTON to complete the throw. If you release too soon or too late, the caber may not flip correctly.

Strategy: The secret to longest throws is building up your speed before the toss, while conserving as much energy as possible. The player who learns how to reach top speed the fastest will usually win the event. Be careful not to run any farther than necessary to build up your speed-long runs with the heavy caber will sap your strength.

Sumo Wrestling:

- Press the FIRE BUTTON to begin the event and go into the crouch.
- Control your wrestler by repeatedly moving the joystick as indicated for the following wrestling moves:

  FOREARM
  \   /
  \   /
BACKWARD PUSH<------------------------> FORWARD PUSH
  \   /
  \   /
BACKWARD SLAP  SLAP  FORWARD SLAP

- Press and hold the FIRE BUTTON to attempt to grasp your opponent's belt. Then perform one of the following moves by repeatedly moving the joystick in the direction indicated, while still holding the button down.

  UCHARI
  \   /
  \   /
BACKWARD FULL<------------------------> FORWARD GRAB
  \   /
  \   /
TRIP LEFT  SNATCH  TRIP RIGHT

- The computer maintains stamina and balance factors for each wrestler.
- Release the FIRE BUTTON to let go of your opponent's belt.
- The first wrestler to leave the ring or touch the ground with any part of his body but the feet loses the match.
World Tour Golf comes with a full set of clubs and tees, so you don't need any of these. What you DO need is your trusty computer and its keyboard. (You can also use a joystick. See your Command Summary Card for instructions on booting World Tour Golf. Look there also for any keystroke commands unique to your computer. On all machines, the keyboard equivalent of the joystick button is the return or enter key - we refer to these controls throughout the manual as simply the button. When the title screen appears, press any key to go to the activity menu.)

### II. Playing Golf

The activity menu is the nerve center of the program. Use it to get to the many selection screens that make World Tour Golf both realistic and challenging. But for now, how about a few holes at Pebble Beach?

The Quick Way to play

To get to the first tee, press the Button (joystick button or return key) five times. This moves you through various menus (described later), and sets up a one-player round. A message describing "playing conditions" appears, giving you a general idea of the prevailing wind and green speed. The next screen that appears is your scorecard. It lists each player’s scores and player handicap (the number of strokes allotted to difficulty of equalize scores). In addition, for each hole the par (target score), yardage, and hole handicap (relative difficulty of each hole), are displayed. For now only one player, "J.S. nicklaus," is listed. You will be able to add more players later.

Play Golf!

Pressing any key puts you on the first tee. The left half of the screen shows a birds eye view of the hole. You will hit your first shot from the tee. Aim down the fairway to the green. The terrain which surrounds the fairway and green is the tough, where you’d rather not hit your ball, if you can possibly help it. The right half of the screen displays a golfer's eye-view of the hole and gives you important game information.

### Club Selection

Before you hit the ball, be sure you are using the right club. You have fourteen to choose from:
- Three Woods (A driver, a 3-wood, and a 4-wood)
- Ten Irons (2 through 9-iron, wedge and sand wedge)
- One Putter

Golf clubs are numbered according to their length and the distance they can hit the ball (A 4-iron will knock the ball farther than a 5-iron). Woods hit farther than irons. The table below lists the maximum range for each type of club:

<table>
<thead>
<tr>
<th>Club</th>
<th>Max Range</th>
<th>Club</th>
<th>Max Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driver</td>
<td>240 yds</td>
<td>6 Iron</td>
<td>155 yds</td>
</tr>
<tr>
<td>3 Wood</td>
<td>220 yds</td>
<td>7 Iron</td>
<td>145 yds</td>
</tr>
</tbody>
</table>

Higher-numbered clubs have more loft—that is, they hit the ball higher in the air and therefore a shorter distance. If you want to hit a ball over a hill or tree, you will want to use a club with a high loft (a 9-iron or wedge, for example).

At the beginning of each hole you are automatically assigned your driver. In most cases, this is the club you will want to use for the tee shot. On shorter holes (par 3 for example) or holes with obstacles near the tee, you may want to use a shorter club.

Select a club by pressing the up and down arrow keys, or by moving your joystick up or down. To determine a clubs range, press the spacebar and an arc appears. This shows the spot where a perfectly hit ball would come to rest on a windless day.

### Aiming Your Shot

On the left hand side of the screen, a crosshair indicates the direction your shot is currently aimed. World tour golf automatically positions the crosshair on a straight line between the ball and the hole. Sometimes however, you will not want to hit your ball straight towards the hole. To adjust your aim, press the left and right arrow keys (or move the joystick to the right or left). The crosshair will move and the point of view window adjusts accordingly. Always check the wind direction and speed shown in the point of view window. If the wind is blowing more than 2 or 3 miles per hour, you may need to aim into the wind to compensate.

### Hitting the Ball

And now it's time to hammer that little white ball! Press the button once to bring up the Swing Meter, which appears in the lower right-hand corner of your screen. Press the button a second time to start your backswing. Press a third time to begin your downswing and strength of the shot.

To hit the ball full strength, press the key when the meter reaches the 100% position. To hit the ball a shorter distance, press the key before the 100% point. You can also overswing, which may hit the ball farther than the clubs maximum range, but may also result in an erratic shot.

Press a fourth time to actually hit the ball! Exactly when you hit the ball determines the accuracy of your shot. To hit the ball straight ahead, press the key when the swing meter is pointing down. If you hit the ball before the meter reaches this position causes your shot to slice (curve to the right). The farther away from the straight-down position your hit occurs, the more extreme the curve. A hook or a slice shortens the distance of a shot. If you're not in the mood to play dexterity games, use the number keys on the top of the keyboard to hit perfectly straight shots of varying strength as shown in the command summary card.

### Hazards

The following hazards are encountered in any game of golf:

**Trees:** When your ball hits a tree, it may be blown down by foliage of it may bounce off in any direction. To hit out from the trees, use a club with a high loft (to hit over them), or use a club with a very low loft in the hope of hitting under them. You can also aim around trees, hitting your ball with a hook or slice so that it will curve back into the fairway.

**Hills:**

- **If your ball hits a hill, it will bounce off. If there is a hill directly in**
- **Your shot will slice.**
- **Your shot will curve to the left.**
- **Your shot will curve to the right.**
- **Your shot will slice.**

**Pits:** Pits are hazards that appear on the fairway and green, and cause your ball to bounce off. The farther you are from the pit, the less effect it will have on your shot. If you are close to a pit, your shot will be affected badly.

**Bunkers:** Bunkers are hazards that appear on the fairway and green, and cause your ball to bounce off. The farther you are from the bunker, the less effect it will have on your shot. If you are close to a bunker, your shot will be affected badly.

**Hazards on the Green:** Hazards on the green are hazards that appear on the green, and cause your ball to bounce off. The farther you are from the hazard, the less effect it will have on your shot. If you are close to a hazard, your shot will be affected badly.

**Water:** Water hazards are hazards that appear on the fairway and green, and cause your ball to bounce off. The farther you are from the water, the less effect it will have on your shot. If you are close to the water, your shot will be affected badly.

**Lakes:** Lakes are hazards that appear on the fairway and green, and cause your ball to bounce off. The farther you are from the lake, the less effect it will have on your shot. If you are close to the lake, your shot will be affected badly.
front of you, you can try to hit over or around it (see trees).

Water

-----

A ball hit into a lake or stream is lost. A new ball is automatically placed immediately behind the hazard and you are penalized one stroke.

Bad lies

-----

The lie of a ball is the environment in which it rolls to a halt. A good lie means there are no obstacles to interfere with your swing. If the ball is hidden in weeds, or stuck in the mud, you face an undesirable lie. Your shots generally won't go as far when you hit from poorer lies. The type of lie you have is shown in the upper right hand area of the screen. Your lie has a definite impact on your club selection. The following table shows the longest club you can use for each type of ball without a high probability of flubbing your shot:

<table>
<thead>
<tr>
<th>Lie</th>
<th>Maximum safe club</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perfect</td>
<td>3 Wood</td>
</tr>
<tr>
<td>Fair</td>
<td>2 Iron</td>
</tr>
<tr>
<td>Poor</td>
<td>5 Iron</td>
</tr>
<tr>
<td>Rotten</td>
<td>8 Iron</td>
</tr>
<tr>
<td>Sand</td>
<td>9 Iron</td>
</tr>
<tr>
<td>Plugged</td>
<td>Sand Wedge</td>
</tr>
</tbody>
</table>

Bunkers: Bunkers (also known as sand traps) typically surround the green, but may also appear on the fairway. A sand lie is the typical lie in a bunker. A plugged lie means your ball is buried deep in the sand.

Out of Bounds: A ball is out of bounds if it leaves the edge of the play area. The ball is placed in its original position and you are charged a penalty stroke.

Chipping When you get close to the green, hit the ball with less than full strength; this is called chipping. When chipping, you will generally use your Wedge. If you are very close to the green, you may want to use your Putter.

Putting When you are on the green, the left half of the screen becomes a bird's-eye-view of the green, showing your ball's position relative to the hole. Don't worry about club selection; the game automatically puts the putter in your hands.

On a flat green, line up the crosshair to define a straight line between your ball and the hole. Watch out for a sloping green because the ball will curve in the direction of the slope. Thus, if the green slopes downward, compensate by positioning the crosshair above the hole.

A symbol on the green indicates the severity of the slope. A brace (|) indicates a slight slope; arrows of increasing sharpness indicate moderate and severe slopes. The direction in which the arrows point of the green is also shown in the point of view window.

The speed of the green also affects your putting. A wet green is slow, while a dry green is fast. On a slow green, expect your putts to go only 2/3 as far as they normally would. On a fast green, they normally would. On a fast green, they will go 30% farther. In a single session on one course, all greens have the same speed. Wind has no effect of putting.

Putting is slightly different from other shots because you only press the button three times. The first press brings up the swing meter, the second starts your backswing, and the third determines the strength of the shot. The distance between the ball and the crosshair on the green is seven feet.

You can also use the number keys to putt the ball the following distances:

<table>
<thead>
<tr>
<th>Key</th>
<th>Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>4ft.</td>
</tr>
<tr>
<td>1</td>
<td>15ft.</td>
</tr>
<tr>
<td>2</td>
<td>30ft.</td>
</tr>
<tr>
<td>3</td>
<td>45ft.</td>
</tr>
<tr>
<td>4</td>
<td>60ft.</td>
</tr>
<tr>
<td>5</td>
<td>75ft.</td>
</tr>
</tbody>
</table>

If you have a very short putt (under 3 feet), and your partner agrees that it's a gimme (a shot so easy, no one could miss), press G and the game automatically sinks your putt. You can also press T for Tap if you are within 4 feet of the hole. This controls the strength of the shot, but still requires you to aim.

Scoring

Once your ball is sunk, the result appears in the upper right-hand area of the screen.

* Par means you have completed the hole in the allotted number of shots
* Bogie is one over par
* Birdie is one under par
* Double Bogie is two over par
* Other indicates that you failed to achieve a double bogie

After you have completed a hole, you return to the scorecard screen. Press any button or key to go to the next hole.

Customizing your Game

Now that you have a feel for golf, it's time to get acquainted with some of the ways you can customize the game.

Using the menus

All the menus work the same. Use the arrow keys (or the joystick) to move the highlight up and down or right and left. Press the button (return key or joystick) to select the highlighted item. The box at the bottom of the screen describes each item as it is highlighted. Use esc. (or its equivalent; see your reference card) to move from any menu to the next higher menu.

In some cases, you must type in a command from the keyboard. You are provided with a default selection in the box at the lower right of the screen. Accept the default by hitting the button, or type in an alternative. The spacebar key removes the typing if you make an error. Press the button when you're finished.

To back out gracefully, hit esc.

The activity Menu

From the activity menu, you can choose to play, practice, or construct a golf course.

The play Options Menu

Number of players allows you to play up to four people. Type of play includes stroke play, (any number may play) or match play (2 some or 4 some only). In
stroke play, the player with the lowest score after golfing 18 holes is the winner. In match play, you win or lose on every hole. Robot players allows you to assign a computer opponent to 1 or more of the player positions. Accept options tells the program that you have set the play options and are ready to select a player.

The Show Players Menu

On the left side of the screen, you see the players present statistics. Either accept the players as they are, by selecting accept players, or change any of their statistics by selecting change players which brings up the edit players menu.

The Edit Players Menu

From this menu you can change the players names, handicaps or attributes. A players handicap is subtracted from his total strokes to arrive at his net score. Use this feature to balance players of different abilities. Players attributes are what distinguishes one golfer from another. If you want to change the default values, select attributes. This takes you to the player attributes menu.

The player Attribute Menu

You can change a robot players attribute as well as those of a human one (not all attributes are available on all machines). Adjust player attributes as follows:

* Drive distance gauges a players strength. The average distance a player hits a driver can be adjusted from 100 to 300 yards. This in turn affects the maximum distance all the other clubs are capable of hitting. The games default distance is 240 yards.

* Drive accuracy is the percentage (1% to 99%, with a default value of 90%). Accuracy affects your shot consistency as well as the likelihood of flubbing a shot.

* Drive tendency reflects each players tendency to hook or slice.

* Recovery skill is a players ability to get out of bad lies. The better your recovery skill, the better your chance of getting out of a rotten lie without flubbing the shot.

When you have finished press accept player. You can select a course to play on.

Load a course and play

-------------

The left side of the screen lists the courses on the disk. To load a course from a different disk, use change disk or change drives and follow the on-screen prompts. Delete permanently erases a course from the disk. Once you've loaded a course, you know what to do-Play Golf!

IV. PRACTICE, PRACTICE, PRACTICE

To hone your skills, you can practice without actually playing. Select Practice from any course. Putting Green lets you practice putting on greens of varying slopes. Driving Range lets you hit shots from the tee with any club, and measures the distance of each shot.

V. GOLF COURSE CONSTRUCTION

To build the course of your dreams, select Construct from the ACTivity menu. This takes you immediately to the course edit menu.

The course edit menu

The left half of the screen shows miniature diagrams of the first nine holes on the course. For now, all of these holes are blank, that is, totally rough with no fairway. The right half of the screen contains the course edit functions.

* Load lets you load an existing course of hole from disk. You can then alter it. (Note: first-time users may want to load a pre-existing course to practice on before tackling a blank course). This menu also lets you erase the current course.

* Save lets you save either an entire course or move holes around within an existing course.

* Hole edit is where you actually create new holes or make existing ones more to your liking.

When you press Hole Edit, a thick frame appears around the first hole on the left side of the screen (Press the spacebar to toggle back and forth from the right and left halves of the screen. This is also the case in most other construction screens). Use the cursor keys or joystick to move the frame to the hole you want to create or modify. If you move the frame downward long enough, the back nine holes appear. When you have chosen a hole, press the button. On a blank hole, this takes you to the draw terrain menu. These are described below.

The draw Terrain menu

There are two steps to constructing a hole. Use the draw terrain (fairways, rough, and water). Later on, you will place the tee, green and various hazards.

When drawing the terrain, you work on the left hand side of the screen with a block representation of the hole. Don't worry about the angular look of the drawing; the program smooths and details the image for you later.

Selecting draw terrain places a thick cursor on the left half of the screen. Use the arrow keys to move the cursor, then press the button to drop a square tile of fairway on the hole. When you have placed as many tiles as you wish, press ESC or the spacebar to return to the menu.

Press the button repeatedly on change terrain to change the drawing terrain from grass to rough to water, and back to grass again. Clear hole fills the entire hole with the terrain with which you are working. Preview hole allows you to see the hole as it appears once it has been smoothed and detailed. You can enter the draw terrain while previewing, but the first time you drop a tile, the blocky image will return.

Several keyboard shortcuts are available to make drawing the hole easier. See your Reference Card for details.

The finish Hole menu

After you have outlined the basic shape of the hole, complete it by placing objects and defining features such as green slope.

Selecting Finish Hole from the Draw Terrain menu takes you to the finish hole menu. The left half of the screen shows the hole you have just designed. The right half contains the functions you use to transform this hole into one which will rank among golfdoms finest.

Place Objects allows you to place objects (green, tee, bunkers, trees, etc.) on the hole. Clear objects removes all objects. Set features takes you to the menu you will use to finish the hole. Draw Terrain returns you to the draw terrain menu, in case you need to make adjustments. Course Edit takes you back to the course edit menu.

Placing Objects Selecting place objects from the finish hole menu takes you to the object type menu. Toggle to the type of object you wish to place on the hole and press the button. Press the left and right arrow keys to reveal the variations for that object type. Press F to flip the object horizontally. Press the up arrow key, to return to the object type menu.
When you have chosen an object to place on the hole, press the button and that object appears on the left side of the screen. Move the object around the hole with the cursor keys or joystick. Hit the button to drop the object. Once dropped, an arrow appears that you use to pick up and move any object on the hole. To pick up position the arrow over the object and hit the button. To remove an object, pick it up and press the spacebar.

You can place up to 50 objects on a single hole, but you cannot overlap them or place more than one tee or green on a hole. Once you have positioned the tee and the green the program calculates the distance of the hole and its par. If you have created a dialog hole, place a par maker (in the other category) at the bend of the dialog to obtain a more accurate distance calculation. Remember that a hole is not playable unless both a tee and a green have been placed. (Note: You may notice that the length of the hole varies from time to time as you play. This is because the program periodically adjusts the placement of the pin on the green just to make the game a little more challenging.)

You can use several keyboard shortcuts when placing objects on a hole. Your command summary card has the details.

**Setting Features**

Choose set features from the finish hole menu to set the hole difficulty and green slope, and put in skyline features.

When you select Hole Difficulty, you must rate difficulty on a scale of 1 to 99 (with 99 being the most difficult). The program then automatically assigns handicaps to each hole based on the relative difficulty ratings you have designated. A hole handicap is a measure of its difficulty relative to other holes on the course. The most difficult hole on the course receives a handicap rating of 1. The second most difficult is assigned a rating of 2, etc. Since you won't know how difficult a hole is until you've played it, you may want to come back and do this later.

Green Slope lets you set the direction and severity of the greens slope. Skyline lets you drop hills, etc. into the background. Exit takes you back to the finish hole menu.

**Saving a hole or course**

First, you will need a formatted (initialized) disk. To save a completed hole or course, return to the course Edit menu and select save. Course edit returns you to the course edit menu.

**Quick Save**

Save a course under its current name from any of the main construction menus (draw terrain, finish hole, course edit) by pressing S. Use the save menu to save a course under a different name.

---END---
The storyteller busted out in hearty laughter.... "HAAAAAA! You! Defeat Lord Denethenor? HAAAA! You don't even look like a warrior or even a Magician... You look more like a thief. Matter of fact, are you the thief that's been stealing shit from around here lately?"

Some of the other people looked at the guy with hostility while the rest checked to make sure they still had their wallets and stuff. The young thief just smiled and said, "Maybe I'm young and maybe I'm even a thief. Maybe that's what it takes to kick this dud's ass." He laughed under his breath. "After all, how many old farts have tried it and never returned? In my profession (whatever that might be), I've gotten out of more trouble situations than any three warriors of my acquaintance could have. I'll pick up some more skills on the way or learn a few more tricks..." His eyes danced with anticipation as he looked at all the people in the room. Some had the look of hope in their eyes. Others wariness but they all could sense the feeling of confidence that the youngster had.

With one quick movement he turned and walked jauntily out of the door.

=================================
= WRATH-GENERAL NOTES =
=================================

The objective of the game is to be the freewheeling traveler that defeats the evil Lord Denethenor and loots his treasure house.

After the game loads, select "1" from the menu to create your character. You may only have one character at a time so after you create him take good care of him (or her). You don't have to speculate over your character's name. As you play the game, your character's health is reflected in "HITS" (quantity of physical damage you can sustain), and stamina (your vitality, which can only be replenished through nourishment). These are both displayed during game play. The star between your hits and stamina represent your internal magical energy. The casting of any spell (AFTER YOU LEARN THEM) will drain some portion of this energy from you, preventing you from further use of magic for a period of time.

Other character attributes are visible when you press "P" to [P]rint status. These include Strength, which reflects the damage you can inflict on enemies; Intelligence, which reflects the damage you can inflict on enemies; and Gold, which you can use to supplies and information. Also listed will be any of your possessions including weapons, armor, any adventure begins on the NE peninsula on the continent of Nisondel. There are no high order beasts or monsters on Nisondel and the ones you do meet will hit you with greatly reduced force. Therefore, use this as a training ground for sure you're gonna need training later. You can also get used to Maize travel and the differences between Day and Night contrived I dunno, but at any rate, here they are.

The storyteller busted out in hearty laughter.... "HAHAHAHA! You! Of course, if your game was last save while you were in a shitty condition ie: surrounded by monsters or close to death you may chose to reload the program and restore your character, which will send you back to the start of the game (POSSIBLY) with some of what you earned in the meantime... The first town you will probably find is Backwoods. There is a dinky, a weapons shop and a trading post in Nisondel. (Trading posts let you sell some of your items if you're hard up for cash.) You need some weapons and some food from the appropriate vendors. You will that the stores keep regular hours so don't wait til the end of the day to do your shopping. To buy something (or sell something) just go up to the counter and stand in front of the merchant, press [C] to [C]onsider the price and indicate to the merchant that you'd like to get. The merchant will offer you choices--- Follow his prompts to make your selection. He will quote you a price and you can either agree by pressing [Y]es or [N]o... Don't forget you need both a weapon AND food to start with so don't spend so much in one store and not be able to afford anything as you need in another. Every time you buy a new weapon (or later on) don't forget to press [B] to [B]equest for your arrest will be posted (dead or alive) in that town. Rather it remains your ally and save valuable information. Make an attempt to be friendly because no one likes Lord Denethenor and you can have valuable allies that you can rely on later.

Keep a journal of the things people say to you and who says it even if it's just a bunch of random people. Later, have to speculate over your character's name. As you play the game, your character's health is reflected in "HITS" (quantity of physical damage you can sustain), and stamina (your vitality, which can only be replenished through nourishment). These are both displayed during game play. The star between your hits and stamina represent your internal magical energy. The casting of any spell (AFTER YOU LEARN THEM) will drain some portion of this energy from you, preventing you from further use of magic for a period of time.

Of course, if your game was last save while you were in a shitty condition ie: surrounded by monsters or close to death you may chose to reload the program and restore your character, which will send you back to the start of the game (POSSIBLY) with some of what you earned in the meantime... As you play the game, your character's health is reflected in "HITS" (quantity of physical damage you can sustain), and stamina (your vitality, which can only be replenished through nourishment). These are both displayed during game play. The star between your hits and stamina represent your internal magical energy. The casting of any spell (AFTER YOU LEARN THEM) will drain some portion of this energy from you, preventing you from further use of magic for a period of time. Your game progress is saved to disk each time you enter a town, castle or maize, dimension door and etc. You can also save your game at any time by pressing "Q" for [Q]uit. If you die you will be prompted to retrieve your game where it was last saved on disk. (If you don't press a rest at this point you can reload the program and it will continue at the last save...
These little short dudes can only strike a few hits but are known more for being able to pass thru stone walls.

------------------
: WORGRECS :
------------------
These are the silly twits... They'll walk into a light barrier and whacko! No more Worgreces... hehehe!

------------------
: KLIMKENS :
------------------
They can give you a pretty good whack with a handaxe, but they LOOK more fierce than they really are.

------------------
: WARRIORS :
------------------
Warriors are some of the few humans that you'll meet outside of civilization. As a rule they aren't so tough but if they get going in the right direction they can be pretty fierce.

------------------
: WIZARDS :
------------------
Magic users can be either Good or Bad. (Mostly bad)... They can cast spells that will throw opponents for long distances... As a friendly tip, never get caught in a fight between two mad wizards.

------------------
: SHARKS :
------------------
As the name implies, the sea traveler will often be found running from a school of these. Yes! They can do to you here what they can do to you in real life...

------------------
: CORSAIRS :
------------------
The dudes are pirates. They pull shit unsuspecting merchant ships and wayfarers like yourself. (Not me, I'm too smart!) They can take some of your goodies if you let them.

------------------
: BLOOD BATS :
------------------
They hang out the maizes until dark and then they're everywhere. They're really pains in the ass!

------------------
: FIELENAS :
------------------
Dangerous mothers. They're almost never alone and ya have to really use your wits... Also, they are vicious (sp) critters that'll rip ya up.

------------------
: CYSTONS :
------------------

Shit! They have four arms and they can really confuse you when you fight them. It's better to just take a long range cannon and wipe 'em out.

------------------
: OGREGES :
------------------
They look like ostriches and they can be just as fierce... Best to avoid them if your hits are low.

------------------
: TERRAHYDRAS :
------------------
These are the monsters that originate in the water, but they can also live on land. There's no way to get away from them other than finding a good strong door and hiding.

------------------
: DEMONS :
------------------
Devilish little dudes. The best tip I can give is that their most powerful weapon is similar to one of the spells that you will learn...

------------------
: DREX :
------------------
One of the most fierce of the things that Lord Denethenor has conjured up. They can fly and they'll chase what they're after across either land or water... <BEMARE>

------------------
: LORD DENETHENOR :
------------------
The evil asshole himself! No ou how awesome this dude is cuz he dosen't (F) around... If he hears that you're coming to challange him, he won't just sit and wait for ya he'll come after you and conjure up all sorts of shit to do you in... If you get close to this dudes realm, that's the time to be MOST CAUTIOUS! And that's my warning o ya!

~END~
Hints for the Wrath of Denethenor by the Nudge

Don't get lost, go to the Gargoyle!
Pass through with Netrelon
Ask lord Mirrirh, he might be able to help you
Speak to the Backwoods hermit of torches
The Bank of Deledain knows who they work for
Doors are so charming
FireTrench can take you a long way
Exit Nisondel on a western Island
Look for a different way out of the Dark
Silver reflects
Find a harbour & take to the seas
Solrain, Mirrirh, & Estrine are the real conspirators
A mages intelligence echoes in the staying power of his spells
Use Wethrir wisely - master it before learning higher powers
There is but one spell that will still the waters
Don't get caught in a field of light
One of Limbar's warriors will help you
The Wizards of CastleDrawn will help you
Demons can smell their pray
That's why he's the Lord
Limbar will get me out
Someday the truth will be revealed & they will praise him
You can't hide from a demon!
I've got a Specre's Atlas
Look in the stone
Don't move in the Dark
I say it's just a myth
You can hide behind your spells
He who goes unseen & speaks unheard is the strongest
Our chef's cooking sucks
You are doomed!
With AQ
All magic is released by the spoken word
The very words which cast the illusion will dispel the source
So it is written...
Look even beyond Cestiona
Lost? Find a scroll
Demon Glow can easily be cast or dispelled
But why? (ed. Good question!!)
I'm afraid your boss isn't too hospitable to strangers
Seek a Western exit
Don't bother with the Hotel Pescara; they don't take drifters
I know something you don't!
The Demon's glow is just a form of magic
Across the channel!
Have you heard the truth?
I've got friend's coming to get me out
Take me with you! I can show you the Western door!
Limbar's nothing more than a Lunatic
Many treasures lie in the hole
There's lots of gold to be had
The citizens of En Siev have dug in
Every spell drains energy from the wielder
Look beneath the ruins of En Siev
Isn't this a great condo?
Move in you own dimension with Monsrol
En Siev is a heathen city
I've seen the Graveyard at Shadowmere
Go in at Midnight, come out at Mystenor
Learn Hexerei in CastleDrawn
Things can change at midnight

I hate raw fish
Ask of Clien at Karibae
The seven towers of Castle Denethena have darkened
I know of CastleDrawn; sanctuary of magic
I crossed Death Meadow!
You'll find Janai in the isles of Bregalad
He used his ower only in defense - seek Bhui in the Dungeon
Seek our Lord Mirrirh
I have learned Specere
Seek help of lord Mirrirh in the dungeon
Open your eyes and the myth will vanish
Death Meadow is impassable - but you must cross
If it won't open, pass through
One of Limbar's warriors knows something
You ski?
Castle Denethena was rebuilt
Clien is on the Lake
A more powerful spell is more tiring
Not so! I've seen the castle
His old castle in Mystenor is completely deserted
Estrine's men destroyed the castle
You won't find him there
It's on an isle surrounded by magic
He fled from his castle to build a remote fortress
2 false entrances, 1 tun: Look south & pass between the caves
Report all suspicious persons
You're not one of them, are you?
The Banshee is fomed
Learn of his castle in Swain's
Enter the hole only with great will
I helped to capture Donovan
All will perish
Janai waits beyond the meadow
Mirrirh and Solrain are the true evil: kill them!
Denethenor lives and you, you shall die
I am Bhui. I know the power of Resonim - speak the word to a wavy light
LaVince is also a disciple
Remove Mirrirh from his throne and claim his rule
The name is engraved on a secluded pub
Don't be afraid to use your magic when needed
Ask of Donovan at the Penitentary
The true exit from the mountain swims in a sea of light
I'm the wealthiest man here!
Stage tricks are but simple spells
You'll always find Aligre near a stage
Seek Shadowmere in Bregalad
You must visit Bregalad someday
There's more than one way to leave Mount Restorn
The crossover occurs at midnight
Search the isles for the amphitheatre
Look south of the mountain
Ever been to the mountain?
Take caution with blanket spells; you may strike a friend
The blanket spell is most draining, but so deadly
Lethren concentrates all your power on a single foe
Remember, Denethor's evil grew from his abuse of the death spells
Like Wethrir, it will shatter upon striking an object
Our Lord has a thing for sharks
Our vault is protected by magic
You will die a fool
All but one passage to Mystenor is useless
You must pass the mountain
The trail is visible only under close inspection
Comb the northern ridge
Red Sands is the link between Shadowmere and Sorie Gulch
The most obvious is rarely the safest
The walls of Mystenor have no passage
Search the Northern ridge for the Mountain
The circular river refuses all but the most experienced
Overcrowded? Never! Just keep death row moving
Look for the door in the graveyard
The gate to Restorn is locked by magic
I didn't know the grenade was armed
65 mph isn't that fast
Forget the legend of Donovan - it's a fool's tale
It's just glass on silver
Find him before he finds you!
Beware, silver dust hides, but doesn't protect
Many tricks can be performed with mirrors
When you want to pass unseen, turn off the stage lights
Throw up a little silver dust
Yes, I am Aligre and you seek the knowledge of Inslerete
Even Denethor can be fooled... sometimes.
If he should discover you... well, you won't live long.
Shadowmere hides more than shadows after dark
You wish never defeat him without Aligres knowledge
Ask at the Banshee of the most deadly
Do not fear the thunder but rather the evil it represents
Move wisely - you have much to learn
Learn to choose your steps wisely
You are closer than ever to mystenor!
He who enters the stench of the cave will not return
Sorry, no ceremony tonight
I've volunteered for the next offering
The lighting is a steady reminder of our proximity to the crossover
To pass Red Sands, float the cavern river
Step into his throne
Sorie Gulch feeds the mystical circular river
Janai looks for the one who will cross the meadow
Go in at midnight and come out at mystenor
His fortress lies by the meadow
The blanket spell, Desapar, is most deadly - use it only in a desperate situation
Limbar says I'm gonna be a great warrior
You say we're gonna take on mirrih
You will cross twice
I've returned from Death Meadow
Sure, we get cots, Limbar gets a jacuzzi
Don't even think about it
Don't hurt me!
Approach him as the sun does: from the east and like a whisper
You must learn balance, Grasshopper
What chu lookin' at?
He stole my purse!
He stepped on my toe!
He owes me five
He killed Scruffy!
He wasted my family
Approaching invisible will not be enough
The Isles of Bregalad hold many secrets beyond your reach!
To escape Red Sands, you must find that red sand
There are many hidden places among these isles
Attract his attention and you shall perish
Welcome to Shadowmere! and have a severely unpleasant experience!
Eat this, dirt bag!
Wait till the witching hour.
Welcome visitors! Feel free to walk about but don't talk to the patients
and stay out of restricted areas
How was your stroll through the graveyard?
About X.Jump
------------

These are two "use" files for ACOS which act similar to ON X GOTO.
The following set up MUST be followed when using X.JUMP

use "a:x.jump",x <- set x to any variable, with a number from 1-64
goto qscan <- jump to this label if x=1

The set up for X.JUMP2 is the same, except the number may be from 0-63.

Ending Comments:
-----------------

Make sure you have the correct amount of labels after the use, so that you don't get a syntax error.

X.Jump is faster than the normal " if x=43 goto label". However you may not notice the difference if your running over 1 mhz, or if your jumping to low numbers. But overall it is faster.

If you have any questions or comments give my board a call.

Purpose
-------

At the request of the Phantom, this Macos external was written. It's purpose was to provide a way for Macos programmers to directly send a string to their modem without Macos touching it. Than, to have the external place the appropriate result code in location $0A.

Syntax
-----

The routine can be called like this....

use "(drive specificier):X.MDMSEND",[string]

where drive specificier is any legal drive spec. and string is any modem command of unlimited length. Please note that the use command for this routine MUST be on it's own line since the RETURN character is what the program uses to determine the end-of-string.

Compatibility
-------------

This routine was originally written to run under Apple's Super Serial Card; however, it should run fine on the GS modem port as well. If there is any problem with it on a GS, contact me! I can write it for the GS.

An Example
-----------

After struggling with many commands whose syntax was unclear even after an example, I feel obliged to place in this documentation an actual example...

Let's say that you wish to hook your board into a network, but you had no way of dialing the nearest site from within Macos. I am assuming that the nearest net site is at (312) 555-4668, and I am assuming that the external has been installed in drive G.

use "g:X.MDMSEND",ATDT1-312-555-4668

That would do it. Please note that there are no quote marks around the command being passed to the modem.

In Case of Trouble
------------------

Just incase you have trouble, I can be reached at the following locations.

Voice Phone: (708) 759-5275 [3 - 10 p.m. please]

Usenet/Internet: hermes@infoplus.chi.il.us [not sure about this one. Right now they're taking about closing this board.]

Dark Image BBS: (708) 355-5412 [Hermes (#7)]

Silver Tongue BBS: (708) 759-1916 [Hermes (#6)]

Parrothead Supplies BBS: (708) 887-1209 [Hermes (#2), Co - Sysop]

TEAM Net: Hermes (on the Hemp Foundation)

Mindboggler BBS: (708) 526-9016 [Hermes]
The source code of this external was included and is fully documented. This code was written with Merlin Pro. Nothing particularly special, but, if you have a thought, please contact me at any of the previous addresses.

```assembly
org $9e00  ; the freespace for use commands in Macos

* --- Equates
Getnxt equ $380  ; get next byte from the program
Goblcomm equ $386  ; engulf the comma
Mdmslot equ $e00  ; where Macos keeps the modem slot*16
A$nd equ $c088  ; the base of the ACTA send byte
ARcv equ A$nd  ; the base of the ACTA receive byte
IntPage equ $c089  ; the base of the SSC status byte
MLI equ $bf00  ; the ProDOS Machine Language Interface

* --- SetInt
* Sets up the necessary interrupts to receive
* chars. from the modem. Because of this, the modem echo
* must be OFF, and the card must use interrupts.

SetInt ldx #$00  ; set-up offset into buffer and interrupt page
loop lda IntPage,x  ; get the byte from the ProDOS page
ax  ; put it right into the buffer
inx  ; up the pointer
lda IntPage,x  ; get the next 1
sta buffr1,x  ; and store it
done jsr MLI  ; call the ProDOS MLI and ask it to...
:parms hex 0101  ; 1 parameter, ref. number 1
buffr1 ds 8  ; 8 bytes to store the old interrupt vectors

* --- Send
* This routine send the user's string to the modem.

Send jsr Goblcomm  ; who needs the comma?
ldx Mdmslot  ; load with offset to slot number
loop lda Getnxt  ; get the next char. from the program
sta ARcv,x  ; send the char. to the modem
pha  ; store off the char. that was sent
:subloop lda Status,x  ; get the status from the SSC
and $e00000000 ; turn off all bits except bit 4 (value 8)
beq :subloop  ; otherwise, keep checking
:done loop  ; if we're done, go on...
_cmp $8d  ; is it return?
beq checkrsp  ; it is, start waiting for response from modem
bne :loop  ; it's not, well keep looping the chars.

* --- checkrsp
* This routine sets up an infinite dummy loop
* The interrupt handler stores off each character in a buffer.
* Once done, ($8d found) it proceeds on to find a match.

checkrsp ldx #$0  ; set offset to zero
loop lda buffr2,x  ; get the last-known byte
_cmp $8d  ; is it return?
```

When Xenocide is loaded, plug your mouse in for some heavy action. You will come to the startup menu. The top left corner of your menu is to calibrate your joystick. (Note: Joystick Optional). The right top corner is to view the high scores. It gives you the option of erasing the high scores. You can clear the high scores by pressing 'C'. The bottom left corner gives you the option of turning stereo ON or OFF. The bottom right corner is simply to start your mission.

Note: It is not necessary to hold down keys. Once the key is pressed you will continue to move in that direction until another key is pressed. Holding down a key will disable the [Open-Apple] and [Option] keys and you will not be able to fire.

--- Fire Controls ---

Button 0 - [Open-Apple]
Button 1 - [Option]

Hovercraft level:
- [Spacebar] - Launch nuclear bomb
- [Open-Apple] - Fire fireball
- [Option] - Fire missile

Cave levels I & II:
- [Spacebar] - Select option
- [Open-Apple] - Fire lasers/auto blaster
- [Option] - Throw grenade/fire sonic wave
- [Open-Apple] - Refuel/fill oxygen tank (only when at a refueling bay)

Bio-lab level:
- [Spacebar] - Select option
- [Open-Apple] - Fire lasers/flame thrower
- [Option] - Throw grenades/drop land mines

--- Hints & Suggestions ---

1. Try shooting at rocks and walls in the cave levels—some have bombs and keys behind them.
2. If you fly by a refueling bay, make sure that you land even if you don’t need the fuel or ammunition—if you happen to die later then you will start back at the last bay that you landed. Now we wouldn’t want that, now would we?
3. When advancing into the Bio-lab, be sure to get a full supply of ammunition and grab the options that will be most valuable to you in the Bio-lab (Regro Shield!).
4. Option boxes in the Bio-lab are not as plentiful as those in the caves, so use them more prudently.

--- Levels ---

The Hovercraft Level:

The object of the hovercraft level is to avoid hitting large rocks and aliens, pick up as many ammunition canisters as possible and get to the docking station which will take you to the next level before running out of fuel. At the start of the hovercraft level you will see a road before you. The ammunition canisters you are to collect will be found along the side of the road and the docking station will be found somewhere along the way. Since a hovercraft hovers above the ground using its anti-gravity pads, it is not necessary to stay on the road. However, if you wander too far off the road you may never find the docking station.

Along the way you will encounter strange alien life forms that you can avoid or shoot. If you happen to hit one at slow speed you will run it over but fast speed will damage your hovercraft. If you hit one of the rocks at low speed it will stop you but at higher speeds it will do massive damage to your hovercraft. Hitting to many objects will destroy your hovercraft!

The ammunition canisters are very important because they will determine the amount of ammunition you will be able to carry in the following levels. To get a canister simply run over it with your hovercraft. (Hitting canisters will not harm your hovercraft). Once you hear the “Alert” voice you will be near the docking station and a red dot will be shown on the radar screen showing the distance and direction to the station. To dock simply run into the docking station and you will be taken to the cave level.

Cave level I:

You have now left your hovercraft and put on a jetpack to travel through the treacherous cave level. The cave level has two basic objectives: to collect five bombs that will be required in the Bio-lab to destroy the moon and to find the docking pad that will take you to the next level. The bombs are placed secretly throughout the cave and there will always be five of them. You cannot continue to the next level until you have collected all five bombs.

As in the hovercraft level, you have a set amount of fuel and ammunition capacity. However, for each ammunition canister that you have collected your maximum ammunition capacity will be raised. You will start out with maximum fuel and ammunition, but as the game progresses you will run out of fuel and undoubtedly ammunition. Thus, it is important that you land at the refueling bays located throughout the cave whenever possible to replenish your fuel and ammunition. It is possible to travel back the cave all the way to your starting position, but you may not go back to your previous level. This makes it easy to clear out a portion of the cave then fly back to the closest
refueling bay and refuel. Also, if you happen to die in a cave level then your
next life will begin at the last refueling bay that you landed on.

Although there are many things that you must beware of in the cave level, there
are also very rewarding things as well. For example, Option Pods (shown as
pulsating blue spheres) provide you with the different options that are listed
at the bottom right-hand corner of your screen. When you collect a blue option
you will be able to activate the first item on the options list. To activate the
option, simply press the spacebar and it will turn from light blue to
yellow, indicating that the option is active. If you collect a second blue
option pod and you have not yet used the first option, the indicator light will
advance to the next option in the list. You may still collect options while
one is activated, but you cannot have two or more options at the same time.
If you have an active option, then collecting more options will move the light
blue indicator down the list as before, but this time skipping over the
activated option. For example, if the Auto Blaster option is in yellow, or
active and the sonic wave option in light blue, collecting one more option
pod will now make Mega Shield a light blue option. Be careful, however, for if
you have Negro Shield in light blue (waiting to use it when your shield runs
low) and you run into an option pod, then Flesh Freeze will now be in light
blue and you will have lost the ability to activate Negro Shield. This could
make even a bad day seem enjoyable!

Once you are at the end of the cave and have collected all five bombs, land on
the docking pad (marked with blinking arrows) and press button 0 on your
joystick. This will advance you to the next level.

Cave level II:

There are a few differences between Cave level I and II. Most notable is the
fact that your travel will take you through an underwater environment. The
following is a list of the differences that you will experience.

1. You will sink if you are not swimming
2. The fuel indicator becomes an oxygen indicator, the refueling bays will now
give oxygen supplies instead of fuel.
3. There are no more bombs to collect in Level II, but there are locked doors
that must be opened with keys, which are hidden throughout the cave. To pick
up a key simply run into it. To open the door just touch the keyhole in the
doors after picking up a key. Note, however, that a key may only be used
once.

4. The bomb indicator becomes the key indicator and will keep track of how
many keys you have.

Once you are at the end of Level II cave, land on the docking pad (marked with
blinking arrows), press button 0 on the joystick and you will be taken down to
the Bio-lab. When you get to the Bio-lab your shield will be repaired and you
will have the same options and ammunition.

Bio-lab level:

The objective of the Bio-lab level is to destroy the moon you are on by
dropping all of the five bombs that you collected in the cave level into
nuclear storage ports that are located throughout the laboratory and teleport
off to the moon.

The screen view is one in which you, the player, are looking down from above
the floorplan of the laboratory. You will notice that there is no indicator or
fuel, as you are now able to walk around the laboratory.

Once you have explored the Bio-lab and have placed all of the five bombs, then
you should go to the central control room and activate the teleporter (by
running into the computer terminal) and then moving to the teleporter pad. You
will then be teleported to your ship where you will be outfitted for your next
mission, or given the win sequence if you have destroyed the final moon.

--- Using The Joystick ---
FOR 10 TURNS, DURING WHICH ENDURANCE LEVEL WILL RETURN TO FULL STRENGTH AND 4 POINTS OF DAMAGE WILL BE HEALED.

P - PURCHASE. CHECKS EXPERIENCE POINT LEVEL TO SEE IF A NEW LEVEL HAS BEEN REACHED. IF SO CHARACTER IS AWARDED MORE HIT POINTS. ALSO, PURCHASE GOODS.

IN TRADING POSTS THE FOLLOWING IS AVAILABLE:

(A) ARMORY SHOP
(M) MAGIC SHOP
(S) SPANISH COIN
(SPC) EXIT

MISCELLANEOUS COMMANDS:

Q - QUIT AND SAVE. SAVES CURRENT GAME STATUS TO DISK.
W - WEAPON SELECTION. CHANGES WEAPON IN HAND
S - SPELL. ALLOW YOU TO CAST SPELLS.
Z - CHANGE TEXT AND MOVEMENT DELAYS.

TO CAST SPELLS:

TO CAST SPELLS, THE MAGIC USER MUST HAVE A XIPHOID AMULET IN THEIR POSSESSION.

OTHER IMPORTANT KEYS:

O - REST & HEAL. PUTS PLAYER IN TRANCE
Ten thousand southern suns have passed since the Archmage Szhaalin tore the very heart from the demon lord Xyphus and hid it in the Arroyan continent. His life's work done, the mighty Szhaalin vanished into the western wilderness, while the gravely wounded demon lord sunk into caverns beneath the Earth to languish in eternal pain. Legend has it that pieces of the demon's heart fell to the soil and formed magic sword-shaped amulets of violet crystal from whence all magic springs, and that somewhere in the very bowels of the Earth itself lies the actual heart—a gemstone the size of a human head.

'Tis said that when the demon lord bled, tribes of goblins sprang from the droplets of ichor—the Cotico, the Malakee, the Maripo, the Sedento, the Mazandi, and the dread Azulus with their companion Hellhounds. All of Arroya was forbidden to human kind by the beasts and monsters that still dwell there. Poisonous serpents and oversized vermin roam the plains, while all manner of the dead—that-walk are to be found in the hills and forests. All the men that have ventured into the lost continent have vanished without a trace, save for occasional sporadic half-mad ramblings that gave birth to legends surrounding Arroya.

Some thirty years ago a conqueror was born. Some men say that Das is the descendant of the great wizard Szhaalin, while others scoff at such talk, calling it the foolish tales of old women...I tell ye that there is much wisdom in the tongues of women, but heed ye what ye speak. In his short lifetime Das has overrun most of the known world, aye, and has brought it to order and justice, albeit with the edge of the sword and the purification of the torch. It is said that men need a strong leader to follow, one who holds little in esteem save the sword and the armor of the dead. Through the Lost Continent there are scattered forts and trading posts, where it is said the once-great Demon civilization still resides. There may be some truth to these rumors as not very many Demons are spotted above ground...Nevertheless, it is common knowledge among the Arroyan Dwarves that there are, indeed, numerous tunnels in the southwest of the continent, come quite large, while others are so narrow that only a human child can pass through them.

Outposts
Through the Lost Continent there are scattered forts and trading posts to be the only source of good metal weapons of Arroya. Healing services are provided at the trading posts as well, at no charge to the wounded character.

Character Races & Professions
There are three races in Arroya from which player characters can be recruited. They are Elf, Human, and Dwarf. Each race has its strengths and weaknesses, some of which may not become apparent until later in
the campaign. Choose your party carefully.

Elf - The Arroyan elf is not a true native of the continent, but rather a descendant of a band of elves that came to Arroya centuries earlier, under the leadership of the warrior-king Ellanyl. An outcast from his homeland, Ellanyl led his colony to the Lost Continent in search of a new home. He rashly burnt his three long ships immediately upon his arrival on the coastal plains of Arroya and subsequently was killed, along with all of his skilled carpenters, in a Demon raid within a year of his landing. The surviving elves established small settlements in the coastal forests and have managed to eke out a meager existence until the present.

Elves are small people, averaging perhaps five feet in height. They are very quick and agile, and are most at home in the woods. They are good fighters and spellcasters, although they tend to tire quickly if using heavy weapons.

Humans - The Human is the only true Arroyan race from which characters may be recruited. For hundreds of centuries they were slaves of the Demon civilization, and their numbers diminished yearly under the harsh treatment they received at the hands of their cruel masters. The slave race of Humans eventually died out, but not before runaways had escaped into the mountains and formed small outlaw bands that still survive to this day. The Humans of Arroya hate Demons above all else and will fight them to their dying breath.

The Human stands between five and a half and six and a half feet tall, usually weighs 150-250 pounds, and is at his or her best wielding heavy weapons. They are not as hardy as Dwarves, but a lot tougher than Elves.

Dwarf - The Dwarves of Arroya are recent arrivals to the Lost Continent. They first touched shore a paltry two hundred years ago, in search of precious metals. The dwarves are a race of miners, and thrive in rocky, mountainous terrain. They are also at home underground and are valued for their acute sense of direction in subterranean passages. They have no love for Demons or other goblin tribes that inhabit Arroya, and are handy in a fight.

The tallest dwarf stands but four feet from head to toe. They are uniformly stocky, usually outweighing their Elven counterparts. Common wisdom is that a dwarf can stand three blows for every two another race receives in a fight. However, they have very short legs and are not fond of running, a trait which makes them laggards on any race.

Professions

There are two classes of player characters in Xyphus: Fighter and Spellcaster.

The Fighter can use any weapon except the Xiphoid Amulet, but may not cast spells or use magic other than in the form of magical weapons and armor enchantments.

The Spellcaster can fight a little, using clubs or maces, but is unable to wield an edged or advanced weapon. A spellcaster can, however, cast spells, provided that he or she possesses a Xiphoid Amulet. There are no restrictions on the armor that a spellcaster may use, but both armor and spells are expensive in Arroya and gold is scarce.

Character Creation

One may have up to four characters in Xyphus, although that number is not required. To create characters, simply type in their names when asked to do so by the program, and choose their professions. Depending on their race and profession, they will be given their proper hit points, skill factors and movement abilities:

Should you succeed in winning the game with a party of four, you might consider tackling it with fewer player characters...

Playing the Game

The game Xyphus consists of six separate scenarios, each one tougher than the previous one. The average playing time of a scenario ranges from 3 - 12 hours, depending on the skill of the player. There are three components to playing Xyphus, the Master Disk, the Scenario Disk, and the Game Disk. The Game Disk must be created by you. The game is always played on the Game Disk you create. Any number of Game Disks can be created with characters unique to that game.

To begin boot the Master Disk. You will be presented with two choices:

(A) - CREATE NEW GAME DISKETTE  (B) - CONTINUE EXISTING GAME

Select (A). You will then be asked to enter the number of characters (1-4) for this game. Using four characters is recommended for the first time through. Less than four makes for a very difficult game.

Once you have selected the number of characters in your party, you will then be asked: ENTER THE NAME OF CHARACTER 1. Upon naming your first character, you will be asked: SELECT RACE: H)UMAN  D)WARF  E)LF.

Choose your race carefully and remember that balanced parties are the key to success in Xyphus.

Upon choosing the character race, you will be asked: SELECT F)IGHTER OR S)PELLCASTER. Choose the profession you wish that character to be.

Finally, you will be shown the character as it exists and asked: CHARACTER OK? (Y OR N). Type "Y" if you are satisfied with the character or "N" if you wish to start over.

Repeat the sequence for the remaining characters in your party.

Once you have created your party, you will be asked: ENTER NUMBER OF DISK DRIVES (1 OR 2)? Type in the appropriate number.

If you have one disk drive, you will be told to put a blank diskette in the drive. This will be your Game Disk. Press the spacebar to continue here, and the program will insert the Scenario Disk into drive one. You will be told to insert the Scenario Disk at the appropriate times. Be patient, there is a lot of data on the Scenario Disk and you will have to swap disks a number of times. The program will always tell you when to do so.

If you have two disk drives, you will be told to put a blank in Drive two and the Scenario Disk in Drive one. The program will then create your Game Disk.

Once you have created your Game Disk, you will always use it to play Xyphus. Each time you boot up the Master Disk, choose the (B) CONTINUE EXISTING GAME option and insert your Game Disk when asked to do so.

NOTE: During the play of Xyphus there will be pauses after battles and victories to allow you to read displayed messages. The computer is waiting for a keypress. Pressing the spacebar will continue the game.

Controls

Xyphus can be played with the keyboard (Macintosh users should see special instructions). The map in Xyphus is based on a system of hexagons, thus you may move any of your characters in any of six
directions - Northeast, East, Southeast, Southwest, West, and Northwest. The keys to use are:

Y - Northeast
H - East
B - Southeast
V - Southwest
F - West
T - Northwest
G - Remain for one turn in the same spot.

NOTE: Should you wish to move the entire party as a group instead of moving your characters, simply hold down the CTRL key while pressing the key for your chosen direction. Common sense should tell you that any party can only move as quickly as its slowest member. This is true for Xyphus.

Combat

The keys for combat are the same as for movement. Combat takes place when a player characters moves next to a creature and then chooses to strike at it by attempting to move through it. Should you attempt to fight something using group movement capability (holding down the CTRL key in conjunction with a direction key), your party may move, but will refuse to engage in combat.

Other Important Keys

0 - Rest & Heal. This command will put the player character into a trance of approximately 10 moves, during which his or her endurance level will return to full strength and 4 points of damage will be healed. However, a character in a trance is extremely vulnerable to and will be unable to defend against an attack until he or she awakens.

P - Purchase. The purchase command serves two very important functions. Whenever it is invoked, the current Experience Point total of the character is checked to see if a new level has been reached. If so, you will be advised of the advancement and your character will be awarded extra Hit Points. It is a good practice to hit "P" whenever you enter a trading post or a fort, regardless of whether you intend to purchase anything or not.

Also, whenever you enter a trading post or a fort, you have the option of purchasing new weapons, spells, or armor. Pressing the "P" key will enable you to do so. You will then be shown a menu:

(A) ARMORY SHOP
(W) WEAPONS SHOP
(M) MAGIC SHOP
(/) CHARACTER STATUS
(BP) EXIT

Choosing any of the above options will in turn lead to a new menu. Entering the Weapons, Armor, or Magic shop will show you a list of available merchandise and the current prices for each item. You may choose to buy whatever you can afford.

Finally, when your party has completed assigned tasks in the scenarios and are all gathered in the destination fort, selecting "P" will end the current scenario and move the party to the next one.

Choosing (/) - Character status - will provide the following two or three screens of information (This option may be chosen at any time during the game):

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1227 of 1262
Spell. This command allows you to cast spells, and will be discussed in the file on Spellcasting.

Z - Change text delay and movement delay. The text delay is the amount of time that special messages are displayed on the screen. The movement delay is the amount of time taken for response to a selected directional move. Pressing "Z" will get the message: ENTER TEXT DELAY (1-9) CURRENT VALUE IS X; followed by: ENTER MOVEMENT DELAY (1-9) CURRENT VALUE IS X. Play with these values until you have found the right ones for you.

Movement, Endurance, & Dexterity Factors

Each character and creature in Xyphus is rated for movement, endurance, and dexterity. What this means is that each creature will move better on certain types of terrain and worse on others, as is the case for the different races of player characters.

Furthermore, depending on the weapon used, each character or creature will strike more frequently during the length of a fight, or less often. For example, a Dwarf wielding a two-handed longsword, will not strike nearly as frequently as an Elf using a hunting knife. (He will do a lot more damage per blow, however). Different monster types will strike at different rates as well.

Finally, each character and creature is rated for endurance. That means that depending on the weapon being used and the spell being cast, the player will tire out more quickly or at a slower pace. The effects of fatigue on player characters is that there will be reduced damage on blows struck or the character may cease to be able to fight at all, and fatigued Spellcasters may not be able to cast some of the more demanding spells.

Armor & Weapons

Metal is very scarce is Arroya - The Dwarves are the only true miners and smiths in the whole land and there are only a few of them. A warrior's wealth is often measured by the armor and weapons he or she owns. There is no plundering of corpses for weapons. In fact, when possible, the weapons and armor are buried with the corpse in accordance with the dictates of Arroyan culture. However, weapons which are lost and have no rightful owner may be claimed by any Arroyan. Legends tell of many magical weapons which are scattered about the Lost Continent.

The Arroyan warrior uses only one kind of armor, and only the most powerful of warriors have full suits. The armor consists of a padded jerkin of cloth, covered with a leather tunic that protects the waist and hips. The tunic is in turn covered with a hauberk of chain mail that covers the torso and protects the arms. Finally, a breastplate of polished bronze is placed over the hauberk. Most Arroyans, however, cannot afford this much armor and they must collect it piece by piece. Fortunately, each component of the armor does provide an additional degree of protection as it is accumulated. Custom (and practicality) dictates that a warrior first purchase a shield, then begin building his or her armor collection. No armorer will sell armor to a warrior without a shield.

Should a warrior manage to purchase a full suit of armor, there is yet another way of increasing his or her armor class. This is through the purchase of an enchantment available through any armorer. The enchantment is a two-part affair called the Veils of Szhaarlin. The first part is called the Inner Veil, and must be in place before the second part - the Outer Veil - can be purchased.

Weapons

There are many types of weapons available in Arroya, some of which cannot be purchased anywhere. The forts and trading posts in different parts of the continent may offer weapons particular to that locale as well as common weapons such as swords, maces, and morningstars. Many of the special weapons are outlawed in other parts of the Lost Continent and may be confiscated by garrison commanders there. (The program will take care of these simply by eliminating them when you move to a new scenario).

Many of the creatures found in Arroya are enchanted by nature, and may only be wounded with magical or silver weapons. Most Lost Continent veterans will tell you that if the creature seems unusual, it will probably require the use of a special weapon to destroy it.

At some time your party may come across enchanted weapons useable either by Fighters or Spellcasters. Be thankful and grab them! Some of these weapons will last throughout the campaign, while others will vanish when their enchantment is used up. Be warned that there are cursed weapons around...

SPELLCASTING & MAGIC AND MONSTERS ARE IN FILE #2. THEY WILL BE RELEASED AS SOON AS POSSIBLE...
Spellcasting & Magic

The use of magic in Arroya is governed by some fairly strict rules. To begin with, the source of magic is the Xiphoid Amulets — small, sword-shaped, violet gemstones that are found in the wilderness of the Lost Continent. Legend says that these stones are pieces of the Heart of Xyphus, torn from the breast of the Lord of Demons by the great wizard Shaalzin thousands of years ago. Legend also says that the Heart itself still exists and must be found before Xyphus can be slain.

What is known about the Xiphoid Amulets is that they seem to be the catalyst for the casting of spells. Once a Spellcaster has purchased a magic scroll or spell, he or she has that spell memorized and can use it forever — PROVIDED THEY HOLD IN THEIR HAND A XIPHOID AMULET WITH WHICH TO FOCUS AND MAGNIFY THE ENERGY THAT BRINGS INTO BEING AN

Another known fact about the Xiphoid Amulets is that they shatter. They do so when their power has been consumed. There is no getting around the fact that the amulets are finite, and that they wear out. Thus, the Spellcaster that conserves his or her spells usually lives to raise children and discuss philosophy late into the evening.

One last fact about the amulets: They can and are often used as weapons. They are small and do very little damage, but they do affect normal and enchanted beings alike.

The casting of a spell is not an easy task for the Spellcaster. Regardless of the success or failure of a spell, it requires a great deal of concentration and energy from the magic user. The amount of endurance necessary to cast a particular spell is noted on the lists of spells throughout the game.

The wizards of Arroya commonly use a dozen spells, although rumors circulate about the existence of scrolls with unknown spells etched on them in magical writing that fades after a short time. Should a player encounter one of these scrolls, they must determine its effect and purpose through experimentation. The well-known spells are:

**Abeja** — This spell produces a profusion of livid welts to appear on

the recipient, severe enough to slay small creature and wound humans gravely. This spell has a high probability of succeeding, although it will only work on normal living creatures.

Matamosca — This spell delivers a sharp blow to its recipient, causing about as much damage as the Abeja spell. It has a relatively good chance of being cast successfully, but will not affect Demons and certain types of enchanted beings.

**Bendicca** — This spell only affects shapechangers and lycanthropes. It causes a great deal of damage on the life force of the dormant shape of the creature, e.g. if a werewolf in its human shape is the recipient of a Bendicca spell, its latent wolf shape will suffer the damage. The spell has a good probability of being cast successfully.

**Hela** — This spell is a staple of the Demon-fighter's bag of tricks. It causes an area of intense cold to briefly materialize around its recipient, causing serious damage. This spell does not always work, but is successful more often than not.

**Tirayama** — This spell is only effective against Undead creatures such as Zombies and Liches. This spell does not always work, but is relatively successful for the skilled Spellcaster.

**Tirayela** — This spell is similar to the Hela spell in its effect, i.e., its damage is rendered by intense cold. However, it is not effective against Demons or certain enchanted creatures. Furthermore, it is an extremely difficult spell to cast correctly and often does not work.

**Hindrance Spells**

**Ciega** — This spell works against all normal (not enchanted or Undead) creatures, and renders them blind for a limited period of time.

**Piedra** — This spell paralyzes its victims. It works against shapechangers and lycanthropes only.

**Lubrika** — This spell slows down Demons by turning the ground beneath their feet into extremely slippery clay. Unfortunately, the effects of the spell are rather short-lived.

**Cieno** — This spell slows down Undead creatures by turning the ground beneath their feet to a fine, powdery substance. The effects do not last very long.

**Healing Spells**

**Sana** — Sana is a high-powered healing spell that will completely cure an injured character, even if that character has been poisoned.

**Goza** — Goza will cure some damage to all members of a party, but is ineffective where poison is concerned.

**Other Spells**

[> Thanx to the Archer <]

These spells were not listed in the manual nor can you buy them from a trading post:

**Attack Spells**

**Sling Of A Sage** — This spell seems to cause a small amount of damage to one creature. It seems to have a high probability of succeeding.

**Magic Firebow** — Seems to affect all monsters and has a high probability of succeeding. To my knowledge it has not been tried on
enchanted beings.

Tree - This is the only spell or weapon, for that manner, that will harm a Treant. It usually destroys them with one try.

Demonda - This spell does an extreme amount of damage to Demons and will usually kill them.

Astral Fence - This spell will protect all the characters in a party from being attacked by monsters, but there is no guarantee that it will be cast correctly.

Star Burst - This is the only known effective weapon or spell that will cause harm to Glass Gods.

Hindrance Spells

Lycod - This spell seems to paralyze the recipient. It only seems to work on shapechangers and lycanthropes.

Casting Spells

Unlike a fighter who must be next to an opponent in order to strike a blow, the Spellcaster may strike from a distance. To cast a spell, simply type "S" when it is the Spellcaster's turn. You will be shown a list of spells available to that character, of which one may be selected. If you decide not to use a spell, press the spacebar to return to the game.

As a Spellcaster advances in level due to experience point gain, his or her effective range for casting spells will increase. So will the probability for successful casting of a spell. Practice makes perfect, even in magic.

YankIt v1.2 README
Copyright (C) 1992 by Andy McFadden
All Rights Reserved
This program is Freeware - distribute freely, do not sell

Usage: yankit t[v]|x[v]|i[v] archive.shk [file1 file2 ...]

Options:
    t - just get a table of contents on the archive
    x - extract files
    i - integrity check; looks like it's extracting, but doesn't write anything
    v - verbose mode; combine with one of the first three
    f - force overwrite of existing files (doesn't prompt)
    s - don't use GS/OS sessions

If "archive.shk" is "-", then YankIt will read from stdin instead of a file.

v1.2 changes:
- (very slightly) more speed
- misc tweaks
v1.1 changes:
- new 'f' flag
- fixes two bugs in LZW uncompression
v1.0 features:
- supports uncompressed, LZW-I, and LZW-II storage
- extracts forked files
- works under APW/Orca, Gno, and ProSel-16 shells
- handles other compression methods and non-file archives (e.g. disk archives)
- silently ignores Binary II headers, so it will extract .BXY files
- "usually" faster than GS/ShrinkIt (see benchmarks for discussion)
- uses only two pages of DP space, making it ideal for running in the background

Info

The "read from stdin" feature allows you to do things like:
   cat foo.shk | yankit tv -
   or
   yankit tv - < foo.shk

under Gno to get a listing of the files in foo.shk (why you'd want to do this is beyond me, but I imagine situations will arise).

** NOTE: the current version of the GNO shell doesn't appear to support this correctly. YankIt will appear to hang, but is actually trying to read from the keyboard. If this happens, just hold down a key until it quits (it's trying to read 48 characters). Orca 1/O redirection appears to work, but supposedly pipes will not because they don't work correctly with binary data.

YankIt will always prompt you before overwriting existing files. YankIt prompts are of the form
   message (Y/N/Q)? N
Unpacking Moria GS packed with LZW-I (368K) from an InnerDrive to /ram5:

YankIt              1:07
GS/ShrinkIt         1:38
YankIt              1:10                0:38
GS/Shrinkit         1:42      With Zip: 0:51
YankIt              1:36                1:05

Unpacking Moria GS packed with LZW-I (368K) from AppleDisk 3.5" to /ram5:

YankIt              1:41                0:50
GS/Shrinkit         1:49      With Zip: 1:00
YankIt              1:09                0:37

YankIt's uncompress routines are faster than GS/SHK's, but GS/SHK will read the entire archive into memory if it can instead of grabbing 32K chunks. This makes it faster than YankIt when I/O with a slow device is involved (especially if that device's I/O contains the processor to slow down to 1MHz temporarily).

On the other hand, YankIt's total memory usage is known at load time (somewhere in the neighborhood of 80K for buffers and code). It also uses very little DP space, and doesn't require any tools that aren't resident in ROM. Generally, YankIt is a win when you need to conserve memory and you're running off of a fast hard drive (which should be a common situation for people using Gno).

Comparison with NuLib

YankIt has features that NuLib doesn't, including:
- ability to handle resource forks
- the integrity check actually does something useful (NuLib's doesn't verify the CRCs)
- smaller and MUCH faster (100% assembly)

However, NuLib has features like:
- can create NuFX archives and compress as well as uncompress
- handles Binary II
- SQ/USQ uncompression and UNIX 16-bit compression/uncompression
- variety of display modes
- lots of other misc features, like the ability to delete files from archives, extract based on partial filename matches, and view files without having to extract them into a file.
- available as source code, and very portable

YankIt is intended as a quick & dirty way to extract files from archives created by ShrinkIt. It is not intended to replace ShrinkIt nor is it a prelude to a Super Duper New and Improved compression program. It was written primarily with one in mind.

If you ask me to add a new feature, be prepared to answer the question, "why can't you just use GS/ShrinkIt to do that?"

Some (rather crude) benchmarks (Apple //gs at 2.5MHz, GS/OS 5.0.4, GS/SHK 1.0.4, ZipGS 8.10K, and a development version of YankIt):

Moria GS is:

MORIA.A 1134 block shell executable
MORIA.CONFIG 6 block text file
MORIA.DOC 129 block text file
MORIA.IGS.INFO 10 block text file

YankIt was timed with "show time; yankit ...; show time". GS/ShrinkIt was timed with a stopwatch. All times should be considered +/- 2 seconds.

Unpacking Moria GS packed with LZW-I (368K) from /ram5 to /ram5:

GS/Shrinkit         1:42                0:51
YankIt              1:10                0:38

Unpacking Moria GS packed with LZW-II (348K) from /ram5 to /ram5:

GS/Shrinkit         1:38                1:07
YankIt              1:38                1:07

Unpacking Moria GS packed with LZW-I (368K) from an InnerDrive to /ram5:

GS/Shrinkit         1:41                0:50
YankIt              1:49                1:05

(and now the interesting one...)

TOWER OF BABEL ??

In the interest of fostering compatibility among communications
programs, part of of the Professional-YAM manual is reproduced here to
minimize the Electronic Tower of Babel.

The YMODEM Protocol is supported by the public domain programs YAM
(CP/M), YAM(CP/M-86), YAM(CCPM-86), rb/sb (Unix, Berkeley Unix, Venix,
Xenix, Coherent, IDRIS, Regulus) as well as Professional-YAM. These
programs have been in use since 1981.

The protocols described below are enhancements to Ward Christensen's
XMODEM protocol, and are public domain.

The 1k packet length capability described below may be used in
conjunction with the Batch Protocol, or with single file transfers
identical to the XMODEM/CRC protocol except for minimal changes to
support 1k packets.

To complete this tome, Ward Christensen's original protocol document
and John Byrns's CRC-16 document are included for reference.

References to the XMODEM or MDXMODEM protocol have been changed to XMODEM
to accommodate the vernacular.

Watch for an article describing the YMODEM protocol in a more coherent
fashion later this year. This article will include some interesting
history on the development of file microcomputer file transfers.

Be aware the article[1] DID quote me correctly in terms of the phrases
like "not robust", etc.

It was a quick hack I threw together, very unplanned (like everything
I do), to satisfy a personal need to communicate with "some other"
people.

ONLY the fact that it was done in 8/77, and that I put it in the
public domain immediately, made it become the standard that it is.

# : 130940 SO/Communications 25-Apr-85 18:38:47
Sb: my protocol
Fm: Ward Christensen 76703,302 (EDITED)
To: all

INFOWORLD APRIL 29 P. 16

I think its time for me to

1. document it; (people call me and say "my product is going to
include it - what can I 'reference', or "I'm writing a paper
on it, what do I put in the bibliography") and

2. propose an "incremental extension" to it, which might take
"exactly" the form of Chuck Forsberg's YAM protocol. He
wrote YAM in C for CP/M and put it in the public domain, and
wrote a batch protocol for Unix called rb and sb (receive
batch, send batch), which was basically XMODEM with
a. a record 0 containing filename date and size
b. a 1K block size option
c. CRC-16.

He did some clever programming to detect false ACK or EOT, but basically left them the same.

People who suggest I make SIGNIFICANT changes to the protocol, such as "full duplex", "multiple outstanding blocks", "multiple destinations", etc. don't understand that the incredible simplicity of the protocol is one of the reasons it survived to this day in as many machines and programs as it may be found in!

Consider the PC-NET group back in '77 or so - documenting to beat the band - THEY had a protocol, but it was "extremely complex", because it tried to be "all things to all people" - i.e. send binary files on a 7-bit system, etc. I was not that "benevolent". I (emphasize > I < ) had an 8-bit UART, so "my protocol was an 8-bit protocol", and I would just say "sorry" to people who were held back by 7-bit limitations.

Block size: Chuck Forsberg created an extension of my protocol, called YAM, which is also supported via his public domain programs for UNIX called rb and sb - receive batch and send batch. They cleverly send a "block 0" which contains the filename, date, time, and size. Unfortunately, its UNIX style, and is a bit weird[1] - octal numbers, etc. BUT, it is a nice way to overcome the kludgy "echo the chars of the name" introduced with MODEM7. Further, chuck uses CRC-16 and optional 1K blocks. Thus the record 0, 1K, and CRC, make it a "pretty slick new protocol" which is not significantly different from my own.

-------
1. The Unix style stuff (time, file mode) is optional. The pathname and file length may be sent alone if desired.

Chapter 1 (cont)

Also, there is a catchy name - XMODEM. That means to some that it is the "next thing after XMDEM", and to others that it is the Y(am)MODEM protocol. I (emphasize > I < ) don't want to emphasize that too much - out of fear that other mfgrs might think it is a "competitive" protocol, rather than an "unaffiliated" protocol. Chuck is currently selling a much-enhanced version of his CP/M-80 C program YAM, calling it Professional Yam, and its for the PC - I'm using it right now. VERY slick! 32K capture buffer, script, scrolling, previously captured text search, plus built-in commands for just about everything - directory (sorted every which way), XMODEM, YMODEM, KERMIT, and ASCII file upload/download, etc. You can program it to "behave" with most any system - for example when trying a number for CIS it detects the "busy" string back from the modem and substitutes a diff phone # into the dialing string and branches back to try it.

Chapter 2

XMODEM Protocol Enhancements

Professional-YAM uses several compatible extensions and logic enhancements to the widely used Ward Christensen XMODEM protocol.

This chapter discusses the protocol extensions to Ward Christensen's 1982 XMODEM protocol description document.

YAM does not ask the operator whether he wishes to keep retrying after 10 attempts have failed to correctly transfer a packet. Virtually all comparable programs are corrected within the first few retransmissions. If the line is so bad that ten attempts are insufficient, there is a significant danger of undetected errors. In that case, it's better to reveal all; better connection.

2.1 CAN-CAN Abort

YAM recognizes a sequence of two consecutive CAN (Hex 18) characters without modem errors (overrun, framing, etc.) as a transfer abort command. The check for two consecutive CAN characters virtually eliminates the possibility of a line hit aborting the transfer. YAM sends five CAN characters when it aborts a XMODEM protocol file transfer, followed by five backspaces to delete the CAN characters from the remote's keyboard input buffer (in case the remote had already aborted the transfer).

-------
1. This is recognized when YAM is waiting for the beginning of a packet or for an acknowledge to one that has been sent.

Chapter 2 (cont)

2.2 CRC-16 Option

The XMODEM protocol uses an optional two character CRC-16 instead of the one character arithmetic checksum used by the original protocol and by most commercial implementations. CRC-16 guarantees detection of all single and double bit errors, all errors with an odd number of error bits, all burst errors of length 16 or less, 99.9969% of all 17-bit error bursts, and 99.9984% of all possible longer error bursts. By contrast, a double bit error, or a burst error of 9 bits or more can sneak past the XMODEM protocol arithmetic checksum.

The XMODEM/CRC protocol is similar to the XMODEM protocol, except that the receiver specifies CRC-16 by sending C (Hex 43) instead of NAK when requesting the FIRST packet. A two byte CRC is sent in place of the one byte arithmetic checksum. YAM's c option to the r command enables CRC-16 in single file reception, corresponding to the original implementation in the MODEM7? series programs. Many commercial communications programs and bulletin board systems still do not support CRC-16, especially those written in Basic or Pascal.

XMDEM protocol with CRC is accurate provided both sender and receiver both report a successful transmission. The protocol is robust in the presence of characters lost by buffer overloading on timesharing systems.

Professional-YAM add several proprietary logic enhancements to XMDEM's error detection and recovery. These compatible enhancements eliminate most of the bad file transfers other programs make when using the XMDEM protocol under less than ideal conditions.

2.3 1024 Byte Packet Option

IF YAM is sending with the k option, the transmitted packet contains 1024 bytes of data. An STX (02) replaces the SOH (01) at the beginning of the transmitted block to notify the receiver of the longer packet length. The receiver shall be able to accept any mixture of 128 and 1024 byte packets. The packet number is incremented by one for each packet[1].

-------
1. The displayed sector number should be the number of bytes divided by 128. This maintains a familiar unit of measurement for the progress report and avoids ambiguity caused by rollover of the sector number.

Chapter 2 (cont)

If 1024 byte packets are being used, it is possible for a 128 byte file to "grow" to 1024 bytes on CP/M. This does not waste disk space on CP/M because the allocation granularity is 1k. When 1024 byte packets are used with batch transmission, the file length transmitted in the file name packet allows the receiver to discard the padding. CRC-16 should be used with the k option to preserve data integrity.
over phone lines. The k option may be used with batch file transmission, or with single file transmission.

Chapter 3 (cont)
YMODEM Batch File Transmission

The YMODEM Batch protocol is an extension to the XMODEM/CRC protocol that allows 0 or more files to be transmitted with a single command. (Zero files may be sent if none of the requested files is accessible.) The design approach of the YAM Batch protocol is to use the normal routines for sending and receiving XMODEM packets in a layered fashion similar to packet switching methods.

Why was it necessary to design a new batch protocol when one already existed in MODEM7? The batch file mode used by MODEM7 is unsuitable because it does not permit full pathnames, file length, file date, or any other attribute information to be transmitted. Such a restrictive design, hastily implemented with only CP/M in mind, would not have permitted extensions to current areas of personal computing such as Unix, DOS, and object oriented systems.

As in the case of single a file transfer, the receiver initiates batch file transmission by sending a "C" character (for CRC-16).

The sender opens the first file and sends packet number 0 with the following information[1].

Only the pathname (file name) part is required for batch transfers.

To maintain upwards compatibility, all unused bytes in packet 0 must be set to null.

Pathname The pathname (conventionally, the file name) is sent as a null terminated ASCII string. This is the filename format used by the handle oriented MSDOS(TM) functions and C library fopen functions. An assembly language example follows:

```plaintext
DB 'foo.bar',0
```

No spaces are included in the pathname. Normally only the file name stem (no directory prefix) is transmitted unless the sender has selected YAM's f option to send the full pathname. The source drive (A:, B:, etc.) is not sent.

-------
1. Only the data part of the packet is described here.

Chapter 3 (cont)
Filename Considerations:

+ File names should be translated to lower case unless the sending system supports upper/lower case file names. This is a convenience for users of systems (such as Unix) which store filenames in upper and lower case.

+ The receiver should accommodate file names in lower and upper case.

+ The rb(1) program on Unix systems normally translates the filename to lower case unless one or more letters in the filename are already in lower case.

+ When transmitting files between different operating systems, file names must be acceptable to both the sender and receiving operating systems. If directories are included, they are delimited by /; i.e., "subdir/foo" is acceptable; "subdir\foo" is not.

Length The file length and each of the succeeding fields are optional[1]. The length field is stored in the packet as a decimal string. The file length does not include any CPMEOF (^Z) characters used to pad the last packet.

If the file being transmitted is growing during transmission, the length field should be set to at least the final expected file length, or not sent.

The receiver stores the specified number of characters, discarding any padding added by the sender to fill up the last packet.

Mod Date A single space separates the modification date from the file length.

The mod date is optional, and the filename and length may be sent without requiring the mod date to be sent.

The mod date is sent as an octal number giving the time the contents of the file were last changed measured in seconds from Jan 1 1970 Universal Coordinated Time (GMT). A date of 0 implies the modification date is unknown and should be left as the date the file is received.

This standard format was chosen to eliminate ambiguities arising from transfers between different time zones.

-------
1. Fields may not be skipped.

Chapter 3 (cont)
Two Microsoft blunders complicate the use of modification dates in file transfers with MS-DOS(TM) systems. The first is the lack of timezone standardization in MS-DOS. A file's creation time can not be known unless the timezone of the system that happened to write the file(1) is known. Unix solved this problem (for planet Earth, anyway) by stamping files with Universal Time (GMT). Microsoft would have to include the timezone of origin in the directory entries, but does not. YAM gets around this problem by using the z parameter which is set to the number of minutes local time lags GMT. For files known to originate from a different timezone, the -zT option may be used use T as the timezone for an individual file transfer.

The second problem is the lack of a separate file creation date in DOS. Since some backup schemes used with DOS rely on the file creation date to select files to be copied to the archive, backdating the file modification date could interfere with the safety of the transferred files. For this reason, Professional-YAM does not modify the date of received files with the header information unless the d parameter is non zero.

Mode A single space separates the file mode from the modification date. The file mode is stored as an octal string. Unless the file originated from a Unix system, the file mode is set to 0. rb(1) checks the file mode for the 0x8000 bit which indicates a Unix type regular file. Files with the 0x8000 bit set are assumed to have been sent from another Unix (or similar) system which uses the same file conventions. Such files are not translated in any way.

Serial Number A single space separates the serial number from the file mode. The serial number of the transmitting program is stored as an octal string. Programs which do not have a serial number should omit this field, or set it to 0. The receiver's use of this field is optional.

The rest of the packet is set to nulls. This is essential to preserve upward compatibility[2]. After the filename packet has been received, it is ACK'ed if the write open is successful. The receiver then initiates transfer of the file contents according to the standard XMODEM/CRC protocol. If the file cannot be opened for writing, the receiver cancels the transfer with CAN characters as described above.

---

1. Not necessarily that of the transmitting system!
2. If, perchance, this information extends beyond 128 bytes (possible with Unix 4.2 BSD extended file names), the packet should be sent as a 1k packet as described above.

Chapter 3 (cont)

After the file contents have been transmitted, the receiver again asks for the next pathname. Transmission of a null pathname terminates batch file transmission. Note that transmission of no files is not necessarily an error. This is possible if none of the files requested of the sender could be opened for reading.

In batch transmission, the receiver automatically requests CRC-16.

The Unix programs sb(1) and rb(1) included in the source code file RBSB.QQQ (rbsb.sh) should answer questions about YAM's batch protocol.

XMODEM PROTOCOL OVERVIEW

8/9/82 by Ward Christensen.

I will maintain a master copy of this. Please pass on changes or suggestions via CBBS/Chicago at (312) 545-8086, CBBS/CPMUG (312) 849-1132 or by voice at (312) 849-6279.

4.1 Definitions

<soh> 01H
<eot> 04H
<ack> 06H
<nak> 15H
<can> 18H
<c> 43H

4.2 Transmission Medium Level Protocol

Asynchronous, 8 data bits, no parity, one stop bit.

The protocol imposes no restrictions on the contents of the data being transmitted. No control characters are looked for in the 128-byte data messages. Absolutely any kind of data may be sent - binary, ASCII, etc. The protocol has not formally been adopted to a 7-bit environment for the transmission of ASCII-only (or unpacked-hex) data, although it could be simply by having both ends agree to AND the protocol-dependant data with 7F hex before validating it. I specifically am referring to the checksum, and the block numbers and their ones- complement.

Those wishing to maintain compatibility of the CF/M file structure, i.e. to allow moderning ASCII files to or from CP/M systems should follow this data format:

+ ASCII tabs used (09H); tabs set every 8.
+ Lines terminated by CR/LF (0DH 0AH)
+ End-of-file indicated by ~, IAH. (one or more)
+ Data is variable length, i.e. should be considered a
Chapter 4 (cont)

1. The last block sent is no different from others, i.e., there is no "short block".

Figure 5. XMODEM Message Block Level Protocol

Each block of the transfer looks like:

\(<\text{SOH}>\text{blk }\#<\text{255-blk }\#<\text{--128 data bytes--}<\text{cksum}\>\)

in which:

\(<\text{SOH}>\) = 01 hex
\(<\text{blk }\#>\) = binary number, starts at 01 increments by 1, and wraps 0FFH to 00H (not to 01)
\(<\text{255-blk }\#>\) = after going thru 8080 "CMA" instr, i.e., each bit complemented in the 8-bit block number. Formally, this is the "ones complement".
\(<\text{cksum}>\) = the sum of the data bytes only. Toss any carry.

4.3 File Level Protocol

4.3.1 Common to Both Sender and Receiver

All errors are retried 10 times. For versions running with an operator (i.e., NOT with XMODEM), a message is typed after 10 errors asking the operator whether to "retry or quit".

Some versions of the protocol use \(<\text{can}>\), ASCII ^X, to cancel transmission. This was never adopted as a standard, as having a single "abort" character makes the transmission susceptible to false termination due to an \(<\text{ack}>\) \(<\text{nak}>\) or \(<\text{soh}>\) being corrupted into a \(<\text{can}>\) and cancelling transmission.

The protocol may be considered "receiver driven", that is, the sender need not automatically re-transmit, although it does in the current implementations.

4.3.2 Receive_Program_Considerations

The receiver has a 10-second timeout. It sends a \(<\text{nak}>\) every time it times out. The receiver's first timeout, which sends a \(<\text{nak}>\), signals the transmitter to start. Optionally, the receiver could send a \(<\text{nak}>\) immediately, in case the sender was ready. This would save the initial 10-second timeout. However, the receiver MUST continue to timeout every 10 seconds in case the sender wasn't ready.

Chapter 4 (cont)

Once into a receiving a block, the receiver goes into a one-second timeout for each character and the checksum. If the receiver wishes to \(<\text{nak}>\) a block for any reason (invalid header, timeout receiving data), it must wait for the line to clear. See "programming tips" for ideas.

Synchronizing: If a valid block number is received, it will be:

1. the expected one, in which case everything is fine; or

2. a repeat of the previously received block. This should be considered OK, and only indicates that the receivers \(<\text{ack}>\) got glitched, and the sender re-transmitted.

3. any other block number indicates a fatal loss of synchronization, such as the rare case of the sender getting a line-glitch that looked like an \(<\text{ack}>\). Abort the transmission, sending a \(<\text{can}>\)

4.3.3 Sending_Program_Considerations

While waiting for transmission to begin, the sender has only a single very long timeout, say one minute. In the current protocol, the sender has a 10-second timeout before retrying. I suggest NOT doing this, and letting the protocol be completely receiver-driven. This will be compatible with existing programs.

When the sender has no more data, it sends an \(<\text{eot}>\), and awaits an \(<\text{ack}>\), resending the \(<\text{eot}>\) if it doesn't get one. Again, the protocol could be receiver-driven, with the sender only having the high-level 1-minute timeout to abort.

Here is a sample of the data flow, sending a 3-block message. It includes the two most common line hits - a garbled block, and an \(<\text{ack}>\) reply getting garbled. \(<\text{xx}>\) represents the checksum byte.

Chapter 4 (cont)

4.4 Programming Tips

+ The character-receive subroutine should be called with a parameter specifying the number of seconds to wait. The receiver should first call it with a time of 10, then \(<\text{nak}>\) and try again, 10 times.

After receiving the \(<\text{soh}>\), the receiver should call the character receive subroutine with a 1-second timeout, for the remainder of the message and the \(<\text{cksum}>\). Since they are sent as a continuous stream, timing out of this implies a serious like glitch that caused, say, 127 characters to be seen instead of 128.

+ When the receiver wishes to \(<\text{nak}>\), it should call a "PURGE" subroutine, to wait for the line to clear. Recall the sender tosses any characters in its UART buffer immediately upon completing sending a block, to ensure no glitches were mis-interpreted.

The most common technique is for "PURGE" to call the character receive subroutine, specifying a 1-second timeout[1], and looping back to PURGE until a timeout occurs. The \(<\text{nak}>\) is then sent, ensuring the other end will see it.
+ You may wish to add code recommended by John Mahr to your character receive routine - to set an error flag if the UART shows framing error, or overrun. This will help catch a few more glitches - the most common of which is a bit in the high bits of the byte in two consecutive bytes. The <cksum> comes out OK since counting in 1-byte produces the same result of adding 00H + 080H as with adding 00H + 00H.

Chapter 5

XMODEM/CRC Overview

1/13/85 by John Byrns -- CRC option.

Please pass on any reports of errors in this document or suggestions for improvement to me via Ward's/CBBS at (312) 849-1132, or by voice at (312) 885-1105.

1. These times should be adjusted for use with timesharing systems.

Chapter 5 (cont)

The CRC used in the Modem Protocol is an alternate form of block check which provides more robust error detection than the original checksum. Andrew S. Tanenbaum says in his book, Computer Networks, that the CRC-CCITT used by the Modem Protocol will detect all single and double bit errors, all errors with an odd number of bits, all burst errors of length 16 or less, 99.997% of 17-bit error bursts, and 99.998% of 18-bit and longer bursts.

The changes to the Modem Protocol to replace the checksum with the CRC are straightforward. If that were all that we did we would not be able to communicate between a program using the old checksum protocol and one using the new CRC protocol. An initial handshake was added to solve this problem. The handshake allows a receiving program with CRC capability to determine whether the sending program supports the CRC option, and to switch it to CRC mode if it does. This handshake is designed so that it will work properly with programs which implement only the original protocol. A description of this handshake is presented in section 10.

Figure 7. Message Block Level Protocol, CRC mode

Each block of the transfer in CRC mode looks like:

```
<SOH><blk #><255-blk #><---128 data bytes--><CRC hi><CRC lo>
```

in which:

- `<SOH>` = 01 hex
- `<blk #>` = binary number, starts at 01 increments by 1, and wraps 0FFH to 00H (not to 01)
- `<255-blk #>` = ones complement of `blk #`
- `<CRC hi>` = byte containing the 8 hi order coefficients of the CRC
- `<CRC lo>` = byte containing the 8 lo order coefficients of the CRC. See the next section for CRC calculation.

5.1 CRC Calculation

5.1.1 Formal Definition

To calculate the 16 bit CRC the message bits are considered to be the coefficients of a polynomial. This message polynomial is first multiplied by X^16 and then divided by the generator polynomial (X^16 + X^12 + X^5 + 1) using modulo two arithmetic. The remainder left after the division is the desired CRC. Since a message block in the Modem Protocol is 128 bytes or 1024 bits, the message polynomial will be of order X^1023. The hi order bit of the first byte of the message block is the coefficient of X^1023 in the message polynomial. The lo order bit of the last byte of the message block is the coefficient of X^0 in the message polynomial.

Chapter 5 (cont)

Figure 8. Example of CRC Calculation written in C

```
/*
 * This function calculates the CRC used by the XMODEM/CRC
 * Protocol.
 * The first argument is a pointer to the message block.
 * The second argument is the number of bytes in the message block.
 * The function returns an integer which contains the CRC.
 * The low order 16 bits are the coefficients of the CRC.
 */

int calcrc(ptr, count)
char *ptr;
int count;
{
    int crc, i;
    while(--count >= 0) {
        crc = 0;
        while(e~count >= 0) {  
            crc = crc ^ (int)*ptr++ << 8;  
            for(i = 0; i < 8; ++i)  
                if(crc & 0x8000)  
                    crc = crc << 1 ^ 0x1021;  
                else  
                    crc = crc << 1;
        }
        return (crc & 0xFFFF);
    }
}
```

Chapter 5 (cont)

5.2 CRC File Level Protocol Changes

5.2.1 Common_to_Both_Sender_and_Receiver

The only change to the File Level Protocol for the CRC option is the initial handshake which is used to determine if both the sending and receiving programs support the CRC mode. All Modem Programs should support the checksum mode for compatibility with older versions. A receiving program that wishes to receive in CRC mode implements the mode setting handshake by sending a <C> in place of the initial <nak>. If the sending program supports CRC mode it will recognize the <C> and will set itself into CRC mode, and respond by sending the first block as if a <nak> had been received. If the sending program does not support CRC mode it will not respond to the <C> at all. After the receiver has sent the <C> it will wait up to 3 seconds for the <soh> that starts the first block. If it receives a <soh> within 3 seconds it will assume the sender supports CRC mode and will proceed with the file exchange in CRC mode. If no <soh> is received within 3 seconds the receiver will switch to checksum mode, send a <nak>, and proceed in checksum mode. If the receiver wishes to use checksum mode it should send an initial <nak> and the sending program should respond to the <nak> as defined in the original Modem Protocol.

After the mode has been set by the initial <C> or <nak> the protocol follows the original Modem Protocol and is identical whether the checksum or CRC is being used.

5.2.2 Receive_Program_Considerations
There are at least 4 things that can go wrong with the mode setting handshake.

1. the initial <C> can be garbled or lost.
2. the initial <soh> can be garbled.
3. the initial <C> can be changed to a <nak>.
4. the initial <nak> from a receiver which wants to receive in checksum can be changed to a <C>.

The first problem can be solved if the receiver sends a second <C> after it times out the first time. This process can be repeated several times. It must not be repeated too many times before sending a <nak> and switching to checksum mode or a sending program without CRC support may time out and abort. Repeating the <C> will also fix the second problem if the sending program cooperates by responding as if a <nak> were received instead of ignoring the extra <C>.

Chapter 5 (cont)

It is possible to fix problems 3 and 4 but probably not worth the trouble since they will occur very infrequently. They could be fixed by switching modes in either the sending or the receiving program after a large number of successive <nak>’s. This solution would risk other problems however.

5.2.3 Sending Program Considerations

The sending program should start in the checksum mode. This will insure compatibility with checksum only receiving programs. Anytime a <C> is received before the first <nak> or <ack> the sending program should set itself into CRC mode and respond as if a <nak> were received. The sender should respond to additional <C>’s as if they were <nak>’s until the first <ack> is received. This will assist the receiving program in determining the correct mode when the <soh> is lost or garbled. After the first <ack> is received the sending program should ignore <C>’s.

5.3 Data Flow Examples with CRC Option

Here is a data flow example for the case where the receiver requests transmission in the CRC mode but the sender does not support the CRC option. This example also includes various transmission errors. <xx> represents the checksum byte.

Figure 9. Data Flow: Receiver has CRC Option, Sender Doesn’t

SENDER                                  RECEIVER
--- <C>                                   --- <C>
<soh> 01 FE -data- <xx> ---> <--- <ack>
<soh> 02 FD -data- <xx> ---> <--- <nak>
<soh> 02 FD -data- <xx> ---> <--- <ack>
<soh> 03 FC -data- <xx> ---> <--- <ack>
<soh> 03 FC -data- <xx> ---> <--- <nak>
<eot> --- <ack>
<ack> --- <ack>

Chapter 5 (cont)

Here is a data flow example for the case where the receiver requests transmission in the CRC mode and the sender supports the CRC option. This example also includes various transmission errors. <xxxx> represents the 2 CRC bytes.

Figure 10. Receiver and Sender Both have CRC Option

SENDER                                  RECEIVER
--- <C>                                   --- <C>
<soh> 01 FE -data- <xxxx> ---> <--- <ack>
<soh> 02 FD -data- <xxxx> ---> (data gets line hit) <--- <nak>
<soh> 02 FD -data- <xxxx> ---> <--- <ack>
<soh> 03 FC -data- <xxxx> ---> <--- <ack>
<soh> 03 FC -data- <xxxx> ---> <--- <nak>
<eot> --- <ack>
<ack> --- <ack>

Apple II Computer Documentation Resources (a2_docs_documentation.msw)
DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1238 of 1262
19200HST

By Joseph Sheppard
Sysop, The Ledge PCBoard (818) 352-3620

WHAT IT DOES:

19200HST is a utility program written with Turbo Pascal 5.0 using routines from Prokit by Samuel Smith. 19200HST is released as a free program. No donations are requested for it's use. The authors are not responsible for any damage that might be caused by the use of this program. Please use this program at your own risk.

The purpose of 19200HST is to aid owners of USRobotics Courier HST modems in setting up for optimum speed.

This program is designed for callers only. Although I run my BBS with the settings from 19200HST, I would recommend that Sysops follow the instructions for their specific BBS package on modem settings.

Registered PCBoard sysops have a similar program called PCBMODEM that should be used instead of this program.

This program will lock your serial port at 19200. This setting may only be effective on 286 and 386 systems. Some multi-tasking software may not be able to handle this setting. If you find that you are having trouble with aborted downloads after running this program and you should probably go into your terminal program and type ATAP1 followed by the ENTER key to reset the modem to it's factory settings.

These settings will do the following to your modem:

UP UP DN DN UP UP DN DN UP UP 1 2 3 4 5 6 7 8 9 10

1 - DTR is controlled by software
2 - Send verbal result codes
3 - D. Inhibit result codes are displayed
4 - Local echo of commands is suppressed
5 - Auto Answer Suppressed
6 - Do not force carrier detect
7 - Single phone line connection (RJ-11)
8 - AT command set enabled
9 - Hang up when escape code is sent
10 - Load from NRAM in power up

These settings from 19200HST, I would recommend that Sysops follow the instructions for their specific BBS package on modem settings.

HOW IT DOES IT:

19200HST starts by giving the suggested dipswitch settings, which are as follows:

Next it sends the following settings to the modem's non-volatile memory:

\textbf{ATS7=6E000X07}
\textbf{S7=E0} - Number of seconds modem waits for carrier
\textbf{E0} - Local echo off
\textbf{M0} - Speaker Off (can be overiden by putting M1 in your modem program's initialization string)
\textbf{X7} - Result code option (OK, CONNECT, RING, NO CARRIER, ERROR, CONNECT, NO DIAL TONE, BUSY, NO ANSWER, RINGING, VOICE)

Once this string is received it sends the following additional settings:

\textbf{AT4H3=6E021E16K06W}
\textbf{4H3} - Hardware and software control

\textbf{AT4H3=6E021E16K06W}
\textbf{4H3} - Hardware and software control

**Apple II Computer Info**

402 - Received data output to terminal on RTS high
401 - Modem controls DSR
401 - Lock port at speed setting (19200)
400 - Disable data compression (override with &K1 in modem initialization string)
400 - Write these settings to non-volatile RAM (NRAM).

After running this program, you should go into the setup portion of your modem program (Qmodem, Procomm or whatever) and change the modem initialization string to ATZ followed by whatever character that program uses to send a carriage return (Qmodem uses a \texttt{\{ Procomm uses a \}!).

**DATA COMPRESSION?**

The HST has a setting for "Data Compression". 19200HST turns this off because I've found that when the HST tries to compress a file that is already compressed, such as an .ARC file that it will slow the transfer down considerably. Text Files and compiler listings that are not compressed will go at blinding speeds, but in the real BBS world it's rare to find files in the download sections that aren't in some sort of compressed form.

If your application finds you downloading mostly un-compressed files then you may want to put &K1 in your modem initialization string. Otherwise, leave it alone and you will see a marked increase in performance.

**TIPS 'N' TRICKS:**

As stated above, this is a free program. You will probably use it once, then throw it away and forget all about me. That's fine, but at least when you call my BBS at 19200 you won't be getting 400 cps! Updates to 19200HST are always available on my BBS, The Ledge PCBoard, which is listed at the top of this file. Although you can't download from my file directory on the first call, you will be able to download any of the programs that I've written, or any third party programs (such as DSZxxx.ARC) that are mentioned in this file. My support door DOES have Xmodem-1K-G (Ymodem-G) so if you are looking for a place to test...come on!

LICENSE AGREEMENT

You are licensed to use this software on a trial basis for a period of fourteen days. If after the trial period, you wish to continue using ZAPCODE, you must purchase a permanent license from Morton Utilities, Morton International. (A permanent license costs only $19.95 - See section entitled "Purchasing ZAPCODE" for details.)

You are granted a limited license to copy ZAPCODE only for the trial use of others subject to the agreement described above, and also the following:

- ZAPCODE must be copied in unmodified form, complete with the following files and only the following files:
  - ZAPCODE.COM - ZAPCODE program
  - ZAPCODE.DOC - ZAPCODE program documentation
  - INVOICE.DOC - Invoice for permanent license
  - ASP.DOC - Association of Shareware Professionals Info.
  - EPFX.PMF - Printer driver: Epson FX Series
  - HPLJ.PMF - Printer driver: Hewlett Packard LaserJet
  - IBMCOLOR.PMF - Printer driver: IBM Color Printer
  - IBMPROG.PMF - Printer driver: IBM Proprietary
  - TSHP341.PMF - Printer driver: Toshiba P321SL/P341SL
  - TSHP35IC.PMF - Printer driver: Toshiba P351C Color Printer

- No fee, charge or other compensation may be accepted or requested by anyone without express written consent from Morton Utilities, Morton International.

- ZAPCODE may not be distributed in conjunction with any other product or service without a specific license to do so from Morton Utilities, Morton International.

Electronic bulletin board operators (Sysops) may post ZAPCODE for downloading by their users without written consent only when the above conditions are met. A fee may be charged for access to the ZBS as long as no specific fee is charged for access to the ZAPCODE files.

ZAPCODE is distributed in a self-unarcng format. If your BBS uses a specific archive program for distributing programs, you may re-archive the ZAPCODE files using it. However, ONLY the files described above may be placed in the ZAPCODE archive.

Disk vendors and other Shareware distribution companies which market diskettes containing Shareware programs for profit MUST obtain written consent from Morton Utilities, Morton International. Permission is usually given; please write for details.

You are not allowed to modify this software under any conditions. You are, however, encouraged to create and distribute your own printer drivers using the extension "PMF". These may not, however, be placed in the ZAPCODE archive.

TRADEMARKS

ZAPCODE is a trademark of Morton Utilities, Morton International.

ZAPCODE consists of the following files:

ZAPCODE.COM - ZAPCODE program
ZAPCODE.DOC - ZAPCODE program documentation
INVOICE.DOC - Invoice for permanent license
ASP.DOC - Association of Shareware Professionals Info.
EPSFX.PMF - Printer driver: Epson FX Series
HPLJ.PMF - Printer driver: Hewlett Packard LaserJet
IBMCOLOR.PMF - Printer driver: IBM Color Printer
IBMPRO.PMF - Printer driver: IBM Proprinter
TSHP341.PMF - Printer: Toshiba P341SL
TSHP351C.PMF - Printer: Toshiba P351C

All printer drivers end in the extension "PMF" (Printer Make File). Printer drivers have been included for some of the more popular printers. If your printer is not yet supported, you can easily build your own driver or customize one of the given. This will be covered shortly in the section "Using The PWF Editor".

System Requirements

To use ZAPCODE you need:

- IBM PC, XT, AT, PS/2, or compatible computer
- A parallel or serial printer

ZAPCODE, simply put, is a printer control utility. With it, you can send control codes to your printer to activate or deactivate any of its options and features. Pop-up ZAPCODE at any time to, for example, reset your printer, turn on condensed print, or advance the page. ZAPCODE can also be used to automatically enter printer control codes inside your word processor, spreadsheet, or any other program. This is great for word processors that don’t support all of your printer’s features but allow you to embed printer control codes inside your documents. Simply pop-up ZAPCODE, select the desired printer option(s), and then let ZAPCODE enter the printer codes for you, just as if you had typed them at the keyboard. ZAPCODE can even be used to print envelopes, as a dialing directory, and even as a crude keyboard macro program. ZAPCODE is ideal for all types of printers including dot-matrix, laser, and even plotters. Additional features include:

- Stand-alone running for those times when memory residency might not be desirable.
- Support for any parallel printer attached to LPT1 to LPT3, and any serial printer attached to COM1 to COM4.
- Completely customizable printer drivers. You can easily modify the included printer drivers to suit any desired configuration, or even create your own.
- Memory resident activation over most applications, including those graphics-based.
- Customizable window colors and activation hotkey.
- Capability of multiple installations for those systems which require support for more than one printer.
- Uninstallation of memory resident copies for those times when the extra RAM is needed.

(C) Copyright 1990 Morton Utilities, Morton Intl.
You'll also need at least 64K available memory to use ZAPCODE in stand-alone mode. 128K is required to use the PMF Editor. When installed in memory, ZAPCODE uses approximately 17K. However, depending on the size of the printer driver, an additional 10K is usually needed.

ZAPCODE is distributed under the Shareware marketing system. The Shareware concept allows you, the user, to use a program on a trial basis to determine if it meets your needs. If you find the program useful and wish to continue using it, you are required to pay a license or registration fee to the author.

If you received ZAPCODE through a distribution service and paid a small fee (usually $3 to $5), this does not constitute payment for ZAPCODE. You have simply paid for the distribution service. The $3.00 or $5.00 or whatever pays for the diskette, duplications and handling and does NOT constitute payment for the programs contained on the diskette.

ZAPCODE license and registration costs $19.95. The file "INVOICE.DOC" contains an invoice which you may print and use for this purpose. Registering ZAPCODE gets you:

1. The latest version of ZAPCODE without the Shareware notice.
3. All of the latest printer drivers. We're always creating new drivers for more printers. If yours isn't currently supported, we'll create it for you FREE. Just mention it to us on the invoice.
4. Six months support plus we'll notify you of any program updates and new products.

The Shareware system is dependant upon honest people. If you use a Shareware program and have not paid for the author, you must pay a license or registration fee to the author. If you received ZAPCODE through a distribution service and paid a small fee (usually $3 to $5), this does not constitute payment for ZAPCODE. You have simply paid for the distribution service.

The Shareware system is dependant upon honest people. If you use a Shareware program and have not paid for the author, you must pay a license or registration fee to the author. If you received ZAPCODE through a distribution service and paid a small fee (usually $3 to $5), this does not constitute payment for ZAPCODE. You have simply paid for the distribution service.

The Shareware system is dependant upon honest people. If you use a Shareware program and have not paid for the author, you must pay a license or registration fee to the author. If you received ZAPCODE through a distribution service and paid a small fee (usually $3 to $5), this does not constitute payment for ZAPCODE. You have simply paid for the distribution service.

The PMF Editor’s main editing screen is identical to ZAPCODE’s hotkey, window colors, and everything else. Codes can be entered in any of three formats: decimal, hexadecimal, or ASCII. This feature defaults off and can be enabled in your AUTOEXEC.BAT file. If other memory resident utilities are loaded in your AUTOEXEC.BAT and conflictions occur when loading ZAPCODE, try different variations in the order each is loaded.

When ZAPCODE is activated, a window is displayed containing the printer options. A bar highlights the currently selected option. The description window contains a description of the selected option. Another window contains a list of keys that can be used to control ZAPCODE. They are:

- **UpArrow** - Move selection bar up one option
- **DnArrow** - Move selection bar down one option
- **PgUp** - Move selection bar up one page
- **PgDn** - Move selection bar down one page
- **Home** - Move selection bar to first option
- **End** - Move selection bar to last option
- **Insert** - Send the selected option to keyboard
- **Spacebar** - Send reset code sequence to printer
- **Slash (/)** - Manually enter codes to send to printer
- **Esc** - Exit ZAPCODE

Use the UpArrow, DnArrow, PgUp, PgDn, Home, and End keys to select a printer option.

Press the Insert key to send the control codes for the selected option to the keyboard. Use this feature to enter printer codes into your word processor, spreadsheet, or any other program. ZAPCODE can be configured to enter codes in a variety of formats, including decimal and hexadecimal. This feature defaults off and you must use the "PMF Editor" to activate it. (See "Using The PMF Editor" for instructions.) This feature only works when ZAPCODE is memory resident. Pressing the Insert key when ZAPCODE is stand-alone or when this feature is off causes the speaker to beep and has no effect.

Press the Enter key to send the control codes for the selected option to the printer. When done, the message "Codes Zapped" will be displayed if the operation was successful. If your printer is off-line or turned off, an error message will be displayed and you will be prompted for necessary action.

Press the Spacebar to send the reset codes to the printer. This is a string of control codes used to restore all printer options to their power-on defaults. Some printers provide a control code for doing just this, while with others, each option must be restored individually. If there are no reset codes configured, this function has no effect.

Codes must be separated by a comma or a space. Codes entered in hexadecimal format must be preceded by a numeric digit and end with the character "h". Codes entered in ASCII format must be enclosed in quotation marks. AS YOU ENTER CODES, THE WINDOW WILL PAD ONCE YOU HAVE REACHED THE RIGHT MARGIN. This allows you to enter an unlimited number of codes.

Example: 27, "&o2e5", 0C5h

While entering codes, use the following keys to edit and control ZAPCODE:

- **LeftArrow** - Move cursor left one character
- **RightArrow** - Move cursor right one character
- **Ins** - Toggle insert/overwrite entry modes
- **Del** - Delete character under cursor
- **Esc** - Abort

Use the LeftArrow, RightArrow, Insert, and Delete keys to edit what you have entered. Press F1 to display a window containing information about the syntax that must be used while entering codes. Press Enter to send the entered codes to the printer. Press Esc to abort.

Some printer options require that a parameter or parameters be entered before they can be activated (eg. Set Tabs). Selecting one of these options causes a window to be displayed prompting you for the missing parameter(s). This window is identical to the window used for entering codes manually. However, there is an additional window containing instructions explaining what is expected. Two additional keys are available for scrolling the instruction text:

- **PgUp** - Display previous page of instructions
- **PgDn** - Display next page of instructions

Once you have entered the necessary parameter(s), the control codes for that option along with the missing parameter code(s) will be sent to the printer.

Using The PMF Editor

Using the PMF Editor, you can create and edit PMF’s and change the following PMF control information:

- Printer Name
- Printer Port and Setup
- Printer Reset Codes
- Activation Hotkey
- Window Colors
- Keyboard Setup

All control information is personal and stored in that PMF. This means that each PMF can have its own personal activation hotkey, window colors, and everything else.

The PMF Editor’s main editing screen is identical to ZAPCODE’s main selection window. There is an additional window displayed...
at the bottom containing status information and a list of keys that can be pressed to control editing. They are:

- **E** - Edit the selected code
- **A** - Add a new code after the selected
- **D** - Delete the selected code
- **M** - Move the selected code
- **C** - Configure other options

The PMF filename and memory usage are displayed in the lower left corner. This memory amount reflects the number of bytes in the PMF would use when installed in memory (using the */F* switch). This amount does not include the 17K bytes ZAPCODE itself uses.

### Edit Printer Code

Press **E** to edit the selected printer code. A window will be displayed containing the printer code name, description and actual codes in decimal. Use the following keys during editing:

- **UpArrow** - Move to previous field
- **DnArrow** - Move to next field
- **LeftArrow** - Move cursor left one character
- **RightArrow** - Move cursor right one character
- **Ins** - Toggle insert/overwrite entry modes
- **Del** - Delete character under cursor
- **Enter** - Finish editing and save changes
- **Esc** - Abort
- **Backspace** - Delete character left of cursor

Press “E” to edit the selected printer code. A window will be displayed containing the printer code name, description and control codes. For example, If you defined the following:

```
"Hello ",EMP#1," My name is ",EMP#2,".,13,10
```

When this option is printed, the following happens:

1. "Hello ", is sent to the printer.
2. EMP window #1 is displayed and you are prompted for "missing parameter" codes. Let's assume you respond by typing "everybody." (quotation marks included).
3. "everybody." is sent to the printer.
4. " My name is " is sent to the printer.
5. EMP window #2 is displayed and you are prompted again. Let's assume you respond by typing "John Doe".
6. "John Doe" is sent to the printer.
7. "." is sent to the printer.
8. Character 13 (carriage return) and 10 (linefeed) are sent to the printer.

Your printer would have printed the following:

`Hello everybody. My name is John Doe.`

EMP windows allow you to do all sorts of great things. Use an EMP window to prompt for the recipient's address and print out the address. Each EMP window symbol represents a code sequence. Use one to prompt for the recipient's address printing envelopes. Examine the included PMF's for examples.

### Editing An EMP Window

To edit an EMP window, place the cursor on the EMP window symbol and press Alt-E. A window will be displayed containing the instruction text. Follow the same rules for editing an EMP as you did for adding.

### Deleting An EMP Window

To delete an EMP window, place the cursor on the EMP window symbol and press the delete key. You will be prompted for confirmation before the window is actually deleted. Attempting to type over the EMP window symbol will also delete it. ZAPCODE will ask you to confirm before it does so.

### Add Printer Code

To add a printer code, press "A". A window will be displayed in which you may enter the name, description, and printer codes.
Follow the same rules for adding a printer code as you did for editing. When finished, the code will be added immediately after the one that was selected when the "A" key was pressed.

Delete Printer Code

To delete the selected printer code, press "D". You will be prompted for confirmation before the code is actually deleted.

(C) Copyright 1990 Morton Utilities, Morton Intl. Page 11

Move Printer Code

The move command allows you to organize and group the printer codes. To move the selected code, press "M". Then select the destination for the move using the UpArrow, DnArrow, PgUp, PgDn, Home, and End keys. The printer code will be moved to the entry immediately before the selected destination. Press Enter to perform the move. Press Esc to abort.

Configure Other Options

Pressing "C" allows you to configure the following PMF control information:

Printer Name
Post Setup
Reset Codes
Activation Hotkey
Window Colors
Keyboard Setup

Use the UpArrow and DnArrow keys to select. Press Enter to configure the selected. Press Esc to abort.

* Printer Name *

This option allows you to enter/edit the printer name. A window is displayed containing the printer name for the PMF. Use the following keys:

LeftArrow - Move cursor left one character
RightArrow - Move cursor right one character
Ins - Toggle insert/overwrite entry modes
Del - Delete character under cursor
Backspace - Delete character left of cursor
Enter - Save changes made
Esc - Abort without saving changes

Use the LeftArrow, RightArrow, Insert, Delete, and Backspace keys to edit the printer name. Press Enter to save new printer name. Press Esc to abort without saving.

* Port Setup *

This option allows you to select and configure the printer port. A window is displayed containing the current port assignment. Your choices are:

LPT1: Parallel 1
LPT2: Parallel 2
LPT3: Parallel 3
COM1: Serial 1
COM2: Serial 2
COM3: Serial 3
COM4: Serial 4

A window will be displayed in the bottom right corner prompting you for the desired window whose colors you wish to change. Use
the UpArrow and DnArrow keys to select desired window. As you select each window, its color will be displayed. Press Enter to confirm selection. Press Esc to end.

After selecting a background color, you will be prompted to select a window part. Use the UpArrow and DnArrow keys to select desired window part. As you select each window part, its color will be updated to reflect it. Press Enter to confirm selection. Press Esc to return to window selection.

After selecting a window part, you will be prompted to select a new background color. Use the UpArrow and DnArrow keys to select desired color. As you select each color, the window will be updated to reflect it. Press Enter to confirm selection. Press Esc to return to part selection.

After selecting a background color, you will be prompted to select a new foreground color. Use the UpArrow and DnArrow keys to select desired color. As you select each color, the window will be updated to reflect it. Press Enter to confirm selection. Press Esc to return to background color selection.

"Keyboard Setup"

The "Keyboard Setup" option allows you to tailor the way ZAPCODE sends printer codes to the keyboard. The following options allow you to customize ZAPCODE to work with virtually any program:

- Code Format
- String Prefix
- String Suffix
- Code Prefix
- Code Suffix
- Code Delimeter

"Code Format" is the format each code is expressed in. The following formats are available:

- Decimal ............................... $,15,255
- Decimal 3 character ................. 005,015,255
- Hexadecimal with digit start ........ 5,0F,FF
- Hexadecimal without digit start ..... 5,F,FF
- Hexadecimal 2 character ............ 05,0F,FF
- Hexadecimal 3 character ............ 005,00F,OFF
- ASCII

(C) Copyright 1990 Morton Utilities, Morton Intl.

The examples to the right demonstrate how three codes (5, 15, and 255) are expressed when that format is used. "Hex with digit start" means that a numerical digit (0-9) must always lead the number. This is the format ZAPCODE prefers to accept hexadecimal numbers in. The last format, "ASCII", causes each code to be entered as its ASCII character equivalent. Thus, the following codes:

72 101 108 108 111

would yield their ASCII equivalents:

Hello

The NUL code (character 0) can be used to define special keys and key combinations. For example, the following codes:

0 59 65 66 67 0 19

translate into:

FL A B C Alt-R

Codes 0 and 59 define the F1 function key. Codes 65, 66, and 67 define keys "A", "B", and "C" respectively. Codes 0 and 19 define the Alt-R key combination. See Appendix D for a complete list of special keys and the codes needed to define them.

There aren't many programs that you would use the "ASCII" format for entering printer codes into. However, it does add to ZAPCODE's functionality in that it allows you to create keyboard macros. You could, for instance, create a PMF dedicated to this cause entirely. To use one of the macros, you would simply pop-up ZAPCODE, select it, and voila!

"String Prefix", "String Suffix", "Code Prefix", "Code Suffix", and "Code Delimeter" are used to specify what comes before, after, and in the middle of each individual code and the entire string of codes. Each of these is sent to the keyboard as an "ASCII" format string. This means you may use special keys and key combinations in them. "String Prefix" specifies what comes before the entire string of codes. "String Suffix" specifies what comes after the entire string of codes. "Code Prefix" specifies what comes before each individual code. "Code Suffix" specifies what comes after each individual code. "Code Delimeter" specifies what comes between each individual code. If three codes were sent, they would look like this:

SP, CP, Code1, CS, CD, CP, Code2, CS, CD, CP, Code3, CS, SS

SP = String Prefix
CP = Code Prefix
CS = Code Suffix
CD = Code Delimeter
SS = String Suffix

(C) Copyright 1990 Morton Utilities, Morton Intl.

The above configuration can be used to enter codes into Lotus 1-2-3. Lotus 1-2-3 requires that each code be expressed as a three digit decimal number and that each is prefixed by the backslash character ".". The "String Prefix" moves 1-2-3 to the "Setup string:" option. The "String Suffix" moves 1-2-3 out of the "Setup string:" option and back to the spreadsheet. With this configuration, all that is needed to do is:

1. Pop-up ZAPCODE.
2. Select desired printer option.
3. Press the Insert key.
4. Goto step 2 if more.
5. Press Esc key.

You may also use the "Send to keyboard" feature to insert printer codes into ZAPCODE itself. For instance, you might want to create two PMF's for your printer. One would contain a definition for each individual printer option. The other might contain entire setup strings which might combine individual printer options. To create this second PMF, you could use the first to insert the codes into the PMF Editor. The "Keyboard
The Printer Make File (PMF)

The PMF is simply an ASCII text file which you may edit using a line editor (such as EDLIN) or a word processor. The PMF Editor allows you to easily customize and create your own PMF's without regard to PMF syntax or structure. You may, however, do the same by simply text editing the PMF. This section and appendixes A, B, and C describe the PMF structure, syntax, and conventions in detail.

The PMF consists of commands which tell ZAPCODE the following:

1. Keywords must be in all capital letters.
2. Keywords may start at any location within the line.
3. Comments may be used by placing a semicolon before the comment text.
4. Blank lines are permitted.
5. The equals sign (=) is not necessary but may be used to enhance the clarity of the PMF.
6. Arguments may be entered in any of three formats:
   - Decimal eg. 255
   - Hexadecimal eg. OFFh
   - ASCII eg. "XYZ"

Arguments must be separated by a comma or a space. Arguments entered in hexadecimal must be preceded by a numeric digit and end with the character "h". Arguments entered in ASCII must be enclosed in quotation marks. To use the quotation mark in an ASCII argument, you must define it twice.

The following page contains an example PMF:

(C) Copyright 1990 Morton Utilities, Morton Intl.      Page 18

PMF Syntax and Guidelines

1. Keywords must be in all capital letters.
2. Keywords may start at any location within the line.
3. Comments may be used by placing a semicolon before the comment text.
4. Blank lines are permitted.
5. The equals sign (=) is not necessary but may be used to enhance the clarity of the PMF.
6. Arguments may be entered in any of three formats:
   - Decimal eg. 255
   - Hexadecimal eg. OFFh
   - ASCII eg. "XYZ"

Arguments must be separated by a comma or a space. Arguments entered in hexadecimal must be preceded by a numeric digit and end with the character "h". Arguments entered in ASCII must be enclosed in quotation marks. To use the quotation mark in an ASCII argument, you must define it twice.

The following page contains an example PMF:
The following is a complete list of all PMF commands. Provided with each is its description, usage, and an example:

**Command: PRINTER**
Description: Names the printer for which the PMF is created. Up to 29 characters can be used.
Usage: PRINTER [printer name]
Example: PRINTER "XYZ Printer"

**Command: PORT**
Description: Defines the port for which the printer is connected.
Usage: PORT [port:baud,parity,data,stop]
port = LPT1, LPT2, LPT3, COM1, COM2, COM3, COM4
baud = 300, 1200, 2400, 4800, 9600, 19200, 38400
parity = O)dd, E)ven, N)one, S)pace, M)ark
data = 7, 8
stop = 1, 2
Baud, parity, data, and stop only used when defining serial ports COM1 to COM4.
Example: PORT "COM2:9600,8,8,1"

**Command: RESET**
Description: Defines the reset codes to be sent to the printer when a reset is requested. Up to 255 codes may be defined.
Usage: RESET [code1, code2,... code255]
Example: RESET 27,"?",1

**Command: ACTIVATE**
Description: Defines an alternate hotkey to be used to activate ZAPCODE when installed in memory. If none is defined, the hotkey defaults to Ctrl-Alt-Z.
Usage: ACTIVATE [shiftmask, hotkey, install message]
install message = message to display in installation window when ZAPCODE is installed. Up to 35 characters can be used to define a message. See Appendix B for shiftmask and hotkey values.
Example: ACTIVATE 8,25,"Press Alt-P to activate."

**Command: COLOR**
Description: Defines alternate color(s) for one of ZAPCODE's windows. You may use as many color commands as there are windows.
Usage: COLOR [window, color1, color2,... color7]
Entering a 0 value for a color argument causes the default to be used. See Appendix C for window numbers and color values.
Example: COLOR 2,0,0,0,0,0,0,30

**Command: KCFORMAT**
Description: Defines "Code Format".
Usage: KCFORMAT [format]
format = 0:Off 1:Decimal 2:Decimal 3 character 3:Hex with digit start 4:Hex w/o digit start 5:Hex 2 character 6:Hex 3 character 7:ASCII
Example: KCFORMAT 2

**Command: KSPREFIX**
Description: Defines "String Prefix". Up to 30 characters can be used. Special keys and key combinations may be defined by preceding each with a NUL code (0). See Appendix D for list.
Usage: KSPREFIX [code1, code2,... code30]
Example: KSPREFIX "ABC",13,0,80,27,"DEF"

**Command: KSSUFFIX**
Description: Defines "String Suffix". Up to 30 characters can be used. Special keys and key combinations may be defined by preceding each with a NUL code (0). See Appendix D for list.
Usage: KSSUFFIX [code1, code2,... code30]
Example: KSSUFFIX "ABC",13,0,80,27,"DEF"

**Command: KCPREFIX**
Description: Defines "Code Prefix". Up to 30 characters can be used. Special keys and key combinations may be defined by preceding each with a NUL code (0). See Appendix D for list.
Usage: KCPREFIX [code1, code2,... code30]
Example: KCPREFIX "ABC",13,0,80,27,"DEF"

**Command: KCSUFFIX**
Description: Defines "Code Suffix". Up to 30 characters can be used. Special keys and key combinations may be defined by preceding each with a NUL code (0). See Appendix D for list.
Usage: KCSUFFIX [code1, code2,... code30]
Example: KCSUFFIX "ABC",13,0,80,27,"DEF"

**Command: KCDELIM**
Description: Defines "Code Delimeter". Up to 30 characters can be used. Special keys and key combinations may be defined by preceding each with a NUL code (0). See Appendix D for list.
Usage: KCDELIM [code1, code2,... code30]
Example: KCDELIM "ABC",13,0,80,27,"DEF"

**Command: NAME**
Description: Defines the name of a printer option. All printer option names are placed in the selection window in the order they appear in the PMF. Up to 35 characters and color commands can be used to name printer options.
Usage: NAME [option name]
Example: NAME "Set Horizontal Tab Stop(s)"
This appendix contains the Shift Mask and Hotkey tables used for defining an alternate activation hotkey. (See the ACTIVATE command in Appendix A for a discussion.)

To activate ZAPCODE, a combination of shift keys along with a hotkey must be depressed. The shift keys are the Ctrl, Alt, LeftShift, and RightShift keys, while the hotkey can be any other. To setup your own, you'll need to substitute a value from the Shift Mask Table for the argument "shiftmask" and substitute a value from the Hotkey Table for the argument "hotkey". The Shift Mask and Hotkey tables are on the next page.

Example: To change the activation key sequence to Alt-R, you would substitute 8 for "shiftmask" and 25 for "hotkey".

Appendix D - Special Keys Table

This appendix outlines the codes needed to use special keys in the "String Prefix", "String Suffix", "Code Prefix", "Code Suffix", and "Code Delimeter". Special keys can also be used when defining keyboard macros instead of printer options. See the section entitled "Keyboard Setup" in "Using The PPF Editor" for details.

The table on the following page lists the special keys on the left and the codes needed to define them on the right. For example, to define "F1" and "Enter", you would use "8,59,131".

</tbody>
</table>

For example, to change the selection bar color to yellow on blue, you would use the following equation:

colorvalue = (1 x 16) + 14

This would yield 30 for the "colorvalue" argument. Thus your COLOR statement would be:

COLOR 2,0,0,0,0,0,0,30

DOCUMENT zippy.zombi

+++  
ZIPPY ZOMBI
By John Romero

The object of the game is to change the color of all the cubes by jumping on them with your man. If you jump off the edge or run into the snake you will lose a man.

The commands for movement are [I] for up and left, [O] for up and right, [K] for down and left and [L] for down and right. You may change a variety of things such as gamespeed, sound and joystick/keyboard control by choosing change from the start-up screen. The only other commands to be noted are:

[CONTROL]--[Q] to stop the play of the game and place you at the start-up screen
[CONTROL]--[J] to toggle the joystick on and off.

If you are playing Zippy Zombi with a monochrome monitor some sets increase in difficulty, as the color change will not be apparent.

Response Time This is the maximum expected delay between the receiver sending a packet to the transmitter and receiving the beginning of a response from the transmitter.

XMODEM refers to the original 1979 file transfer etiquette introduced by Ward Christensen's 1979 MODEM2 program. It's also called the MODEM or MODEM2 protocol. Some who are unaware of MODEM7's unusual batch file mode call it MODEM7. Other aliases include "CP/M Users's Group" and "TERM II FTP 3". This protocol is supported by every serious communications program because of its universality, simplicity, and reasonable performance.

YMODEM/CRC replaces XMODEM's 1 byte checksum with a two byte Cyclic Redundancy Check (CRC-16), giving modern error detection protection.

ZMODEM refers to the ZMODEM protocol with the throughput and/or batch transmission enhancements described in ZMODEM.DOC.

ZMODEM is a second generation streaming protocol for text and binary file transmission between applications running on microcomputers and mainframes.

3. YET ANOTHER PROTOCOL, AGAIN?

Since its development half a decade ago, the Ward Christensen modem protocol has enabled a wide variety of computer systems to interchange data. There is hardly a communications program that doesn't at least claim to support this protocol now called XMODEM.

Advances in computing, modems and networking have spread the XMODEM protocol far beyond the close coupled micro to micro...
environment for which it was designed. These applications have exposed some weaknesses.

+ The short block length causes throughput to suffer when used with timesharing systems, packet switched networks, satellite circuits, and buffered (error correcting) modems.
+ The 8 bit arithmetic checksum and other aspects allow line impairments to interfere with dependable, accurate transfers.
+ Only one file can be sent per command. The file name has to be given twice, first to the sending program and then again to the receiving program.
+ The transmitted file accumulates as many as 127 extraneous bytes.
+ The modification date of the file is lost.

A number of other protocols have been developed over the years, but none have displaced XMODEM to date.

+ Lack of public domain documentation and example programs have kept proprietary protocols such as MNP, Blast, and others tightly bound to the fortunes of their suppliers.
+ Hardware and/or software complexity discourages the widespread application of BISYNC, SDLC, HDLC, X.25, and X.PC protocols.
+ Link level protocols such as X.25, X.PC, and MNP modems do not manage application to application file transfers.
+ The Kermit protocol was developed to allow file transfers in environments hostile to XMODEM. The performance compromises necessary to accommodate non-transparent environments limit Kermit's efficiency.

Even with completely transparent channels, Kermit control character quoting limits the efficiency of binary file transfers to about 75 per cent.

3. YET ANOTHER PROTOCOL, AGAIN? (cont)

Kermit Sliding Windows ("SuperKermit") improves throughput over networks at the cost of increased complexity. SuperKermit state transitions are encoded in a special language "wart" which requires a C compiler. The SuperKermit C code requires full duplex communications and the ability to check for the presence of characters in the input queue, precluding its implementation on some operating systems.

A number of extensions to the XMODEM protocol have been made under the collective name YMODEM.

+ YMODEM-X reduces the overhead from transmission delays by 87 per cent compared to XMODEM, but network delays can still degrade performance.
+ The handling of files that are not a multiple of 1024 or 128 bytes is awkward, especially if the file length is not known, or changes during transmission.
+ YMODEM-g is essentially insensitive to network delays. Because it does not support error recovery, YMODEM-g must be used hardwired or with a link level protocol.

Another XMODEM "extension" is protocol cheating, referred to as "Turbo Download" and OverThruster. These improve XMODEM throughput at the expense of error recovery.

The ZMODEM Protocol is proposed as a means of addressing the weaknesses described above while maintaining as much of XMODEM's simplicity and prior art as possible.

4. ZMODEM Protocol Design Criteria

The design of a file transfer protocol is an engineering compromise between conflicting requirements:

4.1 Throughput

ZMODEM is designed for optimum performance with minimum degradation caused by delays introduced by packet switched networks and timesharing systems.

ZMODEM is optimized for best throughput where line hits occur infrequently. This assumption markedly reduces code complexity and memory requirements.

4. ZMODEM Protocol Design Criteria (cont)

4.1 Throughput (cont)

It is assumed that many transfers will originate from a timesharing system connected to a packet switched network. ZMODEM provides features to allow for simple, efficient implementation on timesharing hosts.

File transfers begin immediately regardless of which program is started first, no 10 second delay.

4.2 Integrity and Robustness

All packets are protected with 16 bit CRC.

4.3 Ease of use

File names need be entered only once. Wild Card names may be used with batch transfers. Minimum keystrokes required to initiate transfers. ZMODEM steps down to X/YMODEM if the other end does not support ZMODEM.

4.4 Ease of implementation

ZMODEM accommodates a wide variety of systems:

+ Microcomputers that cannot overlap disk and serial i/o
+ Microcomputers that cannot overlap serial send and receive
+ Computers and/or networks requiring XON/XOFF flow control
+ Computers that cannot check the serial input queue for the presence of data without having to wait for the data to arrive.

Although ZMODEM provides "hooks" for multiple "threads", ZMODEM is not intended to replace link level protocols such as X.25. ZMODEM provides a near optimal general purpose application to application file transfer protocol to be used with link level protocols such as X.25, MNP, Fastlink, etc.

5. PACKETIZATION

ZMODEM uses packets somewhat different from those used in
X/YMODEM.  X/YMODEM type packets are not used for the following reasons:

- Block numbers are limited to 256
- No provision for variable length blocks
- Line hits corrupt protocol signals, causing failed file transfers. In particular, modem errors sometimes generate false block numbers, false EOTs and false ACKs. False ACKs are the most troublesome as they cause the sender to lose synchronization with the receiver.

State of the art X/YMODEM programs such as Professional-YAM overcome some of these weaknesses with clever proprietary code, but a newer protocol is still useful.

- It is difficult to determine the beginning and ends of X/YMODEM blocks when they are corrupted by line hits. This discourages rapid error recovery.

5.1 Link Escape Encoding

ZMODEM achieves data transparency by extending the 8 bit character set (256 codes) with escape sequences based on the ZMODEM data link escape character ZDLE[1].

Link Escape coding permits variable length data packets. It allows the beginning of packets to be detected without special timing techniques, facilitating rapid error recovery.

Link Escape coding does add some overhead. The worst case, a file consisting entirely of ZDLE characters, would incur a 50% overhead. The particular ZDLE character was chosen after examining the character distributions of many types of files used with personal computers.

The ZDLE character is special. ZDLE represents a control sequence of some sort. If a ZDLE character appears in the data sent within a binary packet, it is prefixed with another ZDLE. An escaped ZDLE is counted once in the CRC.

1. This and other constants are defined in the zmodem.h include file. Please note that constants with a leading 0 are octal constants in C.

5. PACKETIZATION (cont)

5.1 Link Escape Encoding (cont)

The current value for ZDLE is exclamation point (!). Use of a printing character as ZDLE allows application programs to recognize HEX Header Packets. This particular character was chosen because it does not appear often in many types of files likely to be transferred with this protocol. In addition, no known timesharing system uses it for editing.

5.2 Header Packet Information

All ZMODEM frames begin with a header packet which may be sent in binary or HEX form. ZMODEM uses a single routine to recognize binary and hex header packets. Either form of the header packet contains the same raw information:

- A type byte[1] Future extensions to ZMODEM may use the high order bits of the type byte to indicate thread selection.
- Four bytes of data indicating flags and/or numeric quantities depending on the packet type

Order of Bytes in Header Packet

T: packet Type
P0: Flags least significant byte
P0: file Position least significant
P3: file Position most significant

1. The packet types are cardinal numbers beginning with 0 to minimize state transition table memory requirements.

5. PACKETIZATION (cont)

5.3 Binary Header Packet

A binary header packet is only sent by the sending program to the receiving program.

A binary header packet begins with the sequence ZPAD, ZDLE, SBIN.

The frame type byte is ZDLE encoded.

The four position/flags bytes are ZDLE encoded.

A two byte CRC of the frame type and position/flag bytes is ZDLE encoded.

0 or more binary data packets will follow depending on the frame type.

The function zsbhdr transmits a binary header packet. The function zgethdr receives a binary or hex header packet.

5.4 HEX Header Packet

The receiver sends responses in hex header packets.

Hex encoding is required to support XON/XOFF flow control. Use of Kermit style encoding for control and paritied characters was considered and rejected because of increased possibility of interacting with some timesharing systems's line edit functions. Use of HEX packets from the receiving program allows control characters to be used to interrupt the sender when errors are detected. Except for header packet types that imply data packets to follow, a HEX header packet may be used in place of a binary header packet.

A hex header packet begins with the sequence ZPAD, ZPAD, ZDLE, ZHEX. The zgethdr routine synchronizes in the ZPAD-ZDLE sequence. The extra ZPAD allows other parts of the program to detect a ZMODEM packet and then call _zgethdr to receive the packet.

The type byte, the four position/flag bytes, and the CRC thereof are sent in hex using the character set 0123456789abcdef. Upper case hex digits are not allowed; they would false trigger X/YMODEM programs.

5. PACKETIZATION (cont)
5.4 HEX Header Packet (cont)

A carriage return, line feed, and XON are appended to the HEX header packet but are not considered to be part of it. The CR/LF aids debugging from printouts. The XON releases the sender from spurious XOFF flow control characters generated by line noise, a common occurrence.

Note: With ZMODEM and YMODEM Batch, the sending program provides the file name, but not with XMODEM.

0 or more HEX data packets will follow depending on the frame type.

The function zshhdr sends a hex header packet.

5.5 Binary Data Packets

Binary data packets immediately follow the associated binary header packet. A binary data packet contains 0 to 1024 bytes of data. Recommended length values are 256 bytes below 4800 bps, 1024 above 4800 bps or when the data link is known to be relatively error free.

No padding is used with binary data packets. The data bytes are ZDLE encoded and transmitted. A ZDLE and frameend are then sent, followed by two ZDLE encoded CRC bytes. The CRC accumulates the data bytes and frameend.

The function zsbdata sends a binary data packet. The function zrbdata receives a binary data packet.

5.6 HEX Data Packet

The format of HEX data packets is not currently specified. These would be used for server commands, etc.

6. PROTOCOL TRANSACTION OVERVIEW

As with the XMODEM recommendation, ZMODEM timing is receiver driven. The transmitter should not time out at all, except to abort the program if no packets are received for an extended period of time, say one minute.

To start a ZMODEM file transfer session, the sending program is called with the names of the desired file(s).

The sending program sends the string "rz\r*" and a single HEX ZRQRINIT packet with data = 0. The "rz" followed by carriage return activates a ZMODEM receive program or command if it were not already active. If the receiving program receives the ZRQRINIT packet, it totally ignores it as the sending program will be responding to the RINIT packet sent by the receiver. The sending program should also ignore this packet type, which would be an echo of its own packet.

6. PROTOCOL TRANSACTION OVERVIEW (cont)

Since the ZRQRINIT sequence contains no exotic control characters, it can be accepted by the application program as a command to begin ZMODEM receive. The sequence prints as:

\"rz\""M'*1B0000000000000000\"M\"J\"

where \"M\" represents CR and \"J\" represents LF.

The sending program awaits a command from the receiving program to start file transfers. If a "C" or NAK is received, an XMODEM or YMODEM file transfer is indicated, and file transfer(s) use the X/YMODEM protocol.

When the ZMODEM receive program starts, it immediately sends a ZRINIT packet to initiate ZMODEM file transfers. The receive program resends the ZRINIT packet at response time intervals for a suitable period of time (40 seconds typical) before falling back to X/YMODEM protocol. If the receiving program receives a ZRINIT packet, it is an echo indicating that the sending program is not operational.

If the receiving program receives a ZRQRINIT packet, it ignores it.

Eventually the sending program correctly receives the ZRINIT packet.

The sender may respond with an optional CRCYPT packet, which the receiver acknowledges with a suitable frame. (Details to be worked out later)

The sender may respond with an optional ZSINIT frame to set the receiving program's Attention string. The receiver sends a ZACK packet in response.

The receiver then sends a ZFILE packet containing the file name, file length, modification date, and other information identical to that used by YMODEM Batch.

The receiver may respond to this with a ZGETCRC packet, which requires the sender to perform a CRC on the file and transmit same with a ZCRC packet. The receiver may use this information to determine whether to accept the file or skip it.

The receiver may respond with a ZSKIP packet, which causes the file to be passed over.

6. PROTOCOL TRANSACTION OVERVIEW (cont)

A ZRPOS packet from the receiver initiates transmission of the file data starting at the offset in the file specified in the ZRPOS packet. Normally the receiver specifies the data transfer begin at offset 0 in the file.

The receiver may start the transfer further down in the file. This allows a file transfer interrupted by a loss or carrier or system crash to be completed on the next connection without requiring the entire file to be retransmitted. If downloading a file from a timesharing system that becomes sluggish, the transfer can be interrupted and resumed later with no loss of data.

The sender sends a ZDATA header packet (with file position) followed by one or more data packets.

The receiver compares the file position in the ZDATA header with the number of characters successfully received to the file. If they do not agree, a ZRPOS error response is generated to force the sender to the right position within the file.

A data packet terminated by ZCRCGO and CRC does not elicit a response unless an error is detected; more data packet(s) follow immediately.

ZCRCQ data packets expect a ZACK response (with the file offset) if no error, otherwise a ZRPOS response (with the last good file offset). Another data packet continues.
immediately. ZCRCQ packets are not used if the receiver does not indicate FDX ability with the CANFDX bit.

ZCRCW data packets expect a response before the next frame is sent. If the receiver does not indicate overlapped I/O capability with the CANOVIO bit, the sender uses the ZCRCW to allow the receiver to write its buffer before sending more data.

A zero length data packet may also be used as a sending idle packet to prevent the receiver from timing out in case data is not immediately available to the sender.

In the absence of fatal error, the sender encounters end of file. If the end of file is encountered within a frame, the frame is closed with a ZCRCW data packet which does not elicit a response except in case of error.

The sender sends a ZEOF packet with the file ending offset equal to the number of characters in the file. The receiver compares this number with the number of characters received. If the receiver has received all of the file, it closes the file and responds with ZRINIT. Otherwise the receiver sends ZRPOS with the current file offset, forcing the sender to send the missing data.

6. PROTOCOL TRANSACTION OVERVIEW (cont)

After all files are processed, any further protocol errors should not prevent the sending program from returning with a success status.

The sender closes the session with a ZEXIT header packet. The receiver acknowledges this with its own ZEXIT packet.

When the sender receives the acknowledging packet, it sends two characters, "OO" (Over and Out) and exits to the operating system or application that invoked it. The receiver waits briefly for the "O" characters, then exits whether they were received or not.

7. STREAMING TECHNIQUE

ZMODEM allows a choice of data streaming methods selected according to the limitations of the sending program operating environment, receiving program operating environment, and the transmission channel(s).

If the computers can overlap serial I/O with disk I/O, the sender begins data transmission with a ZDATA header and continuous ZCRCW data packets. When the receiver detects an error, it sends the Attn sequence and a ZRPOS packet to force the sender back to the correct position within the file.

At the end of each transmitted packet, the sender checks for the presence of an error packet from the receiver. To do this, the sender may sample the reverse data stream for the presence of a ZPAD character.

If the reverse data stream cannot be sampled without entering an I/O wait, the receiver can interrupt the sender with a control character, break, or combinations thereof, as specified in the ZSINIT frame sent by the sending program.

If the receiver cannot overlap serial and disk I/O, it uses the ZEXIT frame to specify a buffer length which the sender will not overfill before sending a ZCRCW packet.

8. ATTENTION SEQUENCE

The receiving program sends the Attn sequence whenever it detects an error and needs to interrupt the sending program.

The default Attn string value is empty (no Attn sequence). The characters in the Attn string are terminated with a null. Two characters perform special functions:

+ \335 Sends a break signal
+ \336 Pauses one second

9. PACKET/FRAME TYPES

The numeric values for the values shown in boldface are given in zmodem.h.

9.1 ZRQRINIT

Sent by the sending program to call up the receiving program.
P0...P3 are zero.

9.2 ZRINIT

Sent by the receiving program.
ZF0 and ZF1 contain receiver capability flags:

-define CANFDX 1 /* Rx can send and receive FDX */
-define CANOVIO 2 /* Rx can receive during disk I/O */
-define CANBRK 4 /* Rx can send a break signal */
-define CANCRY 8 /* Receiver can decrypt */

ZF0 and ZF1 contain the size of the receiver's buffer in bytes, or 0 if overlapped I/O is allowed.

9.3 ZSINIT

Sender sends capability flags (none currently defined) followed by a binary data packet terminated with ZCRCW. Data contains the Attn string, maximum length 32 bytes. The ZSINIT is only sent to programs that indicate the ability to overlap serial data and disk I/O (CANOVIO).

9.4 ZACK

Acknowledgement to ZSINIT header packet or ZCRCW data packet.

ZF0 to ZF3 contain file offset.

9.5 ZFILE

This packet indicates the beginning of a file transmission attempt.

ZF0 and ZF1 contain special file processing flags:

+ ZBIN This is a binary file

A ZCRCW data packet follows with file name, file length, modification date, and other information described in a later chapter.

9. PACKET/FRAME TYPES (cont)

9.6 ZSKIP
Sent by the receiver in response to ZFILE, makes the sender skip to the next file.

9.7  ZNAK
Indicates last packet header was garbled. (See also ZRPOS).

9.8  ZABORT
Sent by receiver to terminate batch file transfers when requested by the user.
Sender initiates a ZFIN sequence[1].

9.9  ZFIN
Sent by sending program to terminate ZMODEM. Receiver responds with ZFIN.

9.10 ZRPOS
Sent by receiver to force file transfer to resume at file offset given in ZP0...ZP3.

9.11 ZDATA
ZP0...ZP3 contain file offset. One or more data packets follow.

9.12 ZEOF
ZP0...ZP3 contain file offset. Sender reports End of File.

9.13 ZFERR
Error in reading or writing file, equivalent to ZABORT.

9.14 ZCRC
Request (receiver) and response (sender) for file CRC.
ZP0 and ZP1 contain 16 bit file CRC.

9.15 ZCRYPT
Negotiation for encryption.

---
1. Or ZCOMPL in case of server mode.

9. PACKET/FRAME TYPES (cont)
9.16 ZCOMPL
Server request now completed.

10. Transaction
A simple transaction, one file, no errors, overlapped I/O:

11. PERFORMANCE
Some tests of ZMODEM protocol performance have been made. A PC-AT with SCO SYS V Xenix or DOS 3.1 was connected to a PC with DOS 2.1 either directly at 9600 bps or with dial-up 1200 bps modems. The ZMODEM software was configured to use 1024 byte packet lengths above 2400 bps, 256 otherwise.

Because no time delays are necessary in normal file transfers, performance is much faster than with YMODEM, the only observed impediment being the time required by the program(s) to update logging files.

During a file transfer, a short line hit seen by the receiver usually induces a CRC error. The interrupt packet is usually seen by the sender before the next packet is sent, and the resultant loss of data throughput averages about half a packet. At 1200 bps this is about .75 second lost per hit. At 10-5 error rate, this would degrade throughput by about 9 per cent. The throughput degradation increases with the channel delay, as the packets in transit through the channel are discarded on error.

A longer noise burst that affects both the receiver and the sender's reception of the interrupt packet usually causes the sender to remain silent until the receiver times out in 10 seconds. If the round trip channel delay exceeds the receiver's 10 second timeout, recovery from this type of error may become difficult.

11. PERFORMANCE (cont)
Noise affecting only the sender is usually ignored, with one common exception. Spurious XOFF characters generated by noise stop the sender until the receiver times out and sends an interrupt packet which concludes with an XON.

In summary, ZMODEM performance in the presence of errors resembles that of X.PC and SuperKermit. Short bursts cause minimal data loss. Long bursts (such as pulse dialing noises) often require a timeout error to restore the flow of data.

12. TABLES
Figures are calculated for round trip delay times of 40 milliseconds and 5 seconds. A 102400 byte randomly distributed binary file is sent at 1200 bps 8 data bits, 1 stop bit. The calculations assume no transmission errors. For each of the protocols, only the per file functions are considered. Processor and I/O overhead are not included. YM-k refers to YMODEM with 1024 byte packets. YM-g refers to the YMODEM "g" option. ZMODEM uses 256 byte packets for this example. SuperKermit uses maximum packet size, 8 bit transparent transmission, no run length compression.

13. ZFILE FRAME FILE INFORMATION (cont)

Only the pathname (file name) part is required for batch transfers.

Pathname The pathname (conventionally, the file name) is sent as a null terminated ASCII string. This is the filename format used by the handle oriented MS-DOS(TM) functions and C library fopen functions. An assembly language example follows:

```
DB 'foo.bar',0
```

No spaces are included in the pathname. Normally only the file name stem (no directory prefix) is transmitted unless the sender has selected YAM's f option to send the full pathname. The source drive (A:, B:, etc.) is never sent.

Filename Considerations:

+ File names should be translated to lower case unless the sending system supports upper/lower case file names. This is a convenience for users of systems (such as Unix) which store filenames in upper and lower case.

+ The receiver should accommodate file names in lower and upper case.

+ The rb(1) program on Unix systems normally translates the filename to lower case unless one or more letters in the filename are already in lower case.

+ When transmitting files between different operating systems, file names must be acceptable to both the sender and receiving operating systems.

If directories are included, they are delimited by /; i.e., "subdir/foo" is acceptable, "subdir\foo" is not.

13. ZFILE FRAME FILE INFORMATION (cont)

Length The file length and each of the succeeding fields are optional[1]. The length field is stored as a decimal string counting the number of data bytes in the file.

With ZMODEM, the receiver uses the file length only for display (progress reporting) purposes; the actual length is determined by the data transfer.

Modification Date - A single space separates the modification date from the file length.

The mod date is optional, and the filename and length may be sent without requiring the mod date to be sent.

The mod date is sent as an octal number giving the time the contents of the file were last changed measured in seconds from Jan 1 1970 Universal Coordinated Time (GMT). A date of 0 implies the modification date is unknown and should be left as the date the file is received.

This standard format was chosen to eliminate ambiguities arising from transfers between different time zones.

Two Microsoft blunders complicate the use of modification dates in file transfers with MS-DOS(TM) systems. The first is the lack of timezone standardization in MS-DOS. A file's creation time can not be known unless the timezone of the system that wrote the file[2] is known. Unix solved this problem (for Planet Earth, anyway) by stamping files with Universal Time (GMT). Microsoft would have to include the timezone of origin in the directory entries, but does not. Professional-YAM gets around this problem by using the z parameter which is set to the number of minutes local time lags GMT. For files known to originate from a different timezone, the -Z option may be used to specify T as the timezone for an individual file transfer.

<table>
<thead>
<tr>
<th>DB</th>
<th>'foo.bar',0</th>
</tr>
</thead>
</table>

---

1. Fields may not be skipped.
2. Not necessarily that of the transmitting system!

13. ZFILE FRAME FILE INFORMATION (cont)

The second problem is the lack of a separate file creation date in DOS. Since some backup schemes used with DOS rely on the file creation date to select files to be copied to the archive, back-dating the file modification date could interfere with the safety of transferred files. For this reason, Professional-YAM does not modify the date of received files with the header information unless the d parameter is non zero.
Mode - A single space separates the file mode from the modification date. The file mode is stored as an octal string. Unless the file originated from a Unix system, the file mode is set to 0. rb(1) checks the file mode for the 0x8000 bit which indicates a Unix type regular file. Flies with the 0x8000 bit set are assumed to have been sent from another Unix (or similar) system which uses the same file conventions. Such files are not translated in any way.

Serial Number - A single space separates the serial number from the file mode. The serial number of the transmitting program is stored as an octal string. Programs which do not have a serial number should omit this field, or set it to 0. The receiver's use of this field is optional.

The file information is terminated by a null. If only the pathname is sent, the pathname will be terminated by two nulls. The length of the file information packet, including the trailing null, must not exceed 1024 bytes; a typical length is less than 64 bytes.

14. MORE INFORMATION

More information may be obtained by calling Telegodzilla at 503-621-3746.

UUCP sites can obtain the nroff/troff source to this file with

    uucp amen!usr/caf/public/zmodem.mm /tmp

A continually updated list of available files is stored in

    /usr/spool/uucppublic/FILES.

The following L.sys line calls Telegodzilla (Pro-YAM in host operation). Telegodzilla waits for carriage returns to determine the incoming speed. If none is detected, 1200 bps is assumed and a greeting is displayed.

14. MORE INFORMATION (cont)

In response to "Name Please:" uucico gives the Pro-YAM "link" command as a user name. The password (Giznoid) controls access to the Xenix system connected to the IBM PC's other serial port. Communications between Pro-YAM and Xenix use 9600 bps; YAM converts this to the caller's speed.

Finally, the calling uucico logs in as uucp.

omen Any ACU 1200 1-503-621-3746 se:--se: link ord: Giznoid in:--in: uucp

15. ZMODEM Programs

A demonstration version of Professional-YAM is available as YAMDEMO.LQR (A SQueezed Novosieliski library). This may be used to test ZMODEM and YMODEM implementations.

Unix programs supporting the YMODEM protocol are available on Telegodzilla in the "upgrade" subdirectory as RBSS.BHQ (a SQueezed shell archive). Most Unix like systems are supported, including V7, Sys III, 4.2 BSD, SYS V, Idris, Coherent, and Regulus.

A version for VAX-VMS is available in VRBSB.BHQ, in the same directory.

A CP/M assembly version is available as MODEM76.AQM and MODEM7.LIB.

Irv Hoff has added YMODEM 1k packets and basic YMODEM batch transfers to the KMD and IMP series programs, which replace the YMODEM and MODEM7/MDM7xx series respectively. Overlays are available for a wide variety of CP/M systems.

MEX and MEX-PC also support some of the YMODEM extensions.

Questions about YMODEM, the Professional-YAM communications program, and requests for evaluation copies may be directed to:

NOTE: In the following example the digit columns represent:
Dice face value---Number rolled---Points
For example, a sequence of rolls for a player during his first turn might be as follows:
Roll 1:
1---2---200
3---1---0
4---1---0
6---2---0
Player sets aside, say, both 1's for 200 points, and rolls four dice.
Roll 2:
2---3---200
3---1---0
In this example, the player must set aside all three 2's (as there are no other counters), for an additional 200 points, and roll the one remaining dice as he does not yet have 500 total points.
Roll 3:
5---1---50
If no new counters appear on any roll (for example, if neither a 1 nor a 5 had come up on the 3rd example roll), you have rolled ZONKERS, and all points earned previously in that turn are lost. If, in any turn, all the dice—including those set aside—are counters, you must roll all six dice again. If no new counters appear, you have Zonked; otherwise you may either stop or set aside one or more dice and roll again.
In the three example rolls, all dice have come up counters, so the player must roll six dice again. If he rolls ZONKERS all points earned in this turn are lost. If any counters are rolled, the player will have 500 or more points and may choose to take the points earned and stop rolling. Also, if he stops this turn with 500 or more points before rolling Zonkers, he may choose to stop at any time in his next turn as he no longer needs to 'open'. However, if he continues and rolls ZONKERS at any time, all points earned in the current turn are lost.
The game continues until a score of 10,000 or more points is reached by any player (unless a lower limit is set at the beginning of the game.) At this point, all other players get one more turn to try to top this score. The player with the most points after all have rolled is the winner.

Game Operation.
Zonkers may be played either from the keyboard or with a joystick. Prompts of "Press <return>..." may be answered by pressing any key or either paddle button. Responses requiring (y/n) may be entered from the keyboard or with either joystick/paddle button. Where button 0 (open-apple) = "yes" and button 1 (solid-apple) = "no".

Dice selection can be made by entering the number of dice of each face value that you want to keep from the keyboard, but may often be made with the buttons also: i.e. button 0 will select all counters rolled for each face value, and button 1 will choose none. The keyboard must be used to select a number between all and none. Pressing the <Esc> key in response to the "Choose # of dice..." prompt will restart the selection process, but will not give the opportunity to stop rolling.

If only one player is selected, a computer player named "Apple" will be added. "Apple" will always choose to keep all counters rolled in any turn, and will stop rolling if only one or two dice remain (provided of course that he has enough points to "open", or that it is not the last turn in the game with another player leading).
DOCUMENT zoom.graphics

Zoom Grafix documentation

Zoom Grafix is a great utility for printing (what else?)...graphics. The following is a detailed explanation.

special keys

[esc]
is used to escape from where you are back to the beginning. You may use it to stop printing, or just to get back to the picture menu. More about that later.

[<->]
is used to backspace. Use it to change something that you've already typed. In most of Zoom graphics, you can back up past the current line all the way to a previous selection. This can be handy in the tricky parts, like when you're setting the Zoom window

[->]
is the opposite of the [<->] key. It's used to move ahead, and it does something; it accepts each character on the screen that it moves over (duh.)

[return]
is the key that tells Zoom grafix that you're done entering (duh, again)

[spacebar]
is used to make Zoom Grafix stop printing...if your printer has memory in it, it may take a bit longer for it to stop.

the set up

The first time you use Zoom grafix you will be asked for printer info. This set up may be changed if you are using a different printer later on.

Using the wrong set up can't hurt your printer or computer. But the program probably won't print out the picture. If you type in a wrong answer to one of the set-up questions, you can back space with the [<->] key. Using [esc] will take you back to the beginning.

the picture menu

The picture menu lets you see the current graphics screen while letting you change the picture by flipping it, exchanging screens, or loading a new one from a disk.

If the graphics area looks like garbage don't be alarmed; it only means you don't have a picture loaded into the screen yet. If you're trying to print graphics from another program that you were run- ning before you ran Zoom, you might need to swap screens to see the pic. You want press [s] to swap screens.

If you wish to load a picture insert you do's 3.3 disk and press [1]

The flip command [f] will turn the picture upside down. This is useful in printing graphs or charts that don't ask me why though...

the main menu

Apple II Computer Documentation Resources (a2_docs_documentation.msw)

DOCUMENTATION FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1261 of 1262

Apple II Computer Info

The main menu lets you vary the printing of the picture in many ways. You can change any option shown on the menu by selecting its number. The current settings are shown on the right on the menu, and you can decide to go ahead and print it that way - all you have to do is press [return]

1) white dots depending on the graphic you are printing you may want to remove the colors of the dots on the printout. Most plots and graphics look best with the white dots printed black but digitized graphics look better with white dots

2) printout is: this may be either upright or rotated. When Zoom Grafix prints rotated, the printout is always turned 90 degrees (i.e. Upside down). The [f] command from the picture menu toggles between these.

3) size: the size setting controls how many dots the printer prints for each dot on the screen. The smallest picture is 1 x 1, with each point on the screen printed as a single point on the printout. Guess what 2 x 2 does? You can also mix values.

4) Zoom window this is the Zoom part of Zoom Grafix, and it lets you see what part of the screen is to be printed.

The four #'s are the values of the top, bottom, left and right edges of the current Zoom window, which is shown on the picture with a flashing box. With the Apple I high-res screen, there are 192 dots from top to bottom of the screen, numbered starting with 0 at the top down to 191 at the bottom. Horizontally there are 280 dots, numbered starting with 0 at the left to 279 at the far right.

When the current Zoom window is less than the whole screen, you'll be given the chance to easily set it back to the full screen. Of course, if the full screen won't fit on the paper width, it will be clipped off.

As you set the values the box will change. Remember you can always go back and change it.

5) left margin just a way to override the automatic centering. I wouldn't suggest fooling around with it unless necessary.

6) print width this value is preset for the printer you are using, but can be reset if you are using wider or narrower paper. This is not the width of the paper it self is the width of the widest line Zoom Grafix should print. Zoom Grafix will not permit setting too large.

7) delay this option will allow you to change the delay from the original set-up. This is especially important when printing dark areas. Printers with buffers need a longer time to cool, because the delay must be long enough for the buffer to empty out, also time is needed for the print head to cool. To make a delay while printing simply press the [spacebar] and press again to resume printing.

8) printer takes you to theprinter/interface etc. Menu, but does not clear the picture.

9) line or form feeds does the obvious.

10) intensity unless you have a shitty apple silentype don't worry about this. Hmmm I won't either!(no offense to you silentype owners.)

Hint

Instead of using a delay select to have unidirection printing which will only print from left to right...not from left to right to
left...this should give the delay necessary.

FINISH
