The computer killed the filmstrip in the early 80's, taking with it the 16mm film when nearly all audio-visual funding went to computers and software. The educational film and filmstrip companies scrambled "To be your software company," in the words of SVE, but this medium was soon dominated by small producers.

Large publishers and hardware manufacturers are now trying to sell sophisticated CD ROM systems and the idea that teachers will develop their own programs on them. Two things are wrong with this idea: (1) Teachers won't develop their own software and (2) these systems are very expensive. But, they continue to attract attention in educational publications.

Of the 82,297 public schools with computers, 74,014 (90%) are Apple IIs. Macintosh is in 16,237 (20%) schools and MS DOS are in 41,928, (50%), but are the fastest growing segment of the market. Ironically, the growth of MS DOS is attributable to John Sculley's determination to sell Macs to the schools and kill the Apple II. Unfortunately, for Apple the schools don't like the Mac's monochrome screen or price, but it would be a simple matter for Apple to recover the school market with a low price on the GS because it has a color screen, great sound, small keyboard, mouse and can run all the old Apple II software. Apple could corner the school market with a few strokes of a hard pencil. What is to be?
History

Education was originally reserved for royalty, then the rich and first in America, for all. America is the first place where there are "Careers open to competition." In antiquity the Greeks said, "The great man has no seed." but royalty dominated up to the French Revolution. Keeping education, and information, from the people has been the primary tool of repression, witness the Soviet Union where private ownership of computers and modems was prohibited.

The Apple II has been the strongest force in educational computing and the freedom of information it brings. The Apple II belongs in education because it is a high quality, dependable machine and thousands of programs exist for it. Unfortunately, the marketing of this machine has been mismanaged to the point of repression for profit and a lack of understanding the missions of American education: The teaching of basic skills and surveys of subject matter.

REFLECTIONS /
Thinking Communications

By Phil Shapiro

~ Part II ~

In the years ahead it's likely that fee-based online editing services will become increasingly popular on the national information services. Yet as the fee-based online editing services establish themselves as being immensely useful, non fee-based "peer" editing will likely grab strong root, as well.

Peer editing might be defined as any feedback given to professional colleagues or personal friends. The "editing" aspect of peer editing need not concern itself with the grammar or mechanics of the writing. Just as useful as feedback about the general tone. Also useful are subtle pointers and friendly suggestions.

A good example of such peer editing crossed my desk just last week. A colleague of mine had written a business letter and wanted feedback as to its tone and phrasings. This "cold call" business letter was carefully crafted to establish first contact with potential customers.

While the phrasing of the overall letter was generally warm, the lead sentence did not establish emotional contact with the reader of the letter. Reading the lead sentence on its own could leave a reader wondering what
the purpose of the letter was all about.

Once these subtleties were pointed out to the author of the letter, a quick and easy revision of the lead sentence was made. Had the author not sought the feedback of peer editors, it could have been possible that his letter would have missed its mark.

How was this social gaffe overlooked by the author of the business letter? It had never occurred to the author to try reading the lead sentence of the letter in any way other than the way it was intended by him. But the underlying meaning of the sentence was not clearly implied in the chosen words of the sentence. The emotional tone of the lead sentence was flat and neutral — and therefore ambiguous.

Rule number one of business letter writing: Never start a business letter with a flat and neutral sentence. Unless, that is, you're hoping to elicit a flat and neutral response.

Another instance of peer editing crossed my desk a few months ago. In this instance an author of a magazine article made use of a peer editor to review an article written for a national computer publication.

While scrutinizing the rough draft, the peer editor caught a stray remark that could possibly have harmed the article's chance of publication. A quick deletion of the stray remark saved the author's hide, now all the wiser for having sought feedback from a peer editor.

The beauty of online peer editing is that it takes very little effort to courtesy copy two or more persons to elicit feedback on one's rough draft. If two or more peer editors make similar suggestions for changes in the rough draft, their concurrent opinions carry far more weight than each of their individual suggestions.

When such concurrent suggestions from peer editors are independently offered to an author, the force of these suggestions carries all the weight of consensus opinion. Authors can then choose to act on the basis of this consensus opinion.

Or they can choose to disregard consensus opinion — at their peril.

In this Information Age, people with strong writing skills will have a marked professional advantage over those with less developed communication skills. And those persons with established peer editing networks of friends and colleagues will have a marked advantage over those without such networks.

The good news is that online peer editing will result in a general raising of writing standards. This is not to say that shoddy and sloppy writing will never get published. But that with appropriate and effective peer editing, no person need fear putting a literary foot in the mouth.

The moral of all this? The time is eminently ripe to start building a peer network of friends and colleagues. You'll be glad you did when you need to get quick feedback on an important piece of writing. The end result is that your own writing will combine the best ideas of three, six, or even twelve minds.
Which is a powerful idea in its own right.

How can I be so sure? Eleven other people told me so.

[The author takes a keen interest in the social dimensions of communications technology. He can be reached on GEnie at: p.shapiro1; on America Online at: pshapiro]

Computers come in all types and sizes. There are so-called IBM-compatibles and there are Apple's Macintoshes in the two main groups.

And then there are the two other types of modern personal computer -- the many models in Commodore's Amiga line and the equally large number of models in the Atari line.

Still in use are older home computers such as the Apple II, the Commodore C64 and 128, the Atari XL and XE, and computers from Texas Instruments and even Coleco.

But one type of computer is usually left out of this kind of discussion, sometimes because typical PC users don't even know it exists. You won't find it in a store that sells PCs or Macs, but you could buy one if you tracked down a supplier. Businesses and universities buy them by the thousands.

They're Unix computers. A modern Unix computer looks like a PC, in most respects. It has more keys on the keyboard and is usually sleeker on the outside, but otherwise no one would look twice at it if you placed a Unix computer in a row of PCs.

Many companies make Unix computers, but the big guy in the Unix world is Sun Microsystems. Right now, Sun is in the position IBM was in the PC world five years ago -- the industry leader, but challenged by a lot of smaller companies that make clones (in this case, clones of Sun's popular Sparc line of Unix computers).

Sun saw IBM's handwriting on the wall and decided to legitimize the clone makers. For a license fee, clone makers now sell what are called Sparc-alikes. They work like a Sun Sparcstation (the official Sun name for its Sparc computers), but they cost less.

They used to cost a lot less. But then Sun realized that the best way to compete with the clone makers was to cut its Sparcstation prices, and
the result has been a resurgence of interest in Suns, in its clones and in Unix in general.

This is good news all around. Sparcs and their clones are immensely powerful computers, and they can perform hundreds of tasks at the same time. They are built for multitasking, and they do it amazingly well.

But Unix, which gives Suns all this power, has a big problem. Regular Unix is a crazy operating system from the user's standpoint. It's user-hostile, the furthest thing from user-friendly. It has oddball commands and weird combinations of dumb letters that you have to type. (No, I'm not being harsh; I actually know how to use a Unix computer, and I wish I didn't.)

Sun tried to get around the problem by selling a graphical user interface for its Suns called Open Look. It works a lot like the Macintosh system, using windows and icons and a mouse. You drag one thing and click another.

Sun's competitors, however, had a better idea. They created a group called the Open Software Foundation and promoted another graphical user interface called Motif. In many ways, Motif is superior. (It's nicer looking, for one thing, and it works even better than the Mac's interface. PC users can get a good idea of Motif by trying out GeoWorks, which is based on Motif.)

If you bought a Sun, you could always ditch Open Look and go with Motif. This was a lot of trouble, but Sun insisted that Open Look was here to stay.

But in a surprise announcement a short while ago, Sun announced that it was shifting to Motif. This made no waves in the PC and Mac worlds, but it caught the Unix world with its oars out of the water, so to speak. All of a sudden, software companies that make programs that work with Open Look were left without a future, and companies that make Motif software were opening up new bank accounts.

That's all fine, but what does it mean to you and me?

It means Unix computers are going to be standardized in the next year or so. And it means that Unix computers running under Motif are going to show up in stores that also sell PCs. It means Sun clones will get even cheaper -- as will Suns themselves. The price war that hit the PC industry will knock down the cost of Unix computers, too.

Before long, you'll be able to buy a powerful Sun clone for $2,000 or less. That's about 10 percent of what you might have paid three years ago.

But why would you even want to buy a Sun clone?

Because it is powerful, and because, under Motif, it is easy to use. And because there are already thousands of software applications that run under Motif. (Even WordPerfect has a Sun version.)

And, best of all, because a Sun running Motif can do everything Windows 3.1 should do but doesn't. (Heck, Suns can even run Windows with the right software loaded up, and now they can even run Mac programs, too.)
And that, friends, is what makes for headaches at Microsoft, the company responsible for Windows. Microsoft knows that its real competitor in the next few years will not be IBM, which is trying to compete against Windows with OS/2, but the entire Unix world. Many experienced users feel that Unix is already a better system, and when Unix computers are cheap and easily bought, Microsoft had better watch out.

Apple II History, Part 13

By Steven Weyhrich
[S.WEYHRICH]

>>> APPLE II HISTORY <<<

INTRODUCTION   Continuing the discussion of peripherals for the Apple II (in a historic sense), we now look at modems, various types of input devices, music and voice synthesizers, robotic control, some miscellaneous devices, and finally take a look at printers.

[*][*][*]

MODEMS A modem is a unique peripheral device, because it makes use of two-way communication (both sending and receiving data to and from the computer). After the Apple Box sold by A.P.P.L.E., one of the first commercial modems available for the AppleII was the MicromodemII, made by D.C. Hayes in 1979. It sold for $379, and worked at the standard transmission speeds of the day, 110 and 300 baud. The Micromodem was also available for the S-100 (Altair) series of computers. Hayes' product was so popular that their command set has become a standard for modems as they have advanced over the years.

By the mid-1980's Apple released two modems with their own name on them: The Apple Personal Modem 300 and Personal Modem 1200. Both were external modems, using a direct connection to the phone line (instead of the older acoustic coupler), but were more expensive than similar products of the time. By the later 1980's they were no longer in production.

INPUT DEVICES    The number one input device for the AppleII was, of course, the keyboard. There were expanded keyboards available for the II and IIPlus, bypassing the uppercase-only limit. There was once even a keyboard that had plug-in modules that would redefine specialized function keys to make them specific for different programs. Another company sold pressure sensitive pads that were attached to the AppleII keyboard above the top row and could be programmed to generate series of keypresses. The original IIe had a socket or the addition of an external numeric keypad, and the IIGS and later versions of the IIe had this keypad built-in. Because of the detached keyboard in the IIGS it was possible to select between a couple of different versions of keyboards offered by Apple as well as from some third party companies.
The next most commonly used input device after the keyboard was the set of game paddles included with every II and IIPlus. But some users needed more specialized ways to input data to the computer. A large number of interesting input devices were made available through the years; here follows a brief description of some of them.

Creating pictures on the hi-res graphics screen has always been a challenge, from 1977 until today. Using the game paddles or a joystick is one method that could be used, but there is some difficulty in getting accurate lines and curves. Apple addressed this problem when they released the Apple Graphics Tablet in the late 1970's, which sold for about $650. This was a large flat surface, about thirty inches square, with a grid printed on the surface. Using a stylus attached to a wire leading to the tablet, and appropriate software, this could be used to draw pictures on the AppleII hi-res screen. There were two different releases of the Apple Graphics Tablet. The original one, which was released when the IIPlus was the latest machine, was discontinued by FCC order because of RFI (radio frequency interference) problems. The second version, to correct that problem, was released after the IIe was in production. It used two DB-9 connectors to install on the back plate of the computer, leading to the peripheral card plugged into a slot inside. (These DB-9 connectors are the same type used on the back of the IIc and IIGS for connection of a joystick). Currently the Apple Graphics Tablet is not in production.<1>

Koala Technologies has made several input devices over the years. Their first product was the Koala Pad. Released in 1983 and selling originally for $125, this was a small graphics pad (about 8x6 inches) that plugged into the game I/O socket. It was compatible with any software that used a joystick. Using a finger or the supplied stylus, a user could draw on the pad and produce pictures on the hi-res screen with the supplied software or with some other software packages.

In November 1984 Koala released Muppet Learning Keys for $79.95. This was a device to aid preschoolers in using a computer. It was intended to help children ages three and over to learn letters, number, and colors, using the Muppets from Sesame Street as a learning aid. The unit used various contact surfaces to send user responses to the computer, and it attached to the AppleII via the game I/O port.<2>

The Gipson Light Pen System was also sold by Koala Technologies in 1985 for $350. Using a card in slot 7, this device used a special pen that allowed drawing directly on the computer's monitor screen.

Other devices have been released to aid in graphics manipulation on the AppleII. The Computer Colorworks released the Digital Paintbrush System in 1984 for $299. It worked on either the IIPlus or IIe, and used a stylus attached by two thin dacron lines to potentiometers within the tablet, which tracked the position of the stylus. Movements of the stylus (tracing over a picture) were translated into drawings on the hi-res screen. The software included allowed creation of curves and lines, and used Fontrix fonts for lettering. (Fontrix was a program that could produce detailed hi-res graphics pictures, and had many characters styles, or fonts, available to label those pictures). A unique feature of the Digital Paintbrush was the ability to connect two computers using the system via a modem and phone line and allow both users to draw pictures that would appear on both computers simultaneously.<3>
The input device that made the most inroads in the Apple II world was the one that was so unique to the Macintosh: The Apple Mouse II. It was released in May 1984 with a program called MousePaint (similar to the MacPaint program that came with the original Macintosh). The Apple Mouse came with a peripheral card to plug into a slot on the IIe or II Plus; on the IIC it just plugged into the joystick port and the built-in hardware and firmware could handle control of the mouse. MousePaint used the standard hi-res graphics screen and worked only under the ProDOS operating system, but generally gave Apple II users the capability of doing graphics in the same way as Macintosh users had been enjoying, as well as making it possible to design programs that used the mouse as a pointing and input control device.

ComputerEyes was a video acquisition system that came out in July 1984. It allowed use of a video camera to capture images and store them on the hi-res graphics page. It was a slow-scan device that attached to the Apple game I/O socket, and produced black-and-white images in about five seconds. It worked on any Apple II with 48K, Applesoft, and DOS 3.3. Made by Digital Vision, Inc., it originally sold for $12.95 ($349.95 including the video camera).<4>

MUSIC AND VOICE SYNTHESIS  Apple II's have been involved in sound from the beginning, with the inclusion by Steve Wozniak of a speaker so he could make sounds for an Apple II version of "Breakout". As simple as it was, some enterprising programmers have even managed to make this single-voice speaker sound like two and even three different voices (tones) simultaneously ("Electronic Duet" comes to mind). But that was not enough for those who wanted to have better quality music production, and so production of synthesizer cards was in full swing by the early 1980's. Some of those cards included the following:

ALF Music Card (ALF Products, Inc.) was strictly a music synthesizer, with some included software to aid in producing the music. The Mountain Music System (Mountain Computer, Inc.) was a more advanced sixteen oscillator (voice) digital synthesizer, also with software to control it. Soundchaser System (Passport Designs Inc.) was a package that included the Mountain Music System (using slots 4 and 5), plus the Soundchaser, which was a piano-style keyboard for music input, whose card went in slot 7. It allowed four track recording and sound manipulation, using the Apple II primarily as a controller. This was probably the most advanced music hardware system available in the days before the release of the IIGS.

The Drum-Key (made by PVI) was specifically a percussion synthesizer. It required an external amplifier and used included software to produce a wide variety of drum and other percussion sounds.<5>

Beginning in the late 1970's there were several speech synthesizers available for the Apple and other home computers. One brand was the TextTalker, and another (made by Mountain Hardware for $279) was the Supertalker. In the 1980's two other popular brands were the EchoII (slot-based) and Cricket (for the modem port on the IIC) synthesizers, made by Street Electronics. These latter also included the ability to product other sound effects, and some games released at the time had enhanced sound output when the presence of those two devices was detected. For speech reproduction, these devices usually used a method of accepting ASCII text from the computer in the form of "phonemes" to describe and produce voice through a built-in speaker. The phonemes were needed because English words have a variety of pronunciation depending on the context in which they are
used. Properly programmed, the voice synthesizers could pronounce the word "root" to rhyme with either "boot" or "foot". It wasn't until the IIGS came out with the built-in capability of speech reproduction (via the Ensoniq chip) that software making use of that feature became available in any quantity.

ROBOTS AND DEVICE CONTROL Although used primarily for education purposes, there were at least two robotic devices made to work with the AppleII: TOPO (made by Androbot, Inc.), and the Tasman Turtle ($1000, with a smaller version called the Tot for $300) were in use during the mid-1980's. Both used the Logo language to control movement of the robot on the floor. Logo has a graphics command set called "turtle" graphics to simplify the concept for children. A small triangle on the hi-res screen was called a "turtle", and it could be given software commands to move forward, turn, draw, or move without drawing. When TOPO or the Tasman Turtle were connected to an AppleII, the Logo language could be configured to send the same turtle graphics commands to the physical "turtle" robot on the floor. This gave students a concrete example of what their logo programs would do in "drawing" a graphics picture.

Education is not the only place where robotics has been used in an AppleII. Because of peripheral boards called "A/D Converters" (analog/digital converters), it is possible to take information from (for example) a wind speed sensor and convert it into digital information. A computer program can then take this information and send a command signal back to another device (perhaps to activate a motor that raises and lowers a cloth deck cover, depending on how windy it is). Although not a "robot" in the sense that people usually view robots, a computer-controlled device of any kind is, strictly speaking, a robot. This is the concept used in the popular X-10 system used in home control. (The Introl/X-10 made by Mountain Hardware for $279 was one of the first available for the AppleII). This protocol for controlling electric devices in a home has been used for years, and programs exist for the AppleII series (including the IIc) that allow easier programming of the X-10 devices, ranging from security systems to light timers to lawn sprinkler systems.

MISCELLANEOUS HARDWARE Here follows a short list of some other items that could be found for sale in a typical issue of an Apple computer magazine in the early 1980's:

Larger capacity disk drives were made by Lobo Drives, including an 8 inch floppy drive and other various higher density floppy disks.<6>

Hard disks, such as those made by Corvus Systems. You could get a massive 10 MB for only $5,350 (well, it was massive compared to the 143K DOS 3.3 floppy disks).

Clocks, such as the Apple Clock made by Mountain Hardware, for $199. A clock made it possible to time and date stamp files, and identify which version of a file was the most recent.

RESET Key Protector, which prevented accidental RESET on early AppleII's, was available for only $3.25 from Special Systems Design.

DoubleDOS Plus was a DiskII interface card modification that had a switch to allow the user to easily switch between DOS 3.2 and DOS 3.3. It sold for $39, by Tymac.<6>,<7>
By the late 1970's and early 1980's many printers were available for use with home computers. However, the cost was often over $1,000, which limited the number of people who could afford to buy one. Most printers offered 96 characters in the standard ASCII set, including both upper and lowercase characters. The cheaper printers could only print uppercase characters, while some of the more expensive ones were capable of accepting programmable characters or had built-in graphics characters.

There were two main types of printers available. One type operated like a typewriter by striking a piece of metal type against a ribbon and onto the paper. This type of printer was often called an "impact" or "letter quality" printer. It used either a type ball like IBM's Selectric typewriters, or a wheel with spokes that radiated out from the center, with the type characters at the end of the spokes. This later type of letter quality printer was also called a "daisy wheel" printer, because the changeable print wheels looked something like a daisy. These printers were most commonly used by computers in businesses, as they often cost more than $2,000 and were beyond the reach of the average home hobbyist.

The other type of printer in common use was dot matrix. These less expensive printers formed characters with a series of pins in a vertical row that struck the ribbon and produced dots on the paper. As the print head moved across the paper, the dots were printed in patterns that resembled (sometimes vaguely) letters and numbers. The matrix used to form a character was usually referred to as the number of horizontal dots by the number of vertical dots. A 5x7 matrix, for example, used up to five dots across and up to seven dots down. Some printers (like some computers of the time) did not use "descenders" on the lowercase letters that drop below the baseline ("g", "j", "p", "q", and "y"). To print lowercase letters with descenders often required nine or more vertical pins.

The Centronics 730 may well have been the first "standard" printer for the AppleII (as well as for many other microcomputers). It used a parallel cable whose pin layout went on to also become a standard for use with personal computers. That pin layout on parallel cable plugs is still in use today in 1991. Centronics also had several other models, including the 737 and 739. A less expensive printer made by Centronics, the 779, used 5x7 dot matrix characters, and could print in sizes from 10 to 16.5 cpi (characters per inch), ranging from 60 cps (characters per second) at 10 cpi to 100 cps at 16.5 cpi. It also had a one-line buffer (which held up to 132 characters), but printed a limited 64 character ASCII set, all uppercase plus some special characters. As mentioned before, most personal computers of the time didn't have lowercase anyway, so this limitation wasn't necessarily a drawback. The better printers made by Centronics had a large matrix and could produce true descenders on lowercase characters.

A company named Trendcom made two printers that were significant in the history of the AppleII. They had two models, the 100 and the 200. Instead of using the mechanics solenoids that drove pins in a print head, these were thermal printers that needed a special heat-sensitive paper. Their operation was very quiet, about as loud as sliding your finger across a piece of paper. They were inexpensive compared to other printers of the day (most of which cost over $1,000), although the printing looked very much like that produced by a dot-matrix printer. The Trendcom Model 100 printed 40 characters per line on paper that was about 4 1/2 inches wide. The Model 200 could print 80 columns per line on paper 8 1/2 inches wide. Compared to the first printer offered by Radio Shack for their TRS-80

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 793 of 1824
The significance of the Trendcom printer was that Apple chose it as the first printer they released under the Apple name. It could be programmed to control printing of each dot in a column, and so was ideal as an inexpensive means of printing Apple II hi-res graphics. Apple included a special interface card and released the printer as the "Apple Silentype" in June 1979 for $599. It was identical to Trendcom's Model 200 except for the Apple logo in the lower left corner of the font cover. One legend suggests that part of the popularity of this printer at Apple stemmed from the fact that its small size allowed it to fit under the seat of Steve Wozniak's private airplane.

Epson was another company that began early in the business of supplying printers for personal computers, and is one of the few that survives to this day. It got its start in the printer business with the Epson MX-80, one of the first dot matrix printers that sold for less than $1,000. Popular with computer hobbyists of the time, it was capable of printing Apple II hi-res graphics with the optional Graphtrax ROMs. A later version of this printer, the Epson MX-100, became available in early 1982. The MX-100 was a wide carriage model, and could print hi-res graphics without the need to add any special hardware. Epson printers were unique because they had a special feature called a "double print" mode where a line was printed normally, then the paper was advanced 1/216 of an inch and the same line printed again. This filled in some gaps between dots on individual letters, and made printouts more pleasing to the eye. Another feature used in these printers was a "print enhancement" mode, in which the pins hit the ribbon harder and made it possible to make multiple copies using carbons.

Integral Data Systems was also an early manufacturer of printers. Their IDS 125 and IDS 225 printers came out in 1979 (the 225 sold for around $900). These printers used a 7x7 matrix for creating characters. The IDS 125 used a pressure feed method (similar to the method used by typewriters to hold paper in place), while the IDS 225 used a tractor feed mechanism. The IDS printers had the flexibility of being usable with either parallel or serial interfaces (with serial speeds up to 1200 baud). It could do plotting of dot graphics, and also had an optional graphics character set built-in.

By the late 1970's Integral Data Systems upgraded their printers, giving them more capabilities and flashier names. Their Paper Tiger line of printers (models 440 and 460) had an attractive typeface, and used two vertical rows of pins in the print head, slightly offset from each other. This produced overlapping dots to achieve a more solid appearance. Some models could print up to 160 cps, and of course upper and lowercase characters were supported. They were also capable of reproducing Apple II hi-res graphics (with the appropriate software). IDS also sold a printer called the Prism, which could print in color using a special multicolored ribbon.

Other early printers were made by Anadex, MPI, and Microtek.
could fade, especially if cellophane tape was used on the paper. The Apple Dot Matrix Printer was released in October 1982 for $699. Made from a modified C. Itoh printer, it was one of the first few dot-matrix printers that sold for under $1,000. Apple needed it as a better quality printer than the Silentype to help promote the AppleIII as a business computer. More importantly, it was chosen by Apple because it was capable of doing heavy-duty graphics reproduction (such as output from the Apple Lisa computer, still in development at that time). Known also as the Apple DMP, it used a custom ROM programmed by Apple to control the printer's features.<sup>18</sup>

Because Apple was looking for as many business solutions for its customers as it could find, they also announced at the same time as the DMP a daisy wheel printer called the Apple Letter Quality Printer. Costing a hefty $2,195, and made from a modified Qume brand printer, this printer could print at a blazing 40 cps, but did produce very good quality output. It was released with the Lisa and IIe in January 1983.<sup>18</sup>,<sup>19</sup>

The Apple ImageWriter was released in December 1983 as the successor to the Apple DMP. Also made by C. Itoh, it had a faster print speed (120 cps), and could print in eight different pitches (character widths). It was a very reliable, sturdy printer, and sold originally for $675. Later, a wide carriage version whose abilities were otherwise identical was made available. It was replaced by the ImageWriterII in September 1985. The original AppleDMP and the ImageWriterI came in the same beige color as the AppIII, IIPlus, and IIe. The ImageWriterII was the same platinum color as the AppleIIIGS and the newer Macintosh computers. Styled a little differently, the ImageWriterII could do everything the original ImageWriter could do, plus it was capable of printing MouseText characters and could print in color (using a special multicolored ribbon).<sup>19</sup>,<sup>20</sup>

As part of its promotion of the AppleIIc, a new printer was released. The Apple Scribe came in the same "Snow White" color as the IIc and was low in cost at $299. It was a thermal printer, but was a significant advancement over the old Silentype. It could print on regular paper (instead of special heat sensitive paper), and could print in four colors. It could do this using a unique heat-transfer method and a wax-impregnated ribbon. It could print in a "near letter quality" mode (with overlapping dots) at 50 cps, and a draft and graphics mode (80 cps). Its major limitation, however, was a print quality that overall was often not as good as some dot-matrix printers, and a ribbon that was expensive and needed to be replaced too often. The Scribe was eventually discontinued due to these problems and low sales.<sup>19</sup>

In 1984 Hewlett-Packard introduced the LaserJet laser printer. This was a significant breakthrough in printer quality, and was capable of producing documents that looked professionally typeset. Apple decided to develop its own laser printer, and in January of 1985 released the LaserWriter. Although not speedy printers (with best output at four pages a minute b 1991), and very expensive (over $2,000), they were popular with those who wanted high quality printing. At Apple, the new LaserWriter was supported only on the Macintosh, but since the printer did its work through a page description language called "PostScript", it was entirely possible for an AppleII to print on a laser printer. It was only necessary to learn the PostScript language, create a file that gave the necessary commands, and send that file to the printer through a serial interface card. Don Lancaster, long-time AppleII supporter and hacker, wrote a series of articles called "Ask The Guru" in the magazine Computer Shopper, and he
Apple II Computer Info

gave many examples of using a laser printer with an AppleII.

Unfortunately, to this day the perception still exists that a laser printer will not work with an AppleII, even if it is a IIGS. This is partly because there are few software packages for the AppleII that will produce output as PostScript files that can be properly interpreted on a laser printer. However, programs such as "Publish-It!" will print to a PostScript-capable laser printer even on an AppleIIC. All that needs to be done is to have the right cable to connect the two devices.

One of the newest types of print technology to come to personal computers is known as the ink-jet printer. This type of printer works with a dot-matrix, but does not use pins impacting a ribbon. Rather, it uses a print head that sprays ink through as many as 64 holes in patterns to form characters as moves across the paper. The advantage over dot-matrix impact printers is its ability to form more solid characters. In fact, the quality of printout with an ink-jet printer can be almost as good as that obtained with a laser printer. The advantage over laser printers is cost. Where the best price for a laser printer in 1991 is still well over $1,500, the cost of ink-jet printers is getting as low as $500, and for some brands down to $300. The disadvantage for AppleII users? Although it is easy to get the printers to reproduce text, printing graphics to work may be difficult until AppleII software packages directly support those printers. Fortunately, most of these printers will emulate some brands of dot-matrix printers, and if that brand is supported by a software program, then graphics reproduction may be possible.

Apple entered the ink-jet printer market in May 1991 when it released the Apple StyleWriter. A modification of Canon’s BubbleJet printer, this printer does excellent reproduction of text and graphics—on a Macintosh. Unfortunately, Apple didn’t see fit to release drivers (programs to control hardware) to make it possible to use this printer on the IIGS or IIE. It does make use of a new font (typeface) technology called TrueType, which makes it possible to have a single font that can be made any size under software control (instead of having a separate font for each size that you might want to print). It was not until early 1992 when a program called Pointless was made available for the IIGS (not from Apple) that TrueType could be used on that computer.

Although not quite a printer, the Apple Color Plotter was released in June of 1984. It had an advantage over printers, in that it could draw smooth lines and curves. Using four colored pens in a rotating pen head, and selecting them at the computer’s command, the Color Plotter worked by moving the paper up and down to draw vertical lines, and the pen left and right to draw horizontal lines. Control of the plotter was accomplished by sending text commands through a serial card, and consisted of two letter commands (DA = Draw Absolute, DR = Draw Relative, etc.) followed by parameters. It could move the pen without drawing, plot points, draw lines, arcs, and circles, and print text at any location, tilt, rotation, or scale. Lines could be drawn as solid or as patterns of dots.

Presumably this product did not take off because of the limited need for this type of graphics, and the price. Today, although the quality of screen and printer graphics is greatly improved over what was available in 1984, a plotter can still be useful in some situations. Usually, however, the right software can reproduce drawings with a dot matrix or laser printer in as good or better detail than a plotter can.
HI EVERYBODY!  This month is when _everybody_ here gets access to
Internet, so, of course, I visited the brand new Internet Roundtable here on GENie!  Everything you ever wanted to know about the Internet is available here. There are bulletin boards, weekly conferences, and a whole library of files. The online staff are experts in the field and they’re happy to help you out anytime you need it.

The Internet RoundTable has support for the Internet Mail Gateway, Mailing Lists and Newsgroup Digests, "Anonymous FTP" File Request Service, and a whole lot more!  To get there just type INTERNET at any GENie prompt!
But, of course, before you go be sure and solve this month's puzzle. It'll help you get a step ahead of the rest by showing you some of the popular keywords used in the new online world! See ya next month and keep on smilin'! :-)

GENieLamp Information

GENieLamp is published on the 1st of every month on GENie on page 515. You can also find GENieLamp on the main menus in the ST (475), Macintosh (605), IBM (615), Apple II (645), A2Pro (530), Unix (160), Mac Pro (480), Geoworks (1050), BBS (610), CE Software (1005) and the Mini/Mainframe RoundTables. GENieLamp is also distributed on CrossNet, Internet, America Online and many public and commercial BBS systems worldwide.

GENieLamp pays for articles submitted and published with online GENie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or send it to our GE Mail address, GENIELAMP.

We welcome and respond to all GE Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

On Internet: GENIELAMP@GENIE.GEIS.COM

READING GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM] [*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

| Name of sender | CATegory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie Effective July 1, GEnie's non-prime time connect rate drops to $3.00 per hour, a reduction of 50% from the current rate. The monthly fee has been restructured, and moves from $4.95 to $8.95, for which up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

"Can you imagine the abuse it would take to jar chips out of their sockets packed in a styrofoam case, inside a box, inside a larger box full of styrofoam peanuts! It's hard enough to pull one out on purpose. :-)"

Notes From The Publisher

By John Peters

TOP OF THE PAGE   To know me personally, is to know how fanatical I can be when it comes to Digital Publishing. Convincing people that there are definite positive advantages to publishing electronically has been a long and frustrating battle, and unfortunately, the battle is far from over. However, that doesn't slow me down any, it just makes me a little more fanatical about spreading the word. Lately, I have been reading articles about Digital Publishing in high-profile publications like Time, Newsweek and the New York Times so clearly, all is not lost. Digital Publishing is finally starting to find its place in the computing world.

Along these lines, the Digital Publishing Association (a group of folks who are just as fanatical as I am :) are coming out with their second annual Digital Quill awards competition. Take a look...

>>> DPA ANNOUNCES SECOND ANNUAL "DIGITAL QUILL" AWARDS COMPETITION <<<

Birmingham, Alabama - July 19, 1993: The Digital Publishing Association, the first and only trade organization for the electronic publishing industry, announced the Second Annual "Digital Quill" Awards for Excellence in Electronic Publishing.

In making the announcement, Ron Albright, founder and director of the DPA, defined "electronic publishing" as the publication of literature and graphic material in computer-readable, digital format; specifically, materials created on computer and distributed in digital format for other to read through their computers. According to Albright, the term encompasses "everything from plain ASCII text, which can be read on any computer, to complex, hypertext publications that rely on machine-specific programs to view and navigate."

The Quill Award competition is open to all authors and publishers, regardless of DPA membership status. The only requirement is that the materials submitted for judging must have been previously published in electronic format. Submitted materials must either have been uploaded to an online system or distributed on disk for reading by computer as digital materials. In clarifying, Albright said "materials that were simply created on computer - most writers use those for composition anyway - do not meet the criteria of having been electronically published for reading and are ineligible."

Award Categories

- Serial Publication - a weekly, monthly or otherwise regularly-scheduled publication that has been issued for at least 6 months (or at least 3 editions) available prior to July, 1993. This category will include both fiction and non-fiction magazines and newsletters.

- New Serial Publication - a weekly, monthly or otherwise regularly-scheduled publication that has been issued for less than 6 months but has been published at least for two issues. This category will
include both fiction and non-fiction magazines and newsletters and is proposed to recognize and encourage new issues.

- **Fiction Book** - an original (eliminating reprints of the "classics" in digital format - who among us can hope to compete with a digital edition of Shakespeare's classics?) electronically published novel. Length: 50,000 words, minimum.

- **Non-Fiction Book** - an original non-fiction book in digital format. Length: 35,000 words minimum.

- **Short Story** - a single original story appearing either alone or as part of an anthology or magazine and published in digital format. This category shall exclude reprints of stories originally published in a paper publication. Length: 1000 words, minimum.

- **Non-fiction article** - a single originally article appearing either alone or as part of a magazine and published in digital format. This category shall exclude reprints of articles originally published in paper. Length: 1500 words, minimum.

- **Publishing software** - a software program (Shareware or traditionally marketed) designed for publishing text and/or graphics and facilitating their distribution and viewing. Nominations will be accepted from users as well as original authors.

- **Miscellaneous** - this niche will encompass poetry, graphic collections, comics, and other publications outside the standard categories.

**PRIZES** A certificate, suitable for framing, will be awarded to first, second, third winners in each category. In cases where the number and/or quality of submissions warrants, Certificates of Merit will also be awarded. Additional prizes, including cash awards, are under consideration. If available, these will be announced in the future.

**DEADLINES** Submissions will be accepted from original authors or from the editors of a publication in which the submitted material appeared. Submissions must be made in digital format (via modem or on disk) to any of the "electronic addresses" listed below. Deadline for submissions is September 30, 1993. Winners will be announced in conjunction with the DPA activities surrounding "Electronic Publishing Month" which is annually celebrated in November.

Submit materials to any of the following addresses:

- GEnie: RALBRIGHT / DigiPub RoundTable (M1395)
- CompuServe: 75166,2473
- MCI Mail: 370-7474 (RALBRIGHT)
- PRODIGY: DXBD80A

You can also upload submissions to the Desktop Publishing Association BBS at 205-854-1660 (1200/2400/9600; 24 hours/day).

Materials can be submitted on disk by mailing to:

The Digital Publishing Association
1160 Huffman Road
If you are interested in learning more about the awards or digital publishing, drop by the DigiPub RoundTable on page 1395.

Until next month...

John Peters
GENieLamp/DigiPub RoundTable

---

BIRTHS, DEATHS, AND MARRIAGES

With all the activity in the Apple II world this month, I began to realize that the reports of its demise have, once again, been greatly exaggerated. Trying to come to grips with it all in this, my first month as editor, I think I have an idea why it's called a social WHIRL. If it gets any more frantic, it'll be a social whirlpool.

I'd like to outline for you some of the recent births, deaths, and marriages, but it's not an easy task. Sometimes what seem to be births are rebirths or adoptions, or even marriages. Sometimes the deaths are divorces. Oh, to heck with the semantic classification, it's all pretty exciting! You'll find the details within, but here are a few items to pique your interest:

BIRTHS: With a title like SHAREWARE SOLUTIONS II, it might sound like a rebirth, but it's a bona fide newcomer all right. Shareware champion Joe Kohn has started publishing his own Apple II newsletter, and the title, he cautions, was chosen for name recognition and may be misleading, because it deals with much more than shareware. The premiere issue arrived this month, and I have a feeling that Joe Kohn will be passing around a few metaphorical cigars in the first few issues. Something to celebrate indeed!

There are other new arrivals, or rather, shortly-to-arrivals: TypeSet from WestCode Software, Addressed for Success from Econ Technologies, and Bottom Line from Quality Computers. Look for the details in this month's HEY MISTER POSTMAN!
DEATHS: As those who read the past month's issue of GEnieLamp A2 know, INCIDER/A+ folded with their July issue. This month, the Apple II world was shocked and saddened to hear that the June issue of A2-CENTRAL was the last PAPER issue. A2-CENTRAL will continue to publish a disk magazine... so perhaps it's not a death, just a divorce. It's not good news, though.

MARRIAGES: The most exciting news in quite a while comes from a marriage between Quality Computers and AppleWorks guru Randy Brandt: The WORKS 4.0, code-named Quadriga, will be an AppleWorks add-on that is rumoured to be the equivalent of an upgrade. At least, it will require that you have AppleWorks 3.0 to take advantage of it. It's not really AppleWorks 4.0, but the point is, AppleWorks isn't going to be allowed to die!

Now if only we had an AppleWorks GS guru to work on The GaSWORKS 2.0, code-named Lazarus.... (NOTE: This is NOT a rumour, it's just me being silly.)

The social event of the season has just concluded -- the Fifth Annual A2-Central Summer Reunion -- and the reports are still rolling in. Look for more coverage of this great marriage of minds next issue. Let's hope it's not to be the last, as rumor predicts.

One other entry for the marriages column: GEnieLamp A2 and me. I mentioned briefly above that this is my first month as editor. I felt I'd better slip that in quietly so that loyal readers wouldn't goggle at the new name in front of them and figure they'd missed an issue. At the same time, I didn't want to begin with this minor news, since there was so much major news to deal with.

Darrel Raines has moved from editor to a position that will allow him to write more articles for GEnieLamp A2. What's more, Phil Shapiro is looking to hand his co-editor position over to someone else, now that he'll be producing his own disk-based publication, Helium Balloons, and staff writer Mel Fowler has been off nursing a sick modem. Mel's back now, though, I hasten to add!

All these changes at GEnieLamp A2 mean two things:

First, because Darrel and I were forced to change horses in midstream, the A2 Profile interview had to be abandoned this month. It'll be back, never fear! This month, time was just too short.

Second, if you've been thinking that you'd like to write for GEnieLamp A2, then now is the time to step forward. If you haven't been thinking about writing for GEnieLamp A2, then now would be a good time to start! Contact me via GEnie mail (my address is D.CUFF).

I'm just as pleased as I can be to be the new editor of GEnieLamp A2. I've been an Apple II user for some time: I started using an Apple ][-late in 1982, and upgraded to an Apple IIe just a few months later, thanks to an extraordinarily obliging dealer, and got my first IIGS in late 1986. The point I'm laboriously trying to make is that I love the li'l devil too! You are not alone.

I've been absent from GEnie for a number of months, and it was GEnieLamp that led me back. I started downloading GEnieLamp A2 from a
local BBS and was so impressed that I reactivated my dormant GENie account, unable to bear missing out on GENie any more.

By way of a tribute to outgoing editor Darrel Raines, allow me to quote from a message I read on another network recently, not long before I signed on as editor, posted by shareware author John L. Graham: "One bright spot in the Apple II world is GENie's online magazine, GENie Lamp." The credit for this belongs to Darrel, and to Jim Couch, editor of GENieLamp A2Pro, but I hope to be able to do as well... with your help.

[*][*][*]

Before we turn you over to your regularly scheduled GENieLamp, Darrel has a few words of his own to add:

As you've read, we have a new editor this month. It is with regret that I give up that position for this fine publication. However, circumstances dictate that someone else carry on. I am sure that Doug will lead us on to bigger and better things in the world of electronic publishing. I wish him well as editor of GENieLamp A2.

I want to take a moment and tell each of you that I have enjoyed bringing this newsletter to you on a monthly basis. I learned a lot of things along the way. I hope that as I was learning the ropes, we were giving you the information you needed to use your computer and the GENie Information System as efficiently as possible. It has always been my intent to make this newsletter one of the best sources of information for the Apple II community. If we have succeeded in meeting any of these needs for even a few users, then I consider the effort to have been worthwhile.

One of my major objectives was always this: I did not want to print a whole newsletter of old or recycled information. This presented a real challenge to us since a large part of the newsletter content is excerpts from the A2 bulletin board system. The way that we handled this was to insist on printing a large number of original articles that had never appeared in any other format before: the monthly columns such my editorials, our game reviews, Phil's "think" piece, profile interviews, the shareware and upload reviews, and all of our one-time feature articles. I sincerely hope that you found some nugget of new information in each issue.

I will still be writing for GENieLamp. My major focus will be on gaming, but I will be touching on other topics. -Darrel Raines

  o WHAT'S NEW
FREE APPLE CATALOG AND NEWSLETTER

You can get a FREE copy of the latest Apple Catalog by simply calling 1-800-795-1000 and asking for it. Be sure to tell them that you're an Apple II user! While you're at it, you may wish to call 1-800-776-2333 and ask for a free copy of the Apple II Software Newsletter, as well.

(A2.LUNATIC, CAT5, TOP2, MSG:203/M645;1)

WHAT KIND OF MAC IS THAT? I understand price wars more than you know. I know the IIGs-//e are not the main reason for Apples woes, but it saddens me when such a good product is dumped. (especially when I bought one).

BTW all the people who dump on the gs, I had a friend over the other day that is currently programming Macs, it took me 15 min to convince him that my computer is an Apple II!

(EW.CHristian, CAT5, TOP2, MSG:211/M645;1)

VIDEO OVERLAY CARD I have some pretty basic questions about the capabilities of the VOC...

At my local user group, the IIGS is connected, of course, to the GS's RGB monitor, and also connected to a standard TV via the Composite Out jack. During demos, people have a real hard time seeing the images on the RGB because it's so small, and on the TV because it's so blurry.

This is presenting a real problem to the group, and we want to resolve it. It seems we don't have enough money to buy some type of overhead projector ($1500 or so), so it's been suggested that we get a VOC. People seem to believe that connecting a VOC will improve the resolution of a standard composite TV monitor.

Will it, or is this a myth? If it will, can you supply some details? A club member has said that he saw a deal for an inexpensive large screen monitor that had 600 line resolution (whatever that means) and though that by connecting a VOC to that monitor, that we'd get crystal clear resolution. Would we?

In a similar vein, the TV I own has both analog and digital RGB inputs, but being in another part of the house, I've never connected it to the GS. Theoretically, if we were to buy a large screen TV with analog RGB inputs, it should be similar in resolution to the GS RGB. In reality, is it? I bought that TV 7-8 years ago, and the club member who is looking at monitors said that he hasn't run across one with an analog RGB. Are those still made, or is he just running into TV salespeople ignorance?

(J.Kohn, CAT26, TOP13, MSG:29/M645;1)

The VOC does marginally increase the quality of the IIGS composite video output (key word: marginally), but you have to have a pretty good monitor to notice the difference.

A better option is, as you said, to use a TV/monitor that has RGB
inputs. While it's not likely to be as sharp as the Apple RGB monitor, it
WILL be considerably sharper than the composite signal. (Also, the fact
that your TV even HAS RGB inputs tells me that it's a good set and should
show up the difference quite nicely.)

There are electronic reasons for the difference in picture quality,
which I won't go into here, but they're also the reason that we always use
the S-Video inputs on OUR big show monitor whenever possible. The more
wires, the better the signal CAN be. (Doesn't guarantee it will be better,
just that it can be. <grin>)

QUALITY, CAT26, TOP13, MSG:30/M645;1

APPLESOFT REBORN? The July 12th issue of PC Week says Apple is renaming
its Mac OS unit to......AppleSoft! Does this mean System 7 was really written in Basic? <grin>

And from Spencer F. Katt in the same issue:
"...sources said emulation of Mac software on the 601 RISC chip won't be
as fast as some of the new 040 Macs."
(A.COUGHLIN, CAT5, TOP2, MSG:226/M645;1)

APPLE IIIE STILL IN PRODUCTION [n general, the way IIe's are bought
now (i.e. by schools), they will get large orders in batches. So they don't get a large stock of IIe's sitting around
in warehouses, and they don't run the assembly line continuously. When
they get a few large orders, they fire up the assembly line, make 'em, and
ship 'em right out. They may have enough sitting around to fill one or two
orders at a time, so they'd send those out while firing up the production
line.

The bottom line is that the IIe _IS_ still in production, though not
continuously, and they are NOT just trying to unload warehouses full of
them. And consider this: Has Apple EVER had some kind of consumer
promotion just to unload warehouses full of computers? No. You've never
seen it with any Mac models, you didn't see it with the IIc, IIC+, or IIgs,
and you're not going to see it with the IIe. What they usually do with
excess inventory is sell them to a remarketer, like Sun or Shreve (or Price
Club, in the case of the Mac PowerBook 100). They have also: Bulldozed
them into a hole in the ground (Lisa/Mac XL), and sold them at a major
discount to Apple EMPLOYEES (Mac IIsi, I believe).

_{_}

_(implies put, if Apple is still publicly advertising or offering
something, and/or it's still on the dealer price lists, it is still in
production. (A2.LUNATIC, CAT5, TOP2, MSG:131/M645;1)

APPLE NASDAQ AD NASDAQ (the over-the-counter stock exchange) is using
Apple in its ads now, talking about how it started in a
garage, put computers in every school, and so on. Then "Where can you
find companies like that? Actually newspapers publish a list of them every
day." The idea is to show progressive NASDAQ companies are, and what good
investments they can be. Previously-featured companies include Microsoft
and MCI. (L.DEVRIES, CAT5, TOP3, MSG:47/M645;1)

WATCH YOUR PATHNAME LENGTH! > There seems to be a problem with ProTerm
> and over long pathnames. We haven't QUITE
> figured it out yet.
The problem is simple, ProTerm runs under ProDOS 8, NOT GS/OS. Because of this, ProTerm can have a total pathname length of 63 characters.

Let's say your drive is names "MyRealCoolStuff", ProTerm is in a directory called "Communications/ProTerm3.1", and your data is in a directory in ProTerm3.1 called "MyNewestStuff", This path now is...

/MyRealCoolStuff/Communications/Proterm3.1/MyNewestStuff/

That is 57 characters!! Your data files only have 6 characters left before ProDOS 8 has heartburn!!!

So any ProDOS 8 applications (AppleWorks Classic too!!) will choke if you use verbose directory names...

"Burger" Bill Heineman
(BURGERBILL, CAT10, TOP11, MSG:227/M645;1)

Well, it isn't quite THAT simple. This problem doesn't hit TIC and PtP users. There is SOME specific problem with PT3 that does not affect those two programs. Once pathnames exceed about 36 characters, odd things start to happen. However, it appears that not everyone is afflicted with this problem, so we don't quite know what to think. We have received some fixes for the scripts from users who have beaten this, but we need to understand just what the heck is going on here before we start fixing scripts, or we are likely to create new problems.

>>"So any ProDOS 8 applications (AppleWorks Classic too!!) will choke if you use verbose directory names..."

Too true, but PT3 is apparently more sensitive. There may be some other factor here that we haven't figured out yet.
(GARY.UTTER, CAT10, TOP11, MSG:233/M645;1)

BEST CACHE SIZE What is the recommended size for the RAM Cache in the RAM Control Panel?
The System 6.0 manual does not make any recommendation.
I have read in a tech note that it is set by default at 32k.
I have 4.25 megabytes of RAM.
(R.LEROUX1, CAT9, TOP12, MSG:138/M645;1)

A setting of 16K or 32K is usually best. The GS/OS cache isn't particularly fast; I think it still uses a linear search instead of some form of hashing, which means that the bigger it is, the longer it takes to search it. Beyond a certain point, it will actually take longer to search the cache to see if the desired block is already in RAM than to just go read the block from disk again!
(QUALITY, CAT9, TOP12, MSG:139/M645;1)

The cache is used for _ALL_ GS/OS programs, not just the Finder, unless you have something installed like the RamFAST driver, which bypasses it. Prosel 16 is a strange beast, which does a lot of low-level disk operations by itself, so it may bypass the GS/OS cache, as well.

Note that having the RamFAST driver installed bypasses the cache for your hard drive, but it's still being used for your floppies and anything else appropriate. (A2.LUNATIC, CAT9, TOP12, MSG:150/M645;1)
IIGS ROM HISTORY

1. The original, ROM 0 MB was released with all the parts needed to install it in a //e as a conversion unit. The conversion kit itself was a backplane for the //e, plus the MB, plus a mouse (although I think that was optional).

2. The ROM 01 MB was released as a NON-convertible board (possibly in the initial runs, possibly later). This board had neither the dual power supply plugs, nor any of the other internal plugs for //e equipment.

3. The original (convertible) design was mandated as THE ONLY service replacement for defective ROM 01 GS motherboards. This created a problem, eventually, since non-convertible boards were coming in for replacements. The non-convertible boards were upgraded to convertibility in the process of refurbishing, and put into the repair stock. I believe that this all happened before the ROM 03 was released.

4. Whether the ROM 03 MBs ever shipped without the internal ports I don't know. Certainly the ROM 03s were never intended to be put in a //e case, but I know of no reason why they COULDN'T be, and, come to think of it, I know of at least one that WAS. :

I know that it makes no sense to have designed and built boards that HAD the circuitry on them to accept the plugs, but no plugs. Nevertheless, that was done, and there are lots and lots of them out there. Whether your board has them or not is entirely dependent on when it was produced. If the MB on your machine has ever been replaced it almost certainly does have the plugs. MY MB has been replaced, but it was taken out of a brand new machine from the dealers stock because I needed it RIGHT NOW, and the dealer likes me. :) (And was out of stock on GS replacement boards.)

(GARY.UTTER, CAT6, TOP2, MSG:120/M645;1)

SPEAK WELL OF THE DEAD I talked to someone once who was not an Apple II user and never was, but who made an interesting observation about the machine. He said that when it came out, the Mac still wasn't gaining a very significant foothold, and that it looked to a lot of people in the industry like Apple was hedging its bets with the IIgs, that in making it so very Mac-like they were positioning it to take over for the Mac if the Mac really did fail.

And the original Mac was going to be based on the 6502. It was only near the end of the design stage that they switched to the 68000.

All that means nothing now, but it's interesting to think about.

-Dean Esmay (A2.DEAN, CAT5, TOP3, MSG:45/M645;1)

PROTERM MACRO TRACKS FREE HOURS Since GENie has changed its rate structure and we now get 4 hrs free for our $ 8.95 monthly fee, I decided to write a macro to track hours and costs for the current month (to make sure I don't let a month go by without using all 4 of those hours :)

To use this macro, you need to set the "Log Calls to Disk" parm in the
dialing system(s) you are using to call GEnie. If your dial system name
starts with anything other than "GEnie", you will need to modify the search
string used in the line after the INput statement. I have 2 dial systems
to log into GEnie, one is called "GEnie-Automatic" and the other
"GEnie-Manual", so I just check the first 5 bytes of each log record for
"GEnie".

The macro gets the current month, then reads through the PT3.LOG file
looking for records that match the dial system name and the current month.
Hours and minutes are accumulated for each record that matches. GEnie's
rate is then applied. If the total time is 4 hours or less, a cost of $8.95 is displayed. When the time goes over 4 hours, the $3 per hour rate
is applied and added to the $8.95. Current cost, hours, minutes and the
month are displayed.

I've hooked this macro up to the @@2 label in ProTerm 3.1's
PT3.GLOBALS file, so that the macro is invoked when I click on the time in
the menu bar while at the main menu. In PT3.Globals, find label @@2 and do
the following:

@@2
IF !$d, { CHain "GENIE.COSTS" }  * run macro GEnie.Costs *
EXIT  * if in terminal mode *

Here's the macro (GEnie.Costs)

* * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
* Macro to Track Monthly GEnie Costs  * *
* $ 8.95 + $3 per hr for time > 4 hrs  * *
* Art Coughlin  *
* * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
SET $0 = 0
SET $1 = 0
SET $4 = 0
SET &1 = <MId <DAte>,3,3> * get month *
* *
OPEN #5, "PT3.LOG" * open log file & read *
WHILE !(EO #5), { * until eof *
INPUT #5, "$\%$, &0
IF (AND (SEqual <LEFT &0,5>, "GEnie"),
(SEqual <MId &0,35,3>, &1)) { * check for system name *
SET $0 = $0 + (VALUE<MId &0,56,2>) * and current month match* 
SET $1 = $1 + (VALUE<MId &0,53,2>) } } * accumulate minutes *
SET &3 = "95", &0
SET &4 = 0
SET $4 = ($1 - 4) * all hours over 4 are *
WHILE (GT $4, 0), { * multiplied by $3 *
SET $4 = $4 - 1
SET $2 = $2 + 3 }
SET $2 = $2 + 8 * add the monthly $8
* * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
Apple II Computer Info

SET $3 = 0
SET $4 = $0
WHILE (GT $4, 0), {                         * multiply minutes by $.05*
    SET $4 = $4 - 1
    SET $3 = $3 + 5 }                         * add the monthly $.95
SET $3 = $3 + 95                           * check for cents > 99   *
WHILE (GT $3, 99), {                       * and convert to dollars  *
    SET $2 = $2 + 1
    SET $3 = $3 - 100}
IF (LT $3, 10), { SEt &3 = "0" + <STring $3> },1, <<< Correction
    { SET &3 = <STring $3> } }             <<< is here!
SEt &4 = "        " + &1
SEt &0 = "Current Accumulated ^M GEnie Time & Cost ^M "
SEt &1 = " $ " + <String $2> + "." + &3 + "^M ^M"
SEt &2 = " Hours: " + <String $1> + " ^M"
SEt &3 = " Minutes: " + <String $0> + " ^M ^M"
NOte &o+&1+&2+&3+&4

A correction to the macro I posted to calculate GEnie time and costs. The macro will blow up when you have cents less than 10. The statement to do the zero filling of the cents is to blame. Evidently, PT doesn't like it when you set a string variable equal to itself. :( Replace:

    SEt &3 = <String $3>
    IF (LT $3, 10), { SEt &3 = "0" + &3 } } * zero fill cents if < 10 *

With:

    IF (LT $3, 10), { SEt &3 = "0" + <String $3> },1,
        { SET &3 = <String $3> } }             
(A.COUGHLIN, CAT24, TOP3, MSG:6/203/M645;1)

WHY CAN'T JOHNNY LEARN?   A little while back, I did a review in inCider/A+ of an astronomy program for kids. When I first ran the program, some of the data about the planets of our solar system didn't look quite right to me. So, I looked at some recent material I had about the Voyager missions that listed the number of moons each planet had. I compared that to the number of moons that the program said each planet had, and realized that the facts and figures presented in the software was incorrect. I called the company to report this, and they said something like "but, we've been selling the program for two years, and no one else has said anything to us before". I was adamant, and demanded that if they were going to sell "educational" software, they'd better fix their program. After much haggling, I got them to consult an Almanac, and eventually they released a free update to the software.

I wonder how often things like that happen? Probably about as often as someone uses the excuse of "computer error".
-Joe Kohn          (J.KOHN, CAT15, TOP4, MSG:24/M645;1)
OK - I've gotten mine (A2C-On-Disk). I read the letter to A2C-OD Subscribers and know that you have discontinued the Paper Edition. One thing that was missing from the letter was any comments about rebating the $34 a year (pro-rated) that the Paper Edition cost. Are there any plans to do so (or extend the Disk Subscription). Also, what are you doing about the Paper-Only Subscribers? (HAL-9001, CAT23, TOP3, MSG:182/M645;1)

>>>>> Gosh, why all the long faces? Resource Central is still here, and """" """" A2-Central will still live on, albeit in modified form, on A2-Central On Disk. And we've got lots of other publications we're working on.

It's just reached the point where we aren't getting enough new subscribers and the paper edition is way too expensive to put out. By doing this we'll be able to keep doing Apple II support and publishing magazines, albeit disk based, for a long time to come!

-Dean Esmay (A2.DEAN, CAT23, TOP3, MSG:196/M645;1)

>>>>> > Gosh, why all the long faces?

=-=-=-=-=-=-=-=-=-=-=-=-=

Open-Apple has evolved into A2-Central, a highly respected, internationally renowned, prize-winning journal of Apple II news, technical information, tips and ideas.

RC.ELLEN
June 1991

The A2-Central paper and Fishhead's Children subscribers all got letters telling them how much we owe them in unshipped issues...

TOM.W
JUNE 1993

As the Apple II nears the end of its life-cycle, renewals to our flagship publication, the paper version of A2-Central, have fallen to less than 20 per cent.

RESOURCE CENTRAL
June 1993

----=-=-=-=-=-=-=-=-=

-Hank (H.WESSEL3, CAT23, TOP3, MSG:198/M645;1)

...BUT NOW, WITH ADVERTISING! Today I received the latest A2 Central On Disk. Although there was no Resource Central catalog included I was very happy with the announcement in the small RC-advertisement that on the next disk a overview will be given of all the products Resource Central carry. With an overview like that you can have it always 'on-line' after putting it on your hard disk.

I think it is a very good idea to have an advertisement folder on the disk. In that way the whole Apple II community (we are all subscribing to A2COD, aren't we?) will be informed of all the new products coming out and their prices.

Peter van Dongen / Netherlands / Europe (Co-Pilot 2.1.1 + PT 3.1)
(P.DONGEN1, CAT23, TOP3, MSG:21/M645;1)
In short - free advertising on A2 On Disk. I'll accept short AWP files of 5-15K (or less) in length from anyone with a commercial business selling Apple II product of some sort (must be a business, this is not a personal ads section). I reserve the right to cut the ad as I see fit; I'm less likely to do it the shorter the ad is.

There's no cost, it's free, but you're at my mercy in terms of when I'll publish it, its content and its length. ;-)

Dean Esmay (A2.DEAN, CAT23, TOP3, MSG:30/M645;1)

APPLE LAYOFFS

Word on the news this evening is that Apple is planning to layoff 2,500 employees (between 15%-16% depending on the new service) over the next 12 months.

Hopefully this layoff will bypass all of my good friends that work there!

-- HangTime [Script-Central] B-)

(A2.HANGTIME, CAT5, TOP3, MSG:213/M645;1)

SYSTEM 6.0.1 GOODIE #1: ALIASES

The point of having an alias to a file is not that it's smaller than the original file. In many cases you may wish to make aliases to many small files. The point is that you can now access those files from more than one place. For instance, many files may absolutely REQUIRE that they be in a special specific place, such as items within the System folder. Or, you may have several programs that require a large number of extra files in the same directory as themselves, such as dictionary files, startup screens and/or music, etc. (Plato mentioned a good example: games.) Now, with aliases, you can organize all your most used files in such a way that it makes good sense, instead of being restricted to the requirements of each file (location, secondary files, etc.). Aliases are simply a convenience to help you manage your disk volumes better. That's all.

(A2.LUNATIC, CAT9, TOP15, MSG:148/M645;1)

GOODIE #2: MS-DOS FST

If you use Tulin's Floptical driver and do an Easy Update for System 6.0.1, don't forget to remove the SCSIHD.Driver from your drivers folder before rebooting....just a reminder.:)

I read my first 1.44 meg MSDOS disk in the Floptical drive last night. In fact, this was written on my 386 at work, saved to disk and read into the IIgs via the Floptical. Works as advertised!

(A.COUGHLIN, CAT11, TOP16, MSG:78/M645;1)

GREAT NEWS for us Floptical/Apple II owners who must also work with MAC and IBM systems! Once they get the WRITE portion of that FST finished, we'll be set. Moving information between systems will be a breeze. I could be using my GS for a LONG time to come now. The next great thing would be some file translation utilities, i.e. WordPerfect or Microsoft Word to AppleWorks, etc.

No one's ever completely satisfied are they?? :)

J-Bird <<WHO GOT THE LAST GS?!>>

(J.CURTIS8, CAT11, TOP16, MSG:83/M645;1)

With System 6.0.1 you can now read the following disks: 720K MS-DOS, 1.44M MS-DOS, 1.44M HFS, 1.44M ProDOS. (On a Floptical)
drive). You can still read 800K HFS and ProDOS disks with a normal
Smartport 3.5 inch drive (Apple 3.5 or Superdrive).

Tim 'JoAT' Tobin
Lost Classics Coordinator

(A2.TIM, CAT11, TOP16, MSG:101/M645;1)

>>>>> Amazing...

"""""""" Using System 6.0.1's MSDOS FST, my PCT 5.25 disk drive will read
MSDOS-formatted disks under GS/OS. When I tried this, I really did not
expect it to work. But it does. My GS even makes the proper insert
disk/eject disk sounds when I close/open the disk drive latch.

The old problem of the PCT 5.25 drive continuously polling when
"active" under GS/OS is annoying. Besides using PC.SWAP to deactivate the
drive, has anyone found a way to keep the drive from being polled
continuously? I have AEPC System 2.0.4.

Does the PCT 3.5 add-on drive also get polled continuously (under
GS/OS) when active? Has anyone successfully used a PCT 3.5 drive to read
MSDOS 3.5 (720K) disks under GS/OS?

-Ken

(K.WATANABE5, CAT14, TOP12, MSG:115/M645;1)

>>>>> One of the people at Apple who works on this stuff said that yes,
"""""""" the new MS-DOS FST automatically supports drives attached to the
PC Transporter. Apparently it was very easy to arrange.

I would expect anyone who tries it will come back and confirm that it
works. It's supposed to. :-)

-Dean Esmay

(A2.DEAN, CAT14, TOP12, MSG:119/M645;1)

GOODIE #3: 8 MEGS *PLUS* RAMDISK

"""""""" Is it true that system 6.0.1 will allow
ROM 3 users to have a total of 8megs AND
create a RAM5 disk?

I haven't seen this mentioned anywhere on GENie, but "think" I read it
somewhere on a local bbs. Or at least I think that's what being talked
about.

(R.MALTZ, CAT9, TOP6, MSG:138/M645;1)

>>>>> Yep, with 6.0.1, ROM 03 owners can finally have 8 MB of memory and
"""""""" be able to create a RAM5 disk...

-Bryan

(SOFTDISK.INC, CAT9, TOP6, MSG:139/M645;1)

GOODIE #4: FIXES

"""""""" The Find File patch, Sound CP patch, and Finder patch
files should all no longer be needed with System 6.0.1.

The ROM3MouseFix patch is also no longer needed.

(P.CREAGER, CAT9, TOP6, MSG:140/M645;1)

SYSTEM 6.0.1 NON-CHANGE

"""""""

>>> J.CARR20 [LumiTech] writes:

> 
> Since with System 6.0.1 the Fonts and synthLAB disks barely changed at
> all
Since you qualified this sentence with the word "barely", can you enlighten me as to what _has_ changed with these two disks? :-)

With System 6.0.1, we made no code-level changes to synthLab, and the Fonts disk is exactly as that from System 6.0. If you have System 6.0 and want to skip getting these two disks, you won't be missing anything at all.

-Jim Murphy, Still employed Apple guy
(MURPH, CAT9, TOP6, MSG:196/M645;1)

GIVE UP ON APPLE? I have come to the conclusion that it is time to give up on Apple and switch to DOS. I have used DOS at work for the past 6 years, but continued to remain a loyal Apple II user at home. I have used the Apple II since 1984. But recent developments have made me decide to switch. It has become increasingly difficult to get any type of support on hardware or software for the Apple II, so this is good-bye for me. (D.CAVANAUGH, CAT5, TOP8, MSG:1/M645;1)

Apple computer is not the evil corporation that everyone makes it out to be. In fact, they are one of the best companies in the industry.

Try this experiment. Call a Packard Bell retailer and tell them you have a Legend II computer. You don't know much about it but a friend told you that it needs a new motherboard. They will refer you to Packard Bell's 800 number. You will need to send it to a service center. The service center will probably not be able to fix it with the legend II motherboard. Instead you will receive a notice that says "Not economical to repair." That's a catch-all phrase that I used to see on even some Tandy computers and other equipment when I worked at a Radio Shack.

What the hell.....Try it out with a few brands. You'll be surprised at the outcome.

Now, Call an Apple dealer and give them the same story. They will offer to look at it, and if the motherboard is in need of replacement, they will do it. "Not economical to repair" is not in the vocabulary of most good authorized service centers. They will repair it.

CompUSA is a really bad example. They won't even give it a chance. But smaller non-corporate dealers will do it.

Another example of the much finer (yeah right!) computer companies is Leading Edge. If you purchased an early 286 machine, you will discover that there were problems with the ROM bios. This ROM is only found in the Leading Edge (pre-Diawoo days). Will they fix it? No! Can you get a ROM 0 GS updated to a ROM 01? Absolutely!

If you are unsatisfied with the policy of an Apple dealer regarding the servicing, be aware of this fact. If you're to be an authorized Apple repair center, you M U S T service any and all Apple equipment made. The Apple //GS, //e, and //c logic boards are R E Q U I R E D stock items. All Apple parts can be ordered overnight, provided Apple has them in stock. A backorder on an Apple service part is rare. As a former Apple technician, the only time Apple had a problem with stock of repair parts was when they moved the entire operation to Texas. I'm sure they've got it straightened out by now.
Final exercise: Tell them your Lisa screen is burned out and ask how much for the part and labor if it truly is. Answer.... About $250.00

Quality Computers --- Power for Performance.

>>> WHAT'S NEW <<<

WestCode Announces TypeSet:
A TrueType Productivity Package For Your Apple IIGS

San Diego, California: WestCode Software, Inc. is pleased to announce TypeSet, a powerful three-part TrueType font management and productivity package for the Apple IIGS. TypeSet provides Apple IIGS users with several essential tools currently missing from their TrueType toolbox, including: a What-You-See-Is-What-You-Get (WYSIWYG) Font menu, font sets, and font reporting. WestCode spokesman Tony Gentile said, "If you're working with TrueType fonts on the Apple IIGS, you need TypeSet."

TypeSet is a IIGS New Desk Accessory (NDA) which easily installs on a startup disk. The first and most dramatic TypeSet feature is its ability to display fonts in their own typeface inside the Font menu of IIGS desktop software. Apple IIGS users will now be able to see what a font looks like before selecting it. This feature works with most popular desktop applications, such as: AppleWorks GS, BeagleWrite GS, and Platinum Paint. Users may specify whether the font names appear in 10 or 12 pt.

TypeSet also provides users with another powerful feature: font management. Font management is accomplished by allowing users to define font Sets composed of specific user selected fonts. Grouping fonts into different Sets allows the user to control the number of fonts in their Font menu, making font selection easier and reducing clutter. Users may define as many sets with as few or as many fonts as desired in each set.

Finally, the last point in TypeSet's triad of features is its ability to generate reports. TypeSet allows users to generate reports in any of four layouts, including: All Characters, Keystroke Equivalents, Line Showings, and Various Sizes. These reports are perfect for building a user's personal font catalog. The reports generated with TypeSet can be output to both the screen and printer. WestCode CEO Rob Renstrom said, "TypeSet continues WestCode's tradition of bringing state-of-the-art, Macintosh-like technology to the Apple IIGS."

TypeSet is the latest outstanding software product by the programming team of Steven Disbrow and Joe Wankerl of EGO Systems, publishers of GS+ Magazine and authors of the ever popular EGOed Desk Accessory text editor.

Founded in 1990, WestCode Software has earned a reputation for excellence through the success of their innovative InWords OCR program, as well as the award-winning Pointless TrueType interpreter program. With additional products forthcoming and a steadfast commitment to improving existing products, WestCode continues to fulfill its pledge to provide high-quality, low-priced software.

System requirements for TypeSet are an Apple IIGS with 1.25 megabytes of RAM, GS/OS System 5.0.4 or later, and Pointless 2.0 or later.
TypeSet will be available in late July, at a suggested retail price of $49.95.

ECON Announces Addressed For Success GS/OS Desktop Address Database

Oviedo, FL - Econ Technologies Inc. announced the addition of a new member to its line of software. "Addressed For Success" is a GS/OS, desktop-based database management package that elegantly manages large lists of names and addresses. It includes powerful features not found in any other software package, wrapped up in a friendly, easy-to-use interface.

Addressed For Success supports a variety of methods to create an address database. Addresses can be entered using the built-in editor or imported directly from AppleWorks Classic database files. Additionally, any database that has been saved as a standard ASCII file can also be imported.

Filling a void in the Apple IIgs' productivity software, Addressed For Success allows one to easily print addresses, graphics, and postal barcodes on any kind of label form, including envelopes. One can instantly view exactly how labels or envelopes will appear before printing, eliminating guesswork. Addressed For Success contains features found nowhere else, such as: automatic return address generation, a 65,000-character memo field, selection by example, bulk sortings, full support of the clipboard, and automatic PostNet barcode generation. Addressed For Success also comes with over 30 predefined label templates supporting virtually every standard Avery label format.

Addressed For Success is the first GSOS-based program to come as a result of the recent expansion of ECON Technologies' programming staff. It is a testament to the firm commitment ECON has made to bring useful, productivity-oriented software to the Apple IIgs.

Requirements: Apple IIgs with 1Mb of memory and System Software 6.0 or greater. Compatible with The Manager from Seven Hills.

Addressed For Success will be available this summer with a suggested retail price of $49.95.

SHAREWARE SOLUTIONS II:
AN EXCITING APPLE II JOURNEY INTO THE FUTURE

(San Rafael, CA.) Joe Kohn and Shareware Solutions is proud to announce a brand new publication for the Apple II family of computers - Shareware Solutions II: The Newsletter. Written and published entirely by long-time incider/A+ Contributing Editor Joe Kohn, the premiere issue of
Shareware Solutions II is scheduled to debut in July, 1993, just a few short weeks after the final issue of inCider/A+ is published.

As a long time supporter of the Apple II family of computers, Joe Kohn has worked in a number of capacities in the Apple II world, including holding positions as Sysop of the Apple II Forums on The Source Information Network and as the Freeware and Shareware Librarian for Big Red Computer Club. He has been a Contributing Editor for The Apple IIGS Buyer's Guide and inCider/A+ and has had more than 150 articles about the Apple II published in those magazines, as well as in GS+ Magazine, Call-A.P.P.L.E., Softdisk G-S and Big Red Computer Club's Scarlett. His freeware "Connections" column has been reprinted by scores of User Groups world-wide, and his work with Apple II computers has been written about in GS+, Nibble, The AppleWorks Forum, Texas II, and the San Francisco Examiner.

Shareware Solutions II will provide timely information about new and classic public domain, freeware and shareware software, and will continue to provide subscribers with low cost access to that software via the mail. Shareware Solutions II, however, will include much more information than Shareware Solutions: The Column. Shareware Solutions II will also provide general information and solutions that will help Apple II users, educators, and hobbyists continue to use their current computer systems well into the next millennium.

In each issue, Joe Kohn will share useful hints and tips about using the Apple II family of computers, will offer insightful reviews of hardware and software products, will provide money saving advice, and will offer tutorials and "how to" articles. All issues of Shareware Solutions II will include in-depth articles designed to help readers get more bytes for their bucks. Subscribers will learn how to take control over their Apple II's for increased productivity and more fun. Shareware Solutions II will offer information that computer novices will understand and computer hobbyists will marvel at. Shareware Solutions II will offer an on-going source of news and views for the Apple II community, and will be an on-going Apple II resource guide.

Available by subscription only, Shareware Solutions II will provide readers with at least 12 pages of fact filled and professionally written articles in each issue. There will not be any advertising. The North American subscription price is only $25 for 12 issues; for overseas air mail delivery, the cost for a subscription is $40.

In the beginning, Shareware Solutions II will be mailed to subscribers on a bi-monthly schedule, with the eventual goal of publishing one issue per month.

Make all checks or money orders out to Joe Kohn. US Funds Only. Sorry, but no charge cards, purchase orders or COD orders will be accepted.

Apple II Forever!

Subscribe to Shareware Solutions II today!

PMPUNZIP UPDATE RELEASED

Parkhurst Micro Products is proud to announce the latest revision of its popular PMPUnzip utility: PMPUnzip Version 2.0! Version 2.0 is now compatible with the new PKZIP Version 2.0x archive files and works better with multitasking software and text files.

FEATURES

- Access to all files stored in ZIP archives, including files that were stored, shrunk, reduced, imploded, or deflated (NEW!).
- Access to full pathnames stored in ZIP archives, including any subdirectories in the archive.
- All ZIP file extraction routines are written in 65816 assembly language for speed.
- Multiple ZIP files may be open at one time.
- Multiple info windows may be brought up on any of the files in any open archive. Info windows contain more information on the file, including modification date and time, compressed size, and more.
- Archive comments! Using a proprietary PC character font, PMPUnzip will display in the IBM character set any comment included in the ZIP archive. Many PC bulletin boards will have information screens included inside ZIP files using PC graphic characters. These will show up as they were meant to look.
- The last modified time and date (as stored with the ZIP archive) will be retained in the extracted file.
- NEW! Version 2.0 will now automatically convert text files created on other platforms to the Apple's CR-delimited text file format.
- NEW! PMPUnzip now has an option for extracting files in the background. This allows you to use NDAs while extracting, and allows you to use other applications at the same time when operating under multitasking software, such as The Manager (tm) by Seven Hills Software.
- NEW! PMPUnzip now keeps preferences so you can customize how you want the program to work.
- Disk functions. PMPUnzip includes the ability to format or erase a volume and change the attributes on a file.
- MessageCenter aware! PMPUnzip will allow opening of ZIP files from The Finder (tm) (or any Finder-like program that passes file information between applications via the MessageCenter) by either double-clicking on the file's icon or by choosing the file and selecting "Open" from the Finder's "File" menu. You can also have multiple ZIP files selected when you select "Open" and PMPUnzip will open them all.
- Appleshare and other FST compatible. Since PMPUnzip uses GS/OS and the toolbox for all of its disk and file access, it will just as easily open a ZIP archive on an HFS or Appleshare volume as it will a ProDOS volume.
- Single-disk friendly. PMPUnzip was designed to work with single-disk users. You will be prompted for which disk to insert during an extraction.
- Most text used in PMPUnzip is stored as resources and can be modified by any resource editor. For instance, text can be translated into different languages without having to write an
SHAREWARE   PMPUnzip 2.0 is SHAREWARE. The shareware fee is only $15.

For this, you will get a diskette with the most current version of PMPUnzip 2.x, free updates in the mail for Version 2.x, and a 20% discount on ANSITerm Version 2.0. If you have sent in your shareware fee for a previous version of PMPUnzip (1.0, 1.0.1, or 1.0.2), the shareware fee for Version 2.0 is only $5.

(PMP, CAT38, TOP3, MSG:2/M645;1)

Announcing "Helium Balloons"   Balloons Software is proud to announce a new bi-monthly disk-based publication for Apple-using parents, teachers, and librarians. Commencing Sept. 1993, Helium Balloons will include how-to articles, software reviews, book reviews, first-person anecdotes, general education news, along with selected creative writings by and for children. The Apple II version will be distributed on two double-sided 5.25 inch disks. The Macintosh (tm) version will be distributed on a single 800K floppy. Each issue will be accompanied by a short hard-copy newsletter.

The content will include regular columns on creative expression, low-end classroom solutions, special needs computing, telecommunications, gifted/talented topics, emergent literacy, problem solving, community involvement in schools/libraries, student community service, public access computing, and computer equity issues.

Helium Balloons will cover a broad range of subjects of interest to parents, teachers, librarians, and educators. Educational computing will be just one facet of the publication's coverage.

In a related development, Helium Balloons will be picking up the existing Apple II subscribers of the Teachers' Idea and Information Exchange, as well as subscribers to The AppleWorks Educator newsletter.

Important note: The Teachers' Idea and Information Exchange will continue publishing its quarterly publication for Macintosh and IBM users of Microsoft Works. And David Chesebrough, former publisher of The AppleWorks Educator, will continue to commercially distribute his books on the educational uses of AppleWorks. Fashioned in the style of a user group publication, Helium Balloons' central aim is to create and foster a participatory, rather than exclusory, publication. The editorial staff extends an invitation to all like-minded souls to join us on this journey.

Subscription rates: $35/yr. for United States and Territories; $40/yr. for Canada and Mexico; $50/yr. Overseas air mail subscriptions

School site license: $60/yr. Includes both Apple II and Mac versions of Helium Balloons.

Balloons Software, 5201 Chevy Chase Pkwy. NW, Washington DC 20015. (202) 244-2223. GEnie: p.shapiro1; America Online: pshapiro

>>> THROUGH THE GRAPEVINE <<<

*********************************************
APPLEWORKS 4.0? ALMOST! The WORKS 4.0 is a major enhancement for AppleWorks 3.0 that adds vast amounts of functionality to the popular integrated package. Programmed by Randy Brandt and Dan Verkade and published by Quality Computers, The WORKS 4.0 is the result of years of "wouldn't it be neat" daydreaming. Upgrades to every module are incorporated. I'll be posting a complete list tomorrow. (There are so many new features that I simply refuse to even try to list them all without the sheet that Randy sent us close by. <g>)

For the record, Claris is not involved in producing this upgrade. What you will get when you buy The WORKS 4.0 is a disk that modifies your AW3 disk, sort of like a TimeOut application on steroids. YOU MUST have AW3 to use The WORKS 4.0.

Also for the record, the code-name for this product (before it was announced) was Quadriga. The product's real name is The WORKS 4.0. (This disclaimer is included to make Apple's lawyers happy. I've heard some rumbles that "Quadriga" and "Quadra" sound too much alike for their peace of mind. <grin>)

The WORKS 4.0 will be released on October 1, 1993 and will sell for $79.95. For a limited time, you can pre-order it and save $10. Call 1-800-777-3642 to order.

Oh yes. Apple and Quadra are registered trademarks of Apple Computer, Inc. AppleWorks is a registered trademark of Apple Computer, Inc. licensed to Claris Corporation. Claris is a registered trademark of Claris Corporation. The WORKS 4.0 is a trademark of Quality Computers, Inc. And of course, Quadriga is a registered trademark of Ben Hur.

QUALITY, CAT42, TOP29, MSG:1/M645;1

TheWORKS 4.0 Specifications

Desktop >>>

Three desktops allow loading of 36 files
Lists up to 255 files instead of old 170-file limit
Lists text files at "Add Files" menu and automatically loads them to WP
Add to clipboard option adds data without replacing existing contents
Disk and file maintenance included under Other Activities
Alarm clock feature
Auto-save files after preset number of minutes
Five printers may be defined (instead of 3)
Hewlett-Packard DeskJet support built-in
QuickPath allows you to choose from a pre-defined list of pathnames
Change Disk menu shows volume names when OA-? is pressed

Data Base >>>

60 categories per record (instead of 20)
30 reports instead of 20
Get selection rules from a report
Faster display on large files with selection rules
Lightning-fast finds in sorted categories
Reports can auto-sort before printing
Date categories support dates from AD 1000 to AD 9999
Export/import character-delimited text files
Formulas allow spreadsheet-style math in DB
Data from other files can be automatically imported
Data can be automatically exported to other files

Word Processor >>>

Split-screen lets you view one part of a file while working elsewhere
Improved mail-merge & find functions
New symbols instead of caret's make it easier to identify formatting
New glossary feature allows easy entry of addresses and other info from DB

Spreadsheet >>>

Other desktop files may be accessed (as in @SUM("OtherFile":B4...B9))
Date math (and Julian dates) are supported
Titles in the file are printed at the top of each page
New Find options allow searches for numbers, formulas; by row or column
A pop-up list makes it easy to enter functions in a formula
New functions include ALERT, DATE, FIND, JOIN, LC, LEN, MID, TEXT, UC, VAL

System >>>

Runs on 128K 6502-based IIe or better; prefers 256K and 65C02 processor
UltraMacros playback module included (macro files appear in TimeOut menu)
TimeOut & Init Manager built-in

SPECIFICATIONS SUBJECT TO CHANGE WITHOUT NOTICE
(QUALITY, CAT42, TOP29, MSG:21/M645;1)

HYPERSTUDIO FESTIVAL  Well day 1 of the HyperStudio Festival is now
history. Highlights included the opening session
with reluctant introducer Pam Wagner ("I've never done this before.")
followed by a five-minute video made entirely with HyperStudio and produced
by a French filmmaker (whose name escapes me for the moment). Not to be
outdone by the film, Roger appeared and "bantered" for about 45 minutes (as
only Roger can), only to be upstaged in the end by the appearance of
HyperMascot Addy (who did an admirable job of holding her water in front of
a crowd of over 200 attendees, as did Roger ;)). The eighteen 50-minute
sessions ranged from Mac HS topics on video spigot and HyperLogo to IIGS
topics on HS in special education, SimpleScripting and animation. A teacher
from southern Cal even brought a few of her students to show off their stack
making skills. Presenters included Jim Hirsch, Sheldon Davids, Mike
Westerfield and Bill Lynn. The day was capped off by a 3-hour beach party
(that I was unable to attend, unfortunately, so use your imagination). Day 2
is dawning as I write so I'll continue my report later today.

-Cheers... Bill Lynn
(W.LYNN2, CAT32, TOP11, MSG:2/M645;1)

>>>>> That's it! The First Annual HyperStudio Festival is now a part of
"""""""""" history and one that I will not soon forget. The more than 200
people in attendance represented a unique cross-section of HyperStudio
users who shared at least one thing in common... a love for HyperStudio. It
isn't often that I present at a conference where everyone is already
familiar with HS and can share their own unique insights and experience. It
was truly a worthwhile event and I, for one, hope that RWP begins making
plans for next year's event as soon as possible.

Fifteen hour-long sessions were completed today with topics that
included using LaserDisc players effectively, how to make money selling your stacks, using Lego with HyperStudio (neat!), HyperStudio and special education, and Stupid Button Tricks (my session). I was completely taken by surprise with the attendance at the Stupid Button Tricks session (standing room only) and I have to admit that I may be a bit stigmatized by SBT since I was being referred to as "that stupid button guy" (just don't forget the "button" part, OK?). The day was capped off with an "Ask The Experts" panel that consisted of Roger, Mike O'Keefe, Mike Westerfield, Dave Cochran, and Bill Lynn (that stupid button guy). Some "hot" news from RW included the fact that a PC version of HyperStudio may well be a reality by this time next year, and I was successful in getting Mike O'Keefe to admit that the animation procedures in the IIGS version will look a lot more like those in the Mac version soon (i.e. much easier to use, like importing clip art). In fact, don't be surprised if you see HS 4.0 in the not too distant future (once the Mac version is filled out a bit more). Look for stand-alone versions of Mike Westerfield's "HyperLogo" for the IIGS and the Mac very soon (perhaps the IIGS version at KansasFest? Perhaps.).

Look for the HyperStudio Mac Preview Disk (available soon from RWP) which is a fully-implemented version of HyperStudio for the Mac that will run for 30 days.

Well, I'm completely exhausted from jet lag, my ingrown toenail is killing me and I've got to get up at 4:30am to get on a plane :(. Watch for info on HyperFest for next year and don't miss it. I know I won't.

Cheers... Bill Lynn (the stupid button guy)

W.LYNN2, CAT32, TOP11, MSG:3/M645;1

HYPERSTUDIO 4.0? PROBABLY! Gosh that sounds great. Wish I could have been there.

So Bill, did Roger really say that there might be a HyperStudio 4.0?

Dean Esmay

A2.DEAN, CAT32, TOP11, MSG:4/M645;1

Yep! You can corner him at Avilla and ask him yourself.

Cheers... Bill Lynn

BILL.LYNN, CAT32, TOP11, MSG:5/M645;1

Corner him at Avilla? It's not hard to get a question to Roger, the problem is scheduling time for his answer <GRIN!> --KFest '92

A2.HANGTIME, CAT32, TOP11, MSG:6/M645;1

WHERE'S RELIEFWARE? Hi there. Just thought I'd post a request for you BBS'ers and user's group librarians. I have just moved from Clarksville, TN to Midland, GA (courtesy of the U. S. Army), and therefore need to let the world know that ReliefWare Central has moved. Revised versions of OneArm Battle, Plunder!, and Milestones 2000 are in the library, along with a small file (RW.UPDATER) that edits the resources on Version 1.5 of these games to show the new address and a version number of 1.5.1.

If you have these games (or know someone who does), please help me update the version. The forwarding order on the Puyallup address has expired, and the Clarksville forwarding order will die similarly soon. However, ReliefWare is still alive. Thank you!

---7273 E. Wynfield Lp, Midland GA 31820-9025---
Apple II Computer Info

If you run a BBS, or know someone who does, puh-leeze replace your 1.5's with these new ones. Or, better yet: download RW.UPDATER, and it will convert your 1.5's to 1.5.1's. (And it's a quick DL...) :)

The game play is identical; it just changes the address. And no, I doubt I'll update them again (the Army PROMISES they won't move me for several years... and the check is in the mail). ;)

I have started work back on Monster Lab again (I know, I know, it's more than a year past its vapor point) :( and I'll try to finish it this time.

God bless!

---Ken (better late than MS-DOS) Franklin

(KEN.FRANKLIN, CAT6, TOP3, MSG:145 and CAT3, TOP25, MSG:50/M645;1)

WHILE WE'RE AT IT, WHERE'S DTUILS? A discussion occurred not too long ago concerning the whereabouts of DTUtils and its authors, Robert Mueller and Tony Morton. I believe the discussion occurred in the Seven Hills BB area... I thought it more appropriate here. I recently contacted Rob via the Internet and he replied within 24 hours. The text of his response is contained here for those of you interested.

>Development of Desktop Utilities 4.0 is still continuing. I have not
>sent out letters to any people for quite some time as V3.3 is still
>the latest completed version and the cost of sending out over 50
>letters (most international) would be quite expensive from Australia.
>Thus, I have basically remained silent, except for any computer
>networks I have access to (i.e. Internet) where I have said that
>work on DTU 4.0 is continuing, albeit, slowly. It has taken MUCH longer
>than expected to modularize DTU, and all of the modules are being
>totally rewritten to fit into this new modular structure. We
>currently have no idea what the expected completion date is. If
>you know of any other people who have sent in shareware fees, and
>are also wondering what is happening, could you please pass this
>message on to them.
>
>We thank you for your support of Desktop Utilities, and hope that
>your patience does not run out, development IS continuing.
>
>Rob
>
>--
>| Robert Mueller - robm@ecr.mu.oz.au - 2nd year Sci/Eng Melbourne Uni
>@student |
>Ask me about Desktop Utilities 3.3 and the 'soon to be released' version
>4.0 |
>Critic, n.:
> A person who boasts himself hard to please because nobody tries
>to please him.
> -- Ambrose Bierce, "The Devil's Dictionary"

Contact him at the Internet address he shows above and let him know that I told you so. Internet now costs the same as GEmail so no problem there. If you don't know how to access the Internet, p. 207 will help you with it. This letter to Rob was my first try at the Internet gateway and I had no problems. --Rick
SHAREWARE SOLUTIONS II SPECIAL OFFERS  In the initial press release that I'd posted (and re-posted) about Shareware Solutions II, I'd made mention that Shareware Solutions II subscribers would be able to take advantage of some money saving offers.

Among some of the offers that will be made to subscribers in Issue #1 is a nearly 50% discount on software from Seven Hills, and the low cost ($15) availability of System 6.0.1 via the mail.

Through the arrangements I have made, these special offers are only open to subscribers.

In addition to the deals, Issue #1 will include a guided tour of Apple Expo West, a technical article offering step-by-step instructions on how to use your IIGS custom icons with System 6 (even when an application contains its own rIcon bundle that generally takes precedence), an article entitled Modem Madness that includes info that any modem user should enjoy (with a special offer for GENie users and soon-to-be GENie users), a continuation of inCider's Grapevine hint/tips/rumor column, a listing of dozens of freeware and shareware disks available through the mail, a first look at System 6.0.1, and an update on what next to expect from Burger Bill Heineman.

It's not too late to subscribe. The first issue should be in the mail no later than July 15, 1993, barring no further delays. Apple II Forever!

-Joe Kohn

THE (FINANCIAL) BOTTOM LINE  Allow me to leak a rumor... Sometime later this month Quality Computers will be releasing a program called Bottom Line. It is a nice compromise between YMM and Quicken. It provides budgeting capabilities along with checkbook management (something Quicken added to their IBM and Mac versions, but not the Apple II). But it is not as comprehensive as YMM. It is easy to set up and use and allows you to use the same Quicken checks you've always used. It also includes a nifty export utility that allows you to dump your account data into an AppleWorks spreadsheet.

It does have one drawback however... it is not hard drive installable. It runs on either 3.5" or 5.25" disk and runs quickly. It is an 8-bit program so it runs on a //e as well as a IIGS.

Sound interesting?
-Walker

BUT SHE *LIKES* THE IIGS...  Hey all you big hearted GSers! I wonder if any one out there can help me out.

I have a old friend who is disabled and is not able to leave her home. She has been kinda living her life vicariously through the use of a IIGs from my work that I was able to loan her. Though she was given a Mac SE with one meg, two 800k drives, and a Imagewriter I printer, she was never very happy with it, but she has fallen in love with the IIGs <Thanks to Joe Kohn and all his Shareware Solutions!]  It has really made a difference in her whole outlook on life!

Unfortunately, the IIGs has to go back to work, and we have been trying to locate her a IIGs. She is on a extremely limited income, and I
am a California Public School Teacher <which should tell you something
about my financial status> She can't afford much.

She definitely wants a IIgs, and would be willing to swap the Mac and
printer for a basic IIgs set up. <I have another ImageWriter I she can
have.>.

Anyone out there have any suggestions or can offer any help? We can
provide you documentation that she really is disabled so you will know this
is not a scam, and can probably swing some sort of receipt through social
services for any donations that you could write off.

It is amazing the difference the "dead" Apple II has made in her life.
I really want to get her a system of her own.

Thanks!
-Pax!
-- Plato --

STAR TREK RSOUNDS  Now that I'm in the publishing business, I really had
wanted an exclusive "scoop", but after seeing all the
posts here recently about Star Trek sound files, I decided to give up my
scoop, and save you all a lot of trouble.

A Mr. Bill Moore of Tennessee contacted Sound Source Unlimited last
year and asked about availability of Trek sounds for the GS. After being
greeted with the usual questions (which Mac is a IIGS?), and supplying all
the correct answers, Mr. Moore was contracted to convert to IIGS format,
the following:  Star Trek (Classic) Volume 1, Star Trek: The Next
Odyssey.

According to Mr. Moore: "Pricing is unavailable because no release
date has been set;  I will recommend an SRP of about $39.95 each, meaning
places like LRO and Quality will sell it for about $25 to $30 each."

So, just sit tight. They're coming.
-Joe Kohn
Publisher, Shareware Solutions II

NEW TALK IS CHEAP COMING  How to get version 4.00? Stay tuned... I'll
actually shipping (probably a few weeks away).

Do you need it? Probably.

-Don Elton (delton) or delton@pro-carolina.cau.org
Apple II Computer Info

Apple hasn't been involved in actively supporting the Apple II since 1986 when the last real engineering was done to solidify the IIGS design. Ever since then, Apple's given very little attention to the Apple II series, compared to the Macintosh. The time to give up on Apple Computer was about eight years ago.

However, Apple computer is not what makes Apple II computing what it is. It's the developers and third-party companies that have made the Apple II a venerable and productive machine today. We're just lucky that we continue to get new operating system software every now and then from Apple. I don't feel that the future of the Apple II even depends on that.

Don't give up on the Apple II developers, which is what you're really doing. If the remaining Apple II users replaced their machines with PCs, it wouldn't hurt Apple at all, they wouldn't even notice. Unfortunately, the migration would completely decimate the Apple II developers who would surely suffer from it.

[*)[*][*]

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Fun & Games On GEnie

By Juan Jimenez
[J.JIMENEZ]

WARNING:

GEnie PC Aladdin has been determined to be harmful to your health and mental stability. House mice routinely placed in front of a keyboard and given Aladdin and a GEnie account have demonstrated wildly aberrant behavior after short terms of exposure, ranging from increasing the sizes of their paw signatures to 10x times the normal size, to engaging in cage-to-cage flame wars regarding the issue of illegal use of mousetraps in protected rug-covered areas, something which has already been demonstrated to be deleterious to the living conditions and environmental stability of the rodent population in the western hemisphere. Withdrawal symptoms after termination of the test sessions have also ranged from simple begging to have their modems returned to their little computer hutchies to finding patch lines running from their cages to the closest RJ-11, connected to stolen Hayes Personal Modems,
which were themselves connected to the gerbil cages (the gerbils were more than happy to provide power with little generators hooked up to the running hoops in exchange for a share in the lettuce rations).

In one particular case, lightning struck near the testing facility on a dark wednesday night, opening a large tear in the time/space continuum, from which an uncontrollable Aladdin Lag emerged, destroying every water bottle in sight. The rodents were found the next day with their little tongues sticking out, completely dehydrated. Small notes folded in the shape of tiny paper airplanes were found near the fish tank, begging for Evian resupplies.

Secondary effects were also observed on the cat population in the testing facility. As far as we can tell from the evidence (notes of paper with the numbers 1 through 9, with the numerals 1 through 8 crossed out, and small vials of pure catnip next to their bodies) they were completely freaked out at the sight of mice playing Air Warrior, at which point they decided to do away with their entire supply of reincarnations.

REFLECTIONS

Thinking About Online Communications

By Phil Shapiro

IS IT POSSIBLE? Online communications have already changed many facets of workplace interactions. Much has been said already about how electronic mail flattens out a corporation's management hierarchy. Online communications might change the hiring process in a similarly revolutionary fashion. Is it possible that "online interviews" will totally supplant face-to-face hiring interviews?

The purpose of any employment interview is for employees and employers to find out as much as possible about each other. Both sides are trying to minimize the risks of getting involved in an employment situation that later proves to be unfulfilling.

Job interviewing today is flawed only in the respect that it totally lacks logic. About the worst possible way of finding out about a human being (or a company) is to sit down for a casual twenty-minute chat. Admittedly, you can draw some general conclusions about a person's demeanor and character by looking them over from head to toe. But to delve deeper into a person's character you need to probe further below the superficial social surface.

Online communications offers an opportunity for both employers and employees to do just that. Instead of sitting down for a twenty-minute chit-chat, prospective employers and employees can engage in a more involved, deeper, long-lasting online dialogue.
Chances are that online communications will dramatically extend the time-span of the interviewing process. Prospective employers might court potential employees by asking them to send e-mail comments and feedback about goings-on in that particular industry.

To gain further insight into a person's patterns of thought, employers might ask to see current writing samples. But instead of asking to see just "three recent writing samples," employers can take advantage of online communications to make more rigorous demands. It's not too far-fetched to imagine an information-age employer asking prospective employees to send everything they have written in the past two years.

In the situation where the job opportunity involves some measure of creative talent, an employer might reasonably request a potential employee to send a variety of writing samples. Companies such as Microsoft or Apple might realistically ask interviewees to send five pieces of original fiction, five poems, five non-fiction articles, and five recent business letters. Looking at these combined writings should give employers a rounded picture of prospective employees.

On the other side of the coin, potential employees can use online communications technology to probe deeper into the workings of corporations they're considering working for. If a corporation is serious about courting a prospective employee, the corporation should be more willing to reveal more of itself.

The resulting courtship might very well last several months, or even more than a year, before becoming formalized into an employer-employee relationship. The employment interviewing process, therefore, will take on some of the traits of the age-old process whereby two human beings get to know one another.

Many advantages would result from this innovation in hiring practices. Employers would have a very good sense of the character and talents of the employees they're hiring. Employees, likewise, would have a better sense of the company they're going to work for.

The moral of all this? Brush up on your dating skills. You might need them in courting your next employer. And forget about polishing up your resume. More important to have several dozen writing samples on hand to send prospective employers.

In the coming Information Age, the written word will reign supreme. Those who can best mold raw ideas into sterling sentences will be able to write their own tickets.

[*][*][*]

Polishing Green Apples
By Steve Weyhrich
[S.WEYHRICH]

>>> GETTING STARTED WITH THE APPLE IIGS <<<

BACK TO THE BASICS

This is the beginning of a series in which I plan to focus on helping the user who has just acquired his or her Apple II computer. This article, and subsequent ones, will assume that the reader knows NOTHING about their computer beyond how to turn it on. I hope that the information will be useful to someone who is not currently able to use their computer to its fullest, but wants to learn more. Reader feedback is welcomed and encouraged, as I am no longer a beginner myself, and have only a certain dwindling understanding of what information would be useful to the beginner; understanding what YOU want to learn more about will make this monthly feature more valuable for all of us.

I have chosen to start with the Apple IIGS, rather than with the older versions of the Apple II (the ][, ][+ , IIe, and IIc), because I've recently begun to use this model, and the "beginner" experience for it is most fresh in my mind. I plan to turn the discussion eventually to the older models, but the IIGS is more complicated and I believe it to be a somewhat more difficult computer on which to get "up to speed".

Some of you may not own an Apple IIGS, and you wonder whether there is any reason to make the change. Some have made the change, but just can't get the hang of it, and can't really do what they'd like to with it. This article and the ones to follow should help you out.

(By the way, in the course of this article I make reference to "8-bit" and "16-bit" computers. This relates to the amount of information that the microprocessor is able to handle at one time. The models from the original Apple ][ up through the IIc Plus are 8-bit computers; the Apple IIGS is a 16-bit computer. The IIGS can handle up to 8 megabytes of RAM in a single block; the older Apple II's can only handle 64K bytes of RAM in a single block, though some programs can use switch-banks of memory to make use of extra memory.)

FINDING THE RIGHT IIGS FOR YOU

Okay, so you've been thinking for a while about getting one of those Apple IIGS systems. You've been envying all those neat features that the IIGS users are always talking about on the A2 Roundtable on GENie, or at the Apple User Group meeting. Or you feel frustrated that there are just not that many new applications (besides educational games) being released for your Apple IIe or IIc. What steps can you follow to make the move to 16 bits?

Most of the decision depends (as usual) on how much money you have to spend. The ideal Apple IIGS system, fully decked out, may require more disposable cash than you have sitting around. That was where I was about 18 months ago, when I first began to seriously consider changing from my souped-up Apple IIc to a IIGS. I had gone as far as I could with my IIc. It had an 8 MHz Zip Chip, a one-meg Apple RAM card, and a Chinook 40 meg hard drive (the CT-40c, which plugs into the disk port on the back of the IIc). This gave me a nice, fast machine, both in terms of speed of disk access and speed of the programs I ran on it.

The system that I REALLY wanted was one with 4 megs of memory.
Apple II Computer Info

(minimum), an RGB color monitor, a fast SCSI card (for a hard disk, and possibly a tape drive), an accelerator card, one or maybe two Apple 3.5 drives, and one Apple 5.25 drive. I decided I could stick with my old reliable ImageWriter I printer for the time being. But the COST of getting my ideal IIGS system seemed prohibitive. I had to try another approach to achieve my goal.

IT COSTS >>HOW<< MUCH?! Let's look at the expenses involved in getting a IIGS. You can't buy it from Apple dealers any more (assuming they even know ABOUT the Apple IIGS), since it was dropped from the dealer list in December 1992. There may be a few new systems out there that you can buy from dealers that want to clear out their old inventory, but most people today will have to look to the resale market. If you can find someone who wants to sell his or her entire SYSTEM for a good bundle price, and if you have that much cash available, that is the best way to go. You'll have most (if not all) of the pieces you need to comfortably run the most popular software, and very possibly some of the IIGS programs you've been drooling over. But to know if the price someone is asking for their system is reasonable, you need to know what it costs to buy the pieces via commercial mail order businesses.

The most consistently available sources for refurbished Apple II and IIGS systems are Sun Remarketing in Logan, UT (800-821-3221), and Shreve Systems in Shreveport, LA (800-227-3971). Both Sun and Shreve have been selling Apple computers (usually discontinued or refurbished models) for some time. There have been modest changes over time for the prices on pieces necessary to create a basic Apple IIGS system; here are their prices as of June 1993:

<table>
<thead>
<tr>
<th></th>
<th>Sun</th>
<th>Shreve</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apple IIGS CPU, ROM 01 with 256K RAM</td>
<td>$449</td>
<td>$349</td>
</tr>
<tr>
<td>Apple RGB Monitor (for IIGS)</td>
<td>$249</td>
<td>$229</td>
</tr>
<tr>
<td>Apple 3.5 Drive</td>
<td>$199</td>
<td>$169</td>
</tr>
<tr>
<td>Apple 5.25 Drive</td>
<td>$139</td>
<td>$169</td>
</tr>
<tr>
<td></td>
<td>----</td>
<td>-----</td>
</tr>
<tr>
<td></td>
<td>$1036</td>
<td>$916</td>
</tr>
</tbody>
</table>

(NOTE: prices are for used equipment)

Shreve seems to be the less expensive source of an Apple IIGS basic system. I do not know anything about the relative quality of the equipment available from Shreve compared to Sun. I DO know that the IIGS CPU that I ordered from Sun in February 1992 appeared to be a never-used computer; if it WAS used, it was SO well restored and refurbished that I could not tell the difference (with the exception that the system disks supplied with the computer had Sun's label on them). If you're about to call Sun, however, you will be out of luck: They are currently completely out of IIGS computers as of June 1993, and have a waiting list of about 38 names. Shreve DOES have them in stock (as of mid-June). Neither company is supplying the ROM 03 IIGS, which has 1 meg of memory built-in, instead of the 256K built into the ROM 01 version. Also note that the above prices do not include shipping charges, so allow for that. There are probably differences as well in the warranty offered by either company.

MOVIN' ON UP Now with this set of building blocks, you do have a IIGS computer, but you will be VERY limited in what IIGS software
you can use on it. To have a computer that is capable of running System 6, the latest version of Apple's powerful 16-bit operating system for the IIGS, you need a minimum of 2 megabytes of memory to do anything useful. You can upgrade the memory on this 256K computer most inexpensively at this time by either buying it used, as with the computer, or new from the major Apple II mail order houses. Since there were other items I originally wanted on my ideal IIGS system, let's price these as well:

Sequential Systems RAM GS 4 meg $115
Zip GS Card, 8MHz/16K cache $173
RamFAST/SCSI card, 256K cache $139
127 meg SCSI hard drive $304

----

$731

(NOTE: prices are for new equipment)

These prices were taken from the ad for LRO Computer Sales of Woodstock, IL (800-275-4576, or 800-ASK-4LRO) in the July issue of inCider. Very similar prices can be found in the ad for TMS Peripherals of Boca Raton, FL (800-275-4867, or 800-ASK-4TMS), so shop around. These items, along with the cost of the basic system itself, brings the price of my ideal IIGS complete system to $1650-$1770 (again, excluding shipping charges).

These prices were approximately the same when I started to build up my system last year, though the hard drive, memory, and SCSI card prices were higher then. Consequently, I immediately ruled out the idea of getting my ideal system all at once; I couldn't afford that. With this information, however, it did make it easier to determine what systems being sold in classified ads REALLY should cost.

BUILD A GS ON A BUDGET It would be best to find a complete system being sold used by someone who is changing computer platforms to something else. That way, not only can you get all the basic pieces you want, but there may be some nice additional goodies (such as a hard disk or accelerator). If you decide that even a used system is not affordable because you cannot come up with the full price all at once, ask if the seller is willing to have the payments spread out over several months.

If not, then the next best solution is to collect the components one by one. You will not necessarily spend LESS over the long run (and you might possibly spend more), but you will at least be able to get a IIGS and begin enjoying the benefits of a more powerful computer.

The most basic, stripped-down Apple IIGS you can get is simply the CPU (ROM 01 or ROM 03), keyboard, and mouse. You will then need to add a monitor and disk drives. This is where those who are moving up from an earlier Apple II such as the IIe or IIc will find the going easy. For a monitor, you can use the monochrome monitor from your Apple II Plus, IIe, or IIc. You will find, however, that a composite color monitor, although it worked well for graphics, will not display 80-column text clearly.

For a disk drive, you can usually use the ones from your existing Apple II. The disk drives used on the IIc, either the Disk IIc or the UniDisk 3.5, will plug directly into the disk port on the IIGS. The older style Disk ][ drives used on the II Plus and IIe can be used also; you can
just put the same disk card in slot 6 on the IIGS. You can also buy or build a converter plug to allow an older style 5.25 drive to plug into the IIGS disk port. The only disadvantage to the UniDisk 3.5 on the IIGS is that it will run slower than an Apple 3.5 drive, due to a different interleave. (To get a better explanation of "interleave", see the segment on advances in disk drives in Part 9 of my Apple II History, in the February 1993 issue of the A2 GENieLamp.) However, the UniDisk 3.5 will not run any slower than it did on your earlier Apple II, so you haven't lost anything by going with the slower drive.

With a ROM 01 IIGS, you now have the equivalent of an Apple IIe that runs at 2.8 MHz (instead of 1 MHz), and has 256K of memory (instead of the maximum 128K memory on the IIe or IIC). If your IIe or II Plus had a slot-based RAM card, that can be used on a IIGS as a RAMdisk. (Unfortunately, the memory cards used with the IIe auxiliary slot or with the IIC memory expansion cannot be used on the IIGS.) With this arrangement, you have something that is close to what you had before, and you can continue to upgrade from there.

When I was finished with my initial conversion, I had a ROM 01 IIGS, using my Monitor IIc (the "ET" monitor). For disk storage, I used my UniDisk 3.5, a non-Apple brand 5.25 drive, and my Chinook CT-40c hard disk, all of which plugged into the disk port on the IIGS just as it had on the IIc. Because I REALLY needed more memory, I added a C.V.Tech memory card, and installed 3 megs of chips on it, giving me a total of 3.25 megs of usable RAM -- almost three times as much memory as my 1.125 meg IIc. I had lost the speed of the 8 MHz Zip Chip (which I noticed most when using certain AppleWorks macros), but I finally had an Apple IIGS. It was a start.

For those readers who plan to move beyond this start with their IIGS, what you add at this point depends on what you want to do with your new computer. Are you still going to use lots of 8-bit applications? Adding more memory may help with certain programs (AppleWorks, Publish-It!, and ProTerm are examples that come to mind). Want to avoid the floppy shuffle? Getting a hard disk will ease your way. Graphics or games? If you want to get into 16-bit quality, you will eventually need to get that color RGB monitor. Music? A sound board will let you plug your IIGS into stereo sound. And any of these things will enhance the GS operating system, GS/OS, which can be used when you pass the 1 meg barrier: older versions like v5.0.4 will run with 1 meg; newer versions like System 6.0 or 6.0.1 will require 2 megs or more to run well.

In the next edition of Polishing Green Apples, I would like to take a closer look at what you can do with a REALLY bare-bones IIGS system (i.e., 256K RAM and one 5.25 drive), and what it takes to continue upgrading it into a good, productive system.

(If you have any comments or questions that you would like to have addressed in a future Polishing Green Apples column, please send stamped, self-addressed E-mail to S.WEYHRICH. If you cannot find a place to put a stamp on your E-mail, then just send it anyway.)

-Steve Weyhrich

[Disclaimer: The mention of Shreve Systems, Sun Remarketing, TMS Peripherals, and LRO Computer Sales is NOT to be taken as}
an endorsement of these companies by Steve Weyhrich, General Electric Information Services, A2 GENieLamp, or the staff and employees of any radio or TV station you might think of. As with ANY mail order company, the buyer should take proper precautions to inquire about warranty, return guidelines, and other such issues. I have no reason from personal experience to believe that any of these companies would treat you poorly; however, I've only ordered from two of them and cannot comment on any others with any assurance.

>>> REVIEW: ShadowWrite NDA (v1.3) <<<

Program Name : ShadowWrite
Filename : SHADOW1.3.BXY
Library Area : 8
Program Number : 20915
File Size : 53504
Program Type : NDA Full-featured Word Processor
Author : Andre Horstmann [A.HORSTMANN]
Version Reviewed : 1.3
File Type : FREEWARE!

ABOUT THE PROGRAM We have all heard of the great watches and chocolate that come from Switzerland. However, did you know that one of the best Apple IIGS programmers is also from Switzerland?: the genius behind Bright Software, Andre Horstmann. Bright Software has produced several outstanding products including two games, Gate and Spacefox, both available through distributors here in the United States.

One of Andre Horstmann's best efforts for the Apple IIGS is a program called ShadowWrite, a full-featured word processor in the form of a New Desk Accessory (NDA). What a useful idea; I don't know what I would do without one! It is great for opening text files or reading the documents for new programs you have just downloaded. You can have a disk or folder directory opened on one half the screen and ShadowWrite open on the other half. I have used this method to write entries into my database of disk catalogs.
The ShadowWrite NDA has evolved through the past year or so and several versions of the program have been uploaded to the A2 library here on GEnie. This review, however, is of version 1.3, the latest to be uploaded, which among other new features includes a bright, shiny, new-blue ruler, which can be shown or hidden with Apple-E.

Generally speaking, here are some features of this latest version of ShadowWrite that I especially like:

Not only can you launch ShadowWrite as you would any NDA, via the Apple menu, but you can specify which file types you want loaded into ShadowWrite when you double-click on a file from the Finder. ShadowWrite's Preferences option lets you choose to load (by Finder double-clicking) any or all of Teach, text, source code, or AppleWorks classic. Whatever your Preferences selection, you can still open all four types "manually", when using ShadowWrite's Open command.

Preferences will also allow you to change the default font for new documents and the default font for opening text files, where you might prefer a mono-spaced font.

Although only one ruler can be assigned to a document, this new ruler makes setting tabs, margins, and indentation easy. Also, if you open an AppleWorks document, the tabs are automatically set to the AppleWorks defaults. Setting justification is just as easy as clicking your mouse when the ruler is displayed, or as fast as using the key-equivalents.

There are key-equivalents for nearly everything, with different key-equivalents available WITHIN key-equivalents: Apple-H, for example, selects "Save As" from the files menu, at which point you can press Apple-E to save your document as a Teach file, Apple-T for a text file, and Apple-S for Source. Key-equivalents are available for setting justification, font style, and much more.

The fast cursor movement keys are also nice to have, such as Option-Left/Right arrows for beginning and end of line. Apple-Up/Down arrows for page up/page down, and my favorite Apple-1 through Apple-9 to scroll to relative positions in the document, as with AppleWorks.

Stability is another strong point. With all the beta testing that this program has gone through, this latest version is stable and bug-free. I have not experienced a single hang or system crash while using ShadowWrite 1.3.

Find/Replace has the ability to find returns and replace them with spaces, which is especially useful when you download a text file and want to put it into a word processor. No more hunting for stray returns!

Then there's the ability to Clear Highbits. I have often run across problems when the person writing a text file uses the Merlin text editor. Merlin is great for writing source code, but not text files. If you try to read such a file with ShadowWrite all you get is inverted question marks. Try using Clear Highbits and the text will come out perfect... well, at least readable.

The ShadowWrite documentation is clear and concise in describing all the features, menus, and key-equivalents available in the program.
Apple II Computer Info

Memory usage can be a real problem, and Andre Horstmann is aware of it. This full-featured word processor NDA is remarkably small: it only takes 66K. Horstmann even asks users to let him know which features they could do without to make the program smaller. To my way of thinking, ShadowWrite is great just like it is.

The thing I like best about the ShadowWrite NDA is that it is free. Yes, ShadowWrite is FREWARE. Use it all you want, give it to your friends, just do not sell it. Now, can you beat that? I hardly think so!

If you would like to send E-mail to Andre Horstmann, his E-mail address right here on GENie is A.HORSTMANN.

[*][*][*]

Important Note! Version 1.3.2 of ShadowWrite was uploaded during the writing of this review. You can find the new version at file #21059. This update fixed a couple of bugs: (1) bug fixed that didn't let you count words in documents larger than 64 Kb; (2) bug fixed that opened some Teach documents with wrong ruler and menubar colors. Version 1.3.2 also added several new features. Softdisk Issue Text can now be imported, although this feature has not been tested. The Preferences dialog box now includes: Save Window Size (Open Apple-A) - Click this button to save the current window position and size as default window position and size; Scroll Speed - With this pop-up you can set the vertical scroll amount field in the text editor. Changes will get activated the next time you open SW.

>> WHO'S WHO ON GENie <<

---

GENieLamp> Tell us a little about John Peters. Where are you from, what is your educational background, and what do you do for a living?

John Peters> Well, I was born in Green Bay, Wisconsin, but I really don't remember much about it since I moved to Colorado at an early age. Colorado fits me just fine with the mountains and its comfortable climate. Strangely enough, I'm living in the state that is known for its beautiful ski resorts but I've never been skiing. I hear it's a blast. Maybe someday...

Education. What's dat? :) My early life was filled with doctors, nurses, and hospitals, so I missed out on many experiences I should have
had as a kid. I don't dwell on that, though, as I'm much too busy making up now for what I missed then. I guess you could say I consider myself to be a graduate from the, "School Of Hard Knocks" where, by the way, I passed with honors. :) Much of my education has come from books I read. I drive my wife crazy at times because it is rare that you will see me without a book. I read in restaurants, at sporting events, even when I go fishing! I am truly fascinated (and at times, frustrated!) by the power of the written word. I plan on continuing this love/hate relationship with words at a local community college this fall.

As to my _real_ job it is right here on GENie doing the GENieLamp mags, helping out with LiveWire Online and running the DigiPub RoundTable. However, to pay the bills, the last 14+ years I've been working for the Southland Corp. in a 7-Eleven convenience store here in Colorado Springs.

GENieLamp> What was your early experience with computers, and how did you get involved in telecommunications?

John Peters> Several years ago I was browsing in a TV/Stereo store and I came across a salesman who was showing a customer a computer game that was hooked up into a large screen TV. The game was called Star Raiders. I knew about home computers as I had my eye on a TRS-80 computer at the local Radio Shack. However, after seeing Star Raiders I knew right then and there that the Atari computer was for me. So I went to a local computer store and talked the owner into letting me make payments on a complete system. Several months later, I was the proud owner of a 16K Atari 400 computer!

I had a lot of fun with my computer playing games and typing in programs from magazines (anyone remember Softside Magazine?), but there seemed to be something missing. I didn't know it then, but a modem was the answer to my problem because that missing something was people.

However, modems back then were almost as expensive as the computer itself. When the cost of modems finally dropped below $100.00, I bought my first one, a real 300 baud screamer! What a difference the modem made in my computing hobby. I couldn't believe all the things that were available to me with just a simple phone call. Much to my wife's distress, I quickly became obsessed with the online world. Truly, the modem had become my window to the world.

GENieLamp> What were the things that shaped your decision to begin the GENieLamp magazines?

John Peters> After hooking up my new modem, I called my first BBS. I then called another, and then another. Within a week I was active on several bulletin boards all over town. I've always had an interest in writing and it soon became obvious to me that this was the perfect opportunity to start up an online newsletter. I contacted a local SysOp, told him about my idea and TeleTalk Online Magazine was born. Within weeks TeleTalk was being offered on several BBSs around town and it became quite popular. Much to my surprise, after several issues were published I started receiving Email from BBSs in other states. When I received Email from Sweden, I knew I was onto something truly special. I hooked up with local BBS SysOp Bob Connors (who is now the editor for GENieLamp IBM), and we created a nationwide network called T/TalkNET. Soon TeleTalk was being posted on BBSs and commercial online services everywhere.
After a couple of years of publishing TeleTalk, I wanted to do something a little more computer-specific, so I came up with the idea of doing an online magazine which contained nothing but mini-reviews on shareware and PD software. I released three issues of PD_Quickview ST here in the Atari ST RoundTable. I wasn't satisfied with the new magazine, so once again I started looking around for something else to do. While visiting the Atari RoundTable one evening, it occurred to me that maybe the ST RoundTable would benefit from its own online magazine, so I sent off a proposal to the SysOp, Darlah, and two weeks later I published my first GEnieLamp ST. And as they say, the rest is history.

GEnieLamp> Most ventures of this nature are limited to one or two computer platforms. You've ambitiously attempted to offer a publication specifically tailored to a rather wide variety of computer platforms. Why? In retrospect, was this overly ambitious?

John Peters> Good question! Early on I had considered going to other SysOps here on GEnie asking if they would like to have a GEnieLamp Magazine represent their RT, but I rejected the idea as I knew that without GEnie's direct support the magazine would probably fail. But as fate would have it, a couple of months later I received a phone call from the GEnie Computing RoundTable Product Manager asking me if I would like to expand GEnieLamp into other computing areas. Without blinking an eye, I agreed.

The original idea was to have one magazine which covered all the computing RoundTables. But I knew that by doing so I would end up with a huge magazine that had a lot of general (i.e., boring) information which would be pretty much meaningless to most of the readers here on GEnie. So, I went with a separate issue for each computer platform.

As with any business, one of the keys to success is having good people working for you. Since I'm far from being an expert on all the different brands of computers supported here on GEnie, I depend on my editors and writers to collect the information that they feel will be of interest to their readers. In this respect I've been very lucky and have a great support staff for all the magazines.

Ambitious? Yes. Overly so? I don't think so. We've had our share of problems and yes, most of these problems are due to the sheer size of the GEnieLamp organization, but heck, that's what keeps things interesting!

GEnieLamp> What kind of computer equipment do you use personally, and why have you made the choice to use that kind?

John Peters> From day one it's been Atari. I know the system inside and out. However, I am not a fanatic Atarian by any means and I would publish GEnieLamp if I were on an Amiga, IBM, Macintosh or a Sinclair. To me, the computer is nothing more then a tool, a tool that allows me to do what I love to do here on GEnie. I may make the "big switch" someday, but for now, the ST does what I want it to do.

GEnieLamp> You've spoken quite passionately about your interest in digital publishing. For people who are not familiar with the idea, tell us what digital publishing is all about.

John Peters Ahhh.... Digital Publishing is another obsession of mine.
Digital Publishing, in its simplest form, is what you are reading now, an ASCII magazine that is created and distributed electronically. Getting a little more complex, there are machine specific authoring tools and viewers such as Waldo, Dart, Iris, TX2 and others which allow the publisher to include graphics or "hyper" abilities within the text.

I became interested in Digital Publishing when we didn't even have a name for it. Now, Digital Publishing in one form or another is making headlines everyday. I truly think that Digital Publishing is going to be the next big wave to hit the computer industry. Fortunately for those of us on GEnie, we don't have to wait for that to happen as the future is here and right now in a new RoundTable called the Digital Publishing RT. Apparently I'm not alone in my feelings about Digital Publishing as the DigiPub RT libraries are quickly becoming filled with poetry, online magazines, newsletters, short stories, mini-novels and even tele-comics.

Why the interest? With Digital Publishing, _anyone_ can publish a book or a magazine. Like the programmer who tries to sell his or her programs commercially, the typical writer faces the same seemingly insurmountable odds in finding someone to publish his or her book. But programmers have found a way around this problem - they distribute their programs as shareware or freeware. Well, why not writers too? In the DigiPub RT (M1395) we have the tools, the experts, and the means to help the author create and distribute their work, worldwide. Now _that's_ exciting!

GEnieLamp> Is the route that an "author" needs to take to be "published" any different than he or she might pursue in a print media setting? I mean, I could write something pretty goofy and post it in the DigiPub library and say I was "published." Where are the quality controls?

John Peters> There are no quality controls. And why should there be?

GEnieLamp> Back to the GEnieLamp. You impress me as a person who wants to keep doing better. What do you want to see happen with GEnieLamp over the next few months?

John Peters> Overall, I don't see any major changes in the way we do GEnieLamp. However, we will always be fine-tuning the issues. For example, I recently added a support column to GEnieLamp IBM for the Windows RT and will probably be adding an OS/2 RT support column later in the year. The online interview concept (like the one you are reading now) will be found in all the issues along with the popular Mini_Bytes column now found in the IBM and ST magazine. Also, we have a special arrangement with the Newsbytes folks to reprint articles from their popular online newsletter, so we will be phasing that into the all the magazines in the next couple of months as well.

On the downside, we tried to go with two issues a month but it didn't work out like I wanted it to and I had to abandon the idea. I still want...
to do two issues a month, but I'm not going to attempt it again until I'm sure I can do it successfully.

Along the Digital Publishing lines, we are working with the Digital Publishing Association in trying to come up with a format that would allow all computers to view an online graphics based magazine by using a common display language standard. We are doing that now with our GEnieLamp TX2 and GEnieLamp Mac/Graphics issues. However, the viewers are computer specific and not interchangeable among other platforms. I'd like to see that limitation disappear.

Another possibility I'm currently looking into is doing a hardcopy issue of GEnieLamp either in newsletter format or as a magazine.

GEnieLamp> This question is honestly not meant to be promotional. I am wondering why you choose GEnie as your on-line service?

John Peters> GEnie is like an old pair of shoes. It just feels right.

Although GEnie is a huge system, it has a certain "homey" feeling I've found lacking on other services. From day one, I've felt comfortable here on GEnie.

But to be perfectly honest, I first joined GEnie because of the low cost of being here. All the nice people I've met, well, that's an added bonus. The bottom line is GEnie was, and still is, one of the best online deals around.

[EOA]

Can you believe it? I mean come on... the year just started a little while ago and now it's now half over. Oh well, I guess that's just the way things are.

Around this time of year, my family and I would be going down to Florida to spend a couple of weeks in our time share condo and get some sun. This year though, money is kind of tight so we won't be going. Major bummer...

But I DID get to do the next best thing... Yes, that's right. I visited the Florida Roundtable right here on good ol' GEnie! It's very easy to get there too! No long and bumpy car or airplane rides. Just type FLORIDA and you'll be instantly transported to this wonderful and magical place!

Here you'll find anything and everything you ever wanted to know about Florida and about what's going on down there. It's all in the BBS. There are plenty of files to choose from in the software library too. But that's not all... I have saved the best for last. Florida just happens to be the
Apple II Computer Info

home of that great and magnificent place; Disney World! Yeah!

You'll find everything about Disney World here in the Florida RT. Topics to talk about in the BBS and files, files galour! It really IS the next best thing to an actual visit!

Before you take off though, I've put together another little puzzle for you to solve. You can take a crack at it during the trip over there... :) Say 'Hi' to Mickey for me, and keep on smilin'!

Online Thoughts
Did I ever tell you about the time I used GEnie as a disk drive?

You heard it right. I turned this telecomm service into a personal hard-disk drive for an entire week a couple of years ago when I was traveling with my ancient laptop computer.

It all started when I arrived at my hotel in Chicago to cover the Summer Consumer Electronics Show. I had driven from New York with the trunk of my car filled with everything I needed — clothes, an extra pair of shoes, notebooks, my sturdy old Bondwell laptop, the kind with two floppy drives and a built-in modem.

I couldn’t afford the model with a self-contained hard drive, but that was no problem. After all, I always carried a box full of support disks, containing my word-processing software, my telecomm programs, my notes on the electronics industry and my little database of phone numbers and industry personnel.

That is, I always HAD carried all these support disks. When I unpacked my luggage at the Congress Hotel, there was my laptop, ready for action — along with one floppy disk. All it had on it was MS-DOS and two utilities, a stand-alone Xmodem transfer program and a copy of ARC, the file-compression program. I had packed too quickly, and had left all my vital support disks at home.

Getting blank floppies in downtown Chicago wasn’t a problem. I found a store across the street that had just what I needed. But what about all the software I had been using? Most of it was custom-designed. I had spent weeks developing it a few years before, and had been so proud of it I had even uploaded it to GEnie.

To GEnie! Would my software still be there?

More to the point, if they were still there, could I find a way to get those files back from GEnie? I needed a way to download them. It was the classic chicken-and-egg dilemma: Without a telecomm program, how could I get the telecomm software that I needed to send my twice-daily reports on the electronics show back to my newspaper office?

I had a modem in my laptop, and I had DOS. And the Xmodem software I had copied months ago onto the DOS bootup disk was supposed to be used with a regular telecomm program. But I doodled around with it and saw that it hooked into the modem’s serial port even if I ran it all by itself.

That was all I needed to know.

I got the Chicago-area telephone number for GEnie by calling GEnie’s 800 number. By using DOS to redirect my keyboard commands to the modem, I
dialed GEnie and navigated over to the PC software library. In a few seconds, a search for PROCOMM brought up a listing for the shareware version of that familiar telecomm software. I gave the command to GEnie to start a download and typed the command to run my Xmodem transfer software right from DOS.

In a couple of minutes, I was in telecomm heaven. I signed off GEnie and let ARC extract the Procomm files to a blank floppy. Then I ran Procomm and got back to GEnie, searching the file lists for the special Procomm scripts that I had shared with other GEnie users.

They were still there. And so was the little text editor that I had fallen in love with and uploaded to GEnie in '86 or '87. And so were the shareware spelling checker and the other little utilities I had found so useful.

GEnie even had the little database software I had uploaded. All that was missing was my own data — but I had a solution to that, too. I called my office in New York and asked a coworker to find my backup database floppy in my desk drawer. She called GEnie and attached the data to an email message, and 15 minutes later I had the data, too.

The week went by smoothly. I sent my reports back to my office by direct transfer into a computer there, but I also sent copies of everything by GEmail. And on my last day in Chicago, I compressed all my data and sent it via email attachment to my own GEnie mailbox, so I could get it back when I got back to the office.

Since that time, I've joked about the extra drive I installed on my laptop. It's got Drive A:, Drive B: and Drive G:. The first two hold 720 kilobytes each. The third holds the answer to a forgetful traveler's prayers.

(PART 14 -- DOS)
[v1.1 :: 12 Nov 92]

INTRODUCTION   The disk operating system used on the Apple II has an interesting and colorful story, and is a further insight to the early days at Apple Computer, Inc. This section of the History deals with the original DOS for the Apple II, from its first release, up through DOS 3.2.1. —Steven Weyhrich

[*][*][*]

APPLE DOS   For a computer to be useful, it must have a means of easy
storage and retrieval of data. That storage medium must be both convenient and affordable. In the early days of the Apple II computer, the best that they could achieve was "affordable". The built-in cassette port was THE state of the art for personal computers back in 1977; the Apple I computer had a cassette interface available ONLY as an add-on item. But, although a cassette storage system may be inexpensive, it is not very convenient. The simplistic cassette operating system on the Apple II (visual examination of the mechanical index counter on the cassette recorder to know the location of the next program) was downright frustrating to use for many early Apple II owners. Something better was desperately needed.

As you may recall from Part 5 of the History, in December of 1977 Steve Wozniak began a crash effort to develop a floppy disk drive for the Apple II computer. To get it ready for the Consumer Electronics Show in January 1978, Wozniak and Randy Wigginton made a very simple disk operating system that would only load files from fixed locations off the disk in response to one-letter commands. But it was not a true disk operating system (DOS); their rudimentary control program would not be flexible enough for efficient and simple use of the disk drive.

DISK SYSTEM BASICS   To create an operating system that would be both simple to use and yet powerful enough for advanced file manipulations, Apple had much work to do, building on the device driver that Wozniak had written. Among other things, it had to interface well with the BASICS in ROM on the Apple II, and be no more complicated to use than the cassette system. Although Woz's driver routines were efficient in writing and reading data to and from the disk, they could only be used from 6502 assembly language.

Designing a disk operating system from scratch is no trivial matter. On one side is the RAM memory in the Apple II, waiting patiently for a useful program to be loaded and executed. On the other side of an electronic bridge (interface card and connecting cable) is the floppy disk and disk drive hardware itself. The control program the Woz wrote could be compared to a narrow rope bridge crossing a chasm; it works, but you can't carry much with you, and it is easy to slip and fall (lose data). A complete DOS is more like a concrete and steel bridge, capable of carrying autos and trucks in both directions over the chasm. Woz's "rope bridge" was a foundation, but there was much work yet to do.

A disk drive consists of a recording head that is mechanically moved across the surface of the floppy disk, tracing the radius of the disk from the center to the edge. The disk itself is spinning under the head. This is similar to the stylus on a turntable that plays 33 RPM records (remember those?), but the head on a disk drive can be given a command to move to a different "track" on the spinning disk. Also unlike the turntable, which is a "read-only" device, the head on the disk drive can either reads bits off or write bits onto the disk. To be able to find where data has been stored on a disk, it is "formatted" into a known configuration. A blank disk could be compared to empty land that will be filled with new houses, but currently has no streets, street signs, or house numbers. The initial formatting (called "hard" formatting) of a blank disk is, then, like building the streets and assigning lots for future building. The second part of disk formatting (called "soft" formatting), involves naming the streets, designating addresses, and building houses.

In the case of Apple's Disk II, it was designed with 35 concentric
circles ("streets") called tracks. Each track is subdivided into 16 segments ("houses") called sectors. Each sector can hold 256 bytes of information. In the hardware system that Wozniak designed, the timing hole near the center of the floppy disk was not used by the hardware to keep track of which sector was passing the head at any particular time. Because of that, it was necessary for the software to identify in a different way where one sector ended and the next sector began. A complicated method was used of specially encoding each of the 256 bytes so they have a standard, recognizable appearance to a program that is controlling the disk drive, plus some other specialized bytes that identify the start and end of a sector. Although it did decrease somewhat the storage capacity of the disk, the cost savings in less complicated hardware compensated for it.

DOS 3.1 - STRUCTURE & FUNCTION WITH BASIC

With this background, let's get back to tracing the gap between Woz's demo DOS and Apple's first official release, DOS 3.1. Worth and Lechner in their book, "Beneath Apple DOS", divided DOS up into four parts according to function and location in memory. When a computer needs an operating system, it's because there is a need to insulate the user from the complexity of trying to control the hardware. Consider the four parts of DOS as layers; as you get closer to the bottom layer, you are closer to the hardware (the raw data on the disk and direct control of the disk drive), but you also increase greatly the difficulty of managing it. The farther up you go, the easier it is to manage things on the disk, but the less direct is the control of the disk data and hardware.<1>,<2> When Wozniak wrote his disk controller (driver) routines, he worked at the deepest layer, directly manipulating the disk hardware and raw data. This involved some complex timing and error checking for reading and writing data to the disk. This section is also where the program lies that erases the disk and creates the sectors and their addresses. In memory, this layer of DOS started at $B800 on a 48K Apple II.<2>,<3>

Randy Wigginton wrote a "front end" for Wozniak's controller routines. His part could be considered a thin layer that is part of the lowest layer of disk routines. Together, the two layers made up what came to be known as "RWTS", or "Read/Write Track/Sector". It could do four things only: SEEK (to move the disk arm to the desired track), READ (load a sector from disk into memory), WRITE (save a sector to disk from memory), and FORMAT (discussed above). This layer of DOS, the Disk II driver, started at $B600.<2>,<3>

Apple contracted with an outside consultant, Bob Shepardson, to write much of the rest of DOS (though modifications were made by Apple programmers Dick Huston and Rick Auricchio).<4>,<5>,<6> Shepardson's group wrote the layers (parts) of DOS that later became known as the "File Manager" and the "Main DOS routines". The File Manager was the next layer in memory above RWTS. It started at $AAC9 in memory, and was responsible for twelve higher level functions that dealt with files and the disk in general. These functions were OPEN, CLOSE, READ, WRITE, DELETE, CATALOG, LOCK, UNLOCK, RENAME, POSITION, INIT (format a disk and create an empty catalog track), and VERIFY. This set of routines, along with RWTS, would be similar to the file PRODOS in the current 8-bit disk operating system. It handled the disk at the file level, but knew nothing about BASIC.<2>,<3>

The next layer of code above the File Manager contained the Main DOS Routines. These routines started at $9D00 in memory, and were responsible for interfacing BASIC with the disk. This layer would be similar to the file called BASIC.SYSTEM used today in the ProDOS system. Since neither

---

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 862 of 1824
Integer BASIC nor Applesoft were specifically modified to handle disk commands, this part of DOS kept a constant look at any output PRINTed by BASIC. When a BASIC program was running, DOS looked to see if the character Ctrl-D (hex $04) was printed immediately after a Ctrl-M (carriage return). If that sequence was detected, DOS assumed that the next text printed was a command for it. If a BASIC program was not running, then DOS examined anything typed directly from the keyboard. If it decided that a DOS command had been entered, it would execute that command. If the user typed a command that DOS recognized (such as "RUN PROGRAM" or "SAVE PROGRAM") but which resulted in a disk error, DOS 3.1 would generate an error message. On the other hand, if DOS did not recognize the command, it passed it on to the active BASIC for processing.

The final, uppermost layer of DOS was not a program code area but a set of memory areas called "buffers". One buffer was used by DOS for each open file. These buffers ordinarily started at $9600 in memory.

Here is an example of how the layers of DOS interacted: When a user typed the command "LOAD PROGRAM" at the keyboard, DOS intercepted the statement. The Main DOS Routines determined that it was a legal DOS command. The File Manager was called to 1) OPEN a file named "PROGRAM", 2) READ all the bytes associated with that file into memory starting at a specific location, and then 3) CLOSE the file. The File Manager's OPEN command in turn instructed RWTS where to move the disk read/write head, and in what order to read the correct tracks and sectors to find the contents of the entire file, wherever it happened to be on the disk. Complicated, perhaps, but the only thing the user had to know was how to type "LOAD PROGRAM".

Finally, one piece of trivia: Why was the first DOS released for the Apple II called "DOS 3.1" rather than "DOS 1.0"? According to Steve Wozniak, it was Bob Shepardson's group that decided on calling it "DOS 3". It is unclear why Shepardson decided on "3"; possibly it referred to internal revisions done by Shepardson, or perhaps it was a modification of some DOS routines done for another computer that had used earlier version numbers.<2> (Note: DOS 3 was never actually released to the public; that version apparently had a few bugs left to fix, so "DOS 3.1" came with the first Disk II drives shipped by Apple to their dealers).

**DOS 3.1 - MANUAL** When originally introduced with the new Disk II drive in 1978, DOS 3.1 had very little documentation. Because the demand for the disk drive was so great, the engineers at Apple had worked feverishly to produce enough working drives to begin shipping. They went out, although there was not time to complete a real manual on how to use the disk operating system. They did include a leaflet about some of the commands, but there were still, obviously, complaints. One letter to Apple president Mike Markkula made these blunt comments: "You [expletive deleted]. I bought an Apple with floppy and nobody, I mean nobody, in L.A. or San Diego knows how to use the [thing] for random access files. I really feel 'ripped off.' Everybody talks about this great manual in the sky that is coming out soon??? ... [more expletives]! I need this computer now in my business not next year. [Expletive]. I hope your dog dies."<7>

It was not until the release of DOS 3.2 in February 1979 that a true reference manual was made available. It was given the unwieldy title, "Disk II Floppy Disk Subsystem Installation and Operating Manual", and subtitled "Apple Intelligent Subsystems (part #030-0011-00)". It was all of 38 pages long, with weak jokes and typos, but not much else of...
substance. Instruction on how to READ and WRITE text files was given in a
mere ten lines, with no programming examples. The EXEC command was given a
little more description, but was still unclear to many users. The manual
also talked about "*3D0G". What it DIDN'T say was that this meant that
the user was supposed to type "3D0G" from the Monitor prompt (to allow a
return to the active BASIC with DOS connected).<8>,<9>

DOS 3.1 - FEATURES   A catalog of the DOS 3.1 System Master disk would
produce this output:

    I 007 HELLO
    *I 043 APPLESOFT
    I 016 ANIMALS
    I 009 COLOR DEMOS
    *I 004 MASTER.CREATE
    *B 039 RAWDOS
    *I 007 COPY
    *B 007 COPY.OBJ

"HELLO" was the startup file executed when the disk was booted. It
just displayed the following:

    DISK II MASTER DISKETTE VERSION 3.1

    20-JUL-78

    COPYRIGHT 1978   APPLE COMPUTER INC.

>_

stopping at the Integer BASIC prompt. "ANIMALS" was an Integer program
that gave an example of the use of disk files, and "COLOR DEMOS" was a disk
version of a program that had earlier come on cassette. "MASTER CREATE"
was a program that could be used to initialize a "master" disk. Using the
binary file "RAWDOS", it executed the DOS "INIT" command, but put a version
of DOS on the newly formatted disk that was relocatable.<10> When DOS from
a "master" disk was booted on an Apple II, it first determined what was
size of the memory, and then loaded itself into memory as high as possible.
The INIT command properly formatted a new disk, but created what Apple
called a "slave" disk; that is, the DOS loaded from a slave disk was fixed
in memory to the same size as the computer on which DOS had been booted.
In most cases this would not be a problem. However, the problem would
surface if someone whose Apple II had only 16K of RAM shared a disk with a
friend whose computer had, say, 32K of memory. Booting that borrowed disk
would make the 32K computer appear to have only 16K of RAM (since it forced
DOS to load at the highest location available to a 16K machine). A
"master" disk was more versatile, being "intelligent" enough to adapt
itself to differing memory sizes.

The Integer BASIC file "APPLESOFT" was interesting. It was a 43
sector file that appeared in a catalog as an Integer BASIC program (with
the "I" filetype code). If you loaded the file and listed lines 10 through
80, there were lines that would produce the following text:

************************************************
*                                            *
*  APPLESOFT ][ FLOATING POINT BASIC  *
*    APRIL 1978                             *
************************************************
There were also lines that poked some values into memory, and then jumped
to a machine language routine that relocated Applesoft into RAM starting at
$800 (the same place where Cassette Applesoft loaded). If you tried to
LIST the entire program in memory, the lines after line 80 appeared to be a
jumble of Integer BASIC commands. This is because a majority of the file
was actually a machine language program that had been appended to the end
of the short Integer BASIC program that displayed the title above and did
the memory pokes. This machine language code was the Applesoft BASIC
interpreter. Now, if the file "APPLESOFT" was executed by typing "RUN
APPLESOFT", it would display the title and leave the cursor next to the
Applesoft bracket prompt. However, DOS was no longer connected; the result
was much like using Cassette Applesoft. To properly use this file with
DOS, you had to type "FP" from the Integer BASIC prompt. DOS would then
load the "APPLESOFT" file and properly initialize the interpreter, leaving
DOS connected. Since this version of Applesoft still had a few bugs in it,
this method of using Applesoft was made obsolete by the Applesoft Firmware
card and the Apple II Plus.<9>

Interestingly, the error messages produced by DOS 3.1 were made to
look similar to those displayed by Integer BASIC. For example, this is
what happened if an attempt was made to load a type "B" (binary) file with
the "LOAD" command:

>LOAD COPY.OBJ
***DISK: NOT BASIC PROGRAM
>_

Integer BASIC had error messages that looked like "*** SYNTAX ERR" (with a
space following the asterisks). The possible error messages in this
version of DOS that were different from later versions were:

SYS ERROR
CMD SYNTAX ERROR
NO FILE BUFFS AVAIL ERROR
NOT BASIC PROGRAM ERROR
NOT BINARY FILE ERROR

DOS 3.1 - USER EXPERIENCES    One problem encountered by early users of the
""""""""""""""""""
    Disk II was properly connecting the drive to
the controller card, as discussed in Part 9 of this History. Some quirks
in DOS that plagued users at the time of the first releases of DOS 3.1
included one in which LOCKing a file sometimes mysteriously caused the
length of the first file in the catalog to change. Apple told people not
to worry about that; in fact, they told people not to pay attention to the
sector counts in the catalog at all, as there was a bug in that part of the
catalog routine. Another problem in early versions of DOS 3.1 was an
inability to execute READ or WRITE statements in an Applesoft program if
they occurred in program lines that were numbered higher than 256. It also
wouldn't allow more than one DOS command on the same line of a program, so
this was not possible:
10 ON ERROR GOTO 1000
20 PRINT D$;"VERIFY FILE": PRINT D$;"OPEN FILE": PRINT D$;"READ FILE"

Other bugs in early versions of DOS 3.1 included not being able to initialize disks with MASTER.CRE and unless the disk controller was moved to slot 7. (Originally, slot 7 was going to be the disk slot, but Apple decided to change it to slot 6 and leave slot 7 for video cards. Why the various 80-column cards that were eventually released were made to go into slot 3 instead of slot 7 is anybody's guess). The A.P.P.L.E. user group had patches to MASTER.CRE and RAWDOS to fix the slot 7 INIT bug, and the >255 line number bug in Applesoft.<11> Apple later released a modified version of DOS 3.1 that fixed these bugs (without changing the version number).

DOS 3.2 - ENHANCEMENTS As mentioned above, DOS 3 and 3.1 had a few problems. When the Apple II Plus with the Autostart ROM was released, DOS needed to be updated to handle the changes. DOS 3.2, released in February 1979, contained several modifications, but retained 90 percent of the basic structure of DOS 3.1. One interesting change made to plan for the future was a doubling of the number of possible filetypes. The original DOS used "I" for Integer BASIC files, "A" for Applesoft, "B" for binary files, and "T" for text files. DOS 3.2 added types "S", "R", another "A", and another "B". Of those four types, only "R" was ever officially designated by Apple, and that for relocatable assembler object files.

DOS 3.2 included a program called "UPDATE 3.2", which worked much like the earlier program "MASTER.CRE" in changing a "slave" DOS disk into a "master" disk. As time went by, and more users had their Apple II's fully populated with 48K RAM, the need for such a utility became less and less important.<12>

DOS 3.2 - FEATURES A catalog of the DOS 3.2 System Master disk would produce this output:

*I 002 HELLO
*I 043 APPLESOFT
*I 018 ANIMALS
*B 009 UPDATE 3.2
*I 014 COPY
*I 009 COLOR DEMO
*B 003 CHAIN
*A 009 COLOR DEMOSOFT
*A 028 LITTLE BRICK OUT
*A 003 MAKE TEXT
*A 003 RETRIEVE TEXT
*A 010 EXEC DEMO
*A 010 RANDOM
*T 003 APPLE PROMS
*A 039 RENUMBER INSTRUCTIONS
*A 014 RENUMBER

The file "RAWDOS" that was on the DOS 3.1 disk was no longer needed, as its function was included in the "UPDATE 3.2" program.<10> As you can see, some of the files from the DOS 3.1 master disk were retained, but some others were added. There were now several Applesoft files, including a version of the color demonstration ("COLOR DEMOSOFT"), a smaller version of
the older Integer BASIC game "BRICK OUT" ("LITTLE BRICK OUT"), a couple of
files to show simple disk access ("MAKE TEXT" and "RETRIEVE TEXT"), and a
program to exhibit the use of random-access disk files ("RANDOM", with the
file "APPLE PROMS"). There was finally a program ("EXEC DEMO") that showed
how to use the EXEC command in DOS. Also found on this disk were two
utilities for Applesoft. One made it possible to renumber Applesoft
programs, and the other ("CHAIN") allowed linking between multiple
Applesoft programs, retaining the value of any variables created by the
first program. There WAS a CHAIN command built into DOS, but it worked
properly only with Integer BASIC programs.

DOS 3.2.1 In July 1979, DOS 3.2.1 was released. This was merely a minor
upgrade to make some patches to RWTS and correct a timing
problem that caused the utility "COPY" to fail when copying disks with two
disk drives. It also began a system disk version numbering system that
persists to this day, that of adding a third digit to indicate a minor
upgrade. (For example, GS/OS 5.0 changed to 5.0.1 with some bug fixes,
rather than 5.1).<12>

This disk contained the new COPY program, and a program called "UPDATE
3.2.1", which worked just as "UPDATE 3.2" and "MASTER.CREATE" had
previously. The update program was used to modify existing DOS 3.2 disks
to the 3.2.1 version. As a bonus, Apple added some programs to this
Master disk that were just for fun. All written in Integer BASIC, the
games and graphics demonstrations included "APPLE-TREK", "THE INFINITE
NUMBER OF MONKEYS", "BRIAN'S THEME", and "BRICK OUT" (which was an Apple II
version of the arcade game, "Breakout"). The "HELLO" program displayed
this when the disk was booted:

MASTER DISKETTE VERSION 3.2.1 STANDARD
31-JULY-79

~ HOT NEWS, HOT MESSAGES, HOT FILES! ~
READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE .......... [HUM] [*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

<table>
<thead>
<tr>
<th>Name of sender</th>
<th>CATegory</th>
<th>TOPic</th>
<th>Msg.#</th>
<th>Page number</th>
</tr>
</thead>
</table>

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie  Effective July 1, GEnie's non-prime time connect rate drops to $3.00 per hour, a reduction of 50% from the current rate. The monthly fee has been restructured, and moves from $4.95 to $8.95, for which up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

/"true story:  I was downloading a file the other day when /
/ my phone line was hit by lighting.  Just before it died /
/ my modem said "*&^%$$#@!"

G.MARON
THE OTHER NEW YEAR

Perhaps you are always acutely of what day it is, but I personally was astounded to realize that it's September already... the beginning of the academic year. The thought brings a smile to my lips. Do you realize that many teachers returning to school are just now learning about TheWorks, the supercharged AppleWorks project?

TheWorks isn't due for release until later this fall, but its features have been a hot topic since the project was announced last month. Some people have been lucky enough to see demonstrations of pre-release versions of "Quadriga", to use the project's code name, and they all rave about how you can't appreciate the program from cold lists of features. Despite the fact that it wasn't live, even the demonstration of Quadriga that I saw on the _II Alive_ video, "Apple II Review", was enough to make me enthusiastic about the program. We have a real treat in store, it seems!

KANSASFEST

Of course, it must be fall, since KansasFest has come and gone. For the first time ever, I wasn't in a geographical position that required me to banish all thoughts of attendance from my mind, and yet I still couldn't attend. Not to worry, many of the A2 Gang did attend, and they weren't shy about reporting what went on, as you'll read in our THROUGH THE GRAPEVINE section.

Best of all, KFest organizer Tom Weishaar was heard to remark that he'd like to do it all again. While this isn't a commitment for a sixth KansasFest, it's more encouraging than the rumblings about this Fest just past being the last. Perhaps the organizers found the trimmed-back schedule more manageable. Let's all hope that we can meet in Kansas next year!

THE POOR MAN'S TRADE SHOW

I was keening over being unable to attend KansasFest when my copy of the _II Alive_ videotape, "Apple II Review" arrived in my otherwise empty post box. Aside from the exciting Quadriga preview mentioned above (and a brief engagingly shameless promotion of Quality Computers), this videotape features footage from Apple Expo West, which took place last April in San Francisco. While by no means a substitute for attending, the video did console me and intrigue me. So *that's* what Lunatic looks and sounds like....

SYSTEM 6.0.1 RELEASED TO THE PEOPLE

Not long after the Apple II version of "hordes of people" had returned from KansasFest, IIGS System 6.0.1 was made available on GENie. Of course, System 6.0.1 was really released about a month before, but was only generally available through Resource Central. Now that it's more widely released, expect to hear the raves (and gripes) rolling in.

IS THAT A LETTER FOR ME? NOPE, GUESS NOT!

All right, so I've pinched the subtitle of the HEY MISTER POSTMAN column. The point is that the cards, letters, and E-mail *haven't* been rolling in. I'd really like to hear what you think of GENieLamp A2,
and you haven't said a word to me. You don't love me any more!

I don't think you appreciate what a chance you're throwing away. This is only my second month on the job. I'm not set in my ways yet. (That comes the month after next... we editors acclimatize quickly.) Let me know what sweeping reforms you'd like to see. Let me know what parts of GEnieLamp A2 I can't touch without starting a full-blown riot. Let me know there's someone out there!

These days, it's important to know that you're not alone.

GEnie Mail:  D.CUFF                         Internet: d.cuff@genie.geis.com

>>> NOTES FROM THE PUBLISHER <<<

~ By John Peters [GENIELAMP] ~

AND THE BIG NEWS THIS MONTH IS...   For over a year now, Atarians have enjoyed graphics with their GEnieLamp ST thanks to David Holmes and his revolutionary text reader, TX2. On the Macintosh side, Jim Flanagan has been releasing a graphics issue which has drawn nothing but praise for his efforts from everyone who has seen it. But for the IBM folks, the ability to show graphics in GEnieLamp have been noticeably absent. That situation is about to change.

I am happy to announce that are now offering graphics support for the IBM platform with a new viewer called HyperRead by David Leithauser. Like the ST/TX2 and Macintosh graphics issue, HyperRead uses keypresses or a mouse to quickly jump to various articles in the magazine. Also, like the ST/TX2 viewer, HyperRead allows graphics to be incorporated within the text. Next month we will be offering screenshots of the PD_Q and Mini_Byte reviews for the IBM issue just as we do in GEnieLamp ST/TX2. If you're interested in checking out GEnieLamp IBM / HyperRead you can get your copy of GEnieLamp IBM with the HyperRead viewer from the GEnieLamp menu located on page 515.

Until next month...

John Peters

NO FILES IN ROOT DIRECTORY
Because of the way ProDOS is designed, files in the root directory are almost impossible to recover. This is why it’s always a good idea to use folders.
-Bryan

PASSPORT HOUSE LETTER
I guess everyone knows by now that "Incider/A+" has ceased publication. And current subscribers are being offered a choice of having the balance of their subscription filled with either "// Alive", the new Apple // magazine put out six times a year by Quality Computers or with "MacComputing".

But today, I received in the mail a letter from the Alliance International that said they were shutting down operations because of a lack of support from Apple // owners and developers. But the letter also announced the existence of still another new Apple // publication called "The Passport House Letter". Which publishes monthly at $24 a year (12 issues). They can be contacted at:

The Passport House Letter
P.O. Box 145
Miles City, MT. 59301-0145

Is any one familiar with this magazine? This is the first I heard of it.
-(R.ROEHNER, CAT4, TOP11, MSG:87/M645;1)

I receive it and I'm very pleased with it. Its a 12-14 page newsletter about the Apple II development, product reviews, new product reports, and articles like 'The Great Disk Drive' which went into detail with just about everything you wanted to know about Disk Drives of all sorts.
I recommend it!

Thanks
Paul

(P.PAVLICKO, CAT4, TOP11, MSG:92/M645;1)

DEFEATING APPLEWORKS MAIN DICTIONARY

I'd really like to create a German main dictionary.

Here in Holland some people have developed a Dutch dictionary for AppleWorks. You do not have to replace only the Main Directory, but within the program itself there is also a small directory with words that will occur the most. The makers of the Dutch dictionary did also replace this short directory. If you want I can send you the disk, that will change AppleWorks. Maybe you can learn from this. If you want I can email you the names and maybe the addresses of the users that made this program (I believe they are no longer Apple // users but few of them still visit the quarterly Apple Day).

I do have two versions of AppleWorks on my hd. One with the English directory and one with the Dutch directory. This Dutch version has also been patched (patch made by the famous John (UltraMacros) Tegelaar) to make it all Dutch; so Dutch menu's and alerts and so on.

So where are the secrets?

Peter van Dongen / Netherlands / Europe  {Co-Pilot 2.1.1 + PT 3.1}

(P.DONGEN1, CAT17, TOP4, MSG:138/M645;1)

>>>>> Here is a patch for Europeans who do not want to wade through 80,000 English words to check Spelling. It allows them to have a very large Custom Dictionary in their own language as the primary means for spelling tests.

Macro:

a:<all oa-v poke $8d04,$80>! // Check Spelling, Custom dictionary only

Permanent Patch:

Get into Block Warden and F)ollow SEG.WP to byte $8385. Go into E)dit mode and change the $F0 to $80. Write the block to disk and exit.

Thanks once again to Wally Bradford for giving us these locations.

Please tell anyone who's interested that you heard about it in -- TEXAS II.

(B.CADIEUX, CAT17, TOP4, MSG:151/M645;1)

I'VE HEARD THIS BEFORE

Joe Kohn (publisher of SSII) purchased a HP LaserJet 2P the same time I purchased this one. I shouldn't speak for him, but I have read his posts saying he is also pleased.

Actually, I got the HP LaserJet IIP Plus, and I'm more than just pleased with it; I'm thrilled with it.
And, little did I think, when I purchased it, that I'd be using it to print out a newsletter that would elicit comments like "You did that on an Apple IIGS?" and "Which Mac did you use to print that?"

-Joe Kohn

(NO UPGRADE FOR TIMEWORKS PUBLISH IT) The response from Timeworks' Bob Johnson....

> We have to write programs for (almost) the lowest common denominator.
> Most Apple users do not have much more than 128K of RAM - we get calls
> every day from users who don't even have IIe Enhanced machines. We have
> to start explaining what "Enhanced" means and how to get it done.
> There's only so far the program can go, and it's about there now.

> We can see the trend of Apple II hardware sales from our Apple II
> software sales - the trend isn't up. A lot of time, effort & money goes
> into a new piece of software - the developer has to see some potential
> of gain in order to invest in new products. While there are still quite
> a few Apple II's out there, I think you will agree that it isn't exactly
> a growing market.

> As a sidebar - about a year ago, we had some questions about the new
> GSOS. We called Apple & couldn't find ANYONE to talk to about the II's.
> Nobody could even tell who to speak to. They might have still been
> making IIGS's in December, but Apple was done with them long before
> that, if our experience was any indication.

> We appreciate your loyalty and I wish I did have something new to sell
> you, but I also don't want to get your hopes up for something that
> probably isn't going to happen.

> Bob TTS

Oh, well, I tried.

<<<Lloyd>>> (L.DEVRIES, CAT8, TOP18, MSG:56/M645;1)

>>>>> I posted the last few posts concerning Publish It updates (?) to
""""
the AzApple BBS in Phoenix, AZ. Here's a response from Jerry Cline,
of InTrec software, publishers of Proterm 3.1:

The guy is a good politician. He articulated the problems well and he
is accurate in what he is saying.

Hypothetically, here is another way to look at it.

Perhaps another way the situation could be stated is to say: We can
make the drivers available but engineering costs will be $15,000 (or
whatever it would cost to take a top flight engineer off of a paying
project where that person is earning their way) and split the costs (plus a
slight profit - $3000 - to the company) to however many users would like to
make a bid. They would have to develop, test and market the project. Say
they sold 100 drivers, then each person would only have to pay just under
$200 for the driver. If it's justified, then maybe there is a case, but I
doubt anyone will be paying anywhere near that for a printer driver on an
Apple II. But the situation is more realistic.
But when a successful organization has a known active and highly competitive market to pursue (and a lot of engineers, marketing and management personnel to pay for) where just Apple Macintosh alone is 11 percent of an 11 billion dollar market (that is a one-billion-dollar-plus market if your math is rusty) that already encompasses 12 million homes and offices with 4 million being added every year, it makes the Apple II market look bleak. If PublishIt were making a profit on Apple II products, they would support it actively, they are just doing what any business does, following the profit margin. It's the name of the game. If they did any differently, their investors would get a rope. Apple Computer is in the same boat. Think about it.

The part about the lowest common denominator (128K) is the killer and the RAM is not all as usable as it is on Macintosh. That 128K figure is a "hard" number. Consider the Apple IIGs, (which isn't all that different from the Apple IIe), if you write for the GS, you narrow the market from the 6 million Apple II's that were sold (includes Franklin and Laser), to about only 1.25 million Apple IIGS sold and according to Roger Wagner Publishing, about 70% of those are still in the education market. That leaves about +/- 50,000 in user's hands and a lot of those users are not active and are looking to other platforms (you should see our mail requesting ProTERM Mac).

It does not take a rocket scientist's mathematics to understand what market to concentrate on if you are a business and don't want to go broke.

As far as the statement about the Apple IIe being sold in schools? While it is still on the price list, I don't imagine sales are brisk -- Do you? Would you buy a new Apple IIe or how about a bridge in Brooklyn or perhaps some nice Moon property with "Earth-rise" and "Earth-set" exposure.

The choice is yours, check it out!

Let's see now, how does a user go about making a hardware buy?

Apple says, an enhanced Apple IIe with a composite (cheap) color monitor, disk drive, drive controller card, 128K memory, 80 column capability, is only about $1300. Wow, what an earthshaker!

See the Apple product catalog and order yours now! 800/795-1000 - To top off this wild bargain Appleworks, a $239 value is included on a floppy disk -- What a DEAL WHOA!!

-or- a few pages hence in the Apple catalog...

A Mac Classic with a color Trinitron color monitor, 4 megs of RAM, built in 3.5" drive, an 80 meg hard drive and expandable to vistas beyond... $1173.

Which one are you gonna to buy? Gee that's a hard decision!

...<scratch head here and get splinters under your fingernails>

Uhhmm... could I see them choices again -- Huhm?

Jerry

(C.KERN1, CAT8, TOP18, MSG:63/M645;1)
APPLE COMPUTER CO. IN EDUCATION

Afraid so. In the business/home/whatever market, they've sold a tremendous number of machines and are continuing to snap at IBM's heals. Though IBM is still #1, and the host of clones is huge, giving IBM and IBM compatibles something like 80% of the market, if you combine ALL of them.

Still, Apple is doing all right.

In education they're losing fast, and they deserve it. The unfortunate reality is, though, that it's hard for them to feel any pain because they're still profitable and secure. Sure, they threw away billions, but since they also made billions, it's hard to make them realize they made a mistake. ("What do you mean we threw away billions? We made billions!" Saying "You could have made billions more" just doesn't sink in as well as if they were HURTING.)

The only question is, will they figure out why they're losing the education market, and, is it too late for them to do anything about it?

It may be that if they threw everything into the Apple II for education right now, they wouldn't be able to recover what they once held.

Maybe. Or maybe not. We won't find out unless they or someone else tries.

Dean Esmay
(A2.DEAN, CAT15, TOP11, MSG:21/M645;1)

If they made a GS with internal 40 meg, internal FDHD and 2 megs of memory, and sold it to the schools at approx $700 (which they COULD do), they would sell a ton.

(GARY.UTTER, CAT15, TOP11, MSG:22/M645;1)

PROSEL AUTHOR GLEN BREDON TO MOVE
I will be moving permanently sometime around Nov. Watch this space for new address.

(BREDON, CAT30, TOP2, MSG:138/M645;1)

IBM APPLETALK NETWORK?
I recently read of a new IBM-compatible networking method that uses a proprietary protocol and inexpensive phone cable. The cards and connectors run about $150 a machine. What got my attention was the mention at the end of the review that the "proprietary protocol" was a version of Appletalk. The reviewer went on to mention that if you wanted to hook up a Mac to the PC, all it took was a $29 connector.

Called the company and asked about hooking up Apple II's. After the initial explanations, the tech people became quite intrigued, particularly when I told them I thought this was a potentially large market for them. They called back later and said that the Appletalk on the II end would need to be AFT 1.1 or backwardly compatible with 1.1, since that's what they used. Also, the II would not be able to be a server, only a client.

I know Appletalk is built into the GS. What version is it? Also, I have a IIe, and have been looking for a way to hook it up to my PC. If anyone out there has a workstation card and software for the IIe they would be willing to part with temporarily/permanently, I would like to borrow it.
to try this out. (I'll pay shipping.) If it works, then I'd be looking to buy one.

Any info on version? This has the potential to be a very interesting development.

(B.MAPLES, CAT12, TOP22, MSG:1/M645;1)

INCIDER AFTERMATH I just read that MacComputing, the rag that was supposed to replace InCider was killed before it was even able to get its first issue on the stands. Seems the IDG was afraid that the fallout from the Apple layoffs and problems in the computer world made them decide to can the project because they could not get advertisers to advertise.

Maybe they should have stayed with their 65,000 (?) subscribers who own the dead II. Hmm..Apple drops the GS and then has to layoffs thousands, IDG drops the II and folds on a Mac rag. That will teach them to fool around with the Apple II gods!

II INFINITUM----------------------------->

Ron

(RON.ROYER, CAT5, TOP3, MSG:63/M645;1)

>>>>> Tom Abrams - I guess that I was unofficially maintaining the inCider/A+ category here in A2, and it was for that reason that I (Shareware Solutions II) inherited category 28.

Facts...

- inCider/A+ ceased publication with the July, 1993 issue.
- A+ Publishing printed a single issue of Mac Computing.
- A+ Publishing had planned for Mac Computing to be a monthly publication.
- As of today, A+ Publishing will cease to exist.

---Joe Kohn -----------

(J.KOHN, CAT2, TOP4, MSG:92/M645;1)

>>>>> More Facts --

- Cameron Crotty and Dan Muse now both work for MacWorld in San Francisco.
- Joe Kohn is publishing inCider: The Next Generation (well, sort of)
- Joe Kohn has just secured the rights to all his inCider/A+ articles.
- The first edition of Mac Computing is now a collector's item.
- The first subscription copy of Mac Computing was sent to the printers one hour before the entire staff of A+ Publishing was informed that they were going to be laid off.
- HangTime's real name is Bruce.
---Joe (whose real name is Joseph) Kohn
(J.KOHN, CAT2, TOP4, MSG:94/M645;1)

APPLEWORKS GS AND SYSTEM 6 Claris _did_ release a new "Install" script for
AWGS and System 6.0. I called the 800 number
(or spoke to someone online, I don't remember) and they promptly shipped it
to me. Works like a charm.

COPY II PLUS HARD ON HARD DRIVES The problem with Copy II Plus is that it
doesn't check the storageType of files
when copying -- it just assumes that all files have a data fork and nothing
else. I'm sure it also uses direct block reads and writes, with the end
result being that when you tell it to copy a file with a resource fork, it
looks at where the data fork is and copies that block by block, totally
ignoring the resource fork. Luckily, the blocks used by the data in a
resource fork are marked as "used" in the volume allocation map, so it won't
copy any data fork-only files over on top of them. I suspect that its "zero
disk blocks" function doesn't respect those "used" blocks, though (since it
can't see what file uses them, it'd kill them), so that could possibly zap
your files that have resource forks.

In the end, I (like many others) just say DON'T USE COPY II PLUS ON A
IIIGS (unless you're trying to back up copy protected software, or are
working with DOS 3.3). There are simply too many ways that you could
accidentally damage or destroy important files.

-= Lunatic (:)
(A2.LUNATIC, CAT9, TOP6, MSG:284/M645;1)

>>>>> Using the "undelete" function of Copy II+ is one of the KNOWN ways to
"undele" make your hard drive disappear. Sometimes, when you use that option,
C2+, for an unknown reason, will trash block 0 and/or block 1 of your hard
drive. This is a Bad Thing.

This refers to Copy 2+ v9.0, by the way (the most current version, so
far as I know). Older versions don't do this, but they STILL shouldn't be
used on or around a GSOS hard drive. The program is flaky, it is not really
meant to work on hard drives. (It doesn't know, or care, that a HD is not a
floppy.)

Actually, I have Copy 2 installed on MY hard drive, and I run it from
there, but I ONLY use it on floppies. I NEVER use it on the hard drive, for
anything. (In fact, come to think of it, I haven't used Copy 2 at ALL,
haven't even launched it, in at least 2 years.)

Gary R. Utter
(GARY.UTTER, CAT9, TOP6, MSG:296/M645;1)

WHO WROTE RESCUE ROVER? If Bill Heineman did this game, why does his name
not appear on the credits that show up when you
press the down arrow at the dog house, and go down into the hole where the
bones are stacked? Exactly what did he do on this game?
Bill took the IBM PC code and ported it to the IIgs. Then he tweaked it to make it playable on the IIgs. If you ever play the PC version you'll notice a difference.

Thanks to John Carmack we can play Rescue Rover on the PC. Thanks to Bill Heineman we can play it on the Apple IIgs.

Jay Jennings

CMS HARD DRIVE REPAIR For those of you that are looking for repairs or data recovery from CMS drives, I do them. Generally its worth repairing the drives, but if you have a CMS card that has gone bad it is generally more cost effective to replace it with an Apple DMA SCSI card.

For those of you out there who would like to contact me about repairs or just information I can be reached at:

Larry Beyer

DEACTIVATING HARDPRESSED I think it was mentioned earlier that the best way to go when doing backups is to inactivate HardPressed when backing up and when restoring. It turns out that there's a very good reason for that...

I was playing around with Apple's Archiver program, and discovered that it doesn't correctly set the filetype when restoring files. It creates it with the wrong auxtype, extracts the data, and then sets the auxtype to what it's supposed to be.

Well, guess what. If you extract a file compressed with HardPressed, and the auxtype is wrong, HP won't be able to tell that it's one of its own files. So, it'll try to compress it again. Depending on how it was compressed originally, it might succeed. The result is a file that's been
compressed twice, which tends to get real confusing real fast.

If you set HardPressed to "inactive", it won't try to compress the files being extracted, thus avoiding the problem. So, the original advice was good: turn HP off before backing up (to save space) and before restoring (to save your files!)

Hopefully Apple will fix Archiver someday...

- Andy
  (FADDEN, CAT37, TOP3, MSG:202/M645;1)

>>>>> BTW, don't forget that you can totally inactivate HardPressed by hitting 'H' while the system is booting... easier than marking it as inactive from the Finder or ProSel-16.

FINDER TIP Loren -

***************
> if it's not the one you wanted to
> have show up, you have to go digging with the mouse after all.

    Nope--once you have established a letter by hitting it (e.g., "M"), you can bicycle through all the icons ("M's") with that initial with TAB. (But it IS an additional key used...Prosel IS still better, in that respect.)

Kirk Hollingsworth
  (HOLLINGSWRTH, CAT2, TOP21, MSG:37/M645;1)

BRUNNABLE GAMES Seeing some of these BRUNable games gave me an idea.

*************** I first wrote a program that will load and run them as a SYS file that ProSel can pass the name of the BIN file to. Works! I'm adding parms to it so you can slow a GS or //e down to lMHz. Maybe a few other options too. Kind of like SWCP for games.

    The other program I wrote will turn any BIN file to a SYS file. And I don't mean it will just change the filetype. It sticks my header on it and relocates the code into the right place and jumps to it. Also works dandy. Any interest in these? Other ideas for them?
  (G.TOLAR, CAT7, TOP15, MSG:45/M645;1)

RAMFAST SCSI TIP FOR SMALL-CAPACITY DISKS Get into the RF utility and format a disk but DO NOT PARTITION THE DISK. This will give you the maximum capacity. Now exit from the utility and when finder asks you to format or eject go ahead and format it from finder. Now pop the disk out and back in. It should go away and come back as the 1.44m or 720k disk. If you partition the disk then we use up 32k for a partition map.

FONT LIBRARY CLEARINGHOUSE CHANGES I have recently been asked to take over the duties of the Resource-Central Font Clearinghouse. As part of this I have been going over all the old uploads and all the old messages posted here in the BB. Some of you will be getting e-mail from me in an attempt to resolve old issues which appeared to not be satisfactorily completed.

In the meantime, I have noticed, in my downloading and study of the existing A2 fonts, that there are some errors. A few fonts apparently did not have the proper Filetype/Auxtype combination, and were thus not properly recognized by the Font Manager. In others, some fonts were packed with other fonts but not identified as such. Others were called the same font but were really different. Still others were assigned improper ID numbers, which will create conflicts for some people.

I am in the process of trying to clean up these problems, but it will take some time. When I am done, I will presumably have every available font installed on my system. Some will have to be re-packaged and re-uploaded to the library. My question to you is: In what format would you like the fonts? Should I upload an entire family as one archive (Times, Times-Bold, Times-Italic, etc., as one file) or should each font style have its own archive? Or should we go the other way and have each

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
Archive contain several related fonts? If so, what criteria should we use to group them?

Also, what kind of information should be in the description for each upload? I planned to include the actual font name, sizes, # characters defined, Font ID, type (bitmap/TrueType), and alphabet (Roman, Cyrillic, etc.). Do a search on keyword FONT and uploader A2.TIM for a couple samples. Is this acceptable? Would you like something else? If so, what?

Please keep in mind that this project I am undertaking will be a long-term project. New IDs will be assigned within a few hours to days, depending on circumstances, but clearing up old discrepancies can take up to a week or more per font, depending on the research needed. There are a couple hundred fonts (out of several thousand) for which I have questions, and I will likely need the Apple II community's help in resolving many of them, so please bear with me. :)

There are currently two topics for discussions of Apple IIgs fonts. This topic is one, and Category 23, Topic 11 is the other. To assist me, I would like to have this topic be used for general font questions, font uploads, etc., and reserve Cat 23, Topic 11 for official Clearinghouse traffic. What this means is that if you want an ID, please post the request in Cat 23, Top 11. If there is an ID conflict, or some specific font identification problem, it should be raised in Cat 23, Topic 11. If you want to know how a particular font looks, this topic (Cat 8, Top 17) is a good place for things like that. I don't want to be authoritarian about it, but it would really help me get this under control that much sooner. :) The sooner I get this under control, the more of my limited time I can devote to Lost Classics, and getting a Postscript Font utility for the IIgs. :)

Thanks for your help, and all your patience, as we finally get a responsive system for Font IDs in place. :)

By the way, the official mail address for the Resource-Central Font Clearinghouse is:

Timothy Tobin
Font Clearinghouse
P.O. Box 4641
Redondo Beach, CA  90278

Internet:  a2.tim@genie.geis.com
GEnie:  A2.TIM

Please feel free to pass this information on. Also, if you own Font Factory GS, please cross out the old name and address in the manual for the Clearinghouse and write this in its place. :)

Timothy Tobin
Resource-Central Font Clearinghouse
(A2.TIM, CAT8, TOP17, MSG:96/M645;1)

IMAGEWRITER CUT SHEET FEEDER

Bill, I have a cut sheet feeder for my ImageWriter II. I bought it at my local Apple dealer.

LET ME TELL YOU and others, it is one of the best computer investments
Apple II Computer Info

that you can get -- and most people don't know about it.

Mine paid for itself in a year and one-half.

I can use all sorts of paper, even colored, and change at will without any delays.

My big saving is that I used the OTHER side of used sheets for printing out information that I am not sending anywhere. This re-cycled paper saves me a bundle (pun intended).

Every sheet, ALWAYS, feeds to the same spot. It is also perfect for printing on previously printed forms.

I can't say enough about it. Go get one --- YESTERDAY!

Gary Hayman -- (in printer's heaven)
(G.E.HAYMAN, CAT26, TOP6, MSG:180/M645;1)

GOOD DEALS ON SCSI HARD DRIVES I hope this is a good place to let Apple II users know about a good deal on a SCSI hard drive. In MacWeek, La Cie (a Quantum company) is offering a 170 meg Quantum ELS hard drive with a 5 year warranty for $199 (internal mount) or $249 for an external setup that includes a case and cable. The external model includes switchable "active" termination. The phone number is 1-800-999-1386.

I did some checking and there are a few caveats to be aware of. The case and its power supply are covered by warranty for 2 years, not 5. Also, the case is fitted with 25 pin DB-25 connectors instead of the more standard 50 pin Centronics type connectors. This should not present a significant problem, as they supply a 25 pin cable which can be used to connect the drive directly to any Apple II SCSI card or to a Mac. Other devices could be hooked up with a standard 25 to 50 pin cable, especially the cable that may previously have attached other devices directly to the SCSI card.

-= Bill Shuff =-
(W.SHUFF, CAT11, TOP10, MSG:121/M645;1)

>>> HOT TOPICS <<<
SYSTEM 6.0.1 NOW ONLINE ]|t's here! It's here! It's here! System 6.0.1 is now available for download in the A2 libraries!
Just so you didn't miss the banner (and for those GEM and CoPilot people who may find it easier to pull file numbers and names out of BB messages than out of banners), here are the files:

21163 SYSDISK.601.BXY X A2-CENTRAL 930811 606336
Desc: Main SYSTEM DISK for System 6.0.1
21161 SNTLHAB.601.BXY X A2-CENTRAL 930811 534400
Desc: SYNTLAB disk for IIgs System 6.0.1
21160 FONTS.601.BXY X A2-CENTRAL 930811 296448
Desc: FONTS disk for IIgs System 6.0.1
21159 STOOLS2.601.BXY X A2-CENTRAL 930811 521984
Desc: SYSTEM TOOLS disk 2 for System 6.0.1
21158 STOOLS1.601.BXY X A2-CENTRAL 930811 536192
The three files that you MUST HAVE for a complete System 6.0.1 installation are INSTALL.601.BXY, STOOLS1.601.BXY and STOOLS2.601.BXY. If you don't have a hard drive then you probably want SYSDISK.601.BXY, the self-booting floppy system disk. It's missing a lot of files that you may want to customize your system, though, like extra FSTs, drivers, Control Panels, etc. If you want those extras, you need to download the three main system disks anyway. A self-booting floppy system disk CAN be constructed from the three main system disks, but unless you have four 800K drives or equivalents (RAM disks, etc.), it's a real pain and it takes a lot of disk swapping.

Now, in case you're wondering "Should I upgrade? Are there likely to be any problems with System 6.0.1 on my system?" here's the lowdown on most of the reported problems:

Font Manager bug & Pointless - Fixed with FixFontMgr, file #21061, FIXFONTMGR.BXY, in the A2 libraries

System folder "Magic Routing" bug - Not serious. Keep your System folder on the desktop and you'll never see it.

The folder/disk you just opened becomes deselected - Not a bug, just the way things work in System 6.0.1

When you close a window your icon selection changes to that folder/disk - Again, not a bug, just the way it works, now.

Bill Tudor's CDev Alias NDAs no longer work - Third party problem. (:

That's about it, folks! There have yet to be discovered any really major bugs in System 6.0.1 that don't have simple workarounds.

Why should you update your system to 6.0.1? Here's a few good reasons: The MS-DOS FST, Aliases and keyboard navigation in Finder, more bug fixes, a new fast RAM disk driver for /RAM5, and a whole bunch of extra little new features and tweaks.

I say it's definitely worth the upgrade. Figuring out the cost to you, each disk other than the self-booting system disk should take well less than 45 minutes to download -- at $3.00/hour, that's less than $2.20 each! How can you afford NOT to upgrade?

(BTW, I recently realized that at $3.00/hour, or $.05/minute, GENie now costs less than a local pay phone call, which is $.20 or $.25 for three minutes. Wild, huh?)

== Lunatic (:

And just a reminder -- if you already have all the disks from System 6, you DO NOT need to download the System 6.0.1 Fonts or SynthLab disks. There were NO changes to Fonts and the only change to SynthLab was that it was linked with a different linker (no changes to the actual program code were made and the program behaves exactly the same as the
6.0 version).

6.0.1: FONT MANAGER BUG DETAILS   As some of you may know, System 6.0.1 and Pointless 2.0.1 don't work together too well in some cases (specifically when you select Choose Font for a font that has no bitmaps.)

Well, Nathan Mates (our summer intern) found that the problem had nothing to do with Pointless and could be duplicated even without Pointless installed. The problem will crop up anytime you do a ChooseFont for a font that is not installed in the System.

For example, say you create a document in AWGS using a font called "DingDong". If you then open this document on a different system that doesn't have DingDong installed ChooseFont will crash.

Nathan has written a patch program that is very simple and very cautious. It will only work with Font Manager v3.4 (which is what ships on System 6.0.1).

I'll be uploading it to the A2 library in just a few minutes....

Bryan

>>> No, this bug is only in Font Manager 3.4 -- which is part of System 6.0.1.

The patch program is VERY cautious. First it checks for Font Manager 3.4, and then it checks a series of bytes to make sure it hasn't already been patched. And, the patch is only in memory -- not on disk, so nothing is permanent.

Bryan

6.0.1: FINDER MAGIC ROUTING BUG   Unfortunately, yes, this is a bug. It was discovered shortly after 6.0.1 went final and it was (as usual) non-trivial to fix. The simple solution is to not route files from the desktop. Urgh.

Jim "who was really annoyed when this one was found a few months ago"

Murphy

6.0.1: COMMON INSTALLATION PROBLEM   There is also a problem (not a bug) with the SCC.Manager. If you use "Easy Update" all the AppleTalk files are also copied to your system disk. When you boot, the SCC.Manager checks to see if AppleTalk is active and if slot 1 or slot 2 are set to "Your Card" and slot seven is set to "AppleTalk." If not you will get a message stating that AppleTalk is not active. If you are not
using AppleTalk all you do is hit return. The problem is that each time you boot you will get this message and you will have to hit return every time you boot.

Fix 1. If you do not use AppleTalk and do not anticipate using AppleTalk, remove SCC.Manager from your Driver folder and stick it in the trash.

Fix 2. If you are like me and use AppleTalk only during printing to my LaserWriter and Postscript, move SCC.Manager out of the Driver folder when you are not printing. Just remember to move SCC.Manager back into the Driver folder as part of your printer setup routine. It works for me.

-Mel (MelSoft) Fowler

>> This error message is usually caused because at some point in the past you installed the SCC.Manager file in your Drivers folder. This file now generates "The selected AppleTalk Connection could not be found" error message in System 6.0.1 if you don't have AppleTalk. Simply remove the SCC.Manager file from your Drivers folder and this error should go away. If you want to be more sure and do it the official way, or if removing the SCC.Manager file doesn't get rid of the error message, simply launch the Installer, hit the "Customize" button, select the "Network: AppleShare" script from the list, and then hit the "Remove" button.

=A Lunatic (:)

6.0.1: THIRD-PARTY BUG You missed the bug in AppleWorks GS, where the Save As dialog does not remember which volume and directory the file was loaded from. It will result in files being stored on the wrong volume (and being "lost") unless one realizes the path is wrong and resets it.

My workaround is to use Kangaroo to get back to the original directory.

Glenn

>> Thanks, Glenn! I think that's another third party bug, though, especially since I haven't heard any reports of it showing up in other programs. The only reason I included the third party bug in CDev Alias is because that's more of a system-wide problem (happens in all desktop programs) and people may have thought that it was actually a system bug because of it.

=A Lunatic (:)

6.0.1: 5.25" DRIVERS GLITCH Ok, I understand your problem, now. What's happening is that whenever GS/OS detects the Firmware for a 5.25" drive in a slot, it then assumes that there are two drives connected to it. It does this because there is no way for it to reliably be able to tell if you actually have one or more drives connected in that slot. So you don't actually have to have a drive connected. With your system, GS/OS always see the firmware for a 5.25" drive in slot 6, whether the slot is set to "Disk Port" or "Your Card." The only way you can keep
those 5.25" drive icons from showing up in Finder on you system is to do as Udo suggests, and deactivate your 5.25" drive driver.

- Lunatic

Note that this will ONLY affect GSOS. Your 5.25 will still be available to all P8 applications, so you can easily drop into something P8 to copy files from/to the 5.25.

Do you have a better suggestion?

Actually, yes. Buy an adapter cable for your 5.25" drives so you can plug them into the SmartPort on the back of your GS (or into the back of the 3.5" drives you may already have plugged into the SmartPort). Remove the 5.25" drive controller card from slot 7 and move your RamFAST to that slot. Now, your GS will run cooler, you'll be able to disable your 5.25" drives from ALL programs by setting slot 6 to "Your Card," and you could even sell your 5.25" drive controller card and get back more money than the adapter cable cost you.

In your later messages I see that you're using AppleTalk. You can set your slot 7 to "AppleTalk" and slot 2 to "Your Card" and you should then be able to plug your RamFAST into slot 2. (I know this works with the Apple SCSI cards, I'm not so sure if the RamFAST supports slot 2 as well as 5, 6, and 7, though. I'm sure there are plenty of RamFAST owners here who can clarify this, though.) If you're using ProTERM 3.x, it will ignore the actual setting of slot 2 and continue to work fine with a modem plugged into the modem port, as long as you tell it that you're using that modem port (it talks directly to the port hardware). Most other telecommunications software (including the AOL software, I'm sure :) won't do this.

Tim, why don't you try this instead:

Fm: Matt Deatherage 76703,3030
To: Ray Merlin 71435,1071 (X)

> Maybe it was decided that it's better that two icons appear
> instead of none at all.

That's exactly correct, Ray. There is no reliable way to detect 5.25" drive presence, so now 6.0.1 doesn't try at all. Every slot looks like it has two drives, so that's how many the driver reports.

If you only have one, changing the low nibble of the driver's auxtype to $1 should prevent it from trying to find a second one.

Ken Lessing

6.0.1: MINOR BUG? I just found what looks like a minor bug in System
cdev always referenced slot 2 the way the CDA's do.

Don Elton (delton) or delton@pro-carolina.oau.org  
(DELTON, CAT5, TOP5, MSG:35/M645;1)

6.0.1: ALIASES I've also used the idea of putting a single Alias folder on  
the desktop so that I can open folders and launch apps  
easily. However, instead of having the Alias folder itself be located on a  
ProDOS partition, I have it located on my HFS partition. This allows me to  
name the aliases within the folder with more useful and descriptive names  
than ProDOS allows. It is very nice to have all of the items displayed in a  
nice list (like in name order), but to actually have them being displayed in  
small icon format. One trick to doing this is to open the folder, display in  
name order, select all items and drag them onto the desktop, then change the  
view to small icon, then select all of the desktop items and drag them back  
into the folder window. Now they will be displayed in small icon format, but  
lined up in one nice column, just like viewing by name, except that the whole  
name should be visible.

Also, I am noticing one perhaps minor bug in 6.0.1. I have two 3.5" disk  
drives. If I have a disk in each and select both disks and drag them  
into the trash, Finder SHOULD eject both disks. Under 6.0.1 (on my system  
anyway) if the disk in drive 1 has an open window, then the second disk will  
not be ejected. Also, any open windows that the second disk may have will not  
be closed. This is hardly earthshaking, but I'm curious if anyone else has seen this. Brendan Bellina  
(B.BELLINA, CAT9, TOP15, MSG:149/M645;1)

>>>>> I have, I just went and tried it, and you're right, the second disk  
"""" doesn't eject, or close windows. :)  
(GARY.UTTER, CAT9, TOP15, MSG:150/M645;1)

>>>>> Brendan: Why are you dragging files in and out of windows to  
"""" alphabetize them? Just use "Clean up by Name": leave the View set to  
Small Icon, and hold down the Option key while you select Clean Up from the  
Special menu.  

(QUALITY, CAT9, TOP15, MSG:151/M645;1)

MORE ABOUT EASYMOUNT AND ALIASES  Easymount allows you to make Mac style  
"aliases" of applications, directories,  
and volumes (and if you have Appletalk, it will easily mount those Appletalk  
volumes). It is a Good Thing. Keep it, learn to use it.:)  

Gary R. Utter  
(GARY.UTTER, CAT2, TOP21, MSG:15/M645;1)

>>>>> 1. With EasyMount installed in the FinderExtras folder, you have  
"""" access to its capabilities.

2. When you select the icon for an application, a folder or a volume,  
you can go to the Extras menus and select EasyMount, which will make an Alias  
of the item. You can also hit OpenApple M to make an alias. (And that is  
easier. :)

3. An Alias can be opened just like the original item, be it folder,  
file, or volume. (but again, only application files).
4. An Alias has the file type E2 FF. You can use an Icon Editor to set icons to match a particular Alias just as you can any other file (and you don't need to set an "application pathname").

5. You can put an Alias anywhere; when you click on it the file, folder or volume it represents will open, no matter where it may be (as long as it is online).

I don't know what else to tell you, but someone will probably have more.

:)  

Gary R. Utter

-----------

>>>>> I was able to install SYSTEM 6.0.1 with no problems at all (so far). I have a ProSel-16 screen item called FINDER, which takes me there. Once there, open the SYSTEM folder and highlight your ProSel.16 or START, depending on how you setup ProSel-16 (in other words, highlight the file name that is your ProSel-16 main program). Then go to EXTRAS and open EasyMount. This allows you to ALIAS your ProSel-16 module. Save it, find it, drag it to the desktop and you have your easy way back to ProSel-16 from FINDER.

MORE ABOUT QUADRIGA’S FEATURES  Hello people. I finally got around to joining this topic. As Quadriga project manager, I'm excited, stressed out, enthusiastic and bummed all at the same time. Excited to see my vision becoming reality, stressed due to all the time and effort involved, enthused to see the interest, and bummed that it's not ready to ship yet. Of course, it's not late yet, either, but it's been an obsession since early in 1993, and there's still a lot to do.

As for the name, it will always be "Quadriga" to me, just as AppleWorks 3.0 is still "Spike" in my mind, and resides in "/HD/SPIKE" on my hard drive.

A few tweaks to the feature list are in order. The alarm clock likely won't make it into this version. Some other features to add to the list include:

- three clipboards (separate one for each app- WP, DB, SS)
- full editing of all three clipboards
- mouse support included
- screen blanker included, with fancy screen saver disk to follow later
- file lists (Add/Delete...) support arrange by size, date, type, name
- file lists support OA-D to switch desktops, OA-Y to eject 3.5 disk
- WP special codes are unique to each printer instead of being global
- WP find and replace can be restricted to whole word matches
- DB records can be 2560 bytes instead of 1024
- DB sorts can be case sensitive
- DB can list matching categories in another DB file
- DB categories can all be formatted for decimal places, justification, etc.
- DB single record layout can have multiple pages per record, and can include background text along with category data
- SS adds exponential notation formatting
- SS now supports OA-R Replace text or numbers
Apple II Computer Info

There are many more little features, such as displaying category widths when editing DB multi-record layouts and showing coordinates when editing single record reports. We don't have the patience to enter every single little "tweak" here, but your AW will improve as a result.

(BRANDT, CAT42, TOP29, MSG:23/M645;1)

>>>>> > I am wondering is if the "older" TimeOut modules will
"""""" > continue to work?

The old TimeOut modules still work great under The Works.

Yes, we are already taking advance orders, and there is a perk for ordering early. Everyone who orders early will receive a video tape highlighting some of the excellent new things you can do with the Works.

Walker

(W.ARCHER2, CAT42, TOP29, MSG:33/M645;1)

>>>>> How about importing TheWorks 4 files into programs like Publish.It! 4 """""" and GraphicWriter III. Will they work with the 'current' editions of those two programs? (I'm talking AWP files here)

Will Sneeze 2.2 and File-A-Trix be able to still display them?

Gary Hayman - Greenbelt, MD  (w/GEM v 4.21)
(G.E.HAYMAN, CAT42, TOP29, MSG:57/M645;1)

>>>>> Hi kids! I'm back from KFest, and despite minutes of sleep since """""" yesterday, I'm trying to get caught up. It was great to see old friends whose names I can't list for fear of forgetting someone due to sleep deprivation. Anyway, on to the issues at hand.

File Librarian is due to be included with Quadriga. Envelope Addresses likely will be automatically upgraded. Virtually all TimeOuts will have to be modified, although the installer will make it automatic and easy.

re: sorting in German
I'll probably provide some docs for someone to write appropriate sort routines for any languages. I believe a simple 2-string compare routine is all that will be needed. Thanks to Jerry for the idea.

re: numbered categories
The AppleWorks numbered menu bar routine is limited to 30 entries, hence DoubleData and Quadriga can't use it for accessing 60 categories. It shouldn't take long to get to a desired category considering you can use OA-9, or OA-Up or OA-Down to get near in a hurry before finishing with Up or Down arrows. Someone could write a menu macro that could accept a numbered input and then move down to the write position. As for your 15,000 record DB file, you'll be able to find a sorted record in less than a second now.

re: dates
If you read the feature list given in this topic you should have noticed that the SS supports new Date and Exponential format options. The Julian math you referred to is possible in both the SS and DB now.

The DB can display dates from 1000 to 9999 and sort them chronologically. Centuries are optional, so a date can be "Jul 24 93" or "Jul
24 1993". (Other dates are also possible...)

re: WP backwards compatibility

It's possible that some files will load, but that always makes it harder to add features. I'll try to allow bland files to be accessible by AW 3.0, but eventually those stuck in the past may have to settle for ASCII exchange.

(BRANDT, CAT42, TOP29, MSG:50/M645;1)

>>>>> > sorting

"""

You don't have to think in reverse order if you're using AW 3.0, only if you're doing multiple single sorts.

As for expanding the SS edit area, it's a bit late for that now, but we'll put it on the "Possible 5.0 Features, If 4.0 Is Wildly Successful" list.

TotalControl has been improved and included, except for the pop-up calculator which isn't around any more. Everything else is better.

re: other programs importing

Obviously other software will have to be modified to load any "4.0-only" files and will work the same as ever on files retaining 3.0 compatibility.

re: DIF

Greg, I basically don't have a clue about DIF and don't know why anyone would use it anyway, so you'll need to enlighten me on that one.

re: Returns and Tabs in finds

Udo, I'm trying to enhance the find capabilities of AW. One problem with Returns is that they aren't stored in the file as characters, making it a bit trickier, but we'll see what can be done.

(BRANDT, CAT42, TOP29, MSG:62/M645;1)

>>>>> Quadriga allows you to insert or delete categories without destroying the layouts. It will also offer a "pages" option in SRL (single record layout) in which not all categories have to be displayed. Report label formats are expected to allow up to 60 lines so that a maximum record could be displayed with one category per line.

(BRANDT, CAT17, TOP9, MSG:122/M645;1)

>>>>> Most TimeOut modules will need to be upgraded, but the Quadriga installer will handle most of them, so you won't need to send away for a bunch of upgrade disks. Some are obsoleted, and some we just don't know about yet, but our goal is to make it a one-time installation.

(BRANDT, CAT42, TOP29, MSG:80/M645;1)

>>>>> OmniPrint and Outliner will need to be updated to work with Quadriga-modified AppleWorks.

(BRANDT, CAT42, TOP29, MSG:97/M645;1)

>>>>> Good news for SEG.AM (aux slot memory) users. I just crushed the bug which kept Delete and OA-Delete from properly killing carriage returns at the end of a line to pull up the following text line.

Bad news for everyone: due to time constraints, we've had to abandon a couple of DB features. Single record layout will not have a pages/background text in this version. There will be some speed/cosmetic improvements, but a
single scrolling page will have to do for now. If 4.0 is a rousing success, wild stallions couldn't keep us from implementing this in 5.0.
(BRANDT, CAT42, TOP29, MSG:78/M645;1)

>>>>>    >mouse support
"""
  The same as with Ultra. Scrolling and selecting menu items is supported, but no new pull-down menus at this time.

  Windowing would be nice, but not in this version. No time.

  DeskJet support is expected to be about the same as was available with SuperPatch, offering Landscape and Portrait printer definitions.
(BRANDT, CAT49, TOP22, MSG:112/M645;1)

>>>>>    About 4-5 years ago, I got a disk from Don Aquilino (sp??) that somehow added pull-down menus to AppleWorks Classic. I never quite got used to using it, but I know I still have it around here somewhere, and remember that Don was selling it at an AppleFest in San Francisco.

  At that time, Don was involved with Dave Gair and the AW Programmer's Association. Unfortunately, I haven't kept up with them in years.

  Is anyone else familiar with Don's AppleWorks add-on that added mouse driven pull-down menus?

Joe Kohn
(J.KOHN, CAT42, TOP29, MSG:117/M645;1)

>>>>>    > We're shooting for an October 1 release date for the Works. Ultra
"""
  > 4.3 should ship soon after (compiler, debug, options, samples,
  > etc.)

  If I were to buy The Works, would I still want to upgrade to Ultra 4.3? Ultra 4.3 is for AW 3.0, right? Wouldn't every feature Ultra 4.3 gives AW 3.0 already be in The Works 1.0.0.0?

<<<Lloyd>>>
(L.DEVRIES, CAT42, TOP29, MSG:122/M645;1)

>>>>>    Wrong. Ultra 4.2 is for AW 3.0 and ULtraMacros 4.3 is for The Works 1.0.0.0. All that the Works includes is a macro _player_. Ultra 4.3 adds a macro compiler, debugger, options and the ability to record macros.
(BRANDT, CAT42, TOP29, MSG:123/M645;1)

>>>>>    Can this Ultra 4.3 upgrade be ordered now? Where? I've already placed my order for Quadriga with Quality, and would prefer to do all the installing and learning at once rather in stages. I don't always get around to the next stage!

  I purchased Ultra 4 from JEM, but haven't gotten around to really learning it since 3.1 works so well. I planned to make the move this summer when I have time to read manuals and the lessons in Timeout Central, but Quadriga was announced. It seemed "inefficient" to bother!! (inefficient sounds better than lazy or dumb.) Or should I be studying like crazy now so that I'll be properly prepared for Quadriga??

** Marie Barry **
Apple II Computer Info

(M.BARRY2, CAT42, TOP29, MSG:124/M645;1)

>>>>> Marie, there are several other things you can do besides the """"Converter macro to prepare Ultra 3.1 macros for Q.

Required:

- Change Launch "Ultra.System" to Launch "um4.0.system" (required; but be prepared to change it again)
- Change $0="Macro Compiler" to $0="U4 Compiler"
  Change $0="Macro Options" to $0="U4 Options" (but be prepared.....)
- Change & "Path" to .setdisk (required)
- Change Onerr Stop to Onerr Endmacro (required)

Optional (the old ways _still work_):

- Add Titles for a SA-ESC list and Labels to name your project (optional; SA-ESC does not work in default macro set in Ultra 4.2, but it does in Q)
- Change Down Down Down Down Down Down to (Down) 6 (optional)
- Change Msgxy to .writestr (optional, msgxy still works)
- Eliminate all msgxy 0,128's, if all msgxy's are converted to .ws's
- Change { comments } to // Comments (optional)

That should take care of it.

(B.CADIEUX, CAT42, TOP29, MSG:127/M645;1)

WHITHER GS/OS? Hmm! It is illogical for Apple to continue to develop GS/OS given that they no longer even officially SELL the machine that it runs on. Although development of GS/OS probably accounts for a very small portion of Apple's operating budget, none-the-less, it seems foolish to spend ANY money at all on it. Therefore, I've gotta ask the question, 'What does Apple get out of continued development of GS/OS?'

Is it goodwill? Very doubtful. Is it a belief that GS/OS will ultimately turn GS users into MAC users? Hardly worth the cost anymore. Those who would be converted HAVE BEEN converted. Is it R&D? Any research and development for the MAC can be done ON the MAC, not on the GS. Is it a way to keep people at Apple employed? No. If Apple had wanted to cut positions during the recent layoff, a logical place would have been in the Apple IIgs development group. Is it a bureaucratic oversight? Perhaps, but unlikely.

Next question: Why bother to develop an Ethernet interface and MS-DOS compatibility for GS/OS? Is it because Apple, in their benevolence, wants to provide GS users with as much utility as possible before they abandon the platform altogether? Come on! Then why are these things being done?

The only conclusion I can come up with is that Apple plans to license GS/OS along with the MAC system software.

J-Bird <<MAYBE WE AIN'T SEEN THE LAST GS YET!>>

(J.CURTIS8, CAT5, TOP2, MSG:233/M645;1)

>>>>> Jay, I agree that's an interesting, and logical, conjecture. If true, """"it would give a LOT of people in the A2 community a LOT of hope for the future.
But, I submit to you: True enuf, System 6.0.1 came out as promised, but
do we have any CONFIRMATION on System 6.1? Re: the Apple II Ethernet Card,
has ANYONE heard of the current status of this product?

Furthermore, has anyone heard of the current status of the Apple II
group (whatever it's called this week?), esp. in light of the recent layoffs
and the drop in Apple stock and the rumors that Apple's financial
difficulties may force a cut in R & D?

Inquiring minds need to know......

TTFN, Larry ;-)  
(L.FAUST2, CAT5, TOP2, MSG:235/M645;1)

Apple will not license the GS System Software. Period.

(SOFTDISK.INC, CAT5, TOP2, MSG:236/M645;1)

RE GS/OS: actually, I got to thinking a few nights ago that as a
means of "porting" the Mac environment to other hardware, GS/OS is
Apple's Great Experiment (a _successful_ one, IMHO). The Mac was built to
support the interface concurrently, whereas the IIgs brought with it some of
the Apple II (pre-GUI) baggage.

What Apple will license, if anything, is the user interface as a
portable environment. It won't be either the Mac or IIgs OS since both are
somewhat synergistic with Apple-designed hardware.

(WIZARDS.MUSE, CAT5, TOP2, MSG:243/M645;1)

Jay,

Good questions. The only reason I think they keep upgrading GS/OS is to
be nice to us. At the financial and save-face level, it's probably the least
expensive way to make sure Apple can refute any claims that it has dropped
support of the Apple II. But, I'll bet there are also a few softies in upper
management who cut their teeth on either using or marketing the Apple II and
can't stand there watching it get axed. There are many people I know who
work for Apple who have a lot of respect for the entire Apple II series.

(MORGAN-DAVIS, CAT5, TOP2, MSG:244/M645;1)

From the "News" section of _Windows_ magazine, by Paul E. Schindler

According to an Apple senior vice president, Dave Nagel, all of Apple
Computer's proprietary software will be available under Windows as soon as
possible...

Nagel, who heads the Software Architecture Division and Advanced
Technology Group, said that in the future, "there will be no more
single-platform services. We will strive to make our releases near
simultaneous on all platforms."

...In 12 to 18 months, AppleScript and QuickDraw will be available for
Windows, Nagel said. Eventually, all Apple systems software - scripting,
networking, and multimedia - will be available on as many platforms as
possible, he added.

Even Apple's crown jewel - the user interface it has so zealously
Apple II Computer Info

protected in the courts and elsewhere — will be available on UNIX systems by year's end.

(R.WINSLOW3, CAT5, TOP2, MSG:245/M645;1)

WHAT ABOUT SYSTEM 6.1?  > I don't remember the degree of certainty he used,
"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
but Matt definitely mentioned online the
> possibility of 6.1.

Sorry, but I don't know how many times I've said this, but Matt does not, and has never worked in the Apple II engineering group. He doesn't make the decisions on what gets done (and neither do I, for that matter). The only person who can be expected to make statements regarding what we're doing is Tim Swihart, my manager at Apple. He, to the best of my knowledge, has never mentioned that we will be doing a 6.1.

Jim

(MURPH, CAT5, TOP5, MSG:15/M645;1)

The only mention I recall from anyone at Apple about a "6.1" or something like it was along the lines of "we'd _like_ to be able to do a full minor version change for the last version of the IIgs system software."

People then started assuming things, and we all know what that turns us into....

== Lunatic (:)

(A2.LUNATIC, CAT5, TOP5, MSG:16/M645;1)

FLATBED SCANNER FOR IIGS?  AppleScan.GS is a 320 mode GS/OS App. It has
digitizing ratio from 75 dpi to 300 dpi in grey scale, half tone, and line art modes. The version number is 1.0d1. It was written by the Apple II System Software development team in 1990 or 1991, I think. The only place I have seen it is on the Apple Developer Group System 6 CD-ROM. It looks pretty good to me. :)

Our users group got the CD-ROM in the System 6.0 six-disk mailing. There are lots of other little goodies on the CD-ROM, but most are pre-release versions and betas. I'm sure that if you posted a message in the A2Pro area asking about the Developers CD-ROM, someone there could tell you where to get one for yourself. That is if there are any left.

GS.Ozoneman - IIGS Forever!
\__/ 3
___/   ---->>> Delivered by GECopilot 2.1.1 & ProTERM 3.0

(GS.OZONEMAN, CAT6, TOP15, MSG:23/M645;1)

I too would be interested in buying a Flatbed Scanner if it had the software support (OCR). My question is this, how does one hook up a flatbed scanner? I thought it hooks to the SCSI port on Macs. I remember seeing something in the CVTech area that the RF will not (ever) support anything other than a storage device.

(B.HANDLER, CAT6, TOP15, MSG:27/M645;1)

There is a driver that comes with System 6.x that will allow you to run an Apple flatbed scanner on the IIGS. It just becomes another device in your SCSI chain. At this point there is no OCR program written for the IIGS and a flatbed, as far as I know. There is however a graphic screening program that appears to make SHR graphics of whatever you scan in.
I haven't seen this program work and have been told by a friend that the program has a saving problem, "it won't do it", or at least that's what he said.

(GS.OZONEMAN, CAT6, TOP15, MSG:28/M645;1)

WHEN THE MAC COMES IN THE DOOR, DOES THE GS GO OUT THE WINDOW? I'm on my fourth Mac.

I have tons of high dollar, high performance software, and every toy that I could want (except a good laser printer and maybe a tape backup), and I STILL do better than 90% of my work on the GS. I originally got the Mac because I needed a second terminal to do my automated online stuff while I did my REAL work on the GS. I didn't think that it made sense to buy another GS when I had an opportunity to expand my horizons, and I think that was an appropriate decision. Still it took me a year and a half, 4 Macs, and thousands of dollars to get a Mac system that can perform in the same ballpark with the GS, and the GS will STILL whip its butt when it comes to speed and ease of use.

All of this is WAAAYYYYYY off topic, of course. :)

Gary R. Utter
(GARY.UTTER, CAT4, TOP14, MSG:125/M645;1)

>>>>> Right on!! :)"

I don't mean to bash MACs, or even PCs for that matter. In fact, I plan to add one of each to my GS collection. However, the GS is now, and always has been, a very misunderstood machine, especially by folks who didn't own them or didn't know how to expand them.

J-Bird <<WHO GOT THE LAST GS?>>
(J.CURTIS8, CAT4, TOP14, MSG:128/M645;1)

>>>>> > You've mentioned before that you use your GS much more than the Macs for its speed and convenience. Would you go into specifics on that, in an _appropriate topic_? I think a lot of folks here > (including yours truly) would be very interested.

> The Orchard Lounge is a good place: Cat 2 Topic 7.

I use the GS mostly for telecommunications and word processing. There are a number of no-nonsense applications available on the GS that (in my opinion) significantly outperform anything available on the Mac, at least in terms of speed and ease of use. Now, y'all are thinking that this means I am working with P8 applications, and comparing the speed of the GS text screen with the Mac GUI. That turns out not to be the case. I haven't used a P8 application in MONTHS, with the exception of Beta work with the next version of TIC.

I use WriteAway as my main word processor, and Spectrum as my main telecomm application.

When I need to do fancy fonts or complex layouts, I compose in WriteAway, then transfer the text file to the Mac and doctor it with WordPerfect, or perhaps Word 5, and then print it from the Mac. (While Pointless and Express make it as easy to print out high quality stuff from the GS as the Mac, the Mac is still faster, and less prone to glitches. PLUS, doing heavy print jobs on the Mac leaves the GS free for whatever I want. :)
Gary R. Utter

USING YOUR IIGS FOR GEnie IN THE UK

Well about a year ago I asked people on GEnie about their opinion about moving to St. Louis. Everyone seemed to think that was a fine place and I did it. Now, however, I'm moving my family to London, England for a year or so. Does anyone have any advice on using a IIGS in England. Do I need a converter? Will it work on 50 cycles. How 'bout a Magnavox CRT? Modems, DeskJet, hard drives, etc. Any advice would be appreciated. Also how does one get on GEnie from London?

(T.BUCHHEIM, CAT2, TOP4, MSG:100/M645;1)

I think you'll need a voltage converter (240-120) but the GS will work fine on 50 cycles...hold down Option-Control-Reset and choose "Set system standards and 50 hertz" or something like that...

Getting GEnie from London is harder...type PHONE or something like that to find out the phone #...it costs a lot more though.

(T.BUCHHEIM, CAT2, TOP4, MSG:100/M645;1)

1. Check your email.

2. A.LETCHFORD (who is here on GEnie), being a Brit, can answer questions about GEnie access.

3. About power... Your equipment should run fine with a 240 -> 110 transformer. Add up the wattage of everything that will be hooked up and buy the nearest size transformer available (i.e., if it adds up to 275, buy a 300 watt transformer). Don't buy a 50,000 watt transformer to run 500 watts worth of appliances - you'll burn them up!

4. Where to get a transformer? US military installation thrift shops are always good. There is a naval installation in London (HQ, US Navy Europe - tough duty...), airbases at Mildenhall and Lincolnheath, and I'll bet the embassy has a thrift shop too. Otherwise, you have to check with an electrical supply house. Obviously, as most Brits buy Brit electric / electronic kit, they don't need 'em. BTW, you haven't lived till you've seen a British washer. They make British showers look good!

5. Always, always, always, check polarity at the 110 end of the transformer with a 3 prong polarity tester. Always.

6. My GS ran fine set for 60 hertz on 50 hertz current. The screen output went to ca-ca when the control panel was set to 50 hertz.

---

Mike ("Maj") Murley

<Delivered by Co-Pilot & Spectrum>------------------------\_________\)

(M.MURLEY3, CAT2, TOP4, MSG:111/M645;1)

I missed Zorch's original post on this but I will be happy to help if I can. Without knowing the questions asked, my advice would be to open a Mercury 5000 Dial account. Tel Customer services on (in UK) 081 914 2456.

Costs: Standard Registration #40 plus #40 per year rental. (this is
Apple II Computer Info

for one user name. Each additional user name is $10 registration plus $10 rental per annum - at the time of registration. Useful for groups to share the overall cost).

**Asynchronous usage charges per hour:**

- **Peak** (8:00am - 8:00pm Mon - Fri) - $1.75 $3.00
- **Off-Peak** (8:00pm - 12:00pm Mon - Fri and 8:00am - 12:00pm Sat, Sun, Bank Holidays) - $1.35 $2.40
- **Night** (12:00am - 8:00am Mon - Sun) - $0.85 $1.50

These charges are on top of GEnie charges but access is usually by a local call. Cust Service will give the nodes but not all have 9600 access. Once you have an account access to GEnie is a simple as dialing the node and logging on through PAD. I use a modified CoPilot script and I would be happy to share this info if Zorch want to go down this route.

> Where to get a transformer?

I use a site transformer 1500 watt (more than I need but hasn't burned my kit yet). Make sure the transformer can accept through grounding. I have a contact for that but I expect US sources will be cheaper.

Hope this helps. Happy to talk voice: tel no by Email please.

**IIGS BUILT-IN DUMB TERMINAL**

Here is a copy of the original message I received. It was written by M.Aikens1 to A2.Help, where it was forwarded to me.

I was reading the July/August issue of II Alive and in the article "Modem Nation - Making your first call" it says there is a dumb terminal program built into the IIc's firmware. Could you tell me how to access it because I'm interested in that kind of stuff.

E - Mail me at M.AIKENS1

...Sloanie - A2Pro.Help
(A2PRO.HELP, CAT10, TOP6, MSG:1/M645;1)

This message was sent to me by Jerry Kindall of Quality Computers (QUALITY) after I asked him what II Alive Magazine had written on the subject (see last post for the II Alive reference)

It's accessed the same way as the built-in terminal program in the IIC and in the super serial card. First you do IN#2. Then you set up the baud rate, echo, linefeed handling, etc., using the usual Control-A commands (or just do nothing and the system will use the defaults in the control panel). Then do Control-A T (NOTE: Not Control-A Control-T, Control-A T) to enter the terminal mode. Enter Control-A Q to quit.

...Sloanie - A2Pro.Help
(A2PRO.HELP, CAT10, TOP6, MSG:2/M645;1)

Regarding the IIAGS terminal mode: On my ROM 03 IIAGS I was able to get this to work, just as was mentioned in the previous message. Get
into Applesoft BASIC, type "IN#2", then Ctrl-A T (which changes the cursor from a flashing box to a flashing underline). Then I can type any command to the modem (such as ATDT 555-1212), and it will call that number and connect. Ctrl-A Q returns you to Applesoft.

Problems with this method: No buffer, so anything that scrolls by is gone forever.

The IIc worked this way also, except the first version of the Memory Expansion IIc, which had a bug in the built-in terminal program. The Revised Memory Expansion IIc fixed that bug.

I don't think using the computer as a dumb terminal is worth the hassle, considering the number of inexpensive term programs available. You can't do anything except type and read with this dumb terminal.

Steve Weyhrich <IX0YE>-
(S.WEYHRICH, CAT10, TOP6, MSG:5/M645;1)

On my ROM 01 IIGS, I was not. Try as I might, all I could get was a """, followed by "SYNTAX ERROR".

Jeff - Delivered by Co-Pilot v2.1.1 and TIC
(J.CARR20, CAT10, TOP6, MSG:7/M645;1)

RE "terminal in the modem": no, it's in the _interface_, and more specifically in the interface _firmware_. The modem is a box that accepts "AT" commands, but it's the _interface_ that gets the commands to the modem. And it's the _firmware_ that lets Applesoft send and receive the commands.

I don't know if there's an easy way to explain the latter, but let's try this: Applesoft uses the monitor programs (firmware) built into the Apple, and the monitor programs really only know one place to send user output (the display screen) and one place to read user input (the keyboard).

To allow for alternative input/output devices in the peripheral slots, the monitor includes the ability (supported by Applesoft) to change the location of the program(s) that output is sent or input is gathered from. Notice that since the Apple runs these programs, they have to reside in the _Apple_'s memory. (That is, they can't reside in a self-contained box like a modem.)

The way this is done is by allowing each peripheral card to have a tiny slice of the Apple's memory for its specific program, which is normally contained on a memory chip similar to the BASIC and monitor ROMs in your Apple. The chip is on the card, and when you plug the card in the chip is "mapped" into the Apple's memory and the programs on it become available. The monitor (and Applesoft) can then be told to use the card's programs to send and receive data (this, if you haven't figured it out by now, is what "PR#" and "IN#" do).

In this particular case, when we say "dumb terminal" program we are talking about the most _basic_ ability of the card's firmware to allow diverting the input/output flow between Applesoft and the card to connect it between the _display screen_ and the card. (That is, Applesoft no longer receives the input so you don't see '?SYNTAX ERROR', and your keyboard input is routed past Applesoft to the card so you just type 'Hello', not 'PRINT
Okay, are we straight on what the "dumb terminal" is? :) (For want of a better definition, it's the part that allows making the keyboard and screen appear to be connected directly to the communications port, bypassing Applesoft. You _can_ have more features, but that basic input/output capability is the root.)

Many serial communications interfaces have some sort of "dumb terminal" built-in. The Apple Super Serial card does, and so do the IIgs and IIc serial ports. But rip the ROM chip off a Super Serial card and the terminal is "gone", yet the modem _hardware_ is still intact (and can, in fact, still be used to communicate with an external device _if_ a suitable program is available in the Apple II memory, probably loaded from disk). As an example, my Epic internal modem has _no_ (Apple II "mapped") firmware and therefore no "dumb terminal" capability, but is still perfectly usable with many software programs, including all the "AT" functions (the software just loads its own program to talk to the modem hardware). "PR#2" gets you "NO DEVICE CONNECTED" (from ProDOS BASIC), though; it can't find the required "programs" to talk to, so it doesn't think there's a modem interface there.

The Hayes Micromodem, by the way, incorporates the _modem_ and the _serial interface_ (and firmware) on one card. That's why someone might think the "modem" has the terminal program in it, because the tendency is to refer to the integrated modem/serial card as only a "modem".

"Smart" modems accept commands from the dumb terminal and interpret them for their own use. In fact, they contain their own "terminal" function that allows them to work their own serial interface so they can send messages back like "CONNECT" as if they were a remote computer. And that's exactly how the computer sees them; it sends 'AT DT555-FAKE' to what it thinks is a "remote computer" and the "remote computer" dials up and connects to _another_ remote computer, then more or less "hides" except for the modem function (translating between phone line data and computer data).

And, yes, you _do_ run the modem using nothing but "AT" commands, plus the escape ("plus plus plus") sequence...except as far as the handshaking hardware goes (and even that is "AT" configurable).

However...if you rip the (external) "smart" modems off two computers and connect them with a null modem cable, the "dumb terminal" programs can still be invoked to let the systems "type" back and forth. Obviously, the program isn't in the _cable_.

RE things like downloading: that's actually a bit beyond what a "dumb terminal" is considered to do (that is, actually _storing_ data, even in BASIC strings, is a step up). It's possible to do, but not very practical. For one thing, I don't think Applesoft can keep up with anything much past 300 baud, if that. For another, you'd need to "bootstrap" the process in 2-3 steps to get to even a minimally capable communications program; the _time_ invested in learning (or explaining) how to do this and then implementing it is impractical versus buying an inexpensive but fully functional communications package (like Talk is Cheap, to pick one of the lowest-cost ones I know of).

(Someone else might rather spend 10+ hours futzing with this as opposed to spending $40+ on a program. If your time is not more valuable than $4/hour, I have to ask why you have/use a computer in the first place. :)}
NOW SHIPPING!! The Parson's Engineering Focus Hard Card for the Apple II series of Personal Computers. The Focus hard card is a self contained 2.5" IDE hard disk drive with controller card that plugs directly into either an Apple IIgs, IIe or Laser 128 system. It does not require any additional hardware or software to operate. All that is necessary to install and use the Focus hard card is to plug the card into the Apple II computer, replace the cover on top of the machine, and turn the power on.

The Focus card is the same length, height and thickness of a standard Apple II full size peripheral card. It can be used with other cards without mechanical interference. It operates very quietly and also has a power down mode for extended periods of inactivity. (Perfect for BBS's)

Hard Drive Specifications:
* Small Internal hard card for the Apple IIgs, IIe and Laser 128 systems
* Lower cost IDE 2.5" drive and controller
* 40, 80 and 120 Megs sizes available
* Price includes hard card and software, nothing else required
* Easy to install, just plug it in and power up the system
* Quiet Operation
* Zip and Transwarp compatible (Both IIe and IIgs)
* Uses standard Apple power supply, you do not replace you existing one.
* 6 month warranty

Technical specs:
* <18ms access time
* +5V @ 450ma power requirement at startup, 100ma for the rest of the time

Contact Parson's Engineering for future information...

Parson's Engineering
5010 Rimhurst Ave.
Covina, CA 91724
Tel: (818)-966-5538  Fax: (818) 966-5701

Pricing:
Focus 40 : $349  Focus 80 : $449  Focus 120 : $599
Controller without a drive $129

!!! EXPRESS VERSION 2.1 IS NOW AVAILABLE !!!

Express v2.1:
- Fixes a bug where the spool file wasn't being written correctly in low memory situations (which caused printed output to go ugly).
- When printing, forces Twilight II to use background blanking so
Express can keep working.

- The "Printer57600" port driver is now automatically recognized as a serial connection, so data is blasted through Express' serial output routine like other serial connections.

- IPC inward-bound and outward-bound calls added so third-party applications can monitor Express' activity.

If you own Express v2.0 the update is just $3.50 for s&h.

If you own Express v1.0 or v1.1, UPGRADE NOW for $17.50+$3.50 s&h ($21.00 total). Express v2.1 is much faster than version 1, and has several new features (e.g. automatic multiple copies, user-selectable spool folder location, etc.).

SPECIAL OFFER for our online customers: If you own Express v2.0 we can email Express v2.1 to you for free (you'll have to pay to download it, but it's pretty small).

If you want us to email you a copy, send a private note to "SevenHills" stating "Please email Express v2.1 to me." We will verify that you are registered for Express v2.0, then upload Express v2.1 to you on August 9.

All online upgrade requests MUST be received before August 9, 1993.

(SEVENHILLS, CAT43, TOP10, MSG:177/M645;1)

II.SYSTEM This year at KansasFest, Kitchen Sink Software took a little different approach to the sessions that we presented. In the past, we have held sessions for the 8-bit guys who used their IIgs's as fast IIE's and the others who don't have IIgs's but still enjoy hacking around on the Apple II. We have presented sessions on the programs we have written, and just some general programming sessions.

This year we announced a new development system for the Apple II. Imagine having access to Double Hi-Res graphics, graphical user interface, pull down menus, buttons, mouse support, and much more... Well, we demoed our beta version of System II - The Graphical User Interface for the Apple II. System II is an 8-bit development system which replaces BASIC.SYSTEM with a much smaller shell. System II gives you a more complete access of ProDOS from Applesoft. There are also quite a few entry points for machine language programmers. II.SYSTEM (That's the SYS file run by ProDOS or your favorite program launcher) handles the DOS stuff. A supplemental part of System II is the graphics packages. There are two packages, one for Single Hi-Res graphics, and one for Double Hi-Res graphics. These packages add on to the capabilities of II.SYSTEM giving you Applesoft commands to do things like play musical notes (not full MIDI, but one note melodies), add pull-down menus to your programs, do hi-res/double hi-res character generation, define buttons, do screen copying, inversing, combining, and much more.

As I mentioned earlier, a beta version was demonstrated at KansasFest. The bugs that we knew about during the demo have all been fixed (I can't believe how some simple things cause so many problems). We are looking to have the machine language portion of the programming completed by the second week of August (since I am on vacation in Canada until next Wednesday... that's why it will take that long). The runtime...
version of the desktop environment for program launching is expected to be completed by the end of August. We are hoping to release the complete authoring system sometime in September or October (note: we do this just like Apple, we announce the month, but never the year :)

Once we complete the runtime version of the code, we will probably be uploading a demo here to GEnie for your preview. There are several GEnie subscribers who attended the sessions at the conference and are already registered developers with System II. Once we complete the rest of the development system, they will receive all of the documentation, sample code, and machine language information. However, if you were unable to attend the sessions at the conference (not for sleep reasons, but because you weren't there :) we will be offering the development system at a reasonable price in our fall catalog.

I will be on vacation until next Wednesday, but I will be happy to answer any questions once I return. I will also be adding a topic to the list of Kitchen Sink topics over in A2Pro for System II developers to have their questions answered. For now, hopefully, this post will bring people up to speed on the System II environment and we will certainly be bringing more information to the best on-line service in the business as it becomes available.

Eric Bush, Kitchen Sink Software, Inc.
(KITCHEN.SINK, CAT44, TOP2, MSG:31/M645;1)

TALK IS CHEAP V4.00 After more than a year without an update, Talk is """"""""CHEAP, version 4.00 is ready for release. This is a major update and includes the first printed revision of the documentation since version 3.10. The major new features since version 3.31 that was released a year or two ago are:

A very complete (to the limits of the Apple text screen) VT-102 emulator that includes both keyboard and screen emulation.

More great enhancements to the already most-powerful on-the-market scripting language. For those of you that script, have fun; for those who don’t, just wait until you see what creative minds can do with the new features.

Full hardware handshaking is now fully supported for the IIgs ports and the super serial card clones so you can run your computer at maximum baud rate with those new high speed modems and not lose ANY data, even with Appletalk active.

The IIgs modem buffer is now 64K to avoid overruns.

Scripts can now access any data that is stored in the TIC.CONFIG file so they can better control and/or take advantage of the environment in which you run TIC.

TIC now includes TIC scripts that guide the novice user through the software installation process and actually handle all the file copying and directory creation involved.

TIC will ship in both 5.25 inch (2 disks) or 3.5 inch (1 disk) formats as requested by the purchaser (be sure to specify).
Many, many bugs have been fixed (many of which I'm surprised no one else found before now).

One feature hasn't changed... The update price for old users (who can provide a copy of the front page of their manual or trade in the master disk of a competing product) is $15 and new TIC users can still purchase the program for the inflation-busting $40 price of old.

Orders will now be shipped within 7-10 days (as soon as the docs get back from the print shop) from my Orlando address. Dealers and schools etc. can still purchase quantities of 10 or more copies of TIC for a 50% discount (i.e. $200 for every 10 copies purchased).

Checks or money orders should be made out to:

Don Elton
14207 Glenhurst Way
Orlando, FL 32837

GNO/ME UNIX 2.0 August 8, 1993 (Littleton, CO)

"""
"""

Procyon Enterprises announced today that they are now accepting orders for the new version of their GNO/ME UNIX system for the Apple IIGS.

Jawaid Bazyar, Vice President of Procyon and head engineer of the GNO project, said "GNO/ME 2.0 represents a substantial improvement over the original, which was in its own right a ground-breaking work. In the past year since the original release, we've listened to customer's concerns and addressed most of them. We brought even more UNIX power to the IIGS by implementing the most powerful inter-process communication system available for the IIGS".

UNIX is quickly becoming the de-facto standard among operating systems. Even operating systems which never claimed to be UNIX compatible are rushing to provide POSIX compliance interfaces for their systems. (POSIX is the International Standards Organization's UNIX standard).

"This release reaffirms our commitment to the Apple IIGS, a very capable computer that many developers abandoned", said Matt Gudermuth, President of Procyon. "Some people ask if the IIGS is powerful enough to run UNIX, and many used to answer with a resounding NO!. We answer these people by pointing out that the first mainframe computers that ran UNIX were far less powerful than the Apple IIGS. The IIGS is here to stay, and we're going to keep supporting it with our powerful system software."

GNO provides UNIX features in an application environment that runs
"on top of" GS/OS, so that the IIGS software everyone enjoys is actually enhanced by using GNO. Included as standard with the GNO system are almost one hundred standard UNIX utilities and some IIGS-specific ones such as print spooling from text or desktop applications and a "shell-in-a-window" New Desk Accessory. Full support for remote access to a IIGS via a modem, and built-in ultra-high-speed serial communications means that GNO is the perfect system for writing communications programs.

"Communications is one of GNO's strong points," remarks Derek Taubert, the individual responsible for the upcoming Internet access software for GNO. "Because GNO does all the low-level work for me, and gives me a simple interface to access it, I can concentrate on the task at hand instead of worrying about writing things like interrupt handlers".

GNO comes with comprehensive documentation covering all aspects of the system, including programming the kernel, the shell, the C and assembly libraries, and utilities.

For more information, including information on upgrade pricing, contact Procyon at:

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 908 of 1824
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 909 of 1824
On Wednesday during the day we had our GENie sysop meetings, working on ways to bring even more Apple II information to GENie and make the Apple II RoundTables an even better place for Apple II people to be. Over the next few months you'll be seeing some of the results of our efforts, in all areas of the A2 RTs, and I think all the Apple II users here are really going to like what we've got coming up. Further details will be made available as we finalize each plan. Later on Wednesday the rest of the conference attendees showed up, and we all spent a lot of time hanging out and chatting and hacking, etc. late into the night (I got about three hours sleep, last night! I'm not sure where I fit it in, but it was there somewhere. About an hour of it was me missing breakfast.). There are about 100 attendees here, this year. I'm not about to type in all their names, but rest assured that everyone who is anyone in the Apple II world is here! Some of the companies that have representatives present are: Alltech Electronics, Big Red Computer Club, Bright Software, Byte Works, Inc., DYA/DigiSoft Innovations, Econ, GENie Apple II RoundTables, GS+ Magazine, JEM Software, Kitchen Sink Software, Parsons Engineering, Procyon, Inc., Quality Computers, Resource Central, Roger Wagner Publishing, Sequential Systems, Shareware Solutions II, and Softdisk Publishing. There's also lots and lots of individual developers and users here.

Today, Thursday, was the start of KansasFest proper. In the morning there was an opening talk by Tom Weishaar, Uncle-DOS himself. After welcoming everyone to the conference and saying a few opening words, Tom presented a few "awards" to the people who have been able to come to every single KansasFest yet held. Ken Kashmarek got a special award of recognition for being the only person to have come to all KansasFests so far who actually paid full price for all of them! Next, Tom actually went out into the auditorium with the microphone and went to each audience member in turn, asking them to introduce themselves and say a few words about who they were and why they had come to KansasFest. This was the first time anything like this had ever been done, and it was quite fun. Next we had the keynote address by Mike Westerfield, talking about "Amateur Programming for Fun and Profit." It was very informative, giving advice and suggestions to all the programmers, developers, and would-be programmers and developers in the audience.

Following Mike Westerfield was Bill "Burger Bill" Heinemann, giving us all an update on the status of the Avatar project. Currently, the Avatar itself is stalled for lack of funding, since their major financial backer pulled out. Bill said that most of the design work has already been finished, especially on the hardware, and they're mainly waiting on some capital to get the whole thing rolling. In the meantime, they've been working on an Apple IIgs clone computer interface for Super Nintendo game systems! This would be a $299 to $399 plug-in device for the Super Nintendo that would turn it into an Apple IIgs clone computer. A beta or prototype is already working, according to Bill. It has not been named yet.

The device would come with 2 MB of RAM on board, an "IBM style" floppy disk drive (720K and 1.44 MB only, no 800K support due to cost considerations), and an external interface port (it would be either a regular Apple II slot, or a PCMCIA slot -- an optional card cage could be added to give more interfaces). The keyboard would be a standard "IBM style" keyboard with Super Nintendo connectors, plugged into the joystick/Joystick port(s). To
use a mouse you would have to purchase Super Mario Paint and use the mouse included with that (Bill said there's no way he could include a mouse or sell his own and compete with the price). Alternately you could use the Super Nintendo's joypad, but he said that it was very awkward.

The beta/prototype of this device uses the ROM code for GS emulation that Bill is developing for the Avatar. He has gotten some assistance from Laser Computer (like a sheet of around 50 memory entry locations), so this device will be at least as compatible in 8-bit Apple II mode with a real Apple II as Laser computers are. Bill said that he has been able to get HyperStudio to run on the beta/prototype just fine, but ran into problems with Teach from System 6.0, and again even more problems with Teach from System 6.0.1. One problem with this device is that the Super Nintendo screen mode resolutions are different from those of the Apple IIgs. It has four screen modes: 256x224, 256x448, 512x224, and 512x448. Emulating a IIgs, you either lose some screen real estate, or you use a "squeezed" mode which looks "really ugly," according to Bill. The speed of the device was reported to be about twice the speed of a stock unaccelerated Apple IIgs. The only Super Nintendo hardware features Bill reported using for the IIgs emulation were some DMA memory-moving routines and sprite animation for the cursor.

In its original design, Bill reports the device would easily be able to copy Super Nintendo cartridges onto a floppy disk (in fact he said it already can). He is seeking approval from Nintendo for the device, though, which would necessitate disabling that feature in hardware, for copyright reasons. (Bill's written plenty of Super Nintendo games himself, so people could even be pirating his own works! :)

No beta/prototype hardware or photos of such were available to actually be shown.

There were no special activities at lunch on Thursday, but there is entertainment scheduled for lunch on Friday.

After lunch the normal sessions began. This year, there are only two tracks of sessions, instead of the three or four of the past few years. Sessions on Thursday were generally organized into an "8-bit" track and a "16-bit" track. The sessions in one were: "System II: The Complete Graphical Interface for the Apple II (8-bit)," "Programming with System II from Applesoft and Assembler," "Integrating Applesoft and Assembly," and "The Apple II & Education: The HyperStudio Approach." The other track's sessions were: "A Dieter's Guide to Hi-Speed Data Compression," "The Latest & Greatest Advanced Sound Techniques with the Ensoniq 5503," "Fun & Easy: Writing Twilight II Modules," and "Intermediate Desktop Programming." On Friday the sessions are much less easily divisible.

Thursday night in the cafeteria was the Creative Black Tie Celebration and Celebrity Roast. Part of the "celebration" was inspired by Roger Wagner's traditional unique ties -- a contest was held to see if anyone could match or beat Roger's taste in ties (I won the "Most Colorful" prize, for my black leather bow tie :). The "roastee" of honor after that was Tom Weishaar, head of Resource Central and all-around swell guy. The "roasters" were Dennis Doms, Dean Esmay, HangTime, Roger Wagner, and Matt Deatherage (with help from Tara Dillinger). Any description I could write here would simply not do the roast justice, so I'm not even going to try! I'm sure videotapes will be made available by the various groups taping the event, such as GS+ Magazine, Resource Central, and others, so you can just get the tape and see it all for yourself.
Late Thursday night there were some rather amusing antics being performed in one of the dorm lounges, as a group of Apple II developers, including Roger Wagner, played a game where each person in turn had to grab and pick up a paper grocery bag in their teeth, while only touching the ground in one place. After everyone had made an attempt, the bag was shortened a few inches and they went around again. At the end it got down to just a single flat piece of paper with a few frayed edges sticking up. It was quite a sight. Around the time that was ending up, a couple of people pulled out Aerobee flying rings and started sailing them back and forth to each other down the tic-tac-toe board-like halls (the lounge is in the middle). One was making a clockwise circuit and the other was making a counter-clockwise circuit. Everyone not involved dodged and ducked their heads as they went from room to room. (:

UNOFFICIAL KFEST REPORT #1 All of Kfest was more fun than is probably legal, but here are a few of my more memorable moments from KansasFest:

Dean Esmay and Jerry Kindall doing a very passable Beavis and Butthead imitation.

Watching Bryan Zak and Jay Jennings program in a new language that they hadn't used before. Jay was open to a seemingly random place in Volume One of the manual and Bryan to a similar place in Volume Two, and they were having at it, using the "cut and try" school of programming. (These guys are professionals; don't try this at home, boys and girls!) Roger Wagner was gleefully videotaping Bryan and Jay for posterity and possible blackmail, I think. I finally threw all three of them out of my room because it was 3AM and they weren't making a whole lot of progress. I've never seen more error messages than program lines before. *8-)

Rooming with Hangtime. I don't recommend that anyone try this who has feeble health or a pacemaker (or common sense).

The roast of Uncle-DOS. Dean and Hangtime were FUNNY. We should all lean on them to upload their speeches.

Having a long talk with Joe Kohn (one way-cool guy).

The sight of the A2Pro gang, several of which shaved their heads at Kfest.

The seminars on the nifty stuff coming out RSN for the Apple II.

And lots more! TomZ

(T.ZUCHOWSKI, CAT44, TOP2, MSG:26/M645;1)
UNOFFICIAL KFEST REPORT #2   The Funniest Scenes Awards: (as seen by me)

Funniest Sleeping positions:  Sloanie & Jim Z (During a Session)
Funniest Roast Routine: A tie between Dean & Hangtime
Funniest Food: Slaw! (A mountain of it served at KC Masterpiece)
Funniest Luncheon quote: Matt, you ignorant Slut! By Diz
Funniest Comments: Everything by Hangtime..(Matt Deatherage: Honorable mention)
Funniest Attempt at a song: Matt and Yours Truly in the Roast
Funniest Game Name: Bite The Bag
Funniest Hair: Tom W (Honorable mention: A2pro guys)
Funniest Plot to confuse Diz: Jay Jennings, Hangtime & TomZ
Funniest Prankster: A2PRO.Steve
Funniest Nocturnal Activity: Roger Wagner attempting to climb the Dorm building wall
Funniest Computer Sound: Arghhhh! (sp?)
Funniest 5 Days in a Row That I've Had in a Long Time: KansasFest!

— I laughed and laughed! (but don't I always...hehehe)

Thanks everyone!
   Love you!
   Tara ;)

(What makes you think this is funny?)
(What makes you think this is funny?)

(TARA, CAT44, TOP2, MSG:27/M645;1)

>>>>> You forgot: "Don't play with HangTime, you don't know where he's been" -- Matt. <g>

I am so happy to be remembered for my impersonation (with Dean's help) of Beavis and Butthead. To me, that sums up what KansasFest is all about.

(QUALITY, CAT44, TOP2, MSG:30/M645;1)

KFEST -- OUR LAST REPORT   Believe it or not I'm only just getting back on-line from KansasFest. I didn't get home until something like 6:00 a.m. Monday morning and I slept the entire day away. I've been fighting some sort of low-level infection since just before KFest and it started hitting me pretty hard on the way home. Then I had to set my computer back up and had some personal stuff to take care of, so I'm just now catching up to messages from the last week!

KansasFest was a lot of fun as usual. I actually slept most nights this year, which was a change from my usual routine. (Yes, some people actually
DO sleep at KFest. It's not impossible. All you have to do is shut and lock your door. :-)

This year there wasn't a whole lot of news. There was 3D Logo from Byteworks, and that looks mondo cool. Other than that, most of what went on was exploration of things we already knew about, as opposed to new announcements. Randy Brandt's presentation on the new Appleworks, for example, was awe-inspiring. Bill Lynn did a great presentation on using Hypermedia to make great software for the disabled.

One significant bit of news from Jawaid Bayzar was that Sequential is planning to take over manufacturing, sales, and support of the RamFast SCSI card in the near future. I suppose we'll be hearing more about that soon.

There was more but I missed a number of sessions — I hope others can fill us in on those that I missed! Especially on Thursday's sessions, where I was most busy of all and missed nearly everything.

As usual most of the fun at KFest was after hours, wandering around meeting fellow Apple II users, talking about computers and everything else under the sun, and so on.

KansasFest is THE social gathering of the Apple II universe. Those of you who keep skipping it simply DO NOT know what you are missing.

Dean "Five year veteran, gunning for six" Esmay

PS — And after his roasting, Tom Weishaar was heard to say that he sure would like to hold KFest again. Let's all pester him so we can nuke those rumors about this maybe being the last.

FANTAVISION GS RESURRECTED  Several months back I purchased a IIgs "hard drive installable" version of Fantavision GS (formerly published by Broderbund).

The company now publishing this program is: Wild Duck Software, 979 Golf Course Drive, Suite 256, Rohnert Park, California, (707)586-0728.

The price at the time I purchased it was $59.00 + 3.50 shipping and handling (CA residents also pay State sales tax :-(.

This version is System 6.0 compatible and includes a Hyperstudio XCMD that allows you to directly import Fantavision GS animations into Hyperstudio. The program itself works pretty much (from what I can tell) the same as that released by Broderbund but as mentioned, this version can be installed on any hard drive.

Hope that this post is of interest to fellow "animalist:-)"

Also, I have one quick question... whatever happened to the animation program called "Animasia" that was supposed to be published this year for the GS... I recall downloading some of the pre-release info on this program but haven't heard anything about it for a long time... anyone got a clue???

PREVIEW WITH PAPERFREE... SOMEDAY    >>Is there a desk accessory or program
which allows one to see what something
looks like on a page before printing in a P16 program?

Marie,

Not yet but forthcoming 'Hot Products' from ECON Technologies list
something called 'PaperFree' which 'allows you to preview and manipulate
documents on screen before printing them out'. I'm quoting from ECON News and
it goes on to say that it will work with any GSOS application that uses the
print manager. This should therefore work with GWIII. Due for release mid-
summer at a retail of $39.95. Don't know what the mail-order price will be.

APPLENET 2.0 NEARS RELEASE   Since I last posted that bit in topic 1 about
AppleNET being "close enough for release", I've
gotten a couple of requests for me to release what I have now -- a "crippled"
version of AppleNET v2.0, if you please. I'm not sure if I'm comfortable with
this idea, as two of the most important parts are still not implemented (i.e.: messages and files). But, if enough people would like to see AppleNET v2.0b1
released to the public, I think I'd be willing to let it go into GEnie's
libraries.

What do you think?

STAR TREK: FIRST CONTACT V2.0   Here's a bit of advertising for those
Apple II gamers of a science fiction bent...

Star Trek: First Contact v2.0 is almost through its beta test. The game has
been significantly improved. Some of the highlights:

- More complex and detailed. Multiple landing sites on each planet.
- Much smoother operation. All those repetitious command sequences
  have been improved.
- New missions for the alien Intruder.
- Fully Apple IIgs compatible (no crashes!)

Release time (if all goes well) -- two weeks.
Apple II Computer Info

-Jim.

QFAX GS  As far as the modem goes....Check this out.

The Qmodem v32.bis 14.4 modem with send/receive fax. The modem also features:

- Real baud rate of 14,400 bps.
- With v32bis compression you can achieve connections up to 56,600 bps.

The modem has caller ID, send/receive fax, silent answer (automatically distinguishes between voice and fax or you can have it distinguish between fax and data).

Currently, the fax features only work on the Mac and IBM, but we're working on Qfax GS which will work with the modem. Initially it will be send only.

And for the price....hold on to your mouse:)

$299.95.

Quality Computers --- Power for performance

(W.CARVER1, CAT24, TOP5, MSG:125/M645;1)

>>> Bill,

Do you have any idea:
1) When Qfax GS may be available?
2) Whether it will be able to append scanned material, such as a signature?

(M.TOLCHIN, CAT24, TOP5, MSG:130/M645;1)

1> We don't have a release date as of yet. 2> Yes. If you use GraphicWriter or the AWGS page layout, you can include a scan of your signature

Quality Computers --- Power for performance

(W.CARVER1, CAT24, TOP5, MSG:133/M645;1)

>>> Sounds great. I don't suppose you can send a whole scanned page?

(M.TOLCHIN, CAT24, TOP5, MSG:137/M645;1)

>>> As long as it's a 640 graphic. Basically, if you can print it, you can fax it.

Quality Computers --- Power for performance

NEW COPILOT THIS FALL  I have the new CoPilot scripts for TIC and Spectrum about 99% completed.

After a lot of essentially wasted work, I have come to the conclusion that it is simply going to be impossible to continue to support Point to Point or versions of TIC older than v3.31 so far as the enhanced scripts are concerned.
To make this as clear as I can, CoPilot will continue to support PtP and older versions of TIC when it comes to uploading/downloading library files, RT messages and Email. However, the things we are doing with the enhanced scripts are as close to impossible as makes no difference with the older versions of TIC and with PtP.

As of the next release of CoPilot, FULL support will only be available to owners of TIC v3.31 or greater, ProTerm v3.0 or greater and Spectrum.

For those of you who have older versions of TIC your choice is to spend $15 for the upgrade or to be unable to use the "enhanced" features of the new scripts.

NOTE TO PtP OWNERS: You might have missed it, but Don Elton is offering an upgrade path for YOU. Send him your original PtP disk and he will sell you the latest version of TIC (4.0 is now released), complete with new manual, for the same price as the upgrade to TIC owners. $15 for one of the most powerful comm programs around is NOT a bad deal.

NOTE: Dons offer applies to ANY commercial comm program for the Apple II, so far as I know. So all you MouseTalk and Teleworks Plus owners (not to mention a lot of OTHER programs) should think about this real hard, it's a deal that can't be beat. :)

Now, let me tell you a little about what the enhanced scripts will do....

1. Allow you to cancel categories and topics, ignore categories and topics, and mark topics. (And this happens BEFORE you read messages. :)

2. Allow you to draw an INDex of a RoundTable and set you NAME in a RoundTable.

3. Allow you to set up a library search while offline and have it run automatically when you go online.

4. Allow you to set up a message search (by date and/or message # and/or author etc.) while offline and have it run automatically when you go online.

5. Allow you to prepare Xmodem Email while offline and have it sent automatically.

6. Allow you to retrieve Xmodem Email automatically (unattended).

7. Allow you to prepare files to upload to the library while offline and have them upload automatically when you go online.

8. Allow you to check libraries for new uploads once a day, automatically.

9. Allow you to do a RAM instead of a BRO NOR. (FINALLY :)

10. Allow you to break out of the script between RTs without messing
things up. (Useful when you change your mind about doing EVERYTHING right now. :)

Those are the high points. There are a few more minor things that I can't think of right now.

I am CONSIDERING a "personal menu" option that will allow you to call your own scripts from the "enhanced" CoPilot menus, but unless I can make it work smoothly and without much room for error, it won't happen.

Oh, yeah, you'll be able to download the GENieLamp automatically with the new version.

SOME of these things take a bit of configuration, but mostly it is a question of putting a specifically named text file in the GEFiles folder.

I think this update is going to be real popular.

Right now we are working on the translation of the TIC scripts to ProTerm. Once that is done, we'll be ready to go with this. Unfortunately, for all its power, PT3 is a bit more difficult to script for than TIC, so this will take a bit. We're shooting for Labor Day weekend, but DON'T count on it. :)

Gary R. Utter
(GARY.UTTER, CAT10, TOP11, MSG:160/M645;1)

>>>>> From the "good news/bad news" department.....

The bad news is that it now looks EXTREMELY unlikely that we will be able to deliver the new scripts by Labor Day weekend.

The GOOD news is that the reason for the delay is that we are adding even MORE neat features.

1. Ability to set your choice of directory for downloaded files for EACH RoundTable. (finally, eh? :)

2. Ability to set up a list of RTs from which to get a "new files" list, which will be run automatically, once in any given 24 hour period.

3. Ability to do a delayed logon.

4. Ability to toggle the state of Xmodem Email downloading, either automatically, or manually.

There will probably be a couple of other things as well, keep your fingers crossed. :)

Gary R. Utter

APPLE EXPO BOSTON POSTPONED Word has it that Apple Expo Boston has been postponed from October to April. Anyone have any additional information about this?

Tyler
Joe Kohn

SIX PACK BUGS FIXED; NEW FEATURES

The Six Pack bugs (with CdevAlias and the Alarm Clock NDA) have been fixed. Call 1-800-777-3642 for an update.

The BIG update to Six Pack is not quite ready yet. Actually, the coding is all done. The only things left are to squeeze out any last minute bugs that appear (i.e., do some final testing) and to write up some documentation for the changes and NEW (hint hint) stuff. Of course, after that it has to get printed and the programs placed on disk, etc. Timetable? No release date available until the testing is complete, because this is a variable. If all goes well, a great new 6Pack will be available soon...

Can't talk about un-released material, BUT...

+ A number of user-suggestions have been implemented
+ Eight of the existing programs have been enhanced
+ Four new programs may be included in the new release

In general terms, the big changes are...

+ Six Pack modules will talk to and cooperate with each other as well as the Finder
+ The new programs are great!
+ A great happy surprise for SuperDataPath fans
+ Using the finder will be easier and more productive then ever, with lots of functions just a Click or a Keypress away...

Hope that whets some appetites!!

Bill {W.TUDOR}

Here's another little peek at what's coming...

SuperDataPath in _Save_ dialogs!!

>>> MESSAGE SPOTLIGHT <<<
>Gee...I'd like to get a new house with a pool for $2000. And NO
>SHACK! A complete system for $400 and "NO JUNK"?  

$400 DOES seem a bit low for a complete system. However, the way GS stuff is selling right now, as a starting offer it's about right. In my locale, complete systems (some fully decked out) are going for $550 to $600. This is hardly a GS system's functional value, however.

My advice to anyone thinking about selling their GS is: (A) Take your time, and part it out. You'll make more on it, but you'll have to wait for your money. Or, (B) KEEP YOUR GS! As a functional tool, it's worth much, much more than the $500 to $600 you'll get for it (if you get ANY offers at all).

>Mac people consider it junk

Grrrrr! Heck, the dern thing's got a 24-bit-wide data bus, DMA, fully addressable 8MB RAM capability, 4096 colors, FULL OS with the friendliest, object-oriented, graphic-based user interface you'll ever see on ANY machine, including a MAC. It's got TrueType, multitasking, aliasing and file compression extensions... With an RF card and Zip it'll literally run rings around any 386/16...or more than 90% of the DOS boxes in use today, to say nothing of MAC Classics, LCs and many IIs.

DOS still hasn't effectively broken the 640k RAM barrier, not even DOS 6.0, (btw)... and never will. While Windows may look pretty, it runs on DOS, and the majority of the <<real>> work gets done in DOS sessions, anyway. Windoze is a VERY POOR, unfriendly, system-jamming imitation of the Apple user interface, which does little more than steal your RAM and your $$$$. While MACs have a friendly, pleasing interface, most of them can't expand, are often subjectively slower than an unaccelerated GS, or any GS with RF card for that matter. None have a character-based user interface option except for the LC in 8-bit emulation (which, btw, is a joke standing next to a GS running the same software).

The GS is__ still__ a superior machine to most of the computers in use. Why sell it, when most people don't realize how good it is and aren't willing to pay what it is worth as a tool? Don't get caught up in glitter and hype, or be panicked by the fact that Apple has stopped selling the GS. Make hard, objective comparisons before you buy or sell. Consider your needs, and consider the fact that eventually the GS may be worth a lot more money, market-wise. Anything less than that may be a waste of your dollars and your sense. :)

J-Bird <<WHO GOT THE LAST GS??>>

A2.LUNATIC [Lunatic] at 05:24 EDT

The "visionary" aspect of Apple Computer has ALWAYS been taking an existing technology and implementing it in a consumer product, though. Just like Ford invented the Model-T, not the automobile, Apple didn't actually invent the personal computer, they invented the Apple II. They didn't invent disk I/O, they invented an AFFORDABLE disk I/O device (the Disk II).
They didn't invent the GUI, they invented the Lisa/Macintosh GUI (the first mass-market, popular GUI). Likewise, they didn't invent the mouse, laser printers, the SCSI interface, SIMM sockets, 3.5" floppy drives, or many other things that are now taken for granted with 90% of the new personal computers sold today. They did, however, use them first on widely available popular personal computers. So Apple didn't invent the PDA, so what? The Newton still looks to be the Model-T of the future PDA world. Apple got into the true laptop arena late, but boy those PowerBooks sure look nice compared to the MS-DOS/Windows laptops currently available, don't they? Nice enough that even a lot of DOS diehards bought them.

"Apple's NEVER been an "inventing" company. They make a lot of great actual products out of the raw clay (ideas) from others, though. THAT'S how they are "visionary." It may just be that now with so many other potters at their own wheels, the products of any one potter are much less distinct and unique. Plus it's so much more cutthroat now that everyone's trying to find out what everyone else is doing, and beat them to market. Even without spying on each other, everyone is trying to find ways to come up with the same result, and naturally more than one company is likely to follow the same path, independently.

Lunatic     (:

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

>>> JOKEMASTER'S COMPLETE LIST OF BOGUS VIRUSES-POLITICAL VIRUSES <<<
"""""""""""""""""""""""""
BILL CLINTON VIRUS   This virus mutates from region to region. We're not exactly sure what it does, but may be taxing to your system.

BILL CLINTON VIRUS - Strain 2   It doubles the files on your hard drive
while it states it is decreasing the number of files, increases the cost of your computer, taxes its CPU to maximum capacity, and then uses Quicken to access your bank accounts and deplete your balances.

AL GORE VIRUS Not strong enough to act on its own, but when combined with another virus it hops on a bus and travels around the system.

ROSS PEROT VIRUS Similar as the Jerry Brown Virus, only nicer fonts are used, and it appears to have a lot more money put into it's development. Unknown effects, but just when you think it's quit... IT'S BACK!

ROSS PEROT VIRUS - Strain 2 Activates every component in your system, just before the whole thing quits.

ROSS PEROT VIRUS - Strain 3 After several years, the damage caused by this little virus is still unclear. It often displays impressive graphics which have little relevance to the users interests or needs.

Thinking About Online Communications

By Phil Shapiro
[P.SHAPIRO1]

>>> THE SOCIAL RAMIFICATIONS OF LOW-COST HIGH-SPEED MODEMS <<<

Every advance in communications technology brings with it a concomitant advance in human welfare. The easier and less expensive it becomes to communicate at long distance, the greater the benefit to society as a whole.
For instance, when long-distance modem communications is made less expensive, new opportunities open up for software developers around the country to collaborate on new software development projects. Naturally, society as a whole benefits from the fruits of software development projects.

Likewise, when long-distance modem communications is made less expensive, doctors in different parts of the country can more easily share the results of medical tests, medical records, and medical research. Society, as a whole, benefits substantially in this way.

In a similar way, engineers and scientists can benefit from the lower-cost interaction. Writers and artists can more easily communicate, resulting in a more productive cross-fertilization of ideas. Students can benefit from having access to more information resources at their fingertips.

So when U.S. Robotics introduced their popular "Sportster" high-speed modems a few months ago, the online world quickly became abuzz with excitement. With a street price of under $200, these new modems bring high-speed communications within the reach of many individuals and small businesses.

Other modem manufacturers have made similar price cuts in their line of high-speed modems. What makes these high-speed 14,400 bits-per-second modems so useful is that they allow even large files to be transmitted in a matter of minutes.

But what are the social ramifications of individuals and businesses connecting at 14,400 bits-per-second? Many and varied.

In a manner of speaking, high-speed modems shrink distances across the country. With the advent of low-cost high-speed modems, California becomes closer to Washington DC. In the past, physical distances served as a barrier between people. Three hundred years ago, if someone lived more than a hundred miles away from you, you might never have a chance to meet them in your life. Today, the chances of your exchanging ideas with someone across town are almost the same as the chances of you exchanging ideas with someone across the country.

Those of us who have been involved with online communications are so accustomed to incremental improvements in telecommunications technology that it is difficult to appreciate when a truly breakthrough development occurs. The introduction of low-cost high-speed modems in the past few months is the type of advance that will bring a quantum increase in social benefits, both near and far.

In a sense, modem manufacturers are involved in producing a tool that brings benefits to people in all walks of life -- regardless of whether they themselves personally make use of the new communications technology. A reverberation of benefits will be accruing to society as a whole as high-speed modems penetrate our homes and businesses.

A round of applause, please, for U.S. Robotics, Hayes, Microcom, Practical Peripherals, Zoom, Supra and the many other modem manufacturers who have brought us forward to this point. Their work to bring cheaper, faster modems to market will produce social benefits whose importance we're only just beginning to fathom.
IN MY LAST ARTICLE I discussed putting together an Apple IIGS system, with the costs and possible sources of the equipment. This month, instead of the promised closer look at what you can do with a bare-bones IIGS system, I would like to define some terms that will be coming up as our discussion continues. The goal of presenting this word list is to make sure that the technical terms I will be using are clear ahead of time.

I am placing this list not in an alphabetic order, but rather in a topical order, so terms with similar or related meanings are defined in the same general area. If you want it alphabetized, I leave that as an exercise for the reader.

WARNING!! The National Weather Service has issued a Flash Word-Flood Warning, effective immediately for all computers downstream of this issue of the GENieLamp. Be prepared to sandbag your monitor, in case the flood of words gets too overwhelming. If you are unable to safely protect your desk, you are instructed to turn off your monitor or head for higher ground. Do not, repeat, DO NOT flush your buffer until that backlog has cleared, and boil all of your floppy disks before using them.

RAM: Random-Access Memory Can refer to the memory chips in the computer ("I had to order eight of the RAM chips to increase the memory in my computer.") Also used in the context of how much memory is available ("This software package requires a minimum of 768K RAM.") What is important to remember about the RAM used in your computer is that it holds data only as long as power is supplied; if you lose power or shut the computer off before saving your work, it will be gone.
ROM: Read-Only Memory    Electronically the same thing as RAM, with one
                     exception: the programs or data in ROM do NOT
disappear when power is shut off. Thus, ROM is used in to hold
instructions for the computer that are expected to be available at all
times, even when first turning on the computer. This makes the computer
smart enough to get itself started with little intervention from the user.
Although ROM may also be referred to in terms of how many "K" or "megs" it
holds, you cannot store any new data on top of what is stored in ROM; it is
not erasable.

HARDWARE   The physical components of a computer (i.e., the computer
                 itself, the keyboard, disk drive, monitor, etc). Primarily
                 refers to what can be physically picked up, touched, smelled, tasted, or
                 can be modified with hand-held tools.

SOFTWARE   The programs you run on your computer. Software is definitely
                 NOT something that you can handle physically, although the
                 disks on which a program is stored CAN be. Because ROM is unchangeable,
                 software is loaded into RAM and executed in RAM.

FIRMWARE   This is software that has been stored permanently in a ROM chip.
                 It is called "firm" instead of "soft" because it cannot be
                 modified or erased. The Applesoft BASIC interpreter that is part of every
                 Apple II from the II Plus up through the IIGS is an example of firmware.
                 The built-in software routines in the IIGS that manage memory, graphics,
                 and many other functions are also firmware.

MICROPROCESSOR   The "brain" of a computer. This is an integrated circuit
                 that is able to manipulate the data in RAM or ROM and
                 come up with a result through a set of specific steps, or instructions.
                 The microprocessor used in the original Apple II, II Plus, and unenhanced
                 IIe is the 6502; in the Apple IIc and the enhanced IIe it is the 65c02; and
                 in the Apple IIGS it is the 65816. (For those interested, the 6502 is also
                 used as the brains of the Nintendo game system, and the 65816 is the brains
                 of the Super Nintendo.)

                 The microprocessor used by the Macintosh, Amiga and Atari ST computer
                 is the Motorola 68000 series (68020, 68030, and 68040 are progressively
                 more powerful and sometimes faster versions of this processor). The IBM
                 series has used microprocessors made by Intel, with names like 8088, 8086,
                 80286, 80386 (or 386), 486, and now Pentium (previously known as 586 or P5).

8-BIT   The 6502 and 65c02, used in the Apple II, II Plus, IIe, and IIc, is
                 an 8-bit microprocessor, since it handles 8 bits (one byte) of
data at a time. It has an address width of 16 bits, which makes it
possible to handle 64K of RAM (65,366 bytes) at any one time. In order for
certain programs (such as AppleWorks or Publish It!) to use larger amounts
of memory, those programs do what is known as bank-switching, where they
jump among various 64K banks of memory. The 6502 is still working with
only 64K at a time, but it is being fooled into handling larger amounts of
memory. This is somewhat workable, but the memory management is still
somewhat difficult, and not many programs have been able to do this.

16-BIT   The 65816, used in the Apple IIGS, is a 16-bit microprocessor,
capable of handling 16-bits (two bytes) of data at a time. It
has an address width of 24-bits, which makes it possible to handle 16 megs
of RAM (16,777,216 bytes) at a time. This chip can treat all of this
Apple II Computer Info

memory as one large continuous space, and does not have to use any complicated bank-switching scheme as does the 6502/65c02 processors. Because of design limitations, however, the Apple IIGS can use only 8 megs of this address space for RAM; the other 8 megs is partly used by the system ROM, but is otherwise unavailable.

DECIMAL  The base 10 system of counting, where ten digits (from 0 through 9) are used to represent numbers. The number "234" in the decimal system refers to:

\[
234 = 2\times10^2 + 3\times10^1 + 4\times10^0
\]
\[
234 = 2\times100 + 3\times10 + 4\times1
\]
\[
234 = 200 + 30 + 4
\]
\[
234 = 234
\]

(Note that in algebraic notation, "10^2" means "10 times 10", or "10 squared", or "10 raised to the second power". "3\times10" means "3 times 10").

BINARY  The base 2 system of counting, where two digits (0 and 1) are used to represent numbers. On computers, the percent symbol is sometimes used to depict a number as binary, particularly in a language known as assembly (which deals with the function of the computer on the level of the microprocessor). The decimal number "234" would be represented in binary as "%11101010", or:

\[
%11101010 = 1\times2^7 + 1\times2^6 + 1\times2^5 + 0\times2^4 + 1\times2^3 + 0\times2^2 + 1\times2^1 + 0\times2^0
\]
\[
%11101010 = 1\times128 + 1\times64 + 1\times32 + 0\times16 + 1\times8 + 0\times4 + 1\times2 + 0\times1
\]
\[
%11101010 = 128 + 64 + 32 + 0 + 8 + 0 + 2 + 0
\]
\[
%11101010 = 234
\]

HEXADECIMAL  The base 16 system of counting, where sixteen digits (0 through 9 and A through F) are used to represent numbers. This system was designed to make the expression of numbers on a computer easier, since it still shows something about what the number is in binary, but uses fewer digits and is easier to read (once you get used to it!). In this system, the digits 0 through 9 have the same meaning as in the decimal system, but the letters A through F are used to represent the decimal numbers 10 through 15.

On computers that use the 6502 or 65816 microprocessor, it has become customary to designate hexadecimal numbers with a preceding dollar sign. (Other computers may use the letter "H", as "HEA" instead of "$EA"). The decimal number "234" would be represented in hexadecimal as "$EA", or:

\[
$EA = E\times16^1 + A\times16^0
\]
\[
$EA = 14\times16^1 + 10\times16^0
\]
\[
$EA = 14\times16 + 10\times1
\]
\[
$EA = 224 + 10
\]
\[
$EA = 234
\]

It is easy to determine the binary equivalent of a hexadecimal number, simply by taking it a hex digit at a time ($E = %1110$, and $A = %1010$, so $EA = %11101010$).

BIT  A single binary digit, which can be on or off, one or zero. It is the smallest piece of data that can be manipulated at a single time by a microprocessor.
Apple II Computer Info

NIBBLE   One half of a byte, or four bits, this term is not used much by non-programmers. The byte $EA is composed of two nibbles, $E and $A.

BYTE   For the sake of convenience, bits are usually clumped together into groups of eight. A group of eight bits is called a "byte", and can be any number from 0 to 255 (decimal). Thus, the number "0" is "%00000000" in binary, and the number "255" is "%11111111" ("$00" and "$FF" in hexadecimal, respectively).

KILOBYTE   Also known as "K", this is from the metric system method of designating one thousand. However, since computers think in binary, 1 kilobyte is not exactly 1000 bytes, but rather 1024 bytes ($2^{10}$, or 2 multiplied by itself 10 times). Computer memory and disk storage have usually been designated in "K", but with larger and larger sizes of memory and storage becoming available, this is becoming an outdated term. The Apple II Plus came standard with 64K memory ($64*1024$ bytes = 65536 bytes of memory).

MEGABYTE   Also known as "meg" or "MB", this is also from the metric system for one million (or a thousand thousand). Again, this does not refer simply to 1,000,000 bytes, but to 1024 K, or $1024*1024 = 1,048,576$ bytes. The Apple IIGS is capable of handling up to 8 megs of memory, and a common size for a hard disk is 40 megs.

MONITOR   This is used in two ways on the Apple II:

1) "monitor" (not capitalized) refers to the screen or CRT (cathode ray tube) used as a primary display device. A monitor may be monochrome (usually a black background with characters in white, green, or amber), or RGB (Red-Green-Blue) color monitors. A standard television could be attached to a computer, but the resolution is usually not high enough to properly display 80-column text in a legible fashion. A IIGS is most useful (and fun!) with an RGB monitor, but will work acceptably with monochrome. Monitors with names like CGA, EGA, and VGA are primarily for the IBM series of computers, and refer to increasing graphics capabilities.

2) "Monitor" (capitalized) refers to a program in ROM that is used to examine the values of memory addresses, clear the screen, send a character to the printer port, read a keypress from the keyboard, and many other functions.

MOTHERBOARD   Refers to the large circuit board inside the computer. The motherboard holds the electronic circuitry that makes the computer work, as well as places where external devices (such as a keyboard, mouse, monitor, etc.) may be attached.

SLOT   This is a long socket on the motherboard of a computer into which a peripheral card may be plugged. The IIGS has seven slots along the back side of the motherboard, and another one on the right front that is reserved specifically for memory expansion cards.

PORT   This is the designation given to a place where an external device may be attached to the computer. The back panel of the IIGS has a printer port, modem port, disk port, RGB monitor port, monochrome monitor port, and keyboard port.
 INTERFACE   An interface is something which translates something into something else. For example, a keyboard is an interface that translates letters and numbers that humans understand into digital electronic signals that the computer can comprehend and act upon. A monitor is an interface that translates those digital electronic signals into a visual representation that humans can read.

Interfaces are also used between electronic devices. A disk drive uses digital information in a manner different from that used in RAM chips, so an interface card (also called a controller card) is needed to translate from the language understood by the disk drive to that understood by the computer.

PARALLEL INTERFACE   An interface that transmits data to another device through eight or more parallel wires, where each line carries a single bit of information. This allows a full byte to be sent at once. Parallel cables look like flat ribbons.

SERIAL INTERFACE   This type of interface sends data to another device as a continuous stream of single bits. The cable for a serial device is simpler (fewer wires) than the cable for a parallel device, and generates less radio frequency interference; however, it may not be as fast as a parallel device, since it takes longer to send a stream of eight bits than it takes to send eight bits simultaneously.

MOUSETEXT   A set of pictograms that can be displayed on the standard text screen of a IIGS, IIc, or enhanced IIe. These lines, arrows, pointers, and other symbols can be used to highlight plain text. They cannot be directly generated by typing on the keyboard, but must be "printed" to the screen in a particular way.

INTERRUPT   This is a special signal sent to the microprocessor that tells it to stop what it is doing, and start running a special program elsewhere in memory. Certain types of interrupts (such as pressing the Control and RESET at the same time) can never be avoided; the microprocessor MUST respond to that type of interrupt. Other types of interrupts can be temporarily disabled by programs that cannot allow themselves to be interrupted (such as the timing routines used by the software that controls disk drives).

CLASSIC DESK ACCESSORIES (CDAs)   Add-on programs that are available at any time, while using any program on the IIGS, whether 8-bit or 16-bit, as long as that program does not disable interrupts. (A keyboard interrupt is responsible for getting the attention of the microprocessor and displaying the CDA screen.)

NEW DESK ACCESSORIES (NDAs)   Add-on programs that are ONLY available when running 16-bit software that supports access to them (i.e., it must display a menu bar at the top of the screen, and have the solid apple symbol displayed on the left edge). These programs can be and usually are more complex than CDAs.

NEXT TIME   Tune in again next time for a discussion that deals with the IIGS Classic Desk Accessories, focussing on the all-important Control Panel. We'll get to what can be done with a minimal GS system yet. I promise.

Really.

Should you buy now or wait for lower prices?

That question, often ignored by computer publications, is really more important to most users than whether the latest microprocessor is 2.5-times faster than the last release or will really only run their software 2.25-times more quickly.

Because most users never push their hardware or software anywhere near the limits, few buyers really care about the fastest hardware and instead are far more interested in the cost of just enough power to meet their particular needs.

These days, that generally means a 386SX if you don't run Windows, and a 486 if you do, or whatever Macintosh you can afford if you are Apple-oriented.

With the steady deterioration in profit margins for manufacturers and a consequent Dutch-auction atmosphere among buyers, you really have to give some serious thought to non-essential new hardware purchases. (A Dutch-auction just means that, unlike normal auctions where people keep bidding prices up, prices are constantly marked down until products sell.)

Obviously, if you need new hardware then you buy it now, selecting among vendors based on price, quality, and options. This also holds true if you don't have a computer yet - they are such powerful tools that virtually every business and many individuals really need one and the price/pay-off ratio for a first computer has been right for almost a decade.

But what if you would like to upgrade although you don't really need to yet? In that case, your real problem is not selecting a vendor but deciding if prices will continue to drop.

Apple Computer, after suffering the worst fiscal quarter in its history, will obviously have to continue its recent price-cutting ways and work at reducing costs if it wants to improve or even maintain its market share.

Price cuts continue for two basic reasons. First, competition is really getting to cutthroat proportions as more and more buyers are
discovering that, to paraphrase Gertrude Stein, a PC is a PC is a PC. And, second, efficient PC makers can afford to cut prices because component prices are continuing to fall. Intel's 486 processor prices are falling and will probably plunge when AMD starts selling large numbers of its compatible chip.

Also, if you have delayed buying a large hard drive because of high costs, then you obviously haven't been paying attention because many drive prices have dropped by as much as 50 percent just since January.

Don't look for prices to ever go much below $1,000 for a decent computer simply because it costs that much to package, market, warehouse, and support a hardware package at a reasonable profit, but if you are looking at desktop computers priced in the $2,000 to $3,000 range then you can expect to see more features along with larger memories and hard drives added to specific clone models and lowered prices on big-name computers in that price range.

If you are looking at workstations, and especially servers priced from $5,000 to $20,000 or more, then hold on to your hats because it looks as if hardware prices will really plunge.

Why wouldn't they, when you can assemble a 66-megahertz 80486-based server-type system with 16 megabytes of memory and a pair of gigabyte plus hard drives for less than $5,000?

Notebooks are the one major area where prices may have bottomed out and could even increase. Recently Compaq's notebook manufacturer, Citizen, stopped shipping computers to the Texas-based company because the drop in value of the US dollar versus the Japanese yen has meant that Citizen had lost its entire profit margin on the deals.

This upward price pressure may well continue and spread since most notebook computers and all notebook display screens are made overseas and the dollar shows no real signs of strengthening.

(John McCormick/19930716/)
File Type : SHAREWARE! $5.00

ABOUT THE PROGRAM Here is a program that was designed to do only one thing, convert Graphic Interchange Format (GIF, pronounced "jif") graphics into Apple IIGS 320x200 16- or 3200-color graphics. The GIF graphics format was developed by CompuServe to provide a means for exchanging graphics among the different computer platforms. Until now, Apple IIGS users weren't too keen on GIF, mainly due to the poor results seen when GIF graphics were converted to IIGS format. This is no longer the case.

GIF.3200 v0.20, under development by Jonah Stich, has opened the world of GIF graphics to IIGS users. The results are the best graphics that I have ever seen on the Apple IIGS, especially those GIF graphics converted by GIF.3200 to the 3200 color format. Version 0.20 added two important features that no other IIGS GIF conversion program that I know of has: (1) the ability to handle more than 16 colors; and (2) the ability to convert graphics larger than 320x200 pixels.

GIF graphics may range in size from 300x100 to 640x480 and even larger. The 640x480 size is common and is roughly twice the size of a IIGS screen. There may be 16, 256, or 4092 colours per screen.

Converting a 320x200 GIF graphic is simple, just open the GIF file and the program will handle the conversion. When you open a file, the IIGS screen looks like this:

--------------------------------------
_________
Horiz size: 640+ |_________|
_________
Vert size: 480+ |_________|
Color map size: 16777216
Pixel map size: 256
Quantize: Pre-scale COLOR
X Scale: 1:[]| Y Scale: 1:[]
OKAY CANCEL
---------------------------------------

This is what you would see if you opened a GIF file 640x480 with 16777216 possible colors with 256 colors available per screen. To convert this GIF file directly to a 320x200 IIGS screen, just choose an X Scale of 1:2 ratio and Y Scale also to a 1:2 ratio, which will reduce it to half size.

There is a second method of converting this GIF file and that is by using the Horizontal size and Vertical size boxes. Picture in your mind a graphic 640 pixels wide by 480 pixels high. We are trying to draw that on a IIGS screen that is 320x200. If the Horizontal size and Vertical size boxes both contained 0, your IIGS screen stops when it reaches the 319th pixel... that is, it draws only the upper left quarter of the GIF graphic. By entering 20, for example, in the Horizontal size box, you move the GIF
20 pixels to the right and now cover pixels 20 through 340. If you then enter 200 in the Vert Size box, the GIF is moved down 200 pixels and you are looking at the lower half of the GIF graphics. Therefore, by keeping the X and Y Scales at a 1:1 ratio, you select various portions of the original GIF graphic and view them at their original resolutions. To view the whole thing, you just convert several graphics to IIGS format. This is a powerful feature of the program.

Note that in the above example the GIF graphic is 480 pixels high. If you wanted to center the picture vertically for a full IIGS conversion you would set X and Y to 1:2 ratio and input 40 into the Vert Scale.

Quantizing determines which algorithm is used to convert the colors. There are seven quantizing options. There are four for 16 color format: Pre-scale Color, Post-scale Color, Grey scale and Median-Cut. The other three are for 3200 color format, 3200 Color (post), 3200 Color (pre), and Median-Cut 3200. The "pre" options are quick but crude conversions used for looking at the GIF file before converting it. Use these options to figure out how to set the scaling and sizing before making your conversion. The finest conversions are obtained by using the Median-Cut and Median-Cut 3200 options. However, these are also the slowest and may take as much as 20 minutes.

GIF.3200 v0.20 is shareware and has a modest $5.00 fee. As you can tell by the version number, this program is still unfinished. The last rumor that reached our ears was that Mr. Stich was attending UC Berkeley and has not been an active Apple II programmer for some time. I am hoping that this review will rekindle the author's interest in finishing this program and in adding the features he mentioned in the documentation (written in 1990), such as converting to a larger format, 320x396 "page" format or even multiple screens, saving to other formats (such as APF, PWG, 3201), and speeding things up. The conversions do take a long time! If you download this program and would like to see it developed further, send in that all-important shareware fee! You should be able to contact Jonah on GENie at J.STICH1.

One last word about converting GIF files. Your conversion is only as good as the original graphics. GIF.3200 will not make a bad GIF file into a good IIGS graphics.

You can download GIF graphic files from most of the computer RTs on GENie, but the best place is from the Photobase RoundTable, keyword PHOTO.

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 933 of 1824
Finder is starting up. This program is $3 shareware, Copyright 1992-1993 by Lunatic E'Sex. Send fees to the address enclosed, or send a $3 GEnie Gift of Time to LUNATIC. Includes a "Read Me" file. Packed with GSHK. Includes resources.

Keywords: Under the Rug, Rug, Finder extension, FExt, Trash Can, hide trash, kids, children

Number: 21061 Name: FIXFONTMGR.BXY
Address: BRYAN.ZAK Date: 930718
Approximate # of bytes: 2688
Number of Accesses: 301 Library: 6

Description: If you use System 6.0.1 this is a *MUST* download. Nathan Mates discovered a bug in the ChooseFont routine and has been nice enough to write this patch program. If you have Pointless, it will eliminate the need to be sure that there is at least one bitmap of each TrueType font in the system. Packed with ShrinkIt.

Keywords: Font Manager, Pointless, bug, patch, fix, bugfix, 6.0.1, system 6.0.1, Westcode

Number: 21071 Name: NTV16.BXY
Address: G.MCHUGH1 Date: 930720
Approximate # of bytes: 500096
Number of Accesses: 30 Library: 25

Description: Another GREAT music & graphics disk from the One World Wizards. You can read about this disk before downloading it by listing the text file, "About NTV16" located nearby in the library. Enjoy! This is a packed disk. Use ShrinkIt to unpack to a blank 3.5" disk. [Note: There have been problem reports from ROM 03 owners concerning the NTV disks. If you have a ROM 03, this program might not work for you.]

Keywords: Sound, Music, One World, Dr. Tom, Vamps, NTV

Number: 21108 Name: POWERPLAY.BXY V1.1
Address: P.BRINKLEY Date: 930802
Approximate # of bytes: 50176
Number of Accesses: 119 Library: 21

Description: PowerPlay is a GS program containing 4 different games. An earlier version (1.0) is not System 6 compatible. The 4 games are: Tron -- A 2-player light-cycle race game. FourPlay -- A brain-twisting Tetris-like game. GridLock -- A puzzle with ever-increasing complexity. PIgnBULL -- A number matching game, similar to Mastermind. This program is FREeware. Have fun. The GASMAN

Keywords: Powerplay, tron, pignbull, gridlock, fourplay, gasman, mastermind

Number: 21041  Name: VIRTUAL.BXY  Address: B.DUNST  Date: 930712
Approximate # of bytes: 54272  Number of Accesses: 156  Library: 22

Description: This is an awesome little program that will put your graphics on 'walls' and enable you to walk around this 'virtual art gallery.' It accepts $C1 uncompressed graphics, $C0 Paintworks 320 (top half only), PackBytes/Eagle format (all), and Apple Preferred Format. Requires System 5.0 or higher, 1 meg of ram. Written by the infamous Jason Harper! Compressed with GS ShrinkIt version 1.1. This little ditty is really something. I would recommend getting it. Ever play Wolfenstein on the IBM? This is just like walking through those hallways and seeing the pictures on the walls scale. Uploaded by the one, the only...B.DUNST!!!

Keywords: Virtual Reality, Art Gallery, Slide Show, Jason Harper, Pictures, Graphics

Number: 21034  Name: SAP.V0.7.BXY  Address: K.MOCK  Date: 930710
Approximate # of bytes: 212864  Number of Accesses: 79  Library: 22

Description: Updated version of SAP, the Simple Animation Program. SAP is the only freeware animation system for the GS, and the only one which is still supported! This version adds additional power to version 0.5. It allows for user interaction and provides looping capabilities. See the accompanying SAPDEMOV0.7 for a demonstration of the new capabilities. This disk contains complete docs and a tutorial. A GS with a hard drive, accelerator, and 2 megs of RAM is recommended, but not required. Unpack with ShrinkIt GS and you're off...

Keywords: SAP, 0.7, animation, multimedia, freeware, graphics, sound

Number: 20996  Name: CAF.RESUR.BXY  Address: H.PORTNOY  Date: 930630
Approximate # of bytes: 50816  Number of Accesses: 97  Library: 40

Description: CHANGE-A-FILE V.4.17 and RESURRECTION V.2.9. CAF, a batch file utility: Read AWP and TXT files; convert AWP to TXT, TXT to AWP, and AWP 3.0 to 2.x; Repair ADB and AWP files; change file info, strip linefeeds and more. RESURRECTION restores files even when disk directories are damaged. Docs included. Partially free and partially shareware. $10 for both.

Keywords: AppleWorks, CHGFIL, Resurrection, Repair, AWP, ADB, Strip, Linefeeds, Restore

Number: 20975  Name: GS.ENTERTAN.BXY  Address: C.KERN1  Date: 930623

Keywords: Mohawk, picture, CDev, Color CDev, MST3000, Ozoneman

Sometimes files are removed from the library after we publish this magazine. In many cases, the removed file has been replaced with an updated version of that file. If you can't find one of the files listed here, there is a way to check for a newer version. Do a keyword search on the library using a word that describes the file you are looking for. Chances are, you will find a newer version of that file, or another file that meets your expectations.

////////////////////////////// GEnie_QWIK_QUOTE ////
WHO'S WHO In Apple II

~ GEnieLamp Profile: Joe Kohn, Publisher-Editor, Shareware Solutions II ~

**GEnieLamp**> Would you tell us how you first became interested in the Apple II? Was it your first computer?

**Kohn**> I bought my first computer in about 1980. At that time, I narrowed my choices down to two competing systems: The Apple II and the Atari 400. I clearly remember reading that there would be a shake-out in the computer industry, and believed that I should purchase a computer from the company that I thought would be around for a few years. Based on that sound reasoning, I bought an Atari 400.

A year or so later, I went back to my computer dealer, and asked about a new peripheral that I'd heard about. He explained to me what a disk drive was, and after having used cassettes for storage, I wanted one. Unfortunately, the dealer explained, disk drives cost as much as my entire system had cost, and they couldn't be connected to the Atari 400.

I wanted a new computer. I wanted one with disk drives and with lots of power. I wanted a computer that came from a visionary company that would be in business for years and years. So, I got an Osborne I.

A year or so after that, I got an Osborne Executive. It was everything I could have wanted in a computer. It was portable, it had built-in parallel and serial ports, it had a large 8" screen, it ran CP/M, and best of all, it came bundled with word processing, spreadsheet and database software. The database software, quite literally, changed my life. I realized that computers could store any type of information, and I decided that I wanted to master dBase and offer my services setting up and maintaining databases.

Around that time, I was visiting a friend who'd just gotten an Apple II. We were arguing about the merits of our computer systems. I told my friend: "I can run WordStar on my system". He said: "So can I." I then told him: "I can keep financial records on my computer with a spreadsheet. He said: "So can I." Finally, I used my ace in the hole, and said: "I can keep any type of records using dBase." His response, of course, was "So can I."

He then used his ace in the hole. He sat me down in front of his computer, and started up a program named Lode Runner. He watched as my jaw fell, and smugly asked me if my computer could do that.

Two days later, I purchased an Apple II+.

**GEnieLamp**> You used to be sysop of the Apple II forums on The Source, one
It was a case of coincidence and serendipity. In the mid-1980s, a good friend and I, George Goldsmit (the owner of The Apple Resource Center in Tracy, CA) put our heads together trying to figure out a way to support our Apple II habits. We set up and ran the Apple II Information Exchange (ATIE), which we envisioned as being a super User Group for User Groups. We were going to supply the Apple II user group community with technical information, articles for newsletters, and had plans to collect every single Apple II public domain program ever written.

George lived in San Jose at the time, not too far from Apple's headquarters. We registered ATIE with Apple's User Group Connection, and gave George's address.

In late 1986, the Source Information Network was looking for someone to take over and manage their Apple II forums. They contacted Apple to get a listing of Apple II User Groups based in Silicon Valley, and guess who appeared first in the alphabetical listing that they received?

Soon after we took over the Source's Applesig, George founded the ARC, and no longer had the time to devote to the Source, so Applesig became a "one-man band" for more than two years. During that time, I provided all the ongoing Apple II technical support and still had time to upload thousands of programs to the library.

I continued to run The Source's Applesig right up until its demise.

Big Red Computer Club is now known as the place that has resurrected classic Apple II software titles from publishers such as Activision. What was BRCC like when you became its freeware and shareware librarian?

I went to work for Big Red Computer Club two days after the Source closed down. At that time, BRCC was an Apple II user group and was essentially a family operation. I worked from my house, nearly 2,000 miles from the BRCC office. It was a great match, and I think that John Wrenholt and I were a great team. I wrote approximately 50% of BRCC's monthly newsletter and supplied 90% of all the Apple II and IIGS freeware and shareware in BRCC's library. I submitted all my articles via modem, mailed in all the master disks, and never once visited the BRCC offices.

After working for BRCC for two years, the organization had somewhat of a change of focus. It was then that BRCC started licensing and purchasing Apple II commercial software, and started its meteoric climb to become the largest publisher of Apple II software.

When you announced Shareware Solutions II, you joked that organizations that hire you fold not long afterward... The Source, Apple IIGS Buyers' Guide, and now inCider/A+. The Big Red Computer Club has survived your involvement. When did you leave there, and why?

It was a joke, but it has some validity. The Source sold their operation to their nearest competitor, who promptly put them out of business. Then, the Apple IIGS Buyers' Guide sold their operation to their nearest competitor, who promptly put them out of business. Then, inCider/A+ sold their operation to their nearest competitor, who promptly
put them out of business. I was starting to see a trend.

With Big Red Computer Club, we had an amicable parting of the ways about 1.5 years ago. And, despite my leaving, BRCC has flourished ever since.

GEnieLamp> You've been described as a "shareware champion" and "shareware evangelist". How did this start?

Kohn> The very day I purchased my Apple II+, I also bought 100 blank disks, and on my way home, I stopped by the offices of the San Francisco Apple Corps. Within a few hours, those 100 disks were filled.

That was long before the concept of shareware was developed, so all the thousands of programs on those 100 disks were all free. There was just something appealing to me about free software.

GEnieLamp> Do you yourself write programs?

Kohn> Not really.

GEnieLamp> Shareware users clearly have an obligation to pay for programs they keep. Do shareware authors have any responsibilities?

Kohn> At this year's KansasFest, I gave a talk on the very subject of shareware author's responsibilities. I expected my talk to be quite controversial, and was literally shocked when shareware programmers applauded me at the end. At some point, I hope to use those remarks to develop a "Shareware Code of Ethics".

In short, I do feel that a shareware author has certain responsibilities to their customers. If nothing else, they owe people who remit payments a note of thanks. It amazes me how many irate letters I get from users of shareware who tell me how bad and mad they feel after sending in money, and never hear anything back from the programmer, not even a 19 cent post card that acknowledges receipt of the payment, or offers a kind word of thanks. Often, programmers forget the importance of courtesy, and I'd like to change that.

I do have many other ideas on how shareware authors can maximize their profits with a minimal amount of effort, but I'd like to save those for Shareware Solutions II. Once I have written up the "Shareware Code of Ethics", I will be happy to share "the secrets of the stars".

GEnieLamp> Shareware Solutions was the name of your column, which of course focused on shareware, freeware, and public domain software. Does the newsletter only cover shareware, freeware, and PD?

Kohn> The title "Shareware Solutions II" is a misnomer, as in many ways, it turned out to be more like inCider: The Next Generation. I chose the name for one reason and one reason only: name recognition. I figured that after having written a column with that title for 4-5 years, first in the Apple IIGS Buyer's Guide and then in inCider/A+, that it would be a recognizable name for a new publication.

Of course, Shareware Solutions II is about shareware, but it's also
about solutions. Above all, it's about the Apple II.

Obviously, I'm biased, so let me share with you a few letters I've received from subscribers. They can tell you all about Shareware Solutions II.

David Kerwood writes: "I just received my copy of Shareware Solutions II, and I can tell you that I was very impressed with what you have done here. I suppose I have gotten most of the A2 newsletter-format publications that have ever been published since 1986 (when I first discovered the world of Apple II computing), and this has been the best premier publication in this genre that I have ever received."

William Scott writes: "Congratulations on the first issue of Shareware Solutions II. It is more than I imagined. It is well written, informative, and contains information not found anywhere else. Thank you for taking the chance, and supporting those who support the Apple II."

Bill Ingraham writes: "Issue 1 of Shareware Solutions II is really great. I had envisioned it as being all about downloading, and maybe a little news. Instead, it is loaded with news of the II world."

And, if I remember correctly, the interviewer also had a few choice words to say about Shareware Solutions II. Your turn, Mr. Cuff.

GEnieLamp> Thanks for ruining any chance I had at presenting a semblance of journalistic impartiality! <laughs> I believe I said that it was value for money, which in my personal opinion it certainly is.

Kohn> You wrote: "My rating of Shareware Solutions II, overall, is 'must-have'. The content makes you feel you're really getting your money's worth."

GEnieLamp> You announced your decision to start Shareware Solutions II in what proved to be the final edition of inCider. Did you decide to start your own newsletter because you knew inCider's days were numbered?

Kohn> Yes. I knew of inCider's plans at least 6 months before readers did, yet I decided to stick it out to the very end. It was only after my final articles had been submitted to inCider/A+ that I went forward with my plans to self-publish my own Apple II-oriented newsletter. Shareware Solutions II was announced in the July 1993 issue of inCider/A+, as I knew that was to be the final issue.

As an aside, I'd like to point out that I got in the last word. The last words on the last page of the last issue of inCider were supplied by me. Those magical words, of course, were "Apple II Forever."

GEnieLamp> This is your first venture as publisher and editor-in-chief. Do you find it a different experience from that of being a contributor to magazines such as inCider/A+ and The Apple IIGS Buyer's Guide?

Kohn> It's like night and day. As a Contributing Editor, I simply emailed my articles as ASCII text, and several months later, they appeared with art work and were polished products. Now, the text is just the first step of a long process. After writing each article, I have to
lay it out, test print it many times to make sure everything fits and looks
good, bring the completed newsletter to the printers, type mailing labels,
lick stamps, and bring them to the post office.

GEnieLamp> What hardware and software are you using to produce the
""""""
newsletter?

Kohn> I own an Apple IIIGS, and I'm writing all the articles with
"""""" AppleWorks v3.0, beefed up with TimeOut Thesaurus and UltraMacros.
I try to do as much editing and revising as I can with AppleWorks Classic.
Then, I load the articles into AppleWorks GS's word processing module,
where I'll use the Find and Replace function to add "smart quotes", and
then finally, copy each article into AppleWorks GS's Page Layout module,
where all the layout and last-minute editing is done.

Then, it's a simple matter of printing it out on my Hewlett-Packard
LaserJet IIP Plus and then bringing my final copy to the printer for mass
duplication.

GEnieLamp> The professional look of the first issue brings to mind the
"""""" frequent cry "I didn't know you could do that on an Apple II!"
Obviously it can be done... but is desktop publishing with a IIGS and a
laser printer easy to set up and use? What has your experience been?

Kohn> Learning how to use a desktop publishing program is the easy part.
"""""" Learning how to use that program to create a work of art is the
difficult part.

GEnieLamp> Is Shareware Solutions II essentially a one-man operation?
""""""
Kohn> Not essentially. It _is_ a one-man operation. I do everything.
"""

GEnieLamp> Then you also track the subscriptions using your Apple II?
"""""" Kohn> The AppleWorks v3.0 database is just ideal for keeping track of
"""""" subscribers.

GEnieLamp> What do you enjoy doing other than writing? What do wish you
"""""" had more time for?

Kohn> A couple of years ago, I looked down and saw what others refer to
"""""" as "computer stomach", and I didn't like what I saw, so I joined a
local gym and now work out twice a week. I used to ski a lot, but have
only gotten in one day a year on the slopes ever since I started working
full-time with my Apple II. I'd like to go skiing a little more. I also
like to hike, and I love to go to the monthly star party held atop a local
mountain. I like to go to the movies, and I like to go to my local
library. I like to go see the Oakland A's play, but they've been breaking
my heart recently. I also like to listen to music, but find it too
disturbing when working.

I like to share my computer expertise, as a volunteer, to non-profit
organizations, and through CompuMentor (a San Francisco-based non-profit
organization) have helped more than 30 social service organizations and
schools to use their Apple II's more efficiently. I also like to share my
expertise with my neighbors, and am currently President of the GravenStein Apple IIGS User Group.

But, above all, I'm going into my second decade of a love affair. I love the Apple II.

**GEnieLamp>** Shareware Solutions II is currently a bimonthly. Does this seem like a realistic schedule, or do you feel you'll be going monthly soon?

**Kohn>** As of today, I only have "one issue under my belt" so it's premature to say when Shareware Solutions II will become a monthly.

**GEnieLamp>** You've recently acquired an Internet address. Internet mail and newsgroups seem to be very hot topics right now. Will you be addressing this in Shareware Solutions II?

**Kohn>** I've been active on the Internet and Usenet for nearly 2 years, but it has only been during the past 6 months that it dawned on me that the Internet contains the entire accumulated knowledge of all mankind, and it's all just a keystroke or two away. The much-hyped "super data highway" already exists, and in Issue #2 of Shareware Solutions II, I will have a long article all about the Internet. I'll be looking at "the net" from an Apple II user's perspective, and will be providing very specific instructions on how to access it and how to use it.

**GEnieLamp>** What else can people look for in future issues of Shareware Solutions II?

**Kohn>** Shareware Solutions II will provide on-going coverage of the Apple II family of computers.

What I'm most excited about today is "Such a Deal", a new column that will appear starting in Issue #2. I have been making arrangements with Apple II software publishers and hardware manufacturers who agree to give subscribers of Shareware Solutions II special discounted pricing on their products. Just as in Issue #1, Seven Hills Software offered subscribers a 50% discount on most of their software, Issue #2 will contain special offers from at least five well-known (or soon to be well-known) Apple II developers.

In addition, there will be general Apple II hints and tips, articles that should help modem owners to have more fun with their modems, and of course, write-ups of the latest and greatest Apple II freeware and shareware.

My overall goal is to make Shareware Solutions II an indispensable resource for the Apple II community, and to make it the best magazine available for the Apple II. Based on the feedback so far, it looks like I just might be succeeding on both counts.

Online Puzzle Fun

 By Scott R. Garrigus
[S.GARRIGUS]

>>> SEARCH_ME! <<<

THIS HAS GOT TO BE A MISTAKE! A couple of months ago my brother went out shopping for a new computer. Now after all these years of having Atari around the house and me being an avid Atari user, you can imagine my surprise when he came home with a Tandy Sensation. "This has got to be a mistake!", I thought to myself. "This is nothing but an IBM PC clone!". Well, at least that's what I thought at the time; but not anymore. I've heard all the war stories about how IBM's have all these problems and how Windows can't do this and Windows can't do that. Well, let me tell you, after about a month of playing around with it, I have to admit, I really like it! I can't say I like it better than my Atari. No, Atari will always be my first love; but working with Windows on an IBM can be a lot of fun!

As you've probably guessed by now, this month I visited the Windows Roundtable. I must say that after being around for only about a year, they are really doing a great job over there. The BBS is already loaded with topics on all kinds of Windows subjects from General Windows Questions to Windows Development. There are also separate categories for Windows NT and for many Windows software vendors too. They have RTC's every day of the week except for Saturday and Sunday. Even Sysops need a little time off, you know. :) Of course, most of my time has been spent in the software library downloading files and having lots and lots of fun playing with some of the programs. You'll find games, pictures, .WAV files, and utilities galore here.

So if you've got an IBM with Windows, by all means visit the Windows RT! To get there type either M1335 or WINDOWS at any GENie prompt. First, however, be sure and solve this month's puzzle, which is full of all those wonderful Windows buzzwords you ought to know! I don't do all this work for nothing! ;) Until next month!

### ARE WE READY FOR MULTIMEDIA? <<<

---

~ Copyright 1993 by Al Fasoldt. All rights reserved. ~

IS _IT_ READY FOR US? When television was invented, the world was abuzz with talk about the wonders of the new technology. Most of them have been wasted, as we all know by now -- or as we soon discover after an afternoon of sex-and-scandal shows from Oprah, Phil and Maury.

The same sort of dreck is about to come our way in the guise of multimedia. My advice is to pass it by until either multimedia or its...
Multimedia is a catchword for something that no one really knows how to define. It's like love or a bad smell --you can't really define it, but you know it when you find it.

Multimedia is supposed to be the marriage of sight, sound and text in a computer or a device that works like a computer. What makes multimedia different from plain old TV is that multimedia is controllable --you can zip around in a multimedia document, playing it (or viewing it, hearing it, or reading it) in any order, for example.

It's possible to have multimedia on a more-or-less regular personal computer such as an Apple Macintosh or a PC running Microsoft Windows, even if the computer doesn't have anything fancy added on. But to really get into multimedia, you need a computer with some sort of laser disc attached.

Usually, this is a CD-ROM drive. It's a compact disc player that can play (the computer term is "read") CDs that have computer data on them. Most CD-ROM drives can't deliver the data to the computer fast enough, so what you get if you buy a cheap CD-ROM drive is a bunch of jerky images and halting text displays.

In another year, the best of today's CD-ROM drives -- the ones that are fast enough for multimedia -- will be the cheapies, and the world will be ready for the new way of reading, viewing, watching and experiencing things.

But right now, multimedia is for the most part an exercise in silliness.

You can already buy multimedia encyclopedias that show you text and moving pictures. That's good, right?

Not when you see what those moving pictures look like. They're tiny and spasmodic. Uncle Harry did a lot better with his camcorder at the last family picnic.

They also have built-in hi-fi sound. As a devoted high-fidelity fan, I'm probably biased when it comes to judging sound that comes out of one or two tiny speakers attached to a PC, but I can tell you this: Beethoven would end up with the "1813" overture if he had to listen all year to a PC that thought it was a stereo set.

But encyclopedias don't make money for the multimedia mavens anyway. Games do. Computer games with do-it-yourself endings and fancy graphics do. That's what's coming your way.

Don't ask me whatever happened to stickball and hopscotch. They're old stuff. The new stuff keeps the kids in a darkened room, staring at a screen and listening to squeaky loudspeakers all day.

And for those older kids, there are, um, different kinds of games. Adult games, with, um, adult, um ... you know what I mean.

This is dismal, I agree. But there is hope. Companies here and in Japan and Europe are working on multimedia atlases that you can use in the car. They read your position from a satellite and tell you exactly where
you are and how to get anyplace else.

They're also working on multimedia tours of museums. And multimedia
dramas and musicals.

That sounds like fun. And looks like fun -- someday.

In the meantime, I'll just wait and see. Watching a technology grow
up can be a long process.

[COM]////////////////////////////////////////////////////////////////////
COMMUNICATION /
////////////////////////////////////////////////////////////////////
Making Contact
""""""""""""""
By Darrel Raines
[D.RAINES]

Every one of us spends a good part of each day communicating with
other people. It is a large part of most jobs. We must tell others what
is needed from them and we must understand what is required of us. A
failure to express ourselves clearly or a failure to comprehend another can
lead to chaos, either eventual or immediate.

When my boss tells me what s/he wants me to do, it is my
responsibility to make sure that I know what s/he is asking of me. There
have been a number of times that I happily completed a task, expecting to
be praised for my accomplishments, only to find out that my superior wanted
something else altogether. Certainly neither of us was happy about the
situation.

It is rather easy in the case described above to point a finger at the
other person and say, "You told me you wanted the other thing". Only when
we put ourselves in the other persons shoes do we see where they think the
blame lies. When two people fail to communicate, then both are at fault
and both suffer the consequences. The sharing out blame is rather
pointless. This is the time that we should spend understanding why we
failed to communicate and how the situation can be improved next time.

Either party in a communication may indicate that the information
passed was not understood correctly. We should not wait for the other
person to come to us and seek better information. Remember, no one wins
when we do not understand each other. This humorous example will serve to
illustrate:

An American furniture salesman met a very pretty
French woman on one of his regular trips to Paris to buy
goods for his stores in the States stores. They seemed to
like each other immediately, but neither spoke the other's
language. Then the salesman hit upon an idea. He grabbed
a piece of paper and drew a picture of a plate and fork. The young
French woman nodded her head in vigorous agreement, so the American gentleman called a cab and took the lady to dinner at a local restaurant.

They were both enjoying each other's company over a fine meal when the American took a napkin and drew a picture of a glass with bubbles popping. The young French woman smiled her agreement. The salesman ordered a bottle of champagne and they enjoyed the bubbly refreshment with the rest of their meal. After dinner, the American man drew a picture of a pair of shoes and a trumpet blowing musical notes. The beautiful lady smiled and once again agreed to his suggestion. Soon the couple were dancing the night away in a nearby nightclub.

After a while, the young woman smiled demurely and motioned for the pencil and paper. She blushed slightly and drew a picture of a four-poster bed. The American was amazed. To this day he has not figured out how the young woman knew that he was a furniture salesman!

Now obviously these two would-be lovebirds did not communicate at a critical point. The same thing can happen to us if we do not constantly work at making ourselves clear.

Most of us use electronic media as a method of communication on a regular basis. We may not stop and think about this phenomenon, but the fact is still there. If you work in a computerized office, then you probably have Electronic mail (E-mail) set up to make life easier. As a GENie subscriber, you probably use the E-mail system here to pass information back and forth between friends and acquaintances. If you use visit any of GENie's RoundTables or use a bulletin board system (BBS), then you know that you can "talk" with a large number of people by posting a single message.

All of this dissemination of information will probably give us the false impression that we are "communicating" with one another. Not necessarily. The quality of what goes into the message makes all the difference in the world. Two people could send 50 messages back and forth and never get their points across. Only if one chooses one's words with some care and precision is the desired meaning conveyed.

It is imperative that you spend some time thinking about the content of your messages before you send them. You are not present when a message is read, so you must anticipate the reader's state of mind and try to present your message in a way that they will be able to understand. This is not always easy. But it is important if we are to use electronic communication effectively.

We tend to think of E-mail as a time saver. We can send out the same message to a dozen people faster than we can tell one person, face-to-face, what we wanted to say. However, the danger here is that we will fail to convey our message in a way that can be understood by all twelve people, each with a different perspective on what you are trying to communicate. The results may be less effective than expected.

I can probably talk at least 20 times faster than I can type. This fact alone should indicate to us that electronic communication will never entirely replace speech. There will always be some types of conversations
that can be held more effectively with verbal communication. Therefore, you should always be on the alert for the types of messages that would be better communicated on a one-to-one basis.

To summarize: Proper communication is one of the most important tools for productive working arrangements. We must, individually, seek to improve our methods of communication. It does not do any good to try and assign blame when we misunderstand one another: all of us suffer the consequences of the problem. Electronic communication, just like its verbal counterpart, is subject to the problems if we do not use it effectively. In this electronic age, we should be on the lookout for situations where verbal communication would be a more productive alternative to the E-mail standard.

I hope that I have communicated my message clearly. If not, then send me a communication indicating the problem and I will re-communicate my communication concerning the topic of communication. If you did not understand the last sentence, then give me a call and we will work it out. :)

[*][*][*]

Darrel Raines is an Electrical Engineer who works as a contractor to NASA on the Space Station Freedom program. He is also an avid computer hobbyist, programmer and writer. You may reach him on GENie at D.RAINES.
only 100.75K available for data storage. Steve Wozniak, the author of the original DOS disk driver (RWTS), had found a way to increase the storage capacity of Apple floppy disks. Changing slightly the method used for encoding data on the disk made it possible to have 16 sectors per track, instead of the original 13 sectors per track in DOS 3.1 and 3.2. This resulted in a disk that could now hold a maximum of 140K of data (124K excluding DOS and the catalog track), a 23 percent increase over the 13 sector disks. The remarkable thing about this upgrade was that the disk drives themselves did not need to be changed to make this possible. Only the ROM program on the Disk II controller card needed to be changed to make the move to DOS 3.3. Those users who bought this upgrade to DOS 3.3 had to change the ROM chip on the disk controller (or have their dealer do it for them). An updated and greatly expanded version of the DOS manual was also included in the DOS 3.3 upgrade.<1>

DOS 3.3 - FEATURES The DOS 3.3 System Master disk included many programs that had previously been present on the DOS 3.2 Master, plus a few others. The "COPY" program (used to copy entire disks) was translated to Applesoft as "COPYA" for those II Plus users who didn't have access to Integer BASIC. The newer COPY programs also worked properly on single drive systems (previously, you had to have two disk drives in order to use this program to copy a disk). To allow users to startup their older 13-sector DOS 3.2 disks, a binary program called "BOOT13" was included. (Also, a separate disk called "BASICS" was included that could be used in the same way as a pre-boot for 13-sector disks).<1>

Because of the changes in the ROM controller, it was not easy to read disks formatted under DOS 3.2 directly from DOS 3.3. It could have been incorporated into DOS 3.3, but would have called for a major effort in rewriting the track and sector access routines, as well as making DOS larger than the earlier versions. Instead, Apple supplied on the System Master disk a conversion program called "MUFFIN" to allow files to be moved from 13 sector to 16 sector disks. Enterprising hackers in the Apple II world made modifications to MUFFIN and created DE-MUFFIN, a DOS 3.2 utility to convert the files back to the 13 sector format.<1> Rich Williams at Apple wrote the MUFFIN program (which was supposed to stand for Move Utility For Files In NewDOS).

The System Master disk also contained a new utility called "FID" (which started at version "M"; just like DOS "3", nobody knows why the first public release didn't start with "A"). FID, written entirely in assembly language, allowed easier copying of files, particularly Text and Binary files that couldn't simply be LOAded and SAVeD from one disk to another, as could Applesoft and Integer programs. The name "FID" was odd, however. The Apple manuals said it stood for FIle Developer, but Rich Williams (who also wrote this utility) said that the original name of the program was FISHEAD (which had some sort of mnemonic meaning that he could no longer recall). Apple Marketing said he couldn't name a program FISHEAD, so he changed it to FID, which they said was okay. It really stood for Fishead In Disguise (or Fishead In Drag by some within Apple).<2>,<3>,<4>

Some Apple II users didn't like to have to use utility programs to manage their collections of disks in both the 13 and 16 sector formats. One method that was used to overcome this inconvenience was to piggyback the old and the new disk controller ROMs and use a switch to toggle between systems. The most elegant solution I've found was a ROM chip that plugged into a special card (the ROMPlus made by Mountain Hardware, or the ROMBoard...
made by Andromeda). A call to a memory location would switch between DOS 3.2 and 3.3, making file conversions quite easy. Soft Ctrl Systems, the company that sold this Dual DOS ROM also sold ROMs that gave instant access to an Applesoft renumber and merge program, an Applesoft editor, and a specialized disk command menu and disk map.<2>

Another change found on the DOS 3.3 System Master was in the method used to load the alternate BASIC. Since by this time the Language Card was available (which, as you should recall, was simply 16K more RAM to add in parallel to the Apple II ROM), there were two groups of users to service on bootup. For Apple II Plus owners, there was a file named "INTBASIC", which would load Integer BASIC onto the Language Card. For the older Apple II (non-Plus) users, the file "FPBASIC" would be loaded onto the Language Card when the DOS 3.3 disk was booted, making Applesoft available. The last version of the DOS 3.3 Master disk, released with the Apple IIe, used a new utility to load these files which was significantly faster than the standard DOS BLOAD command.

DOS 3.3 - MISCELLANEOUS A rumor expressed in a letter to Call-A.P.P.L.E. magazine in January 1982 suggested that up until Christmas of 1980 there never had been an assembly language source listing of DOS. The writer of the letter stated that changes made to DOS up until that time were done by patching it with the mini-assembler in the Monitor. However, during a phone interview in September 1991 with John Arkley at Apple, he said there ALWAYS was a source code listing for DOS, as far back as DOS 3. He believes the writer of the letter may have been referring to the problem with the lost Autostart ROM source code (see Part 6 of this History). Arkley stated that the earliest versions of DOS were written using a cross-assembler on a Horizon microcomputer.<5>,<6> He also said that the only part of DOS 3.3 that was assembled from scratch was the new RWTS. The rest was merely attached to RWTS and "conditionally" assembled (a programmer's term; sorry). They made a few patches to fix bugs in the File Manager and Main DOS routines, but did so only in very specific places, to avoid moving undocumented entry points that programmers had been using up to that point.<3>,<4>,<7>,<8>

DOS 3.3 - LIMITATIONS The major limit of DOS 3.3 was that it, like its predecessors, was designed specifically to support the Disk II drive. Hard disks, RAM disks, and 3.5 disks (like those used in the Macintosh when it was released in 1984) could not be directly used with DOS 3.3.<9>

PASCAL SYSTEM The Pascal system was released in 1979, prior to the DOS 3.3 upgrade. It used the same hardware upgrade to the Disk II controller as was included with DOS 3.3. The method used by the Pascal disk system to store files was quite different from that used by DOS, however. Instead of the 256-byte "sectors" used with DOS 3.2 (and by 3.3), the Pascal system used 512-byte "blocks", using two sectors per block. Pascal used the larger 140K disks from the beginning, and its method of file naming was somewhat more limited. Instead of names that could be as long as 30 characters and could contain any ASCII character (as was the case with DOS 3.2 and 3.3), Pascal files could be only 15 characters long, and could contain only letters, numbers, or a period. It was designed with a little more flexibility in the types of files that could be created, however. Instead of DOS 3.2's limit of eight different file types ('A', 'I', 'B', 'T', and the other four little-used ones), Pascal was designed to allow many more, and used a two-byte code to designate file types. A Pascal file entry also had space for a date when
the file was created or updated. DOS 3.2 or 3.3 could not easily do this, even if a clock card was installed.<7>,<10>

Pascal disks differed also in being able to have a unique name to designate each disk. DOS 3.2 and 3.3 could be formatted to use up to 254 different volume "numbers", but this feature was seldom used and did not allow disks to be very unique. The Pascal disk name could be up to 7 characters in length, and had the same limits of character choice as did file names. Another feature of the Pascal disks that differed from the older DOS disks was how space was allocated on a disk for a particular file. Under DOS 3.2 and 3.3, space was used on the disk to identify which sectors were used and which were free. When a new file was created or an existing file was enlarged, this track/sector list was consulted by DOS to find where free space could be found, and the list was updated when a new sector was used. The advantage was that all space on the disk could be used as it was needed, but the disadvantage was that a file could be "fragmented", with the sectors that made up that file scattered throughout the disk.

Pascal disks did not have any map of free blocks. Instead, a Pascal file used only consecutive blocks on a disk, and a new file would be started following the end of the last file on the disk. The advantage of this system was faster access to disk files, since they were all on one continuous piece of the disk. The disadvantage was that if a file was deleted, the newly freed space could not be used unless Pascal's "Krunch" utility was used to move all files forward over the unused space.

The Pascal system also included some other built-in disk utilities, an assembler, and a compiler. As part of this system one could also purchase from Apple a compiler for FORTRAN programs and a few other computer languages.<10>

CP/M   With the release of the Microsoft CP/M Softcard, a disk system was needed to handle this foreign programming environment. (Recall from Part 12 of the History that the CP/M system gave Apple II users a Z-80-based computer inside their 6502 computer and, therefore, access to programs and utilities that were previously unavailable). CP/M disks were designed to use four 256-byte sectors as one "block" (twice as large as the Pascal "block"). Like DOS 3.2 and 3.3, the first three tracks on the disk were used for the CP/M operating system which was loaded into memory when booting the disk. Like Pascal, the CP/M directory was found at the start of the disk, instead of in the middle as DOS was designed.

Apple II CP/M disks followed the standard CP/M file naming system. A file name consisted of 8 characters, followed by a period, and then a three character "extension". One interesting feature of CP/M files was that if a file was longer than 16 CP/M blocks (64 DOS sectors), a new directory entry would be made with the same file name. This entry had an extra byte set to show that this was a continuation of a previous file, instead of a new, separate file.<10>

SOS/PRODOS   The operating system designed for the Apple III computer was called "SOS". This title arose from the Apple III’s code name, "Sara", which itself came from the name of engineer Disk Huston's daughter. Originally, then, SOS stood for "Sara's Operating System". The manuals released with the computer, however, used the more professional-sounding name "Sophisticated Operating System." SOS was the first operating system for a microcomputer to use the concept of "device
drivers", which were programs taken from the startup disk and made part of
the operating system. These drivers told the computer how to communicate
with the various devices that were attached to it, from a variety of disk
drives to the keyboard and monitor. This gave flexibility to the Apple III
to use new technology as it became available.<9>

When Apple designed the Apple III, they were under constraints of
maintaining some compatibility with the Apple II disk format. They used
the same disk controller and the same capacity disks as the Pascal/DOS 3.3
systems: 35 tracks, of 16 sectors each. However, the engineers were free
to make any changes they wanted in the way in which files were stored on
the disk. They came up with something that was a hybrid between the DOS
3.3 and Pascal methods of file storage. From Pascal they took the concept
of using 512-byte blocks as the basic unit of storage, a two-block "system
loader" program at the start of the disk (this loader would locate a larger
system file elsewhere on the disk to actually start the operating system),
and a four-block main catalog (which they called a "directory"). From DOS
3.3 they used the concept of disk maps and block lists for each file,
allowing parts of files to be stored anywhere on the disk (and eliminating
the need for the Pascal "Krunch" function). The SOS filing system also
continued the use of a byte to identify different filetypes, space for a
date (and time) of file storage, and the 15 character file names using only
letters, numbers, and a period. Because the Apple III was intended to be a
business machine and had to be able to access larger disk devices than were
allowed for the Apple II, they also added the ability to create and use
different levels of file directories. A single four-block directory had
space only for 51 files; even if it was enlarged to allow more files, on a
large disk it would soon be difficult to find a file in a list that got
longer than a couple of hundred names.

The SOS disk file system also would allow files to be as large as 16
MB, and a single disk volume could be up to 32 MB in size. In 1981, when
the 5 MB Profile hard disk was released by Apple for the III, this limit of
32 MB was considered to be more than adequate.

In 1984, when ProDOS was released for the Apple II as a "Professional
Disk Operating System", the same file structure was used. In fact, the
disks were so designed that a disk created by the Apple II ProDOS formatter
installed an Apple III SOS loader segment in the second block on the disk.
This made it possible to boot the same disk on either an Apple II or an
Apple III, if the necessary system files unique to each computer were
present on the disk. Also, files could be shared easily between the two
computers. Even as late as 1992, when the Apple III has been out of
production for eight years, disks formatted by Apple II System Utilities
still have SOS boot information located on block 1. What may be even more
amazing is that this disk system for the Apple III, released in 1980 (and
probably designed in 1978 or 1979), is still flexible enough to be useful
for Apple II's in 1992.<10>

PRODOS   The original DOS for the Apple II was designed primarily to
support BASIC. If a programmer wanted to make use of the disk
system for an assembly language program, he had to make use of
undocumented, low level calls to the DOS File Manager, or possibly to some
of the Main DOS Routines. This method was clumsy, and often made
inefficient use of memory, as DOS expected that any calls made to it were
done on behalf of BASIC. Moreover, this tied the hands of programmers at
Apple in their ability to enhance DOS, since any changes they might make
would most likely change internal addresses, and cause older software to
malfunction if used with the revised DOS.

Another problem with DOS was speed. Since each byte read from the
disk was copied between memory buffers THREE times, much of the disk access
time was spent in moving things around in memory. Consequently, as hackers
took DOS apart and found better ways to do things, several variations of
DOS speed-up programs appeared by 1983, including Diversi-DOS, ProntoDOS,
and David-DOS. Each of these programs were mutually incompatible in terms
of the low-level calls they made, and had slightly different ways of
speeding up DOS.

DOS was also limited since it was device dependent. It was designed
to work quite well with the Disk II drive, but to make use of a hard disk
or RAM disk (a pseudo-disk "drive" that was actually RAM memory, had no
moving parts, and was therefore quite fast), DOS had to be patched. This
usually made it impossible to use different brands of hard disks together,
or to use a hard disk and a RAM disk simultaneously.

Other problems with DOS included poor support for interrupt signals
generated by various hardware devices, obstacles in designating memory
areas as protected from being overwritten by DOS, and the difficulty in
customizing DOS for special functions.

With the introduction of ProDOS, all of these weaknesses were
addressed. ProDOS would run up to eight times faster than DOS in accessing
5.25 disks. It supported a standardized protocol for hardware-based
devices, allowing reads, writes, status calls, and formatting (erasing).
This allowed a large variety of disk devices to be used on an Apple II.
Support was also included for a hardware clock, allowing date- and
time-stamping of files. Hardware interrupts were supported, necessary
system calls were placed in a standard location in memory (called a "global
date"), and memory could be protected from being overwritten by the actions
of ProDOS.

Because the functionality of this disk operating system was enhanced
so much, its size grew as well. To specifically support Applesoft BASIC, a
separate "SYSTEM" program was included that worked nearly the same as the
older DOS 3.3 did. In addition, it included some further enhancements that
had been requested for years by Applesoft programmers. The only
disadvantage of the new ProDOS was that it did NOT support Apple's original
Integer BASIC, since the ProDOS program loaded itself into high memory
where Integer BASIC was loaded in an Apple II Plus. Since very little
development of software had been done in Integer BASIC since the
introduction of Applesoft, this was felt to be a reasonable trade-off. And
if Integer BASIC was needed, it could still be run under DOS 3.3. At the
time of this writing, there has been no release of a ProDOS system program
that would support Integer BASIC (with the exception of an Integer BASIC
compiler distributed by ByteWorks in late 1991 for instructional
purposes).<1>

PRODOS 16 When Apple released the IIGS, with its considerably greater
power compared to the older 8-bit Apple II's, changes were
needed in the operating system to better manage that power. This had to be
done with another goal, that of maintaining compatibility with older Apple
II software. The new operating system was called ProDOS 16, and the
operating system intended for use with 8-bit software (both on the IIGS and
on the older Apple II's) was renamed ProDOS 8. But ProDOS 16 version 1.0
was somewhat of a temporary fix to the problem of disk access for 16-bit
Apple II Computer Info

software. It was not written in 16-bit code, and it simply translated the
new system calls defined for ProDOS 16 into ProDOS 8 calls to actually
carry out disk activities. As such, it was slow and cumbersome.<9>

GS/OS With the experience of SOS, ProDOS, and the Macintosh Operating
System to draw from, Apple engineers and programmers devised a yet
more powerful and flexible disk operating system for the Apple IIGS.
Written completely in 16-bit code, GS/OS was released in September 1988.
It was more than a DISK operating system, but a truly comprehensive
operating system that also handled keyboard input, monitor output (text and
graphics), mouse input, printers, modems, and more. In these respects it
was just as powerful as the older SOS written for the Apple III back in
1980. But they also added a new concept.

Although GS/OS would allow an Apple IIGS to communicate with disk
devices that had not been used on an Apple II before, there would still be
the limits of having to know exactly HOW files were stored on that disk.
ProDOS could only handle files stored in the specifically defined
ProDOS/SOS format; DOS 3.3 could only handle files stored in THAT format;
and so on. To make this new system as broad-based as possible, Apple
programmers built into it the concept of a File System Translator (FST).
With the appropriate FST teamed up with a suitable disk driver, GS/OS could
theoretically be able to read ANY disk created by ANY computer. The FST
simply translated the requests made by GS/OS into the language "spoken" by
the disk it was trying to read. This task had never before been attempted
by a computer company in designing a disk operating system. Apple,
recognizing that the computers used in the real world would never be 100
percent Apple, made it possible to simplify transfer of data between
different computers. The concept was first implemented in a limited
fashion on the Macintosh, when the Apple File Exchange program was modified
to be able to use MS-DOS disks. The Mac system is now also able to add its
equivalent of an FST for the ProDOS and MS-DOS disk systems, but not as
easily as has been implemented in GS/OS.

GS/OS was also made more flexible by removing the older Apple II
method of identifying a disk by the slot where its disk controller was
attached, and removing the limitation of only two disk devices per slot.
The limits of maximum file and disk size built into ProDOS 8 were expanded.
A GS/OS file or disk volume can be as large as 4 GB (gigabytes), or 4096 MB
to be more specific. However, when GS/OS is dealing with ProDOS disk
volumes, it still has to stay within the limits of ProDOS (files no bigger
than 16 MB, and disk volumes no bigger than 32 MB).<9>

System Software 5.0 for the IIGS was introduced in May 1989. It added
speed, speed, and more speed to many features of the IIGS, accomplishing
this through more efficient software coding. There were patches to the
IIGS ROM Toolbox to improve throughput in many of the built-in capabilities
of the machine. A new feature called "Expressload" was added, making it
possible for certain program files to load from disk up to eight times
faster. GS/OS was modified to be capable of staying in memory during a
switch to ProDOS 8 applications, making the return to GS/OS significantly
faster. The text-based control panel was supplemented by a new
graphics-based one that was accessible in the same way as other 16-bit desk
accessories. Access to 3.5 disks was accelerated by implementing a feature
called "scatter read", which could take an entire track (rather than just a
single block) of data from the disk at a time. An FST for AppleShare was
added, allowing a IIGS attached to an AppleTalk network to access the file
server as a disk. It also included an FST to allow access to CD-ROM
drives, new utilities for disk partitioning, and it had an intelligent "Installer" program to make it easier to install system or application files.<11>,<12>

Because of further improvements in features, System Software 5.0.2 (an upgrade to 5.0) required a minimum of 512K memory, and worked best with 768K or more. Versions 5.0.3 and 5.0.4 needed a full megabyte of memory.<9> An improved "standard file dialog" was included in the system tools for 5.0.3, (making it possible to choose files more easily for loading into an application), as were improved drivers for the ImageWriter II and ImageWriter LQ printers. System 5.0.4 was released six weeks after 5.0.3 to fix some remaining important bugs discovered too late.<12>

GS/OS SYSTEM 6 Before System 5.0 was released, plans were already in store for further improvements to the system software. Apple IIIGS "power" users were calling for the ability to use Macintosh HFS (Hierarchical Filing System) disks, as well as the older Apple II DOS 3.3 and Pascal formats. Although there were some simple third-party translation programs available that allowed transfer of files from Mac disks to ProDOS disks, they did not provide the same ease of use as did the direct access possible with ProDOS and CD-ROM files. Although it sounded to these users like a relatively straightforward proposition, the increased complexity of the Mac HFS directory structure complicated things. Not only did the Mac disks contain more information about each file than did ProDOS disks, but the names of files on Mac disks (as on DOS 3.3 disks) could contain characters that were not "legal" for ProDOS file names. To help with this problem, the new FSTs were designed to watch for potentially illegal filenames, and to make suggestions for alternate names that WERE legal.

Apple software engineers had always made it clear to programmers clamoring for additional FSTs that such changes were more than just dropping the new FST into the System/FST folder on a boot disk. Modifications were necessary throughout GS/OS to accommodate these new features, and the time needed to make these changes was becoming longer than originally planned. To allow some improvements to be made available without waiting for them all, the system software engineers divided tasks during 1990, putting the features that could be programmed most quickly onto a fast track that would allow them to be released as Version 5.0.3 later that year.

The other half of the team worked on the rest of the planned enhancements for what would become System 6.0. When 5.0.4 was completed, the entire team again came together to continue work on this upgrade. After fourteen months of hard work, they were finally ready to release GS/OS System 6.0 in March 1992. In addition to FSTs for the Mac HFS disks, DOS 3.3, and Apple Pascal, device drivers were created to allow support of the Apple Scanner, the slot-based Apple II Memory Expansion card (which on the IIGS works primarily as a RAM disk), and the Apple Tape Drive. The SCSI drivers were enhanced, and the Apple 5.25 disk driver was made faster. A new printer driver was included, to support the Apple StyleWriter inkjet printer, and more large fonts were included to use with that and other printers. The Finder was re-designed almost from scratch by Andy Nicholas, the author of ShrinkIt and GS-ShrinkIt. Archiver (a disk backup utility) and Teach (a GS/OS-based text-editing program) were also included. Finally, ProDOS 8 v2.0.1 was released, allowing 8-bit programs access to as many as fourteen disk devices on a single slot. This made large, partitioned hard disks usable even to Apple IIC and enhanced IIE users.
(this version of ProDOS 8 required the opcodes of the 65c02 chip, although ProDOS 8 v1.9 was still available to run on the Apple II Plus or unenhanced IIe).<12>

At the 1992 KansasFest, Apple engineers announced that v6.0.1 of GS/OS would be out later in 1992 or early in 1993. Because of delays in the completion of the Apple II Ethernet card (which this version of GS/OS will specifically support), the actual release will probably not be until the middle of 1993. Aside from being able to handle the Ethernet card, this revision is expected to include fixes for bugs found in 6.0, and an MS-DOS FST (at least read-only, with write capability to come later).

READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE .......... [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

<table>
<thead>
<tr>
<th>Name of sender</th>
<th>CATEgory</th>
<th>TOPic</th>
<th>Msg.#</th>
<th>Page number</th>
</tr>
</thead>
</table>

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that the message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie  GEnie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. GEnie's non-prime time connect rate is $3.00. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014, DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

"This is what is so great about Apple II people on GEnie! I asked a question one night, and the very next night I get what I need!"  K.LESSING

FROM MY DESKTOP

Notes From The Editor
By Douglas Cuff
[EDITOR.A2]

THERE'LL BE SOME CHANGES MADE  Up until now, one man has assembled all the
issues of GENieLamp (A2, A2Pro, IBM, Macintosh, [PR], ST, and TX2)... our senior editor and publisher, John
Peters. This month, each editor is assembling his own issue.

All of a sudden, I find myself with more to say about what appears in
the magazine. Will GENieLamp A2 have CowToons? Will it have Search_ME?
Will it have more articles? More commentaries? More reviews?

Well, I'd like you to tell me. Last month, I pleaded for feedback. I
got two replies -- thank you both! -- which is certainly better than no
replies, but doesn't exactly put me in the position of needing a telecom
agent. (What's a telecom agent? See Phil Shapiro's "Reflections" column.)
One of my correspondents suggested that silence indicated assent, possibly
even wholesale approval. If so, it's a great relief, but it doesn't help
me learn what the readers want me to keep now that I have more say over
what goes into an issue.

Unfortunately, this changeover, like the last one, means that a few
features -- the Who's Who in Apple II profile [WHO], and Online Library
[LIB] -- had to be dropped due to lack of time. They'll be back, never
fear. In the meantime, this month you'll find a sort of mini-profile of
shareware author Charles Hartley in Mel Fowler's PD_Quickview [PDQ].

NEW COLUMN   New this issue is a brand-new column for GENie users
outside the U.S. First up, Udo Huth from Germany shares his
experiences of computing and telecommunicating. The line forms directly
behind him.

Of course, if you have an idea for an article on another subject, I'd
love to hear from you. You don't have to be a polished writer, just have
something to say! It doesn't have to be long and it doesn't have to be
earth-shattering.

ASSOCIATE EDITOR WANTED  We need help! There aren't enough hands to do
all the work. For that reason, there is no Who's
profile this month. Phil Shapiro, who used to handle the interviews
and much else besides, in his capacity as co-editor, is busy running his
own newsletter. GENieLamp A2 needs a new associate editor. Here's your
chance to hob-nob with famous Apple II personalities.

THE SECOND CHANCE   I once worked on a specialized quarterly magazine with
a small but constant subscriber base. The problem was,
the readers were either mired in apathy or lethargy... I never figured out
which. Virtually everyone renewed their subscriptions, but not until the
day issues stopped arriving and they realized they had been cut off.

One day, the printing firm that owned the magazine was sold, and the
buyers didn't care tuppence about the magazine. The letters poured in.
The magazine had to be saved. There was not another one like it... no
close competitor to absorb the subscriber base. (Just think about THAT for
a minute, former _inCider/A+_ and _Nibble_ subscribers.)

Fortunately, the staff of the magazine persuaded the local university
to become the publisher, and the magazine was given a second chance. Over
ten years later, it's still going strong. The last I heard, the readers aren't quite so apathetic. They knew it had been a near thing.

The Apple II is a long way from being finished yet. I sure hope you'll help me keep it alive as long as possible by becoming involved in GENieLamp A2.

KEEPING HOPE ALIVE Two months ago, in my first editorial, I spoke about corporate births, deaths, and marriages in the Apple II world. This month, we had a genuine death. On September 7, Kathryn Beth Willig passed away. She had cancer of the colon.

I'm not about to deliver a eulogy. I didn't really know her well enough to do that. I knew her in her role as a Seven Hills Software partner, and came to recognize her messages quickly, look forward to them, and looked for excuses to chat with her. In the end, she dispensed her knowledge while logging on to CompuServe from her hospital bed, via her Mac Powerbook.

She probably wouldn't have been best pleased at my mentioning her in a GENieLamp editorial like this. She didn't like it when people -- particularly people she didn't know -- tried to style her a hero because she had cancer. She certainly wouldn't have cared for becoming well-known because she had died.

It's not her death I want to talk about. What she did when she was alive is far more important.

Kathryn Willig had the capacity to answer the same question fifty times, and be as cheerful and helpful to the fiftieth person as with the first. The knowledge she had was usually helpful, but her attitude was always so. She cared... and she hoped. She actually dared to hope. Every one of many times when it seemed as though Apple were abandoning us, that all was lost, and that we had devoted years of our lives to computers that were obsolete, she dared to hope. She dared to be cheerful, and managed to do it without being insensitive to others' fears and dreads.

Let's see if we can't do the same. Personally, I think we can.

>>> NOTES FROM THE PUBLISHER <<<

~ By John Peters [GENIELAMP] ~

FINALLY, FULL INTERNET ACCESS My latest online adventure started when I spotted an ad in a local computer zine for low cost access to Internet via an online system called Spectrum. Hmmm... Full access to Internet for only $12.95 a month? That's certainly worth a phone call. So I logged on, had a look around, liked what I saw and signed up. Since Internet access was the reason I signed on in the first place, I immediately went to the Internet area. FTP? Telnet? UUCP? It quickly became obvious that for this online adventure I was first going to have to do some serious homework.

So, my first step was to add the Internet RoundTable to my Aladdin
auto-pass. Second, I raided their file areas looking for anything and everything I could find on Internet. (For an excellent primer on Internet, download Zen and the Art of the Internet, file #40. To get there type: M1045;3).

Armed with this newly learned knowledge, I once again logged into the Internet system. My first destination was the Cleveland FreeNet, a popular system that I used to log onto in my old PC Pursuit days. Within seconds I had logged on and was searching their file bases for interesting tidbits. It felt like old times again...

So, what does all of this have to do with GEnieLamp?

I am happy to announce that the nice folks at Spectrum have decided to offer GEnieLamp to their subscribers and will now also offer GEnieLamp to Internet members via FTP anonymous access. The address is: sosi.com and the Lamps are available in the ~/pub/GEnieLamp directory. My personal address on Spectrum Online Systems is: jpeters.sosi.com

If you do get GEnieLamp via Internet, take a moment to go to our local conference area, local.genielamp and tell me about you and your Internet adventure. Who knows? Working together maybe we'll both be able to figure out this wonderful thing called Internet!

Until next month...

John Peters

Green and Purple Plaid? Your GS has gone Grunge. Watch out that it
doesn't move to Seattle.

(D.JOHNSON106, CAT9, TOP6, MSG:233/M645;1)

MAINTENANCE TIPS I am starting a project on a book and disk designed to
keep those Apples running and welcome your suggestions,
questions and recommendations. Perhaps the most important, easy to do and
quick, suggestion I can make to keep your Apple II running is to unplug it,
remove each card and run over the slots with a pencil eraser. This removes
the airborne grease that seems to find its way onto the gold-plated tabs
and will eventually disconnect the card.

I have also taken a cranky mother board, and again, after unplugging
the power supply, lifted each chip with a small screw driver, once on each
end, then pushed them back in place and the weird symptoms disappeared!
Apparently the little bug feet get greasy too, or perhaps corroded and this
small amount of motion is enough to clean them. (note: The chips need not
be fully removed, just lifted a couple of millimeters and then pushed back
in place.) This trick has worked well many times and we have literally
"saved" a couple of mother boards with it.

Adrian

(A.VANCE, CAT15, TOP15, MSG:1/M645;1)

INTERNET MAIL WITH CO-PILOT A better way to address Internet mail with
Co-Pilot: Address the letter to yourself,
then include the line *to,user@sitename@inet# as the first line of the
letter. This will override the address you entered. (If it doesn't work,
YOU will get a copy of the letter, which will let you know it failed.)

(QUALITY, CAT10, TOP11, MSG:284/M645;1)

APPLEWORKS GS INSTALLER FOR SYSTEM 6.0 > Since you have the new AWGS
Installer disk, do me a favor
> and compare the application on that disk with the shipping version of
> Installer and see if it is actually the same file.

All of this has gotten me curious, too. Here's the story...

I used to frequent the 'Claris' area on AOL (I don't know if they
still maintain that area...haven't looked in quite awhile, but if you have
access to AOL, try keyword 'Claris'), and after System 6 was released, it
was discovered by many the _something_ was wrong with the way AWGS
Utilities disk, which is where the Installer and its Scripts are located,
was working with System 6. As most of us know, from time to time AWGS has
to be reinstalled (I say most, for I actually know someone who has used
AWGS for years, and has never _once_ crashed or had to reinstall---must be
a faulty disk! :-)

Well, _someone_ from Claris (sorry, don't remember his name) responded
to us via AOL stating that _if_ we were registered, request via E-mail, and
he would send us an updated 'Utilities' disk that would deal with System 6
properly. I did just that, and was sent, free of charge, an Official disk
Apple II Computer Info

with a Claris label that reads "AppleWorks GS, Utilities, "REVISED"."

I will do as you ask, and visually compare to see what the differences are and post back here.

Here is what I found regarding the "Revised" edition of the AWGS "Installer. This is somewhat misleading because I didn't mean to imply that the 'Installer' itself, as in Application, was changed, but that an updated _script_ was written by Claris and put onto a disk. The files on the 'Revised' disk compared to the files on the original AWGS v1.1 Utilities disk are as follows...

On the 'old' Utilities disk, there are 32 different 'Text' files in the 'Scripts' folder.

On the 'Revised' Utilities disk, there are only 5 'Text' files as follows...

1. ATIW.CL created 6/3/92
2. AWGS.EASY created 4/13/92
3. DCIM.CL created 5/16/88 and modified 6/3/92
4. DICTIONARIES created 7/6/89 and modified 4/13/92
5. AWGS created 7/6/89 and modified 6/4/92

These five scripts are the _only_ scripts in the 'Scripts' folder, but they seem to do the same job as the 32 in the 'old' 'Scripts' folder, only in a more compatible way with System 6.

Two other differences...

There is an 'Icon' folder with "AW.Icons" and "AWGS.Icons" files. There is a 'System' folder with 'Fonts', 'CDevs' and 'Drivers' folders. The 'System' folder seems to be there to replace the need for the 'AWGS.System.Disk', as the files within are the same as on the 'old' system disk.

From my understanding, this 'Revised' disk solved several problems that some were having after installing System 6. I certainly _could_ be confused, though. :-)

Jeff - Delivered by Co-Pilot v2.1.1 and TIC
(J.CARR20, CAT17, TOP17, MSG:192&198/M645;1)

WHAT DOES FASTFONT DO? System 6 puts a file named "FastFont" in the "Fonts" folder. What is the purpose of this file? Can it be eliminated (to save space)?

Thank U. David (D.THOMAS29, CAT9, TOP6, MSG:188/M645;1)

FastFont is a special version of Shaston 8 plain. It's designed so that the Font Manager can use it quicker for things like drawing "System text" (text that makes up menus, radio buttons, simple buttons, pop-up menus, check boxes, etc).

You CAN delete it if you really need the space, the Font Manager will then use the "normal" Shaston 8 plain that exists in the ROM of the GS.

Bryan (SOFTDISK.INC, CAT9, TOP6, MSG:190/M645;1)
Apple II Computer Info

>>>...with the appropriate performance "hit".

(ALTERNATE APPLEWORKS DICTIONARY? now that you've got the rights to AWKS
and AWGS, might it be possible for you to part with the information, how the main dictionary format of AWKS and
AWGS is? I'd like to do German main dictionaries for both programs. I'd
consider also to pay a certain license fee to you, for every copy of the
German dictionaries sold. OTOH, if you don't wanna part with this kinda
information, would it be possible to compile a main dictionary from a word
list I'd send to you? Again, I'd pay for that.

Udo - Still GS'ing along happily -

Good questions. I'm not sure if the dictionary format is
proprietary or not. (Proprietary to someone besides us, I mean.)
I do recall someone telling me that it took an accelerated machine a couple
of DAYS to compress the dictionaries used in QuickSpell/AW3.

(Udo - Still GS'ing along happily -

(Yeah, good dictionary compilers can take quite a while to run --
to compress our in-house test dictionary from 2.4MB to 750K takes
around 9 hours on a 9/64 GS!!)

The UniDisk is markedly slower anyway, but the 2:1 interleave will
send you screaming. (4:1 on the Apple 3.5 on the IIgs is slower than 2:1,
but not as severe as 2:1 versus 4:1 on the UniDisk 3.5 or Apple IIc Plus
3.5 interface with either drive type.)

Known problems with HardPressed are (as
mentioned in the GS+ review): compressing
HCGS stacks, accessing compressed GraphicWriter III files and working with
files over AppleShare.

The GW-III problem was fixed with the small patch I uploaded a few
weeks ago. The problems with HCGS and AppleShare have been fixed and are
part of the soon-to-be-released v1.0.1 (it's in final testing right now).

If all goes as planned, the update to v1.0.1 will be available online, so anyone with v1.0 will be able to update to v1.0.1 by just
downloading a file from GENie. So there's no reason to wait unless you
need really need a v1.0.1 feature (e.g. you do all your work over
AppleShare).

Works pretty well with everything else.

The problem with GW-III was fixed with the really small patch.
Basically, GW-III was checking for errors by examining the 65816
'Z' flag. This is acceptable but slightly unusual behavior.
It had problems because instead of setting the 'Z' flag I was setting the 'N' flag, so GW-III was seeing errors when there really weren't any. It would say to itself, "ah, there's an error there, I wonder what it was. Well, hmm, there wasn't REALLY an error there, so let's go into an infinite loop and hang the system."

It works just fine now, though. I think some other minor problems with some desk accessories cleared up after the patch.

- Andy (FADDEN, CAT37, TOP3, MSG:234&236/M645;1)

THE BUG THAT WASN'T A few months ago we got a report that this Yahtzee game wasn't working when both HardPressed and Pointless were installed. I tried it and sure enough, it died.

Well, with a little (well, a *LOT*) of help from Dave Lyons, I tracked it down to a really weird value for the direct page space for the line edit tool box. It seems that some old TML Pascal source code did the LESTartUp() call incorrectly, passing the arguments in the wrong order.

What this means is, the line edit direct page space gets the value that was supposed to be the userID, and the userID becomes the DP value. Usually you end up with a DP of $1002, which looks funny because the toolbox DP is always page-aligned.

Dave did a patch for this that patches the tool call, checks the order, and swaps them if they look funny. He's sending me the source code for it; I'll upload it after I have a chance to check it out.

The reason I find this interesting is that GS-Tape was exhibiting similar problems with both HP and Pointless installed. I'm hoping that this patch will clear up the problems with GS-Tape as well.

The easy way to tell if this is a problem with your application is to start it up, go into Nifty List, and hit 'v <return>'. This gives you a list of loaded tools with versions. If the line edit toolset has something like "WAP=$1002", then you're having this problem.

- Andy (FADDEN, CAT37, TOP3, MSG:251/M645;1)

SHAREWARE SOLUTIONS II CELEBRITY TESTIMONIAL I'd just like to say that Joe's magazine is what InCider could have been if they truly cared about the Apple II. I only regret that the magazine didn't have any more pages since I read it non-stop after I got mine in the mail.

Burger (BURGERBILL, CAT28, TOP4, MSG:47/M645;1)

APPLE CREDIT CARD NO LONGER VALID It gives me the same feeling I got when I tried to order some materials from APDA with my Apple Credit Card, and then to hear them tell me that Apple Credit is no longer valid and that I was supposed to get a notice of such back in June. Yeah right, I know the mail is slow, but my bill seems to get here every month on time. Sure would be nice if they would invalidate my debt in the process (fat chance)! :-)

Tyler (A2.TYLER, CAT5, TOP4, MSG:43/M645;1)
FROM MAC TO IIGS   Setting up a AppleTalk connection between my IIGS and
PowerBook was very easy. I just disconnected my
ImageWriter II and attached that same cable end to the port on the
PowerBook. After installing the necessary system files with the respective
Installer programs on each machine (very straight forward), changing a few
Control Panel settings, and rebooting, all I had to do was activate
AppleTalk on both sides. Great work by the Apple System Software creators.

BTW, I did this to move a large MAC TrueType font collection from the
MAC to the GS. The collection fonts were on HFS disks with each font in
separate "suitcases." I "unsuitcased" the fonts onto the MAC RamDisk,
accessed the RamDisk from the GS thru AppleTalk, and copied the fonts onto
the IIGS hard drive. The setup was very stable throughout the whole
operation and acceptably fast.

All GS owners who have access to a MAC should try this. It's very
impressive the way it works. You don't need to buy any special connectors
if all you're doing is connecting a one GS to one MAC.

--= Ken Watanabe -==
(K.WATANABE5, CAT12, TOP4, MSG:22/M645;1)

SPLIT ERGONOMIC KEYBOARD   Apple's new keyboard will work fine with the GS,
but the sound keys don't do anything. An Init or
Control Panel could be written to fix this...<hint, hint!>
(T.BUCHHEIM, CAT2, TOP4, MSG:226/M645;1)

POPULAR HEWLETT-PACKARD PRINTERS   The 550 series (I'm not actually aware
of a 550, per se, only the 550C) is an
upgraded 500. The paper handling and a lot of other stuff that is not
visible have been improved. Especially with regard to the color model.

With the 500C, you could have a 3 color cartridge, with no black ink,
or a black cartridge. If you printed in color, the printer imitated black
by blending a real dark brown. The color and mono cartridges didn't line up
the same, so it was not possible to print a graphic WITHOUT black and then
go back and reprint just the black.

With the 550C, both black and color cartridges can be in place and
working at the same time, it prints colors AND black, at the same time, and
generally gives a much better color output as a consequence.

For black and white (or more precisely, monochrome) printing, there
is no significant difference between a 500, 500C and 550C. If you don't
anticipate a need for high quality COLOR printing, then the 500 is your
best bet.

Gary R. Utter   (GARY.UTTER, CAT12, TOP8, MSG:212/M645;1)

APPLEWORKS GS MEMORY TESTER   Does the memory tester that comes with AWGS
work properly with the CV Tech piggy back
card?
(J.NICOLETTE1, CAT46, TOP6, MSG:101/M645;1)

>>>>>>   Yes, quite well, including any memory that might exist in the piggy
back slot.
(J.CARR20, CAT46, TOP6, MSG:102/M645;1)
ERROR CODES  You may want to download a copy of the NDA, Super Info III. It contains a comprehensive list of error codes, probably the most comprehensive that I have seen. I think this is a start, anyway.

Tyler  (A2.TYLER, CAT9, TOP11, MSG:12/M645;1)

FONT CLEARINGHOUSE REMINDER  Well, it has been a few weeks now since my last post, and we are days away from a massively updated database being released in A2. The database has increased in size by about 60%. There is a very good likelihood that we may soon be getting a larger assortment of fonts into A2 as well.

So stay tuned!

In case you are developing a font for the Apple IIgs, be sure to request a Font ID assignment from the Clearinghouse. I know there has been some problem in the past with responsiveness, but I would like to assure you that it will not be a problem in the future.

To get a Font ID is rather simple. Just e-mail me a copy of the font under consideration, or snail-mail it to the address in the previous message, or the address soon to be in the topic header. :) You will get an assignment post-haste. If you are working on a font but it is not yet completed, you can be assigned a temporary ID for purposes of identification, with a permanent assignment after completion. (The temporary IDs expire after a specified time and are re-used, so don't plan to keep the number. :)

Timothy Tobin
Font Clearinghouse

(A2.TIM, CAT23, TOP11, MSG:16/M645;1)

<<<<<  If you are into fonts, I recommend that you look into a new A2 file. File #21372 is an AppleWorks database of the latest known $C8 fonts in the Apple IIgs world. The file contains about 1700 listings now, and requires AppleWorks 3.0 with at least 230K of desktop space. It has preliminary data on several fonts in terms of how many characters are defined in the font strike, as well as an attempt to define the alphabet used (Roman, Cyrillic, etc.).

I am interested in the public's comments on the new structure, as well as help in filling it out with the latest data. If you have been having Font ID conflicts, this database is a must-have item. It tells you what the font IDs =should= be, so you can safely change your offending fonts to the appropriate IDs.

I am also looking for input in case errors crept into the listings, so as to make it as accurate as possible.

Tim Tobin
Resource Central Font Clearinghouse

(A2.TIM, CAT8, TOP17, MSG:136/M645;1)

HIERARCHIC INIT POSITION COUNTS  ]^[t's a good idea to make sure that Tool.Setup, TS2, TS3, and Resource.MGR are always the first files in your System.Setup folder. If you're going to be moving Hierarchic around at all in the directory order, make sure it...
comes after those files.

-= Lunatic (: 

QUICKIE 3.1 DIFFERENCES Differences between Quickie 3.1 and Older Versions: Definitive Answer From the Programmer -

The palette used by all versions of Quickie covers the full range of 16 shades of gray, which is all that the Apple IIgs is capable of. BUT, upon close examination of any scanned image, most people will discover that only 12-13 of these shades are actually used by the time the final image is generated. There are a number of technical reasons for this, but it boils down to the fact that the generic smoothing technique used in Quickie 3.0 and before was not a perfect solution.

The Contrast and Brightness controls added in Quickie 3.1 (both to the application and the NDA) have the effect of allowing the user to customize the grey-scale smoothing process to his/her own needs. By adjusting the Contrast, you can fully utilize ALL 16 shades of gray in ANY picture, resulting in smoother graduations between shades. This is most useful when scanning a portrait, where the "shading lines" which older versions of the software created on faces can be greatly reduced or eliminated.

Adjusting the Brightness can lighten or darken a picture so you don't have to keep adjusting your scanner head's light/dark dial just because you changed original images. Adjusting both controls together can give you some really interesting posterization effects while maintaining (or reducing) fine detail.

A relatively minor enhancement to the Quickie 3.1 application also lets you create text labels for your pictures, using any font on your system.

The bottom line is that Quickie 3.1 allows you far more control over the quality of the images that you scan than ANY previous version, with the only limitation being that you are still stuck with monochrome images. The upgrade is well worth its price because you can get MUCH better monochrome pictures with a LOT less scanning and re-scanning, than ever before.

Re: Quickie Color - (name not finalized) - It's well under way, and as soon as I work out a couple of bugs in the color rendition scheme, you will start seeing some samples. Don't wait for it to upgrade to Quickie 3.1, though, because there is no reason to wait for color before getting the best possible monochrome results from your scanner!

Steve

P.S. - Has anyone found the Easter Egg in the System 6.0.1 version of Quickie 3.1?

MOUSETEXT IN APPLE M FONT To access the Mousetext characters in the Apple M font you simply hold down the Option key while pressing the appropriate letter. You can even get the "running man" by holding down Shift while you hit "F" and "G." This all _IS_
documented in my original upload of the font here on GEnie, along with the
original mention of why I chose "Apple M," as HangTime has described.

-- Lunatic (:)

USER FINDS THUNDERSCAN   Thanks _VERY_ much for the information. With your
""""""""""" information, and a couple of directory calls, I tracked down what I needed. Thunderware's new phone number is
510-254-6581. Software version 1.2 is the latest for the IIc/IIe. Version
1.0 is the latest for the IIgs. For the MAC, it is version 1.3.2. A
software update costs $29.00 + shipping.

From the old version of software (for MAC system 5!) that my friend in
Bolivia has, the person at Thunderware thought that it had origionaly been
sold for a 512K mac. The newer macs do not have the necessary power at the
serial port, so now it comes with a power plug that plugs into the disk
drive port, to provide power to the Thunderscan. That cord costs $25.00. I
am not sure that this is what Allen needs, but since it is cheaper than a
phone call to Bolivia, I ordered it.

Thank you Mr. Kern for your help. Without it, I would not have been
able to find the company. Since the question was about a MAC, I should
have gone over to the MAC board, but I would not have gotten an answer
there.

This is what is so great about Apple II people on GEnie! I asked a
question one night, and the very next night I get what I need!

I have been on this board for six years, and although the people have
changed, the helpful attitudes do not change.

Apple II people are special. And GEnie is a great place to meet!

Thank you one and all!!!

Ken Lessing   (K.LESSING, CAT2, TOP21, MSG: 1/M645;1)

APPLE /// SUPPORT  Gary - Thanks for the initial push to Bob Consorti. He
""""""""""" and Joe are _still_ supporting Apple ///'s. They sold
me some basic utilities that are indespensible for my ///plus.

Joe Consorti handles most sales at:
   Apple /// Products
   1174 Hickory Ave
   Tehacapi CA 93561

Bob Consorti handles the Tech questions now at (617) 731-0662 weekday
evenings or weekends.

Dave Huggins  (D.HUGGINS1, CAT12, TOP10, MSG:48/M645;1)

HARD DRIVE BARGAIN   I recently purchased a Quantum 170 meg ZPG from La
""""""""" Cie. This the unit advertised in MacWeek, etc. for
$249.00 It ships with a 25 pin cable, power cable, Mac software and
manuals, The hard drive is loaded with about 40 meg of software. The sales
rep did not indicate any problems with using it on a GS. After testing it
on my Mac and copying the software onto disk, I connected the HD to my GS using a Apple HS SCSI card, connecting it to my Chinook 40 Meg HD. I partitioned the ZPG into 2 ProDos partitions and 1 HFS partition. The HD works great with no problems. This drive is a bargain.

Les K. (L.KAPLER1, CAT11, TOP10, MSG:151/M645;1)

NOW DO YOU SEE WHY YOU SHOULD PAY YOUR SHAREWARE FEES? Over the next few days, I'm going to be uploading freeware updates to my major shareware programs. This includes Quit-To, File-A-Trix, FloorTiles, Ant Wars and ShutDown Reminder. This means that these programs will henceforth be available for free, with no obligation or request to pay me anything.

The reason I'm doing this is that I'm winding up my involvement with the Apple II as I move on to Mac programming. Releasing these programs as freeware is both a parting gesture of generosity, and a way for me to weasel out of any obligation to continue to provide Apple II user support. I will continue to check into this Topic for a short while, and will do my best to answer any mail/e-mail questions regarding my A2 programs. I just won't be maintaining my database of registered users, won't send my disk of goodies to paying customers, and won't be producing any more updates.

I don't suppose I have to explain the basics of why I'm leaving Apple II programming. It would be nice if I could continue to produce for BOTH the Mac and the Apple II, but I don't have enough time or brains to spare for that. It's going to take all my resources of both just to catch up and keep up with developments in the Mac world.

It's been fun, it's been rewarding (mostly emotionally), and it's been -- well -- lots of things. I wish I could shake hands with all my paying customers, and thank each one in person. In lieu of that, I'll say it here:

Thanks a zillion, and good bye.

Karl Bunker (K.BUNKER, CAT13, TOP10, MSG:91/M645;1)

UNEXPECTED BONUS WITH 6.0.1 The greatest advantage of Sys 6.01 I only discovered this morning:

The Applied Engineering fax software is working properly again !!! So not only Tetris is running like it should but also AE fax. I tried everything but did not succeed to hang the system.

Apple : THANKS !!!!

Peter van Dongen, Netherlands, Europe (P.DONGEN1, CAT9, TOP6, MSG:453/M645;1)

APPLEWORKS UPGRADE PRICE Q&A Whether you should upgrade to AW 3.0, here are the facts:

<table>
<thead>
<tr>
<th>Upgrade</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>AppleWorks 2.x to 3.0</td>
<td>$79</td>
</tr>
<tr>
<td>AppleWorks 3.0 to 4.0</td>
<td>$79</td>
</tr>
<tr>
<td>AppleWorks 2.x to 4.0</td>
<td>$99</td>
</tr>
</tbody>
</table>
If your eventual goal is to get 4.0, buying the AW 3.0 upgrade and following it up with the AW 4.0 upgrade is, er, dumb. B) Better to go for AW 4.0 right away and save $60.

(QUALITY, CAT42, TOP29, MSG:155/M645;1)

>>> > Will there be any way for a non-owner to get AW 4.0?

Certainly. You just have to pay full price for it. ($169.95, same as AW 3.0.) That version will be shipping by November 1. (The reason: there are more manuals included with that version.)

(QUALITY, CAT42, TOP29, MSG:164/M645;1)

AW 4.0 is a complete new package. It does not require AW 3.0 to modify it.

(QUALITY, CAT42, TOP29, MSG:181/M645;1)

APPLEWORKS 4.0 MACROS Ultra 4.3 is the only macro program that works with AppleWorks 4. The AW4 disk includes a TimeOut updater program that will make many TimeOut packages work with AW4, including Ultra 4.2. Ultra 4.3 is basically a "tweaked" version of Ultra 4.2, but does have a few new features. For example, the .online command now accepts a volume name as well as a file name. If you specify a volume it returns the number of blocks free instead of the size.

If you have Ultra 3.x, 4.0 or 4.1, you'll need to upgrade to Ultra 4.2 before you get AW4. Because Ultra 4.2 is a combination of an updated Ultra 4.1 and the originally planned Ultra Extras disk, there is no online or free upgrade available- you must get Ultra 4.2 directly from Quality.

(BRANDT, CAT42, TOP29, MSG:231/M645;1)

What if you don't have any of the UltraMacros packages? Do you need Timeout UltraMacros 3.x first as well as Ultra 4.3, or is Ultra 4.3 usable on its own on Appleworks 4.0? (I remember reading somewhere, the Resource Central catalog I think, that to use Ultra 4.x you needed to have Timeout Ultramacros already installed.)

David [Bird.Watcher]

(D.WALLIS2, CAT42, TOP29, MSG:247/M645;1)

TimeOut UltraMacros 3 was a prerequisite for Ultra 4 when it was a JEM product. When I sold Ultra 4 to Quality, they made it TimeOut UltraMacros 4, since they own TimeOut. Therefore you'll be able to purchase UltraMacros 4.3 directly from them.

However, since the full UM 4.3 won't come out until sometime in October, you're better off ordering UM 4.2 now, and then letting the AppleWorks 4 installer update you to UM 4.3 and you'll be ready to work as soon as AW 4 ships. The full package will take longer because I'll have to double-check all of the sample files and notes, but the program files will be the same.

(BRANDT, CAT42, TOP29, MSG:249/M645;1)

MACRO CONVERSION SERVICE We now have a service where we will update your macros from UltraMacros 3.1 to UltraMacros 4 for a very small charge per macro Word Processor file (up to 4,009 bytes). We'll do the entire update, using all possible new dot commands, even finding AppleWorks 4.0 PEEKS. Your macros will be updated by professional
programmers with complete and understandable update notes, and a player version if you don't plan to update to Ultra 4.3 itself. E-Mail for information, or wait for your next newsletter (scheduled for Oct 1), TEXAS II v3.8.

(B.CADIEUX, CAT42, TOP29, MSG:269/M645;1)

RTFM = REAL TIME FLEA MARKET I was sitting in a Real Time Conference room the other night and I was remembering all the fun I had at the last Trenton Computer Festival. That was in April. I really enjoyed walking around the flea market talking to the vendors, (I had a parking spot myself so I was a vendor also). Trying to haggle the price down a few more dollars for the lastest and greatest must have is fun once a year. But I missed that event! I wished it was going to take place next weekend! I wanted to spend money and make some of my junk somebody elses junk!

Then it hit me! Why not have a Real Time Flea Market! Everybody get all their junk together and make a list of their offerings. Then at a special RTC/RTFM we all could exchange all those dust collectors we have been saving!

So what do you think? Is this something you would attend? Should this be a yearly event? I don't think that is often enough, how about once every 3 months? What day of the week? Saturday, Sunday, a weekday? If we hurry we can do this on the Labor Day weekend!

The Bear (A2.BEAR, CAT4, TOP2, MSG:130/M645;1)

>>>>> Great idea, Bear! I vote for sometime on Saturdays. The rates are the cheapest for long-distance folks at that time. Once a month might be best, if you miss one you can always make the next one.

Charlie (C.HARTLEY3, CAT4, TOP2, MSG:134/M645;1)

<<<<<< The Real Time Flea Market would conflict with Category 4 here but how many people never list their wares here and would attend a RTFM to try to sell something. I think both could peacefully coexist.

The status right now is that these will start in the next month or so. We missed the Labor Day weekend because I had accidentally ignored this Topic and I thought there was no interest in a RTFM. We have a few surprises up our sleeves, and I will upload an edited transcript to the Library. That way if you can't make the RTFM you can download the file and look at what was offered and not bought.

The Bear (A2.BEAR, CAT4, TOP2, MSG:139/M645;1)

TOO MANY (OR TOO FEW) 5.25 DRIVES IN FINDER? \es, the number in the low nibble of the 5.25 driver (the last digit of the number in hex) is supposed to be the maximum number of devices REGARDLESS of what slot they are in.

[ I would guess that there are simply certain combinations of hardware and software that cause the system to think that there is firmware for 5.25" drives in some slots where it doesn't really exist. ]
Apple II Computer Info

(____) o, here's an addendum: If setting the aux type of your 5.25 driver to $0101 causes you to lose ALL of your drives, try incrementing the last digit to the next higher odd number (i.e. to $0103, then $0105, then $0107, etc.). If you're using 6.0.1 and you only have one 5.25" drive and only one shows up in Finder, from the outset, simply consider yourself lucky. (Also, remember where to come to look for help (right here) if a second phantom drive suddenly starts showing up.

-=- Lunatic

PROLINE BBS FOR MAC OR PC? Since it's been nice and quiet here for a while, I thought it might be interesting to artificially generate some discussion. Over on AOL, a couple people started asking if MDG would consider creating a version of ProLine for the PC or Mac.

We got into a very long and deep debate about all sorts of things relating to this single premise: development time, funding, merits of cross-platform versions, special interfaces, the affect on the existing Proline installed base (pro and con), and so on. In the period of just a week or two, there were about 100 messages posted (which is amazing for AOL, so don't snicker).

About half the people encouraged and supported the idea of cross-platform products. But others were staunch in their desire to keep ProLine an Apple II-only phenomenon. I had my own opinions as to why it would work or why it wouldn't (and I was about to expound on this, but I think it would be fun for you to find this out on your own here).

Before I begin, let me state for the record that MDG is not planning to ditch the Apple II market so we can pursue ProLine elsewhere, though I have a feeling this is how some of you may incorrectly perceive this exercise to drum up discussion. The topic was proposed by some PC or Mac person on AOL and, well, things took off rapidly (and heatedly) from there. So, with that clearly emblazoned into your graymatter . . .

What do you think about the idea of ProLine for the Mac or the PC? Why or why shouldn't MDG pursue such a prospect?
What are the pros and cons?
What do you think the affect would be on the Apple II market?
How would Apple II users feel about MDG if it happened?

Explain your answers and feelings. You don't have to respond to all these -- pick the ones you find most interesting to comment on.

NO BEHIND THE SCENES DRAMA WITH APPLEWORKS? Steve, there's not much to the Claris story. Joe just spent a lot of time convincing them it was in their best interest, PR-wise and financially, to get out of the A2 and hand it over to us. They finally agreed.

SHAREWARE SOLUTIONS II PRODUCED ON AN APPLE II Jerry - You convinced me at KansasFest, and after seeing a SSII make-over done with Quark XPress, I thoroughly believe that
it would make my life easier and that I'd be able to create a much more polished and professional looking newsletter.

Call me stubborn or call me naive, but in my mind, I'd be defeating the purpose if I used a Mac to create SSII. After all, within the pages of SSII, I'm singing praises to the Apple II. It just wouldn't seem right to me to use anything but an Apple II. A subtle and between the line message that I am trying to put forth in SSII is that the Apple II can be used for any purposes. So, I will continue to lay out and print SSII on my IIGS.

We're talking about me and SSII, and I think it would be a nightmare if you tried using AWGS to layout and publish II Alive. Then again, II Alive is a slick glossy magazine, and SSII is a home brew newsletter.

I haven't said anything yet about what I'd like to see in the AWGS PL update, as all I'd have to say is "ask Jerry". And, I do hope that in a year, or however long it takes, that AWGS will have those features that can be found in Mac DTP and high end word processors.

Joe Kohn (J.KOHN, CAT28, TOP4, MSG:62/M645;1)

>>>>>> RE the philosophy of layout "nationality": I think the question is whether you use the Apple II enough to be familiar with the average user's situation. When writing A2-Central, we wrote all the text for the issues in AppleWorks, but then we poured it into QuarkXPress to typeset. The main reason was that this allowed us to take the issue to a service bureau for phototypesetting into camera-ready copy, taking several stages of "translation" out of the process (what we saw was _usually_ what we got on the printed copies). Of course, this was before AppleWorks GS or GraphicWriter III. (When Tom started the publication, I think AppleWorks had yet to be generally accepted!)

I looked at AppleWorks GS's page layout module and found it too awkward, a throwback to PageMaker 1.2 days. I had used PageMaker by then and decided the cut-and-paste method of colummated AppleWorks printouts I was using for an SF newsletter at the time wasn't so bad...this was before I typeset Open-Apple/A2-Central, but I think Tom was using AppleWriter or AppleWorks with embedded typesetting codes at the time, then doing manual pasteup from the typesetter output.

I've since looked at GraphicWriter III and I might have been inclined to try using it for an "Apple II pure" environment. The main reason _I_ personally wouldn't have switched (unless Tom told me to :) is that I was already familiar with QuarkXpress _and_ the mechanisms were in place to have the service bureau handle its files. Getting them to adopt another "standard" (especially one on a computer that wasn't getting much penetration in the "serious" market, for whatever reason) was not an option (even if they would be willing to look into it, there was no "Linotype" driver available for the IIgs).

As a practical matter, somewhere on the line you _do_ go to non-Apple II production. That is, unless you're printing every copy yourself straight from the layout program. And you use non-Apple computers for other parts of the production chain. (Like exchanges using GENie's computers. :)

A _lot_ of the reason is the economy of scale. Smaller publications can more easily remain "pure" because they don't have to deal with the industry chain (and industry computer standards) required to get large
quantities of material into print quickly. It's ironic that the (slow, but
seemingly steady) decline of the Apple II market has allowed us to be more
"pure" in approach, in that the "purity" can only (seemingly) be maintained
in that restricted environment. I don't know that, in those circumstances,
the ability to remain "pure" can be celebrated unreservedly.

Then again, we'll see what happens when Joe hits a few thousand
subscribers. Maybe he can pull it off. :)

(And before anyone runs out to get a Mac for DTP work, an aside to
consider: QuarkXPress is basically an _institutional_-type software
package; the current _mail-order_ price is about $550! Plus unless you like
to measure production time in fortnights you'd better get at least a
IIfi-speed Mac to run it, with lots of memory and hard disk space. What
programs like GraphicWriter III do is give you all the _practical_ features
someone needs to do page layout at a price that won't put you in servitude
to a repayment schedule for months or years to come. What a full-time
_business_ uses is often not the best thing for an individual or even a
home business to use.)

(WIZARDS.MUSE, CAT28, TOP4, MSG:66/M645;1)

GRAPHICWRITER III AND TWILIGHT II TIP   James Smith (part of the
Twilight II team) called me a
couple weeks ago to report that there is apparently a problem in Twilight
II and printing...if you have the "Menu bar box" option checked, printing
from some apps (notably GWIII) ends up getting random lines on the page.
Open T2's Setup dialog and UNCHECK that option (if it's on) and those odd
hyphens just might go away!

Thanks, --Dave   (SEVENHILLS, CAT43, TOP10, MSG:203/M645;1)

SCHOOLS REPLACE APPLE II   Can anyone give me ideas, rebuttals or
counterarguments in this situation?

I have volunteered to be an aid in one of our grade schools' Apple
labs. I have talked with the person the school district has hired
part-time to keep the machines running, and he states that "within a given
period of years" (there is no set time frame yet) that ALL apples in our
school district will be replaced with IBM's or compatibles.

I feel this is a waste of resources, and always-scarce money.
Apparently, the plan is to phase the Apples out as they go bad, until
there are no more left, then replace with all MS-DOS machines. I have put
in a word for the new PowerPC, but there was little enthusiasm from this
individual when I mentioned it.

Is this a "wave of the future" to replace school Apples with ms-dos
platforms? How can a district be persuaded that it will be unviable to do
so? Apparently, rumors that I had heard several months back regarding
this switch-over are more true than I thought...it saddens me to see this
happening, as, in my opinion, Apples are alive and well in education.

It also seems like a very serious waste of resources, and precious
monies that many districts (ours included) do not have available. I have
mentioned that upgrading and continuing to keep the Apples running would
be the most economical way to go, but this individual is a die-hard MS-DOS
person to the core....
Anyone have any ideas, suggestions, rebuttals, arguments that I can use?

**GEEna**
(G.SAIKIN, CAT15, TOP11, MSG:122/M645;1)

**NEW TIC TIP #1**

TIC TIC sets the port to whatever you select in TIC. The control panel is ignored. This is the way basically all the packages (other than possibly the AOL software) work. You can set the port rate in TIC to 19200 if you have a modem that does buffering (all high speed modems do this) and then basically forget about baud rate.

Don Elton (delton) or delton@pro-carolina.oau.org
(DELTON, CAT10, TOP11, MSG:256/M645;1)

**NEW TIC TIP #2: COPilot**

TIC 4.00 uses x-on/x-off flow control as well as hardware handshaking so you can no longer use ^Q or ^S as something to wait for in a script since they're filtered out and acted on at the driver level. You made the correct change to work with the GENie mailer without my help (The copilot scripts have to have that same mod to work with TIC 4.0).

I suspect that your ^C is being sent but perhaps the timing is too close after the file upload or something. You might try running the script in DEBUG mode or perhaps trying to send the ^C manually (after interrupting the script) to see how that works just to help debug the problem. Another idea would be to add a pause between the file upload and the xmit ^C statement. I'm not so sure that ^M as a prompt is a great idea either depending on whether you're using full or half duplex. Other possibilities would be ^J or perhaps just an unprompted upload? You'd have to experiment with that to see which works best.

Don Elton (delton) or delton@pro-carolina.oau.org
(DELTON, CAT13, TOP3, MSG:154/M645;1)

>>>>>> > "I _am_ able to find $version checks for v3.3 and v3.2, but can't find any others, including v3.31."

That's because there aren't any others. It is time for a confession. I'm on drugs. I've got a nasty infection, and I'm taking painkillers and antibiotics and not sleeping very well. It makes me pretty fuzzy. This has been going on for about a month. I'm having (very minor, outpatient) surgery this Friday, and I should be back to what I refer to as "normal" by the middle of next week.

Anyway, earlier versions of the CoP scripts tested for version 3.2, 3.3, and 3.31. The current scripts (Kens last version), handle things a little more smoothly and ONLY test for the older versions that don't work properly with the new "On $matched" command. If you are not using v3.3 or v3.2, then the scripts don't take that little jog into an older version of the routines.

In short, I goofed (twice) on this issue. The ONLY change you need to make to run CoPilot scripts with TIC v4.0 is to replace that "^Q" with "Ready for Input" followed by a 1 second pause. Sorry I put you to all the work. If I had gotten it right the first time it would have been a 2 minute job. (Sigh)

Gary R. Utter (GARY.UTTER, CAT10, TOP11, MSG:338/M645;1)
NEW TIC TIP #3: CONFIG Any time a version number changes, TIC will remove
your old tic.config file and write out a new one. This is done because I
sometimes have to make changes to the internal format of the config file
and crashes might occur otherwise. I also don't know which of the 40 or so
previous versions of TIC you might be updating from so I can't easily transfer
over the settings from a previous file. I can't remember if this is mentioned
in the docs or not but I guess it probably should be, perhaps a section on
updating from a previous version. I also probably should have mentioned
somewhere about having to install to a fresh directory. I couldn't add it to the
script itself as you may have noted that there wasn't but maybe one block (if
that) to spare on the 5.25 version of the disk but I'll see what I can do.

Don Elton (delton) or delton@pro-carolina.oau.org
(DELTON, CAT13, TOP3, MSG:180/M645;1)

LATEST ON CV TECH SUPPORT I have no clue. We've shipped all or existing
stock to SS and have stopped taking orders from the mail order guys. I've
got some equipment to liquidate (all apple stuff) and that should be that. I'm
kind of hanging on to make sure that there are no last minute problems
with the rom I sent to Jim "whiner" Maricondo (grin) and a couple others.
Unless someone whines bloody murder shortly I'm going to put a lid on the
RF board software and ship the update to SS and then it's their baby.

Drew (CV.TECH, CAT46, TOP2, MSG:235/M645;1)

(CV.TECH, CAT46, TOP2, MSG:244/M645;1)

<<<< The jury is still out (grin). I know that SS will be doing all the
"real" work (selling, RMAs phone tech support). We have an
agreement whereby I answer questions for them for the next few
months until they get settled into the RF board. I've already shipped
them all the physical stuff (stock, PCBs, parts, artwork, assembly drawings,
schematics, etc). We also shipped them the source code to 3.01c when we
thought that would be the last rom for the RF board (ya, right). Then we
had to fix the Jim Maricondo "port it from the Mac" problem and now we may
or may not have to do something with the MS-DOS FST support. I'd like to
dump it all in a box and ship it to SS today but I'd rather wait until I'm
certain that all the reasonable changes have been made for GS/OS 6.01. I'm
still waiting for RALPH KITTS to send me system 6.01 on a floppy so I can
take a look at it (or anyone else that would like the MS-DOS stuff to
work). I'd download it but I have no way of moving it from my MS-DOS
machine over to my GS (ugg).

Drew (CV.TECH, CAT46, TOP2, MSG:244/M645;1)

>>>> In that case, allow me to introduce myself. My name is Jawaid
"Bazyar, I'm Sequential's online tech support dude, and I'm nuts.
Most folks here can vouch for that.

I intend to give Drew a run for his money (especially with all the
money of mine he's already run off with! :)

Jawaid @ Sequential

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 981 of 1824
QUALITY COMPUTERS TO PUBLISH APPLEWORKS, APPLEWORKS GS

August 30, 1993 -- St. Clair Shores, MI

Quality Computers, the world's largest Apple II mail-order retailer and publisher, announced today the signing of an agreement with Claris Corp. (Mountain View, CA) which will make Quality the publisher of AppleWorks and AppleWorks GS, the popular integrated packages for the Apple II and IIGS.

"Claris will continue to focus their development and marketing efforts on their Macintosh and Windows products," says Joseph Gleason, president of Quality Computers. "We will provide Apple II users with the integrated software solutions they want and need."

Quality's "Quadriga" project, also known as TheWorks 4.0, was originally envisioned as an independent upgrade to AppleWorks 3.0. Now, however, Quadriga will be released as version 4.0 of AppleWorks. "The fact that we were already working on the upgrade went a long way toward convincing Claris that we were the right company to take on the product," comments Gleason.

The new version of AppleWorks, developed by veteran AppleWorks programmers Randy Brandt and Dan Verkade and featuring dozens of improvements to every area of the program, is scheduled to begin shipping on October 1. Users who upgrade will receive new program disks and a new reference manual (including a "What's New" summary), and, if the order is placed before October 1, a free "Enhancing AppleWorks" video.

Quality also plans a new version of AppleWorks GS within the next year, and is now soliciting user suggestions for that upgrade. Gleason indicates that further upgrades, such as an AppleWorks 5.0, may also be in the cards.

The AppleWorks 4.0 upgrade is $79.95 from version 3.0 ($99.95 from older versions). For further information, contact Quality Computers, 20200 Nine Mile Rd., St. Clair Shores, MI 48080, or call 800/777-3642 or 313/774-7200.

STAR TREK: FIRST CONTACT 2.0 Some general info for all those interested and some shameless self-promotion for myself...

Star Trek: First Contact v2.0 is now available in the GEnie files section. The game will run on all 128K Apple II's (enhanced IIe) and the IIGs.

I'm especially interested in hearing your reactions, comments, and (knock on wood) bug reports, if any.

Enjoy!

Jim Royal

LATEST POINTLESS HANDLES BUG Pointless 2.0.2 available soon!
The new version of PointLess should be ready in a week or so. There are few fixes and improvements:

1. Corrects the System 6.0.1 Font Manager bug in Choose Font option
2. Improved memory management
3. Improved font rendering routines including accented characters
4. Added a dialog box when attempting to save abitmap font with incorrect parameters such as point size set to zero.

There are number of other fixes mostly internal that a user would not normally see.

NOTE! - We will be sending out flyers to registered users to announce the new version and an offer to buy the update. However, we will also be uploading a "patcher" program here that you can download to update the program. Feel free to distribute the "Patcher" to other PointLess users and to include it on user group DOM’s.

Please don't hound me about exactly when the update and patcher will be reaready, I have enough to do with slurping soft drinks and such without responding to inquiries :)

>>>>> Updates to PointLess v2.0.2 from version 2.x is only $5.00.
""""
"""""Upgrade" from pre-version 2.x is $19.95.
(WESTCODE, CAT37, TOP5, MSG:113&119/M645;1)

>>> THROUGH THE GRAPEVINE <<<

AVATAR PROJECT UPDATE Status: Some tools have been seeded to beta-sites for testing with IIgs applications. A Super Nintendo device has been built to allow IIgs desktop software to run on it, it is in pre-beta (Late Alpha) stage and will be seeded in about 1-2 months. More tools are being finaled at 6.0.1 level and will be seeded as well.

The main desktop model is designed (second prototype) but no money to build it is available AT THIS TIME. The Super NES device is the one that will grill the toolbox we wrote for us.

If Adrian or anyone can license the official Apple II design from Apple then please contact us immediately at BURGERBILL on GENie or AOL but currently our design is so differant that we don't see a need to go thought the cost and time for us approach Apple about anything.

We are still working on it. Would you rather have us do it right the first time or do it over after it ships?

Burger Bill Heineman
(BURGERBILL, CAT15, TOP11, MSG:119/M645;1)

NEW ADDRESS FOR PROSEL AUTHOR All: Sometime in November I will be moving.

My new, and permanent, address will be:
58188 Trails End Rd., North Fork, CA 93643. The phone number will be (209)
SCARLETT REPORTS "NO SYSTEM 6.1." It was reported in the latest edition of Scarlett that there would be no more major System updates for GS/OS: "We know that System 6.0.1 is the last major update that Apple will ever release for the IIGS." (pg. 5, v12, n3) So much for the promised System 6.1.

Since we haven't heard anything more about the Ethernet card, I suspect that the card is history too. There's been no news here for some time. I wonder what the Apple II group is working on, or whether it is even in existence anymore.

J-Bird <<WHO GOT THE LAST GS?>>

I didn't realize that Scarlett became the official magazine for Apple Computer. :)

Tim 'JoaT' Tobin
Lost Classics Coordinator

Scarlett was also the magazine that insisted that the Apple IIGS would be discontinued on April 1st or 1991 or 1992. Yes, it did eventually get pulled from production (in December 1992), but they made it sound like they had some inside information that was giving them a scoop.

However, unless some of the Apple guys that get on here ever want to tell us otherwise, Jim Murphy has pretty well said that no 6.1 was ever promised (although he has not gone so far as to say that there will DEFINITELY be no further updates).

If I'm wrong about this, please throw floppy disks at me... :-)

Steve Weyhrich <IX0YE>---<

REPORTS OF GS+ DEMISE GREATLY EXAGGERATED I was happily reading V4.N6 when I read the words "...the eventual end of GS+ Magazine..."! I know that "all good things must come to an end" but those were not nice words to read given the state of affairs in the II world. Are things getting so bad that even a fine magazine like GS+ is thinking about its eventual demise?

Ron

Hmmm, I knew people would take that "...end of GS+ Magazine" thing the wrong way. :-) No, we're still here. Have been for 4 years. Every month someone calls us and asks us if we're still in business. Hopefully we'll be here for a long time to come. But things will end - we just can't forecast when.

The End of GS+ is always on Steve's mind, just like the end of the world, his latest tax bill, his last day on earth...

TIMEOUT CENTRAL You macro-types may be interested to know that I've been
appointed the associate editor of TimeOut Central. While
macros are not all we are interested in publishing (templates, tips, and
techniques are also welcome), if you have some you'd like to share with
others, and get your name in "lights" at the same time, send them to me:

Will Nelken
1675 Grand Avenue
San Rafael, CA
94901-2211

They do need sufficient accompanying documentation and/or annotation
to guide someone else in their effective use. :-)

I hope some of you take this opportunity to spread the delight of
AppleWorks computing!

| (-+) - |

...Will (W.NELKEN1, CAT17, TOP6, MSG:61/M645;1)

SOUNDMEISTER PRO TO SHIP Will the SoundMeister Pro come out? Absolutely
"***************************************** :) The Pro has become one of our most requested
pre-products and will make it to your hands at the end of September.

To recap: The first version of the Pro cost too much to produce. We
then had to go back to the drawing boards and redesign it from scratch. And
thus the delay.

As a sideline, someone had told me that Quality said that the Pro was
cancelled. That is entirely untrue and I don't know why they would say it.
I'm looking into the matter right now.

Michael (ECON, CAT35, TOP5, MSG:28/M645;1)

<<<< Let me clarify my poor clarification on the release of the
"""" SoundMeister Pro. The Pro will begin production at the end of
September and the first production run will take about two weeks. If you
have ordered a Pro from Resource Central, or from us, you will receive your
Pro by the second week of October. In other words, all of the preliminary
orders will be filled first. However, if you're waiting for the Pro to be
generally available before ordering, you'll have to wait until the end of
October, at the earliest, to receive one. So if you're anxious to receive
a Pro, I'd suggest you get in your order soon.

Michael (Hey... it's Friday :) (ECON, CAT35, TOP5, MSG:35/M645;1)

SHAREWARE INFO CLEARING HOUSE I just looked at IconEd, and sure enough,
"""" Mr Elseth lists 2 different addresses in
version 2.0. I also ran an older version, and in v1.3, he listed his
Rochester, MN address, so my guess would be that he moved recently to
Duvall, WA and forgot to change the address in the 'About' box.
Rather than make assumptions, though, I'll contact him and find out for sure.

At KansasFest, I gave a panel on maximizing shareware profits, and brought up the very subject of shareware authors moving, and not telling anyone where they moved. In the past few weeks, I have gotten letters from people trying to track down both Joe Jaworski and Bill Basham, as they had tried to send them money and it was returned by the post office.

So, I just want to let the rest of the Apple II world know that I have volunteered to be a clearing house of sorts. If you are a shareware or freeware author, and you have moved, please let me know where shareware fees can be directed.

You can send change of address info to me at:

GENie = J.KOHN
AOL = joko
CIS = 76702,565
Internet = joko@well.sf.ca.us

or the old fashioned way...

I thought some of you might find amusing this excerpt, quoted in entirety, from the latest WordPerfect newsletter (Fall 1993):

Apple Support Clarification
---------------------------
In our previous issue of WPReport, we inadvertently misled you on our decision to discontinue support for Apple computers (Apple IIe, IIc, IIGS, and their compatibles). We mean the obsolete Apple computers, not Macintosh! We are heavily engaged in developing software for the Mac. Please feel free to call us toll-free at (800) 336-3614 with any problems running our products on your Mac.

Oh, the _obsolete_ ones. Whew!

:: Dan ::
(D.CRUTCHER, CAT5, TOP4, MSG:41/M645;1)

We're working on the next version of ModemWorks, so we're interested in your suggestions (especially bug reports, if you have any, on 3.0).

(MORGAN-DAVIS, CAT32, TOP4, MSG:19/M645;1)

A new rev. of Platinum Paint will be available soon. Just a few more wrinkles to iron out.

> Do you know what was changed between 2.0 and 2.01?

Sure, really the only fix that is in 2.01 is the ability to print any size document. 2.0 allowed you to create a picture larger than one 8.5x11 sheet of paper, but wouldn't let you print anything but the first 8.5x11
Unfortunately, we've found a few other bugs, like crashing when specifying a degree of rotation, resizing, and a few other problems. These will be fixed in the forthcoming revision.

Walker       (W.ARCHER2, CAT42, TOP23, MSG:98&100/M645;1)

GRAPHICWRITER III PROMISED   Someone _is_ actively working on GWIII. It will require System 6. The interface is being brought up to date (hotkeys in dialogs, arrow keys that work in line edit boxes, etc.). As for new features, the only "guaranteed" feature a at this point is a "real" font menu. The big feature we're trying to add is support for the system clipboard, and a new "picture" object that will maintain its original bitmap quality even when scaled (as opposed to creating a new bitmap at screen quality whenever a bitmap is scaled).

We have no time estimate (every month we tell people "several months"). Basically, it'll be done when it's done, but it _is_ being worked on. I'll have a better guess when we actually start beta testing (no clue when that will be).

Thanks, --Dave   (SEVENHILLS, CAT43, TOP6, MSG:111/M645;1)

COPILOT SCRIPTS TO BE UPDATED   Here is a list of features that the new scripts add, in no particular order.....

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Get A2 and/or A2Pro GENie Lamp
Get A2 Disk of the Month
Get Livewire magazine
Get billing summary
get INDex for any RT
set delayed logon
choose default (always/never) for automatic Xmail download
choose default prefix for downloaded files by RT (including mail)
choose RAM or BRO by RT or globally
ignore/cancel cats and tops (before reading messages)
mark topics
search for messages (by all the usual criteria)
search for library files
get "new files list", (allows you to set WHICH RTs to do this in)
automate Xmail uploads (offline processing)
automate Xmail downloads (and toggle always/never)
automate library uploads (offline processing)
set "actions to perform" on GENie
restart CoPilot action script
enter Terminal mode
get GO to RTC
MANUALLY retrieve Email, with the operations scripted, i.e. the user can call this script and it will take them to Email, list the queue, and ask them to input a number. ALL they have to do is input the number, the script does the rest.

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

As you can see, we have added a LOT of stuff beyond what I listed last time (for those who were watching). I had initially hoped to have this stuff done and posted by Labor Day, but I said weeks ago that that was not going to happen. I had high hopes of getting them done by mid to late
September, but I kept finding new things to add.

Right now it looks like 2-4 weeks. We have to finish the PT3 translations, and get a bit of Beta testing done.

Gary R. Utter  

THE LATE GREAT RESOURCE CENTRAL OFFICE MOVE  

Carl, I believe it will be smaller. It's actually in the same complex, just shifting things around (and even that's enough to screw things up pretty darn good <sigh>)

Moving into a smaller place is not a bad thing. In fact a big part of the reason for not needing the larger space was because they sold ALL kinds of old stuff during KFest (Things that were taking up valuable space). Have no fear, Resource Central is still very much alive and well B-)

HOWARDSOFT TO RAISE APPLE PRICE  

For those who may have missed it, the following excerpt is from HowardSoft's upgrade letter for 1994 Edition of Tax Preparer:

"In order to continue to develop an Apple version, we'll soon need to raise Apple prices to IBM levels. Avenues for advertising to a large number of Apple II owners have virtually disappeared, and many former owners have chosen to switch to IBM-compatibles or Apple Macintoshes rather than upgrading their Apple II workhorses. (Remember, we allow you to switch to the IBM version at update prices! And your Apple Macintosh can use the Apple II version if you use Apple's IIe emulation card, or the IBM version if you use Soft PC.) But there's an out ..."

"Order by September 25th and you'll lock in the old $79 price for your Apple update. That's a $20 savings just for ordering early! (And tell your Apple II friends about us. One happy customer telling a friend is the best way we've found of then having two happy customers, and the only way we can fight the natural attrition of Apple customers.)"

Robin  

BEAGLE BUDDIES ON GENie?  

We're considering moving the Beagle Buddy stuff over here from AOL, actually, and providing support exclusively online. This is still in the planning stages, but it should work for getting more up-to-date stuff out to Buddies on a more regular basis.

(QUALITY, CAT42, TOP2, MSG:308/M645;1)

MS-DOS READ AND WRITE?  

I'm not sure which topic I should be in - but here goes. Yesterday I installed Peter Watson's MSDOS utility program, including the utilities to WRITE and read msdos disks. It seemed to work just fine - reading and writing to the msdos partition on my hard drive and the msdos formatted disks in my pctransporter. I transfered text files back and forth from the prodos disks to the msdos disks just like using the transfer program in the transporter. So far so good. So my question is - has any one else tried this program ? - has anyone encountered any problems ? I think I want to send my shareware fee.

(J.BAUER4, CAT2, TOP4, MSG:139/M645;1)
NEW SIX PACK FEATURES REVEALED  > I've been thinking of buying Six Pack.

> Should I buy now or wait a few weeks

> and get the new release??  I am on 6.0.1 if that makes a difference.

> Thanks.

Actually, you can order the new release now.  When it ships, it will be among the first to go out.

Quality Computers --- Power for performance
(W.CARVER1, CAT42, TOP26, MSG:235/M645;1)

>>>>>  Cool, guess that means its about ready to go!!! Stay tuned for more information on...

  ButtonBar v1.0
  XtraSounds v1.0
  SizeUp   v1.0
  LaunchList v1.0 ...and lots of updated modules..
  (W.TUDOR, CAT42, TOP26, MSG:236/M645;1)

>>>>>  ButtonBar?  XtraSounds?  SizeUp?  LaunchList?

"""
I'm going to guess XtraSounds is a replacement for (or works with) Apple's Sound CP, and LaunchList sounds like RunQ or QuickLaunch...but I don't have a clue as to what ButtonBar or SizeUp are...(could ButtonBar be like a toolbar on Windows/Mac programs?) These sound interesting...
(T.BUCHHEIM, CAT42, TOP26, MSG:239/M645;1)

>>>>>  Yep, ButtonBar is a toolbar for the Finder.  SizeUp adds up the entire selection and tells you how big it is in K. (It can also, I believe, intervene in a copy operation if you don't have enough room on the target disk, before the copy operation begins.  Just like the Mac.)

The rest of 'em are just like you guessed.  B)
(QUALITY, CAT42, TOP26, MSG:240/M645;1)

>>> MESSAGE SPOTLIGHT <<<

Category 2,  Topic 5
Message 75        Sun Sep 19, 1993
T.SMITH59 [Terrell]          at 01:51 EDT

There are several reasons I've been tempted to look at other computer systems.  One is that the //e I use is old (not good enough), another is the desire to have a laptop (why doesn't someone take the Mac LC card and put a screen on it etc. etc. and make a laptop?).

So why have I decided to stay with the Apple //e?  Several reasons:

1) I borrowed a friends laptop for a week.  It was great to have the portability.  But the programs were dogs compaired with AppleWorks (with TimeOut and UM, of course).  There were several things I just couldn't do, or that I could do, but were akward.

2) Money.  Although the graphics and sound of the newer computers are awesome, do I really need to have those things?  My wife helps me here - she asks, "Do you need that to get the job done?"  To which I have to say...
no. And if I changed to another platform, even though the prices have
come down (way down), I'd still have to spend a small fortune on software.
And what to do with all the stuff I already have for the //e? Very little
would transfer over.

3) Does it do the job? Actually, the //e does such a good job that
people here at the office ask me how I printed such-and-such, or was able
to do such a nice data base, or how I scanned that graphic, etc. They all
use IBM PC's. While windows has improved the IBM world greatly, I see
every day their frustration with not being able to do what they want to do.
I'm able to do top-quality work with AppleWorks, several TO.Applications,
Macros, PublishIt 4.0, a scanner, and ProTerm 3.1. It does help to have a
HP 4 Laser printer which does PostScript. I'm able to use all the high
speed Laser printers here at the office (20 pages/min!), and convert files
from MS-DOS (using Cross-Works), read files from MAC (using HFSLink), and
print PostScript (using PubIt).

Of course, there are limitations to what the //e can do. I can't
scale my fonts on the printer as easily (I can do it, but it's somewhat of
a hassle). I don't have WYSIWYG in AW, it's very close though in PubIt.

And there's terrific support for the //e through A2, A2pro, QC, and
many others. Where would I find that support in the MS-DOS world?

So friends, I for one have decided to just sit where I am and
continue to use this ancient machine until it dies, which will not be for a
long long time. I've had it for 12 years now, and nothing in the hardware
has gone bad. (One chip went bad on the 16K language card on my II+).

I was amused when GEnie sent me a card about "Service Warranty Offer"
for "all" computers: just pay $ each year and they'll come to your house to
fix it for you.... One catch, the computer to be covered cannot be older
than 5 years (or was it 7?). My II+ and both my //e's have got that beat
by a mile. I sent the card back, thanking them for reminding me what a
great machine I have. "They _don't_ make them like they used to." Those
"cheap" MS-DOS machines are. They don't last long before burning up,
crashing, or being out of date.

How long does an average disk drive last on one of those things? Five
years? My Disk II is at least 15 years old. I bought it used. How soon do
HD's crash? The one our office bought lasted several months. The monitor
blew up (I was using it and smoke began to pour out the back. It probably
knew I'm an Apple user :)

Well, the new machines look great. They have great graphics. Low
prices (all is relative). I have a machine which is already paid for, and
does what I want it to do (well, almost. But it's close enough.)

---

While on GEnie, do you spend most of your time downloading files?
If so, you may be missing out some excellent information in the Bulletin
Board area. The messages listed above only scratch the surface of
what's available and waiting for you in the bulletin board area.
If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

(D.JONES117/CAT8, TOP50, MSG:534/M245)
Online communication brings with it all sorts of benefits... but as the old saying goes, "Too much of a good thing can be a bad thing." When people start getting inundated with electronic mail they need to find ways to streamline their online time.

Just last month I observed an amusing, creative solution to e-mail overload. A friend of mine has a son in the fifth grade who takes a strong interest in computers and telecommunications. For two or three years this young fellow has been pleading with his parents to get a 9600 baud modem for the family computer. Since this youngster typically spends fifteen to twenty hours each week online, he is weary of the low speed of his family's 2400 baud modem.

Recognizing an opportunity to help themselves, the parents in this family agreed to buy a 9600 baud modem for the family, on condition that the fifth-grade son spend time each day helping his parents answer their own electronic mail from work. The youngster agreed to take on this new family chore and, true to his word, now spends ten to twenty minutes each day retrieving his parents' e-mail. He sets up his communications program so that his parents can sit down and quickly answer their e-mail after dinner each evening.

While this story sounds more amusing than alarming, it does raise some thorny ethical issues. Why is it that the parents of this family felt compelled to answer their work e-mail from home? Because hardly anyone has enough hours in the day to do productive work and still find time to answer all the electronic mail that arrives at his or her desk during the day.

The term "telecom agent" refers to a person who helps streamline one's online communication experience. In the case of my friend's family, the young child served as a "low-level" telecom agent. His duties were simply to retrieve e-mail, save the messages to a hard drive, and set up the communications program for easy answering of the e-mail.

"High level" telecom agents take on the extra duty of saving incoming e-mail messages to a hard drive, and classifying incoming e-mail into categories and/or specific folders on the hard drive. High-level telecom agents can also take on the responsibility of answering some of the more routine e-mail messages that arrive at a person's desk. In that way, busy business professionals can streamline their online communications.
So the next time that you feel overwhelmed at how much e-mail is arriving at your desk, perhaps it's time to start looking around for a fifth-grader to come to your aid. In the months ahead it may not be unusual for kids to have this new chore added to their list of family chores. The familiar refrain of parents around the country could plausibly evolve to something along the lines of: "Okay, Chelsea, I want you to: 1) Clean your room, 2) Take out the trash, 3) Retrieve mom and dad's electronic mail. And don't forget to feed the cat."

-Phil Shapiro

The author takes a keen interest in the social dimensions of communications technology. He can be reached on GENie at P.SHAPIRO1; on Internet at: p.shapiro1.genie.geis.com; on America Online at: pshapiro

---

INTRODUCTION   I hope you were not too deeply flooded by the list of terms that came flowing out of this column last time. If you start feeling as though you are drowning again this month, I suggest that you get out a printed copy from last time, and refer to it as necessary.

This month we will dine on some of the nuts and bolts of how the Apple IIGS computer hardware is set up, and discuss how to modify it to suit your needs. You will find a napkin provided to the right of your keyboard, and please don't eat with your fingers. Ready? Here comes the first course....

UNDERSTANDING THE IIGS HARDWARE   In the "old" days, setting up and using an Apple II required little more than plugging the computer's power cord into the wall, attaching the monitor, and turning on the computer. Use of a disk drive (originally an expensive option) involved a little more effort, inserting the controller card in the correct slot and connecting the disk drive(s) to that card. The same sort of effort was necessary if you wanted to add a printer, modem, clock, or other peripheral.

The Apple IIGS is, in a sense, EASIER to set up and use than an Apple II+, though it achieves this through greater internal complexity. (That is, by the way, the major improvement in computer software since the earliest days of personal computers; in exchange for a machine that is easier to set up and use, the internal functions have had to progressively become "smarter", requiring less user input.) There is far more hardware built into the IIGS than the II+, so the user has to add fewer peripherals than formerly to be able to carry out the most common operations. The IIGS is actually two computers in one: when starting up, the 65816
microprocessor is in 8-bit "emulation" mode (that is, it acts just like a 65c02). If you don't add any hardware to it beyond plugging in a disk drive, you can start it up with a disk meant for use with an Apple IIe or IIc (or even a II+) and it will act just like one of those computers.

The standard settings on a IIGS give it the electronic equivalents of an Apple IIe with 128K of memory, a Super Serial Card (an Apple brand of a serial interface card) in slots 1 and 2, an 80-column card in slot 3, a mouse controller card in slot 4, a Smartport in slot 5, and a 5.25 inch disk controller in slot 6. (The IIGS actually comes with 256K on the motherboard in the ROM 01 version, and 1 meg with the ROM 03, but that extra memory is not readily available to many 8-bit programs that can be run on the GS.) Through software control, the IIGS can be switched to full 16-bit mode, and is then capable of doing quite a bit more than the IIe.

SLOTS 1 & 2 The Super Serial Card was distributed by Apple Computer to allow serial devices to be connected to the Apple II. The IIGS comes standard with this capability, and uses the same software commands as did the older, plug-in card. The place to connect to these two serial cards is at the printer port and modem port (on the left side of the back panel of the computer). Note that you are NOT restricted to using a printer ONLY with port 1, and a modem ONLY with port 2; you could just as easily connect them the opposite way and have it work. Furthermore, you could attach TWO modems (or TWO printers), one on each port, and everything would function just fine. However, there are some other settings (which I will discuss in a later article) that would need to be changed in order for this to work. Also, there is a lot of software, particularly the 8-bit type, that is designed to ONLY work with a printer in slot 1, and/or a modem in slot 2. It is the standard that has developed over the years, and you will rarely go wrong by connecting things in accordance with that standard.

SLOT 3 The 80-column card in slot 3 is there primarily for backward compatibility with older software. The original Apple II had a 24-line by 40-column display, and users who wanted more text on the screen needed to add a card -- traditionally placed in slot 3 -- to get the full 80-column display (which is a "standard" older than the microcomputer industry itself). The Apple IIe had this 80-column capability built-in, and simply needed some memory added to make it work; the IIc came with this additional memory already present. The IIGS follows the example set by the IIc; it also has the necessary memory for 80-column text display.

SLOT 4 A controller card for a mouse was built for the Apple II, II+, and IIe, after the Macintosh popularized the device. This allowed the development of software that could use (or required) a mouse. The Apple IIc came mouse-ready; all you had to do was buy one and attach it to the joystick port in the back. The IIGS maintains this tradition of having the mouse controller in slot 4, again for backward compatibility with this older software. However, the mouse is more integrated with the IIGS design, and it is not plugged into the joystick port, but rather is attached to the port on the keyboard. The older software which expects to find a mouse card will be able to locate it at Slot 4 and allow use of the mouse.

SLOTS 5 & 6 Disk drives have long passed the era of being an optional accessory, and are absolutely necessary for use of modern software. While it is still possible, on the Apple IIGS, to start up in BASIC, type in a program, and run it, you will not be able to save that
program to a cassette tape drive as was possible on the II+ and IIe. The
disk drive and some sort of disk control software ("operating system") are
needed to do anything useful on the IIGS. Here again, tradition takes
precedence, and the electrical equivalent of a 5.25 inch disk controller
card (originally known as a "Disk II" card) is assigned to slot 6, and the
controller for 3.5 inch disk drives (through a software convention called
the "Smartport" protocol) is assigned to slot 5. If you look at the back
panel of the IIGS, however, you will find that there are not two ports for
the two types of disk drives. Instead there is a single socket with a
picture of a disk, and both sorts of disk drives are attached here. The
disk drives made to work with the IIGS can be connected together in a chain
(known as a "daisy chain"), and the chain is then plugged into the disk
port on the back panel. Any 3.5 inch disk drives (also called "3.5
drives") must come first in the chain, plugging the first one into the disk
port, and then the next drive to the first drive, and so on. Up to four
3.5 drives can be attached in this fashion, although most users will not
have more than two. If you want to add one or two 5.25 inch disk drives,
these are also attached to the end of the chain. The disk controllers
built into the IIGS will be able to tell the different types of disk drives
apart.

SLOT 7   This slot is not specifically assigned to an internal function on
the typical baseline IIGS system, but has the capability of
acting as an AppleTalk network controller. I will not spend any time
discussing this in this article, as most new users will not have need of
this. (To be honest, I've never used it and have no idea of how to set it
up.) In situations where AppleTalk is not going to be used, slot 7 is
often used for a controller for a hard disk.

CLASSIC DESK ACCESSORIES   Although the IIGS comes with the
equivalents of seven cards for each of its seven
slots, the physical slots are still present inside. These have been
retained because many users will need to add capabilities to their computer
that go beyond those of the built-in hardware. For example, if you
purchase a printer that only runs with a parallel interface, you will need
the ability to plug in a parallel card and bypass the serial interface
hardware. How does the computer keep track of whether it is using the
built-in hardware (as described above), or some add-on hardware? It does
this through means of a desk accessory called the Control Panel.

   Classic Desk Accessories (or CDAs, defined in last month's article)
are available at ANY time on the IIGS, whether running the older 8-bit
software, or newer 16-bit software. CDAs use the 'classic' text screen
display. (There are, of course, New Desk Accessories as well, that are
accessible only in a "desktop" type of IIGS program, one that uses the
mouse, overlapping super hi-res windows, and a menu bar, as with most
programs on the Macintosh.)

   The CDA menu can be displayed at nearly any time by pressing the three
keys Option, Control, and ESC simultaneously. Whatever the computer is
doing will be interrupted (either immediately or after it is done with a
timing-sensitive operation), and the screen will change to display a box,
with the top line labeled "Desk Accessories" (preceded by the MouseText
picture of an outline of an apple). On the ROM 03 version of the IIGS, the
menu will look like this:

   Control Panel
   Alternate Display Mode
Apple II Computer Info

Memory Peeker
Visit Monitor
Quit

with the top item, Control Panel, highlighted. (The ROM 01 IIGS may have
the same items available, but the Memory Peeker and Visit Monitor
selections will not be in the list until a specific command is entered from
the keyboard while in the Monitor.)

Alternate Display Mode is used to allow certain older 8-bit Apple II
programs to display the graphic screens properly. I have not yet come
across anything that required activating this CDA; however, I don't use
many graphics-specific 8-bit programs. Memory Peeker displays information
about memory allocation in the IIGS, and Visit Monitor allows you to get
into the IIGS Monitor program at any time. The use of these CDAs is beyond
the scope of this article (and my experience); most users will never need
to use them at all.

TIME FOR DESSERT Well, that's enough for now. Chew this over

Alternate Display Mode is used to allow certain older 8-bit Apple II

programming彻底, don't forget to brush, and next month we
will dine on the Control Panel CDA itself. Bring your own catsup, and I'll
bring the Grey Poupon (but of course!)

Computer Keyboarding (v5.0)

By Mel Fowler

Program Name : COMPUTER KEYBOARDING v5.0
Filename : KYBD5.HD2.BXY
Library Area : 51
Program Number : 21139
File Size : 194944
Program Type : Typing tutorial for Apple II
Author : Charlie Hartley (C.HARTLEY3)
Version Reviewed : 5.0
File Type : SHAREWARE! $10.00

ONCE UPON A TIME Most fairy tales start with "Once upon a time". As a

retired Navy chief, I must begin this sea story with
"This ain't no bull".

When I was in Radioman "A" school in San Diego, we learned typing and
Morse code at the same time. With headphones on, we would hear "dit daw,"
say "A", and type "A" with the correct finger. It was something to be
seated in a room with 45 other guys all saying "A" at the top of our
voices. I must say though, this method did work... I was later stationed
at the San Francisco ship-shore CW facility and was comfortable copying 30
to 35 words per minute.

This was before personal computers, word processors, and in a day when
the Navy was still using Morse code as a major means of communications.
With today's computers and programmers like Charlie Hartley, we now have
Computer Keyboarding to teach us how to type. But before we get into the
I am a long-time resident of Kentucky. I went to college at Campbellsville College in Campbellsville, Kentucky where I graduated in 1965 with majors in English and History/Political Science. I came straight from Campbellsville to Shepherdsville, Kentucky to begin my teaching career. I have taught some type of English class to grades 7 through 10 and some kind of social studies class from grades 7 through 12, all in the same school building.

This is my 29th year as an educator and my third as an assistant principal. This year we opened a new school -- Bernheim Middle School -- and my tongue is dragging from the work it has taken to get it open. Betty and I have been married for 31 years and have a daughter and three grandchildren. We have four generations living in our house -- my mother, us, and our daughter and grandchildren.

I first became interested in computers in the late 1960s when I watched a TV show hosted by Walter Cronkite titled, I think, "The 21st Century." One particular episode was about computers and it fascinated me. I promised myself that someday I'd have a computer.

I bought my Apple //e around 1984. At first I used the //e mainly for word processing, but it wasn't long before I began tinkering with Applesoft BASIC. I bought the programming books and read them carefully. More often than not, I was confused, but I experienced just enough success to know that I wanted to do more.

Because I was the computer nut on my middle school faculty, I got to create and teach a twelve week course using the //e's in our school. At first it was a programming class where I taught the students how to create log-res graphics screens as well as simple sound and graphics programs. This appealed to many of my students but was boring to others.

It didn't take long for me to figure out that most people were more interested in using the computer as a tool to do other things rather than creating their own programs. I gradually shifted the class away from programming toward such things as word processing. To facilitate their ability to use a word processor more effectively, I began a program of typing instruction using a piece of commercial software (sorry, I don't remember its title).

I was never satisfied with this software because it dwelled on speed at the expense of accuracy. It was even possible for the students to skip lessons which meant that they failed to learn some keys. Over the years I had developed into a fairly good two-fingered typist. I tried to use this program to improve my own skills, but my progress was disappointing.
I decided to try to write a program to teach typing. It wasn't the first program I had written, but it certainly was the most ambitious. I called the first version "No-Frills Keyboarding" because it used only the text screen, no graphics at all. While some of my students experienced success with it, others called it "No-Thrills Keyboarding" when they thought I wasn't listening.

In order to make the program better, I decided that I would have to include graphics and make the whole thing run faster. To do that I had to turn to assembly language programming. Again I read books on it, including many programming examples in such magazines as Nibble and Call-Apple. By trial and error, I slowly developed the assembly language code that is the major part of my present program.

I have never taken classes in computer programming and I don't know much of anything about programming languages other than BASIC, assembly language, and a little AppleWorks macro programming and some SimpleScript stuff for HyperStudio. If my programming is structured, it is because I have followed the examples of others whose work I have studied. With the keyboarding program, it became highly structured out of necessity as the program grew and took on a life of its own. The early versions probably resembled spaghetti code.

The latest Keyboarding uploads on GENie, uploaded on 8/7/93, include all of the bug fixes except #5 (file #21151). If you don't have it, get it.

I have also uploaded a number of other files that are freeware including:

1. Super Tic Tac Toe (#20907)
2. Don't Fence Me In! (#20817) -- a game of strategy.
3. Video Data Base (#18375) -- a DB manager for keep track of videos
4. Computer Terms Quiz (#18271)
5. Cooperative Learning worksheets for Apple // version of "Where in the World is Carmen Sandiego" (#18041)
6. Computer Spelling Lessons (#18068) -- a completely automated and individualized spelling tutor/testing program for 7th graders.

I am presently tinkering with several small projects including something that I have tentatively titled "Acme Academy. All I can say now is that it has something to do with the cooperative learning worksheets named above.

Charlie
Aren't you happy I didn't ask Charlie for his life story? &;-)

Computer Keyboarding version 5 is a complete typing tutorial with a beginner's section, intermediate section, and teacher's utilities. This program had to be written by a teacher -- no one else could have thought so much about its structure and the ability to keep track of a student's progress.

When you start with the beginner's section, you sign onto a register. From that point on the program knows you and how far you have progressed through the tutorial. When you quit, the point where you finish is stored with your name. The next time you log on, you will be asked if you are a new user, if you say no the register will be displayed. You highlight your name and the program takes you to the point where you left off last time.

You are taken through a pre-typing routine which makes sure that your belly button is in front of the "H" key, your back is straight, hands above the keys with fingers pointing down, setting so that your elbows are at your sides, with one foot slightly ahead of the other and flat on the ground. I found this section to be helpful and if followed, keeps your legs from falling asleep. I find it most difficult to type when I can't feel my foot.

Starting with the "home row" keys, you are led through various typing exercises, such as "fff jjj jjf fjj fjfj fjff" and so on. Keys are then added as you continue with the exercises. This could be a tedious process, but Charlie keeps the interest up by throwing in several versions of a space invaders type game. You must type the letter before it hits the bottom of the screen. As the game progresses, the letters start lower down on the screen and travel faster. Charlie has also added his Super Tic-Tac-Toe to this program and it may pop up at any time to give you a break and a little fun.

As letters are added to your vocabulary, you start typing words made up of the letters. Charlie must have spent many hours thinking of words with ASDFGHJKL; in them. However, his time was well spent and added a lot to the tutorial. I found it a lot easier to type words than "jffj jffj", I must say.

Computer Keyboarding stresses accuracy more than speed. However, there is one game were you must type quickly and accurately in order to win. A sentence is supplied at the bottom of the screen and a graphic "worm" starts moving as you type the sentence. You must complete the sentence before the "worm" completes its move.

There is one recommendation that I would like to make for the beginner's section. Most of my typing problems are with the number and punctuation keys. This is covered naturally, but there is no way to access this section directly. It would be helpful if you could practice the areas that you feel you need without starting all over.

In the second, intermediate section of the program, you are provided with a split screen where a paragraph is displayed in the upper half of the screen for you to type into the lower half. All the keys on the keyboard are available for use, including numbers and punctuations. This
is a great section for someone like myself that just wants to brush up on his typing. You are monitored continually and if you make a mistake a beep sounds and you cannot continue until you type it correctly. After each paragraph you are supplied with a critique giving you the number of mistakes and a percentage of accuracy.

The third section of the program is for teachers and provides information on the students' progress. You also have access to a database with various comments that can be used in a report to the student. This section is for the classroom and make the program complete for use by teachers.

Computer Keyboarding will work on any Apple II and is available for download in both 5.25 inch (#21140, 21141, 21142, 21143) and 3.5 inch/hard drive (#21139) versions. Both versions also need the bug fix in file #21151. The program is shareware and has a modest $10 fee. If you would like an on-site license, you can make as many copies as you like for use in the classroom for $100. When Charlie gets your shareware fee, he will provide you with a password which gives you access to the full program.

Charlie has his own Topic on A2. If you have any questions for him, you can find him at Category 13, Topic 8 or send E-Mail to C.HARTLEY3.

Mel (MelSoft) Fowler

ACROSS THE WIRES /

GEnie Worldwide!

By Udo Huth

[U.HUTH]

>>> THE APPLE IIIGS IN GERMANY -- A BLEAK OUTLOOK? <<<

(Disclaimer: This is my personal view, not a definitive nor even complete statement of how things are here in Germany. There may still be things I have no knowledge about -- I don't know everything! -- and therefore aren't addressed properly in this article.)

Editor Doug Cuff asked me if I'd contribute an article to GEnieLamp about using an Apple IIgs and accessing GEnie from overseas. So here we go:

When it comes to official support, the Apple IIgs is probably more orphaned in Germany than in the U.S. Here there is almost nobody left at the Apple dealers who knows what an Apple IIgs is. Very rarely you find someone who still knows about the Apple II line of computers. Apple Germany, too, prefers to forget that such a thing as an Apple II ever existed. But there is still one person in customer support of Apple Germany who knows the Apple IIgs and is able to answer questions one might have.

GERMAN SOFTWARE There is almost no native (German-language) software for the Apple IIgs. From the early days of Apple II computing there are German versions of AppleWorks Classic, but they ended officially with version 1.4 (essentially version 2.0 without the Mail Merge function). There are German versions of AppleWorks Classic 3.0 available, but they are not from Claris, have to be called A2.Works, and have more problems than one wants to think about.

Real 16-bit German programs for the Apple IIgs are very few indeed. There is a German version of FontFactory available, which was sold here before it was ported into English and subsequently sold by Seven Hills; then there is a program called Pedigree available, which sports German and English versions; and last but not least, there is a program for accessing the German BTX system (a service of German Telekom). This is quite good -- a few of those who own an Apple IIgs and a Macintosh use the IIgs program instead of a Mac program, as the IIgs version is way better. Perhaps five German shareware programs are also available, which are more or less useful; but that's about it. Some enterprising guys have ported System 6.0 to German, but that displays some erroneous behavior that the original version doesn't.

So Apple IIgs users in Germany are forced to rely solely on English software. This is very hard for those who are not quite fluent in English.

ON-LINE COMMUNITY Some bulletin board systems in Germany do have an Apple board, but they are almost exclusively for Macs... if I didn't sometimes post messages about the Apple IIgs, there would be nothing about this fine computer to be found! There is one Apple II BBS I know of, but as I'd have to pay long distance charges to access
it, I don't know what's happening there.

Besides, there are not many IIgs users online. The majority of IIgs users in Germany don't even have a modem. The on-line community in Germany and in the US differs considerably. In the US a IIgs user buys his IIgs and a modem, than s/he goes on-line and asks questions about things s/he doesn't know about. In Germany a IIgs is bought, than the user tries to make head or tail out of the thing he bought, and when s/he is proficient in the use of the Apple IIgs, eventually a modem is bought. In the meantime s/he relies on user groups or personal contacts for questions.

Due to this, you find little or nothing about the Apple IIgs on German BBSs, which are run exclusively on MS-DOS PCs, Amigas, or a few Unix systems. The best -- sometimes only -- source of information about Apple IIs for those who are daring enough to try is GEnie.

GEnie FROM GERMANY GEnie is available here in Germany for a fee of $18 during non-prime time and $27 for prime time access. There are no such things as a basic fee, which includes a certain free time or anything like that. The meter is running from the first second you access GEnie -- well, page one and the greetings of the RTs are free (the latter only if you did nothing prior to accessing the RTs which costs money). Uploads to the libraries are free too, but that doesn't help my bill much.

GEnie is accessed from Germany via the packet-switching network Datex-P. You can either use nodes provided by the German Telekom (which support no error checking protocols) or nodes provided by GEnie (which support MNP4 or V.42). GEnie's own nodes were introduced just recently and are not very widespread so far. The access costs are the same for either node, although GEnie encourages you to use their own nodes if you can access them with a local call. The maximum speed for access here in Germany is 2400 baud.

Over the whole of Germany there are distributed just 30 GEnie nodes of either flavor. So, for the majority of people this means a long-distance call for reaching a node. The German Telekom bills quite heavily for this. A long-distance call in Germany gets billed in 42-second increments at non-prime time, which adds up to a fee of about $12 for each hour (on top of GEnie's charges).

Downloading of public domain software from GEnie is prohibitively expensive. It would be cheaper to pay someone in the US his on-line time, disks, and postage costs for snail-mailing those disks to Germany.

Although everything I said before may sound rather bleak, GEnie is a valuable source of information for me (and the few other Germans on-line here). Some of the info found here cannot be obtained otherwise. For example: an acquaintance of mine bought System 6.0.1 and found it crashing at once, because he also uses Pointless! By the time he and I were in contact, he had reinstalled System 6.0, because he knew of no other way to get the system working again. His rating of Apple wasn't very high at that moment.

Large portions of the newsletter of our SIG consist of information obtained from GEnie. If I hadn't access to this information, I wouldn't know what to write about every two months!
I do my GENie sessions with the help of CoPilot and TIC, which saves me some time, for I don’t have to type all the commands myself. This helps to keep down the bill. I did have to modify the TIC scripts, however, because accessing GENie via Datex-P necessitates some other commands prior to getting to the U# prompt. Accessing GENie through GENie’s own nodes necessitates still another sequence of commands, so I've changed my scripts for that, too.

There is but one glitch in this whole picture. Since GENie has lowered its U.S. rates, there are many new GENie users, which isn’t a bad thing in itself. But those new to GENie tend to quote former messages excessively and more often than not use long signatures of more than one line. This drives up the on-line costs for the overseas users by a considerable amount. So let me close this article with a plea to all of you, not to quote excessively and use a shorter signature whenever possible.

On the whole I've "met" only fine people on GENie; and the questions I had were answered very rapidly, the record being two minutes from asking to having the answer. In fact, I was disconnected due to line noise after sending part of my messages. When I logged on again my script did a BOR NOR again, and I found the answer to my previous question!

Udo Huth,
Leader of the Apple IIgs SIG in the AUGE

"Didn't you just set up Larry with that '486, 66 Mhz monster with 16 Meg of RAM, a 340 Meg hard drive and the HP laser printer? Then why do you still use a computer that was invented back in the 1970s?" The people who ask these questions just don't understand.

Part of the problem is that our entire society is caught up in the newest, latest, greatest technology race. If you do not have the newest CD player with video display capabilities, 10 disk changer, and a cigarette lighter, then you are not keeping up with the times. Each of us have fallen prey to this craze at one time or another. In fact, this same phenomenon may account for your owning an Apple IIgs in the first place.

However, I think that it is worth while to put aside the hype for awhile and take a hard look at the reality behind the statements made by my friends (and perhaps yours). I do not deny that there are times when it is imperative that a person update their equipment. My television set went south a few months ago. It would not have cost much to repair the TV, but it was 11 years old and might have a picture tube blow at any time. My wife and I felt that the money was better spent on getting a new television with some of the current gadgets attached. What fun!

On the other hand, a client (and friend) of mine was in the market for a home computer that would let him keep track of home finances and would run lots of educational software for his children. Price was also a factor for him. This sounded like an ideal situation for an Apple II. The client is now happily using a previously owned Apple IIgs computer complete with AppleWorks and kid's software. Another happy customer!

In both cases, the customer got what he/she needed and was able to effectively use his/her financial resources. Our new television set has many nice features. The controls are much easier to use than the old one and the picture is bigger and brighter. My Apple IIgs client has all of the tools that he wants for his home computer and his kids have a great time "playing" on the computer. In addition, this client is ecstatic about the multitude of cheap software that is available either from software mail-order houses or as used software from individuals.

Some of my friends and/or clients have specific applications that require the latest computer technology for support. In these cases, the obvious answer is to buy a new computer with the necessary capabilities. However, most people do not even scratch the surface of what their computers are capable of doing. An Apple IIgs is a powerful computer. It is very much able to run hefty word processors, spreadsheets, databases, and publishing systems. Existing packages meet the needs of most home users. In fact, many Apple II users do not go any further than AppleWorks or AppleWorks GS to meet all of their software needs.

Of course, there is more to home computing than just productivity software. Educational software has always been a strong point for the Apple II computer. Graphics packages are available to bring out the artistic side of any user. Telecommunication software provides access to a world of people and ideas. Now, did I forget anything? Oh yes, game software is a must for most home computer users.

My personal opinion is that the reason behind the success of the Apple II had more to do with the built-in joystick port than it did with the fact that it was a color computer. Every home Apple II owner that I know has
spent a significant amount of time playing games on their computer. Therefore, they are interested in the availability of good entertainment software for the Apple II. Once again, there is a whole world of software that has been written for this popular computer. As a matter of fact, I could probably play on my computer for the next 10 years and never exhaust the supply of games that I currently own for my Apple.

With all of this going for the Apple II, why do people shun the computer as old technology? One reason for this attitude is ignorance of the true capabilities of my Apple. Some assume that an old machine is a slow and useless machine. Nothing could be further from the truth. Another reason could be that no huge commercial firms still write software for the Apple II family. While this is true, there is plenty of software and support coming from the companies that have remained in the Apple market.

The final piece to this puzzle will be examined in next month's column. At that time, I will examine the availability of shareware, freeware, and roll-it-yourself-ware. I will also answer the following riddle: "How is Apple II shareware like a fine wine?" Stay tuned and find out.

(PART 16 -- LANGUAGES)
[v1.0 :: 22 Jan 92]

INTRODUCTION This section of the History deals with the various languages that have been used on the Apple II during its life, as well as giving an introduction to the scary topic of programming in general.

PROGRAMS "R" US Nearly everyone reading this is already a programmer, on one level or another. Even if you don't know a "GOTO" from a "STA $C030", you already know how to program something. For the act of "programming" is nothing more than giving instructions to a non-human device to have it carry out what you want it to do. The device that most of you already know how to program is your automobile. The act of giving
those instructions may not seem like programming to YOU; nevertheless, in its strictest sense, programming it is. You want the car to go forward? Set the transmission to "D". Go in reverse? Use "R". Of course, the programming needed to operate an automobile is quite simple, and cannot be done in more than one step at a time. An example of a device that is more complicated to program but does let you store up several instructions in advance is a VCR. On the VCR you instruct it to record a television broadcast that starts at 7:00 PM and ends at 8:30 PM, on channel 6. The more sophisticated VCR's can have several programs set up in advance. If you can operate a VCR in this fashion (which is, admittedly, not always as easy as I have described), you are a programmer.

When it comes to the microcomputer, the process of programming (giving it instructions on how to carry out a task) is somewhat more complicated. This is primarily because the computer is far more flexible in its ability to accept instructions and carry them out than is an automobile or VCR. Devices attached to a computer can be manipulated by a program to do something useful (print a letter several times, or perhaps read the outside temperature and sound an alarm if it drops too low). This flexibility, plus the speed at which a computer can execute its instructions, makes it a powerful tool for doing things that have previously taken much more effort and time. And, as a project becomes more sophisticated, so also must the programming acquire a similar level of sophistication. The rate at which computers, including the Apple II, have increased in capacity during the past fifteen years has made it possible to design programs that can do things that were not even dreamed possible back in the days of the 4K Integer BASIC machine.

An example of programming evolution on the Apple II was given during Kansasfest in July of 1991. To fully appreciate this narrative, you need to know a little about an old Integer BASIC program, APPLEVISION. This was found on the DOS 3.2.1 System Master disk, and was a fun little display that showed off the use of hi-res graphics. It began by creating a simple line drawing of a room, with a picture on the wall ("HOME SWEET HOME") and a television set. On the screen of the TV appeared a man who danced to the tune of "Turkey In The Straw", which sounded on the built-in speaker. It ran repeatedly, until the user interrupted the program. It was fascinating at the time, since there was nothing in the program text that showed off exactly HOW the hi-res effects were accomplished. But things have gotten a bit more complex as time has gone by:

"Roger Wagner's keynote address featured a history of hypermedia which Roger set into action and left to run as he wandered offstage. The history began with Bob Bishop's classic AppleVision, done in black and white on the original Apple II. Progressive screens enhanced the AppleVision image using subsequent incarnations of Apple II graphics (single hi-resolution, double hi-resolution, and the IIGS's Super Hi-Resolution modes). Finally, thanks to a laserdisc player under HyperStudio's control and a video overlay card, Roger's image appeared within the television's screen and spoke to the audience, completing the introduction before turning the presentation back to Roger (returning from offstage)."<1>

To follow the programming progress that has made such magic possible, we will begin with the first two built-in high-level languages for the Apple II, Integer BASIC and Applesoft, and move on to a briefer discussion
of some of the other languages that have been available over the years. Next will be a summary of various 6502 and 68816 assemblers that Apple programmers have used over the years. Finally, I will present an introduction to "hyper-programming".

FUNDAMENTALS OF PROGRAMMING A programming language has the standards to translate "what I want" into commands that the computer understands. To do so, it must take some human language and convert it into the binary dialect of the computer on which it is executed.

Computer languages usually come in one of two different types: "interpreted" and "compiled". A language that functions as an interpreter takes the text of the program and translates it at the time of execution into commands the computer can understand. A compiled program, on the other hand, has already had the program text translated into executable code BEFORE it is run, usually including some extra code needed to carry out necessary functions of input, output, and calculations. As such, an interpreted program usually runs more slowly, but has the advantage of being easier to modify and re-run without the delay of first re-compiling. A compiled program will ordinarily run faster, but may use more memory than an equivalent interpreted program.

Languages are also given the designation of being "high-level" or "low-level", depending on how close they are to the base language of the computer on which they run. The lowest level of computer programming is at the level of the bytes understood as commands by the microprocessor. This "machine language" is typically not very understandable to humans. A low-level language more often used by programmers is "assembly language". This uses commands somewhat more understandable ("LDA $24" means "load the accumulator with the contents of memory location $24") and are then assembled (actually compiled) into machine-readable code. Assembly language is very powerful, since it works on the byte level of the computer. However, as a low-level language it can be very complicated and requires an intimate understanding of the function of the computer.

As a language becomes more "high-level", it is easier for humans to read, but requires more effort from its interpreter or compiler to translate it into the native language of the computer.

INTEGER BASIC This was the first language available for general use on the Apple II (aside from assembly, which will be dealt with later). Most of the details concerning its development have already been covered in Part 3 of this History. It was a quick, compact language, and its creation was an example of programming directly in machine language (since Steve Wozniak, the author, had no assembler available to use). Its disadvantage was the lack of easy access to floating point operations, and it lacked some string handling functions. Apple II users, especially those who wanted to produce programs that could be used in business applications, wanted something more powerful to use.

Despite its limitations, Integer BASIC was a language that had a fanatically loyal following. For those thousands who purchased Apple IIs from June 1977 to June 1979, this was the only programming language available, and it took on a status similar to that of a beloved first-born child. Games, utilities, and even some simple business-use programs were written using Wozniak's hand-assembled masterpiece, and those who followed the pages of Call-A.P.P.L.E. magazine learned much about the internals of the language. With the disassembler built into the Monitor, people tore
Val Golding, the editor of Call-A.P.P.L.E., even wrote a series of columns in 1979 entitled "So Who Needs Applesoft?" These articles showed how to simulate some of the more advanced features of Applesoft in this older BASIC. A.P.P.L.E. even sold (under license agreement with Apple Computer) "Integer BASIC +", a relocatable RAM version of the original ROM BASIC. It had all the features of the original language, plus a "USER" command, the ability to easily do four direction scrolling on the text and lo-res screens, easy printing of ASCII characters, and improved error handling.<2>

Apple never released a comprehensive reference manual for Integer BASIC. The only manual available for it was primarily a tutorial (and a general introduction to using a computer). The "Apple II BASIC Programming Manual" didn't even call it "Integer BASIC," but referred to the language as "Apple BASIC." It gave most of its programming examples in the form of segments of a graphics and sound demo that created a lo-res ball bouncing off the sides of the screen.<3>

With the many programs available that were written in Integer BASIC, it was almost a necessity for Apple to offer a means for Apple II Plus users to be able to run the older software. The Integer Firmware card made this "backward compatibility" possible. This was especially important in the early days of the II Plus, when there was little new software available to use with Applesoft.

APPLESOFT I Although Wozniak had written some floating point routines into the Integer Basic ROM, Apple II users needed a version of Basic that would make floating point math easier to do, particularly for business use (where the number to the right of the decimal point is as important as the one to left). Apple decided to license a 6502 version of a floating point BASIC from Microsoft Corporation. Back in 1977, Microsoft was producing BASIC interpreters for nearly every microcomputer that was produced. The version Apple purchased was almost identical to the MITS extended BASIC that Microsoft had previously written for the Altair 8800.<4>,<5>

This BASIC was named "Applesoft", and was released in November of 1977 on cassette. It was loaded as a 10K program that looked to the computer just like an Integer BASIC program, though only a small part of it really was. To make it easy to load and start from cassette, the Applesoft interpreter was attached to the end of a short Integer BASIC program. When the Integer program was run, it poked some values into memory and jumped to the start of the machine language section, which relocated the Applesoft interpreter to the lower part of memory (at $800), just after the memory that held the screen display.

Using this version of Applesoft (which later became known as Applesoft I) could be frustrating. It took several minutes to load from the cassette tape, and it was not dependable. If the wrong key was pressed while entering or running an Applesoft program, the program that was being run could be wiped out, and the Applesoft interpreter itself would have to be reloaded from cassette. However, few users knew how to make use of the floating point routines that Wozniak had written into the Integer ROM, so this unreliable Applesoft BASIC became the only practical means of doing floating point math on the Apple II.

Aside from the reliability issue, another difficulty with Applesoft involved hi-resolution graphics. Although the Apple II was capable of
displaying it, the Applesoft interpreter extended up into the memory used by the hi-res screen, and so prevented its use. Furthermore, this early version had no built-in commands to manage hi-res graphics.<5>

Applesoft I came with a manual that was 8 1/2 inches by 11 inches in size, and sported a blue cover with square glued binding.<6> This came to be known as the "blue book" (recall that the reference book for the computer itself was affectionately known as the "red book"). When starting the interpreter after loading it from the cassette, a screen was displayed announcing that Applesoft was copyright 1977 by Apple and Microsoft. It then asked the user for the memory size of his computer, and gave options of allowing either LET and REM statements OR the use of lo-res graphics. The names of the lo-res graphics commands were very different from those that existed in Integer BASIC (and in the later versions of Applesoft). The commands were:

- PLTG = Go to lo-res graphics mode
- TEX = Go to text mode
- PLTC N = Set color to N (0–15)
- PLTP X,Y = Plot square at X,Y
- PLTH X1,X2,Y = Plot horizontal line from X1 to X2 at Y
- PLTV Y1,Y2,X = Plot vertical line from Y1 to Y2 at X

There was a note about these commands in the reference card included with Applesoft I that warned about using graphics coordinates only between 0 and 39, or a program could "self-destruct". Apparently it lacked the error checking that could prevent the plotting of lines from spilling over into the text of the Applesoft program itself.<6>,<7>

The A.P.P.L.E. user group published a patch in 1978 that allowed programmers to avoid the question about using LET and REM statements versus lo-res graphics, and use the graphics only. The author of the patch pointed out that the LET statements were not necessary ("A = 3" worked just as well as "LET A = 3"). The REMark statements could be simulated by putting them at the end of a GOTO line (where they were ignored by the interpreter), and the GOTO could just jump to the following line:

```
530 GOTO 540: REM LINE 540 SETS VARIABLE N.
540 N = 2
```

Additional patches were made available for some of the other bugs found in Applesoft I.<8>

APPLESOFT II  In spring 1978, Randy Wigginton and some others at Apple made some needed revisions to Applesoft. Using a cross-assembler running on a North Star Horizon (Z-80) microcomputer, they fixed the known bugs and added other commands to control features unique to the Apple II. These commands included the ones needed to draw and manipulate hi-res graphics. Also, the lo-res graphics commands were renamed to be more consistent with the equivalent commands in Integer BASIC (GR, HLIN, VLIN, etc.) This version was called "Applesoft II", and eventually it was available in five forms: Cassette RAM and Diskette RAM (which loaded to the same memory locations that interfered with hi-res graphics as did Applesoft I), Firmware card ROM, Language card RAM, and finally main board ROM (in the Apple II Plus).

When Applesoft II was started up from cassette or diskette versions, the display screen now showed a copyright date of 1978 by Apple Computer,
Inc., and 1976 by Microsoft (which may be either their copyright date for
the original Microsoft BASIC, or possibly for Microsoft's first 6502
version).<6> This RAM version of Applesoft II used memory from $800-$2FFF,
and the Applesoft BASIC program itself was loaded beginning at $3000. When
the versions that came on ROM and for the Language Card RAM were released,
the BASIC program could load at $800, and much more memory was available
for it. Some of this extra space (in high memory) was reclaimed by DOS
when the Disk II was released, however.<5>

Applesoft in the original IIe was unchanged from the II Plus version. When the IIc was introduced in 1984, however, Apple programmers had
cautiously made a few useful changes to the language:

- Input processing was changed to allow lowercase entry of
  Applesoft commands (they were translated into uppercase)

- Screen output commands (PRINT, TAB, HTAB, etc.) were
  modified to more properly handle the 80-column screen

- Program lines (when LISTed) were changed to begin in
  column 2, making screen editing easier

- All of the cassette tape routines (LOAD, SAVE, SHLOAD,
  STORE, and RECALL) were removed, since the hardware did
  not support cassette I/O. The keywords were still in the
  token table, but now pointed to the same memory vector as
  the ampersand ("&") command.

- Patches were made to the lo-res graphics commands (GR,
  HLIN, VLIN, PLOT, and SCRN) to work with double lo-res
  graphics. However, a bug was introduced that allowed
  PLOTting vertically to areas outside of the double lo-res
  graphics screen, which would land right in the beginning
  of the $800 space where the Applesoft program text was
  located (similar to the "plot" bug in Applesoft I).

When the Apple IIe Enhanced ROMs were made available, Applesoft in
those ROMs had undergone some similar modifications. All the above IIc
changes were added, with the exception that double lo-res graphics
capability was NOT added (lack of ROM space), and the cassette I/O commands
were NOT removed (since the cassette input and output port was still
present).

The version of Applesoft on the Apple IIGS closely resembled the
Apple IIc variant, the only exception being a fix of the double lo-res
PLOTting bug. However, a bug in the SCRN function that applied to double
lo-res mode was NOT fixed. No changes to Applesoft from the IIc version
appeared in the Apple IIc Plus.<9>

The manual written for Applesoft II was far more comprehensive than
either the older "Blue book" or the Integer BASIC manual. It gave not only
programming examples for each of the commands, but included much more
information about the various ways in which each Applesoft statement could
be used. It also mentioned some of the differences between Applesoft and
Integer (for those who wanted to convert their older programs), and gave a
little information about the internals of Applesoft to aid in creating
machine language additions to the language. Curiously, the manuals that
have been reprinted even as late as 1990 by Addison-Wesley have included an
odd cautionary note to programmers. In a section in the index about
"reserved words" (words reserved as Applesoft commands), it advises against
using "XPLLOT" as a variable name, stating that "it is a reserved word that
does not correspond to a current Applesoft statement." What is apparently
meant by this comment is that at one time Apple intended to extend the
language and add another command "XPLLOT" to it, probably working with HPLOT
in the same way that XDRAW complements DRAW in doing hi-res graphics.
Examination of the command table within the Applesoft interpreter shows
there is NO entry labeled "XPLLOT", and a disassembly of the interpreter
shows NO preliminary code to support the command. Somehow this precaution
persisted to the present day and has never been removed, even though it is
extremely unlikely that Applesoft will ever be upgraded.<10>

Particularly helpful for programmers was the foresight to include a
simple extension called the "ampersand hook". If Applesoft came across the
"&" symbol while interpreting a line, it jumped to a known location in
memory and left it to the programmer to insert the correct code to add a
machine language extension to the language. With the publication of
important information about the internals of Applesoft in 1980, assembly
language programmers could now add statements to do things that could not
be done with the language as it was originally created. Music, extended
graphics, IF-THEN-ELSE logic, and even the missing "XPLLOT" command could be
added to the language. The only limits were the author's imagination (and
available memory).

The importance of Applesoft as an influence to productivity on the
Apple II cannot be overstated. Since the release of the Apple II Plus in
1979, every variety of Apple II has contained Applesoft in virtually an
unchanged form. This has made it possible for anybody to write programs
that ALL other Apple II users will be able to use, since the language does
not have to be purchased or added. If there were thousands of Integer
BASIC programs from the two years when Integer Apple IIs were produced
exclusively, there are hundreds of thousands of Applesoft programs that
appeared over that subsequent thirteen years. Even today, it is not
uncommon for an applications program to include a configuration module
written in Applesoft using the disk commands available with BASIC.SYSTEM in
ProDOS. It is often faster to write such a program in BASIC, and the
author knows without a doubt that his customer will be able to run it.

APPLESOFT 3 (?) In 1979 there were rumors at the West Coast Computer
Faire about an enhancement to Applesoft II that was in
the works at Apple. It would possibly be called Applesoft 3, and would be
as much of an enhancement over Applesoft II as that version was to
Applesoft I. Supposedly it was intended to merge DOS and BASIC, and would
include such powerful functions as IF-THEN-ELSE, PRINT USING, WINDOW, and
VIEW PORT. It was predicted to be a RAM version only, and would be about
24K in size. Knowing the events that actually followed, this rumored BASIC
was probably the "Business Basic" released with the Apple III, rather than
an enhancement for the Apple II.<11>

READING GENieLamp  GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

<table>
<thead>
<tr>
<th>Name of sender</th>
<th>CATegory</th>
<th>TOPic</th>
<th>Msg.#</th>
<th>Page number</th>
</tr>
</thead>
</table>

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GENie  GENie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

Notes From The Editor

By Douglas Cuff

MOVERS AND SHAKERS  Recently, my wife and I moved.  Across the city.  Not a major drama, but still quite a lot of activity.  By the time we had settled into new quarters sufficiently for me to pay attention to the outside world again, I noticed that there was moving and shaking in the Apple II community.

For instance, Ellen Rosenberg, formerly editor of A2-Central, has become managing editor of II Alive magazine.  (Jerry Kindall continues on as editor-in-chief.)  Telecommunications being what they are, I doubt Ms Rosenberg will have to pick up and move to Detroit, which is probably something of a relief for her, as I seem to recall it's been less than a year since she moved to Texas!

Then it transpired that Softdisk Publishing had persuaded Dean Esmay to move to Louisiana -- physically, this time! -- and work for them.  (This does NOT, I repeat, NOT, mean that Dean is leaving as Head Sysop of A2.)

Meanwhile, Tom Weishaar (High Priest of the Apple II RoundTables) and Kent Fillmore (Macintosh RoundTables) made their move by forming Syndicomm, a company that will handle two Apple II RTs, three Mac RTs, and two new Power-PC RTs!

FROM THE GENERAL TO THE PERSONAL  If this much activity started my head spinning, imagine how I felt when the E-mail started pouring in to my account:

- Submissions for GENieLamp A2!  You'll find the first one submitted in this issue, an almost unbelievable but true tale about a disk drive that survived some of the roughest treatment I've ever heard of.  There are more to come in future issues.  (See how easy it is to earn yourself two hours' worth of non-prime time credit?)

This month's submission for Across The Wires (GENie Worldwide) is particularly exciting.  Check it for details about the formation of World Wide User Group (WWUG).  It's so encouraging when someone attempts to help the disaffected and disenfranchised, no matter where in the world they might be!

Also, this month's Apple II profile is a "live" interview, direct from GENie's Online Talk Show, "A Walk on the Wild Side with Tara & Co."

- Applications for the post of assistant editor!  I had hoped to be able to make an announcement in this issue, but the decision has proved so difficult that I'm holding off until next issue.

- Feedback on how we're doing here at GENieLamp A2... from as far away as Australia!  Keep those cards and letters coming!

Finally, to make my head spin even more, I myself seem to have picked up a new job as a contributor to II Alive!
Is this going to happen EVERY time we move? I'm not complaining --
rather the opposite -- I'd just like to know in advance. It's an awesome
responsibility. <grin>

-- Doug Cuff

THIS JUST IN: IIGS STILL DEAD > he said "Lady, don't you know, the IIGS
is dead??"

My reply to this salesman would have gone something like this:

"Oh really? My user group was going to purchase hundreds of floppy
disks, reams of paper and assorted disk cases for our 'dead' computer. I
guess we'll take our business elsewhere."

It probably wouldn't get much of a reaction from the salesman, but I
wouldn't know because I'd have hung up before he got a chance to reply.

(A2.TONY, CAT3, TOP34, MSG:21/M645;1)

EXPLORING THE MS-DOS FST Well, good news and bad news on the MS-DOS FST.
It will work with a floptical but it will never work with a large media device. The MS-DOS FST was designed for floppies only and it will not support the directory structure of a large MSDOS volume. The number of sectors/FAT will be 9 or the MSDOS FST will refuse to recognize the volume. The MSDOS FST also refused to deal with a partitioned media device. I got in a screwed around with the base blocks and got it to recognize that the media was a dos volume but it didn't like the size of the FAT tables from a big MSDOS volume. I put my Syquest onto my Adaptec controller and formatted it for MS dos land and then moved it over to my GS. From there I started poking around with the directory data created by the MSDOS machine until the MSDOS.FST would recognize the media. To get the MSDOS.FST to recog- nize the media I had to poke over the bytes
until the size of the FAT table was that of a floppy. So the bottom line is that the MS-DOS FST will work with what it was intended to work with, floppies. It will not work with a Syquest or a Bernoulli.

Drew  (CV.TECH, CAT46, TOP2, MSG:67/M645;1)

>>>>> |rew, it's interesting what you say concerning the MS-DOS FST not supporting SyQuests and other large media formatted as MS-DOS, when the Apple guys specifically mentioned SyQuests "and any other MS-DOS media you can get hooked up and have a driver for" (paraphrased) being supported, when the MS-DOS FST was announced. (This was at KansasFest '92.) Maybe they never actually TRIED using any large media with the MS-DOS FST, but instead expected that it was generic enough to work?

\ou said:

> The number of sectors/FAT will be 9
> or the MSDOS FST will refuse to recognize the volume.

SSC BUG? "The 6551 chip in the Super Serial Card has a known bug - you lose the character "about to be sent" when the CTS line goes low and then high. This is what's causing a couple of the PTSE screens to look flaky, and it also messes up Zmodem file transfers (you will usually lose the second packet, and never see the error.)"

The above statement was recieved from a Sysop of a local BBS. Does anyone know about this problem with the Apple Super Serial Card? Could you leave comments about this "problem"? Thanks

(B.PERCIVAL, CAT24, TOP5, MSG:156/M645;1)

>>>>> My second hand information confirms your statement.

I have not yet done this, but have been planning to for quite a while. My ancient SSC is set up for RTS/CTS hardware handshaking at 19,200 baud, but it rarely gives me any problems, so perhaps I should leave it alone.

You may go first. <g> If you do make the change, _please_ be sure to post the results here.

Hugh...
BTW, this information was courtesy of the OGGNET.
(H.HOOD, CAT24, TOP5, MSG:157/M645;1)

PUBLISH IT AND LASERWRITER PLUS FONTS  According to the PubIt manual, you
should set your serial port as on page 5-90 of the manual. There is also info there about a cable.

Select the IIgs Serial Port in the PubIt "Select Interface" setting.

In PubLishIt set the printer in "Select Printer" to LaserWriter Plus
and Font Widths to LaserWriter Plus. The HP 4 will emulate the LaserWriter
NT. This gives you the maximum number of fonts which will be used as
internal fonts. These are:

- Westwood = ITC Bookman Light
- Racine = Courier
- Des Plains = Helvetica
- Wilmette = New Century Schoolbook Roman
- Deerfield = Times Roman
- Ravinia, and = ITC Zapf Chancery Medium Italic
- Barrington = Palatino

(undocumented, but it works. Barrington is on Font Pack 1).

POSTSCRIPT THEORY SIMPLIFIED  I haven't said anything all this time but I
have been following this string along in
different boards. . . to recap, it seems to me that you're wanting to
download some Postscript fonts from the GS to a Postscript printer, similar
to how the Mac can.

Based on what I've read and looked at around here, the problem seems
to be with the GS Laserwriter Driver. I've been taking a look at this
lately (I don't have a Postscript printer--YET--but I have been studying
the language because i intend to get one soon. . .), and what I was hoping
to do was port over part of the Mac's driver to the GS.

HOWEVER, looking at the GS driver, it seems to be partially Postscript
and partially something else (possibly 65816 machine code, possibly some
encrypted Postscript, possibly something else, who knows?)

In any case, my theory is that the flowchart for the part of the GS
driver that's not downloading the fonts looks something like this. . .
I'm hoping whoever wrote the driver can help us shed some light on it, and I believe that person is Matt Deatharage. . . I seem to remember reading in Genielamp A2Pro that he worked on the driver for 6.0.1. In any case, I'll keep looking at it also. . . if I can find the right area of code to tweak, I'm pretty sure we can work it out.

NORTHGATE KEYBOARD REPORT
As requested about 2 weeks ago, I am posting information on Northgate Keyboards. I have an IBM-PC model, but the dipswitch settings are probably similar for the Mac keyboards (for use on a IIgs).

The DIP switches are located under the Northgate logo plate on the front of the keyboard. (Lift the plate with a fingernail.) The first three dipswitch settings correspond to the type of computer to which the keyboard will be connected. (Write down the original setting and try various settings to see if any correct the improper reset problem.) Switch 4 is for Novell networks (leave it alone). Switch 5 swaps the CAPS, ALT, CTRL keys. (On a Mac keyboard, perhaps it just swaps CTRL & CAPS.) Switch 6 swaps the "\" and "*" keys. Switch 7 enables the Dvorak layout for the keyboard. Switch 8 enables a Sticky Keys feature. While all these settings may not be appropriate for the Mac keyboard, you can always experiment.

BTW, Northgate provides technical support for their products at
1-612-943-8346 and on Compu$erve (go northgate). They may be willing to answer questions about the Mac keyboards even if they no longer sell them. (They have an excellent reputation for technical support.) The manual for the keyboard contains much additional useful information. If anyone has a question, feel free to EMail.

David [Bird.Watcher]

(D.WALLIS2, CAT42, TOP10, MSG:133/M645;1)

SETTING THUNDERCLOCK    Found my own solution to the setting of the Thunder
Clock, re my message number 20. GEOS from Berkeley Softworks (probably not available anymore anywhere) has drivers that let you set the clock for the GS clock, NoSlot clock, Thunderclock, and TimeMaster from AE. For your info.

(L.HORWATH, CAT12, TOP2, MSG:21/M645;1)

QUALITY COMPUTERS ASKED "WHY BUY FROM YOU?"    I responded to a very similar query about that from the Internet a while back. In brief, our drive is THE easiest to set up (includes a video to show you how), and is backed by the best support in the industry. (Our technical support staff is five times larger than our competitors' staffs combined.)

If you feel you don't need that support -- and many GEnie users don't; after all, if you can figure out a modem and GEnie you can probably figure out a hard drive! -- then by all means, shop for the best price. We've always separated ourselves from the others by our level of support, but if you don't need it, then why pay for it?

There have been times in our company's history when we've competed solely on price. However, our customers just weren't satisfied with the support that came with the lowest price. If we still competed solely on price, there would be no II Alive; there would be no AppleWorks 4. We wouldn't have the resources to take on such projects -- not enough technical support staff, not enough of an advertising budget to get the word out about these new developments, not enough clout to be taken seriously by Claris.

We're dedicated to providing Apple II support in a BIG way. Not just after the sale but in many, many other ways. People who buy from us know what they're getting -- not just a good product, but a commitment to stand behind them in the future, whatever computer they're using.

(QUALITY, CAT42, TOP5, MSG:55/M645;1)

APPLEWORKS GS/HARDPRESSED CONFLICT SOLVED    I'd be willing to bet that today I'm the happiest Apple IIGS user on the planet. I found the cause of the problem with AppleWorks GS and HardPressed! And, Andy, you'll breath a sigh of relief because it has absolutely nothing to do with HardPressed!

I got your disk with System 6.0.1 and HardPressed, and it still did some strange things with AWGS on my system. So, I visited Will Nelken who has both a ROM01 and a ROM3, and using that 6.0.1/HP/AWGS combo, everything worked great on both his machines.

I went home and was ready to re-install my old 1.5 meg RAM card, when I decided to sit down and think about the problem, and try to figure out what was different between my system and Will's systems.
It didn't take long. I had had AppleWorksGS configured to pre-load several of the modules. As soon as I re-configured AWGS to not pre-load any of its modules, AWGS started acting perfectly behaved with HP installed. I tried the Fit In Window option at least 50 times, and there wasn't even a hint of problems.

So, all I can conclude is that AWGS has a bug in the pre-loading code that prevents it from pre-loading 100% of what is needed.

Could someone else confirm this for me? If you have HardPressed and AppleWorksGS and a desktop publishing document, could you set it up to pre-load the PL module, and then after re-running AWGS, use the Fit In Window option? Tell us what happens. It freezes, doesn't it?

Charles Garrett - Since you were able to duplicate this problem, could you check your AWGS config options and see if you have some modules set up to pre-load? I bet you do.

I'd really like to thank both Andy McFadden and WestCode for all the assistance they have offered trying to track down this insidious bug. I really think that Andy McFadden went above and beyond the call of duty in helping track down this bug.

Now, I can finally say with conviction that "HardPressed is great!!!"
using Quick Launch for some time and had gotten used to having the Quick Launch menu at the top of my Finder Extras pull down menu. After installing the Six Pack modules I discovered that my Quick Launch menu was now wayyyyyy down at near the bottom and was a small pain to scroll down to. So I started playing around with the order in which the PIF's appear in my Finder Extras and System.Setup folders.

What I found was this....apparently any PIF's in the Finder Extras folder that display a menu under the Extras header are added after those PIF's that are in the System.Setup folder. They are stacked on top of each other, which means that the last PIF in the Finder Extras folder will be on top when you pull down the Extras menu. After a little playing around I was able to get my Extras pull down menu to display the menu items in the order I desired.

I used the SORT function of the ProSEL 16 file utilities module to sort my System.Setup and Finder.Extras folders to get the exact order I wanted. My Extras menu pulls down with Quick Launch on top, followed by ProBOOT, followed by Six Pack's MoreInfo, followed by Six Pack's File Peeker, etc. Well, you get the picture.

As a side note I found that Six Pack's modules don't display their little bootup icons unless they are in the System.Setup folder. Is this true of all PIF's/TIF's? I also seem to remember that PIF's in the FinderExtras folder don't load until Finder is active.

Sorry for the rather long post but I (maybe I'm the only one, though) find this stuff very interesting. Running System 6.0.1 on 4mb and ROM 01.

(LKRUPP, CAT9, TOP5, MSG:189/M645;1)

>>>>> Boot icons don't show up for files in the Finder.Extras folder because the Finder is already active when these extras are initialized.

Tyler

(A2.TYLER, CAT9, TOP5, MSG:190/M645;1)

>>>>> It's true...the cute little boot icons don't show up for Finder Extras unless they are in the System.Setup folder. And by having them located there, they take up memory even when you're NOT in Finder...

Could some bored programmer write an Init that serves no purpose other than to display the boot icons of any active files in the FinderExtras folder? That way, we can have the cute icons AND the saved memory when not in Finder. Is it do-able?

-- Matthew Ryan |SysOp, Dreamscape 24-Line BBS |(818) 781-7529 --

(M-RYAN, CAT9, TOP5, MSG:192/M645;1)

IIGS GAMING ENVIRONMENT

Well... Actually, I have seen a version of Eamon converted for use in HyperCard GS. I cannot remember the author. It was the equivalent of the master disk and the beginner's cave. It also seemed to have a FEW problems.

And I might also add that I happen to know of one ongoing effort to create an Eamon gaming system for the IIgs. The non-interactive demo effort is essentially complete and should result in an upload within the next few weeks. The system revolves around a database system and does not require any programming skill to "write" new adventures. Therefore, all
that you have to do is script the adventure rooms, monsters, treasure and other goodies. The system is a combination of color text and static (not animated) graphics. The program is also the first software (that I am aware of) to use both the 320 and 640 resolution graphics modes on the same screen! A database editor (could be a text editor) and a graphics program are all that is required to create an adventure.

It is true that this system is not a conversion of the original gaming system. However, the original Eamon series is written in Applesoft basic and there is no "Standard" version of the game program. Each adventure uses a tailored version of the original software. I believe that Tom Z. has stated before that he did not anticipate anyone ever converting each individual game to Micol Basic GS or some equivalent. I happen to agree that the effort would be too great for the gain.

You may wonder how I know so much about the Demo that has an impending release? Well, I happen to be the author of the software in question. I have long wanted to add something significant to the public domain for the Apple IIgs. I hope that this game will be my lasting contribution.

I should add one warning: I am a bit slow about finishing something like this. Drop me a line if you get antsy about seeing the demo.

Happy gaming, Darrel Raines

[D.Raines]

(D.RAINES, CAT16, TOP8, MSG:48/M645;1)

>>>>> Darrel, I know about the Hypercard version of the Eamon Main Hall. However, as you said, it has problems, and no one has seen fit to fix them, so I don't count this as a serious "Eamon-GS" effort.

Your new gaming system sounds pretty exciting! What are you planning to call it? How similar is it to 8-bit Eamon?

You seem to have some misunderstandings about Eamon. Eamon adventure design does NOT require =any= program modification, but is database-based, just like your system. In fact, the vast majority of Eamons use unmodified programs. Where the conversion effort falls down is due to the fact that there about a dozen different incremental versions of the program, as bugs were fixed and enhancements were added. Also, most of the best Eamons =do= have extensive program modifications, as the authors redesigned the system to make it do what they wanted for each adventure.

If you are locking the authors out of program redesign and forcing them to do everything the way that you have envisioned, then your system will never see the rich diversity of play that Eamon has enjoyed. Indeed, virtually all of the very best Eamons were hand-built by their authors. I have always viewed Eamon's Applesoft base as a strength rather than a weakness because it has permitted ordinary people to design extraordinary adventures.

Heh. I'll be interested to see how many versions your system runs through in the next few years, before you get it the way you want it. *8-)

TomZ

(T.ZUCHOWSKI, CAT16, TOP8, MSG:49/M645;1)

<<<<<< TomZ - You make a number of good points. I want to make it clear that I am intending to create a gaming system that is as flexible
as possible. I am also trying to stay true to the spirit of the original Eamon games. Therefore, I want the system to be text based for the most part. The graphics are meant to supplement the text in much the same way as the last Infocom games used graphics.

> If you are locking the authors out of program redesign and forcing them to do everything the way that you have envisioned, then your system will never see the rich diversity of play that Eamon has enjoyed.

Well, again, this is not my intent. However, the problem lies in the fact that no standard programming language has been established on the Apple IIgs that lets the average home user write his/her own programs. I know that many people will disagree with this statement, but each of them will probably argue for one of a number of different "languages": HyperCard Script, HyperStudio Script, ORCA/Pascal, Microl Basic GS, etc. The arguments themselves will serve to prove my point.

This leaves me with a difficult decision to make as a software author: "How do I allow the users to create their own games without forcing them to use the source language that is not a standard?" I have been leaning toward providing a flexible system that uses flags in a database to "script" the course of the adventure. This allows the adventure creator the ability to produce a unique adventure within the predefined parameters of the adventuring system. It does not allow the creator to make unique effects that are not already available within the system. (Contrast this technique to the vampire that walks around in the dungeon of the Haunted House: a unique effect.)

I have always viewed Eamon's Applesoft base as a strength rather than a weakness because it has permitted ordinary people to design extraordinary adventures.

I understand your point here. I don't know how to address it in light of my earlier statements. It appears that the only alternative to a strictly database approach is to release both the adventure authoring system and the source code for the main program. My current language of choice is ORCA/Pascal with some assembly language as needed. If I were to go with this approach, I would not be able to control the direction of program enhancements.

This last item is not an ego issue. I want you to think about the state of Eamon on the Apple II before you began to work toward a "clean" set of adventures. Most of the Eamon distribution houses were interested in disk copy money only. Very few took the time to make sure that the adventures ran correctly. Very few people took the time to fix problems and collect a complete set of Eamon adventures. Your efforts have gone a long way toward making the Eamon world a safe place for the novice adventure gamer. If I release the code in source format, I run the risk of incompatibility and loss of user confidence.

One alternative that I have considered is allowing programmers to update the gaming system on an individual basis. If someone wants to add a feature to the system, then I would give them the source code, and they would produce the changes. This would allow me to enforce backward compatibility and such. But this technique does not allow complete freedom for the adventure game creator. I hope that this discussion makes clear my dilemma.
In the meantime, I am sure that most people would rather see some type of demonstration and subsequent game rather than nothing at all. In light of that fact, I will continue to develop with my original design goals and will entertain changes to the design goals after people can run the demonstration.

Thank you for your feedback and ideas, Darrel Raines

[D.Raines]

 WHEN MACSOUNDGRABBER DOESN'T WORK...  MacSoundGrabber is a fine utility, but it won't convert each and every sound from the Macintosh. Especially Mac System Sounds are noticed by MacSoundGrabber but not converted. Fear no more — there's a way to convert those sounds. Just load the resource part of the Mac file into ShadowWrite with the option "Load file(s) as raw data"; then save back to another disk as TXT file. Load the file into SoundShop (from the HyperStudio package) although it will complain. Load the file anyway. You have to tune the replay frequency and have to edit out a bit of garbage at the beginning of the sound, where the Mac file had a header. I converted two sounds already by this procedure. The files contained but one sound, however. This procedure should work with multiple sounds as well, but you probably will have to edit the raw file a bit more.

Udo — ... just a IIGS freak —

(BOTTOMLINE = ON BALANCE  The reason BottomLine isn't hard-drive installable is that it runs under a highly customized version of DOS 3.3 and has its own file structures. (The program is essentially Broderbund's On Balance, for those who remember that. It's really quite a fast and usable little program despite the hard drive thing.)

(QUALITY, CAT8, TOP10, MSG:41/M645;1)

 DESKJET AND SERIAL VS PARALLEL   > ..have a GS .. ImageWriter II .. Deskjet > 500 .. tips/suggestions?

Charlie, I have a similar setup, and quickly became disenchanted with driving the DeskJet with the serial cable. My recommendation to you and anyone else who's interested is this — buy a parallel card. You say you have Harmonie so you should have a good selection of parallel card drivers to choose from (for myself I chose AE's Parallel Pro, without the Buffer Pro add-on card).

Stuff the parallel card into slot 1; leave it set to "Printer Port". Hook up the parallel card to the DeskJet (standard parallel cabling, available at Wal Mart, even). The beauty and elegance of this setup is apparent when you drop out of a GS/OS program (say, AWGS) that you would typically print to the DeskJet, and jump into an application like Printshop GS that is practically hard-wired for the ImageWriter. You don't have to change any settings, since slot 1 is already configured as the printer port. When printing to the DeskJet in a GS/OS program, drivers supplied by Harmonie are smart enough to recognize the parallel card in slot 1, even though it is _not_ set to "Your Card". What you end up with, essentially, is the IIGS automatically sending a print job to the printer appropriate for the program you are using (automatic switching!). If you do have a need to print to the ImageWriter while in a GS/OS-aware application (say,
for printing labels in AWGS), then it is a simple matter of picking the Imagewriter/printer port combination in the "DC Printer" control panel device (CDEV).

I ran my DeskJet 500C for several months using the serial cable setup you want to use, and the serious lack of printing speed drove me nuts. Express (print spooler from Seven Hills) mitigated this somewhat, but it was an imperfect solution, at least for my needs. When I went the parallel route a few months ago it was a revelation, especially for color printing. I would recommend this setup without reservation.

David ---> waiting for Spectrum, with the AWGS comm module <----

OLD APPLE II CARDS    There is a place called Atlaz Computer Supply that is offering an IIe enhancement kit for $45.00. For some reason, I want to say that is less than what I have seen in other places. Am I wrong.

This Atlaz Supply is pretty funky. They still offer a lot of Apple II/II+ specific cards.

EDUCATIONAL CLEARING HOUSE   One more feather in the cap of schools that stick with Apple will be a great amount of Apple II resource material available through the Eisenhower National Clearhouse (ENC) destined to go online sometime in October or November.

    This ENC will consist of a large database and library of educational resource material for science and math, and I understand a smaller library of other educational materials unrelated to science/math. Much work is being done on this project by Eric Bush of Kitchen Sink Software.

    As has been mentioned, there is SO MUCH more Apple II software available for education in the lower grades, than the ms-dos platform. I truly believe that schools that are going to switch to another platform, are simply wanting to be on the "cutting edge" of technology and want to "keep up with the Joneses" as it were. Unfortunately, it saddens me when I see districts struggling just to keep a decent teaching staff onboard, and then spending needless dollars for something they THINK will bring them out of the "dark ages" - apparently persuaded by heaven knows who that the Apple II platform IS in the dark ages...

    SamIam: I think you should encourage holding out until the PowerPC's come out. From what I've heard, they are really going to be great, and WILL be able to handle two platforms.

    But, it's hard trying to tell a district that is "wooed" by purveyors of "cutting edge technology" that their "old trusty Apples" are just as valuable and just as viable now as they were 10 years ago! - even more so! It all comes down to the "Hatfield and McCoy" type feud that is going on between computer platforms - none more prominent than that between IBM and Apple II...
Apple II Computer Info

GEna

SYNDICOMM APPLE II, MAC, AND POWER PC RTS

I also wish that Tom Weischar would take over the MAC and IBM RTs!!!

Someone probably already posted this, but in essence, Tom Weishaar is now one of the people overseeing A2, A2Pro, Mac, MacPro, and now PPC and PPCPro(?). Syndicomm is the contracting organization over these RTs now. And guess who is one of the major owners of Syndicomm? :)

I am sure he is sorry about not being able to swing the IBM areas, but one can't have everything. :)

Tim 'The Joat' Tobin, Lost Classics & R C Font Clearinghouse

MS-DOS READ AND WRITE UTILITY! I got this program on a disk from a local friend who downloaded it from the InterNet. It was uploaded by Peter Watson from Australia. I have had great success transferring files back and forth to the transporter - much the same as using the transporter transfer program. Very handy because it is not necessary to startup the transporter as I can send the files to the C: drive and then copy to floppies later for transfer to the 386. I understand that it will work with any drive that the GSOS msdos FST recognizes. I would be glad to upload the file if I was sure how to do it. I've never uploaded a file to GENie and with my luck I'd probably crash GENie :)

My setup: Apple HS SCSI / Tulin Floptical / Tulin drivers / Sys 6.0.1 / MSDOS FST

Peter's utilities are pretty nice, and the Command.Com shell he provides is easy to use and even allows Applesoft commands. I had Apple's MSDOS FST installed and didn't see any conflicts. At $15, it's a bargain!

PAYING FOR AUSTRALIAN SHAREWARE

It sure is, but Peter Watson is having a difficult time cashing American checks. In fact, he's not cashing them, because the service charges that his bank imposes works out to a little more than $15.
So, he's going to send some of those checks to me. The same thing happened a year or two back with the FTA, and I was able to get about $20 in cash for more than $250 that was mailed to France. (Part of that reason is because the checks were out of date by the time I got them.)

If you're going to be sending shareware fees to Australia, please send them in a form that is usable. That would be an International Money Order. Or, if you trust the US and Australian postal systems, you can always wrap $15 up in a well disguised envelope and tape it shut.

Sending a regular US check to Australia is not the best way to submit your shareware fee.

APPLEWORKS SITE LICENSES  If schools don't buy AW4 after being bombarded with ads in Enhance and in direct mail, there's probably not much we can do. After all, we can't FORCE anyone to upgrade.

Though it should be pointed out that we do expect the majority of AW4 business to be from schools. The key here, of course, is site licensing. Even AW3, with no promotion, sold LOTS of site licenses (LOTS being a big number which is classified <g>). We expect site licensed copies to outsell single-user copies by at least 10:1.

(QUALITY, CAT42, TOP29, MSG:323/M645;1)

APPLEWORKS 4 SHIPS WHEN??  AW 4 will _not_ ship Oct 1, especially since it happens to be a Friday. I believe the latest word is that the manuals won't be ready before Tuesday, but if all goes well, I suppose shipping will commence Wednesday. I'm assembling the master disk today.

(BRANDT, CAT42, TOP29, MSG:121/M645;1)

>>>>> Was told Tuesday by QC salesperson that Four isn't shipping now until the 12th.

<<<Lloyd>>>

<<<< Who'd a thunk I'd have to find this stuff out online...

(BRANDT, CAT42, TOP29, MSG:131/M645;1)

>>>>> QC Official Announcement:

After many months of development and testing, AppleWorks 4.0 is getting very near to completion. Our projected release date for this major revision to the classic 8 bit Apple II program was October 1st. We regret to announce that there will be a short delay.

AW 4 has been in beta testing for some time now, and although the product seems very solid, and everyone involved with the testing is excited about it, we still feel there are several issues that need to be resolved before giving it our final stamp of approval.

Currently, Quality Computers has thousands of backorders on AppleWorks 4.0. Believe me, every day that we delay shipment breaks our hearts (after all we don't get to charge you until they go out the door. :) ) Making money is important to any company, however Quality is a concept we are far
more concerned with. We feel that the investment in extra time testing and fixing the remaining bugs will far outweigh any inconvenience caused by this short delay in releasing the product.

Our revised release date will be October 15th (2 weeks off schedule).

Walker  (Quality Computers)
(W.ARCHER2, CAT42, TOP29, MSG:147/M645;1)

>>>>> According to the letter I received yesterday from Quality, """
""""AppleWorks will not start to ship until October 15. This is due to some last minute brainstorming of features Randy and Dan are putting into the program. Quality informs people who have ordered that pre-release orders are in the thousands, and that they'll take until Oct 25 to get them all shipped, so expect to receive AW 4.0 by --> November 8.

(T.SMITH59, CAT42, TOP29, MSG:157/M645;1)

>>>>> At press time, Quality Computers announced that it will start shipping AppleWorks 4.0 on October 27. The company expects to ship all back orders by October 30 and asks customers not to call about their order unless it hasn't arrived by November 15.
(NAUG, CAT17, TOP37, MSG:125/M645;1)

>>>>> Quality says that the manuals will be back in and that shipping will start around the 29th of this month. It sounds like this will PROBABLY occur since the manuals are all that they are waiting on. I don't represent Quality, but I called them on another matter and thought that you might want to know.

Darrel Raines  (D.RAINES, CAT42, TOP29, MSG:248/M645;1)

APPLEWORKS GS UPDATE A MIGHTY UNDERTAKING   Regardless of the specifics of this case, most people in this topic have no idea what they are asking of QC.

   Updating/Upgrading AWGS is NOT like doing so for AppleWorks Classic. Randy Brandy has been intimately involved with AW Classic for a number of years. QC doesn't have anyone from the original AWGS team (and it's HIGHLY unlikely that that will change.)

   I'm completely guessing here, but I'm pretty sure that AWGS is mostly 65816 assembly (except for the spelling checker stuff I believe). If this is true, I would say that there could be somewhere around 500,000 lines of source.

   This is NOT a trivial task for someone to undertake. Simply getting to know the code so that simple bug fixes can be written is going to take time. Complex bug fixes? Think in terms of months.

   New features? Revamped modules? Think in terms of many, many months.

   I would say that if QC does a decent bug fix/_VERY MINOR_ feature addition update that charging $25-$45 for it would NOT be unreasonable. They'd have to do that just to recover their investment in programmer's
salary.

Now, please, don't take this the wrong way: I'm not saying that updating AWGS is impossible. I'm just saying it's not going to be finished next week. It is not a trivial undertaking.

Keep this in mind when asking the world of QC :)

Bryan

(SOFTDISK.INC, CAT42, TOP32, MSG:103/M645;1)

>>>>> We are assembling a fighting force of extraordinary magnitude...

Oh. Sorry. What I mean is, we are even now in the process of negotiating with a top-of-the-line project manager for AWGS, and we have already been in contact with several highly-regarded programmers about being part of the AWGS team.

If this goes through, perhaps "fighting force of extraordinary magnitude" would be a good term.

While I'm sure it won't be a trivial undertaking, I'm certain that if anyone can do it, these guys can. We sincerely hope to have a bug-fix release by Christmas and a major upgrade by next June. We will probably offer the bug-fix upgrade for free when you pre-order the major upgrade: in other words, you'd place the order for the major upgrade, and would get two upgrades for that price. The major upgrade next summer, and a bug-fix upgrade in a couple months to tide you over. How does this plan sound to everyone? B)

(QUALITY, CAT42, TOP32, MSG:104/M645;1)

>>>>> I was talking to Quality Computers today and was told that the AWGS upgrade was coming around February and that there would be no bug-fix before Christmas as reported here earlier.

Michael

(QUALITY, CAT42, TOP32, MSG:213/M645;1)

APPLEWORKS 4/TIMEOUT BACKWARD COMPATIBILITY
1. AW4 will load all existing AW files. This includes AW3 files with DoubleData and/or TotalControl, I believe. If it didn't, it wouldn't be AppleWorks. B)

2. AW4 word processor files are exactly the same as AW3 WP files, so if an app will load AW3 WP files it'll load AW4 WP files.

3. Most TimeOut applications will work with AW4 after an update. We are including a patch program on the AW4 disk which will be able to update most TO apps "on the fly" without you needing to order new disks.

(QUALITY, CAT42, TOP29, MSG:93/M645;1)

>>>>> From the Updater file on the disk (and Randy's latest word):

Outliner will be updated when I have time. I expect it to be available in December.

APPLEWORKS 4 GOODIES AND EXTRAS
Here's what Quality lists in the "Enhancements Catalog," with over "$750 in savings" with purchase of AW 4.0 (actually, I noticed that the "retail"
has been raised, but the "special" price is lower than Quality's latest):

TO Grammar.........$39.95
TO Thesaurus........$24.95  These three together.......$89.95
TO Superfonts.....$34.95
TO Reportwriter.....$39.95
TO Graph..........$39.95  These three together.......$94.95
TO Sidespread.....$24.95
TO Superforms......$34.95
TO Ultramacros 4.3..$39.95  (The order form lists it as $29.95)
TO Desktools IV.....$29.95  These three together......$89.95
TO ShrinkIt Plus...$29.95

AfterWork Screen Saver....$24.95
Q-RAM GS2..........$179.95
Q-RAM //e...........$89.95
32K Imagewriter Buffer...$24.95

One-touch commands disk for AW 4.0.......$14.95
CheckWorks (Checkbook inside AW)........$29.95

Exploring AW 4.0: Tips from the experts (video)....$19.95

Each item is listed as "with purchase of AW 4.0."

___!___  Terrell Smith
  tsmith@ivcfnc.fullfeed.com

(T.SMITH59, CAT42, TOP29, MSG:249/M645;1)

>>>>>  TimeOut ShrinkIt Plus is a package that contains TimeOut ShrinkIt
        (which is NOT available online), and, as a bonus, also includes the
        stand-alone ShrinkIt and ShrinkIt GS. TimeOut ShrinkIt can compress and
        de-compress files directly to and from the Desktop.
        (QUALITY, CAT42, TOP29, MSG:198/M645;1)

>>>>>  The only changes to TimeOut Graph are those required to make it
        compatible with AW 4. The "Coming soon" messages were only to
        indicate that an AW 4- compatible version is not yet available, not that
        new features are coming.

        However, a TimeOut SuperGraph for the IIgs is planned for this year.
        (BRANDT, CAT42, TOP29, MSG:109/M645;1)

>>>>>  > TimeOut SuperGraph printing

        SuperGraph will save SHR pix which can be loaded, tweaked and printed
        with Platinum Paint.

> DeskTools IV

        The name is basically just to link it with AW 4, and it's aimed at
        folks who didn't buy the first two DeskTools. Our update program will
support the early faithful.

> AfterWork

All AfterWork modules are text or double hires, so they work on anything that runs AW 4. If this disk is a success, we may do a IIgs version with super hires screen savers for AW 4.

(BRANDT, CAT42, TOP29, MSG:223/M645;1)

APPLE COMPUTER EXECS "EXECUTED"? Some interesting Apple "chit-chat"...

Last week, long time Apple Board of Directors member Alfred Eisenstadt (sp??) was fired by the rest of the board. In response, he filed a lawsuit, asking for damages for unlawful termination.

According to the San Francisco Chronicle (9/28/93), Eisenstadt included documentation when filing the lawsuit that says that Sculley did not resign but was fired.

(J.KOHN, CAT5, TOP3, MSG:188/M645;1)

>>>>> > If you're so inclined, head over to NEWSBYTES (m316;5) to read """" > about Bob Puette's resignation, effective October 15.

The heads are rolling at Apple. That's 3 down in just a few months..Scully, Eisenstadt and Puette. And, according to information supplied to the court by Eisenstadt, who is suing for wrongful termination, "resignation" is Apple new-speak for being fired.

In a related Apple story, they just released sales figures after the close of the stock market yesterday. Apple shareholder's made $.02/share, down from $.81/share the previous quarter.

And, in an analysis in this week's InfoWorld, it was conjectured that Apple is committing corporate suicide.

It sure is interesting times for us Apple watchers.

Joe Kohn

(J.KOHN, CAT5, TOP3, MSG:228/M645;1)

>>>>> According to the AP, Sculley has been named chairman and CEO of Spectrum, located in N.Y. Spectrum is a one product company that has lost money every year since 1988.

Terrell Smith
tsmith@ivcfnsc.fullfeed.com

(T.SMITH59, CAT5, TOP2, MSG:66/M645;1)

>>>>> It was announced Monday that Sculley had landed on his feet, joining a telecommunications company named "Spectrum." Its stock immediately rose 31%.

<<<Lloyd>>> (L.DEVRIES, CAT5, TOP2, MSG:65/M645;1)

>>>>> And then Spectrum gave back about half that gain today.

Apple's stock price also rose significantly during the last few days.
Was this in response to Sculley's departure or was there some other factor?

-- Ken Watanabe --

(K.WATANABE5, CAT5, TOP2, MSG:67/M645;1)

Last week, Apple announced their latest quarter's earning. On something like $2 billion in sales, Apple made a $2 million profit. Apparently, many securities analysts had predicted that Apple would lose money in the last quarter, so even though Apple made only $.02/share (down from approx. $.90/share the year before) earnings exceeded expectations, and thus the rise in the stock price.

At least, that's the way I understand it.

Joe Kohn

(J.KOHN, CAT5, TOP2, MSG:68/M645;1)

>>> WHAT'S NEW <<<

MAGIC NEWS GROUP READER

Because of the hundreds of messages contained in the various news group feeds on the Internet/USENET (where message numbers are preceded by - CS-ID:), many have found that it just takes too long to read them 'on-line'. A bulk or group capture is preferred and reading can then be accomplished at a more leisurely rate -- not tying up the line more than necessary.

This AppleWorks macro set will greatly facilitate the reading of the news group messages by owners of AppleWorks 3.0 who are equipped with UltraMacros 3.1. When the messages are captured, they can be saved as an AppleWorks file or a text file that is later converted to an AppleWorks file. Loading the captured news group file into AppleWorks and activating this macro either with a compile and a SA-A (OPTION-A) or launching it as a previously compiled task file (SA-A is done automatically for you in this case) will allow you to do some amazing things.

NOTE: this macro is designed to work in conjunction with AppleWorks 3.0 and UltraMacros 3.1

===================================================================
MAGICAL FEATURES
of the
MAGIC NEWS GROUP READER
===================================================================

- "ONE LINE REMAINING" screen scrolls in either direction to facilitate ease of reading of news group messages

- All new messages placed at TOP OF SCREEN

- Quick SKIP forward or backward from TOP OF MESSAGE to top next or previous message
Apple II Computer Info

- Allows all messages with a common THREAD to be READ IN SEQUENCE, temporarily skipping other messages

- Returns you to the STARTING POINT of the thread read sequence after reading the thread, or even a partial reading of the thread

- When asked, can display the NUMBER OF REMAINING MESSAGES in the file relating to the current message

- PERCENTAGE progressed into file continuously displayed

- Has special CLIPPING FEATURE which allows you to quickly clip messages or parts of messages and place them in a NG.CLIPPINGS file on the desktop. Will automatically establish the file if not on your desktop. Operates during normal news group reading or thread searches.

- HELP SCREEN always available

- Can be used as a TASK file OR A MACRO file

- Original DEFAULT MACROS easily available

- SPEEDS your reading of news groups a trillion times (only joking, but it feels like it)

- Works in combination with APPLEWORKS 3.0 AND ULTRAMACROS 3.1

- Macro with CODE ANNOTATIONS and explanations included

- EXTRA SURPRISE demos and useful macros included on the disk

DETAILS ON THE COMMANDS CONTAINED IN

THE MAGIC NEWS GROUP READER

BY

MAGICAL SOFTWARE

SA = THE OPTION KEY OR SOLID APPLE KEY

1) FORWARD A SCREEN OR TO THE MESSAGE [SA-RIGHT (Arrow)]: By pressing this macro, a message will flow to the top of the screen and stop. The next press of the same combination will either scroll the message up 'almost' one screen or move the next message to the top of the screen -- whichever comes first. Note: 'almost' one screen places the bottom line of the screen at the top of the screen so that you can have continuity with your reading. This is different than an AppleWorks OA-DOWN.

2) BACKWARD A SCREEN OR TO THE PREVIOUS MESSAGE [SA-LEFT (Arrow)]: By pressing another macro, you can back up the 'almost' one screen or move to the previous message at the top of the screen, whichever comes first. This is different than an AppleWorks OA-UP.
3) MESSAGE TO MESSAGE - FORWARD [SA-DOWN (Arrow)]: A press of a third macro will scroll from message to message in the forward direction, skipping the contents. This is used when you aren't interested in the Subject and want to move on to the next message without performing the AppleWorks screen by screen text scrolling. Subjects, when new messages appear at the top of the screen, are always on the fourth line down. This allows you to make instant decisions about the interest of the message before reading or moving quickly to the next message.

4) MESSAGE TO MESSAGE - BACKWARD [SA-UP (Arrow)]: Another macro will do the above, but in reverse. Perhaps you would like to re-read a previous message in the stack. This will get you to the correct place quickly.

5) READING THREADS: A great feature of this macro is that it will allow you to follow a Subject thread, reading only those messages that are in the thread line, and when you are finished, either by running out of thread messages or selecting to stop reading the thread, returns you to the starting point where you 'registered' the thread. This is extremely handy when you have a subject of interest and would like to follow that conversation without being interrupted with other Subjects during your read.

=========
'SA-T' registers thread
'SA-N' moves to the next message containing the thread
'SA-E' exits the thread find feature and returns you to the original message
=========

6) HOW MANY MORE MESSAGES IN THREAD? [BA-T]: From the news group reader mode, this feature will count and display the number of related messages remaining in the file. It may be used to determine if you want to register and read the 'thread only' messages.

7) CLIPPING FEATURE [SA-C]: While either in the news group mode or the thread search mode, you can quickly copy and paste messages or parts of messages into a file named NG.CLIPPINGS. If that file is not on the desktop, the program will place it there automatically. If you change the file name of NG.CLIPPINGS and desire this feature, a new NG.CLIPPINGS will be established for you and will accept the automatic deposits. [Note: in this case, when back at the news group reader main macro, you must press SA-A to re-initialize everything before a new clip is made - see Hint below]

8) HELP SCREEN [SA-H]: You can call up a reminder Help Screen.

9) WHERE ARE YOU?: As you use the macros, you will automatically be told, on the message line, the approximate PERCENTAGE you have progressed in the file.
10) ORIGINAL DEFAULTS [BA-L]: You can, at any time, get your original default macros back so that you can use them, or other task files to perform other activities on the news group file collection. For the rapid launching of this macro (news group reader) as a task file, it is suggested that you place a macro in your default macros that will launch it.

Example: <token of choice>:<AWP LAUNCH "NG.READER.TASK">!

Of course, this assumes that you have compiled this macro and 'Created a Task File' using Macro Options, naming it 'NG.READER.TASK'. [or used the task file already supplied on the disk]

11) PRISTINE CONDITION DESIRED [SA-A]: This starts or restarts the macro from the keyboard.

This macro is written using UltraMacros 3.1 (not Ultra4) because the majority of macro users have not upgraded to Ultra4 as yet and UltraMacros 3.1 has the greater audience at this point in time. This does not leave Ultra4 users out of the loop, for they can still use this macro, by launching their ULTRA.SYSTEM to get into AppleWorks instead of UM4.0.SYSTEM. Ultra4 is recognized as a much more powerful program and it is hoped that it will attract a greater audience in the future. Remember also, that the Newsgroup Reader is presently designed to work with AppleWorks 3.0 and UltraMacros 3.1.

HINTS:

While holding down the option key with your left index finger, lightly rest your right index and middle fingers on the right arrow and down arrow keys -- these are the most used keys.

If you are doing 'clipping' and for some reason change the name of the NG.CLIPPING file while it is still on the desktop, it is recommended that you re-enter the original file and 're-fresh' it by pressing [SA-A]. If you were in the process of doing a 'thread read' then press [SA-E] first (to get back to the start message and erase the file marker), and then press [SA-A] (initializes variables and prepares file and THE MAGIC NEWS GROUP READER for use.)

If you move (not copy) information out of the news group file -- thus shortening it, your percentage readings will be off. No problem, just do a [SA-A] when back in the reading mode and everything will be reset correctly once you use the macros again.

This program relies on normal USENET messages that commence with:
'CS-ID: ', followed by a message number as well as the requirement that the file is flush to the left margin. An AppleWorks setting of LM-0 and RM-0 is recommended.
Super Menu Pack is a nifty little utility that does three things:

1) Turns the "Control Panels" menu item into a hierarchic item, so you can directly choose a CDEV from the sub-menu that appears when you highlight the Control Panels menu item.

2) If Westcode's TypeSet is not installed, the Font menu will show the fonts in the actual font (e.g. Times is shown in Times; Helvetica in Helvetica). This works in programs like Teach and AppleWorks GS (programs that have a standard font menu).

3) The neatest thing (I think): Hold down the mouse at a certain spot on the screen and a window pops open that displays all the characters in the font you are currently using. Highlight a character and SMP tells you what keystrokes you need to type that character, or just release the mouse button and SMP will type the character for you!

Super Menu Pack is $29.95 plus $3.50 shipping and handling. If you buy Westcode's TypeSet program, a special offer is included where you can get Super Menu Pack at a discount (so if you plan to get TypeSet, buy it first).

Thanks, --Dave

SuperDataPath v4.1
SelectIcons v1.1
Workset v1.1
CDev.Alias v2.1 (1)
Alarm Clock v3.1 (1)

(1) Already shipping

A very bried description of each follows...

ButtonBar - NEW program! Button Bar adds a "button bar" to the Finder desktop. Buttons are provided for almost all of the Finder's functions such as "Icon info", "Eject disk", "Shutdown", and "Verify". In addition, buttons are provided to call on other Six Pack modules, such as "More Icon Info" (MoreInfo) and "Peek at File" (File Peeker). You can hide or show the ButtonBar at any time, and you can even have the ButtonBar open up automatically when the Finder launches.

LaunchList - NEW program! Allows you to keep a list of your favorite applications in a window on the screen all the time. You can even set the Launch List window to open up automatically. Double click an application (or click the Launch button, or press RETURN with the Launch List window in front) and you're off and running...

SizeUp - NEW program! SizeUp allows you to check on the size of a selection. Just select some icons (including folders and entire disks) and Choose "Selection Size..." from the Extras menu. The files and/or folders in the selection are counted and their size on disk reported. In addition, SizeUp will check to make sure a selection will fit on the destination disk when you perform a Finder copy.

XtraSounds - NEW program! XtraSounds adds extra sounds to the Finder! You can assign any system sound (from the sounds folder) to virtually all Finder functions (such as Copy, etc...).

MoreInfo - Includes a preferences dialog with options to use "SHIFT/unshift" menu items, where items like "LOCK/unlock" can be selected that will LOCK files if the shift key is down and unlock them otherwise. In addition, you can specify which (if any) menu items should appear in the Extras menu.

MoreInfo also can respond to other Finder extensions. For example, FilePeeker and ButtonBar can "ask" MoreInfo to do things (such as lock files) for them.

FilePeeker - Allows other Finder extensions to ask it to peek at a file
- Fixed a bug in the Hex/Ascii display
- Allows you to copy text to the clipboard in text displays

HotKeys - HotKeys now remain active even when another SixPack window
Apple II Computer Info

(such as the LaunchList window) is in front. Also added
HotKeys for: Peek At File, Show Launch List, Get Selection
Size, Open Filespec Window, Lock File(s), Unlock file(s),
Hide file(s), Unhide file(s), Activate file(s), Deactivate
file(s), Update created time, update modified time,
toggle button bar!, Close Finder Windows, and Show MoreInfo!

SuperDataPath - Works in Save dialogs!! (need I say more?)

SelectIcons- Works better with HotKeys. Responds to requests from other
system extensions.

Workset - Works with many more Applications. A bug was fixed that
sometimes prevented the data files from being loaded when
certain applications were run.
- You can now have INITS and Finder Extensions in worksets,
and they will be installed when the workset is "launched"
if you have IR installed in your system.

CDev.Alias - Note: Six Pack is already shipping with this new version.
- Works with System 6.0.1 (bug was fixed).

Alarm Clock- Note: Six Pack is already shipping with this new version.
- Works with System 6.0.1 (bug was fixed with the Settings
  window). Note: Six Pack modules not mentioned above remain at
  their current~~~ revision level.

Get'em today! And let mw know what you think. Post any questions here as
well!

POINTLESS V2.0.3 Yes there is a Pointless v 2.0.3 that we are shipping
""""""""""""""""""""""""""""
now. There is a small problem in v2.0.2 that affects
printing TypeSet reports in some fonts. The special characters would print
out funny, well it's trtrue that they look funny anyway :), but seriously
they would overrun each other and such on the print-out. Alan fixed it
right quick I'll post more details on update policy when I get them. NOTE!
if you order an update or upgrade you will get v 2.0.3, very few versions
of 2.0.2 went out the door.

(WESTCODE, CAT37, TOP4, MSG:271/M645;1)

HARD DISK DRIVE PRICE BREAKTHROUGH External enclosures, better built
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
PC Board and through hole solder, better built power supply with
sophisticated ICs runs cooler and needs no fan, can fit in a briefcase.
The drive is about the size of an Apple 3.5 drive and the same color.
Powered by an inexpensive wall transformer; power and SCSI cables
included.... These drives use Quantum Drives, and carry a manufacturer's
two year renewable warranty. That is, if the drive fails in the first two
years, Quantum will replace the drive and your warranty starts over.

BRIGHT SOFTWARE INTRODUCES "PEDIGREE" 2.0
written by Volker Herrmann

Switzerland -- Bright Software (Gate, SpaceFox, Symbolix, ShadowWrite, ShadowDial, Stammbaum) has finally released the American version of the ultimate genealogy application for the Apple IIgs: Pedigree II. PEDIGREE, the _only_ full-featured desktop application for genealogy tracking, is now ready to ship. The German counterpart, "Stammbaum II", has already been available for a few weeks.

__ FIND YOUR ROOTS! __

Just enter your ancestry and Pedigree will organize and succinctly display it in whatever manner you would like. Pedigree is easy and intuitive to use. Even photographs of your relatives are easily managed. And, of course, the program handles the GEDCOM standard.

Whether a novice or a pro in genealogical research, Pedigree II and your Apple IIgs answer your genealogy needs efficiently.

Once again, Bright Software has shown that the Apple IIgs is a solid, powerful computer. Both Pedigree and Stammbaum use the full potential of this extraordinary computer and are, without doubt, the most advanced genealogy applications on the market for the Apple IIgs. They make your computer more useful than ever!

more power - low price - best support

Pedigree's cost is only US$40.00/SFr.60,-/DM 70,-; far less than its "genealogical" rivals! (We have special school prices and site licenses. Please inquire.)

Demo versions are available directly from Bright Software (please enclose US$3.00 in cash for air mail delivery and specify American or German display language), and possibly soon on all major online services.

System requirements: Apple IIIGS, 1.5 Mb RAM, one 3.5" disk drive. Recommended: 2Mb or more, two drives or hard disk. Pedigree runs best under system 6 and The Manager (multitasks while importing GEDCOM).

PC APPLETALK? I talked with the Coactive folks again the other day (the ones who make the PC hardware/software version of AppleTalk) and found out that they had a new beta coming out and wanted testers. I gave them my name, Stowe Keller's name (he's the one working on upgrading the II emulator), and Resource Central's address. They are still _very_ interested in the Apple II market, and plan on enlisting these as beta testers (so they said).

----- Get the Lamp! -----
(B.MAPLES, CAT12, TOP6, MSG:109/M645;1)

GRAPHICWRITER III TEMPLATE CONTEST WINNERS  Choosing the winners was tough, partly because most of the submissions weren't actually _templates_, but were _examples_ of things that had been done. Realizing that a completed document could also be used as a template (with a little work), and due to the low number of participants, we decided to allow those "non template" entries in all but the first category.

For "the largest collection of useful templates" category we considered only the entries that were actually templates. The winner in the group was Charles Szasz, who submitted certificate, brochure, newsletter, and calendar templates.

The winner of "the most original template idea" is Jim Murphy. It wasn't so much what he did in GWIII, but what he did to produce the coupons. After printing the file onto NCR paper so a carbon copy is made, he lightly glued the two copies together using glue stick. And for the finishing touch he runs the sheets through a sewing machine with a needle but no thread—effectively perforating the edges of each coupon so it could be torn off easily!

The most useful template idea came from Daniel Sczygelski, who designed a "key shortcut" template. His template includes instructions right on the page, and all you must do is Select All, change the font, then print! Super Menu Pack can't be beat for accessing special characters on-the-fly, but this template is very useful for creating a printed font reference.

The most sophisticated templates were submitted by Dean Taylor. In addition to simple letterhead and signs, he included order forms and 3-fold pamphlet/brochures.

Finally, an honorable mention goes to Joe Citro for his "bull shooter's" certificate. We had categories for most original, most useful, and most sophisticated, and this template made us realize we should've had a "fun" category.

The following prizes are hereby awarded: Charles Szasz: $100 Jim Murphy, Daniel Sczygelski, and Dean Taylor: 3 Seven Hills products Joe Citro: 1 Seven Hills product

Thanks to all who participated in the contest!

Earl Childers President, Seven Hills Software
(SEVENHILLS, CAT43, TOP6, MSG:127/M645;1)

ZIP TECHNOLOGY -- WHERE AND WHO?  I hunted down Zip Technology to the number (310)568-2002. For anyone outside of Southern California, you must understand, we have picked up 3 new area codes in the past 5 years, in the Los Angeles/Orange/Riveride counties alone, so phone number have been changing around.

Additionally, I have discovered that they are planning a name change.
I do not, however, know what the new name will be.

On the square,

James Hannum

APPLE TO CHANGE DRIVE FORMAT? I could swear I heard a rumor somewhere
compatible drives completely in the future. Dunno if that's reliable or
not, but I do remember hearing that.

Yes, Apple's hinted (very strongly) that they're scraping GCR and
going with MFM for a variety of reasons (cheaper mechs, cheaper
parts, getting in bed with the rest of the industry...)

When I made my post before I was assuming a SuperDrive on the GS -- I
believe the 720K formatter ALWAYS uses MFM encoding.

NEW EDITOR AT STUDIO CITY In case you haven't yet heard, Dean Esmay has
accepted an editorial position with SoftDisk
and will be leaving the staff of Studio City. Beginning with the next issue
I will assume the duties of managing editor (for both the GS and Mac
versions).

I am looking for quality stack submissions and/or ideas for future
issues. There is also a chance that in the not so distant future I will
require an assistant (although I think I'll be going it alone in the
beginning).

Cheers... Bill

CIVIL WAR SOFTWARE We have a relatively new two-disk package on the Civil
War which includes one of our "AV DiskBook(tm)s" on
the Civil War and a second disk with quizzes and one out-and-out game; a
real "shoot'em up" with Civil War cannons, Union and "Johnny Reb" soldiers.
The set has sold well and I wondered whether or not we would get a lot of
flak on the gagame. What would be your guess? I would really be
interested to hear and after a dozen or so posts I will tell you what
happened. Adrian

IIIGS FINANCIAL PROGRAM Due to the recent interest in the forthcoming
update to the financial program, Financial GeniuS,
I have opened this topic for discussion.

The program should be released soon, but due to the fact that it
hasn't been released yet, no official "press release" telling all the
features of the program is available. When the time comes, a full
description will be placed within this category and the demo file will be
available in the software library so that you can "try before you buy."

For now, suffice it to say that Financial GeniuS v 2.0 is a _full
fledged_ financial package with comparable features to any other financial
package you might buy for your GS. It allows budgeting, transaction entry,
cost analysis, check printing... Just about anything you might want!

The shareware fee for Financial GeniuS v 2.0 will be $35 ($15 if updating from v 1.0).

Wait patiently for more info...

Rick Adams

author, Financial GeniuS
(R.ADAMS48, CAT8, TOP3, MSG:1/M645;1)

<<<<>

> Does FG have a section for investments and insurance like MYM?

"""

No, not like MYM. There are easy ways to track investments within Financial GeniuS, but I believe the MYM keeps track of various and sundry info (like Bank name, acct #, etc.) that FGS does not track. Insurance is most likely something FGS will not support (unless I hear a big uproar).

>a shareware program?

Yes.

> will it print Quicken style checks?

Yes. It will print to any check you set it up to print to. The "manufacturer's setting" for check layout is for a Quicken-style check. It can use the Print Manager or ASCII text for prints.

> when is Financial Genius 2.0 going to be released?

I hope to have a demo available to upload by this weekend! Someone is working on a demo account for me, and testers are making sure we get rid of _all_ bugs (we've been testing since March- there were LOTS of bugs in this HUGE program). When the program is released, I will start a BB topic in an appropriate area so that we can discuss the Pros and Cons of the program.

Until then...

Rick Adams

SOUNDMEISTER PRO RUMORS Also, no, the SoundMeister Pro is not out.

"""

Michael
(ECON, CAT35, TOP9, MSG:72/M645;1)

>>>> I heard somewhere that the SoundMeister Pro stereo sound card for the GS is NOT going to be manufactured. Darnit! I've been waiting for it to come out so I could buy it. I have an AE Sonic Blaster stereo card now. I just wanted something with excellent recording capabilities in stereo. Oh well!

Maybe the Soundmeister will be just as good. As long as it sends its output in stereo, I don't really care.
Russell Nielson

Apple IIc

Lives

(R.NIELSON1, CAT35, TOP5, MSG:53/M645;1)

I read about it not being manufactured in A2-Central On Disk. I am disappointed because I was looking forward to seeing what it could really do. By the way, according to the article in A2-Central, ECON is also discontinuing their hard drives. They will service what they have sold but will no longer sell hardware but will concentrate on software.

Can anyone from ECON confirm this?

Ron

(RON.ROYER, CAT35, TOP5, MSG:55/M645;1)

I saw that there is still background noise even with the SoundMeister Pro, what about building a metal body shield for the card. The shield could be ground (and, of course, cover with an insulating material to prevent current shortage, which aren't reccomend for a computer) to isolate the card from any main board noise. I'm not a professionnal about that stuff, but I see the interior of my IIGS covered with metal to reduce radio interference.

BTW, the background noise is a reason why I want to trow my SB in the garbage. The problem is when I'm digitising, mainly. During a digitising session, I record the motherboard in forground and my sample in background.

Not very usefull.:(

(G.BOURGETEL, CAT35, TOP5, MSG:48/M645;1)

Where did you see this information? The SoundMeister Pro has not even been released for beta testing yet, so such claims can only be hypothetical at best. I think we need to get some actual tests with the board before such information can be taken seriously.

Tyler

(A2.TYLER, CAT35, TOP5, MSG:49/M645;1)

SEQUNENTIAL SYSTEM BUYS CV TECH

> Will owners of CV Tech's memory card still be able to get product support?

Yes.

What about the lifetime warranty? (Just asking...I'm having no problems).

The lifetime warranty is now a six month warranty. I'm sure you'll understand that we cannot honor a lifetime warranty on products we did not make a profit on.

However, memory being what it is, I doubt you'll ever have any problems with the CVTech ram card. :)

Jawaid

(PROCYON.INC, CAT20, TOP2, MSG:4/M645;1)

As long as the board can be checked if needed (at a fair price), I'm not too concerned about the warranty. I just don't want my CV Tech ram card rendered unservicable due to this sale...
BTW: No, I don't understand that you cannot honor a lifetime warranty on products you did not make a profit on. You took on all the obligations of CV Tech when you purchased the A2 division.

(R.WAGONER4, CAT20, TOP2, MSG:5/M645;1)

>>>>>> No, Richard that is not how it works in the business world. When """"you buy a company you usually only buy it's inventory and name. It is then up to the new company whether they will honor any outstanding "obligations". They are under no legal responsibility.

This is no reflection on CV but how can any company offer a 'lifetime' warranty? What is lifetime? If the product stops working is that considered lifetime. It has out lived its life. Who can say?

Just my 2 cents worth.

(_,_)  
Buzz 
/\_. _-  enjoy vino
(W.WALLING1, CAT20, TOP2, MSG:9/M645;1)

<<< Sequential did not purchase CV Tech; it purchased CV Tech's """"products. New sales have the standard Sequential 2-year warranty, which includes toll-free phone support. If a product is under warranty there is no charge for examining possibly defective boards. Existing RamFasts boards have the same warranty except for the six-month term (if it hasn't broken in 2 years it is unlikely to do so just because we bought the products - unless you somehow manage to rig the SCSI cable into a 120V wall socket).

Sequential will be manufacturing the RamFAST and the GS-RAM Plus (formerly the CV-Ram 8MB memory board).

New drivers are a distinct possibility; if you have suggestions, please feel free (no, actually, you're under compulsion, Bryan :) to email me regarding features along with any technical data you feel is relevant. I.e., I have no idea what a "GS/OS Compatible Driver", so you'd better tell me - and quick :) Particularly, we are investigating adding ISO 9660 CD support to the RF driver (it doesn't work right now, for some unknown reason - but then neither does the Trantor NEC CDROM driver).

It is highly unlikely that there will be further ROM revisions.

RamFAST programming specifications will be made available shortly; we have not yet decided on the exact means this will be done.

Let's see, anything else... nah. Basically, we're real nice people, and we don't go out of our way to screw people.

Sequential currently has the RamFAST available for a special introductory price of $139. A price has not yet been set on the GS-RAM Plus.

Jawaid (PROCYON.INC, CAT20, TOP2, MSG:16/M645;1)

<<<< >How long for the reintroduction special on the RamFast? How much?
A good long time, I imagine. :) $139.

Jawaid insurgency (PROCION.INC, CAT20, TOP2, MSG:58/M645;1)

AUDIO/VIDEO FOR RamFast? > "The RamFast will never play music or video".

"ISO 9660 simply means support for the High Sierra file system, and has no implications for music or video.

Aside from the fact that the first quoted statement is incorrect, what Dan said is true.

What I'll be working on shortly _is_ audio/video support for the RamFast.

Jawaid insurgency (PROCION.INC, CAT20, TOP2, MSG:45/M645;1)

...AND A NEW PRODUCT? > Sounds like SS is really gonna try to maintain A2 support...Thanks.

As long as there is a market, there will be marketers :) Seriously, we're going to be coming out with a brand-new, revolutionary Apple II product soon. Keep watching this category...

Jawaid insurgency (PROCION.INC, CAT20, TOP2, MSG:69/M645;1)

RAMFAST 3.01d LAST ROM? We thought that we were going to have to change the roms for the MSDOS FST but it turned out that that wasn't the case. We did fix a minor bug that has been in the rom since 3.01a. The bug caused removable media that was physically write protected to show up on the desktop as non-write protected and that would cause some grief. That is the only difference between 3.01d and 3.01e, the physical write protect fix. The logical write protect stuff wasn't effected. Hmmm... hope everyone knows what I mean by physical vs. logical write protection. By physical write protection I mean the write protect notch on the disk. On a Syquest it's the little red wheel that turns. On a flopical it is the little black tab that moves back and forth. If a device reports that it is physically write protected then the RF recognizes this and will not allow you to change the partitioning or write to the media. You can also "logically" write protect the media inside the RF utility program by going into the "SCSI_Utils" and changing the write protect bit. This invokes a software write protect inside the RF host interface code that will prevent the OS from writing to the media. Hope this make sense....

Drew insurgency (CV.TECH, CAT46, TOP2, MSG:104/M645;1)

MORE VARIABLES FOR TALK IS CHEAP? If someone were to request it, I could always add a couple more variables to TIC. $0 and $9 would be easy to add, maybe $X, $Y, and $Z too. The only restriction in the current syntax is that I can't start a variable with a letter that matches that of the first character of one of the existing pre-defined variables so $P would conflict with $Prefix for example.

Don Elton insurgency (DELTON, CAT29, TOP16, MSG:39/M645;1)

>>>>> More variables would ALWAYS be good, so let me request them right now. :)

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
Gary R. Utter    (GARY.UTTER, CAT29, TOP16, MSG:40/M645;1)

II ALIVE DROPS AD INSERT... Well, we'd like to say that we got rid of the QC insert because of popular demand, but the truth is it was just too expensive. (You will notice some other cost-cutting measures through the magazine -- two-color pages where once there were four-color pages, etc.)

Before anyone asks, NO, II Alive is not in any kind of trouble; we knew we were going to lose money on the inCider/A+ deal for a while. We have just decided to minimize the loss. B)

Page count will remain the same, as will the editorial content.

...AND THEN ADDS STAFF! II Alive, Quality Computers' bi-monthly Apple II publication, recently brought on some new people who will make the magazine better than it's ever been before -- and allow us to bring it to you on schedule once more. These new folks are:

Managing Editor: ELLEN ROSENBERG

Many of you know Ellen as the former editor of A2-Central -- not to mention the primary organizer of recent KansasFests. Ellen will take on most of the jobs I've been doing: polishing articles and coordinating editorial content, along with an occasional article or two.

Contributing Editor: DOUG CUFF

We'll be counting on Doug, who's best-known on GENie as the editor of the A2 edition of GENieLamp, to provide us with an article or two for every issue, thereby freeing our staff writer Joseph Selur <grin> for other jobs.

Interview Editor: TARA DILLINGER

With Tara on our staff, we can lay claim to being the only computer magazine with a Goddess -- an A2 Goddess, of course. Tara's first interview, with Byte Works president Mike Westerfield, will appear in our next issue.

In addition to the people mentioned above, we've also still got Jeff Hurlburt as Review Editor, and of course, yours truly as Editor-In-Chief.

Wow! A year ago I couldn't even spell "staff", and now I've got one! B)

Please welcome our new staff members to the II Alive team!

Category 2, Topic 7
Message 58        Sat Oct 09, 1993
A.HUTCHINSON [Plato] at 03:01 EDT

I have a great one to share with you Apple II aficionados...
I had a lady contact me today - referred by my user group (GSAUG: Gravenstein... have you downloaded our HS stack?!?!) Anyway, she is a night custodian at Marine World, Africa USA in Vallejo CA. In a dumpster there she found an enhanced Apple IIe w/128k, duodisk, monitor, and Grappler Card. She had gone to the local Apple shop, and the guy there said that she shouldn't expect the machine to do much because it is an "obsolete" computer (Funny, I still thought Apple made IIe's), but that he would give her the number of my user group.

She came over, and I ran AppleWorks, Quicken, and some games for her, gave her a bunch of numbers for support, and sent her on her way with some freeware stuff I had got from GEnie. She was happy as a clam.

Needless to say, I will now be checking the dumpsters at Marine World on a daily basis.

Pax! --=Plato=--

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

You Want What?

"""

>>> A DAY OFF <<<
"""

So you want a day off. Let's take a look at what you are asking for......

There are 365 days per year available for work. There are 52 weeks per Year in which you already have two days off per week, leaving 261 days available for work.

Since you spend 16 hours each day away from work, you have used up 170 days leaving only 91 days available. You spend 30 minutes each day on
coffee break. That accounts for 23 days each year, leaving only 68 days available.

With a one hour lunch break period each day, you have used another 46 days, leaving only 22 days available for work. You normally spend 2 days per year on sick leave. This leaves you only 20 days available for work. We are off for 5 holidays per year, so your available working time is down to 15 days.

We generously give you 14 days vacation per year which leave only 1 day available for work and I'll be damned if you're going to take that day off.

[*][*][*]

Our thanks to Jim Lubin for digging up this month's Humor Online article.

[P.SHAPIRO1]

>>> SOME THOUGHTS ON THE NATURE OF ELECTRONIC MAIL <<<

About one year after I signed up for GEnie I persuaded my older brother, Ian, to open an account as well. My brother lives over 400 miles away so we don't get to see each other often. Both of our lives are busy, leaving little time for leisurely long-distance phone calls.

I figured if we both had accounts on GEnie we could stay in touch via electronic mail. Superficially, electronic mail appears to be a "cold" form of communications. But, we've found just the opposite to be true. E-mail binds us closer together than any voice communications could.

I haven't spoken with my brother by phone for almost two years. Yet I feel closer to him than at any other time in our lives.

A typical week has us exchanging three or four short messages. The brevity of the messages belies the quantity of communications taking place. Many of our sentences have undertones and overtones that "speak" far more than the bare words themselves.

Inside jokes. Family lore. Allusions to shared incidents in our childhood. These make up the "messages behind the message."

No small part of our messages involve spoofing family members and mocking our own idiosyncrasies. Wild exaggerations and wily understatements further enliven these exchanges.

Sometimes the most humorous e-mail messages I've received from my brother have been one-word sentences. If you choose just the right word it can speak volumes of what's on your mind. Honest.
Speaking of humorous e-mail messages, one particularly creative e-mail message had me rolling on the floor with laughter. One day, while I was unsuspectingly reading my electronic mail, an e-mail message in Yiddish pops up on my screen.

Neither I nor my brother speak or understand one word of Yiddish. But we were brought up in a household where Yiddish was spoken quite regularly at family gatherings.

In an inspired moment of creative mischief my brother had composed nonsense sentences that sounded very much like Yiddish. After recovering from the initial startle, it dawned on me that my brother was sending me a complete e-mail message in Yiddish -- a language entirely foreign to both of us.

In another incident, I needed to seek my brother's advice on an engineering design project I was working on. While the questions themselves were entirely serious, I thought it might be fun to couch the questions in a little humor. Spoofing another "family team" of inventors, it seemed only appropriate to address my e-mail message to: "Dear Orville," and sign off at the end of the message with, "Your devoted brother, Wilbur."

My brother runs his own engineering consulting firm, and was quickly able to supply me with answers to my questions. So pleased was I with the response, I rushed off a short note saying: "Thanks. Received your explanations. Buying a train ticket to Kill Devil Hills this afternoon."

Just as e-mail travels equally well in both directions, so too can friendly assistance travel in both directions. A few months ago I had an opportunity to reciprocate. One of my brother's corporate clients asked for detailed statistics on imports and exports of engineering equipment. The only library in the nation with a full collection of such statistics is the Department of Commerce library, in Washington D.C..

I happen to live in Washington D.C., and the Department of Commerce is just a short subway ride from my house. It took me no more than an hour or two of research to track down the information he needed. How were the results of this search reported? Via electronic mail, of course.

Lately I've been spending time thinking about the emotional bonds that electronic mail seems to foster. What is it about this technology, so superficially impersonal, that makes it more personal than even the sound of the human voice? Why is it that the text from electronic mail messages carries with it an emotional content far richer than that carried by ordinary hard-copy text?

Strange as it may sound at first, no communications channel can compare with the emotional warmth of ASCII text. Since the dawn of language, no tool has been devised that is more powerful for transmitting feelings and ideas.

With emerging new communications technologies just around the bend, it behooves us to give serious thought to such subjects. Is it possible that even a videophone would be less warm a communications channel than a plain ASCII e-mail message? Perhaps.

After all, flickering images and sounds represent just the surface.
Words, by contrast, represent the soul of all emotions and ideas. My brother told me so.

-Phil Shapiro

BEGINNER'S CORNER

Polishing Green Apples

By Steve Weyhrich

[S.WEYHRICH]

>>> HOOKED ON CLASSICS (Part 1) <<<

LAST TIME OUR INTRODUCTION... to the AppleIIgs dealt with a description of the IIgs hardware, particularly the slot layout and what the various slots are used for in a standard IIgs setup. We then turned to a way in which the characteristics of the hardware could be adjusted, and I introduced you to the IIgs Classic Desk Accessories. This month we will begin a look in detail at the Control Panel, the most important of the CDAs built into the IIgs ROM.

GAINING CONTROL The Control Panel CDA is the major feature you will need to learn in order to change your IIgs from its standard settings to something more to your liking. This built-in program makes it possible to alter the characteristics of the hardware that handles each of the slots, as well as other features that are unique to the IIgs. These custom settings are stored in a separate part of RAM on the IIgs that is protected by a battery on the motherboard, and will not change even when the power is turned off. (However, if the settings seem to be changing randomly, that can be an indication that your battery is getting weak and may need to be replaced). There is also a graphic-based Control Panel in the New Desk Accessories that comes with the GS/OS system software; that version is a bit more advanced, allowing changes to all of the battery RAM settings possible in the CDA version, plus some other settings that the CDA version will not alter. However, I have found it to be quicker to make the most common changes using the CDA Control Panel.

As review, you can access the Classic Desk Accessories menu by pressing Open-Apple, Control, and ESC at the same time (release the ESC key first). When at the CDA menu, press RETURN while the inverse bar is on "Control Panel" to enter that utility. What you see displayed will be something like this (on a ROM 03 IIgs):

Control Panel

<table>
<thead>
<tr>
<th>Display</th>
<th>06:53:59</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sound</td>
<td>8/9/93</td>
</tr>
</tbody>
</table>
Select V ^                Open <-|

(where the "V" is actually a down arrow, the "^" is an up arrow, and the "<-|") is the universal symbol for the RETURN key). On a ROM 01 IIgs, it looks slightly different:

Control Panel

Display 06:53:59
Sound 8/ 9/93
System Speed
Clock
Options
Slots
Printer Port
Modem Port
RAM Disk
Quit

Select V ^                Open <-|

On the ROM 01 version, the keyboard and mouse controls were grouped into a single category, "Options". The ROM 03 IIgs has the capability under hardware control of letting the keypad act as a mouse controller (for handicapped users), and so when the ROM was revised, the "Mouse" controls were expanded and placed in a separate part of the control panel. Don't worry; we'll deal with them both when the time comes.

Let's examine each of these items in detail.

DISPLAY This Control Panel item allows you to adjust various aspects of the display of the IIgs screen. Instead of white text on a black background that characterizes previous Apple II computers, the IIgs is capable of doing limited display of colored text. By "limited", I mean that you can designate a single color for the background, and a single color for the text. The border can be given a unique color as well. This is, in my opinion, a design decision that should have been made more flexible. I find the multiple text colors possible on the IBM PC style video controllers to be a better way to do things, particularly when it comes to making text-only programs easier on the eyes. For example, WordPerfect on the IBM PC will allow display of underlined text in one specific (user defined) color, italicized text in another color, and so on. In this regard, the IIgs text screen is not significantly more advanced than that found in the original Apple II.

Selecting the Display entry in the Control Panel gives this result:

Control Panel
Display
~ Type: Color  
~ Columns: 40
  ~ Screen Colors-
  ~ Text: White  
  ~ Background: Medium Blue  
  ~ Border: Medium Blue  
  ~ Standards: Yes
  ~ Hertz: 60-

Select <-> V ^ Cancel: Esc  Save <->|  
(The "~" represents the check mark you see when viewing this on the GS text screen.)

The first Display item that is highlighted is "Type". Pressing the left or right arrow keys will switch between "Color" or "Monochrome". Be aware that if you are using an RGB color monitor, this setting only has an effect on double hi-res graphics. Super hi-res graphics (which most of the GS/OS-based programs use, will still appear in color even when this options is set to "Monochrome". If you do not have an RGB monitor, setting this to monochrome will allow you to view more easily the colors on super hi-res screens as shades of grey (or green or amber, depending on the type of monitor you are using).

I have an RGB monitor, and the only time that I have found it necessary to change this setting was when trying out the Shareware game, "Star Trek: First Contact", which makes extensive use of monochrome double hi-res graphics. Viewed with the Type setting at "Color", the words are unreadable, but changing it to "Monochrome" made it possible to play the game.

The "Columns" selection refers primarily to whether the IIGs starts out in 40 column mode for text-based applications (as was the case on the older Apple II's), or in 80 column mode. Any program can override this setting if it knows how; however, some older programs may not display properly in 80 column mode and may not know how to change back to 40 columns. Those programs will primarily be those written before 80-column hardware was universally available, pre-Apple IIe, and may send text to the screen using tricks that work just fine on a 40 column screen, but look strange in 80 columns. How you choose to set this option is largely dependent on how many older programs you will be using, and on how you want things to look when starting up.

Changing the settings for screen colors is primarily a matter of preference. Old-timers, who are most comfortable with light colored text on a dark background, will probably see no reason to change from the default white text on blue background. But feel free to experiment, and see what looks best to you. This display control panel program will not let you select an option that completely impossible to read (i.e., pink text on a pink background), but it may allow you to select some possibilities that are hard to see (dark blue text on a black background).

There is a topic in the A2 Roundtable where users recently were describing examples of text colors that they found appropriate for their
needs. Personally, I have become used to a dark colored text on a light background, since that is more like what we are accustomed to read on paper. I have varied between dark blue or black text on a white background, to black text on a light blue background. Some users like yellow text on brown, and others like white on dark grey. One user had what he called a Halloween mode (black text on an orange background and black border), and a "watermelon" mode (black text, pink background, green border). Be creative, but select something that does not give you a headache!

The "Standards" setting simply allows you to quickly change whatever awful colors you have experimented with back to the standard white text on blue background. The advantage is that this lets you change things quickly back to something readable. The disadvantage is one slip of the finger on that arrow key, and your carefully constructed color display is history, so move the cursor bar down to this setting only if you REALLY want to use it.

The "Hertz" entry at the bottom of the list is not really an option to change, but rather a display of a setting that can only be adjusted through a very specific operation. If your IIgs is running in a country that does not use the U.S. standard AC (alternating current) frequency of 60 Hz (cycles per second), you will not have a normal appearing screen display. Changing this is done completely outside of any control panel, Classic or otherwise. You must press Option-Shift-Control-RESET (four keys) to access the menu that lets you change this frequency. If you have no need to make such a change, don't bother; that menu also will let you change all of the Control Panel settings back to their defaults (in case you REALLY mess them up). Your IIgs owner's manual will have more discussion about this, and I refer you there.

SOUND

The Sound screen in the Control Panel looks something like this:

```
Control Panel
Sound
~ Volume |--------*--------|
~ Pitch  |------*--------|
Select <-- -> V ^ Cancel: Esc  Save <-
```

This is a rather straight-forward option. Instead of the traditional "beep" sound made by previous Apple II's, from the II up through the IIc Plus, the IIgs will let you change the volume and pitch of the startup sound. I call it a "bonk", rather than a "beep", and personally find the pitch of the default sound to be rather annoying. This is also the sound that will be made if some error condition occurs (and if you have not used the Sound CDev in System 5 or 6 to assign another sound to an error condition). If you also dislike the default settings and want something different, just use the right and left arrow keys to move the "*" on the pitch line to something more pleasant. My preference is to have the pitch set all the way to the right line.

The volume can also be made louder or softer in the same way. Save your settings by pressing RETURN.
SYSTEM SPEED

Here is what this Control Panel looks like:

```
Control Panel
System Speed
~ System Speed: Fast
Select <-> V ^ Cancel: Esc  Save <-|
```

This setting allows you to change from the typical, faster speed of the IIgs microprocessor (2.8 MHz), to the "normal" 1 MHz speed of a 6502 processor used in the older models of the Apple II. For most purposes, you will want to leave this set at the faster setting. However, some older Apple II games or music programs will not operate properly at the fast speed, and so it may be necessary to change it temporarily with this Control Panel.

Speed control settings for the TransWarp and Zip GS accelerators are done via a custom desk accessory loaded from disk, and so will not be affected by the setting here.

As before, the setting can be changed by using the left or right arrow keys, and saved by pressing RETURN.

CLOCK

The built-in clock in the IIgs should be set to the correct time, for proper time/date stamping of files that you work on, and for other programs that make use of the time or date. Here is what this Control Panel looks like:

```
Control Panel
Clock
Month: 11
Day: 9
Year: 93
~ Format: MM/DD/YY
Hour: 10 PM
Minute: 1
Second: 23
~ Format: AM-PM
```

The two format settings are altered in the same way as usual, by using the left and right arrow keys. The various date formats are entirely to your preference; just be sure that you remember what you've set it to, as MM/DD/YY (typically used in the U.S.) and DD/MM/YY (often used in Europe) look very similar. Using the month, day, and year listed above, MM/DD/YY is 11/9/93, but would be 9/11/93 using the DD/MM/YY setting. The time format setting changes between AM-PM and 24 HOUR clock. The time above would be 2201 in 24 hour (military) time, but 10:01 PM in AM-PM time.

To change the month, day, year, hour, minute, or second entries, put the cursor bar over that item with the up and down arrow keys, and use the left and right arrow keys to change it. Press RETURN to save the setting.
Several years ago I worked for a security company that required me to be armed. The company, as well as the maker of the defective pistol they provided, shall remain nameless.

During this same period, I was running a local BBS on my old Apple ][+ -- the system included two RANA 5.25 inch floppy disk drives and a Applied Ingenuity Overdrive. The Overdrive took time to cycle up, and I needed a BBS that would automatically reboot after a power failure, so I wrote a custom startup program that delayed the computer's attempt to boot the hard drive until after the drive had finished its warmup cycle. (Remember, this was on a ][+, before interrupts!)

At any rate, the company I worked for required me to carry my weapon at all times, loaded and ready to fire -- we would be inspected from time to time just to check this. But I refuse to keep a loaded weapon in my home, so before I would go out I would load my pistol. I kept the ammunition separate from the pistol and usually placed it on top of my computer desk.

One morning I was leaving and following my routine: I made sure that the safety was on -- it was always on! -- grabbed the clip and loaded it, pulled the receiver back and let go (to load the first round). At this point the hammer fell and should have been stopped by the safety from firing the pistol, but there was a problem and the gun fired.

People who aren't ready for a pistol shot sometimes don't realize that it's gone off and, I admit, I didn't know that the gun had fired right away, until I started wondering why there was smoke all around and a shell casing spinning around on top of the computer. Then I realized that the gun had gone off, but where had the bullet gone?

My first rule on dealing with any weapon is always know where the bullet is going to stop and how will it get there. The gun had been pointed in the general direction of the computer, but I didn't see anything like a hole there, so I looked behind the computer at the wall... no hole. I couldn't find a hole anywhere. The BBS was running fine, and calls were being answered. No hole. Just when I was going to give up and...
leave for work, I saw it. Right in the bottom of the disk drive opening to my boot drive, a 5.25 inch RANA brand disk drive.

I picked up the drive and just below the drive opening was a 38 caliber hole. I heard the sound of broken metal rolling around in the drive unit. I pulled out the disk, and it looked okay, so I shut down the BBS and ran Copy ][+ to do a check on the drive. I ran a verify on the boot disk and everything checked out except for the last track on the drive. I rebooted the system from the drive with the hole in it and everything worked okay. I didn't have time to do anything else, so I left it until after work.

I came back from work and checked the BBS. Still okay. I decided to take the number two drive out and swap it with the boot drive so that I could take a look at the damage. Once I got the case off of the boot drive, I saw a LOT of damage. There was a large hole in the middle of the frame and at the back of the frame, the front of the case was plastic and the bullet was caught by the back of the case. (Of course, the frame was pretty thick.) There were about twenty pieces of metal and the remains of the bullet. There were a lot of wires hanging down in front and one of the drive motors for the head positioner was bent. There was also some foil that had peeled back from the bottom of the disk head where the wiring hooked up to it.

I smoothed out the foil, and figured out that the wires weren't hooked up to anything (they went to sensors that aren't required for Apple drives). There was a small sliver of metal that was wedged in the band that drove the head positioner and I removed that. I reassembled the drive and put it back in service as my drive 2. I ran Copy ][+ on it and did some diagnostics, everything still checked out okay.

That was about five years ago. The drive is now ten years old and I still use it... not very often, but I still have it, and the Apple ][+ that it was on. I don't have the BBS anymore, but after 8 years it was burnout time anyway. I've got a IIe and am now using a IIgs now, I'll be using my Apple II's as long as they keep running, and I'm sure that I'll be able to keep them running for a VERY long time to come.

>>> SEVENTH ANNUAL ADVENTURE GAME WRITING CONTEST ANNOUNCED <<<

October 18, 1993, MISSION SAN JOSE, CALIFORNIA -- Softworks today announced that it is sponsoring its seventh annual contest for the best computer text adventure game developed using the Adventure Game Toolkit (AGT).

The Adventure Game Toolkit is a computer program which allows MS-DOS, Macintosh, Amiga, and Atari ST computer users to create their own "interactive fiction" or text adventure games. Games developed on one of these computers may be played on any of the other computers.

The Seventh Annual Adventure Game Toolkit Gamewriting Contest offers a grand prize of $100 for the best game submitted. Additional prizes may be added if the judges decide that more than one entry is outstanding. Gamewriters, including contest winners, will also retain all rights to their games.

"The main purpose of this contest is to encourage people to share the
games they've written using the Adventure Game Toolkit," said Mark Welch, one of two co-authors of the AGT system.

"A lot of people start to write a game, and spend quite a few hours on it, but stop before they really finished the game, or before it's really playable," said Welch. "We are hoping that the contest will inspire people to create full-featured, playable games that can be enjoyed by other adventure game fans."

PREVIOUS CONTESTS Softworks has sponsored six prior adventure game writing contests. The winner of the first contest was ALICE, written by Douglas Asherman of Oakland, California. ALICE put the player in the role of Alice in Wonderland, meeting many of the same characters described in Lewis Carroll's 19th-century book, while also adding some humorous 20th-century perspective.

The 1988 contest winner was A DUDLEY DILEMMA, by Lane Barrow, a Ph.D. candidate at Harvard. In this game, the player assumes the role of a Harvard student in his/her quest for knowledge, adventure, and a diploma. Along the way, the player experiences a student sit-in and meets panhandlers, MIT students, and other bizarre characters roaming Harvard Square.

SON OF STAGEFRIGHT, by Mike McCauley, was the 1989 winner. In this game, you play the role of an actor (or actress) trying to get out of an old, abandoned theater. This is an adventure game in three "Acts," where each Act has a different theme and a different challenge. The game is fun(ny), frightening, and very clever.

Patrick Farley wrote the 1990 contest winner, CRIME TO THE NINTH POWER. This game features Cliff Diver, a private investigator living and working in San Francisco. Cliff is cut from the same cloth as such famous PI's as Sam Spade and Philip Marlowe. In this game, you must help Cliff to escape from the deadly milieu of the Zamboni crime family's secret headquarters. Along the way, you and Cliff will face such challenges as snarling Dobermans, bad booze, and a couple of Zamboni's goons (named Flash and Bonzo), and have a brief encounter with the succulent Tatiana and her three beautiful sisters.

In the 1991 contest, we had a tie for first place: COSMOSERVE - AN ADVENTURE GAME FOR BBS-ENSLAVED by Judith Pintar, and THE MULTI-DIMENSIONAL THIEF by Joel Finch.

COSMOSERVE - AN ADVENTURE GAME FOR BBS-ENSLAVED -- as might be guessed from the title -- is an adventure that takes place inside a BBS or Bulletin Board System (complete with sound effects for logging on, switching the computer ON and OFF, etc.). COSMOSERVE is a very, very original, innovative, and unusual game!

In the game THE MULTI-DIMENSIONAL THIEF, you play the role of a thief faced with the challenge of rooms "borrowed" from other universes and permeated with a number of useful items including the infamous "portable hole." Filled with wonderful puzzles that will remind you of Infocom's finest, THIEF is extremely well-written, clever, and very funny.

In the 1992 contest, we again had two winners: CLIFF DIVER: INVESTIGATOR FOR HIRE -- PURCHASED SIGHT UNSEEN By Pat Farley and SHADES OF GRAY -- AN ADVENTURE IN BLACK AND WHITE By Mark Baker, Steve Bauman,
Belisana, Mike Laskey, Judith Pintar, the Hercules/Assoc. SysOp, and Cindy Yans.

Pat Farley's CLIFF DIVER: INVESTIGATOR FOR HIRE -- PURCHASED SIGHT UNSEEN is the second in the series of adventures featuring the San Francisco PI, Cliff Diver. In this adventure you and Cliff search for lost paintings. This game really shines because Pat writes so well and his game very faithfully recreates the sound and feel of the classic "hard-boiled" detective stories of Raymond Chandler and Dashiell Hammett.

SHADES OF GRAY -- AN ADVENTURE IN BLACK AND WHITE -- was conceived, written, and coded by seven people: two from England, two from the East Coast and three from the West. They have never met each other; never, in fact, spoken to each other on the phone, nor even corresponded by mail. The entire project was managed through E-Mail, from within a private CompuServe Gamer's Forum. This marvelous, mammoth game is as innovative as Pintar's previous winner, COSMOSERVE, which tied for first place in the 1991 contest.

CONTEST DETAILS To be eligible for the contest, entries must be designed using the Adventure Game Toolkit and written during the contest year. Contest entries must be postmarked by December 31st of the contest year and received by Softworks no later than January 15 of the following year. For example, the 1993 contest will consider games written between January 1, 1993 and December 31, 1993 and received by Softworks no later than January 15, 1994.

Judging begins approximately February 1st and the winner is announced in the spring following the contest year. The judges consider each game's originality, cleverness, fiendishness, humor, raw cunning, and professionalism, in arriving at their decision about the contest's winner.

Entries must be submitted on disks for the IBM PC (or compatible computer), the Apple Macintosh, Amiga, or the Atari ST computer. AGT source code for the game must be provided, but will not be publicly disclosed without the consent of the author. In addition to the AGT source code, each entry must be accompanied by a game "walk-thru" or solution to be used by the contest judges. A map of the game would also be very helpful, but is not required.

No purchase or fee is required to enter. Game authors need not be registered users of AGT to enter the contest. Gamewriters, including the contest winner(s), will also retain all rights to their games -- including the right to copyright and sell their games -- if they wish. However, it is "customary" for the contest game authors to allow their games' source code to be distributed (to registered AGT user only) -- if their games are judged as one of the "Best of the Contest."

AGT DETAILS The Adventure Game Toolkit has been favorably reviewed in a number of personal computer publications including "PC Magazine", "Computer Gaming World", "Big Blue Disk", and "Public-Domain Software & Shareware." According to those reviews, AGT "allows for creating remarkably complex and sophisticated games in a fairly simple way," that "anyone with an ounce of imagination can create adventure games...similar in layout and sophistication to those from Infocom," and "the process is easy...and you'll have hours of fun doing it." AGT was awarded the Adventure & Strategy Club's "Golden Chalice Award" for 1992.
The Adventure Game Toolkit is distributed as shareware, so that MS-DOS, Macintosh, Amiga, and Atari ST computer owners can try out the program before buying it. Copies of the program disks may be obtained from user groups, bulletin boards, and authorized disk vendors for a nominal fee, or directly from Softworks. Included on the program disks are a dozen sample adventure games with complete AGT source code. Registration is only $20, or $40 including a printed copy of the 200 plus page manual, which can also be purchased separately for $25. Registered users may also purchase the Pascal source code for AGT for only $50.

For more information, contact Softworks, 43064 Via Moraga, Mission San Jose, CA 94539. Telephone (510) 659-0533.

Who's Who In Apple II

By Tara Dillinger

[TARA]

>>> WHO'S WHO <<<

~~~~~~~~~~~~~~
~ GENieLamp Profile: Roger Wagner, HyperStudio creator and proselytizer ~

[This month's interview comes to you "live" from "A Walk on the Wild Side with Tara & Co.!", a new Online Talk Show on GENie's A2.]

<TARA> Welcome to WOWS!

<TARA> Now we'll begin the formal part of the interview. I'll call Roger in a minute...He's in our "Green Room" now.

<TARA> From 9:30-10:30 the room will be in listen only and from 10:30-11 there will be Q & A.

<TARA> Would anyone who doesn't have their first name up please set your name out of courtesy to Roger?

Room is now in listen-only mode.

<TARA> Here he is! Yes you're here, Roger! :)

<ROGER.WAGNER> Hello! I guess I was dis-oriented by all these stage-lights! Quite a setup you have here!

<TARA> Our Special Guest Star tonight is Roger Wagner who is not only well known as the creator of HyperStudio, but also as a Hypermedia Evangelist and as the Patron Saint of the IIGS. Welcome to "A Walk on the Wild Side!", Roger. Thank you for coming.

<ROGER.WAGNER> Thank you! Great to be here! I LIKE wild places!

<TARA> Let's start from the beginning -- How did you first get involved with computers.

<ROGER.WAGNER> A name mixup in the criminal justice system... but nothing
was ever proved...Actually, I was earning an honest living as a science teacher, and heard about the Apple II... and soon discovered summer vacations weren't enough time to do all the fun stuff!

Originally, I thought I would take the little guys (little guys = Apple II's) door-to-door at businesses, and make zillions!

<ROGER.WAGNER> The only flaw in the plan was that I didn't know zip about business OR computers! So.....I found I had lots of time on my hands to play at learning how to program in BASIC. I also discovered that people would actually pay for programs written in BASIC! ('Course, that was at a time when there was NO software for the computer at all!) :)

<TARA> What was your first product and how did that come about?

<ROGER.WAGNER> Well... the first was a program that re-numbered Applesoft programs. It was written in BASIC itself, so one of the tricks needed was to figure out how to have two BASIC programs in the computer at once, with one working on the other! I put it on cassettes (no disk drives then), and hand-typed labels. Sold them for $10 each at the user group, and then through small ads in magazines.

There was a little drawing program called "Roger's Easel" (lo-res), but our "biggie" at the time was "Apple-Doc". It made a list of all the variables in a program. Sold 100 copies a week for a while!

<TARA> Wow!

<ROGER.WAGNER> (that first program was called "Programmer's Utility Pack")

<TARA> And later came Hyperstudio, about 5 years ago, right? Briefly, what is Hyperstudio?

<ROGER.WAGNER> I designed HyperStudio about 5 years ago, and found a team of programmers to work on it with me. The idea originally was to have sort of a "Print Shop version of HyperCard".

<TARA> What a novel idea! :)

<ROGER.WAGNER> It's changed over the years... but the basic idea is the same. make everything as simple & direct as possible. I wanted something that a person's grandmother & nephew could play with at the holidays to make a family tree or whatever.

<TARA> Hyperstudio has a reputation for being easy to learn. How quickly can someone learn to work with the program and how easy is it to learn the scripting language?

<ROGER.WAGNER> It takes only an hour or so to grasp the basics of the program. The scripting language is TOTALLY optional. The secret behind HyperStudio is to avoid having to do scripting. The scripting is there for very specific applications where variables are required, but for most users, it's not needed.

Today, the program has found a fantastic following in education, ranging from Kindergarten classes up through university...and there are some commercial projects using it as well.
<TARA> How did you assemble the team that worked on this project?

<ROGER.WAGNER> I checked out who was doing neat work on GEnie! Seriously, I tell anyone looking for programmers to see what they can find online, look at the work different people have done, and go from there. In the case of HyperStudio, I found Eric Mueller (sysop for awhile here), Ken Kashmarek, Michael O'Keefe, and Dave Klimas. They all lived in different states (AK, IA, MA and CA), and we exchanged files via modem here along w/ email messages.

RWP is somewhat unique in fact, in that even today it is an "extended" company, with people on-staff in Washington, California, Massachusetts, and even Montreal!

<TARA> What have they done since? Do any of them still work with you?

<ROGER.WAGNER> Michael is on staff here. Eric went off to Hollywood to make movies! Ken Kashmarek has a "real job" :) at John Deere running BIG computers, and has been working on NBAs and other add-ons for HyperStudio.

<TARA> Apple later came out with it's own version of Hyperstudio -- HyperCard. How do these two programs compare?

<ROGER.WAGNER> Well, to be fair, HyperCard was out first (on the Mac). Actually, Tutor-Tech from Techware in Florida was out on the Apple IIe before either HS or HC!

<TARA> Really!

<ROGER.WAGNER> HyperCard was designed as one of the first applications for the Mac at a time when there wasn't much software for the Mac. It serves a dual purpose of being a general database, and also a less intimidating programming environment for database-related applications. However, multimedia aspects of HyperCard have been add-ons, and the program is still intrinsically black & white, and script-driven unless you add additional 3rd party modules. At this point, I believe Apple is looking towards entirely different software products to answer multimedia authoring, from their perspective.

HyperStudio, on the other hand, was designed from the beginning to be a simple and direct multimedia authoring system with full support of color, sound, animation, etc. This was because at the time, the Apple II was the ONLY computer in the U.S. that offered all the media elements with a large installed base. Color Macs existed, but were expensive. The Amiga had the price, but there were only about 100,000 units in the U.S. The GS was the platform that fit the bill! (and still does!).

<TARA> Yes!

<TARA> This has become almost a movement. There's a Hyperstudio Festival every year, there are disk based publications such as Studio City, there is a Category right here in the A2 Bulletin Board all devoted to Hyperstudio. Why the enthusiasm, and how do you feel about heading such a movement?

<ROGER.WAGNER> First, the "why"...I've felt from the beginning that the secret of personal computers was personal expression and creativity. Canned programs are ok, and balancing your checkbook might be interesting for some, but it is the very personal nature of computers that has really
been at the heart of their success. Anyone who has really understood the phenomenon has sensed this aspect of the technology.

HyperStudio is, by its very simplicity, a powerful tool for personal creativity and expression, and the fun of the last few years has been watching the incredibly diverse ways in which so many people have used it. That's what also makes it such fun for HS users to all get together, whether it's at our HyperStudio Festival this last summer, or here online!

<TARA> So How do you feel about heading this movement?

<ROGER.WAGNER> I love participating in the party! I can't say I'm the "head" of the movement - just a noisy participant!

<TARA> On the lighter side Roger, you are well know for having an overabundance of energy, to put it mildly. There were stories at KansasFest about you concocting outrageous games and scaling building walls as a few of your nocturnal activities. Is the "Hyper" in Hyperstudio borrowed from a self description?

<ROGER.WAGNER> It *might* have been....but it wasn't! "Hyper" just means "above & beyond"! :) When we were trying to find a name for this "thing", we just thought about creative places, and most of them were called studios! The Hyper ties in to both the "ultra-studio" theme, and also the connection with "hypermedia", as coined by Ted Nelson.

<TARA> And of course..Your notorious ties..How did that get started?

<ROGER.WAGNER> Well... as I recall, there was a conference a ways back where there were going to be a lot of official-looking computer people, and there might even have been a request from the staff of some booth I was going to be in to wear a tie. Well... I didn't want to be mistaken for a PC salesman! So... I found a tie that reminded me of HyperStudio, with lots of bright colors, and looking generally strange!

At the next show, someone asked me where my tie was, so I had to do it again. THEN came the day when Steve Disbrow

<TARA> (Of GS+ Magazine?)

<ROGER.WAGNER> That's the one! (or his like!) said "We already saw THAT tie last time!", and I had to start getting new ties for every single conference!

<TARA> You also video tape virtually everything you see. Do you ever watch all those tapes? Or do you just make ties out of them?

<ROGER.WAGNER> I don't watch ALL of them! :) but... :) <ROGER.WAGNER> I DO keep some for investment value in case I need to get 'Diz to "cooperate" some day!

<TARA> Blackmail material, eh?

<ROGER.WAGNER> (I also believe in the concept of video as being "note-taking of the future" and the Printer of the present!)

<TARA> Ah yes..The VCR as a printer...Getting back to the nocturnal antics...Whatever possessed you to play Spider Man?
As I recall, it was just late at night at K-Fest, and people were just sort of hanging around...I was getting back from somewhere, and instead of coming up the walkway, I decided to take a shortcut up a little 15' wall nearby! :) One thing led to another, and soon we were out looking for parts of the Dorm there that we could climb! :) 

In a former lifetime, before computers completely devoured my "real life", I used to enjoy rock-climbing!

Oh...hence the urge to scale a building!

And you also have many electronic toys. What have you collected and what's the fascination with these toys?

Well...One of the neat things about the Apple IIGS is its ability to be connected to just about ANYTHING! Also, its very easy to fiddle a bit, and program it up in HyperStudio to interact with these things. Most of the "toys" are video-related because the GS is so "video-friendly". Quite a bit ahead of its time in that way. It is only VERY recently that the new Mac "AV" machines offer some of this, but still nothing like what the GS offers.

I think it was K-Fest 2-3 years ago, when we announced HyperStudio 3.0, that the introduction showed effects on the GS that are still for all practical purposes out of reach on a Mac.

Tell us a bit about Merlin, and where did you get that name?

"In the beginning".... two other successful programs for the company were ASCII Express (a modem program), and Merlin, the assembler. Merlin was originally named "Big Mac", but had a program called "Sourceror" that generated source code from raw object code. I think the Merlin name was inspired by that.

I see you have a sense of humor Roger...)

nah

Getting back to Hyperstudio, you've ventured out into the world of the Mac and I've heard your next area is for the PC. How is the expansion into new areas going?

How things go in the PC world will have to be seen...I have really no experience in that area, but I understand that there ARE a lot of those machines out there! :) My real enjoyment comes from playing in the area of personal creativity. HyperStudio is a tool for that, and the Mac has been an easy extension to the GS software.

Many people don't realize how very similar the GS and Mac toolbox programming (and user) environments are. If you know one, the transition to the other is easier. I WAS surprised however to discover that the Mac wasn't always "more powerful"! This isn't meant to be a pick-on-the-Mac evening, but I think Apple II users should know that they CAN take pride in their machine! For example, text fields on the Mac are 32K in size, and can have one background color. The GS is 64K, and we easily mix different background colors behind the text. The GS has something called "TaskMaster" that handles all kinds of events for the programmer. On the
Mac this has to be re-created by each programmer. The GS text items have lots of neat "automatic" features relating to the Apple & Option keys; the Mac doesn't. It just is easy to forget that the GS OS was designed AFTER the Mac, and many improvements in the operating system were made to make life easier and more productive.

<TARA> What are your newest products and what response are they getting?

<ROGER.WAGNER> HyperStudio on the Mac came out last May, and has been doing very well. We are also selling HyperStudio back to installations that didn't know what their GS machines could do until they saw it on the Mac! :) It has taken a lot of my energy to get this new product out, so some other things are still in the "oven", but we've been working on some other projects as well. Mainly in the area of things that tie into multimedia, though. A "HyperStudio Companion" product. More Clip-Art volumes.

<TARA> Aren't you now working with one of your old competitors Mike Westerfield? :)

<ROGER.WAGNER> That's true! I didn't think that there were competitors in the Apple II world, just co-players! :)

<TARA> True enough!

<ROGER.WAGNER> Mike has developed HyperLogo for HyperStudio on the Mac, and that's built into the software. It should please Apple II people, who sometimes say things about the Apple II funding Mac stuff, that in THIS case, HyperStudio Mac has funded the development of HyperLogo, which in turn made possible 3D Logo for the GS! (Now available from Mike at ByteWorks!).

<TARA> Great! And as I said earlier..Mike will be here on the Show Monday Oct 25th!

Well, Roger this has been fun! In this part of the show we open up the format for Questions & Answers from our "audience". But before we do that, I'd like to introduce you to a group called the "HyperMediacs" and their founder -- FernoGuy.

<ROGER.WAGNER> Hi, FernoGuy!

<TARA> Here's The founder of HyperMediacs...FernoGuy!

< [FernoGuy] B.DUNST> Roger, have you heard of the Hypermediacs before?

<ROGER.WAGNER> Tell me about it!

< [FernoGuy] B.DUNST> Basically, we are just a bunch of guys dedicated to pushing HS3.1 to its limits. Just as the FTA pushed Merlin, we do the same with HS. It's truly an awesome media, and allows us much flexiblity.

<TARA> Sounds exciting!

< [FernoGuy] B.DUNST> We are in Category 13, Topic 4. Could you dispel a rumor for me?

<ROGER.WAGNER> I'm listening! :)
<[FernoGuy] B.DUNST> Are the rumors of Hyperstudio 4.0 true? Will we be seeing it before the end of the year?

<ROGER.WAGNER> Sounds like a rumor we'd rather un-dispel!

<[FernoGuy] B.DUNST> ooooo k,

<ROGER.WAGNER> However, although we ARE working on further changes to HyperStudio GS, just getting HS Mac 1.1 finished has kept me pretty busy! We have a policy of sending a free update out about six months after an initial product release, so that early buyers don't have to worry about paying for updates that just fix bugs! As I mentioned, we do have a HyperStudio Companion (GS) product in the works. I DO want to know more about what you're doing, though! It sounds very interesting!

<[FernoGuy] B.DUNST> Well, thanks. I've just come to introduce the group. Now I shall fade into the woodwork...

<TARA> Thanks FernoGuy! I'm taking the room out of listen only now...Please be orderly in your questions...one at a time...:) Room is now in the talk mode.

<TARA> Dean You wanted to say something?

<[Dean] A2.DEAN> Hey Roger, what's this rumor I hear about there being HyperStudio books in the works? :-)

<ROGER.WAGNER> Hey Dean! :) That's no rumor!

<[Dean] A2.DEAN> Why, tell us about it! O:-)

<ROGER.WAGNER> LOTS of publishers are scrambling to cash in on the HyperStudio BONANZA! :)

<TARA> Tim You had a question?

[] >Tim pi< [] T.BUCHHEIM> I have several...first, what exactly is the HS Companion?

<ROGER.WAGNER> HS Companion will be a collection of New Button Actions, Extras, new Transitions, and maybe even some clip-art and clip-sounds to add on to existing HyperStudio packages.

<TARA> Dean?

<[Dean] A2.DEAN> Will Addy the HyperDog be making an appearance on the IIgs?

<ROGER.WAGNER> Addy the HyperDog made her first appearance "in person" at the HyperFest in San Diego!

<[Too Obvious?] BILL.LYNN> You can get a HyperDog at Coney Island!

[] >Tim pi< [] T.BUCHHEIM> Second, can I still upgrade my 3.01 to 3.1 for free? I never got around to it... :)

<ROGER.WAGNER> (upgrades from 3.0 to 3.1 are free if you send back the disks; $10 if you just call the 800# (800 421 6526) and ask us to send
them).

<TARA> Thanks Roger...:)  Tony?

<[Tony] A2.TONY> I don't have a question, just a comment. Do you remember the Applesoft Toolbox Series? Of course you do :)  Well, I still have it, and occasionally look at it.

<[Dean] A2.DEAN> I just wondered if you'd be using Addy on the IIgs as well as on the Mac.

<ROGER.WAGNER> At some point, Addy may show up in the GS package. Depends on when we reprint the manuals.

<[Dean] A2.DEAN> Thanks Roger. :-)

<TARA> Anyone else?  Questions?

<TOM.W> yes

<TARA> OK, Tom.

<TOM.W> Roger, do you have a promo going out to people who have returned their warranty cards soon?

<ROGER.WAGNER> For the Mac version, everyone who registered gets the 1.1 update for free. We will also be sending out a new StudioWare Catalog sometime in the next few months (I hope!). HS Companion will be sometime next year.

<[Dean] A2.DEAN> We ought to get you to carry back issues of Studio City in your Neat HyperStuff catalog. :-)

<TOM.W> I see.

<TARA> Who else has a question?

<PROCION.INC> Me :)

<TARA> OK, Jawaid...

<PROCION.INC> Roger, do you need any more HS add-ons for the Companion? :)

<ROGER.WAGNER> Of course!  I'm always looking for more!  Anything worth doing is worth over-doing! :)

<TOM.W> Essential Roger.

<PROCION.INC> Anything in particular, or should I bug you in email? (:-)

<ROGER.WAGNER> Send me ideas e-mail. See the description of the HS Companion above for general categories.

<[] >Tim pi< [] T.BUCHHEIM> I guess I should read up on the {$NBA} directive in my Pascal manual..... :)  Maybe I could come up with something..

<TARA> Roger is such a wonderful human being...
<ROGER.WAGNER> :) 

<[] >Tim pi< [] T.BUCHHEIM> :) 

<TARA> ...and I use that term loosely...:) -- that he has agreed to give away a prize tonight! Right now my staff is checking who's eligible for the prize...

<[Too Obvious?] BILL.LYNN> You have staff? Tom, how did she get staff?

<TARA> And as soon as I have that info, I'll announce the winner...

<[Real Thing] RC.ELLEN> Don't ask, Bill. You DON'T want to know. Believe me.

<PROCYON.INC> Must be related to her Goddess powers.

<[] >Tim pi< [] T.BUCHHEIM> :) 

<TARA> It seems that Tim is tonight's winner! Congrats! Tim!

<[] >Tim pi< [] T.BUCHHEIM> Yeah!

<[Tony] A2.TONY> Yay Tim!

<[] >Tim pi< [] T.BUCHHEIM> What do I win?

<A2.SUSAN> Great Tim.

<TARA> You win the RWP product of your choice!

<[] >Tim pi< [] T.BUCHHEIM> great!

<TARA> Just send your mailing address to Roger and he'll see you get it! :)

<[] >Tim pi< [] T.BUCHHEIM> okay!

<TARA> Well we're almost out of time...for tonight's show. Thank you for being our guest on "A Walk on the Wild Side!", Roger! :)

<ROGER.WAGNER> I certainly want to say "thanks" for the invite!!!

<TARA> You're welcome!

<TARA> Thank all of you for being here. Thanks to Tony, Nate and Sloanie for their segments.

<[Tony] A2.TONY> Any time Tara :)

<TARA> Be sure and join us next week when we help Jerry Kindall, editor of II Alive celebrates his birthday, right here! 9 PM Eastern!

<TOM.W> Now that Nate's here, I gotta go. Nice tie, Roger.

<[] >Tim pi< [] T.BUCHHEIM> Thanks for such a great show!

<A2.SUSAN> Hey, you don't have to leave. We'll be returning to our regular
unstructured RTC's shortly, for another 2 hours yet.

<TARA> Yes anyone who cares to may stay and hang out..:

<PROCYON.INC> How about a Roger Wagner ASCII Tie contest? :)

<TARA> Roger, we appreciate you taking the time to visit..we'd love to have you stay if you could, and we understand if you need to run..:

<PROCYON.INC> Indeed :)  

<ROGER.WAGNER> I do have to go (dinner!) but thanks VERY much for the fun tonight!

<A2.SUSAN> Stop in any time Roger.

<TARA> You're welcome..Come back and visit soon!

<ROGER.WAGNER> Thanks everyone! Bye for now!

[**][**][**]

Tara Dillinger (GE Mail: TARA) is the resident Goddess of A2 and A2Pro. She hosts the only Apple II Online Talk Show -- "A Walk on the Wild Side with Tara & Co!" Monday Nights from 9-11 Eastern. She is also Interview Editor for II Alive.

[ATW]ACROSS THE WIRES

""""""""""""

By Gina E. Saikin
[A2.GENA]

>>> WORLDWIDE APPLE II USER GROUP <<<

THE WWUG IS THE BRAINCHILD OF... Lunatic E'Sex, conceived in a dorm room at Kfest, nurtured through the ensuing months, and finally coming to term on October 17, 1993 -- our first official meeting. GS.OZONEMAN and myself were volunteered for the task of officiating at the meeting, as we were the hosts for Bewitched, Bothered & Bewildered, which takes place on Sundays, a position we both consider an honor.

The concept behind WWUG is simple: we in the Apple II (A2) area of
GEnie realize the desperate need for support, and are aware that such support for the Apple II is waning. Alas, many Apple dealers when faced with an Apple II problem, have very little to no knowledge of how to solve it. Also, many folks have little to no access to user groups in their community, and are left frantically searching for answers. I remember when I first got my Apple in 1991, and I had a question about something (can't remember what now) and called Apple's hotline, and virtually no one knew anything about the IIe, and could offer me no assistance. The simple fact that the Apple User Group Connection has been dropped by Apple, and sent out a questionnaire disk in MAC format should speak volumes!

I'll have to add a little plus for Apple, Inc. in here -- their Apple Library User Group newsletter valiantly attempts to feature Apple II items of interest and software, even though it is fast becoming a MAC and MS-DOS world out there.

Recently, Tom Weishaar and Kent Fillmore combined minds, hearts and spirits together to create a corporation called Syndicomm, which will manage seven RT's here on GEnie -- MAC, MACPro, MAC-PS, A2, A2Pro, PPC and PPCpro, amongst other duties. An umbrella users group -- International Computer Owners Network was created to provide an umbrella organization for the users of the RT's, of which WWUG is a Special Interest Group (SIG).

The goal of the WWUG is to lend support in the Apple II community, create a sense of continuity amongst Apple II owners; hold monthly meetings where we will invite special speakers to tell us about important happenings in the Apple II world, software experts who will give product "demos" (explanations), and we may even be able to twist the arms of some our favorite Software authors to make an appearance! There are also long-range plans to create an online Consulting Network, via a topic in the Bulletin Board, wherein there would be specialists "on call" to answer your questions and help you initiate systems, set up a system and any other help you may desire.

How does one demo a program online? Obviously, due to the fact that we are online, and not in a meeting room, modifications have to be made. Essentially, the demonstrator will describe the program, the pros, cons, bugs and any other information deemed important, as well as explaining how the program can be used in the every day life of the user... be it a game or a productivity program.

What happens at a typical meeting? Usually, the meeting opens with introducing WWUG, it's philosophy and goals, and we can also during this time help any newcomer become at home in the RTC (get into split-screen chat, master some simple commands, etc.).

Then we lead into what's new in the Apple II world, where announcements of upcoming events are mentioned -- new products, new software, upcoming conferences and so on.

After we hear what's new, we then introduce the speaker or demonstrator, and afterwards, open the floor to questions about his/her speech or demonstration.

When our speakers are finished, and everyone has satisfied their curiosity about what was said, we open the floor to questions about hardware and software. At the end, we announce any special happenings here in A2 on GEnie.
We had our first formal meeting on Sunday, October 17, which was a rousing success! We had not one, but two special speakers -- Tom Weishaar, and Bryan Zak of Softdisk. Tom popped in just as I was introducing the WWUG and Syndicomm -- poor guy, he didn't have a chance... he was immediately pegged for an interview, and with his usual aplomb, fielded all the questions thrown at him.

Bryan Zak then proceeded to tell us all about Softdisk -- a magazine on disk that has all original programs; no public domain, shareware or freeware there. He gave us information on how to sign up and told us how we could submit articles -- he didn't promise he'd accept them -- but encouraged the attendees that they would be read and considered!

But, instead of just reading about the WWUG, why not come in some Sunday at 2 p.m. eastern? I think you will find that it a valuable experience, and well worth a two-hour chunk of your Sundays -- it's the 3rd Sunday of every month. Don't forget to stay online for the Bewitched, Bothered and Bewildered RTC which will continue on until 8 p.m. eastern.

You as readers, can help in this endeavor. In Category 3 of the Apple II Bulletin Board, is a new topic, #34, entitled "The World Wide User Group Mtg." Please post in here any suggestions, ideas and even critiques! Also, please post the following on your local BBSes!

[*][*][*]

You can attend the WorldWide Apple II User Group meeting, every third Sunday from 2:00 PM to 4:00 PM Eastern in the Apple II area on GENie (Keyword A2, Page 645).

To sign up for GENie, follow these simple steps:

1. With your computer and modem, dial 1-800-638-8369. In Canada, dial 1-800-387-8330.
2. When you connect, type HHH
3. The computer will respond with U#=
4. Type XTX99017,APPLE and press RETURN.
5. Now answer the questions and you will be able to use GENie the next working day. Be sure to have a credit card number or, in the U.S., a checking account number, when you sign up.

[*][*][*]

We plan to continue to widen WWUG's scope and plans as time goes on. We want to say to the world "The Apple II is not dead!". To paraphrase a Mark Twain, "The demise of the Apple II is greatly exaggerated"

Watch for our newsletter from each meeting, which will be a part of the GENieLamp, starting with December's issue!

[EOA]
In the first installment of this article I discussed the fact that an Apple II computer can do many of the things that the typical home user, educational institution, or small business owner would want to perform with his/her computer. We went over a number of examples of how "older technology" computers are able to produce results that will meet the requirements of most casual users. We also looked at a few examples of how "cutting-edge technology" computers are required for some situations.

This month I intend to discuss the availability of programs in the form of shareware, freeware, and do-it-yourself software. The usefulness of this type of program will be examined. We will also discuss the reasons why such software is more advanced on computer platforms that have been around for awhile. The last topic we will touch on deals with where to find all of this good software.

Is it Live or is it Memorex? One of the bad raps that has been handed down about shareware and freeware programs since their inception has been that you get what you pay for. Therefore, the conventional wisdom states that the software available for free, or nearly free, must be of poor quality and chock full of bugs. This is occasionally true, but many good software products find their origin as a package that was developed by an individual and distributed via shareware.

Many of the original ideas behind commercial products have found their first expression in the form of a freeware program that was widely accepted in the user community. There are many word processors, graphics packages, games, utilities, fonts, and other goodies that have appeared in the shareware market. In fact, many products would not be worth marketing by themselves on a commercial basis. There is just not enough value in a program to remind me of appointments that will cause me to spend money on a commercial software package. A shareware version that does what I want will easily garner a payment of $10 for the author.

Another advantage to shareware packages is the ability to try software before you buy. People will likely take advantage of this feature by not coughing up the payment asked for in the shareware banner. However, the customers that do pay for a package are very likely to be happy customers that will use word-of-mouth to advertise the shareware product. This type of customer base is extremely important for a successful entry into the crowded software market.

The fact that many shareware products are of such high quality prompts the question, When should a person buy commercial software and when should one buy a shareware package? The answer is simple: Look for shareware first and then purchase commercial software that meets a special need or has the support that you just cannot find in a shareware package.
The thing that is most interesting about shareware and freeware is that the longer a computer platform is around, the better this type of product becomes. In other words, higher quality/low cost software abounds on the Apple II computer mostly because of the fact that it has been on the market for 15 years. This fact is attributable to a number of factors: tools, example code, and "weekend programmers".

One of the simple facts about computers is that complex software takes quite a while to write and debug. It is not an overnight process to create a development system that allows other software to be written in a timely manner. The GS/OS operating system that makes the Apple IIGs perform much like a Mac is not the product of a few weeks of effort. It is important to realize the amount of time that was spent making this operating system available.

In much the same sense you can look at the ORCA development environment and see that it is a much more productive environment than the alternatives preceding it. I can write, debug, and test a program much faster than I ever could prior to obtaining this environment. The result is more productive programmers and greater quality/quantity software output.

The next piece in this puzzle involves the "weekend programmer". Many people will sit down and use their computer with commercial software to begin with. After awhile, they want a package that will do exactly what they want it to do. They will scratch their heads and think, "Hey, didn't I get an Applesoft manual with this computer?" The next thing that you know, these people are joining the thousands before them who share their software with the general public.

When you get a raft of "weekend programmers" started on their own software and let them go at it for 15 years, the result is bound to be a number of good programs that never get distributed commercially. Some of this software is, nonetheless, quite good. The beneficiary of this logical series of events is the general public (you and me) who will take these packages and put them to good use on their personal computers.

Added to this generally encouraging environment is the availability of example code. Very few people write a program from scratch. They are much more likely to take code from other programs and put it together to make a new and unique product. Therefore, it is important to have example code lying around in archives for all of these hordes of programmers to get ideas and answers.

An even better situation is the fact that Apple system software has a great number of software toolsets available to programs running under GS/OS. You can think of the toolsets as a group of subroutines that perform most of the more difficult and tedious tasks in an efficient manner. This makes life much easier for the novice programmer. All that is necessary to create a fairly complete program is a set of calls to the various toolsets from a master routine that performs the major functions.

If you want an example of the theory that I have expressed here in action, then take a look at the IBM software market right after that machine was introduced. For many years, Apple Computer crowed about the fact that thousands of software titles existed for the Apple II computer. They contrasted this fact with the dearth of software available for the
fledgling IBM computer. It took a number of years and a tremendous amount of effort on the part of tool manufacturers and "weekend programmers" before the IBM/clone shareware market surpassed that of the Apple II.

Finding Your Local Wine-cellar    We now have enough information to answer the riddle that I posed at the end of last month's installation: "How is Apple II shareware like a fine wine?" The answer is: "It gets better with age!" We have shown that many vital links in the software development chain have been forged by Apple, Inc. and various programmers in the past. Therefore, current Apple II owners benefit by having a very mature base of free and nearly free software available at their fingertips.

The question before us now is how to get that software for our own use. There are a number of viable methods for obtaining freeware and shareware. One of the easiest methods involves nothing more than a modem and an account on GEnie. The GEnie system has one of the best (perhaps THE best) software distribution and support networks for the Apple II series of computers. You can use one of two automated front-end software packages to access the system and download thousands of different programs written specifically for your computer. GEM and Copilot, the front-end software mentioned above, are even free of charge. GEnie tries to make filling your hard drive with software as easy as possible.

There are other methods available for obtaining software. Local user groups are a good choice since they also provide immediate support from other computer users just like yourself. Public domain and shareware distribution companies are another source of this type of software. They provide disks full of software for a fee. The fee pays for material, overhead and shipping. I do not usually recommend this method of procuring software. I find that the fees are usually too high to justify going this route. However, many individuals find one of these methods to be right for them.

In any case, the most important thing is for each Apple II user to be aware of the software that is available for the cost of a phone call, gas to a user group meeting, or copy/distribution fee. There is literally a world of material ready and waiting for you to tap into it. Don't be discouraged that your Apple IIgs computer is no longer the latest and greatest hardware technology. Instead, realize that the blessing in this situation lies in the fact that so much software is available for your use. New computers do not have this benefit. Only time can provide the tools, examples, and effort necessary to amass this vast array of useful software.

The next time that someone tells you that you are using a computer that is based on outdated technology, simply smile and say, "Yes, and that is what I like about my trusty Apple II computer."

Darrel Raines is an Electrical Engineer who works as a contractor to NASA on the Space Station Freedom program. He runs a small business on the side that deals in custom computer systems and software. He is also an avid computer hobbyist, programmer and writer. You may reach him on GEnie at D.RAINES.
"I called Merisel (4 billion in wholesales last year, and / 
only number 2) and ordered an IDE 240 meg drive today; the / 
sales lady sez, "let me see if we have any; we are / 
discouraging small drives." I asked here what was / 
considered a small drive; response: "Anything under 500." / 

****** A PLEA FROM THE APPLE II HISTORIAN ******

I've been looking high and low for a copy of a particular book that I WISH I'd bought years ago when it came out. It is called _Fire In The Valley_ by Paul Freiberger, and subtitled, "The making of the personal computer. It is copyright 1984, but is now out of print and so no bookstores that I've called can order it for me.

Anyone who wants to sell me their copy of this book, PLEASE contact me! On GEnie, you can reach me at S.WEYHRICH, or via the Internet, at s.weyhrich@genie.geis.com. Thank you!

APPLE PASCAL  Applesoft was easy to use because it was interactive. You entered a command, and could immediately try it out. The disadvantage was a lack of more powerful commands, and it could be difficult to create large and complex programs. Efforts were begun within Apple to develop a more comprehensive language for the II, one that could be updated and modified if necessary. Since Applesoft was in ROM, it was more expensive and difficult for the end-user to install any upgrades to that language.

In 1979 Apple Pascal and the Language System was released. It sold for the steep price of $495, and came on four 5.25 floppy disks (all in the format of the Pascal disk system, of course). It also included the ROMs to change 13 sector disk controllers into 16 sector controllers, and the Language Card to plug into slot 0. As discussed in previous segments of this History, the Language Card was a 16K RAM card that made an Apple II into a full 64K RAM computer. Because of the extra available RAM, the Pascal system could load into memory without having to avoid the space used.
Apple II Computer Info

by the Applesoft (or Integer BASIC) interpreter. And with some complicated
bank switching, even routines in the Monitor could be used if needed.

Apple chose to use the Pascal standard defined by the University of
California at San Diego (UCSD). To make portability between various
different computers possible, UCSD Pascal programs were compiled into a
specialized code called "P-code". This "P-code" program could then be
executed on any computer that had a proper interpreter. An Apple Pascal
program could, then, run a little faster than an Applesoft program (since
it WAS compiled), but not as fast as assembly language. The extra power it
provided made it an attractive choice for some programmers.

The earliest version of Apple Pascal got complaints from users because
it would not support lowercase (for those who had modified their Apple to
display lowercase), and it was so large that it was quite awkward to use by
those who owned only one disk drive.

Since the original UCSD Pascal language was designed to work with a
full 80 columns of text, this was somewhat of a problem for the 40-column
Apple II. For those Apple II's that did not have an 80-column card, Apple
Pascal would display half of the screen at a time. In the Pascal Editor,
entry of a line longer than 40 columns would cause the screen to scroll to
the left. Using the arrow keys to move back to the left would scroll the
screen back the other way. If needed, you could jump directly to the other
half of the screen by pressing Ctrl-A.<1>

The limitation of Apple Pascal came from the need for a user to own
the Language Card (or one of the later equivalent 16K RAM cards), and the
fact that it was incompatible with the large library of DOS 3.2 programs
and files that were already available. Eventually, with the proliferation
of the 64K Apple IIe and 128K Apple IIc, a platform for Pascal applications
was available. However, by that time the primary disk system being
promoted by Apple for the II was ProDOS, and Apple never officially
released a version of their original UCSD Pascal that would run under that
operating system.

The Apple Pascal system has evolved up to version 1.3, which will
support the more advanced features of the Apple IIe and IIc, but does not
work as well with the IIGS as some would like. Instead, IIGS programmers
now have versions of Pascal distributed by third party companies (like
ORCA/Pascal from ByteWorks) created to take full advantage of that machine
in 16-bit mode.

INSTANT PASCAL This version of Pascal was written by Think Technologies,
and Apple later bought the rights to sell it as a program
for teaching Pascal. It would run only on the Apple IIC or on a 128K IIe
because it used the double hi-res graphics mode, functioning much like a
Macintosh "desktop" with multiple resizable windows. It had a mouse-based
editor that checked program syntax as each line was entered (as did the
older Integer BASIC) and automatically indented lines and boldfaced Pascal
reserved words. Since it was intended for teaching, it also had a
single-step trace function and the ability to modify the contents of
variables while a program was running. Though good for learning the
language, it was quite slow because of the overhead needed to display
everything in graphics, and because it was an interpreted version of Pascal
(instead of a compiled version).

Fans of the original Apple Pascal complained loudly after Apple
Apple II Computer Info

introduced Instant Pascal. After this new Pascal came out, Apple didn't seem motivated to make any further upgrades to the older Pascal, which still used the original Pascal disk system format (Instant Pascal was made to run directly under ProDOS).<2>

FORTRAN  Released by Apple in 1980, Apple FORTRAN ran under the Pascal operating system. It cost $200 (over and above the $495 needed to get the Language System). Programs written in FORTRAN for other computers could run with little modification under Apple FORTRAN (if a user needed that ability). As a compiled language, it ran faster than Applesoft, and probably also faster than Pascal, since FORTRAN wasn't translated into an intermediate "P-code." Apple's FORTRAN had many bugs in it, though, and since its introduction in 1980 it was never upgraded. By September 1986 it had disappeared from their product catalogs.

Another way for an Apple II user to get FORTRAN was to buy the Microsoft Z-80 Softcard for $345 and Microsoft FORTRAN for $200. This version of FORTRAN was more full-featured than Apple's, and offered some advantages in usability. It did NOT require changing to the 16 sector disk controller ROMs (if you didn't want to). Also, standard Microsoft BASIC (which was more advanced than Applesoft) was included in the Softcard package.<3>

In June of 1987 Pecan Software released FORTRAN for the IIGS. It ran under ProDOS 16 (GS/OS), but still used the UCSD format for its FORTRAN by creating a ProDOS file that acted as a UCSD volume.<3>

OTHER LANGUAGES  PILOT: Designed primarily for creating tutorial modules, this language allowed educators to design interactive programs to instruct students and test them on their responses during the process. One early version was written in Applesoft and was text-based. Apple later released their own version that ran under the Pascal system for $125.<4>

FORTH: This was an interesting language described as "extensible." It had a number of built-in commands, and new ones could be added as easily as typing its definition. These added commands could then be used in larger programs. Two versions sold in the late 1970's were "Apple Forth 1.6" (Cap'n Software) and "6502 Forth 1.2" (Programma International). Apple Forth 1.6 was a good package, but it used a unique disk system that was not compatible with DOS 3.2. Programma's Forth was more extensive, but also more complicated.<5>,<6>

LOGO: Developed from LISP (LISt Processing) language to be an aid for learning, Logo has been popular over the years in the school environment. Apple's first version of Logo (which operated under the Pascal system) could run on any 64K Apple II, while Apple Logo II (released in July 1984 for $100) ran under ProDOS on Apple II's with 128K memory.<7>

COBOL: This language has had limited availability for the Apple II. The only version I am aware of was from Microsoft. It sold for $599 and ran under the CP/M system with the Microsoft Z-80 Softcard.<8>

C: A language that is currently popular among "power" programmers. It has some of the structure of Pascal, but also some of the low-level power of assembly language.

ASSEMBLERS A large variety of Apple II assemblers have been available
over the years. The earliest one, of course, was the mini-assembler that came with every Integer BASIC Apple II. That one was only good for immediate entry of assembly code; if changes were needed, much of the code would likely have to be re-entered from the beginning. Some other assemblers available in the early days include:

TED/ASM: Developed at Apple and smuggled out the doors around May 1978, this assembler had memory conflicts with DOS, so they couldn't be used together. The text editor module was written by Randy Wigginton, and the assembler was written by Gary Shannon. In the early days, it was the only assembler they had available that would run on an Apple II.<9>

RANDY'S WEEKEND ASSEMBLER: Also written by Randy Wigginton, this one slipped out of Apple in September 1978. The text editor was written mostly in SWEET-16 (Wozniak's 16-bit emulator in the Integer BASIC ROM), and was therefore slow. Unfortunately, it had its own set of bugs.<9>

MICROPRODUCTS ASSEMBLER: The first commercially available assembler for the Apple II, this was a "four character assembler", meaning that labels (a designation identifying a line or variable) could only be four characters long. Later it was expanded to work with six character labels. Despite some annoying bugs, it was inexpensive at only $39.95.<10>

SC-ASSEMBLER II: Probably the second Apple II assembler that was commercially distributed. Externally it was similar to the Microproducts assembler, but was better supported and regularly upgraded. It was very compact, and achieved that goal by making heavy use of SWEET-16 code. Consequently, it was slow when assembling. The author, Bob Sander-Cederlof, later started a popular newsletter called "Apple Assembly Lines" to both support his product and to be an information center for 6502 assembly language tips and techniques.<10>

BIG MAC/MERLIN: Sold originally by A.P.P.L.E. as "Big Mac", and later under the name "Merlin" by Southwestern Data Systems (later known as Roger Wagner Publishing). This assembler has been well supported over the years and has been extensively upgraded. It is one of the few remaining assemblers that have moved on to the 65816 GS/OS world, while retaining full compatibility with the previous 8-bit 6502 versions. Currently it is sold as Merlin 816 (including an 8-bit version) and Merlin 16+. The author, Glen Bredon, has also done many other programs and utilities for the Apple II.

ORCA/M: Sold by the ByteWorks, the current version was chosen by Apple Computer as the official assembler of the APW (Apple Programmer's Workshop) programming environment on the IIGS. ByteWorks has since expanded its product line to include versions of Pascal, C, BASIC, and other IIGS languages.

APPLE EDASM: This was Apple's original "official" assembler for the II Plus and later 8-bit Apple II's. Though no longer actively supported (ORCA/M having supplanted it in the APW environment), the early versions for DOS 3.3 were included on the Apple Toolkit disk, which also had a hi-res character generator that could be interfaced into Applesoft programs. The early ProDOS versions of EDASM were sold with a 65c02 debugger called BUGBYTE.

UCSD PASCAL ASSEMBLER: Part of the Apple Pascal package, it was popular because it had macro capability, could do conditional assembly and
create relocatable code, and had a good text editor. However, programs created with it could not be run on a standard (non-Language card) Apple, because there was no utility available early on to transfer the files to DOS 3.2. (Later, A.P.P.L.E. published transfer utilities called "HUFFIN" and "PUFFIN" for movement to and from DOS 3.3, named affectionately after Apple's "MUFFIN" utility for DOS 3.2 to 3.3 file transfers).

MISCELLANEOUS OTHER ASSEMBLERS: ASM/65, sold by Programma; "EAT" (Edit and Assemble Text) sold by Software Concepts, and written in Integer BASIC; and L.I.S.A., sold by Laser Systems.<10>

MACROS VS. SCRIPTS With the increase in complexity of applications programs has also come a secondary level of programming. This extension has been called a "macro," meaning that a single step would accomplish several separate ones that would ordinarily take more effort. Early examples of this were available in some DOS 3.3 utilities, where pressing Ctrl-C from the keyboard (for example) might cause the word "CATALOG" to appear on the command line. In this example, a macro was used to save keystrokes and speed up repetitive activities. Similar macros were available for BASIC programmers, making a control key sequence print many of the common BASIC keywords, speeding program entry. (This type of macro was different from macros used in some assemblers, such as Big Mac/Merlin and the Pascal assembler. Here a "macro" was a new command that was defined to represent several standard assembly operation codes. This did not shorten the final resulting program, but made it possible to more easily enter repeated sequences of assembly codes).

Application programs began to take this concept and include a macro capability (either offered with the program or as a third-party add-on product). With time, some of these macro features have become so complex that they have become programming languages in their own right. In fact, many of them are being referred to as "scripting" languages, since they "direct" the function of a program, as a director uses a script to film a movie. This has been most popular with telecommunications programs, where the process of logging on to a remote computer, downloading new messages, and uploading replies is automated with a script that analyzes the responses from the other computer and takes the appropriate action. It has also been popular in programs like Applewriter (WPL, Word Processing Language) and AppleWorks (UltraMacros), where each has had its own method of automating repetitive tasks.

A LEAP IN COMPLEXITY The environment for writing, compiling, and debugging programs has evolved along with the applications created by those programs. Originally, the Apple II and other computers of the day were used in a "command-line interface" environment. This means that each command was typed one at a time, and sometimes "batched" together to simplify a repetitive process (as with EXEC files under Apple DOS). An example of this command-line interface can be found by starting up Applesoft (or by using MS-DOS on an IBM). Anything that is to be done with this language has to be started by typing the proper command from the keyboard. Misspell the word "LOAD", and an error message is printed and it will stubbornly refuse to do what you wanted. The same command line is used for entering the lines of a BASIC program, or RUNning the program. This method was used because it was what programmers of the day were accustomed to. Nearly every computer prior to the microcomputer revolution worked in the same way, even if it was done using punched cards instead of being typed at a keyboard.
Minor differences were used from time to time in different computer languages, but none really took effect and changed the way in which people used computers until the release of the Macintosh in 1984. Macintosh used a radically different method of operating a computer. Instead of typing each command, the user would point to something on the screen and "click" on it using the mouse pointing device. Macintosh programmers extended this concept to every application released with it. This different environment has been called a "graphic user interface" (GUI), and uses the concept of objects rather than typed commands. To delete a file, you don't type "DELETE PROGRAM," but point to the picture (icon) representing the file and drag it onto a picture of a trash can. This "desktop" includes more complex commands chosen from menus that appear in boxes called "windows" that pull down like a window shade from command category names on a "menu bar."

As the command line disappeared, so did traditional methods of handling program data. Words were still typed into a document on a word processing program, but many of the features that set up margins, tabs, and page breaks were translated into graphic icons selected with the mouse. Eventually this progressed into the world of the programmer. The text of a computer program was entered much like any word processor text, and the command to compile it into an executable program was now selected from the menu bar at the top of the screen.

A step further along this path is the concept of "object-oriented programming" (OOP). In this method, the details of windows, menu bars, buttons, and other GUI standards are used to create other programs that use a consistent interface. Instead of having to laboriously define at the byte level how to create a window box, the computer already knows how to do this; the programmer just has to tell the computer how big it should be and where to place it on the screen. OOP programming allows smaller modules (called "objects") to be used to build a more complex final product. A language that works in an OOP environment is finally available on an Apple II, but before we get to it, a little more introduction is necessary.

HYPERTEXT "Hypertext" is a term created by COMPUTER LIB author Ted Nelson that refers to a method of allowing a user to move from one concept to another in a text by linking the two concepts together.<11> The first type of program that used "hypertext" was a simple text-based one. Certain words in the text of a document being viewed were marked to indicate that other information about that word was available elsewhere. Moving a cursor to that word and pressing a key would jump to the additional facts. For example, in an article about the history of music, the word "sonata" might be highlighted. Selecting this word could jump to another article that discusses sonatas in greater detail. When finished, the user could jump back over this link to the place he left in the original article.

"Tutor-Tech" was the first comprehensive hypertext system available for the Apple II series. It worked on 8-bit Apple II's, and was designed primarily for use in a classroom setting. Entirely graphics-based, it defined certain parts of the screen as "buttons", and moving the pointer to that area could allow the program to move to a different screen or cause something else to happen. As with any graphic interface, icons that represented certain functions were used to designate commands (i.e., to exit the program, you pointed to a picture of door labeled "EXIT").

In 1986 a remarkable program became available on the Macintosh that
Apple II Computer Info

was, for a time, included with each Mac sold. "HyperCard" was a comprehensive system that used the idea of hypertext, plus added a programming language that consisted of words and phrases as close to English as anything else previously available on a microcomputer. The HyperCard system took care of the details of how to draw boxes and buttons, and left it to the user to define where to put them and how to label them. And because of the language (which Apple called "HyperTalk"), user actions could do more than just move to a different picture (called a "card" by the program). It was possible to design simple databases, games, and much more using this system. Because it called a single part of an application a "card", a collection of cards comprising an entire HyperCard application was called a "stack".

With the release of the IIGS, the power was finally available in the Apple II world to create a similar product. But it didn't come first from Apple Computer; instead, Roger Wagner Publishing introduced a product called "HyperStudio" in May of 1989. This program used the super hi-res graphics modes accessible on the IIGS to create its own type of stacks. Like HyperCard on the Macintosh, HyperStudio used buttons and objects on the screen to direct movement through a stack application. It also included a hardware card that made it possible to easily digitize sounds to use in stacks. Though more extensive than Tutor-Tech, it was not quite as flexible as HyperCard, since it lacked a true programming language.

In January 1991, Apple released HyperCard IIGS, a conversion of the Macintosh product. This finally made a fully programmable hypermedia environment possible on the IIGS. Later in the year Roger Wagner Publishing responded with an updated version of HyperStudio that also included a programming language similar to HyperText that afforded more control over that stacks that were created. Although neither of these products gives the user power over details of the computer system itself (as does "C" or assembly), it does make it possible for a beginner to create programs that have outstanding graphics and sound without having to know exactly how the hardware produces these effects. This, along with the flexibility possible with these products, has led Dennis Doms in an A2-Central feature article to suggest that HyperCard IIGS (and now also possibly HyperStudio) will become the "Applesoft" of the 1990's; that is, an Apple IIGS user with HyperCard IIGS can create programs as easily as the Applesoft programmer of 1980 could do, but with far more attractive results.<11>

<6> Cap'n Software's version was written by John Draper, the legendary phone phreaker "Cap'n Crunch" who had worked at Apple in its early days. During his time at Apple he had designed one of the first peripheral cards for the Apple II: A telephone controlling device that also just happened to be capable of hacking into long distance telephone switching systems, and was therefore quite illegal.

  OR jpeters@sosi.com

- Our Internet anonymous FTP address is: sosi.com. All current versions of GENieLamp are available in the ~/pub/GENieLamp directory.

- Back issues of GENieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3

- GENieLamp pays for articles submitted and published with online GENie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP on Internet to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2

The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GENie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GENie prompt.

YOUR GEnieLamp Computing RoundTable RESOURCE!
READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index, you will find the following example:

HUMOR ONLINE ............ [HUM] [*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

[Name of sender] [CATegory] [TOPic] [Msg.#] [Page number]

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie  GEnie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GEnie Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. GEnie's non-prime time connect rate is $3.00. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014, DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

~ MERRY CHRISTMAS FROM THE STAFF OF GEnieLamp! ~

"First I have to find out what an eprom is. Is that a /
/ repair I have to do in a rented tux <g>?"

Making Ready for the Holiday Season

I love getting ready for the holiday season, provided I'm allowed to do it in my own time. By that I mean that I refuse to acknowledge the presence of wrapping paper in the supermarket the day after Hallowe'en, and all the other commercial exhortations to get in the holiday spirit several months before the event. That way, I enjoy the holiday all the more when it does finally arrive.

This year, my wife and I will be flying home for the holidays, which is pretty much the nicest gift I can think of. Not only will we have the chance to be with our families, who we've not seen since last year this time, but both of us will get a short respite from our daily duties at home. For instance, our hosts have no modem for their Apple IIgs, so I shan't be able to work on GEnieLamp over the holidays. Heh heh heh.

Maybe your family isn't actually composed of blood relations, but I do hope that you'll have a good holiday with them, whoever and wherever they are.

Welcoming A New Member To Our Family

I'm thoroughly delighted to announce
Apple II Computer Info

that GENieLamp A2 has added to its staff the A2 Goddess, Tara Dillinger. Tara is the new assistant editor, and will be in charge of our Apple II profiles -- the section of GENieLamp A2 that seems to draw the most praise and interest. Tara is by now an old hand at interviews, as every Monday night she conducts a live online talk show for the A2 RT: WOWS, A Walk on the Wild Side with Tara & Co.!

As WOWS fans already know, Tara is endearingly loopy, which means she should fit right in with the rest of the staff. Welcome, Tara! I'm so delighted by your joining the staff that I feel as though I'm getting an early present.

WELCOMING NEW WRITERS Just as exciting is the fact that submissions for GENieLamp A2 keep pouring in. Old-time GENieLamp A2 contributor Larry Faust has returned with his take on an inexpensive 14,400 baud modem, and Jay Curtis begins a new series on Apple II hybrids.

What's more, a few readers write me each month -- I wish it were more, but I mustn't be greedy -- to let me know how much they enjoy the magazine, or to make suggestions for improvements, or for articles. It's always great to hear from you!

We'll meet here again after the holidays. Just now, I have one or two family traditions to carry on... and nothing could make me happier.

Happy holidays to all our readers!

-- Doug Cuff

APPLE II USERS INDEPENDENT  I think, to an extent, part of the
"self-reliance" of Apple II folks is that a
lot of us started when the _only_ way to get help was from someone else
floundering with their new toy. This counted even most computer store
operators.

In 1990-81, things started changing as the market started exploding.
Hacker types were phased out at computer stores and slick company-
"trained"-in-technology types took over. The solution became more "here's
what we can sell you to fix that" rather than "here's how to fix that".

In many cases, the former answer (_buying_ the solution) is actually
the proper one these days. But it isn't _always_ the right answer. I
think many of the Mac and PC folks have "grown up" with the "if it isn't
off the shelf, it can't work" mindset (many of the PC folks coming from the
mainframe environment where this seems to be _THE_ mindset, but my recent
experiences on this are another story :) and don't think well any other
way. Most of the Apple II users who have stuck it out are probably some of
the same hard-core [sorry] users who started back in the Olde Days, or know
some who did and caught the bug.

Under stress, people fall back on what they know. :)
(WIZARDS.MUSE, CAT11, TOP10, MSG:230/M645;1)

TWO PRINTERS ON A SWITCH BOX  I'm having difficulty hooking up two
printers to my GS via a switch box.

Going from the printer port to an A-B switch box (mini-din 8 to
mini-din 8), then A to Imagewriter (md8-md8) and B to DeskJet 500 (md8-25).

What happens is NADA -- no response from either printer. Tested the
cables by hooking them up directly and they work. Using a switch box that
I have been using with my modem (with which it works just fine). So all
the individual components seem to be okay, but no printing.

What's the answer?

|   |   |
|   |   |

...Will  (W.NELKEN1, CAT12, TOP17, MSG:163/M645;1)

>>>>>> I had a similar problem, because I didn't know something very
"""""""" important about the cables. The standard GS to IW2 cable
"reverses" the connections between the two ends. Since I didn't know this,
I was trying to connect my GS to IW2 using two of these cables thru a
switch box, which "reversed" it one too many times.

---

Apple II Computer Documentation Resources (a2_docs_genielampl.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1097 of 1824
The solution is to buy a "straight thru" cable (which unfortunately looks just like a GS to IW2 cable) to go from your GS to switchbox. Then connect your standard cables from the switch box to printers. My cable has the following arrow symbol on it, which may be a standard (?):

<---
--->

If you tested ALL your cables separately and they all worked, this is your problem, since one of them (the "straight thru") should not have worked by itself.

I'm not sure why the modem works; maybe a modem is more flexible in it's connections.

APPLEWORKS DATABASE FIND AND REPLACE

Does Appleworks 4.0 have any feature that will replace all occurrences of a certain word in a certain field in all records of a database with another word? For example, I have a Category in which I often entered "None". Now I'd like to go thru and change those 400 "None"'s to "N/A". Is this possible with AW4, or even AW3?

(KEN.GAGNE, CAT42, TOP29, MSG:420/M645;1)

>>> Try putting this formula in the catagory. We'll assume the category is named socks.

@if([socks]="None","N/A",[socks])

Then OA-K the entire file

(W.CARVER1, CAT42, TOP29, MSG:431/M645;1)

>>> Nice trick, Bill -- wish I'd thought of that one. <g> Don't forget to remove the formula after recalcing the file.

(QUALITY, CAT42, TOP29, MSG:434/M645;1)

PROGRAMMER LEAVES SOFTDISK

I just wanted to say goodbye to everyone before I get busy and drop out of sight. I'll be around for the next week, but after that...

My last day at Softdisk is November 30. The next day I'll be heading for Seattle and a job with Ariel Publishing.

I'll be keeping my PUNKWARE account so contacting me via e-mail will still be possible, but after next week all Softdisk-related correspondence should be addressed to Bryan.

It's not only been educational, but immense fun as well. Thanks for everything.

APPLE II AND THE INTERNET

GET YOUR APPLE II

INFORMATION HERE!!!

Greetings, Apple II fans!

After much lurking about on A2 and A2Pro for the past few weeks, I
think I've finally worked up the confidence to tell you what I'm *really*
here for (besides bugging people in the RTC all night). ;-) I was
approached by Lunatic last month with an offer to become A2's and A2Pro's
official Internet Contact Person. My chief duties as the latest addition
to A2 staff will be to ensure that all Apple II-related files appearing on
the Internet are uploaded to the libraries on GEnie. As well, I am here to
answer any questions you have about the Internet as well as to provide
pointers on locating Apple II resources on the Internet.
A little personal background: I'm 22 years old (b. 1971) and in my graduating year at the University of Toronto. My specialty lies in the field of genetics and molecular biology. My future plans include graduate studies or medical school, whichever I can get. ;-) My addiction with personal computing started back in Grade 5 with a Commodore PET in the classroom and BASIC programming. A friend down the street had a mondo cool Apple ][+ with colour graphics -- that got me hooked on Apples. I *nearly* bought an original Mac 128 back in 1984, but decided to hold off for something with colour and a bigger screen. ;-) A few years later, in Grade 10, the Apple II GS appeared at a local dealer and I knew I *had* to get one. Well, six years later, I'm still using the same machine. :)

My first contact with the Internet was with Usenet, a giant "BBS" with several thousand "newsgroups" (like GEnie's RT's and categories) and over a million readers worldwide. One kind soul on a local BBS uploaded messages from comp.sys.apple2 (the main Apple II discussion area) once every couple of days so the rest of us could see what was going on in the mystical network. Like most people, my first hands-on experience was during my freshman year at university. I gradually learned the unwritten "netiquette" and at the same time discovered one of the great Apple II resources.

Today, I am the administrator of an Apple II FTP site, an online repository of files accessible by anyone in the world with FTP (File Transfer Protocol) on their system. Files uploaded to these FTP sites frequently do not find their way to GEnie. I intend to change that by logging all new file uploads and transferring them to the libraries here, confirming GEnie as the largest Apple II online resource.

The first thing I would like to do is set up a few topics specifically about the Internet in general and as it relates to the Apple II. I'm not sure where to start, so feel free to leave suggestions here for discussion. I would like one just for general Internet questions, but more technical matters would be best left to the Internet RT. Another topic could be "News from comp.sys.apple2", featuring excerpts and compilations of messages from Usenet. What does everyone think?

One last thing... I'd like to thank Lunatic and the rest of the A2/A2Pro staff for a nice welcome, especially A2.GEna and A2.Susan who were always helpful in the RTC with my "newbie" questions. :) I guess I'm not really a stranger here, since there are many, many names I recognize from my travels through the Internet. So before this turns into a total mush-fest, I'll sign off for now. :)

- Brian <taob@io.org, 90taobri@wave.scar.utoronto.ca, b.tao@genie.geis.com>

 COMPUTER DAY CAMP  NOTE: Don't worry. This isn't a request for money. I'm on to a good thing and want to share it.

For the last nine summers I have conducted a not-for-profit computer day camp for children in an "economically deprived" community. A public school is one of four major sponsors, and we use their facilities and three or four of their Apple //e's. Ten other computers are scrounged, mostly from the university where I teach. I donate my time, and another sponsor -- a treatment center for disturbed kids -- pays minimum wages to a recreation director and a crafts supervisor. This center also provides us
with a van. A local church lets us use a van as well.

We operate for eight to ten weeks each summer, depending upon how long school is out. Sometimes we run concurrently with school summer sessions. We bring children to the school from their homes each weekday for two weeks, feed them a snack on arrival and a hot lunch later, given them two hours in the computer room and another two hours at crafts and recreation before we take them home in the evening.

For a two-week camp we ask a donation from parents of $10 for the first child from a household and $5 each for any others, but jobs are scarce here, and we take in less than $500 altogether from the 120 to 150 kids who attend.

Computers are inherently inclusive, so we were able to include in the 1994 camp two children with severe visual handicaps, a boy in an orthopedic brace, three children who are institutionalized for emotional problems, and a mute autistic.

The four 2-week camps cost us less than $1000/week in out-of-pocket expenses, and the kids, their parents, and all the sponsors are ready to do it again in 1995.

My university has given me a one-year Sabbatical at half pay, and I am writing a book to tell potential sponsors in other communities how cheap and easy it is to run camps like this one.

I have my sponsors, and, as I said at the beginning, I'm not looking for handouts. I _would_ appreciate comments from others out there who are using computers to reach disadvantaged kids.

Thanks.

Eric Schonblom
(J.SCHONBLOM, CAT15, TOP17, MSG:1/M645;1)

DESK ACCESSORIES WHEN SHIFT-BOOTING? How can I activate specific CDA's or NDA's after shift-booting into the system?
-(Tim)-
(T.HOHS, CAT9, TOP5, MSG:234/M645;1)

To activate (install) specific NDA's or CDA's, you need to have a program such as Softdisk GS's InstantDA. Sorry, I'm not sure which issue(s) of Softdisk GS this is available on (I've seen it on several this year) You could probably ask over in Softdisks area and Bryan (or Jay or someone :) will let you know (yes, backissues are available:) There are probably a few other programs like this floating around but I'm not familiar with them.

-Harold

(Nope, IR (Init Reload) won't work, it's an INIT and thus wouldn't be loaded during a shift-boot sequence. I just know someone will mention it:-)

(H.HISLOP, CAT9, TOP5, MSG:235/M645;1)

>>> HOT TOPICS <<<

APPLEWORKS 4.0 SHIPS Yes, it did begin shipping November 1. So far we've
shipped about 3,000 copies. We tried to do it starting from the first date but we ran out of 5.25" disks at one point (we had plenty of NORMAL ones but for double-sided duplication our machines need special disks with two index holes). Since many of the first orders included both 5.25" disks and 3.5" disks, because we weren't asking which disk size you needed at first, some of those are still backordered.

We also have a few hundred orders with accessory products which are not yet available (but should be in a few days) -- the One-Touch Commands Disk and the Exploring AppleWorks 4 video. If you ordered AW4 and one of those two products, we are holding your order so it can all be shipped together. The delay should be a week at most and you'll still receive yours before the November 18 date stated in the last letter. (If you want us to split the order and ship your AW4 now, just call us and we'll be happy to do so, but it really won't be that much longer.)

...THEN APPLEWORKS 4.01 SHIPS

We've temporarily halted shipping on AW4 to fix a couple of minor bugs which early recipients have found. We will resume shipping on Monday 11/8 with Version 4.0.1. If your copy of AW4 has already been shipped, we will be sending you new disks on Monday.

Meanwhile, if you're having problems getting auto-save to work, hold tight. <g> (QUALITY, CAT42, TOP29, MSG:329/M645;1)

If you're having trouble with auto-save, just exit to Basic, set the prefix to your AppleWorks directory and type this in:

```
poke 768,118
bsave aplworks.system,TSYS,B$9A4,A768,L1
```

or with a disk editor, change +$9A4 in APLWORKS.SYSTEM from $56 to $76.

(BRANDT, CAT42, TOP29, MSG:335/M645;1)

Here is the status of 4.01. It is currently shipping out in all of the NEW packages of AppleWorks. Everyone who has already received 4.0 are on a list, and we even have mailing labels printed and ready to go.

However... our disk duplicators are running full speed 8 hours a day, and even now we are having trouble keeping our assembly line stocked. Fortunately, today we got a good start on making a literal mountain of 4.01 disks that should be a good start at filling all of the reshipments to those who received 4.0.

What this all mean to you is... There is no need to call, if you got AW 4.0 you will get 4.01 in the mail automatically. And, it should be shipping from here sometime next week.

Walker (W.ARCHER2, CAT42, TOP29, MSG:343/M645;1)

HOW TO MANUALLY UPDATE AW 4.0 TO 4.01

Gary, if you're running AW 4 and get AW 4.01, why use the installer? Why not just use the built-in file copy function and copy the changed files? (OA-A to arrange by date, grab the new ones and go.) You really only need to copy APLWORKS.SYSTEM, SEG.DB, SEG.DR, SEG.SS and SEG.WP. Get the MAIN.DICTIONARY now from AW 3 and you won't have to worry about it.
later.

(BRANDT, CAT42, TOP29, MSG:306/M645;1)

<<<< I forgot a couple of files. You should also copy SEG.AW and SEG.UM. Then if you have SideSpread, you should run the Updater on that, and if you’re using any of the TimeOut apps on the disk, get the latest versions of those. Anyway, there’s nothing magical about the installation, so you can look at file dates and copy files manually.

(BRANDT, CAT42, TOP29, MSG:307/M645;1)

<<<< re: Standard Settings

All info ever saved by AppleWorks is stored in SEG.ER. No other files are ever changed. If you want, you can delete your current setup after copying SEG.ER to a save place, reinstall AW4 using the installer, then copy SEG.ER back and you’re in business.

(BRANDT, CAT42, TOP29, MSG:349/M645;1)

AW 4 DESKJET GLITCH STOMPED Thanks entirely to Tom Smith (T.SMITH52), I’ve solved the DeskJet proportional problem with clovers despite not having a DeskJet myself. Despite being unable to test it, I guarantee this patch will solve the problem. From Basic, with your Printers disk in the drive, type the following:

POKE 768,15
BSAVE SEG.PR,A768,B$F9E,L1

Now reinstall the DeskJet drivers so they get plugged into your SEG.ER. BlockWarden and other disk edit folks can change offset +$F9E in SEG.PR from $11 to $0F.

>>> JFK

I have nothing to do with ReportWriter, but I can tell you Dan Verkade is working on it and hopes to have it ready by early December.

(BRANDT, CAT42, TOP29, MSG:400/M645;1)

SIDESPREAD BUG IN AW 4 Has anyone besides me encountered a Timeout problem with AW4? I have installed TO SS, updated it with Timeout Updater, and the following, limited problem occurs. Everything works just fine when printing in Draft or Standard quality, but when trying to print in High quality, it bombs out (to the monitor) after printing just a few lines. High quality only, mind you. (I need high quality, my eyes not being what they once were, you see. :))

Thanks for any comments or help.

*******
* Tom G *
*******

(T.GROHNE1, CAT42, TOP29, MSG:150/M645;1)

>>>>> Tom, a similar problem with TO.SIDESPREAD was reported to Randy by me on 5 November. Randy says that Dan was able to duplicate that problem. In my case, the SideSpread bombed out after printing one or two columns, IN REDUCED PRINT MODE. Yesterday I noticed that the same problem occurred when using High quality. (My eyes, too, ain’t what they used ot be :)).
I assume that AW4.0.1 will fix this problem, since Randy mentioned last week that the Updater will need to be run again for SIDESPREAD when 4.0.1 is received; apparently something has been done to the updater...

You ain't alone -- it's just that not too many people seem to be using SideSpread, or else they haven't been working it out with AW4.0. See ya.

Dave Mattis (D.MATTIS@GENie.geis.com) burping turkey in Florida
(D.MATTIS, CAT42, TOP29, MSG:151/M645;1)

>>> Dave and Tom G, I assume Dan's SideSpread repair in AW 4.01 solves """" the high quality as well as reduced mode problems, because they both sound like the same problem. Now you just need 4.01 and you should be set. (BRANDT, CAT42, TOP29, MSG:152/M645;1)

BUG IN AW 4 DATABASE REPORTS To duplicate try this.

Set up a data base.
Set up a report with only two categories.
Put the cursor on the second category and hit OA-A to arrange.

With me the second category is not the one I'm asked if I want to arrange on!

The work around is to have a blank category in the data base and then choose sort on several categories. That way I can get the list of categories and get it to work correctly. (D.MCKEE3, CAT42, TOP29, MSG:412/M645;1)

>>> David, after a bit more checking, I found the problem only occurs """" on the last category in the file. The correct name shows up as the default category any time you're not on the last category. (BRANDT, CAT42, TOP29, MSG:415/M645;1)

HOW TO RECOMPILE AW 4 DEFAULT MACROS I'm having problems trying to decompile the default macros for AW 4.0. The second macro, ba-[], decompiles in part to this:

BEGIN:
$1=.AWPath::
$1=left $1,65535+$ $117 :
left oa-tab>0<savescr:
IF Z=0 sa_: RPT ENDIF:

Obviously, this does not re-compile properly.

Can you post the actual source for that macro? I'd like to change the message in this macro about "Default macros installed", but cannot do so if it won't compile. Thanks!

Steve Weyhrich <IX0YE>---< (S.WEYHRICH, CAT42, TOP29, MSG:218/M645;1)
Steve, why don't you just get the source file for the default set from the sample files disk and compile that, instead of trying to de-compile the default set?  

(QUALITY, CAT42, TOP29, MSG:219/M645;1)

AW 4 TRIPLE DESKTOPS How do I add files to the 2nd and 3rd desktop when the 1st desktop is full? All I get the message "Desktop full" and I can't switch desktops in any way then. The manual tells about that neither.

Udo - ... just a IIGS freak -  
(U.HUTH, CAT42, TOP29, MSG:221/M645;1)

The normal meaning for "desktop full" is that all memory has been used up. There's only one memory pool, so there's no way to use a second desktop index in that case. If you are referring to the index being full (that is, there are 12 files on the desktop), then you can use any of the available commands to switch to another desktop index and add more files.

(BRANDT, CAT42, TOP29, MSG:229/M645;1)

AW 4 DICTIONARY PROBLEM I'm experiencing a glitch with the AppleWorks 4 main dictionary: it doesn't seem to know words occurring alphabetically between approximately for* and foss*. Can anyone out there duplicate this? Please try "forte forth fortieth fortification fortify fortissimo fortitude fortnight fortnightly Fortran fortress fortunate fortune forty forum forward". I can't get AW4 to recognize any of these!

I'd simply replace the AppleWorks 3.0 MAIN.DICTIONARY file, but I notice that the new version is some 7 blocks larger....

Doug Cuff  
Editor, GENieLamp A2  
(EDITOR.A2, CAT42, TOP29, MSG:273/M645;1)

Doug, there's no difference between AW 3 and AW 4 regarding spell checking. None of the code has been modified. The exact same dictionary files were supposed to be used, but you're right about the 7-block difference. I have no idea what happened there, but there must have been some sort of copy error, since there is no alternate dictionary version. Copy your AW 3 main dictionary file and use it.

(BRANDT, CAT42, TOP29, MSG:274/M645;1)

Was your AppleWorks 3.0 installed from 5.25" disks? If so, that's the reason the the AW4 dictionary is larger. The 5.25" version is truncated to allow it to fit on a 5.25" disk.

Quality Computers --- Power for performance  
(W.CARVER1, CAT42, TOP29, MSG:275/M645;1)

Bill, the problem is that something went wrong when the 3.5" master was created. Was your malfunctioning drive involved by any chance?  
Anyway, somehow the dictionary file was slightly damaged, somehow becoming 7 blocks longer, yet dropping words in the for* to fos* range. In any case, the AW 3 MAIN.DICTIONARY file can be copied over and all is well.

(BRANDT, CAT42, TOP29, MSG:278/M645;1)
AW 4.0 TIMEOUT BUG FIXED IN 4.01

I have had AW4 about 3 weeks now and no problems at all. Today I received the "One Touch" disk and copied all the new TO Apps to my Timeout dir. That gave me exactly 30 TO apps in it.

I booted AW4 and it loaded the TO apps O.K, apparently but put me in the "Unable to find Timeout..." I hit "try again" and it appeared to load O.K. but left me in the "add files " screen instead of the Main Menu. I hit ESC and into the Main menu, then OA Esc to the Timeout menu and only 29 had loaded.

The computer would "crash" HARD if when I did the following: Hit TAB for TO menu 2, when I used the TO calculator and hit the space bar to exit and when I went into the TO Util and tried to change memory status. The Calculator would work alright but crashed on space-bar exit.

If I reduced the number of TO apps to 28 everything works great, no problems. The manual says you can have all the TO apps you want in the TIMEOUT directory and AW4 would make more than 1 menu. It also says a single menu would hold 30 applications.

I don't have a DeskJet printer so eliminated those 2 applications but what happens when I add more from either your second disk or another disk?

See if you can duplicate this phenomenon! ;-)

SMALL BUG IN AW 4 SPREADSHEET

I think I have found a bug in the spreadsheet sheet. I have seen it a few times before but I could not repeat it. I fond a way to repeat it.

1> Open a spreadsheet.
2> Set OA-V value format to DATE.
3> Put a number in a cell (Not today's date).
4> With the cursor on that cell type "@" and press an arrow -> key. The value in the cell will not be changed.
5> Move cursor to a blank cell.
6> Type "@" arrow-key. The value from the first cell is entered here, not today's date.

There is no problem if you press ENTER then press the arrow-key to move. Typing @ "RETURN" will always enter today's date.

Tom.
Thanks for the SS bug report. Dan will look into it. Obviously it's not a high priority because entering ".@ right arrow" is not a normal sequence and is easily avoidable, but we'll try to fix it in v4.02 anyway.

(BRANDT, CAT42, TOP29, MSG:389/M645;1)

APPLEWORKS 4 ADD-ONS #1: ONE TOUCH COMMANDS

Will, how about a complete list of what will be on those (One Touch Commands) disks? Thanks in advance.

If I've got my records straight, the first one from Quality includes:

- DJ Two-Side -- Print a two-sided document on a DeskJet IW
- Two-Side -- Print a two-sided document on an ImageWriter
- OA-H Swap -- Swap OA-H printers on-the-fly
- Print Label -- Print a single label from a data base file
- PrintClip -- Print a clipping (selected portion) from a file
- SaveClip -- Save a clipping from a file
- FileFinder -- Search your drives for that missing file
- HangMan -- The chalkboard game comes to life on the Apple II
- Load Workset -- Load any of up to 99 groups of up to 36 related files
- Pop-Up Calc -- Basic arithmetic calculations on-the-fly anywhere
- Number2Words -- Enter a number, get it back in words, up to 99,999.99
- Typing Speed -- Clock your typing speed (Zero to sixty in...)
- Screen Color -- (IIgs only) Re-paint your screen on-the-fly

How it sells will determine if they do another one. But even if they decide not to, there'll still be another one. :-) It's in the works, but presently includes:

- Multi-Column -- Print AWPs in 2, 3, or 4 columns
- DB Hilighter -- Highlight individual categories onscreen
- DB Dialer -- Highlight a phone number and dial it via modem
- Bell Changer -- Set the AW bell tone the way YOU like it
- Reverse Feed -- Trigger a reverse form feed on your ImageWriter
- Batch Filer -- Process a batch of Desktop files at once
- Box Tool -- Draw rectangular frames in an AWP

Got some ideas you'd like to see? Post them here.

+(+)-

...Will

(W.NELKEN1, CAT42, TOP24, MSG:44/M645;1)

APPLEWORKS 4 ADD-ONS #2: AFTERWORK SCREEN SAVER

Here's some news from tonight's RTC to make your hearts beat faster:

<[Terrell] T.Smith59> What can you tell us about "AfterWork"? How far along is it?

<[Jerry] Quality> Should be shipping by the end of November. It's cool. You'll have to see it to believe it. The first time I saw the AW screen melting I couldn't believe my eyes. B) It'll be a lot like After Dark... there will be various modules which you can set various options on.
Probably we'll release programming info for the modules eventually.

Terrell Smith
tsmith@ivcfnc.fullfeed.com

(T.SMITH59, CAT42, TOP29, MSG:285/M645;1)

PATCHING APPLEWORKS 4 I would much rather see future patches to AW4
implemented as INITs rather than as actual patches to the code. (Or add the POKEs to the startup macro, but that would require UM.) This would make installing/removing the patches much easier and possibly you'd also be able to hold down the Apple key at boot time to determine exactly which patches were being installed.

Just a personal preference but I'd like to get out of supporting the heavily-patched versions of AW as much as possible.

(QUALITY, CAT42, TOP29, MSG:323/M645;1)

Jerry, the problem with Inits for patches is that they then have to be active, and if you hold down both-apple keys when booting up to save time (when you don't need macros), suddenly you have a different version. There are advantages to going the Init route, but it's a tough call. If patches just change bytes, the AppleWorks memory map stays the same and there's nothing extra involved in supporting such a version.

(BRANDT, CAT42, TOP29, MSG:326/M645;1)

MACRO PATCHES FOR APPLEWORKS 4 FROM TEXAS II Macro patches can be applied as part of an UltraMacros startup routine. No permanent changes are made to your AppleWorks disk.

Hotkeys (no Return after pressing a number at menus) revert to normal for the 1st character if the menu has over 9 items.

A:<all x=$1c55:poke x,$ad:poke x+1,$f2:poke x+2,$0e:
poke x+3,$c9:poke x+4,$0a:poke x+5,$90:
poke x+6,$25:poke x+7,$ea:poke x+8,$ea:
poke x+9,$ea:poke x+10,$ea:poke $1cca,$e4>! // Hotkey patch

Change the tone of the error bell by changing 180 or 50:

B:<all poke $1447,180:poke $1449,50: >! // Change error bell
T:<all bell>! // Test the bell

Change the --> to a checkmark or to a MouseText arrow:

C:<all $4d=" " + chr$ #"D":.pokestr $1,$0aea>!
<ctrl-C>:<all $1=" +chr$ #"S"+chr$ #"U":.pokestr $1,$0aea>!

More startup macros change other characteristics:

D:<all poke $ab75,#'-'>! // Change Date separator to "-"
<ctrl-D>:<all poke $ab75,,'#.'>! // Change Date separator to "."

F:<all poke $11ad,$0d>! // Disable OA-H formfeed

O:<all poke #socursor,1:ctrl-x>! // Activate overstrike cursor
Apple II Computer Info

V:<all poke $10ef,#'!'>!       // Change vertical line in menus

Why anyone would want to do this, we don't know:

Y:<all poke $0f14,1>!        // Cancel yes/no questions

On the other hand, Reversing Yes/No Questions is very popular:

:\:<all $91=chr$ 141+chr$ 8+chr$ 192+chr$ 173+chr$ 149+  
chr$ 208+chr$ 174+chr$ 153+chr$ 208+chr$ 141+chr$ 153+  
chr$ 208+chr$ 142+chr$ 149+chr$ 208+chr$ 173+chr$ 150+  
chr$ 208+chr$ 174+chr$ 154+chr$ 208+chr$ 141+chr$ 154+  
chr$ 208+chr$ 142+chr$ 150+chr$ 208+chr$ 141+chr$ 9+  
chr$ 192+chr$ 96:.pokestr $91,$800:poke $800,0: jsr $801>!

TEXAS II on MACROS (c) 1993 Kingwood Micro Software, 2018 Oak Dew, San  
Antonio, Texas  78232-5471. Macros by Beverly Cadieux, Wally Bradford,  
and Nicholas Pyers. For clarity, the text of TEXAS II on MACROS is  
printed on a Hewlett-Packard Deskjet 500  printer. If these macros  
change for v4.0.1, we'll post them again.

If you like and use these patches, and would like to have more, it's  
very simple. Subscribe.

[ TEXAS II (c) Kingwood Micro Software, 1993 issues, 6 for $12; 1994  
issues (Jan-Jun), 6+3 for $15. TEXAS II is sold in 6-issue sets, not  
by the year. 1994 subscribers will get 6 issues of TEX, and 3 issues  
of TEX on MACROS. ]

(B.CADIEUX, CAT13, TOP15, MSG:1/M645;1)

<<<<< For those who missed it, here's the TEXAS II subscription info  
""""again.

A subscription includes 6 issues of TEXAS II (Appleworks ideas,  
little-known features, undocumented commands, news and reviews of  
independent add-ons, and lots of of good cheer). It also includes 3 issues  
TEXAS II on MACROS, for a total of 9 newsletters. An example of TEX on  
MAC was posted in messages 1 and 4 (approx) above. These are PRINTED  
newsletters which come in the US mail approximately every 6 weeks. TEXAS  
II is sold in 6-issue sets, not by the year. We might do from 9 to 12  
issues a year, whenever there is news. The price of the next six issues  
(4.1 to 4.6) is $15 US and Canada, $18 overseas.

We also have disks which are sold individually or in sets of 3. They  
are available on either 3.5" or 5.25" (3, 2-sided disks). Each disk  
contains the text of the newsletters, plus about 700k of interesting  
Macros, Font Lore, and regular AppleWorks files which do not require  
macros. The current issues are TEXAS II on Disk vols. 5, 6 and 7 for  
$24.00, or $8.50 each. Shipping is included on all, and Texas residents  
please add 8.25%.

There is no combination rate for both newletters and disks. We  
encourage you to subscribe to both, because if you don't, you miss out on  
so much. About 80% of our subscribers get both the paper newsletter and  
disks, and many of them contribute regularly to fill them with articles and  
macros from all over the world.

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1109 of 1824
Apple II Computer Info

For current subscribers, renewals are due now. TEXAS II v3.9 and your renewal info will be mailed next week. Vol. 7 will ship shortly after that, along with a year-end index and our annual "Best of 1993" report. Vol. 7 will include the Block Warden info mentioned above, some early info on AppleWorks 4.0 PEEKS, and something even more interesting that you need to know about -- POINTERS. It also includes the famous "Simple TimeOut Calendars for 1994," (our _eighth_ year!) and lots of other goodies.

At some point, we do close subscriptions, and don't accept any more until the next round of 6 is ready to start. So please do respond now if you're interested. Thank you very much for all the e-mail.

ALL APPLE II HARDWARE AND SOFTWARE GONE FROM PRICE LISTS
Okay folks, I'm *not* trying to start a bunch of rantings and ravings, however, our district technology coordinator informed all of our schools (there are over 50 of them) that the Apple IIe has now been removed from the price list. I asked him about it and he said that he got the word from the area Apple guy (can you tell I can't remember his title) in Bellevue, Washington. These seem like pretty reliable sources to me. Can anyone put this to rest or possibly confirm it?

--Steve DePaul

>>>>> It's true. As of last week Apple is no longer selling anything for the Apple II. That includes peripherals, CPUs and software.

Bryan

>>>>> I'm SURE that they will be selling off their inventory. They may sell it all to Sun Remarketing at a discount, but the on hand inventory will go somewhere where we can buy stuff from it.

Just because it isn't on the price list, doesn't mean it doesn't exist.

AND they will still be selling repair parts through the usual channels.

Gary R. Utter

APPLE INC AUCTIONS OFF REMAINING INVENTORY
For what it's worth gang: Apple is holding an auction: they are getting rid of the remaining inventory of a lot of their machines: IIGSes included.

See the latest issue of MacWEEK for more details...

Bryan

>>>>> There will be an auction of Apple stuff in three places around the country:

Chicago         Nov 20  
Framingham, MA  Dec 4  
Herndon, VA     Dec 11  

According to the brochure sent out (slick, glossy, heavy paper), it 
includes powerbooks, Macs, IIGSs, speakers, monitors, printers, CD Roms, 
scanners, Claris software. The fine print states "the auctioneer reserves 
the right to group one or more items into one or more selling lots..." so 
this may be a good opportunity for schools or dealers to scoop up a bunch 
of stuff, but bad for individuals who want one piece.

Terrell Smith  
tsmith@ivcnfsc.fullfeed.com

>>> WHAT'S NEW <<<  
""""""""

HYPERLOGO GS SHIPS   Scripting HyperStudio for the Apple IIGS just took a 
giant leap forward! HyperLogo for HyperStudio GS is 
now shipping.

If you've been waiting for this new product, wait no more! Add 3D 
pictures and movies to your stacks. Use Logo's powerful artificial 
intelligence features to control your stacks. With HyperLogo and Talking 
Tools, you can even create stacks that can read what you type! It's all 
here for the low introductory price of $50 plus shipping, or get HyperLogo 
and 3D Logo, our stand-alone version, for just $85. These programs will 
cost $95 each after the introductory special expires, so don't wait!

If you ordered HyperLogo when 3D Logo started to ship, your wait is 
over. All backorders have been shipped, and all should arrive by 22 
November.

If you would like more information about HyperLogo, just ask! Or, if 
you prefer, send me your mailing address by e-mail or call (505) 898-8183 
and we'll send an information package that tells about all of our Logo 
products for the Apple IIGS.

Mike Westerfield

SEQUENTIAL INTRODUCES CD-ROM FOR RAMFAST   Today, Sequential Systems is 
""""""""
proud to announce the 
introduction of DiscQuest(tm) and DiscQuest GS(tm); a System of Hardware 
and Software that will give today's Apple IIGS User access to the exploding 
library of information available on CD-ROM.

DiscQuest(tm) utilizes standard SCSI CD-ROM drives and will support 
currently available CD-ROM titles from leading Multi-Media publishers such 
as Creative MultiMedia, Grolier, Compton's and more. DiscQuest(tm) 
Software, developed by Sequential Systems, Inc and Procyon, Inc., provides 
"text search", "still graphics display", and "audio" from 
DiscQuest-supported titles. Bundled with Sequential Systems' RamFAST SCSI 
Interface, search performance of the DiscQuest System(tm) using a 
non-accelerated Apple IIGS is similar to that of a Macintosh LC.
DiscQuest GS(tm) Software (for Apple IIGS computers) will be made available to resellers and end-users for use with other SCSI-type CD-ROM drives and for dealer bundling. The software includes a copy of Creative Multi-Media's popular title "The Family Doctor". DiscQuest(tm) Suggested Retail: $99.95.

The DiscQuest GS System(tm) is a bundled product that includes Sequential Systems' DiscQuest(tm) Software, an external CD-ROM drive with cable and one disc caddy, a RamFASTe SCSI interface, and four (4) supported CD-ROM titles. Suggested retail for the complete bundle will be around $650.

Sequential Systems' and Procyon's on-going commitment to DiscQuest (tm) and Apple II will produce new features and many new supported titles that will result in a complete and powerful information-based CD-ROM platform for Apple II.

We sincerely believe that your customers will find the DiscQuest System to be a useful and exciting addition to their Apple IIGS system.

Dealers may call 800-759-4549 for dealer pricing.

>>>>> DISCQUEST COMPATIBILITY:

"""

DiscQuest works with the following hardware:

Any Apple IIGS with 2MB of RAM or greater

RamFAST/SCSI with NEC, Sony, Apple, Sequential CD-ROM drives
Apple High Speed SCSI with Sony, Apple, and Sequential CD-ROM drives

If you have a RamFAST you need the very latest ROM revision, 3.01e.

>>>>> A SYNOPSIS OF DISCQUEST(TM) SUPPORTED TITLES

"""

Darwin Multimedia CD-ROM

--------------------------------------

- Charles Darwin's complete texts with original illustrations of the final editions of: "The Voyage of the Beagle", "The Origin of Species", "The Descent of Man"
- 1859 manuscript outlining the theory of evolution, by Darwin and Alfred Russel Wallace
- The Darwin Timeline detailing significant events in his life
- A Darwin bibliography of over 1000 primary and secondary references
- Original maps from the voyages of HMS Beagle and HMS Adventure
- More than 650 color and black & white images
- Natural sound recordings from Cornell University Laboratory of Ornithology
- Illustrations from "Zoology of the Voyage of the HMS Beagle"
- Plus never-before published material from other distinguished naturalists
Apple II Computer Info

Monarch Notes(R) on CD-ROM

This Multimedia CD-ROM edition of Monarch Notes includes the complete text of the entire collection! Each Monarch Note includes author biographies, literary style overviews, relevant historical information, story synopses, character analyses, critical commentaries, bibliographies, and essay questions. This CD-ROM was given Byte Magazine's "Jerry Pournelle's User's Choice Award" as "CD-ROM Of The Year". Hundreds of authors and works are surveyed in this compendium that Computer Shopper magazine calls "Mondo Cool".

Sherlock Holmes on disc!

- The complete text of Sherlock Holmes stories by Sir Arthur Conan Doyle
- Linoleum block prints by Dr. George Wells accompany each story
- The Medical Casebook of Doctor Arthur Conan Doyle by Alvin E. Rodin and Jack D. Key and Medical Poetry by Dr. George S. Bascom
- Complete text index and table of contents browsing

The Family Doctor

- Easy to understand advice to nearly 2,000 of the most commonly asked health questions
- An illustrated human anatomy that lets you explore the body systems, structures, and functions from head to toe
- Approximately 300 color illustrations to simplify explanations
- Comprehensive data on more than 1,600 prescription drugs
- Health update booklets, local and national resource listings, and a glossary of over 100 medical terms

Shakespeare

- The Complete Works of Shakespeare including plays, poems, and sonnets in full text
- Both American and Queen's English versions
- A complete text index and table of contents browsing

Great Literature (Personal Library Series)

- Full text of over 500 literary classics with Illustrations, CD-Quality voice-overs and music performances
- Famous narrations by Bob Saget, Dave Coulier, and George Kennedy
- Live (not synthesized) music performances
- Full search and browse ability - music and text
- Thousands of images
- A true multimedia experience!
- Everything from Alice in Wonderland to the Nixon Tapes to the Declaration of Independence!

Parenting - Prenatal to Preschool

"Like having all the experts on call 24 hours a day"

Multimedia Audubon's Birds

- Complete text of the 1840 first edition "Octavo" set of John James Audubon's Birds of America
- All plates, including 500 full color bird lithographs
- CD quality bird calls for many birds through the courtesy of Cornell Laboratory of Ornithology
- Full text index and table of contents browsing

Multimedia Audubon's Mammals

- Complete text of the 1840 first edition "Octavo" set of John James Audubon's Quadrupeds of North America
- Over 150 full color mammal lithographs
- CD quality sounds for many mammals through the courtesy of Cornell Library of Natural Sounds
- Full text index and table of contents browsing

The Best of The Bureau

The Best of the Bureau is a distinguished collection of literature and history, with hundreds of works culled from the best titles of the Bureau Development. Just type in a word, phrase or subject and the powerful search and retrieval capabilities put the information you want at your fingertips - instantly. This is more than just thousands of pages of text. It is a complete multimedia personal reference library - all on one disc!

We have included the best of Dickens, the wit and humor of Twain, riveting biographies of the famous and infamous, ancient and up-to-the-moment histories of the cultures, lands and people of the world and lots, lots more. It's the perfect way to start your Personal Reference Library!

US History on CD-ROM
Countries of the World on CD-ROM
and
History of the World on CD-ROM

Authoritative and diverse collections of articles, writings, and images on history and culture.

Sequential Systems
lastPATCH PATCHES APPLEWORKS 4.01

About lastPATCH

lastPATCH is my way of thanking everyone who has supported SuperPatch over the past several years. I have appreciated your interest and encouragement very much, so here is something back. Thanks. From the bottom of my heart.

Just as the "About" message says in lastPATCH itself, you will not find formal documentation here. However, most people will have little trouble using lastPATCH, especially those who are familiar with SuperPatch. lastPATCH is a leaner, more focused subset of SuperPatch. Aesthetically, I prefer lastPATCH for that reason.

If you have problems using the package, please do not call Quality Computers. Instead, ask a friend, or call the SuperStuff BBS (named pro-xy) at 616/381-1726. My user name there is jlink. Leave me e-mail and I will do my best to respond.

While SuperPatch will work with just a single 5.25 inch drive shared between both itself and AppleWorks, lastPATCH does not support this rather ineffective hardware setup. (The code to support such a situation was quite cobby, and I really enjoyed deleting it from my source files as I developed lastPATCH.) You must have two drives to make lastPATCH work, or a hard disk, in which case you run lastPATCH from its own folder and point it at AppleWorks in another.

If both your drives are of the 5.25 flavor, you must use a little creativity to cope with the way AppleWorks 4.0 functions under this limitation. Just copy the files Aplworks.System, Seg.Aw, Seg.00, Seg.Rm, Seg.Xm, Seg.Am, and Seg.Wp onto a spare floppy. Do your patching as usual, then copy the patched files back onto the disks where they belong.

lastPATCH 1.0 works with version 4.01 of AppleWorks. Earlier and later versions can be expected to return "unknown" on any patch area that has been moved from its location in version 4.01.

To get going with lastPATCH, copy all the files in the archive to a disk or folder, along with BASIC.System and ProDOS, if you need them, and launch Startup.

Copyright
lastPATCH is fully copyrighted. I retain all rights and ownership. End users get a license to use it, at their own risk, naturally, but with no obligation to pay for it.

Still, there are a few very clear restrictions that limit what you can do with lastPATCH. They boil down to you can't make money from it. With exception of distribution by NAUG and America Online, no one is permitted to charge ANYTHING for lastPATCH, including the time it takes to download or the disks it might reside on.

Thus, please do not upload it to Genie, CompuServe, Delphi, or other commercial information services, or distribute it through the "disk of the month" clubs that impose a "copy charge." Do, however, upload it to BBSes that charge nothing for public access, copy it onto disks for your friends, and so on. I believe this arrangement will provide lots of access to anyone who wants to use it, while giving me some opportunity to look in on how things are going. Besides, if I am not going to make money from it, why should anyone else?

These privileges and restrictions seem simple enough to me, and I hope they are honored. If you know of a circumstance in which they are not, please let me know at my SuperStuff address above.

About the new AppleWorks

AppleWorks 4.0 is quite an achievement. Its practical functionality compares favorably to applications I use on Silicon Graphics workstations that are many magnitudes more powerful than any Apple computer. For instance, nothing available on any platform checks spelling as fast as the spell checker built into AppleWorks. Nor does any platform support an app that scrolls text faster than AppleWorks.

An art critic once suggested that good art can withstand any abuse or misunderstanding by its audience. AppleWorks seems like it meets this same test, given everything that has happened to it over the past decade.

Clearly, I must put myself at the top of any list of AppleWorks abusers because of my incessant patching and tinkering. But there are lots of others who fit this same shoe as much as I do. Version 4.0 reflects the influences and richness of this somewhat rag tag group of "enhancers," from the earliest efforts by programmers at Applied Engineering, to my own SuperPatch. It seems like a scene from the Canterbury Tales, in which no one is quite sure who is coming, who is going, who is leading, and who is following. Nor do we need to know, to enjoy the process of travelling together.

I wonder what Bob Lissner thinks of this new version (if he thinks of it at all), and suspect that he might not approve of all the things that have been done to his brain child. But I hope he understands that an outcome like 4.0 was implicit in his initial decision to reveal the inner workings of AppleWorks to the developer community at large. By doing more things to his product, that community has enabled everyone to do more things with it. Without hacks, inits, and add-ons, AppleWorks could not have lasted like it has.

In any case, AppleWorks 4.0 still testifies to the strength of Lissner's original conception and commitments. As the art critic said, if
it is good enough, it can stand up to anything (even a couple hundred patches).

You need use 4.0 but a few hours to appreciate how much has been added. Tom Weishaar once suggested that AppleWorks ought to become an operating system for the Apple //e. Version 4.0 responds to that request. TimeOut in its multiple manifestations is now an official part of the program, as are the AppleWorks inits, Double Data, Total Control, and the playback portion of UltraMacros. Of course, lots of patches that users applied to earlier versions are also part of the new release, including the hack to customize the cursors, no less. lastPATCH offers 18 that were not included so you can add them yourself, to continue this tradition of unprecedented user customization and "abuse."

Most of what remains valuable about the Apple // is associated, in one way or another, with AppleWorks 4.0. Take advantage of it.

John Link

OS:        ProDOS

John Link has heard your comments and is responding with his NEW AppleWorks v4.01 patching program

LastPATCH

This new FREEWARE program contain the following patches:

lastPATCH Specifications

Applwoks.System:

1. No return after pressing number of menu selection (hot keys).
3. Overstrike instead of insert cursor on boot-up.
4. Change error tone for any Apple //.
5. Change `Do you really etc' to `Really?'.
6. Change `Type entry etc' to `Enter any d*** thing you want'.
7. Change `Preloading AppleWorks' message to anything you want.
8. Move Apple-Q menu to upper right corner.
9. Mouse marks instead of text arrows in all menus.

Seg.Aw:

10. Change `Carefully saving' message to anything you want.
11. Change 'Path:' to mouse text.
12. Change 'Subdirectory:' to mouse text.
13. Change 'Disk:' to mouse text.
14. Change 'Disk volume' to moustext.
15. Change 'More' to mouse text down arrows.

Seg.00/Rm/Xm/Am:

16. Reverse all 'No/Yes' queries to 'Yes/No'.

Seg.Wp:

17. Change <cr> character to mouse text bent arrow.
18. Customize Page Break lines as mouse text.

PLEASE feel free to leave any comments about LastPATCH here in the NAUG area

MACRO LANGUAGE ENHANCEMENTS:

Script Files

A brand-new feature of ANSITerm Version 2.1 is the use of script files. Script files are text files that contain ANSITerm macro language commands. Script files are much more versatile and can perform much more complicated tasks. Several sample script files are included with ANSITerm Version 2.1.

Script file features include:

- Up to 255 Labels per script file
- No limit to the size of script files except memory
- New commands for procedure calls and label branching
- Different script files may be chained together
- Comments may be added to scripts to make them clear

SBACK <strvar> <num>
STRING <strvar> <num> [ <num> ]
UPPER <strvar>
WINDOW <num> <num> <num> <num>
```

Other commands from Version 2.0 have been enhanced and new features have been added, including full support for the new ASCII Receive method, modifier key support for the KEY command, enhancements for the VIEW command, subdirectory access for the INPut command (a parsed text string will be returned for each file entry in the directory), and many more.

**Number Size**

```
Number size has been increased to 2-bytes. This means ANSITerm Version 2.1 will recognize numbers between 0 and 65535 instead of 0-255.
```

**String Expressions**

```
Strings may now be automatically concatenated within a string or numeric parameter by using the "+" operator. For instance:
```
```
assign s0 "The time is "+time"^M"
```

The entire expression will be seen as a single string to the command.

**Numeric Expressions**

```
ANSITerm Version 2.1 supplies a collection of numeric operators that may be used to evaluate numbers. Operators include:
```
Operator Function
+ Addition
- Subtraction
* Multiplication
/ Division
% Modulus
& Bitwise AND
| Bitwise OR
^ Bitwise Exclusive OR
> Shift Right
< Shift Left

Multiple operators within a single expression will be evaluated left to right and the result will be used for the parameter.

Numeric and String Settings

Numeric and string settings may now be specified for any command that requires a number or a string. For instance:

message "The time is " time "^M^J"

In addition, settings may also be used within string and numeric expressions. They will be seen, in all respects, as numbers or strings.

Auto-Conversion of Strings and Numbers

ANSITerm Version 2.1 will automatically convert all string and numeric parameters for macro commands into the proper type required for the particular command. This means you can mix numbers and string representations of numbers within the same parameter and the strings will automatically be converted to their numeric values. Likewise, numeric expressions within string parameters will be evaluated and then converted to a string.

Global Macros

Global macros may now be used from just about anywhere in ANSITerm, including the editor, scrollback, dialogs, and line edits. A new macro command (KBoard) allows you to stuff keystrokes into ANSITerm's keyboard buffer and can be used for performing commands, typing out line edits, or anything else you might want to do.

Global Macro Editor Enhancements

ANSITerm Version 2.1 supports multiple sets of global macros. Instead of the single set of 52 global macros that Version 2.0 supported, you may now create any number of different sets of global macros. Global macro sets may be loaded and created right in the Global Macro Editor, or they may be loaded by using the macro language.

ANSITerm Version 2.1 now also supports auto-execution of global macros at startup, shutdown, after file transfers, and after a disconnect.
This allows for custom scripting for features such as dial and transfer logs, automatic execution of scripts when ANSITerm is started, and more.

**EDITOR ENHANCEMENTS:**

- New easy-to-use Preferences window
- Definable editor width from 20 to 80 characters
- Definable quote string, up to 15 characters
- The editor now supports the loading and saving of Appleworks(r) Classic AWP files. You can use the editor to convert between standard text, APW source, and Appleworks AWP files. Tab settings from AWP files will be retrieved and used, and will be saved with any AWP file.
- New command to remove control codes and convert Unix "newline" characters to carriage returns.
- Send To Modem has been enhanced with the new ASCII Send features (see below)
- You may specify a special group of global macros just for use in the editor. This global macro set will be loaded in when you enter the editor and the previous set will be reloaded when you exit the editor.
- The cursor mode will be saved with your configuration.

**SEND TO MODEM ENHANCEMENTS:**

ANSITerm Version 2.1 adds more features to all "send to modem" commands, including ASCII Text Send, OA-M in the editor, and Send to Modem in scrollback.

- ASCII Text Send will now do intelligent word wrap.
- ASCII Text Send support for Appleworks Classic AWP files.
- New preference to add spaces to all lines in the send, or just empty lines.
- New prompt character may be specified to aid in pacing of sent text.

**NEW PREFERENCES AND FEATURES:**

- New easy-to-use Preferences window. Just use the arrow keys and return to modify a setting!
- New Backspace mode will tell emulations how to handle a backspace character.
- New online cost feature. You may now specify a per minute and per hour cost for your online session. Cost may be displayed in the status line, or can be accessed through macros.
- You can now have ANSITerm prompt you before you hang up on the modem.
- You may now specify how you want ANSITerm to handle the "scrollback full" condition. You can have it prompt you like normal, or automatically clear or halve your scrollback.
- New Autosave Scrollback Feature: ANSITerm can now automatically save your scrollback to a text file whenever you exit or when scrollback is cleared or halved. This file can later be loaded into the editor or Viewed in case you might have missed something in your last ANSITerm session. ANSITerm can either overwrite or append scrollback information to this file.
- New Screen Saver Feature: ANSITerm will now blank your screen for you in order to protect your monitor. You may specify anywhere
from a 1 to 255 minute delay before the screen is blanked, or this feature may be disabled.

- Capture to Editor Feature: ANSITerm can use the editor as a capture buffer. All information you receive from your modem can be automatically sent to the editor. You can also tell ANSITerm to filter put any non-displayed characters, including ANSI and VT-100 codes and control codes.

DIALING DIRECTORY ENHANCEMENTS:

- Directory has been expanded to 50 entries
- New housekeeping features include sorting, deletion of entries, insertion of entries, and moving entries around.
- More information is now stored with each directory entry, including:
  - Delete key mode
  - Backspace mode
  - Number of lines to scroll
  - Cost per minute online
  - Cost per hour online
  - All ASCII Text Send settings
  - Default transfer protocol
  - Send and receive Binary II flags
  - MS-DOS file name setting

FILE TRANSFERS ENHANCEMENTS:

- The estimated time of completion for the file currently being transferred now appears in the transfer dialog. This estimate is recalculated after each packet of information is received, so it gives you an up-to-the-second approximation of when the file transfer will be completed.
- Up to 64 files may now be selected for a batch send from any directory and volume.
- ASCII Text receive has been completely changed. All ANSITerm commands and macros will work during an ASCII receive. ANSITerm Version 2.1 will now just buffer any received text, filtering control codes or not depending on your preference. You can pause, cancel, or finish the receive at any time and save it to a text file.
- ANSITerm can now automatically add a Binary II header onto any sent file using xmodem or ymodem.
- Binary II extraction will now work with ymodem batch receives.
- ASCII Text send will now perform intelligent word wrap, depending on the line size setting. See SEND TO MODEM, above for more details and other new features.

OTHER ENHANCEMENTS AND NEW FEATURES:

- The Set File Attributes option in the Disk Utilities will now lock and unlock files with a single keystroke.
- Up to 64 files may now be copied at one time using the Disk Utilities.
- You can now enter a valid command while the Help Window is displayed and go directly to that command.
- View command will now work with Appleworks Classic AWP files. You may also specify virtual baud rate, CR mode, whether or not to perform word wrap, and whether or not to add the viewed file to
High-speed serial port drivers will now perform software handshaking when their buffers are getting full. This prevents character loss during high-speed message dumps.

File Dialogs will now sort directories and display file names in both upper and lower case. Selecting directories has been made more convenient and saving files will now display a file dialog.

ANSI emulation now fully supports the PC function keys and special keypad functions, as well as arrow keys.

New three-line chat duplex, usable with any emulation.

---------------------------------------------------------------------

Upgrades

The ANSITerm Version 2.1 upgrade includes 60 pages of new documentation and three new quick reference cards. Upgrade price for current owners of ANSITerm Version 2.0 will be $20 within the US, $30 outside the US. Owners of ANSITerm Version 1.x can upgrade to Version 2.1 for only $40, $50 outside the US (includes the entire ANSITerm Version 2 manual and documentation). All prices include shipping.

Purchases

The intro price for ANSITerm Version 2.1 is still $69 direct from Parkhurst Micro Products. This includes a high-quality 3-ring software binder, over 240 pages of documentation, diskette and holder, four quick reference cards, and 5 free hours of time on Delphi Online Services. Please add $5 for shipping and handling within the US, $15 outside the US.

Information

For more information, write to Parkhurst Micro Products, 2491 San Ramon Valley Blvd, Suite 1-317, San Ramon, CA, 94583, or call (510) 837-9098. Email may be sent to PMP on either Delphi or GEnie, or to pmp@delphi.com or pmp@genie.geis.com on the Internet. Parkhurst Micro Products accepts checks, money orders, Visa, and MasterCard.

>>> THROUGH THE GRAPEVINE <<<

POWERPC IIGS?   Saw in Enhance that you are looking at providing software that would allow a PowerPC to emulate a II or IIGS. That would be great!!! and would eventually mean that the first truly portable II would be a PowerPC!

(R.FISCHER7, CAT42, TOP 29, MSG:66/M645;1)

SOUNDMEISTER PRO CANCELLED   I'm going to post the official press release about the cancellation of the Pro and then I'm going to add a few comments afterwards.

Official Press Release Re: SoundMeister Pro

Econ regrets to announce that due to a number of reasons the board of directors has opted not to put the SoundMeister Pro into production. After
various delays, the design for the SoundMeister Pro was finally completed, approximately 6 months behind schedule. During this time an insufficient number of orders for the SoundMeister Pro were placed. Due to the high initial costs of a first run of the SoundMeister Pro, coupled with a small demand, the SoundMeister Pro has been deemed a very high-risk endeavor for Econ and has therefore been cancelled. Advertising and design costs for the SoundMeister Pro now run into the thousands, which Econ is forced to absorb.

Econ will no longer design any new hardware projects due to the low demand and very high costs and risk involved in these ventures. The regular SoundMeister will continue to be produced and sold as long as demand continues. Econ will be concentrating all future efforts into software updates and new productivity developments.

We apologize for the inconvenience this causes the individuals who have placed orders for the SoundMeister Pro and do thank them for the interest they have shown in our product.

Sincerely,
Econ Management

(ECON, CAT35, TOP9, MSG:77/M645;1)

I feel just as bad about the Pro being cancelled as everyone else. In particular, I had told you that the Pro "definitely" would be coming out at such and such a date and now it won't be. The decision was made at the final hour because, like the press release said, the cost of the initial run would be just too high compared with the number of pre-orders we had received.

However, the original SoundMeister is still being sold, supported, and produced here at Econ. The SoundMeister has sold very well and it is still selling well. In fact, we have run out of our last batch of cards and won't be able to fill new orders for about 4 weeks. Yes, four weeks because of the ordering and building lag inherent with hardware.

We will be concentrating on productivity software in the future, like Addressed For Success. There are many different types of software that haven't been done for the GS, and those are the ones we'll be going after.

If you have any further questions, please ask.

Michael Lutynski

APPLEWORKS 4 ADD-ON UPDATE #1: OMNIPRINT Yes, we do plan to update OmniPrint when the versions of 4.0 ship. They have had some "extra" development time involved with getting AppleWorks 4.0 ready for release which has slowed our release of the new version of OmniPrint.

When AppleWorks is complete, I look for the new release of OmniPrint to follow within a month to 6 weeks.

Eric Kitchen Sink Software, Inc.
(KITCHEN.SINK, CAT25, TOP5, MSG:5/M645;1)
APPLEWORKS 4 ADD-ON UPDATE #2: BACKUP  Good News! TO.Volume Backup works with AWKs 4.0 without any modifications. TO.File Backup must be updated for use with 4.0, but the new version is already done. We will begin shipping as soon as necessary in-house QC and beta-site testing is completed. Update will cost $10.00 for registered users of TO.Disk Tools, and should be shipping before X-mas.

THE APPLE FIXER  We have just completed The Apple Fixer(tm), a combination disk and booklet which will help you to maintain and repair your old Apple II computers. The disk includes a drive cleaning program, speed adjusting program and monitor test pattern as well as a disk mapping program that can be helpful in improving drive alignment when used with a system master disk as a standard. The package sells for $19.95, plus $3.50 shipping and handling. It will be released in our "94 More" catalog which will go to the printer in mid-December.

SUPPORT FOR TURBO IDE CARD  Welcome to the Turbo IDE Card area. This topic is intended for technical support and general discussion. Before we opened this topic, we gave support via personal e-mail since September 1992. Any questions and comments concerning the Turbo IDE Card should be placed in this topic from now on.

SHH Systeme from Germany is devoted to developing hardware (and its associated firmware and software) for the Apple IIe and Apple IIGS. While other companies are leaving the Apple II as if they had never been there, we will continue to support the Apple II as long as GEnie will allow us to do so. We definitively will remain loyal to the Apple II and NOT to any other computer! (BTW, at this time SHH Systeme is the only company in Germany that is developing hardware for the Apple II).

If you don't know anything about the Turbo IDE Card, first have a look into the GEnie library. You will find a complete description about the card and some notes about its performance. The files are named TURBO.IDE.BXY and TURBO.NEWS.BXY. Also, some other Bulletin Board categories carry comments about the Turbo IDE Card (for instance cat 21, topic 6).

Needless to tell you (isn't it?) that:

- the Turbo IDE Card is the fastest IDE controller available for the Apple II.
- the Turbo IDE Card is the only REAL accelerator card for Vulcan, Vulcan Gold and InnerDrive/Overdrive hard drive systems.
- the Turbo IDE Card is the fastest IDE controller available for the Apple II.
- the Turbo IDE Card is as fast as (or faster than) any SCSI controller on the Apple II market.

Encouraged by the Turbo IDE Card's feedback we felt we had to continue our development efforts. So stay tuned to see a new piece of hardware for the Apple II in the near future. Well, if there is somebody who believes the Turbo IDE Card is vaporware, our next project also will be...
vaporware to this person: don't stay tuned. Thanks to Jawaid Bazyar, David Grenda, John Willett and some other nice guys, the Turbo IDE Card turned from vaporware into real hardware! It's like magic! Thanks once again.

If there is anybody who would like to be a beta tester of new hardware (ahem... vaporware!), let me know here.

Current pricing:

Turbo IDE Card (english manual, utilities disk, three feet cable)

US$ 139.00 plus $24 shipping/handling (air mail to the US). One year limited warranty on parts and labour. Free support via GEnie bulletin board.

SHH Systeme, Joachim Lange
(J.LANGE7, CAT13, TOP22, MSG:1/M645;1)

ANOTHER DTUILS UPDATE

There has been a lot of talk concerning DTUtils here in the A2 category recently. I contacted one of the authors (again) to get an update on their progress. Rob Mueller's response to my letter and certain comments that have appeared here on GEnie follows:

OK. Yes, things are going very slowly. Tony and I are both studying quite hard for University work, we both consider our marks quite important and are always trying to be straight A students (esp. Tony since he is in his last year of Engineering), that is one of the reasons things are going so slowly. Secondly, we originally intended 4.0 to just be 3.3 broken up. This has turned out not to be the case. 4.0 is a virtual complete re-write with some REALLY amazing module interface routines. Tony has written some of the most tight, powerful and flexible code I have seen in a LONG time, he is a real master at coding and will re-write lines of code if he can save 2 bytes. (probably a bit overboard, but you get the idea). At the moment, the docs for writing modules alone is coming in at 100K of text! So, the kernel is basically done, the NDA modules is basically done, the Clock module is nearly done, the menubar manager is 3/4 done, the VDA manager is nearly done, but the rest is still in its old form.

When it comes to replacing DTU with other programs, yes, that may be so, but think about the following. How big is transprog III in comparison to DTU3.3? Its probably bigger than all of DTU3.3 combined! And what about T2? How buggy is T2? OK, do the DTU3.3 screen blander is "basic" but it works! What about the text clock and the menubar clock? There are other programs, but again, how big are they? The ability to add fonts/das/inits has been replaced by IR, but can you add things using a CDA like DTU when you are in a text enviroment or there is no NDA menu? (besides, the CDA interface is HEAPS faster than the Standard File Dialog!) But then there is the icing on the cake in my eyes. Virtual DAs! What other program implements them as easily as DTU? And all these features (plus a few) come in at about 35K! So not only do you save memory (smaller program, and virtual DAs means you don't have to load any at boot up), you're whole system boots much faster!

With regards to poorly programmed, I challenge him to prove...
it! Tony has to be one of the finest programmers I have ever seen, and if I might put aside modesty for a moment, I think my code is pretty good as well! Fast, tight, and basically bug free (most of the bugs that occur in DTU are due to system incompatibilities because DTU has to patch over quite a bit of the system).

Again, sorry for the long delays, but programming is a hobby, not a job!

Rob

His comments are his to own...

Rick Adams

(R.ADAMS48, CAT2, TOP7, MSG:98/M645;1)

I don't know, how buggy is Twilight II? Umm, like hardly at all? Hundreds of satisfied users can't be wrong; ask any of them if you don't believe me. Who wants a boring, run-of-the-mill screen saver that makes your computer look dull and bleh-like. I'd happily challenge Rob to substantiate his claims before continuing to spread mis-information. Rob is not a very honorable person. He tried to steal beta versions of Twilight II (and Twilight II programming specs) from beta testers, obviously afraid of it. Luckily the integrity of our beta testing team is greater than that of Rob's.

<<Jim

(DYA, CAT2, TOP7, MSG:100/M645;1)

APPLEWORKS GS WORK CONTINUES Yep, in fact we had to do a complete build of it to replace the Claris title screen with one of our own. We do have a team working on it.

I'm not even going to guess a date, because the last time I did it got reprinted in dozens of user group newsletters and somehow became an official release date... even though I ended the post with "how does that sound?"...

(QUALITY, CAT42, TOP32, MSG:233/M645;1)

>>> MESSAGE SPOTLIGHT <<<

Category 5, Topic 3
Message 89 Thu Nov 25, 1993
RON.ROYER at 00:26 EST

With the demise of the complete Apple II line, I would like to tell a story about an incident that happened recently. I was at a party two weeks ago and I got to talking about computers with a fellow GS enthusiast. While we were talking, a few other people joined in. One person said that after 11 years, she finally had a mouse and had to get used to it. She said her family recently upgraded from a IIe to a Compaq Presario. Because she didn't want to lose 11 years of data files, she had planned to have her daughter spend time this summer keying in the files from the old Apple IIe.

I told her about Crossworks and she was completely surprised that such a thing even existed. Another person said that he had just purchased a new
Mac because he COULDN'T UPGRADE HIS GS with a hard drive. His Mac dealer told him that the GS was no longer being manufactured and that peripherals were no longer available for them! My friend and I told him not only about the companies that sold hard drives for GS but that external drives sold for the Mac could also be used for the GS and that with a Ramfast card attached it would probably run as fast as the drive he has on his Mac. He was quite surprised. He went on to say that the speed difference was amazing. He hated waiting for his GS to load AppleWorks. When we told him about ZipGS and TranswarpGS, he was really shocked. He never realized than any such thing every existed! My friend also told me he had a neighbor who had relegated his GS to his cellar where it is collecting dust while he uses his new 486 PC.

Here are three former Apple II owners who no longer use their II's because they were told lies or did not get the information the needed to continue to get the most out of their GS's. I wonder how many other GS's and IIE's are just collecting dust for the same reasons. It's a pretty disgusting situation. It's really too bad that there aren't more cities and towns that have the kind of support that A2.Susan gives. (I read about this on the December A2 Central On Disk)

Ron

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Apple II Computer Info

(They rhyme with suite and straight and debt.)

A moth is not a moth in mother,
Nor both in bother, broth in brother,
And here is not a match for there
Nor dear and fear for bear and pear.
And then there's dose and rose and lose --
Not look them up -- and goose and chews.
And cord and word and card and ward,
And font and front and word and sword,
And sew and go and thwart and cart...Come, come, I've hardly made a start!
A dreadful language?  Man alive,
I'd mastered it when I was five.

REFLECTIONS /

Thinking About Online Communications

By Phil Shapiro

[REF] PHIL SHAPIRO

---

A few months ago, public television broadcast an intriguing documentary about the Library of Congress. In that show, Steve Jobs made a brief appearance, talking starry-eyed about digitizing the entire Library of Congress -- making its contents available via high-speed modem lines to anyone and everyone in the nation.

Jobs' comments got me thinking about just how valuable it might be to have such vast information resources at one's fingertips. And my conclusion is that it would be of little value to anyone.

Here is why I think so:

By definition, exhaustive information resources are exhausting to search through. Ninety-five percent of the books and magazines stored in the Library of Congress you'd never want to read anyway. Books and magazines that are truly useful to people are stored in those endearing institutions we call "neighborhood libraries".

The value of the Library of Congress is not so much derived from the content of the information on the shelves, as it is in the skill and wisdom of the research librarians that work there. It's the warm-blooded, human intellectual capital working at the Library of Congress that gives the institution its immense value.
When Congress needs answers to important questions, they send queries over to the Congressional Research Service. Research librarians whose work is worthy of basing national policy upon are dispatched to find and report answers. In some ways these wise and knowledgeable library professionals serve as the "learned minds" of our national legislature.

So what does this have to do with online communications? The point being made is that the great hope of online communications is in bringing a streamlined dissemination of knowledge to the public. If we followed Steve Jobs' vision, we'd be successfully connecting a firehose of information to each and every household in this country. This would do little to advance the public good.

But if were to make more reference librarians available online, the public good would be advanced immeasurably. Why is an online reference librarian so immeasurably more valuable than a live, in-person reference librarian?

I'll tell you why.

Walk into any city library in this country and spend a few minutes observing the typical workday of reference librarians. The phone rings off the hook from approximately opening time to closing time. Reference librarians scamper this way and that, juggling the information requests of phone patrons and walk-in patrons. Few patrons receive in-depth answers to their questions. And the same questions could conceivably be answered over and over again, year in and year out, with no one being the wiser.

Last month I had the chance of witnessing an exceedingly patient librarian politely inform a walk-in patron that she would be right with him -- just as soon as she attended to the two persons who were waiting on hold. The patron became understandably impatient as the librarian made valiant efforts to perform this superhuman juggling act.

Here is how online information technology could come into play to further the interests of this patron, this librarian, and the public good:

If patrons posed their reference questions as public messages online, librarians could spend more than sixty seconds providing them with answers. Making use of online technology, reference librarians could have the luxury of actually investigating reference question before supplying answers. The result? Thoughtful answers to thoughtful questions.

But here's the kicker. Once the answer to a patron's question is posted in a public message area, that particular question and answer join the stockpile of public knowledge available to the entire nation. So when queries are posed that have already been answered, librarians can simply point back to the "frequently asked question" whose answer is already accessible. Librarians need not spend time and effort answering the same question twice. And the labor that is saved can be applied to more thoroughly answer genuinely novel questions.

Is online library reference service another "Jobsian" pie-in-the-sky dream? Hardly. Working models of this type of online service have been sprouting up all over the country in the past few years. In Washington DC, where I live, several generous community-minded librarians provide such a service on "CapAccess," the new free community information service. Similar "freenets" in other cities around the country are starting up
parallel online reference services. Countless small town libraries have set up "Friends of the Library" bulletin board systems (BBS's) that could be put to such use, as well.

The national information services could also provide leadership in this exciting new field. It will be interesting to see which of the information services is the first to provide online library reference service. To my knowledge, no such service currently exists on GEnie, America Online, CompuServe, Delphi, or Prodigy.

The magic of information technology can make grandiose "Jobsian" schemes superficially appealing. We need to continuously ask ourselves whether such schemes advance the public interest in a way that merits grand-scale expenditures. Thoughtful people can tell you that great social advancements can take place with the imaginative use of existing information technologies. You don't have to be a reference librarian to know that.

-Phil Shapiro

BEGINNER'S CORNER /
Polishing Green Apples

By Steve Weyhrich

>>> HOOKED ON CLASSICS (Part 2) <<<

MORE CONTROL PANEL BASICS   In the last edition of Polishing Green Apples, I began a discussion of the Control Panel classic desk accessory on the Apple IIgs. We covered "Display", "Sound", "System Speed", and "Clock" in more detail than you probably cared to know. This time we skip on down past "Keyboard" (or "Options"), plunging downward into the icy waters deeper in the menu, touching on "RAM Disk" and "Slots".

RAM DISK   Briefly, a RAM disk is a range of memory that has been designated to the computer as being a storage device. "Solid-State Data Storage" would probably be a more appropriate name, but the name was applied long ago and has stuck. RAM disks have been around in the Apple II world as far back as the DOS 3.3 days. The 128K Apple IIe could be convinced to make use of the second 64K bank of memory by patching the disk operating system to pretend that there was a disk device at Slot 3, Drive 2. (Since the firmware for the 80-column display on the IIe was activated by accessing Slot 3 from Applesoft with a "PR#3" command, it seemed proper to make that slot the one where this "disk" drive would reside.) Later, with the introduction of ProDOS, it was fairly simple to...
design a control program (called a "driver") to turn a segment of memory into a storage device. In Gary Little's book, "Apple ProDOS: Advanced Features For Programmers", he included a driver that used the upper part of the main 64K memory on an Apple IIe or IIc as a very small RAM disk.

RAM disks have been popular, since they are fast (no moving parts!) and quiet. Their drawback comes by their very nature; when the power is turned off, your RAM disk and all the files stored on it are gone. Consequently, a RAM disk must be used with caution.

On the IIgs, there are two ways in which a RAM disk may be used. One would be through a card plugged into one of the seven expansion slots. (This method will also work on a IIe or II Plus.) The other method, more commonly used, would be to take some of the main memory for the IIgs and designate it specifically for use as a RAM disk. That is where this Control Panel device comes in to play.

Here is the appearance of the RAM Disk Control Panel:

~ Resize After Reset: No

(These numbers would be more or less correct for an Apple IIgs with 4 meg of RAM.) What is common between these two is the ability to select the size of a RAM disk by pressing the right and left arrow keys. The amount of memory that can be used is limited only by what is free; however, the memory used by the RAM disk is unavailable to the system, so an 800K RAM disk on a IIgs with 1.25 megs of memory would significantly limit which applications you could run. On a system that is large enough to allow it, an 800K RAM disk is very nice, since it has the same storage size as a 3.5-inch disk, and makes it easier to duplicate one of those disks if you have only one 3.5-inch drive.

Notice that the ROM 01 version had the option of choosing a minimum and maximum size for the RAM disk. I've not been able to find anything that explains to me exactly what this means, but I believe it was intended to allow the IIgs memory manager to use some of the RAM disk space if it was needed, to the point where it would encroach on the minimum size. My understanding is that there were some bugs in the ROM code that was to handle this, and so it has been recommended to always make those two sizes the same.

On the ROM 03 version, there is also the option of making a change in the RAM disk size take effect by simply pressing ctrl-RESET to reboot the
system (if set to "Yes"), or to make it necessary to shut the computer completely off before such a change will take place. For those people who set up a RAM disk size and never change it, this setting doesn't matter. If you have a limited amount of memory, and only use a RAM disk under certain circumstances (for copying 3.5 inch disks, for example), being able to resize the disk without having to shut the power off may be a useful feature.

SLOTS  Moving back up in the Control Panel list, the Slots item is the key to configuring your Apple IIgs to be in tune with the different peripherals that you have plugged into it. To review, the IIgs comes with a number of functions built-in that most users need to get adequate use out of it. With no extra cards plugged into any of the slots, you have two serial cards (for printer and modem), the firmware needed to properly manage 80-column text display for 8-bit programs, a controller for the mouse for 8-bit programs, and firmware to handle 3.5 inch and 5.25 inch disk drives (as well as some other disk devices that follow Apple's protocol). Additionally, there is some firmware that makes it possible to connect the IIgs to an AppleTalk network.

The normal settings for the Slots Control Panel appear as follows:

**Control Panel**

**Slots**

~ Slot 1: Printer
~ Slot 2: Modem
~ Slot 3: Built-In Text Display
~ Slot 4: Mouse Port
~ Slot 5: SmartPort
~ Slot 6: Disk Port
~ Slot 7: Your Card

**Startup:** Scan

Select <- -> V ^ Cancel: Esc  Save <-|

Notice that the only slot that is not specifically assigned to something else is Slot 7, "Your Card". This is free to plug in any other type of device you would like, although most IIgs users prefer to put a hard drive controller here. And that, as an example, is where modification of the Slots Control Panel might be necessary. If you choose to spring for a hard disk (which I would strongly recommend; it makes using any computer MUCH easier, and prices are dropping to the point where it is very affordable), you will need a SCSI controller card to allow the computer to communicate with the hard drive properly. When the SCSI controller is plugged into Slot 7, no changes are necessary to this Control Panel; it is already set up to expect some sort of card to work here. However, if you need to use AppleTalk, you may need to keep this slot free. In that situation, you will need to put the SCSI card in some other slot.

(In a later segment of this column, I plan to discuss in greater detail the ways in which a hard disk drive can be added to this computer.)

The Slots Control Panel is adjusted in the same way as the others. Use the up and down arrow keys to select the slot you wish to change, and then use the arrow keys to change the setting. Note that for Slots 3-6, the only alternate setting available is "Your Card". So if, for example,
you wished to put a SCSI controller card in slot 4, you would need to change the setting for that slot from "Mouse Port" to "Your Card" and then reboot to make the settings take effect.

Slot 7 is unique in that it can be used for connection to an AppleTalk network. If you choose to use it in that way, a ROM 01 IIgs will require that you set Slot 1 to "Your Card". A ROM 03 IIgs will need to have either Slot 1 or Slot 2 set to "AppleTalk".

In the ROM 03 version of the IIgs, Slot 1 and 2 can also be changed from "Modem" to "Printer" to "Your Card" to "AppleTalk". Being able to quickly change either of these slots to "Modem" or "Printer" is handy for connecting two serial printers to the IIgs. Although two printers certainly can be used on a ROM 01 machine, there are some settings that would need to be manually changed in the Modem Port Control Panel (which will be discussed in the next installment of this column).

Finally, there is the Startup setting. This is one place where the IIgs particularly has a flexibility advantage over the Apple IIe or II Plus. When booting up those older models, the firmware will begin looking at Slot 7 for a valid disk controller card, and work its way down to Slot 1 until it finds one. The problem with the IIe is a hard drive MUST be placed in Slot 7 if you want to boot from it; otherwise, a 5.25 inch drive controller card in Slot 6 will be identified first, and the computer will attempt to boot that disk drive. Certain types of speciality video cards have to go in Slot 7 on the IIe and II Plus, and so trying to put a hard disk controller in that slot may complicates things.

On the IIgs, you can make it boot from ANY slot you want, even Slot 1, by simply changing the setting on the Startup item in the Slots Control Panel. "Scan" makes it work just as on the IIe and II Plus (starting at Slot 7 and going down to Slot 1). Pressing the right or left arrow keys with Startup highlighted will change to "Slot 1", "Slot 2", and so on up through "Slot 7". It is also possible to set it to boot from "RAM Disk" and "ROM Disk" (and "AppleTalk" in the ROM 03 IIgs). If you select any of these settings, and a bootable device is NOT found, you will get the screen with the sliding apple that tells you to check the startup device.

The "AppleTalk" setting makes it easy for a ROM 03 IIgs to boot from the network. A ROM 01 can also boot AppleTalk, but the setting for Slot 7 would need to read "AppleTalk" and Startup would have to read "Slot 7". When configured this way, a IIgs would not even need any disk drives; the AppleTalk connection would provide file storage on the remote file server (usually a Macintosh). The primary drawback would be speed of file loading and saving (which would not be up to the speed of a fast SCSI hard disk controller).

The "RAM Disk" setting can be useful if you have set up a RAM Disk (via the RAM Disk Control Panel, discussed above) and have moved to it files or a disk image that you want to boot. I have an 800K RAM disk on my IIgs, and will sometimes move files from a 3.5 disk over to the RAM disk, and then boot the RAM disk to get better speed in loading and saving files. As mentioned before, it is essential to move over to a REAL disk anything that you want to keep permanently.

The "ROM Disk" setting is somewhat archaic. It referred to a particular place in the IIgs memory map where space had been set aside to access files on a plug-in card. The difference between a RAM disk and a
ROM disk would be that when the computer is turned off, the data stored on a RAM disk disappears. A ROM disk would not lose its contents, since it was in non-erasable memory. No true ROM disk cards were ever released for the IIgs, and so with one exception this feature was never used. That exception was Applied Engineering's "RAM Keeper", which took some of the memory on a RAM expansion card, kept it alive via an onboard battery, and convinced the computer that it was a legal ROM disk. The advantage of this approach was that most of the system files necessary to boot the IIgs could be kept on this "ROM" disk, and when it was turned on, it would boot quite rapidly. In the days when hard drives were quite expensive, this was a more affordable approach to make the IIgs easier to use. Today, however, this is not as flexible as using a fast hard disk controller, and so has fallen by the wayside.

ESCAPE Let's back up out of this menu for another month. Join us next time, same Bit-Time, same Bit-Channel, for more exciting adventures in exploring some of the other options available on the Apple IIgs Control Panel.

TECH TALK /

Apple II Hybrids

By Jay Curtis

[J.CURTIS8]

>>> INTRODUCTION TO APPLE II HYBRIDS <<<

Although the Apple II appears to have reached an evolutionary dead end, it still displays a remarkable ability to survive in its present form(s). It's definitely a technological Rasputin; no matter how hard they try to kill it, it just keeps coming back. Heck! The Apple II is a lot like that annoying battery-powered bunny that keeps "going and going and going" across our television screens. Just when we least expected it, here comes AppleWorks 4.0! It's amazing!

I think that the Apple II will be around as long as there are
personal computers. It will continue to have its own devoted following in
spite of how Apple treats it, in spite of the indifference of so many other
kinds of computer owners, and in spite of the relentless growth of new
technology. One A2 GENie user said that they would have to pry his IIgs
out of his "cold, stiff fingers" on his death bed to get it away from him.
I understand the sentiment. I think that I'll have my IIgs BURIED with me!
It's not just a computer; it's something special, and that's why I want to
talk about "Apple II hybrids".

So what is an "Apple II hybrid"? Well, it's NOT one of those
mysterious beasties that consist of a combination of analog and digital
systems (which have been around since the '60s). So relax.

Webster's dictionary offers the synonym "composite" for the word
"hybrid". It also says that a hybrid can be: "something (as a power
plant, vehicle, or electronic circuit) that has two different types of
components performing essentially the same function." Webster's also talks
about "persons" as hybrids. While computers are not persons, different
computers DO have different PERSONalities. This fits in nicely with
another of Webster's definitions of hybrid: "a person whose background is
a blend of two diverse cultures or traditions."

In the coming articles, we'll be looking at machines that combine the
Apple II architecture with some other computer architecture so that the
resulting computer is capable of processing software written for both the
Apple II and at least one other computer's operating system. That's our
definition of an Apple II hybrid.

Technically speaking, the Apple IIgs, all by itself, fits that
definition. In native mode, it runs 16-bit GS/OS software, while its IIe
mode is essentially an emulation mode which allows it to run 8-bit ProDOS
and DOS 3.3. Consequently, there are some among us who do not consider an
Apple IIgs to be a REAL Apple II. Just try telling that to a IIgs owner
who spends the lion's share of his time in AppleWorks classic and ProTerm,
however!

In coming articles, we'll focus principally upon the PC Transporter-
equipped IIgs and IIe computers and also upon the Macintosh LC and
Performa series computers that have been equipped with the IIe Card.
(Fortunately, I have both an LC/IIe hybrid at work and a GS/PC hybrid at
home, so I've got first-hand knowledge of both of them.) Along the way, we
may also talk a little about other Apple II hybrids, like the ones that use
Diamond Computer Systems "Trackstar" cards, and run 8-bit Apple II software
on PCs.

We'll also talk about the various schemes for encoding data on
magnetic disks and about the peripheral devices required to read from and
write to different filing systems on different computers. In particular,
we'll talk about Transdrives, Superdrives, and Floptical disk drives in
use with Apple II systems for reading and writing to ProDOS, HFS, and
MS-DOS. We'll also talk about file translation software that is currently
available or under development, and about how it contributes to the
integration of two different computer systems within one box. Ultimately,
we may take a stab at the question of whether the Apple II or IIgs stands
any chance of becoming a "personality" on a Power-PC RISC-based computer,
and we'll do this by soliciting the opinions of some of our more eminent A2
BBS members.
The evolution of Apple IIe and IIgs computers as machines that are capable of processing MS-DOS has been an interesting thing to watch, especially since the MS-DOS FST was introduced with the GS's System 6.0.1 software a few months ago. It is expected that new software innovations, patches, and capabilities will become available for the GS/PC hybrid before this series of articles on Apple II hybrids is complete.

Why investigate Apple II hybrids? First, the blending of computer operating systems and software capabilities seems to be an inevitability. It is probably just a matter of time before it will no longer matter what kind of computer you use. If your software has been digitally encoded, your new computer will process it, or at least it will be capable of processing it with the right emulation software.

Second, one means of extending the useful life of an Apple II is by extending its functional capabilities. Use of a PC Transporter card in an Apple IIe or IIgs -- or System 6.0.1's HFS and MS-DOS FSTs -- or the IIe card for the Macintosh -- will help to keep the Apple II alive as a system. In doing this, new software (like AppleWorks 4.0) is created. When people get used to using new, more powerful software, they then have a need for continued sales of the hardware, and the cycle repeats itself.

Many Apple II watchers are betting that the current version of the LC's IIe card may be the final incarnation of the Apple II. They may be right. It's quite likely to be the last HARDWARE version of an Apple II, but that doesn't preclude a SOFTWARE version of an Apple II running on a RISC-based machine sometime in the future. In the preface to its 178-page manual for the LC's IIe card, Apple notes that there are "more than 10,000 Apple IIe programs." Many of these programs are still popular in countless schools throughout the U.S. They are also still popular with countless independent users, and the demand for hardware or software emulations to run these programs will exist for some time to come. Don't hold your breath waiting for the death of the Apple II. It has many years ahead of it in some form or other.

In the next two months, we'll look at how the PC Transporter accomplishes its work inside of an Apple II, and at what kinds of peripheral devices can best be used to support an Apple II that also processes MS-DOS. We'll also take an in-depth look at the software that helps to turn a IIgs into a highly integrated machine, capable of manipulating MS-DOS files in both Apple and PC modes. We'll probably poke a little fun at MS-DOS, comparing it with ProDOS as we examine some of its strengths as well as its weaknesses. Later articles will focus upon the IIe-equipped Macintosh LC III. The LC/IIe hybrid has some nice strengths as a II, and it needs to be re-examined.

Until next month, it's okay; think "hybrid".
BEFORE WE BEGIN... I must tell you that this article is a review for a shareware program. I figure that if I do not tell you early, you may lose sight of where we are headed. So remember, this is going to be a software review. This is going to be a software review. Got it? Good.

I want you to think back to the early days of Apple II hardware. Think back all the way to the point that floppy drives were just becoming standard equipment for computers. At that point, the well-heeled computer owner was able to get output from his Apple II+ by installing an Apple Parallel Portcard and some type of dot-matrix printer. The printer was probably made by IDS (Paper Tiger) or Epson (MX-80). The output was readable, but looked pretty bad after the ribbon started to get old.

Now jump forward to the early days of the 1990s. The well-heeled Apple IIgs owner now has enhanced graphics modes, fantastic stereo sound output, and faster number crunching. And what exactly does our intrepid user have to print his lovely output files? Why, a direct descendant of the dot matrix printers that were mentioned above. The only choice is whether you have a 9-pin or 24-pin print head.

I reached the point, a few years ago, where I needed a new printer and wanted the most professional output that I could afford. However, since I was only pursuing part-time jobs on the Apple, I could not afford to spend much money on a printer. Therefore, it was necessary that I consider the benefit of purchasing a LaserJet-compatible printer instead of the popular
PostScript-compatible printers. The decision was very difficult to make. PostScript printers were anywhere from $100 to $500 more than an equivalent LaserJet printer. I finally decided to go the cheaper route.

Just after I purchased my new printer, a few good things started happening that helped change the way that I used the LaserJet-compatible printer. The first thing to happen was the release of an ink-jet version of the common laser printer. This printer is called the DeskJet. The ink-jet technology was much more affordable to the general public. Along with that hardware advance came an interest by software makers in supporting these less-expensive printers. Riding this wave of events, the Harmonie and Independence print driver software was born. Apple IIgs users were now able to get very high resolution graphics and text output from their LaserJet-compatible printers.

This proved to be a good point in the evolution of the Apple IIgs LaserJet print drivers. Two competing products were available that would give you PostScript-quality output for a package cost that was still much less than the cost of the PostScript laser printer. Life was good. But there were problems... small, but irritating, problems.

The Harmonie print driver seems to handle graphics better than other drivers, but is somewhat less adept at creating crisp text output. It also suffers from a very severe problem that was not noticed by many early reviewers. Harmonie would not print more than one page from any word processing package other than AppleWorks GS.

The Independence print driver seems to handle text quite well, but is not as smooth in the graphics department. Circles and other curves seem to bring out the worst problems. Independence is not as exact in the area of print size adjustment. The designers opted for an easy interface and less complete control over the output sizing.

Both print drivers suffer from a few common problems. The first, and biggest problem, is print speed. Both will take from 2 to 4 minutes per page, depending upon how dense the text and graphics are. Another common problem is that the programs use quadruple size fonts to build the bitmap that they use for the output. These fonts are slightly bigger than the aspect ratio needed for precise output scaling. Therefore, both drivers end up printing accurately for the top, bottom, and left margins. The right margin is always slightly longer (further to the right) than it shows up in the WYSIWYG display.

One thing becomes apparent when you analyze these drivers. Both of them depend upon a rasterized image being built to send to the printer. Neither of them downloads a font to printer memory and then uses it from there. I thought of this solution while I was first reviewing the Harmonie and Independence packages. However, I was not able to start such a project at that time. Then, a similar solution to this problem came floating by in a partially-implemented form. An NDA was written that would download any Apple IIgs font to the LaserJet II-series printer. This still did not quite satisfy the requirements that I had in mind. A user could not automatically use the downloaded fonts in his/her printout. This turned out to be the next step in the evolutionary process.

Finally, another solution is available that solves more of the text output speed problems and the exact sizing problems inherent with the other drivers. Author Heath Wilkinson has released a $15 shareware package
that fills some of the gaps listed above. This print driver is for the LaserJet IIIP (although many other printers should also work). It downloads the nearest font size match that it can calculate for the fonts that you use in a document. The fonts are adjusted for the difference in aspect ratio between the Apple IIgs and the LaserJet. Once the fonts are downloaded to the printer, the process of printing a page becomes just like printing simple text. The downloaded font is used to form the characters sent.

There is one major advantage to this scheme: it is fast! The initial setup time is required for each printout to download the necessary fonts. The downloaded fonts are removed after each print. Therefore, the printer memory will not become full after a number of different fonts are used. The only disadvantage to the one-printout/one-set-of-fonts rule is that multiple printouts with the same fonts will all require time for the fonts to be sent to the printer. However, it should be noted that this same scheme is used by the Microsoft Windows Print Manager to print to LaserJets. No graphic support is provided in the current driver. Therefore, you cannot expect to achieve satisfactory output from a paint program. That is the wrong use for this driver. Use this driver only when you want fast, accurate renderings of text using Apple IIgs and/or TrueType fonts. It should be noted here that TrueType fonts are preferred, since Pointless can generate any size font from the outline. Otherwise, you will have to anticipate the correct size of fonts to have available in your System/Fonts folder. The TrueType route is obviously easier.

The author claims that his driver software is much faster than either Harmonie or Independence. He gives an example where a multiple-page document is printed with both Harmonie and the LaserJet driver. The LaserJet driver is much faster over the long haul. I tried my own tests using my own target document files. The results show that the driver will be about the same speed as any other for the first page. After that, the LaserJet print driver can burn through the printing process and will provide exceptional speed.

As I mentioned earlier in this article, the LaserJet print driver is shareware, yet still does not support graphic output. Therefore, your shareware payments should encourage the author of this program to finish his work. In any case, the print driver is very functional right now when it is used as a TrueType font/text printer. You can reach the author of this program at the following address: H.Wilkinson2. You can find the current version of the print driver by searching the A2 libraries using the name H.Wilkinson2 as the uploader.

In summary, we can see that the LaserJet print drivers have gone through an evolutionary process during the past four years. Different techniques have been developed to make printing of Apple IIgs files both smoother and faster. This process has benefited the end user by creating ever better software to meet their needs. There is no reason to think that the process is over yet. The world has still not seen the ultimate mouse trap. Nor do we have the ultimate LaserJet print driver. Yet.

>>> WHO'S WHO <<

~ GEnieLamp Profile: Jim Royal, Author of Star Trek: First Contact ~

GEnieLamp> When did you first start using an Apple II?

Royal> I purchased my trusty Apple IIc in late 1984. Surprisingly enough, the Apple dealer is still in business and to this day will happily service the machine. I bought the computer largely because it was cool. I hadn't a clear idea what I'd do with a computer, beyond a little word processing, and even that was only a faintly conceived expectation. But everyone was getting a computer, so I did.

Over the years, I've added extra memory, 5.25 and 3.5 disk drives, a mouse, and most recently an accelerator. When I think back, the Apple IIc's contemporaries in 1984 were the IBM PCjr, the Macintosh 512K, and the Commodore 64. It looks like I made the best choice at the time.

GEnieLamp> When did you start programming your Apple IIc?

Royal> I began programming almost immediately, in Applesoft BASIC, following an introductory programming course in college. My first major effort was the beginning of a game which actually contained the conceptual nugget of Star Trek: First Contact. That program was accidentally erased before it was anywhere near completion -- in wry hindsight, probably an act of God taking revenge on what was likely a truly wretched piece of code.

I think my biggest revelation in programming was learning Pascal. After years of writing the most horrifying spaghetti code in BASIC (producing results not entirely unlike those of someone trying to build a road in a blizzard) I suddenly had a clear vision of how a computer program SHOULD be written. Shortly thereafter, I went back and re-wrote all those godawful little Applesoft menu programs and minor utilities I had created over the years. To this day, I always recommend that beginner programmers learn Pascal first and BASIC second, if at all.

GEnieLamp> Was there any one person who helped ignite your interest in computers?

Royal> No one person prompted me to take up computing -- it was the uniformly pro-computer environment of the early 1980s. All the computer companies were delivering the hard sell. All the schools wanted computer labs. All teenaged boys wanted a computer (if they didn't want a car first). What sold me on the Apple II was an eight-page glossy advertisement in Omni magazine which extolled the virtues of the Apple II over the IBM PC. I still have that magazine. How times change.
Whose work in the Apple II field do you admire most, and why?

The one group of people who have contributed the most to the Apple II world would be Beagle Bros. They maintained a reputation of high quality and good humour right up until their untimely demise at the hands of the ruthless Macintosh marketplace.

Would you briefly describe your game, Star Trek: First Contact?

Star Trek: First Contact is a simulator which brings to the Apple II user the realistic experience of deep space exploration. It combines elements of a strategy game and an arcade game to create an authentic recreation of the Star Trek flavour and ideology.

Your mission: To explore forty unknown worlds and to seek out and contact the inhabitants. But meanwhile, an alien Intruder is exploring the same area of space. Its mission is unknown, but you must find it, contact it, and deal with it. Will the mission end in a peaceful greeting or will your ship and many inhabited worlds be destroyed? Only you can decide.

Star Trek: First Contact will run on a basic 128K Apple II with one 5.25 disk drive. It fully supports large-capacity disks and expanded memory. Version 2.1 offers many improvements over v1.0, including a new save game feature, a wealth of detailed information on each planet, the streamlining of many commands, and a sophisticated course-plotting function.

What influenced you to write a Star Trek game?

Far too many of the commercial and public domain Star Trek games are all variations on the same theme... the Enterprise placed against a zillion Klingons all lined up in a row to be shot at. I've always felt that, aside from the limited intellectual scope of such games, they never represented the thrill of deep space exploration. I wanted something different. So I set out to create it myself.

I wanted a game which would accurately reflect the spirit of the show. To explore... to encounter and discover... to occasionally get into a phaser fight if the situation calls for it. I hadn't realized how tough that would be.

Both the original Star Trek series and the Next Generation are strongly character-oriented shows, and that's the source of the show's dramatic power. But I didn't want to make a role-playing game. I wanted to command a starship.

I ended up with a compromise. There's a very limited sort of role-playing in the dealings with the Intruder vessel and with the Away Team missions. With a more powerful computer (such as a IIgs or a Mac), these elements could be expanded. And I managed to keep the starship-commander aspect at the core of the game.

Finally, I shaped the game as a training simulator during the time period of The Next Generation mainly for flavour and verisimilitude.

Apple II Computer Info

GEnieLamp> When did you release the first version?

Royal> Star Trek: First Contact 1.0 was release in June 1992. Version 2.0 came out in August 1993, and 2.1 was released in September 1993. To this date, I've received about a dozen mailed comments from users who appreciate the game -- one from Helsinki, Finland.

GEnieLamp> Can you comment a bit on your ideas about shareware as a publishing channel?

Royal> The future of the Apple II will definitely involve shareware. While mail-order companies such as Quality Computers continue to bring new software and hardware to the user, their range of suppliers is getting smaller all the time. The Apple II is still a viable platform for hundreds of thousands or even millions of people, and a broad show of support for programmers will keep the machine alive for years to come.

I'm gratified that some of my users have been sufficiently impressed by ST: FC to pay their ten-dollar donation in thanks for the game. Many have not sent their cheques, however, and I have no idea if they enjoy the program or not. Feedback is much more important to me than a shareware fee. And it is only by thanking and encouraging shareware authors that users will continue to benefit from new and exciting software. I want to hear from the people who play my game. Their comments are valuable to me.

GEnieLamp> I like to pay for shareware the minute I've decided to keep the program. Being a Canadian, I find I can't pay U.S. shareware authors without a trip to the post office or bank. Do you, as a Canadian shareware author, have trouble with U.S. payment?

Royal> I have no problems cashing cheques from American banks -- which is fortunate, because all but three of my shareware donations have come from American users.

GEnieLamp> Could you tell us a little about what language you used to program Star Trek: First Contact?

Royal> First Contact was written in ZBasic. It's a surprisingly flexible language. It allows the user to define long functions which work exactly like Pascal procedures. It has up to 54-digit math. It supports several different graphics modes on the Apple II, and it is a lot faster than Apple Pascal.

There have been versions of this language created for IBM, Mac, Radio Shack and Z-80 computers, so the source codes programmers produce are ninety-nine per cent portable. Unfortunately, Zedcor's support for the Apple II edition has almost disappeared.

GEnieLamp> Do you have any horror stories about stomping bugs in Star Trek: First Contact?

Royal> Bug stomping for ST:FC was an absolute nightmare. The program consists of eight semi-independent modules, which interact with each other in many different ways. I'm quite sure if I had not spent six months planning the design of the game on paper, the whole project would have become completely unmanageable very quickly.
Not helping matters at all was the ZBasic compiler itself. It's a very reliable piece of work until you start pushing at its memory limits. Sometimes, adding a subroutine to the game would paradoxically result in more free space. And removing a subroutine would occasionally produce an Out of Memory error. To combat these electronic shenanigans, I would revise and compress the code. And compress. And compress. Version 2.1's source code is probably nearly twice as space-efficient as version 1.0. I learned a great deal about programming efficiently, and I invented a whole slew of memory-saving programming techniques.

IBM and Macintosh programmers, who have gobs and gobs of megabytes to play with don't know what they're missing. I say you're not a real programmer until you've tried fitting a complex game into 28K. (ZBasic limits you to 28 kilobytes for code and 30 kilobytes for variables).

Probably the funniest bug the game had was the result of misplaced equals sign. At one point, the Intruder would refuse to attack. He would much rather buzz 'round and 'round the Federation starship and then suddenly flee for no reason. Firing at him made no difference — it would make him run faster. Nothing could make him turn around and fight.

The design of the game allows a small number of "control" variables to switch whole groups of behaviour patterns for the Intruder on and off. And a single flag held the key to this problem. With it switched off, the Intruder instantly reverted to his old belligerent self. It took a week to do this, however.

GEneiLamp> What do you do for a living?

Royal> By training, I am a journalist. I write and announce the news on a pop music radio station in Montreal. Up until recently, I was also the producer/host of a weekly newsmagazine show on an alternative radio station. Right now, my nine-to-five job is a technical writer for Eicon Technology. Eicon produce software and hardware for an endless variety of computer connectivity needs — all the way from LANs to transparent X.25 packet-switching network interfaces. I help write their manuals.

GEneiLamp> Besides programming, what other hobbies and interests do you have? What do you wish you could spend more time doing?

Royal> I collect music (among my favorites are Vangelis, Mozart and singer Sarah McLachlan) and I read science fiction (Ursula K. LeGuin, Stanislaw Lem, Arthur C. Clarke). I am an avid cyclist — I avoid all motorized transportation in the summer except in the heaviest rain. BBSing is becoming more and more my major past-time.

But I only wish I could spend more time on my true love — broadcast journalism. For those American readers out there... Peter Jennings, Jim Lehrer, Shelia McVicar, Peter Kent... all are Canadian. But recessions do have a way with the world.

GEneiLamp> How do you prefer people to contact you?

Royal> I'd love to hear from people any way which is convenient for them. Either by post or through E-Mail (GE Mail = J.ROYAL1; Internet =
Apple II Computer Info

j.royall@genie.geis.com). Authors are always pathetically eager for feedback. I'd like to know how people find the game, and if there are problems, I'll gladly fix them.

By Larry Faust
[L.FAUST2]

THE $99 LINELINK 14.4E MODEM AND THE APPLE II

A recent MacWarehouse catalog offered the Hayes-compatible, fax-upgradeable LineLink 14.4e modem for the unbelievably low price of $99. A cable, telecommunications software, and Accu-Weather (a Mac application) were also included in the deal.

Wow, I thought. Up and running at hyper-speed for less than $100...just plug and play. I was doubtful; this was a _Mac_ mail-order outfit, after all. It just sounded too good to be true. But the price was just too low to pass up. I had heard of Apple II's modeming at such speeds -- and higher! -- so I called their toll-free number, 1-800-255-6227, and ordered one (product number BND0249). Although MacWarehouse gladly accepts MasterCard, Visa, Discover, and American Express, my mail-order method of choice is COD. ($6.00 additional fee, but worth it to me). Credit card orders are sent via Airborne Express next day, while COD orders go via U.P.S. 2nd day.

Well, this whole LineLink thing had taken our friends at MacWarehouse more than a little bit by surprise. At the time I called, they had sold out and the back-order list was some _2,000_ names deep! But I was assured that a new shipment would come in during the following week.

In the meantime, I scoured my online resources for information and end-user experiences with the LineLink and the Apple II. The plethora of posts on GENie and the Internet revealed that this was indeed a popular deal amongst the Apple II community.

Eventually, my patience was rewarded, and the modem arrived last week. Despite its plastic case, the modem was more substantial that I thought it might be; definitely not the shoddy product that its low price implied. The LineLink is slightly larger than the Apple 5.25" disk drive, making an attractive space-saving modem/5.25" drive/3.5" drive pyramid.

But functionality was the main concern of the users who put up all those posts. One does not fork over $99 just to have a good looking box; it's got to work too!!

And work it does; _at all speeds up to 14,400 baud_ (underlined because some users were reporting that the max was 9600 baud)! Not only that, but the Mac cable that came with the modem worked with my IIgs _straight from the box_. Gone were my nightmares of hunting around to find the special "hardware handshaking cable" that some were talking about online!
The manual is brief (28 pages), but gives an adequate overview of the LineLink. It states that the fax upgrade refers to the fact that Mac fax software, not hardware, is necessary to use the modem's fax features. It's fax-ready out of the box; all the Apple II user needs is someone to release Apple II fax software (c'mon, Quality, Econ, and Intrec <g>).

Although it says "Technology Concepts, Inc." on the front, the LineLink is manufactured by Prometheus Products, Inc., a major modem manufacturer. It uses v.42/v.42bis/MNP-5 error correction and data compression, and the manual states that "peak data rates up to 57,600 bps may be attained using v.42bis."

As far as the Control Panel settings go, the IIgs's MODEM PORT must be set to the following parameters and then rebooted:

- Line Length: UNLIMITED
- Delete Line Feed: NO
- Echo: NO
- Buffering: NO
- Baud: 19200
- Data/Stop bits: 8/1
- Parity: NO
- DCD Handshake: NO
- DSR Handshake: NO
- XON/XOFF Handshake: NO

On the software side, the Mac comm software and the Accu-Weather were useless, but I recycled (reformatted) the disk. I use -- and highly recommend -- ProTERM for all Apple II telecommunications. (Although I used ProTERM to evaluate the LineLink, it implements the majority of the industry-standard Hayes AT command set and should operate with every Apple II telecom package on the market.)

In order to correctly initialize the modem under ProTERM, select INSTALL under the MISC menu. Click the MODEM button, and select HAYES SMARTMODEM v9600 (CTS/RTS). Click OK (No, the default Smartmodem init string does NOT need to be "tweaked," but can be if desired). Remember to change your BAUD selections on each entry of your dialing list to 19200 (the closest setting to 14400 on the list).

After playing with it for only one week, I gotta tell ya, this little screamer is a GREAT value! Screens of text that used to spill onto my screen at 2400 baud literally fly by, and off-line reading with the ProTERM scrollbar buffer is now a necessity instead of a convenience; I can only imagine my long-distance savings. My only complaint so far is the length of time that the modem takes to auto-baud when confronted with a carrier slower than 14400 baud. I've logged onto several local and national BBSes and, in some instances, have had to extend my default connect time from 30 to 40 seconds.

At the last time I checked, MacWarehouse was still taking orders. My recommendation to the Apple II user who is thinking about a high-speed modem with fax capability is to call now and order a LineLink 14.4e -- ask for it by name. Quick, while this offer lasts!

[EOA]
[AII]/////////////
INTRODUCTION

In this part of the History, we will go into an overview of software that has been designed for the Apple II, and then look further at two of the most influential programs ever written for this computer, VisiCalc and Apple Writer.

"WILL SOMEONE PLEASE TELL ME WHAT AN APPLE CAN DO?" One of the most
important features to a customer considering any computer is, "What can I do with it?" It might be an attractive-looking box, with incredible features and potential, but if all it can do is run demonstration programs, it won't be very useful. In the early years of the microcomputer era, most users had to either write their own software or use programs written by some other amateur. "Commercial" software written by "professionals" was unavailable, except possibly from the company that produced the computer. And unless the user knew assembly language AND the internals of the computer intimately (which depended on the willingness of the manufacturer to divulge those secrets), the only application software available was likely to be written in BASIC. Anyone who has used the versions of BASIC available at that time are well aware of the quirks and limits placed on the programmer by that language and by the small memory sizes available (see discussion in Parts 16 and 17).

As we have already seen, the Apple II came with few intentional secrets; the primary limitation on information distributed with it was the time required for Apple to produce a printed manual. When the first manual finally did arrive, it included a commented source code listing for the entire Monitor and all its supporting routines. This openness had a lot to do with the early success of the Apple II. Other manufacturers, such as Atari (with their models 400 and 800, based on the same 6502 as the Apple II) and Texas Instruments (who made a 16-bit machine called the TI 99/4), kept everything very secret and thus tried to maintain some control over distribution of software. This MAY have been done to ensure that only high quality programs were released, but more likely they were concerned about controlling who received royalties on sales of the software. Unfortunately for them, it choked the development of amateur software authors (who may have later become professional authors).

As an example of this corporate secrecy, one early programmer named John Harris wanted to write games for the Atari, but could not get the company to release any information on how certain effects were achieved in their commercially released games. He was bright enough to eventually figure out the secrets himself, and became one of the wealthy software "stars" of the late 1970's and early 1980's.<1> Computer producers of the time did not yet grasp the principal of the software/hardware loop:
Available software stimulates sales of hardware (computers and peripherals), which further enlarges the software market, which sells more computers, and so on. The industry was too new to know how to do much more than make and sell new computers.

SOFTWARE ON THE APPLE II

In the Apple II part of the computer world, the first distribution of software came from home authors. These people were usually first-time computer buyers who were captivated by the excitement of owning their OWN computer, and then had to sit down to actually find something useful or fun to DO with it. They often brought their first programming efforts to show off at the computer store where they had bought their machine. Since the store owners had very little software to offer to their potential customers, some of these authors ended up with the opportunity of having their programs duplicated and made available for sale. Ken and Roberta Williams started their company "On-Line Systems" (later Sierra On-Line) this way with a game called Mystery House, one of the first adventure games featuring hi-res graphics pictures.<2>

Other early software came from the first user groups. These usually developed out of the gatherings that inevitably took place at the computer stores, as mentioned above. Since the people who actually used these computers day in and day out at home had a better grasp of how they worked and what could be done to work around problems, the store owners often ended up referring their new customers to these groups for the detailed help they needed. Not only were there the older groups (like the Homebrew Computer Club), but many newer, more machine-specific groups developed. Names like A.P.P.L.E. (Apple PugetSound Program Library Exchange) and International Apple Core became known well beyond their local beginnings as they began to distribute their newsletters and magazines to a national audience. Later, they became major sources of informational articles, utilities, and application programs that were as yet unavailable anywhere else.

Many of the programs sold by A.P.P.L.E. were popular with Apple II owners. A.P.P.L.E. was designed as a club with dues to pay for the collection of programs, all considered to be public domain, but sold to members at a nominal price to cover the costs of duplication. A.P.P.L.E.'s programs were written by amateur home users who had a unique idea, were able to make it work, and found that they had a product that was useful to others as well. Originally collected on cassettes, and later on disks, some of the programs were eventually made available as commercial products by authors that knew they had something unique that would be in demand by Apple owners hungry for something to use on their computer. A.P.P.L.E. sold many of these as GamePaks, which contained several games on the same tape.<3>

Understanding that a large variety of available programs would help encourage more sales for the Apple II, Apple took some steps to help software authors get their programs on the market. In 1980 Apple employee Mike Kane suggested that Apple help distribute programs that were good, but whose authors couldn't get a publisher to distribute them or didn't have access to computer stores that were willing to sell it for them. Kane formed a division within Apple, called it "Special Delivery Software", and promoted both third-party and Apple-sponsored programs under that label. Between 1979 and 1981 a number of different programs were sold through Special Delivery Software, sporting the Apple logo and displaying a standardized appearance (packages, manuals, etc.), all listed in a catalog...
that could be used by dealers for orders. Apple Writer was originally
distributed in this fashion, as were other less well-known programs such as
Tax Planner, Plan 80, Script II (for Pascal), and MBA (a spreadsheet).
Apple also established the Apple Software Bank and used it for special
programs through 1980. It was more clearly a set of Apple-sponsored
programs than were those sold through Special Delivery Software, and some
of them programs, such as Quick File and Apple Plot, achieved strong
popularity and were moved more into the mainstream of sales for
Apple.<4>,<5>

SOFTWARE EVOLUTION: THE COMMAND LINE INTERFACE

Some of the earliest programs available for the Apple II had a user interface that was quite similar to the ones available for use with time-sharing terminals on mainframe computers: A command was typed on a line, and the computer would execute that command and return with a prompt for the next command. This method was the necessary way of doing things, because video displays were expensive and not in common use. This was particularly true for those who used remote terminals, which usually consisted of a paper-based glorified typewriter connected by a phone line to a mainframe. This device was physically limited to allowing commands to be entered one line at a time. The concept of displaying things on the screen in any order desired, not necessarily going from top to bottom (as would be necessary if it was being typed on a piece of paper in an teletype) was difficult for many programmers of the time to grasp. Moreover, for design purposes, the software code built-in to a computer (like the Apple II) that handled a command line style of interface was much simpler (and shorter) than what would be needed for a more complex interface. With memory at a premium price, simple would have to do. Thus, the Apple II used the command line interface in both the Monitor and in Integer BASIC. These could be used as building blocks to create more complicated software, once people figured out how to do it.

The command line interface, though simple to implement in a program, had the disadvantage of requiring the user to know (and correctly type) the names of the commands. For example, a word processing program might use the command "LOAD" to get a text file into memory, the command "EDIT" to begin to make changes to that file, and then the command "SAVE" to put a copy of the completed work back onto tape or disk. "SORT", with various pieces of modifying information called "parameters", might be the necessary command to arrange the information in a database file into the desired order. Other commands might be needed to search for a specific word, replace a word, and move lines around. In fact, early word processors were often quite similar to writing a program in BASIC: Each line had its own line number, and inserting new lines often meant having to renumber the lines to make a new line available between two existing ones. If extra text had to be added to a line in the process of editing, making it too long, the end of that line might have to be re-typed into the following line and deleted from the current one.

More sophisticated text editing programs eventually began to appear that took advantage of the fact that the user was not working with a typewriter and paper, but with a video screen. These "full-screen editors" would allow use of the arrow keys (or the IJKM "diamond" on the keyboard) to move the cursor around on the entire screen, and it made text entry and later editing easier. As they were further refined, these newer word processors even allowed what had previously been impossible: Text could be typed in the middle of a line, and the text to the right of the cursor would be magically pushed to the right (even "wrapping around" to the next
line if needed) as things were typed. Deletions were just as easy. What was still cumbersome was the need to have specialized commands, often entered as combinations of the Control key and another letter, to carry out some of the functions of search and replace, copy, and so on. Moreover, these command keys were often different from one program to another, with Ctrl-F in one program being used to begin a "find" process, and in another program as a command to jump to the "first" line of the file. As the full-screen method of text editing became more standard, the command-line type of interface became less commonly used.

SOFTWARE EVOLUTION: MENUS  As mentioned above, one of the problems with the command-line method was the requirement for the user to have a good memory for the names of the various commands necessary for the program to function. If the command name was typed incorrectly, or if a specific parameter was omitted or given in the wrong order, an error message would appear, causing great anxiety and hand-wringing to those who were still trying to overcome their fear of using a computer. As an alternative for certain functions in a program, the concept of "menus" became more popular (and was actually used as early as the Apple Color Demo program that came on cassette with the first Apple II's). A menu was simply a list of possible functions a program could carry out. It still often used a command style prompt ("Type choice") to allow entry of the desired item on the menu, but gave a little more ease-of-use since a specific command name did not have to be memorized. A further enhancement of this style of program construction was called a "magic menu", after a sample program written in BASIC and distributed by Apple. In this type of menu, the user had the option of typing the number of the desired menu entry at the prompt, OR he could use the arrow keys to move a large inverse bar up and down the menu to that item. After selecting the item with the arrow key, it was executed by pressing the RETURN key. This came to be known as the "point and shoot" method of command selection.

AppleWorks (which will be discussed in detail next month) took the "magic menu" interface to its highest form, adding the metaphor of "file cards". One menu appeared on the screen enclosed in a box, with a "tab" on the top left of that box. This box resembled a 3x5 file card. When a selection was made from the menu, another file card would appear on top of the previous one, slightly down and to the right, leaving the tab on the lower box still visible. This allowed stacking of menus, with a clear path identifying which menu led to the current menu. The ESC (escape) key was used to "back up" one level, erasing the menu card on top and re-drawing the menu card underneath it. Also, prompts were displayed on the top line of the screen that told where ESC would take you, and what function was currently being executed. Part of the success of AppleWorks stemmed from its ease of use in this respect. Not only were there no cryptic commands that had to be remembered and typed, but the use of special command keys was reserved for advanced use of the program. And when such special keys were needed, a standard "help" screen was available for quick reference. It was possible to do quite a bit in AppleWorks without the need of even opening the instruction manual.

SOFTWARE EVOLUTION: GRAPHIC USER INTERFACES  One thing necessary to make computers easier for people to use was to overcome both the fear problem and the frustration problem. Those who were inexperienced in the use of computers were often afraid that they would press a button that would cause something terrible to happen. If they overcame the fear problem, they still had to face the frustration
of trying to decipher cryptic error messages ("*** TOO MANY PARENS" or "$27 Error"), or lack of success in getting the computer program to do what they wanted it to do.

Adding familiar things to the screen, like the file card menus in AppleWorks, made the fear factor diminish. Making the keys that controlled certain features of that program work consistently from the word processor to the database to the spreadsheet decreased the frustration factor even further. But there were still barriers to overcome in making computers easier to use.

When Lisa appeared on the scene in 1983, and Macintosh in 1984, computer users were exposed to a radically new concept in computer software. These computers lacked the previous standard of typed command input to control programs. Instead, they used a bit-mapped graphics screen to represent a desktop, with pictures (called "icons") that represented a program to run or a file to load. It took the "point and shoot" interface to the limit; you used the mouse to move a pointer on the screen onto an icon representing that program, and then "click" on it to start the program! For more complex control, the Mac used a variation on the "magic menu" system: A "menu bar" at the top of the screen gave a list of command words, arranged horizontally on the same line. Pointing to one of the words and holding down the mouse button would cause a menu to "pull down" like a window shade, displaying several further options available. The desired choice on the menu could be highlighted by moving the mouse to that item (such as "Delete") and the command would be executed. This approach made use of the Lisa and Macintosh considerably easier for the novice computer user, although some commands were also given keyboard equivalents similar to the old "Ctrl" key commands, so a more experienced user could execute some of them without having to take his hands off the keyboard. If AppleWorks could be considered easy enough to use without opening the reference book, this graphic user interface (GUI) was even more so. It also provided a standard environment that all programs written for the Mac could use, making it easier to learn how to use a new program.

Although the 6502 processor did not have the horsepower of the 68000 in the Mac, some programs began to appear for the Apple II that tried to make use of the same concept of overlapping windows, pull-down menus, and a mouse- (or joystick-) driven pointer. Quark released a program selector called Catalyst that used a similar graphics-based desktop, icons for files, and the point-and-click method of file execution. It was included with some of the early UniDisk 3.5 drives, and on Quark's hard drives. Another company, VersionSoft (from France) had a program called MouseDesk, which was distributed in America by International Solutions. MouseDesk worked just a bit better than Catalyst, but did not do very well as a standalone product, especially with Catalyst being given away free with the new UniDisk. Eventually, International Solutions made MouseDesk available for only ten dollars via mail-order, hoping to get it into general enough use that their other graphic- and mouse-based products would sell better. Although that did not happen, International Solutions did eventually sell the rights to distribution of MouseDesk over to Apple Computer. Apple then modified the program and included it with as a rudimentary desktop (modeled after the Macintosh Finder) for their first versions of ProDOS 16 System software for the Apple IIgs.

With the release of the IIgs, it became possible for better GUI software to be produced for the Apple II. The 65816 processor had a bit more power, and the IIgs provided a better quality graphics environment
(via its super hi-res mode) and more available memory than was possible on
the older 8-bit Apple II's.

SOFTWARE: APPLE'S GREATEST HITS  It is beyond the scope of this writing to
go into much detail about the many
programs released over the years, as the sheer volume of them since 1977 is
enormous. Even a brief mention of them all could become a book in its own
right, but Appendix A contains a listing (in moderate detail) of popular
software released over the years. In this segment here I will address in a
little more detail three programs that have been particularly influential
in the Apple II world: VisiCalc, Apple Writer, and AppleWorks.

By 1980, the Apple II software market had established itself fairly
well. This allowed users of the computer to no longer have to write
their own programs, but instead move on to simply being able to USE them.
Softalk magazine, which began in that year, had started nearly from the
beginning with an analysis of top selling software of the day. In their
second issue (October 1980) their bestseller list first appeared, with the
top thirty software programs ranked based on actual sales information
obtained by polling retailers across the country. In that first list the
top selling program was VisiCalc.

SOFTWARE: VISICALC  A major part of the answer to the question, "What
can I do with this computer?" lies in whether or not
the software program in question is so important or useful that it
literally sells the computer. Robert X. Cringely, in his book "Accidental
Empires", put it this way: "VisiCalc was a compelling application -- an
application so important that it, alone justified the computer purchase.
Such an application was the last element required to turn the microcomputer
from a hobbyist's toy into a business machine. No matter how powerful and
brilliantly designed, no computer can be successful without a compelling
application. To the people who bought them, mainframes were really
inventory machines or accounting machines, and minicomputers were office
automation machines. The Apple II was a VisiCalc machine."<6>

VisiCalc offered a way of using a computer that no one had ever
thought of before, especially at the time when most computers were
mainframes with limited access to the "average" user. VisiCalc was written
by Dan Bricklin, a programmer that had decided to enter Harvard Business
School in the fall of 1977 and learn a second profession. Because of his
programming background, he saw ways in which some of his class work could
be simplified through the use of computers. He wrote programs in BASIC on
the college time-sharing system to do his financial calculations, but found
it tedious to have to re-write the program to deal with each new type of
problem.

In a class that dealt with business production, Bricklin learned that
some companies used long blackboards (sometimes stretching across several
rooms) that were divided into a matrix of rows and columns. Each row and
column had a specific definition, and calculations were made based on the
contents of each cell (the intersection of a row and a column). If the
value of one cell changed, the values of any cell that made use of the
first cell's value also had to be changed. Because this was all written on
a blackboard, the results had to be checked and re-checked to make sure
that something hadn't been missed when changes were made during a planning
session. Bricklin conceived of a computerized approach to this production
and planning matrix. Even though the computer could not display the entire
matrix at once, the video screen could be used as a window on a part of the
matrix, and this window could be moved at will to view any part of it. Best of all, the computer could keep track of all the calculations between the various cells, making sure that a change made in one place would be properly reflected in the result of a calculation in another place.

Over a single weekend he wrote a program in BASIC that demonstrated this concept. This demo program was rather slow and could only display a single screen of cells, but it was enough to illustrate the concept.

Bricklin teamed up with a friend from MIT, Bob Frankston, and together they looked for a publisher for the program. They found Dan Fylstra, who had graduated from Harvard Business School a couple of years earlier and had started a small software company called Personal Software, which he ran out of his apartment. Fylstra's primary product at the time was a chess program for the Apple II, and he was preparing to release the first commercial version of the adventure game Zork. After he heard what Bricklin and Frankston had in mind, he agreed to help them out. Fylstra loaned an Apple II to them as a platform on which to develop a more full-featured (and faster) machine language version of Bricklin's program.

During 1978 and 1979 they worked together, as time permitted, with Bricklin doing the program design and Frankston writing the code. (One design contribution made by Frankston was the idea of using "lookup" tables, which he wanted so he could use the program to calculate his taxes.) They did most of their development work on an Apple II emulator running on a minicomputer (much as Apple itself had used a local time-sharing computer for development of the original Apple II Monitor program). They named their program "VisiCalc", and by October 1979 it was ready for release.

At first, VisiCalc was not a big hit. When most customers at computer stores were shown what the program could do, they didn't really grasp the concept behind it well enough to appreciate its possibilities. When business customers who had some computer knowledge came in and saw the program, however, they immediately saw that it could simplify much of what they did. VisiCalc actually SOLD Apple II's to many customers, and these businessmen managed to sneak the new computers onto their desks (despite company policies that discouraged use of anything but the company's mainframe). The combination of the Apple II's ability to expand its memory up to 48K, and the new Disk II drive to use for quick and easy data storage and retrieval, made VisiCalc an ideal program to sell potential users on this new computer.

Although executives at Apple Computer had been shown a pre-release version of VisiCalc, they also did not really understand the potential of the program. Trip Hawkins, an Apple employee responsible for developing plans to help sell computers to small businesses, could see that this could become a major selling point for getting Apple II's into those businesses. He negotiated with Dan Fylstra about the possibility of Apple purchasing from Personal Software all rights to VisiCalc (thus locking up the market in Apple's favor). However, Apple's president, Mike Markkula, felt that the $1 million in Apple stock offered by Hawkins was too expensive and cancelled the deal. If his decision had been otherwise, the future of the microcomputer industry might have been quite different; however, Apple was headlong in their push to create their next product, the Apple III, and a million dollar investment in an untried program for this "aging" Apple II was not in their agenda at the time.

Bricklin and Frankston had themselves formed a company called Software Arts, and it was this company that had contracted with Fylstra's Personal Software. As part of their arrangement, they were obligated to create
versions of VisiCalc for many other microcomputers, from the TRS-80 to the Commodore PET and eventually to the IBM PC. As sales of VisiCalc grew by leaps and bounds, Personal Software (and Software Arts) became quite wealthy. To more closely identify his company with his flagship product, Fylstra changed its name from Personal Software to VisiCorp. He also hired other programmers to write companion software to extend the usefulness of VisiCalc. These included VisiFile (a database system), VisiSchedule (capable of creating critical path PERT schedules), VisiCalc Business Forecasting Model (a set of business templates for VisiCalc), and VisiTrend/VisiPlot (graphs, trend forecasting, and descriptive statistics).

But despite these additional products, VisiCalc continued to be VisiCorp's cash cow. This, ironically, led to the company's biggest problem, centering around a disagreement about money. VisiCorp's contract with Software Arts guaranteed Bricklin and Frankston a hefty 37.5 percent royalty on each copy of the program that VisiCorp sold. VisiCorp was responsible for marketing and distribution of the program, but it was Software Arts who owned the rights to it, and they had no motivation to change their contract to decrease the royalty percent to a number that was more typical for programmers.

The problem escalated when VisiCorp filed a lawsuit seeking damages because Software Arts was supposedly late in providing them upgrades to VisiCalc. Software Arts countersued, and demanded back the rights to distribute the product themselves. Further complicating matters was the fact that the name "VisiCalc" was a copyright of Software Arts, but a TRADEMARK of VisiCorp.<7>

By early 1985, things had worn on to the point where Bricklin decided to end the battle by selling the rights to VisiCalc -- but NOT to VisiCorp. Instead, Mitch Kapor, who ran the Lotus Development Corporation, purchased the program. Kapor had previously worked for VisiCorp, and had helped write VisiTrend/VisiPlot. After he sold the rights for those programs to VisiCorp, he began design on a spreadsheet program that would run specifically on the IBM PC, with the additional features of limited word processing and the ability to create graphs. His program, Lotus 1-2-3, worked as well on the IBM PC as the original VisiCalc had on the Apple II (the ports of VisiCalc to other machines had never been quite as good as the original), and Lotus eventually captured the spreadsheet market on the IBM. In fact, it became the "compelling application" that helped push that computer platform into prominence. It had, however, made a significant contribution to decreased sales of VisiCalc, and after Lotus succeeded in purchasing it from Software Arts, VisiCalc quietly disappeared from software store shelves.

SOFTWARE: APPLE WRITER

This was certainly not the first word processor for the Apple II, but it was one of the most popular. During the four years that Softtalk magazine was in print, Apple Writer rarely (if ever) disappeared from their best selling software list. Even if it was not in the Top Thirty, it usually held some spot on their list of top Word Processors.

The original version was released in 1979. Apple Writer 1.0 had to deal with the limitations of the Apple II in the form of its uppercase-only keyboard and 40-column display. Clearly, a document produced on a computer COULD be uppercase only, but it was more valuable if it could look more like that produced on a typewriter. To achieve entry of upper AND lowercase characters, Apple Writer used inverse text to display uppercase,
and normal text to display lowercase. When entering text, an uppercase letter was entered by pressing the ESC key once. This changed the usual cursor box to an inverse caret (^), and the next letter entered would be uppercase (displayed in inverse). If the ESC key were pressed twice in a row, the cursor changed into an inverse plus sign (+), and was now an editing cursor that could be moved through the text. The IJKM diamond on the keyboard was used to move the cursor, just as it was used for moving the cursor for editing lines of BASIC programs. Although the box cursor used in Apple Writer looked just like the flashing box also used in Apple BASIC, this cursor "floated" through the text instead of sitting on top of a character. If you moved it through the word "AND", it would look like this as it went from left to right: *AND A*ND AN*D AND*.

This original version of Apple Writer actually consisted of two separate binary programs: TEDITOR and PRINTER. The first program was used to actually edit the text, and the second one would print the files created by the TEDITOR. In its first release, Apple Writer had two problems that bothered some early users of the program. One was that the files created by the program were Binary files (instead of Text files), apparently as a means to speed saving and loading files under Apple DOS. Although it worked fine for Apple Writer, the files could not be used by any other program. The other problem had to do with the way in which it used (or misused) the ASCII character set. The Apple II, you may recall, used the upper half ($80-$FF) of the ASCII set for its screen display of "normal" characters (much of the rest of the microcomputer world tended to use the lower half), and used the lower half ($00-$7F) for flashing and inverse characters. In the upper half, the characters from $80-$9F were designated as control characters (generated by pressing the "Ctrl" key with a letter key), $A0-$BF were special characters and numbers, $C0-$DF contained the uppercase alphabet and a few more special characters, and $E0-$FF repeated the characters from $A0-$BF (this is where the lowercase letters should have been, according to the ASCII standards). Since the lowercase ASCII characters were unavailable, the Apple II video routines translated any characters in the $E0-$FF range into characters in the $C0-$DF range, making them displayable on the uppercase-only screen. Apple Writer, for some reason, used the $C0-$DF range internally for display of uppercase letters (which WAS standard) and the $E0-$FF range for special characters and numbers (instead of using the $A0-$BF range). When some users began plugging different ROM characters chips (like the Paymar chip) into their Apple II Plus computer, they found that Apple Writer wouldn't display text properly. The number "3" appeared as a lowercase "s", and "%" as an "e". A special patch was soon developed to intercept Apple Writer's text output to the screen and make the correct translation to display lowercase as lowercase, and numbers and special characters where THEY were supposed to be.

Apple Writer 1.0 ran from 13-sector DOS 3.2 disks, and the binary files it produced had names that began with the prefix "TEXT." (a file named "LETTER" would appear on disk as "TEXT.LETTER"). Apple Writer 1.1 was released in 1980 when DOS 3.3 became available. It ran under the newer 16 sector format, and contained some minor bug fixes. This version also had available a companion spell checker called Goodspell.

The next version released was called Apple Writer II. This one came out in 1981, was copy-protected, and still ran on an Apple II Plus under DOS 3.3, but now produced standard Text files instead of the older Binary files, and could properly display 40-column lowercase characters when the character generator ROM was replaced. It also supported 80-column text if
a Sup-R-Term card was plugged into slot 3. In 40-column mode, words would now "wrap" to the next line if they were too long to display on the current line (the older versions of Apple Writer appeared to split the word and continue it on the next line). The ESC key was still used as a pseudo shift key (one press) and to enter editing mode (two presses, displayed as an inverse "@" instead of the "+" in previous versions), but the keyboard SHIFT key could be used to enter uppercase characters if the "shift key mod" was performed (recall that this connected the shift key to the input for button 3 on the game paddles). Other new features included a glossary and the Word Processing Language (WPL). In modern terminology, WPL was a macro or scripting language, making it possible to automate nearly everything the program was capable of. A WPL program could create templates like form letters, or could be used for entry of repetitious text (such as your return name and address for correspondence).<8>

Apple Writer //e, also copy-protected, came next in 1983 with the Apple IIe. This took advantage of the features of the new IIe (such as the built-in 80 column display and full keyboard). It also included improvements in tabbing (since a TAB key was now available on the keyboard), could create larger text files (these could be larger than the size of memory, by loading just a segment of the file into memory at one time), could "print" text files to the disk, could directly connect the keyboard to the printer (to use like a typewriter), and had improvements in the WPL language. When the Apple IIc came out, users of this version of Apple Writer had some problems, as the inverse status line at the top of the screen displayed uppercase characters as MouseText; however, patches quickly appeared to remedy this situation.<10>

The first version to run under the ProDOS operating system was called Apple Writer 2.0. It came out in September 1984, was not copy-protected, and it fixed the MouseText problem. It also allowed the user to set right and left screen margins, giving a closer approximation of the final appearance of the printed text. This version also had the capability of connecting the keyboard directly to the printer OR to a modem, allowing it to be used as a rudimentary terminal program. This version had some problems with properly printing to certain third-party parallel printer cards (such as the Grappler).<11>

One annoying "feature" that was added to this version (and was also present in a couple of other Apple-distributed programs, AppleWorks 1.3 and Instant Pascal) was that it did NOT follow Apple's published protocols in properly handling slot 3 RAMdisks (or other disks). Since some programs used all 128K memory that could be present in a IIe or IIc, Apple had given guidelines in one of their Technotes on how to properly "disconnect" the 64K RAMdisk (which was designated as slot 3, drive 2) so all 128K would be available to the program. Apple Writer and the other two programs mentioned above had been written so that they disconnected ANY slot 3 disk device, whether a RAMdisk, hard disk, or a genuine Apple disk. It is not clear as to WHY this had been done, although it was suspected in publications at the time that someone at Apple had done this so memory cards not made by Apple would fail to work. Some of these memory cards had been made to also work in slot 3 but to not interfere with the official 128K of program memory. Their manufacturers had worked to follow Apple's published standards, and then had been bypassed by what appeared to be programming arrogance. Patches to make these programs work properly appeared when the problem was identified.<12>

Apple Writer 2.1 appeared in late 1985. It contained some minor bug
Apple II Computer Info

fixes, including the above-mentioned problem with some parallel printer cards. The 2.0 version had printed characters as low-ASCII (values $00-$7F), which caused a problem with some kinds of interface cards and printers. Version 2.1 changed this so characters were printed as high-ASCII ($80-$FF), although files printed to a disk file were saved in the original low-ASCII format.<13> This version also was not copy-protected, making it possible to easily install on a 3.5 disk or hard disk.

When AppleWorks appeared on the scene, Apple Writer began to decrease in popularity; however, old time users did not like AppleWorks as well as Apple Writer, primarily because it put a layer of "protection" between the user and the program. This made it easier for the computer novice to immediately put the program to use, and less likely to do something that would "mess up" his printer or interface card internal settings. That same protection also made it harder to do specialized jobs. For example, where Apple Writer would allow entry of control characters (which allowed very specific control of printers and their interface cards), AppleWorks was much more restrictive in this sense, handling more of the details of printer control internally. Apple Writer's power made it possible to even create documents on PostScript laser printers (as demonstrated by Don Lancaster in his Computer Shopper column, "Ask The Guru"), something that all the computer experts claimed was not possible on an Apple II. Where Apple Writer allowed an experienced user to use all features on a printer and interface card to the maximum, AppleWorks was more dependent on the printer and card already knowing how to be cooperative with it. The same thing that gave Apple Writer its power also made it harder to use for less skilled users, who probably found intimidating its nearly-blank screen with no prompts or instructions visible.

For several years, from around 1988 through 1992, Apple Writer was not readily available except as a used program. The exact reason for this is not clear. One reason probably had to do with the better-selling AppleWorks, which had the additional features of a spreadsheet and database. But with its Word Processing Language, Apple Writer was still more suitable for certain jobs than was AppleWorks; and yet, Apple simply stopped upgrading, distributing, and supporting it. But in the summer of 1992, one of the Sysops on GENie's Apple (A2) Roundtable, Tim Tobin, was successful in contacting Paul Lutus. Tobin was coordinating a project that A2 had started to try to locate and revive the availability of "Lost Classics", programs that had ceased publication (often because their distributor had gone out of business), and recovering Apple Writer was high on his list. Lutus agreed to make his program available on a "freeware" basis: It could be copied freely and given away, but could not be sold for a profit. (This arrangement was quite similar to an earlier program Lutus had written, FreeWriter. He had released this program as freeware in 1984. FreeWriter was very much like Apple Writer, except it did not have a built-in ability to print the documents it created, and it did not have WPL). This new, free distribution was possible because although Apple Computer held the copyright on the Apple Writer documentation, Lutus had retained the copyright on the program itself (Apple had held the copyright on versions 1.0 and 1.1 of the program). Although the program is based on older technology, and does not take advantage of the larger memory sizes frequently available in the Apple II's of today, it still is powerful and is a welcome addition to any software library.

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3
- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com
- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.
- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2
- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the
DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GENie prompt.

READING GEnieLamp  

GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

**HUMOR ONLINE ............ [HUM]**

[*] GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  

To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

```
(SMITH, CAT6, TOP1, MSG:58/M475)
```

```
| Name of sender | Category | Topic | Msg.# | Page number |
```

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie  

GEnie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. GEnie's non-prime time connect rate is $3.00. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

```
/ "To tell the truth, I personally learn more about the/ Apple II here on GEnie's A2, and I definitely prefer the/ courtesy and respect that we have here in A2 a whole lot/ more than the chaos and anarchy of the Internet. But, / every day, the Internet both amazes me and amuses me. If I/ were looking for some type of arcane bit of trivia on any/ subject, I know I'd turn to Gopher or WAIS before I turned/ anywhere else. But, if I had an Apple II related question, / I'd ask it here on GEnie's A2."
/ J.KOHN //
```
The tale had a familiar theme, but it still unnerved me.

Tim Rogentine was regaling the denizens of GEnie's A2 RoundTable with the story of an acquaintance planning to buy a new computer. Mr Rogentine mentioned the Apple II to this acquaintance, who responded with derisive laughter.

"Do you know anything about them?" he asked.

"Enough not to get one!" was the reply.

"I know enough not to need to know any more" is a phrase that scares the willies out of me. It's the beginning of prejudice.

Mr Rogentine's story has a happy ending, for his acquaintance was reasonable enough to allow him to demonstrate what an Apple IIgs can do, and open-minded enough to be impressed by it. Occasionally, though, you come up against someone incapable of understanding the difference between making up one's mind and closing it.

One of my first lessons in keeping an open mind came from a digital watch.

When I was in high school, my best friend and I both thought the digital watch was a pretty neat idea. However, my best friend preferred an LCD (liquid-crystal digital) display similar to the type now found on solar-power calculators, while I had nothing but scorn for anything but an LED (light-emitting diode) display of the sort that now graces our VCR and microwave oven. After some good-natured but heartfelt debate, we approached Mr Hicks, a teacher whose opinion we both respected, and laid the matter before him.

"Which of the two do you prefer?" we asked.

I was confident of a judgment in my favor, a victory. I knew I had right on my side.

"Oh, a liquid-crystal display," Mr Hicks smiled at both of us.

I was sure he had overlooked the ultimate advantage of the LED display. "But with LED, you can check the time in the middle of the night!" I insisted. (For younger readers: LCD watches have not always featured a night light.)

"Yes, of course," Mr Hicks acknowledged. "That's why I have that sort
of alarm clock. But not on my wristwatch."

Before I could rally from my shock and offer a rebuttal (which ran, I believe, "Er--")), Mr. Hicks distributed another of his all-friends-here smiles and closed the discussion by leaving us.

I had invested too much emotional energy in my watch to abandon it on the spot; however, some years later I returned to a more traditional watch with a dial face that showed time as a kind of distance instead of a collection of numbers. It took a while, but I had learned a valuable lesson about the way people think when they are convinced they are on the side of the angels.

Such people make up their minds -- and then they close them.

Worse still are those who close their minds on the assumption that they have all the facts. Opinions of one's friends are not facts. One's own opinions are not facts. In short: opinion, no matter how widely held, is never fact.

Apple II users are accustomed to those who only know enough not to want to know any more. Occasionally we even find ourselves dismissing the competition without examining it. Or perhaps we perform a grudging examination of the alternatives, paying lip-service to the idea of being open-minded, while determined to remain convinced that the Apple II is superior. "We'll give 'em a fair trial... and then we'll find 'em guilty!" It doesn't matter what your position is -- closing your mind will weaken it.

My Apple IIgs can't do everything, but it does do everything I need it to, and more. This doesn't mean I refuse to recognize the utility of other computers; there are indeed tasks currently beyond the capacity of my IIgs.

However, here's the nub: I don't need to do any of those things!

Many years ago, when computers were just starting to become popular acquisitions, I was given sage advice: counter sales talk of what a computer can _do_ by reminding yourself what you was _need_ it to do. For some reason, people seem eager to persuade themselves that they need something they didn't know existed a minute before. Built-in animation may be impressive, but not terribly useful if you use your computer for word processing and telecommunications. Only once in my life have I need a full-featured desktop publishing program... and that was when I was working for a book publisher.

The responsibility of keeping an open mind involves a lot more work than making a decision and sticking to it, come hell or high water... and of course, there are times when sticking to your decision is the Right Thing. But closing your mind isn't, not ever.

Once when I was in England, I saw a poster advertising beer which simply consisted of the brand name and the slogan "I haven't tried it because I don't like it". I chuckled appreciatively.

That was many years ago... when I was still wearing a digital watch.

[*][*][*]
One or two ancillary matters to deal with before I let you loose on this month’s issue.

First, we love for you to reprint GEnieLamp articles in your non-profit newsletters, but do be aware that you’re required to give us credit. I read a lot of Apple II user-group newsletters and magazines, and most are scrupulous about giving credit where credit is due. Last month, though, I noted with some dismay that one editor had reproduced an article by Darrel Raines and neither mentioned its source nor printed the copyright information. Please... if you reprint us, give us credit. See the end of any issue of GEnieLamp for further information.

Second, thanks to Peter J. Paul for responding to the November 1993 plea of Steven Weyhrich, Apple II historian, for a copy of Fire in the Valley. Thanks also to Dan Cross, who also offered a copy.

AREA CODE CHANGES  Starting tomorrow, our area code will change from (313) to (810). Actually, you will still be able to
get through if you use (313) but you'll get a recording reminding you to use (810) the next time. By this time next year (313) will no longer work.

So if you want to fax something to us, the number is (810) 774-2698. Our BBS number is (810) 774-2652. And our main voice number is (810) 774-7200.

Our toll-free order line remains unchanged at (800) 777-3642.

North Carolina has added an area code, and mine has changed:

BBS DEVELOPMENT PROGRAM FOR SALE
The following came in over the APPLE echo on Fidonet this morning.

Please sit down and hold on to something before reading it :)

- cut here -

[Apple Users Conference #5]
[303/307]
From : Lance Taylor-Warren
To : All
Subject: Carry on a Apple II Software tradition...
Date : 29 Nov 93 16:00

Have I got a deal for you...

Have you ever wanted to be your own boss? Have you often thought about writing your own BBS Program? Now is your chance to do both. I have the following for sale:

1 - Apple IIgs ROM 03, RGB Monitor, Extended Keyboard (5mb RAM)
1 - Apple IIgs ROM 01, Green Screen, Regular Keyboard (1.5mb+Ram)
1 - 3.5" drive
1 - 5.25" drive
2 - 5.25" drives (w/ controller)
2 - ZipGS Accelerators (8mhz & 9mhz)
1 - Apple SCSI card - RAMFast SCSI card (rev c)
1 - Seagate 43mb Hard Drive
1 - Quantum 80mb Hard Drive
1 - Stereo Card for GS
1 - ProDEV DDT 16 Debugging board

And the icing on the offer, all the source code and commercial distribution rights for GBBS Pro (Both ProDOS and DOS 3.3 versions) and the source code and distribution rights for LLUCE as it stands today. This means you will fully own BOTH products. I will also include EVERYTHING I have Apple II related. The systems will include everything on the hard drives. All the sources and other development stuff as well as the DPS Support BBS as it is the day of the sale. Also included is the index cards of all known registered owners of
GBBS Pro.

As you have by most likely figured out, I'm selling all my Apple II stuff in hopes that someone out there has the time and the motivation to finish LLUCE and make a run for the market that's out there for it. I'm tired of looking at it and would love to see someone else run with it.

Our projected marketing figures for LLUCE show that it has the potential to make well over $100,000 once it's done. All that is really left to finish is the docs and the installation/configure program. Once someone has come up to speed on how things are setup, you could have a new BBS product within a month. With the rapidly declining prices of Apple II equipment it becomes an even better platform to use as a base for a BBS. Why tie up a Mac or an IBM to use as a BBS with that Apple II sitting in the corner collecting dust is just perfect for the task. So now the BIG question...

How much do I want for everything listed above? Well, even tho it's worth well over $20,000. I'm willing to let it go at a fraction of that price to the right person. If you are interested, please contact me at 702-322-5533 or via the following e-mail address, Internet: lance@dps.com, Fidonet 1:213/312 or 1:213/0. Visa/MC/Discover/AMEX accepted.

* Origin: Net 213 NC - Internet Gateway Reno, NV (702) 322-9796 (1:213/0)
- cut here -

My comments? I'm not sure how he was expecting to make $100,000 off it with METAL being freeware... if it was going to make that much, why didn't he finish it? But then who knows...

Dave

(BACKDROP PATTERNS CONTEST) Send us your original BackDrop patterns by January 31, 1994 and we'll pick the best one. The winner will receive a shiny new check for $25 (ok, it's not a lot, but this isn't brain surgery either folks ;-) AND you'll get your name and pattern published on an issue of Softdisk G-S!!

You can send your patterns to SOFTDISK.INC or you can mail them:

Softdisk Publishing
ATTN: Softdisk G-S
606 Common Street
Shreveport LA 71101

Good Luck!

(WORLD PERFECT WASHES THEIR HANDS, THEN FLUSHES) I received WPGS from a parent of 1 of my students
when they got a Mac. The WPGS came with manual and 4 disks...No program
disk. They moved out of town. I sent in the registration card to Utah and
requested a backup copy. WP called me back and said they copied over all
GS copies with Mac versions. No more copies available. Nice huh?
(M.SCHOOP, CAT8, TOP8, MSG:84/M645;1)

EASTER EGG IN APPLEWORKS 4 there's even an easter egg in AWKS 4.0 - go to
the very end of the main menu Help screen and
press OA-A...

Udo - ... just a IIGS freak -
(U.HUTH, CAT42, TOP29, MSG:170/M645;1)

TRIVIA DROPS TEXT MODE I would like to know how the TRIVIA board can get
away with kicking all Apple users off of TRIVIA?
TRIVIA no longer plays in TEXT format and they do not offer front end
graphic software for the Apple users IIE, IIC, or GS. They decided a couple
of weeks ago to stop playing in TEXT mode. I complained in an e-mail to the
Trivia feedback, and I will admit I called them Creeps for doing it but
that was after I spoke with customer service and they said they could do
nothing about it. The answer back to me was that they would not put text
format back and that my system was obsolete and I should buy a new one.
That they are not responsible for people who insist on keeping obsolete
systems. WRONG THING TO SAY TO AN APPLE USER!. They even informed me I
could buy inexpensive equipment from them. I think that the answer stunk
and I almost dropped Geanie services. I decided to give it another month
because Gene from the round table was supposed to get back with me, but I
have not heard anything. Another person is now investigating, I think her
name is Pat (I forgot to write it down). I really enjoyed playing trivia
and had friends that played there. It really isn't fair that TRIVIA is
allowed to discriminate like this. Please, the powers that be, consider
putting back Text mode or giving the Apple IIE & C, C+ & GS users front end
graphic software so we can fully enjoy ALL of Geanies services.
PeggyTheodorakis

(M.THEODORAKI, CAT3, TOP13, MSG:148/M645;1)

>>>>> There are a few multi-player GEnie games that require graphic front
ends where none are available for the Apple II (Air Warrior and
BattleTech, I think.) But this is the first I've seen of a current game
that actually removed a text version for no apparent reason.

Most of the games have graphic front ends, but for the most part they
aren't required. I can't think of a reason why Trivia can't be played in
straight text unless they've made some major changes.

If you get a response explaining their reasoning, please let us know.

Tony Ward [via GEM 4.21/PT 3.1]
(A2.TONY, CAT3, TOP13, MSG:151/M645;1)

>>>>> <Sigh> I hate this.
"""""""" No, what's going on in NTN Trivia is not a "sign of things to
come." We're still gung-ho on Apple II support here, and plan to be here
for many years to come, and we're still at work on new products for the
Apple II to make GEnie a better experience.

Why the folks who run NTN Trivia are doing this is beyond me. I'm
offended by the "obsolete computer" line myself.

One of the things we have trouble making people understand is that on GENie, different people run different areas. We who run the A2 RTs have nothing to do at all with the people who run NTN Trivia. What they say does not go for us, and vice-versa.

I will have a word with them about their choice of language. I can't argue with them about their software choices; apparently they feel that the changes they're making to their own software makes an ASCII version undoable. I can't argue with them about that because I'm not a programmer. But I WILL speak to them about their attitude.

Dean Esmay

(A2.DEAN, CAT3, TOP13, MSG:158/M645;1)

EASTER EGG IN QUICKIE  Has anyone else found Quickie's Easter Egg? <G>
""""""""""""""""""""""""""""""""""""""""
I'm using v3.1 so I'm not sure if it works with earlier versions. Once you have a picture on screen (either loaded or scanned), click on the empty space in the menu bar right of the Color menu. A hidden menu! Now you can change the tone of your picture from Grey to Brown, Green, Yellow, Red, or Blue.

-Ken  (KEN.GAGNE, CAT40, TOP8, MSG:178/M645;1)

>>>>>>  Congratulations, Ken!
""""""""""""""""""""""""""""""""""""
As the first user to describe the Easter Egg, you get the prize - specifically, a congratulatory message from me, the author. (Note congratulatory message on first line of this post. :)

I had rather hoped that people would find and enjoy this feature of Quickie 3.1, especially since I am a great fan of toning in my own darkroom projects. For many images, toning provides character and depth that is just not present in a simple gray-scale picture.

Have fun!

Steve

(S.MCQUEEN1, CAT40, TOP8, MSG:179/M645;1)

APPLEWORKS QUICK-DELETE FOR FILES  Tonight I inadvertantly discovered "expert" mode while in the file-delete operations. Which is to say I pressed OA-Return while a file was highlighted. I saw the hard drive light flash, suspected the worst and immediately exited to ProSel and launched the exhume utility -- which, thank Glen Bredon, salvaged a file that had several hours of work in it.

I think this is a dangerous feature, and I fear that a few people will lose a few files because of it.

(D.CRUTCHER, CAT42, TOP29, MSG:224/M645;1)

DESKJET OR DESKWRITER  Not quite the ONLY difference. The DeskWriter's serial port only speaks at a high baud rate (56.6k?) meaning you need a special high-speed serial driver to use it on a IIGS. Also, the DeskWriter has AppleTalk capability built in (although you need a Mac to use this; there are no AppleTalk DeskWriter drivers for the IIGS). The DeskJet has a parallel interface (in addition to its serial interface) while the DeskWriter only has the serial/AppleTalk interface
Apple II Computer Info

(it's one port). Finally, the DeskWriter comes with Mac drivers while the DeskJet does not (may come with Windows drivers; dunno).

The breakdown - DeskJet: IIe, IIc, IIGS with appropriate interface or cable
Works with GS/OS programs via Harmonie
Works with 8-bit programs that print plain text or which have drivers (Publish It, AppleWorks)
Serial or parallel interface
Also the best choice for a PC

DeskWriter: IIGS only via serial cable
Works with GS/OS programs via Harmonie
Does not work with 8-bit programs (or any programs which do not use the GS/OS print manager, e.g. ORCA shell, etc.)
Also the best choice for Mac

Where I say Harmone, you can also use Independence (similar product).

PICKFONTS WORK-AROUND Pickfonts is not compatible with AppleWorks 4.0. I would assume that it will be updated. In the meantime, a good workaround is to create a database with three categories. (Font name, recno, and font code)

Place the following formula in the recno field.

@currecno (check the oa-f to be sure I've got it right)

Then put this formula in the font code field.

@join("<",[recno],"=",[font name],">")

Insert enough blank records to hold your fonts.

for all the fonts that reside in the superfonts standard directory, type it's name into the font name field. ex courier.12, courier.10...

If the font resides elsewhere, type the full pathname. ex /ql/system/fonts/new.york.24

When the file is complete, save it as Superfonts in an easy accessible directory.

Create a glossary in the word processor that lists the font name and returns the font code followed by a <rtn>.

There you have it. Pickfonts. You will need to have the database on your desktop when you plan to use superfonts.

WHO KILLED THE ROM 04 IIGS? One reason Apple supported the II as long as they did was that there were some VERY loyal people at Apple that still believed in the II -- they just happened to be in the minority and weren't the ultimate decision makers.

For example: the fabled ROM 04 GS? From what I understand it was all set to go into production and was killed at the VERY last minute by none
other than Jean Louie himself. <sigh>

Bryan

(SOFTDISK.INC, CAT5, TOP3, MSG:292/M645;1)

>>>>> Forgive me, but Jean Louis had long since departed Apple when the
"""
ROM 4 was killed. The principle person that killed off the ROM 4
was Bob (Petute) Puette.

Tyler

(A2.TYLER, CAT5, TOP3, MSG:293/M645;1)

>>> HOT TOPICS <<<

"""
QUALITY WILL NOT BUY THE APPLE II   I want to lay this one to rest once and
"""
for all. There are three chances of
Quality (or anyone else) taking over the Apple II line: slim, fat, and
none.

It's not for sale. If it was, it would be priced to drive any
potential purchaser out of business shortly (or so that the machines could
not compete price-wise with the Macintosh, which amounts to the same
thing).

Apple is going to sell us THEIR technology so we can turn around and
compete with them? I don't think so.

We were able to get AppleWorks because it cost Claris basically
nothing to give it up. (They are saving enough in tech support staff and
getting enough in royalties to make it worth their while.) The fact that
we are selling AppleWorks does not compete with Claris in any way; if it
did, they never would have allowed it.

(QUALITY, CAT5, TOP3, MSG:205/M645;1)

WHILE AS FOR AN APPLE II POWERPC...   Jerry - Could you comment on the
"""
remarks in the latest Enhance about
Quality creating a II or IIGS emulator for the PowerPC?

Thanks...
Joe Kohn

(J.KOHN, CAT5, TOP3, MSG:206/M645;1)

>>>>> We're looking into it. An Apple IIe emulator would probably be
"""
pretty easy (actually, we'd likely try to get our hands on the
Laser ROM code); a IIGS emulator would likely require Apple's cooperation,
which I don't think we'll get. (We're still studying the technical
feasibility of that one yet.) And, of course, we're testing the waters.
If a lot of teachers tell us they'll buy such a thing, it would make us a
lot more interested in doing it. B)

I'm dubious it will come to pass. But then, I felt the same way
about the AW4 deal with Claris, so I've been wrong before. B)

(QUALITY, CAT5, TOP3, MSG:207/M645;1)

AUCTION REPORTS   I know there is supposed to be a place to put
"""
information about the auctions but I can't find it. So
if this message needs to be moved, please do so.
I want to let everyone who might be attending any future Apple Auctions to get the word out loud and wide NOT to keep bidding up. It makes not sense bidding up for items because then everyone pays a higher price.

I got a IIgs, with a color monitor with a Superdrive (is that just a regular 3.5 drive or is it the 1.44 drive?) for $350. I thought that that was a good deal.

This is the way the auction works:

There is a list of items to be auctioned off and the list just keeps getting repeated throughout the day with a different number of units available each time around.

Here is a list of items and their prices the third time around:

<table>
<thead>
<tr>
<th>Item Description</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quadra 950 8 MB Ram, 400 M HD 2/ 16&quot; RGB, extended keyboard</td>
<td>$ 3950</td>
</tr>
<tr>
<td>Quadra 700 4 meg ram, floppy same RGB and kb as above</td>
<td>$ 2400</td>
</tr>
<tr>

<td>Color Printer</td>
<td>$ 400</td>
</tr>
<tr>
<td>Color Scanner</td>
<td>$ 800</td>
</tr>
<tr>
<td>CD Rom 150 Drive</td>
<td>$ 150</td>
</tr>
</tbody>
</table>

They had other a few other items but I was unable to get those prices. These were the prices for individual units. The prices when sold in lots of 10 or more were lower. I was going to buy the CD Rom drive but two people told me that the price was too high by about $50. Given some of the bidding I saw and the prices, I wonder if Apple or the auction company had some plants. I saw a few people who keep their cards up on a lot of items until the price got to a certain point then never bid on the item again and did not take any items. Wierd!

Sorry for the long message but I wanted to let people who were planning on attending any future Apple auctions to know what the going prices were, at least in New England. (RON.ROYER, CAT2, TOP4, MSG:355/M645;1)

>>>>>> Here is a list of the things auctioned off in Boston and the """""""" prices as the day went on and different lots were reoffered:

Quadra 950, 8mb Ram, 400mb HD $4,750 $3,950 $3,850 $3,900 $3,800 $3,700

</table>

I missed a couple of prices here than there that's why the blanks. The kidneys only last so long. Also the back in those fold up chairs.

My feeling was about the best price you were going to get was wholesale. There was quite a few dealers there and if the prices were to low they would keep bidding because it was a real good buy and where trying to get the merchandise for there business. Once the price was no long attractive the buyers would stop buying and the general public took over. There was around 4,000 bidders there.

A good example of this was the MAC Classic at $425. Normally with the price was in the $500 range and a lot of different people bought them at this price. But the classic was bid on right after a comment from the Ross-Davis people that no one was bidding up prices and they didn't care what the prices were. This was in a direct response to a flyer passed around saying Ros-Davis was trying to artificially inflate the prices either in their own interests or Apple's interest. (I don't feel that was happening) The bid on the Classic stopped at $425 and everyone was all set to get a great price, but low and behold when the auctioneer asked the high bidder how many machines he wanted the bidder replied "all of them". No doubt a buyer who also knew a good price.

I think the individual buyer some times got caught up in the heat of the auction and where not using there head. A lot of the time there were hundreds of the items being bid and the price was bid to high by some one and there ended up only be a few items sold and the rest ended up being sold in large lots. Also people had there minds set on a particular product and paid the price.

I sat next to a guy who wanted a Quadra but he had gotten a quote from a local dealer several hundred dollars less than what the machines went for.

Probably on the best bargains were the GS's. It was a Rom 3 machine.
with keyboard, mouse, monitor AND they were giving you a Super drive for
the 3.5" drive (no 5 1/4). If I had known they were giving the super
drive I would have bought a couple more than the one I did buy. Parts
alone are worth a couple hundred dollars more than that. Live and learn.

All in all it was an interesting experience. I bought another GS, a
Mac IIvx and a cd rom player. I was happy with what I paid and got, just
wish I had bought a couple more GS's. I'd have my own network in the
house. Now I have to figure out how to network the ones I have.

Buzz   \\/.  ___ enjoy vino
(W.WALLING1, CAT44, TOP5, MSG:26/M645;1)

>>>>> I hit the auction in Herndon today. It never fails to amaze me
what a**holes people are. People were bidding against each other
to get one machine that were in lots of 100+, even when they knew the high
bidder wouldn't take them all. The prices were outrageous! Apple
Computer made a bundle. They should probably think about getting rid of
their dealer network and just hold about 6 auctions a year. :) Some of
the audience had flyers from local sellers. The prices in the flyers were
often considerably less then what the stuff went for at the auction. They
did sell over 400 IIIGS's at the auction though. That puts more out there
for our developers to reach!! I got one on the next to last lot (5th) for
$370. Not bad for a new ROM 3 with RGB monitor and SuperDrive.

I got my GS on the 5th lot and didn't wait to see what the last lot
went for. Can you believe that people were buying GS's for $575 and $550
?? They sold a bunch at that price too! I wonder how many of them went
home and were suprised that a GS isn't a model of Macintosh. :)

LASTPATCH CONTROVERSY I talked with John Link today to inquire about the lastPATCH arrangements. He explained that initially he was only going to release it on his own SuperStuff bulletin board. Then, persuaded by his good friendship with John Connelly, he conceded to letting John release it in his NAUG area on AOL, and granted NAUG the rights to duplicate the disk for their members.

   So this did not start off as an anti-GENie move at all, and was only released to AOL and NAUG after some hefty negotiations with a good friend.

   lastPATCH is a freeware gift from John to the Apple II community in appreciation for the interest and support of the past. It represents about forty hours of work and is thoroughly copyrighted. lastPATCH is an AppleWorks 4.0-specific patch program offering the following options:

   1. No return after pressing the number of the menu selection (hot keys).
   3. Overstrike cursor instead of insert at startup.
   4. Change error tone on any Apple II.
John wants everyone to know that the program is available for a phone call to the SuperStuff bulletin board at 1-616-381-1726. I'm not certain yet if it is now available on the following boards, but it is expected to be:

- John Connelly's BBS (1-313-421-9144)
- NAUG's BBS (1-615-359-8238)
- Quality Computers' BBS (1-313-774-2652)

It is about a 3-minute download. At the right hour, that call should cost less than mailing a disk for a copy from a friend.

(W.NELKEN1, CAT17, TOP10, MSG:46/M645;1)

>>>>>> > Has anyone flamed-out long enough to call John Link and ask him """" > to reconsider?

I wrote him a letter, but not to ask him to reconsider or to ask him why. Whether his program is on GENie or not is none of my business or concern. I did ask about some personal business, then lamented the lack of DeskJet documentation on the AppleWorks 4.0 disk. In case anyone has been on another planet, the reason we now have DeskJet Drivers built in to AppleWorks 4.0 is thanks to John Link. The reason we don't know how to use them is because nobody thought to include documentation other than the Ctrl-A and other commands added by Randy.

APPLEWORKS 4.01 UPDATES GOOF  <Sigh> Apparently, in the fray of stuffing all of those little white mailers, we ran out of disks and one of the assembly line folks ran back to the duplicator for a new set of disks. Sadly, they must have picked up a box slated for re-duplication that contained v. 4.0 instead of the newly duplicated 4.01 disks. We think this only affects a small number of the updates sent out.

It would help us out a lot if any of you could report the version number of AppleWorks that you get when you get this update. It comes in a small white mailer, and it should arrive at your doors anytime from today till mid next week.

Needless to say, we extend our apologies for the mixup.

(W.ARCHER2, CAT42, TOP29, MSG:265/M645;1)

OUTLINER FOR AW4 DELAYED   I had hoped to finish Outliner by Christmas, but it's becoming obvious that it won't be done until 1994 (maybe not started until then). AfterWork is getting close, but I haven't been able to work on it for a few days. I hope to get back to it tomorrow, and I expect we'll be shipping before Christmas.

(BRANDT, CAT42, TOP29, MSG:313/M645;1)

RECORDING MACROS IN AW4   Three or so people have mentioned limited recording. As Steve pointed out, that's because you're using the default set, which only has a handful of bytes free, thanks to Steve packing it full of features. You can remove the macros you don't need and then recompile and resave the default to leave free space, or if you just want easy playback of temporary keys, use macro 0.

The reason you can't use OA-X to replace an existing macro is because of the way commands like "next", "rpt" and "()x" work. This change was made in AW 3 with Ultra 4 to allow maximum speed and to eliminate the old problems with some "bad" numbers causing problems inside of loops. You can record over any temporary recorded macros, but macros which were compiled and are part of the set can't be replaced by OA-X.

(BRANDT, CAT42, TOP29, MSG:335/M645;1)

>>> WHAT'S NEW <<<

SPECTRUM SHIPS!   Spectrum is a new graphics-based telecommunications program written specifically for the Apple IIgs. It uses the standard Apple IIgs "desktop interface" so it's easy to learn and use. And you don't need to sacrifice speed or features.

Spectrum supports baud rates from 50 to 57,600 and includes many file transfer protocols (including Zmodem and CompuServe B+, both of which support auto-receiving and auto-resuming interrupted file transfers).

A powerful, yet easy to use, scripting language lets Spectrum be tailored specifically for individual use. Scripts can do almost anything, ranging from emulating a bulletin board to the daily automatic logging, sending and retrieving of mail.
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1179 of 1824

A rich text editor is built-in for convenience (supports text, TeachText, and AppleWorks Classic file formats).

Spectrum requires System 6.0 (or later) and is compatible with The Manager v1.1 (not available yet).

The retail price of Spectrum is $129.95.

Special Introductory Offer Through January 31, 1994 Spectrum is available at the VERY special introductory price of only $50 plus $3.50 shipping and handling. To order call 904-575-0566, M-F, 9-5 ET, or just submit your order via e-mail (provide your name, address, phone number, and Visa/Mastercard/Discover number with expiration date).

Thanks, --Dave

(SEVENHILLS, CAT43, TOP15, MSGS:1&2/M645;1)

<<<< ARRRGGG! Well, after creating the master Spectrum disks we did a test Install to make sure the Installer scripts were working right. Sure enough they did and SP ran on our system. HOWEVER, our system already had a required file installed...Spectrum REQUIRES the "Hierarchic" INIT, but this file was overlooked in our installation scripts, and it is not included on either Spectrum disk.

SO, unless you already have Hierarchic (from owning Kangaroo, TransProg, The Manager, or Super Menu Pack) this means you will not be able to run Spectrum until you get Hierarchic. :( I will upload a copy of Hierarchic into the A2 libraries and post the file number when I do. In the meantime you can download Hierarchic (along with some extra tech info) from the A2Pro library:

Type: M530;3 (A2Pro software library)
Then select option 6 (download a file)
Then specify file number 3552

I really apologize for this major oversight.

Thanks, --Dave

P.S. All disks shipped on 12/17/93 or later have this problem corrected.

(SEVENHILLS, CAT43, TOP15, MSG:10/M645;1)

DANGEROUS BUG CONFIRMED IN HARDPRESSED There have been a few (two or three) cases where somebody has reported that HardPressed + LZSS has flat-out trashed their files. I've gone around in circles trying to duplicate it, but wasn't able to.

Well, finally somebody determined that if you use a profile that compresses everything with the unlikely combination of differential + LZSS + adaptive Huffman (supposedly great for MODs), compressing and uncompressing the same file a couple of times will leave you with a hosed file. Guess what, I made it happen. :-(

The fix required is a replacement LZSS module, which I will upload as soon as I verify that I haven't introduced any new problems. I'll be sending a copy of it immediately to everybody who has had problems with it before (assuming I still have their e-mail addresses), so they can verify
that the problems are gone.

In the mean time, turn "verify" on. It WILL catch any problems with LZSS trashing a file. The nature of the bug is such that, if you haven't seen any problems before now, you probably won't, but there's no telling whether adding a new INIT to the system will shift things around enough. The bug has been in there since HP v1.0, and VERY few people have reported problems.

I'm glad we finally got this one... I've been worried about these mysterious file trashings.

>>> THROUGH THE GRAPEVINE <<<

NO GENIE MASTER FOR APPL_EWORKS 4? There is a legal holdup right now, so I can't say when, if ever, we'll be releasing an update to GEM to work with Appleworks 4. There's not much more I can say about it at the moment.

Dean Esmay

(A2.DEAN, CAT29, TOP3, MSG:74/M645;1)

NEW COPILOT SCRIPTS BEGIN _SERIOUS_ BETA Okay, it's time for plan B.

The ProTerm scripts, while very CLOSE to being ready, just won't be in shape for a 12/22 release.

The modified Installer (to handle Spectrum) is ready, but has not had ANY Beta testing, which makes it a very iffy proposition to haul off and attempt to produce a new version of CoPilot based on it by 12/22.

SO, here is what we are going to do.

On 12/22 I will upload the new scripts for TIC and Spectrum, complete with all files needed to run Spectrum/CoPilot as an OPEN BETA. That means that we have already run a Beta cycle, and things look pretty good, but we are going to use y'all for guinea pigs for a couple of weeks.

The new PT scripts will also go up, with installation instructions, as Open Beta, as soon as they are ready. (Very soon, but NOT on 12/22.)

After those of you who choose to download them and use them for a couple of weeks, and after we have thoroughly tested the other stuff we need to include, we will THEN put together a new release of CoPilot.

This will allow us to put out a better product in the long run.

Those of you who don't HAVE CoPilot should hold off for a few weeks longer and download the new version when we have it all complete. (That is a VERY strong suggestion...)

Those of you who are getting Spectrum, and want to use it with CoPilot, will need to download CoPilot and install it for use with TIC,
then download the new Spectrum scripts and install them over the files you just installed. I'll give instructions here for anyone who needs them.

Gary R. Utter  (GARY.UTTER, CAT29, TOP13, MSG:84/M645;1)

HARDWARE MYSTERY UNDER WRAPS  Joachim Lange (J.Lange7) of SHH Systeme has contacted me to handle doing some beta testing of a new peripheral for the Apple //e and //GS that is in the final phases of development. I now know exactly what this product is, and what hardware it supports (and is capable of supporting). There isn't (to my knowledge) any product currently available for the Apple // series that does what this card does, or even comes close to it. I believe that it will be of great use to many Apple //e and //GS users (myself included) once it has passed some further real world testing and has had some further development work done on the associated driver code (which exists but needs some minor work done to fully support the capabilities of the hardware). I expect to have a beta revision of this hardware in my hands soon, along with the source code for the drivers. When this "vaporware" is firmly in my hands (err... in my //GS :), I'll post a message confirming it's arrival.

>>>>>  The clues thus far,

"""

> what can be connected to this gizmo is usually cheap(er) and you
> can connect more than one.

> There isn't (to my knowledge) any product currently available for
> the Apple // series that does what this card does, or even comes
> close to it.

> development work done on the associated driver code (which exists
> but needs some minor work done to fully support the capabilities of
> the hardware). I

Usualy cheaper; existing driver code. The only thing I can come up with is a card that allows you to use 1.2 and 1.4 drives. They are the only peripheral that is cheaper and we already have 5.25 and 3.5 drivers.
(J.FENSKE2, CAT13, TOP23, MSG:64/M645;1)
WAITING SIGNATURE UPGRADE AND Q-FAX  We'd hoped to have some Signature
upgrade or other by now, but D. Proni (the program's author) had his hands more than full with his own company, Econ. If we can get Q Fax finished up, maybe then we can start looking at some new features for Signature. B)
(QUALITY, CAT42, TOP2, MSG:76/M645;1)

> I think that most sysop's would jump on that wagon, if the option for a multiline
BBS's systems got serious.

The existing GS hardware permits at least a 3-node BBS: two incoming data lines and one local login. When my GS was at 8 MHz, it handled a simultaneous console login and dialup login at 2400 bps very easily. I doubt that a second 2400 dialup would affect performance noticeably. The GNO serial drivers are quite efficient, so I would be interested in seeing how fast I push both serial ports at the same time, while logged in myself.
(B.TAO, CAT13, TOP23, MSG:38/M645;1)

One of the reasons Andrew (Roughan) and myself wrote Eclipse (BBS package with language), was to eventually get a multi-line BBS running, on ONE machine. I believe it is possible, although in those days the line speeds were slow enough to allow multi-threading etc. without the user noticing any slow downs. I don't have GNO, so I don't know how it performs, but a custom threader...

If anyone is interested, drop me some mail. We may just continue from where we left off.

Regards,
Richard
(RICHARD.B, CAT13, TOP23, MSG:61/M645;1)

You know, I heard someone say that Apple Inc. has just came out with another new computer. But this one is different. It's a 486 clone???

If this is true, then their either desperate for $$$ or they don't have much faith in the Macs!

Tim Rogentine
(T.ROGENTINE1, CAT5, TOP3, MSG:245/M645;1)

I'm wondering... How many people here would be intrested in an inexpensive (under $30.00 + shipping) gizmo that would provide two (stereo) "line level" outputs from the GS?

This would require an external amplifier and speakers (or cables to your stereo system) to complete the setup. Absolutely no adjustments, simply plug it onto the Molex connector (next to the Ensoniqs chip) and hook up the cables.

If only so-so intrested, say so here, if _really_ intrested, and willing to commit to a purchase, say so in e-mail. If enough people commit to purchase, I'll start making them. (NO up-front money is being asked for!)
If a "poor mans digitizer" is also desired, I can add that to the design fairly easily, guestimate another $5.00. (you supply a mike, or other audio source)

$200 REWARD FOR PRINT SHOP/HP UTILITY   Regarding the offer of a reward for a Print Shop driver, utility, program or whatever that will allow printing of Print Shop generated letterheads, greeting cards, signs, etc to Hewlett-Packard brand printers...

The reward has been doubled, and it now stands at $200!

Softdisk Publishing has agreed to match the $100 reward offered by Shareware Solutions II.

I'm sure Softdisk will post some type of official press release in their category, and print their offer in an upcoming issue of Softdisk.

In any case, Shareware Solutions II would like to offer a great big thank you to Softdisk Publishing (THANK YOU Lee, Bryan and Dean) for your additional and continued support!

Joe Kohn

(J.KOHN, CAT28, TOP4, MSG:109/M645;1)

How about really sweeting the pot?  I will contribute $20.00 bucks to the reward.  I am sure that there are others out there willing to put up $20.00 for such a desperately needed "shareware solution." How about it folks. Maybe if we have a big enough reward, it will get done a lot quicker!

Pax!  --=Plato==--

(A.HUTCHINSON, CAT28, TOP4, MSG:114/M645;1)

L.DEVRIES [Lloyd]            at 08:29 EST

I've suggested this to Quality Computers and I'll suggest it here: I think we're all miss the bulk of current Apple II users.....teachers. I don't think most subscribe to on-line services or Apple magazines and newsletters. I don't think they know the rest of us exist, or that there is any place to buy anything for the Apple II's any more. Every classroom in my sons' elementary school has a IIe; none of their teachers yet has known where she can get software.

So, if I were promoting an Apple II publication or service, I'd advertise and publicize in teachers' publications. There are two national unions (the National Education Association and the American Federation of Teachers), and I'm sure each has its own publication for its members. Most
stations have a state union (a branch of NEA, probably), and each probably has ITS own publication. Then there are the local newsletters (where I grew up, it was the "Ossining Teachers Association.") And of course professional journals.

What this means is that an advertiser like Joe (or QC or anyone else) could start with some of the smaller, cheaper publications and build up to the bigger ones. Publication advertising is usually less expensive than direct mail.

<<<Lloyd>>>

Apple Pie
""""""""""""""""""""""""""""""""""""""""""""""""""""""
By Steven Weyhrich
[S.WEYHRICH]
(profuse apologies to Don McLean)

A long, long time ago,
I can still remember how those programs
Used to make me smile.
And I knew if I had my chance,
That I could make those users dance
And maybe they'd be happy for a while.
November breezes made me shiver
With every upload I'd deliver
Bad news on the desktop
I couldn't make the text stop.
I can't remember if I cried
When I read about our faltered pride
But something touched me deep inside
The day
  the IIe
died.

So, bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Mountain Dew and sighed,
Typin' "This'll be the day that I die.
This'll be the day that I die."
Do you know your Apple's core?
Do you have faith in Woz's lore
If the Red Book tells you so?
Do you believe in ROR and ROL
Can BASIC save your mortal soul
And can you tell me why Pascal runs so slow?
Well, I know you love that Lisa hack
'Cause I saw you mousin' in the back
Well, MacWrite was big news
But AppleWorks got great reviews, oooh
I was a twenty-something computer fan
With a loaned assembler and some program plans
But I knew I'd be just an "also-ran"
The day the IIe died.

I started singin'
Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Cola Jolt and sighed,
Typin' "This'll be the day that I die.
This'll be the day that I die."

Now for twelve years we've been on our own
The software comes on my telephone
But that's not how it used to be
When ol' Steve Jobs planned a brand new box
With designs he borrowed from Xerox
And the cash, well it came from you and me
Oh, and while our Woz was looking down
Steve Jobs stole his designer's crown
The /// plan was adjourned
No money was returned
And while Wagner wrote "Assembly Lines"
We liked our BASIC programs fine
And most thought ProDOS was devine
The day the IIe died.

We were singin'
Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Dr. Pepper and sighed,
Typin' "This'll be the day that I die.
This'll be the day that I die."

HUFFIN, PUFFIN, move files with MUFFIN
Single drive, lots of disks I'm stuffin'
Eight piles high, and fadin' fast...
With Macs out landing in the grass
The Pirates tried for a forward pass
Moving IIe to the sidelines, in a cast
Now, the IIC Fair was sweet perfume
And "Forever!" was our marching tune
We all got up to dance
Oh, but we never got the chance
'Cause the Mac-heads tried to take the field
Our Apple II's refused to yield
Do you recall what was revealed
The day the IIe died?

We started singin'
Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Diet Pepsi and sighed,
Typin' "This'll be the day that I die. This'll be the day that I die."

And there we were all in one place
An online conference lost in space
With no bucks left to start again
So come on, Tom be nimble, Tom be quick
Uncle-DOS made all our Apples tick
'Cause Merlin is the hacker's only friend
Oh, and as I watched him on the stage
My hands were clenched in fists of rage
No one that I could tell
Could break that Sculley's spell
And as the flames climbed high into the night
To light the sacrificial rite
I saw Sculley laughing with delight
The day the IIe died

He was singin'
Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank lemon tea and sighed,
Typin' "This'll be the day that I die. This'll be the day that I die."

I met a girl who sang of Blues
And I asked her for some Apple news
But she just smiled and turned away
I went to the computer store
Where I'd seen the Apple years before
But the man there said the IIe couldn't play
And in the schools the children screamed
The teachers cried and the hackers dreamed
But not a word was spoken
The disk drives all were broken
And the news mags that I'd liked the most
Softalk, inCider -- were all toast
They'd grabbed the last train for the coast
The day
the IIes
 died

And they were singin'

Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Snapple soda and cried,
Saying, "This'll be the day that I die.
This'll be the day that I die."

They were singin'
Bye, bye to my Apple II pie
Hooked my RamFAST to the SCSI
But the SCSI was fried
And hackin' boys drank Snapple soda and cried,
Saying, "This'll be the day that I die.
This'll be
the day
that I die."

Thinking About Online Communications
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
By Phil Shapiro
[P.SHAPIRO1]

>>> SOME THOUGHTS ABOUT TELECOM TRAINING CENTERS <<<
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Our society values learning enough that we spend 200 billion dollars each year on our public school system. Likewise, in the interest of promoting learning, we subsidize a large and robust public library system.

As we walk through the portals of the information age, thoughtful people have been spending time thinking about the role that government and industry can play in helping bring more of our nation's population online. What types of social institutions can we construct that can help people learn how to use communications software? Learn how to use bulletin boards? Learn how to use the national information services? And learn how to use the Internet?

Currently, just a small fraction of the nation's population is online. This fact is drive home by considering that fewer than 10 percent of all home computers are connected to a modem. Furthermore, market studies have shown that the penetration of personal computers in the home is approximately 35 percent of the nation's households. Taking one tenth of 35 percent yields a paltry 3.5 percent.

The bare truth is that the vast majority of the nation's population is not yet online. It behooves the nation as a whole to work vigorously to train our fellow citizens in basic telecommunications skills. The more people that can be reached online, the more each one of us can benefit from communicating with them.

I can recall distinctly my own first faltering forays into the online world. A leader in my local user group, Ken DeVito, spoke in an animated voice about connecting up his computer to the online networks. This kind fellow generously offered to take phone calls at his house to help people get connected up themselves.
After buying a modem and communications software, I hesitantly called Ken at his home. Having heard that telecommunications can be a complicated subject I went out of my way making sure I had my modem and communications software all set up correctly. Cautiously, timidly, I made my first phone call. Lo and behold, the word CONNECT bounced up onto my screen.

I imagine that most of us who are already online had similar help and encouragement from friends and colleagues the first few times we went online. That type of informal learning was fine in the 1980s when online communications was largely the province of computer hobbyists. But as we plunge headlong into the information age, the time is long overdue for our society to set up more formal channels for teaching online communications skills. We cannot continue to rely on the goodwill of the Ken DeVitos of the world to help everyone get connected.

What existing social institutions are best suited to take up this task? Schools, for sure, can help train our younger population. User groups, certainly, can help give online demonstrations and tutorials at their meetings.

But neither schools nor user groups are equipped to handle the huge numbers of people we need to train. The most suitable social institution to help train our nation's populace is public libraries.

Public libraries already have a mandate to promote the dissemination of knowledge and information. Calling upon our libraries to help train our nation in online skills makes even more sense when you consider the great overlap between basic telecommunications skills and basic research skills. The skills of searching and capturing information from an online database is closely parallel to the skills of searching and capturing information from a CD-ROM database.

While public libraries serve as the perfect venue for training sessions in online communications skills, no one for a moment would think that libraries have the funds to initiate such services on their own. What is obviously needed is a partnership between the private and public sectors to help bring telecommunications skills to the masses.

Phone companies, naturally, can play an important role in giving reduced rates for the installation of new phone lines in libraries. All that would be needed would be about eight to ten new phone lines for each library. Computer manufacturers should obviously step forward to make donations of computer hardware for telecom training purposes. These donated computers need not be an onerous expense since low-end computer systems work perfectly fine for telecommunications purposes.

Modem manufacturers, obviously, have a social duty to make their immensely useful devices available for use at library training centers. Here again, the low-end slower modems serve eminently well for training purposes.

It goes without saying that the national information services should step forward to donate accounts that could be used in training centers. Many of the national information services have probably already given thought to how they could help support publicly funded telecom training centers.

Larger software publishers could step in to provide communications...
software and general financial support for the training centers. Mitch Kapor, Steve Wozniak, and other luminaries in the computer world have already taken bold steps to promote social causes with the Electronic Freedom Foundation. The participation and support of these luminaries would go far in making the training centers successful social institutions.

Finally, the public sector can assist by providing tax incentives to the phone companies, computer companies, modem manufacturers, national information services, and software companies that donate in-kind goods or services to the telecom training center. The public sector could also help with the issuance of "Online Citizen" certificates for those persons who show mastery of basic telecommunications skills.

Few North Americans are aware that the public library systems in the United States and Canada are held up as model systems in other nations around the world. Early in our two country's histories the people of our nations gave strong support to funding and promoting schools and libraries.

For the good of our nations, we need to take the next step to help bring more of our citizens online. The time for a public/private telecommunications skills initiative is long overdue. For the good of our nations, we need to create social institutions that can take over the supportive role of those who helped get the first 3.5 percent of us online.

After we're able to get the first 10 percent online, the momentum will be strong enough that we can pull another 50 percent online before the turn of the century. And with 60 percent of the population online by the year 2000, our countries will then be well positioned to move forward with the exciting possibilities of the information age.

-Phil Shapiro

Polishing Green Apples

"""""""""""""""""

By Steve Weyhrich
[S.WEYHRICH]

>>> HOOKED ON CLASSICS (Part 3) <<<

"""""""""""""""""

STILL MORE CONTROL PANEL BASICS    Yes, we are STILL slogging our way through the IIgs CDA Control Panel. This month, as you look at ways to lose that holiday weight, pay those holiday bills, and shovel that holiday snow, why not take a break and join me as we learn about "Options" (ROM 01), or "Keyboard"/"Mouse" (ROM 03). Scrape the ice off your monitor, and turn on that heater (this time of year it would probably be NICE to have a Pentium-based computer; they generate a LOT of
Here is another difference between the ROM 01 and ROM 03 versions of the Apple IIgs. At this point in the CDA Control Panel, the ROM 01 version is called "Options", and the ROM 03 version is called "Keyboard". They look something like this when you select them:

(ROM 01)                      (ROM 03)
Control Panel                 Control Panel
Options                      Keyboard

~ Display Language: U.S.A.                      ~ Display Language: U.S.A.
~ Keyboard Layout: U.S.A.                        ~ Keyboard Layout: U.S.A.
~ Keyboard Buffering: No                        ~ Keyboard Buffering: No
~ Repeat Speed: |------*--------|                ~ Repeat Delay: |-------*-------|
~ Repeat Delay: |-------*-------|                ~ Double Click: |-------*-------|
~ Cursor Flash: |-------*-------|                ~ Cursor Flash: |-------*-------|

-Advanced Features-                -Advanced Features-
Shift Caps/Lowercase: No          Shift Caps/Lowercase: No
Fast Space/Delete Keys: No        Fast Space/Delete Keys: No
Dual Speed Keys: Normal           Dual Speed Keys: Normal
High Speed Mouse: No

Select <- -> V ^ Cancel: Esc Save <-|  
(The "Double Click" and "High Speed Mouse" entries for the ROM 01 version will be discussed below.)

Display Language/Keyboard Layout The intent of the top two entries, Display Language and Keyboard Layout, was to simplify the manufacture and use of the IIgs for foreign countries. Older models of the Apple II would require a different character generator chip for each country where it was sold, to account for local differences in characters (for example, in Great Britain the character produced with a Shift-3 was the British stylized "L", for "pound", whereas here in the U.S. Shift-3 produces an octothorpe, which looks like the tic-tac-toe board). Manufacturing and stocking all these different ROM chips increased the cost of producing the computer. To have it built into the IIgs, selectable through this Control Panel, simplified things considerably. A separate keyboard is still necessary to be consistent with regional differences around the world, and the Keyboard Layout needs to be adjusted to match the type of keyboard that has been connected. In any case, the modular design of the IIgs still makes that easier than on previous models of the Apple II.

If you make changes in the Display Language you will see some unusual characters substituted for characters like ",", "\", and so on. For users in the U.S. this would be primarily a curiosity; however, if you are developing software that might be used by IIgs owners in other parts of the world, you should change the Display settings to ensure that you are not using some characters that will not show properly with other language layouts. (AppleWorks, for instance, may not show proper screen characters with certain features when other Display Languages are selected).
One of the other uses of the Keyboard Layout would be to change from the standard (also called "Sholes" or "QWERTY") keyboard to the Dvorak system. This takes the arrangement of the letters on the keyboard and moves them into something that can be much faster to use—once you become accustomed to it. All of the most frequently used characters in English are placed in the home row (where it currently holds "ASDFGH", etc.). If you make this change and don't change the keycaps on the keyboard, you will find that typing a "D" causes an "E" to appear on the screen.

I actually changed my Apple IIc keyboard layout years ago (via the "Keyboard" switch in the upper left corner) to the Dvorak layout, and used a typing program called MasterType to teach myself to use it. And I do admit that my typing began to get faster and a little more accurate. However, using a Dvorak keyboard is like being left-handed in a right-handed world. If the ONLY keyboard you are ever going to use is YOUR keyboard, you'll have no problems, once you get used to Dvorak. But since there was a Dvorak keyboard at home, and a QWERTY keyboard at work, my brain became too confused to keep making the switches, and so I went back to the old standard.

On the IIc it was not TOO much trouble to pop the caps off of all the keys and rearrange them into the Dvorak layout. However, I've never tried this on my IIgs, and do not know how difficult it would be. If you want to make this change, just be careful not to FORCE anything as you try to remove the keycaps. If you break something, you'll probably have to pay SOMEONE to have it repaired (or replaced).

Keyboard Buffering   Keyboard buffering allows the user to continue typing while the computer is busy doing something else, and will save up the keystrokes until the program running is again ready to accept them. I have not personally seen that this works very well in the programs that I regularly use. IBM-type computers seem to buffer up nearly EVERY keystroke that is entered, regardless of what else the system is doing. If you know ahead of time which type of keystrokes will be needed to carry out a certain function, this can be a time saving feature. However, the IIgs buffer doesn't seem to be designed the same way, and you will just have to try it out yourself to see if having this turned on helps out in YOUR situation.

Repeat Speed/Repeat Delay   Repeat Speed and Repeat Delay refer to the auto-repeat of keys pressed on the keyboard. On the Apple II Plus, a separate key was included on the keyboard to allow a key that was held down to repeat. On the IIe and IIc, an AUTOMATIC repeat is built-in; if you press the "A" key and hold it down, it eventually begins to repeat and continues to do so until the key is released. The IIgs does the same thing, but lets you modify it to suit your style. The Repeat Speed is a relative measure of how fast the repeated keypresses are generated, and the Repeat Delay refers to how long a wait there is until a pressed key begins to repeat. If you are a heavy-fingered typist and have the Repeat Delay turned down too low, you may find some accidental repetition of some keypresses. If you don't like the default settings for these options, play with them until you find something more suitable.

Cursor Flash   This should be self-explanatory. If that pulsating cursor is not at a speed that seems comfortable for you, use this to make it faster or slower.
Shift Caps/Lowercase  The various advanced features in this next section of the Control Panel are primarily for those who have become very accustomed to the feel of the keyboard, and want to work a bit faster. Shift Caps/Lowercase changes the function of the Caps Lock key slightly. When this feature is set to "No", the keyboard will generate uppercase letters when the either the Caps Lock key or the Shift key is down. If this feature in the Control Panel is set to "Yes", the Caps Lock key will still cause letters on the keyboard to come out as uppercase; however, pressing the Shift key while the Caps Lock key is DOWN will cause letters to come out in lower case. In other words, the Caps Lock key will now change the function of the Shift key--but for the letters A-Z ONLY. Other characters on the keyboard (such as numbers and the symbols on the number keys) will STILL require the Shift key be pressed to generate them.

Fast Space/Delete Keys, Dual Speed Keys  These features allows more rapid movement of the cursor if the Control key is pressed along with certain other keys. If Fast Space/Delete is set to "Yes", Ctrl-Delete causes the Delete key to erase text twice as fast as other keys repeat, and Ctrl-Space causes you to insert spaces twice as fast. When Dual Speed Keys is set to "Fast", Ctrl-Up, Ctrl-Down, Ctrl-Left, and Ctrl-Right (arrow keys) will move the cursor twice as fast as usual. If the Repeat Speed setting further up in this Control Panel is set to the top speed possible, these particular features will appear to do nothing, since it will not repeat faster than the fastest speed.

MOUSE  On the ROM 03 IIgs, the ability to make the keyboard simulate mouse movements was built into the firmware code. This was intended to make it easier for handicapped users who could not easily use a mouse still handle software that needed one. Because of this, the mouse-related items in this Control Panel were moved to a separate entry, which looks like this:

```
(ROM 03)

Control Panel

Mouse

~ Mouse Tracking: [-------*------]
~ Double Click: [------*-------]

~Keyboard Mouse~
~ Delay To Start: [-------*------]
~ Acceleration: [-------*------]
~ Maximum Speed: [--------*-----]

Select <- --> V ^ Cancel:Esc Save: <-]

Notice that the setting in the ROM 01 version (under "Options") calls Mouse Tracking a "High Speed Mouse". Setting that option to "Yes" makes any movement of the mouse on your table top to cause the cursor on the screen to move twice as far as usual. On the ROM 03, you have some finer control over the specifics of the mouse tracking.

With enhancements the in System Software made available in System 6, the distinction between a ROM 01 and ROM 03 became less apparent, as now BOTH versions of the IIgs can make mouse movements accessible to
handicapped users that cannot handle a standard mouse. However, if a program that does not run under GS/OS (or under System 6) needs this type of access, a ROM 03 GS will still be necessary.

Double Click items are present with both versions of the IIgs firmware. The Double Click control adjusts how quickly two clicks must be made in order to be properly registered by programs that use them for shortcuts (such as selecting and launching a program from the Finder). If your double clicks aren't always being accepted, you may have this set too high or too low for the speed you use. Try adjusting it and see what works better for you.

The remaining items are specific for the keyboard mouse feature. This is activated by pressing the Open-Apple (Command) and Shift keys at the same time, and then pressing and releasing the Clear key. After you've done this, the numeric keypad can be used to control the position of the cursor on the screen, and the center key ("5") is used to simulate the button on the mouse. Other features involved in controlling the keyboard mouse can be found in the ROM 03 IIgs Owner's Reference or the System 6 User's Reference.

Back to the Mouse Control Panel: Delay To Start is similar to the Repeat Delay on the Keyboard Control Panel; this refers to how long the keypad keys have to be held down before the mouse cursor will move. Acceleration controls the speed at which the mouse cursor moves under keyboard control, and Maximum Speed refers to how fast the cursor moves.

As mentioned above, if you are running System 6.0 or 6.0.1, you have these features available on ANY version of the IIgs. The adjustable Control Panel settings would not, of course, be available from this CDA Control Panel. Instead, a ROM 01 user will need to access the NDA Control Panel (from the Apple in the upper left corner) in a GS/OS program, and make the changes in how the keyboard mouse works from there.

NEXT MONTH Well, the heater finally kicked in, and my monitor is not fogging up any more from the melted ice. We are approaching the end of this examination of the Control Panel Classic Desk Accessory. Communication with your printer and modem like you've never seen it before, RS-232 serial interfaces, and more--next time, on "Polishing Green Apples"! Don't miss it!!

Steve Weyhrich is a family physician from Omaha, Nebraska. He has been using Apple II computers since 1981, and writing about them since 1990. He follows closely the events that continue to shape the destiny of the legendary Apple II and IIgs computers, and writes a monthly column called the "A2 News Digest" for A2-Central disk magazine. He is also the author of the "Apple II History", available on fine BBS's everywhere. Add water and simmer until well done.
The World Wide Apple II User's Group meets every Sunday. This month, we thought it would be fun to present you with the highlights of the WWUG meeting, live, as they happened. There's only space for a short extract with featured guest Jerry Kindall of Quality Computers, so drop in on the WWUG meeting this Sunday to find out just how widely the conversation ranges! -- Ed. }

Room 1, Bewitched, Bothered & Bewildered

Notice on door: Come on in...new? Never fear...we'll help you unlock the secrets of A2 & GENie with a few swipes of his magic lamp! Don't forget...starting at 4 p.m. eastern, will be our 3rd meeting of the WWUG...featuring AppleWorks 4.0!

[ We join this RTC in progress -- Ed. ]

<[Carl] C.MANUELIAN1> I started with an AII + in 79

<[GENa] A2.GENA> I've got about 3-4 working II+'s in my basement... plus a LOT of software, and other parts...

<[Paul] PMP> didn't get my + until 82

<[Carl] C.MANUELIAN1> I still have programs on CASSETTES!

<[GENa] A2.GENA> This is stuff from A2.Susan's store...over the next several Sat's (after the holidays), I'm going to be taking a box at a time, inventorying it, and then posting it up in the bb

<[Paul] PMP> but its an OLD ]+[... a reconditioned ][

<[GENa] A2.GENA> Wow, Carl! Those ARE old...they're antiques!

<[Paul] PMP> oh, I actually have OFFICIAL Apple cassettes... like Hoppalong Cassidy, Lemonade Stand, etc

<[Carl] C.MANUELIAN1> My gs cant load them and I sold my old IIe. I should have put them on disk

<[GENa] A2.GENA> Well...would they work on a II+?

<[Carl] C.MANUELIAN1> Yes--They were written on a II+

<[GENa] A2.GENA> i.e., you culd use the II+ to transfer them over to disk? I would suspect they're old dos3.3 programs, right?

<[Carl] C.MANUELIAN1> I never thought of trying that

<[Paul] PMP> no o/s at all if they're on tape...

<[GENa] A2.GENA> Carl...someone with more expertise than I would have to say if it would work, but...

<[Carl] C.MANUELIAN1> Tey were written before DOS 3.3. They work with original ROM Applesoft
Paul PMP: I used to save my BASIC and machine language programs on cassette... used to mess up all the time, which annoyed me to no end then I took the leap and spend $350 + $99 for the controller for a 5.25" disk drive...

Carl C. MANUELIAN1: I would just start up the computer and cue up the cassette and type load

A2.GENA: You could pose this ? in the bb... cat 2, topic 4

Quality:* is here.

A2.GENA: Hi, Jerry!

Paul PMP: Greetings, Jerry. How's it going?

Jerry QUALITY: Hi all

Carl C. MANUELIAN1: HI Jerry

A2.GENA: So, shall we begin? Jerry, I'm going to make a few announcements, then give it over to you. Since there's not a crowd, I don't think listen-only is necessary...

Jerry QUALITY: Oh, OK

Carl C. MANUELIAN1: Jerry--Love Quality--Thanks for your Apple II support

Jerry QUALITY: Announce away. (Thanks, Carl.)

Fred F. GREATOREX: Hello Jerry.

A2.GENA: Alright...as you know, WWUG was the brainchild of Lunatic, while we were sitting in a dorm room at kfest...and as Jeff and myself were the leaders of the BBB, we were appointed to get this group off it's feet. We figured that getting Apple II support out there was becoming more andmore difficult, so we'd try to help with an online support group!

Our first area is "What's New in Appledom" -

As we all know...AW4.0 is now shipping and becoming very popular. In a few moments, Jerry here will be telling us all about it!

Also, Spectrum is soon to come off the drawing board and into production...it's a desktop communications program...will undoubtedly please those who use Manager and SwitchIt on a regular basis!

ANSITerm has come out with a new version, which will be shipping soon. Paul didn't stick around too long for me to have him tell us a little about it, but... as soon as I can find the time, I'm gonna abstract our interview with him last month...all about ANSITerm!

Now, for a few previews of some library files I've found quite cool. For holiday pics, file #21761 has christmas and Hannukah stuff... File #21778 is the December Disk of the Month...loaded with goodies. File #21740 is a real nifty little program - it is an auto-trash thing...that is, when you dump something in the trash, it automatically erases it...
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1196 of 1824

without you having to hit OA-T. File #21728 is a general GS file utility, and file #11631 is a real nice program to play sounds in the background. Right now, I can’t get it to work, but I suspect it doesn’t like one or more of my myriad da’s/ini’s, and I haven’t had time to find out which one is offensive...

Does anyone have any questions???

<$[Fred] F.GREATOREX> Are any of those files duplicated on the A2 Dom disk?

<$[GEna] A2.GENA> Fred, I'm not certain...haven't looked at the contents yet of the Dec Dom...got most of those files from the Dean's List :) I can't dl the DOM right now until I can get my 3.5" drive working :

<$[Fred] F.GREATOREX> Cool.

<$[GEna] A2.GENA> Alright...Here's (said in my best Johny Carson announcement voice <grin>) Jerry! We're going to open the floor to questions...you all know the basics of AW4.0, right?

<$[Jerry] QUALITY> Well, as you know, AppleWorks 4 has been shipping for about a month and a half...A lot of people are already using it and enjoying it. B) Anything I can help clear up about AW4?

<$[GEna] A2.GENA> Jerry, I know that it incorporates many of the time-outs...which ones are they?

<$[Carl] C.MANUELIAN1> What has been added since VERS. 3?

<$[Fred] F.GREATOREX> can you send me a free copy?

<$[GEna] A2.GENA> :

<$[Jerry] QUALITY> The majority of things that have been added are new database features, GEna. TotalControl is now built in. Also, UltraMacros is built in...

<$[Carl] C.MANUELIAN1> What is total Control?

<$[GEna] A2.GENA> I haven't played around too much with TO's myself...but...

<$[Jerry] QUALITY> TotalControl is an add-on Randy Brandt developed... It allows one data base to access data from another data base, or from a spreadsheet. It also lets you use formulas in the data base.

<$[GEna] A2.GENA> That would have been a BIG help in the job I was on earlier - at home!

<$[Jerry] QUALITY> Similar features were added to the spreadsheet...

<$[GEna] A2.GENA> I had multiple db's - one for each customer...and had to make reports on totals (customer = client)

<$[Carl] C.MANUELIAN1> Can you set up seperate calc fields in the data base for reports?

<$[Jerry] QUALITY> Reports no longer have calculated fields... all the calculations are done in the data base itself... You can even set up

Apple II Computer Info
auto-calculate categories so that when you change one category, the calculated category is automatically updated.

<[GENa] A2.GENA> In the DB, too? that could be done already in the ss, right?

<[Jerry] QUALITY> Right... the data base has gained a whole bunch of spreadsheet-like features

<[Carl] C.MANUELIAN1> Is this similar to the way AWGS hansles the DB?

<[GENa] A2.GENA> Cool! I was using DB's exclusively, due to the fact that I had to cull out stuff...

<[Jerry] QUALITY> The spreadsheet remains the best place for number-crunching and what-ifs, the data base is the best place for keeping lists of things. Actually, I'm not sure if it's at all like the AWGS data base. I've never used the AWGS data base. (Believe it or not <g>)

<[GENa] A2.GENA> Actually, the SS WOULD have been better for me (number crunching), but I HAD to take out specific things, say, all records of a given merchandiser from an entire list of merchandisers who worked for one client

<[Carl] C.MANUELIAN1> It's hard to explain how I use the data base for customer order. But I need something that calcs tax and shipping after culling the order from the inventory DB

<[Jerry] QUALITY> In the Word Processor, you get Glossary functions. Which allow you, basically, to do mail merge one record at a time...

<[GENa] A2.GENA> Jerry, when I worked on the old xerox 860's - glossary function was like a macro...i.e., type one letter, and a phrase would pop up...that's what THEY called glossary

<[Jerry] QUALITY> In other words, you want to write a letter to someone, so you pull up your name and address glossary; it gives you a list of the people in your address data base... When you pick the name, it inserts the name and address into the WP document

<[GENa] A2.GENA> Wouldn't the new formula thing in the DB fill Carl's "order"?

<[Jerry] QUALITY> Yes, you can probably do that all using the data base now, Carl. The data base supports 60 categories instead of 30... so there will be lots more room.

<[GENa] A2.GENA> Indeed! (for my vendor database, how nice!) Jerry, one thing...does it support, like the ss, sideways print for the db?

<[Jerry] QUALITY> You still need Sidespread for that... Unless of course you have an HP Deskjet 500

<[GENa] A2.GENA> I thought SideSpread only worked with the ss!

<[Jerry] QUALITY> True... but you can easily copy the data base records to the spreadsheet
A2.GENA> True...

Jerry QUALITY> The DJ 500 driver lets you print sideways from any application, but that's only because the DJ can print sideways.

A2.GENA> Question...until I get my hands on AW4.0 (which may be a while financially), can I copy the records from the DB into the SS in 3.0?

Jerry QUALITY> Yes, you can... anything from one module can be copied to any other module, starting with 3.0

A2.GENA> (there are NO calculations...just data) (now, if I can just find my 5.25" version of SideSpread <grin>)

Jerry QUALITY> Let's see... AW4 also has three independent Desktops... and three Clipboards. Built-in disk and file utilities... Better mail-merge... Many of the most popular AppleWorks patches (for example, cursor shape and blink rate) have their own option on the configuration menu. There's a built-in clock display and screen blanker. Lots of other stuff. B)

A2.GENA> Alright... anyone have any questions?? Don't all speak at once ;)

A2.GENA> Jerry... I think you've left them speechless ;)

Carl C.MANUELIAN1> What are the prices for upgrade

** <PMP> is here.

Jerry QUALITY> Upgrades from 3.0 are $79.95... from 2.x, $99.95... From 1.x, $119.95... Or if you don't have AW already, you can get the package for $179.95. To upgrade, you just need to send your original disks (or photocopies) to us...

Quality Computers, 20200 Nine Mile Rd., St. Clair Shores, MI 48080

Carl C.MANUELIAN1> What original Time Outs are now part of the new 4.0 package?

Jerry QUALITY> Hmmm, TimeOut Paint... There aren't really any TimeOuts included per se... that is, you don't activate them from the Apple-Escape menu... It's more like AppleWorks ate 'em for lunch

A2.GENA> Oh... speaking of TO's... what about original TO's... are they compatible with 4.0?

Jerry QUALITY> For example, FileMaster is now incorporated... but you access it from the Other Activities menu, not from the TimeOut menu

Carl C.MANUELIAN1> I understand-- what features I should say-- I understand they have been incorperayted into the core program

Paul P.JANETZKE> When's the world conf.

A2.GENA> NOW!

PMP> what about macros? Does 4.0 have something like UltraMacros
Built-in?

<[Jerry] QUALITY> It has an UltraMacros 4 player built in...

<[Paul] PMP> cool!

<[Jerry] QUALITY> You need UltraMacros 4.3 or later to compile and record your own.

<[GEna] A2.GENA> What about compatibility with present TO's..? i.e., side spread, etc.

<[Jerry] QUALITY> Some of them will work without modification. AW4 comes with an updater which will update many of them. We hope to have more working early in 1994.

<[GEna] A2.GENA> Is there a list of those that will/will not, and those that can or cannot be updated, or is it mainly "hit/miss"?

<[Jerry] QUALITY> I don't have the list handy, but it's been posted in Cat 42 Top 29.

<[GEna] A2.GENA> Ah....alright!

<[Jerry] QUALITY> Sidespread has been, I think.

<[Paul] P.JANETZKE> Hey, I know it's probably been asked already but what is the status on the AWGS update Jerry???

<[GEna] A2.GENA> Actually, not, Paul :)

<[Paul] PMP> good question...

<[GEna] A2.GENA> Indeed!

<[Jerry] QUALITY> Well, we've got Jim Merritt as project manager.... And we're in the process of getting the source Claris sent us to compile... and looking at the suggestion lists to see what we can do in a reasonable time frame.

<[Paul] PMP> :) thats always a problem...

<[Jerry] QUALITY> We hope to have something released next spring.

<[GEna] A2.GENA> Great! oh, and make it like system 6.0.1, too :) right?

<[Paul] PMP> one feature, if it hasn't been mentioned yet... having the spell checker work in PL...

<[Jerry] QUALITY> That might be doable, depending on how closely the two data structures resemble each other.

<[Carl] C.MANUELIAN1> I am mostly using AWGS--I am also in the AWGS Upgrade.

<[Paul] PMP> and having 360 degree rotations of objects and text would be nice :)
I like AWGS for page layout...with an old imagewriter I, print quality is better than Publish It...

If you're going to rotate something 360 degrees, what's the point?

Besides...can't use Pointless with Publish It!

0-360 degree... like having angled text, etc.

Not sure how feasible that is, but I'll add it to the list. Anyone else got any pet suggestions for AWGS? B)

oh... and having boxes with widths that scale properly in condensed mode sorta like how GWIII does it... i always have to add additional lines at the top and bottom to make them the same width as the sides

Since mine doesn't seem to like 6.0.1, I don't use it...

I would like to see a better telecomm modual for AWGS such as an auto logon modual

Yes!...I'm certain that a LOT of people echo that, Carl... and better "split-screen" capability?

oh... and a BIGGY... make it IPC-compatible with an "Extras" menu kinda like the Finder for external/TimeOut-type programs

I'm not sure how much effort we'll be putting into the telecomm module, to be honest. Most AWGS users don't have modems, so the telecomm is kinda low on our priority list.

Interesting note, Jerry, about users v modems

Hi, Auri

Hey Gena!~

I'm just looking for a good window (GS) interface for my telecomm program

Spectrum, Carl, when it comes out!

My suggestion right now is to investigate AnsiTerm or Spectrum

That sounds great jerry--

ANSITerm, though excellent, is not a GS program, right? er desktop, that is

right, it's not a desktop program

A stand-alone telecomm program is always going to be more powerful than the one in an integrated package
<[GENa] A2.GENA> Hint, hint...Paul...for your next update :)

<[Paul] PMP> :/

<P.JANETZKE> Well I'm probably going to get FLAMED for this but as far as I'm concerned you can ditch the telecom altogether unless you make it something that the GS can really use like full color ANSI and stuff like that. That's my $.02 worth.

<GENa> A2.GENA> Poor Paul...he's gotten SO many suggestions for his next update :)

<Paul> PMP> :)  hey, 2.1 just came out, gimme a break!

<GENa> A2.GENA> Well...maybe if we badger Paul...hehehe

<QUALITY> Jerry--I saw your ad for spectrum--is it out yet?

<Carl> C.MANUELIAN1> Has Quality received any shipments of Spectrum from Sevenhills?

<Auri Man> A.RAHIMZADEH> I'm using Spectrum :)  It should be out soon!

<Paul> Jerry, what about the "Extras" menu idea? I'm sure this has been brought up before, since it would be a GREAT advantage for AWGS

<QUALITY> ANSI is a good way to slow down your baud rate. B) The good thing about the AWGS comm module is that it will serve to get modem novices online

<P.JANETZKE> Well Jerry, my point is if it;s not the best why worry about it when the best can be had elsewhere. If a major update to the telecom would cost too much in time and/or money then find something else. I'm happy with PT 3.1.

<GENa> So am I, Paul, but if I can use a 'com program that is desktop, a good wp desktop program, etc., then I could use some of the other goodies, like SwitchIt, The Manager and HardPressed...

<P.JANETZKE> I mean Megaterm isn't slow and it does excellent color ANSI for the GS.

<Auri Man> A.RAHIMZADEH> Wait for MultiGS 2.0 Gena :) 

<P.JANETZKE> Good point about novice users, but the package deals that are offered with modems usually provide a telecom package/

<QUALITY> It might get zmodem..

<GENa> True, Paul, but most of the modem packages nowadays offer Mac and ms-dos com ware

<P.JANETZKE> No Megaterm starts as P8 but then uses superhires for complete ANSI emulation.
Hey Jerry is Quality working on some sort of FAX software for the GS, I think I remember reading about this somewhere. If so what's its status??

<!--Jerry QUALITY> I think the Q Fax software's gonna be a wash. Unless we can get the author to finish it...

<!--Jerry QUALITY> Unless someone has some more questions about AW4 or AWGS, I think it's time for me to move along.

<!--Paul PMP> what about the "Extras" menu, Jerry? :)  

<!--Jerry QUALITY> It's a suggestion many have made, Paul

<!--Paul PMP> thought so :)  thanks

<!--GEnea A2.GENA> Alright! Thank you very much Jerry for your informative talk!

<!--Paul PMP> Thanks for the info, Jerry. I'll be looking forward to the new AWGS update!

<!--Paul P.JANETZKE> Thank for the answers Jerry!!

<!--Jerry QUALITY> Thanks for having me, GEnea!

<!--GEnea A2.GENA> You're welcome, Jerry!

<!--Jerry QUALITY> Randy has done a phenomenal job with AW4. I'M impressed... and that's not easy. See y'all later.

<!--GEnea A2.GENA> Laters, Jerry

<!--Auri Man A.RAHIMZADEH> l8rness Jerry! looking forward to my next II Alive! :)  

<!--Paul PMP> has anyone received the new II Alive yet?

<!--Auri Man A.RAHIMZADEH> not here... can't wait tho! :)  

<!--Jerry QUALITY> New II Alive mailed the 7th so it's on the way.

<!--Auri Man A.RAHIMZADEH> awesome!

** <!--Jerry QUALITY> has left.

<!--A2.GENA> I suppose this concludes the formal part of the meeting :)  I'm going to TRY to get Brian for January - Internetting

Review of TypeSet
"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
by Darrel Raines
[D.RAINES]

TypeSet
by WestCode Software Inc.
15050 Avenue of Science, Suite 112
San Diego, CA 92128
1-800-448-4250 (orders only)
or 619-487-9200
list price $49.95 (introductory price $29.95)

[*][*][*]

This time, we'll be putting a software package called TypeSet on the examining table. This program was created by Steve Disbrow and Joe Wankerl
of _GS+ Magazine_ fame, and is distributed by WestCode Software.

TRUETYPE TECHNOLOGY A little over a year ago, many Apple II computer
users were surprised and pleased to find when
TrueType technology arrived for the Apple IIgs. With the introduction of
Pointless, Apple IIgs owners could use scalable fonts with many most
popular software packages.

TrueType fonts are available from a variety of sources. They only
limitation to the number of typefaces available from Pointless is the disk
space that a person is willing to allow his font collection to eat up.
Once the typeface definition exists and is visible to Pointless, the
software can generate a font in any size (point) that the user wants. You
probably can guess that many people find themselves with more fonts than
they know what to do with.

When WestCode Software updated their Pointless package this year,
they made many significant improvements. Some improvements will allow a
user to have even more typefaces available. The trade-off is that it can
be confusing to find all your typefaces and to remember what they look
like. It is at this point that TypeSet enters the picture.

PROGRAM DESCRIPTION TypeSet claims to be a tool that will let you do
three things:

1) You can see a sample of each typeface in the pull-down Font menu.

2) You can choose which of the typefaces will be available from
pull-down Font menus.

3) You can print four types of reports to a printer or the screen.

TypeSet can be installed using the Apple Computer's Installer program
with scripts written for that specific purpose. The first item that the
installation process requires is the name of the user. The original can
then be copied -- there is no copy protection -- and used to install the
TypeSet program on a hard drive or on your favorite floppy system disks.
You can also simply take the appropriate file (that's right... only one!) and
put it in the System folder of your boot hard drive. If you gather
from this that installation is a snap, then I have described the process
correctly.

The TypeSet software works as a New Desk Accessory (NDA). This type
of program is available under the Apple pull-down menu within any standard
desktop program. From here, the software can set up and change the way
that other software gets information about the Font pull-down menu.

When you select the TypeSet NDA, you are presented with a number of
choices concerning how the Font menu appears under desktop programs. A
button is also available that will take you to the report menu for other
choices. When you have made your selections, the TypeSet NDA can be closed
and put away until the next time that you want to customize the Font menu
look.

Under the title of "Settings" you are given the option of whether or
not you want What-You-See-Is-What-You-Get (WYSIWYG) Font menus. You may
also choose the size of the typefaces displayed. Another nice feature on
this page is the ability to change the keyboard selection sequence to your
own preference.

The main feature of TypeSet is available on the main page. You are given the opportunity to create and manage typeface "Sets" that can be selected on the fly. A set consists of any number of typefaces that have been previously established under Pointless. Any typeface that Pointless knows about is available; however, you can select which typefaces are shown as a Font menu selectable item. Any number of sets can be created and the set membership is available for editing on the first page. When you make a set active on this page, then only those typefaces are shown on Font pull-down menus until you change the set.

One of my favorite features of the TypeSet package is the ability to print typeface reports. Four different reports are available: All characters, key equivalents, various sizes (same typeface), and line samples (multiple typefaces). The first three reports are meant to display important information about any single typeface. The final report is meant to be used for giving examples of many different typefaces in a small space. About eight typefaces are shown per page on the line sample report. These reports can be shown on the screen or sent to the printer using your favorite print driver. This NDA, in conjunction with Harmonie or Independence, provides fantastic reports on an HP IIF compatible laser printer.

**PROGRAM PERFORMANCE**

The first and last thing that hits me about this package can be summed up in one word: speed. TypeSet is too slow. I do not mean just a little pokey; I mean that you can eat a heavy snack during some of the operations available in TypeSet... even on my system, which has a 8 MHz Zip card and a RamFast SCSI controller.

My major reason for buying the software was the promise of the ability to handle many TrueType typefaces without having to go into Pointless to change what was available. I wanted to be able to create sets and use those sets to limit the typefaces shown on my menus.

TypeSet seems to slow down in direct response to the typefaces that have been defined under Pointless. Therefore, the very reason that I bought the package turns out to be its weakest point. WestCode indicates that TypeSet is the perfect solution for managing large typeface selection situations. I have to disagree.

The problem is not even limited to using the TypeSet NDA. Because TypeSet is active whenever a desktop program is executing, some unexpected delays quickly become apparent. Every time you start a new desktop program with a Font pull-down menu, TypeSet sets up the list of typefaces that will appear on that menu. During the initial setup time (i.e. before the menu titles appear at the top of the page), there is an extended delay while the Font menus are created. This was an unexpected event! I have put together some typeface sets that caused the Finder to take an extra two minutes to start up. (It may be that this is due to slowness of the system software's List Manager. However, this is only my personal theory.)

Another area that relates to overall speed concerns the Font menu using WYSIWYG names. It takes a long time to move through the menu in this mode. This happens because Pointless has to create the typeface on the fly -- TypeSet's manual even suggests a way to speed this up. You must create a fixed point size font for each TrueType file that you list on a menu.
This alternative takes up about 10-25 extra blocks for each typeface. It can take more than 30 seconds to display a 20 item typeface menu.

During testing, TypeSet proved to be unstable; a serious concern. By this, I mean that I have had the software crash a number of times while trying to create sets, change sets, create reports or print reports. I have never had a problem with stability in connection with the WYSIWYG Font menu. The only pattern that I can glean from my testing indicates that the more typefaces available from the Pointless setup, the more likely that I am to crash the system. This "feature", combined with the speed problems that I have listed, have made for some slow and frustrating evenings using TypeSet.

My last concern may be related to the system crashing -- I cannot honestly rule out that possibility; however, it seems to me to be a different problem: I have had set definitions disappear from one session to another. I will have created a set that has a few of the typefaces for use with a particular type of program. Once I go to another desktop program and reenter TypeSet, the set definition is gone. This tends to serve as yet another area of frustration.

I do not want to leave this review without listing one of the outstanding features of this package. The typeface reports are an outstanding facet of the TypeSet NDA. It is extremely nice to be able to choose a list of typefaces and have TypeSet print out a group of professional-looking reports; however, I have found a few areas of instability in this area also. There have been times -- though relatively few -- when the system will crash while printing reports. On the whole, this is the strongest feature of TypeSet in its current state.

RECOMMENDATION I cannot really recommend the purchase of TypeSet at this time. I feel that additional testing is needed to iron out some of the problems that I experienced. I also think that the program needs to be significantly speeded up.

The only reason that I would recommend TypeSet at this time is for its reports feature. However, this is an expensive way to handle that task. Even when the software is used exclusively for reports, the speed problems will still be a concern. Most people will want to wait and see what WestCode Software does to address these problems. With some fixes for the most serious defects, I should be able to recommend this software at some point in the future. Until then, I will use Pointless to manage my typeface selection.

[*][*][*]

Darrel Raines is an electrical engineer who works during the day as a contractor to NASA building simulations. During the evenings, he plays with his Apple IIgs computer and writes articles like this.

Who's Who In Apple II
////////////////////////////////
By Tara Dillinger
>>> WHO'S WHO? <<<

~ GEneLamp Profile: Randy Brandt ~

GEneLamp> Randy Brandt is the programming wizard behind AppleWorks 4
        by Quality Computers, and he has his own software company
called JEM Software. He was one of the people that worked on AppleWorks
3.0 and also worked for Beagle Bros.

Well, Randy, let’s start from the beginning... where were you born
and where did you grow up?

BRANDT> I was born in Morris, Manitoba and grew up in Kamsack,
        Saskatchewan and Kola, Manitoba. Kola had a population of 80 (7
in my family). Kamsack was [named for] an Indian chief. My parents are
back in Kamsack. I have a sister in Phoenix and the rest are in Canada.

GEneLamp> What is your educational background?

BRANDT> I have a degree in Sec Ed/English from Christian Heritage College

GEneLamp> What had you originally planned to do with your life?

BRANDT> End it. Just kidding. I was going to be a scientist.

GEneLamp> In what field?

BRANDT> I went to CHC as a Biology major. I dropped that after an "A" in
        Genetics. I loved the theory, but hated the lab work. My virgin
female fruit flies kept multiplying.

GEneLamp> How and when did you get started with computers?

BRANDT> I started with computers in college. In 1980 my school,
        Christian Heritage College, got an Apple II, and I started
hacking. My first program was a grading package for my girlfriend Joanna.
She is now my wife and pregnant with kids #4 and 5.

GEneLamp> That first program must have impressed her, then! :)

BRANDT> Joanna wasn’t impressed until I started making some money.

GEneLamp> What was your first programming job, and when was that?

BRANDT> Beagle hired me in 1984.

GEneLamp> What have you directly worked on for Beagle Bros?

BRANDT> My Beagle products were ProByter (a disk zap package) and
        Extra K, doing docs and a bit of software. Then I wrote Big U,
followed by numerous others from MiniPix to MacroWorks.
What was it like to work at Beagle Bros?

Working at Beagle was great, although I was only there a month or so, since I actually have worked at home for the last 8.5 years. It was great at Beagle Bros because Bert Kersey is hilarious and everyone got along. Bert was always pulling pranks, making phony ads, etc. He's just a funny person.

His house had a trapdoor-looking pattern at the front door, with a sign that said "Press doorbell once for trapdoor, twice to ring." At Hallowe'en he had a battery-powered hand clawing at the window.

Who did you work with there?

I worked with Mark de Jong, Mark Simonsen and Alan Bird. Later, in the Simonsen era, I worked with Mark Munz, Matt Reimer and Dan Verkade. We used to get together every Friday for lunch since we all worked at home.

No office to go to?

None of us _wanted_ to go to the office to work.

Tell us about each of your co-workers.

Alan is the genius. He's the only one with as many kids as I have. Mark Simonsen is a good guy as well, and a very good programmer, especially with graphics and printers. Mark de Jong didn't program as much, but he loved messing with little SuperMacroWorks programs, and even did a text-based game and paint program. Dan was a good friend of mine before Beagle days, and I got him hooked up with Beagle. Matt was a high school student and I met him while subbing his chemistry class. Years later we found out his grandfather and mine had been buddies in Canada in the 1930s. All the more amazing is that we met in San Diego.

You taught chemistry?

For how long did you teach?

I student-taught a semester, then I taught a year, then I did some subbing. Computers were my love and I couldn't land the comp sci job at my school, so I left.

Rob Renstrom is another Beagle friend. He wrote PowerPrint and TimeOut Graph and now owns WestCode. John Obberick of WestCode and Jon Simonsen are also Beagle friends.

I didn't realize that an ex-Beagle Bros alumni owns WestCode.

Yes, John and Rob started out at Beagle.

How much were you involved with the AppleWorks 3.0 project for
Apple II Computer Info

"""

BRANDT> AppleWorks 3.0 was developed by Alan Bird, Rob Renstrom and I. I
did a lot of design and my share of programming.

GENieLamp> How did Claris approach you guys with this?

BRANDT> Claris contacted Mark and said it was between us and Pinpoint.
After lengthy acrimonious negotiations, the lawyers made a deal.

GENieLamp> Was it a difficult project?

BRANDT> Hard to say. It had tough times and easy times, but was weird
because we were used to doing our own thing. AppleWorks 4 was
easier in that I had complete control, but harder because of the added
responsibility and pressure. However, Claris wasn't paying us much so the
motivation was lower: we got a flat fee. With AppleWorks 4 I get a
royalty. AppleWorks 3.0 is basically the only non-royalty project I've
done since 1985.

GENieLamp> When did you start your own company?

BRANDT> I started JEM Software before my Beagle days, back in January
of 1984. My first products included Commodore 64 hardware and
my grading package. I came up with name in college using Joanna's
initials. I told her it might get somewhere someday, but she just laughed.

GENieLamp> How has having your own company been for you?

BRANDT> JEM has been fun, but I'm really doing everything through
Quality now, except for one MS-DOS program.

GENieLamp> So is JEM defunct now?

BRANDT> No, it's been around since 1984, just not very active at the
moment. To me, I _am_ JEM Software, so everything I do is JEM.
I don't have plans for any JEM-published products at the moment.

GENieLamp> What are some of the products that you have at JEM Software?

BRANDT> My MS-DOS package is called the Volunteer Management System.
Past products included TotalControl, DoubleData, PathFinder, Mr.
Invoice, Late Nite Patches, DB Pix and probably a few I've forgotten.
Outliner and Ultra 4 were originally JEM products. OmniPrint is another.

GENieLamp> JEM has been doing okay, then?

BRANDT> Well, we've been busy. That doesn't always mean there are
revenues. However, I'm supporting a big family on Apple II
income.

GENieLamp> That's pretty amazing in itself! :)

BRANDT> My wife hasn't worked outside of the home since 1985.

GENieLamp> Anything that you haven't done that you'd like to try?
BRANDT> Anything I'd like to try? Good question. Skydiving looks interesting, but I have 5 kids now... I love playing hockey, so I'll stick with that. I'd like to travel to Europe someday.

GEnieLamp> Which brings up the next question.... You seem to be a very competitive person. Why is that? Do you think that helps or hinders you personally and professionally?

BRANDT> I _am_ competitive. I guess part of it is because I was a little wimp all my life. I started high school as a 4'11" 85 pounder who had just turned 13. Now I'm a 5'10" 155 pound brute! :)

I never shied away from the hitting in hockey and football, but I was always small, wore glasses, and was called "runt" or "professor." Maybe I decided to make up for it.

I always loved sports, so maybe that made me competitive, or maybe I loved sports because I'm competitive. Hey, is this a therapy session?

GEnieLamp> What, besides computers and hockey, do you do?

BRANDT> I play church league softball. I play with my kids. I teach an adult Sunday School class in my church. I read a lot. I mess with computers a bit.

GEnieLamp> Fill us in a little on the background of the AppleWorks 4. How were you approached about this?

BRANDT> I wasn't. I approached Joe [Gleason, president of Quality Computers].

GEnieLamp> How did that go?

BRANDT> Well, he had approached me to work with Quality, then I proposed AppleWorks 4. He liked it. We did it. Claris was a pain, but they finally came to an agreement.

GEnieLamp> Who else worked with you?

BRANDT> Dan Verkade, the author of ReportWriter and DoubleData. He was an accountant when I met him.

GEnieLamp> Do you two have a good working relationship?

BRANDT> Very good. He's one of my best friends. Dan is the nicest guy you could meet.

GEnieLamp> Was it a difficult project?

BRANDT> Yes. It still is. But I _liked_ it (old man voice).

GEnieLamp> How do you like working with Quality Computers vs Claris?

BRANDT> No comparison. Claris was a pain. For example, I put in a spelling dictionary option so users could set the location, but they said that was confusing and made me remove it. Then users accused me...
of leaving it out so I could sell SpellCopy (another JEM product).

**GEnieLamp>** Really?

**BRANDT>** Really. I had total control of AppleWorks 4 since I was the project manager.

**GEnieLamp>** And you like having total control?

**BRANDT>** YES. I'M POWER MAD! I HAVE A NAPOLEONIC COMPLEX!!!!

**GEnieLamp>** Is the current version of AppleWorks 4 a stable, bug-free program?

**BRANDT>** AppleWorks 4.0 isn't stable. AppleWorks 4.01 is. Debugging is torture! There are bugs in every big piece of software on every platform. There are a few in 4.01, but nothing too scary yet.

**GEnieLamp>** What did you use as a development system for AppleWorks 4?

**BRANDT>** I used a Centris 610 to develop AppleWorks 4. I use MPW with the IIgs assembler connected to my IIgs via AppleShare.

**GEnieLamp>** Can you let us know ordering information and prices for AppleWorks 4?

**BRANDT>** Call 1-800-777-3642 (810-774-7200 if not in the US/Canada), or send your order to Quality Computers, 20200 Nine Mile Rd., P.O. Box 665, St. Clair Shores, MI 48080. Prices: $79.95 for an upgrade from AppleWorks 3.0, $99.95 from AppleWorks 2.x, or $119.95 from 1.x.

**GEnieLamp>** Are you working on AppleWorks 5?

**BRANDT>** AppleWorks 5 is not being worked on. It might [be] some day.

Apple II Hybrids

By Jay Curtis

[J.CURTIS8]

>>> THE APPLE II AND MS-DOS <<<

Gregg Keizer may have said it best in a 1991 inCider/A+ article about the Macintosh LC: "The best bridge is one you can't see."(1) An ideal AppleII hybrid would be one that allowed the user simply to stick a foreign operating system's disk into a disk drive, open the directory and either perform file maintenance or launch programs by clicking icons or by highlighting menu items.

Many Apple II owners have discovered that something close to that ideal is possible on a Apple IIgs equipped with a PC Transporter. Until
recently, owning an Apple IIe or IIgs with Applied Engineering's PCT card was more like owning two computers inside one box, rather than one integrated machine. Except for Applied's excellent file transfer utility -- which runs only on the PC side -- there just wasn't much communication between the PCT and the Apple II. The advertisements that introduced the PCT card in 1988 claimed, "With PC Transporter, MS-DOS programs see your Apple hardware as IBM hardware. You can use the same hardware you have now."(2) While truthful, many claims made in Applied's ads could be somewhat misleading. Users have often found that owning a PC Transporter provided less convenience and integration than they imagined.

To be certain, the PC Transporter can (and did) make use of Apple II peripherals. For example, users can store MS-DOS files on standard ProDOS devices and on the PCT's own (MS-DOS) "Transdrives." Similarly, ProDOS files can be stored on the Transdrives as well. However, both kinds of data storage are nonstandard, and users have found that these nonstandard disks cannot be read in disk drives on other machines. Users have also discovered that MS-DOS files, even those stored on ProDOS devices, were inaccessible in Apple II mode. Additionally, ProDOS files that had been stored on the PCT's Transdrives, could only be read in those drives and not in standard ProDOS drives.

Despite these limitations, a PCT card can also offer certain advantages. For example, all 768 kilobytes of the PCT's RAM can be made available to an Apple IIe or IIgs as a RAMdisk in ProDOS mode. With Applied Engineering's special ProDOS software, the PCT's RAMdisk can be used as expanded desktop for programs like AppleWorks. Additionally, PCT users fortunate enough to own a PCT Transdrive system have found that they can store up to 360K of ProDOS data on a single 5.25 floppy disk, a much nicer alternative to the 143K available on standard Apple 5.25 floppy drives.

An Apple IIe equipped with a PCT card and Transdrive system, remains a formidable tool. Besides it's MS-DOS capability, it has nearly 1MB of RAM available in ProDOS mode. With the additional disk drive storage available through the PCT's Transdrives, all of AppleWorks can be run from a single 5.25 or 720K floppy. Add in Mac file transfer programs for the Apple II such as HFS Link, plus similar Mac file transfer programs for MS-DOS (available from GENie), which will run on the PCT side, and an Apple IIe shares files with both Macintosh and MS-DOS systems with ease. Today's Apple IIe, running with AppleWorks 4.0, a PCT card, and MS-DOS 5.0 can keep up with the best of them.

FILE TRANSFER In recent months, the Apple IIgs has received a major boost as a "GS/PC" through the development of GS/OS System 6.0.1's MS-DOS file system translator. To make use of this FST, however, you need at least one of the following: a Floptical disk drive, a Superdrive, or a PC Transporter card. With the right equipment, the FST opens and displays MS-DOS volumes right on the GS desktop in the same way that it can open and display any standard GS/OS or ProDOS volume.

With the FST, you can copy files from MS-DOS volumes and subdirectories to ProDOS volumes and subdirectories by dragging and dropping icons -- in the same way that you can copy files between ProDOS, GS/OS and HFS volumes. You can also open and display MS-DOS text files on the GS desktop with utilities like ShadowWrite or Teach, simply by clicking their icons. You can modify these files like any text file and save them back to ProDOS. Besides being able to work with standard MS-DOS
diskettes, the FST can also open and display those special PC Transporter MS-DOS floppy disk volumes that have been created on standard ProDOS drives.

There are, however, some limitations. Using the FST you cannot, for example, copy ProDOS files to MS-DOS volumes or delete MS-DOS files from MS-DOS volumes. The FST is a read-only translator. Additionally, the FST won't recognize PC Transporter hard drive volumes. The FST does not have a complete icon set and will not identify most file types under the "Icon Info" menu bar selection. Blank page icons for unknown file types, text icons, and directory folders are all that appear to be available. Fortunately, MS-DOS filename conventions take care of part of this problem -- the three-character filename extension can help signal the contents of a file.

Further refinement is called for. An ideal FST should have its own set of icons for most of the important MS-DOS file types. COM, BAT, and EXE, for example, are among those which need their own icons. The FST should be able to open and display hard drive volumes on the desktop, and it should be able to perform some basic file maintenance (i.e. copy, move, delete) upon MS-DOS files. Such an FST should permit both reading and writing. In view of the fact that Apple has discontinued the Apple IIe and IIgs including plans for the Ethernet card, it seems most unlikely that any refinements of the MS-DOS FST will be produced by the Apple II development team. That task will be left to Apple II enthusiasts who have the necessary programming skills to finish Apple's work.

If a full read/write desktop FST is ever developed for GS/OS, it seems probable that the FST will be created as a system extension, NDA, or separate utility program, rather than being fully integrated into the GS desktop. Hugh McKay, an Apple II programmer who had an MS-DOS copy program available for the IIgs before Apple's team had released their own FST, is one likely candidate to write a full set of MS-DOS desktop utilities for the IIgs. You can download Hugh's MS-DOS file copy program from the GENie A2 Library (file #20669: MSDOS12.BXY). Another likely candidate is Australian Peter Watson. In fact, Watson already has a nearly full set of MS-DOS utilities which run under GS/OS (file #21414: MSDOSUTILS.BXY).

Watson's utilities were written as a set of integrated executable files that will run under a GS desktop shell such as ProSel-16, or under Watson's own minishell which he has named, appropriately enough, COMMAND.COM. The utilities use the text screen display rather than the GS desktop. These 16-bit utilities will not run under ProSel-8 or as 8-bit ProDOS utilities -- bad news for IIE owners.

Watson's utilities are good news, however, for PCT-equipped AppleIIgs owners. The utility's shell program can be launched from the GS desktop like any ProDOS system file. The utilities can poll all IIgs devices online, searching for MS-DOS capable volumes. They can display files in _any_ MS-DOS volume, including PC Transporter hard drive volumes. Watson's command-line display is nearly identical to the MS-DOS command line display. When the directory command "MDIR" is typed, the standard MS-DOS header with MS-DOS drive designation, serial number, and directory are displayed first, followed by a list of files for the directory by file name and attribute, number of bytes, date and time -- just like MS-DOS. The only difference for diehard MS-DOS users is that the Apple II's standard text screen characters do not greatly resemble the funky MS-DOS font.
The program's command-line syntax is a bit difficult for the beginner, but online help is available for all commands. The user has a definite sense that this is a transitional interface between MS-DOS and ProDOS. The syntax is MS-DOS-like syntax. Command capabilities include format, copy, delete, directory display, rename and type. The most obvious advantage to this program is that the user has considerable control over MS-DOS volumes and files without leaving ProDOS. The program offers more control than that given by the GS/OS FST.

Watson claims that he wants to add "make directory" and "remove directory" commands plus an "undelete" command and a "read-only version" of FDISK, which would provide hard disk partition information. He also says, "I want to make this a full desktop interface program -- Real Soon Now!" As they stand right now, the utilities are solid and, at $15 for the shareware fee, they are a real bargain.

PROGRAM LAUNCHING

Applied Engineering improved on its software for the PC Transporter since its introduction. One upgrade provided a BASIC utility called PC.LAUNCHER. This utility creates task files that allow the user to directly launch any MS-DOS program from GS/OS or ProDOS. On the Apple II side, each task file can be given names like "DBase.IV," "MicroSoft.Works" "ProCOMM.Plus," or whatever applies. The user simply double clicks icons for each of these files in GS/OS and the corresponding MS-DOS programs are launched. The task files can be installed anywhere on your hard drive, or you can create aliases of them under 6.0.1 and place them in a launching menu right alongside ProDOS or GS/OS applications.

Apple IIe users with PCTs are also able to take advantage of this launching capability. Because the task files are ProDOS files, they can be run from any 8-bit ProDOS launcher or desktop management program, such as Byrd's Better Bye, Sneeze, or Copy II+. MS-DOS programs are launched like any ProDOS program, by simply highlighting the selected file and hitting <Return>. Because I use both AppleWorks classic and Microsoft Works, I have Applied Engineering's MS-DOS File Translation program patched to my AppleWorks TimeOut Program Selector with a PC.LAUNCHER task file. This allows me to access the PCT's file translation program from within AppleWorks, translate files directly into AppleWorks format from MS-DOS, and then return directly to AppleWorks and call up the files. Of course, I can also move things the other way (from AppleWorks to Microsoft Works) when needed.

Launching an MS-DOS program occurs almost as smoothly as launching an 8-bit ProDOS program from GS/OS. The only difference is that (in contrast to the GS's "One moment please...") the "PC Transporter" announcement screen is flashed briefly on the screen, and then the traditional DOS memory counter runs before the selected program itself is run. If you're running MS-DOS from a hard drive with RamFAST interface, the time to load MS-DOS is, subjectively, little more than it takes to run a ProDOS session from GS/OS. If you're booting into MS-DOS from other devices (such as a 3.5" disk, much slower than the average hard drive), the wait will be longer. Through use of another executable file on the MS-DOS side of things, PCT.QUIT, it is also possible to quit back to the IIgs or IIe desktop by simply typing BYE at the MS-DOS prompt.

While running MS-DOS, IIgs users will especially like the fact that the IIgs control panel and all Classic Desk Accessories are always available.
available during an MS-DOS session, just as they are in GS/OS. Therefore, the IIgs can take advantage of a kind of multi-processing, a capability which Applied Engineering has taken special pains to insure in newer versions of its PCT software. One particularly useful application of this capability may be that it allows users immediate access to ProDOS directories through any CDA file utility while an MS-DOS program is running.

CONCLUSION As for the ideal Apple II hybrid posited at the beginning of this month's article -- one that would allow any disk to be inserted in a drive and then be available for copying files or launching programs -- it seems to this writer that the evidence is now in. An Apple IIgs with a PCT and/or a drive like a Floptical or SuperDrive is probably the best integrated hybrid that you are likely to see, short of the development of a PowerPC with an Apple II personality some time in the future.

Next month we'll talk more about the kinds of disk drives that are necessary for good integration in an Apple II/PC hybrid and about how the PC Transporter does its work within an Apple II. We'll also talk about low-level disk formatting or encoding schemes like MFM and GCR, something a potential hybrid owner/user really needs to know about for successful use of their machine. Until then, think hybrid!

NOTES

ANSITerm 2.1 has just started shipping. It's an update to Paul Parkhurst's ANSITerm 2.0 with a lot of added features.

And, of course, the long-awaited update to the very popular AppleWorks 3.0, Appleworks 4.0 is now shipping. December’s meeting featured Jerry Kindall who told us all about AW4.0, and the cool updates it has!

DECEMBER’S FEATURE  Jerry Kindall of Quality Computers was our featured guest at the December meeting of the WWUG. He gave us a very thorough look-see at AW4.0 – and told us of it's many new features. I'll give you a brief outline here.

AW4.0 incorporates many of the time-outs that now have to be manually patched into AW3.0, including TotalControl, which gives you the ability to pull data from several databases and/or spreadsheets for a report. Time-Out Paint and Time-Out Filemaster are two more TO's that have been incorporated into the AW4.0 package. These TO features will be accessed from the "Other" menu rather than the open-apple-control-escape method used now.

Most of the external Time-Out features will be compatible with AW4.0, and some that are not, will be able to be updated by the included Updater. The rest will soon be made compatible.

There is also the added feature that allows you to use formulas in databases, and will increase the number of categories to 60, up from the 30 now. This is a very handy tool for those who must use databases, in lieu of spreadsheets for number-crunching, particularly if they have to pull out specific peoples, places or things...when making a final report!

Another neat feature will be in the Word Processor. It's called Glossary, and will allow you to merge letters individually from any database of names/addresses...rather than having to tweak the database, when you want to send only one or two letters out, as you do now!

Jerry also told us that an update to AppleWorks GS was in the offing.

For ordering AW4.0, here are the prices:

<table>
<thead>
<tr>
<th></th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update from 3.0</td>
<td>$79.95</td>
</tr>
<tr>
<td>Update from 2.0</td>
<td>$99.95</td>
</tr>
<tr>
<td>Original</td>
<td>$179.95</td>
</tr>
</tbody>
</table>

NEWS FROM THE A2 LIBRARY  There are several excellent files in the library that I'll recap here, but there are thousands of files available...and all are good!

File #21778 is the December DOM - loaded with goodies.

File #21740 is called AutoTrash - wherein your trash will automatically be dumped, when you drag it into the trashcan. No more having to hit OA-T to do that! But, be careful!

File #21728  File Passage - a great little GS utility program.

File #11631  BGSound - plays music in the background - even in 8-bit programs (like ProTERM), as it is a CDA
NEWS FROM A2  What's new?  New files, new faces and much valuable
information for the users of Apple II's! We are the best
online support for Apple II's of all the commercial online services! Come
visit us - we're on page 645 and have a bulletin board chock full of
informative stuff, a library with over 21,000 files, and nightly RTC's for
you to come in and either just talk or ask questions about any problems
you're having.  See ya there!

(PART 19a -- APPLEWORKS)
[v1.3 :: 10 Dec 93]

INTRODUCTION   With all the news recently about the latest version of
AppleWorks, it seems appropriate to reach the part of the
History that deals with this long-lived and popular program. In this part
we will deal with the earlier incarnations of the program, and discuss some
of the enhancements made to it in the past.

APPLEWORKS   There is one program in the Apple II world that has not only
showed amazing staying power in a world where this year's
software hit is next year's yawn, but has also gone on to spawn a number
of software companies and magazines that do nothing but sell products for
it. That program is AppleWorks. Originally released in 1984 by Apple
Computer, it has gone on to become one of the best selling computer
programs of all time, on ANY computer. Although few seem to mention the
influence it has had, it is evident in the number of computer programs that
have come out for the IBM and Macintosh that have the "Works" name on them
(Microsoft Works, ClarisWorks, Beagle Works, and others). AppleWorks was
one of the first "integrated" software packages, preceded on the Apple II
only by The Incredible Jack (published by Business Solutions in 1983; this
program ran under DOS 3.3). It put modules that performed word processing,
database management, and spreadsheet calculations into a single
environment, using similar commands in each module. Previous software
programs specialized for each of those jobs had their own unique keyboard
commands that were often very different from each other. If you went from
Apple Writer to VisiCalc, or from VisiCalc to DB Master, you had to learn a
completely different method of controlling the program. Furthermore, the
data files created by those programs were usually not compatible with each
other, making it difficult and awkward to move information directly from
one program to another. AppleWorks not only created a continuity between
these modules, but went a step beyond in allowing them to share data with
each other via a space of memory called a "clipboard". This clipboard was
part of a larger memory area called a "desktop", which could hold data for
up to twelve different files at the same time, which made data sharing even
more convenient.
AppleWorks was written by Rupert Lissner (who later changed his first name to "Robert". <1>) Its earliest incarnation was in another product sold by Apple, called QuickFile. QuickFile was an Apple III database program written in Pascal. It was flexible and easy to use, and Apple agreed to market it for Lissner in 1980. It was later translated into a version for the Apple IIe (also in Pascal) called QuickFile IIe. As a database program it was flexible and powerful, but somewhat slow due to the inherent limitations of the UCSD Pascal system that Apple favored at the time.

After seeing the Office System on the Lisa computer, Lissner conceived the idea of a single program that would put word processing, database, and spreadsheet capabilities together, and run on an Apple II. It was originally called "Apple Pie", and he began work on it in 1982. Lissner took two years to complete his program, and did it entirely in assembly language to achieve better speed. He wrote versions of the program to work on both the Apple II and Apple III computers, making use of the same filetypes and data structures. Apple Pie files created on an Apple II could be used on an Apple III, and vice-versa.

Apple decided to market the Apple II version themselves, and called it "AppleWorks". Lissner was left with the rights to the Apple III version. He sold those rights to Haba Systems, who brought it out under the name, "/// E-Z Pieces". That program continued to be compatible with the Apple II version up until Claris (the software company formed by Apple in 1987) upgraded the Apple II AppleWorks to version 3.0 in 1989.

A STAR IS BORN  When it was finally released, AppleWorks was one of the most comprehensive programs ever written for the Apple II. Although neither of the three modules were significantly more powerful than other standalone programs, they had enough power for the average computer user to do what was needed. The memory management system was the extremely flexible, eventually being able to handle not only the basic 128K on a IIe or IIc, but also several different types of memory cards used on those computers and on the IIgs. Far larger than the memory of the 64K Apple IIe on which it would run (as a minimum memory configuration), the program was smart enough to swap in or out from disk the parts it needed to carry out its various functions. Considering that it would run on a computer whose microprocessor could address only 64K of memory at one time, the power achieved by this program is remarkable. There are few other software packages ever released that have as smoothly and seamlessly made up to two megabytes of memory on an 8-bit computer appear to be one contiguous space.

AppleWorks' user interface was designed with menu bars, rather than the older command line interface (such as the one used in Applesoft, Integer BASIC, and the Monitor). Apple's own researchers had put human subjects in front of a computer keyboard to learn what was easiest to use. They designed an interface that was based on using arrow keys to move a cursor (or "bar") to different choices in a list, and then using the return key to make the selection. They also came up with the concept of the "desktop" (represented in text rather than in graphics as on the Lisa and Macintosh), and a "clipboard" for transferring data between files. Apple shared this information with Lissner, and he went on to use it in his program design. <2>

APPLE'S "PROMOTION" OF APPLEWORKS  The marketing decisions made concerning AppleWorks have not been very clear to the outside observer over the years. At the time that AppleWorks was ready
for release there was a considerable amount of company money and time being spent in trying to make the Macintosh sell in the computer marketplace. Those who had the most influence at Apple were not very interested in a "simple" text-based program, when the Mac and its graphic interface was the "cutting edge" in technology. Those people believed that the Mac represented the future of Apple, and were not interested in wasting time with old Apple II technology in any form.

Another problem was Apple's past record in selling software. Tom Weishaar made these comments in the November 1987 issue of Open-Apple:

"...Apple was trying very hard to get the big MS-DOS developers to work with the Macintosh. One of the reasons these developers gave for their reluctance to work on the Mac was their fear that Apple itself would compete with them -- Apple, obviously, had tremendous advantages in terms of distribution and access to inside information. Apple had a reputation for developing applications software for its machines that would kill the market for similar software -- Apple Writer (which was at the top of the Apple II software charts at the time) and a complete set of applications software for the Lisa being major examples. Powerful voices inside Apple wanted the company to get out of the applications software business."<3>

However, despite the concern about Apple selling AppleWorks, the decision was eventually made.

"Apple's punishment for its indiscretion was immediate -- within six weeks its illegitimate child sat at the top of the Apple II best-seller list. AppleWorks achieved this without the benefits of a mother's love -- it succeeded in spite of, not because of, Apple's meager marketing efforts in its behalf. Since AppleWorks was released, for example, Apple has run 26 pages of ads in A+ magazine. The word 'AppleWorks' appears in those ads exactly zero times. Four of the ads show screen shots of AppleWorks ... the Apple IIgs ad in the September 1987 A+ [shows a screen shot of] AppleWorks ... in the gutter between the pages and is the only one of the 23 programs shown that isn't mentioned by name. This is typical of the treatment Apple's bastard child gets from its mother. [Del] Yocam, [Apple's Executive Vice-President in 1987], didn't mention it or Lissner in his birthday speech [at the 1987 AppleFest, celebrating the tenth anniversary of the Apple II], and John Sculley, Apple's president, doesn't mention it or Lissner in his ... book, Odyssey."<3>

When it first appeared on the market, AppleWorks STARTED at number 2 on Softtalk's top thirty list. It moved to the number one spot in Apple sales by the following month, and stayed there for a LONG time. By the end of 1984, AppleWorks had moved into the number one spot in monthly retail software sales for ALL computers, overtaking the MS-DOS best-seller Lotus 1-2-3 (a spreadsheet program with graphics and rudimentary word processing capabilities). Some reports estimate that it was selling thirty to forty thousand copies per month at one time.<10> But since it was not their beloved Macintosh that put an Apple program into first place, corporate Apple ignored the milestone. Since that time, though no longer in first place, AppleWorks has continued to do very well, despite an absence of advertising on the part of Apple, and minimal advertising on the part of Claris.<3>

APPLEWORKS REVISIONS

The first change to AppleWorks came with the released of version 1.1 in 1985, which was a modification to help overcome problems with non-Apple printers and
interface cards. Later that year version 1.2 came out with the ability to use more easily even more of this non-Apple hardware. Both relatively minor updates were made available free of charge to existing owners of the program.

Version 1.3 of AppleWorks came out in early 1986 for a $20 update fee. It provided a bit more functionality for those users who had larger capacity disk drives. Specifically, it better supported the new UniDisk 3.5 for file storage and made it possible to format disks on that device. Previous versions could load files from 3.5 disks only by specifying the ProDOS pathname; version 1.3 could access these disks with the more familiar slot and drive numbers. Also, since Apple now sold a large memory card which would plug into any free slot on the Apple IIe, this new version of AppleWorks could expand the size of the desktop to as much as 1,012K. By this time, Applied Engineering and other companies had already been doing quite well selling RAM cards for the auxiliary slot on the IIe, and had also included special software that patched previous AppleWorks versions to allow a larger desktop. They went further than Apple, however, in also allowing larger word processing and database files to be created.<4>

Up through the release of AppleWorks 1.3, the only changes that had been made were bug fixes and enhancements to work better with new hardware. In September 1986, along with announcements about the new Apple IIgs, Apple released version 2.0 of AppleWorks. It now required a minimum of 128K (previous versions would work with 64K, but allowed only a 10K desktop). In exchange for the greater memory requirements, it gave users a built-in ability to do mail merge, added more functions to the spreadsheet, and supported Apple memory cards even better than v1.3. Furthermore, word processing, database, and spreadsheet files could be larger than in previous versions. Existing users were able to upgrade to v2.0 for $50, which included a completely new manual, a very reasonable price considering the extra abilities of this new version.<5>

July 1987 saw one change that had an impact on future distribution of AppleWorks. Apple decided to create a separate company, named "Claris", to handle some of the popular software that they had released for their AppleII and Macintosh computers over the years. As mentioned above, products released by Apple had a tendency to be the "kiss of death" for third-party companies trying to market similar programs. For example, after the outstanding success of AppleWorks, virtually NO text-based work processors released for the Apple II made much of an impact on the market. Claris had the responsibility of handling AppleWorks, Apple Writer, and the various Macintosh programs that had been available from Apple for that computer.

Claris has publicized AppleWorks via only three major ads since they took the product over from Apple (as mentioned above, however, AppleWorks had previously received NO advertising space). Their first promotion, run in 1987, stated that AppleWorks 2.0 had received a unique upgrade -- its own company. This was primarily a plug for Claris, of course. The second ad was rather clever. This one had a white background with a red sports car up on blocks with its wheels missing. The caption read, "There are still some Apple II users who don't have AppleWorks", suggesting that working without that program was like owning a sports car without wheels. Beagle Bros did an even more clever followup to that ad, by using another double-page spread with a white background, and four tires in the same location as the blocks in Claris' ad. Their ad read, "There are still some AppleWorks users who don't have TimeOut", suggesting that the sports car in
the Claris ad was AppleWorks, and TimeOut was the wheels for that car. The third promotion run by Claris for the program was to announce the v3.0 upgrade in 1989. This one showed an old worn tennis shoe (representing the old version) and a new running show (representing the new version).

A free update of AppleWorks to version 2.1 was released by Claris in September 1988. It provided IIgs users some bug fixes that made it work better on that computer, plus it was supposed to support a desktop as big as eight megabytes, if that much memory was installed. However, because of the way in which desktop memory in AppleWorks was handled, this turned out instead to be a maximum of two megabytes. No further functionality was added to AppleWorks at that time.

APPLEWORKS 3.0 In 1988, while Claris was issuing its minor update to AppleWorks, they were making plans to do some major improvements to the program. Since they primarily had Macintosh programmers working for them, they first asked Robert Lissner, the original author. He wasn't much interested, since he had already made good money off the program and didn't really have the motivation for such a major project. Claris then decided to turn to a third-party company to do the work for their project, which was given the code-name "Spike". There were planning to hire a company named Pinpoint Publishing to do the work. Pinpoint was selling an enhancement package for AppleWorks that gave users some features that MS-DOS users had available on their computers (a "pop-up" calendar, terminal program, and other modules), and seemed to be making a major effort to promote their product and stimulate more sales of AppleWorks. By this time, however, Pinpoint was financially getting into trouble, with sales of their products (AppleWorks-related and otherwise) below what was needed to support the large user support network they had set up. Consequently, they were eager for the chance to contract out to Claris for the AppleWorks upgrade. However, they planned to make very minimal changes to it, staying exclusively within Claris' specifications.

During this time, Claris kept hearing from AppleWorks users who were much more loyal to Beagle Bros, who had a series of products called TimeOut. These products worked in a fashion similar to those from Pinpoint. After some complicated negotiations that nearly fell through several times, Beagle finally took on the job to do the AppleWorks project for Claris. Beagle programmers Alan Bird, Randy Brandt and Rob Renstrom worked on it for almost a year, in between a few other projects that were going on at the same time. They did their work on Macintosh II computers running the MPW (Macintosh Programmer's Workshop) cross-assembler, primarily for the sake of speed.<6> As enthusiastic Apple II programmers who also knew AppleWorks inside and out, Beagle's team added a lot of power Claris had not planned on in their original specifications. Occasionally they called on Lissner for help in understanding why certain parts of the code were written as they were, but all of the work came from these "Beagle Boys". Viewing it almost as a labor of love, they went beyond what they were asked to do, and enjoyed making AppleWorks into a program that they would want to use. Randy Brandt stated, "I think it's safe to say the AppleWorks 3.0 project yielded the worst hourly rate I've ever made in AppleWorks-related programming, but it did give me a lot of insight which came in handy on future projects."<7> Additionally, they fixed over one known hundred bugs in AppleWorks 2.1.<8>

In June 1989, Claris announced the AppleWorks 3.0 upgrade at the National Educational Computing Conference in Boston. The features that were added or improved are too numerous to describe here; in brief, it
added nearly all the things users had wanted the program to do. It was
easier to use, it took better advantage of extra memory (going beyond the
two meg limit on the IIgs), and it was easier to customize special printers
to work with it. And it included a new feature that was becoming standard
in many commercial word processors: A built-in spelling checker. Because
of these extra features, the maximum desktop size on a standard 128K
AppleII was now reduced to about 40K (down from the original 55K). Also,
the program now loaded from TWO double-sided 5.25 disks (or a single 3.5
disk), instead of the previous one double-sided 5.25 disk.

Apple had for years included registration cards with their products,
both hardware and software, to identify the user in Apple's files as an
owner of that product. Unfortunately, although they had done a good job at
including those cards with everything they shipped out, they had done a
somewhat less satisfactory job of actually compiling the data from those
cards. Consequently, Claris really had no available information about who
was and who was not a "registered" owner of AppleWorks. They decided that
they would make an initial upgrade offer of $79 for customers that owned
ANY previous version of AppleWorks (from v1.0 to v2.1), and through
A2-Central magazine they even made available a special $99 offer: An
A2-Central subscriber could get the program from Claris for that price,
even if he could not prove previous ownership of AppleWorks.<9> Later,
owners of previous versions could still upgrade for $99 if they wanted.

Since that time, unhappily, Claris has concentrated exclusively on
Macintosh products and apparently has no plans for further updates or
upgrades to AppleWorks. This was unfortunate, since there were several
known bugs in the program, and Beagle Bros programmer Mark Munz eventually
decided to release his own AppleWorks bug-patcher program into the public
domain to correct these known problems. Rather than take the hint and make
a v3.1 release to officially acknowledge and correct these problems,
Claris' policy was to simply wait until a customer complained about them
and then to direct them to Mark's Patcher program.

ENHANCEMENTS: PINPOINT  AppleWorks has been such a major influence in the
Apple II world that the program has itself spawned
a number of related products that act to enhance or expand its usability
for different purposes. This is a reflection on the widespread penetration
of the program, as well as the desire of Apple II users for more and better
features.

One of the first customization features that appeared for AppleWorks
was from Pinpoint Publishing. They had originally been called Virtual
Combinatics, and had sold a program for the Apple II called Micro Cookbook.
Suddenly in 1985 they burst upon the market with a new name and a
significant new product. Their Pinpoint Desk Accessories was primarily an
enhancement for AppleWorks, though it was also possible to install its
features for use under Applesoft, and eventually Apple Writer and Word
Perfect. Taking after the popularity of "pop-up desktop" programs for the
IBM PC like Sidekick, Pinpoint added some similar features to AppleWorks.
These features were available at any time, simply by pressing solid-apple
and P (option-P on the IIgs). At this point a little "Accessories" menu
would pop-up onto the screen, drawn using MouseText characters, and the
desired feature was selected by moving the cursor bar up and down the list,
pressing RETURN for the one you wanted (working just like AppleWorks). The
accessories included Appointment Calendar; Calculator; Communications (a
small terminal program for use with a modem, which could send AppleWorks
word processing files or save incoming text as a WP file); Dialer (just
highlight on the screen the number you wanted to call, and it would be
dialed for you via the modem); GraphMerge (which allowed you to print a
word processing document with all or part of a double hi-res picture
included with the text); Notepad (a miniature word processor, holding up to
32 lines of text and saving notes in AppleWorks WP format); QuickLabel
(take an address off the screen and place it on an envelope template for
printing); and Typewriter (type and print lines one at a time). This was
all very exciting at the time, multiplying the abilities of AppleWorks
beyond what it was built to do. Because of disk-space requirements this
was more convenient to use from a 3.5 disk or hard disk, but actually could
be used from 5.25 disks without TOO much trouble. Eventually a spelling
checker was also made available to use with Pinpoint.

o Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3

o GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com
Apple II Computer Info

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.
- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2
- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

READING GENieLamp  GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE .......... [HUM] [*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

__________|_____|___|____|__________
|Name of sender|CATegory|TOPic| Msg.#|Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GENie  GENie's monthly fee is $8.95, which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-3880 in Canada. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

FROM MY DESKTOP /

Notes From The Editor

//
Details are still a little sketchy, but the spring catalog from Resource Central notes that there will be an ICON Summer Conference this July in Kansas City. Since it's sponsored by the International Computer Owners Network, it might not be exactly the same KansasFest of old, but you can bet that it will attract the Apple II community. (For those of you just tuning in, ICON runs the Apple II, Macintosh, and PowerPC RoundTables on GENie. The Resource Central empire seems to be changing and expanding.)

The upcoming conference, whatever its name, started me thinking. What with one thing and another -- poverty, and formerly living on an island, in a city within five miles of Canada's easternmost point, being chief among them -- I've never looked in on Uncle DOS and the usual suspects when they gather in Kansas City during the summer. Therefore I don't really know what happens and who turns up.

From what I hear, however -- chiefly through reports in Shareware Solutions II, in our sister publication, GENieLamp A2Pro, and "live" on GENie itself -- the event attracts old-timers and newcomers. It attracts people who are online and those who aren't.

Both these points strike me as being extremely important. We of the Apple II community need to meet newcomers and to be introduced to people who don't own a modem... if only to persuade them to buy one! Otherwise, the Apple II gene pool will become extremely limited. It's not as if we represent any serious threat to computing as it is, but unless we seek out those just lurking outside the light of our campfire, things are going to get mighty incestuous.

When I bought my first modem, I started looking for a local BBS. Because of their unofficial nature, there weren't any listed in the telephone directory, so I was forced to cast my net widely. I started on a multi-national information/communication network much like GENie. From there, I tracked down a private BBS in Toronto -- Canada's equivalent of Detroit, New York, or Chicago... depending on who you ask. The BBS in Toronto, Ontario led me one province east to a BBS in Montreal, Quebec. The BBS in Montreal led me to one much closer to home, in Canada's Maritime region. (All this time, my phone bill was mounting.) I got as close as Halifax, Nova Scotia, but could not get beyond that... and there was no way I could afford to call long-distance for my daily telecommunications fix. I gave up.

Some months later, I picked up a local teacher's newsletter, and discovered that there was a local BBS within about two miles of my house. Once I had made that first call, I soon found half a dozen other BBSes being mentioned, and learned the first rule of BBSes: BBSes concentrate on advertising themselves on other BBSes. Instead of looking for new customers, they try to poach users from other system operators.

The lesson is, I hope, clear. Before you open that important first door, you think you're alone in the house. Once you open the right door, though, you'll find a party going on.
"Yes, but surely, by now, everybody knows about at least one Apple II magazine or on-line service?" I hear you say. (Well, when I'm the one writing the editorials, I jolly well hear you say it.)

"Not by a long shot," I reply.

Just two months ago, quite by chance, one poor, lost soul with an Apple II Plus, two Disk ][ drives, and a barbarically slow DOS 3.3 application program happened to meet one of our local Apple II experts. Upon learning of a ProDOS version of the same program -- even of the existence of ProDOS itself -- this individual's eyes reportedly became as wide as salad plates, and said eyes were close to filling with tears. This person's reaction to the news flash that there was an Apple II user's group close by, I leave to the reader's imagination.

With that insularity very much in my mind, I'm pleased to announce that this issue contains an article from a Apple II enthusiast outside the GEnie network... Ron Higgins has contributed a piece on a bug in the Apple Super Serial Card. I'd like to thank Ron for helping us dispel the myth that GEnieLamp A2 is only for those on GEnie. Not only are GEnieLamp A2 readers found on networks other than GEnie, but our contributors are sometimes outside the fold too. We welcome your submissions, no matter where you are! It's wonder to receive an article from outside the GENie pool -- I hope the first won't be the last.

-- Doug Cuff

NEW HARDWARE RTC

Starting last night, and every Wednesday night henceforth, from 11pm till 1am EST (or maybe even later? :) I will be hosting a new RTC devoted mainly to hardware questions, problems, etc. (of course other questions are always welcome, particularly from newcomers :)

If you have some obscure piece of hardware, or some kind of _strange_ hardware problems, or just want to learn a bit about what makes your Apple tick, stop on by and pull up a chair (not that one, thats where my hot soldering iron is! :) Smokers are welcome, we have special air handling equipment for the comfort of non smokers :)

If you have any questions about hardware, the care and feeding thereof, modification tips, etc. please bring them to the RTC next Wednesday night. If we run out of hardware stuff, one never knows what the topic will turn to... (last night it was ASCII art, which Bird does quite nicely :)

-Harold
(Wed Night RTC 11pm 1am EST)
(Hdwr probs handled live!)
(H.HISLOP, CAT2, TOP7, MSG:231/M645;1)

HOW _DARE_ WE OUTPERFORM AT LOWER COST? This is a MAJOR COMPLAINT about AppleWorks 4.0. I use a Mac at work and AppleWorks 4 is making it look bad. Most of the people at work have either a Mac or Apple II at home, the ones that have computers anyway.

They keep coming up to me and asking why the $500 Mac program, they just purchased, can't do some of the stuff AppleWorks 4.0 can do. What should I tell them? Although this posting is mostly "toung 'n cheek", it is based on fact. I know your name is "Quality", but can't you just slack-off a little until the people at Apple give the Mac an AppleWorks.

...ESPECIALLY SINCE WE'RE DEAD! Thanks for expressing your appreciation. BTW, I'm still self-employed. I'm working with QC on this project and others, but they haven't hired me. (That means I keep my freedom, _and_ get to pay lots of self-employment tax and medical insurance.) It's been a very enjoyable arrangement for me, and hopefully for them as well. People have warned me about the dangers of writing Apple II software (it's a dead market!) since 1984. I started at Beagle back then with just a wife and an apartment. By May we'll have five kids living in our house, with virtually all payments being made by Apple II software sales. While it's true no one is getting rich from the A2, I'm happy just to make my payments on time and avoid commuting. It beats working for a living!

(BRANDT, CAT42, TOP29, MSG:461/M645;1)

DISCQUEST MINI-REVIEW

> If anyone has purchased DiscQuest, it would be really nice to leave a message here about it's strengths and weaknesses.
I have been using the DiscQuest software with a RamFAST (with latest
SS ROM) and an Apple PowerCD. Everything works as advertised with the
CD-ROM that was sent with the package, The Family Doctor. The graphics are
not in color but much more detailed than I expected. My only complaint is
the selection of currently available CD-ROM software does not really
interest me. If I could get an encyclopedia CD-ROM, it would go from being
a good purchase to a great purchase. I would be happy to answer any other
specific questions.

Rick Light (R.LIGHT4, CAT20, TOP12, MSG:134/M645;1)

SUGGESTIONS FOR THIS SUMMER'S CONFERENCE

Joe Kohn leaping out of a huge Apple-II cake and starting a
song and dance number featuring popular songs of the 60s?

Matt Deatherage and Stevie Wonder playing a "We are the World, We are
DTS" duet?

Tom Weishaar swipes Evil Knievel's bike and defies death by jumping
through a flaming loop over a dozen old Apple Profiles?

Roger Wagner gets shot out of a cannon and grabs a three story tall
tie while flying through the air swinging up onto the top of Ridgeway dorm?

Bryan Pietrzak recites all 423,000 routines names of GSLib in two
minutes without pausing to take a breath?

Dean Esmay morphs into a 500 ft tall Jerry Garcia and terrorizes
downtown Kansas City?

Naaah, too drab.

Nate (A2PRO.GELAMP, CAT23, TOP10, MSG:49/M645;1)

PONGLIFE LOOKING FOR INPUT

PongLife will attempt to prove that our
computer is NOT dead. Through reviews of FW,
SW, and PD software, to interviews with Apple programmers, as well as
programming tips, and databases of all available software, WE WILL BRING
IBM TO ITS KNEES.

ps. I'm not a nut. So, you want to help out, eh? PongLife is
looking for program reviews, programmers to interview, programming tips,
and various Apple II specific bits of info. Such as Apple BBS's, etc.

Post a message here, or E-mail, if you'd like to help out.

Thanks, Ben Johnson (B.JOHNSON17, CAT13, TOP19, MSG:1/M645;1)

BEST-KEPT SECRETS OF 1993 (#1)

> Also, I understand MECC has published a
> similar program where kids can construct
> a dinosaur park. Some of their stuff is on the GS platform

I don't know why MECC doesn't get more publicity. They continue to
produce some wonderful software for the IIe/IIgs. If you are not on their
mailing list, you can call (800) 685-MECC. In Canada, you can call (800)
663-7731.
Apple II Computer Info

I was told by one of their operators that they plan to continue to release 6 new titles for the IIe/IIgs yearly. Not bad, if true.

Pax! --plato-=--
(A.HUTCHINSON, CAT6, TOP3, MSG:220/M645;1)

SWIM CHIP
I need a bit of help...
I have a PCT here for repair, I believe it has a dead drive controller chip on it... What does this have to do with SuperDrives?
Simple, the chip in question is an Apple chip! I strongly suspect that AE obtained these from Apple, and that they may be the same chip used on the SuperDrive controller cards.

The Apple part number is:010-0101-1 (c) Apple 1987 It is a 44 pin PLCC (about 3/4" square surface mount chip)

If someone with a SuperDrive controller could check for a chip with this number (it might end with -2 or higher) I'd appreciate it. (It would at least give me an idea of where I might be able to find a chip to fix this PCT)

Thanks!

-Harold
(Wed Night RTC 11pm 1am EST)
(Hdwr probs handled live!)
(H.HISLOP, CAT11, TOP7, MSG:67/M645;1)

------

[arold, that chip is indeed the same chip as used on Apple's SuperDrive controller card. It's the SWIM (Super Wozniak Integrated Machine) chip, which replaced the IWM (Integrated Wozniak Machine -- yes, they switched the "I" and the "W" because "SWIM" sounds better than "SIWM" :) chip on Macs sometime after the Mac SE came out. Applied Engineering purchased a number of those chips from Apple for use on their PC Transporter cards, to enable the PCT to have Apple drives connected directly to it and read and write data in MFM format with them (they had to do some tricks in microcode to get them to do all that on 800K drives designed only for GCR, though, and as people with PCTs know, it's not perfect).

Apple II Computer Info

Contents of TEXAS II on Disk vol.8: TimeOut Word Counter - TimeOut QuickFonts - TimeOut Catalog to DB - TimeOut Catalog to WP - TimeOut Catalog to SS - TimeOut File Finder - TimeOut Tree Directory - TimeOut Vital Info lists all your Standard Settings. PEEKS for the Environment - How to use PutBlock and Relblock - Very small macros that do a very big job: Number to Text ($15.00 to "Fifteen and 00/100 Dollars" ), QuickPathchange. And so much more, I can't remember.

In order to be notified about TEXAS II on Disk vol.8, you must be a TEXAS II subscriber. This is the last week we'll be asking for it... so please subscribe now. 6 issues (+ 3 free issues of TEXAS II on MACROS), $15 US, $18 overseas. Thanks. Last time. I promise.

Kingwood Micro Software, 2018 Oak Dew, San Antonio, Texas 78232-5471

(DOS 6.2 AND PC TRANSPORTER    For anyone interested, I got my PCT to work with DOS 6.2 and my Hard Drive.

To do it, I had to create the Hard Drive Partitions from scratch and do an Fdisk and Format. After doing and re-doing it a few times, it appears that you cannot redesignate your hard drives or floppies for that matter using the PCT control panel once you've created your boot drive. After a small amount of anguish, I have two 6.2 partitions on my Hard Drives and they work fine. Not sure I would recommend this to anyone--didn't have this problem with 3.3.

John Stankowski

(A WORD TO THE WISE    I won't go into the ugly details but take my word for it:

DON'T EVER use Optimizer when you are using Prosel 16 with TheManager active. B-(

Randy (Still has one partition de-activated) Chevrier

EDUCATION, MODEMS, AND THE APPLE II    I received an e-mail letter this morning related to the education survey that I uploaded recently. I prefer not to identify the writer, but I would like to share with you my response to something in the letter because I think it relates to this topic.

++++++

In your letter you said, "I think it is fair to say that education is not interested in this medium." referring to online communications.

I have to disagree. I believe that educators do not frequent online services because (1) they do not have access to the necessary equipment, (2) they do not
know what is available and the possibilities that exist, (3) generally they do not have the time or money necessary to explore online communications on their own, and (4) educational institutions, particularly public ones, do not encourage such activities for many of the same reasons list above.

Case in point: This fall I made it possible for two teachers at my school to have their students participate in an exchange of writings with students in other parts of the country. This was through the ScrapBook USA writing project headed by Emery Roth on America On Line. I handled all of the online work from my home because our school does not have access to a modem and phone line to do this at school.

The teachers and the students were excited about the project and put a lot of effort into it. As it came to a conclusion, I heard the same comments from many, "It would be nice to be able to do more of this!"

However, they won't unless I make it possible. Neither of the teachers have a modem at home. The school is not prepared to spend the money needed to make online communications a possibility at school. The costs involved include long-distance phone bills since there are no local numbers for us and we have not been able to convince those who control the purse strings that it is worth the expense.

Within five years I believe you will discover that educators will be using online communications to great advantage, because by that time education will have caught up with _today's_ business world and the difficulties I mentioned above will have been overcome.

The interest is there, and it is growing. The problem for online services is to anticipate it and be there waiting.

+++++

Charlie          (C.HARTLEY3, CAT2, TOP11, MSG:11/M645;1)

>>> HOT TOPICS <<<

APPLEWORKS 4.01 HAS SHIPPED   Nightly (or somewhat nightly) status report:

All copies of the dual pack AW 4.01 updates were shipped to the Post Office today! (yay). Unfortunately, the post office sent them back. It seems they wanted us to print 'Third Class' on all of the packages. To put it politely, they were being picky on this run.

The good news is that all 500 of the last updates are packaged, labeled, and posted, and will be in the mail as of tomorrow. That should do it for AppleWorks. We also cleared lots more backorders today.
BUG IN SSC CHIP FIXED

As I promised, I have received, installed and tested the new Harris CDP 65C51AE1 replacement chip for the standard 6551 on the Apple brand SSC. I ordered it from Lightning Systems, P.O. Box 4, Mukwonago, WI 53149-0004. (414) 363-4282

As you know, the standard 6551 has a problem, when using CTS hardware handshaking, with trashing the character being sent when the CTS flow control line is asserted.

I have personally experienced this problem on my SSC, using hardware CTS handshaking, driving a serial printer. (I use CTS handshaking rather than DTR or XON/XOFF for reasons I won't explain here.)

I am pleased to report that the new chip has solved this problem, all for $4.00.

But, there's more.

With the chip, I received info about a $27 replacement chip for the 6551 on the SSC, that supports additional baud rates of 38.4K, 57.6K, 115.2K and 230.4K.

From personal experience, I know my Zipped //e has enough trouble keeping up at 19,200 baud with ProTerm, so I have seriously to wonder about the practical effect of being able to use the higher bauds rates. Anyone care to speculate?

FWIW, here is what the sales sheet says:

-------------------------------------------------------

Turbo ASB

Do you have a high-speed modem, or other high-speed serial communications device? Did you know that most Serial Interface Cards for the Apple II are limited to only 19.2k bps?

Well, they don't have to be anymore. The Turbo ASB can blow away that nasty 19.2k bps barrier. With the Turbo ASB, your serial communications can run as fast as 230,400 bps!!!

The Turbo ASB replaces that pokey old 6551 chip on your Serial Interface Card and transforms it into a speed demon.

The Turbo ASB supports all the standard bps rates you are used to (slow...) and adds 38.4k, 57.6k, 115.2k and 230.4k!

The Turbo ASB is available from Lightning Systems. Order product "Turbo ASB". $27.00 each plus $3.00 S&H in the States, $10.00 S&H everywhere else.

-------------------------------------------------------
Can the IIe handle 230,400 bps? For that matter, can the IIGS?

Hugh...                   (H.HOOD, CAT12, TOP5, MSG:170/M645;1)

>>>>>  Hmmm.... "dis 'ere chip sounds neat" ;)
"""""""" I know, from experience, that a stock //e can handle 19.2KBps, as long as minimal screen handling is done. (ie: feeding a bunch of stuff to a printer, or some other device) Receiving 19.2KBps is also doable, the catch again is trying to keep a screen updated...

I would think that if the slick code was written for this new chip, and used on a //e with an 8Mhz Zip Chip, that the max baud rate it could handle (in bursts) would possibly be as high as 230.4KBps.

The biggest bottlenecks in handling the serial port is trying to keep the screen updated properly, and the _long_ delays for disk I/O, should they be needed. The disk I/O problem (for the most part) goes away with a RamFast (Hello cached DMA, Goodby huge overhead times :) but the screen still needs some real special handling... It's do-able, but somewhat tricky to program (due to the 80 col screen being held in two seperate banks of memory.) This screen handling would require hard coded line address lookup tables, with even / odd bank information being extracted from the horizontal posn.

PMP, (Paul) should be able to comment on what he's found as far as high speed serial goes, after all he wrote AnsiTERM (and it handles some high speed stuff :)

-Harold
(Running the NEW CoP/TIC scripts)
(They're Here!!!)
(H.HISLOP, CAT12, TOP5, MSG:171/M645;1)

>>>>>  Hugh, why can't your Zipped //e keep up at 19,200 Bd? This is strange, as I operate a stock IIGS with 2.8 MHz at 38,400 Bd (transferring files from and to an AMIGA via null modem cable - the AMIGA 500 can't go any faster, I suppose the IIGS still has reserves at that speed ;-))  )

Udo      - ... just a IIGS freak -
(U.HUTH, CAT12, TOP5, MSG:177/M645;1)

<<<<<<  I received the following response from Ron Higgins at Lightning systems concerning using the //e with his Turbo ASB replacement chip for the 6551 in the SSC.

================================================================

My Apple //e has got a Zip Chip 8000 (8 MHz) in it, so may results may be better than others.

I've been able to use ProTERM v3.1 running at 57,600bps without any problems. 115,200bps overruns it though.

The need that I see the Turbo ASB filling is those that have modems faster than 14.4k (V.32bis).
The reason for this is that compressed files (the most commonly transferred) achieve about 1650cps (16,500bps), but as modems get faster and faster (I've got a 21.6k USR) the transfer rate starts to exceed the 19.2k limit of the SSC.

I feel that 38,400bps should be just about right for those high-speed modems. (At least for now) But I've also provided for 57,600 and 115,200 if we need them.

Hugh...            (H.HOOD, CAT12, TOP5, MSG:273/M645;1)

NEW CARD FROM SSH SYSTEME...   Finally, a picture is available in the A2 library. Now you can see how much vapor we have produced. Even better, the vapor never disappears! Kind of a high-quality, solid-state vapor.

Sorry that my talking often is irony, but a not-too-long time ago some important persons here on GENie claimed that we are producing nothing than vaporware ("...nobody has seen the card...", see category 21, topic 6).

Joachim           (J.LANGE7, CAT13, TOP23, MSG:96/M645;1)

...CALLED THE BLUEDISK CARD   Vapor-Ware Leak: We have shipped the first two beta boards of our new project to the US testers. We are pleased to announce that the purpose of our new product is to allow the Apple II community to utilize the inexpensive disk drives available to the IBM compatible user.

Specifically, this card is intended to allow standard MFM floppy disk drives to be used by the Apple IIgs _and_ IIe, directly by the Apple operating systems (ProDOS and GS/OS) for storage of all Apple II compatible programs and data.

We have completed both the hardware and software allowing use of Double Density, High Density and Extra Density floppy disks in a _variety_ of capacities, and are continuing work on the software utilities that will be shipped with the card. In addition, software for using inexpensive MS-DOS style floppy streamers is planned but not complete.

When the first beta tests are finished, we will come up with specs and information about availability.

The information given here refers to our uploads (see A2 library):

21878 NEWHARDWARE.BXY
   Desc: A picture of a new Apple II product
   (Apple Preferred Super Hires)

21899 NEW.HW.GIF.BXY
   Desc: GIF pict. of an upcoming product
   (higher resolution than #21878)

SHH Systeme, Joachim Lange
Any preliminary guesses as to cost yet?  <<

"""
Cheap!

Cheaper than a Turbo IDE Card, cheaper than a RamFAST SCSI, cheaper than Apple's floppy controller. Special introductory offer! Watch for the specs.

Joachim

>>>>> Very simply, the BlueDisk controller card allows owners of Apple //e's and Apple //GS's to:

1) Use darn near any MS-Dos machine type floppy drive (these are quite inexpensive, and very easy to find)

2) Read & write MFM format disks at 720k, 800k, 1.44Mb, 1.66Mb, 2.88Mb (amongst others) Even more densities may be supported (the hardware already supports all possible densities that exist, the driver code is currently going thru beta & enhancements)

3) Allow any Apple //e or //GS to read or write darn near any MS-Dos disk.

4) Seamlessly works with GS/OS applications (and many P8 apps) and provides up to three times the data storage available on 800k disks.

5) Other "floppy connector" type PC related hardware _may_ be supported in the future.

There it is in a nutshell. (note that this is an abreviated list of whats already in existance, future enhancements (driver code) _will_ add more features :)

-Harold

BlueDisk slot requirements:

Any slot other than slot 3. (a minor bug is preventing use in slot 5, this will be fixed before public release)

The control panel needs to be set to "Your Card" to access the BlueDisk.

So, in my setup (BlueDisk in slot 6, which is probably where most people would place it) I can either have access to MS-Dos type disks OR Apple 5.25" disks, but not both at the same time.

Please remember that this product is still going thru beta testing, so it's normal that Doug and I are running into some minor bugs, anoyances, etc. (it's not only normal, it's to be expected at this stage of the game) The information here is accurate for the ROM & GS/OS driver we have at the moment. However, we are expecting new ROM code and a new GS/OS driver to arrive shortly from Joachim (bug fixes, etc).

-Harold
Bill Heineman has proclaimed to me that he will be able to create some type of program patch for Print Shop GS so that greeting cards, signs, banners, etc can be printed to Hewlett-Packard DeskJet 500, DJ500c, DJ550c, LaserJet and DeskWriter printers, as well as to Apple's StyleWriter I printer.

Now that Bill has had a chance to look at PSGS, and knows what would be involved and how much time would be needed to complete the project, he was able to give me a revised quote on the cost.

It's a lot higher than previously estimated.

So, thinking again out loud...the pledges that have come in so far will only cover a small percentage of that cost. So, maybe that's not quite the way to go?

I wonder if a more realistic scenario might be that I just pay Bill his fee, and then publish the results as a low cost commercial software product, with a special "Such A Deal" discount offered, of course, to Shareware Solutions II subscribers.

OTOH, being a man of my word, the reward is still open, and will go to the first person that can create a freeware or shareware patch/utility.

The only thing that bothers me about the "contest" and reward is that it's just so uncertain. Maybe it'll result in a Shareware Solution, but maybe it won't? To date, no other programmer has contacted me to tell me that they are working on such a project.

Decisions, decisions...

Feedback, as always, is appreciated.

Joe Kohn

Just how much does Bill think it will take? Is he interested in the possibility of pre-sales?

If this thing is doable, and we can get enough people to commit to pre-ordering it by sending their checks to you to hold for the finished product, then I vote we push forward.

Set a price for advanced sales. Announce it here, in the next SSII issue, and anywhere else you can think of. Set a deadline for advanced sales for say one month or until the following issue of SSII. If enough people commit hard cash (ok, checks), then Bill goes ahead. If not, well we will just have to figure out what to do next.

What do you think?

Charlie

Charlie - After I found out that Bill wasn't too interested in the contest/reward, we basically talked about him creating the drivers on a contract programming basis. I would pay him for his work, but he would not retain the rights. As originally envisioned, I thought that we could do this for the few hundred dollars that has already been pledged, and then...
release it as freeware.

As it is, my job is to write and publish a newsletter. My first thoughts on reading your comments about taking pre-orders is that it would take a lot of paperwork to stay on top of, and probably some accounting skills that I sure don't have (and don't especially want to acquire).

So, the way I'm thinking today is that I personally would be willing to take the risk of putting up the money in advance, and could act as the product manager, the marketing manager, the beta-tester and documentation writer. Then, the completed program/patch/whatever would be sold as a commercial product through Shareware Solutions II.

In that way, no one else besides me is taking a risk of any kind.

The completed product would then be available for the same ball-park figures as several people have pledged ($20-$25). Maybe $20 for subscribers and $25 for non-subscribers?

Switching gears...I just want to say that Shareware Solutions II is the first business venture that I've ever been involved with, having always worked for others before. I guess at this point that I'm asking for some business type of advice. If it's inappropriate for me to be talking about things like this "in public", someone just tell me. As I said in Issue #1, this is all new ground for me.

Joe Kohn

(SPECTRUM AND SECURITY) Two points about security when using "Spectrum"

With some of my calls I have to dial a number which includes a 10 digit PIN to connect to our Mercury Phone system. This would be visible to anyone who opened the dialing menu.

Sending a PassWord from the internal store is visible & liable to be in a capture buffer if connected to a Full Duplex system. I have proved this.

Using scripts for dialling& log on gives you more scope for protecting sensitive info.

My way of ensuring they do not get passed on with scripts is to store them in a 'File' which I can hide anywhere on my 105mByte drive. The script only needs to know the location of it. As an exercise in security I have protected this further with a PIN. Although no one else has access to my system I could set it so that if someone tries unsuccesfully to run the script the file would be over written, not just deleted.

KenDawson from England - < Delivered by GECo-Pilot & TIC 4.0 >
[Still learning about 'Spectrum' & New CoPilot scripts]

APPLEWORKS 4 PATCHER You might want to check out RFP (Randy's Free Patcher) created by Randy Brandt (one of AW 4.0's authors) -- it's better (IMO) and it's available on GEnie.
...Will  (W.NELKEN1, CAT42, TOP2, MSG:125/M645;1)

...NOT TO MENTION APPLEWORKS 4.02   AW 4.02 goes final this week and the
"""""""""""""""""""" updater should be uploaded to GENie
next week and should be available for public downloading before the end of
the week. It will also be on TimeOut-Central, NAUG’s disk, AfterWork, and
available for $10 or so from Quality if you don’t have access to any of the
other sources. Obviously you can get it right here.

(BRANDT, CAT42, TOP29, MSG:649/M645;1)

NEW FINANCIAL GENIUS    Financial GeniUS * v 2.0 has been released! This is
"""""""""""""""""""" a financial program similar to others on the market
today. FULL featured, cheaper, and more user friendly than ANY other
financial program. And this one is for your GS.

Financial GeniUS is a program that will store your financial records
and allow you easy access to this information in many forms. Financial
GeniUS has the ability to produce a variety of report forms which will
allow budgeting, cost projections, credit card management, investment
management, tax return reports, year-to-date analyses, and many other
useful applications. All entry of data—categories, budgets, transactions,
addresses, etc.—is incredibly easy to master and use without hassle on a
daily basis. Financial GeniUS uses the standard methods of entry on the GS
(menus, line edits, lists, text edits, radios, check boxes, pop-up
menus…) with a flexibility that few can ignore. All in all, Financial
GeniUS is the perfect program for a person or family who is financially
conscious (or attempting to become that way).

The only way to get the full perspective on this financial program is
to download the demo from your local BBS. If that is not possible, the demo
is available from the author for $5. Send a check or money order to:

Rick Adams
FGS Demo
1627 Ball St.
Galveston, TX 77550.

The demo includes a tutorial that will help you to understand the
basics of the program. A separate demo account has been included to
illustrate basic use of the program as well as to let you in on some
advanced features available to you while using the program.

NOTE: Financial GeniUS is being distributed as shareware. The demo
version does not allow changes to be saved to an account. In order to
receive the fully enabled version as well as written documentation, the
shareware fee of $35 must be paid to the author.

Update Notice    The wait is over! The new version of Financial GeniUS is
"""""""""""""""""""" ready to ship. I listened to all of your suggestions and
fit in a few of my own as well. You will be amazed by the improvements!
Version 2.0 is a total rewrite. No more waiting for disk access; version
2.0 now loads everything when you open your account. Because Financial
GeniUS is now memory-based, you are allowed access to all portions of the
program at any time. If you discover you need to enter a category to your
account while you are entering transactions, you can open up the category/
budget section, enter your new category, and BOOM, it appears in the
transaction window for immediate use. Improved handling of all aspects of
your account has been added. You may now edit, remove, and add auto
transactions and payee addresses. Use of auto transactions has been
dramatically enhanced to allow entry of any transactions you want in any
order you specify. System 6 controls allow ease of movement through
windows to make entry of data much more fluid and controlled. Filtering of
transactions has been dramatically improved; find the transactions you need
in no time at all. In addition to the increased functionality of FGS, the
data structure has been expanded to allow larger accounts while maintaining
its goal of using only necessary memory. The new account limits include:
200 categories, 150 auto transactions, 200 payee addresses, up to 50
transactions in the clipboard, and transactions still only limited by
memory! This update is a must!

New Features :

$ Memory based to make it faster and more accurate; well tested to
prevent bugs.

$ Separation of program segments to make all sections of the program
available at all times (i.e. concurrent category, transaction, auto
transaction, and payee address abilities).

$ Re-developed menus and windows to be more accessible and
comfortable.

$ Updated for complete System 6 compatibility.

$ Finder*-like Windows menu to rapidly find or close a specific
window.

$ Customize the program by saving window positions.

$ Cut, Copy, and Paste transactions via a clipboard.

$ Expanded support of split transactions.

$ Memos in transactions.

$ Expanded support of variable budgets.

$ Better report generation: faster, more intuitive, and easier to
read. (Saves to disk in Teach or ASCII).

$ Print checks using the GS Print Manager.

$ Auto load and auto backup features.

$ Compatible with The Manager, SwitchIt!, and other program
switchers.

$ Was 16k, now uses only 9k of stack space!

$ Convert program makes v 1.0 files compatible with version 2.0 while
checking for errors in account files.
$ 130 pages of written documentation.

$ Import accounts from other programs.

$ Smaller account files.

$ Lots more!

NOTE: The upgrade price for Financial Genius v 1.x to 2.0 is $15.

Send check or money order AND _registration number_ to:

Rick Adams
FGS Update
1627 Ball St.
Galveston, TX  77550

Demo Account Not Yet Available Due to circumstances beyond my control,
the demo account mentioned in the
Financial Genius announcement is _not_ included in the uploaded demo. That
demo account will be uploaded separately as soon as it is completed. Since
the beginning of the year is now here (Happy New Year!), I thought it best
to let the 'public' try before they buy NOW.

A tutorial is included with the demo that will give you the basic
feel for the program and will let you know whether you want it or not. The
demo account will show a lot more abilities of Financial Genius and show
you more possibilities for maintaining your finances. If you're in no
rush, wait for the demo account to be released. I will re-upload a
'complete' package when that time comes.

Finally, if you desire to upload the FGS demo to another bulletin
board system, PLEASE _wait_ for the package that contains the demo account.
That way others will see a 'complete' Financial Genius!

Thanks,

Rick Adams, author Financial Genius

(R.ADAMS48, CAT8, TOP3, MSG:{22}/M645;1)

KEYBOARDING 5 UPDATED Keyboarding 5 (aka Computer Keyboarding) version
"""""""""""""""""""""""""""""""""""""""""""""""""""

21861 KB5.HD.BXY -- this is the complete version for hard drives and

21862 KB5.D1.BXY -- this contains the files for the 5.25 inch STARTUP

21863 KB5.D2.BXY -- this contains the files for the 5.25 inch PROGRAM

This version includes all previous bug fixes as well as numerous
cosmetic changes designed to make the program more user-friendly.

Keyboarding 5 is SHAREWARE. Until you pay the shareware fee, each
time the program is booted you will be reminded to pay the fee. The program
Apple II Computer Info

allows you to complete all of the 'home keys' lessons and begin with the first set of new keys (e u g). However, it will lock up at that point if the fee has not been paid. The key to unlocking the rest of the program is given to you when you pay the fee.

The SHAREWARE fee is $10 if you download the program or obtain it from another source other than me. When you send the fee to me, specify an e-mail address or snail-mail address to get the password in return.

If you wish to get the program directly from me, do the following:

1. Send me $15.
2. Include your name and address.
3. Identify which size diskette you want - 3.5 inch or 5.25 inch.
4. If you are purchasing this for someone else, give me that name too.
5. Mail it all to
   Charles Hartley
   455 Foster Lane
   Shepherdsville, KY 40165

I will send the program on bootable diskettes. I have a license with Apple to include ProDOS and BASIC.SYSTEM with the program.

If you request the program on a 3.5 inch diskette, I will include some extra goodies since there is ample room on that diskette.

Keyboarding 5 continues to be available as a site license for schools. The school site license fee is $100. Address all inquires to me at the address above.

Thanks!

Charlie          (C.HARTLEY3, CAT13, TOP8, MSG:25/M645;1)

NEW HARD DRIVES A2.Bill asked me to move the discussion of new hard disk drive products over here as a more appropriate place. So, here we are in our new home.

Later tonight, I'll post brief reports of both the Roadrunner40 and the AppleLeaf hard disk drives. I'll also discuss the Diplomat.

The Roadrunner is primarily aimed at the Apple IIe because the package includes a late (read the latest) model CMS SCSI card. This holds the price down a lot. Also included are a card for power on which any available 2.5" Quantum GO Drive (SCSI) can be mounted. The producer was able to obtain something just under 1,000 of these 40 meg drives, and designed the card for the power, SCSI ID and Terminator power. Again ways to hold the price down.....

The Roadrunner has been tested in a IIe and a IIGS at Charlie's AppleSeeds and found to work correctly in both machines!

Retail price is a suggested $199.00
Where else can one find, for an Apple IIe, a 40 meg drive AND SCSI card for that price? AND, don't forget, its SCSI!

Also available, a limited supply of Roadrunner20 units for a suggested retail price of $149.00.........

Chuck Newby
Charlie's AppleSeeds

PROSEL LITE New addition to the Roadrunner: ProSel LITE

ProSel LITE adds the ProSel (PRO)gram (SEL)ector to the Roadrunner, so that you can have the best program selector available on the Apple II Series in 8 bit mode.... Essentially, what you get is the ability to create a program selector screen for your Roadrunner. The EXTERNAL Program Selector Editor is part of the LITE package, as are all of the screen demo files which show you what can be done. In addition, three (there) are about 10 pages of dox, in AWP format for how to best use the Program Selector Screen and both the internal and external screen editors.

ProSel 8, discussed elsewhere on GEnie, can be purchased for $28.00 plus $2 postage, with proof of purchase of your Roadrunner. That represents a $10 (25%) discount over the suggested retail price.

Chuck

>>> THROUGH THE GRAPEVINE <<<

TWILIGHT II CONTEST Check out file #21904 for full information on a new Twilight II art contest! You can win cash and prizes :) Hurry; the deadline is Feb 14, 1994.

YOU DON'T HAVE TO OWN TWILIGHT II TO ENTER THE CONTEST!

Also included is a beta version of a toast module for Twilight II written by Nathan Mates. Check it out! :-)

Please place all discussion of the contest right here! Enjoy and good luck!

NEW GEM NOT SCUTTLED AFTER ALL? Just wondering if there was any news on GEM for AW4....

<<<Lloyd>>> (STAMPS.RT, CAT29, TOP4, MSG:45/M645;1)

>>> Beta testing is vigorously proceeding...hang in there.

...Will (W.NELKEN1, CAT29, TOP4, MSG:46/M645;1)

NEW COPILOT "OPEN BETA" SCRIPTS The CoPilot scripts for Spectrum and TIC are in the library, and have been since
before daybreak.:)

The library folks are aware that the CoPilot files need to be released as soon as possible, and they will be making every effort to get them out. If there is any delay on this, it WILL be unavoidable. (And my apologies to the library staff for putting them under pressure like this.)

The ProTerm scripts are VERY near complete, and if nothing unexpected comes up in THAT arena, you should see them early next week.

Gary R. Utter    (GARY.UTTER, CAT29, TOP13, MSG:{85}/M645;1)

>>>>> I've been so busy trying to whip the new CoPilot ProTerm scripts into shape that I've got 800K or unread messages in my A2 buffer! I'm not sure what Gary has posted about the ProTerm version of these scripts but I thought I'd take a second to give a status report.

As far as I know, the scripts are done and bug free. The last set of changes are in the hands of the Beta testers.... Since I may be going out of town for a couple days, I'm deciding whether to bite the bullet and upload them.... I'm inclined to upload them and see what happens :). In any event, you should see them within a week...no matter what.

These scripts are pretty much direct translations of Gary's TIC scripts. Because of this, I've used none of the power commands in the ProTerm macro set. The bad side is that it makes it GOto laden spaghetti code. The good side is that it is so like the TIC/SPECTRUM scripts, almost anyone can look at additions to the TIC scripts and easily impliment them in the ProTerm scripts. Also, this first order usage of the ProTerm macro language should allow use with ProTerm 3.0 as well as 3.1. I did about half the scripting using ProTerm 3.0 by accident. But after switching to 3.1 I didn't see any reason why 3.0 shouldn't be perfectly adequate. If there are any problems with 3.0, please jump in and let me know. I want to make sure they are 3.0 compatible (and I _think_ they are now).

I'll leave it to Gary to explain the 'features' of the scripts. You can yell at me for any ProTerm bugs though....:) Watch for them. It won't be long now....

SOFTDISK CONSIDERS ONLINE SALES  We will be offering certain Softdisk standalone products in a download superstore from GEnie as well as other services.

We're looking into the possibilities of being able to download back issues. We're also looking at allowing subscribers to subscribe electronically and download the latest issue from GEnie and other services. Selling back issues that way is also being talked about.

None of it is set in stone, but I imagine we'll know within a month exactly what we're going to do.

(Oops, I should have answered this on the SOFTDISK.INC account. Hard to keep 'em straight sometimes. %-)  

Dean Esmay       (DEAN.ESMAY, CAT34, TOP9, MSG:243/M645;1)
QUIET DEATH OF QFAX GS  I was leafing through my back issues of the late lamented A+/InCider and I found a press release in the June '93 issue to the effect that Quality was soon to release a product called Q-FaxModem GS. It stated that the software to transmit (and eventually receive) faxes would be available separately. Since I have recently purchased a high-speed modem with fax capability I am very interested in such a product. Has this software been released by Quality?

Sam King  (S.KING1, CAT42, TOP3, MSG:138/M645;1)

>>>>>  Alas, no. Q Fax has died a quiet death. We held every hope that the software would be completed, but after a year and a half we have finally begun to notify our customers that we will no longer be so 19A b *E"3 keeping everyones hopes up. The author continues to work on the project, and he may even finish it for another publisher. If they bring it to us in a finished form we will probably carry it, but we will not be pursuing the project any further.

Walker  (W.ARCHER2, CAT42, TOP3, MSG:139/M645;1)

NEW ECON SUPPORT PERSON  Due to recent internal changes and events at Econ Technologies Inc., we've been unable to provide timely support on both of our online support areas. Unfortunately our time resources have been severely taxed and therefore time intensive task such as bulletin board support had to be sacrified. In order to counter this situation we have commissioned a new individual to provide support for Econ Technologies here on GEnie.

Kevin Piclesimer is the new ECON dude here on GEnie! Kevin is an enthusiastic Apple IIgs owner who has enjoyed using the Apple II for many years. Kevin will be providing answers to general & specific questions concerning ECON products here in our support area. He will also do his best to help you through any problems you may be having with any ECON product although he may have to refer you to ECON tech. support.

Please give a kind welcome to Kevin as he joins the GEnie community!

Best Regards,

D.Proni  (ECON, CAT35, TOP2, MSG:33/M645;1)

BUG DISCOVERED IN PROTERM 3.1  You just uncovered a bug in ProTERM 3.1! Its there, its in the code! Congratulations if you and I are ever on Times Square, I'll give you a big hug in public. <smile>

Greg was looking over the PT3.1 code and found that during a routine test for 1200 baud modems, he removed part of the "maintenance" code for those modems and never put it back (blush).

It now seems apparent that not many are using 1200 baud modems as you are the first to note the problem that the 1200 baud modes is indeed instructed to answer the phone if it rings. <smile>

Just add
S0=0 (read that as S zero equals zero)

to the end of your Init string and it should solve the problem.
Jerry Cline @ InTrec Software, Inc.  

(INTREC, CAT24, TOP2, MSG:263/M645;1)

DIGISOFT CONSIDERING CD  DigiSoft is currently considering the production of a new IIGS CD-ROM disc. How much interest would there be? We don’t want to make it and then have only 20 copies sold, for instance... On the other hand, if we could sell 100, we’d get the project underway immediately. So, what say the masses? Just how many AII users have CD-ROM drives now that they are much cheaper?

Most of the stuff on the disc will be in HFS format, so AII users with access to Macs with CD-ROM drives could copy off files and bring them home to the GS as well. There might also be a prodos partition for P8 programs.

<<Jim

Message 51    Mon Jan 03, 1994
T.A.GATES at 03:09 EST

Ah, the good ol' days!

Not to mention the "other guys", but if anyone also gets on CompuServe (hey, I use it to access my company mainframe - GENie is where I have my fun :) - the 'Behind the Screens' column by John Edwards in the Jan 94 magazine was interesting.

He mentions a kind of yearning for 4k RAM, Kilobaud and OnComputing magazines, the take-over of the micro computer industry by "consultants", the disappearance of the original hackers (in the good sense).

I still have my original 1979 Apple II in my 4-year old daughter's room. She still gets a great kick out of making it tick. I get a much greater kick watching her have fun with it.

Circa 1976, had taken BASIC and FORTRAN courses at the Univ of Minnesota totally by consequence (another whole story) and fell in love with the things. A year before my high school physics teacher was busy building a computer from a kit (Altair I believe) and got me interested in the kit building side. So HeathKit was a way of life for some time as well.

Drooled over the ads in Byte magazine about the 4K RAM machines that you put together on the "kit a month" plan. Then the ads for the Apple I, you could get just the motherboard and add your own case, power supply and keyboard - or - buy the works in a case already!

Even in those days, Apple was high priced compared to other computers. I recall the month-long debate over spending my $2000 on 16K Apple II with an AppleSoft language card, or get the Ohio Scientific computer with 32K of memory, disk drive, monitor for the same price. The decision on the Apple was almost a coin toss type of affair. What sinched
the deal was I couldn't find software for the O.S. machine outside of the
Montgomery Wards store. Yes, Wards! They sold them right next to the
tires and batteries. :)

I loved what the Lisa and Mac computers could do and had a part in
bringing a Lisa into our office. This eventually became a love/hate affair
as the arrogance of the Mac owners/users and the shenannigans within Apple
Inc. regarding the II vs Mac became more profound. So, when my dad saw
this neat new IIGS computer coming on the market, he asked if I'd be
interested in one. How can you say "no" to your dad. ;)
I'd guess that this Woz signature machine will last at least as long as the II in my
daughter's room. And, if Quality moves ahead with plans on a software
emulator for the PowerPC's, I'll really be in hog heaven. Finally someone
to bridge the gap that Apple was never willing to.

Ah, memories!

T.A.Gates

R.HOSKING [WOODCHUCK] at 22:51 EST

Sometimes we Apple II users have our rewards.

I had a project at the office which would work the best using a
database. Our office is awash in messy-dos machines. The guru in charge
of software feels that if it is bigger (read more expensive), the software
must be better so in his infinite wisdom, bought rBASE as our data base
software. In an attempt to give it a fair shot, I have been trying to
learn rBASE for a year and like the other folks in the department, have
muddled along and still can't set up a data base. (If the manual is over 1
1/2 inches thick, don't buy it). Having a deadline to meet, I said to hell
with messy-dos and planned on using Appleworks database to get the project
done. As luck would have it, the nor'easter of 94 (that's what the news
media called it) gave me the chance to get Appleworks up and running at
home. My boss told me to take work home Monday night and work at home
instead of driving 35 miles to the office on Tuesday. Not one to argue
with the boss, I did just that. As the snow fell and the wind blew, I
typed away on the IIGS and got the project done.

Wednesday morning, I brought my Deskjet 500 printed custom output
into the office and showed the boss what could be done with a "SIMPLE"
database program on an obsolete computer. As he was working with my output,
I went into my office and started doing some SuperCalc work on my messy-dos
machine when the computer hung on me. It wouldn't even recognize a
ctrl-alt-delete boot. I turned off the machine and rebooted to find only a
blank screen, no cursor and the sound of the harddrive spinning. When the
service tech looked at my dead machine, he found that the motherboard was
fried and had to be replaced.

Could it be that my DOS machine saw the Apple output and threw in the
towel?

Dick (Woodchuck) Hosking
While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GENieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

If operating systems ran airlines:

**DOS Airline** Everybody pushes the airplane until it glides, then jump on and let the plane coast until it hits the ground again, then push again, jump on again and so on.

**DOS with QEMM Airline** The same thing but with more leg room to push.

**The Macintosh Airline** All the stewards, stewardesses, captains, baggage handlers, and ticket agents look the same, act the same, and talk the same. Every time you ask questions about details, you are told you don't need to know, don't want to know, and everything will be done for you without you having to know, so just shut up.

**The OS/2 Airline** To board the plane, you have your ticket stamped ten different times by standing in ten different lines. Then you fill out a form showing where you want to sit and whether it should look and feel like an ocean liner, a passenger train, or a bus. If you succeed in getting on board the plane and the plane succeeds in getting off the ground, you have a wonderful trip...except for the times when the rudder and flaps get frozen in position, in which case you have time to say your prayers and get yourself prepared before the crash.

**The WINDOWS Airline** The airport terminal is nice and colorful, with friendly stewards and stewardesses, easy access to the plane, an uneventful takeoff...then BOOM! the plane blows up without any warning whatsoever and you're dead.

**The WINDOWS NT Airline** Everyone marches out on the runway, say the password in unison, and form the outline of an airplane. Then they all sit down and make a whooshing sound like they're flying.

**The UNIX Airline** Everyone brings one piece of the plane with them when
they come to the airport. They all go out on the runway and put the plane together piece by piece, arguing constantly about what kind of plane they're building.

The ATARI Airline

No one knows where the ticket agents are or the terminal is.

REFLECTIONS /

Thinking About Online Communications

By Phil Shapiro

[P.SHAPIRO1]

>>> DEVELOPING YOUR ONLINE SOCIAL SKILLS <<<

The other day I got to thinking about the two types of telecommunications skills a person can possess. The first type is technical skills: how to use the features in your communications software, how to read and leave messages on local bulletin boards and national information services, how to diagnose the problem when your modem has difficulty connecting with a remote system.

The other type of telecommunications skill is far more subtle and amorphous. It's the skill a person has at knowing what to say, how to say it, where to say it, and whom to say it to. It's the "savoir faire" skill of knowing accepted online social practices, and of playing the game according to the unwritten rules.

It's this second type of telecommunications skill I find most fascinating.

You can tell when a person has developed a facility at this skill. Their public message postings sound concise, well-thought out, sensitive to others' feelings, and inviting reply. Their private electronic mail messages have similar attributes.

You can also tell when a person's online social skills are not fully developed. The person who sprinkles exclamation marks hither and thither in their writing may be unaware that their puppy-dog exuberance betrays a certain naivete. Likewise the poor soul who has yet to learn that the English language has evolved to where lower case lettering is indeed permissible.

Knowing what to say online is only half the battle though. Knowing how to say it is the real challenge.

It takes skill to choose just the right words to elicit the desired response. Another way of saying this is that online communications gives you ample opportunities to put your foot in your mouth.
You need not feel overly self-conscious if you do commit the occasional social gaffe, though. Online communications is so new to all of us that everyone can recall social gaffe's of their own.

Just last week I myself had a narrow escape. In a moment of reckless abandon I courtesy-copied an electronic mail message. My reason for doing so was to save myself the trouble of sending a separate e-mail message to the courtesy-copied party.

Doesn't sound too dangerous on the face of it, does it? Aha, but foot-in-mouth opportunities abound in the online world. No sooner had I dispatched the message than I realized the possible perils of my action. Some stray comments in my message could possibly be taken the wrong way by the courtesy-copied party.

Luckily, I narrowly escaped a rather embarrassing situation. Next time I'll think twice about using the convenience of courtesy-copying. I'm all the wiser for having narrowly missed that precipice.

The truth is that online social skills are closely akin to the social skills we use in conducting our everyday face-to-face affairs. Those who have developed refined social skills in the tangible world usually have no trouble transferring those skills to the online world.

Tact. Courtesy. Thoughtfulness. A reserved, controlled demeanor. These are all indicia of a refined mind -- both online and off line.

These are commendable skills to hone and refine. You cannot learn them quickly. You cannot learn them from any guidebook. You can only learn them through experience.

As you journey through the online world, take time to reflect upon the positive examples of online social skills you encounter. You will enrich yourself immeasurably as a result.

-Phil Shapiro

[*][*][*]

The author takes a keen interest in the social dimensions of online communications. He can be reached on GEnie at: P.SHAPIRO1; on America Online at: pshapiro.
like me, have recently updated to a newer, faster modem, this may be helpful.

PRINTER PORT / MODEM PORT  These two options in the Control Panel are quite similar, so I will deal with them together. Modifying the characteristics of a serial port on the Apple II, II Plus, or IIe required popping the top off the computer and flipping some tiny little DIP switches. To do this on the IIgs is much easier; you just enter our handy little CDA Control Panel and use the arrow keys to change things.

Before describing the various entries in these Control Panels, let's diverge for a moment and discuss parallel versus serial devices, and then explain what a serial device needs to properly communicate. The parallel interface was designed originally by a company named Centronics, which manufactured printers, way back before microcomputers existed. They designed an inexpensive way of sending data from a computer to a printer that involved having a separate wire for each of the eight bits in a byte. Besides these eight wires, there was also a wire from the computer to the printer to tell it that a character was coming, and another wire from the printer back to the computer to tell it that the character had been printed, and it was ready for more. The only problem with the parallel interface is that it is expensive to have a cable that runs over a long distance (if your printer and computer can't be right next to each other). Because of these drawbacks, the serial interface is often used as an alternative.

Serial interfaces have been around for a LONG time, so long that a specific standard has been defined to designate exactly how a serial interface should work. This is called the RS-232-C standard, and that's why you see that name on some serial devices (when they claim to be compatible with that standard). The simplest serial interface would be one line for data and another for a ground, but several others were added over the years, until there were as many as 25 different lines with different meanings. In the microcomputer world, where practicalities such as price have reigned supreme, this has been reduced significantly. The Apple IIc, the first Apple II to use the serial interface as a standard, used only five of the lines coming out of the computer, although the plug at the other end had to have 25 pins to follow the RS-232-C standard. The IIgs and Macintosh computers use eight lines for data transmission to achieve slightly better control. This uses one data line in each direction, plus other lines for control (letting one device tell another when it is ready for more).

Now that we have that out of the way, here is what these Panels look like:

~ DCD Handshake: Yes
~ DSR/DTR Handshake: Yes
~ XON/XOFF Handshake: No

Select <- -> V ^ Cancel: Esc Save <-|

(Note that as in previous month’s articles, the "~" character represents the checkmark that appears next to each line in Control Panel setting that is the default selection for that feature.) All these parameters are necessary to help your computer communicate properly with alien species (i.e., printers and modems). Now, we’ll take each of these in turn to explain what they mean.

Device Connected On the ROM 01 IIgs, this is an option that can be adjusted by pressing the right or left arrow keys to select "Printer" or "Modem". On the ROM 03 IIgs, the Printer and Modem Control Panels are smart enough to tell you what setting you have made in the Slots Control Panel. If you have Slot 1 set for "Printer", it tells you that; if for "Modem" (yes, you could have two modems attached), it tells you that. If for "Your Card" it will say that also, and if "AppleTalk" (on the ROM 03), that name is displayed. If AppleTalk is selected for either of these two slots, many of the other options are NOT displayed; apparently only the first four are needed to properly control an AppleTalk interface.

Line Length This option refers to the number of characters that will be sent to a port before a carriage return (Ctrl-M) character is automatically generated by the computer and sent down the serial data line. This may be necessary when using some very old printers that REQUIRE this type of control, or if the page that you are trying to print seems to continually print characters off the right edge of the paper. In most modern applications, however, the software takes care of where the line should end and continue on the next, so most users should just set this to "Unlimited". A modem also MUST have this option set to "Unlimited".

Delete first LF after CR Here, LF = Linefeed (Ctrl-J), and CR = Carriage Return (Ctrl-M). When these terms were originally defined back in the teletype and typewriter days, a Carriage Return meant that the movable print head was moved back to the left end of the line. However, without a Linefeed to move the paper up one line, any printing that continued from this point would go right over that printing that had already appeared on the line. So, when information was sent to a teletype it was necessary to send both a Ctrl-J and a Ctrl-M to make sure that the next line of printing WAS printed on the next line.

From the beginning, the original Apple II would move the cursor to the next line on the screen with ONLY the Ctrl-M character. It became customary for printers attached to Apple II’s, and later to the Macintosh series, to also require ONLY the Ctrl-M character, rather than the Ctrl-M/Ctrl-J (CR/LF) byte pair. This made sense in terms of saving a bit of time during printing, and space in a text file; each line in the file would require one byte less of storage if it only used the Ctrl-M character.

In the CP/M world, and later in the MS-DOS world of the IBM PC, the custom of using BOTH the CR and the LF bytes persisted, and so some
printers expect to receive BOTH a CR and LF to work properly. Other
printers (such as the Apple ImageWriter) only require a CR to work properly
(in its default setting).

Since the settings on printers differ, this can be used to change how
the serial port talks to the printer. If all the lines in your word
processing document print out double spaced, setting this option to "Yes"
will allow the serial port firmware to "eat" the extra LF character.

Add LF after CR Similar to the above discussion, an application that
does NOT send a LF after a CR may cause some printers to
print every line in a document on top of each other. If that happens with
your setup, setting this option to "Yes" will cause the serial port
firmware to burp out an extra LF character every time a CR character is
sent.

Echo When using a modem, two modes of data transmission are used.
"Full-duplex" means that a character sent to the computer on the
other end is sent back ("echoed") to the computer on your end.
"Half-duplex" (which GEnie and nearly no one else uses) means that the
characters sent from your end are NOT sent back to your computer.
Therefore, to see what you are typing, your terminal program must be set to
half-duplex, or you must set this Control Panel option to "Yes". If you see
twwo of everything you type, the remote computer is sending each
character you type back to you, and you need to set Echo to "No".

Buffering This option, if activated, uses a space in RAM where data being
sent to the printer or modem can be temporarily stored up when
the device is busy and can't handle any more data for a moment. For a
modem, if you find that you are losing some data at times, turning this
option on may help. Apple's manuals suggest leaving this turned off unless
a particular program or device requires that it be on.

One "gotcha" that once hit me was turning Buffering "On" in the
Printer Port. It began to cause problems when I tried to print several
documents from AppleWorks; as each new document began to print, it appeared
to clear out the remainder of the previous document. After tearing out a
few hairs ("But this USED to work!!!"), I finally recalled that I had made
that change, and returning it to normal fixed everything. Moral: Don't
turn Buffering "On" unless you have specific instructions to do it.

You will probably find that if you use a high speed modem (9600 baud
or faster) this option will need to be turned "On".

Baud The approximate speed (in characters per second) that the serial
port will send data to the device attached to it. When the IIgs was
designed, the most common speed for printers was 9600, and for modems was
1200. The baud rate for printers should be set to the fastest speed that
the printer can handle (make sure the settings on the printer match what
you set here). For many modems, this setting may NEED to be set to the
speed at which you want to use the modem; however, with newer modems, it
may be possible to have the Baud setting in the Control Panel set to the
highest speed (19200) EVEN if the modem cannot communicate faster than 2400
baud. This Control Panel setting will determine how fast the computer
communicates with the modem; the modem will communicate over the phone line
at whatever speed IT has been set to.

In general, put this option to the highest setting that allows you to
make a reliable connection.

Data/Stop Bits  To allow eight bits of data to be sent on a SINGLE electrical line between two devices, there has to be a way to tell when one byte ends and the next one begins. Consider this series of characters: "GODISNOWHERE". Does it mean "GOD IS NOWHERE" or "GOD IS NOW HERE"? Without the space character it could be difficult to determine the correct meaning of the words. In the transmission of a series of bits, it is absolutely critical that there be a way to tell where the "space" should go.

"Data Bits" refers to whether a byte is sent as five, six, seven, or eight bits. Although five or six bits may not send many characters based on the ASCII character set, some older standards require such a setting. However, I know of no standard BBS or major online information service that uses such a limited protocol.

"Stop Bits" refers to how a byte is terminated; by the above example, it identifies how a "space" between bytes is identified. This is either one or two bits.

In nearly all circumstances these days, it will be unnecessary to change this setting from 8/1 to anything else.

Parity  This option has to do with an older method of error checking. After each character is transmitted, a parity bit may be required to allow the computer on the receiving end to determine whether or not the character was sent accurately. If not, that one character would be re-transmitted.

Parity is set to either "Odd", "Even", or "None". An "Odd" parity requires that an extra bit, either 0 or 1, is added to the end of the 5, 6, 7, or 8 bit character to make sure that it has an odd number of 1 digits. "Even" parity means that the extra bit should make the entire transmitted character have an even number of 1 digits. "None" means that the parity protocol is not used, and in most cases this will be the best choice.

DCD, DSR/DTR, XON/XOFF Handshake  These three Handshake options are used to help the device attached to a serial port to be able to tell the computer to stop sending data to it. A printer, for instance, is not able to print data as quickly as the computer can send it. If the printer could not tell the computer "Stop, I'm full right now!," data would be lost as the computer continued to dump data to it.

DCD stands for "Data Carrier Detect"; DSR for "Data Set Ready"; DTR for "Data Terminal Ready"; and XON/XOFF are the names for ASCII characters that tell the transmitting device to start and stop sending, respectively.

THE END OF THE CLASSICS  Finally, we are at the end of this description of the CDA Control Panel. Hopefully, it has made it easier for you to make adjustments to your Apple IIgs, and to understand what those adjustments are for. Next time, join me here as we begin to look into the use of increasingly affordable hard disks on Apple II computers.

[*][*][*]
Steve Weyhrich is a family physician from Omaha, Nebraska. He has been using Apple II computers since 1981, and writing about them since 1990. He follows closely the events that continue to shape the destiny of the legendary Apple II and IIgs computers, and writes a monthly column called the "A2 News Digest" for A2-Central disk magazine. He is also the author of the "Apple II History," available on fine BBSes everywhere. He is really getting tired, however, of talking about the CDA Control Panel.

Apple II Hybrids

By Jay Curtis

>>> HOW THE APPLE II READS AND WRITES MS-DOS <<<

The Macintosh world has been buzzing recently about an Apple-manufactured 68040 Processor Direct Slot card that actually allows a Macintosh to run MS-DOS programs. Running inside a Mac Quadra 610, this 486 co-processor does has features that take it beyond the PC Transporter; however, I can't help but be amused by the attitude of the Mac-o-philes at my work place. One in particular has been crowing about what an "amazing technological breakthrough" the card represents and how "nothing like it has ever been done before." One of these days I'll bring him to my home and quietly demonstrate how my PC Transporter-equipped IIgs can launch and run the latest versions of Microsoft Works, ProCOMM Plus, and Word Perfect from GS/OS desktop icons.

The PC Transporter is, for all practical purposes, a small, high-speed XT that is contained upon a single card. When it was introduced, XTs were considered "aging technology" in the PC world, when compared to the accepted 286 standard, and the just-emerging, ultra-fast, 386 systems. Nonetheless, the ability to cram an entire XT on a single card was considered an engineering accomplishment, and the card must be viewed, historically, as state-of-the-art technology in consideration of what it could do.

Even today, the PCT is no slouch. People who have just enough knowledge about computers to think that they "know" you can't run IBM software on an Apple II, are usually amazed when they see a machine that will do exactly that. The PCT uses a V30 microprocessor -- essentially the equivalent of an Intel 8086, only smaller. The V30's speed is 7.14 mhz, but subjectively it runs much faster than that. I can compare the card's performance (using non-Windows, MS-DOS applications) with an old XT and with an HP Vectra 386/16 at my work place. Running inside my GS, most of the PCT's functions seem much closer in speed to the HP Vectra than the XT.

I haven't tried to verify Applied Engineering's claim that MS-DOS programs run 3 times faster on the PCT than on a PC/XT. Many factors govern speed and the perception of speed on personal computers, and with Applied's claim, you could easily imagine the PCT running like a 22 Mhz 386. Don't. It probably isn't THAT fast. Think along the lines of a fast
286 running a text-based program. Yes, Windows WILL run on the PCT, but there's no advantage in doing that. A GS user already has a (better) windowing environment with GS/OS system 6.0.1, and according to those who have tried it, Windows will slow down the PCT to a snail's pace. The PCT is strictly a DOS engine, and what it does, it does with speed and panache.

According to Applied Engineering, the PCT gets its speed from the fact that it is a "co-processor." In either an Apple IIe or IIgs, the Apple's own microprocessor and ProDOS system software handle the I/O from the V30 while emulating PC I/O ports. This enables the PCT's V30 to process MS-DOS programs "at full speed" while accessing its own on-board RAM.(1) Therefore, the PCT can be said to be running INSIDE an Apple, both figuratively and literally, given that most of the I/O is overseen by ProDOS.

There are, however, two important exceptions to the rule that you need ProDOS for I/O management: First, the PCT has its own Color Graphics Adapter (CGA) controller for generating video. In an IIgs, a "ColorSwitch" is required to automatically switch between the GS's RGB analog color output and the PCT's digital output. The second exception to ProDOS I/O management is found in the PCT's on-board, MFM floppy disk controller. If it were not for the MFM controller, there would be no way to get program instructions from a STANDARD MS-DOS diskette into your Apple II/PC hybrid. It is helpful to think of this controller as your principal doorway to the MS-DOS world beyond the PC Transporter and Apple II hybrid system.

Considered by itself, the PC Transporter card is capable of working with three types of MS-DOS volumes. These volume types are MFM, GCR and hard disk. The PCT can read and write directly to MFM/MS-DOS volumes ONLY through its on-board MFM floppy disk controller. The controller, in turn must be connected to either PC Transporter "Transdrives" or to a standard Apple 3.5 microfloppy drive to be able to read and write MFM/MS-DOS diskettes. The PCT reads and writes to hard disk and GCR/MS-DOS volumes through the Apple's microprocessor and ProDOS.

ABOUT "LOW-LEVEL" FORMAT   "GCR" and "MFM" are sometimes called "low-level" formats or "disk formats." This is done to distinguish them from "file formats," such as MS-DOS, ProDOS and HFS. "MFM" is principally used by PCs and PC compatibles, while "GCR" is principally used by Apple IIs. Another way to think about GCR and MFM is that they are HARDWARE-RELATIVE terms that have to do with the schemes used by the drives themselves, and their interface cards or controllers, for encoding data on diskettes. MFM stands for "modified frequency modulation." GCR stands for "group code recording." On the other hand, the FILE formats MS-DOS, ProDOS and HFS, should be thought of as "SOFTWARE-RELATIVE" terms for our present purposes.(2)

As file formats, MS-DOS, ProDOS and HFS can be independent of MFM and GCR. Thus, it is possible to have MFM-encoded ProDOS diskettes, and it is also possible to have GCR-encoded MS-DOS diskettes. The 1.4MB and 720K ProDOS disks created by Floptical disk drives are MFM-encoded ProDOS. The 720K and 360K ProDOS disks created by the PCT's Transdrives are also MFM-encoded. However, convention pairs MS-DOS with MFM in the PC world and ProDOS with GCR in the Apple II world. (It should be noted that HFS is often written to both MFM and GCR; Superdrive-equipped Macs routinely work with both formats.)

It appears to some Apple watchers that the company will soon leave
the GCR standard behind (along with the Apple II) to make their drives and
data disks more cross-platform compatible with the PC world and to save
money. This would seem to be a logical step as Apple moves toward
promotion of the PowerPC and, therefore, a single hardware standard with
the PC world. It is all the more reason for Apple II devotees wishing to
remain with dynamite power applications like ProTERM 3.1 and AppleWorks 4.1
to develop bridges to enable them to move their data with greater ease
between their Apple and other platforms when needed.

It is important for cross-platform and hybrid users to keep in mind
which kind of diskette (GCR or MFM) that they are working with, because
each kind of diskette requires a certain kind of disk drive and/or
interface in order for it to be written or read. For example, a user
cannot write a 720K MFM/ProDOS diskette in a Floptical disk drive or PCT
Transdrive, then take it to a standard GCR 800K Apple drive and read it.
Similarly, anyone who takes advantage of the PCT card's ability to write
MS-DOS to a diskette through a standard GCR Apple drive and controller,
should not expect to be able to read one of these diskettes in a standard
PC or compatible drive.

The Apple 3.5 and Applied's Platinum 3.5 are, however, capable of
reading and writing both 720K MFM/MS-DOS AND 800K GCR/ProDOS when hooked to
the PCT card. On the ProDOS side of an Apple II/PC hybrid, a special
Applied Engineering software program called "PCT.SWAP" can turn these
drives on and off as ProDOS drives. This capability has caused some
AppleII fans to opt for the PC Transporter card in place of Apple's
Superdrive bundle.

As many know, the Superdrive and its controller card give Apple II
users the capability to rewrite high density HFS, MS-DOS, and ProDOS in MFM
and GCR. By comparison, however, the PCT's advantage is that it gives the user the ability to not only rewrite MFM/MS-DOS and GCR/ProDOS, but also to
RUN MS-DOS. Additionally, IIe users who do not possess 800K 3.5 capability
get the added benefit of a 3.5 floppy disk controller (usable on both
ProDOS and MS-DOS sides of their machine) with their PCT card.

Unfortunately, the Superdrive cannot be hooked to the PCT's MFM
controller and cannot be accessed by the PCT as an MFM/MS-DOS device. The
Superdrive's double and high density diskettes CAN, however, be accessed by
the PCT through the Apple II's ProDOS emulation of PC I/O (in the same way
that standard Apple 3.5 drives can be accessed by the PCT through the Apple
ports). Additionally, with Peter Watson's (GS/OS) MS-DOS utilities and
System 6.0.1's MS-DOS FST, it is possible to format and rewrite MFM/MS-DOS
in both double density and high density from the IIgs side of a GS/PC
hybrid, or from ANY GS for that matter, hybrid or not.

For those who already have 3.5 capability (hopefully most of us by
now), one drawback to consider in comparing the PCT and Apple's Superdrive
bundle is that the PCT's controller will not handle high density (1.4MB)
diskettes. This is often the essential consideration for those who
purchase the Superdrive. Also, while the PCT and Apple 3.5 combination
will read and write MFM/MS-DOS, PC-compatible drives on other machines are
finicky about reading and writing MFM/MS-DOS diskettes which have been
FORMATTED in the Apple 3.5 drive. Most Apple II hybrid users who rely on
the PCT and Apple 3.5 drive combination purchase preformatted IBM
diskettes. Others may wish to consider using the PCT Transdrive system,
which not only flawlessly formats MFM/MS-DOS, but is also able to display
MFM/MS-DOS diskette volumes on the GS/OS desktop with the MS-DOS FST.
Though neither the PCT Transdrive system nor the PCT and Apple 3.5 combination are capable of reading or writing high density diskettes, there is one MFM-capable device, other than the Superdrive, that CAN read and write 1.4MB high density. The Floptical disk drive has been receiving much attention lately among Apple II hybrid and cross-platform users because of its ability to handle MFM encoding AND its ability to rewrite high density. This gives it many advantages, especially for Apple IIgs devotees who want to work with both the MS-DOS and HFS file system translators. It seems important, therefore, to briefly consider use of the Floptical in this series on Apple II hybrid computers.

ABOUT FLOPTICAL DRIVES  Tulin, PLI and IOMEGA sell the majority of Floptical drives to AppleII owners. Unlike Superdrives, Floptical drives are limited to only MFM encoding. However, besides being able to rewrite high density diskettes, they also can read and write VERY high density (21MB) Floptical diskettes. These Floptical diskettes are 3.5 floppy diskettes which have been "etched" or "stamped" on one side with a series of small pits, laid down in concentric rings.

If you turn a Floptical diskette over, open the shutter and hold the diskette at an angle to an incandescent bulb you get refraction, a rainbow effect across the diskette's surface appearing much the same as when you hold an old LP record at an angle to light. A light emitting diode inside the Floptical drive's case shines on this surface, and an optical servo mechanism reads the pits to position its magnetic read/write heads. Therefore, positioning is done optically, but, unlike an optical disk, which encodes data optically in small reflective pits, data are encoded MAGNETICALLY on Floptical diskettes. The Floptical drive achieves its very high data densities because of the precision which can be derived from optical positioning.

Like the Apple Superdrive, the Floptical drive cannot be accessed directly as an MFM/MS-DOS device by a PCT card because it cannot be attached to the PCT's MFM/MS-DOS controller. The diskettes can, however, be accessed as special hard disk volumes by the PCT.

Floptical drives are SCSI devices, and therefore they must be hooked to an SCSI controller card. Once they are properly configured on the SCSI bus, a floptical diskette, placed in one of these drives, can function like any other hard drive volume, with one important difference. Floptical diskettes are removable. Being removable, they can be used as backup devices or substitute volumes containing alternative programs and data. Therefore, they can also provide multiple hard disk volumes to both the Apple II and PC sides of the hybrid. Used as PCT hard drive volumes, these diskettes offer tremendous flexibility to Apple II hybrid users.

Next month, we'll talk more about PCT hard drive volumes and about use of the PCT control panel and hardware drivers. We'll also talk more about the kind of software that runs on the PC side of the Apple II/PC hybrid and what benefits the user can expect. Until next month then, think hybrid!

NOTES

(1) PC Transporter User's Manual, p. 73
(2) Before we make this definition too rigid, however, we should acknowledge that MS-DOS and ProDOS are more than just filing systems. They are also disk operating systems. As such, they have code built into them which enables them to work with peripheral devices. In this sense, MS-DOS and ProDOS are also hardware-relative terms.

Golden Oldies

by Darrel Raines

DR'S EXAMINING TABLE /
One of the potentially frustrating things about owning an older computer system is that you feel left out when you see your friends going to the nearest computer store and buying that great new game for their system. They plop down $50 for a new dungeon game that will blow the socks off anything that was ever created before. The package consists of music and graphics that will make you think that you are actually in the room with the dragon that just toasted your exploration crew.

All this sounds great to the average Apple IIgs owner (except the high purchase price). The trouble is that there are no longer new games coming out for the Apple. You begin to feel left out and start to consider purchasing a new computer just so you can play the latest and greatest computer games. Well, hold onto your mouse for just a minute. I have an alternative that I think you should consider: used software.

Unless you were a lot wealthier than the average Apple II owner, you did not have the resources to purchase every game that was written for the Apple II over the years. I certainly tried, but even I could not accomplish this feat. Therefore, many games and other useful software were written for your computer, but escaped your clutches for some reason or other. Now is your opportunity.

Run, don't walk, to the nearest Apple IIgs and boot up the telecommunications software. Log onto GENie and hop over to the Apple II RoundTable (A2). Enter the bulletin board area (option 1) and set your category for number 4 (SET 4). You are ready to enter the magic kingdom. In just a few weeks, you'll have hundreds of opportunities to purchase used software that needs a new, loving home. All that you have to do is browse (BRO) the different topics to find the software that you managed to miss in the past few years. There are even a number of hardware items that may tickle your fancy.

Once you see a title that sounds good, drop a note to the person who left the original "For Sale" message. If the price sounds too steep, then make a counter-offer. If the price sounds fair, then shout quickly "I will take that item off your hands." If you are the first one to make an offer that the owner accepts, then you will be the proud owner of a new toy. The seller will generally send the package to you and expect prompt payment in return. You will get the original software, documentation, and many hours of entertainment.

I should interject a word of caution at this point. I have never had a problem in receiving merchandise or payment while using this process. However, the possibility does exist that you could get ripped off during an exchange. I have never experienced a problem other than slow payment. I have also been guilty of taking some time in shipping equipment to a purchaser. I am working on this; it only works against me in the long run. Be sure to work out who pays for shipment and what order the payments are exchanged with the person you are buying from. Take nothing for granted; spell out every detail.

I have been able to find many good deals by purchasing my software in this manner. I have also sold some items that would otherwise be gathering dust on my shelves. Not only that, but by selling my used software, I have more money to purchase someone else's used game for my computer. What a deal!

I have finished many computer games, especially adventure games,
where the software and documentation look exactly like they did when I purchased the game. The only difference is that I have completed playing the game and killing the ultimate bad guy. Now I do not know what to do with the game. I will not be playing again anytime soon, since I spent long hours on the game before finishing it. Why not sell the software on the Apple II RoundTable?

You can place an ad for a software package almost as easily as you can find someone else’s software to purchase. All you have to do is compose a brief ad for the forum message and type it under the correct topic in category #4. There are topics for 8-bit software, 16-bit software, IIgs computer systems, peripherals, and so on. Find the correct category and type away. Even if you happen to pick the wrong topic, the forum sysop will move the message for you and leave a friendly note telling you where to look for replies.

I have managed to find several packages just recently that I have been wanting to purchase for years. I never got around to ordering this software... or I didn't have the money... or something always came up. By buying used software, I have been able to get a few games that I always wanted, a page layout package that looked useful, and a database program that my wife needed for her Biology Test Question Bank. These packages were purchased for a reasonable price and included full documentation and the original disks.

Now that you know the "Used Software Solution", why don't you clean out the computer closet? Place ads for all your unwanted software. Make inquiries about software you see in the Apple II RoundTable. Sell software and equipment. Buy a new game. Trade adventure games with someone one the far side of the continent. It might even provide you with as much excitement as your friend who just purchased that $50 game for his IBM clone. Maybe more.

Since we have opened this Pandora’s box used software, a natural question follows: "Which software should I try to find?" You can ask your friends what games they have enjoyed playing. You can seek opinions in the other categories on the RoundTable. Of course, the reason that I brought up the subject is that I have an even better idea. You can read GEnieLamp A2 edition.

You see, next month, and from time to time in the future, I will be reviewing some golden oldie software packages that you can purchase on the used software market. This will help you find that gem that you may have missed when it first came out. Until next time, happy bargain hunting.

[HAR]uguayin Bug in Apple SSC Card

Known Bug in Apple SSC Card

by Ron Higgins
In the "Hey Mister Postman" column of November 1993 issue of GENieLamp A2, B.PERCIVAL and H.HOOD were discussing a problem with the 6551 chip in Apple's Super Serial card, frequently used as a printer or modem interface. The 6551 chip, which the SSC uses, can lose characters when sending. Typically, this can interfere with PTSE screens and with ZMODEM file transfers.

Every time the CTS line from your modem goes low to tell the computer to stop transmitting data, the current character is lost. What happens is that the 6551, (ACIA -- Asynchronous Communications Interface Adaptor) chip stops transmitting immediately when the CTS line is lowered, no matter where in the current character it is.

A character is made up of 8 bits (ones and zeros that computers can understand). These bits are sent to your modem one at a time. If the modem is getting the bits too fast, it must tell your computer to stop sending them until it can catch up. It does this by signaling the computer via a control line to stop sending data.

In the old 6551 chip design, the 6551 would stop sending bits immediately upon getting the signal from the modem to stop sending data. It didn't matter where in the current character it was, the chip just stopped. It would then throw away the unused portion of the character it was sending and, when asked to start sending data again, restart with the next character. This is, of course, bad -- we have now lost part of a character. To the receiving end, this appears as a missing character on the screen, or an error in a file transfer.

Now the question is whether or not you are affected by this problem. You may be run into this "bug" if the following conditions exist:

- You are sending data from your computer to another (it may affect uploads, but never downloads).
- You are using a high speed modem (9600 bps or faster).
- You are using hardware flow-control (sometimes called hardware handshaking)

What do I do if affected by this problem?

The only solution to this problem is to purchase a replacement 6551 chip where the problem has been corrected. The Harris CDP65C51AE1 chip, mentioned in the November 1993 issue, is a good replacement. I've been using it without trouble for over 11 months now.

Where do I get a replacement?

Good question -- this is NOT something you can run to Radio Shack(tm) for. You need to order it from a electronic parts supply house. I do not know of anywhere that will sell just one chip, but I'm sure that they exist.

On the other hand, I have purchased a small quantity of these chips (about 75 pieces), and am offering them to anyone needing them. The cost is $4 per chip with $3 shipping & handling per order in the US. Send check
Apple II Computer Info

or money order to the address listed below. Send E-mail to my Internet account for information on shipping costs outside the US.

Remember, don't fix it if it ain't broke!

Ron                Lightning Systems     Lightning Systems
rhiggins@carroll1.cc.edu  (414) 363-4282  200megs   P. O. Box 4
Apple // Forever!       14.4k USR Dual Standard   Mukwonago, WI 53149
** Ask me about the new Turbo ASB for your Apple // Computer **

[To save you the trouble of asking about the Turbo ASB, read on. Also, see the "Hey Mister Postman" section in this issue of GEnieLamp A2. On behalf of our readers, I asked Mr Higgins about the Turbo ASB, a product he is currently working on. -- Ed.]

The Turbo ASB is an add-on board for an Apple Super Serial Card (or compat.). What is does is eliminate the 19,200 bps barrier that the SSC has. It's an external baud rate generator that pushes the 6551 ACIA to a maximum of 230,400 bps. It also supports standard bps rates of 38,400, 57,600 and 115,200.

All you need to take advantage of all this speed is one of my add-on cards and a 1-byte change to software. It will definitely be supported in ProTERM, with probable support in ANSIterm, Spectrum, ModemWorks/ProLine, and PMP drivers for ACOS.

The World Wide User Group (WWUG) is our online usergroup, which meets the 3rd Sunday of every month. The online usergroup concept was developed to create support for our Apple II community, support which is sadly waning in too many areas.

A special announcement: WWUG has now been renamed PAL. T. R. Onan, who goes by the name TRON, won the naming contest, and will choose a publication from Resource Central as his prize. PAL -- Planetary Apple League -- was voted in primarily because both the acronym and the words say volumes; PAL for friend, and what they stand for indicates that we ARE indeed a world-wide organization!

WHAT'S NEW IN APPLE II-DOM  AppleWorks 4.01 has now been shipping for a time, and so far, it's been proven to be a real nifty update of the ever-popular AppleWorks 3.0, the staple of many Apple II users.

ANSIterm 2.1 is out, and it too, is being hailed as a great telecommunications program, that has many new features that were NOT in version 2.0.

And, finally, Spectrum has been released and has been shipping, and is also meeting with great enthusiasm in the Apple II world. Below, will
be a short note on the meeting with Dave Hecker of Seven Hills, and Ewen Wannop, the author.

PAL MEETING -- JANUARY 19, 1994  Dave Hecker of Seven Hills and Ewen Wannop (all the way from England!) graced us with their presence at January's meeting of PAL. Below are a few short features of Spectrum, a GS/OS Desktop term program for the GS.

First, Spectrum is a GS/OS desktop program, therefore, all the goodies (inits, desk accessories, etc.) that are available under GS/OS desktop programs will be available in Spectrum! And, users of The Manager, HardPressed and AutoArk will be able to use these programs with Spectrum, as well! You could, as well, scribble something in ShadowWrite while still online, or go to your calendar NDA and note a date of something you may see online to attend!

Spectrum has many of the "common features" of most telecom programs -- it has a chat mode, various emulations available, and a "macro" ability. However, Spectrum goes beyond macros, into a total scripting language -- which is by far more flexible! You could even develop a script to run a BBS!

Other features of Spectrum include disk utilities (copy, format, delete, and so on). These are just a few goodies. To find out more, check out SEVENHILLS category in the Apple II RoundTable Bulletin Board, #43.

THE LIBRARY STACKS  Below are some great files...brought to us by our librarian, Tony Ward [A2.TONY]:

```
22045 GS1040.93V2.BXY       AWGS SS to do your 1993 income taxes
+22043 AW1040.93V2.BXY       AppleWorks SS to do your 1993 income taxes
22025 DISKTIMER.BXY         Measure your IIgs hard drive speed
+22012 MSDOS13.BXY          Copy files from MS-DOS disk to ProDOS
22011 WRITEAWAY.BXY         WriteAway v2.0 -- IIgs word processor
22000 WELCOME4.0.BXY        Change your GS/OS startup screen
21996 PT3.SETTIME.BXY       ProTERM macro to set the IIgs clock
21994 CPUSPEED.BXY          Shows the current speed of your IIgs
21988 SYSFAILPLUS.BXY       Improved IIgs system death manager
```

Just like the Dean's List, a (+) means it works on 8-bit Apples.

WHAT'S NEW IN A2?  There are a couple new faces in A2 -- Harold Hislop, who is our resident "hardware guru", who hosts an RTC on Wednesdays from 11 p.m. to 1 a.m. eastern, appropriately called "Hardware Hacker", and Donnie Grimes, who right now fills in as RTC host where ever he is needed.

We've got a bulletin board just loaded with great information and answers to your most thorny questions. Make sure to check it out! And don't forget our nightly RTC's and all-day Sunday RTC, where help is literally "at your fingertips"!

[EOA]
INTRODUCTION   In this segment of the History, we look further into improvements made to AppleWorks, and then take a look at the newest version, 4.0.

ENHANCEMENTS: BEAGLE BROS AND COMPANY   The next significant AppleWorks add-on appeared in June 1986. It was a product sold by Beagle Bros and called MacroWorks.<1> Written by Randy Brandt, this program patched itself into the keyboard-reading routine of AppleWorks and allowed the user to automate certain functions and assign them to a specific key on the keyboard. Previously, many of AppleWorks features were accessed by pressing either the open-apple or solid-apple (option) key together with another key (recall that the apple keys were nothing more than access to the pushbutton inputs on the joystick). For instance, open-apple and "C" (oa-C) together were used to start a "copy" function. Before MacroWorks was patched into the program, either oa-C or sa-C had the same effect. After adding this enhancement, the solid-apple keys were given their own, separate identity, offering more than double the number of functions that could be executed from the keyboard. (Pinpoint had done something similar, by taking sa-P for its own purposes).

A macro was actually a series of keystrokes that could be entered from the keyboard (similar to WPL programs for Apple Writer), but was automated so that a single keypress would activate it. For example, typing a return address could be assigned to the sequence solid-apple-A (sa-A). Or sa-S could be defined to save ALL the files on the desktop and quit the program. Anything that could be done manually with AppleWorks could be automated with MacroWorks, and it could even do some things that could NOT be easily done manually.

The idea of automating keystrokes in AppleWorks was not unique to MacroWorks; soon after, AutoWorks was released by Alan Bird of Software Touch, and Pinpoint Publishing got into the act with their product, Keyplayer. Brandt upped the ante later in 1986 with an upgrade called Super MacroWorks, which added a few new features and was made to work specifically with the new version 2.0 of AppleWorks.

It didn't take long for the other companies to come out with enhanced versions of their programs to work with the newer version of AppleWorks. But the most significant enhancement yet came during 1987. Beagle Bros had just undergone a change in management, as its founder Bert Kersey retired and his company merged with Software Touch. Mark Simonsen and Alan Bird, owners of Software Touch, had previously worked at Beagle before leaving to start their own company. Aside from AutoWorks, they had released enhancements such as SideSpread (which would allow a spreadsheet to be printed sideways on a dot matrix printer) and FontWorks (which allowed word processor files to be printed using different font styles and sizes, using codes embedded in the WP text). As they merged back into the Beagle fold, they brought with them plans for a series of AppleWorks add-ons and
Written by Alan Bird, TimeOut installed itself into AppleWorks and interfaced directly with Lissner's remarkable built-in memory manager. The neat thing about TimeOut was that after the engine itself was installed, adding other modules was no more complicated than copying them over to the disk from which AppleWorks started. This addressed one of the problems with all of the other enhancement programs available; if they were not installed in the correct order, the patches would begin to step on each other, and crashes were much more likely. TimeOut provided a clearly-defined protocol for adding new features to AppleWorks without this patching hassle.

The first TimeOut modules released included DeskTools, FileMaster (which allowed file copying and more), Graph (spreadsheet graphing), QuickSpell, SideSpread (update of the older Software Touch program), SuperFonts (update of FontWorks), and UltraMacros (a more powerful version of Randy Brandt's Super MacroWorks, using ideas from AutoWorks). More followed in subsequent years, including a thesaurus module and a full-featured telecommunications module that worked within AppleWorks.

ENHANCEMENTS: JEM SOFTWARE

Over the years, Beagle Bros has been a major contributor to the longevity of AppleWorks through its many TimeOut enhancements. And they did many users a favor by making upgrades available virtually free, through a program they called "Beagle Buddies". Just contact your Buddy, give evidence that you really owned the program, and he would update (for example) UltraMacros from version 3.0 to 3.1, without charge. The down side of this service, however, was that there was NO income received by Beagle for updates, making it financially difficult to pay the authors of those updates for their work. For this reason, authors like Randy Brandt (one of the AppleWorks 3.0 revision authors) have decided to start their own private company for release of other products for AppleWorks. Through his company, JEM Software, he released PathFinder, which made setting the pathname for the AW "Add Files" menu easier and faster to change. Although that feature was built in to AW 3.0, Brandt did not stop there. With the help of Dan Verkade, he created TotalControl, which added features to the database module that make specific qualifications for the type of entries that could be made in new or existing records. DoubleData changed the database module so AW could handle twice as many categories per record as it was designed to do. Mr. Invoice made it possible to produce invoice-type documents with AppleWorks, and DB Pix added graphic capability to the database, displaying single and double hi-res and Print Shop / Print Shop GS graphics. Brandt also wrote an update to UltraMacros 3.1, called Ultra 4.0, which added considerable power to the macro language. All these add-on programs enhanced the usefulness of AppleWorks for very specific applications, significantly extending the lifespan of the program.

Brandt also came up with the concept of "inits" for AppleWorks. A small patch was made to AppleWorks to incorporate this feature. Adding an init was simple; it was copied into a subdirectory called AW.INITS, and any binary program found there with a name that started with "I." was automatically loaded and patched in at startup time. These inits ranged from one that improved the handling of the screen print function built-in to AW, to other much larger applications (TotalControl was added via an init, for example). The difference between these inits and TimeOut applications was that inits were always working, whereas TimeOut programs...
had to be specifically activated to work. Brandt used the same concept of simple extensions when he designed Ultra 4.0; additional commands (called "dot commands") could be added to the macro language in the same way as other inits.

ENHANCEMENTS: PATCHES As with other popular programs, there have been many patches that have appeared over the years to customize AppleWorks to do things more to a particular user's likings. These first appeared as one to several byte patches that would be applied using Applesoft, poking the bytes to memory and then using the BASIC.SYSTEM command "BSAVE" to put them into the right place in the program. Patches were published in various places to do things like changing the pitch and duration of AW's awful error tone, make it possible for AW to access a disk device in slot 1 or 2 (which it refused to do ordinarily), or make more than one custom printer (not easily done in versions before 3.0). Other patches were published to fix various bugs that were uncovered over time. Eventually, these patches were collected into several different programs whose purpose was to streamline the process. Randy Brandt, through JEM Software, released Late Nite Patches for AppleWorks 2.0. John Link created a program called SuperPatch that he provided via online services initially, later changed it to shareware as it got more and more massive, and eventually arranged for it to be sold via Quality Computers. Written in Applesoft, John's program made it possible to not only apply the various patches, but to also remove them neatly.

Beagle Bros came out with AW 3.0 Companion (later updated to Companion Plus) which allowed not only a large number of useful changes to be made to AppleWorks, but also included a version of Mark Munz' Patcher program to correct some bugs that had made it into the program (and which Claris refused to fix via an upgrade). The Beagle program followed John Link's lead by making it possible to remove most patches as easily as they were applied.

APPLEWORKS 4.0 The year 1993 brought a major surprise: Another upgrade for AppleWorks. Two paths converged during that year to bring about this unexpected turn of events. Quality Computers, a mail-order business based in Michigan, had been steadily increasing in size and influence during the previous several years. They began as do most such enterprises, selling software and hardware products that various companies around the country had available. One of their earliest enterprises was to sell software written by Joe Gleason, the company's founder. They were prominent in their advertising in the Apple II magazines that remained in the market; in inCider/A+ magazine they always had the first two to four pages of available ad space. During the early 1990s, they even began to distribute some hardware items of their own (usually produced by another company, who allowed Quality to sell them under their own name). When Beagle Bros decided to concentrate solely on their upcoming Macintosh product, Quality stepped in and purchased the rights to sell and upgrade the Beagle products, thus expanding their influence in the world of Apple II software.

Randy Brandt, as mentioned above, had also been quite busy with production of software products to enhance AppleWorks. Although AppleWorks 3.0 in 1989 had many of the features that he wanted to have, he continued to come up with new ways to enhance it. Through Beagle Bros and his own JEM Software, he continued to create add-on tools to allow users to get more out of the program. But in the back of his mind there was always this wish that AppleWorks ITSELF could be enhanced and fixed, to modernize
it with features that many of the MS-DOS and Macintosh products on the market had incorporated since that last version of AW was released by Claris. Unfortunately, Claris continued to show no interest in doing ANYTHING with AppleWorks, not even being willing to make the effort to release an update to fix known bugs in the program. Claris' other AppleII product, AppleWorks GS, suffered from the same neglect.

In the spring of 1993, Brandt contacted Joe Gleason at Quality Computers and discussed his interest in a major upgrade to AppleWorks 3.0. Having worked on the "Spike" project to develop 3.0, Brandt knew the program inside and out, and knew exactly how he could accomplish his goals of program enhancement. The BEST method would be to incorporate the changes into the program source code and recompile it; but Claris still held the rights to it. Gleason was extremely interested in the proposal, and began holding discussions with Claris to see if they would be willing to sell the license for releasing AppleWorks to Quality Computers. This would give Quality the opportunity to upgrade AppleWorks through a rewrite, as well as to provide technical support in a way that had not previously been possible.

Brandt and his long-time programming associate, Dan Verkade, began working on the upgrade to AppleWorks (code-named "Quadriga"), while Gleason negotiated with Claris. Although they all hoped that it would be possible to release the finished product as AppleWorks 4.0, they recognized the possibility that Claris would not relinquish its death grip on the program. In that eventuality, it was determined that there would be no choice but to put it out as a VERY large patch program. The proposed product name would be "TheWorks 4.0," and in order to make use of it a customer would need to already own AppleWorks 3.0. Installing TheWorks would patch into AppleWorks and make use of what code in the program was still useful, but still give access to all the new features they wanted to include.

Many features included with the Quadriga project were like a "best-of" list from TimeOut modules of the past: Triple Desktop, which gave access to as many as thirty-six files at a time; UltraMacros, in the improved "Ultra 4" version that JEM Software had released, in a form which allowed playback of pre-compiled macros (the compiler would be available separately); DoubleData, to increase the number of available categories in the database module from thirty to sixty; TotalControl, which further enhanced the abilities of the database; support for more printers, including newer style printers such as the Hewlett-Packard DeskJet 500; links between the database and word processor; and links between spreadsheets (similar to the "3-D" features that were currently available in MS-DOS programs like Lotus 1-2-3).

While Brandt and Verkade worked on the program code itself, Gleason was doing his best to convince Claris that it would be in their best interest to sell AppleWorks to Quality. As Quadriga was nearing completion, Gleason showed Claris executives that Quality was prepared to release it as a patch program, even if AppleWorks was NOT sold to them. Apparently Claris took this as clear evidence that Quality not only was determined to follow through on the project, but could pull it off. Negotiations became more serious, and by late August 1993 a contract was signed by both parties. This contract allowed Quality to purchase (for an unspecified sum) the rights to publish AppleWorks AND AppleWorks GS, and have the right to use that product name (which was actually an Apple trademark licensed to Claris).
With the legalities out of the way, the Quadriga project proceeded at full steam. They had a goal of releasing the program by October 1, but some last minute problems delayed the actual debut of the program until November 1, 1993. As with many programs, some bugs surfaced within a week of the distribution of v4.0. However, these were quickly resolved, and shipping of an updated version 4.01 resumed within a week. A version 4.02 update was expected by the start of the next year, to fix some other less serious problems that had been identified by early users. Brandt himself wrote a small patch program to customize version 4.01 and 4.02. Compared to four years of absolute inactivity by Claris to fixing known problems in version 3.0, this was much better support.<2>, <3>

BEYOND APPLEWORKS   AppleWorks is probably the most powerful integrated program ever written, in terms of speed (being text-based) and overall useability for a wide range of purposes. The one single problem that it has caused in the Apple II world is that it is SO comprehensive that it has killed the market for nearly every other text-based word processor, database, or spreadsheet program, even at a time when new such programs were being written. At this point in time, there would be little point in creating a new text-based program in either of these categories, since AppleWorks 4.0 covers all those areas so comprehensively. For most users, AppleWorks 4.0 (also known as AppleWorks "Classic") will meet ALL of their needs in a computer program. And on an Apple IIgs with expanded memory, the 4.0 version can make it possible to process and manipulate tremendous amounts of data easily.

However, what AppleWorks CANNOT do on an Apple IIgs is to take advantage of some of the features that GS/OS makes available: Easy access to foreign disk storage formats, use of outline font technology (via Pointless), access to a graphic-based work environment, the ability to switch between multiple programs (via program switchers like The Manager and Switch-It!) and many other features that IIgs users prefer. The other Claris program that Quality purchased, AppleWorks GS, could possibly meet the requirements for those users. AWGS (which is actually a rewrite of an older program, GS Works, purchased by Claris from StyleWare and remodelled slightly) is significantly different from AppleWorks and cannot be considered an upgrade, but may meet the needs of IIgs users that want something more like a desktop publishing program. Since Quality Computers has also purchased the rights to AppleWorks GS, IIgs users can look forward to a revision to THAT program as well, to correct the many known bugs that IT contains. And, depending on how good Quality can make it, AppleWorks GS may not be quite the killer of competing software that AppleWorks Classic was. Other programs have been released over the years that Claris has neglected AWGS to try to fill in the gap, and at least on the IIgs side of this fence, some healthy competition may result in better software for all users.

GEnieLamp is also distributed on CrossNet, Internet, America Online, Delphi and many public and commercial BBS systems worldwide.

- To reach GEnieLamp on Internet send mail to genielamp@genie.geis.com OR jpeters@sosi.com
- Our Internet anonymous FTP address is: sosi.com. All current versions of GEnieLamp are available in the ~/pub/GEnieLamp directory. Due to the added expense involved, we ask that when you get GEnieLamp via the anonymous ftp for GEnieLamp, that it _not_ be ftp'd during the hours of 9AM and 5PM Eastern Standard Time. We appreciate your cooperation in this matter.
- Current issues of all versions of GEnieLamp as well as back issues of GEnieLamp IBM are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GEnieLamp platform (FREQ FILES for names of back issues of GEnieLamp IBM):

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1274 of 1824
Apple II Computer Info

Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3

GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2

The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

LOG OFF .............. [LOG]
GEnieLamp Information.

[IDX]...

READING GEnieLamp  
GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ........ [HUM]
[*]GEenie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  
To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GEenie  
GEenie's monthly fee is $8.95, which gives you up to four hours of non-prime time access to most GEenie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, without charge. GEenie's non-prime time connect rate is $3.00. To sign up for GEenie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-3880 in Canada. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEenie's customer service line (voice) at 1-800-638-9636.

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1279 of 1824
As our collective world grows smaller, so do our individual worlds. We're "cocooning" -- a word dreamed up to legitimize lethargy and apathy by making them appear to be family values.

This tendency to laud emotional detachment has made me even more grateful to be part of the Apple II community than ever (limited gene pool or not). Our community seems to be peopled by those who have emerged from their cocoons as butterflies -- butterflies, moreover, who have no idea how much color they bring to the lives of others. I won't go so far as to claim that you can be sure that everyone that's using an Apple II has never burned down an orphanage, but we seem to have more than our fair share of caring individuals, and less than our fair share of ivory-skulled zealots.

Of course, it is a personal incident that prompts this observation: Recently, my copy of _II Alive_ failed to arrive. Larvae that I am, this would have been distressing enough for me as a subscriber, but the issue in question was my professional debut. (At last count, it was my fifth professional debut.) That is to say, I had contributed a few bijoux to the journal in question, and desperately needed my own copy, if only to bring a smile to the faces of my parents. As the publisher had distributed its entire print run to the clamouring hordes, it seemed future employers were going to have to take my word that I had indeed written for _II Alive_.

This moving drama swiftly reached a happy ending by the simple expedient of visiting GEnie's A2 RoundTable and pleading for a spare copy. "Top prices paid!" I yelled from the sidewalks up to the upper-floor apartments.

The echoes had scarcely faded when Rich Hare from Michigan had his spare copy in the post. The cost of posting the magazine from Michigan across the Canada-U.S. border was scandalously high given the distance travelled, but Mr Hare cheerfully offered to eat the postage costs.

Cheerfully, mind you. Not grudgingly; blithely. Despite the fact that I've never met Rich Hare. I have, to be sure, occasionally seen the ASCII bunny-head with which he signs his messages here on GEnie and on CompuServe, but that's the extent of it.

As an incident, it's probably not sufficiently remarkable to be the subject of an editorial. But it's not the first time such a thing has happened -- heck, it's not even the first time such a thing has happened to me! Sara Groves, Hal Shapiro, Terry Steeper, and heaven knows how many others have rushed to my rescue over the years.
Apple II people seem to consider a day lost during which they do not practice at least one random act of senseless kindness. Harold Hislop's recent arrival on the A2 RoundTable just seems to underline the sense of community... hardly a day goes by when Mr Hislop doesn't tell some poor caterpillar about to be crushed under the bootheels of indifference, "If nothing else works, send your hardware to me. You pay the postage costs, and I'll try to fix it." (I'm beginning to think the man gave up sleep at the tender age of 8.) Mr Hislop is not the patron saint of the Apple II, but it's only because there are too many other contenders.

It's not so unusual for computer users to care about their computers -- if you don't believe me, disparage someone else's computer platform -- but those who own Apple II computers seem to care about the computer owners. Even those who have little are willing to share what they have. Someone who uses a program sees a way to improve it -- and before you know it, that someone has taken over support for the program. People actually *volunteer* for workloads that seem destined to cause burnout, brownouts, blackouts, and knockouts.

The first time a complete stranger went considerably out of her way to do me a favor, I thanked her until it became positively fulsome. I expressed my hope that I could pay her back one day. While the conversation that follows comes from Robert A. Heinlein's book, _Job_, it could almost be the conversation that we had that day:

"...I'll make you a deal. You take me to dinner but I lend you the money."

"I'm a poor risk."

"Nope, you're a good risk. What the bankers call a character loan, the very best risk there is. Sometime, this coming year, or maybe twenty years from now, you'll run across another young couple, broke and hungry. You'll but them dinner on the same terms. That pays me back. Then when they do the same, down the line, that pays you back. Get it?"

"I'll pay you back sevenfold!"

"Once is enough. After that you do it for your own pleasure. Come on, let's eat."

It's because of our sense of community that the Apple II gentlefolk will enjoy a summer conference in Kansas City, Kansas this July. It promises to be quite a banquet. Or didn't you know that the attraction of dinner parties was meant to be the conversation, not the bill of fare?

FREE UPDATES STILL VALID
As I said, I'd let you know how upgrading a ROM 00 GS to a ROM 01 went.

In a word "SLICK".

Took it to a small Authorized Apple dealership in Rocklin CA (just north of Sacramento) where I had purchased my first Apple system (a II+) and also purchased my first IIGS system. I went in, walked through all the Quadra's & Centra's etc. to the service counter and timidly asked if they could possibly update my IIGS.

The fellow says "got a ROM 00 there, huh?' (pops off the top and says "yup, you need the upgrade - it'll take just a few minutes until someone is free to do it". He then went on to tell me what a great machine he thought the GS was. In about 20 minutes I was out of there with an invoice marked "warranty repair - no charge".

Where, but in the "Apple II World", can you get a warranty like that?!

Again, THANKS ! to all who informed me about the free update.

(D.HEYES1, CAT12, TOP5, MSG:508/M645;1)

I called Apple today (800-SOS-APPL) to ask about the IIc upgrade for unidisk and modem compatability. The person I spoke to was polite, but said the program was over a long time ago. I insisted he check with a supervisor, he returned by saying, "...I like when people like you call. I learn something new. The authorization number is _ODL660_"

Keith

(K.SAGALOW, CAT26, TOP3, MSG:109/M645;1)

THE INTERNET/APPLE II GRIND SITE
> How's grind iowa doing toward that goal? Like how many MB are you up to?

Well, Steve Nelson (the Apple II FTP admin) is trying to get a replacement unit because the drive they have now was coughing up bad blocks to the tune of a couple hundred a day. It seems to have settled down now, but he's not taking any chances. I have no idea how much is on the drive right now, but he is mirroring at least three other Apple II sites to build up the file collection. He is investigating the possibility of creating accounts for off-site volunteers to aid in the maintenance of the archive.

BTW, for those who don't know what the "grind" site is, here's some background info. Last year, a few people on the Internet decided it would be nice to have a single, comprehensive FTP site for Apple II files. A call was put out on the net for donations to buy a 1-gigabyte drive to house the archive. While that was going on, the CS students association at the University of Iowa agreed to donate their resources to maintain the site (thus the address grind.isca.uiowa.edu). Eventually, we collected over $1200 in donations. Hard drive prices had been dropping the whole time, and now we found we could afford a nice 1.7-gigabyte drive.

The idea is to press a CD-ROM for every 500 megabytes of files on the site. This could then be sold for a nominal cost and the funds put back into running the site and pressing more CD's. The grind site, like most
FTP sites, is run by volunteers who have a desire to see the project succeed. It only recently got off the ground (the HD was installed over Christmas), so things are still a bit disorganized, but it'll straighten itself out soon.

(B.TAO, CAT10, TOP10, MSG:180/M645;1)

IS THIS A VIRUS? The last couple of days I've had a problem show up in Co-Pilot, AWGS, and AppleWorks. I'll be working merrily along and I'll look up at my screen, and there it will say "Welcome Datacomp". Anyone know where this is coming from? Anyone know how I can get rid of it?

Harold, this could be part of [one of the] problems I have E-mailed you about [with your init]

(EW.CHRISTIAN, CAT12, TOP16, MSG:32/M645;1)

>>>>> That's a strange one, never heard of it, seen it, or anything else. No idea how to get rid of it. (yep it just might be causing problems with my extended keyboard init...)

-Harold

(H.HISLOP, CAT12, TOP16, MSG:33/M645;1)

>>>>> I haven't seen a "new" Apple II virus in a long, long time. Most of the original viruses were 5.25" disk-based and did numerous bad things. Some of the nastier ones (according to The Exorciser's documentation):

CyberAIDS (circa 1988) - can destroy the data on all connected drives by erasing the root directory and bit map. This was spread via "SYS" files in the root directory.

Festering Hate (1988) - advanced version of CyberAIDS that attaches itself to "SYS" files in ALL folders, not just the root directory.

Lode Runner (1988) - destroys data on any connected drives when a certain month/day/minute combination occurs. Spread via the boot blocks of non-5.25" disks.

Blackout (1988?) - messes with the IIgs battery RAM making your IIgs look dead even though it's perfectly fine. This one has been talked about recently in the A2 BB.

You won't find any of these viruses on files in the A2 library. I run every file through 2 virus checkers and I check executable files (SYS, S16, TIF, PIF, NDA, CDA, ...) for suspicious disk access calls. To date, I have found exactly one problem file and it has been deleted. You have to be careful when downloading programs from local "pirate" BBSs that carry illegal copies of copyrighted software. In the past, hackers would crack software (remove the copy protection), install the virus, and upload it to every local BBS they could find. There's really not much to worry about nowadays because the hackers have moved on to more lucrative platforms (PC, Mac, etc.) There's just not enough satisfaction (if you can call it that) in planting a virus that relatively few people will ever see. Wow! Did I really have to be that verbose? Probably not, but you asked :)

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
TWILIGHT II PASSWORD? Yeah, we're considering a password feature for the next version. In the meantime, here's a little known trick you can use (but you'll have to do it every time) with caps lock lock: after the screen blanks, hit caps lock, then hit shift-clear. The screen will not be able to be unblanked until shift-clear is hit again (to reactivate T2).

<<Jim

HFS FST CHOKES ON DISKS? Is there a new HFS format around? I just bought the Mac Quadra 840 AV, and it won't read HFS disks created by the IIGs. Yet the IIGs will read disks from the 840 AV just fine. Another interesting note is that a SE/30 will read my HFS IIGs disks, so I know my HFS FST is fine.

Mike Kingsley

This problem is known, and it's not related to the HFS FST on your GS. The problem seems to be some of the new disk drives Apple is putting in new Macintosh models.

There is an entire topic about this in the Macintosh RT (page 605) and Apple has been informed of the problem, but no solution has yet been found, other than just always formatting the disks on your Quadra 840 AV -- they should then work just fine on your GS and SE/30.

Bryan

Incidentally, that isn't exclusively a Mac/IIGs problem. Even old/new _Macs_ occasionally won't read each other's disks. (This was making me crazy with the PowerBook.) It makes buying off-the-shelf Mac software a real treat. :( (POWERPC.PRO, CAT9, TOP7, MSG:84/M645;1)

TEXAS II STRAIGHT TALK Someone sent e-mail saying my prices are confusing. I am sorry about that. Please do not hesitate to call (210) 490-6373 for more details.

TEXAS II Subscription, 6 issues, printed newsletter ........... $15
TEXAS II Subscription (Europe, Australia) ...................... $18
TEXAS II on MACROS (3 issues, printed) ...................... sent free

You must be a subscriber (see above) to order TEXAS II on Disk:

Disks 8,9, and 10 (upcoming)...$24  Disks 5,6, and 7 (recent)...$24
Disks 2,3, and 4 (past)...... $24  Single disks vol.1 to 8 ... $10

B. CADIEUX, CAT13, TOP15, MSG:159/M645;1

REVIEW OF TULIN DRIVERS This may not be the best review of the Tulin NEC driver, but I'll bet it is one of the first.
Apple II Computer Info

System: Apple ][gs with Ramkeeper, 6 meg GSRam+, 10 mhz Zip, Quickie, 240 meg Quantum vanilla hard drive, 3M vanilla tape drive, NEC 3Xe (triple speed CDROM), 3.5" drive, 5.25" drive, and a few other hangers on.

Software: sys 6.01, Quicklaunch, Find File, IR, EGOed, File Manager, Lithium Grease, Contacts GS, Typeset, Pointless, all latest releases.

Good stuff: It works, I can read Mac disks, copy files with the Finder, or CD Roam. I can sometimes get it to play music through the headphone jack.

Mediocre stuff: (this is so good to begin with, there is no bad stuff):
Tulin has very sparse documentation.

Things omitted: a) you must install the Apple drivers for Multimedia and CDROM to access the music side of the drive. Otherwise GS/OS sees the music CD as a volume and refuses to mount it without trying a format. So it ejects by your choice, or by failing to format. Even with the drivers, it is an iffy thing to get the NEC CDROM to play music with GS/OS.

b) dragging the CDROM icon into the trash disconnects the drive, it does not eject the disk. To change disks you must change, then drag the dimmed disk to the trash. This does not work for music CD's (see below).

c) The MAC CD shows up as three volumes, one of which is unreadable (device 12 on my machine, so maybe that is part of the problem. NEC.CDROM.01.00 is the one in use, the other two Prosel shows in the device listing are mysteries to me.

d) Music CD's can be listened to if your timing is good. You must hit play in the control panel at the right time (or be in an application other than the Finder) to intercept the attempt to recognise the disk.

e) Prodos 8 stops the music, you lose the recognition of the disk too, causing an eject (manually, as the CD controller is confused) and re-insert.

So What: It's the only game in town, and Tulin will fix it if it's really broken.

Perhaps this needs to be closer to a removable drive type volume.

I really like listening to music while I compute, and this is the best there is (CD's with headphones). DiskQuest requires this driver for the Apple card. The NEC triplespeed is faster than the 5.25, slightly slower than the 3.5 drive. I'll do some timing if requested, but for speed, you'll get the Ramfast anyway.

If you see any glaring errors in my setup or reporting, send it here or e-mail me.

Rainy @;^)
(I.WILSON6, CAT20, TOP12, MSG:196/M645;1)

QUALITY DISK DUPLICATOR
We got our new disk duplicator in last week.
This should virtually ELIMINATE mixups like the
one with the One-Touch Commands Disk (and the AW 4.01 mailing), since instead of having a master disk which is read into the duplicator each time a batch of disks is made up, our new duper stores all the masters on a hard drive, reducing the likelihood that an obsolete master could be used. The duplicator also stores a customized label for each master disk, and applies the labels as the disks are duplicated, eliminating mislabeling problems. This thing is SLICK (it had better be, for what we paid for it!). In all our disk mixups, the problem has been attributable to human error. Remove the humans from the process and you can drastically reduce the errors. B)

BUG STOMPED IN APPLEWORKS 4.0.1 TO 4.0.2 UPDATER  The mystery is solved.

If you run the existing MAKE402, your AppleWorks has been successfully patched by my MAKE402 program by the time you get the error message. You can reboot at that point and run AW 4.02 successfully, although you should manually copy SEG.DC from the MAKE402 files to your own AppleWorks startup disk if you want to autocopy the dictionaries.

KANSASFEST PLANS  The dates are Thursday to Saturday July 21-23. The location is Avila College, which in Kansas City, Missouri. (Why do we call it KansasFest? I don't know.) Last year the price to stay in the dorms at Avila and get breakfast and supper in the cafeteria was $30/night double room or $40/night private room. This may change this year; we don't have a final contract yet, but it does change it won't change by more than +/- $5/night. If you prefer, you can also stay in a local hotel and eat in local restaurants.

Last year the price of the conference itself was $350. This included lunch and snacks on Thursday and Friday. Our tentative plans this year, barring opposition here in this topic, are to have the entire conference at Avila, as we did the first two years. The last three years we've also used the NOMDA conference center, which is a great facility, but expensive. If we can do the whole thing at Avila the price will come down by at least $100.

As always, we need to know what you'd like to see and hear at the conference, and we'd like to have some folks volunteer to make presentations. Resource Central is a MUCH smaller company than it was a year ago, so to pull this off we're going to need more help from those of you who love this event to get it all organized. And the more outside help we get, the lower we can set the price. Let's talk.

Do you think that non-programmer, non-hacker, recreational GS users would get anything out of Kansas fest?

Would a non-programmer get anything out of Kfest? Depends what you consider "fun". If hanging out all night (and I do mean ALL night)
with a whole bunch of computer phreaks, eating pizza, bouncing from room to room, and just partying hardy is your idea of fun, then GFI. KFest is more programmer oriented from 09:00 to 17:00, but all the hours in between are up for grabs (and several are usually spent at the KC Masterpiece!) -- HangTime [Script-Central] B-->

(A2.HANGTIME, CAT23, TOP10, MSG:54/M645;1)

<<<< The final makeup of the event will depend entirely on who comes. """"
Yes, as an ICON event, it opens the possibility of having info on other platforms. Even last year, as an Apple II event, there were an awful lot of Macintoshes around. On the other hand, as an event with a long history as the premier gathering of Apple II folks, I'm sure the Apple II presence will continue to be strong. Users have made up the majority of the attendees for some time. While there are seminars that are of interest only to developers, there are others that are of a more general interest. There is no reason not to come because you're "just a user". There is nothing about this event that's outside the control of any of you. Let us know what you want and we'll either get it or delegate getting it to you <g>. Seriously, Sally, Jeff, and I can't put this whole thing together ourselves. We need those of you who want to come to participate in the planning and organization, which means you can make it whatever you want it to be.

(TOM.W, CAT23, TOP10, MSG:75/M645;1)

>>>> To reiterate what Tom has said about KansasFest, it is not just """"
an event for programmers. I know; I've gone 4 years in a row, and I'm not a programmer.

I've really enjoyed myself at Kfest, and will attend Kfest 94.

I've especially enjoyed hosting a panel/talk the past 2 years, and would like to do so again. 2 years ago, I spoke about the FTA and used Kfest as a way to publicize the Bouncin'Ferno 2 contest that I set up. Last year, my talk _was_ directed towards programmers, and I "shared the secrets of the stars" (the shareware stars, that is) in an effort to help shareware programmers maximize profits.

I'd like to host one or more sessions at KFest 1994. Of course it is up to Tom to accept or reject a proposed panel, but before we even get that far, I'd like to turn it over to *you*...my fellow Kfest attendee.

What would you like to hear me speak about?

Joe Kohn

(J.KOHN, CAT23, TOP10, MSG:76/M645;1)

HYPERCARD IIGS AVAILABLE FOR DOWNLOADING Hey, I just noticed that there are several files for HyperCard GS in the library now! Looks like Apple has released it! Thanks!

I'm _so_ glad I didn't buy it! Now I can get it for free! :)

(P.CREAGER, CAT3, TOP13, MSG:198/M645;1)

>>>> This is a bit misguided -- had more people purchased it, Apple might have updated it past 1.1 and made it even more useful. But as it stands, the HyperCard IIgs package comes with about 600 pages worth of manuals that are not available online, and never will be as far as I can tell. If you see a HCGS package for sale and you like the program, you'd better purchase it because once everyone is out, there won't be any more
CD-ROM DRIVES AND DISCQUEST

Whoa! Who said that? My RamFAST certainly works with a variety of CD-ROM drives.

Hopefully the following diatribe will clear up all the confusion...

discQuest SCSI Controller and CD-ROM Drive Compatibility List

Card: Apple High Speed SCSI Card

Apple CD-150: Complete compatibility
Apple CD-300: Data is okay, no audio
Nec (any) : Currently incompatible, a new Nec driver is forthcoming from Tulin
SCSI-2 : depends on the drive, some work fine, some have various cosmetic problems (like with inserting/ejecting CDs), no audio support

Card: RamFAST SCSI Card

Texel : Complete compatibility (Sequential's drive is a Texel)
Nec : Complete compatibility
SCSI-2 : Complete compatibility (any SCSI-2 CD-ROM drive... virtually all CD drives made today are SCSI-2, ask the vendor)
AppleCD-150 : Data is okay, audio currently does not work

(The Apple CD-300 and PowerCD's are SCSI-2 drive).

New news on the CD-150/RamFAST: I have located technical information on the CD-150, I should have it in my hands by the end of the week. This means the RamFAST will do audio on a CD-150 very shortly.

Tulin is finishing up their updated Nec CD-ROM driver for the Apple SCSI card. After that one, I have suggested they make a SCSI-2 CDROM driver for that card. I encourage everyone with interests at stake to call Tulin and encourage them to do so as well.

In short, it's all coming together rather well, and I must say I'm quite pleased :)

Jawaid

"WHAT'S YOUR RECOMENDATION FOR A RAMFAST?" Anything _but_ an Apple CD-150. :) Seriously, the RamFAST seems to work great with every CD-ROM drive we've found so far. I do not recommend the CD-150 because of the audio support problem, but any CD-ROM made today (the CD-150 is obsolete) should work.
DISCQUEST NOW WITH COLOR! discQuest v1.2 is now shipping. Included in this release are the following enhancements:

- Bug fixes :)
- Color rendering of images
- Various user preferences (including "page" mode mouse movement of pictures)
- Better audio support (incl. new support for the CD-150 & RamFAST!)

Additionally, by the end of next week we'll have available Media Control drivers for all the CD-ROM drives (w/ RamFAST) that discQuest supports. Which is to say, you'll be able to play audio CD's on a RamFAST for the first time.

MANAGEMENT CHANGE SyndiComm, Inc., the company that manages the Apple II, Macintosh, and PowerPC-related RoundTables on GEnie, has been sold to Dean Esmay, who becomes the company's new President. Esmay had been the chief sysop of the Apple II and PowerPC RoundTables.

Tom Weishaar and Kent Fillmore, former co-owners of SyndiComm, intend to remain active on GEnie, but will no longer have any responsiblity for the seven SyndiComm-managed RoundTables.

WAITLESS PRINT BUFFER FOR APPLEWORKS 4 AppleWorks 4 Print Buffer

AppleWorks 4 co-developer Dan Verkade recently announced the release of WaitLess, a set of patches that add automatic print buffering to AppleWorks 4. WaitLess lets you use AppleWorks while your printer generates your output.

Using WaitLess is easy. You print normally from AppleWorks; the print thermometer appears on your screen and fills quickly as WaitLess uses the AppleWorks desktop memory to store your output. The program then returns you to AppleWorks while it prints your document.

A TimeOut utility included with WaitLess lets you turn off buffering, pause and re-start a print job, or stop the current print job and clear the buffer.

WaitLess lists for $17. NAUG members can buy the program directly from Clear Night Software for $15 plus $3 s/h ($8 s/h for international orders).

Include a check or money order with your order; Clear Night does not accept credit cards. Purchase orders accepted with payment of a $5
processing charge.

WaitLess requires AppleWorks 4.01 or later. The program works on any system capable of running AppleWorks 4, but at least 256K of RAM is recommended. Clear Night Software maintains a "satisfaction guaranteed or your money back" policy for NAUG members.

[Clear Night Software, 51 Bowen Road, Perris, California 92571.]
(NAUG, CAT17, TOP42, MSG:126/M645;1)

SCAN COLOR IMAGES WITH YOUR IIgs AND QUICKIE   NEW!!! Quickie-C(tm)!!! With our new color adaptor for the Quickie scanner, you'll be able to scan color images into your Apple IIgs. This process eliminates the need to purchase an expensive hand scanner. The adaptor comes complete with scanner circuitry, built-in light, color filters, and software. Just mount your Quickie scanner green, and blue. The software automatically mixes the colors. After just a few moments, a color image is displayed on your screen!

- Colorize in 16 or 3200 colors in 320-mode
- Options for using default desktop palettes to create desktop images or 640-mode pictures for use with AppleWorksGS
- Software contrast and brightness controls allow fine adjustment of the final image
- Colorize scanned images with different settings as many times as needed to produce the desired balance
- Wide scan option allows you to scan and colorize and image up to 8 inches wide
- Individual filter rescan functions let you correct scanning errors without repeating the three filter passes
- Custom viewing mode allows you to scroll around a large picture, even in 3200 color mode
- Palette sorting makes 3200-color images legible even when viewed in 16 colors
- Monochrome toning allows you to save more interesting gray-scale pictures using Sepia, Red, Blue, Green, and Selenium toning effects (standard gray-scale is also still available)
- BONUS! With purchase of color adaptor above, Quickie 3.12. New, improved algorithm for gray-scale software gives smoother shading transitions, and minimizes dithering effects even from newsprint.

Quickie-C requires and Apple IIgs equipped with a minimum of 2MB RAM, and GS/OS System 6.0, or later.

Introductory price: $99.95 (SRP 129.95)
(VITESSE, CAT40, TOP8, MSG:210/M645;1)

BETA BLUEDISK CONTROLLER NOW FOR SALE   Silence is golden...
...but we don't want to be too golden (we have been busy behind the scene). So we think it's time to open sales a bit. You might have noticed that a lot of beta tests have been done on the BlueDisk card and the results aren't too bad IMHO. We have discussed features of BlueDisk, we have fixed some minor bugs, we have changed and optimized the behavior of BlueDisk to make disk handling as comfortable as possible. You have heard that BlueDisk's appearance in the operating system now comes very close to Apple's original drives (this has been a rather difficult thing to do). And you have heard that many different disk formats can be read or written (and of course formatted). Yes, I dare to say that this is the most versatile floppy disk controller for the Apple II. Last not least, BlueDisk is the absolutely cheapest way to use high capacity floppy disks with your Apple II. If you only read this message, please step back and read all messages beginning from mid January 1994 (in addition, two BlueDisk pictures are available in the A2 library).

BlueDisk's firmware and software have reached a state where we can offer cards to you. Yes, you can get a BlueDisk card _now_. You would receive a firmware/software that still has "beta version" numbers and there still _could_ be some minor bugs. But our tests show that no bugs have been left that could be essential to data security.

So, once again, we can offer BlueDisk cards which are in "final" hardware condition and have "near final" software versions. If software upgrades are required, you can get them free via the GEnie A2 library, or our beta testers probably will help. Joachim Lange of SHH Systeme confirms that all results about beta tests and performance published here in BB topic 13 are authentic and true.

Here is a short list of things you get if you buy a BlueDisk now:

- A floppy disk controller that supports DD, HD and ED MFM floppy drives (5.25" and 3.5", "MS-DOS style") in a variety of formats.
- A utility disk that contains a GS/OS driver and a program that helps you checking MFM drive installation. Additional utilities are in work but not complete.
- A "draft" manual (preliminary) written in English.
- One year limited warranty on parts and labour.
- Support here in the bulletin board and via the A2 library. (BlueDisk works with Apple IIe enhanced and Apple IIGS ROM01 or ROM03)

Some important features not mentioned before:

- Tested with Archiver backup (720K to 2.88meg per disk, uncompressed)
- Tested with HardPressed
- Tested with MTools (MS-DOS read, write (!) and format (!))
- Works in slot 5 if slot is set to your card (new)
- Tested with PC-Transporter (some restrictions apply: you cannot
Apple II Computer Info

boot MS-DOS, drive parameters must be set up correctly and
DRIVER.SYS must be installed, _same_ problems that occur with a
floptical drive connected to a SCSI card).

Some important things about what's _not_ working (which, in our
opinion, isn't the fault of BlueDisk):

  o  ProSel 16 refuses to backup on non-Apple, non-slot 5 floppy
drives.
  o  Salvation Backup doesn't recognize non-Apple floppy drives.
  o  ProSel 8 Cat Doctor doesn't format correctly.
  o  MFORMAT (MTools v1.3) won't allow to _change_ the low-level
format of the current disk. Blank disks aren't formatted as
expected. No GS/OS formatting dialog is presented before
formatting begins.

Pricing: This is an introductory offer and it will be valid for a limited
time only.

BlueDisk single card package as described before:

  US $109  plus  $16 shipping/handling
  two packages:    $109 each plus $21 s/h
  three packages:  $109 each plus $24 s/h

Shipping is via standard air mail for overseas orders.

Payment: All orders must be prepaid. We accept payment by cash, check or
money order (American or German currency) and payment via post
office. If payment is _not_ by cash, an additional fee of US $10 (DM 17)
is required (we have to pay this fee to get the cash for the check). If
you feel unsure when sending cash, please use registered mail.

>>> THROUGH THE GRAPEVINE <<<<

IIGS FAX SOFTWARE? I noticed several messages in A2 over the past week
about people asking for send/receive fax capability
right from their Apple II. Although it is more likely that Apple IIGS
users will see this wish fulfilled first, I would not hesitate to say the
//e and //c may eventually have the proper software as well (Timeout Fax,
anyone?). :) I also noticed Bill Heinemann was dropping delicious little
tidbits about SimCity GS in another category. Here is my little
firestarter. ;-)

When file #22282 has been verified and released, please download it
to see an actual transmission received by GS fax software. The original
file was twice the size in both dimensions, but it was reduced by 50% to
Apple II Computer Info

make the file size more manageable. I can't give out many more details at the moment, except to say Richard Wifall is the author of the software. It is presently in alpha, but he expects to begin beta testing in a couple of weeks. There is already a working G3->APF converter (that's what produced the graphic you see in the library), and there are tentative plans to produce it as a stand-alone application, an NDA (for receiving faxes at any time) and as a shell utility for GNO and ORCA users.

Please post your comments, feature requests, suggestions for a name, etc. in this topic. I will forward them to Rich from time to time. If you want to contact him yourself, he can be reached on the Internet as rwifall@nmsu.edu (RWIFALL@NMSU.EDU@INET# from the GEnie e-mail page).

(B.TAO, CAT10, TOP9, MSG:1/M645;1)

<<<< The sendfax portion will initially be coded as a standard GS/OS device driver. All you do is drop the appropriate faxmodem driver in your System folder and away you go. When you're in AWGS, go into the "DC Printers" control panel and pick your faxmodem rather than your printer. Then you can "print" your document to the faxmodem without having to go through a hard copy first! IMHO, this is the *only* reasonable way to write a sendfax (i.e., as a printer driver rather than a stand-alone utility). This means anything that uses the Print Manager will now have fax capability.

Faxes generated directly by a computer are MUCH cleaner than the spotty, "dirty", misaligned stuff you see with a regular fax machine. The graphic file I uploaded will prove this nicely.

Number: 22295 Name: FAXCOVER.BXY
Address: B.TAO Date: 940224
Approximate # of bytes: 56960
Library: 23

This is the cover page of a fax transmission sent by NEC's FastFacts(tm) document request service. The original fax image was received on an Apple IIGS running as-yet unnamed software, converted and scaled down to a 320-mode 864x1100 APF graphic. You will need Platinum Paint 2.0 to view and print this graphic. The ShowMe! NDA and FinderView 3.0 Finder extension will also view this oversized APF. Please see Category 10, Topic 9 for discussion on fax software for the Apple II.

Writing Adventures on the IIGS

Actually, years and years ago I tried to write a game using Eamon, but it wasn't my idea of a great time. :)

I've used TADS on MS-DOS, and I can use that quite nicely, but there's no IIGS version.

One of the other adventure design languages has been ported, but I don't like it much.

I'm trying to compile Inform, which lets you create Infocom-format adventures that can be played by Big Red's Lost Treasures of Infocom package, but have run into some problems getting it to compile (ORCA/C is running out of memory while building one of the files-- I need to split it up :).

Another reason I haven't looked at Eamon again is that I read somewhere that a new version of Eamon (v7.0?) would be out soon, but I haven't seen it yet.

Gem for AppleWorks 4?

We're nearing completion of the beta cycle. As soon as the documentation changes are completed, we will need to do a final short test on the installer and then we'll be ready. It shouldn't be long now.

Greg [ A2U Guy ] ...via GEM 4.22 and Spectrum
(A2PRO.GREG, CAT29, TOP4, MSG:52/M645;1)

The Magic News Group Reader

[Now works with:
  AppleWorks 3.0 with UltraMacros 3.1
  AppleWorks 3.0 with Ultra 4, 4.1, 4.2
  AppleWorks 4.x with or without UltraMacros 4.3]

Allows readers of Proline USENET/InterNet news groups to quickly read and process, WHILE OFF-LINE, their news group captures saved in an AppleWorks file. The MNGR greatly facilitates and increase your pleasure and speed while reading hundreds of news group messages.
For details go to GENie / A2 / CAT 13 /TOPIC 5

(G.E.HAYMAN, CAT10, TOP10, MSG:191/M645;1)

-----
Gary - A few months back, you'd said that as soon as you finished
the AW 4 version of your Magic News Reader, that you'd then think
about expanding its use to other than ProLine news reading.

Is that still a plan?

If so, what can I send you to show you what usenet newsgroups look
like on my site?

I'd love to have an offline usenet reader!

Joe Kohn

(G.JOHNSON, CAT10, TOP10, MSG:192/M645;1)

-----------
Right now, THE MAGIC NEWS GROUP READER relies on several
standards: 1) 'CS-ID: ' starts the FIRST line of each new newsgroup
message 2) 'Subject: ' starts the FOURTH line of each message

With AW4, I feel that that could easily be adjusted to meet a variety
of headers -- the formats remain constant from message to message.

Why don't you send me a 'cut' of three or four messages that you
would normally capture and I could take a look at it to see if I could go
further with this and possibly expand THE MAGIC NEWS GROUP READER.

Joe, handy for you would be the Clipping feature of MNGR. Since you
are a collector of information for SSII, as you peruse the newsgroups you
can instantly 'clip' information of interest. Also, the ability to follow
threads is of great value.

TO OTHERS: If your news group messages are different than the
typical pro-line messages (CS-ID and Subject) then send me a 'cut' of
yours so that I can play with them.

PLEASE: SEND info to me at my EMAIL address of: ghayman@cap.gwu.edu

Gary Hayman - MAGICAL SOFTWARE (CAT 13 TOPIC 5)

APPLEWORKS GS THIS SPRING I was hoping that my mentioning it would spur
Quality into making a official
announcement/press release here in A2. But since they have remained
silent, I will give the information that they included in the flyer.BTW
when you recieve the flyer look on the back page near the mailing
information. Here is what it says:

APPLEWORKS GS 2.0 Coming Spring 94
Dozens of new & improved features!

- Macro record & playback
- Compatible with Pointless(tm), The Manager(tm), and accelerators
- System 6 Savvy
- Import/Export to Macintosh WP format
- Print Preview
- Large fonts over 48 point
Apple II Computer Info

- Bezier curves and degree rotation in Paint module
- Text wraps around graphics
- Auto-Save
- GS/OS compatible clipboard
- Pre-defined envelope printer
- Many, many more!

NEW! $99.95 Upgrade from 1.1

---------------------------------------------------------------------------

My only question is: If I order now will they wait until they ship before they charge my credit card? Now that I think about it thats what they did when I ordered AWKS 4.xx

My faxed order will go in today!!! Thanks Quality!!!!!!!!!!!!!!!!!!!!!!!!!!

(D.SINGLETON2, CAT42, TOP32, MSG:323/M645;1)

DIGISOFT TO SELL APPLE II CD   A quick status report: the CD is well underway. I'm not predicting a release date yet though, as there still are too many variables :-)

Thanks for everyone's support!

<<Jim   (DIGISOFT, CAT13, TOP29, MSG:56/M645;1)

LOOKING GOOD IN (LASER) PRINT   In a few issues of Shareware Solutions II, I have referred to low cost laser printer options. A few issues back, I mentioned that the Okidata OL400e, a 300 DPI laser printer that offered HP LaserJet IIP series compatibility, was available for less than $500. If I remember correctly, I may have even offered my opinion that this printer was the printer that was going to start a laser printer price war.

Imagine my surprise when I looked at my local newspaper today, and saw a huge ad for CompUSA - a computer "superstore" with branches around the country - offering the Oki OL400e for $389?!?

Imagine that? A laser printer for less than $400?! Such A Deal!!

Offering HP LaserJet IIP series compatibility, this printer is definitely worth checking out. It is essentially "plug and print" with the Apple II or IIGS. As you know, Shareware Solutions II is produced on an HP LaserJet II serie printer, so you should have an idea - if you've seen SSII - of what a LJ II is capable of outputting from an Apple II.

I have not personally used this printer, so don't take this post as an endorsement of the Oki OL400e. But, if you are thinking of buying a new printer, owe it to yourself to visit a CompUSA (or other computer warehouse stores) and see the OL400e for yourself. In the final analysis, only you can decide if this printer is worth buying for your Apple II system.

Joe Kohn   (J.KOHN, CAT28, TOP4, MSG:313/M645;1)

A2.LUNATIC [Lunatic] at 00:05 EST

|\ot to bring up an old argument, again (uh oh, too late...), but Woz would have really done a disservice to those students to have bought them Apple IIs NOW, unless he was going to write all the software for them himself, service the hardware, and adapt many new peripherals for them on his own. I'm sure Woz loves the Apple II as much as we all do, but the simple fact is, for new purchases, and for longevity, it just isn't the best buy. Yes, if he'd been allowed to buy used equipment, he could have gotten a good deal on Apple IIs -- but I don't know of any schools that allow large purchases of used equipment, and I don't know of any single vendor that would have full labs' worth of appropriate Apple IIs and associated hardware and software to sell (much less service and support).

\//e're here, we love our machines, they do what we want, they have lots of life and new capabilities left in them, and we're going to stick by them (and them by us) for a long time to come. But our world, the Apple II world, is not growing any more, and we shouldn't expect it to. We are still here IN SPITE of everyone else, and that's because we, as Apple II users, owners, and programmers, have the strength to weather these blows. To ask others to join us now, as we stand shoulder to shoulder against the crushing hordes of the MS-DOS/Windows/Mac industry, would not be fair.

][t takes strength to be an Apple II user, today.

-= Lunatic (:

Thinking About Online Communications

By Phil Shapiro

[REF] >>> SHARED LONG DISTANCE BILLING: A PHONE SERVICE LONG OVERDUE <<<

Each month my phone company sends me information about the new enhanced phone services they have to offer. And each month I scan the list looking for something that might truly be useful. It seems at times that phone companies have gone to great lengths to provide every new feature we don't need, and few new features that we do need.
At the top of the list of enhanced features the phone company should be providing is "shared billing". Shared billing is a way of splitting the cost of long distance calls between the caller and the receiver of the call. The concept of "shared billing" has great possible uses in both the business and residential phone market.

Take, for instance, the case of a small business that sells its products nationwide. If the business cannot afford to set up a toll-free phone line, it is faced with a difficult dilemma: it cannot afford to pick up the entire cost of calls from prospective customers, yet it does not want to shift the cost of those calls entirely onto the shoulders of those prospective customers. Both the small business and the prospective customer have a shared interest in the communication taking place from such a call.

So it would be to everyone's benefit if the billing would be shared. The end result? When each party feels that the conversation should come to an end, the call can be terminated. Both parties can avoid being in the awkward position of picking up the entire cost of the call.

Likewise, shared billing would be fondly embraced by long distance lovers. With Janine in Ann Arbor, Michigan, and Justin in Washington DC, what better way to promote a harmonious relationship than to have long distance bills split evenly on both phone bills? Chances are long distance lovers would spend even more time on the phone than they already do if the billing of the calls were shared.

How might this "shared billing" service be implemented, you ask? Very much in the same way that long distance collect calls are now implemented. The calling party might dial a special two digit prefix to signal that he or she wanted to place a "shared billing" call. So Justin in Washington, DC might prefix Janine's phone number with the two digits "99."

The long distance phone company would then recognize that a shared billing call was being placed. The next step would be for the long distance phone company to prompt Justin to clearly enunciate his name and city, so that Janine can be alerted to an incoming shared billing call from her beloved.

Janine, on her side, would receive a phone call that started with an automated message from the long distance phone company. The automated message would run something to the effect: "A shared billing call has been placed to this number from Justin in Washington DC. Press the two digits 99 to accept this call."

Janine could then have the option of accepting or declining the "shared billing" call.

It seems to me that the "shared billing" concept goes far beyond a "mere convenience". When used in a business setting, "shared billing" could act as a serious stimulus to small business. Considering the vital role that small businesses will be playing in the information age economy, this new phone feature could speed up the wheels of our economy in ways that will benefit consumers and businesses alike.

Considering its possible uses in both residential and business phone...
service, long distance companies would do well to give serious thought to bringing "shared billing" services online. In case the executives at phone companies are too busy with their conference calls to read this article, my message to them can be boiled down to: "Get smart. Call 99."

-Phil Shapiro

PREAMBLE   We hold these truths to be self evident; that not all computers or their users are created equally. Therefore, with this Polishing Green Apples article I will begin a discussion about hard disks, which can level the playing field somewhat between our favorite computer and those Big Blue and Big Mac things out there. I plan to address their internal workings (the basics), what they can be used for, their cost, how to use them to the fullest, and anything else of interest that I can come up with.

CONSUME MASS QUANTITIES!   When talking about the resources of your computer (memory, storage, and speed), most newer applications for the Apple II and IIgs tend to do just that: Consume mass quantities. Okay, so you probably don't absolutely NEED a hard drive in order to make use of your computer. You CAN continue to use floppy disks, either 5.25 inch (which hold 143K) or 3.5 inch (holding 800K). You do NOT need to take advantage of any of those ads that recently have appeared for low cost hard disks or "floptical" drives...

...and you don't really NEED power steering, power brakes, fuel injection, AM/FM Cassette, or air bags in your new car...

But...

...those items can sure make things easier for you as a driver. And in the same way, a hard disk can make things significantly more convenient for you as a computer user, whether you consider yourself a "power" user or not. In fact, using an Apple IIgs WITHOUT a hard drive is getting downright frustrating these days. Some newer applications require so much disk swapping (even with TWO of the 3.5 drives) that they can become more hassle than they are worth.

Let's face it, the "good ol' days" when a program AND its data files would fit comfortably on a 143K floppy disk are long gone. Programs are
larger (because users have demanded more and better features), and the data files that they create and use have also become larger. Additionally, just keeping track of your library of programs can become difficult when they are spread over some 30 to 50 (for some users, over 200) different disks.

As in an earlier article, let's begin with some pertinent definitions. For a general review on how disks work at their most basic level, I suggest you obtain the February 1993 GENieLamp A2, which carried part 9 of my AppleII History. (Either file #1078 or #1075 from GENie's DigiPub libraries.) In that segment I explained in detail the concept of interleave, and how it affects the speed at which data can be read from or written to disks, which is applicable to hard disks as well as the older floppy disks.

DEFINITIONS (for disk drives)

**Disk**  
A storage device, usually made up of a plastic film coated with magnetic particles (much like the tape used in audio cassettes). Aligning these tiny magnetic specks one way represents a binary "0", and in another direction as a binary "1".

**Floppy disk**  
A flexible disk within a protective envelope of firmer plastic. It has most commonly come in 5 1/4 (or 5.25) inch size in the past, (and 8 inches also, but that size never penetrated very far in the Apple II world). However, the newer 3 1/2 (or 3.5) inch size has been popularized over the past ten years by the Macintosh and other newer generation computers. Strictly speaking, the 3.5 disks are still considered to be "floppy", even though the flexible part of the disk is encased in a hard plastic shell with a metal sliding window to afford greater protection to the surface of the disk.

**Hard disk**  
Also known as a "fixed disk", this device is significant for its much greater storage capacity. Where the Apple II standard 5.25 disk typically holds about 143K of data, and a 3.5 disk holds 800K (.14 and .78 meg, respectively), a hard disk holds anywhere from 5 meg to over 1000 meg of data. A hard disk is not usually as portable as a floppy disk, since it is built directly into the mechanism that reads and writes the data. However, a company known as Syquest has created a series of hard disks that are removable, with capacities of 44 meg, 88 meg, and 105 meg.

**Magneto-optical drive**  
These drives are currently significantly more expensive than other mass storage drives available. However, their storage capacity is quite high, and the disks are NOT sensitive to stray magnetic fields as are most other disks used in computers. The term "magneto-optical" means that this type of disk uses both magnetic AND optical technology in it function.

An optical disk is much like a CD or CD-ROM, except that it can be written to. When reading, a laser is aimed at the disk surface, and the direction that the light is deflected determines whether it was a "1" bit or "0" bit. When writing, a higher-powered laser heats the disk surface to the point where its previous "1" or "0" is erased, and while it cools, a magnetic field is used to determine the NEW bit that is written there.

Because it is more complicated, the currently magneto-optical drives are slower than standard hard drives, but the resistance of the disks to accidental erasure make them more reliable for long-term storage. This is
Floptical  This is a trademarked term, which means "floppy drive, optically tracked". It is made by only a few companies that have joined together to create and market these drives as a mass storage alternative to the traditional fixed or hard drive. The disks look just like a standard 3.5 floppy disk, but is very different in the amount of data it can hold, currently either 20 or 40 megs. This type of a storage device is similar to older drives in the way which data is stored on the disk surface, using a magnetic read/write head. However, other types of disk drives use a stepper motor or a mechanical screw to position the read/write head over the disk surface; a magneto-optical drive uses an optical sensor to determine where on the disk surface the head should be placed. With this method, higher densities of data storage can be obtained, 1245 tracks per inch, compared to the more typical 135 tracks per inch on a standard floppy disk. However, it also requires a disk medium that has been specially created to containing the tracking marks that the optical sensor uses to place the read/write head, and so each disk is significantly more expensive than a standard 3.5 floppy.

Another advantage of the Floptical drives are their ability to ALSO handle the standard (in the MS-DOS world) 720K and 1.44 meg 3.5 inch floppy disks. So with this disk drive you can have the advantages of a large removable storage device, plus the ability to manage older types of disks.

CD-ROM drive  An audio CD uses a laser to read the digitized musical "data" from the disk and relay that to other circuitry, which turns it into sound. A CD-ROM does the same thing, but uses it simply as data which COULD be sound, but also can be programs, pictures, and more. These drives are getting to a critical mass in the computer marketplace, and more CD-ROM disks are becoming available all the time.

Although SCSI CD-ROM drives meant for the Macintosh have been usable on the Apple II and IIgs for some time, there have not been many of the CD-ROM disks that were useful for our computer. However, the new discQuest software from Sequential Systems makes it possible to utilize the propriety coded data on many of the popular CD-ROMs that are available, opening up the CD-ROM world to the Apple II.

Tape drive  The original tape drive for the Apple II was a standard cassette recorder using audio tapes. It was slow and not very easy to use. Modern tape drives are capable of higher density for data storage, and faster access. However, because of the way that a tape works -- in a linear fashion -- tape access will never be as fast as disk access. (This is for the same reason that it is faster to jump between songs on a record album or a CD in random order than to rewind and fast-forward a cassette to do the same thing.) These are used primarily for backing up data from a hard disk.

RAM disk  Acts just like a disk drive with moving parts, but is in reality just a bank of RAM chips with software that designates where data is stored in the bank. The advantage is speed (no moving parts to wait for), but the disadvantage is data stored on a RAM disk disappears when the power is turned off.

Backup/restore  Because the law that states "Anything that can go wrong, will go wrong" definitely applies to computers, it is necessary to ensure that if something goes wrong with your large storage
device you have a protection from loss of important data files. Think of it as "safe computing". In this case, it does not involve a condom, but rather making a duplicate copy of your vital files and keeping the copy in a safe place. With floppy disks, it may be as simple as duplicating the entire disk, and then putting the duplicate away. For a hard disk, it is unlikely that you just happen to have ANOTHER hard disk sitting around to use for backing it up. In that case, you need to be able to write part of the hard disk files to several smaller capacity disks, or perhaps to a tape. When you load files back onto your hard disk from the backup disks, this is called "restoring" the files.

Sector A term describing a certain number of bytes that are stored as a group on the disk surface. In DOS 3.3, data was read from or written to the disk in 256-byte sectors. This was felt to be the best compromise between the limited memory available on older Apple IIIs (requiring smaller sector sizes) and the speed of disk access (which could be improved with larger sector sizes).

With the small disk capacities available with the older Apple II operating systems (143K for DOS 3.3, and 112K for DOS 3.2), a smaller sector size made more sense. This is because even if a file consisted of only 50 bytes of data, 256 bytes was still the minimum size that could be used as a holding space for that data on the disk. The other 206 bytes were wasted space. A larger sector size would just have the potential for wasting more space if many small files were stored on the disk. An older operating system, CP/M, used 128-byte sectors. However, as a file gets larger and larger, it requires more overhead in the directory to store the map that tells the disk system where the sectors that make up the file can be found. A larger sector size makes for smaller file maps.

Block The Sophisticated Operating System (SOS) designed for the Apple III redesigned the data structure for disk access so 512-byte chunks of data were used. These were called "blocks", and allowed data to be read a bit faster with each disk operation; reading 256 bytes twice was slower than reading 512 bytes once. ProDOS was designed as a subset of SOS, and so used exactly the same disk format.

Track Data stored on the surface of a disk are arranged as concentric circles, one within another. These circles of data are called tracks. Each type of disk device has its own peculiarities as to how many tracks can be utilized on the disk surface, and how many sectors or blocks can be placed on a single track. The older 5.25 disks used on the Apple II have a standard of 16 sectors per track, and 35 tracks per disk (DOS 3.2 could only handle 13 sectors per track). The 3.5 disks use a varying number of sectors per track, with fewer as you go from the outer rim of the disk toward the center. Since the tracks are smaller in diameter at the inner part of the disk, there is less disk media available for packing data into blocks (fewer inches of disk pass under the read/write head until the track starts over), and so some disk devices have fewer blocks per track on the inner tracks.

Interleave Refers to the way in which groups of data are written to a disk to achieve the best throughput and speed for the device being used. A fast disk drive might be able to use a 1:1 interleave, where the physical number of a disk sector corresponds to the logical number of the data sector being written to it. A slower drive or slower controlling software may need to use a 2:1 or higher interleave, to allow the drive to read a sector, and while it is processing it, have one or more disk sectors...
pass beneath the read/write head that are ignored. If the interleave is set correctly, the disk should be at the right position when the software is ready for the next sector of data to be immediately read.

**DOS 3.3** (NOT the "DOS 3.3" that was released by Microsoft for the IBM PC a few years ago.) This oldest disk operating system for the Apple II still in use. (DOS 3.3 was preceded by DOS 3.1, 3.2, and 3.2.1, but they are little more than historical curiosities now.) It is limited primarily to 5.25 disks, although with some patches it can be made to work on hard disks or 3.5 disks. This disk operating system is quite liberal in the types of characters allowed in naming files. A filename under DOS 3.3 can be nearly ANY character in the ASCII set, even if that character would not display on the screen; however, it may not handle lowercase characters well, since it was designed to work with the Apple II Plus, which did not have lowercase. A filename must start with a printable letter (A-Z), but after that, anything goes. Examples include "APPLE-VISION", "A REALLY #$%@ FILE", or "THIS FILE IS _____". The length of the filenames was limited to 30 characters or less.

**ProDOS** Known now as ProDOS 8, it stands for "Professional Disk Operating System", and is more flexible than DOS 3.3 in the types of disk devices it will support, and how much capacity on each disk is allowed. A filename under ProDOS must start with a letter, is limited to only 15 characters, and those characters can only be letters, numbers, or a period. Examples include "BASIC.SYSTEM", "B1.2.3.WOW", "B.....C...D". The largest size disk device supported under ProDOS is 32 meg, and so a hard disk that is larger than 32 megabytes must be partitioned into multiple volumes that are 32 megs or smaller.

One of the other advances that came about with ProDOS 8 was device independence. That is, ProDOS was not tied down to a specific type of disk hardware, as DOS 3.3 was (which was designed to work only with 5.25 disks, although it was patched many different ways to allow it to use other types of disk devices). As far as ProDOS is concerned, if the software that controls a disk device responds to certain types of commands in the right way, it does not care whether that device is a 5.25 disk, 3.5 disk, hard disk, RAM disk, or tape drive. If the right controlling software was designed, you could even attach a computer via a phone line and modem to a large disk storage device elsewhere, and data could be saved and loaded from that remote device just as if it was right there on the desk next to the computer. In fact, an AppleTalk network works very much like that example (minus the phone line and modem, of course).

**GS/OS** A true chameleon of an operating system. Its earlier incarnation, ProDOS 16, was shipped with the original Apple IIGs, and in that form ONLY handled disk input and output, and actually made use of the older 8-bit code in ProDOS 8 for most of what it did. When GS/OS came out, it was designed to deal with nearly everything that the computer did, in addition to disk functions.

**Directory** A list of files on a disk, usually including other information about the file's size, the date it was created or modified, and the kind of information the file holds.

**Catalog** The same as a directory, but an older name used with DOS 3.3 or earlier operating systems.

**Subdirectory** Just like a directory, but at a "deeper" level than the main
or root directory on a disk. Makes it possible to organize files in different groups.

Partition This refers to a method of taking a disk device and "breaking it up" into two or more smaller sized disks. On a PHYSICAL basis, this does not mean that the disk is actually changed. On a LOGICAL basis, the disk device may either have a storage capacity that exceeds what the operating system is able to handle, or it may need to be divided up for the convenience of the user.

A disk drive that has been partitioned into two or more smaller devices may APPEAR to the computer and its disk operating system as if there were more than one PHYSICAL device attached. For example, the maximum size disk volume that ProDOS can handle is 32 megs. If a 40 meg hard disk is attached to a computer running the ProDOS operating system, only 32 megs of it will be usable, and 8 megs would be unavailable and therefore wasted. Partitioning that disk into different sized volumes (20/20 or 30/10 or 32/8) allows ALL of it to be used for storage.

With the older DOS 3.3 operating system, in which a 143K disk size was standard, hard drives used at that time were logically divided up into multiple 143K volumes. In this case, there was still a particular slot and drive that was assigned to the disk controller card, but any particular 143K "disk" on that hard disk was accessed via a "V" parameter ("V" for volume) in DOS 3.3 disk commands. A catalog command would then be issued as "CATALOG,S5,D1,VI", "CATALOG,S5,D1,V2", and so on.

SCSI Stands for "Small Computer Systems Interface", and is usually pronounced "scuzzy". It refers to a set of commands that are used to control storage devices of various types. The SCSI protocol even allows the use of devices such as modems and printers, but I haven't seen much of this penetrate into personal computers as a whole, and none have appeared for any computer in the Apple II line.

When the term "SCSI" is used with the name of another piece of hardware, it means that that device is intended to be used on a chain of devices that all communicate with one another via the SCSI command set. Therefore, a SCSI cable is used to connect a SCSI hard drive and a SCSI tape drive to the SCSI controller card plugged into a computer.

Generally speaking, connecting a SCSI device to a computer is no more complicated than turning off the power, plugging it in, and turning it back on. In reality, however, this sometimes requires a bit more to be done to make it function properly.

CONCLUDING STATEMENTS We'll stop here for now, and let you chew on that for a while. Next time I will begin to get into some suggestions on how to organize your hard disk to get the best use out of it. In the meantime, keep your eyes on those sale prices -- hard disks are getting more affordable all the time!

[*][*][*]

Steve Weyhrich is a family physician from Omaha, Nebraska. He has been using Apple II computers since 1981, and writing about them since 1990. He follows closely the events that continue to shape the destiny of the legendary Apple II and IIgs computers, and writes a monthly column called the "A2 News Digest" for
Who really needs a PC Transporter? After all, in a world that has become thoroughly dominated by Microsoft Windows, what advantage is there in adding what is "merely" a DOS engine to an Apple II?

When considering this question, it is good to keep in mind that Windows must run on top of DOS, and nearly anything that can be written to MS-DOS can be imported to a Windows application. In fact, some DOS fanatics view Windows as little more than a specialized DOS user interface, program launcher and file manager. (1) If you happen to be someone who loves the capabilities of their Apple IIe or IIgs, but must routinely work in the MS-DOS and/or Macintosh worlds, the addition of a PCT card may be a perfect option to pursue.

Any Apple II user who has ever had to work on a PC, however, knows that MS-DOS is a pain to navigate from the command line. More current versions of MS-DOS (4.0, 5.0 and 6.x) have made desktop navigation easier by supplying a shell with pull down menus, popup dialogue boxes, and mouse capability. On the PC Transporter, the Apple mouse works acceptably with MS-DOS programs that use the mouse. Hybrid users must, however, configure the PCT by adding the appropriate mouse drivers through the PCT's control panel and through MS-DOS. Several users have reported running MS-DOS 6.2 (the latest version) with no problems on their Apple II/PC hybrids. Many more, however, continue to use MS-DOS 3.3 and 5.0, regarding them as the most stable and least likely DOS versions to cause any difficulties.

Applied Engineering gives users the option of attaching a PC keyboard to their Transporter or of using the Apple keyboard and mouse in PC emulation. Apple users who are most comfortable with their Apple keyboard will probably want to use Applied's emulation rather than attaching the PC keyboard. The emulation relies upon the use of macro key combinations for function keys and upon key substitutions on the numeric keypad for such things as page up, page down, right, left, numlock, print screen, etc.

GS/OS vs MS-DOS Unlike GS/OS users, who have up to 8MB of directly addressable, conventional RAM available, MS-DOS users have had to beg, borrow and steal additional RAM to get beyond the basic 640K to which MS-DOS has always been limited. Consequently, there now exists a confusing potpourri of memory protocols for "messydos" users, which include "Conventional, Expanded, Extended, High, and Upper" memory. DOS users, who need to run Windows or other memory-hungry applications on a regular PC, must configure DOS to use these additional areas of memory for storage of device drivers, TSRs, (2) and parts of the operating system itself. Most Apple II/PC hybrid users, however, will probably not need to
bother with all of these machinations, given that GS/OS or ProDOS will
be used as their principal operating system.

As 16-bit operating systems go, GS/OS 6.0.1 pretty well beats MS-DOS
6.2 hands down. Even the most casual user can't help but notice the
superiority of the GS/OS desktop user interface over the MS-DOS shell on a
640x200 display. There are better color availability, use of icons,
resizable and movable windows, superior sound capability and much superior
program launching and file management. MS-DOS users must always add
Windows to DOS to get anything comparable to GS/OS. Even then, many Apple
users feel that Windows comes up short. Beneath the obvious cosmetic
advantage over MS-DOS is GS/OS's ability to function as a full operating
system which manages virtually every aspect of I/O. The ease with which
GS/OS can be configured and expanded through the use of desk accessories,
control panel devices, inits, system extensions and so forth, should make
PC users green with envy.

However, despite the advantages of GS/OS over MS-DOS, PC users are
NOT green with envy. In fact, millions upon millions of them blithely use
their computers each day, quite unaware that there might be anything any
better than MS-DOS or Windows. It has been said so often that it has
become cliche, yet it still bears repeating: If Apple had not held back
development of GS/OS or promotion of the IIGs, there would probably be many
fewer MS-DOS machines around now, especially in education. Because today's
students are tomorrow's business market, more earnest promotion of the
Apple II series would have made good business sense. Nonetheless, that
isn't how it all came about. The important point for Apple II users to
consider about MS-DOS is that, while it may not be especially wonderful, it
is UBQUITOUS.

MS-DOS TERRITORY In my city, the "MS-DOS 6.2 Upgrade" package occupied
the largest portion of software retail shelf space in
nearly every software retail store I visited this past December. In 1992,
IBM added the ability to run multiple DOS sessions simultaneously under
their most advanced operating system, OS/2. (3) Earlier versions of OS/2
could run only one DOS session. That change, along with increased support
for Windows, have probably contributed to a four-fold increase in OS/2
sales. Windows NT supports MS-DOS and can also run multiple DOS sessions
under what it calls "VDMs" (Virtual DOS Machines). "Soft PC" and "Soft AT"
run DOS on the MAC, as do Orange Micro's 486 Nubus card and Apple's own 486
PDS card.

Like it or not, MS-DOS is everywhere. Even Apple seems to be
acknowledging this fact at long last with the development and promotion of
the 486 PDS card. While the MAC 486 cards target Windows users, DOS-only
applications are the principal reasons for the existence of Insignia's
"Soft PC" and "Soft AT" emulators, and some believe that the ability to run
non-Windows, DOS-only applications will be the principal reason that many
will actually buy Apple's PDS 486 card.

SHARING FILES Despite all of this, no Apple II user should ever feel that
they need to give up their computer because of
incompatibility with other machines and operating systems. In my
workplace, the MS-DOS machines run DOS 5.0, WordPerfect, ProCOMM Plus,
R-Base and MicroSoft Works for DOS. All of these are non-Windows
applications, and, with brief testing, all of them appeared to run fine on
my GS/PC at home. As mentioned earlier, the GS, even without a PC
Transporter card, has the capability to format, read and write HFS and
Apple II Computer Info

MS-DOS.

The Macs in my office run System 7 and Microsoft Works 3.1. With System 7's Apple File Exchange, I can import DOS Microsoft Works files that have been created on my GS/PC at home, and the files translate beautifully to the MAC version of Microsoft Works. Apple File Exchange also works very nicely with AppleWorks classic files and MicroSoft Works 3.1. When it is necessary for me to export files to a PC from my IIgs at home, either the PC Transporter or Peter Watson's utilities fill the bill nicely without having to use one of the office's MACs as an intermediary.

In an earlier article we discussed the Watson utilities and the MS-DOS FST, which run under GS/OS on the Apple II side of a GS/PC hybrid. However, Applied Engineering also has a ProDOS file translation and file management utility that runs under MS-DOS on the PCT side of an Apple II/PC hybrid. This utility and documentation come stored on the "MSDOSVOL" file which comes with the PC Transporter software. The utility, an executable file that runs under MS-DOS, is labeled "TRANSFER.EXE."

Applied's transfer utility will catalog and display any online ProDOS volume while IN MS-DOS, allowing the user to navigate their Apple II directories in much the same way as they would from ProDOS. Files are displayed in standard ProDOS fashion by name, type, number of blocks, modification date and creation date. File transfer can be done both ways between MS-DOS and ProDOS. However, translation is somewhat rudimentary from MS-DOS to ProDOS, and best results come from the transfer of (ASCII) text files.

MS-DOS's annoying habit of placing extraneous linefeed and return characters into DOS text files can make file transfer from MS-DOS to ProDOS somewhat less than straightforward. Two ProDOS 8 utilities that are potentially helpful in using DOS text files on the Apple side of an Apple II/PC hybrid are Stowe Keller's "List" utility (GENie A2 library file #17171, LIST024.BXY) and Mark Munz's "CR Stripper" (which runs as a TimeOut AppleWorks enhancement). You can obtain "CR Stripper" on the TimeOut "TextTools" disk. Munz's utility works by allowing you to highlight a block of text within an AppleWorks word processor file when you wish to remove extra returns. You then simply press <RETURN> to get rid of them, then move to the next block of text. Stowe Keller's utility has the capability to automatically add or remove linefeed and return markers with a print-to-disk feature.

A more straightforward method of moving files between MS-DOS applications and AppleWorks is "Cross-Works". Cross-Works has the capability to make full translations of files (keeping file formatting intact) between AppleWorks and several popular DOS applications (i.e., Lotus 1-2-3, dBase, Word Perfect and Microsoft Works). Cross-works, currently sold by Quality Computers, has been designed to be used in direct serial transfers and modem file transfers, but it can also be used with the PC Transporter.

AppleWorks 4 has improved text file handling capabilities which makes its use in both HFS and DOS import/export much easier. However, for those who have not yet made the switch to AppleWorks 4, there are two additional TimeOut utilities that will facilitate file movement between AppleWorks and your most often-used MS-DOS (or Mac) word processor. These utilities are "AWP to TXT" (available on the TimeOut "PowerPack" disk) and TimeOut "Textloader+" (available on the "Companion Plus" disk). AWP to TXT is a
relatively fast method of converting AppleWorks WP files to TXT files without having to use the AppleWorks "print-to-disk" feature. Textloader+ will allow the loading of up to 12 text files from disk and automatic conversion of them into AppleWorks WP files.

HARD DRIVE SPACE While the PC Transporter card does not require a hard drive in order to operate, considering all of the additional software that becomes necessary on both the Apple and PC sides of an Apple II/PC hybrid, a hard disk drive is a very nice peripheral to own. Approximately 64MB of hard disk space can be allocated on a ProDOS hard disk to MS-DOS. The PC Transporter's system software makes use of ProDOS's ability to create 16MB files that then serve as MS-DOS emulation volumes. Using the PCT's control panel and system software, two 16MB files can be linked to emulate one 32MB MS-DOS volume. The PCT control panel will allow two hard disk volumes to be online at one time. Anyone who finds that they require more space than that for storage of MS-DOS software and data files, probably should consider using a regular PC.

Once the 16MB ProDOS files have been properly described to the PC Transporter system software as available for MS-DOS use, they can be "FDISKed" and then formatted. So far as MS-DOS is concerned, it is always interacting with standard MS-DOS hard disk volumes. On the ProDOS side of the Apple II/PC hybrid, these MS-DOS volumes look simply like large ProDOS files. Their MS-DOS contents are not accessible to ProDOS. (At the time of this writing, Peter Watson's IIgs MS-DOS utilities, which CAN access these volumes, provide the only exception to this rule.) The PC Transporter system software can also work with "small" MS-DOS volumes, allowing the user to allocate any ProDOS block device as a PCT hard disk.

SYSTEM SOFTWARE Configuration of the PCT's use of the Apple's hard drive, mouse, keyboard, printer, modem and disk drives would not be possible without the PCT's system software, BIOS and control panel. Being a DOS engine, the PCT has 640K of conventional RAM available for running programs. The PCT's additional 128K of RAM is reserved for use by its BIOS (Basic Input Output Services code) which is loaded as a binary data file into the PCT's RAM by a ProDOS system file when the card is booted.

The BIOS and System Software function in much the same way as the ROM firmware functions in an Apple II. You can add or delete I/O drivers through the PCT's control panel. This control panel can be accessed at any time while in MS-DOS by pressing a <caps lock> - <shift> key combination. It works much the same way as the GS's ROM control panel and system software. Over the years, much of the refinement and updating of the PCT's functions has been accomplished by AE's engineers through simple improvement of the PCT.SYSTEM and drivers. While Applied Engineering has steadily worked to improve its portware through changes and additions to its device drivers, it appears to this writer that, even now, there remains much that could be done to improve the PCT card's portware and therefore its versatility and functioning.

Much has been said in this article, and in the three previous ones, about the PC Transporter Card and its role in Apple II/PC hybrids. However, there are two other Apple II/PC hybrid computer systems that seem worth mentioning, and next month we will talk briefly about these systems. Until then, think hybrid!

NOTES
(1) Dan Gookin, author of _DOS for Dummies_, expresses amusement at Windows' "happy friendly graphical face" (p. 271). He asks, "What's the difference between a DOS program and a Windows application?" and answers, "About $300." (p. 61). Gookin, a onetime Apple IIgs and MAC owner, displays the attitude of the hard core DOS user toward Windows in _DOS for Dummies_.

(2) Terminate and Stay Resident applications.

EMERGENCY BEEPER  TOOT TOOT

EMERGENCY BEEPER  TOOT TOOT
Golden Oldie Review: Xenocide

by Darrel Raines

If you remember, in last month's column we started a discussion on how to build a personal software library of games, utilities and applications that would make Bill Gates jealous. I described how you could use GEnie and the A2 RoundTable to purchase used software from other people just like yourself, and promised to help you decide what software was worth acquiring by reviewing some golden oldie software from time to time.

I should mention that this column will be somewhat different than a new product review. I will not be wasting your time and mine by talking about software that I did not like. There is a purpose in reviewing new software that does not live up to high standards. However, with such a large selection of used software available to you, there is no need to spend a lot of time talking about poor commercial programs.

This month I have chosen the arcade game Xenocide. Xenocide was originally published by Micro Revelations in 1989. The software was written by Brian Greenstone with graphics from Dave Triplett. You may remember this team from a number of very good Apple IIgs "24-hour" shareware games such as Cosmocade, Pirate Killers, and Orbizone. This game was their only commercial venture.

Xenocide, much like a number of shoot-'em-up games, gives you a scenario where you can feel comfortable blowing away the evil villains that appear with regularity on your screen. It seems that alien creatures have taken over the three planets that you are supposed to be protecting. Therefore, you need to exterminate these pests and destroy the planets before they complete a gate that will allow some bigger and more nasty meanie into the area. It's time to pull out your joystick and go to work!

In order to start blowing away the bad guys, you first have to go through a setup screen. The options available to you on this page allow the external speakers or other stereo output to be used for the better-than-average musical score. A high point total Hall of Fame is shown so that you can ponder over your past heroics. There is also a joystick calibration option on the main menu. I have found that this game does not recognize when it is running on an accelerated machine. Therefore, you will be unable to calibrate your joystick (and play the game) if you do not set the accelerator back to a normal speed.

The final option on the main menu is for Play/"Let's get it on"/Go. Now the fun starts. You are shown a picture of three different planets. A message informs you that the first planet is Malachite, the rock planet. You are then placed in the driver's seat of a hovercraft and given control of the vehicle.

An overview of the game might be in order here. The object of the game is to blow up each of the planets, in order, before you expire yourself. You have three lives (men) and can get additional men only after certain milestones. You must complete a number of different games/levels in order to blow up a planet. There is a hovercraft level, an underground level, an underwater level and a laboratory level for each planet. The landscape in the levels will differ on each planet. However, the basic
The hovercraft level is played much like a road rally game, with a difference. You have to watch out for some very large bugs and critters on the road. If you happen to hit a bug, they leave a reminder on your windshield. After a while it can be very difficult to see where you are going. Therefore, the best advice is to stay away from the grasshoppers... er, I mean aliens.

The hovercraft is somewhat sluggish in performance and does not have very much fuel. You have to proceed to a docking station before your fuel and/or shields run out. Rockets and lasers will protect you from the potential road-kill. The supply of these weapons is limited, so you cannot just blast away. Besides animals/aliens, the road is littered with rocks and supply canisters. You have to avoid (or shoot) the rocks and you need to collect the canisters. The number of canisters you collect will determine the amount of ammunition that you can carry on the next level.

If you manage to dock your hovercraft, then you proceed to the underground cave. In this area you are propelled by a jet backpack. You can protect yourself from the cave dwellers with a laser and with a supply of grenades. And believe me, there are many nasty creatures in the cave. If you ever played the game Cavern Cobra, you will be familiar with this part of Xenocide. The object is to collect five individual bombs that are strewn throughout the cave. The bombs will be used later in the laboratory. There are re-fuel and re-supply stations along the way. You have to hop from one of these to the next before you can get more jet fuel for your backpack and more laser power and grenades for your weapons. If you happen to collect all of the bomb sections, then you can take an elevator tube to the underwater level of the game.

Before moving on to the underwater level, I should spend a few sentences describing the wildlife that resides in the cave. I do not know where the design team got all of their ideas for this game, but I can only assume that they ate too much pepperoni pizza before going to bed. The resultant bad dreams would have served as inspiration for the cavern critters. There are dragon flies, floating bowling balls, mounted canons, falling stalactites, lava pools, bouncing barrels, blinking stars, repelling-field generators, and deadly mushrooms to name a few. You can get so interested in looking at the pretty (but deadly) scenery that you could forget to avoid the bad guys. This section of the game qualifies as one of my all-time favorite arcade games. The graphics, game play, and objectives make for a rollicking good time.

One of the features of the last three levels of each planet are the option pods. These little jewels are very important. They appear as either a blue dot or a red brick, depending upon the level. Each time that you grab one of these, you advance a notch in the option sequence. The options available will let you have a stronger shield, shoot a meaner gun, replenish your shield energy, or otherwise increase your chances. You will learn to use these wisely or you will never get past the first level of caverns. However, once mastered, the option pods become your best means of escaping the underground cave.

Just when you thought that you had finished with the caves, you get a nasty surprise. The next level is just like the caverns, with the exception that the caverns are underwater. You replace your jet pack with compressed air and your laser with an underwater gun. However, this level
of the game plays just like the last. Seaweed, eels, starfish, and other submerged critters will make your life miserable. The object to this level is to find a set of keys that will open doors in the underwater caverns. At the end of these caverns is an elevator that will take you up to the biology laboratory on the planet surface. Since this level is otherwise just like the underground cavern, we will move on to the laboratory.

After climbing out of the elevator, you remove your underwater gear and load up for the final confrontation. The aliens in the laboratory are all robots that have many mean tendencies. They love to shoot at you from behind cover. And some of them have grenades just like yours. In this level you have a few resupply areas available for more laser power and grenades. However, your objective is to place the five bombs collected in the underground caves in five strategic locations within the lab. Once all of these bombs are placed, you have a few seconds to find and activate a transporter that will take you back to your ship above the planets. If you manage to do all of this, then the planet will blow up for your enjoyment and the aliens chagrin.

The hovercraft level is played from the vantage point of the cockpit inside the vehicle. The underground/-water levels are played with a side view of your character. You control the character while being able to see in all directions around him/her. The laboratory level is played with a top view of the action. You survey the scene from a god’s-eye view. The only thing that you cannot see from this view is a few robots off screen that can shoot at you without you being able to see them. Because of the different objectives and the different perspective of each level, you could actually call this game a melding of three separate games into one package. In my opinion, this feature adds to the variety of the game as a whole.

This program is one of the better arcade games ever written for the Apple IIgs computer. The variety of levels and mini-games (with subplots) allow the player to stay interested in this shoot-em-up long after the boredom has set in with a standard game of this genre. Music sets the mood for each level of play. It is not obtrusive, yet does serve to show off the IIgs sound capabilities. Action is smooth, especially when you consider the fact that the game only runs on unaccelerated machines. Action is continuous and does not lag between levels. The plot, while not necessarily believable, does a good job of setting up the rest of the game. All in all, this is an exceptional game.

I do have a few complaints. The software really should have made provisions for a player to visit any one of the planets. By constraining you to a sequential movement among the planets, many game players will never see more than the first planet. I have only managed to complete one full planet and all but the last few seconds of the second planet. So I do not know what the surface and caverns of the third planet look like. My other complaint lies in the fact that the software cannot detect and adjust for the processor speed of the Apple IIgs. It can be very annoying to work around this problem without the proper software installed to slow down the accelerator.

My final complaint lies in the difficulty of the game itself. You can end up playing for about 45 minutes to an hour for each game. If you were able to finish the whole series, it would take you about an hour and a half. However, the levels increase in difficulty along the way. There is virtually no chance that the average game player will ever finish this game.
Now with all of this said, I heartily recommend Xenocide. You will find the playing experience to be enjoyable. The graphics and sound will amaze you. The smooth scrolling of the screen will make your Amiga friends jealous. The joy of blasting aliens to bits will make you feel like a proud marine. All-in-all, the game is one of the best to ever be written for the Apple IIgs computer!

Remember, if you are having trouble finding one of the golden oldies in your favorite mail order catalog, then use the resources of GEnie. Hop on over to the Roundtable and check out category number 4. You will be glad that you did. Until next time, blast a few aliens for me.

[*][*][*]

Darrel Raines is a computer programmer, hacker, and hobbyist. When he is not writing articles for GEnieLamp, he works for NASA as a contractor. He is still looking for real aliens to blast -- or shake hands with.

Who's Who In Apple II

>>> WHO'S WHO <<<

~ HangTime, Editor of Script-Central ~

Recently, HyperCard IIgs was released for downloading in the A2 and A2Pro libraries. To celebrate this wonderful event, we wanted to interview someone who's an expert on HyperCard IIgs. The closest thing we could find to that expert was our own HangTime -- A2 Hypermedia Librarian -- Host of HangTime's HyperBar and Grill in A2Pro -- editor of Script-Central -- and HyperCard IIgs user extraordinaire!

GEnieLamp> What is HyperCard GS?

HangTime> That's a question asked by many quite innocently; however, it's a loaded one. First of all, the name is "HyperCard IIgs"... although it's frequently abbreviated to "HCGS".

So what IS HyperCard IIgs?

Answer: What would you like it to be? It is many things. In as few words as possible, though, I'd say it's:

1) a HyperMedia engine
2) A complete programming environment.

GEnieLamp> Let's start with the HyperMedia engine. Isn't it a sort of database with sound and graphic capabilities?

HangTime> I am no authority on the definition of HyperMedia, but I can
HyperMedia is the linking of text, graphics, and sounds. In its most simple form, a digital "story book" would fit this description. You could have a story about wild animals including pictures of the various creatures. You could add yet another dimension to your story my "attaching" sounds to the pictures of the animals. Thus after reading a virtual page of the story one could click the mouse on a picture of say a lion, and hear it roar.

In a more complex model, one could have words in the story link to other words in other parts of the story. Moving to an example of a technical journal, if one were to not understand what is being explained clicking on a keyword might bring the reader to a further discussion of the topic. And much like the story book example, pictures and or sounds might be included as well. In theory (and with an infinite amount of time) all words could be linked with other words. A cross-reference, if you will.

GEnieLamp> What are the differences among a field, a button and a card?

HangTime> Sticking with the simplest description, a "button" is something you click on to cause an action. A "field" holds textual information, and the card is what holds the buttons, fields, and any graphic elements. This however is not completely true in the case of HyperCard because HyperCard is not THAT restrictive. The above descriptions are true, however much more can be done in HyperCard.

GEnieLamp> How is HyperCard different from HyperStudio?

HangTime> My standard answer to that is: You can link Text, Graphics, and Sounds with HyperStudio, but if you want to DO something with those things, you want HyperCard. The main difference between the two is HyperTalk, the Scripting (or programming) language that HyperCard uses. HyperTalk is a complete programming language that allows access to the full range of things that an Apple IIgs is capable of. HyperTalk has been called the Applesoft BASIC of the 90s, but again that is not an accurate description because HyperTalk can do MUCH more and a lot easier too.

GEnieLamp> Is it hard to use?

HangTime> Not at all. If you want to make the computer beep, the command is, oddly enough "beep"! If you wanted it to beep twice the command would be "beep 2". Sound hard to you?

GEnieLamp> No, not at all.

HangTime> For an example of how powerful HyperCard can be using only the tools included with the package, I was able to create a "stack" that logged onto GEnie and send/receive text in 20 minutes. This time includes reading the documentation to figure out how to get a stack to use the Modem port. Try THAT in BASIC or Pascal. B-)}

GEnieLamp> What hardware requirements are there to run HyperCard?

HangTime> HyperCard Requires:
Apple II Computer Info

1.5 Megs of memory and a Hard Drive, but I think 2 Megs is better
(and with 4Meg cards going for around $120, why would anyone want less!)

GEnieLamp> What else would be good to have on your system to get the most

HangTime> Other then the standard GS equipment, nothing else is required.
HCGS doesn't take advantage of a stereo card, though pumping it
through a 100 Watt stereo system wouldn't hurt.

GEnieLamp> Isn't HyperCard supposed to be slow?

HangTime> An accelerator is also a really good add-on, Just a 7mhz
Accelerator is plenty to make HCGS very useful.

GEnieLamp> Since you used the word "stack", explain what a stack is.

HangTime> Besides all the cute little metaphors, a "stack" is just the
name given to the "thing" that you create with HyperCard. The
term comes from using a metaphor of a "Stack of Index Cards"... because
it's possible to imagine a HyperCard stack as being just a series of cards
that are all instantly accessible.

GEnieLamp> Okay, so let's say I have a IIgs with at least 2 meg of
memory, a hard drive, a color monitor and I'm interested in
finding out about HyperCard IIgs. What's the first thing I do?

HangTime> Download it. From the A2 Library on GEnie.

GEnieLamp> How many disks is it?

HangTime> There are 6 disks making up the complete suite. This includes
HyperCard IIgs along with all the support stacks (Help, Tour,
Sample Stacks [2 disks worth], Ideas, Xcmds, etc)

GEnieLamp> This program sold for about $70 previously. How did A2 get

HangTime> I was speaking with Matt Deatherage, an Apple employee and head
of the A2Pro RT on GEnie, and we were discussing how great
HyperCard is and what a shame it is that more people aren't using it.
Since Apple is no longer selling the product Matt spent a few weeks talking
with the high muckity mucks and arranged for it to be electronically
licensable. That's the long and the short of it.

GEnieLamp> But no manuals are included. What can you do without manuals?

HangTime> Depends how gutsy you are.

If you check out the stacks that are included in the package
and don't mind digging into the code, you might very well figure out a LOT of
HyperTalk. Also, A2 University is just gearing up to teach a HyperTalk course beginning February 17! This course will start you out on the basics and take you through the nitty gritty.

GEnieLamp> And there is a HyperCard RTC in A2Pro for additional help.

HangTime> When is that? What is covered in the RTC?

GEnieLamp> I think the _major_ RTCs are going to be the HyperTalk courses for awhile, but in addition to these Thursday night courses there's a HyperCard RTC every Wednesday night as well. There is no set agenda, all HyperCard questions are fair game.

GEnieLamp> How about stacks by other people -- are there some available for downloading to see what can be done?

HangTime> Yes, there are PLENTY of HyperCard stacks available on GEnie for download in both the A2 and A2Pro libraries. Plus with the new availability of HCGS, you are likely to be seeing dozens more very shortly!

GEnieLamp> Is there a way to share or sell stacks that I write myself?

HangTime> Sure, just like any other software, you can sell it commercially (if you know how, or find a company to do it), or upload them to any BBS you might frequent.

GEnieLamp> A good example of the full range of uses for HyperCard is displayed in the disk based magazine "Script-Central", which you edit. How did this magazine come about?

HangTime> Believe it or not, all I did was apply. That's the short story. The longer version is that I got HCGS the day it was released (overnight delivered in fact) and spent the next 6 hours or so reading all the manuals cover to cover. I had my first stack completed and uploaded a couple of hours after that. From that point there was no stopping me, I was having too much fun.

I immediately became the HyperMedia librarian for the A2 library. Then a couple of weeks after that I logged on to find some mail from Dean Esmay mentioning that Tom Weishaar (owner of Resource Central) was looking for an editor for a HyperCard publication. Before I even finished reading Dean's letter I was sending a letter off to Tom... and the rest is history.

GEnieLamp> How long ago was this?

HangTime> Let's see, 3 years and 14 days ago (38 minutes, 29 seconds and 40 ticks) HyperCard was released, and I got my copy several hours after that. And the first issue of Script-Central was in July 1991

GEnieLamp> What does a typical issue of Script-Central contain?

HangTime> There's no such thing as a "Typical" issue. Every issue is new and different, filled with a variety of stacks and info. When you start up an issue of Script-Central the first thing you see is some sort of titles (some animations, sounds, whatever I feel like doing that
month). After the titles you find yourself standing before the front door to our HyperCard School House (address 65816 School House Road). Knock on the door by clicking on it and you enter the world of Script-Central.

Once inside the building you can move around by clicking on doors, buttons, drawers, and even a couple of not so obvious things (I like hiding gags in each issue). In our Regular Departments area you can find things like Clip Art News, Rumors, Mail, Press Releases and the like. Additionally the Work Shop is also in this area providing new fonts, sounds, scripting tips, Xcmds, ready to use handlers, Homework, or any of probably a dozen other things. Items in various rooms tend to change over time, as I come up with new ideas, or become bored with the "same old stuhp". This is all on the main floor of our Virtual School House. On the second floor you'll find the main "Feature" stacks of the month. These cover ALL the bases, from Games and Utilities to straight HyperMedia-type applications.

GEnieLamp>   Is there a sample issue that can be downloaded?

"""""""""""""""""
HangTime>   Yes there is, but it doesn't do justice to the Script-Central of today! That demo was created almost three years ago and the stacks we're doing today are light years ahead of that.

GEnieLamp>   Any other comments about HyperCard IIgs?

"""""""""""""""
HangTime>   There is not enough time in the day to talk about all that HyperCard is, let alone DO all that HyperCard can do. The end.

[EOA]

PAL NEWSLETTER /
March 1994 Report

By GEna Saikin
[A2.GENA]

Welcome to the March issue of PAL!

PAL (Planetary Apple League) was created to help fill in the gaps all too often left by the availability of user groups in the local communities. We meet the third Sunday of every month, in the Apple II Real Time Conference area, and each month is filled with demonstrations, announcements of what's new in the world of Apple, and in the Apple II Round Table, as well as time for questions and answers on hardware and software problems.

This is YOUR meeting! We want suggestions and feedback as to what YOU would like to see! Please feel free to email GS.OZONEMAN or A2.GENA, the leaders of PAL with your ideas and suggestions.

WHAT'S NEW IN THE APPLE WORLD

As we all know, Spectrum has been released, and is being met with great enthusiasm. Though there are still wrinkles to be ironed out, that is commonplace for new programs. Talented people are already busily creating autogreet and other automated type scripting and are loading them into the A2 library.
AppleWorks 4 and its updated versions continue to be popular, and why not? AppleWorks is and always has been the "workhorse" of the Apple II world!

discQuest, the newest program out, is described below by Jawaid Bazyar [PROCYON.INC]. discQuest (with a small D) is a revolutionary program for the IIgs. It is a front-end program that enables people with Apple IIgs's to "read" CD-ROM's. There are now over 15 titles available -- from Shakespeare to the Family Doctor; from Darwin to the Classics. To quote from Jawaid's presentation:

Basically, discQuest is a "front-end" to access these particular CD's in a user-friendly, fast, efficient, and productive manner. Before you say "but only 15?", let me mention some of the titles available: Parenting; US History; Countries of the World Encyclopedia; Darwin (his journals, books, maps, and research notes); Complete Works of William Shakespeare, Complete Sherlock Holmes; and History of the World (not the Mel Brooks version :), just to name a few.

In short, there are a wide variety of very comprehensive titles in our group of 15. DiscQuest allows the user to view the text articles, graphics images (in some cases Photographic quality!), and play audio clips from the CD. Everything is tied together in a rough "HyperMedia" or "HyperText" format, so that cross-references can be viewed easily. In addition, you can export text via the clipboard, or save text out to a file on disk, for inclusion in a report or whatever.

NEW discQuest Titles (as of January 1994)

Total Baseball -- New 1993 Edition (CMC)

This Multimedia guide is the most comprehensive baseball reference ever compiled.

- 2,300 pages of statistics and articles - dating back to 1871
- Player, pitcher, and relief-pitcher registers
- Top 100 All-Time Leaders: Life-Time and Single-Season
- Most Valuable Player, Cy Young, Rookie of the Year, and Hall of Fame awards
- A variety of rosters
- Detailed articles covering everything from hitting streaks to scandals to controversies
- More than 600 photos and images of players, teams, and ballparks
- Sound clips of some of the game's most memorable moments

1991 YearBooks(R) (YearBook Medical Publishers, Inc)

Other discQuest titles

- Darwin Multimedia CD-ROM (LIGHTBINDERS)
- Monarch Notes(R) on CD-ROM (Bureau)
- Sherlock Holmes on disc! (CMC)
- The Family Doctor (CMC)
- Shakespeare (CMC)
- Great Literature (Bureau)
- Parenting -- Prenatal to Preschool (CMC)
- Multimedia Audubon's Birds (CMC)
- Multimedia Audubon's Mammals (CMC)
- The Best of The Bureau (Bureau)
- US History on CD-ROM (Bureau)
- History of the World on CD-ROM (Bureau)
- Countries of the World on CD-ROM (Bureau)

This pretty much sums up DiscQuest. For further information, contact Procyon, Inc.

THE LIBRARY STACK The A2 RoundTable has a library that contains thousands of public domain freeware, shareware and other assorted programs. Here is a short listing of the best of the most recent additions:

- 22235 RADTRASH.BXY Animated trash icon & "flush" rSound
- +22234 TAX.FORMS93.BXY 1993 federal tax forms - AW spreadsheets
- +22227 BIG402B.BXY Updates AppleWorks 4.01 to 4.02
- 22225 MINITALK162.BXY Telecom program in a CDA
- 22220 CDA.ADB.BXY CDA to view AppleWorks ADB files
- 22207 DISKOPEN.BXY Auto-opens Finder's disk icons
- +22183 A2.DOM.0294.BXY A2 Disk of the Month, February 1994
- 22181 DISKTIMER2.BXY Check the speed of your hard drives
- +22171 A2AWLIBLONG.BXY A2 library database - lists all files in A2

Thanks to the efforts of Matt Deatherage, we have also recently received a license from Apple Computer that allows us to distribute HyperCard IIgs! The complete HyperCard IIgs program comes on six 3.5" disks:

- 22199 HTALKHELP.BXY HCGS HyperTalk Help disk
- 22198 HCGS.HELP.BXY HyperCard IIgs Help disk
- 22197 STACKS2.BXY HyperCard IIgs Stacks disk #2
- 22196 STACKS1.BXY HyperCard IIgs Stacks disk #1
- 22195 HCGS.BXY HyperCard IIgs Program disk
- 22194 INST.TOUR.BXY HCGS Installer/Tour disk

We also have a "starter kit" that contains just enough files to give you a taste of what HyperCard IIgs is all about:

- 22200 HCGSSTARTER.BXY HyperCard IIgs Starter Kit

Our libraries contain all kinds of interesting files. Whether you're looking for games, graphics, music or system files, you can find it all right here in A2!

GUEST ARTICLE I asked a newcomer to the IIgs to write a short article on her experiences. Read with a blimmer of remembrances when
YOU were once new!

I have had my Apple //c computer for almost ten years now. My mom, a junior high computer teacher, let me play with her classroom disks and games. I always thought that the only things there were for the Apple were math games.

I originally logged on to GEnie with an old IBM. But, knowing I was going to lose access to that, I sought to find out if there was a way to continue my stay with my Apple //c. After visiting the A2 RTC and looking through the bulletin board, I discovered that there were TONS of things I could do with my Apple!

With the help of Sue and Gena, I found out that I could not only access GEnie with my Apple //c, but there were also many many software programs out there! Between the freeware and shareware in the A2 Library, and the commercial software available through various commercial outlets, I have learned more and more about my Apple.

I had always considered myself an "Apple Gal" but was considering switching to IBM, out of desperation. Now, I am DEFINITELY still am an "Apple Gal" and plan to stay that way for a long time! I would not be on GEnie today without the wonderful help from Gena, the rest of the A2 staff, and the users in A2. Thanks to everyone for all their help!

WHAT'S NEW IN A2? As our library stack mentions, HyperCard GS (HCGS) is now available in both the Apple II RT library and the Apple II Programmers RT library. It was once a commercial program, but now is available to the general public! For further information on HCGS, please read the related interview right here in this issue of GEnieLamp!

CONCLUSION Remember, we have Real Time Conferences every night of the week, from 9 p.m. to 1 a.m. eastern time; and all afternoon on Sunday! We're here to help you with any problems you may have.

Don't forget our Bulletin Board, with is full of advice, questions, and answers on almost any conceivable subject. Feel free to post a question, or if you know the answer to a question, by all means, contribute!

[EOA]

By Steven Weyhrich
[S.WEYHRICH]
the magazine landscape, and some additional material had to be added. Consequently, I’ve chosen to combine parts 20 and 21 into one large file, and then split that file into three smaller pieces that are more appropriately sized for publication in GEnieLamp A2. They will be called Part 20/21a, 20/21b, and 20/21c (this will avoid the problem of changing the numbering sequence for this segment of the history).

In this segment, we will deal with the magazines Micro, Call-A.P.P.L.E., SoftSide, Apple Assembly Line, Nibble, Peelings II, and Softalk.

INFORMATION AND COMMUNITY From the earliest days that Apple II user groups have sprung up, there have been newsletters shared within (and often among) these groups, providing hints and tips on how to make the best use of this computer. Some of these user groups eventually turned their newsletters into nationally distributed publications, sharing the information on even a wider scale. Nationally distributed magazines that dealt with computers began to run regular columns and special articles that dealt with the Apple II, while other magazines began with the purpose of serving the Apple II community exclusively. This segment of the History will take a look at some of the publications that have grown (and sometimes failed) during the age of the Apple II. I will be concentrating on those that were either exclusive to the Apple II or that dealt heavily with it.

Micro (1977-1985) Micro began with the October/November 1977 issue, and covered the 6502 microprocessor (and later the 6809) in all the various computers that used it, including the KIM-1, the AIM-65, the C1P, Commodore's PET, the Ohio Scientific, the Atari 800, and, of course, the Apple II. It was an excellent source for machine level code for the 6502, eventually including more and more articles that applied specifically to the Apple II. Many general-purpose machine language articles appeared in its pages, such as "Improved nth Precision" (code optimization for the 6502), "Precision Programming", and "Computer Assisted Translation Of Programs From 6502 to 6809". They also carried do-it-yourself hardware articles, such as "C1P To Epson MX-80 Printer Interface", "PET/CBM IEEE 448 To Parallel Printer Interface", and "Apple II Digital Storage Oscilloscope".

Micro tended to use each issue for a particular theme, starting out with articles that concentrated on a particular brand of computer per issue, and later expanding to topics that applied to several computers (such as printers, games, and languages). The articles presented were usually technical in nature and could be very useful for the advanced Apple programmer.<1>

One feature that was unique to this magazine was the "Micro 6502 Bibliography", which presented a reference to many different computer publications and the topics these magazines covered that were specifically important to programming the 6502. Also, the magazine's cover was unique, giving the impression of looking out from the INSIDE of a computer monitor, over the keyboard to the room beyond. Graphics on the screen would be reversed, since it was supposed to be a reverse view.

Call-A.P.P.L.E. (1978-1989) This magazine began in February 1978 as a newsletter for a newly formed Apple II user group in Seattle, Washington. This group, which called itself the Apple Pugetsound Program Library Exchange (A.P.F.L.E.) was begun by several early
Apple II owners in the area. They began a newsletter, Call-A.P.P.L.E., and under the leadership of its founder and editor, Val J. Golding, it grew to become a full magazine by 1979, and its boundaries spread well beyond the Seattle area. As pioneers in the era of Apple II exploration and expansion, the group's members and magazine subscribers discovered and published many hints, tips, and programming techniques necessary to the early Apple II community. Their major thrust, as with user groups today, came from assisting members in getting their systems to work. This covered anything from establishing communication between a computer and the newest low-cost printer, to the nuts and bolts of adding memory chips to get a full 48K. Call-A.P.P.L.E. also informed its readers with reviews of new software and programming languages, and entertained them with short Integer BASIC and Applesoft programs that did strange or unexpected things (in a recurring feature entitled, "So What Did You Expect?") They also served their members by scheduling guest speakers for the group meetings, and printing a summary of the meeting in the magazine. Their early speakers included notables such as Mike Scott (president of Apple Computer), Randy Wigginton, and Steve Wozniak.

By 1980, Call-A.P.P.L.E. had become a full magazine published on slick paper, and it carried advertising by some of the new software and hardware companies. Their articles became more complex, dealing with topics such as "Moving DOS 3.3 To The Language Card", and "Applesoft Internal Structure", as well as various hardware or construction articles.

The year 1984 saw many changes for Call-A.P.P.L.E. The front cover had previously been white, with the title logo at the top, followed by a list of major articles. Beginning with the January issue, the cover was now graced with color artwork, and a subtitle was included under the logo: "The World's Largest Apple User Group". In April, Val Golding stepped down as editor, handing that position over to Kathryn Halgrimson Suther. She had been working with him on production of the magazine since he hired her back in 1980, and was best qualified for the position. And finally, in September 1984 the membership voted to change their organization to a co-operative, officially named A.P.P.L.E. Co-op, to help improve their efficiency and allow them, under Washington state law, to continue expanding services in as inexpensive a manner as possible. Previously selling software written primarily by members, they now began to carry outside software and hardware items considered useful to their members.

A.P.P.L.E. also advanced the cause of providing useful technical information to Apple II (and Lisa and Macintosh) programmers by helping with the formation of APDA (Apple Programmers And Developers Association) in September of 1987. Through a membership in this Apple-sponsored group, a programmer could obtain up-to-date tech notes and preliminary material directly from Apple, to aid in the refinement of his project. (Apple later took APDA back under its own control in December 1988.)

Another change for the magazine occurred beginning in June 1988. The cover artwork was toned down, and the thrust of Call-A.P.P.L.E. changed as it become more of a technical journal than the "hint and tip" magazine it had originally been. Again the cover listed the major features for that issue, but in a smaller typeface than in the old days. Articles were now much more complex, consistent with the increase in complexity found in the new Apple IIGs. This was also reflected in the subtitie now found under the logo on the front cover: "The Magazine For The Advanced Apple IIGs And Apple II User". Topics covered included a series by Mike Westerfield about "Programming On The GS With APW" (he was the author of the ORCA/M assembler.)
used in the official Apple Programmer's Workshop on the IIgs), "NDAs 101" and "NDAs 102" (Tim Swihart writing about writing New Desk Accessories), and "A Powerful Graphics And Sound Trio" (utilities to allow use of super hi-res graphics and GS sound from Applesoft BASIC).

Even more significant in 1988 was the change in the name of the sponsoring group. In her monthly editorial in December of that year, Kathryn Suther wrote, "Sorry, Val, but the Co-op is undergoing a name change. Apple Computer, Inc., doesn't seem to appreciate the word Apple in our name with or without the periods. Rather than having to license the name back from them, we opted to change the name of the co-op to TechAlliance, a computer cooperative." (Fortunately, they were not apparently required by Apple to change the title of the magazine). The members felt that this name more accurately reflected what the organization was doing; support, technical journals, and access to products and information. They also laid plans for a journal aimed at Macintosh programmers, called "MacTech Quarterly".

With declining Apple II sales in the late 1980s, it was becoming harder for TechAlliance to put out the type of magazine they wanted as a monthly publication. Part way through 1989, the decision was made to switch to a quarterly printing schedule to allow it to stay in print. However, with the ninth issue of that year they had to announce that they were ceasing publication. With the passing of Call-A.P.P.L.E. came the passing of an era. Val Golding wrote to A2-Central's Tom Weishaar about it: "The 12-year illumination of Call-A.P.P.L.E.'s guiding light is about to be extinguished. The next issue will be the last. 'Call' was my baby and I loved it very much, even these last several years when I didn't play a direct role. It is, after all, like a death in the family." He went on to mention that he believed that their research into Applesoft internals and the use of its ampersand command made it possible for the appearance of more advanced programs earlier than would have been possible otherwise. He included a copy of his guest editorial from that final issue, reprinted in the pages of A2-Central in January 1990:

The Editor Bytes Back
Val J. Golding, editor emeritus
Full Circle

Perhaps I've lived in a private dream world all this time, where visions of ampersand faeries were real and 16K of RAM sufficed. My 1978 world where, still wrapped in swaddling clothes, the infant Call-A.P.P.L.E., with wise men guiding, exploded upon the technological night sky--its contagious fountain of knowledge spreading like a Washington wildfire, a depth and rugged determination to share never before and never again to be seen.

Volume 12, number Nine; there will be no Volume 13. Words I thought would never be written blur my vision and scar the moist paper with ugly burn marks. "Our last issue". A doorway to another dimension has closed after 12 years.

It would take pages to list our accomplishments and firsts, more still for our failures. But we stood proud while others perished. And so it will be in the future, the Alliance remains to serve its members.
None of it would have been possible without those brilliant pioneering researchers and authors, far too numerous to even consider thanking individually. Virtually every Apple author writing today appeared first in these pages. It isn't fair, however, to leave without at least expressing my gratitude to and admiration for Kathryn Halgrimson Suther, without whom we would not have survived thus far. I love you, Ms. K.

Still everything is O.K. I wouldn't have missed it for anything. "The moving finger, having writ, moves on..."<2>

SoftSide (1978-1984) SoftSide was a magazine about software, begun in October 1978 by Roger Robitaille. It had a format similar to the early issues of Nibble, with articles and program listings to enter and try out. A version that was specific to the Apple II began in January 1980, and lasted as a focused publication until August 1980, when it combined with the other versions of SoftSide that were for the TRS-80, IBM-PC, and Atari computers. The Apple edition was edited by Mark Pelczarski, who was also an Apple II game author and publisher.

One problem some readers had with SoftSide was with their program listings; they were a copy of the printout from a dot matrix printer. The dot matrix printers of the time were not as legible as they are now and by the time it was photographed and put into the magazine, it had become a bit illegible. One reader commented, "After a short while of typing, you felt like you needed some of the 'coke bottle bottom' eye glasses!"<3>

Like many computer publications of the time, SoftSide fell on hard times because of financial pressures and competition. This came during their attempt in 1983 to increase their distribution and reach a larger audience of readers. As a result, Robitaille made some efforts to reorganize the publication into a new magazine called SoftSide 2.0 (directed towards the computer user), and Code (for the programmer), with disk versions of both to be made available. Unfortunately, he was never able to get either concept fully established, and SoftSide disappeared from view.<4>

Apple Assembly Line (1980-1988) This was something more than a newsletter, but not quite a magazine. It was edited and printed by Bob Sander-Cederlof, author of the SC-Assembler, and was written initially for support of that product. It included information about how to write assembly language routines for various projects, and one of Sander-Cederlof's favorite pastimes was finding ways to squeeze the most code into the fewest bytes possible. Often he would take sections of code from Apple's system software, disassemble it, and point out how it could have been coded more tightly or efficiently. He also included various products that he or others had written that were useful for other programmers, including a package of extensions for Applesoft that allowed 18 digit precision math functions.

In 1993, the Apple II Programmer's Roundtable (A2Pro) on GENie was given permission by Bob Sander-Cederlof to upload the complete text and source code for every issue of Apple Assembly Line that was ever produced. Matt Deatherage, chief Sysop for that roundtable, took on the laborious task of converting all of the old DOS 3.3 and hybrid DOS 3.3/ProDOS disks provided by Sander-Cederlof. Deatherage had to convert all of the old files into a format that was accessible under ProDOS (which you may recall has a more limited file-naming system than did DOS 3.3). Also, he had to
locate and organize all of the various source files pertinent to a particular issue of the newsletter from the various disks that Sander-Cederlof had previously made available to his subscribers. After compiling all of the information, Deatherage then created individual archives for each issue and uploaded them to the A2Pro library. They are there available on an exclusive basis, as permission for uploading them to any other online service or BBS was NOT granted.

Nibble (1980-1992) Begun in his living room in January 1980 by Mike Harvey, Nibble survived longer than most Apple II magazines. His original advertisement for the magazine stated:

NIBBLE is an unusual Newsletter for Apple II owners. Each Issue will follow a major theme...such as:

* DATA BASE MANAGEMENT
* PROGRAMS FOR THE HOME
* TEXT PROCESSING
* COMPUTING FOR KIDS
* SMALL BUSINESS JOBS
* GAMES AND GRAPHICS
* PRACTICAL PASCAL
* etc.

Significant programs will be in each issue, surrounded by articles which show how to USE the programming ideas in your OWN programs.

Examples of Upcoming Articles...

* Building A Numeric Keypad
* Home Credit Card Management
* LORES Shape Writing
* Designing Games That Last
* Arcade Shooting Gallery
* Random #'s in Assy. Lang.
* HIRES Weaving Design

And many many more. NIBBLE will literally "Nibble Away" at the mysteries of the Apple II to help Beginning and Advanced Programmers, Small Businessmen, and the Whole Family enjoy and USE the Apple MORE!

It costs a paltry $15.00 for 8 Issues! It will invite and publish user ideas and programs. DON'T WAIT! Send your check or money order right now, to receive the January issue! Mail to:

S.P.A.R.C.
P.O. Box [number missing]
Lincoln, Mass. 01773

Software Publishing And Research Co.<5>

Mike worked carefully to make sure that he was not under the pressure of banks or investors, and so worked out of his own savings, running the company on a "pay as you go" basis. He printed enough of the first issue, 42 pages long in black and white, to mail to the few who responded to his ad, and the rest were sent free of charge to Apple dealers to make them aware of Nibble's existence. Their initial schedule was for eight issues per year, which was what he could afford to put out. By mid 1981 the
magazine had grown to the point where Harvey could quit his regular job (president of a subsidiary of Exxon Enterprises) and work full-time as publisher of Nibble. His editorials over the years covered many topics that were helpful for small businesses, giving advice that would help them survive in good times and bad. He certainly took his own advice; although Nibble expanded to the point where it went to a monthly schedule (around 1984) and was printed as a square-bound magazine, it had to reduce by 1990 back to a center-stapled format with fewer pages. Eventually its newsstand distribution also had to be curtailed, and in the end it was available only by subscription.

Nibble's articles covered a wide array of topics, from simple Applesoft and Integer BASIC programs, to complex assembly language applications, BASIC extensions, and games. In its prime it also included a popular series called "Disassembly Lines", by contributing editor Sandy Mossberg, M.D. In his series, Mossberg taught some of the tricks and techniques of assembly language by taking parts of DOS 3.3, and later BASIC.SYSTEM and PRODOS, and "disassembling" them into readable assembly source code. This provided some insight into reasons why Apple's system programs worked the way they did, and made it possible to either modify them to fix bugs, or to incorporate the programming techniques in other projects. Mossberg later went on to delve into the Apple IIgs toolbox (built-in ROM routines).

Nibble was a good place to learn how to write programs. Their published listings were well commented, and the tricks used by the programmers who wrote their articles were available for all to see and learn. Along with the various utilities they published were games (some that were very complicated, with long tables of hex bytes to enter). They also included in later issues reviews of various commercial software products, and always made available disks containing all of the programs from a single issue of the magazine, for those who didn't want to enter by hand the programs.

In April 1985 a section was added to the magazine called "Nibble Mac", to cover topics of interest to Macintosh users. Later in 1985 this was split out and a separate publication (short-lived) with the same title was printed to concentrate on the Macintosh users. Nibble also helped establish the concept of copyright protection on program listings printed in magazines. This was important to Nibble, as they sold disks of their old programs to save readers the trouble of typing in by hand the long listings.

With decreasing sales, a decision was made in 1991 to no longer supply Nibble to newsstand vendors and continue the magazine on a subscription-only basis. The market for Apple II programming-oriented magazines continued to decline, and the July 1992 issue announced itself as the last one. The balance of subscriptions were filled out through A2-Central.

Peelings II (1980-unknown) Started around August 1980, this magazine was devoted entirely to Apple II software reviews.

Softalk (1980-1984) Softalk ... ah, this one was special. Of all the magazines that have dealt with the Apple II since its release in 1977, none have been quite like Softalk. Their first issue in September 1980 was 32 pages, including the cover which featured Darth Vader.
with the title, "Apple Helps The Empire Strike Back". This first issue opened with the following introductory remark. I reproduce it in its entirety here, because it highlights what I feel is the ideal in a computer magazine, and because the last two paragraphs are still very applicable today:

Welcome to SOFTALK. Whether you're a hobbyist or a businessperson, a programmer or a nonprogrammer, SOFTALK is designed for you, because each of you has chosen Apple for your computer; and so did we.

SOFTALK is a feature magazine, intended to pique the curiosity and intrigue the intellect of everyone who owns an Apple. In SOFTALK, you'll find articles about people who own and use Apples, some of them famous, some merely ingenious. You'll find articles about issues—those most pertinent within the microcomputer industry, such as piracy, and those the microcomputer is helping to solve, such as unemployment among the handicapped.

SOFTALK'S regular columns will strive to keep you up with what's new in software and hardware and what's new in the companies that make software and hardware. We'll also try to keep you informed of how the computer is making news, both in the United States and abroad, both seriously and lightly.

SOFTALK is not a programming magazine. Beginning in October, our programming columns will be intended as tutorials, offering running courses on how to program. Although we believe that those of you who are seriously involved in programming will enjoy SOFTALK, for your programming applications we recommend that you seek out the excellent programming articles and tips in such magazines as APPLE ORCHARD, MICRO, CALL-A.P.P.L.E., CREATIVE COMPUTING, and the many other fine magazines that address themselves to this aspect of computing.

Fun is another feature of SOFTALK. There will be puzzles, games, contests. The prizes won't be huge, but they will be fun. This month, you'll find a contest on page 2; later in the magazine lurks another puzzler.

We encourage you to patronize our advertisers. Those advertisers make it possible for you to receive SOFTALK. And, further, we hope you'll support your local computer store. A healthy retail sector is crucial to our industry on every level; it is to all our benefits to help our retailers prosper.

I hope you share my enthusiasm for Apple and for the remarkable microcomputer industry, because, when you share it, you'll find yourself looking forward to the fast-coming future with excitement and optimistic anticipation. If SOFTALK serves only to instill such a positive enthusiasm in you, it will be well worthwhile.<8>

Oddly enough, Softalk owed its beginning to a television game show. Margot Tommervik was a contestant on "Password", and with part of her winnings she purchased an Apple II computer. She was fascinated with the machine and what it allowed her to do. When a local computer store offered
a prize for the first person to solve On-Line's Mystery House adventure, she dove into it headlong and had it solved in twenty-four hours. Later that year, she came across a publishing house that was trying to produce a magazine about software and wanted a partner. With the rest of her "Password" winnings, Margot and her husband Al agreed to do the magazine if they were allowed to determine its course and retain management control. It would be as much a magazine for Apple II enthusiasts to enjoy as a platform for software publishers to display their wares. Although it had the modest beginning of only 32 pages printed on newsprint stock, within a year there were over one hundred advertising pages in each issue. It was an ideal arrangement: The readers got a magazine that was specifically about their computer, and the software and hardware companies got a magazine with widespread distribution that could showcase their products to those readers.<9>

Part of the uniqueness of Softalk was due to the way it did business. Although it was a magazine that was available by mail or in computer stores (as were other computer magazines of the day), this one offered EVERY Apple II owner a FREE six month subscription as a trial! One only had to provide the serial number on the bottom of the computer, and you were in the club. And it felt like a club, almost a family, of fellow Apple II (and later, Apple III, Lisa, and Macintosh) enthusiasts. This unusual method of providing a magazine lasted even until the final issue.

Softalk carved its niche among the other Apple II magazines of the time by providing a variety of articles not available anywhere else. Whereas Nibble was best known for its games and utilities, Call-A.P.P.L.E. for its technical information, and Apple Orchard for its focus on beginners and Apple user groups, Softalk concentrated on the Apple computer industry. This included information about Apple Computer, Inc., as well as the many companies that provided software or hardware for the Apple II. A monthly series called "Exec" (taken after the DOS 3.3 disk command), profiled a company that made hardware or software for the Apple II, and gave some of the background about its products. They carried reviews of many new releases each month, and provided news on a continuing basis ABOUT the companies making those products. They also developed a monthly best-seller list for Apple II and III software, and used not the sales figures provided by the companies who marketed the programs, but rather the actual sales figures from the software and computer stores that sold them. Their reason for doing it this way was to get a more accurate picture of what was SELLING, not just what was shipping.

As time went by, Softalk expanded its coverage to include columns that dealt with specific programming areas on the Apple II, but chose to do so in a tutorial fashion, as they promised in their introduction article. Roger Wagner started in October 1980 with a column called "Assembly Lines" that taught 6502 assembly language (he says that what he knew about 6502 assembly was only about one month ahead of what the readers were learning<10>); Doug Carlston instructed users in the art of BASIC programming in "All About Applesoft"; Mark Pelczarski expounded on hi-res graphics techniques in "Graphically Speaking"; Taylor Pohman (an Apple employee) wrote about the Apple III in "The Third Basic"; Jim Merritt (who also worked for Apple) championed Pascal in "The Pascal Path"; Greg Tibbetts delved into Apple CP/M in "Softcard Symposium"; and Bert Kersey and Tom Weishaar deciphered DOS 3.3 and ProDOS in "DOSTalk". Other regular features included "Fastalk" (an annotated listing and description of current and classic software), "Marketalk News" (product release announcements) and "Marketalk Reviews" (detailed product reviews),
"Tradetalk" (Apple industry news), "Hardtalk" (hardware projects or information), "Storytalk" (fiction, primarily computer related), and eventually a column called "Backtalk", which was a look back at older issues of Softalk itself (this began on the third anniversary of the magazine). One unusual column, called "Open Discussion", was quite similar to the interaction on today's online information services. They printed letters from readers that ranged from comments on previous articles to questions such as "How do I get Apple Writer to work with my printer?" Rather than directly answering each question, Softalk often left it to readers to send in replies with help. In its last year, Softalk did begin a column called "If Then Maybe", which actually took some of those technical questions and used some of its consulting writers (the "Softalk Sages") to answer them.

Each month there was a new contest, usually involving a puzzle of some sort that might or might not require the use of a computer to help solve it. The winners of the previous month's contests were awarded a credit towards $100 worth of products advertised in Softalk. The puzzles were creative and unique. One issue asked to have various shapes in a later part of the magazine identified (some that were obvious, such as a computer monitor, some less so, such as a hand phaser from Star Trek). Another contest consisted of only lists of five character scrambled words; no clues, no instructions, no direction. One month had a crossword puzzle with VERY obtuse clues. One November issue featured tiny little "hi-res" turkeys scattered throughout the magazine; the goal was to correctly count ALL of them. Some of the contests even allowed those entering to be creative; one asked entrants to write a short paragraph that might illustrate the use of an Apple computer by a fictional or non-fictional historical figure (an example being Emperor Nero playing an adventure game in which he is trying to figure out the correct commands to get it to allow him to burn down Rome). In the case of multiple entries with correct answers, the winner of the monthly contests was selected with a random-number generator. Even if you didn't enter the contests, they were fun to read and ponder, and some of the winning entries (when creative writing was involved) were great.

Softalk suddenly disappeared after the August 1984 issue was mailed. There was no announcement, nothing that had indicated that this was going to happen, and with its disappearance the "Golden Age" of the Apple also passed. (By this time Softalk Publishing also had two other magazines, "Softalk For The IBM PC" and "St. Mac", for the Macintosh). This ending could have been predicted by the way in which the magazine had gotten smaller and smaller in size over the previous few months, but its ending was still somewhat of a shock to the readers. One reader was reported to have said that if he had known that they were having financial problems he would have taken up a collection!

What led to the demise of Softalk? Several factors likely played a role. One was the explosion in the number of magazines for and about computers between 1981 and 1983. Each new magazine that appeared was yet another place where a vendor needed to consider putting advertising dollars, and for some small companies it was simply not affordable to put ads in ALL of them. Another factor that figured in was the introduction of the IBM PC, and the sudden need for companies to produce versions of their programs that would run on THAT computer. When the recession of 1982-84 arrived, the computer market began to lose steam, and small single-product companies either had to associate with larger ones or go out of business. Lower consumer spending on computer hardware and software hurt the market
further, and the necessary advertising dollars were simply not available, and Softalk became, unfortunately, one of the casualties.<11> Perhaps the major factor that contributed to this was that Softalk did not have any large publishing company backing it up; it was owned and operated by the Tommerviks, and they didn’t have the cash cushion that would allow them to pay expenses during time of slow advertising revenue.<12> Perhaps if a major publisher had taken an interest, Softalk would still be around today.

In its prime (December 1983), Softalk was over 400 pages long, but by its final issue in August 1984 it had shrunk down to only 128 pages. Although a next issue was in the works (according to the "previews" section in the table of contents), it never made it to the printer. Remaining subscriptions were filled out by inCider magazine, but sadly, the magic was gone.

GENieLamp is also distributed on CrossNet, Internet, America Online, Delphi and many public and commercial BBS systems worldwide.

- To reach GENieLamp on Internet send mail to genielamp@genie.geis.com OR jpeters@sosi.com

- Our Internet anonymous FTP address is: sosi.com. All current versions of GENieLamp are available in the ~/pub/GENieLamp directory. Due to the added expense involved, we ask that when you get GENieLamp via the anonymous ftp for GENieLamp, that it _not_ be ftp’d during the hours of 9AM and 5PM Eastern Standard Time. We appreciate your cooperation in this matter.

- Current issues of all versions of GENieLamp as well as back issues of GENieLamp IBM are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GENieLamp platform (FREQ FILES for names of back issues of GENieLamp IBM):

Platform  Magic Name To Use
----------   ----------------
GENieLamp IBM ................. GLIBMB
GENieLamp ST ................. GLST
GENieLamp A2Pro .............. GLA2PRO
Apple II Computer Info

GENieLamp Macintosh ............ GLMAC
GENieLamp TX2 .................. GLTX2
GENieLamp A2 ................... GLA2

- Back issues of GENieLamp are available in the DigiPub RoundTable
  Library #2 on page 1395. M1395;3

- GENieLamp pays for articles submitted and published with online GENie
  credit time. Upload submissions in ASCII format to library #42 in
  the DigiPub RoundTable on page 1395 (M1395;3) or Email it to
  GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions
  or just to say hi, you can contact us in the DigiPub RoundTable
  (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet us "live" talk to us every Wednesday night
  in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2

- The Digital Publishing RoundTable is for people who are interested in
  pursuing publication of their work electronically on GENie or via
  disk-based media. For those looking for online publications, the
  DigiPub Software Libraries offer online magazines, newsletters,
  short-stories, poetry and other various text oriented articles for
  downloading to your computer. Also available are writers' tools and
  'Hyper-utilities' for text presentation on most computer systems. In
  the DigiPub Bulletin Board you can converse with people in the
digital publishing industry, meet editors from some of the top
  electronic publications and get hints and tips on how to go about
  publishing your own digital book. The DigiPub RoundTable is the
  official online service for the Digital Publishing Association. To
  get there type DIGIPUB or M1395 at any GENie prompt.

READING GENieLamp
GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO
To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)
|_______|_______|_______|_______|
|Name of sender CATegory TOPic Msg.# Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GENie
GENie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: JOINGENIE and hit RETURN. When you get the prompt asking for the signup/offer code, type: D524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLamp READERS!
If you sign onto GENie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there's no excuses! *** GET INTO THE LAMP! ***
There's no doubt about it, my wife Tara should really be writing these editorials. I'm sure we could overcome the technicality of her not actually being the editor of GEnieLamp A2 if we tried.

Tara uses our Apple IIgs every day to log in to the UNIX-based system at the university she attends. It requires her to enter her login name... and it's case sensitive. So the daily ritual goes something like this: She starts up SnowTerm, a shareware VT100 package, and dials the university computer. She waits for the "Login:" prompt, rapidly types her account name, and then groans as she sees it appear on the screen... all in capitals. I've left the Caps Lock key down again. "Oh well," she sighs. "Other wives have their toilet seats; I have my Caps Lock key."

Although I have three brothers and no sisters, I've always had excellent toilet-seat manners. So how is it that the only time I leave the Caps Lock key up is when I'm in a word processor? I admit my first computer was an Apple II-Plus, but it's been 10 years since then. Like most bad habits, mine has an unconscious element. As soon as I exit AppleWorks, I hit Caps Lock with my thumb without even thinking about it. Evidently I have a deep-rooted fear that any minute I may need to run some software written for a 48K Apple II.

Even Tara's masterly condensing of the Caps Lock Key Condition pales compared to her summary of the reaction in the Macintosh press to the "death" of the Apple IIe. I showed her the vicious rejoicing that was taking place on CompuServe and, while incredulous, was not too appalled to quip, "Pretty Mac-y-avellian."

Is it any wonder I want her to take over my monthly editorial?

[*][*][*]

The silly season came early this year, and March did not deign to come in either like a lion nor like a lamb, but chose to come in like a loony. That _has_ to be the explanation. How else do you explain such comments in the A2 RoundTable as:

-- J.SCHONBLOM [J.ERIC]

and:
> Randy, don't you just _hate_ 5.25 disks...?

This is the essence of truth, refined into one pure rhetorical question.

-- BRANDT [Randy]

And how about this mnemonic for people who don't understand which of the Hewlett-Packard printers -- DeskJet or DeskWriter -- works well with an Apple II?:

Simple enough to remember....

The GS can use the JET, the Mac has to WRITE ahead for reservations ;)

-- H.HISLOP [Harold]

Ken Lucke (K.LUCKE) and Harold Hislop (H.HISLOP) collaborated on "The Case of the Hundreds of rBundles", a discussion that reads like a 1930s American hard-boiled detective story:

It was a cold day in the city. The frozen ground felt like peanut brittle. I felt like a cigarette. If you don't know what a cigarette feels like, ya ain't missin nuttin. 'Specially after they's been ground out.....

I'd had a busy week, trying to crack the Case of the Absent Download. I was relaxin' in my office, plannin' to do a little modemin' that night, but waiting for the rates to go down.

Eventually, Ken got around to detailing his problem, which was a Desktop file that kept expanding whenever he ran Spectrum. Harold took up the tale:

It was a rainy day in Trenton, so much that even the organic frisbies were grounded... I had been perusing GENie looking for things that seemed out of whack when I stumbled into an old nemesis... Finder 6.0x! The infamous (and somewhat nasty) bug in it that tries to glom onto disk space had struck yet again!

Harold proposed a solution: lock your Desktop file. It could have ended there. Evidently Ken doesn't like to be outdone (though, equally obviously, he has no compunctions about being overdone):

It was another gritty, rainy day in the City of Seaside, all the tourists were under cover. 'Cept fer one. Name of Harold. Harold Hislop. Came into town on a big white horse, which is kinda strange, even for a tourist town. Has this stethoscope around his neck and a hundred or more cables of different types and lengths trailing around him like Lady Godiva's hair. Said he had the cure for ol' Mr. Spectrum.

Maybe all of the foregoing is due solely to spring fever. All I know for sure is that I'm glad there's a phone line separating these people -- not just from me, but from each other! The mind boggles at the thought of what some of these people will get up to during July's ICONference.

Still, as Hunter S. Thompson observed, "When the going gets weird,
the weird turn pro."

APPLE IIGS RGB MONITOR FIX  Any reasonably competent technician can fix

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
that problem for pennies (plus his or her labor charges) with the following information....

1. The part that causes the problem when it fails is a "choke" or "inductor", it is mounted on a small circuit board attached to the back of the monitor tube itself. This part looks like a small blue ceramic ball with two leads coming out the bottom, and is color coded for 10 microhenries.

2. There are three of these items on that circuit board, and if any one of them fails, the symptom is a screen all of one color, with total loss of any controls of the monitor. The parts are identified by number, and what color the screen is will tell you which one to replace....

   L6R2 for a Red screen
   L6G2 for a Green screen
   L6B2 for a Blue screen

3. You can probably get a 10 microhenry choke at Radio Shack, or it is available for $1.28 (plus a $5 Handling charge) from Digikey Corporation at (800) 344-4539. They take Mastercard, Visa, and C.O.D.

   The Digikey part number is M8025-ND.

4. After replacing this part, the monitor colors will need to be readjusted via the small color trimpots on the same circuit board.

SHAREWARE UPDATE  Dave Lyons is no longer accepting shareware fees on his software.

--- Eric S.  
(aka Sheppy)

(E.SHEPHERD, CAT34, TOP9, MSG:281/M645;1)

APPLEWORKS WORD PROCESSOR AND NP  > This concerns inserting 'NP' into word processor documents I find that
> having done this the cursor jumps to some distance away for where the
> 'NP' was inserted so that it is no longer on the screen.

   You've been bitten by a feature. AppleWorks 4.0 will not break a paragraph with the np option. If you wish to do just that, just add a carriage return to the end of the line just before the place you wish to issue the new page command.

   This new feature/bug has actually saved me time. When I see a page splitting a paragraph that I don't want split (most of them are just these type), I just issue the np command and continue onward knowing that the np command was inserted at the end of the previous paragraph.

Quality Computers --- Power for performance.
(W.CARVER1, CAT42, TOP29, MSG:182/M645;1)

>>>>>  I have some more information regarding the jumping cursor when inserting 'NP' options.

   This again occurred when I was getting GEnieLamp ready to print.
I have found it occurs after using 'O-A K' to calculate the existing breaks then doing 'O-A O' NP the cursor then moves to a variable distance from the 'NP' always below it and in one case it was 42 lines below.

Note this only occurs if the 'NP' is inserted while the calculated page breaks are still visible ie no other editing is done first. This is annoying as I usually want to do other things at that point ie removing of redundant blank lines at the top of the new page.

KenDawson [England]
(K.DAWSON2, CAT42, TOP29, MSG:276/M645;1)

That may make a lot of sense. There was an AW3 bug with page breaks jumping, and I fixed it in AW4, but I may have only fixed the ctrl-P entry point and not the OA-O NP, although I'd think they should use the same code. I'll check it out.
(BRANDT, CAT42, TOP29, MSG:282/M645;1)

Please, all user's/lovers of Apple II's, if you have any related hardware that is no longer working, and not economically repairable thru commercial sources. DON'T trash it, don't just let sit in the cellar, or the garage, until it gets damaged further, or thrown out. Invest a few $ in the future, and in other Apple II users in need. Send them to one of us who can and will perform component level salvage and repair, without commercial labor charges. It really doesn't much matter which one of us gets what, we communicate and exchange with each other on a need and have basis regularly.

Please distribute this ideas as far and frequently as you can!

Many of the parts we can get through salvage are either not available for purchase, not affordable for purchase, or simply take too much time to track down for purchase (even when they are available and affordable).

Doug Pendleton --> Delivered by Co-Pilot, ProTerm & Woz IIIGS System 6.01
科学和魔法是可互换的术语，取决于观察者的立场。

Hardware that you send to Doug or myself doesn't have to be Apple related in all cases. Things like hard drives (SASI, SCSI, IDE) have _MANY_ parts in common, as do tape drives, power supplies, some keyboards, etc. (Now that the BlueDisk controller is available, yes, even PC type floppy drives and tape drives are desired!)

Also there have been numerous times where I have salvaged parts from boards taken from other systems (PC, Mainframe, Industrial Controllers, etc) that have been used to repair stuff that works on Apples.

Basicly, if it has _anything_ to do with a CPU controlled device, and it's unusable by you, there is a VERY good chance that Doug or I can salvage enough parts from it to fix items that are used on Apples to make it worth our time and effort. (Who knows, _you_ may be the next person to

NOT A VIRUS DEPT., PART 1

Well I have found the source of my "Welcome Datacomp" problem!!!! I believe it was referred to as "unlikely", but it is NOT on my hard drive ANYWHERE. It is coming through my Vision Plus card that I purchased used recently! You say "Pizza, How do you come to this conclusion!" I say simple! When I posted about my problem here, I dissasembled my GS to take to a user group demo. When I did that, I disconnected the line running to my VCR. The problem has been gone since. Well today, I hitched up that cable again and left for work. When I came home I had a screen full of "Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp, Welcome Datacomp" WELL you get the picture! So I disconnected the cable to my VCR and left it for about an hour, nothing. I reconnected the cable, and in an hour I had that message on my screen 4 times! WOW! So at least I know where it's coming from [sort of].

Thanks for all the suggestions!
THE APPLE II LED THE WAY  Here's one of the better reminiscence articles I've seen since the official shut-down of the Apple II by Apple in November. I found it in the March 1994 issue of the Monsanto Apple Users Group newsletter, "MAUG Log", and was submitted to that newsletter by Ralph Supinski from America Online by someone named "Clyde III" (BTW, I'd like to know how to get in touch with that person if anyone knows; is that an AOL user name, and what is the Internet gateway address of AOL?)

------------

What It Was All About
From: Clyde III

Years from now, when Power PCs are considered low-end machines, and Macs and Pentiums have long since been forgotten, I hope they'll remember the Apple II.

What the Apple II was all about:

The Apple II was about computing in color: the first computer with built-in color video. The Mac tried to make black & white cool, but it almost died on the vine for trying. Now that every computer uses color, except for the cheap or light weight, will they remember that the Apple II was the first one?

The Apple II was about the speed of disk drives: the first micro-computer to use a disk drive. Remember cassette tapes? Could it have been that they might today be using hard cassette drives, if not for Woz and his Disk ?

The Apple II was about fast startups and low memory overhead: the only computer ever to use sensible floppy disk-based operating system. DOS and ProDOS required nothing more than the juice from the plug and a closed drive door to get up and running from a floppy. 'Nough said!

The Apple II was about business sense: the first spreadsheet that lit the business world on fire. After Lotus and Microsoft knock each other out fighting over this crown, will they remember that it was Visicalc on the Apple II that first blew everyone away?

The Apple II was about integrated applications: when Mac's OS and Windows are long gone, will they remember that it was AppleWorks that showed the way?

The Apple II was about losing yourself in a computer game: the greatest software was born on the Apple II. Ultimas I-V were created on the Apple II. Wizardry was born on the Apple II. Sierra On-Line's first game was programmed on an Apple II. Will they remember?

What the Apple II was all about was breaking open the door to computing for the rest of us and giving us access to this most powerful and wonderful of pursuits.

We will never forget.
Clyde

OKAY, BUT WHERE'S BEAVIS?   Harold writes:

> (Yes folks, fNotButtHead really is the Apple assigned name for this
> particular flag bit in device driver files...)

Doncha' just love it? :-) I was sooooo mad when I had to make
changes to the GS/OS Device manager just to add a new Apple-defined status
call to device drivers because people ignored the rules. I won't name
cards, but a very fast caching SCSI card that I use in quite a few of my
machines broke terribly when I added the new feature. That card was the
single motivation for the name of the bit. I had to add it, and I named it.
:-)

Jim Murphy,
Macintosh System Software Hack/MacsBug engineer
(MURPH, CAT20, TOP12, MSG:255/M645;1)

ROM 1 GS MEMORY BUG?   Dave, are you using large files? The ROM1 GS has a
memory management bug that can cause data corruption
with large files. I believe the problem is solved by running System 6.0.1,
although I'm not sure. Of course, if you use UltraMacros, you'd have to be
careful about any inits you had installed.
(BRANDT, CAT17, TOP4, MSG:349/M645;1)

>>>>>   Uh, this sounds like something that a couple hundred thousand of us
might find worthy of further discussion. In what exactly does a
"large file" consist? Are only AW filed affected; are all AW filetypes
affected; does it occur only under certain "save" conditions? Does it only
show up when GS/OS is loaded, or is this a pure P8 thing as well?

I realize that you probably don't know the answer to all these
questions, but those of us who frequently manipulate valued data in
AppleWorks would appreciate any tips, suggestions or caveats that may
apply. On one of my (ROM 01) GSs I have occasionally experienced data
corruption of large database files (2000+ records). It is so infrequent and
sporadic that I have never been able to pin it on anything -- in fact I
have suspected random "burps" in the SCSI chain rather than anything in
AppleWorks or the GS itself. But hey, a "memory management bug" works for
me.
When you elucidate on the memory manager bug you referred to would you please include the Apple part number on the ROM_01 rom that you've confirmed this problem with. (ie: 342-0077-A, 342-0077-B, etc)

I have reason to believe (however this is NOT yet confirmed) that Apple may have actually released more than one "flavor" of the ROM_01 roms without publicly documenting it. This memory manager bug may, or may not exist in all such suspected versions, and I'd like to gather as much info on this possibility as I can before "jumping out of the frying pan and into the fire" as it were.

Thanks!

-Harold
Resident solder slinger.

Okay, I opened up a can of worms. Here are the facts as I know them. I have a client in Brooklyn who handles his entire watch repair business with AppleWorks. A couple of years ago I updated him to DoubleData and TotalControl to increase his capacity. As he worked with files up to 500k or so in size, he suddenly started having random characters, often parentheses, appear in his files. He called me in a panic, worried about the macros messing things up. We went back and forth on it for weeks as he went crazy, having to do searches for weird characters and hoping he'd catch the corruption each time.

Finally, he came up with a series of 100% reproducible steps, but they worked flawlessly for me. Then he shipped me his hard drive and memory card so I was running the same byte-for-byte programs on the same data, but it still worked great. Suddenly it hit me that he had ROM 01 and I had ROM 03. I took his drive and card to a ROM 01 and there it was! He got rid of both ROM 01 computers and his Laser, got three ROM 03 machines and has never seen the problem since. I have no idea what the serial numbers were on his ROM 01 computers, so I can't help there. I just know that the problem could be demonstrated in minutes on any ROM 01, and never on a ROM 03.

Later he found an Apple tech note about a memory management bug which is fixed by GSOS. He's convinced that was his problem, although I don't believe we ever tried the steps under GSOS to see if that fixed it. This bug was insidious, since he could run for days without a problem, then suddenly end up with a trashed file when he was busiest.

THE EASY (APPLEWORKS) WAY TO ADD LINEFEEDS Lloyd, an empty file _is_ just a receptacle, but it can be an AppleWorks word processor receptacle, a text receptacle, or an MS-DOS text receptacle. When you put your contents into an MS-DOS text file and save it, the linefeeds are added because AW4 knows that the output has to be in MS-DOS format. This means you can keep an empty MS-DOS shell file handy, and any time you need MS-DOS output, you just dump your text in, change the name and save. Presto! An instant MS-DOS text file.

I _Think_ I have just been hit by a virus!
What happened was I accidently quit CoPilot to go "Online & Quit" to Spectrum. I realized that I didn't want to do that, just wanted to quit. So as Spectrum was loading, I was holding down the Apple key in anticipation of hitting "Q" to quit. When Spectrum's opening dialog showed, I suddenly got, in the exact center of the screen, a smaller box that had a nicely drawn British flag and the words "Made in Britain", and the sound "Trumpets" played (even though it is NOT assigned to any of my control panel sounds). I wasn't paying much attention until it hit, and had already hit the "Q", and the Flag disappeared before I had any chance to inspect it closely.

At first, I thought that this might be some sort of "Easter Egg" in Spectrum (although why they would say "Made in Britain" was beyond me), but I have NOT been able to duplicate this happening.

Since the words "Made in Britain" appeared to be part of the picture, I have not tried searching for those words anywhere on my disks, but I think I will try it anyway. I have added NOTHING to my system lately that I didn't get online here on GEnie or commercially. No HD damage has appeared, nothing else untowards has happened.

Anyone else ever seen this?

Ken Lucke  (K.LUCKE, CAT12, TOP16, MSG:54/M645;1)

>>> Do you suppose the fact that the author, Ewen Wannop, is a resident of Great Britain might have any relevance?

Ain't now way this is a virus. Period.

(GARY.UTTER, CAT12, TOP16, MSG:55/M645;1)

<<< I have had it confirmed by Dave at Spectrum that this is an easter egg, and that I was the first to report it. No prize, though :(

>>> HOT TOPICS <<<

GS FAX SOFTWARE BY WIFALL > Where will Pointless (no problem, I think),
> and Harmonie (not in the picture even) fit
> in?

Harmonie will continue to work with your printer. The fax driver is simply for another device that happens to be connected to your modem port
rather than to your printer port. ;-) It will appear as a 200 dpi printer
to GS/OS, so all existing software that works with today's printers will
automatically be able to fax documents. Pointless will continue to work as
it always has (in fact, you will *need* Pointless to create good looking
faxes).

Think of it this way: rather than sending a document to your own
printer, you are using someone else's fax machine as the "printer". :) That's why implementing sendfax as a printer driver is the only reasonable
solution. Trying to fit send-receive fax into Spectrum or Proterm would be
a wasted effort since you have to fire up those program every time a fax
came in or you had one to send out. This way, the fax driver becomes
instantly available to any properly written GS/OS desktop program that uses
the Print Manager. Even something as old as my 1986 copy of DeluxePaint II
will now be able to fax graphic images. Who would have imagined this just
a few years ago? ;-) 

-----|-----  Sent by CoPilot (beta)
*>=====[_]L)    for ANSITerm 2.1
   -'-'-
     (B.TAO, CAT10, TOP9, MSG:32/M645;1)

>>>>>  My dad was kind enough to let me post something here to clear
""""  things up a bit.

First of all I would like to reinforce what Brian said that no one on
this topic speaks for me. So anything you hear here about my program is
going to be at best second hand and at worst simply rumors. With that
aside, let me try to answer a few questions on this topic about my program.

It will be GS specific and so will obviously require GS/OS. At this
stage it will only work with Class 2 compatible modems. In particular, any
modem that uses the rockwell chipset and supports Class 2 should work quite
well (I am developing the program using a Supra v.32bis) Current plans are
for a NDA for receiving and fax manipulation, and a print driver for
sending. Shell executables and/or any other form would be nice, but will
probably depend more on what type of deal I make with a publisher then
anything else (ie Yes, it will be commercial).

I'm not looking for any beta testers at this time. I don't have any
release date planned, and even if I did I wouldn't tell what it was. :) If
you want more information on exactly how the development is progressing I
suggest you read the gsfaxstat.txt file (I don't know if Brian uploaded
this or not, but you can get it on internet from grind.isca.uiowa.edu
apple2/caltech/uploads/gsfaxstat.txt via ftp) I will be updating that file
semi-regularly and making it available on internet (unless someone wants to
give me a free account here ;).

If you are planning on purchasing a faxmodem and you want it to work
with my program when it is released, make sure it is class 2 compatible. I
doubt I will ever get around to working on any Class 1 support. (Note: I
don't think the Supral44LC supports Class 2, but make sure to ask Supra or
find out.)

If you have any specific questions, I can answer them using this account
till I go back to school. (Translated this means anything posted after
friday night won't be replied to by me. I can be contacted by internet
e-mail at rwifall@nmsu.edu though. Read your GENie user manual for help
sending internet email :) (friday night meaning March 11th)

Richard Wifall   |  Have you ever received a fax on your AppleIIgs?
rwifall@nmsu.edu |  You will. But it won't be a product of AT&T.
     (J.WIFALL, CAT10, TOP9, MSG:75/M645;1)

>>>>> Ummmm. This makes one of the dumber guys ask, "What's the diff
""""
between Class 1, Class 2 and Class 3, etc.?

Mature mind wishes to know...

Dave (D.MATTIS@GEnie.geis.com)
     (D.MATTIS, CAT10, TOP9, MSG:77/M645;1)

>>>>> Dave - Ok, heres a quick primer in fax-speak. Class 1, 2 and 2.0
""""
refer to how the computer talks to the faxmodem in software. Class
1 is an official standard. Class 2 is not an official standard, but is
fairly well standardized among faxmodem makers. Class 2.0 is the offshoot
of Class 2 and is also an official standard.

Ok, now you're wondering what in the world this means to you? First
of all you can ignore Class 2.0 for awhile. There aren't any faxmodems
that I know of that actually support this standard yet. This leaves class
1 and class 2. The differences between them are basically that the class 1
command set requires that the computer do more of the work involved in a
fax transmission whereas in class 2, the modem does more of the work and
the computer does less. Class 2 is enough of a standard among the faxmodem
manufacturers that compatibility should not be a problem. There is no such
thing as class 3 at this time. I choose to support Class 2 at this time
because it is easier from my standpoint and I haven't really taken a good
look at what Class 1 requires.

Don't confuse "Class" with the "Group" designation of a fax-machine.
The Group designation determines what machines your fax will talk with
Basically every modern fax machine or fax modem is group 3 and should have
no problems communication with each other (outside of bugs in the
firmware).

BTW, I forgot to mention above, but the main reason that Class 2 is
fairly well standardized among faxmodem manufacturers is because many of
them use the rockwell chipset so they all should have the same
implementation.

Now on another note: Printing faxes..

If you own an HP DeskJet or some other high resolution printer,
you're in luck. I printed out a fax today using a HP DeskJet portable. (It
has the same internals as a DeskJet 500) and it looks _good_. Now if you
are unlucky enough to still use an ImageWriter II (like I am) then printing
faxes is not going to be a fun experience. Basically it boils down to the
fact that the ImageWriter II simply does not have a high enough resolution
to support printing faxes without some loss in quality. This means that in
order to print a fax on an ImageWriter II it must be scaled down first. To
put it frankly, the output does not look all that great. I may have to
offer the option of splitting a fax into multiple pages so that it can be
readable when printed on an IWII. (especially with small text)

I think thats all for now...
Richard (In disguise ;)

> On Quality and their fax software, the last thing I heard is that they
> had abandoned all their fax projects, it's funny how they keep
> advertising it though.

You might note that the IIGS version of the FAX software (which we
abandoned) is different from the FAX software that we advertised in the
AppleWorks flier. The IIGS fax software was a longterm project that the
author never finished. We felt that we couldn't keep our customers waiting
any longer and just cancelled our participation in it. That's not to say
it won't be finished in the future, or that we aren't interested in any
other products that might do the same thing.

Walker - QC       (W.ARCHER2, CAT10, TOP9, MSG:55/M645;1)

>>> WHAT'S NEW <<<
"""

AFTERWORK SCREEN SAVER RELEASED   Just received AfterWork. I had trouble
with the 5.25 installer. After
installing, none of the UM.Inits loaded, only the AfterWork inits. I
checked the disk, and both the UM.init and the MR.init were there ok.

Then when AW started, it jumped to the "You must activate Inits and
reboot to use UM" message on the standard setting inits screen. Inits
_are_ activated. But OK, I'll bite, so I changed it to "no" then "yes" and
rebooted, just to be sure. Same thing.

Now, for the Installer to "find" the AW disk, I did find I needed to
change the AW Startup disk pathname from /AW back to /Appleworks. After
installing AfterWork, I renamed the disk /AW again. My inits are on a disk
named /Appleworks in another drive, to avoid swapping disks. Since the
standard settings have the init pathname, this ought to be OK, no? So why
don't the UM.init load after the AfterWork inits?

My 5.25 AfterDark Installer disk shows an error on Track 16 Block B,
and the back of the disk (notched) is blank. No, it does have something on
it: it makes the drive head go beserk, which needs a reset to stop it.

I had no problems with the 3.5 installer on another machine with a
3.5 drive. However, the oa-x UM function no longer worked at all with
AfterWork installed. Is this normal? (I sure hope not.)

The various modules are GREAT! Especially Meltdown (I almost died
laughing, and can't wait to set the time to 1 minute while my son is
typing), Trickle (you should have seen the eyes of the people at work),
Fans, Lemming Lines, and Boxes. And to be able to add sound and change the
settings, Wow! One guy at work said, "Hey, I can't modify any Windows screen blankers!" Another asked, "Can I get that for my screen?" "No, sorry," I answered, "you have to have an Apple to get this kind of stuff."

BTW, I noticed that with the delay for blanking set to 1, it went into AfterWork even while I was typing away. No big problem, just a comment.

Randy and Matt are to be commended on a job well done. But how about these questions?

TIMEOUT SHRINKIT SHIPS TimeOut ShrinkIt should be shipping today, finally. (Got the manual done last week. <g>)
(QUALITY, CAT42, TOP29, MSG:194/M645;1)

>>>>>> Actually, TIMEOUT SHRINKIT officially shipped this afternoon. :)
"""" Sorry for the delay.

Walker - Quality
(W.ARCHER2, CAT42, TOP29, MSG:206/M645;1)

ENHANCE SHIPS APPLE II TO II ALIVE Have you ordered from us in the past year? If not, you won't get our catalogs and whatnot... usually. There are other ways to get on the mailing list, namely by being on one of the other lists we rent.

We are mailing a separate Apple II catalog this time. All Apple II stuff that is NOT related to education has been removed from Enhance. And if you have told us that you are NOT a teacher, you will stop getting Enhance since it does not have any Apple II home/consumer stuff.
(QUALITY, CAT42, TOP2, MSG:218/M645;1)

NEXUS RELEASED AS FREeware! It seems as if the Apple IIIGS world is going hyper over hypermedia. First HyperCard IIIGS, then...

Tracy Valleau, the author of Nexus, has just re-classified the status of that hypermedia authoring system. Formerly costing $179, Nexus has just become copyrighted freeware! In his distribution notes, Tracy says that the freeware Nexus is the "exact same commercial program that won rave reviews and an A+ Editor's Choice.

"Nexus allows you to link together standard text, graphics and sound files. There is no need for you or your students to learn new graphic or authoring software: just use the files and programs you already have.

"Using Nexus, you can open a text document, click on the word 'elephant' and Nexus will automatically retrieve and display a picture of an elephant (or more text about elephants, or play the sound of an elephant.) This is all done without importing the files, changing their format or even altering them in any way! Use it for interactive fiction; multimedia based education and so on. The limit is the imagination."
Mr Valleau has stated that in order for any profit making organization to distribute Nexus, written permission must first be received. I have just written to Mr Valleau seeking that permission.

I have also spent the morning getting hyper about Nexus. Mr Valleau had sent me a demo disk that is filled with Nexus created stacks, and after looking at many of them, I feel that Nexus is a valuable addition to the IIGS hypermedia arena. It may not be as powerful as HyperCard IIGS, and it may not have as many bells and whistles as HyperStudio, but the price is right and its ease of use will make Nexus a powerful hypermedia contender in schools.

Shareware Solutions II would like to salute Tracy Valleau for making Nexus available as copyrighted freeware!

Joe Kohn
(J.KOHN, CAT28, TOP4, MSG:342/M645;1)

>>>>> Here comes Nexus

Mr Valleau has given Shareware Solutions II permission to distribute both the Nexus program and the Nexus demo. He didn't want me to add the sample Nexus files I already had to the program disk, so it looks like the SSII Library will start off with both.

He also said that it would be just fine with him if Nexus were uploaded here to the A2 Library. Since I mentioned this yesterday in email to both Dean and Tim Tobin, let me ask them...do you want to upload it, or should I?

As I like to joke, Shareware Solutions II sometimes takes on a life of its own, and tells me what I should write about. It sure likes like the major theme of issue #5 is going to be IIGS hypermedia.

Joe
(J.KOHN, CAT28, TOP4, MSG:351/M645;1)

MAGIC NEWS GROUP ARRANGER [and it's FREE to registered owners of THE MAGIC NEWS GROUP READER]

by Gary Hayman
(c) Copyright 1994
Gary Hayman & Magical Software

[Versions for AppleWorks 3.0 with TimeOut Installed and AppleWorks 4 with TimeOut activated]

Those of you who already own Magical Software's THE MAGIC NEWS GROUP READER (MNG READER) know of the great 'Subject thread' following features that are included with that program.

All one needs to do is to register the thread in any message with a SA-T)hread and subsequent presses of SA-N)ext will take you to the next message in the thread (even replies) until there are no more messages in that thread left. A press of SA-E)xit will exit the thread search and return you to your starting message. If you want, you can use the BA-T)hreadCount feature to actually tell you how many messages in the thread from that point to the end of file.
Announcing a New Related Product  THE MAGIC NEWS GROUP ARRANGER (MNG ARRANGER) takes your news group captures and automatically sorts each message so that all same subject thread messages appear one after the other. This is done by completely re-arranging all the messages in the file - no simple task.

Now as you read your messages, with the MNG READER you will see groups of subject thread messages -- all together. This will even increase your speed in reading news group messages for if you enter a thread that you are not interested in, the quick repeated pressing of SA-Down Arrow will zip you through them without you having to read the contents of the messages in the thread. The included 'Subject is Highlighted' feature of the MNG READER aids in this task.

Once activated, the MNG ARRANGER does it's job and produces a new file with the arranged messages in the proper order. MNG ARRANGER will first count the number of messages in your file in order to later provide you with a running status indicator of the number of messages out of the total number have been processed. While it is doing this first task, it is also checking to see if 'CS-ID: ' and 'Subject: ' are in the proper place [flush left, separated by two lines]. If not, it will let you know and provide you with the opportunity to hand correct the errant message(s). When all is well, it will proceed to do its major task of finding and moving. If you have hundreds of messages, you may want to grab a cup of coffee as the MNG ARRANGER does it's automagical stuff - or just watch while being hypnotized by the flashing screens. You can always check on the progress by the text printed on the message line. As the messages are transferred, the processing speed keeps on increasing.

Example  To give you an example as how I use it to my advantage; I am in and capture the Internet/USENET newsgroup messages of 'alt.magic'. I process the messages with MNG ARRANGER and read the new file with MNG READER. I use the SA-C)lipping feature to extract messages or portions of messages in which I am interested. I later use this clipped file to post on a Magic BBS in the Washington DC area. By having subject threads together, it provides a continuity for my clippings.

How Can You Get Your Copy Of The Magic News Group Arranger?  Until further notice, I will furnish FREE OF CHARGE to all registered owners of the MNG READER, the new MNG ARRANGER. If you are a registered owner you must request it by sending email to me at:

ghayman@cap.gwu.edu

The file will be sent to you via email in a BINSCII format of some Shrunk files. This means you must have one of the BINSCII programs (ProDos or GS/OS) and one of the Shrink.It programs (ProDOS or GS/OS) in order to process the file I send you. Using this technique, my turnaround time is very rapid and you can receive your file in only minutes after I read your email request and verify you as a registered owner of MNG READER. Also, and this is a plus, I can send it to foreign countries with no international border bother at all.

The MNG ARRANGER is designed as a TimeOut application that is to be placed in your TO.APPLICATIONS directory (AW3) or TIMEOUT directory (AW4). Since there are two different versions of the program (AW3 and AW4) you must specify which one you desire. You may have both, however, please make
separate requests and on different dates please.

Running The Magic News Group Arranger Once installed in the proper directory all you have to do is to go to your TimeOut menus [OA-ESC], highlight MNG.ARRANGER, select it, and let it do its thing. You will find your arranged news group messages in a new file on your desktop named ARRANGED.

Another Related Program  P.S. To let you in on a little secret. There is, in existence (at this very moment), a third module in this series -- THE MAGIC NEWS GROUP RESPONDER which I am still playing with to ascertain if it would be of value to individuals other than myself. In the future, I may release this module too.

NOTE: OA = Open Apple or Command key
SA = Solid Apple or Option key
BA = Both Apples or the Command & Option keys

The MAGIC NEWS GROUP READER & ARRANGER require AppleWorks 3.0 with TimeOut installed or AppleWorks 4.x with TimeOut activated.

See previous messages for details about THE MAGIC NEWS GROUP READER and its use for off line high speed reading of Internet/USENET News Group messages. A 'received' format is required.

>> THROUGH THE GRAPEVINE <<

THE ULTIMATE ULTRAMACORS BOOK? Doug, it's the compleat, concise, and unabridged anthology, encyclopedia, dictionary, reference, easy does it, yes, I can! book of UltraMacros. Items are listed A to Z; if you want to learn about Display 0, just look up under D and you'll get everything you ever wanted to know, and some you didn't know you needed to know.

I do not have an official title yet. It is specific to AppleWorks 4. Available after April 15.

(B.CADIEUX, CAT13, TOP15, MSG:223/M645;1)

<<< Gary, TEXAS II subscribers will be the first (and the only) ones to know.

(B.CADIEUX, CAT13, TOP15, MSG:226/M645;1)

BILL HEINEMAN GAMES OF SOFTDISK G-S? Don't pester us about Bill's games -- pester Bill. We have been trying for MONTHS to get Bill to make final changes to his games and he is not.

Believe me, we want to publish those games as much as anyone, but we can't publish them until they are complete.
Apple II Computer Info

Bryan (SOFTDISK.INC, CAT34, TOP4, MSG:117/M645;1)

APPLEWORKS GS 2.0 SETBACK? I called the other day and placed my order for AWGS v2.0. I was informed at the time that the new _projected_ release date is now July, '94. This is fine by me. My only question is that when you first acquired the rights, a mention was made about a version 1.2 to correct bugs, followed by the v2.0 for some major enhancements. Has this changed?

Jeff - Delivered by CoPilot v2.1.1 and Spectrum v1.0 (J.CARR20, CAT42, TOP32, MSG:376/M645;1)

>>>>> Yeah, our programming force of extraordinary magnitude just sort of fell apart. The person we picked to lead it just didn't have the full-time commitment for the job.

(QUALITY, CAT42, TOP32, MSG:377/M645;1)

DIGISOFT UPDATE Sorry for my couple week absence! I have been pretty busy with school and other endeavors and now things are back to normal.

Re: Art Contest

We are currently sorting and reviewing the entries received. If you still would like to enter, that is okay - feel free to email us any more art! We hope to reach a final decision within a few weeks; I will keep you posted.

Re: DigiSoft CD

This is currently our top priority... We are putting a lot of work into it and are making considerable progress. Stay tuned. It will have everything we can find that is usable to an Apple II user, in all uncompressed form.

<<Jim (DIGISOFT, CAT13, TOP29, MSG:86/M645;1)

ALL-TECH ONLINE? Speaking of All Tech, look forward to them being online in A2 in the near future. :)

(GARY.UTTER, CAT2, TOP19, MSG:187/M645;1)

WAITLESS ALMOST READY? Since we're in the AW 4 topic, I might add that Dan Verkade is about done with WaitLess (those California guys with their pointless names!), an AW 4 print spooler which stores the print info on the desktop as fast as AW will kick it out, then sends it to the printer during cursor blinks, allowing you to keep working as the printing goes on in the background. Printing isn't faster, it's probably slower, but you get your computer back much quicker, as Chuck explained, and as the WaitLess name implies.

(BRANDT, CAT42, TOP29, MSG:286/M645;1)

SHAREWARE SOLUTIONS II UPDATE Several things have changed since I initially announced Shareware Solutions II in May, 1993.

In my initial press release, I stated that SSII would be 12 pages in length. As we all know, each issue has been 20 pages.
I also announced that I had high hopes that Shareware Solutions II, after a few issues, would become a monthly publication. I had initially thought that when I became more familiar with Desktop Publishing that I'd be able to step up my production schedule.

After having produced 4 issues, I think I can safely say that it would be a Herculean — if not impossible — task for any one person to write, edit, layout, publish, fold, stamp and mail a 20 page newsletter on a monthly basis. I'm comfortable now with the bi-monthly schedule, and have come to the conclusion that Shareware Solutions II will remain a bi-monthly newsletter. Actually, I came to that conclusion several months ago.

I just wanted to let everyone know that it is now official; Shareware Solutions II is, and probably always will be, a bi-monthly publication.

When I first announced Shareware Solutions II, I stated that a subscription was for 12 issues. Being a man of my word, I just wanted to clarify that all current subscribers (with very few exceptions) will receive those 12 issues of SSII. Your 12 issue subscription has effectively become a 2 year subscription. I feel a need to clarify that now, as several people have recently sent me subscription renewals; since you're a year too early, I will be returning your checks to you.

Knowing now for a fact that SSII is a bi-monthly publication, I plan to revamp the subscription fees to bring them more into line with what other Apple II publications charge. Although nothing definite has been determined, I'm thinking of offering two different subscription rates...

Plan A) This will be a one year, 6 issue subscription. People who subscribe to Plan A will start their subscription with the then-current issue.

Plan B) This will be similar to the current "charter subscriber" plan. It will be a 2 year, 12 issue subscription starting with the Premier issue of Shareware Solutions II.

I have not yet set the rates for these new plans, but will think about this a whole lot in the next week or two, and announce those new rates here. Whatever they are, they will become effective on May 1, 1994.

Anyone subscribing to Shareware Solutions II between now and May 1, 1994 will still be able to take advantage of the Charter Subscriber Rates. If you subscribe now, you will receive a package that includes the first 4 issues, and still have over a year left on your subscription.

APPLIED ENGINEERING SWAN SONG? According to a good source...

As of Monday, March 25 1994, Applied Engineering has closed their doors. (confirmed by their lawyer)

I have very mixed feelings about this.
1) AE finally got their just deserts for having sc*#ed all the Apple // people who are the ones who really built the company in the first place.

2) Now where do people like Doug, Bill and myself go to get replacement custom chips (PAL, GAL, Eprom, VLSI, etc) to repair AE products????

If a whole bunch of Apple // users were to pool some funds real quick there MIGHT be a chance that a bunch of these irreplaceable chips, in house documentation, source code, etc could be purchased before it gets lost, or sold for salvage value. I am NOT in a position to pursue this possibility, but maybe there are others here with the needed background and finances to pursue this possibility.

If this occurs, I would be willing to make the effort to get to Carrolton (etc) to sort thru a bunch of this hardware, documentation, source code, etc so that prime repair parts (the really critical stuff) and needed paperwork, etc could be obtained.

-Harold
Resident solder slinger.

> in all the years that I have participated in online communications
> via various avenues, I have _never_ seen such an outpouring of good
> will towards another.

I think our goodwill toward Harold comes, not from the fact that he fixes our broken toys, but from the fact that he personifies a quality that seems to be in short supply these days. The old work ethic. Most of us in this forum share this ethic, but we see a lot of the opposite all around us. So many people these days (maybe it was always so) look for any excuse to avoid work. Work is the enemy to them. But our friend Harold solicits work to do for us at no charge so that he can feel useful. And useful he is. I liken society to a machine. We are all cogs, gears, shafts and cams in the machine. Some are just idlers, some carry their share of the load. Some drive and some are driven. Quite a device.

VACC Dave .............

While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GENieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.
In the beginning there was ENIAC. And the ENIAC was without language or form. And so was created Machine Code. And it was Good.

On the second day, Hex was created. And it was good.

On the third day, Assembly Language was created. And it was good.

On the fourth day, Fortran was created and it was good.

On the fifth day, man programmed in Fortran. And it was very good.

And it was spoken: "Thou may program in any of these, but the tree of COBOL thou shall not partake for thou shalt surely pay for thine transgressions."

But, there was a hacker in the woods who took the form of a mini and spake to the man and said "Thou shalt not pay for thine transgressions, for he knoweth that if thou partakest, thou shall have power to program large and wonderful things that shall be readable by others!"

So, the man partook of COBOL.

And it was spoken: "Thou hast partaken of the tree of COBOL: Thou art doomed to write hundred thousand line programs, be enslaved by IBM, and not have other good programming options for years."

And it was so. Many years passed. IBM dominated. Programs grew larger and larger. BASIC, Pascal, SNOBOL, PLI, Ada and many others came and went. IBM dominated. And COBOL programs grew.

Then, as implied, a program came out of the telephone.

It spread to the universities who took it on and made it grow.

IBM tried to kill it many times, but after the PC was introduced, it was inevitable. First, A. Written in Assembly, not COBOL. Then B which was better that A. Then finally C took full form and shape.

With UNIX, it launched into the market seemingly impervious to COBOL's domination. IBM tried again to kill it. Through security holes, and portability, and unreadability IBM tried. But C could not be quashed.

The implied savior of programming everywhere had come!
And the great COBOL could finally start to be removed. Open systems and high capacity graphic's aided and spurred C on until there was C for DOS, C++, and finally, C for the IBM series 3090.

And it was very good.

REFLECTIONS /

Thinking About Online Communications

by Phil Shapiro

[PHIL SHAPIRO]

>>> THE FUTURE OF ONLINE COMMERCE <<<

Our nation has always had a long and proud history of inventors and tinkerers. From Benjamin Franklin and Thomas Jefferson, to Henry Ford and Thomas Edison, to Orville and Wilbur Wright, to Steve Wozniak and Steve Jobs -- the creative spirit of Americans emerges anew in each and every generation.

Inventiveness is so much a part of our national culture that we even have stores which cater specifically to the "do-it-yourself" spirit. Almost every city in the nation has a few "home repair" stores, and every small town in the nation has at least one Radio Shack store.

The usefulness of Radio Shack stores was brought home to me in a personal way last month.

Without any warning, my Apple II monochrome monitor burned out. A kind and helpful person in the local computer user group, Jon Hardis, offered to take a look at it for no charge. Two weeks later I received a phone call from Jon saying the monitor had been fixed. "All you really needed was an inexpensive doo-dad replacement from Radio Shack," he declared matter-of-factly.

The way he said the words "Radio Shack" implied that the burned-out part in my monitor could be replaced with a commonplace device that any self-respecting electronics hobbyist could obtain with a simple stroll down to Radio Shack. Well, I don't hold myself out to be an electronics whiz by any means, but I'm fascinated by the fact that he was able to repair my monitor so easily. And to think that all he really needed was an
inexpensive doo-dad from Radio Shack.

But this episode also got me thinking about some not-so-positive encounters I've had with Radio Shack. On more than a few occasions, I've asked technical questions of Radio Shack in-store employees, only to be given entirely erroneous answers in return.

To be sure, you could hardly expect every Radio Shack employee to be knowledgeable about everything they have for sale in their stores. The complexities of the products, and the complexity of the terminology describing the products, are too much for anyone but an electronics hobbyist to fully master.

Which is where online communications could come into play. Radio Shack could take a leadership role in bringing online tech support to its customers. Tandy doesn't need to hire an audio components expert for each and every one of its stores. Rather, it could provide an audio components expert online, with an Internet address that could easily be reached by anyone with an account on GEnie, America Online, or CompuServe.

Likewise, Radio Shack could provide tech support for any of their other products they sell. Note: I'm not just talking about post-sale tech support. More than anything, Radio Shack needs pre-sale tech support.

And the tech support need not be narrowly focussed to a particular product. Someone working on an electronics project should be able to discuss that project online with a suitable Radio Shack expert, and then receive recommendations and suggestions by that expert.

Imagine the possibilities: an ongoing online dialogue between a techie guru and someone with a keen spirit of inventiveness. If Radio Shack had had an online tech support service back in the 1960s, you can bet that they would have received a barrage of questions from that pesky youngster, Steve Wozniak.

By offering such an online service, Radio Shack would overcome the problems they currently have with in-store employees who are unable to answer tough technical questions. Not only that, Radio Shack would dramatically reduce the quantity of returned merchandise -- merchandise bought in error.

But more important, by implementing a free online tech support service, Radio Shack could help foster and perpetuate the inventive spirit that brought our county the electric light bulb, the airplane, the Model T, and the Apple II.

The next generation of inventors are making their way through elementary school today. And they have just a ton of questions they'd like answered.

[Footnote: I called Tandy-Radio Shack's main office in Fort Worth, Texas, to find out if they might already offer an online tech support service. They told me the closest thing to such a service that they offer is tech support for Tandy computers, via PC-Link.

If you're interested in seeing Radio Shack offer free pre-sale and post-sale online tech support, take a minute to write a hard copy letter to Tandy Corporation's director of customer relations, Ms. Lucille Frey. The
address for Tandy Corporation's executive offices is: 1800 One Tandy Center, P.O. Box 17180, Fort Worth, TX 76102. If you'd rather not write a letter, you might send Ms. Frey a hard copy printout of this article.]

Phil Shapiro

[*][*][*]

The author takes a keen interest in the social dimensions of communications technology. He can be reached on GENie at P.SHAPIRO1; on America Online at: pshapiro.

Polishing Green Apples

by Steve Weyhrich
[S.WEYHRICH]

>>> HOOKED ON STORAGE (Part 2) <<<

PRELUDE Last time I laid the groundwork for an understanding of the function and use of a hard disk, with a brief explanation as to why a hard disk is not necessarily a luxury item, on through to some vocabulary that will be used as we continue to discuss the topic. This month the discussion will turn to what is needed to create a mass storage system for YOU.

PUTTING THE PIECES TOGETHER Now that you've decided to take the plunge and buy a hard disk, what exactly do you need to make it work with your computer? Your decision depends primarily on which computer you have, how much storage capacity you plan to buy, and how much speed you want. As usual, some of those decisions will hinge on how much money you can afford to spend on this upgrade. Remember that no matter HOW much storage or speed you have today, you'll want more within a year. It is probably best to buy as large and as fast a drive as you can afford right now, because on the used market you can be sure that you will never get back what you paid for it. (The depreciation of computer equipment is pretty steep.)

APPLE IIIC For IIc owners, the choices are few. Originally a "sealed" computer that the user would simply plug in and start using, the Apple IIIC was not designed with expandability in mind. In fact, the original IIc was conceived to use one and ONLY one external 5.25 drive; it was not until user demand prompted them to upgrade the hardware and firmware to handle the larger capacity 800K UniDisk 3.5 drive that it became possible for a greater variety of disk devices to be used on the IIc. This modified disk port, which is nearly identical in function to the one later used on the Apple IIgs, utilizes a firmware protocol that Apple named the "Smartport" protocol. It includes the necessary commands to allow the ProDOS operating system to communicate with different types of disk devices.

After the Smartport protocol was created, however, a protocol that was more flexible and more widely accepted across the computer industry
Apple II Computer Info
came into use. The Small Computer Systems Interface (SCSI; pronounced "scuzzy") protocol used commands similar to those used on the Smartport, but not similar enough to be directly compatible. Although Macintosh computers beginning with the Macintosh Plus came with a SCSI port built in, the IIc never was upgraded with that ability. Companies that wanted to build hard drives that would work on the Apple IIc had to jump through some hoops to make it work at all. Consequently, you will definitely pay more for a hard drive on the IIc than it would cost to outfit a II Plus, IIe, or IIgs with a similar-sized drive.

Sequential Systems
For brand new hard drives, there is only one choice available: Sequential Systems sells a SCSI drive, originally designed by Chinook, which uses a built-in adapter to enable it to work with the Smartport on the IIc. That adapter translates Smartport commands into proper SCSI commands. After Chinook sold their hardware operations to Sequential Systems, the IIc hard drive was not discontinued, as it fills a niche that is available nearly nowhere else.

As of this writing, Sequential still sells the CT-40c ($399) and CT-100c ($549), 40- and 100-meg hard drives respectively. They are selling the 40-meg version "while supplies last", as it is getting more difficult to obtain new hard drives at a size less than 100 megs. These drives use SCSI mechanisms made by Quantum, a respected name among disk drive manufacturers. With the drive comes a utility program that will allow you to repartition the drive if you wish, but it does come already formatted and partitioned. (Recall that partitions are necessary since ProDOS can handle disk volumes only up to 32 meg in size.) The CT-40c is divided into two 20 meg partitions, and the CT-100c into multiple 32 meg partitions.

(Note: These drives will work only on versions of the Apple IIc that can accept a UniDisk 3.5. To see which version of the IIc YOU have, get into Applesoft BASIC, and type "PRINT PEEK(64447)". If it responds with "255", you need an upgrade -- which Apple is still supposed to do for free; ask for authorization number "ODL660" at your dealer. If you see a 0, 3, or 4, you can use this hard drive. The Apple IIc Plus will respond with a 5, and will be compatible with the Sequential drives.)

Alltech Electronics / ProApp
Alltech Electronics still sells some older hard drives for the Apple IIc that carry the ProApp name. These are 40 meg drives, and require UniDisk 3.5-capable Apple IIc's. However, they use a protocol called "RLL", which is different from the more common IDE and SCSI types of hard drives. As with the Sequential drives, the ProApp drives come with partitioning software, and are divided into two 20-meg partitions.

Quark
One other hard drive for the Apple IIc may be found on the used market: the Quark QC-10. This is a 10-meg hard drive that was released soon after the IIc came on the market in 1984, and was unique in that it managed to function on the ORIGINAL Apple IIc disk port (recall that this was designed to work ONLY with a single external 5.25 drives). Because of that design, a QC-10 possibly may NOT work with a IIc that has been upgraded to use the Unidisk 3.5 or memory expansion; however, if the drive itself is still functioning, it may be possible for an enterprising hacker to make the modifications to allow it to work. (I do not have specifications about what type of hard drive this was, nor how they made it work on the old IIc disk port, and cannot be certain about whether it can be used "as is", or would require modifications.)
HARDCORE AN APPLE IIC   A couple other considerations about the use of hard drives on the IIc must be made here.

Versions of ProDOS up through v1.9 would allow no more than four disk devices to be attached to a disk device on slot 5 (which is where the IIc and IIgs Smartport appears in the classic Apple II slot scheme). On other slots no more than two disk devices could appear. Because of this, a hard disk that was partitioned into more than four volumes would not be fully available for use on the IIc. For example, if you purchased a CT-100c and wanted five 20 meg volumes, only the first four would show up in a disk list. (ProDOS must remap those other drives to make it appear that they are attached to another slot and drive. The first volume attached to the Smartport can be accessed at Slot 5/Drive 1, the second at slot 5/Drive 2, the third at Slot 2/Drive 1, and the fourth at Slot 2/Drive 2.)

Beginning with v2.0.1 of ProDOS, up to fourteen disk devices could be attached to a single slot. If you are running that version or any later one on your IIc, you could theoretically divide that 100 meg hard drive into as many as twelve smaller-sized volumes. (To go beyond twelve would possibly interfere with access to the internal 5.25 drive, and to the 64K RAMDisk in Slot 3/Drive 2.) My personal recommendation would be to aim for 20 meg partitions on the IIc; if you use ProSel as a program selector -- highly recommended, by the way -- some of its hard disk management utilities cannot handle volumes greater than 20 megs unless you are running on a IIgs.

One other little problem with the use of a hard drive on a IIc: The IIc will start at slot 7 and scan down to slot 1 until it finds a disk device with a valid disk that can be booted. The internal 5.25 drive is at Slot 6/Drive 1, and a hard disk attached to the Smartport will appear at Slot 5/Drive 1. It is preferable to boot from a hard disk, for the sake of convenience. On a IIe, you would just put the hard disk card into slot 7; on the IIgs, you would change the control panel setting to make it boot from the right slot. How to do this on a IIc, where such changes cannot be made?

When I used a IIc and a Chinook CT-20c hard drive, my solution was to write a short utility that I called "SmartBoot". It is still available in the A2 Library:

13641 SMARTBOOT.BXY V2.1 X S.WEYHRICH 901002 32760 328 40
Desc: Improved Hard Disk Booting

This program, which is also useful on the IIgs and IIe, lets you use a disk device that IS available immediately (such as the internal 5.25 drive on the IIc) to look at another slot and drive, and continue checking that location until a valid disk is available. That means that you can also turn on both the computer AND the hard disk simultaneously, and SmartBoot will wait until the hard disk has come up to speed before it tries to boot it. In the above example, SmartBoot is stored on a disk in the internal 5.25 drive, and is configured to check Slot 5/Drive 1, which is where the hard disk's first partition is found. (SmartBoot has other features, but I won't go into them here.)

Want a hybrid computer that "does everything", but can't wait for a PowerPC with Apple II emulation? A colleague of mine recently reported that he had a Mac LC 475 (1) up and running with an Apple II PDS card and Soft PC, giving him a hybrid computer platform that runs Apple II, Mac and MS-DOS software.

According to my colleague, the economical, 68040-based Mac LC 475 runs at a sprightly 22 MIPS (3 times faster than the 68030-based LC-III). Because of this fact, he claimed that he could get "acceptable" performance from Insignia's PC emulation software while running DOS-only applications on his Mac. Formerly, the biggest complaint about Insignia's Soft PC emulator for the Mac has been its lethargy, but the LC 475 gives Soft PC a shot of adrenaline.

My colleague said that Windows still runs slowly on his 475, however. He also said that Apple II emulation from the PDS card remained consistent with an off-the-shelf, 1 mhz IIe. The IIe screen display may be somewhat faster with the LC-475 than with the LC-III, however. Of course, the 475 won't run IIgs applications, but this poor man's PowerPC may be just the thing for Apple IIe owners who want to expand their horizons while retaining their capability to run the latest and greatest 8-bit applications like AppleWorks 4. We will talk more about the LC/IIe hybrid and the Mac's PDS IIe card in next month's article.

Up to this point, all our hybrid articles have focused upon PC "transporter"-equipped Apple IIe and IIgs computers. However, there are other Apple II hybrid platforms that blend PC and Apple II technology that should to be covered in this series. All of them are based upon Diamond Computer System's "Trackstar" card, a 128K, 65C02 coprocessor board that is designed to fit into an expansion slot on a PC or PC compatible system to make a PC/IIe hybrid. Radio Shack sold these cards with its Tandy 1000s, and Diamond Computer sold them direct to public schools.

Two of the more notable hybrid systems that used the Trackstar were the "WPC Bridge" and the "Laser Turbo XT DUO". New Science Prospects, a company in Houston, Texas, sold the Laser Turbo XT DUO, while Cordata corporation bundled the Trackstar with its Wizard PC and sold their system as the WPC Bridge. It's worth noting that the Trackstar card uses exactly the same Apple II ROM instructions as the Laser 128 Apple II compatible computers. (2) Therefore, the DUO and Bridge also possess this same relationship to the Laser 128.
Last December a spokesperson for Diamond Computer Systems advised me that the Trackstar is "no longer in production." However, Diamond Computer may still have some of these cards within its inventory, and many of them can be obtained as used equipment. If you can get your hands on a Trackstar Plus, which can be installed in a 386 class computer, you may find some of its capabilities to be quite useful. Like the Trackstar, neither the DUO nor the Bridge are manufactured any longer.

DUO The 8088-based DUO ran at 10 mhz (PC mode). It sported two 5.25 " floppy drives, which could read both 143K Apple and 360K IBM formatted disks. It came with 512K RAM in IBM mode. At approximately $1300 for computer and monitor, the DUO cost a bit less than the pricey WPC Bridge, which listed for $1695. Like the DUO, the WPC Bridge also sported dual IBM/Apple-compatible 5.25 drives, an 8088 microprocessor and 512K RAM. However, the Bridge sold as a single plug-and-play unit with a monitor built right into the CPU chassis, just like the Mac Classic.

WPC BRIDGE Cordata corporation felt like the WPC Bridge would be a sure hit with public schools. However, like so many others, including Apple Corporation itself, Cordata misjudged the schools and the Apple II market. While Apple users were moving in droves to 128K systems and ProDOS, or to the Apple IIgs, Cordata was sending out its Bridge as a 64K Apple II Plus emulator, bundled with Apple DOS 3.3.(3) In order to allow the Bridge to make full use of its 128K Apple RAM, the user would need to supply his or her own ProDOS.

Besides being bundled with an older Apple disk operating system, the Bridge was also bundled with an older IBM operating system (DOS 2.11), and this was done when MS-DOS 3.3 and the 286-level PC had become the accepted standards. The WPC Bridge wasn't a complete flop, however. It had many excellent features, although many of its best features (so far as Apple II users were concerned) were derived from the Trackstar card itself.

TRACKSTAR FEATURES Because the Trackstar is a CO-PROCESSOR card which has its own on-board Apple RAM and microprocessor, one of its neatest features was (and is) the Trackstar's ability to do multiprocessing. This was a feature also found in both the DUO and the WPC Bridge. Using an Alt-Esc key combination, a Trackstar user can switch between two programs running simultaneously in both Apple and PC modes. For example, a spreadsheet program can be run on one side of a PC/IIe hybrid while the user works in the word processor on the other side.

Another good Trackstar feature is its ability to be used in a PC LAN network. When installed in a 286-level or 386-level PC, the Trackstar can function as a server to a network of similarly equipped hybrids, enabling a group of PC/IIes to access both 8-bit Apple II and MS-DOS programs and data that have been stored on a single server. This feature has been of particular interest to schools which have equipped their PC labs with the Trackstar, enabling their students to enjoy the best of both the Apple II and PC worlds over a network.

The Trackstar shares similar features with the PC Transporter. For example, while the PCT allows the storage of MS-DOS data and programs on the Apple's CGR volumes, the Trackstar enables the storage of ProDOS data and programs on a PC's MFM volumes. Virtually any of the PC's MFM block devices will work, including devices which use high density diskettes. Unfortunately, it is not possible to attach a CGR/ProDOS 3.5 microfloppy device directly to the Trackstar so it is not possible to load programs or
data from this type of diskette. However, MFM/ProDOS diskettes, which have been written in a Floptical or similar device, should be accessible by the PC's drives.

Like the Transporter, the Trackstar uses a specially configured directory on the PC's hard drive for the storage of ProDOS files and programs (up to 10MB only). MS-DOS is used for I/O management between the Trackstar's 65C02 microprocessors and the PC's serial and parallel ports, printer and drives. A special connector on the Trackstar enables a standard, 5.25, Apple-compatible drive to be connected to the Trackstar for hard-to-load, copy-protected programs. Also like the Transporter, the Trackstar uses keyboard emulation to allow PC-standard keyboards to function like the Apple keyboard.

The Trackstar was sold with utility software that allowed rudimentary text and binary file translation between MS-DOS and ProDOS. This software, however, was not as powerful as the corresponding PCT file translation software. Just as the PCT is booted from ProDOS, the Trackstar coprocessor card is booted from the PC's MS-DOS operating system. The Trackstar Plus was keyboard selectable for 2 mhz "turbo" operation, and it would support 640x200 CGA and 720x348 Hercules video resolutions on the PC monitor. An Apple compatible joystick could be connected directly to a special connector on the Trackstar, a feature not offered with the Transporter.

For Apple II power users, the Trackstar's 128K of RAM was a major limitation. New Science Prospects promised in one of their flyers that the 128K Apple RAM would become expandable to 640K in the Turbo XT DUO by late 1989. I don't know if Diamond Computer's engineers were planning to actually add on-board RAM expansion capability to the Trackstar, or whether they were planning to borrow the DUO's native 512K RAM (through some kind of system software magic) for the Trackstar. Though I have made calls to dealers, I have never been able to verify that this feat was accomplished, and I believe that the Trackstar's Apple RAM never exceeded 128K.

A few years after New Science Prospects had promised to make more RAM available for their Trackstar-equipped DUO, Apple computer itself was faced with the same problem with their IIe PDS card and Mac LC. Fortunately, for those Apple II power users who made the switch to the LC and IIe PDS card, Apple delivered on their promise and could make up to 1MB of the LC's RAM available to the IIe card. Next month, we'll talk about the Apple IIe PDS card and the Mac LC series computers. Until then, think Hybrid!

NOTES

1) The Mac LC 475, Mac Quadra 605 and Mac Performa 476 are all essentially 68LC040-based LC-IIIIs.

2) To my knowledge, the Laser 128 and Trackstar were the only 'legal' Apple II clones that were ever produced. A firm called "Language Arts" wrote the Apple II ROM knockoff for these systems. Anyone wishing to produce an Apple II software emulator for the PowerPC might be wise to start by attempting to acquire the rights to this ROM.

Golden Oldie Review: Bard's Tale

by Darrel Raines
[D.RAINES]

This month I intend to pull another "Golden Oldie" from the shelf and
review a software package that you will be most likely to find in the "used
software" areas -- "Bard's Tale". This program was originally written for
and distributed by Electronic Arts. The game was produced for many
different computer systems, including the Apple II, IIgs, IBM clone, Atari
and Amiga platforms. The game was successful enough to justify two
follow-up games and, for some platforms, a construction set that allowed
you to create your own scenarios. I will be reviewing the Apple IIgs
version of this game.

Bard's Tale is an adventure game in the mold of the Wizardry
scenarios: You are called upon by the people of Scara Brae to rid them of an evil wizard who has closed down the city gates and controls most of what goes on within the city walls. Outlaws, demons, and monsters of all description have taken over the city. You are responsible for gathering a band of merry men to release Scara Brae from the clutches of this deadly maniac. Fortunately, there is a good deal of monster-thumping to be done along the way. We should be in for some fun!

The first thing that struck me when I loaded this game was the graphics. "Out of This World" has some of the best animation that I have ever seen on an Apple IIgs, but Bard's Tale gets my vote as one of the best still-graphics games. It is true that the graphics in this game have some limited animation, but this is only a crude frame swapping that doesn't really qualify as animation in my book. The graphics are realistic and lead the player to believe that he/she is actually viewing the scenes depicted on his/her computer screen.

The screen is laid out with three main areas. The bottom half of the screen is reserved for a view of the party roster and the current statistics of each character. You may point with the mouse to get more information about a character. This action will also bring up a menu that allows the character to perform many different activities, such as trading supplies and casting spells. The roster also indicates in what order the band travels, which is important for battles since the first three characters are the ones who do most of the hand-to-hand combat. The back three characters are only able to join in the fray via the magic system. Current statistics are always shown in this area including the all-important health indicator (hit points) for each character.

The top left corner of the screen is dedicated to showing a view of the outside world. If the team is engaged in combat mode, the view screen is reserved for a picture of the nasty that you are currently facing. The limited animation comes into play here, but does not really add much to the overall effect of the game. When not engaged in battle, the port is used to show the streets, houses, and insides of homes that are apparent in your field of view.

The final display area is the top right hand corner. This area is used to tell the player what is going on in the world around him. It is also used in combat mode to select which option each character will take during battle. Any information displayed in this area will scroll at a rate selectable by the player. Therefore, you must pay attention to this part of the screen, or you may miss something important.

The play of Bard's Tale should be familiar to all adventure-game players. You go through a short character-building sequence and then are thrust into the adventurer's guild where you can build a team of characters. Some of the character classes are geared toward fighting, while others are geared toward magic. The Rogue is a thief. Finally, there is a unique class called the Bard. The Bard can fight and can wield weak magic with his songs.

The composition of a party is pretty much standard. You need two fighters, a Bard, a Rogue, and two magic users. You may chose to differ from this standard, but the results may not be what you want. Even though this game has an objective (getting rid of the evil wizard), the main task is to build your characters in experience. Once you have some powerful characters, you can go whip the big boy.
When it comes to character development, this game has a number of good features. However, one of the worst features is the one that hits new players right off the bat. It is extremely difficult to get characters past the first and second levels of the game. Your characters will soon be dropping like flies. The only way to bring them back to life is with the help of some expensive monks -- the cost of healing and bringing back to life a party of six characters required me to create and steal the money from more than fifty throw-away characters. Life is tough, and then you die... and then you pay exorbitant fees to come back to life!

Once you get a few levels under your belt, the fun begins. Exploration commences in a large city that has a number of hidden dungeons. You soon find that life will go well for you if you can develop a couple of powerful magic users. There are four types of magic users. However, once you learn the spells of any one branch of magic, you can start over (retaining the memories of the learned spells) and learn a new branch of magic. Therefore, it is possible to develop a magic user that will know all the spells for each of the four magic disciplines. This type of character will be known as an Arch-Mage. The greatest part of your time will be spent in trying to develop one or more of these characters.

As you explore the city and dungeons, mapping is an important concept. There are a few riddles and hidden items that must be found for you to be able to find the ultimate bad guy. You must therefore delve into each and every corner of the dungeons to assure success in the final battle.

The quality of graphics in the dungeons and the wide variety of monsters that you encounter make this game a joy to play. The interface is smooth and allows both mouse and keyboard entry of commands.

Bard's Tale uses the sound support of the IIgs to good advantage. The number of instruments used in the music is limited, but the quality of the songs is better than usual. One of the unique features of this adventure game is the special nature of the Bard character. As you would expect, there are certain advantages to be gained for this character. The Bard can weave certain long-term magic by playing tunes on his musical instrument. There are many different instruments available. Some of them have special attributes that are useful in battle as well. Of course, only the Bard can use these instruments. When these weapons are used you will hear appropriate sounds from your speakers.

There are a few weaknesses in this game. The chief fault is that you must return to the adventurer's guild before you can save a game. This can be most annoying if you happen to lose your way in a maze. More than once, I had to turn off the monitor and hope that we did not have a power failure before my next session. As mentioned earlier, it is difficult to get past the first two levels.

In general, Bard's Tale is an extremely enjoyable game and deserves a look. The play is smooth and absorbing; the graphics are fun to look at and add to the realism of the game; the user interface is comfortable. My recommendation would be to find a copy of this game and play it!

DR's prognosis: A fine specimen of an adventure game. It has a fine future ahead of it as an aging classic.
Darrel Raines likes to play games on his computer. He has been known to write reviews about these games from time to time. He also sometimes works for NASA as a subcontractor on the International Space Station.

The purpose of this new column is to introduce you to some files in the A2 library that you may have overlooked. Each month I'll try to find a variety of files that deserve a little recognition and tell you a little bit about them. When appropriate, I'll offer suggestions on how to make them more useful.

All of the files described this month are public domain. Each month I'll identify the files that are copyrighted freeware or shareware.

Let's get started with 8 files that are among the first 4000 files ever uploaded to the A2 library.

INTERNAMAZE.BNY   File #1298   6300 bytes   (ProDOS game)

INTERNAMAZE by Dennis G. Ward with Applesoft conversion by Bill Fortenberry is a good example of a lo-res graphics game. It's also a neat program to study if you're interested in improving your knowledge of lo-res graphics programming.

The program creates a random maze on the lo-res screen and shows it to you from a top (overhead) view. Then it switches to a head-on (as if you were in the maze) view and waits for you to decide which way to go. Movement is determined by the E D X S keys with E being forward, X reversing direction or turning around, D turning right and S turning left.

The game has various aids or on-screen helps. You may choose to leave footprints, have compass directions displayed, and have access to a map. The map is the overhead view of the maze with your path clearly marked.

You start the game with 100 points. Each time you look at the map, it costs you 5 points. You also lose 1 point each time you go forward if you have already been there before. The object of the game is to complete the maze, losing as few points as possible.

In addition to deciding if you want to leave footprints, have a
compass, or have access to the map, you also choose a difficulty level between 1 and 10. I've chosen level 1 and also level 10, and I haven't noticed a great difference; but I haven't examined the code closely enough to determine for sure what the difficulty level does.

The graphics are acceptable on a monochrome screen, but are easier to see on a color monitor. Uppercase input is required. I haven't discovered any way out of the game except control-reset.

Running on a regular IIe, the program is kind of slow, but that is because it is written almost completely in Applesoft BASIC. You spend a fair amount of time waiting for the maze to be created; but since it's created on the screen in front of you, it's interesting watching it do its thing.

If you're into maze type games you'll like this one. And if you're interested, you'll be able to fix some of its shortcomings and make it even better by following these directions:

Get into BASIC. LOAD the program into memory. If you don't know how to do that, do this: RUN the program and at the first chance you get to type anything, press CONTROL-RESET to exit the program.

Next, type the following lines just as they appear below. Press RETURN after each line.

1500 IF G$ = "y" THEN FTS = 1
1515 IF G$ = "y" THEN COMP = 1
1525 IF G$ = "y" THEN MAP = 1
1660 IF Z = 155 THEN TEXT : HOME : END
1665 IF Z > 197 THEN Z = Z - 32

Next, type "SAVE INTERNAMAZE" (without the quotes) and press RETURN. Now, thanks to line 1660, when you press the ESCAPE key you will exit the program without having to press CONTROL-RESET. The other lines add the ability to use lowercase letters.

[*][*][*]

THE.GALLOWS.BNY File #1612 5040 bytes (ProDOS game)

The next program is titled THE GALLOWS and was written by Douglas Konitzer and uploaded on March 29, 1987. It is a fancy take-off on the hangman type game. It is actually misnamed because it displays a guillotine instead of a gallows or hanging tree. It requires an 80 column display.

This "word guess" program displays a guillotine which lowers each time that you select an incorrect letter. Like most games of this type, you are shown a list of the letters that you have selected. The program also tells you whether the word is a person, place, or thing. It comes with a supply of words, but it is fairly easy to change them or add additional ones. The words can be up to 18 letters in length.
There are some drawbacks to the program. The most serious is that
the program treats lowercase and capital letters as separate letters. This
can create a problem when the sample words are in all capital letters and
the user is typing lowercase letters. The other main problem is that you
need to know at least a little about BASIC programming to change the sample
words.

If you're into hangman type games you'll like this one. And if
you're interested, you'll be able to fix some of its shortcomings and make
it even better by following these directions:

Get into BASIC. LOAD the program into memory. If you don't know how
to do that, do this: RUN the program and at the end of the program, when it
asks you if you want to play again, type a capital N.

Next, type the following lines just as they appear below. Press
RETURN after each line.

1725 GL = ASC(GL$) : IF GL > 90 THEN GL = GL - 32 : GL$ = CHR$(GL)
1995 IF T$ = "n" THEN TEXT : HOME : END

Next, type "SAVE GALLOWS" (without the quotes) and press RETURN. Now
you will be able to type your answers in lowercase. If you want to correct
the erroneous references to "gallows" and replace them with "guillotine"
then add the following lines before you SAVE the program.

1140 DT$(1) = "Welcome to the GUILLOTINE game"
1210 DT$(8) = "bottom of the GUILLOTINE. To help"
1300 VTab 3 : HTab 13 : PRINT "THE GUILLOTINE"
1580 VTab 12 : HTab 5 : PRINT "RESETTING GUILLOTINE-STAND CLEAR"

The program lines that contain the sample words are lines 2040, 2050,
2060, 2070, 2080, and 2090. To replace them with sample words of your own,
do the following: decide first whether the word is a person (1), place (2),
or thing (3). Then begin typing with the number first followed by the word
as shown in the examples below.

2040 DATA 1,CLINTON
2050 DATA 3,GOLDENROD
2060 DATA 2,ARKANSAS
2070 DATA 0,0

The line number is typed first, followed by the word DATA and a
space. Next type the number (1,2,3) followed by a comma followed by the
word TYPED IN CAPITAL LETTERS. Do not put any spaces before or after the
comma. Press RETURN after each line. Finish with a line like #2070 above.
The two zeros tells the program that it has reached the end of the list.
There can be up to 150 words listed. Be sure to SAVE the program after you
add new lines.
MSETXT.RACE.BNY     File #2232     5040 bytes     (ProDOS game)

RACES is a rather simple game that uses the 80 column enhanced IIe, IIc, or IIgs to run a race among 5 runners. The whole program runs randomly from the decision as to how big your stake is to which runner wins the race. You get to decide how much to wager and whether to bet for or against a particular runner. The odds are different depending on how you bet.

If you regularly purchase lottery tickets, you'll probably like this game. The skill involved and the chances of consistently winning are about the same in both. <grin>

The author is identified only as Michael A.

BMW.BNY     File #1352     3780 bytes     (ML Subroutines)

The next program, BILL'S MINI WINDOW, may be of some use to those of you who like to program the IIe in Applesoft. According to the directions file that comes with it, this program "provides a way to do simple 'pop-up' windows in Applesoft Basic. The &SAVE command stores the current text screen (40 or 80 column) in a buffer and opens the window. The &LOAD command restores the text screen and sets the text window to full screen dimensions."

A WORD OF CAUTION HERE! I've been able to get this program to work with the 40 column screen, but there seems to be a problem with the 80 column version. The &SAVE clears the window, but the &LOAD returns garbage to the screen. Since the main part of the program is written in assembly language, you will need that ability to try and fix it.

BMW.BNY unpacks to 3 ProDOS files: BMW -- the actual program; BMW.DEMO -- Applesoft demonstration program; and BMW.DOC -- text file of documentation. Bill Fortenberry is the author of this program, which was uploaded on January 25, 1987.

Joysticks and RF Modulators

Jim Lubin uploaded several interesting files in late 1986. Among them were two sets that described how to build an RF modulator and a joystick. Each set contains a short text file listing the parts needed and giving a brief description of the process, and a high-res graphics screen showing the schematics. The graphics are very well done.

If you're reasonably proficient in working with hardware, you might want to take a look at these. If you're not, don't bother.

The RF modulator files are RF.MODUALOR.SCH.BNY (file #1246) and RF.MOD.BNY (file #1245). The first one is the graphics screen with
Apple II Computer Info

approximately 8820 bytes. The second one is the text file and is approximately 3780 bytes.

The joystick files are JOYSTICK.BNY (file #1244) and JOYSTICK.TXT (file #1243). The first one is the graphics screen with approximately 8820 bytes. The second one is the text file and is approximately 3780 bytes.

According to Jim Lubin, this will tell you how to build your very own joystick for your Apple II, II-Plus, IIe, or IIgs.

ANS.MACHINE.TXT File #1437 8820 bytes (text file)

Do you hate answering machines? Then you might be interested in this next text file. According to the long description...

"This file, written by Rod Serling of CYGNUS, discusses the backlashes of buying an answering machine. Ever notice how the number of calls to your house seem to drop drastically when you install that answering machine? A humorous look at the common answering machine."

This is dry humor, not slapstick. You'll either agree with him or wonder why you downloaded it.

KERMIT Reference Files

Do you use KERMIT? I found two files uploaded by Pharing in late 1987 that may be helpful to you. The first one, named VI.CMD.REF.TXT (file #2660; approximately 15120 bytes), is described this way.

"Apple users with the KERMIT program will appreciate this extended command reference when using VI on a UNIX/XENIX/ULTRIX system. Print out this text file and keep it handy."

The second one, named VI.QUICKREF.TXT (file #2659; approximately 5040 bytes), is described this way: "This is for Apple users, using KERMIT on UNIX/XENIX/ULTRIX systems; a quick reference card for vi for those who don't have access to one."

With the increased interest in accessing the Internet, some may find these files useful.

WOZ.HRTZFLD.TXT File #494 22680 bytes (text file)

The oldest file that I could find in the A2 Library is an article titled...

Reflections from Steve Wozniak and Andy Hertzfield on Apple Inc., and Diverse Other Items,
During a Flying Visit Downunder for Breakfast

This is a report by John MacGibbon of a visit by Woz and Hertzfield with the New Zealand Wellington Apple Users' Group in December 1985.

The greatest part of the article is given over to a discussion of Steve Jobs at a time when Woz and Jobs were not on the best of terms.

Some of the other topics discussed include LCD monitors for the Apple IIc, the AppleTalk network, AppleWorks for the MAC, Jam Session, the Mac's future, esoteric uses for the Thunderscan, desktop publishing, and products linking the Apple II and the Mac.

While most of this information is available in other places and is dated, it is interesting to compare what they had to say in 1985 with what has happened since then.

I wonder what became of files 1-493?

[*][*][*]

Next time we'll take a look at some more recent files, including some that are GS-specific. Until then, happy downloading!

-- Charlie Hartley

>>> A VISIT WITH JAWAID BAZYAR <<<

A CD-ROM software interface for the IIgs seemed a pipe-dream to many Apple II fans. However, Jawaid Basyar, author of GNO/ME, SwitchIt, and discQuest, never had any doubts that it could be done.

I met Jawaid on a cold, snowy Saturday this past February at Sequential Systems in Lafayette, Colorado, where he had promised me a personal demonstration of Sequential's CD-ROM bundle and the discQuest software that makes it all possible. Just a few miles away in Boulder there was an all-important basketball game that same day between the University of Colorado and my own alma mater, the University of Kansas. The rest of my family was going to that game. However, for me basketball could wait; I couldn't pass up the opportunity to meet Jawaid and see discQuest.

"Someone called up here and wanted us to admit that we didn't have CD-ROM capability," Jawaid said as he unlocked a door to Sequential's plant and offices. He explained that after Sequential sent out their press releases, many people couldn't believe it was true, and others seemed openly hostile to the idea that the GS could actually possess such a capability. Nonetheless, discQuest is a reality that not only works, but
it works well.

In a matter of minutes, Jawaid and I were sitting in front of a RamFAST-equipped IIgs with CD-ROM drive, and he was running a beta color version of discQuest. As reported in last month's GEnie, the color version of discQuest is no longer in beta, and is now being sold with Sequential's CD-ROM bundle as version 1.2.

Jawaid is a C programmer who does some GS development on a 486 PC compatible and then ports his code to the GS using his UNIX-like environment, GNO/ME. The discQuest software, however, was developed strictly on a GS. According to Jawaid, DiscQuest makes use of a CD-ROM format called "DiscPassage". To date, Sequential and Jawaid have identified some 15 DiscPassage CD titles that will work with discQuest. No doubt Jawaid's familiarity with the PC has helped him in his understanding of DiscPassage, which was originally set up for use by PCs.

DiscPassage is primarily a hypertext format that includes 640x480, 256-color images. A bit of software sorcery is necessary to make a PC's VGA color images fit the IIgs's 640x200 screen resolution. To do this, Jawaid's discQuest "front-end" turns the GS screen into a mouse-controlled window that slides around over a slightly magnified PC graphic image to display portions of the image in color mode. Keyboard commands can then shift between this color image and what Jawaid calls a "16-color gray scale" display to provide full, single-page images of the graphics. Color or gray-scale can be selected as defaults. The arrangement works smoothly on an algorithm that Jawaid calls an "octree quantization method."

The CD-ROM search functions of discQuest are performed from a standard GS screen display with menu bar. Searches can be performed by author, keyword, subject and title. A "Related Items" selection is also available from the menu bar. Jawaid feels that the search functions benefit from a "very fast index built into DiscPassage". Subjectively, searches seem to occur about as quickly with a RamFAST-equipped GS as those performed on a CD-ROM drive attached to a MAC LC. Text displays are in standard 640x200 GS black-on-white. The GS user can capture the text for use in other documents, and graphic images can be printed to disk. Jawaid explained that GS/OS system 5.04 or higher is necessary to use discQuest.

Sound is provided through the CD-ROM drive, itself, rather than the GS. As the user accesses specific portions of a CD's text and graphics, an audio track on the CD automatically plays the corresponding sound data through a speaker jack on the drive. Sequential bundles a pair of small, multimedia speakers with its drive, discQuest software and CD-ROMs. In this writer's opinion, the speakers provided adequate sound and amplification. A flyer from Sequential offered two bundles, both of which include an RF card, single and double speed "Texel" CD-ROM drives, multimedia speakers and a selection of four CDs.

The RamFAST SCSI card offers the widest compatibility with CD-ROM drives. However, discQuest will also work with the Apple high speed SCSI card. For those who missed last month's GEnieLamp A2, it was reported that the RF card would work with Texel, NEC, and "virtually all" SCSI-2 CD-ROM drives. The Apple high speed SCSI card would reportedly work with the Apple CD-150, Apple CD-300 and some Apple SCSI-2 drives. Jawaid said that Tulin was completing a driver for the Apple HS SCSI card which would allow it to be used with NEC drives. However, if you own the Apple SCSI card, it might be best to try before you buy. For those who already own a RamFAST
or Apple HS SCSI card, Sequential will sell the discQuest software, CDs and drives separately. RamFAST owners may require a ROM upgrade to their cards for compatibility.

Jawaid lamented that no encyclopedia CD was as yet available for the IIgs. This was due mainly to the fact that none exists in "DiscPassage" format. Nonetheless, Jawaid felt that an encyclopedia was "doable", and he expressed confidence that an encyclopedia would eventually be available. He said that DiscPassage is licensed to several different companies but that none have yet come up with an encyclopedia. Meanwhile, at more than 600MB storage per disk, there's more than enough information available on Sequential's collection of 15 CD-ROMs to keep users busy for some time.

Big Red Computer Club has announced through their publication SCARLETT that they will also offer the Sequential CD-ROM bundles, discQuest software and CDs for sale. A full list of the CD titles is available from Sequential and another list of the titles was posted in last month's GEneLamp A2. Additional lists with complete descriptions of each CD are available in the most recent issue of Scarlett and on GEne's Apple II RoundTable in Category 20, Topic 12. Check out these lists. They include such things as a Darwin multimedia collection with complete text and graphics from several of his works, the complete Monarch Notes, complete collected works of William Shakespeare, U.S. history, world history, and countries of the world on CD.

Jawaid explained to me that he wrote discQuest for the same reason that he wrote GNO/ME, simply because "People told me it couldn't be done." He said, "People get to a point in the GS market where anything that couldn't be done in the past becomes impossible. I've never let anything like that bother me." He said a CD-ROM interface for the GS was always a possibility once GS/OS system 5.04 (with its support of ISO 90 CD ROMs) was released.

Personally, I'm glad that Jawaid Basyar enjoys this kind of challenge. DiscQuest really works. I've already got a RamFAST card, and CD-ROM drives are dropping in price faster than leaves in October. Now all I need to do is save a few more of my pennies, and I'll be able to get my own drive and discQuest software. I can hardly wait.

PAL NEWSLETTER /

April 1994 Report

by GEna Saikin

The Planetary Apple League (PAL) is an online user group that meets the third Sunday of every month. The purpose is to provide a place that Apple II users can meet with their fellow users and gain knowledge and have fun! Our meetings include the main speaker plus information about what's happening in the Apple II world and in the Apple II RT on GEneie, as well as guest articles -- some humorous, some serious.

WHAT'S NEW IN APPLEDOM? Soon to arrive -- early this summer, we hope! -- will be the long-awaited update to AppleWorks GS, making it more function and System 6 compatible.
Several other new programs have already been out, and have been enthusiastically embraced, among them:

- Spectrum, a desktop communications program for the Apple IIGS;
- AppleWorks 4, and update to the "workhorse" of the Apple II world;
- AnsiTERM 2.1, another communications program for the Apple II, with a marvelous ANSI emulation.

A new "diskazine" has entered the Apple II world: PongLife, which will contain informative articles, product reviews, and many graphics and music -- done in HyperStudio format.

SPECIAL SPEAKERS - PONGLIFE
Auri Rahimzadeh and Ben Johnson, co-editors of PongLife were the guests at the March 20 meeting of PAL.

They told us about PongLife, and what to expect in future issues. The first issue contained a reviews of several communication programs, and an interview with accomplished programmer Tony Morales.

According to both Auri and Ben, issue #2 will have more graphics, more music and a much better interface, plus more articles, more reviews, interviews, and other goodies. To quote the editors, the new interface will have the following features:

"Online Help in all areas, so if you ever wonder what an option does, just click on Help Me! and it will list all buttons on the screen and tell you what they do! A JUMP command, which will let you jump to any 'page' in the issue, instantly. And the questionnaire will automatically ask you questions then create the text file so you can print it out without printing it out first, then filling it out..."

THE LIBRARY STACKS
With over 22,000 files uploaded to our library, it is exceptionally hard to choose which ones to put here, as all are good. However, since in the interest of space, we DO have to narrow it down. Below is what is known as the Dean's List -- a list of the best files:

22225 MINITALK162.BXY  Telecom program in a CDA!
+22222 AT.COMMAND.BXY  Text file of modem commands.
22220 CDA.ADB.BXY  CDA to view AppleWorks database files
22207 DISKOPEN.BXY  Automatically open your Finder disk icons
22200 HCFSSTARTER.BXY  HyperCard IIgs starter kit - A must-get!
+22183 A2.DOM.0294.BXY  A2 Disk of the Month, February 1994
22181 DISKTIMER2.BXY  Check the speed of your hard drive
+22171 A2AWLIBLONGLONG.BXY  AppleWorks database - lists all A2 files\n22151 FLI.VIEWER.BXY  View IBM .FLI animations!\ling\n+22090 NF.BXY  Nightfall II v1.0 - NICE astronomy program
22084 EAR1.1.BXY  Hear sounds/music directly from Finder
22083 EYE1.1.BXY  View graphics & more from Finder
22081 BLEACH.V1.1.BXY  Makes Finder & now STANDARD FILE folders white!

GUEST COLUMN: THE CONTINUING SAGA OF MY APPLE II
Well, after several months of using my Apple IIc on GEnie, I finally took the plunge and bought an Apple IIgs. I
would have never been able to do this without the support of all the good
guys and gals of A2. I have a basic "bare-bones" system with CPU,
keyboard, a monochrome monitor, and a 5.25 drive.

The "continuing" part of this saga is how everyone is really joining
in to help me find the other parts that I need to have a complete system.
Everyone is helping me hunt high and low and in the bulletin board for
equipment. It seems that I am finally on my way to becoming an Apple II
user of today!

But then, it happened. My quest for new equipment was postponed as I
had to refocus my attention on having my keyboard cleaned and repaired.
Folks, I know you have heard this a thousand times, but DON'T EAT AND DRINK
AROUND YOUR COMPUTER!!!! Yes, salsa. Not the thick chunky kind either.
The thin, runny, oozing kind. It makes a nice layer of sludge inside a
keyboard. Trust me. I know this for a fact.

Well, my Apple fate is now in the hands of Harold, A2's resident
hardware guru. I think if it weren't for all the people here in A2, I
would have defected to the world of PC by now. But, I am still here and
still working at it! Stay tuned for more details!

WHAT'S NEW IN A2? We continue to have nightly Real Time Conferences
(RTCs) from 9 p.m. to 1 a.m. eastern time, and all
afternoon on Sundays (2 p.m. to 8 p.m. eastern). Our bulletin board is a
wealth of information for Apple II'ers, so feel free to browse -- and post!
And don't forget our library, filled with thousands of useful and fun
files.

There has been one sad note in A2. The son of Doug Pendleton, known
for his expertise in hardware, and a frequent visitor to A2, was shot and
killed in a drive-by shooting on March 19. We wish Doug and his family the
best, and grieve with him in his loss. Topic 18 in Category 2 has been
designated "In Memoriam" for Doug's son.

(PART 20/21b -- MAGAZINES, CONT)
[v1.2 :: 10 Feb 94]

INTRODUCTION We continue this month with review of the Apple II magazines
that kept us using our favorite computer to its fullest,
including Computist, A+, inCider, Apple IIgs Buyer's Guide, II Computing,
Open-Apple/A2-Central, Compute!, and Apple Orchard. (As a reminder, I've
taken the original parts 20 and 21 of the History and combined them,
added some new info, and then split the result into three Lamp-sized pieces.)
Apple II Computer Info

Commutist (1981-Present)  This magazine began originally back in 1981 with the name "HardCore Computing". A flier mailed out during 1982 gave this description of the magazine: "HARDCORE COMPUTING, a small magazine in Tacoma, Washington, warns pirates about the latest technology that companies are using against them. HARDCORE is a magazine dedicated to the Apple-user. There are a lot of computer magazines, but HARDCORE prints the information that other magazines refuse to print, information vital to you as a computer user." By 1983 it was split into two separate publications: "HARDCORE Computist" (devoted to "kracking"; see below), and "CORE" (devoted to general Apple II topics). CORE was to have been published four times a year, but was dropped after only a few issues. The first issues of CORE, during 1983, covered graphics, utilities, and games. The third quarterly issue was to have been about databases, but the games topic was substituted and the database topic never appeared in print.<1>,<2>,<3>

For the first four issues, the name "HARDCORE" dominated the title page. Beginning with issue #5, "Hardcore" appeared in smaller type, with "COMPUTIST" taking over a dominating position on the cover. By issue #27, the name "Hardcore" was dropped completely from the cover. Although it began as a glossy format magazine, this was discontinued with issue #45 in 1987, and with issue #66 in 1989 they changed to a tabloid format. The publishers claim that one reason for the name change to simply "Computist" stemmed from a complaint sent in by a young subscriber whose mother was throwing out the magazine before he got it, because she thought it contained pornographic materials!<1>

"Computist" was, admittedly, in the business of teaching users how to "strip". But this did not refer to X-rated topics, but the ability to strip the copy-protection from commercial software. This technique, known as "kracking", was a popular pastime for some software hackers of the day. Using powerful programs such as Locksmith and Copy II Plus, Computist gave specifics on how to make a disk work as easily as a standard Apple DOS disk.<3> The combination of ProDOS and un-protected commercial programs took much of the wind out of Computist's sails, since the special help needed to copy disks was no longer necessary. There were, of course, those who used the techniques printed in Computist to "pirate" programs (duplicate and distribute protected software), but many used it to standardize the modified DOS so that the programs could be used with RAM disks, large floppies, and hard disks.<1>

Though it is still being printed, "Computist" is much different than it was in its early days. It is no longer Apple II-specific, and has expanded to also cover the Macintosh and IBM. Its publishing schedule has also become rather irregular. Each new subscription still comes with a tutorial by Wes Felty on disk de-protection and the use of a program called "Super IOB".<4>

A+ (1983-1989)  Ziff-Davis, who published other computer magazines such as Creative Computing, began publishing A+ in January 1983. This new Apple II magazine carried primarily hardware and software reviews and consumer-oriented articles. It was somewhat similar to today's inCider/A+ in terms of being a general interest Apple II magazine as opposed to the programming slant of Nibble (A+ had virtually no type-in programs).<5> During the time that both A+ and inCider were being published there continued a friendly rivalry between the two.

One of the features unique to A+ was a column called "Product
All-Stars", a classified-style listing of the current popular software and hardware similar to the old "Fastalk" column in Softalk magazine.

During the latter part of A+'s publishing run, Gary Little became its editor. He had previously written books about the Apple IIe, IIc, IIgs, and their disk operating systems, and so was very qualified to know the computer and its uses. He replaced Lisa Raleigh, who left to take a job with Apple Computer. Not long after, and just prior to the magazine's merger with inCider, Gary Little also was hired away by Apple. It was felt by some subscribers that Little's short stint with A+ significantly improved the magazine, and they were saddened to see him go.

When Creative Computing had ceased publication in 1985, subscribers found their remaining issues were switched over to A+ Magazine by Ziff-Davis. In 1989, the publisher chose to discontinue A+, and allowed it to merge with inCider magazine.

inCider (1983-1993)   This magazine was originally begun by Wayne Green, who had been involved in technical magazines for many years. As mentioned above, it was not a programming magazine, though it carried columns that answered readers' questions about programming as well as other Apple II questions. The main direction that it has seemed to take over the years was in helping advertise available software and hardware, and carry articles that helped Apple II users learn to use the software they owned. These columns included "AppleWorks In Action" by Ruth Witkin; "Press Room" by Cynthia Field (which detailed ways to do desktop publishing with Print Shop, Publish-It!, AppleWorks GS, and GraphicWriter); "Bridging The Gap" by Gregg Keizer (discussing ways to help the Apple II and Macintosh work peaceably together); "Apple IIgs Basics" by Joe Abernathy (highlighting programming on the IIgs); and "Apple Clinic" (questions and answers about using Apple IIs).

In 1989 inCider merged with A+ Magazine, as mentioned above, and in December 1990 the editors chose to broaden their audience by adding coverage of the Macintosh computer to their Apple II features. This was a highly unpopular move with many Apple II loyalists, who had already had quite enough of Apple Computer telling them to "move up" to a Mac. "Polluting" their Apple II publication with this better-loved younger sibling infuriated many, and they vowed to let their subscriptions expire. However, at this point in time there were few national Apple II-specific publications remaining, and no others that appeared on the magazine racks at large newsstands (since Nibble had by then gone to mail-only distribution to subscribers). Apparently inCider's distributing company, A+ Publishing, felt that they couldn't survive without making some attempt to broaden their customer base, and they chose this as what they felt was their best defense in a shrinking market. For several months afterward, the magazine got just a little bit smaller in size, eventually going from a square-bound back to a stapled format. This shrinkage stabilized in early to mid 1992, and by late that year, inCider/A+ was still in business.

However, rumors began to surface in October 1992 about plans by inCider to change to a format that would focus almost entirely on the Macintosh, with significantly less attention paid to the Apple II.<11> Initially, it was said that inCider/A+ would cease under that name with the January 1993 issue, and would reappear as just "A+" in February 1993. Reasons cited at the time were declining advertising revenue, and they hoped that by changing themselves to deal with the Macintosh in more detail (particularly from the point of view of educators), they could continue to
Cameron Crotty, Associate Editor of inCider/A+, stated online in the A2 Roundtable on GEnie during October, "inCider/A+ is going primarily Macintosh. The shift will occur in February and will probably include a name change (not finalized). WE WILL CONTINUE TO COVER THE APPLE II FOR AS LONG AS IT REMAINS FEASIBLE. I cannot say (because I do not know) whether the coverage would be mixed in or in a separate section (input would be appreciated). With the shift in focus, we are also trying to enlarge the book..."

He also said, "Right now, inCider/A+ has two choices: 1) stay with the Apple II and be dead in 6-8 months or 2) shift to the Mac and try to survive. We believe that there is a low-end Mac niche at least as large as our current circulation (perhaps larger), and that most of our readers (75% or more) will maintain their subscriptions (numbers from editorial surveys & such). We also believe that we can attract the advertising we need to survive by shifting to the Mac. We may be wrong. We may be dead in 6-8 months anyway. But a change has to be made. We cannot survive on our current course."

There was, of course, considerable discussion of this planned move on the A2 Roundtable on GEnie. Some advertisers, like Quality Computers, threatened to withdraw their advertising ENTIRELY, if such a move took place. Perhaps it was because of statements like this, or perhaps Crotty spoke out without authority to do so. In any case, there was considerable back-pedalling on the announcement that began to appear. Joe Kohn, who had been writing a column in inCider/A+ called "Shareware Solutions" for some time, stated that he had been told that there had as yet been no CORPORATE decision to make any changes, and previous statements should be disregarded.<12>

inCider/A+'s new Editor-In-Chief, William Kennedy, wrote an editorial for the February 1993 issue of the magazine. In his editorial, he made great pains to point out that the rumors that had been flying about were never accurate from the beginning. Yes, with the March 1993 issue they had plans to redesign the layout of the magazine, and probably put the Mac stuff in a separate section, but he stated firmly that it would remain oriented to the Apple II.<13>

However, it was eventually clear that IDG Communications, the company that printed the magazine for A+ Publishing, was not going to continue to produce what they viewed as a losing venture. Quality Computers, which had decided by early 1993 to start their own Apple II magazine, arranged to take over inCider/A+'s remaining subscription base and fulfill it with their publication. inCider/A+ ceased publication with the July 1993 issue, but ended it as abruptly as did Softalk, with no announcement to subscribers to make them aware of the change until Quality Computers sent a letter discussing it. IDG then planned to begin a new Macintosh publication called Mac Computing, utilizing most of the old inCider/A+ staff. However, after the first issue was produced and distributed, IDG changed their minds and terminated the project.<14>

If the editors of inCider/A+ had chosen to maintain their focus on the Apple II, and had not taken the unpopular move of becoming a combination Apple II/Macintosh publication, perhaps they would have survived longer. Perhaps things would have still turned out as they did, even if they HAD remained true to their original topic. In any case, with the disappearance...
of inCider/A+, so also ended the era of newsstand Apple II magazines.

Apple IIgs Buyer's Guide (1985-1990) This magazine began originally under the name, "The Apple II Review" in the fall of 1985. After about five issues the name was changed to "The Apple IIgs Buyers Guide". The changed magazine began in the Fall of 1987, and it ceased publication in the Fall of 1990. It was published in a high gloss format, and over half of each issue was devoted to a listing of available IIgs software/hardware.<6>

II Computing (1985-1987) This magazine published from October/November 1985 until February/March 1987. Trying to appeal to a variety of readers from beginners to experienced Apple II users, it printed program listings (including at one time listings made for the Cauzin strip reader), reviews, and general articles. It covered items in more depth than incider, but less than Call-A.P.P.L.E. or Nibble, offering a combination of both type-in programs and general articles. It had available a companion disk available containing the programs in the magazine.<5>,<7>

Open-Apple / A2-Central (1985-Present) As mentioned above, Tom Weishaar was a writer of Softalk's "DOSTalk" column beginning in April 1983, after Bert Kersey retired from the position. He continued with it until Softalk went bankrupt after the August 1984 issue. An Apple II user since 1980, and author of two programs sold by Beagle Bros (Frame-Up, a graphics slide-show display, and ProntoDOS, an enhanced version of DOS 3.3), Weishaar had previous experience with writing newsletters from his days with the Commodity News Service in Kansas City. After Softalk folded, he realized that there was still a market for a technical publication for the Apple II that also could be helpful for the beginning user. In January 1985 he began with a newsletter he called Open-Apple, which continued where "DOSTalk" left off. The initial issue (Volume 1, No. 0) included readers' letters (some left over from DOSTalk, but some intentionally phony, with return addresses like the Okefenokee Swamp), information about Applesoft and Logo, and one response to a reader asking how to create a disk that would boot WITHOUT DOS 3.3. At $24 for a monthly eight page newsletter, its subscribing cost was as much as full-sized magazines of the day. However, Open-Apple did not carry any advertising, and the amount of useful information printed each month made it worth the expense.<8

As the newsletter matured over the years, the coverage of Logo disappeared, and Applesoft dwindled as well, reflecting changes in reader interests. During the late 1980s, coverage of AppleWorks was heavy, and nearly every issue would contain some way to patch the program to customize it for a certain function. Coverage of the IIgs was also prominent, and Weishaar and his various editors have struggled to find the balance between articles that dealt with the new technology without ignoring the sizable number of readers who still owned the older 8-bit Apple IIs.

In December 1988, the name of the newsletter was changed to A2-Central. Several reasons were given for the change. One was similar to the reason given by A.P.P.L.E. for changing its name to TechAlliance; Apple Computer was in the habit of threatening legal infringement against those who used "their" name without permission or at least licensing it. Another was to indicate philosophically what was the purpose of the magazine: To be the center of the Apple II universe, and a central source of information and programming resources. Earlier in the year, Weishaar
had also agreed to be the manager of the Apple II roundtables on the online
service GEnie. This extended the information available to him for his
publication, as well as the ability for more prompt exchange of information
for his readers. In fact, there was a great similarity between the
conversations that took place on GEnie, in the reader questions section of
A2-Central, and the old "Open Discussion" part of Softalk magazine. New
users could ask "how do I get XYZ program to run with my ABC printer?", and
experienced users could help them, either online or in a letter written to
A2-Central.

Because the newsletter included international readers as well, and
these people had difficulty in getting their hands on certain Apple
II-related products or books, a catalog was added to the A2-Central line-up
in early 1989. This initially carried books, but quickly expanded to
include software and hardware. February 1989 also saw the first issue of
A2-Central-On-Disk, which included a text file of the current month's
newsletter, as well as an assortment of the latest shareware and freeware
programs for the Apple II. At times it also contained text files with
useful information (such as updates to the official Apple II tech notes).

September 1989 saw a change in editors for A2-Central. After nearly
five years of working constantly on it, Weishaar turned over the reins for
the month-to-month work to Dennis Doms, and moved himself to the position
of publisher. There was little change in the content or style of the
newsletter (since Weishaar was still running the show), but it freed him to
recover from the burnout of meeting a monthly deadline, and to work more on
managing the company itself. One of the new items that appeared in
December 1989 was a disk-based publication called Stack-Central (later
changed to Studio City). What was unique about this bi-monthly product was
that it was based on HyperStudio, the graphics, sound, and text
manipulation program from Roger Wagner Publishing. As such, it could be
read in a "non-linear" fashion; that is, you didn't have to start at the
beginning and read through until you got to the end. You could jump from
one topic to another, or thread through topics in a fashion that could not
be duplicated in a printed publication.

More new disk-based products appeared from A2-Central in 1990. August
1990 saw the start of TimeOut-Central, devoted to AppleWorks and the
TimeOut series of enhancements distributed by Beagle Bros. It was also a
bi-monthly publication, and was originally edited by Richard Marchiafava,
who had previously written a column called "AppleWorks Advisor" for
user-group newsletters. In March 1991 the editorship was transferred to
Randy Brandt, the Beagle Bros programmer who had written many of the
TimeOut applications, as well as several for his own small software
company.

8/16-Central, specializing in programming for both 8-bit Apple IIs and
the IIgs, began in December 1990. It was a continuation of a short-lived
magazine called 8/16, published by Ross Lambert's Ariel Publishing Co.,
which itself was preceded by several separate newsletters that specialized
in Applesoft or assembly language or other programming for the Apple II
series. 8/16-Central was a monthly disk, but didn't keep enough
subscribers to stay afloat. In October 1991 it was discontinued, and the
remaining subscriptions were folded over into GS+ Magazine. Later, the
contents of the entire run of 8/16-Central were upload as individual file
archives to A2Pro on the same exclusive basis as were the Apple Assembly
Line files previously mentioned.
Weishaar's organization began to carry Hyperbole in March 1991. Produced by an outside source, it was also a HyperStudio-based disk publication, but its focus was not on making HyperStudio stacks, but on actually USING the program to produce a literary form that had never been done before. It consisted of poetry, art, and sounds, combined together in a way that could not be presented in printed form. For example, one series of stories that appeared early on in Hyperbole involved a medieval theme, with the story told from various points of view, depending on which picture was selected on the "door" that introduced the story. To get the entire story required going back to the main door and selecting a different picture. Sound and graphics were also integrated into articles that appeared in this disk-magazine.

Finally, Script-Central began in June 1991. This was similar to Stack-Central, but was dedicated to HyperCard IIgs. It featured some animated sequences that introduced it, and the user could select the articles to read by pointing to doors in the Stack-Central "building" on the screen, and follow hallways to other articles (sort of like combining a magazine and a video game).

A2-Central itself has undergone few changes in its life. Its focus has shifted slightly to keeping abreast of the newest changes in the Apple II world (in terms of products and events that affect that computer), where previously it spent a lot of time talking about various specific products (such as AppleWorks, HyperStudio, etc.) The spin-off disk publications that were started have filled the niche needed to continue user-support of those Apple II products. The editorship has changed a couple of further times as well; Jay Jennings briefly took the place of Dennis Doms as editor in November 1991, before going to work for Softdisk. Ellen Rosenberg began editorship after that, and made the change of accepting feature articles from outside authors for the first time since A2-Central began publication.

When Nibble magazine folded in 1992, A2-Central took over their subscription list, filling out remaining issues for those people. It was hoped that many of those people would see enough value in A2-Central to renew when the time came, but not enough readers did so. Weishaar started up a new paper newsletter called Fishhead's Children, intended to be a resource for those who had to bridge themselves among the Apple II, Macintosh, and MS-DOS computers. However, the new publication did not have enough subscribers to maintain a positive cash-flow, and in June 1993 a letter was sent out to both Fishhead's Children and A2-Central subscribers:

Dear Subscriber,

Dominoes are falling at Resource Central and you've been hit.

As the Apple II nears the end of its life-cycle, renewals to our flagship publication, the paper version of A2-Central, have fallen to less than 20 per cent. That domino has been teetering ever since we took over Nibble's subscribers a year ago.

We had hoped to stabilize the situation with a new publications, Fishhead's Children, which would take us into new territory. Unfortunately, that publication hasn't been the success we had hoped it would be. For each $100 we've spent trying to obtain new subscribers, we've taken in less than $10.
We can no longer carry this expense without putting our entire company in jeopardy, so that domino has ceased publication and fallen.

Without a successful Fishhead's Children, there's nothing to pay the even-increasing bills the paper version of A2-Central is running up. A2-Central-On-Disk continues to have strong renewals, as do our other disk publications, but they're not big enough to continue supporting our paper publications. It all means that I have no choice but to cease publication of the paper version of A2-Central as well.

The letter went on to explain that the value of remaining subscriptions (not counting the old Nibble people) would be credited to the subscriber's account, and could be refunded or applied to another product sold by Resource Central. A2-Central-On-Disk would continue to be produced as it had before; it cost much less to duplicate and mail disks than it did to print and mail paper newsletters. This would also be the place where the newsletter A2-Central would continue to appear (in a digital, rather than in a paper format).

The January 1994 issue of A2-Central-On-Disk was renamed to simply "A2-Central". Dean Esmay, who had been editing the disk publication from its beginning, went on to work with Softdisk in Louisiana, and newcomer John Peters came on as editor. The appearance of the text was dressed up in a manner similar to that used in the GENieLamp online newsletters, which Peters had been overseeing for several years. Not himself an Apple II user at the time when Weishaar signed him up, Peters gathered several veteran Apple II writers to assist in producing the text of the newsletter each month, and in collecting the freeware and shareware files that were included with each issue. At this time my own independent monthly news compilation, the A2 News Digest, became exclusively a part of A2-Central. (The Digest had previously been available on GENie as source material for Apple user group newsletters.) Doug Cuff, who was editor of the A2 edition of GENieLamp and a contributing editor for II Alive, was also tapped to write articles for A2-Central. Peters continued the practice started by Ellen Rosenberg of soliciting articles written by other authors not routinely associated with A2-Central.

Peters was also commissioned to coordinate work on disk publications for the Macintosh (called Macrocosm), and IBM and compatible computers (Solid Windows and Config.Sys, for the Windows and MS-DOS user, respectively).

The disk newsletter, catalog, and other disk publications continue today under the corporate umbrella of Resource Central, Inc., which also has sponsored annual summer conferences since 1989. These conferences have brought together some of the top Apple II developers in the country for two days of classes and workshops on many topics. Held in Kansas City in July or August, it has been nicknamed "Kansasfest", since it contains AppleFest-like activities.

Weishaar's interest in and dedication to the Apple II has been much appreciated; he was chosen as a recipient of the Apple II Individual Achievement Aware for 1991. His philosophy was summed up in a statement made in a printing of the A2-Central catalog in the Fall of 1990, where he wrote: "The significant thing about the Apple II has always been the community of people that has sprung up around the machine, teaching other
people how to use it, designing hard and software for it, exposing its inner flesh to the light of day, and USING it to manage businesses, run church groups, educate children, and turn out prosperous and happy human beings."<9>

Compute!  "Compute!" was a hybrid magazine that catered primarily to the Commodore 64 computer. It would usually feature games that had versions written for several different computers, including the Apple II. In the late 1980s it began having special issues dedicated to some of the different platforms featured in the main magazine, and there were a few issues called "Apple Applications" for the Apple II.

Apple Orchard  Apple Orchard was published by the International Apple Corp for about several years. It was aimed primarily at user groups, and was billed as a user's group user's group. Contents of early issues were a compendium of articles from various user group newsletters.<3>

GENieLamp is also distributed on CrossNet, Internet, America Online, Delphi and many public and commercial BBS systems worldwide.

o To reach GENieLamp on Internet send mail to genielamp@genie.geis.com OR jpters@sosi.com

o Our Internet anonymous FTP address is: sosi.com. All current versions of GENieLamp are available in the ~/pub/GENieLamp directory. Due to the added expense involved, we ask that when you get GENieLamp via the anonymous ftp for GENieLamp, that it _not_ be ftp'd during the hours of 9AM and 5PM Eastern Standard Time. We appreciate your cooperation in this matter.

o Current issues of all versions of GENieLamp as well as back issues of GENieLamp IBM are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GENieLamp platform (FREQ FILES for names of back issues of GENieLamp IBM):

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3
- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GEnieLamp. On Internet send it to: genielamp@genie.geis.com
- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.
- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2
- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

Reading GENieLamp

GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO

To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: [58].

ABOUT GENie

GENie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: JOINGENIE and hit RETURN. When you get the prompt asking for the signup/offers code, type: DSD524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLAMP READERS!

If you sign onto GENie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there are no excuses!

*** GET INTO THE LAMP! ***
Deadlines love to lie in wait for me. What's more, while they're waiting, they invite their friends to gang up on me.

The fact is, I always have at least three monthly deadlines -- not counting the rent check -- and they're all exactly the same day: the last day of the month. GENieLamp A2 is one of those deadlines, of course, but the one that's been giving me the most trouble lately is editing the newsletter for the local Apple II user group, the London Apple Corps.

Two months in a row, my other commitments kept me from finishing the newsletter in time for our monthly meeting. (My other commitments will keep me from acting as editor for the London Apple Corps next year, but that's another story.) I was determined not to make it three in a row, and bled time from other projects to get as much advance work done on the newsletter as possible.

It wasn't enough to not to be late; this time I had to be early, for my parents were paying us a visit over the Easter weekend. Once my father and mother arrived, all work would have to cease. As my wife -- the long-suffering Tara -- and I drove to the airport to greet the travellers, one computer was uploading copies of GENieLamp A2 while another was printing out the final proofs of the London Apple Corps newsletter. When I finally dropped the proofs off at the printer, I felt great relief and satisfaction.

Except that the printer, normally reliable, didn't have the newsletter ready in time for the meeting. So I couldn't hand out copies to the attendees. So the group's postage bills were going to be over budget again.

Anger is powerful, but irrational anger has a greater strength. I couldn't do a thing about the fact that I had no newsletters to hand out at the meeting, but after the meeting was over, and the newsletters ready to be picked up, the thing began to gnaw at me. I had invested a lot of time in trying to keep the postage bill down. It wasn't my fault that the newsletters weren't ready, but that didn't make me any less angry.

I looked at the pile of newsletters with distaste. If they'd chosen that moment to make a sarcastic remark, I would have chucked the lot into the fine-paper recycling bin. Instead, I hauled out a city map and began
It soon became apparent that there were too many to deliver, so I started culling. Anyone outside the city limits would have to rely on Canada Post. Ditto for anyone who hadn't paid their club dues. By this process, I managed to get it down to a couple of dozen.

I don't know the city we live in terribly well. Perhaps that accounts for the fact that it took me three and a half hours to deliver 20 newsletters. (Some addresses I never did find. I only hope Canada Post fared better.)

That's how I came to travel the extra mile -- quite literally -- this month. I'm glad I did it, too. It taught me something about the city I live in and even a little something about the members.

Still, I wouldn't have done it if it hadn't been for someone who had just gone the extra mile in a less literal sense: Harold Hislop.

If you hang around the A2 RoundTable, you already know how another Apple II journal reprinted some advice on hooking up hard drives that Mr Hislop had posted. Unfortunately, that journal missed a minor but important correction that he posted afterward. When a couple of subscribers to the journal followed the advice, bad things happened. We're not talking about puffs of black smoke, but something that makes your heart sink almost as much: data loss.

The subscribers called a bewildered Harold Hislop, who took the view -- without pleasure, but also without flinching -- that if the advice had his name on it, then it was his responsibility to help the unfortunate subscribers.

Bravo, Harold. It was remembering this that kept me trudging around peering at house numbers when I felt like slinging my stack of newsletters into the nearest post-box and charging it to the London Apple Corps. Sometimes, knowing that someone else took the responsibility of fixing a problem that s/he hadn't created is all the inspiration you need.

[*][*][*]

You'll notice that there's no PAL Newsletter in GEnieLamp A2. Don't worry, it'll be back next month.

You'll also notice that there are no CowToons this month. They won't be back new month, because Cowboy Mike has hung up his spurs. All hail and farewell, Mike.

You'll already have noticed that our profiles of Apple II personalities have been absent for a while. Is anybody missing them? Is anybody bidding a good riddance to bad rubbish. Can anyone out there hear me? Hello?

-- Doug Cuff

REPLACING SYSTEM SAVER FAN > "Is there room in a system saver for a
"""""""""""""""""""""""
> second fan?"

Sorta. You'll have to move some wires around, maybe, but you can MAKE
it fit without a lot of effort.

Gary R. Utter (GARY.UTTER, CAT2, TOP4, MSG:542/M645;1)

>>>>> Just how the *&^% does one pop open the System Saver. I found two
"""
small screws (besides the ones holding the fan) but there must a
trick to opening up the beast. I'm just a curious type and the talk about
changing fans made me want to peek inside. Whoaaaaa......Rubic's Cube time.

Larry (LKRUPP, CAT2, TOP4, MSG:543/M645;1)

>>>>> Larry, look under the foam, there are several screws hidden there
"""
---HangTime [Script-Central] B->
(A2.HANGTIME, CAT2, TOP4, MSG:544/M645;1)

What Hangtime said. It's not as mysterious as it looks. It's not so
much that they HID the screws to build a deliberate puzzle, just
that the foam goes on after it is assembled. If you feel through the foam,
you'll find them. I recommend cutting a little "x" over each screw with a
razor blade before you take the screws out.

Gary R. Utter  (GARY.UTTER, CAT2, TOP4, MSG:547/M645;1)

I'm using their 3" (80mm) 32 CFM fan, part #273-242. It fits
perfectly where the original System Saver fan goes. However, the
screws that clamp the wires to the original fan don't fit the new fan so I
just dug up some screws that do fit.

Tony Ward  [via GEM 4.21/PT 3.1]
(A2.TONY, CAT2, TOP4, MSG:549/M645;1)

LACK OF RESPONSE TO FREeware  File Passage is a freeware file utility for
the Apple IIGS. It implements file commands
such as copy, backup, move, catalog, and delete, and lets you customize how
each command works by the use of a great variety of options and filters.
I recently wrote to the author, Charles Bartley, to note a problem with
version 2.0.1 sometimes getting a "resource not found" error during
startup. Along with the fix, he responded to a question I had asked...

"No I haven't heard from anyone concerning FP except another
programmer on the east coast who I sent a random free copy to."

No comments or encouragement after 100 GENie downloads? After File
Passage was included on a GENie Disk of the Month and on A2-Central?! I'm
surprised that no users dropped Charles a note to thank him for his
efforts, but it's unbelievable that nobody from Resource Central or GENie
let him know that his work is being distributed on their disks.

The new version (2.0.2) has been uploaded to the A2 library, and will
be file #22558. If you want to send him a note of encouragement, the
address is:

Charles C. Bartley, 1310 Cholla Ct., Lake Havasu City, AZ 86406.

--- Dave Tribby  (D.TRIBBY, CAT3, TOP25, MSG:80/M645;1)

MULTI GS  Reply-To: ltchean@iss.nus.sg
""From: Lim Thye Chean
Subject: Multi GS

I am very excited over Multi GS v2.0. In fact I am pretty impress! As
you might have known, I am a Switch It user, and have been using it for
quite sometime. So I am writing this mini-review for Multi GS v2.0, from a
Switch It user perspective.

Btw, I have also played with The Manager (demo), and the other few
switchers (including Alan Bird's and LeapFrog).

Multi GS v2.0 seems to combine the best of both world of Switch It
and The Manager. It uses similar metaphor of The Manager, where you can
click on the window to switch application, and all application shares the same screen. Like Switch It, it has stack sharing!

I am very surprised to know that Multi GS stack sharing is even BETTER than Switch It! First, it works. :) And it excels Switch It in this: Let's say you have stack sharing shares set at 4K, and under Switch It, that means that you are not able to run application like AWGS! But Multi GS allows! All it does is to create a new stack space for AWGS since it is larger than 4K. I think this feature is pretty cool, and should be implemented in Switch It in the first place.

The second feature that impressed me is: it is able to launch ProDOS 8 program - and beyond what The Manager does - it is also able to launch desktop application! You see, many applications are sure to crash. For example - GNO/ME or many games. I try launching GNO from Multi GS, and it works beautifully. And upon quitting, returns me to Multi GS. This alone can eliminate one of the major reason to buy Switch It.

Up to my surprise! I can run my own Mandelbrot IIGS v2.2 on Multi GS! And I can switch it and out without any problem. Wow. Switch It and The Manager simply fails to run it nicely. And I am even more surprise to see my other applications such as Super Magic demo to run without any problems. I have tested Multi GS with many applications, and with correct setting (like some you have to set the write direct to screen as on), this software is as stable as both the commercial products. Btw, it runs Proterm fine too.

It is also the only switcher than can load more than one application during startup. It can load up to 7! And like The Manager, it traps error quite nicely.

Of course, I am still using Switch It right now, due to some "problems" in Multi GS.

First - I hate the screen updates! Icons on desktop flashes here and there, and this is exactly why I choose Switch It over The Manager in the first place. I found that irritating. Backdrop (desktop pictures) also drops the background occasionally.

When switching application and Multi GS trying to close all the DAs, if the DAs present a dialog (like ShadowWrite with "Save..."), Multi GS will enter infinite loop.

I can't find the Show window option documented.

The 3 major reasons I prefer Switch It over Multi GS: 1) Many times during switching, there is a noticeable pause; 2) Multi GS takes up 11K of stack space! 1) Even if I request Multi GS to run Finder on Start up, it will load Finder and returns control to Multi GS. This force me to manually switch to Finder everytime.

Personally I think Multi GS is now a very powerful opponent for both Switch It and The Manager. It is stable and has many features lack in the commercial software. $20 shareware price is very reasonable, and I suggest users who has not bought any switcher yet take a close look at this software. This might be exactly what you want, with a much lower price.

For user who has The Manager, the only 2 advantages Multi GS offer
are ability to launch incompatible GSOS application and stack sharing.

Switch It seems to be having the least feature among the 3. Its main selling point - stack sharing is unfortunately not as good as Multi GS. And since you can't launch GNO from Switch It (but you can launch Switch it from GNO), Multi GS will be more attractive to GNO users who use it occasionally (like me). But Switch It is a test and proven product, and it is faster and less irritating when switching application.

I am still using Switch It. But it is a little aging now. It needs more functions to be able to fight with The Manager (new version is coming out) and Multi GS (with better stack sharing and able to launch GNO). I have the following suggestions:

* Ability to launch ProDOS 8 program.
* Ability to launch GSOS program (not switch. Switch it just quit Finder and itself and pass control to the software).
* Needs stack sharing as good as Multi GS.
* Most important - the main advantage I saw in Switch It is the compatibility with GNO - if somehow it can ALSO be an extension of GNO - this will be able to differential itself from the rest. For example, if GNO attempts to run an application while Switch It is the desktop application, and Switch It able to trap this, this will be very convenient for GNO users.
* Features like memory map etc will be good.

---

WHAT DOES THE MANAGER HAVE OVER MUTLI-GS v2.0? Hmmm. Good question. In my opinion, The Manager v1.0 has very little over Multi-GS.

The only thing I see is that The Manager is more of an "elegant" MultiFinder-like utility. I like the extra menu, and the icon of the program you are using as that menu's "title", I like the fact that The Manager is not a separate "application"; I don't like having to scroll to the _bottom_ of my NDAs to get to another application while using Multi-GS.

However, Multi-GS seems to currently be more "feature-full". The ability to set up a default of programs to run as soon as Multi-GS is loaded, stack sharing, access to a CDA that will put you in Multi-GS so that you can get to another application no matter what the "front-most" application is doing (some exceptions apply, of course). TM 1.0 is also pretty slow at doing some things because of some of its background processing...

BUT, I am reserving my opinion (and my Multi-GS shareware fee (: ) until the release of TM v 1.1. I _truly_ believe it will outdo Multi-GS at
that time. I think Dave and the beta testers will make TM into a rock solid MultiFinder-like utility with all of the "pluses" of Multi-GS with all of the current "elegance" that TM offers. TM will also offer some "extras" (if I remember correctly), like InterProcess Communication so that programs will know what's going on (when they are switched to, switched out of, frontmost, etc.). I feel this will offer programmers (like myself) and ultimately users a greater "power" over the environment in which they work.

Anyway, that's my spur of the moment $0.02 (I could come up with more +s and -s if I had the time (; ).

Rick
(R.ADMAS48, CAT43, TOP15, MSG:492/M645;1)

FREEWARE FLOPTICAL DRIVERS I find that by placing a RamFAST SCSI partition map on the floptical, it becomes unreadable on an Apple HS SCSI system with Rich Bennett's freeware floptical drivers. Does anyone know if this happens with the Tulin drivers?

(B.TAO, CAT11, TOP16, MSG:297/M645;1)

The reason is that when the RamFAST formats, it lay's down an Apple partition map, of about 32K or so (from memory). My driver doesn't use a partition map. My reasoning was 1) Why partition 19MB? and 2) Easier to write! ;) It also means that MS-DOS flopticals *SHOULD* work OK with the MS-DOS FST and my driver, although I haven't tested it. The RamFAST will recognise a disk without a partition map, but if you reformat, it WILL lay one down for you.

Regards,
Richard
(RICHARD.B, CAT11, TOP16, MSG:298/M645;1)

Ah, so you're the culprit. ;-) I didn't mean to partition any of my disks (except one), but once it's there, you cannot remove it with the RamFAST software even if you do a low-level format. One disk *is* divided into one 15-meg and 6 800K partitions. The 15-meg one is a backup of my HD boot partition and the remaining six hold System 6.01 disk images. Very handy for distributing copies of it at the usergroup. ;)

> My driver doesn't use a partition map

> My reasoning was 1) Why partition 19MB?

> It also means that MS-DOS flopticals *SHOULD* work OK with the MS-DOS FST and my driver, although I haven't tested it.

Haven't tried that either. I can't even get the $$$@! Macs at school to recognize the floptical without crashing. There are using the drivers and utility software provided by PLI (I bought the drive at a Mac store), although I may need a newer version.

(B.TAO, CAT11, TOP16, MSG:299/M645;1)

TURBO ASB WITH PROTERM 3.1 The Turbo-ASB is a daughter-board addition to the SSC to allow the use of 38400 baud and full hardware handshaking. There is a driver for ProTERM 3.1 and the Turbo-ASB available for download from The InTrec BBS. When using the Turbo-ASB driver with ProTERM 3.1, you dont need to do anything special.
Apple II Computer Info

From the user perspective, the only difference is that 38400 is the maximum baud rate instead of 19200. The only RlossS is that 110 baud doesn't work so well (not a big deal). In addition to the higher maximum baud rate, the Turbo-ASB also corrects a hardware handshaking problem present on many SSC boards (this problem can cause extra errors during zmodem uploads). I have used the Turbo-ASB and it works great with ProTERM 3.1. I would recommend that people who plan to use the Turbo-ASB at 38400 with a //e should have some sort of accelerator.

While it is also possible to use even higher baud rates (57600 & 230K), it becomes much harder to use and I would only recommend that for hardcore hackers.

Greg Schaefer @ InTrec Software, Inc.

(INTREC, CAT24, TOP5, MSG:173/M645;1)

TURBO ASB WITH SPECTRUM FWIW, the Turbo-ASB will work with Spectrum 1.0, straight out of the box! Contact Seven Hills for more details...

Regards,
Richard

DISCQUEST INFO BUNDLE We are pleased to announce that we now have big bundles of information available about discQuest, the discQuest CD-ROM drives, and the discQuest CD-ROM titles. If you want this extensive information, simply send your name and US Snail address to SEQUENTIAL or PROCYON.INC.

Jawaid

(SEQUENTIAL, CAT20, TOP10, MSG:44/M645;1)

POSTING ON THE INTERNET VIA GENIE The only "public" destination you have to worry about is in the "Newsgroups:" header. Use these mail commands to send a copy of your reply to the appropriate newsgroup:

*CC comp-sys-apple2@cs.utexas.edu
*CC comp-sys-apple2-comm@cs.utexas.edu
*CC comp-sys-apple2-gno@cs.utexas.edu
*CC comp-sys-apple2-programmer@cs.utexas.edu
[etc.]

That will mail your message to the automatic news gateway at the University of Texas. It will then post the message on your behalf to the newsgroup. Of course, once GENie gets *real* Usenet access here, we won't have to go through this. ;-)

(B.TAO, CAT10, TOP10, MSG:319/M645;1)

<<<<<< Oops... a few boo-boos in my note to Harold about replying publically on Usenet. The correct command is:

*acc,comp-sys-apple2@cs.utexas.edu@inet#

The *ACC command adds an address to your Carbon Copy list. You need a comma separating the command from the first address, and don't forget to append "@inet#" to EACH Internet address. The above example should bounce a copy of your e-mail message to comp.sys.apple2. I just mailed out a test message to see if this in fact works (and to see how long it takes).
While perusing the Usenet's comp.sys.apple2 newsgroup yesterday, I noticed a very interesting posting. The title of the message was "Test" and the text of the message was, "This is just a test. Please ignore."

On Usenet, messages like that appear fairly often. I left one myself, just a few weeks ago, after switching Internet Service Providers.

The only thing out of the ordinary was the email address of the sender. It was B.TAO@genie.geis.com.

Anyone care to comment?

Joe

Ok, subtly aside. What I'm trying to ask is if GEnie is working on expanding Internet access to include more than just an email gateway?

I personally believe that all the online services are trying to keep up with each other. A week or so ago, AOL expanded Internet access so that AOL members (on Mac or PC's only) can access Usenet. To my way of thinking, that would just be the first step towards providing full net access.

Is GEnie far behind? I think not.

But, I know not. I am merely speculating. Does anyone know, one way or the other, or am I simply reading too much into Brian's usenet "test" posting?

Joe

Brian sent that post from GEnie to test to make sure the University of Texas mail-->Usenet mechanism worked right from GEnie.

Eric Shepherd

If I DID know something about that, I wouldn't be allowed to talk about it. In fact, anyone who had real information about a product under development by GEnie would be bound by an NDA.

Remember when Apple people couldn't talk about what Apple was developing or not developing? This would be the same deal.

Gary R. Utter

As you no doubt realize now, that was just me testing out the UTexas news gateway. I had given Harold the addresses to use, but I thought it would be best to try it myself. ;-) This is the only way GEnie users can leave message to the public via netnews. Take the name of the newsgroup, convert the periods to hyphens, and append "@cs.utexas.edu@inet#" to it.

comp.sys.apple2.comm --> comp-sys-apple2-comm@cs.utexas.edu@inet#
rec.sports.basketball --> rec-sports-basketball@cs.utexas.edu@inet#
alt.binaries.pictures.supermodels  -->  well, you get the idea. ;-) 

On second thought, the gateway *may* not work for the "alt" groups, since they tend to come and go as they please. That will require some additional experimentation (since I'm not sure who to contact at UTexas to ask). The mainstream newsgroups (comp, misc, news, rec, sci, soc, talk) will work.

   (B.TAO, CAT10, TOP10, MSG:348/M645;1)

MUSEUM PIECE #1  >" Has anyone actually SEEN a twiggy disk? :)

""""""""""""""""

I know a guy who has one cast in a block of Lucite. He attached a couple of pen holders and stuff like that to the Lucite and it sits right smack in the front center of his desk.

This guy bought one of the first 100 or so Lisas made, and paid a FORTUNE for it. He says it is a reminder to himself that being on the cutting edge can be dangerous. :) 

Gary R. Utter  (GARY.UTTER, CAT4, TOP17, MSG:371/M645;1)

MUSEUM PIECE #2  The DuoUniDisk (which Apple claims to have never made, """"""""""""""""

but I have one of their prototypes right infront of me :) is a dual 3.5" UniDisk type drive. It's the same footprint as a standard single 3.5" UniDisk drive, but approx twice as high.

Notes:
(1) Copy files to and from: 10 files for a total of 717 kB. The files were copied to and from the Ram disk to minimize copying times.
(2) Formatting and copying was performed in the Finder, except for MS-DOS formatted disk. This was performed using Peter Watson's MS-DOS utilities (mformat, mcop, gmcopy).
(3) MS-DOS was limited to 1.44 MB and lower densities due to limitations in mformat. Files were copied using binary option (CR translation off) for fastest copies. Approx. 3 sec. was needed to load mcop and gmcopy into memory (included in total).
(4) Times are +/- 1 sec.

How's that?

David
(D.WALLIS2, CAT13, TOP23, MSG:427/M645;1)

PROSEL DOESN'T DETECT DAMAGED RESOURCE? If I am not mistaken, someone here had a problem with getting a message from GSOS, "Volume SoandSo may be damaged", while ProSel 16 shows that the volume has no errors.

I have discovered that ProSel 16 (at least on MY system) will not detect a damaged RESOURCE file. Specifically, the Spectrum Preferences file can be damaged/corrupted in such a way that GSOS can detect it but ProSel can't.

This file cannot be deleted by Finder, but CAN be deleted by the ProSel 16 "problem file deletion method". The volume then needs to be FIXED with Volume Repair, and once this is done, the error message from GSOS disappears.

I haven't been able to verify this other than the fact that it worked for me. (I don't know of any way to deliberately corrupt this file for testing purposes.)

Gary R. Utter
(GARY.UTTER, CAT30, TOP2, MSG:376/M645;1)

WRITING ADVENTURE GAMES Oh, you can do a lot with SAM. But it takes a LOT of patience and a LOT of time, or you have to constrain your story inside the limits of SAM, which isn't easy for me to do (just look at my TELOS transcript for a hint of what I like to do with adventure games :).

I'm still looking for a good text adventure design system for the Apple II. I've started writing a general-purpose set of routines for it in Pascal, but I've been too busy to do it. I'd really like a pre-built system that I can just pump ata into to construct my game, but I don't have one. I had a good system all set up in ORCA/C a couple years ago, but I lost it in a hard drive crash.
I've got a couple dozen adventure games either totally or partially designed, either in my head or on paper, but I haven't got a good way to crank them out. :

Eric Shepherd     (Sheppy)
(PowerPC.PRO, CAT34, TOP9, MSG:330/M645;1)

What I want to see in a text-adventure design system (having tried a lot of them :):

1. The ability to create LOTS of rooms. Many adventure design systems have a limit of less than 100 rooms, and that won't cut it for some of my more complex games. I designed a game once with over 1,200 rooms in it!

2. Directions including northeast, southwest, etc, as well as in and out.

4. Complex objects -- objects whose descriptions and information can change over time. An object may be worthless until you have done something else.

5. A reasonable parser. Commands like "Bill, put the blue onion into the rightmost pot" should be accepted.

6. Expandability -- the normal verbs go, use, open, close, eat, and take aren't enough to make a good game. I need verbs like pull, push, tie, cut, hide, and other things like that. I should be able to tack new verbs in (this is the primary thing that stalled me with SAM).

There's more, but I won't get into it now.

My problem with SAM and my adventure was this:

The game begins in a cell at the top of a tower. The ceiling is cracked and is clearly ready to collapse, but is being held upright by a sturdy beam. A sturdy bunk is fastened to the wall, and on the bunk is a horse blanket (the really rough, scratchy kind). There's a sturdy door, very tall, and mounted above the door (too high to reach) is an axe. A window lets you see the grey and decimated landscape outside.

If you stop to look at the beam, you'll notice that there's water trickling down it.

If you mess with the beam, it slips and the ceiling crashes down on you. Not only are you buried under a few hundred pounds of rock, but you also notice, just before you die, that thousands of gallons of water pour down onto you.

The solution to the "get out of the cell" puzzle was to be this:

Get the blanket and tie it to the beam, then duck down under the bunk. Give the blanket a yank, and the ceiling (and the water above) come down. You then get out from under the bunk (still underwater) and swim to
the surface, where you find yourself within easy reach of the axe. You
then grab the axe and break the door open with it.

The problem was that to implement this in SAM, all the player had to
do was pick up the blanket, then click USE and the blanket would get tied
to the beam (since there's no TIE command). Then if they clicked USE
again, the beam would move and the ceiling would collapse.

SAM's limited command set gave away the solution to the puzzle.
Implemented in a text adventure, I think my puzzle would be pretty good
(not spectacular, but reasonable). In SAM, there isn't a puzzle, really.

Eric Shepherd  (Sheppy)
(POWERPC.PRO, CAT34, TOP9, MSG:332/M645;1)

>>> HOT TOPICS <<<

A EULOGY FOR APPLIED ENGINEERING  I have extremely mixed feelings about
the demise of Applied Engineering.

At first, I just couldn't believe the news that they'd gone out of
business. So, I tried calling them. "The number you have reached is not in
service at this time."

I own a number of AE products, including a Vulcan Hard Drive, a
PCTransporter, an AE-RAM card, a DataLink modem, and a TransWarpGS. At the
point when I realized that I had more AE equipment inside my GS than Apple
equipment, I even affixed an AE logo sticker to the front of my computer.

Like many in the Apple II world, I was upset and felt sleighted when
they started charging Apple II owners for "tech support." But, I understood
the reasons; they were a company struggling to stay alive.

Please remember that for many years, AE provided the Apple II world
with hardware galore. For a long time, they also supported several of the
Apple II magazines with page after page of ads. I used to be involved with
the Apple IIGS Buyer's Guide, and know for a fact that the revenues
generated by AE's ads kept that magazine afloat.

Over the years, AE employed many loyal Apple II engineers and
programmers, and provided the Apple II world with a steady source of new
(albeit expensive) hardware. I personally became friendly with several AE
employees, and now feel bad for them, and their families, as they line up
for unemployment.

Although it's been several years since I've purchased anything from
AE, I'm saddened by their demise. For the longest time, AE was the number 1
supporter of the Apple II, and I don't think that we should ever lose sight
of that.

As with the death of anyone, it's far better for the living to
remember the dead from the era of their lives when they were vital and
enthusiastic. For the longest time, AE was a great friend of the Apple II
world, and I for one would rather dwell on those good times, and look back
fondly at AE's contributions.

I can still clearly remember the thrill of plugging in my first GS
memory expansion card, and having a whopping 1.5 megabytes of RAM. Thanks AE.

I can still clearly remember the thrill of adding 100 megabytes of hard disk storage to my system. Thanks AE.

I can still clearly remember the thrill of stepping up to 2400 baud. Thanks AE.

I can still clearly remember the thrill of inviting one of my MS-DOS friends over to marvel at my Apple that could run IBM software...faster than my friend's XT. Thanks AE.

I can still clearly remember the thrill of running my GS 3 times faster than other GS owners. Thanks AE.

Thanks, AE, for all the good times. May you rest in peace.

Joe Kohn (J.KOHN, CAT28, TOP4, MSG:451/M645;1)

>>> What most people don't realize is that the original owner of AE (and true Apple II enthusiast) sold AE several years ago. The new owner decided to branch out into the Mac arena. Approximately 1 year after starting the Mac stuff the company had a huge upheaval that resulted in more or less a hostile coup of Mac people throwing out the long time Apple II folks. This was the beginning of the end, as all the really talented and innovative people who made AE a success were lost.

D. Corkum (D.CORKUM, CAT5, TOP3, MSG:296/M645;1)

>>> > With the demise of AE. Will we still be able to get heavy duty power supplies for our GS's, and if so, where can we get them?

Already covered. We have a new supplier for power supplies. I don’t personally know who it is, but I think it’s the same manufacturer that AE used:) The prices of the supplies is still unchanged.

Quality Computers --- Power for performance. (QUALITY, CAT12, TOP11, MSG:121/M645;1)

LINELINK MODEM AND FAX SOFTWARE > How about the Linelink that everyone is talking about. Will that wrk with the promised Fax software FOR SURE?

Well, I did a little checking on this. The following AT commands revealed some information:

AT+FMFR (manufacturer ID) = SIERRA,V32BIS/F
APPLE II COMPUTER INFO

AT+FMDL (model number) = SQ322X
AT+FREV (revision number) = 3.02,081793,SSC

AT+FCLASS can be set to 0, 1, or 2. So the LineLink supports both classes.

Now, I think the promised Fax software is based on the Rockwell chipset, as opposed to the Sierra chipset that the LineLink uses. It should be compatible, though....

--- later ---

I just called the technical support number listed in the LineLink manual. The technician told me that the LL uses a 'new' chipset that Sierra has developed, and it's compatible with the Rockwell chipset. He also said that if a particular fax program doesn't have a selection for the Sierra chipset, use the Rockwell one and everything will be fine. He also told me that I should use the MacFax software that MacWharehouse sells, as that's the software they (the technical support line) support. :)

So, if you have a LineLink, this new Fax software will work just fine. :)

B.WELLS5, CAT10, TOP9, MSG:130/M645;1

ALLTECH ARRIVES ON A2!  A Short bit of historical info:

Alltech Electronics Co has been around since 1983. The founder/owner of the company has been around the Apple II since then. Having worked with Vista Computer Company (Which is now ACP). Vista used to make floppy drives for the Apple II, one of which was the Vista 1500. A Removable 5.25" "magazine" that would hold 5 5.25" disks and "reach out" and get the disc you requested and pull it into the drive. Very similar to todays multi-cd players. It was very popular with BBS sysops back then.

Alltech has three southern California stores that specialize mainly in PC stuff and surplus electronics parts/equipment. The Oceanside store, the newest of the three, opened in 1989 is where the Apple II operations are centered. Alltech began mail order Apple II peripheral sales around 1987 with a Disk ][ compatible, Full Size 5.25" drive, which we still sell many today.

I came upon Alltech in 1989 when the store appeared here in Oceanside less than 2 miles from my house.

Since opening the third location, and moving all the Apple II related operations here, we began to provide service and parts as well as expand the amount of products available and include new products as well, something we're not really known for. We do sell/stock new items as well. Mainly hardware items. For software sales, if we don't have it, we recommend other sources like Quality Computers, Big Red, Seven Hills, etc.

We specialize in hard to find and older items, and. We do repairs on just about any Apple II peripheral. All refurbished products are fully checked out before shipping. Items such as printers are torn down to the...
bare bones and completely cleaned and re-assembled and tested prior to being sold.

We can be thought of as "recyclers" in a way, because when we come across a large supply of something out there than can be used as an Apple II item, with some or no modification at all, we, we do in order to bring more products to the Apple II. Things as simple as the IBM PS/2 Model 25 carry case that fit a GS system so perfectly, it could have been called a "IIgs system transport case" from day one. Another example is the Atari ST RGB Monitor we had recently, and now the CGA for the //c, a 100% compatible RGB color monitor solution, for only $129.00.

We have products and services for the Apple ][/][+, //e, //c & IIgs. We even have parts & service available for the Apple /// and some Lisa/Mac XL stuff too!

We will be moving soon, to a 30,000 sq. foot building with 2 stories and the phone numbers/address will change. The 800 line will remain the same and the existing phone number/address info will remain valid as the local retail portion of the current location will remain.

(T.DIAZ, CAT46, TOP1, MSG:1/M645;1)

MUCH ADO ABOUT SHAKESPEARE I am posting this on behalf of Larry McEwen (L.MCEWEN) who has uploaded his 6-disk Hyperstudio stack collection called, "Much Ado About Shakespeare."

[*][*][*]

MUCH ADO ABOUT SHAKESPEARE was created during 1990 and 1991. During that period of time I was growing an intra-spinal-cord tumor. I finished it the night before my entry into the hospital for spinal cord surgery the next morning. On that day, my wife walked from the hospital to a nearby postal service center and sent all six disks to Roger Wagner Publishing. Roger was beginning to collect stacks created by HyperStudio users and Steven Allen was working with him to make selections. A short time after I was dismissed from the hospital, Steven Allen called me and we agreed upon $29.95 as the price of the finished product. During the next few months, v2.0 of MUCH ADO ABOUT SHAKESPEARE was finished and was advertised in the Roger Wagner Publishing Company catalog at $29.95.

This is an improvement over those early versions. Because my immune system continued to deteriorate, I found that I was sick more days per month than well. Finally, I faced the fact that I could no longer work productively and was disabled. As a hobby for those very few days in some months when my energy level allowed me to dabble with the IIgs, I finished v3.11 of MUCH ADO ABOUT SHAKESPEARE.

MUCH ADO ABOUT SHAKESPEARE is not in the "Public Domain" and it may not be copied and given to another.

It is copyrighted by Larry B. McEwen, and may not be legally used unless $25.00 has been sent to the national office of:

Immune Deficiency Foundation
MUCH ADO ABOUT SHAKESPEARE
3565 Ellicott Mills Drive, Unit B2
Ellicott City, MD, USA, 21043
Please do this within two to three weeks.

This is a good cause and we need help. The first case of Primary Immune Deficiency Disease which caught the public's eye and ear was the case of the "Houston Bubble Boy", a boy who lived in 1950's Texas. His story was made into a movie. A very young John Travolta starred as the "Bubble Boy" whose short life was contained within that plastic sterile environment.

The Primary Immune Deficiency Diseases do not receive the attention that the HIV "AIDS" cases do. Our cases do not get the headlines, and they do not get the political attention or the budgetary appropriations.

If you wish to have a Home.Stack without the appeal, I will send you one if you will send me a copy of your receipt from the IDF and your name and address.

Thank you for your help and kind consideration. Thank you!

Larry McEwen
603 East 5th Street
Hastings, NE 68901

ALLTECH TAKES OVER SOUNDMEISTER 23 Apr 1994:

Alltech Electronics wishes to announce the availability of the SoundMeister card for the IIgs.

We have taken over production of the SoundMeister card, the only available stereo / digoitzier card for the IIgs. Projected price will be about $59.00 and availability should be around the last week in May.

The SoundMeister card will ship together with Digital Session software and a disk or two of sample rSound files for use with System 6's Sound CDEV or Q Labs Signature GS Sonics CDev. Sonics is a replacement for Apples Sound CDev that is shipped with system 6 and a system 6 like Csound CDev for System 5.0.4 users.

Available also, as a set will be the SoundMeister with a set of amplified speakers w/volume control for $74.00.

For users of other sound hardware, Digital Session will also be available separately, as soon as modules to support digitizing on other
Someone is going to ask this, so I might as well do it. Tony, any chance of reviving the SoundMeister Pro? I've been waiting for two years to buy one.

Eric Shepherd       (Sheppy)
(POWERPC.PRO, CAT46, TOP7, MSG:2/M645;1)

The SoundMeister Pro, for the time being isn't an option currently. It wasn't completely finished when the project was shelved. After the Sound Meister is done, shipping and dealt with, if there is solid demand for something like the Pro, it can be looked into.

Everything I'd heard was that the SoundMeister Pro was almost finished, just needed minor tune-ups, when it was killed.

Doug Cuff, GEnieLamp A2
(EDITOR.A2, CAT46, TOP7, MSG:30/M645;1)

Everything I'd heard was that the SoundMeister Pro was almost finished, just needed minor tune-ups, when it was killed.

As for an upgrade, if the SMP should be produced, I think that can be worked out.

There is alot to do before it can happen, including determining just how much more work would need to be done since this was never a finished product, never made it past the second wire wrap prototype. No real software support was done for it other than a couple 'raw' testing applications.

Of course, there is support for it in Digital Session for digitizing

I'm pleased to announce that the keynote speaker at this summer's conference will be Randy Brandt. In AppleWorks 4.0, Randy has made major contributions to the Apple II community in the last year.

We also have a confirmation from Western Design Center that they will be on hand to demonstrate their new Mensch Computer. Steve Disbrow from GS+ magazine is once again preparing to roast a Major Apple II Personality (and provide lunchtime entertainment and a technical sessions as well). We also
have sessions lined up from Joe Kohn, Bill Heineman, Roger Wagner, Joseph Wankerl, and others. There are still session openings, however, so if you'd like to do a presentation, send me a proposal now! (Session proposal deadline is May 1).

(TOM.W, CAT23, TOP10, MSG:118/M645;1)

NEW RAMFAST DRIVERS I just uploaded a new version of the RamFAST Media Control drivers. This new version fixes a bug that caused crashes or other malfunctions if your RamFAST was in a slot other than 7.

It will be file #22641 when released.

Jawaid (PROCYON.INC, CAT20, TOP12, MSG:349/M645;1)

CYNTHIA FIELD JOINS SHAREWARE SOLUTIONS II Although I'll shortly be "officially" announce a change to Shareware Solutions II, I'm so excited, I just wanted to share the excitement with all my friends online.

For several years, I was proud to share the inCider/A+ masthead with Cynthia Field. Of all of us involved with inCider/A+, it was generally Cynthia's articles that I turned to first, as they always included information that I could learn from. Over the years, she just had a way of finding out about new Apple II products, long before anyone else did.

Cynthia Field's credits in the Apple II world are long and varied. She currently is a Contributing Editor to NAUG's AppleWorks Forum. Many of you may also remember that Cynthia Field was hired by Apple Computer Inc to write the Apple II Newsletter. And, more recently, many will remember that Cynthia wrote inCider/A+'s New Product section.

I'm pleased and proud to announce that Cynthia Field will be sharing her knowledge of the Apple II with subscribers to Shareware Solutions II. Starting in Issue #5, due to "go to press" this month, and in every issue thereafter, Cynthia Field will be writing a new column, tentatively titled "New Apple II Products."

In each issue of Shareware Solutions II, Cynthia will be writing about new Apple II commercial software products and new hardware products. Details, of course, still need to be worked out as to the exact format of Cynthia's column, but knowing her as I do, I wouldn't be surprised if she wrote about 10-15 new products that even the most die-hard Apple II fan hadn't heard of before.

Is this great news, or what?

Joe Kohn (J.KOHN, CAT28, TOP4, MSG:501/M645;1)

POWERGS DISKAZINE PowerGS is the latest "diskazine" available for the Apple IIGS. It was started by Auri Rahimzadeh (who created PongLife Issue #1), and is part of the Power-GS group, which sponsors both the new PowerGS Diskazine and GS MOD Monthly, which is published by Tony Morales. Get info on both here!

If you would like to contact me, you may reach me at the following places:
Apple II Computer Info

GENie: (email) A.RAHIMZADEH (and I'm in the RTCs almost every nite!)
Internet: (email) aurir@cap.gwu.edu Home: (phone) 890-1593 BBS: (data) 890-
8771  2400-14.4k ANSI/PTSE/ASCII (email) User #1, Auri Man

By the way, PowerGS Issue #2 (I started it at 2 since I did most of
PongLife Issue #1) will be finished THIS WEEK, so get your modem ready and
download it! [grin]

If you would like it BINSCIIed to you on internet (which is cheaper
for many people), please email me your internet address and I will have it
off to you once it's done.

Welcome to the World of PowerGS!!!

-Auri Rahimzadeh
Editor in Chief
(A.RAHIMZADEH, CAT13, TOP38, MSG:1/M645;1)

NEW A2-CENTRAL EDITOR Congratulations are in order for our own Doug Cuff,
who's going to take over as editor of A2-Central
with the next issue! John Peters, who has been our editor, is letting go of
A2-Central to concentrate on ICON's new publication for Windows users,
Solid Windows, and an upcoming publication for MS-DOS users, Config.sys.

Doug has long been a reader of A2-Central and brings a background in
writing and publishing that should be very helpful in keeping A2-Central at
the hub of the Apple II community.
(TOM.W, CAT23, TOP4, MSG:399/M645;1)

BLUEDISK UPDATE Due to the fact that the beta testers didn't have enough
time for beta testing (and still being busy with other
things), we have prolonged the introductory offer for the BlueDisk card.
The software version 1.0 isn't available yet, but again, the beta versions
have proved to be very stable and free of data corrupting bugs. In fact,
the only "bug" we had to fix since opening sales was a small problem due to
spindle motor speed tolerances of some disk drives (you might read between
these lines -and from other messages- that BlueDisk works fine).

Here is the updated information you may need before ordering:

BlueDisk package contents:

- Interface Card (works in Apple IIe enhanced or Apple IIGS)
- English Manual (draft, preliminary)
- Utilities Disk containing
  GS/OS Driver,
  GS/OS Driver Installer script,
  Drive Tester,
  special BlueDisk ProDOS 8 Formatter
  (including MFORMAT in the near future)
  BlueDisk Icons file
  R/W test program

Warranty and Support:

One year limited warranty on parts and labour, free support via the
Apple II Computer Info

GEnie A2 Bulletin Board (cat 13, top 23), free software updates up to v1.0
via the GEnie A2 library and help from our beta testers.

BlueDisk Pricing:

- Pricing for U.S. Orders (Canadian add an extra US $4 s/h)
  
  US $114 plus $16 shipping/handling
  
  two packages: $114 each plus $21 s/h
  three packages: $114 each plus $24 s/h

  Shipping is via standard air mail for overseas orders.

- Pricing for European Orders (surface shipping only)
  
  DM 200 plus DM 19 shipping/handling
  
  two packages: DM 200 each plus DM 24 s/h
  three packages: DM 200 each plus DM 27 s/h

  European orders only accepted if paid by cash or EuroChecque

This is a (prolonged) introductory offer. The price for BlueDisk, final software/firmware version 1.0 will be $135 (prospective).

---

>>> This introductory offer is valid until June, 15. 1994 <<<

---

Payment:

All orders must be prepaid. We accept payment by cash, check, travellers check or money order (American or German currency) and payment via post office. If payment is _not_ by cash, an additional fee of US $10 (DM 17) is required (we have to pay this fee to get the cash for the check). If you feel unsure when sending cash, please use registered mail.

THE GRAPHIC EXCHANGE MODULES > What about The Graphic Exchange by Roger
> Wagner? Won't it handle the conversion to
> GIF as well?

As it comes, no. But, if you buy the Library Disk #1 for The Graphics
Exchange, it has the modules you need for GIF pictures. That's one nice thing about this program. They made it modular so you can add modules later for other graphic formats. I have heard that Roger Wagner is planning another disk of modules for TGE.

MSDOS UTILITIES V2.1 I received e-mail today from Peter Watson concerning the registered version of his MTOOLS package. Version 2.0 is the current publically available set. Version 2.1 (and soon to be 2.11) will be available only to registered users some time in April. Here is what you can look forward to in the new version:

[*][*][*]

>>> This list below is taken from the "revision notes" text for V2.10.
BTW, the text has tabs in it.

MSDOS Utilities V2.10

All utilities:
- Better trapping of invalid device numbers and recognition of 12-bit FAT disks. Many messages edited and/or made consistent.
- Support for UNIX-style parameters, eg. MDIR -iw .d7
- Support for the device number to be included as part of the MSDOS path name, eg. MDIR .d7/TOOLS; GMCOPY GSFILE .d7/TOOLS
- A default MSDOS device may be set in an ORCA/GNO shell variable or in a parameter file named 'MSDOS.Device'!!!

COMMAND.COM:
- Strip control characters from files being 'TYPE'd
- Add CREATE, DELETE, RENAME and FILETYPE commands

MFORMAT:
- Allow disk size and interleave as options. Fix bug where D/Density disks were actually formatted as 800K, not 720K!
- Also, check for supported disk sizes _before_ formatting
- Bug fixed in display of 'used' vs 'free space'
- More info displayed when format is complete
- Support 21Mb floptical disks (/S:21M)
- Added '/X' (no auto-eject) option
- Defaults for '/X' and '/Q' now easily patchable
- Volume name syntax changed from '/V name' to '/V:name'

MDISKCOPY:
- Allow interleave to be specified when formatting (/I:x)
- '/I:x' sets '/F' option
- Added '/X' (no auto-eject) option
- Defaults for '/X' and '/F' now easily patchable
- Will now copy a disk in up to 20 passes (ie. larger disks)
- Prompts for repeat copy of same disk, or copy of other disks

MDEL:
- Confirm if '*.*' specified or defaulted
- A directory name specified deletes all files in the directory
  (after confirmation!)
Apple II Computer Info

- Wildcard deletes can no longer affect '.' and '..' entries

MCOPY:
- Use JudgeName call to convert filenames only if necessary
- Better support for copying to non-ProDOS (eg. HFS) volumes
- Added '/O' option (overwrite existing files automatically)
- Defaults for '/B' & '/O' now easily patchable

GMCOPY:
- For generated filenames, the (extra) extension (.TXT or .BIN) is no longer automatically added
- Fixed a major bug when extending directories
- Improved support for non-ProDOS source disks
- Added '/O' option (overwrite existing files automatically)
- Defaults for '/B' & '/O' now easily patchable
- Unlike all other utilities, GMCopy now no longer supports the old command syntax where the device number followed the command name

MRENAME:
- Now renames files in subdirectories as it was supposed to do!

FINDMFM:
- Displays device numbers of MSDOS devices in decimal, not hex

MMD:
- Added utility to create directories

MRD:
- Added utility to remove directories

MFDISK:
- Added utility to display fixed disk partition details

MPATCH:
- Added utility to patch defaults of some MSDOS Utility options

You could also add that only registered users get the MMD, MRD and MPatch utilities.

V2.11 will be a minor update to support PC Transporter logical volumes larger than 16Mb (ie. with two ProDOS files), and with additions to MFormat to improve use with the BlueDisk (eg. more disk sizes supported, an option to use the GS/OS format dialogue for the low-level format).

MORE ABOUT AUSTRALIAN SHAREWARE

In another topic, long away and far away...

The subject came up of paying shareware fees to Peter Watson for his MS-DOS Utility package.

After getting an email this week from someone asking if they should send Peter's shareware fee to me, it was suggested that I post my reply in public.

A while back, I did Peter Watson a favor. He sent me a few hundred...
dollars worth of US checks, and I cashed them, and sent Peter one check in return. That way, he only had to pay one bank processing fee.

Right after we did that, Peter spoke to his banker again, and found out that what we'd done was unnecessary. The upshot of the whole matter is that Peter can cash personal US checks at his Australian bank.

Whether he brings in one check, or twenty, he only has to pay a single $5 service charge. So, Peter is not cashing the checks immediately, but when he has $100 or $200, he'll bring them in, and be able to cash them all, for just a single $5 fee.

So, feel free to submit your personal check in US dollars for MS-DOS Utilities. Send it directly to Peter Watson, whose address is listed in the documentation.

Speaking of Australian shareware...

Does anyone have v2.1 of John MacLean's DOS 3.3 Launcher? If so, could you please upload it.

Apparently, John does not currently have use of an Apple II, but he completed an update to DOS 3.3 Launcher recently, and now swears that he sent it to me. He didn't, or if he did, I never got it. I can't track it down anywhere, and John is a bit hazy on who he sent it to.

Did he send it to *YOU*?

If he did, I want it! Please upload it. Thanks!

Joe (J.KOHN, CAT28, TOP4, MSG:513/M645;1)

I guess you've been speaking to John Maclean then? Yes, he sold his Apple IIgs late last year, and everything else Apple related with it.

I'll have an ask around locally about 2.1 of DOS Launcher. I know I only have 2.0.

John also completed yet another Graphics Exchange toolset disk about two or three years back, that RWP never released. Devoted Graphics Exchange owners may like to pester RWP for that one.

Regards,

Richard (RICHARD.B, CAT28, TOP4, MSG:516/M645;1)

APPLEWORKS GS RUMORS AND DATES I would say that a product advertisement in our recent Apple II mailing qualifies this as a little more than a "rumor." Rumors are things that people say to each other based on wishful thinking. They are not things you receive advertising for in the mail. B)

(II.ALIVE, CAT17, TOP22, MSG:89/M645;1)

I talked to Quality late last week and was told the release date for AWGS 2.0 is July 1, 1994. Given delays I am hopeful for an August or September release.

Michael
Just to be up front with all of you... I know that the salespeople are saying July 1, but honestly we don't have a good solid date. The salespeople are told July 1 because that is our best and most optimistic date.

We really hope that something will be available at least by mid-summer.

It is a BIG job though... Basically the code is being thoroughly re-worked.

Walker
Quality Computers

GS/OS RAMFAST UTILITY?  No, not yet. But stay tuned for information.

BTW, such a thing would make a GREAT shareware program for someone to write. The information to do it is available from the Sequential BBS.

The timing of your question is kind of amazing. I just got off the phone with the BurgerMeister, not 2 minutes ago.

As I'd mentioned in the last issue of SSII, the project turned out to be a lot more difficult and time consuming than originally anticipated. Apparently, Bill has had to come up with patches for 17 different PrintShop GS files. Originally, he thought that he'd need to patch only one or two files. But, with the patches applied, he says that PSGS now runs much faster, and due to the changes he's made, even those who own an ImageWriter will see improvements.

At this point, he is quesstimating that it'll be only a few more weeks until he sends me a full working program.

Then, of course, a testing phase needs to occur, and if it passes that, then I'll need to write some documentation. So, it's still going to be a while.

But, according to Bill, the drivers WILL be done, and maybe we will be printing Memorial Day signs and banners on our HP printers?

Speaking of PSGS, I can't believe that I've had that program so long, and only yesterday found out about an Easter Egg. Run the program, and look at the main menu. Then, re-set your IIGS clock to December 5-31, and look at the PSGS main menu again.

Joe Kohn

SHEPPYWARE TEASERS  hehe..yeah, Sheppy has a lot of stuff going on right
now, and one of them is almost done (besides KN 1.2 :)
hmm..I'd better not say anything, tho :)
(T.BUCHHEIM, CAT13, TOP18, MSG:274/M645;1)

The latest piece of SheppyWare is:

1) "Way past kewl" (c)Sonic the Hedgehog

2) Has had very few problems during beta testing, even on my system.

3) Not only has it found a permenent place on my system, I use it
several times every day.

Best I leave it to Eric to say what it is, where & when it will be
published, etc :)

-Harold
Resident solder slinger.
(H.HISLOP, CAT13, TOP18, MSG:276/M645;1)

yup, the next piece of SheppyWare is great, and I use it 4 out of 5
""""""""""""""""""
times I boot my system. :) but, I don't think he wants betatesters
telling everyone all about it, so I'll shut up now and let you all be
surprised and amazed when you see his next great program :)
(T.BUCHHEIM, CAT13, TOP18, MSG:277/M645;1)

WHITHER PROTERM?  A while back a friend brought my attention to a thread
here which involved some speculation of the future of
InTrec Software. I found and read through the related parts of the thread
which seemed to be summed up in the following statements:

> In other circles, this is popularly referred to as "pulling a
> Beagle".
> :-/

> Exactly my point. Let me blunt: InTrec is working on Mac & PC versions
> of ProTERM. I consider ProTERM to be a great product, and would hate for
> InTrec to go the way of Beagle Bros and Applied Engineering.

Pardon my jousting here, I can't resist a flipant cynical reply:
Beagle only had Point To Point and AE had Ready Link -- We have ProTERM!
<grin>

Excuse my moment of artistic freedom, now on with the serious stuff.

After reading the thread and signing off, I thought it would set
minds at ease if I explained our official position and policy on the
subject. The piece got lengthy and after I got to a point where I thought I
had all the bases covered, I saved it and got some Zzzz. The next morning I
read through the text and had second thoughts about posting what to me had
been good therapy, but to others would be boring and perhaps appear self
gratifying. So I have not posted my (expanded) thoughts but will give the
"Reader's Digest" version.

Our plans are to release ProTERM/Mac in the not too distant future
(possibly during the Summer months), and when it is released, we will
continue to support ProTERM/A2. In fact, our strategy is the same as it was
the day Greg Schaefer and I sat down over a couple of beers and decided
this is what we wanted to do and they are listed in the same order of priority as they were on day one.

- Develop a strong telecom position by improving a product that was already established in the marketplace.
- Develop a version for the Macintosh platform and establish it in the market.
- Develop a version for the PC platform and establish it in the market.
- Look back to see what is needed to bring the Apple II product up to date.

Even then, our intention was for each product to be complimentary to the others. As planned, ProTERM/A2 built our company and gave it a solid foundation, and now ProTERM/Mac will provide the resources to build our strength. We consider the different products to be like siblings which will compliment each other in the same market. When all three are out, we will again look at ProTERM/A2 for a revise. All three of those products will allow us to support a broad base telecom market.

At that point, we will look at whatever else may show promise, including another part of our original plan, offer a publishing/marketing platform for programmer-authors who want to maintain control of their products like we've done for Greg Schaefer.

Will we "...pull a Beagle?" (to reference the exact phrase)

Our product development of each of the ProTERM/A2 3.0 and 3.1 took longer than we expected. ProTERM/Mac has been the same. But our track record for delivering dependable products stands, and we expect it to remain. It does take time to do it right, but its a matter of not being intimidated by those who would like to see the new product. No good whine before its time. ;-) 

This is getting out of hand again so that's it. Hopefully that will end the speculation about our allegiance or our plans about new releases.

Oh, there was one other question, "Will we be bought out by a monster?" Its doubtful. Truth is, we enjoy what we do, and if we sold the toys, the dream would end. To quote another Apple II guy who made it but walked, and is now still trying to make his NEXT venture, "The Journey is the Reward." Hey! That would be an excellent title for a book!

Jerry Cline @ InTrec Software, Inc.
Publishers of ProTERM telecom software.
Winner of the Awards of Excellence - Best Apple II Software.
Sent automatically from ProTERM's Editor.

OUT OF THIS WORLD NOT LONG FOR IT? > Does anybody know where I can get
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~ > OOTW?

Big Red Computer Club
423 Norfolk Ave
Norfolk, NE 68701
If you've been thinking about ordering OOTW, but have put it off, don't put it off too much longer. I had a conversation the other day with the owner of BRCC, and he informed me that when the current stock is gone, there will be no more.

Joe Kohn

USER GROUP CD-ROM? our Apple IIGS SIG is in the process of producing a CD-ROM. This CD will contain 238 disks worth of shrinked Apple IIGS public domain (fonts, pics, utilities, desk accessories, sounds, inits, CDEVs, etc., etc.) plus about 180 disks worth of Macintosh PD. The price for this CD will be around $40. Shipping from Germany to the US airmail will be $11 for the CD within the jewel case, and $5 for the CD within a 5.25" disk mailer. Are you interested in this beast??

Udo - ... just a IIGS freak -

NEW COPILOT COMING SOON I have killed the "ascii airplane" in the next version of CoPilot, and it won't be reappearing.

For those of you who might not know. Sheppy doesn't just write
extradornary programs for the II. Occassionaly. he turns into a knight in
shinning armour and charges in on a white horse to safe people from
disasters.

At our last meeting one of our members who is unemployed showed up
with a hard drive problem. The partition with all his programs had
disappeared from his hard drive. Obviously, he was very concerned and did
not know what to do. Sheppy took a quick look at the problem at the meeting
and then took the hard drive home with him. By the next morning, he had
recovered almost all of the lost files.

This kind of dedication and help is greatly appreciated by all of us
in the Apple II community.

Bob Weithofer
President - Appleholics Anonymous - Oxnard, CA
Delivered by Co-Pilot v2.5 Beta & TIC

NADINE.K [Aladdin Lass]

What would happen if God had to do it all over again?

AND GOD SAID:

"IN THE BEGINNING, GOD CREATED HEAVEN AND EARTH." He was then faced with a Notice of Violation and a class action lawsuit for failing to file a Part A notification and an environmental impact statement with HEPA (Heavenly Environmental Protection Agency), an angelically staffed agency dedicated to keeping the Universe pollution free.

God was granted a temporary permit for the heavenly portion of the project, but was issued a "cease and desist" order on the earthly portion, pending further review by the HEPA.

Upon completion of His construction permit application and environmental impact statement, God appeared before the Heavenly Environmental Protection Commission to answer unresolved questions regarding His application.

When asked why He began these projects in the first place, God simply replied that He liked to be "creative." This was not considered adequate reasoning; and God was required to substantiate this further.

HEPA was unable to see any practical use for earth, since "THE EARTH WAS VOID AND EMPTY, AND DARKNESS WAS UPON THE FACE OF THE DEEP." And God said, "LET THERE BE LIGHT." He really should never have brought up this point, since one Commission member was very active in the Sierrangel Club and immediately protested, stating "How was light to be made? Would it be a nuclear-powered or coal-fired generating plant? Would there be strip mining? What about thermal pollution? Air pollution? Universal warming?" God explained that the light would come from a huge ball of fire. No one on the Commission really understood this, but it was provisionally accepted assuming (1) there would be no smog or smoke resulting from the ball of fire, (2) a separate burning permit would be required, and (3) since continuous light would be a waste of energy, it should be dark at least one-half of the time. And so God agreed to "DIVIDE THE LIGHT FROM THE DARKNESS, AND HE CALLED THE LIGHT 'DAY', AND THE DARKNESS 'NIGHT'." (The Commission expressed no interest with in-house semantics.)

When asked how the earth would be covered, God said "LET THERE BE FIRMAMENT MADE AMIDST THE WATERS, AND LET IT DIVIDE THE WATERS FROM THE WATERS." One ecologically radical Commission member accused Him of double-talk, but the Commission tabled action since God would be required first to apply for a "firmament" permit from the ABLM (Angelic Bureau of Land Management), would be required to obtain water permits from the appropriate agencies involved, and further, insure that construction of any
firmament would result in no net loss of wetlands.

The Commission asked if there would be only water and firmament, and God said "LET THE EARTH BRING FORTH THE GREEN HERB, AND SUCH AS MAY SEED, AND THE FRUIT TREE YIELDING FRUIT AFTER ITS KIND, WHICH MAY HAVE SEEN ITSELF UPON THE EARTH." The Commission agreed to this, as long as only native seeds were to be used.

About future developments, God also said "LET THE WATERS BRING FORTH THE CREEPING CREATURE HAVING LIFE, AND THE FOWL THAT MAY FLY OVER THE EARTH UNDER THE FIRMAMENT OF HEAVEN." Here again, the Commission took no formal action, since this would require approval of the Game and Fish Commission, coordinated with the Heavenly Wildlife Federation and the Audubongelic Society.

It appeared that everything was in order until God said that He wanted to complete the project in six days. At this time He was advised by the Commission that His timing was completely out of the question. HEPA would require a minimum of six to nine months to review the permit application and environmental impact statement, and then there would have to be a 45-day public comment period followed by public hearings. After any and all public comments were considered, it could feasibly take 12 to 18 months before a permit could be issued.

And God said, "THE HELL WITH IT!"

>>> SOME THOUGHTS ON THE ECONOMICS OF ELECTRONIC MAIL <<<

""""""""""""""""""""""""""""""""""""""""""

The United States postal service has proposed raising the price of a first class stamp from 29 cents to 32 cents. Like many other people, I'm adamantly opposed to this proposed increase. It doesn't go nearly far enough. An extra three cents per stamp? Oh, come on. If the postal service truly had the best interests of the nation in mind it would raise first class postage to 40 cents per stamp.

Here is why:

The low price of postage stamps continues to foster an economy based on shuffling papers and envelopes around the country. Each year billions of letters get stuffed into billions of envelopes that get mechanically hauled in aging postal service trucks to technologically undernourished sorting centers that channel the mail to overaged airplanes that fly crowded skies to understaffed airports, channeling the mail back to aging postal service trucks driven by underpaid postal carriers who are mandated to deliver the mail through inclement weather even though they may not be feeling well.

It's not quite that bad. But it's close.
By golly, it doesn't have to be this way. If the price of postage stamps were increased to 40 cents, a lot of homes and businesses would start getting interested in using electronic mail.

Suppose the Federal government adopted a policy to encourage the entire nation to get connected up online. As a hypothetical example, suppose the Federal government placed an eight cent surcharge on the new postage stamp to help fund this goal.

With the revenues from such a government subsidy, computer manufacturers could produce an inexpensive dumb terminal that could sell for $50. This would be a disk-driveless machine. Just keyboard, monochrome monitor, and dedicated terminal program.

Plug this device into any phone jack, and you're connected to the information highway. Using this device you can send and receive electronic mail to your heart's content. No per message charge. After all, e-mail takes up just a tiny section of network bandwidth.

Now, if you want to trudge over to the post office in the freezing rain to stand in a long line to buy stamps, you should have the perfect right to do so. It's a free country.

But the government should make it its business to help promote electronic communications. Listen, communications is the vital engine of all commerce. It happens to be the engine of education, medicine, science, art and a few other things that are thought to have a positive effect on the social good.

Streamlined communications means streamlined everything else. Slow-poke communications means slow-poke everything else.

Someone once did a study to find out the real price of mailing a business letter. Well, it takes about ten minutes to write a one page business letter. Then it takes two minutes to print it. One minute to fold it. Three minutes to address the envelope. Another minute to fold and seal the envelope. A minute to stamp the envelope and throw it in the bin to be picked up by aging postal service trucks, to be hauled to... well you get the idea.

The time that it takes to send one letter doesn't seem overly inefficient. But if you multiply the inefficiencies of one business letter by a couple of billion, you arrive at a humongous collective inefficiency.

One of the best ways of making this country more competitive in the international marketplace would be to raise the price of first class postage to a sufficiently high level that individuals and businesses start taking electronic mail seriously.

Imagine the fear such an action would strike in the hearts of big business in Japan. The country that invented the telephone, the light bulb, the airplane, the transistor, and rock-and-roll -- all connected up with near instantaneous online communications.

Such a prospect ought to cause a few people to lose sleep on the other side of the Pacific. And for good reason. It's as efficient to us as it is threatening to them.
The author takes a keen interest in the social dimensions of communications technology. He can be reached on the information superhighway at: p.shapiro1@genie.geis.com; and pshapiro@aol.com

Well, I hope you had a cover on your GS. Biomuck isn't good for it, you know.

---

INITIALIZATION  Last month I concentrated on hard disk solutions for the Apple IIc, and some tips on use for that computer. This month the discussion turns to assembling a mass storage system for the Apple IIs that have slots -- the II Plus, IIe, and IIgs.

"INNIES" VS "OUTIES"  Slots make adding features to a computer system MUCH easier. That has been the major strength with the Apple II series (except for the IIc) from the beginning. Even the Macintosh finally had to crumble to popular demand and make some sort of internal expansion slots available for users who wanted to upgrade and enhance their system.

Despite the help that slots give us, there are still two OTHER choices that must be made when selecting a hard drive. The selection of an internal versus an external drive has mostly to do with cost and aesthetics (i.e., whether or not you mind having your desktop cluttered with extra boxes attached to sockets on the back panel). In some situations, an internal drive package may be available at a lower total cost than an external drive, since the external needs the addition of a controller card (which usually comes packaged with the internal drive).

INTERNAL DRIVES  The internal drives themselves come in two basic forms. One type is completely self-contained on a card that simply plugs into a slot. Some examples of these "hard card" types of drives include the Zip hard drive (sold by Zip Technologies, the makers of the Zip Chip and Zip GS card), several models of self-contained hard drives sold by Charlie's Appleseeds, and the Focus Hard Card sold by Parson's...
Apple II Computer Info

The Apple II Computer Info (which is very similar to the Zip hard drive). The primary advantage of it is ease of use; you plug it in, turn the computer back on, and you have 20 megs or more of storage available, WITHOUT any extra wires trailing from the back of the computer. The primary disadvantage of these drives is that you can ONLY have that one drive attached to the computer on that slot; if you want to add another hard drive, you will need to use another slot. On the Apple IIe this may not be too great a problem, but on the IIGs it may require disabling one or more of the built-in features that already require a slot.

The other type of internal hard drive common to the Apple II series is one in which the computer's power supply (that large metallic box to the left when you remove the top from the computer) is replaced by another power supply that also just happens to contain a hard disk drive assembly. A cable runs from the power supply/hard drive to an interface card in one of the slots. Historically, internal hard drives for the Apple II series have been of the IDE type control protocol, rather than the more commonly-used SCSI (Small Computer Systems Interface) protocol.

Examples of this type of internal hard drive include the Applied Engineering Vulcan, Applied Ingenuity's InnerDrive, and the Pegasus drive made by Econ. None of these is currently available new, but can be found on the used market. The Pegasus drive differed from the others in that it used a SCSI controller. This has usually been an advantage over the IDE type of drive, primarily because of better speed obtainable with the SCSI interface cards.

Turbo IDE Card

SHH Systeme, a company located in Germany, manufactures a controller card they call the Turbo IDE. It significantly improves performance of IDE drives, including older ones like the Vulcan and InnerDrive. (In fact, the online "ads" I've seen for the Turbo IDE claim that "We make IDE drives RAMfast!", a take-off of advertising done by CV-Tech for its RamFAST SCSI card.) The Turbo IDE uses DMA (Direct Memory Access) to achieve its higher speeds of data transfer. This means that the block of memory being transferred to or from the disk drive is directly accessed, rather than being moved first to ANOTHER place in memory, and THEN being sent to the disk.

Since IDE drives seem to cost a bit less than SCSI drives of the same size (at least in a quick review of ads in PC-based magazines), this could be a more affordable solution without any loss of performance. Furthermore, the Turbo IDE card will significantly speed up the operation of older Vulcan drives, prolonging their usefulness. Also this card will support up to two IDE drives, so an older Vulcan plus another larger IDE drive could both be used.

The utilities disk that comes with the Turbo IDE Card has its own formatter that is able to reformat a Vulcan drive from its original 7:1 or 5:1 interleave to 1:1 or any other value desired (which may improve performance). A complete format takes anywhere from three to eight minutes, depending on the size of the drive. The Turbo IDE supports ANY type of IDE drive; starts up in less than a second (there is no chain of devices that has to be scanned, unlike SCSI cards); and it takes only nine seconds to get to the Finder on a minimum IIGs system, and less than a second to get to ProDOS 8. Finally, it is possible to boot from any of 16 partitions on two drives at the user's request without any extra boot utility, selected at boot time.
EXTERNAL DRIVES

External hard drives are more widely used in the Apple world at this time, primarily because of Apple's decision to include a built-in SCSI port on their newer model Macintosh computers. For the Apple II, SCSI requires two pieces of hardware: a SCSI interface card, and the SCSI drive itself. Because of the flexible design of the SCSI protocol, it is possible to attach up to seven devices to a standard SCSI card, and not all of those devices need necessarily be hard drives. Tape backup drives, magneto-optical and Floptical drives, and CD-ROM drives can be attached to most SCSI cards. The limits may be more constrained by the system software than by the system hardware; whereas the Apple IIgs can easily accommodate all of the above mentioned devices, it may be more tricky for the IIe. If you have a IIe, you will have to look carefully to make sure that the device you want to attach can be accessed by the programs you are able to use. If you have any uncertainty about this, talk with a vendor that is used to dealing with Apple II users, and ask specific questions about compatibility with YOUR equipment.

SCSI CARDS - APPLE

For SCSI interface cards, you can chose between the RamFAST SCSI card and an Apple-built SCSI card. The newest (last) Apple card is the Apple II High Speed SCSI card, which is the fastest version available. The older versions of the Apple SCSI card are identified as either Revision A or B; these have to be upgraded to be compatible with the Apple IIgs (although the Rev B card will work on the IIe). The Rev C card works on the Apple II, II Plus, IIe, and IIgs. The Apple High Speed SCSI card uses the 65c02 opcodes, and so requires an enhanced IIe, IIgs, or an older Apple II that has had its 6502 processor replace by either a Zip Chip or a 65c02 chip. The fastest SCSI interface made by Apple is the Apple II SCSI card.

As mentioned above, the Apple II High Speed card is a faster choice for a SCSI interface than the older cards that Apple produced. With this card, the speed of data transfer between the computer and the hard drive is significantly improved. There are some drawbacks, however. First of all, the way in which the HS SCSI card gets faster speeds is to do Direct Memory Access (DMA), just as the Turbo IDE card mentioned above. The IIe does not reliably work with DMA enabled on this card (it may actually cause a crash), and so some of the speed improvement may not be noticed on the IIe. On the IIgs, DMA works just fine. However, the speed is not nearly as good when running ProDOS 8 applications (such as AppleWorks) as it is with GS/OS applications. If a IIgs user doesn't do much in the 8-bit world, the Apple HS SCSI card may be just fine. If AppleWorks and other 8-bit programs are frequently used, the slower speed in those programs may make this a less desirable choice.

Since the Apple II High Speed SCSI card is made and sold by Apple, this may be the best way to go if you have any concerns about future compatibility and service. (Admittedly, it may take a little explanation to an Apple Dealer that this item for repair goes into an Apple II and NOT a Mac, but if all else fails, 1-800-SOS-APPL should be able to get you the needed help).

Those seeking out the Apple HS SCSI card should also be aware of a couple of other points. First, Apple made a change to the ROM (firmware) code on the card after it was released, but did NOT make any changes in how those cards were labelled. Because of this, it is not easy to always tell whether a particular card is the older or newer version. One advantage of the newer version is that the card will continue to check the hard drive attached to it until it has come up to speed, and THEN try to boot that
drive. The older card, and many other hard disk controller cards, will check the hard drive to see if it is ready; if it does not receive a positive response from the drive, it will return a "DEVICE NOT READY" error and stop. This simply means that the hard drive must be turned on first, allowed to come to speed, and then the computer is turned on.

The other possible problem with the differences between the two versions of the Apple HS SCSI card have to do with "term power". For a SCSI chain of devices to work properly, the electronics of the link between each device in the chain (including the card) require that the chain be powered by at least ONE of the devices (in some circumstances, it may be good if term power is supplied by more than one device). The older HS SCSI card did NOT supply terminator power; the newer one does. This may cause a conflict if the hard drive attached to the card does not supply term power. If the card DOES, everything is all right; if the card does NOT, then NOTHING in the chain is supplying term power, and it won't work. There are some hardware patches that have been posted to alter the cards that do NOT supply term power so that they DO. This does, however, require some knowledge of electronics and the ability to use a soldering gun, so don't try this trick unless you REALLY think you know what you are doing.

Buying an Apple HS SCSI card NEW from a mail order company does not necessary guarantee that you will have the newer version of the card. If they (or Apple) have had a card sitting in the warehouse for a long time, it may be the older card. Sometimes it is not possible to tell which version it is until you plug it in and try it out.

SCSI CARDS - RAMFAST

The RamFAST SCSI card, formerly sold by CV technologies and now by Sequential Systems, is more expensive than the Apple card. The Apple card may be found in some places for $99, and the RamFAST has sold for as little as $139. However, there are several major advantages of the RamFAST:

1) It works as quickly under ProDOS 8 as it does under GS/OS. That means that you do NOT take a speed hit if you prefer to work in the 8-bit world (as is the case with the Apple HS SCSI card).

2) The card has BUILT-IN utilities to partition and format a SCSI hard drive. That means that you CANNOT lose a configuration disk somewhere in the pile on your desk; the configuration programs are ON the card and available at any time by pressing the "0" key when you do a RESET.

3) Some of the RamFAST utilities include tape backup software, which will even work in the background. This means that you can start a tape backup, and then exit the utility program and do some work on a disk partition other than the one which is being backed up. (Actually, you CAN work on the one being backed up, but it is locked and you will not be able to save any files to it.)

4) Like the Turbo IDE card, the RamFAST has the ability to shuffle the partitions on a hard disk so a different one can be used as the boot partition if you wish. For example, if you have GS/OS version 6.0.1 on one partition, and version 5.0.4 on another partition, you can select which one you want to boot by pressing the appropriate number key upon RESET. This is not possible with the Apple card.

5) You can specify exactly WHERE a partition will appear in the ProDOS 8 disk mapping table (which Slot and Drive number) within the
RamFAST configuration program. This was not possible with the Apple card until ProDOS 8 itself was changed to work with more than four devices on certain slots after version 1.9.

6) Finally, the RamFAST is STILL being actively supported and upgraded by Sequential Systems. It is highly unlikely that any further changes to the Apple II High Speed SCSI card will ever appear from Apple. At the time of this writing, Sequential has even made it possible to play musical CD disks in a CD-ROM drive attached to the RamFAST. Upgrades are available at a very reasonable price.

SCSI CONNECTIONS   "Term power" was mentioned earlier in this article. Part of what "term power" is powering are the "termination" resistors that must be present at both ends of a SCSI chain of devices. The resistors decrease the extra signals that can be induced and reflected on the chain due to the high frequencies used in data transfer. To work properly, these resistors need to be powered. This power can come from only ONE device on the chain, although the newer SCSI-2 protocol suggests that each device power its own terminator resistors (if being used). If the terminator absent at the end of a chain of devices, none of the drives attached may appear to be present; or, if termination resistors are active in the middle of the chain, nothing may appear past that point. This is not a hard and fast rule, however; sometimes things will work properly even though the termination has NOT been done properly. If it works under those circumstances, consider yourself lucky; but set it up properly as soon as possible to avoid an unexpected loss of data.

In the cases of the various versions of RamFAST cards that have appeared (up through Rev D) and on CMS SCSI cards, the SCSI card itself has termination resistors on its end of the chain. That means that only the LAST device attached to the SCSI chain needs to have termination resistors installed. Other devices between the card and the end of the chain should have their termination resistors disconnected or turned off, as this MAY cause problems with proper function. In the case of Apple's Rev C SCSI card, termination is NOT supplied on the card, and so the FIRST device attached to the card must have termination resistors installed, in addition to those on the LAST device attached. Also, the cable running between the Apple card and the first device on the chain should be very short.

SOURCES   In case your appetite has been stimulated by this explanation (and if that is the case, you really need to get out more often), here are sources of some of the various disk drives and controller cards spoken of in this month's article:

FOCUS HARD CARD:

Note that the Turbo IDE card sells for about DM235 (that's 235 Deutsche Marks). The price in U.S. dollars will vary, depending on the current exchange rate, but was $135 up until recently. They also charge DM38.00 (about $22.00) to ship a card to the U.S., and it includes an IDE cable, a utilities disk, an English manual, and a one year limited warranty on parts and labor. Free online support is available in Cat 13/Topic 22 in the A2 Roundtable. For more details, check out files #20961 TURBO.NEWS6.BXY, and #19646 TURBO.IDE.BXY in the A2 Library.

[TEC]///Apple II Hybrids///

Apple II Hybrids

by Jay Curtis
[J.CURTIS8]

>>> THE MACINTOSH LC/IIe HYBRID <<<
John Dvorak, an editorial writer for MacUser, recently wrote, "Suppose the Mac had been based upon the Apple II, for example. Can you imagine how horrible and limited it would be?"(1) This kind of statement is not surprising, especially coming from Dvorak. Dvorak displays a remarkable ignorance of just how far both Apple II hardware and software have come in their development. Instead of checking out his facts, he uses the Mac crowd's narrow beliefs and tired cliches about the II's limitations to try to make a point about the growth of computer technology. In his editorial, Dvorak's real target is Windows running on Power Macintosh systems, but as he shoots at Windows he hits the Apple II and perpetuates Apple's own myth about its limitations.

In fact, I can easily imagine a Mac based upon an Apple II because I already own such a machine. It's called a "IIgs," and the one that I own has several desktop capabilities under System 6.0.1 that I cannot find on the System 7-equipped Mac that I use at work.

Even as a used machine, the 16-bit Apple IIgs, with its accelerated Apple IIe mode, 24 bit data bus, and 8 MB addressing still offers a reasonable upgrade path for any 8-bit Apple II user. Through Apple's development of GS/OS, the IIgs has acquired what is essentially a Macintosh user interface, a Mac-style operating system and, finally, both Macintosh and MS-DOS file system translators. Today's IIgs with System 6 will drive any of the latest peripheral devices including fax-modems, CD ROM drives and high resolution printers. I can easily imagine a server-class Apple II (built around Western Designs' 65832 microprocessor) possessing an SVGA display, 32 bit bus and unlimited addressing. In truth, whatever Apple II limitations exist, exist because of APPLE MARKETING DECISIONS, not because of any inherent limitations in the technology itself.

When Apple introduced its Apple Macintosh line in 1984, it also introduced a dilemma for Apple II users. Simply put, the Macintosh was not designed to run Apple II software. Unlike the users of IBM PCs and compatibles, who could take their old software with them when they "upgraded" to a new x86-based platform, Apple II users had nowhere to go. Many sales of the Trackstar and PC Transporter cards (discussed earlier in this series) were almost certainly generated because of this dilemma. With no clear upgrade path, some Apple II users began migrating to PCs rather than Macs, and they maintained their cross-platform compatibility with the Apple II through the use of the PCT and Trackstar coprocessor boards.

Apple has done a number of things to insure cross-platform compatibilities between the Apple II and the Mac. The company would love to convince their Apple II customers that all Apple products are essentially the same thing so that they can feel good about "upgrading" to a Macintosh. Nonetheless, even though both the II and Mac carry the same logo, they are different computers. As it gradually became obvious that Apple had no intention of developing the Apple II architecture any further (nor allow anyone else to develop the architecture), an Apple II/Mac "bridge machine" became the hope of many Apple II users.

Apple II users, however, had to wait six years after the Mac's introduction before a bridge machine would finally appear as the Macintosh LC/IIe hybrid. Yet, for many Apple II users it was too little, too late. For example, IIe users had already forged their own upgrade paths by outfitting their computers with accelerator chips, additional RAM and other improved capabilities. A good bridge machine, they reasoned, should offer them at least as much capability in IIe mode as they already possessed with
their enhanced Apple IIIs. After all, when PC users upgraded to a higher x86 system, they were automatically guaranteed a faster microprocessor and better addressing to use with their existing software. Apple II users, on the other hand, were getting LESS than an off-the-shelf IIe with the IIe PDS (Processor Direct Slot) card.

As far as IIgs users were concerned, no bridge machine even existed, because the LC’s IIe PDS card couldn’t run IIgs software, and many IIgs users ran GS applications and games exclusively. It was especially the superb sound and color graphics of IIgs games that GS users would miss if they bought an LC. In addition, the multiple expansion slots found in IIs and IIGSes had always been prized by Apple II lovers, and both Apple IIgs and Apple IIe users were disappointed by the fact that the LC had only one slot, which had to be used by the IIe card. The LC’s lack of slots, together with the IIe card’s 1 mhz processing speed were seen as significant limitations.

Comparisons between the IIe card-equipped LC and the Apple IIgs were inevitable after the LC was first introduced in late 1990. Most of these comparisons found the two computers to be nearly equal in their capabilities. Price comparisons, using mostly Apple peripheral equipment and official retail pricing, found the LC to be cheaper in price than the IIgs.(2) Most IIgs users knew, however, that the street price of a comparably-equipped IIgs remained less than an LC with IIe card, at least at the time it was introduced. However, Apple continued to hold the prices of both its IIgs and IIe at the same level while gradually bringing down the price of its increasingly more powerful LCs. It was this marketing strategy which rankled with Apple II supporters and eventually enabled Apple to discontinue both the IIgs and IIe by citing decreased demand for these systems.

Despite the LC’s perceived shortcomings at its introduction, Apple’s LC line and its IIe PDS card have gone on to enjoy remarkable sales. The LC, including its various Quadra and Performa incarnations, has been Apple’s best selling computer, helped especially by competitive pricing and replacement sales to schools. The LC’s IIe PDS card remains the only Apple II still in production. At one time, Apple was reported to be sending out 75 percent of its LCs equipped with the IIe card.(3)

Sales of the IIe card, especially to schools, remain strong in many places up into the present time. Additionally, anyone who has taken the time to read GENie's Macintosh LC categories will find that the topic of IIe card compatibility remains very important to Mac users who are contemplating upgrading to the latest, 68040-based, LC-style machines. Many of the sales of AppleWorks 4 have almost certainly gone to users of LCs with IIe PDS cards.

It has been rumored on GENie's A2 roundtable that some Apple officials, surprised by the strength of their LC-line and IIe PDS card, have lamented privately that they did not continue development of the Apple II line further. Hindsight, as they say, is always 20/20, but it seems very doubtful that Apple will now reverse their policy toward the development of Apple II hardware.

Although it leaves much to be desired in Apple II mode, the LC/IIe hybrid has a number of features worth exploring. As indicated in last month’s article, the LC itself now comes in several versions which include the Quadra 605, Performa 475, LC 475, Performa 460 and LC-III. All of
these machines possess essentially the same motherboard with IIe PDS capability. The LC-III and the Performa 460 series computers are fast 68030-based Macs, while the Performa 475, LC 475 and Quadra 605 are VERY fast 68LC040-based Macs. As reported last month, these 68040-based LC-style Macs run at 22 MIPS, about three times as fast as the 68030-based LCs. Unfortunately, while all of these machines run Apple II software with the Apple IIe PDS card, they continue to run the software at 1 mhz, and they benefit only from slight improvement in the video display speed.

It is expected that, as sales of the Power Macintosh line increase, prices on these very fast, LC-style machines will continue to come down as they become Apple's low-end computers. It has been announced that a future Power Macintosh upgrade will become available for the Quadra 605s and LC/Performa 475s. At present, Apple is providing Power Macintosh upgrades for other Macintoshes but not for these LC-style machines. Power Macintosh upgrades for LCs are a virtual certainty, however, given the sheer number of LC-style machines in existence and the potential dollars that can be made by anyone who provides the "Power" hardware at a reasonable cost. The current official price of Apple's Power PDS card is $699.

PowerMac upgrades will be provided in the form of complete motherboard swapouts from Apple or as PDS coprocessor cards from both Apple and DayStar corporation. The capabilities of this new hardware will vary somewhat with the type of board and the type of Mac it is installed in, but all upgrades guarantee remarkable speed improvements in Mac emulation as well as the capability to run multiple operating systems in other emulations. Apple II users must wait to see if the Apple II can play a software emulation role in the new technology. While Apple II emulation software is reportedly being investigated for the PowerMac and PowerPC systems, it has not been promised by anyone. Nonetheless, Apple II users have gotten used to waiting on new technology, and somehow it has always become available.

Despite the limitations of the LC/IIe hybrid and the perception by people like John Dvorak that the Apple II is "limited," a IIe card-equipped, LC-style Mac may well represent one of the best new computer choices for an Apple II user who plans to maintain their IIe capability while expanding their software base on a new platform. It is the tremendous power of the LC 475s, their IIe compatibility, their low cost, and the promise that these Macs will soon become PowerMac compatible that make them such a good buy. Therefore, next month we will examine how well the LC/IIe hybrid works as an Apple II. Until then, think hybrid!

NOTES

New developments of hard- and software for the Apple IIgs do not take place in the United States alone. One firm developing new products is found in Germany.

Joachim Lange (/SHH Systeme, Bergstr. 95, D - 82131 Stockdorf, Phone: ++49 89/8 57 70 40, GENie: J.LANGE) scored a big hit when releasing the BlueDisk controller for the Apple IIgs (and the enhanced Apple //e). This controller will accept two MS-DOS drives of any size. (These are drives which use the MFM format for data recording, whereas the "normal" Apple drives use the GCR format for data recording -- the Apple SuperDrive is capable of both MFM and GCR formats.) The formats currently supported are 5.25" disks with 360K, 720K, and 1.2MB, as well as 3.5" disks with...
720K, 800K, 1.44MB, 1.6MB, and 2.88MB. Disks can be formatted from Finder with the capacities mentioned for ProDOS and HFS. (Yes, you can format 800K and 1.6MB MFM disks for ProDOS and HFS!) A BlueDisk controller with a double-drive is far cheaper than an Apple Superdrive with controller, and it's even cheaper than a SCSI Floptical drive.

As I write this, the BlueDisk controller is still available as introductory offer for DM200 plus shipping and handling. The introductory offer is valid as long as the GS/OS driver and the firmware are in "official beta stadium". Extensive tests by beta testers in the US and my own findings have shown, however, that everything works and is stable. I don't know whether the introductory offer will still be valid by the time GENieLamp A2 reaches you.

With System 6.0.1 and a BlueDisk controller, you're able to read disks in ProDOS, HFS, and MS-DOS format in the above mentioned sizes directly from Finder. You can write disks in the above mentioned sizes in HFS, ProDOS, and MS-DOS.

Just a moment -- write MS-DOS? Yes, you can write MS-DOS disks with a BlueDisk controller, although not from Finder. You have to use the MS-DOS Utilities by Peter Watson; but more on that later on.

The BlueDisk controller comes with a GS/OS driver and a testing program. The driver provides a bit more functionality than the built-in firmware. The test program lets you test the drives connected to the BlueDisk controller.

The driver operates in two modes; one mode polls the drives continuously, which generates some noise (owners of a PC Transporter will know what I'm talking about; this was the reason to develop some patches, which "hide" the TransDrives from GS/OS); the other mode does not poll the drives continuously, which will keep GS/OS from recognizing disk changes automatically. In this second mode you have to press the Control key to tell the BlueDisk controller to check the drives. You may toggle the modes with the key combination Shift-Control.

When the driver is deactivated, you'll see a 5.25" disk icon on the desktop for every drive connected to the BlueDisk controller (just like for the normal Apple 5.25" drives). After inserting a disk, you have to double-click on the drive icon, to show the disk icon for opening it (just like you have to do with Apple 5.25" drives). Without the active BlueDisk driver not all of the above mentioned disk sizes are available, because they are not (yet) implemented in the firmware.

The circuit board itself is very well done. You use a DIP switch to configure the slot you want to install the BlueDisk controller in. A set of three jumpers is used to tell the BlueDisk controller how many (one or two) and what kind of drives (5.25" or 3.5") you have connected to it. Two soldered jumper wires configure two signals for 2.88MB drives.

After installing the controller and connecting the drives (when you buy everything from ///SHH Systeme, a cable for that is provided), I started the first tests. I took a pack of preformatted MS-DOS disks I happened to have available -- the disks were recognized by Finder just fine as MS-DOS disks. I reformatted one into a HFS disk and copied a file onto it -- and was disappointed -- it took forever and forever and forever... but more on this in a moment. It was definitely NOT the fault of the
BlueDisk controller and driver.

I performed the following tests (all tests were conducted with a stock IIgs running at 2.8 MHz):

Writing and reading of a 490K file to the different disk sizes and formats with and without the BlueDisk driver.

</table>
While doing those tests I made an interesting discovery; it took 245 seconds to write a file onto a HFS disk in one instance (see above "it lasted forever..."). MS-DOS disks are usually preformatted at 1:1 interleave; when the writing took so long, I had just reformatted the disks for HFS, leaving the interleave intact. When I initialized the disks from Finder, using the 2:1 interleave, things became a lot faster. All the above tests were done on 2:1 interleave disks (even the MS-DOS timings, but the MS-DOS utilities write to the disks direct, not using the BlueDisk driver efficiently). The differences you encounter when using the different interleave factors are dramatic:

1:1 interleave 228 sec.
2:1 interleave 45 sec. (!)

The 5.25" 360K, 720K, and 1.2MB disks are formatted with 52:1 interleave according to Finder!?

I recommend you format disks always from Finder with 2:1 interleave for use with ProDOS or HFS. MS-DOS disks can be formatted with different interleaves from within the Watson MS-DOS utilities. They are recognized by the MS-DOS FST just fine.

(BTW, tests of the beta-testers and Joachim Lange found that the HFS FST is programmed for slowness deliberately! It uses SINGLE block read and write calls and writes blocks in the wrong order. That is, blocks 200-300 are written in the order 300, 299, 298, 297, I, and it uses a single GS/OS call for each block. I think you can imagine that to be slow, can't you?)

GS/OS recognizes the drives connected to a BlueDisk controller as Superdrives, by the way.

The MS-DOS FST recognizes a MS-DOS disk as such with the following steps:

1. Read block 0 (the boot block)
2. Byte $0000 has to be $E9 or $EB
   (8088 code long resp. short jump)
3. Byte $1FE has to be $55
   (ID byte)
4. Byte $1FF has to be $AA
   (ID byte)
5. Bytes $00B - $00D have to be $200
   (512 bytes per block/sector)

Well, there's but one glitch in this whole picture -- when Kangaroo is used to change folders or disks, the drives connected to the BlueDisk controller are accessed about 20 times (when there are no disks in the drives), til Kangaroo displays its menu. Even when loading just a file from HD, the drives are accessed once prior to loading the file. When there are no entries in Kangaroo's file and folder submenus, this behavior doesn't occur. When there are disks in the BlueDisk drives, Kangaroo looks
only about three times, before displaying its menu. When Kangaroo isn't
activated, GS/OS just looks once at the drives and that's it.

The testing program for the drives has the following menu:

<table>
<thead>
<tr>
<th>IRC</th>
<th>Rst:0</th>
<th>Dr2: yes</th>
<th>n/a: 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Typ2: 5.25&quot;</td>
<td>Typ1: 3.5&quot;</td>
<td>ME2: on/off</td>
<td>ME1: on/off</td>
</tr>
</tbody>
</table>

1: Drive 1 Motor: OFF/ON
2: Drive 2 Motor: OFF/ON
O: Select Drive 1
T: Select Drive 2
D: Disable Drive Selection
0: Recalibrate Selected Drive
9: Seek Track #79 of Selected Drive
+: Step to Next Cylinder (inwards)
-: Step back (move outwards)
R: Try to Read From Disk
Q: Quit

To test a drive, you select a drive and switch its motor on. Then you
can issue the commands (0,9,+,--) to the drive. The program will
respond with a message. When this is a positive message, the drive is
functioning properly.

BlueDisk:

- has been tested with Archiver's backup function; there have been
  no problems with either of BlueDisk's formats and sizes.
- works just fine with HardPressed
- works in Slot 5, when its set to "Your Card"
- works with PC Transporter (there are the same problems you
  encounter when using a Floptical with the PC Transporter)

Things which don't work (but neither the fault of the BlueDisk
controller nor the driver):

- ProSel 16 does no backups to drives, which aren't connected to
  Slot 5
- Salvation Bakkup does not recognize non-Apple drives
- ProSel 8 Cat Doctor does not format correctly

A software package that BlueDisk users will find useful comes from
Peter Watson of Australia. Watson's MS-DOS Utilities contain the following
commands:

MDir reads the directory of a MS-DOS (MFM) disk
MType types the contents of a file to screen
MCopy copies files from MS-DOS to GS/OS
GMCopy copies files from GS/OS to MS-DOS
MRename changes MS-DOS file names
Apple II Computer Info

MDel      deletes files from MS-DOS disks
MLabel    creates a disk name for MS-DOS disks
MAtrib    changes file attributes for MS-DOS files
MFormat   formats disk for MS-DOS
MDiskCopy copies whole disks
findMFM   tries to recognize all connected MFM capable drives
Online    shows all volumes online with their drive numbers
MMD       creates a directory/folder
MRD       deletes a directory/folder
MFDisk    shows partition info (on a HD)
MPatch    patches the parameters of some commands

The commands need a shell to be usable. A shell called COMMAND.COM comes with the program, but you may use the ORCA/Shell, ProSel-16, or GNO/ME. The aforementioned MS-DOS commands are small programs, which are loaded from disk when requested. In addition to them there are a few built-in commands contained in COMMAND.COM:

Prefix    selects the standard prefix
Cat       shows a directory/folder
Type      shows the contents of a file on screen
Ver       shows the version number
Help      displays the help texts
Quit      quits COMMAND.COM

As you may see, the necessary functions for writing to and modifying MS-DOS disks are there. After starting COMMAND.COM, the ">" prompt welcomes you and the program is waiting for you to enter something; it's solely text based. A valid entry might be "MFormat .d7 /Q"; this erases the disk in device 7, creates a MS-DOS root directory, and creates the FAT (File Allocation Table -- what the VTOC [Volume Tables of Contents] is for ProDOS, the FAT is for MS-DOS.) To copy a file from a ProDOS disk onto an MS-DOS disk, you have to issue the command "GMCopy .d7 :Hard2:Read.Me ReadMe.TXT"; this instructs Command.Com to copy the file Read.Me from /Hard2 onto the MS-DOS disk in device 7 and change the name of the file to ReadMe.TXT.

Well, there isn't much more to say about the MS-DOS Utilities. They function as advertised and do their job; however, you're dealing with MS-DOS, so you might have to try a few times sometimes to get the syntax of a command right. Entering a command which needs parameters to operate without those parameters will cause COMMAND.COM to display that command with some samples on how to use the parameters. With "Help name" you'll get an explanation of the command "name".

Peter Watson asks US$15 or AUS$20 for his Utilities. This is money well spent; you'll get a big bang for the buck. For $5 more you'll receive the latest version of the Utilities.

All in all, still more possibilities and functionality for our "good ole" Apple IIgs!

DR'S EXAMINING TABLE

Golden Oldie Review: VCR Companion
by Jim Wellman
copyright (c) 1989

>>> GUEST REVIEW <<<

DR wasn't able to be with us this month, so instead we present a guest review from Jim Wellman, who was co-sysop of APPLESIG on the SOURCE(tm) at the time this review was written. While VCR Companion was a recent product when this review first appeared, you'll find it cropping up in sales of second-hand software quite frequently, and can still find it at some mail-order houses.

[ ]

MACHINE ]e, ]c, ]c+ ]gs with 128k memory, one disk drive, monochrome or color monitor (television).

OPTIONAL Mouse/joystick, second disk drive, VCR, VCR Companion Film Library.

PUBLISHER Broderbund Software Inc.

The VCR Companion is a unique approach to titling your home movies! I have been a "weekend" freelance photographer doing weddings and other events since 1985 and have always wanted to do movies.

Well, I purchased a camcorder not long ago and started doing home video movies. You know the type: Birthdays, parties, picnics, and other events as requested. I even started taping the weekly church service.

The problem I encountered was to give proper credit to those that were participating. That is where VCR Companion entered the picture. I saw this program on the shelf and just had to try it out.

VCR Companion comes with the following standard features:

- 12 Fonts (scripts);
- 12 Boarders;
- 12 Background Pictures;
- 12 Background Patterns;
- 12 Animations; and
Apple II Computer Info

- 12 Background Icons.

Also, you can install VCR Companion to your hard drive for easier and faster use! However, I was not successful in installing it to my 20 meg drive as it is partitioned only for ProDOS applications.

As a bonus VCR Companion included:

- 12 Additional Animations;
- 12 Icons; and
- 3 "ready made" scripts for you to examine.

I found the easiest way to use this program is to just start! I had taped an office party and needed to put titles on the tape. I did the titles in about 30 minutes and placed them on the tape without problems. I took the finished tape to the boss and asked him to play it back... success! All the people in the party were just raving about it... especially the titles!

A couple of weeks ago I had the opportunity to shoot my first video wedding. I warned the bride and groom ahead of time but they still wanted the movie of their special day. I prepared myself with four blank tapes: One for the wedding, one for the reception and the one for candid shots of that day and the last tape for the final product.

I took about one hour to prepare the titles and music. I then placed the titles on the new tape followed by the wedding, reception, and candid shots! Each section had the titles announcing the section.

I delivered the tape to the newly weds and watch them watch their wedding. They saw the titles start with a "cover" and an animation of the bride & groom kissing! That scene faded to listing the grandparents, parents, aunts, uncles, brothers and sisters. Well, you should be getting the picture by now... the movie was a success: They were happy and so was I!

Follow the easy to read instructions to put your finished titles on tape. VCR Companion even gives you a diagram to follow so you can connect your computer to the VCR.

VCR Companion allows you to import your own animations created by Dazzle Draw, Fantavision, or Animate. You must observe the size constraints placed from VCR Companion when converting from these programs to the VCR Companion.

Some other uses of VCR Companion could be slide titles, "welcome to the business" tour, computer advertising, and many other ideas!

I created a self run advertisement for my business that presents information, advertisement, and other items as a slide show. The uses of VCR Companion are really endless: Just let your imagination go and you will really enjoy VCR Companion.

So even if you don't own a camcorder or a VCR you will find that the VCR Companion is a welcomed addition to your library... I certainly did!

[*][*][*]
Welcome back to the Treasure Hunt! This month we will take a look at a variety of files including some GS/OS stuff and some interesting text files. We will conclude with one of my personal favorites.

First we will focus on HyperCard IIgs and related files available in the A2 Library. This terrific program has been available online since early February for the price of $3 an hour downloading. No doubt many of you have already taken advantage of this addition to the library. For the rest of you, here a brief description of what you need to do to get started with HyperCard IIgs.

Here is a list of the HyperCard IIgs Program Files:

<table>
<thead>
<tr>
<th>File#</th>
<th>Title</th>
<th>Brief Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>22194</td>
<td>INST.TOUR.BXY</td>
<td>HCGS Installer/Tour disk</td>
</tr>
<tr>
<td>22195</td>
<td>HCGS.BXY</td>
<td>HCGS Program Disk</td>
</tr>
<tr>
<td>22196</td>
<td>STACKS1.BXY</td>
<td>HyperCard IIgs stacks disk #1</td>
</tr>
<tr>
<td>22197</td>
<td>STACKS2.BXY</td>
<td>HyperCard IIgs stacks disk #2</td>
</tr>
<tr>
<td>22198</td>
<td>HCGS.HELP.BXY</td>
<td>HyperCard IIgs help disk</td>
</tr>
<tr>
<td>22199</td>
<td>HTALKHELP.BXY</td>
<td>HCGS HyperTalk help disk</td>
</tr>
</tbody>
</table>

Each of the files is a 3.5" disk image. All of the six files are required to install HyperCard IIgs from floppy disks. HyperCard IIgs _requires_ 1.5 megabytes of RAM and a single disk volume greater than 3 megabytes. System 5.0.4 or later is also required.

Unpacking a disk image can be a bit of a hassle if you are not careful. I suggest that you download the files to a folder on your hard drive and then unpack them to a blank diskette using ShrinkIt GS. Also, be prepared for a long download. I suggest doing it between midnight and 6 AM, when the online traffic is lightest.

Once you have downloading the six files and unpacked them to diskettes, select the Installer program from the Tour disk and follow the directions to install HyperCard on your hard drive.

Now let’s take a look at several neat HyperCard stacks available in the A2 Library.

[*][*][*]

QUICK.TUTOR.BXY File #15466 (HyperCard Stack)
According to A2.TYLER, who uploaded this HyperCard stack, "this is a stack created by Sebastian Foti, an instructional computing instructor at the University of Florida's College of Education. The stack gives an overview of how to use the different tools within HyperCard to write one's own stacks. There are some interesting ideas included for the use of buttons that will cause the tongues of the creators of HyperCard GS to drag on the floor and their eyes to bulge out of their heads."

Foti, who calls his stack "Quick 'n Easy HyperCard Tutorial," describes it this way: "This stack was created as an introduction to the basic elements of HyperCard GS. It is designed to offer the user a chance to play with HyperCard without worrying about making a mess of the stack. The changes made to the stack will not be permanent."

He begins with a brief definition of what HyperCard is. Then he explains in some detail what the various elements (buttons, fields, pictures) of a card are with ample examples of each. Foti gives you the opportunity to play with these things to your heart's content _without destroying the stack_.

This is a fairly long download (182272 bytes), but in the opinion of this novice HyperCard user, well worth it. Now if someone will just tell me how Foti did the "slippery button"....

[*][*][*]

HCFONTVIEW.BXY File #16991 (HyperCard Stack)

According to Alvin Yee, the author of this stack, "Font Viewer is a stack that will let you select all Font Attributes such as Font Family, Size, Style & Color and alter them via HyperCard Buttons. It will then show you an example (more than 1 line and in color) of your choices. Also present are options for field styling and changing the background color. As a bonus, a HyperCard Screen Saver is included. The Screen Saver paints random triangle outlines in random colors on a black background."

This freeware stack displays all its directions on screen as the text that serves as an example of the font choices that you make. At first glance, the scope and variety of buttons on the screen may be a bit overwhelming to the novice user. If you read the onscreen directions carefully, it soon becomes clear what you can do with this stack.

You may also get a print-out of the directions by first clicking on the sample field (where the text is). This brings up a dialog box that gives you the option of printing the sample text using the current font attributes.

Font attributes include style (plain, bold, italic, underline, shadow), size, height (use this to alter the default height set by size), alignment (left or right justified, or centered) and color.

Once you have the font just the way you want it, you may install the font attributes onto a field in another stack. You may also save up to three different settings for the font.

Aside from its uses with HyperCard, this stack will also let you see
what each of the fonts in your font folder look like. As a bonus, you can select a full character set table using the font, style and size of the font that you have in the sample window. Then you can print it out.

This file contains 68480 bytes, which is a relatively short download, particularly for the value you get.

[*][*][*]

VISUAL.FX.BXY File #14763 (HyperCard Stack)

This is a freeware HyperCard stack by Hangtime and Chet Day. According to Hangtime, it "demonstrates all the different visual effects available through HyperTalk. It allows the user to try all the effects at any speed (very fast, fast, slowly, very slowly), and even add an image to go to rather than a card image (all 16 colors, plus inverse) via a PopUp menu! It's VERY easy to use, and it's VERY, VERY small (only about 13k!). This stack is _not_ locked in any way, so use it, look through it, figure out how it works, but most of all have fun!"

This is another stack that gives you an opportunity to experiment with HyperCard without worrying about messing up. HyperCard has a variety of visual effects that can be used to move from one card to another. These include zoom (open, close, in, out), wipe (up, down, left, right), scroll (up, down, left, right), iris (open, close), barn door (open, close), checkerboard, dissolve, fade, and of course plain.

If you are a novice, as I am, and particularly if you have little experience with visual transitions, this is an excellent stack to learn from. Besides, as Hangtime says, you can take it apart to see what makes it tick. In my experience as a programmer, I have frequently learned much from working my way through someone else's code.

[*][*][*]

NOWORRIES13.BXY File #22323 (HyperCard Stack)

This final HyperCard stack for this month's column was just recently uploaded to the library. The stack was created by Brendan Bellina. He describes it this way:

"No Worries v1.3.0 is a HyperCard GS stack that allows the launching of GS/OS, ProDOS, Applesoft BASIC programs, as well as opening other stacks, New Desk Accessories, and Documents, all within an environment that is very similar in appearance to the Macintosh At Ease software. Includes security to protect against unauthorized addition/deletion of applications buttons. Earlier versions published in Script-Central. This is the first freeware release."

If you need security to prevent others from messing with the computer settings (school children messing with the control panels for example), this stack provides a straight forward way to do that. It uses a single system password that restricts the user to running the programs that are already set up in the stack, unless he has the password.

At the same time it gives you a point and click format for choosing
programs to run. Setting up the stack for these programs is easy. For example, if you want to run HyperStudio from this stack, pull down the "No Worries" menu and select "set up mode." Then pull it down again and select "Link to GS/OS Application." From there you will select the location of the HyperStudio file from the standard dialogue menu. Once you have it located, an icon will appear on the screen. Drag the icon to where you want it. It will now appear complete with the name of the program. Clicking on it will take you to HyperStudio. Quitting HyperStudio will return you to this stack.

It is also possible to link to ProDOS applications (system files), to BASIC programs (requires BASIC.SYSTEM), other stacks, documents (linked to GS/OS applications), and various menu commands.

If you need security, and/or if you really like the look and feel of "At Ease," then this stack will be a good download for you. If, like me, you don't need security, then you probably don't want it.

If you decide to download this stack, be sure to become familiar with it before you apply the password protection. Also, be sure to read all the good information provided in the help screens. To get to them, select "help" from the "No Worries" menu.

By the way, Brendan was the professor at a recent A2 University course on HyperCard GS over in the A2Pro Roundtable. To learn more about the course, visit their library and search on "HyperCard."

That concludes the HyperCard stuff. Now let's look at some interesting text files.

[*][*][*]

**NIGHT.XMAS.TX**  File # 4496  (Humorous Text File)

I like this one! As stated in the file description, "If you fed 'The Night Before Xmas' into a computer, and then asked the computer to explain the story, it would look something like this." This is a short download (6300 bytes) and well worth it.

Here is a short excerpt...

"T'was the nocturnal segment of the diurnal period preceding the annual yuletide celebration, and throughout our place of residence, kinetic activity was not in evidence among the possessors of this potential, including that species of domestic rodent known as Mus Musculus."

[*][*][*]

**CORP.DEFS.TXT**  File # 4501  (Humorous Text File)

If you work in corporate America, or even if you don't, I think you'll like this file. This is a humorous text file containing some silly definitions for corporate terms and phrases.

Here are two examples ...
Clarification: Filling in the background with so many details that the foreground goes underground

Committee: A group of the uninformed appointed by the unwilling, to do the unnecessary

At only 3780 bytes, this download will only cost you pennies, and I guarantee that you will get at least that must satisfaction from it.

[*][*][*]

MATH.DEFS File # 4502 (Humorous Text File)

Math students, math teachers, and anyone who ever struggled through a math class, will enjoy this tiny little text file created by Rainer Kock. In it he says, "Any student who ever sat or slept through a mathematics course knows that certain words and phrases occur very frequently. This glossary might eliminate some confusion." You'll smile reading it.

Sorry, no quotes this time. At 2520 bytes, you will have it before you know it.

[*][*][*]

DISCLAIMER.TXT File # 4559 (Humorous Text File)

It seems that everything you buy comes with some kind of disclaimer. They all seem to be saying "If it ain't right, it ain't my fault!" Well, whoever put this file together must have tried to incorporate all of them into one funny disclaimer that disclaims everything!

If you haven't seen this one before, it just might be worth the 5040 byte download.

[*][*][*]

MUSIC.MIDI.APPLE.BNY File #4897 (Informative Text File)

This is an article written by Leah R. H. Weisman and Tyler D. Weisman (A2.TYLER) describing the development of music hardware and software on the Apple II line of computers.

It includes a description of what MIDI is all about. While the article was written in 1988, it still makes interesting reading today, especially for the beginner.

Besides, who knows, if enough of you download the file, Tyler might decide to bring it up to date. (Hint, hint!) At 8820 bytes, this is well worth the download.

[*][*][*]

SPELL.MACH.BXY File #18068 (Applesoft Program)
The Spelling Machine is an individualized spelling lessons program designed specifically for seventh graders. While it was designed for use at school, it is perfectly suitable for parents who want to help their children improve their spelling.

The freeware program begins with a diagnostic test to determine a list of words that the child does not already know how to spell. Once it has collected a sufficient number of words, the program presents the child with a list of 10 words to learn. It also prepares a worksheet to be printed out that includes definitions and sample sentences using the words.

Once the child has completed the worksheet and studied the words, he goes back to the program to take a test. The test is presented in a multiple choice format with several possible spellings to choose from. The program presents the words in random order and presents each word twice for correct spelling. If the child gets it right both times, it is put in his completed list. Next, a new set of words, including those missed on the previous test, is presented complete with a new worksheet. When new words are needed, the child takes another diagnostic test.

There is a whole year's worth of lesson words available with this download. It is a large download (124416 bytes), but well worth it for someone who has a real need for it.

This program runs on anything from an unenhanced IIe on up. Oh, by the way, the programmer is a pretty neat fellow too. <grin>

[*][*][*]

Well, that concludes this month's column. I would appreciate any comments that you might have concerning the first two columns, and about anything you might like to see in future columns.

Until then, happy downloading!

Charlie

>>> ON GETTING MY FIRST GS <<<
""""""""""""""""""

"Where have you been?" my wife asked.

"Picking up the GS," I replied. "You know, the one I traded for... with that new client."

"That's all we need around here -- another computer!" she exclaimed. I could tell, though, that she was intrigued. Hadn't she heard me talk about getting one for years?
"Are you going to give it to me to use for my papers?" she asked, knowing the answer. "I could put it in the bedroom."

"No, it's going right on my desk, next to the 486."

"Well, don't make a big mess, Mr. GS-Man!" But she smiled as she said it.

I had traded for the GS with a new client that was getting rid of it. Consulting time in return for computer. It was a ROM 3 with a 3.5" and a 5.25" drives, a straight stock machine with no hard drive and 1.25 meg memory that had cost the client thousands of dollars when bought. I knew it was going to need some additions -- a hard drive, more memory, a Zip chip, more software -- but that would come later. For now, it was enough to finally have an actual GS in the house.

Quickly, I cleared out a spot in the computer area. The GS wound up next to the Ile that had served me so well all those years, and right down from the 486/33. "Got to get a SuperDrive or a BlueDisk," I thought to myself. "Or maybe that Coactive thing will come through. Well, like Margaret Hamilton once said, 'All in good time, dearie, all in good time.' Let's get this thing fired up."

Quickly I discovered that there were no system disks anywhere with the machine. Bummer! Having a good Apple II friend in Dan Crutcher, I called him up and explained my plight.

"So you finally got a real computer, eh? Well, I hate to see a computer go to waste, _especially_ a GS. I've got an old 30-meg drive you can borrow for a while. Come get it." I was in business!

"Welcome to the IIgs! System 6.0.1." What a welcome sight! After wanting a GS for years, I finally had one in the house. And I must say, the last two weeks have been interesting, to say the least.

I'm a computer professional. I spend my days _working_ with computers, of all shapes and sizes, from 8088s to Pentiums, with even a few Macs thrown in here and there. This GS, as it is right now, is in many ways outclassed by those other machines. They are faster, bigger, have much better displays, and more useful software in many areas.

But even acknowledging all that, there's one thing the GS has all over those other machines: It's more FUN! That's right, I get a _kick_ out of using this machine! I love dragging files to the Bill the Cat trashcan and having him go "Ack! Phhllt!" I enjoy the "whoosh" when I open windows, and the "hsoohw" when I close them. I appreciate the filing system, and the simplicity of use, and the little nice features here and there.

I hope to get a memory card soon, and a Zip chip also. Dan's going to need this drive back also, so I've got to dig up a hard drive as well. But for now, I'm grabbing a few files from GEnie every so often, and writing some things, and just generally enjoying my new machine.

It's good to have a GS in the house. May it live long, and prosper.

[EOA]
[AII]/~~~~~~~~~~~~~~~~~~~~~~~~~
INTRODUCTION

We conclude this month our look at the magazines that have helped us in the past, and in some cases continue to help us today to use our Apple II computers. This will include GS+, Softdisk, Softdisk G-S, II Alive, Shareware Solutions II, and some foreign Apple II magazines.

GS+ (1989-Present)

In the late 1970s, Steven Disbrow entered the world of microcomputers with his purchase of a TRS-80 Model I, complete with cassette storage and 4K of memory. To learn more about his computer and what it could do, he picked up a newsstand magazine called "80-Micro" (published by Wayne Green, who had also started Byte and incider magazines). He enjoyed the humor that the editors of that publication included, and the fun they showed one could have with a computer. Active also in the local TRS user's group, he originally disdained Apple IIs and those who used them. However, in 1984 he found that he needed the ability to communicate with a mainframe computer in order to do some schoolwork. After looking into the cost of upgrading his TRS-80 to be able to do this, he found that it actually cost him LESS to buy the newly released Apple IIc with a 300 baud modem (and at that time, a new IIc went for about $1300), so he crossed enemy lines and entered the Apple camp.

As he got more familiar with his IIc, his interest in that computer and the upcoming 16-bit IIgs also increased. While learning more about it from Apple magazines at the newsstand, he noticed that many of the publications that dealt with the Atari ST included a disk with each issue. Disbrow went so far as to contact several of the Apple II magazines that were in print at the time to see if THEY had any interest in a companion disk, but he did not find any interest. After purchasing his Apple IIgs, he saw that there still was no combination magazine and disk for this computer, and decided to start one himself.

When Disbrow started his magazine in September 1989, he chose to make it exclusively for the Apple IIgs, and so named it "GS+". Published bi-monthly, the byline on the cover of each issue reminded subscribers of what made HIS magazine unique: "The First Apple IIgs Magazine + Disk Publication!" He recalled the humor and fun that he had always seen in 80-Micro, and determined to make his magazine fun in a similar way. Disbrow felt that this was especially important, considering the generally negative attitude that was prevalent among Apple II users at the time, as they saw less and less active support from Apple for their computer. Still in print at the time of this writing, GS+ concentrates on news, software and hardware reviews, published programs and utilities for the IIgs (some with source code), and interviews with people who are involved with the IIgs.
One of the survivors in the Apple II magazine world is also unusual in terms of the type of publication that it is. Rather than using the traditional paper and ink medium, Softdisk came on the scene as one of the first magazines distributed in only a machine-readable form. Back in 1981, Jim Mangham, a programmer at LSU Medical Center in Shreveport, Louisiana, felt that the time was ripe for an Apple II disk-based magazine. It would have the advantage of providing ready-to-run programs that did not have to be typed in, yet could still be listed and modified by the "reader" if desired. Mangham's idea was not unique in the computer world as a whole; "CLOAD" for the TRS-80 began as a magazine on cassette as far back as 1978, and other paper publications offered companion disks as an extra, containing programs from a specific issue. But no one had yet put a whole magazine on disk for the Apple II, and Mangham decided to fill that gap.

Originally, he planned to call it "The Harbinger Magazette", and after getting a preliminary first issue prepared, he called Al Tommervik of Softalk magazine to discuss advertising. Tommervik thought it was a great idea, and not only did he want to advertise it, but asked to be a partner in the venture. He suggested that they change the name to "Softdisk" (since it would be, in essence, a Softalk publication). By the time Mangham was ready to mail out his first issue, he had fifty subscribers. Since he needed a minimum of two hundred pieces to qualify for a bulk postage rate, his father found one hundred and fifty disks in his mailbox that month.

To create his new "magazette", Mangham chose to use double-sided disks that were pre-notched on both edges, to ensure that both sides would be useable. (Recall that the Disk II drive could only use one side of the disk, and so it was common to conserve money and use the other side by cutting a notch on edge of the disk opposite the factory one and flipping the disk over.) These double-sided disks were expensive, costing him three dollars apiece, and so he set up the subscriptions to require return of the previous issue in order to get the next one (it was left up to the reader to make his own copies to keep). When the disk was returned with the five dollars for the next issue, the reader could also use a simple text editor on the disk to return any "letters to the editor" he might have, commenting on the previous issue's contents or asking other questions. This return disk could also be used for submitting programs, pictures, or articles for use in future issues of Softdisk. Some of the subscribers that became prolific contributors of material even ended up WORKING at Softdisk!<2>

Softalk magazine provided free advertising for Softdisk, and the subscriber base gradually grew. Some of the revenue for the magazine came from subscription payments, and some came through advertising. Ads for Softdisk were sold by the disk sector, and provided an advertiser a unique opportunity; he could give a potential customer a chance to actually SEE how the program he was selling looked. Some of the ads could be animated (usually using the text screen to use less disk space), and were actually entertaining. This was most prominent in the ads Softdisk had for their own products; by 1983 they had begun a line of software called "Rich And Famous" (which they said was what the authors wanted to become). Consisting of programs written by regular Softdisk contributors, these disks sold for $9.95 apiece, and a $4 royalty on each disk went to the author. The disks offered various types of games, including hi-res graphics adventures and card games, office-based utility software, general
Apple II utilities, and disks of music (in Electric Duet format).

Each issue of Softdisk had a "cover", which consisted of a hi-res picture and the issue number. These eventually were created to look just like the Softalk logo, except the globe in the upper right corner was animated. Starting in August 1983, Softdisk expanded to two double-sided disks, and the two-way subscriptions now requested that only one of the two had to be returned. One-way subscriptions were also available by now, for those who didn't want to bother having to return the disks. By January 1984 (issue #27), Softdisk became available through retail stores (primarily computer stores, but later also through bookstores) at the price of $12.95 per issue. They also began putting out a disk magazine called "Loadstar" for the Commodore 64 computer in June 1984, at a price of $9.95 (since it was a single disk per issue it cost less).<3>

As mentioned earlier, Softtalk magazine folded after its August 1984 issue, leaving the future of Softdisk somewhat in doubt. In return for some benefits that Softalk had provided (free full-page ads, space in their booth at computer shows, and permission to include some programs from the magazine on Softdisk), it had part-ownership in Softdisk. Since Softalk was now bankrupt, the possibility existed that Softdisk would be absorbed into the liquidation of assets. To avoid this outcome and to ensure the future of the magazine, Softdisk purchased back its shares from Softalk's creditors (at a price probably higher than what they were worth) and continued on their own. Although a few ads were placed in remaining Apple II magazines after that, Softdisk continued primarily on word-of-mouth referrals (which didn't increase circulation by much). Sales of some side items (primarily blank disks) helped keep the company going during this difficult time.<4>

In May 1985, the two-way disk subscriptions were discontinued, and Al Tommervik started a brief tenure as editor-in-chief. He helped develop a more professional appearance for the magazine (and for Loadstar), through higher quality graphics and cover design. When Greg Malone began as editor-in-chief in late 1985, he continued the improvements by starting a graphics-based presentation in favor of the older text-based method they had used from the beginning.<4>

Softdisk, Inc. added a disk magazine in 1986 for the IBM PC, called "Big Blue Disk".<5> At this time Softdisk magazine itself began including re-releases of older commercial software whose publishers were willing to inexpensively release publishing rights; they also began to publish some newer shareware programs. The first series of "reprints" were games previously released by Polarware/Penguin Software.<6>

By 1987, Softdisk began again advertising itself in magazines, a practice that has been continued up to the present time. This began a large expansion in circulation for the Softdisk magazette and their other disk publications.<6> Later that year saw the changeover from the older DOS 3.3 operating system exclusively to ProDOS (beginning with issue #73). This issue also saw the start of a more attractive graphic user interface that supported use of a mouse (as well as the keyboard), and had pulldown menus and animated graphics. Within the next year or so, retail distribution of their publications was discontinued (booksellers were not leaving the products on the shelf long enough to allow them to sell) and distribution returned exclusively to a subscription basis.<7>

In November 1988, the first issue of Softdisk G-S was released,
Apple II Computer Info

supporting the standard IIgs desktop interface standards. This publication
has maintained a high quality standard and has done well. At the time of
this writing, Softdisk, Inc. continues to put out the following monthly
disk magazines: Softdisk for 8-bit Apple II's; Softdisk G-S for the IIgs;
On Disk Monthly (formerly Big Blue Disk) for the IBM PC; Gamer's Edge, also
for the IBM PC; and Diskworld for the Macintosh. Loadstar for the
Commodore 64/128 is still available, but only on a quarterly basis.

II Alive (Mar 1993-Present) Joe Gleason was the president of Quality
Computers, an Apple II mail order company
based in St. Clair Shores, Michigan. He observed with considerable concern
the gradual erosion of Apple II-specific information through the format of
the traditional slick magazine. When inCider/A+ added Macintosh coverage,
this began the gradual decline in the fortunes of that magazine, which was
Quality's major advertising outlet. Quality had begun a combination
magazine and catalog called Enhance, with a focus towards educators (where
the Apple II was still fairly strong). But Gleason wanted something more.

Jerry Kindall, who worked at Quality and was a frequent presence on
the online services, made this announcement in October 1992: "When
inCider/A+ decided to switch over to a primarily Macintosh focus, we
decided the time was right for us to start our own Apple II publication to
fill the void. II Alive will begin publication in...1993. Every single
article will discuss the Apple II. Every single ad will promote Apple II
products. The Mac will be mentioned only in connection with the Apple II
(as will the IBM)--for example, in articles on networking or file
exchange."<10>

They planned to initially offer the magazine on a bi-monthly basis,
and for people who subscribed before December 31, 1992 they offered a free
video tape that highlighted new Apple II products.<10> A sample issue of
the magazine was mailed out to everyone on Quality's mailing list in early
1993, and the first official issue appeared in March 1993. The logo on the
cover had a circle around the title announcing the flavor of the magazine,
"Celebrating The Apple II". Kindall was named as editor-in-chief, and
eventually had some other staff hired to help him: Ellen Rosenberg, as
managing editor (formerly editor of A2-Central); Doug Cuff as consulting
erator (also editor of the online magazine GENieLamp A2 and writing for
A2-Central); and Tara Dillinger as Interview Editor (who was also in charge
of doing online interviews on the A2 Roundtable on GENie).

Regular columns featured in II Alive included Test Drives (reviews of
new products), Ask Mr. Tech (technical questions and answers), Head Of The
Class (programs that were of particular interest to educators), AppleWorks
At Large (tips on uses for that program), Macro Exchange (sample
UltraMacros programs for AppleWorks), Modem Nation (information about
telecommunications), Shareware Spy (discussion of freeware and shareware
software), and more.

Compared to inCider, this magazine seemed to be having fun in the
various articles it presented, and attempted to capture a little of the
flavor of Softalk from the old days. Because of Quality's introduction of
AppleWorks 4.0 in the fall of 1993, the November/December issue was not
available until late in December (Kindall also was responsible for writing
the manual for that program); however, after this they worked hard at
returning to their correct bi-monthly schedule. At this time, II Alive is
the only glossy magazine that deals with both the 8-bit and 16-bit versions
of the Apple II.
Joe Kohn had been writing articles and a regular column called "Shareware Solutions" for inCider for quite a while, when the rug got pulled out from under him by the demise of the magazine. He had taken extra efforts to make disks available to readers who didn't have modems, disks that contained some of the best available shareware and freeware programs he could find. To continue in these efforts, in mid-1993 he decided to begin a self-published newsletter called Shareware Solutions II. He posted on GENie that his newsletter would "take Apple II users on an exciting journey into the future. Each month, I plan to write articles about freeware/shareware (of course) and will continue to provide low cost freeware/shareware disks to subscribers via the mail. There will also be Apple II oriented reviews and articles that focus on low cost solutions to common Apple II problems. There will be columns geared to novices and new modem owners; techies, hackers, teens, senior citizens and educators alike should find lots to interest them.... Subscribers will learn how to tame their Apple II computer, and will learn what it will take to make their Apple II a powerful computer solution well into the next century and beyond.

"I believed it when Apple proclaimed 'Apple II Forever', and Shareware Solutions II will help to make that more than just an empty slogan!"<11>

Rather than to try to stick to a specific publishing schedule, Kohn decided to sell his subscriptions on the basis of the number of issues, rather than by the year. As his bi-monthly schedule fell behind at times this plan turned out to be wise. And the content of his newsletter reflected the extra care that could be taken when a deadline didn't have to be rigidly adhered to; his first few issues have been excellent, including some special offers of commercial software for readers. It is to be hoped that Shareware Solutions II will be around for a long time.

Foreign Apple II Magazines The Apple II not only got press in the United States, but has also been on the newstands in Europe in various forms, though most are no longer being published. One that began as "Windfall" (later changing its name to "Apple User") was the biggest magazine for some time. "Peeker" was published in Germany, and carried articles similar to those found in Nibble. In the Netherlands there are still a few hobbyist magazines that cater to the Apple II crowd, including "Klokhuis" (which means "Apple-Core"), "Pro-2" and "Het AppleDossier".<8>

In Britain there was at one time a magazine called "Orchard Computing", published by a company named Argus Specialist Publications. Some of the issues were primarily reprints from Nibble, but they also accepted articles from local readers.<9>

<8> Crouzen, Alex. GEnie, A2 ROUNDTABLE, Oct 1991, Category 2, Topic 16.

- Back issues of GENieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3

- GENieLamp pays for articles submitted and published with online GENie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GENie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the
digital publishing industry, meet editors from some of the top
electronic publications and get hints and tips on how to go about
publishing your own digital book. The DigiPub RoundTable is the
official online service for the Digital Publishing Association. To
get there type DIGIPUB or M1395 at any GEnie prompt.

READING GENieLamp   GENieLamp has incorporated a unique indexing system
.................................................. to help make reading the magazine easier. To
utilize this system, load GENieLamp into any ASCII word processor or
text editor. In the index you will find the following example:

...HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM].
If you want to scan all of the articles, search for [EOA]. [EOF] will
take you to the last page, whereas [IDX] will bring you back to the
index.

MESSAGE INFO   To make it easy for you to respond to messages
.......................... re-printed here in GENieLamp, you will find all the
information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

____________|      __________ __|____ |_____________
|Name of sender | CATegory | TOPic | Msg.# | Page number|

In this example, to respond to Smith's message, log on to page
475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that
this message is a "target" message and is referring to a "chain" of two
or more messages that are following the same topic. For example: {58}.

ABOUT GENie   GENie's monthly fee is $8.95 for which gives you up to
......................... four hours of non-prime time access to most GENie
services, such as software downloads, bulletin boards, GEN Mail, an
Internet mail gateway, and chat lines, are allowed without charge.
GENie's non-prime time connect rate is $3.00. To sign up for GENie
service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330
in Canada. Upon connection type HHH. Wait for the U#= prompt. Type:
JOINGENIE and hit RETURN. When you get the prompt asking for the
signup/offer code, type: DSD524 and hit RETURN. The system will then
prompt you for your information. Need more information? Call GENie's
customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLAMP READERS!   If you sign onto GENie using the
.......................................................... method outlined above you will
receive an *additional* six (6) free hours of standard connect time
(for a total of 10) to be used in the first month. Want more? Your
first month charge of $8.95 will be waived! Now there are no excuses!
*** GET INTO THE LAMP! ***

// GENie_QWIK_QUOTE //
//    NTSC _does_ stand for "never the same color," doesn't it? //
//                                J.SCHONBLOM //
[EOA]
Now, look. I know you don't think you're hurting anybody, but your mother and I are very worried about some of the things you've up to recently.

Like what? Well, do you recognize this?

REPRINTING GEnieLamp

If you want to reprint any part of GEnieLamp, or post it to a bulletin board, please see the very end of this file for instructions and limitations.

Have you ever seen it before? You have.

Have you ever bothered to look at the end of GEnieLamp A2 to READ the instructions? You haven't. Well, here's a shortened version:

Material published in this edition may be reprinted under the following terms only. Reprint permission granted, unless otherwise noted, to registered computer user groups and not for profit publications. All articles must remain unedited and include the issue number and author at the top of each article reprinted. Please include the following at the end or the beginning of all reprints:

(c) Copyright 1993 T/TalkNET Online Publishing and GEnie. To join GEnie, set your modem to 2400 baud (or less) and half duplex (local echo). Have the modem dial 1-800-638-8369 (USA) or 1-800-387-8330 (Canada). When you get a CONNECT message, type HHH. At the U#= prompt, type JOINGENIE and hit the [return] key. When you get the prompt asking for the signup code, type DSD524 and hit RETURN. The system will then prompt you for your information. Call 1-800-638-9636 (voice) for more information.

Don't squirm in your chair! That stuff that you find "too boring to read" is important. Damned important.

Yes, I know you've heard it all before, but apparently it hasn't sunken in, or I wouldn't be seeing Apple II newsletters each month that reprint whole sections of GEnieLamp A2, and the only acknowledgement is "Downloaded from GEnie". No mention of GEnieLamp, no mention of the issue number, and certainly no sign-up information. You've even been leaving off our COPYRIGHT information!

No, your mother and I are NOT "being mean". We work work long, hard
hours each month to provide a free magazine for the Apple II community. No, we do NOT get paid.

We're not ASKING you to pay for what we write, just watch how you quote it. If you don't care enough about our work to give us proper credit for us, don't copy it for your own purposes.

It doesn't matter if you think our rules are "dumb". You have to abide by them if you use our material. If you don't want to abide by them, you can't use our material. There is no third option whereby you get to use our material according to YOUR rules.

"All the other kids' parents let them?" Can you name any? Sure, I can name a newsletter that DOES take the trouble to credit us properly -- WAUCtalk. There are others too, all of them bored to tears by all this garbage and wondering when the heck I'm going to start my "real" editorial. They have to sit through this -- which is wholly unfair to THEM -- just so you can feel important because you won't play by the rules.

When you start ACTING like a grown-up, that's when.

Yes, you can come downstairs again when you're ready. Just remember -- this bored me more than it bored you.

[*][*][*]

Sorry about that, people. Domestic matter.

I'm pleased to report that the PAL Newsletter is back this month, but you'll also find that the Apple II Hybrids column is missing... don't worry, it will be back next month, I promise! Darrel Raines's DR's Examining Table is missing again this month -- unfortunately, I wasn't able to find a guest reviewer this month.

-- Doug Cuff

INTELLECTUAL PROPERTY DON'T GET NO RESPECT   Well, Software of the Month

Issue 181 includes Jason Harper's SHRConvert v2.1.

It was my understanding that when SuperConvert was introduced as a commercial product, he withdrew SHRConvert as shareware. I think I remember a bruhaha a few months ago where LRO was chastised for including it on the hard drives they sold.

Rich  ('-')   (R.HARE2, CAT2, TOP20, MSG:168/M645;1)

HYPERCARD:  MISSED IT BY THAT MUCH!   We are indeed sold out of HyperCard IIgs. More maddening, a few months ago Addison-Wesley told us they had 2,000 copies of the HC IIgs Script Language Guide, but when we called to order more last week they claimed they were out of print. We contacted the product manager of the Apple Library who checked for us and confirmed that the books had been recycled.

This leaves A2Pro and Script-Central as the only living repositories of HyperCard IIgs information.

(GARY.UTTER, CAT30, TOP3, MSG:129/M645;1)

GLEN BREDON'S WHEREABOUTS   He retired recently, and so far as I know, is in the process of finishing off the writing of a textbook. That is a MAJOR project. I hope we will be seeing more of him when it is done.

Gary R. Utter  (GARY.UTTER, CAT30, TOP3, MSG:129/M645;1)

EXPRESS TIP   I wanted to pass along a tip I just figured out for using Express...

Since some programs don't start the Print Manager, Express cannot print from within those programs. One such program is the "DoubleSolitaire"
game I sometimes play. Even though it is a desktop program, it does not use the Print Manager. I tried to edit the ToolStartup Record, but it doesn't even use resources (imagine a new program out there not using resources!).

I had a whole bunch of printing to do that was already spooled on disk, so I tried this: I opened ShadowWrite NDA, which is a Word Processor NDA (so naturally uses the Print Manager) for those who are not familiar with it, and Express took off printing, even within the Solitaire game, even with the NDA window not frontmost.

So the tip is, if you want to spool-print from within a desktop application that does not use the Print Manager itself, open an NDA that does use it and leave the window in the background, Express will take care of the rest.

Also, another tip is for programmers of new Applications: Please start up the Print Manager, even if you are not going to use it yourself from within your application, so that us Express users can still print in while in your application!

@ROUND BUG IN APPLEWORKS? I forgot which category was the spreadsheet cat here but I've got a bug for you.

Using AppleWorks 4.1 on an Apple IIGS, the @round function has stopped working. I noticed this in 4.0.2 as well. I'm not sure about earlier versions of aw4, but it did work in aw3.

Try placing the number 1.234 in cell A1

Not place @round(a1,2) in B1.

You'll get 1.234.... Surprise!

Quality Computers --- Power for Pperformance.
(QUALITY, CAT38, TOP5, MSG:66/M645;1)

BUG IN RAMFAST 3.01E ROM (NO IDEA ABOUT 3.01EZ) Uhm... the built in backup / restore function in this version of the rom _IS_ broken. BUMMER!!!

The backup function appears to work properly, leaving one with a false sense of security. As near as I'm able to tell at this point the partition map for the device(s) being backed up is not written to the backup in the proper format, so one can't restore from the backup. [I have been able to recover data from these backups, it's not fun, but I can do it if _really_ needed]

I've also had problems trying to restore from a tape that was made using the 3.001 roms. (restores fine with 3.001 rom, but not with 3.01e) This makes me suspect that there may also be a problem in the restore function itself.

Also I am unable to load a tape and bring it up on the Finder desktop. (GS/OS can't recognise... Eject or Format.... Yeach!!):
>>> This does NOT affect GSTape!!!! (which still works just fine :)

Not only have I made sure that Jawaid is aware of this problem, but I learned that he too has recently been "bit" by this. (he had a HD fail and couldn't use his backups... he was able to get the "dead" drive going long enough to recover data, but he learned :) I would expect that he's busy trying to find the bug(s) and correct them.

DISCONTINUED SOFTWARE AT COMPSULT I just received a catalog that I requested form Compsult. It is a company in CA that specializes in discontinued software. The Apple section is very small so I will post it here for anyone interested. They only list the GS stuff. They have ALOT more stuff for the Amiga and the Commodore and of course MessyDos. They have some Mac stuff too. I did notice that the list of the Apple stuff does not include some of the titles I saw at the booth they had in Phx a couple of weeks ago. So if you are looking for something you could call them and ask about it. Here is the Apple ][

ZIP GS AND CPS FOLLOW
Harold.. I reset all my Zip delay settings according to your guidelines as described in Zip topic 2, message 87, (all delays disabled except CPS follow), and my GS runs even faster still!

BTW, what does CPS follow do?

...mike (moving faster and faster)

CPS Follow means that when you set your GS to Normal speed (using the Control Panel, for instance), the ZipGS automatically slows down to 1 MHz.

SPECTRUM AND SECOND CHANCE ON QUIT
Anyone who's been annoyed by the fact that Spectrum doesn't verify a quit command, add the following line to the file "User.Script" in the "Spectrum.Scripts" folder (create the file if it doesn't already exist; it's run automatically by Spectrum each time Spectrum is run):

Record "Accidental Quit Protection Enabled!!^M"

This will ensure that you get at least one chance to cancel a quit command, no matter what. :-)

...Sloanie

PRINT SHOP GS EASTER EGG
I was cleaning out my garage again today, and I was going through some old user group newsletters when I came across a note that I hadn't paid attention to when it was published years ago. Did you know that in PSGS if you click on the word "printer" at the top of the screen in the printer setup screen you get a prompt to enter a custom printer driver?

The note went on to include an IWII driver that supposedly corrected a problem with printouts because the printer was always printing bi-directionally.

I tried it tonight, and sure enough, it's there. Haven't entered the driver because I haven't noticed a problem, but now I'm going to have to look.

I got my copy of PSGS when I bought my second GS (actually my third, but it's the one my son uses - the second is in the garage) and it's an original disk, but he didn't have the manual. So I have no idea if this is mentioned in the dox or not. If anyone is interested, I could post the codes to enter here.

Dave Rogers
certain circumstances (not always predictable), the
HFS FST will TRASH the directory structure. There is however one sure fire
way to avoid this. Do not ever allow the Finder to create a Finder.DooDoo
(Finder.Data, Finder.Root, etc) file on the HFS volume. Also do not attempt
to copy one of these files to the HFS volume. (either to the root
directory, or any subdirectory) [it seems that the HFS FST attempts to
interpret the data in these files so it may be stored in the directory
structure instead of a file, as is normal for the HFS file system, and it
fails miserably in it's efforts]

-Harold
Resident solder slinger.
(H.HISLOP, CAT20, TOP15, MSG:12/M645;1)

>>>>>  This is quite incorrect. The FST does nothing special to try and
"""
convert the GS desktop files to the Mac desktop file on HFS disks.
There certainly could be a directory corruption bug in the FST, but it has
nothing to do with Finder data files. I have no idea where this very-much
incorrect rumor got started, but it's not true.

Jim
(MURPH, CAT20, TOP15, MSG:14/M645;1)

<<<<<< My personal experience, and that of quite a few others, indicates
"""
that the HFS directory structure will be trashed if Finder.DooDoo
files are present, but appears to be stable if these don't exist. [ergo
it's reasonable to assume that something weird is going on with the
handling of Finder.DooDoo files] This could be (apparently is) an erroneous
conclusion, but hey... it walks like a duck, etc :) This is usually a
repeatable on demand situation (>75% incident of trashing the directory
upon demand for me).

I'm not refering to the Desktop file at all, only the Finder.xxx files.

-Harold
Resident solder slinger.
(H.HISLOP, CAT20, TOP15, MSG:15/M645;1)

>>>>>  Desktop file, Finder.xxxx file, whatever, it doesn't matter.
"""
Neither are special-cased by the HFS FST, so it's very-much a
coincidence. Quite possibly the problem could be brought about easily by
the manner in which the Finder uses GS/OS calls, but it has nothing to do
with HFS-level data translation, 'cause that doesn't happen.

Jim
(MURPH, CAT20, TOP15, MSG:16/M645;1)

>>>>>  Doug Pendleton writes:
"""
> Do you have any suggestions on how to avoid the HFS trashed volume
> problem that Harold and you have been exchanging messages on?

I'm sorry to say, but I really don't. I've actually never experienced
the problem myself. This is most-likely because I really only use the FST
as an interchange mechanism - I just use it to read HFS-format disks from
my various Macintosh machines. It's difficult, if not impossible, to
suggest a work-around for a problem that you haven't seen and have no idea
what it's root cause may be. Sorry.

Jim
(MURPH, CAT20, TOP15, MSG:18/M645;1)
PROBLEM DOWNLOADING MAC FILES WITH SPECTRUM SOLVED! As long as the
Macintosh program you are downloading has been wrapped in MacBinary (almost all files are) you can download to any Apple II and the Mac will be able to unpack it. The trick is in getting the file from the Apple II to the Mac.

If you have a IIgs and Spectrum, you can download the file directly to an HFS disk. Then take the disk over to the Mac and strip off the MacBinary header. You should now have a perfectly normal Mac archive (Stuffit) that the Mac can unpack.

If you have a IIgs, but you don't have Spectrum, download the file to a ProDOS disk (just like you would any Apple II file.) Now return to Finder, move the file to an HFS disk, and follow steps listed above.

If you don't have a IIgs, you will need to use Apple File Exchange to move the file to a HFS disk. Then follow the rest of the steps and all should go well.

- Tony Ward (A2.TONY, CAT2, TOP4, MSG:117/M645;1)

>>>>> Actually, Spectrum automatically strips off the MacBinary header (whether you want it to or not). That means when you download the file onto an HFS disk, you WILL have a Stuffit or Compact Pro archive file that looks like it should in the Mac Finder.

The problem with this method, however, is if you download the file onto a ProDOS volume. Then, you have a Mac archive file WITHOUT a MacBinary header, and if you move it onto an HFS disk for transfer to a Mac, the Mac won't know what to do with it because it has no valid Mac filetype information. (As far as the Mac is concerned, it is some sort of generic binary Apple II file).

So, if you are going to be successful with downloading Mac files with Spectrum, do it directly to an HFS disk, and you won't have to bother with the MacBinary-stripper program.

Steve Weyhrich <IX0YE>---<
(S.WEYHRICH, CAT2, TOP4, MSG:122/M645;1)

<<<<<< Thanks for clearing that up. I always thought Spectrum handled MacBinary according to the "Binary II Down" check box, but I never actually tested it. Apparently, Spectrum always strips MacBinary whether you want it to or not, regardless of the "Binary II Down" check box. This is bad.

New rule: Don't use Spectrum to download Mac files unless you download directly to a HFS disk.

- Tony Ward (A2.TONY, CAT2, TOP4, MSG:124/M645;1)

>>>>> Hold it

I routinely download Mac files with Spectrum. Spectrum DOES strip the MacBinary headers, and it will modify the names of the files to match ProDOS naming conventions.
However, it will also save the necessary file information (Spectrum knows Resource Forks, and so does ProDos). I just double checked to be sure. I downloaded half a dozen files from the Mac RT last night, and this morning I dumped them onto an HFS floppy and put them in the Mac. No problem, none at all.

I can't account for anyone having problems doing this, and if anyone IS having problems, we need to figure out why.

Gary R. Utter    (GARY.UTTER, CAT2, TOP4, MSG:129/M645;1)

>>>>> When the IIGS Finder copies a file from ProDOS to a Mac disk, it extracts the Mac filetype and creator out of an "optionList" so it can set the type/creator on the Mac disk. If you are using AFE to move a ProDOS file from a ProDOS disk, AFE knows NOTHING about the "optionList" so AFE sets the type to "PDOS".

So, use the IIGS Finder to copy from ProDOS to an HFS disk, then insert that HFS disk into the Mac (no further conversion necessary).
(SEVENHILLS, CAT43, TOP15, MSG:528/M645;1)

>>>>> Ah, now THAT might be the key to the problem. I've been using ProSel 16's file utility (the 16-bit Cat Doctor) to copy my files, and I'll bet that Gary always uses the Finder. I'll try it using the Finder (which is not so annoying to use now, since I =finally= have a Zip GS.

Steve Weyhrich <IX0YE>---< (S.WEYHRICH, CAT43, TOP15, MSG:529/M645;1)

>>>>> I can almost guarantee ProSel 16 is why you're having trouble. It's older and probably unaware of the optionList. If the (System 6+) Finder doesn't work then you might have to download to an HFS disk in the first place (though I think the optionList is set regardless, so that step shouldn't be necessary).

--Dave          (SEVENHILLS, CAT43, TOP15, MSG:531/M645;1)

>>>>> What? I am not sure what you are saying. Is optionList newer than SYSTEM 6.0.1? I don't know if ProSel-16 is aware of optionList or not, but I do know that ProSel-16 was updated for SYSTEM 6.0.1.............

FYI, ProSel-16 relies HEAVILY on GS/OS, and uses it a great deal.

I'll re-read this thread later this weekend, and see if I can summarize, send to Bredon and see what he sez.

BUT, IF ProSel-16 can't handle something, its most likely because GS/OS cannot.

Chuck
Charlie's AppleSeeds

(A2.CHUCK, CAT43, TOP13, MSG:243/M645;1)

>>>>> The optionList was not used until System 6.0, and is only used for keeping Macintosh file information. For instance, the Macintosh type and creator and the like are in the file's optionList.
If ProSel-16 causes files to lose their Macintosh type and creator information when you copy them, then it doesn't recognize the optionList, and that's a Bad Thing.

(PowerPC.PRO, CAT43, TOP13, MSG:244/M645;1)

>>>>> Option Lists...

These are described in my copy of the GS/OS Reference (for GS/OS System Software Version 5.0 and later) but, as Sheppy points out, they weren't used until System 6.0 (as we didn't have the "extra" FST's till then, so there was no use for option lists :)

(back from snooping ProSel-16 8.84...)

Uhm... it sure looks to me like option lists aren't being supported. (all I see are nulls where the option list long pointer should be in the call lists... ugh.)

-Harold
Resident solder slinger.

(H.HISLOP, CAT43, TOP13, MSG:245/M645;1)

>>>>> I'll pass this info on to Glen Bredon, regarding optionsList....

Chuck

(A2.CHUCK, CAT43, TOP13, MSG:247/M645;1)

WHAT HAPPENED TO TMS? An update on PowerCity controversy.

This morning I called Power City and spoke with a man named Tony Brown. I told him my sob story (I will spare you this again) and asked him if Power City had been TMS.

Tony Brown from Power City told me that TMS has not become Power City. He said that Zorch had obviously been in touch with Power City, and they had helped him with his problem, as they would have helped me with my problem. (I don't want their help if they had not been TMS) and that is why he had an invoice with Power City name on it. He again told me what the salesman had told me in April, This rumor had been started because this company is located down the road from where TMS had been, and some employees previously employed at TMS, had become employed at PowerCity. It is obvious to me that some people who frequent this board have been stiffed by the demise of TMS, and it would be wrong to paint Power city with TMS's problems if they do not have the same owners.

I have no reason to believe that Tony Brown is lying. I am inclined to believe that this is the truth. I know the importance of posting things like this on busy bbss and I didn't think it was fair that this rumor should go unanswered (especially since I had posted that this was not true before). I asked Mr Brown if I could post a synopsis of our conversation tonight and use his name; he said I could.

To finish the conversation, He inquired as to what Computer I used the drive on, and when told, he said "Oh, well we don't sell products for the Apple II". I told him you certainly do.

Well, enough of this.

bill

(W.GEORGE2, CAT20, TOP13, MSG:486/M645;1)
"Is it legal for these guys to just close down and quit honoring their warranties?"

It is not only legal, it was unavoidable. I know those guys, and they would NOT have done this if they had any choice. They were driven out of business by something (probably the shortage of Quantum drives, and competition from bigger companies).

"Forget about TMS, They have forgotten about you."

Again, I know those guys, and I would be VERY surprised if they have forgotten about their customers. Remembering their customers is not the same as being able to do anything for them, however.

Let's get a little balance here folks. You can be sure that Steve, Scott and Greg suffered a lot more financial and personal distress over this than any of YOU did. All these guys did was fail in a business that they spent years of blood, sweat and tears building up from nothing. They didn't set out to screw anyone.

FYI, all the TMS drives were Quantum or Syquest mechanisms, which come with a two year warranty of their own. That warranty is still good, honored by Quantum and Syquest. For the past couple of years, they used CRU cases, which are ALSO waranteed by the manufacturer, for at least a year. Now I don't know how to contact CRU, but they are a MAJOR supplier of hard drive cases to assemblers like TMS and APS and MacLand and what have you. They DO advertise in the Computer Shopper, and it is entirely likely that you can track them down and get that cable from them at a real reasonable price. (But probably not under warranty at this point, although, who knows, it might be.)

The cable (for those who might be making one) is a 50 pin header which feeds two 50 pin Centronics connecters. The only thing unusual about the TMS cable in this case is that the 50 conductor ribbon cable has been seperated about every 10 conductors or so in order to make it a bit more flexible, allowing you to connect both 5.25 and 3.5 form factor drives without stressing the cable. (I purchased one of the "seperated" cables when I wanted to install a Syquest mech in a case that had originally held a Quantum 105, and found that the "solid" cable wouldn't flex far enough by about 1/8th of an inch.)

Anyway, what TMS did, in terms of their two year warranty, was to make things easeir for you by taking in your defective Quantum or whatever, swappign out a new one, and sending your old one back to Quantum. They served as a "middleman", in other words, and while they definitely had costs in doing this, they didn't REALLY do anything, warrantywise, that you can't do for yourselves. As Tim has already discovered, Quantum will be quite accomadating about warranty work, they are NOT interested in screwing their customers, and you will find (in my experience, at least) that Syquest is the same way.

I know it's aggravating (I probably have more TMS equipement on hand than anyone reading this), but TMS never set out to screw anyone, and if they had been able to stay in business, this would not have happened. I really hate to see people slamming them just because their business (and their livliehood) went down the tubes.
SKULLEY'S REVENGE VIRUS? I think I may have a virus, new to the Apple Community, on my Apple IIgs. At the suggestion of Tom Zuchowski, I am posting a description of some of the effects I have noted, here, in hopes that someone that reads this can help me with a solution.

Tom,

Thank you for responding. Yours is the only response I've had to date. I've been struggling with this virus for over one year now, and just haven't been able to get rid of it.

The virus 'program' seems to interfere with AppleWorks as well as other programs, causing crashes to occur at the most unexpected moments. I think I received the virus shortly before I installed GEM last year and blamed some of the early instability on that program. Since that time I've had plenty of evidence of a virus, so now know those crashes were no fault of GEM.

Some of the odd happenings, I now attribute to the virus are as follows:

1) The 'kicker' that convinces me that I have a virus is that when I take a look at the Clipboard, using Edit from the Menu Bar, I see a picture of a grinning skull. The skull fills the Clipboard and has a crack appearing on top of its head.

2) Another odd thing that has happened since the virus came is that the Apple Menu (bar) becomes transparent. By that I mean when I pull down a menu item (File, Edit, View, Special, etc.) I can see right through it. The writing on the menu list is written over any windows that may be open. The resulting garble is hard to read at best.

3) Yet another feature of the virus is that some times when opening a window, the writing on the Title Bar becomes gibberish. Other times one or more of the file information lines become gibberish. Sometimes all the written data in the window becomes gibberish, and sometimes it will all appear normal.

4) Sometimes when you open a window in the finder, it will be filled with multicolored dots. At times the color fills the whole window and at times it only fills part of the window with the remaining part appearing normal. When the color fills the whole window, if you wait a while, the titles for each file will begin to appear. One can double-click where the icon for the program startup should be located, and it will appear to operate normally (except for AppleWork/GEM). Then when quitting that program, the windows on the finder desktop all appear normal.

5) The once rock stable operation of the Classic AppleWorks program has become a thing of the past. I have deleted and re-installed this program on my hard disk many times over the past year, trying to solve the problems.

One time, last fall, two files (with identical names??) appeared in my AppleWorks folder and defied any attempt to place them in the trash or otherwise to delete them. I finally got rid of them by initializing that
section of my hard drive.

Just recently (about two weeks ago) when the problems again became so severe I couldn't use the computer, I tried reformatting my hard drive for the second time. (I tried this last year too.) When I reloaded AppleWorks and applied TimeOut Ultramacros, everything appeared normal. However when I tried to boot UltraWorks, the program crashed on startup. I then tried restarting AppleWorks.Sys with the same results. I next tried shutting down and restarting by booting AppleWorks from my 3.5-inch drive. The results were the same. I then got an AppleWorks disk, I knew was clean of any virus and tried booting it from the disk drive. Same results. Then I tried something I had never done before. I turned off my hard disk. I then booted AppleWorks from the 3.5-inch drive. Every thing worked fine, that time!! It made me feel that the virus must be residing on the hard drive.

None of the above features appear in the memo describing Apple II viruses you wrote to me. Could this be a new Apple virus? Any help in identifying the virus and in getting rid of it would be appreciated. Right now that computer wouldn't make a good fishing sinker. I'm always afraid that I might inadvertently infect my daughters computers or those of other relatives and friends.

Thank you for your response.

Doug (D.FISHKIN, CAT12, TOP16, MSG:70/M645;1)

>>> WHAT'S NEW <<<

TENTATIVE ICONFERENCE SCHEDULE  ICONference July 21-23 1994  Tentative Session Schedule, as of May 27:

Keynote speaker: Randy Brandt, Project Manager, AppleWorks 4.0

Pat Wilson, Microsoft - Special Preview of Microsoft Windows 4.0 (Chicago) (non-disclosure required)
Pat Wilson, Microsoft - Microsoft Office for Windows Demo (2 hours)
Nick Dazio et al - Launch of the The Mensch Computer
Roger Wagner - subject to be announced
Mike Westerfield - subject to be announced
Michael Lutynski - Animasia 3-D
Jim Maricondo - UNIX & the Internet; UNIX and the Apple IIgs: GNO/ME
Bill Lynn - Way Cool & Way Cheap Macintosh Utilities
Greg Nelson - Multimedia Authoring with CD-ROM
Nathaniel Sloan - The Ins and Outs of Telecom Scripting
Joe Kohn - Looking Good in Print
Joe Kohn - All About the Internet
Lane Roathe - How to get a job in the computer industry
Erick Wagner - Apple II Interfacing, How to Control and Monitor Real-World Devices
David Ciotti - Soldering for Beginners, Which End of the Iron is Hot?

We are also still hopeful that we can get a session on Mac System 7.5 from Apple. Anything else you'd like to see that not's on the list yet?

(TOM.W, CAT23, TOP10, MSG:136/M645;1)

APPLE II T-SHIRTS  GS Resources "II Infinitum!" T-Shirts, now available
for $15.00 each plus $2.00 S/H, in the following sizes and shirt colors:

Sizes:
   Adults
   S, M, L, XL, XXL, XXXL

Children
   S (6-8), M (10-12), L (14-16)

Shirt Colors:
   Black, White, Navy, Red, Royal Blue, Lt. Blue, Turquoise, Kelly Green, Jade (Green), Bright Yellow, Yellow Gold, Aqua, Pink, Fuchsia, Purple, Maroon, Watermelon, Ash, Wedgewood, Peach, Mint Green, & Orange.

Each shirt will have the infamous "II Infinitum!" logo in gray and blue on the front, along with the words "II Infinitum!" under it in blue. (Darker T-Shirt colors will look best.)

To order send your check or money order for $15.00 per shirt and $2.00 S/H (each order), along with your name, address, phone number, email address, size, color, and quantity to:

Jeffery S. Rash
GS Resources, T-Shirts
30 Woodgreen Dr.
Thomasville, NC  27360

Make your checks payable to "Jeffery S. Rash". Please allow 4 to 6 weeks for delivery.

Please fill free to put this press release into any A2 newsletters, magazines, etc.

II Infinitum!
(GS.OZONEMAN, CAT4, TOP2, MSG:250/M645;1)

TIMEOUT DESKTOOLS IV Just wondering how DeskTools IV (?) is progressing. I ordered a set back in the Fall, and the received a note in January the program was still in development, and would be released in the "next few weeks".
Apple II Computer Info

Haven't heard anything since...
(N.SPANGLER, CAT42, TOP24, MSG:69/M645;1)

>>>>> I saw someone working on a manual for it the other day so it's
"""""""" getting close. B)
(II.ALVIE, CAT42, TOP24, MSG:70/M645;1)

>>>>> DeskTools IV should ship soon. The programs are about done, and the
"""""""" installer was nearly finished as of Friday. I think the docs will
be done next week and it should ship by May 16.
(BRANDT, CAT42, TOP24, MSG:71/M645;1)

BIG RED COMPUTER CLUB TO CLOSE
Just got Scarlett the other day and am
"""""""" saddened by the announcement that BRCC
will "close its doors by the end of 1994." Sorry to see them go--thank
goodness for Softdisk, QC, GS+, Joe Kohn (SS II), and GEnie. We still have
alot to be grateful for...but it hurts.
John
(J.STANKOWSKI, CAT2, TOP7, MSG:138/M645;1)

>>>>> I have little doubt that a large part of the reason BRCC is closing
"""""""" down is that it put so much effort into bringing new software to
the IIGS and got so little in return. Yes, Out of This World sold around
3,000 copies, but although that's good for the Apple II community, it's
really not a lot, especially considering the number of Apple II users out
here.

And Lost Treasures of Infocom... I'm willing to say they probably didn't
sell enough of those to even break even, which is another shame -- a couple
of VERY minor problems aside, it's an excellent package, and a lot of fun.
(PowerPC.PRO, CAT2, TOP7, MSG:140/M645;1)

>>>>> To tell the truth, I'm thinking more along the lines of Scarlett
"""""""" readers needing another source for Apple II information, and SSII
could certainly meet that need.

The reality of the situation is that many of the software licenses
that BRCC had were time-limited. By that, I mean, that BRCC only had the
rights to publish some of the programs for a year or 2. So, a lot of the
original commercial titles that BRCC sold are no longer theirs to sell.

Although I don't know it for a fact, I imagine that John Wrenholt got
out the old spreadsheet, and concluded that it just wouldn't be financially
advantageous to re-new the licensing agreements.

BRCC is many many times larger than SSII, and therefore has many more
resources. If BRCC decided that it wasn't financially feasible for them to
continue marketing some of the older games, I'm sure that it wouldn't be
feasible for me to attempt to market them either.

I've known for a long time that this was coming. Please keep in mind
that BRCC's decision was not strictly based on finances. John Wrenholt
started BRCC more than 12 years ago, and in the computer industry, that's a
heckuva long time. So, don't discount the "burned out and tired" aspect of
it.

Probably 6 months ago, or more, I talked with BRCC about the
possibility of SSII somehow taking over the Scarlett subscriber list.
There were just so many details involved, that we both just dropped the ball. The last time I talked to John, I did suggest that maybe we continue the conversation at KansasFest.

In the meanwhile, I'm just really saddened by this turn of events. John Wrenholt has always been one of the Apple II people that I've always respected and admired. I've learned a lot from John, and as I told him just a few weeks ago, in a lot of ways I used Scarlett as a model for SSII. (Remember, my involvement with Scarlett was in the pre-commercial software phase of BRCC.)

I mourn the loss of BRCC, and feel that the Apple II community is losing a very old and good friend.

Joe Kohn
(BRCC Librarian 1989-1992)
(J.KOHN, CAT6, TOP3, MSG:141/M645;1)

NEW X-10 SOFTWARE   A new version of the X10 Survival Kit is now available. The Kit consists of:

**X10House (v 2.2) - new features:**

* Events can now be updated via an Update Event dialog.
* A Sound dialog allows selection of sound files and volume settings. Sound files no longer have to be in the X10.Data folder.
* Events that are being corrected for sunrise or sunset are now flagged in the display list and when printed.
* A Preferences option to automatically update the CP290 clock during startup.

**X10Doctor (v 1.1) - new features:**

* Events that are being corrected for sunrise or sunset are now flagged in the various lists.
* Menus and dialogs have been added to control X10ACE, PowerScreen and Virtual10.
* Uses the IIgs Battery Ram to determine Daylight Savings / Standard Time for sunrise / sunset corrections. Time no longer has to be selected in the Setup dialog.

**X10ACE (new) -**

Automatically Corrected Events. X10ACE allows you to apply sunrise and/or sunset corrections to specific events at an interval of your choosing. The corrections can take place during boot-up, or X10ACE can remain memory resident and apply the corrections at a specific time of day (for those who run their IIgs 24 hrs a day). X10ACE is an Init and is placed in the System.Setup folder. Requires a desktop environment.

**PowerScreen (new) -**

A "screen blanker" that uses the CP290 to turn your monitor off and on. PowerScreen can be controlled from X10Doctor or from a separate NDA, both use IPC (InterProcess Communication) to "talk" to PowerScreen. PowerScreen is an Init and requires a desktop environment and System 6.x. You will have to attach an appliance
module to your monitor for PowerScreen to work.

**Virtual10 (new)**

An automatic schedule loader that allows you to load multiple schedules (up to 128) throughout the year. Requires a desktop environment and System 6.x. Virtual10 can run in 3 modes:

* Normal boot-up: Virtual10 will check during boot time to see if it's time to load a schedule.

* Auto-boot: Virtual10 will set 2 events in the CP290 to auto-boot your IIgs at a specified time of day and then turn it off. During auto-boot Virtual10 will do the schedule check then, if it detects the Finder, it will use IPC to tell the Finder to do a "safe shutdown" and then wait for the 2nd CP290 event to turn off the power. An appliance module must be attached to the IIgs for auto-boot mode to work.

* Memory resident: Virtual10 will remain in memory and check each day at a specified time to see if it's time to load a schedule. This mode is for people who run their IIgs 24 hrs a day.

2 bonus NDAs
(1 bonus NDA if you have the previous version of the X10 Survival Kit)

The shareware fee is $22 (US). If you have registered a previous version of X10House, the upgrade is $7. To get your copy, send a check or money order to:

Art Coughlin
230 Clamer Road
Trenton, NJ 08628

I've uploaded a "demo" copy of X10House v2.2 to the library. The uploaded version is fully functional except the Set button on the Update Event dialog is disabled. File number 22718.

```
//
//\ rt
// ~\ ........
(A.COUGHLIN, CAT6, TOP10, MSG:101/M645;1)
```

**RUN-TIME HARDPRESSED**

I've uploaded HPRT v1.0 to the A2 library (file #22768).

If you haven't been following the discussions, HPRT is a stripped-down version of HardPressed that can only expand files, and only knows about the LZSS module. However, it's freely distributable, and can be used for things like user group mailings and on-disk magazines (see the documentation for info about commercial use though... it's still free, but we'd like a little free advertising in return).

Owners of HardPressed may find it useful for things like bootable 800K system disks, since the whole thing is in a single 96 block INIT instead of half a dozen different files. It's also nice for sending LZSS-compressed stuff to your friends who don't have HP.
To demonstrate HP and HPRT to people who don't know anyone with HP, I've also uploaded a collection of files compressed with HP (file #22769). The archive is about 100K (I tried to keep it small so that people would be willing to download it), and is about 10K smaller than it would have been had I used GS/ShrinkIt to pack everything instead of HardPressed.

Let me know if you have any problems with these.

- Andy

>>> THROUGH THE GRAPEVINE <<<

UPDATE ON SOUNDMEISTER PRO

The board was never built, to this day. It exists in the form of a working prototype and simple test Applicat Z does not support digitizing to the hard disk. Never did. If that's the feature people are going to want, that may be the sticky part.

the Soun Z and was not part of the deal for the SoundMeister. The artwork/layout of the Pro was not started. It exists in wirewrap form only at this time.

We are going to look into it more, if it appears to be a finishable product without too much more engineering, then a deal can be worked out, and only then. Having a working wirewrap prototype is one thing, getting it on a PCB.
and working can be another half of the game.

Digital Session software in its current form supports the Pro hardware if found, fully with more capability. Very much similar to what the Audio Anoimator is capable of. In fact, if the complete technical specs to the AA were available, Digital Session could be made to support it much better than AE's software did.

(T.DIAZ, CAT46, TOP7, MSG:44/M645;1)

WHAT ABOUT ECON?  Certain products are being sold off and the ones that you are aware of are the SoundMeister and Digital Sessions to Alltech. Other information is forthcoming. Econ still exists as a corporation, but their future is in vertical market Macintosh and Power Macintosh products. It is unfortunate, but they just can't seem to be able to make a living on Apple IIgs products alone any more. The market is just not what it used to be and the Pronis do really regret the situation.

Tyler

(P.PC.TYLER, CAT35, TOP2, MSG:57/M645;1)

A BUNCH OF SHORT MESSAGES ABOUT APPEWORKS 4.1!  AW 4.1 should ship in June with about 20 or so bug and quirk fixes, and an updater for ReportWriter and PickFonts.

(BRANDT, CAT42, TOP29, MSG:359/M645;1)

<<<<  Have you found anything on the Mail Merge spacing problem

Yup. It's fixed in AW 4.1.

(BRANDT, CAT42, TOP29, MSG:355/M645;1)

<<<<  I plan to include an updated of RFP on the AW 4.1 disk if QC approves. I expect it to ship in June. I'm waiting on a slinky card to solve a couple of bugs related to that before we ship.

(BRANDT, CAT17, TOP14, MSG:193/M645;1)

<<<<  Sales people haven't heard of AW 4.1, and won't until we know when it will ship and how much the update will cost. It won't be much, and will likely be available online as well.

(BRANDT, CAT17, TOP14, MSG:198/M645;1)

SHAREWARE SOLUTIONS II TO (RE)PUBLISH CONTACTS GS  What a difference a day can make!??! All copies of Shareware Solutions II, Issue 5, have been mailed, and it's now time for Shareware Solutions II to take yet another giant leap on its exciting Apple II journey into the future!

Shareware Solutions II is branching out.

Shareware Solutions II is expanding.

Shareware Solutions II is growing.

Shareware Solutions II is taking on a new project.

Shareware Solutions II is pleased to announce that it is now the publisher, and exclusive distributor, for a IIGS commercial software product.
Previously available from Simplexity Software, ContactsGS is a IIGS New Desk Accessory that allows you to keep and easily maintain a rolodex-style name and address database that is accessible from the IIGS Finder and from within any Apple IIGS program that displays the Apple Pull Down Menu.

ContactsGS was written by (Burger) Bill Heineman.

Pricing information is not yet available. The ContactsGS NDA, however, should be available for sale within the next several weeks. First, though, a manual needs to be written.

Stay tuned for additional details.

Joe Kohn           (J.KOHN, CAT28, TOP4, MSG:568/M645;1)
<<<<<<  > Can you refresh us as to what ContactsGS is and does

Sure I can. It's a IIGS New Desk Accessory that, in essence is a name, address and telephone number database.

When accessed from the Apple Pull Down Menu, ContactsGS takes up about 2/3 or 3/4's of the screen. Call it up, and you're ready to start entering information into the different fields.

There are fields for Last Name, First Name, Street Address, City, State, Zip, Telephone Numbers, and then there are 2 Misc.fields that allow you to jot down any info you want. Each of those Misc fields can hold a total of 80 characters (when running System 6 or later). With System 5, I believe that each Misc field can only contain 42 characters.

Like other databases, you can sort your data. You can also use ContactsGS to dial your telephone using 2 different methods. If you have a modem connected to the built in modem port, you can call up any particular record, and if you click on the Modem option, it'll dial that phone number. Or, you can transmit the tones to the built in (or external) speaker. Theoretically, you could then hold up your touch tone phone to the speaker, and it'll dial the number.

On that last point, my neighbor told me yesterday that I have a very loud modem, because he heard me testing that feature out. I laughed when he said that.

ContactsGS stores the data in an ASCII Text file, where the different are separated by Tabs, and each record ends in a carriage return.

One of the options in AppleWorks, when creating a new database file from an already existing ASCII text file, asks (paraphrased) if the fields are separated by tabs and each record ends with a Return. So, just choose that option when loading in the ContactsGS data, and it'll import everything.

And, I plan to add some automation for the AW import/export of data.

Joe               (J.KOHN, CAT13, TOP24, MSG:180/M645;1)

BYTEWORKS TO RELEASE NEW PROGRAM   We're in the process of releasing a new...
Apple II Computer Info

program for the Apple IIGS that is not a programming product. I'd like to see about getting an area set up here in A2 to support it, since A2Pro doesn't fit the bill. I'd also be interested in scheduling some conferences to chat with A2 folks about the new program.

Who do I talk to over here to get the ball rolling on something like this?

Mike Westerfield

(USER GROUP CD UPDATE) The Apple IIGS SIG and Mac SIG here in Germany are producing a joint CD. It will contain about 180 (?) disks worth of Macintosh PD and 250 disks worth of Apple IIGS PD. Provided everything works out well (this week the HD contents are copied onto a CD-R for delivery to the CD production firm and I do hope there'll be no glitch in that process) the CD will cost US$ 43.00 resp. CAN$ 60.00 plus s/h.

Shipping the CD airmail with jewel case to the US or Canada will cost US$ 10.00 resp. CAN$ 14.00, shipping the CD with booklet and inlay card in a 5.25" disk mailer will cost US$ 6.25 resp. CAN$ 8.75. (I suggest you buy your own jewel case and get the CD in a floppy disk mailer...) I will accept cheques in US or Canadian currency. Please, add US$ 2.00 resp. CAN$ 3.00 for cashing fees. So to get the CD, mail me a cheque for US$ 51.25 resp. CAN$ 71.75. I'll post my address here, when the CD is done. Guys living in Europe send me an Eurocheque for DM 77.00 (CD with jewel case). Within Germany the price will be DM 72.00 (for nonmembers of AUGE).

Udo - ... just an IIGS freak -

FOUNDATION RESOURCE NOW FREWARE Yes, that's right! Foundation, the resource editor created by Lunar Productions, is now Freeware. It should arrive on GENie in just a few short weeks, after undergoing some revamping and modification.

We're waiting for some missing source files to be sent to us, and for the completion of the port from ORCA/C v1.3 to ORCA/C v2.0.1 of the source code. Then we'll be making minor modifications, to add new copyright messages (to indicate freeware status) and to list the names of some new maintenance contacts.

The source code has been released as freeware as well, and will be uploaded to GENie at the same time as Foundation v1.0.2 is uploaded. However, in order to help control and maintain Foundation, a small group of people, including myself and Andy Wells (who is doing the port to ORCA/C 2.0.1), are asking that a small group of people be selected to maintain an "official" version of Foundation.

This is NOT intended to keep other people from making changes to Foundation. The plan is to have the "official" source maintained and available online for download, and to allow other people to make changes and/or suggestions and submit them for inclusion in the "official" version of Foundation.

This is a great opportunity for the Apple II community to come together to build its own software library -- as a team. Let's make Foundation great!
A topic will be created in A2Pro, after Foundation has been released, for discussing changes to it and programming issues about it.

Eric Shepherd (POWERPC.PRO, CAT13, TOP39, MSG:1/M645;1)

>>>>>> For the benefit of those like me who don't understand, what is the """" purpose of a resource editor? (Please, don't tell me it edits resources!)

Charlie (C.HARTLEY3, CAT13, TOP39, MSG:2/M645;1)

<<<<< A resource is a small bit of data that contains information used by """" a program. Resources are often used to contain the necessary data to create menu bars, windows, and buttons, along with lots of other things.

A resource editor lets users and programmers alter these resources. A resource editor can, for example, be used to change the name of the Finder's trash can from "Trash" to "Land of the Dead" (which I have done :). A programmer could use a resource editor to create and modify the menus in a program he or she is writing.

It's a wonderful tool when used properly, and gives a lot of power to its users.

The original Foundation Project was eventually supposed to result in two resource editors: Foundation for developers and Foundation for users. The User's version of Foundation would have more warning messages and would be easier to use. The programmer's version (which is the only existing version) is a little harder to use, but is still a very effective tool.

The freeware Foundation Project will almost certainly combine these into one package, probably involving a Foundation which features an Expert mode for programmers that know (or THINK they know) what they're doing and a User mode for weekend resource editors.

Anyone who currently has Foundation: your input is welcome! Although the first freeware release will be almost identical to Foundation v1.0.2, we'll want your suggestions for 1.0.3!

Eric Shepherd (Sheppy)
(POWERPC.PRO, CAT13, TOP39, MSG:3/M645;1)

EDIT MAC RESOURCES ON A IIGS? Softdisk has mentioned publicly that they resource manager for the IIGS eventually.
(POWERPC.PRO, CAT13, TOP39, MSG:24/M645;1)

ETHERNET CARD FOR APPLE II? I'll tell you what I am working on - a driver to allow to use one of these SCSI Ethernet units so prevalent in the Mac world. I've contacted several different makers, but I'm still waiting for anything useful to be given to me. A couple of the companies sound more promising, but I'll be giving them another round of pestering this week, and continue until I get direct answers.

Anyway, I'm pleased to see there is a fair amount of interest in this sort of thing, both here and on the Internet Apple II group. I will
definitely let everyone know if anything comes of it. In the meantime, if
anyone has any experience (good or bad) with any of these Ethernet boxes,
please drop me a line or post in an appropriate area (maybe CAT 12, TOP 4 -
A2-Mac, or perhaps a new category). I'd like to know if there are any
significant differences between these units, especially in terms of speed.

Michael Hackett
Some Assembly Required

DISCQUEST ENCYCLOPEDIA ON CD > Sequential isn't answering its e-mail...
""""""""""""

All: I apologize for this, but I've been hard at work on Compton's
Interactive Encyclopedia.

> Does this mean current owners of diskQu$ can get the update by getting
> the Encyclopedia?

If you currently own discQuest, you can get the Compton's front-end
software free if you buy the Compton's CD-ROM from Sequential for $99 (well
below the regular retail price, I might add).

> Will it work with other CD's beside the Encyclopedia? I have noticed
> that "Comptons" is on a lot of CD's.

We don't know yet. We will be looking into this; there are at least
_four_ different CD's that are Encyclopedia's from Compton's! Each seem to
be a bit different.

Jawaid (PROCYON.INC, CAT20, TOP12, MSG:{460}/M645;1)

>>> MESSAGE SPOTLIGHT <<<
""""""""""

Category 13, Topic 25
Message 117 Wed May 04, 1994
A2.CHUCK at 22:49 EDT

I was asked to send an E-Mail telling all about Charlie's AppleSeeds,
and while flattered, decided it would be a good idea to tell the world
about Charlie.

Charlie's AppleSeeds was established as a result of three problems
that developed within the first year after I obtained my Apple IIe
Computer.

First, I quickly became addicted to the computer. After I had a
checkbook up and running, had typed in all the interesting but frustrating
Nibble programs and had nothing much left to do, I started an AppleWorks
database of all of my VA manuals on procedures, regulations and laws.....
That lead to the second problem; memory. With a 128k machine, I quickly
had about 8 database files that literally took several hours each night to
add a mere 100 new lines of data to.

That lead the final problem; my wife would not hear of me spending
budget money on my TOY! The argument got rather bitter at times. Finally
she did agree to allow me to buy a memory card on the Master Card and pay
it back from my $25 a payday allowance. I then spent days driving all over
San Diego County looking for an inexpensive memory card to replace the extended 80 column card. I finally ended up at the store where I purchased the machine in the first place, and, GET THIS, the dealer that sold me the computer, gave me $129 in trade for the Extended 80 Column card, towards the purchase of a 768k Checkmate card.

Rather than relieved, I felt, "I can do better than this!" So, I went down town to get a business license, register a company name and set up a sales tax account with the state. I knew that I had to have a fictitious name (business name) and that I had to search local records to make sure it was not in use in San Diego County. I had always been a garden hobbyist, and as I was driving down town, trying to think of a really neat name, I remembered Charlie Appleseeds, the guy that planted Apple Trees all over the place in the 19th century. Well, heck, I got the name wrong, it was Johnnie, but since I was Charles, at the time it seemed to fit, since I would be selling memory cards and those are found in Apple Computers, and Appleseeds are the things inside an Apple, I had my name.

I then established business relations with Checkmate, a great bunch of people back in 1986. I advertised in the local computer magazine which came out every two weeks, and allowed cheap ads. I would get about 20 calls and send a great deal of time on the phone, advising people, knowing from what they were telling me that they would find out what I thought was the way to buy, then buy somewhere else. My first sale was to Jean in Chula Vista, and it was AutoWorks by Alan Bird, NOT a Checkmate memory card!

Then I would do things like create massive spreadsheet price lists that I forgot to audit, and then end up selling programs and memory cards for like less than a dollar over my cost...... After the first six months, everything I had in the bank was owed to the California Sales Tax guys. I was depressed.

BUT, during that time, I was doing a lot of beta testing and leg work for the programmers at Software Touch (Alan Bird, and Mark Simonsen). After AutoWorks was released, coincidentally with MacroWorks (Beagle Bros Randy Brandt), I wrote a letter to every Apple II magazine editor about how great the program was and Paul Statt actually called Alan Bird as a result of my letter writing campaign and some good things started to happen for Software Touch.

Then one day when I stopped by Alan's office, he showed me a new feature that he had working inside AppleWorks, MY FAVORITE PROGRAM. That window turned out to be TimeOut. I was involved with beta testing of all the TimeOut but had no idea until just before the AppleFest that year, that Mark Simonsen had bought out Beagle Bros. At that point, there were seven TimeOut packages and four more nearly completed. I had acquired the competitions programs from Pinpoint and was very impressed with what they offered, and then I got a newsletter that had an article about the Pinpoint User Group assistance program; I forget what it was called now, but it got me to thinking that the Beagle Bros TimeOut family needed something similar because not only were we introducing a massive number of add-on programs, but we were rapidly providing changes, enhancements and bug fixes. So I went to Mark Simonsen with what became the Beagle Buddy idea, which we started up in early 1988. My idea was that I would keep these Local Apple II User Group AppleWorks gurus updated and current on all of the TimeOut stuff and get them to help me sell Beagle Bros software to their user group members. I ran the Beagle Buddy program for three years without pay from...
Beagle Bros, but free reign at the shop, so to speak. The program was taken in-house and became part of the advertising budget, but the full-time employees never really had the time to devote to the program that I had provided.

When AppleWorks 3.0 was introduced, Beagle Bros took me to San Francisco to the AppleFest with them, and I met the buyer from Programs Plus and Roger Coats. I had just, after a year, convinced Professor Glen Bredon to let me publish and distribute ProSel and ProSel-16, and Programs Plus started buying, on average, 50 copies of ProSel-16 per month, while Roger Coats was buying upwards of $6000 (wholesale value) worth of Beagle Bros product from me. Let me tell you, it was a neat feeling to take a box containing fifty 3.5" disks to the Mail Bank and asking that they be shipped COD for $2,000.00! And how depressing, in June 1991 when I had to write over $4500 worth of checks to pay income taxes because 1990 was such a great year. AND ALL IN MY SPARE TIME TOO!

In all the years since 1986 when I started, I have never regretted starting my little side business, but I have done all this without paying nearly enough attention to my kids and wife, and now, they are letting me know. I am still addicted to my Apple II systems (I have three in the house, and a computer room, stuffed with box, magazines and computers). Last year was pretty slow, but still more than I did in sales in 1988, and while this year seems pretty slow too (where the heck did all the Apple II Buyers go?), things are not entirely bleak. I am starting to sell hard disk drives, something I have wanted to do for three years, and now that I have a really nice drive enclosure (the Diplomat), drives smaller than 540 megs are hard to find. However, with TMS closing their doors and Quality Computers growing so fast that they are having (apparently) a hard time finding sales people knowledgeable in Apple II, I feel more than ever that I must continue to try to stay active in business for the Apple II Users. Its almost like an obligation to me. I don't want to stop what I am doing, business wise, and I don't want to turn my back on Apple II Users. I use almost everything I sell and that makes it easier for me to sell. It also allows me to assist users after the sale!

So, there you have it; Charlie's AppleSeeds, how and why.

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of
what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Fun & Games On GEnie

by Steve Weyhrich

[S.WEYHRICH] Here for your amusement, in honor of our own Brian Tao:

>>> INTERNET FILEMAN <<<

(to the tune of "Wichita Lineman")

I am a FileMan for the I'Net
And I cruise the main node
Searchin' on the run
For another hot upload.

I send them zingin' through the wires
I upload them while online
And the Internet FileMan
Is still on the line...

The last batch needs ver-i-fi-cation
Hope that Sysop's been trained
And if that virus scan fails
It will cause no end of pain

And I need them more than want them
And I want them all for MINE
And the Internet FileMan
Is still on the line...

REFLECTIONS /

Thinking About Online Communications

by Phil Shapiro

[P.SHAPIRO1] >>> SOME FACTS ABOUT THE U.S. POSTAL SERVICE <<<
Last month this column included the recommendation that the U.S. Postal Service raise the rate of first class stamps from 29 to 40 cents. Loyal readers of the column were kind in letting me know that the editorial was long on opinions and short on facts. Taking a second look at the editorial, I can't help but agree with them.

Here then is the U.S. Postal Service revisited -- but this time supported by facts.

THE QUANTITY OF MAIL DELIVERED EACH YEAR

The first fact that stares you in the face when dealing with the U.S. Postal Service is the humongous quantity of mail that is delivered each year. I called the national headquarters of the U.S. Postal Service in Washington D.C. and asked them how much mail they delivered last year. A polite and friendly postal service employee informed me that the Postal Service delivered 171,219,994,000 pieces of mail in 1993.

Well, that looks like a large number, certainly, but what does it mean in more practical terms? In practical terms, the Postal Service delivers about 500 million pieces of mail per day.

If this doesn't seem like a large number, try this little experiment: Take a day off from work sometime, and in your free time casually sort and deliver 500 million pieces of mail. [Or just try counting to 500 million. -- Ed.]

How much does all this mail weigh? In 1993 the Postal Service delivered 19,592,264,000 pounds -- that's 19 billion tons -- of mail.

To make this figure more meaningful, we can say that the Postal Service delivers 10 million tons of mail per year. On a daily basis that works out to 27,400 tons per day. To help haul that mail to your mailbox, the Postal Service uses 100,000 trucks.

SHifting HARD COPY MAIL TO ELECTRONIC MAIL

If just one percent of all of the current mail were shifted to electronic mail, the load on the U.S. Postal Service would be substantially diminished. (To the tune of 5 million fewer pieces of mail to deliver each day.) If ten percent of all current mail were shifted to electronic mail, the load on the U.S. Postal Service would be diminished by 50 million pieces of mail per day.

A ten percent reduction in mail volume would yield all sorts of efficiencies: Fewer sorting machines would be needed, fewer mail carriers would be needed, fewer delivery trucks would be needed, fewer fuel would be needed for those trucks, fewer mechanics would be needed to repair the trucks, etc.

HUMAN NATURE SLOW TO CHANGE

But you can bet your last postage stamp that people are not going to change the way they communicate unless they start feeling the pinch in their wallet. Raise the price of a first class stamp to 40 cents, and a lot of people will have a spontaneous new interest in learning about telecom.

To be sure, in some ways it's unfair to talk about shifting hard copy mail to electronic mail. Some mail, such as glossy advertising flyers,
just unsuited to the e-mail format. (Thanks be!) And other mail has no meaningful ASCII content at all. (Tangible merchandise and other types of "non-letter" mail.)

But over 90 percent of current mail is ASCII text, being physically shuttled around the country by trucks and planes. How much more efficient would it be to shuttle this mail around via computers? Plenty.

The U.S. Postal Service has ambitious plans to modernize its sorting facilities in the next ten years. Billions of dollars are being allocated for this venture. Wait a second, folks. That money is being thrown into a huge hole. Far better to use that money to subsidize inexpensive terminals for each and every person in the country.

Set up free public access terminals in public libraries, railway stations, shopping malls, government buildings -- anywhere where people could sit down and jot off a quick e-mail note to a colleague, a legislator, Al Gore, or Bill Gates. You shouldn't have to own your own dedicated phone line to travel down the information superhighway. On-ramps should be provided wherever human beings have a need or an interest to communicate.

Then we as a nation can get serious about moving ahead in the Information Age -- without having to worry about sorting and delivering 500 million pieces of mail per day.

-Phil Shapiro

BEGINNER'S CORNER

Polishing Green Apples

by Steve Weyhrich

>>> HOOKED ON STORAGE (Part 4) <<<

STAKING OUT YOUR TURF    If you've been following the previous installments
in this series, I have led you through the decision of when and if to purchase a hard disk or other mass-storage device, and how to find and connect one to your particular flavor of Apple II. Now we need to discuss methods of dividing up (and safe-keeping) all that lovely space for most efficient use.

BACKGROUND Unless the hard disk that you purchased is only 20 megs in size, you will likely need to partition (divide) that disk to be able to make use of it. There are many reasons for partitioning, and the size you choose depends on your particular needs.

First, the ProDOS operating system has a built-in limitation of 32 megs per disk volume. In 1994 this limit seems just a bit too constricting, especially on the Apple IIgs, where large programs are more the rule than on 8-bit Apple II's. In 1979, however, when SOS (the Sophisticated Operating System for the Apple III) was designed, 32 megs was as enormous a size as 32 GIGAbytes seems to be today. ProDOS was designed to be compatible with SOS, and thus the 32 meg per volume limit remains to this day. It would be POSSIBLE to overcome that limit, but not without a major rewrite of ProDOS, and the hassles of compatibility problems with older software. It is unlikely that we will ever see this changed, now that the status of the Apple II unit at Apple Computer is a mere shadow of its former self; so, like everything else we do in the Apple II world, we learn to make do with what we have.

An obvious solution to this problem would be to take whatever size of disk you've purchased and divide it up into multiple 32 meg partitions, with the final one being the remainder after the division. For example: A 120 meg hard drive would be divided up into three 32 meg partitions, with a fourth partition that was something under 24 megs in size. That last partition would not be EXACTLY 24 megs in size, although the mathematical logic works out that way. Some of the space on the hard disk needs to be used for a partition map that lets the SCSI controller keep track of where a partition begins and where it ends. A 300-meg drive would be split into nine 32-meg volumes, with less than 12 megs remaining.

BACKUP Real life, however, is not that easy. The decision on how many partitions to make, and what their sizes should be, depends on more than what the operating system will allow. One consideration to make is this: What do you plan to use in making backups of this hard disk?

"Backups? I have to make BACKUPS too?" Darn right you do. Murphy's Law of Data Loss states that the likelihood of losing all or part of your disk files is inversely proportional to the amount you are at risk of losing. In other words, if all you have to lose are the files on a 143K floppy disk, it won't disappear easily. When you have an 800K disk, it gets a bit more risky. With 32 megabytes, you can almost guarantee that eventually, SOMETHING will clobber your disk and cause you to lose hundreds of files, many of which may be difficult to replace. So, the rule is BACK UP YOUR FILES, and do it regularly. Did you hear me? *B*A*C*U*P* -- Do it regularly! You've been warned. Don't you come whining to ME when your disk crashes and that file you worked on for two whole WEEKS is gone forever!

BACKWORK What should you use for doing your backups? You have several choices available to you:

Floppy Disks (5.25) PLUS: Dirt cheap
MINUS: To back up a full 32 meg volume it would take just over 234 of these disks and probably an entire day of time. Probably would cause repetitive strain injury, too. And acne.

Floppy Disks (3.5) PLUS: Still pretty cheap

MINUS: Full 32 meg backup still takes a LOT of disks, over 40 of them. Still slow, but not as bad as 5.25 disks.

Tape Drive PLUS: MUCH more convenient than floppy disks.

Time spent doing a backup depends primarily on how much money you choose to spend on a tape drive to begin with. The least expensive, a 3M 40-meg SCSI tape drive (available for as little $150 used), may take an hour to back up a full 32 meg partition; however, it is VERY reliable. Other SCSI devices are available, with larger capacities and faster backup times, but their cost is significantly higher.

MINUS: Because tape access is sequential rather than random, recovering individual files from a backup tape can be a slow and tedious process (just as locating and playing a specific song on an audio cassette is less convenient than on a CD or vinyl recording).

Syquest Cartridges PLUS: Pretty good speed for both backup and recovery of disk volumes. Sizes run from 44 meg up to 270 meg per cartridge.

MINUS: The initial outlay for a drive runs from $230 and up, with the 270-meg drives costing more than $550. Also, individual cartridges are expensive, costing over $70 apiece. Still, $70 for 40 megs of storage is cheaper than buying another hard drive.

Floptical disks PLUS: As with Syquest cartridges, good speed.

MINUS: Still an expensive hardware item, and size is usually 21 megs (actually more like 19 or 20 megs of useful storage), so it would take about one and a half to store a full 32 meg volume (more about this later).

Hard Disk PLUS: Using a second hard drive of the same size for doing backups is not as silly as it might sound. The cost of a second hard drive may be less expensive than buying a Syquest and cartridges, for example, and it should be as fast as what you have right now.

MINUS: The backup hard drive is subject to the same failures and losses as the original drive is,
and if something goes wrong with the backup drive, you've lost EVERYTHING that you stored on it the last time you did your backup.

So, if the point of this article is to talk about partitioning a hard disk, why so much time spent on discussing methods of doing backups? Because backups are so important, and you will be doing them regularly (RIGHT?), it will help you to have your hard disk organized in such a fashion as to get the most out of your chosen backup method.

For example: If you plan to do your backups to 800K floppy disks, you can decrease the amount of time spent on one volume by making them smaller. If it takes 40 disks to back up a full 32 meg volume, consider that it takes only 26 disks to back up a 20 meg volume. You have more volumes to back up, perhaps, but fewer disks per volume.

If you buy a Floptical drive, the disks on which you will do your backups will be around 21 megs in size (not quite all of the 21 megs on those disks are available). So, it might make sense to divide your hard disk into 20 or 21 meg partitions, so you can more efficiently use the space on those Floptical disks. The same goes with the 40 meg 3M tapes: Two 19 meg partitions will fit onto a single 40 meg tape (some space is used for tape directory), so creating 19 meg partitions may be the most efficient way to divide that space. None of the Syquest cartridge sizes come out to exact multiples of 32 megs, so it may be prudent to set the sizes of your partitions to coincide with the available space to use in doing backups with THAT device.

And, since we've gone so far down the backup path as to talk about backing up full volumes, and the consequences of those choices, this would be as good a time as any to discuss what software is available for doing backups. The cheapest method of doing backups is to just use a file copy program and copy files one by one over to a backup disk until it is full, and then repeat the process until the entire hard drive partition is completed. This will certainly work, and has the advantage of letting you decide exactly WHICH files you REALLY need copies of. The disadvantage is it is a labor-intensive process that you will not do as regularly as you should.

[By the way: I do know some folks who NEVER make backup copies of their system files or commercial software, since they have the originals around to reload if something happens to trash the copies they use on their hard drive. This is all fine and dandy if you never make any patches to these programs. However, the more complicated the software, the more it can be customized to your likings, and the hassle involved in reinstalling and reconfiguring all those programs needs to be weighed against the convenience of being to simply restore it all from a backup if something DOES crash.]

There are two main methods used in doing backups: A FULL-VOLUME backup copies ALL the files from the hard disk to the backup media, either as an automated file-by-file copy, or as a literal image, block by block, of the original disk. A full-volume backup really should be done periodically to make sure that all the files on your hard drive are safely stored SOMEWHERE.

The second method of backing up files is called an INCREMENTAL
backup. Incremental backups only copy certain files to the backup disks. This can be done either by date of the files, or by whether or not files have changed since the last full-volume backup (whether the "backup-bit" is set; this is something the operating system takes care of).

People who are EXTREMELY careful about their disks and their work-in-progress will do a full volume backup weekly, and an incremental backup on a daily basis. (I've even heard of those who do this on a daily and HOURLY basis.) The advantage of incremental backups can be seen when there are several versions of a program, for example, which change when the program is being developed. If it turns out that a new method being used simply doesn't work, the programmer can go back to the version he saved three days ago and start from there again, rather than trying to remove all the changes he added since then.

BACKUP SOFTWARE: 8-BIT

Backup II For the Apple II Plus/IIe/IIc computers, the least expensive option for hard disk backup is a program called Backup II, written by Apple Computer. However, the program has given problems to some people, and it is possible that recovering a single file may simply not work. For instance, if one disk in a series of backup disks develops a bad block; the entire backup may be unavailable. However, it is "free" for the cost of a download from the A2 Library on GENie (a part of file #13735, SCSI.UTILS.BXY).

EasyDrive Quality Computers sells this program, which is a file selection utility for 8-bit Apple II's. It also has a hard drive backup and restore utility, but is limited to being able to only do a full-volume restore. That means if you only need to recover ONE file, you had better have a spare hard disk partition that you can make use of, to restore the last full backup of the disk where the file was last stored.

EasyDrive's backup utility is unique in its ability to use multiple different sizes of backup media. For example: You could begin a backup from a 32 meg hard drive partition to a 21 meg Floptical disk. If that disk became full before the backup was completed, you could finish it on 3.5 floppy disks.

ProSel 8 Glen Bredon's ProSel 8 is the oldest and most comprehensive of the available disk management programs for the Apple II. One of its many features is a hard disk backup package that also allows recovery of specific files. However, you must know the name of the file you wish to recover to successfully do so without restoring the entire backup. For this reason, it is a good idea to use the included Info Desk utility to make a full disk directory on either paper or a disk file and store it somewhere safe before doing a backup, so you can find the exact file and path at recovery time.

ProSel 8's disk backup software uses an image, rather than incremental, method of backup. Also, it is hard coded to use either 5.25 OR 3.5 disks, but not a mixture of them (as EasyDrive can do).

One feature of ProSel 8 that should be discussed here: Disk optimization. Because of the feature of ProDOS that dynamically allocates disk space as it is needed, files have a tendency to eventually become fragmented as they are saved over and over. This may begin to slow down...
the loading files from the disk. To combat this creeping lethargy, disk optimization/defragmentation utilities were developed, and ProSel 8 had one of the first: Beach Comber.

This brings up the limitations of Beach Comber. To properly plan your disk partitioning in such a way as to allow use of this program, keep the following information in mind. If you have a plain vanilla Apple IIe or IIc, with 64K or 128K of memory, Beach Comber will not work if your disk partitions are greater than 10 meg in size. If you have a 1 meg RAM card, you can use Beach Comber to defragment hard disks up to 20 meg in size. To defragment a 32 meg disk partition requires an Apple IIgs, and the optimization utility in this ProSel-16 is more comprehensive anyway.

How critical is disk defragmentation anyway? If you are using 3.5 disks (which do not have the memory limitation mentioned above), it may make quite a bit of difference. If you are using an older, slower hard drive or interface card, disk optimization may also achieve some performance improvement. On an Apple II High Speed SCSI card, or on a RamFAST card, with a newer SCSI drive, the improvement achieved may be minimal.

BACKUP SOFTWARE: 16-BIT

ProSel-16 Like ProSel 8, this 16-bit version of ProSel is primarily a program selector, but has many utilities that come with it, including a backup and restore utility that is done by file, rather than as a disk image. Backups can be done for an entire volume, for changed files only (those with the backup bit set), and for files newer than a certain date. Files can be restored either individually or through an entire set.

The limitations of this set of utilities are primarily due to its roots in the Apple II text screen. (Although most ProSel-16 displays are in super hi-res graphics, they only use it to the extent of printing text that is indistinguishable from Apple II text, except they can be in multiple colors.) When ProSel was first written for 8-bit Apple II's, it started as a program selector, and then more features were added as the author, Glen Bredon, felt it necessary to add them. When the Apple IIgs came to be, the utilities were updated to make use of the GS/OS environment; however, their appearance was NOT changed, except in minor ways. Access to desk accessories is available, and the mouse can also be used. However, despite all its power, ProSel-16 has been known to be difficult for a new computer user to make use of; it just works differently from graphic-based programs like the GS Finder. I find ProSel-16 to be extremely valuable; but then, I've been using it since I had a IIc, and am familiar with it.

Salvation-Bakkup Vitesse sells a collection of utilities that is currently bundled as Salvation Supreme. It includes a program launcher (Wings), virus checker (Deliverance), Backup/Restore utility (Bakkup; yes, that IS how they spell it), and more. The Salvation utilities are GS/OS desktop-based; that is, they use the graphic user interface in a similar fashion to the GS/OS Finder, with icons, windows, and so on. It is preferred by many GS users who like to use programs that adhere to the Apple's desktop guidelines, and allows access to desktop accessories via the Apple menu. Beyond this general information about Salvation-Bakkup, I do not have any personal experience on which I can draw for making comparisons. For a discussion of Salvation-Bakkup compared to
ProSel (from Vitesse's point of view), you can download file #10167, "VITESSE.BXY", in the A2 Library. (From ProSel's point of view, try file #10051, "COMPAR.BXY".) There is a demo file of Bakkup in file #9854, "SALV.DEMO.BXY", in the library as well. It works but has some features of the commercial version disabled.

Universe Master Another graphic-based disk backup program, this has a demo file of version 1.0 available in the A2 Library, file #19188, "UM.DEMO.BXY". It performs disk repair operations as well as backup and restore. The version 1.1 revision has been due to be released for about a year now, and it is hoped that Econ will have this available soon.

GS-Tape This utility by Tim Grams is supposed to make use of a tape backup drive very easy. It does full or partial backups, and I believe that it will span over several tapes, which makes it more efficient to backup from 32 meg partitions to 40 meg 3M tapes. I found that I was unable to try the demo file, #19742 "GSTDEMO.BXY", because it claimed that there was no valid RamFAST driver available (not true); apparently it chokes because I've used a utility to rename the partition names of my hard drive to something else. It requires the RamFAST SCSI card, obviously, and needs version 3.0 or higher of the ROM for that card.

THE BOTTOM LINE If you plan to get a hard drive larger than 20 megs in size, you need to be aware of what I've discussed here about planning your partitioning properly. It will save you headaches later, especially if you do your backups regularly.

NEXT TIME A look into the world of hard disk directory organization.

[*][*][*]

Steve Weyhrich is a family physician from Omaha, Nebraska. He has been using Apple II computers since 1981, and writing about them since 1990. He follows closely the events that continue to shape the destiny of the legendary Apple II and IIgs computers, and compiles a monthly column called the "A2 News Digest" for A2-Central disk magazine. He is also the author of the "Apple II History", available on fine BBSes everywhere.

How Much is That Doggie in the Window?

by Susie Oviatt [SUSIE]
Welcome back to the Treasure Hunt! This month we will take a look at some HyperStudio stacks and related materials. Unless otherwise indicated, these are freeware stacks.

[*][*][*]

Much Ado About Shakespeare (by Larry McEwen)

This six-disk multi-stack is about as nice a presentation as I have seen done with HyperStudio.

To quote the author, "The ultimate objective for creating MUCH ADO ABOUT SHAKESPEARE is to interest the user in Shakespeare's works and to promote a desire to read them.

"The immediate objective is to provide the user with a brief overview of the life, theatre, and the works of Shakespeare as seen through both 19th and 20th century introductory writing, art works, and photo and lithographic plates. Synopses of the plays are included as aids to study and understanding."

Mr. McEwen, who is a retired teacher, has succeeded admirably in reaching his immediate objective. His love for his topic shines through in the quality of the material.

This massive presentation includes 259 cards, 856 buttons, 298 text
fields, more than 250 separate graphics, and more than 47,000 words. As you
might have guessed, this is not free.

To get this masterpiece, you are looking at close to five hours of
downloading time at 2400 baud. At $3.00 an hour, that’s about $15.

In addition, Mr. McEwen has copyrighted this work and requires that you
send $25 to the Immune Deficiency Foundation if you wish to keep it. Let him
tell you why you should do this in his own words:

"MUCH ADO ABOUT SHAKESPEARE was created during 1990 and 1991. During
that period of time I was growing an intra-spinal-cord tumor. I finished it
the night before my entry into the hospital for spinal cord surgery the next
morning. On that day, my wife walked from the hospital to a nearby postal
service center and sent all six disks to Roger Wagner Publishing.... During
the next few months, v2.0 of MUCH ADO ABOUT SHAKESPEARE was finished and was
advertised in the Roger Wagner Publishing Company catalog at $29.95.

"This is an improvement over those early versions. Because my immune
system continued to deteriorate, I found that I was sick more days per month
than well. Finally, I faced the fact that I could no longer work
productively and was disabled. As a hobby for those very few days in some
months when my energy level allowed me to dabble with the IIgs, I finished
v3.11 of MUCH ADO ABOUT SHAKESPEARE.

"This is a good cause and we need help. The first case of Primary
Immune Deficiency Disease which caught the public's eye and ear was the case
of the 'Houston Bubble Boy', a boy who lived in 1950's Texas. His story was
made into a movie. A very young John Travolta starred as the 'Bubble Boy'
whose short life was contained within that plastic sterile environment.

"The Primary Immune Deficiency Diseases do not receive the attention
that the HIV 'AIDS' cases do. Our cases do not get the headlines, and they
do not get the political attention or the budgetary appropriations.

"Thank you for your help and kind consideration. Thank you!"

So there you have it, folks. About 40 bucks will get you a fine
HyperStudio presentation AND a warm feeling in your heart. Go for it!

Here is the information you will need to download MUCH ADO ABOUT
SHAKESPEARE. Make certain you are using GS/OS 6.0.1. Mr. McEwen has tried
it with System 5.0.4. and found no problems. However, it was written in this
form under System 6.0.1. If you are using your own HyperStudio, make certain
you are using version 3.1j or above.

First download either file #22583 or #22584 depending on whether you
need the runtime version of HyperStudio or not. Then download each of the
other files listed below.

Each download has a copy of the Read.Me file on it. The copy on download #22639 is the most accurate. That file gives more information, including the address for your payment. It also contains detailed instructions for how to put the stacks on separate 3.5 disks or on your hard drive.

Some final pointers: Mr. McEwen has included several hidden buttons in these stacks. To find them, remember to press both the option and command keys simultaneously. This will force a display of the locations of any hidden buttons. Also, I'm not entirely pleased with how the stacks exit back to HyperStudio. The best way I've found to leave these stacks is to press command-M to get the menu bar displayed. Then you can use it to move on.

[*][*][*]

Sound Effects Stacks (by Joel Helton)

There are three volumes of these sound effects stacks by Joel Helton. Joel has recorded these sounds from his own LPs.

Volume 1 contains the following sounds (sound file name in brackets, if different): radio static [AM.STATIC], bong, door creak [CREAKDOOR], explosion, gunshots, telephone ring [TELEPHONERING], telegraph, wireless, thunder/rain [THUNDERRAIN], and wind.

Volume 2 contains the following sounds: steam engine [STEAMENGINE], diesel loco [DIESELLOCO], puke (yes, that's right), pocket change, more thunder [THUNDER], warning signal, and dog howling.

Volume 3 contains the following sounds: Twilight Zone [TWIGHTZONE], 20th Century [TWENTIETH], Scary Organ [SCARYORGANMUSIC], Lone Ranger [LONGRANGERSTART], Far East [FAREASTMUSIC], Dramatic [DRAMATICMUSIC], and Dragnet [DRAGNET.SND].

The quality of the sounds is good, for the most part. If you're looking for sounds like these, these downloads may be just the ticket. However, these are fairly large downloads, and many sounds are available elsewhere. I have not had time to determine how many of them are available in the library as individual sounds. Searching in the library on the individual sound names should let you know.

Here is the information that you need to know to download these files:

Sounds of History Stacks (by Joel Helton)

[apple II computer documentation resources (a2_docs_genielamp1.msw)]

Genie Lamp Folder -- www.textfiles.com/apple/ -- 18 September 2000 -- 1497 of 1824
Apple II Computer Info

Also from Joel Helton, three stacks that give us a taste of the sounds of history in the 20th century. He describes the first stack this way: "This stack contains scanned pictures using the Quickie hand scanner. Each graphic matches a sound file. For instance, you can see a graphic of the Hindenburg explosion and listen to a part of the famous radio broadcast of the disaster. Others include Charles Lindbergh, Caruso singing 'Over There', and Edward VIII giving up his throne for the woman he loved."

Joel describes the second stack this way: "Included in this stack are sound files of: the start and end of World II, Challenger disaster the dropping of the first Atomic Bomb, and Winston Churchill's 'finest hour' speech. Also included are Quickie scanned graphics."

This is how he describes the third stack: "In this stack are sound files of famous moments in baseball history (via radio broadcasts). Also included are scanned graphics.... Sounds include: Larson's perfect game, Lou Gehrig retiring, Babe Ruth retiring, and Bobby Thompson's homerun.

The black and white graphics are well done, as are the sound clips, even if they are too brief at times. Keep in mind, however, that the longer the sound clip, the longer the download.

These stacks require at least HyperStudio 2.1 to function, and work just fine with the latest version. Here is the information that you need to download these files.

Earth Stack (uploaded by N.JENTZSCH1)

I was disappointed with this stack. According to the long description, it was written by a high school senior for his final project for an honors science class, and was to be a "suggestions" stack on ways to save the environment.

I cannot fault the student for his facts. The problem is with his presentation. In a word, the stack is boring. It fails to make use of the tools that make hypermedia effective. Beyond a few graphics and some connecting buttons, this is essentially a written report.

Usually I try not to criticize like this. However, since this stack takes over two hours to download at 2400 baud, I felt the need to caution others about its contents.

If you really must see it for yourself, here are the details.

<table>

**Apple II Computer Info**

[*][*][*]

**Viking History Stack (by Ms Ross's 5th/6th graders)**

This is a neat stack. Created by fifth and sixth graders at Idelwild Elementary School in Tacoma, Washington, it is a fine example of what children can do with HyperStudio.

Apparently each child took one aspect of Viking lore and created one or more cards for it. Even the simplest of them are informative and contain original artwork. Some of them allow the viewer to decide what he wants to know more about by providing several buttons.

Since it only takes about 10 minutes to download this stack, I can recommend it to you highly. The pleasure of seeing how creative the kids can be is worth the download.

Look for file #22176, titled VIKING.BXY, uploaded by T.MCNAIR4, and containing only 107,648 bytes.

[*][*][*]

**Egypt Stack (by Ms Ross's 5th Grade Gifted Class)**

This is not as good as the Vikings stack, in my opinion, but it is still good enough to merit your attention, especially if you are looking for examples of how kids can use HyperStudio. It is another 10 minute download at 2400 baud.

Look for file #20986, titled EGYPT.STACK.BXY, uploaded by T.MCNAIR4, and containing 105,088 bytes.

[*][*][*]

**Button School (by Bill Lynn)**

Bill Lynn is a master at creating neat HyperStudio stacks. This stack is an excellent tutorial on creating animated buttons for your stacks.

Bill begins by explaining basic button drawing, and continues with five additional lessons that detail how to create a variety of button styles. Included are momentary pushbuttons that appear to be pressed and then released, momentary flashing pushbuttons that do the same but with a change in color, latching pushbuttons and lighted latching pushbuttons that stay down until you click outside the button area, and finally lighted latching/reset pushbuttons that display a pattern of buttons. In this last case, the button stayed depressed until another button in the array is pressed.

This is file #17302, titled BUTN.SCHOOL.BXY. It contains only 63,616 bytes. This is a must-have stack if you want to learn how to create your own buttons for your stacks.

[*][*][*]
Apple II Computer Info

Animation School (by Bill Lynn)

Bill Lynn has also created a comprehensive tutorial on "cel" animation in this stack. Learn how to create your own animations by following his clear and easy to follow examples.

This is an updated version of the original stack first published on Stack-Central. It takes advantage of the new features of HyperStudio 3.0 and later versions.

Bill first teaches you how to create a flower in bloom with expanding petals. Next, he describes how to do a paddle ball in motion animation. He also teaches you how to create your own "dialog boxes" and how to use masks to create large scale animation.

This is a $5.00 shareware product. It is file #18907, titled ANIMSCH3.0.BXY, containing 367,360 bytes. Expect it to take about 34 minutes to download at 2400 baud.

[*][*][*]

That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Next time we'll take a look at some great graphics files uploaded by Pat Kern. Until then, happy downloading!

-- Charlie Hartley

PAL NEWSLETTER /

May 1994 Report

by GEna Saikin

PAL (Planetary Apple League) is an online user group and has a meeting the third Sunday of every month in the Apple II RT (m645;2).

Last summer, the idea of an online usergroup was conceived by Lunatic E'Sex in a dorm room at Kansas Fest, and took root. With the waning support of the Apple II in general, it was felt that an online user group would help infuse new interest and fill in the gaps, for folks finding themselves without a nearby group. GEnie has the best Apple II support of all online services -- Apple II Forever!

MAIN MENU Many Apple II publications have come and gone. Yet there are many strong survivors out there -- among them, A2-Central, published by Resource Central.

Sam Latella had the idea of compiling newsletters from Apple II usergroups from around the world. Tom Weishaar got wind of his idea, and suggested that he incorporate it into A2-Central -- a marriage made in heaven! He will be writing a monthly column encapsulating what's going on
around the world in the Apple II world -- taking articles and snippets from newsletters worldwide.

This is an intro to his A2World, in his own words:

---------------------

Not another International Apple ][ User Group Newsletter!!!

Welcome to the beginnings of a truly International Apple ][ newsletter called A2World...<----- "What else would we call it."

Ever wonder what other Apple ][ users groups were doing around the world or just A2 users in general? Well I have, and actually have talked to several people around the world, and exchanged newsletters. I've chatted with people in several countries like Italy and Israel. The information from these A2 users is vast and unbelievable.

Now you're probably asking why am I mentioning this? Well for starters, I'm interested in this kind of information, and secondly I think you are too :-) . Want to find out more about the A2World Newsletter? Well then join us at the next PAL meeting on MAY 15, 1994 (at 4:00pm) to find out more about A2World, and the far off places it could lead you and ][].

---------------------

THE LIBRARY STACK   As usual, A2 has a bunch of great files for everyone.

***************   Below is a collection of files posted as the Dean's List:

+22594 A2NDX9404TX.BXY          Apr '94 A2 Category/Topic Index (TXT)
+22591 A2.DOM.0494.BXY          A2 Disk of the Month, April 1994
22571 FGS.DEMO.BXY              Demo - GS specific financial application
22563 MENUFIX.BXY                MenuFix NDA - changes menu bar colors
22562 WORLD.GS.BXY               World - IIgs text adventure game
22559 GSTAPE.UPD.BXY             Updates GSTape to v2.1.3
22558 FILEPSG.202.BXY            File Passage v2.0.2 - GS file utilities
+22550 GLAMPA29404.BXY          GEnieLamp A2, April 1994 (AWP version)
22546 MATHGRPH221.BXY            MathGraphics v2.2.1 - function plotter
22530 SPLASH.ED.BXY              IIgs splash screen editor
22528 MUSICOMP2.2.BXY            MIDISynth Music Composer v2.20
22525 ZIPGS.FAQ.BXY              Documentation on accelerators
+22521 QUITTER4.0.BXY            Quitter v4.0 for ProDOS 8

(The +'s denote that these files are ProDOS 8)

WHAT'S NEW IN A2?   There are many new things happening in the Apple II RTC here on GEnie. Among them is the release of an updated GEM for not only AppleWorks 3.0, but for AppleWorks 4.0.2 as well. Below is further information on this release:

GEM (GEnieMaster)   There are two new versions available for this venerable GEnie front end for the Apple II in the A2 library: GEM 4 for AppleWorks 4.0 (File #22690, GEM4.V4.22.BXY) and GEM 3, for AppleWorks 3.0 with UltraMacros 4.2 installed (File #22688, GEM3.V4.22.BXY). If you do not have AppleWorks 4.0 or UltraMacros 4.2, do not despair, the "standard" version of GEM (4.21) is still available (File #20978, GEM.4.21.BXY), and all you need is AppleWorks 3.0 -- you don't even need UltraMacros, since the run-time version is included with GEM. You also need one of the following
telecommunications programs for GEM to work properly: ProTERM 3.0, Talk Is Cheap 3.2, or Point-to-Point 4.0. (Or later versions, of course.)

The folks in A2 will be supporting all 3 versions of GEM. Stop by A2 Category 29 to get quick answers to your GEM questions. The A2 experts in offline processing are more than willing to help.

If you have an Apple IIgs, we also have available a program called Co-Pilot, a full desktop offline message processor that does not require AppleWorks. A new upgrade to Co-Pilot is currently being tested and will be available soon.

ICONference July 21-23, 1994 will mark the annual conference, sponsored by Resource Central in Kansas City, MO. This year, there will be more platforms represented... including the new Power Mac.

Traditionally, this is a conference for programmers and developers, but there are many seminars of interest to non-programmers, and of course, much of the fun is meeting people in person that you've only met online! Last year, activities outside the conference included such zany things as a bag-biting contest and Roger Wagner's imitation of Spiderman, as he attempted to scale the roof at Avila College, where the conference is held. It's three days of learning, fun and hilarity.

Please see Category 23 (Resource Central Online), Topic 10 for further information on the conference.

New Hosts As you have probably noticed, there are some new faces in A2 conducting RTCs. Let's welcome Tim Kellers, Doug Pendleton, Cindy Adams and Eric Sheppard (Sheppy)!

Cindy Adams helps out on Sundays and co-hosts the PAL meetings. Tim Kellers hosts the first half of the RTC on Tuesday nights. Doug Pendleton and Harold Hislop are our resident solder slingers, hosting a hardware conference on Wednesday night; and Sheppy holds down the fort for the first half of Saturday's RTC.

CONCLUSION Remember that the Apple II RT has nightly conferences from 9 p.m. to 1 a.m. seven days a week, and an afternoon conference on Sunday, from 2 p.m. to 8 p.m.

Our bulletin board is a wealth of information on all sorts of topics, from hard drives to the intricacies of desktop publishing. We also have a category dedicated to buying and selling equipment... many good buys can be found there!

With over 22,500 files uploaded to our library, there is no doubt that the file you are looking for -- if it's not a commercial release -- can be found! Just explore!

[EOA]
INTRODUCTION

As we near the conclusion of the Apple II history series, we will this month dwell on telecommunications services available for Apple II users. Admittedly, my direct experience here is limited except for a year or two on CompuServe, and several years on GEnie. The information presented on America Online, Delphi, and the Internet is, unfortunately, second hand. If anyone wants to better educate me on errors in what I’ve presented, feel free to send me e-mail at s.weyhrich@genie.geis.com and set me straight!

REACH OUT AND BYTE SOMEONE

Since the earliest days that it was available, there have been those who have found ways to communicate using their computers with other Apple II users over the phone lines. Although some inexpensive imaginative methods have been employed (such as A.P.P.L.E.’s "Apple Box" that used the cassette port to send and receive programs via the phone line), the release of the DC Hayes Micromodem II in about 1979 made it possible for a new type of computing. Although there were those who wanted to use their Apple II as a home terminal for access to a school or business mainframe from home, many users created their own small systems that could be called from elsewhere. These "bulletin board systems" consisted of a single computer that was always waiting to answer the phone. When it rang, the computer would answer the phone and establish two-way communication via the modem. A program running on this computer would then allow the calling computer to do various things, such as reading messages left by other users, to posting messages for others to read. As these systems became more sophisticated, it became possible to send and receive programs or other data files on these BBSes, play games, and participate in online surveys. The system operator ("sysop") was responsible for maintaining the software and the message databases, often leaving his computer on for 24 hours a day to be available for callers.

The success of these small, local systems encouraged the larger, mainframe-based systems to expand and offer services to non-business users during off-peak hours. They figured that since the equipment was idle during that time anyway, they might as well have SOMEONE use it and earn them some extra money. Most of the major online services that started in the late 1970s are still in business, in one form or another, and others have entered the game since then. Competition has increased, the number of users accessing these national systems has grown, the number of features offered has also gone up, and the cost of online communication has dropped.

The ability to transfer files from one Apple II to another has evolved over time. Initially, an Applesoft or Integer BASIC program might be "downloaded" (sent from the BBS to the calling computer) by simply doing a "LIST" of it. That was fine, unless the program had some machine language parts added on. Then, the bytes of that assembly code had to be sent as hex digit pairs (i.e., 20 00 BF 65 10 03 04, etc.), since anything shared between the computers had to be in printable ASCII codes. With the noise possible on some telephone connections, this could result in a single character becoming garbled now and then, resulting in a program that wouldn't run because of the error that was introduced. Various programs for the Apple II were devised...
over time to make this more efficient, including some that used the method of encoding the hex bytes (digit pairs) into single printable ASCII codes that were then decoded on the receiving end into a usable program.

Eventually, Apple II BBS programs (and the terminal programs that were used to call those BBSes) began to use the "XMODEM" standard devised in 1982 by Ward Christensen to more efficiently and accurately send such files over a phone line. As Apple software became more sophisticated, and as the files became larger and larger (particularly with the introduction of the IIgs), protocols were established to allow more than one file to be sent in a single transmission. The first major protocol that was agreed upon among the major online services was the Binary II protocol. Designed in 1986 by Gary Little, this allowed a standard method of grouping files that could work for any of the disk formats available on the Apple II. In 1988, Andy Nicholas designed a more comprehensive method of not only putting several files into a single file (usually called an "archive"), but also compressing those files to save time and space when transmitting them between computers. He called this protocol "NuFX" (NuFile eXchange), and implemented it and the data compression in a program called ShrinkIt (and later GS-ShrinkIt) that he released as "freeware" -- that is, he did not charge for the use and distribution of his program. The NuFX protocol was adopted by Apple Computer as the official protocol for file transmission for the Apple II, and Nicholas later went to work at Apple after his graduation from the college that he was attending when he designed the protocol.

NATIONAL ONLINE SERVICES Since there are far too many local systems to discuss in even a passing manner here, let's take a look at the various nationally available systems and their history as it applies to the Apple II.

Internet (1970s-Present) The United States Department of Defense began a computer network in the late 1960s called ARPAnet (Advanced Research Project Agency Network) to facilitate communication between widely scattered universities and research centers. To make it possible to have real-time intercommunications, electronic mail, and the ability to exchange files and other important information, they developed a set of standards to make it possible to carry out these functions. The effort was very successful, and eventually the university research groups wanted to use it for everything, not just Department of Defense work. Eventually it was opened up to non-Defense projects (with restrictions to prevent commercial ventures) and it was called Internet. To gain access to Internet required a computer "node" (usually through a university). Although the term "Internet" -- sometimes simply "the net" -- is often used to refer to all these computer networks, there are at least three major ones that are linked together at most sites: Internet, Bitnet, and Usenet. Internet is most commonly used to send electronic mail and messages.<1>

With the widespread penetration of Internet across the country, there have developed many different groups and forums, including ones that were specific to the Apple II. Since Internet was already in existence when the Apple II was released, and long before any home users with modems created single-user bulletin board systems, it probably represents the first online "service" available for the Apple II. The original newsgroup was called "comp.sys.apple", and in 1990 its name was changed to "comp.sys.apple2" to distinguish it from newsgroups that were dedicated to the Macintosh. Through Internet addresses, Apple II users can even communicate directly with employees of Apple who have accounts on the net.<1>,<2>
The Source (1979-1989) The Source began in 1979 and lasted until 1989. For much of its life, it was owned by Reader's Digest. It was accessible through Telenet or Tymnet nodes; that is, through computers in a locality that act as gateways to many other online computer services across the country. (Often there is an additional fee for using the Telenet or Tymnet node, besides the charges for the specific service being accessed.) The Source had many online services available, including over twenty financial and business services, access to several national and international news services, and computer-specific news features. An online encyclopedia, shopping, interactive games, and airline reservations were also available. One feature unique to The Source was the capability to create "scripts" that the mainframe kept track of (rather than being on the user's local terminal program disk). These scripts could be used to quickly move to certain areas and perform repetitive functions (such as scanning and reading electronic mail, and checking for new files in the library).

The Apple II had a presence on The Source from its earliest days, but the APPLESIG was updated in 1987, and Joe Kohn (who has written articles for inCider/A+, had worked with the Big Red Computer Club, and now has his own newsletter, "Shareware Solutions II") was the chief sysop. He operated the APPLESIG from May 1987 until The Source closed down.

Kohn worked to make APPLESIG a major information source for Apple II users. Registered with Apple as a user group, they had expert advice available, as well as a large library of articles and software. The online charges were lower for APPLESIG, which also made it attractive for users. As with other online services, a bulletin board section was also maintained for ongoing discussions between users about various topics of interest. They also had an online presence maintained by "The Apple IIgs Buyer's Guide", and were allowed to reprint articles from "MicroTimes" and "A+" magazines.<3>

According to Kohn, one thing that likely contributed to the demise of The Source was their insistence on a $10 monthly minimum charge, long after other national online services had either eliminated or significantly lowered such charges. [Recently, monthly minimum charges have returned to some networks. -- Ed.] Another problem that he identified was that their system was not as easy to use as some other services (although former users feel that the Source's library search protocol was better than any other). The Source was bought out by CompuServe, and its subscribers merged with that service in 1989.<4>,<5>

CompuServe (1979-Present) This service originally began as "Compu-Serv" in 1969 as an in-house computer processing center for Golden United Life Insurance Co. During the next ten years they expanded their offerings to business users, and by 1972 had over four hundred accounts across the country. In 1977 the name was officially changed to "CompuServe Incorporated", and by 1979 they were ready to begin offering service to computer hobbyists. Their new service was called MicroNET, and it started on July 1, 1979 after two months of testing with the 1,200 members of the Midwest Affiliation of Computer Clubs. Items available online were bulletin boards, databases, and games. Soon after they started this, an Apple II special interest group was begun. It gave itself the name "MAUG" (for "MicroNetted Apple User Group").

In 1980, CompuServe merged with H&R Block, and changed their personal computer service name from MicroNET to CompuServe Information Service. They have continued to expand their services and capabilities through the years, and are widely available across the country.<6>
Each user on CompuServe is assigned an eight or nine digit ID code, divided into five digits, a comma, and then the other three or four digits. For example, a user's code might be 76543,4321. When directing electronic mail to a specific user, it is necessary to use that ID code so the system knows exactly WHICH Joe Smith you want to receive your message.

The bulletin board and message sections on CompuServe are divided up into Forums, usually dedicated to a specific service. The MAUG section covers more than one forum, since the message traffic is too large to manage in a single forum. Messages within a forum are organized under major subject, and then under minor subjects. Each message is assigned a number, and the various messages are linked together into "threads". For instance, user #1 asks a question about a brand of modem. User #2 links his answer to that message and answers the original question. User #3 also answers the question, but adds a comment about terminal programs. User #4 picks up on THAT comment, and adds his views about the terminal program that HE likes, without mentioning anything about the modem question that user #1 asked. And on it goes. Eventually, the topic will probably die out, to be restarted later by someone else when it is necessary. The message thread can be followed when reading these posts, or you could simply read all the messages sequentially by their message number. A sequential scan would read ALL messages about ALL topics, whether the messages were connected or not. Following the thread pursues one conversation; following all the messages pursues ALL conversations that are going on.

One problem that can occur with this type of system depends on the volume of message traffic. The software that CompuServe uses will assign a new number to each new message, but when the total number of messages has passed a certain point, the first messages will be deleted. If the range of messages when signing on Monday runs from 15000 to 17000, by Tuesday it may run from 15500 to 17500 (and the first 500 messages from 15000 to 15499 have disappeared). If there are any especially useful conversations going on, the Sysop (system operator) for that forum may choose to save the messages and their threads into a file in the library for access in the future by those who were not involved in the conversations when they were going on.

Each forum on CompuServe has the capability of supporting live conferences, where many users can be present simultaneously and hold live interactive conversations (as opposed to the bulletin board conversations where you must post a message, and then log on later to see if there has been a reply to it).

The MAUG libraries hold programs that have been uploaded for years; some are from the early part of the 1980s (if you can wait for the file scan to get back that far). Of course, there are also many files that are new, and they are added daily by the active people there.

As with the other major online systems, there are many other services available online besides the MAUG forums, including news services, online shopping, games, and more.<7>

Delphi (1982-Present) In 1982 the General Videotex Corporation began an online service called Delphi (probably named after the oracle of ancient Greek mythology). They have not been a major player in the competition for customers between national online services, but neither have they succumbed to financial pressure and passed away. Like The Source, they are accessible through Telenet and Tymnet. They have had an Apple II
SIG (Special Interest Group) since around 1985. Erik Kloeppel was head Sysop (and still may be) for that SIG for several years.

In January 1992, General Videotex purchased the BIX online service operated by Byte magazine in an effort to enlarge Delphi and increase its market share. Delphi today is unique in the degree and scope of its access to the Internet.

**GENie (1985-Present)**

GENie is owned and operated by General Electric, and the name stands for "General Electric Network for Information Exchange". It has been in business since 1985, and, like other online systems, offers many different services to its subscribers, including news, an online encyclopedia, online shopping, games, financial information, and areas of interest to users of various brands of computers.

Where CompuServe's sections are called Forums, GENie calls their sections RoundTables (or RTs for short). Each RT is divided up into a bulletin board, library, and conference rooms (called "Real Time Conferences", or RTCs). The bulletin board is divided up into a number of categories, and each category consists of a number of topics. Each topic then has individual messages that (hopefully) deal with that topic. Unlike CompuServe, messages will not disappear from a topic until the Sysop decides to delete them (and this does not occur until the number of messages either get too large to be manageable, or they become old and outdated). If a topic contains messages that are particularly helpful (such as information about the use of a common computer utility program), the messages may stay up for YEARS. If it becomes necessary to purge old messages, they may be placed into the library so they are still available for reading in the future.

As for user IDs, GENie decided to use a combination of letters and other symbols to give each user a unique name, instead of the number system CompuServe employs. A new user is typically assigned a user name that consists of their first initial, a period, and their last name. If there is another user with the same user name at that point, a number is added. For instance, Joe Smith would be given the name J.SMITH; if there already are three Joe Smith's on the system, then this name would be assigned as J.SMITH4 to tell him apart from the others. A user may ask for a different name (for a price) if the one assigned to him or her is not satisfactory. These tend to be as varied as vanity license plates on automobiles. If J.SMITH4 owns a restaurant, he may ask GENie to give him a name such as EAT.AT.JOES instead of his original name.

GENie started supporting the Apple II computer on October 27, 1985, about five days prior to its going public. Kent Fillmore was the first Apple Information Manager, and the first Sysop was Cathy Christiansen. Fillmore started the America Apple RoundTable (AART), for the Apple Users and /// Computers, as well as the A2PRO RT (Apple II Programmers) with Michael Fischer (MFISCHER), A+ Magazine RT with Maggie Canon (A.PLUS), the Apple/Mac User Group RT with Leonard Reed (BIBLIA), the ProTree RT with Bob Garth (PROTREE), and the GENie Sysop's private RoundTable.<8> Fillmore left GENie in October 1987 and Tom Weishaar took over some of those RTs. Fillmore later returned to GENie in June 1992 to become the Product Manager for Computing RoundTables/ChatLines.<9> Currently, Weishaar has formed a new organization called ICON, standing for International Computer Owner's Network. ICON has taken over the management of A2 (Apple II) and A2Pro (Apple II Programmer) RTs, the Mac and MacPro RTs, and the PPC (Power PC) and PPCPro (Power PC Programmer) RTs.
To stay competitive with older and sometimes larger information services, GEnie has usually kept its online costs below those of the other systems. The association with Tom Weishaar and his newsletter, A2-CENTRAL (originally OPEN-APPLE), has been beneficial for both. GEnie’s 100,000th member in March 1988 was an Apple II user that joined because of a special offer through OPEN-APPLE. Weishaar has been able to keep more direct contact with Apple II users, from both those who work professionally with the II to those who use their Apple II’s for special purposes only.<10>

**AppleLink-Personal Edition / America Online (1988-Present)**

Beginning in May 1988, Apple Computer contracted with Quantum Computer Services to start a consumer version of its AppleLink network. Apple's original network, in operation since 1985, had been used primarily for communication functions within Apple Computer and its various sites across the country, as well as a source of technical support for certified Apple developers. When their new consumer service, AppleLink-Personal Edition (ALPE) was introduced, they changed the name of the original network to AppleLink-Industrial Edition. Apple's hope was to use ALPE as a method of providing better support to its customers.

AppleLink-Personal Edition was unique for an online computer service in its use of a custom terminal program. Rather than requiring the user (possibly a novice) to spend a lot of time in learning how to use a terminal program, a modem, AND ALPE, Quantum and Apple designed a special program that handled all the communications details, including the sign-on password. Each time that the user signed-off from ALPE, a new, randomly selected password was selected and saved on the ALPE disk for the next time. ALPE was aware of this password, and so the chances of someone breaking in on another user's account and using time (and money!) was nearly eliminated.

The ALPE terminal program was intuitive, as was the use of the Macintosh (and Apple IIgs) desktop interface. Icons (pictures of desired functions) were selected with the mouse or cursor (depending on how you had it configured). Making the call and logging in were handled by the terminal program, transparently to the user. When the connection was made, a choice between Apple-specific services and ALPE general services was available. The general section was directed to entertainment, business services, online shopping, and general education. There was also a place for playing online games, alone or with other users. An "auditorium" could be used for members to attend conferences with special guests, allowing direct questions and answers with the guests.

The Apple Community section was the part with the greatest importance to the dedicated Apple II (or Macintosh) user. Here direct contact with Apple Computer, Inc. was available (through the "Headquarters" icon), as well as other hardware and software vendors. Apple product announcements and information about products in testing could be found here, as well as direct access to Apple engineers and developers. There were Forums (special interest groups) for various aspects of Apple computing, Apple University (with courses on productivity, programming, and specialized software applications), and Software (library of available programs for downloading).

In 1990, AppleLink-Personal Edition was modified to connect with the services Quantum provided for other home computers, and the name was changed to America Online. It was still slightly less expensive than the other major online services, and because of the icon-based terminal software, still the easiest to use for the beginner.<11>
CONCLUSION The main benefit for an Apple II user on a large, online service such as those described above is the availability of many experienced users that can provide prompt, timely answers to questions or problems. Some hardware and software companies maintain an online presence, to allow immediate feedback for their customers with technical problems. There are also many files in the libraries on these services, providing software at low cost, some quite professionally written. Apple Computer has also allowed most of these services to act as official "user groups", and so have availability of official technical notes and file type description notes for the Apple II series.

GEnieLamp is also distributed on CrossNet, Internet, America Online, Delphi and many public and commercial BBS systems worldwide.

- To reach GEnieLamp on Internet send mail to genielamp@genie.geis.com OR jpeters@sosi.com

- Our Internet anonymous FTP address is: sosi.com. All current versions of GEnieLamp are available in the ~/pub/GEnieLamp directory. Due to the added expense involved, we ask that when you get GEnieLamp via the anonymous ftp for GEnieLamp, that it _not_ be ftp'd during the hours of 9AM and 5PM Eastern Standard Time. We appreciate your cooperation in this matter.

- Current issues of all versions of GEnieLamp as well as back issues of GEnieLamp IBM are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GEnieLamp platform (FREQ FILES for names of back issues of GEnieLamp IBM):

<table>

</tbody>
</table>

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3
Apple II Computer Info

- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

READING GENieLamp

GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO

To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

<table>
<thead>
<tr>
<th>Name of sender</th>
<th>CATegory</th>
<th>TOPic</th>
<th>Msg.#</th>
<th>Page number</th>
</tr>
</thead>
</table>

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GENie

GENie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330 in Canada. Upon connection type HHH. Wait for the U#= prompt. Type: JOINGENIE and hit RETURN. When you get the prompt asking for the signup/offer code, type: DSD524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLamp READERS!

If you sign onto GENie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there are no excuses! *** GET INTO THE LAMP! ***

//不甘心的书架://GENie_QWIK_QUOTE /////
// My Cockatiel had been making strange noises and I ///
I should have know better. Heck of an admission for someone who won't tolerate backpedaling to have to make, but it's true.

Last month, I pointed out the absolute necessity of giving GEnieLamp proper credit. It seems the only people -- a stupendous two -- who were stirred up enough to reply to my editorial were those who are obeying the rules.

The reason I should have known better is that, during my school days, I frequently blushed with shame when a teacher delivered a broadcast lecture about sloppiness... or lack of diligence... or -- well, you get the picture. I always assumed I was the intended recipient, whether my mark was 99 or 49... while those for whom the rather strident advice was intended preserved a look of insolent boredom.

I don't want to analyze it, I just want to own that I should have remembered that only the wrong people actually listen to such strictures. Some of you may know it as preaching to the converted.

I also want to clear up a misunderstanding and answer a few questions about giving proper credit.

First, it is not necessary to reproduce the credit information facsimile. One of my two correspondents complained that it was difficult to find a way to reproduce credit information that was 10 lines long and 73 characters wide in a paper newsletter. Having just put in a year as editor of the newsletter of the local Apple II user group, I knew immediately what he meant. An article is always two paragraphs too long or two short. The available copy never fits the available whitespace, particularly if it's 73 characters wide and had to be spread across the page.

In fact, the GEnieLamp credit is 8 lines, not 10 (you are not obliged to reprint our decorative borders), and need not be presented exactly as shown. You can format it any way you like, so long as you don't add or omit anything, and as long as it's legible. Just be sure to include it!

Second, the messages GEnieLamp A2 reproduces from the A2 RoundTable in its HEY MISTER POSTMAN section: I have been asked if it's necessary to
credit GENieLamp A2 when quoting a message from the RoundTable that appeared in GENieLamp A2. This is a tricky one. The answer seems to be "no", but you still must ask permission and give credit to the RoundTable.

GENieLamp A2 doesn't own the messages it reproduces, but because it's sponsored both by GENie and the A2 RoundTable (which makes me a servant of two masters), it doesn't have the same hassles of requiring permission to reproduce messages for its own purposes that other magazines have. Therefore, GENieLamp A2 can reproduce the messages, but can't grant anyone else permission to re-reproduce them (unless you reproduce the entire column). To reproduce an individual message or selection of them, you must contact GENie, and/or the RoundTable, and/or the person who posted the message. (Possibly I have listed them in reverse order of importance.)

Third, it's been brought to my attention that the GENieLamp credit information is relevant only to those in the United States and -- owing principally to me -- Canada. Why should those in Australia, Europe, or Japan have to reproduce information about North American 800 numbers?

The answer to this: I don't know. (Sorry, but I really get tired of people who only ask themselves questions designed to make them appear clever.) Or more fully, I don't know, but you do have to. I agree that it makes little sense, but you must do it. If you think a rule or law is stupid, by all means lobby to have it changed. But until it is changed, obey it.

Finally, so much attention has been given to the reproduction of the copyright information that some are forgetting to mention GENieLamp A2 anywhere. Please, put "Reprinted from GENieLamp A2 (July 1994)" at the top of each article you reprint from this month's issue. Please remember to include the precise issue you are reprinting from, and please remember that "A2" part, since there are also GENieLamp A2Pro, Macintosh, IBM, Windows, ST....

[*][*][*]

It's time for you to bid Steven Weyhrich a fond farewell. (I don't have to do it myself -- I get to keep working with him on A2-Central, which decreases my own personal sadness quite a bit.) This month he's presenting the final installment in his Polishing Green Apple column and the last chapter of his Apple II History. These two columns seem to get reproduced in every Anglophone Apple II newsletter in the world (usually uncredited <gnash gnash>).

It's for people like Steven, who is a great guy besides being a talented writer, that I fight for proper credit. (Face it, folks, nobody ever rips off my editorials, so my personal stake in this is minimal.) One correspondent asked if I didn't have any respect for the GENieLamp A2 readers. Sure I do, but not at the expense of the GENieLamp A2 writers. Standing up for "your" writers comes with the job of editor.

(I'm still not sure how preventing readers from stealing from GENieLamp is showing them disrespect. Does anyone out there know?)

[*][*][*]

Finally, a comment on our HEY MISTER POSTMAN column. Every month, we reproduce -- facsimile -- spelling mistakes and all -- messages posted to
the A2 RoundTable. We don't editorialize; we don't summarize; we just reproduce the messages as posted. (Okay, sometimes we cut parts of the message that quote other messages, and such. But that's it.)

It was this column that drew me back to GEnie, and it's our publisher's feeling that the column does a good job of attracting others. I'd like the column to be as informative as possible, for the sake of our readers. Not, however, at the expense of those who post on the A2 RoundTable.

As I've said, GEnieLamp is a recognized part of GEnie, not some separate publication. As I've said, we reproduce facsimile. Even with that understanding, some of those who post on the A2 RT don't want to see their messages reproduced in GEnieLamp A2. If you're among that group, would you please add a "Copyright 1994" or "All rights reserved" or something similar to your signature?

I'm asking for a favor here. It's NOT one of those deals where I stand on the mountain-top and proclaim, "If thou dost not add this to thy signature, I will copy thy messages and to hell with thee!" It's just that, again, I find myself the servant of two masters -- those who read and those who post. There just isn't any way for me to maintain a list of those who do and don't want to appear in GEnieLamp A2. (Maybe the next versions of GEM and Co-Pilot will prevent me from archiving messages from a customizable list of GEnie accounts. But I wouldn't count on it.) I barely have the time to put together the HEY MISTER POSTMAN column as it is... and since I am putting the column together right up until deadline time, it's difficult to know what the final content will be.

It's become obvious to me that there's no easy solution to this problem. That means I must settle for a difficult solution. I'd really appreciate the help of all who post to GEnie's A2 RoundTable in making the difficult solution as easy as possible.

[*][*][*]

This month, we celebrate two returns. Our wandering boy Darrel Raines is back with his Golden Oldie review, and Charlie Hartley has provided us with a profile for our popular "Who's Who in Apple II?" interview series.

-- Doug Cuff

RAMFAST 3.01E OR 3.01EZ? I am a little confused, based on some recent postings. What is the latest ROMs for the RamFast SCSI Card, 3.01e or 3.01ez? If 3.01ez "exists", so to speak, what is the difference between 3.01e and 3.01ez?

(A.KENT4, CAT20, TOP13, MSG:122/M645;1)

They are effectively identical. The 'ez' ROM has a two-byte change to allow the RF firmware to work with the Zilog processors we use (instead of the Hitachi parts). The 'ez' still works with the Hitachi part, so we only ship 3.01ez. Sequential is paranoid about revisions.

Jawaid

(PROCYON.INC, CAT20, TOP13, MSG:173/M645;1)

MINOR SPECTRUM BUG #1 GOOSE -- After you Open CaptureFile "FoldernameFilename", doing Close CaptureFile (via script or by choosing it from the menu) does result in a bogus "syntax error". That's a bug.

A workaround is to save/clear the capture buffer before you want to start capturing to a file, then set the AutoSave path, set AutoSaveBuffer ON, and set Append ON. Data will come into memory, then be purged to the file whenever the capture buffer fills. When you are finished capturing to a file do Save Buffer.

You can then reset the AutoSave path to the "normal" capture buffer path, or set AutoSaveBuffer OFF so the user will be prompted when the capture buffer fills.
I'm deep into v1.1 so don't remember offhand what problems are in v1.0 (they are all minor and can be worked around). READ 16 ALL to see some of the prior scripting messages. I think the biggest tip is "do not mix slash-delimited with colon-delimited filenames".

Thanks, --Dave  (SEVENHILLS, CAT43, TOP16, MSG:111/M645;1)

MINOR SPECTRUM BUG #2   If NOT Contains does have a subtle limitation: The first string needs to be AT LEAST as long as the second string (the manual states the command as: If Not Contains "LONGstring" "SHORTstring" Then Statement).

I found that in actual use I'd end up with the first string being shorter than the second, which means the "if not contains" statement does not work (because it's expecting the first string to be longer) and therefore the Statement is not executed.

Human logic says that if the second string is longer than the first string, then the second string is obviously NOT contained within the first string, but SPv1.0 did not have that rule check. SPv1.1 adds that rule so you can more easily use the IF NOT CONTAINS command.

For now, I think the easiest workaround is to use the "if contains" command and do the opposite (I believe the IF CONTAINS command works "logically" even if the first string is shorter than the second).

Thanks, --Dave  (SEVENHILLS, CAT43, TOP16, MSG:124/M645;1)

DESKTOOLS IV PROGRAM SELECTOR   I set up four programs for use with TO Program Selector. I tested all of them and they all worked as advertised. Today, while doing a demo for the AppleJAX user group, one of the four does not return to AW4.

I get a message after exiting the selected program that says,

"Insert AppleWorks program disk containing

/p8/aw4/ERIKA.E.BRANDT

and press RETURN or ESC to reboot"

ESC does not reboot—I have to do a three finger job.

My AW4 program is located in /p8/aw4/. The other three work fine. The one that does not work is RamFAST.System but it worked last night. Strange!!

I have tried doing a configure with TO Utilities to no avail.

Speedy....Keep smilin'

(R.REEDY, CAT42, TOP24, MSG:72/M645;1)

>>>>> Speedy, Erika is my first grader. Her name was used because I """""""" needed a temporary file that Program Selector could use to get back to AppleWorks. Erika the file is much tidier than Erika the daughter, and always cleans up after herself. Well, actually she erases herself upon execution. Come to think of it, why don't other files die when they're
executed? Anyway, if you delete Erika the file, there's no way to get AW restarted and the message appears, since the temporary quit code is trying to execute the file and can't find it.

(BRANDT, CAT42, TOP24, MSG:80/M645;1)

INVALID EAMON ASSUMPTION It seems a lot of Eamon adventures receive 7's. Have any gotten 9's or 10's?

-Ken Gagne (KEN.GAGNE, CAT16, TOP6, MSG:53/M645;1)

------------

>>>Ken, everything that I've uploaded for some time now has been 7-rated because I already did the better ones and am working down the list. Here is a list of the Top Twenty (the first number is the rating and the second is the number of people who have rated it):

SD#137 Redemption 9.5/1
124. Assault on Dolni Keep 9.2/6
114. Thror's Ring 9.0/6
78. The Prince's Tavern 9.0/3
194. Attack of the Kretons 9.0/2
120. Orb of My Life 9.0/1
204. Sanctuary 9.0/1
161. Operation Endgame 8.9/5
150. Walled City of Darkness 8.8/2
147. The Dark Brotherhood 8.7/3
129. Return to Moria 8.6/4
166. Storm Breaker 8.5/2
145. Buccaneer! 8.3/3
108. The Mines of Moria 8.2/4
148. Journey to Jotunheim 8.2/4
121. Wrenhold's Secret Vigil 8.2/2
169. The Black Phoenix 8.1/5
91. FutureQuest II 8.0/5
117. Dungeon of Doom 8.0/3

All of these adventures (except "Redemption") are in the A2 library in 80-col. versions.

A (7) rating seems to have become the standard rating for "above average", but it doesn't really show up all that much more often than other ratings. There are 35 Eamons rated between 7.0 and 7.9, making up just 15.6% of the total Eamon listing.

TomZ (T.ZUCHOWSKI, CAT16, TOP6, MSG:54/M645;1)

APPLEWORKS GS DB EASTER EGG Back when I worked at Claris, I beat the programmers over the heads with lead pipes until Tom Hoke put an Easter Egg into the DB module: if you press Apple-Option-H in any AWGS DB document, it toggles a mode in which the Enter key works the same as the Return key (i.e. it does whatever you've configured it to do). IMHO, this should have been the default, but Oh Well. BTW, you have to (temporarily) set Keyboard Translation to None in order for Apple-Option-H to be recognized (because of the Option key), but don't forget to set it back to Standard when you're done. Also, this attribute gets saved with the document, so you only have to do it once on a document to keep that behavior.

-G.T. Barnabas, GS Software Engineer
EXTENDED KEYBOARDS IN APPLEWORKS   In another topic, I had asked Randy if
AW would ever support extended keyboards. Silly me--it already does. When Randy posted the obvious
answer (RTFM), I decided to program the extended keyboard keys (such as, page up and page down). Here is what I came up with:

Extended keyboard macros:

<ba-t>:<all : oa-up>!     Page up
<ba-y>:<all : oa-down>!    Page down
<ba-s>:<all : oa-, >!       Home (start of line)
or
<ba-s>:<all : oa-1)!       Home (start of file)
<ba-w>:<all : oa-. >!      End (end of line)
or
<ba-w>:<all : oa-9)!      End (end of file)
<ba-r>:<all : oa-e)!       Insert
<ba-u>:<all : oa-del)!     Delete
<ba-x>:<all : oa-m>t)!    Cut
<ba-c>:<all : oa-c>t)!     Copy
<ba-v>:<all : oa-c>f)!     Paste

Of course, to get these macros to work, you have to enable keypad macros (from the main menu, select: Other Activities, Select standard settings for AppleWorks, UltraMacros options, Enable keypad macros). If you want to use the keypad to enter numbers (like I do), you have to add the following macros:

<ba-1>:<all>1!
<ba-2>:<all>2!
<ba-3>:<all>3!
<ba-4>:<all>4!
<ba-5>:<all>5!
<ba-6>:<all>6!
<ba-7>:<all>7!
<ba-8>:<all>8!
<ba-9>:<all>9!
<ba-0>:<all>0!
<ba-rtn>:<all : rtn>!

In adding these macros to your default macros, check carefully for conflicts with existing macros (e.g., ba-T for TripleMenu).

David             (D.WALLIS2, CAT17, TOP16, MSG:128/M645;1)

SHADOWWRITE 1.3.3 EASTER EGG   Harold, I did some snooping of my own after
reading your message about the easter egg and I found out how to activate it. Do you have your pencil and paper ready?
Bring up the "About ShadowWrite" window, hold down all three modifier keys (Control-Option-Command) and click the "More Info" button. Voila! It's very nicely done, I think you'll enjoy it.

- Tony Ward       (A2.TONY, CAT23, TOP27, MSG:61/M645;1)

...THREW AWAY A PEARL   I recently attended a school district auction
looking for various shop equipment from the
industrial education programs.

I didn't find what I came for, but instead noticed a lot called "Room of Electronics".

In the _room_ was a junk heap 5 feet tall of about 25 discarded computers, 50 overhead projectors and a bunch of other items left for dead.

I noticed stacked in the middle of the heap 2 filthy Apple IIe systems.

If you got the lot, you were responsible for removing the entire heap, and I did not care to do that.

The entire room went for $40 (forty dollars). I walked up to the guy who bought it and offered him $40 for the (2) IIe systems, thinking that maybe they'd be good for parts. After all, there's no way they could be working, right?

He sold me one of the IIe systems for $20 (twenty dollars), without the monitor.

I brought it home, and it worked fine. So, for $20, in essence, my school system sold me:

1. Enhanced //e CPU with 128K
2. (2) Unidisk 5.25 drives with controller card
3. Apple Super Serial Card
4. Microtek Printer Card

What a crime. I'd be willing to guess that all the overhead projectors need was a bulb or fan motor. <no grin>

>>> HOT TOPICS <<<

STM = APPLE II EMULATOR

Hello folks. This is a continuation of a conversation I started over in the CD-ROM topic in Cat 11.

It seems Jim Nitchals (of Cavalier Computer fame) is in the throes of a major undertaking. He and others are busily writing an Apple II emulator to run on the Macintosh.

Ho hum you say?

Well, as a nice addition to go along with it, he has been busy contacting a lot of Apple II programmers who wrote things to get their permission to re-publish a lot of the classic software on a CD-ROM for these Mac owners who buy his emulator (called STM). I have succeeded in convincing Jim of the benefits of having both an HFS and ProDOS partition on this CD-ROM, one partition for each platform. He has only to go back to the authors and ask for additional permission to include their programs on a ProDOS partition as well as the HFS partition. With a ProDOS partition, even Apple IIe owners will be able to use this CD-ROM.
Jim even went so far as to say he would welcome input. He can be reached at JIMN8@NETCOM.COM through GEnie's Internet mail gateway. I ask only that you be considerate of him, he is a busy man, after all. :) If you know how to reach any authors/programmers, let him know (and let me know!). If you have any suggestions, make them. :) 

This project of Jim's is almost exactly what I had in mind when we started the Lost Classics project. Unfortunately, I have been stymied by the lack of contacts, a problem which Jim is not saddled with. :) 

I am pretty psyched by the prospects, and if he is successful, it bodes well for keeping support for our lovable computers just a little bit longer.

Tim 'The Joat' Tobin, Lost Classics & R C Font Clearinghouse
(A2.TIM, CAT7, TOP7, MSG:3/M645;1)

STM (which stands for Stop The Madness! of all things :) is an Apple ][+ emulator that runs on any Macintosh running System 7 or later. It emulates it very nicely, including two Disk II drives (more later), the sound, all video modes, and everything else you can ask for.

The Disk IIIs are emulated by allowing you to select a disk image file to "insert" into each of the two drives. If you want to play Karateka (and Karateka does work on STM), you would use a program on a real Apple II to copy your original Karateka disk into a disk image file, then bring that file over to your Macintosh and "insert" it into STM's drive 1. Then you'd reset the Apple ][+ emulator by selecting the Reset option in one of the menus, and Karateka will boot up.

The video is emulated perfectly, down to the funky colors you get in hires graphic modes when certain colors get close to each other. Hires, lores, and 40-column text area all supported.

The emulator comes with a DOS 3.3 System Master disk image embedded inside the STM program itself, so even if you don't insert a disk in one of the drives, you can boot into DOS 3.3. It's very cool to watch good old AppleVision running on a Macintosh!

You can choose to limit the emulated speed to 1 MHz, but even with that option disabled I have yet to get beyond 1.05 MHz, so it's not that big a deal. You can double the size of the video screen's window, which is nice for people like me that have very high-resolution monitors.

You can also choose to have a running display of the state of the emulated 6502 registers, accesses to various components of the system (such as language card RAM, the disk drives, and the simulated speaker).

The sound works, and sounds very much like it does on real IIs, but it does tend to distort some since the emulator's speed isn't consistent -- it tends to wander anywhere from 200KHz to 1.1MHz on my Power Mac 8100/80.

Everything I've heard and seen indicates that the emulation is excellent -- and it should be; it appears to have the actual Apple ][+ ROM included in it -- and that's the most fun of all... getting that good old BEEP and seeing "Apple "]" at the top of STM's window, followed by "DOS 3.3 SYSTEM MASTER... LOADING INTEGER BASIC INTO LANGUAGE CARD."
Way cool. :)  

(POWERPC.PRO, CAT7, TOP7, MSG:6/M645;1)

I was privileged to see a tentative list of programs which are """"slated to appear on this CD-ROM (upon pain of something nasty if I revealed it to anyone). Suffice it to say that if only half the titles end up appearing on this disk, it will be a very good CD-ROM to have if you have an Apple II computer. :) In fact, once this CD-ROM sees the light of day, it would be worth it to buy a CD-ROM drive for this disk alone.

I asked about anticipated cost for this disk, but they aren't ready to talk MSRP yet. Nor release date. As soon as Jim is ready to talk turkey on these aspects, I will post it here. In the meantime, if you have any specific questions, I can see what I can find out. Jim is planning on moving into a new house in a few weeks, so he may be a little hard to reach for a while. :)

Tim 'The Joat' Tobin, Lost Classics & R C Font Clearinghouse  
(A2.TIM, CAT7, TOP7, MSG:12/M645;1)

Tim, if these authors are willing to release their stuff on this """"CD-ROM, how about as individual files for us here on A2 ???  
(P.CREAGER, CAT7, TOP7, MSG:14/M645;1)

That is being discussed. You must remember, though, that the STM """"project will be a commercial product, and some of the authors will be getting royalties from the sales. Under those circumstances, it would be difficult to get a release to put them online. However, all is not lost. Jim and I have been talking about various ideas, and we may be able to do something of a limited nature.

You must remember though, that Lost Classics' purpose is not necessarily to get software for the A2 library, but to preserve classic software and keep it available for current and future Apple II owners. Getting the software re-published commercially certainly meets that criteria. Barring re-publication, uploading into A2 is our fall-back position.

Not to pick on you, but as a community, we Apple II owners will have to pay for what we get, one way or another, or we won't be getting anything more in the future. Assuming the STM project sells for a reasonable cost, we will have to buy the disk, or there will likely not be any more made. And I have some ideas for follow-on projects which will only succeed if enough CD-ROMs are sold initially to make a sequel worthwhile.

Tim 'The Joat' Tobin, Lost Classics & R C Font Clearinghouse  
(A2.TIM, CAT7, TOP7, MSG:15/M645;1)

APPLEWORKS 4.1 ARRIVING SOON   AW 4.1 will be out sometime in June.  

re: ReportWriter  

The updater will be available here before too long.  
(BRANDT, CAT17, TOP15, MSG:46/M645;1)

In AW 4.1 how about adding "Compare Files" to the file activities  

___!___
Sorry, no time for a major change like that. This is primarily a bunch of bug fixes, not a new-feature version.

Ah, I thought that would be 4.03, and that 4.1 means new features. Well, for the future.

I suppose, but there actually are some subtle new features, although it's not specifically a "new-feature" version. In another words, if it takes a lot of work, it's too much of a new feature.

If you mean creating a WP file from another file and having it marked "Unchanged" instead of "New," why then it's a minor new feature that gets included. AW 4.1 includes the ReportWriter updater. It also has RFP 1.2, which has a totally new option, and all of it is new to the official AW package. Steve Beville's latest updated macros are on the package, loading text files shows the line number, saving text files now saves true tabs, AW now prints to a slot mapped to a hard drive, etc. Some may call many of these "features" bug fixes, but they weren't errors in coding, they required new code. There are also 20+ actual bug fixes.

There were so many changes to the master disks that I thought 4.1 was an appropriate version number, even if no "major" new features were added.

APPLEWORKS GS NOT ARRIVING AT ALL? I hope that the person I talked to at Quality today was incorrect. I phoned to check on the price and place an order for AWGS 2.0 and was told that the project had been cancelled. Not delayed but cancelled. I hope that I was incorrectly informed. Please tell me I'm wrong!!!!!!!!!

Michael E

Bill Carver asked me to read the messages in this topic and post a message about the cancellation of the AppleWorks GS 2.0 project. (I don't usually read this topic because Bill handles most of our online support on GEnie.)

Here's the short version. The reason AppleWorks GS 2.0 has been canceled is inadequate source code and development documentation. A more detailed explanation (somewhat technical) follows.

When we took over AppleWorks and AppleWorks GS, we assumed that updating AppleWorks GS was going to be a fairly straightforward task. Unfortunately, we were wrong. The source code for AWGS is 7 megabytes in size. Those who have seen it have called it the most poorly organized and documented source code they've ever laid eyes on. Claris was unable to provide us with any form of documentation for the source code, nor were they able to provide us with their official bug list.

The source code was designed to build under an old version of MPW (Macintosh Programmer's Workshop). I have it on good authority that even
the old MPW wasn't actually capable of compiling the source code as it was provided to us; it seems likely that it was compiled in pieces and then patched together by hand. We did not receive any documentation on this process -- in fact, there probably never was any.

To give you an idea of how bad the AWGS source was, consider that it took Jim Merritt, who we originally contracted to lead the project, four months just to get the source code Claris sent us to produce an executable version of AppleWorks GS 1.1. Even then, the program was not 100% byte-for-byte identical with the shipping version because of the hand-patching which was used in the original version.

Jim Merritt, as you may know, is no slouch. He's the one who, working at Apple, coordinated the development of the IIGS System 5 Finder, among other things. The original plan was for Merritt to divide the program among several programmers (of his choosing) and have them work on the project independently. Merritt would be responsible for coordinating things and making sure all the program segments could be combined into a fully functional program.

This turned out to be an impossibility, because the source code simply was not arranged in any coherent fashion. I've been told that there are sections of the AppleWorks GS source code which exist mainly because nobody knows exactly what they do -- Claris was afraid that removing them would cause the program to stop working!

At around the same time another programmer decided he wanted a shot at it. This programmer was Bill Heineman, author of Harmonie, Out Of This World, and other programs, and renowned around the IIGS world as an extremely competent programmer. As the weeks went by, we realized that it was beyond his abilities, as well.

A third team, led by Steve Disbrow, also had a look at AWGS. After spending a few weeks with the source code, Disbrow recommended to us that we scrap it and rewrite the entire AWGS application from scratch. This is, for obvious reasons, an economic impossibility. So, after almost ten months of effort by the top programmers in the IIGS world, we have concluded that the task of creating a major upgrade is a near-impossible one.

While we are continuing to investigate ways of providing an upgrade to AppleWorks GS, we feel it is unfair to hold orders for a product which, at this point, we can't promise to deliver. Rather than keep everyone holding their breath, we have decided to notify our customers that the project has been canceled. If the project gets going again, we will let everyone know. We just don't want to get anyone's hopes up.

This was not an easy decision for anyone here -- not just because we're now going to have hordes of angry customers calling us, but because this company WAS founded on the Apple II, and that computer remains special to many of us. Furthermore, as part of our contract with Claris to take over AWGS, we made a royalty guarantee, which basically means we're going to owe Claris a few hundred thousand dollars out-of-pocket if we don't release AWGS 2.0.

Some of you have already told us you will never buy anything from us again because you feel betrayed by our actions. That's certainly your privilege. Still, I think that if you stop to consider the situation,
you'll realize that the main reason you're angry at us is that we got your hopes up -- which is something Claris certainly never did. (If we had left the program in Claris' hands, do you suppose THEY would have produced an upgrade?) We gave it our best shot. We've done everything we could (more than most companies) to support Apple II users. Some of you may see it differently.

If you have AWGS 2.0 on order, you will receive a notice by U.S. Mail confirming the situation as I have outlined it here. Thank you for your patience and support throughout our attempt to develop this upgrade.

One final note. In an RTC (which Harold mentioned) I referred to a specific programmer as being unable to deliver the product on time. Harold did not mention this person's name, which I'm thankful for, but I still owe this programmer an apology. In fact, it's possible that any or all of the programmers who worked on AWGS 2.0 might think I was referring to them. It was certainly not the fault of any programmer; every one of them gave it their all. My comments in the RTC were based on incomplete information and a sense of frustration. My apologies.

Jerry

PS -- If you are a IIGS programmer and feel that you can do what Jim Merritt, Bill Heineman, and Steve Disbrow put together couldn't do, drop me some e-mail and convince me.

(II.ALIVE, CAT42, TOP32, MSG:474/M645;1)

""""
Since we've got nothing more to lose at this point, these people just may get their chance. (Subject to final approval by Joe Gleason, of course, but I think he can be persuaded.)

These folks will have a head start because of the work the earlier teams (especially Merritt's) did. Harold, not to worry, the thing IS buildable under MPW now, at least. B)

Thanks to all of you who have been understanding.

(II.ALIVE, CAT42, TOP32, MSG:483/M645;1)

"""

AWGS started out as GSWorks (or something similar) a product developed by a company called StyleWare. StyleWare published MultiScribe, MultiScribe GS, TopDraw and a couple of other programs that were really quite nice in their day. AWGS users would find MultiScribe GS and Top Draw QUITE familiar, as they served as the basis for a couple of AWGS modules.

Claris bought out StyleWare SOLELY to get their hands on GSWorks. Rumour had it that they intended, among other things, to port it to the Mac. (Where it would have become, in theory, what ClarisWorks is now.) As part of the deal, Claris got the services of the StyleWare programmers, in part because there was no WAY they could work with that code (which was still Beta at the time) without the original programmers to interpret it for them.

Claris later sold all the former StyleWare products to the Beagles. MultiScribe and MultiScribe GS became BeagleWrite and BeagleWrite GS, TopDraw became BeagleDraw, etc. (And Quality acquired them from the Beagles.
The source code for AWGS goes back at least 5 or 6 years, perhaps more. It was developed by programmers who (no offense if they are reading this) were known for kludging things to force them to work if that was what it took to get things out the door on schedule. It has since been modified by programmers who didn't understand it in the first place, and had precious little understanding of programming the GS in the second place.

That code is such a mess that even patching it to provide GSOS compatiblity took Claris many months, and making it "compatible" with v5.x took (as I recall) over a year. AWGS v1.0 will not even run under System 6, and just barely runs under v5.x.

I am surprised to learn that Quality was planning on an upgrade based on the original code. I fully expected v2.0 to be a ground up rewrite (and I didn't understand how QC could afford it :).

That's just background for anyone who might not understand how this code could be this ugly and hard to work with.

Gary R. Utter (GARY.UTTER, CAT42, TOP32, MSG:493/M645;1)

>>>>> Okay, now that all this has been said, I'm going to say everything """" I've been thinking on this, so bear with me:

1. ON THE HISTORY OF AWGS AppleWorks GS has always been a very slapped-together program. Most of the reported bugs exist because of the nature of the source code. Keep in mind that AWGS was originally written under ProDOS 16, and hasn't evolved much since then. The few resources it used were constructed by hand because Apple had no tools for building them yet (and, for this reason, there is an illegal resource in AWGS' resource fork).

AppleWorks GS is just BARELY working, by all descriptions I've heard from people that have seen the source code to v1.1. The project was poorly managed while at StyleWare, and when Claris bought the project, they were just as appalled as Quality is at the quality of the code, but they had nothing to do but finish the job as best they could. Most of the original programmers continued the work on v1.0v2; v1.1, however, was coded in some areas by new programmers that had no idea what the code was doing.

Claris also enforced a precise release date, which limited what could be done -- the program shipped with a large number of known bugs.

2. QUALITY COMPUTERS AND AWGS I applaud Quality for getting involved at all (although I suspect they wouldn't have if they'd known the condition of the existing source code). And I hope Joe allows a team of programmers to make one last shot at the job.

3. THE FIRST THREE TEAMS Looking at that list, there are a lot of very talented programmers there. The only thing I can see that would prevent their making a strong impact on AWGS (aside from the massiveness and twistedness of the code) is the fact that, unless I'm mistaken, all of them have jobs and/or are extremely busy people. They may quite simply not have had the time to work on it -- especially when it's so big.
4. THE FOURTH TEAM  My name has been mentioned in this discussion, so I'll comment. The same day the rumors started flying, I emailed Quality and offered to work on AWGS, and was given a non-negative response (I'm being intentionally vague here). A good number of programmers have expressed interest, and a lot of us are talking amongst ourselves about how we would go about the project if and when we get involved in it.

5. THE FUTURE OF AWGS  Personally, I think a more reasonable goal for AWGS would be to hold off on version 2.0 until after a minor upgrade, v1.2, is done. This would provide an intermediate solution to users so they would have a more stable and System 6-friendly version of AWGS while, at the same time, familiarizing the programming team with the source code. Then, and only then, would we tackle a version 2.0. This is, of course, all assuming Quality were to agree -- it's their money.

All of this has been my own opinion and viewpoint on the issue. Don't bother Quality or anyone else because of anything I said here.

One last thing -- I tend to believe Quality will permit one last team to give AWGS a shot. They can't lose anything if they do, and it might just save them a potentially large amount of money. However, I don't speak for Quality -- or for anyone else other than myself.

(PowerPC.PRO, CAT42, TOP32, MSG:494/M645;1)

<<< WHAT'S NEW <<<

QUICKIE 3.2 WITH MORE TOOLS

IMMEDIATE RELEASE  Vitesse, Inc.
Friday, June 10, 1994  (818) 813-1270

VITESSE ANNOUNCES QUICKIE(R) 3.2

LA PUENTE, CA -- Vitesse, Inc. announced today the release of Quickie 3.2, an update to their popular hand scanner system for the Apple II. This latest version incorporates new imaging techniques for more enhanced, sharper images than ever before. It also contains a powerful collection of image editing tools. Originally, these tools were provided to permit simple cleanup of scanned images, to manually eliminate imperfections which might be introduced by dust or other impediments encountered during the scanning process. In this latest release, these tools were expanded to permit more complex image editing tasks, but continued to emphasize manual image manipulation.

With Quickie 3.2, several automatic image processing features have been introduced. These features can be used in combination with the manual tools, or with each other, to achieve a variety of effects with little effort. These effects range from minor changes in resolution (Blur and Sharpen) to the bizarre and surreal (Laplacian, Sobel, Negative, and image combinations). Most of these effects are produced using an image processing technique called "filtering," while a few actually combine two images to produce a new effect.

The filters implemented in Quickie 3.2 operate only on a selected portion of the image, and fall into three categories: Unary, Linear or...
Nonlinear. A Unary filter simply applies a conversion formula to each pixel of the affected image individually, changing each pixel in a uniform, predetermined way. A Linear filter operates on a region of pixels surrounding each pixel to be changed, using a linear function of the values of the surrounding pixels to alter the value of the current pixel. Linear filters always take the longest time to process. The Nonlinear filters implemented in Quickie 3.2 also examine the pixels surrounding the current pixel, but simply choose one of these pixel values to replace it. While much quicker, Nonlinear filters are not as fast as Unary filters. The many filters included in Quickie 3.2 include: Negative, Blur, Blur More, Sharpen, Sharpen More, Laplacian, Emboss Raised, Emboss Inset, Sobel Horizontal (vertical and diagonal), Gaussian Blur, Median Filter, Minimum Filter, Maximum Filter, Closing Filter, and Opening Filter.

Quickie 3.2 provides several functions which combine two images to create a new one. To enable them, you must Cut or Copy all or part of an image to the Clipboard, then Paste it into your target picture. These Image Combinations include Add Images, Average Images, and Subtract Images. Add Images adds the pixel values of the source and target images, Average Images takes the average of pixel values, and Subtract Images subtracts pixel values.

Quickie 3.2 also incorporates a technique called, "toning," which was initially introduced in Quickie 3.1 as an Easter Egg. Toning allows the user to select the monochromatic palette of their choice. The available palettes were drawn from the world of black and white photography, where special chemicals can turn grays in a normal black and white picture into changes of brown or Sepia, blue, green, or red. Other processes merely "warm" or "cool" the grays by subtly introducing the slightest hint of red or blue without noticeably altering the picture's color. Selenium toning warms the grayscale palette slightly.

Quickie 3.2 requires an Apple IIgs running GS/OS v5.0.4, or later; 1.5MB RAM if running GS/OS v5.0.4, or 2MB RAM if running System 6.0, or later; a 3-1/2" floppy disk drive; a hard disk drive is recommended.

Quickie is a registered trademark of Vitesse, Inc. All other trademarks are the property of their respective owners.

(VITESSE, CAT40, TOP8, MSG:292/M645;1)

Something else that we forgot to mention in the Quickie 3.2 announcement:

Quickie 3.2 is offered FREE as part of the Quickie-C introductory package. Therefore, if you've already ordered Quickie-C, or are planning to order it for the introductory price of $99.95, you'll already receive Quickie 3.2.

If you haven't ordered Quickie-C and are not planning to do so, Quickie 3.2 is still available for $24.95.

Thanks,

Lowell Erbe
Vitesse, Inc.
Technical Support  (VITESSE, CAT40, TOP8, MSG:300/M645;1)
NEW ADDRESS FOR EGO SYSTEMS  Effective June 15th 1994, EGO Systems and GS+ Magazine have moved!

Our new phone numbers are:

Technical Support and Inquiries (new):  615-332-2087
FAX (new):  615-332-2634
Orders (unchanged):  1-800-662-3634

Mail Address (unchanged):

EGO Systems/GS+ Magazine
P. O. Box 15366
Chattanooga, TN 37415-0366

Please make a note of our new numbers, and remember to use them, and not our old numbers, in the future.

Steven W. Disbrow
Publisher of GS+ Magazine

EGO SYSTEMS GETS AUTO ARK  Just to avert your complaints about Econ and Auto Ark, Auto Ark has been sold to GS+ and they are responsible for any updating that will be done. Econ is not out to hurt anyone, but due to the diminishing Apple IIGs market, they have had to direct their efforts elsewhere, in order to remain in the black.

Tyler

FOUNDATION RESOURCE EDITOR ARRIVES  Foundation v1.0.2 has now been uploaded to A2Pro’s library. It is file #4174 there. This is just the commercial version with freeware notices added, a readme included, and some other minor changes (some extra stuff is included with it).

I’ve been talking to Marc about the damaged files. _I_ can download them, because I used MacAOL. But the contents are damaged (the archive is fine, but the files contained within appear to be damaged). I’ve just downloaded them and will try to find time to look them over within the next few days.

APPLE DISCONTINUED PRODUCTS  The following products have been removed from the June 13, 1994 Apple price list:

APPLE PRODUCTS DISCONTINUED:

A0076LL/A Apple II SuperDrive Controller Card

(T.MORALES, CAT5, TOP2, MSG:262/M645;1)

>>>>> The MessagePad 100 was discontinued quite a while ago (about the
same time the 110 was released).

Everything on that list I'd already heard was discontinued.

Some of it, though, was a terrible shock to hear about. (the
Superdrive and controller in particular)
(PowerPC.PRO, CAT5, TOP2, MSG:264/M645;1)

>>>>> THROUGH THE GRAPEVINE <<<<
*****************************************************

IS SOUNDMEISTER SHIPPING? I called Alltech today (June 1) to order a
SoundMeister, and was told that they will be
ready for shipping in mid-June. I hope so, since this is my Father's Day
present...

IRONTOOTH (D.Zahniser)
(D.ZAHNISER, CAT46, TOP7, MSG:64/M645;1)

>>>>> They will take your order for processing once the cards are ready
to ship. I've had some delays with getting boards built and that
setback the projected time for availability. I wish I hadn't put that in
the II Alive ad yet, if everything had gone right, boards would have been
available now. Except it never does, does it?
(T.DIAZ, CAT46, TOP7, MSG:71/M645;1)

>>>>> The recent issue of GS+ with the SoundMeister in it came out about
a week ahead of time, combined with some delays in the board
manufacturing process. I've got several PCB projects going at once with two
different manufacturers and I'm still rather new at all this.

if not shortly there after.

Some other things we will also have available:

Drives and External Drive cases/power supply setups for the Blue Disk
card. A compatible AE PCT Transdrive assembly. A Dual unit with both 360 &
720K drives for $74.00 and a single drive unit with either for about
$45.00. The single drive unit will accept an additional drive.
We are also looking into finding the perfect (as perfect as we can find) tower case & power supply combo for the GS for those who have been thinking about installing it all into one case.
(T.DIAZ, CAT46, TOP7, MSG:65/M645;1)

SIMCITY AND OTHER BURGER BILL GAMES  Do someone know what happened to the SimCity that was talked about in April, did QC drown BurgerBill with work or?

While I'm at it, have somebody talked to Apogee about W-3d or a solo/multi Doom version for the IIgs yeat. I can still remember Burgers comment when W-3d was hot that it could be do'n on the GS.

Jonte  (JONTE.R, CAT6, TOP3, MSG:178/M645;1)

>>>>>  Jonte, there is a Wolf engine done for the GS. BurgerBill wrote it months ago for a game called "Catacomb Abyss". It was suppose to be released by Softdisk GS, but it appears that it was shelved. Too bad, because it could easily be converted to Wolf 3D. I have a copy of it since I was one of the testers. It really required an accelerator to play it, but it worked great.

Bug Softdisk about it. Maybe they're finally release it. It's a shame since it was basically finished. Just a few last minute things needed to be completed. They probably didn't want to release it because it was too fancy of a title for Softdisk. It would make all their puzzle games pale in comparison! :)

Scott  (S.EVERTS, CAT6, TOP3, MSG:180/M645;1)

>>>>>  S.EVERTS, get your facts right. Catacomb Abyss was never released because it was never finished by the author. It wasn't "shelved", and it wasn't "basically finished". There were more than "Just a few last minute things needed to be completed".

It is a cool game, but it is NOT "too fancy a title for Softdisk". Indeed, Softdisk wrote the original game for the PC (and in fact, it was done by the same folks that did W-3D and Doom, before they stopped working at Softdisk). And it certainly wouldn't "make all [Softdisk's] puzzle games pale in comparison!" Softdisk puts out a variety of programs, and this is one more of them. Catacombs is OUR game, designed BY Softdisk, FOR Softdisk.

Don't bug us about it. Burger Bill is a talented guy, but if he doesn't finish things, they can't be released. Anyone that wants to see this cool technology should bug Bill to finish it.

-G.T. Barnabas (my opinions are my own)
(BARNABAS, CAT6, TOP3, MSG:181/M645;1)

GRAPHICWRITER III VERSION 1.2 TO GO BETA?  We're still working on updates to all those things (and more). GWIII v1.2 will probably enter beta testing this month, and then it'll be up to the testers to tell us when it is ready!

--Dave  (SEVENHILLS, CAT43, TOP6, MSG:159/M645;1)
Apple II Computer Info

GWIII v1.2 supports PICTure objects (Formulate friendly) and it has "real" Font menu (font friendly). Reminder: It should be going into beta testing this month--we have NOT yet announced any anticipated ship date! :)  

--Dave  
(SEVENHILLS, CAT43, TOP6, MSG:163/M645;1)

CO-PILOT HISTORY LESSON  To sum it up......

1. A2 acquired the rights to CoPilot from Ken about a year ago.

2. The version we acquired was v2.1.

3. We released that version with some tuned up scripts, specifically to deal with changes in the GENie logon that took place last July. To differentiate between that and the original, we called it v2.1.1. This is the current OFFICIAL release version. :)  

4. As soon as v2.1.1 was out, we started working on some SIGNIFICANT enhancements to the scripts. I had the overly optimistic idea that these could be finished by Labor Day weekend (LAST year).

5. I sent the source code to Harold, with the idea that we wanted to make some small changes to the program itself to work better with the new scripts. THAT opened a whole 'nother can of worms.

6. We FINALLY released the enhanced scripts for Christmas. We released them as "open Beta" simply to get them in the hands of the users, knowing that there were a few small bugs in them that we hadn't pinned down yet.

7. We released two more versions of the "open beta" scripts, and the ones that are currently available are pretty good. There are a couple of real small bugs (i.e. bugs that will not bother 99% of the people), and those are fixed now, but the fixed scripts have not been released. They WILL be in the final release, which is now only a few weeks away.

8. Due to Harold's patching on v2.1 of CoPilot, we have eliminated the final problem (from the scripters point of view) which was that the program itself wrote two of the necessary scripts, and the scripts it wrote had problems with such things as 9600 access.

9. Harold's patches were not able to eliminate a few known bugs in the CoPilot application (such as the fact that the program will lose the "archive prefix" for some users for no apparent reason). However, he was able to alter several things to make the program more usable, such as the limitation on Email addressing which prevented the use of Internet mail addresses in the mail module.

10. His most recent change resulted in the need for a couple of new scripts to be written. So far, these seem bug free (they're pretty simple) but we want to send them out to our Beta testers this week for final approval.

11. If all goes well in the Beta cycle this week, then CoPilot v2.5.0 is finished. (FINALLY! :)  

---
12. Harold still needs to write the new Installer scripts, but his depends in part on his having an exact list of what scripts and other files are to be installed, and THAT depends in part on the result of the final Beta cycle. (If a serious bug crops up, it might result in the need for one or two more new scripts, short ones). So, once we are absolutely final on the total number of scripts, and the names of those scripts, Harold can write the Installer, and we can turn it loose.

14. (That's right, there is no 13 :) If all goes well in the next week, we will have v2.5.0 available in the library for the 4th of July. If more problems crop up, we will still have it available before Kfest. (Call it July 15th.)

15. The "CoPilot II" rewrite will be officially named CoPilot v3.0 when it is released.

Gary R. Utter  (GARY.UTTER, CAT29, TOP13, MSG:263/M645;1)

POWERGUIDE -- ONLINE NAVIGATOR TO DO IT ALL  Finally, .......

<trumpets please!>

I am proud to announce:

========================================
||                                   ||
||  PowerGuide will go stand alone!  ||
||                                   ||
========================================

PowerGuide 1.0, the navigator for the next millennium, adds to it's versatility. Besides staying compatible with major telecom programs, it can be used as a standalone GENie navigator as well. PowerGuide is the first and only one to achieve this ultimate goal. And it is available for your GS. So no matter which telecommunication program you use or don't use, you can now access GENie from one convenient place and stay in control all the time.

PowerOnline is a set of scripts to interface with GENie. These scripts are written and maintained by premier script writer Glenn W. Hoffman, assisted by Kevin P. Reid.

Of course, this is a big project, and by far not finished, but what's currently available suits about 80 - 90% of what you need in the A2 BB.

Even though we tested this interface for several month now, we are releasing this stand-alone interface project as beta right now to gain more experience on other systems as well. So if you want to help us making the coolest navigator around even better, please support us in beta testing, thanks.

Alex [blasted to this BB via PowerOnline]
(A.CORRIERI, CAT29, TOP31, MSG:24/M645;1)

QUICK CLICK CALC (AND MORE)  Mike Westerfield will indeed be along to support Quick Click Calc in this topic.
And we didn't give The Byte Works a whole category for just one topic. I can say no more...

Bill Dooley (A2.BILL, CAT45, TOP2, MSG:17/M645;1)

>>>>> > Does anyone know more details
""

From my flyer:

<paraphrasing>

Password protected files, User selectable row/column width/height, horizontal or vertical split screen, Publish/Subscribe (imports and exports data to other files), Formatting options including height of cell and of course width of cell, because you can set fonts and styles and colors individually in cells. Pie Charts, bar graphs, line drawings, 3-D graphs, line or surface to scattered data points using linear regression. More.

$60!!!

Ken Lucke < Delivered by Co-Pilot & Spectrum v1.0>
(K.LUCKE, CAT45, TOP2, MSG:6/M645;1)

>>>>> From my flyer..
""

Quick Click Calc ... the perfect solution for (1) grade books (2) balancing checkbooks (3) weekly, monthly or yearly budget plans (4) figuring car or house payments (5) savings plans for college or retirement (6) a super calculator (7) charts and graphs (8) tracking coin collections or baseball collections (9) statistical analysis.

The whole flyer is too detailed for me to reproduce here, but you can probably get more info in A2Pro, cat 36.

Requirements include Apple IIGS with at least one 3.5 drive, 1.125 meg of RAM, and System 6.0.1. It supports printers, hard drives, networks and color screens when available.

They are also offering what appears to be good prices on their programming products including some free updates.

Price is $60 + $5 s/h per order. Their phone # is (505) 898-8183.

Now where's the hammer to break that piggy bank ... I may just buy this one.

Charlie (C.HARTLEY3, CAT45, TOP2, MSG:8/M645;1)

>>>>> Yes, we do take plastic. For Quick Click Calc, the price is $60 plus $5 shipping in the US & Canada; write if you are somewhere else. I'm also happy to send out complete price lists and technical information on any product you're interested in. Just send a mailing address and what you want.

For ordering, the information we need is:

Name
Shipping address
What you are ordering
What you expect to pay, with shipping
VISA or MC Card # & expiration date (Or check if sending by ground mail)

You can contact us at:

Byte Works, Inc.
4700 Irving Blvd. NW Suite 207
Albuquerque, NM 87114
(505) 898-8183
GENie mail: ByteWorks
AOL Mail: MikeW50
Internet: MikeW50@AOL.COM

Like I said, we're in the early stages of getting things set up. If you want info sooner, send me your mailing address by e-mail.

Mike Westerfield

(BYTEWORKS, CAT45, TOP2, MSG:19/M645;1)

BLUE_DISK ANNOUNCEMENT
Look forward to see a note about the BlueDisk v1.0 release by the end of this month. We will come up with the _final_ specs and pricing here in the BB. All information given here will also be uploaded in the A2 library for those people not dropping by in our topic.

If there are still any questions of _general_ interest that need to be answered, please let me know. We will try to include answers in our announcement.

SHH Systeme, Joachim Lange

(J.LANGE7, CAT46, TOP12, MSG:68/M645;1)

CD ENCYCLOPEDIA ANSWERS
> What can I expect from the encyclopedia?
> B & W or Color?

Color

> Can we access _all_ the information on the cd?

I've made my best effort in the time available. There are 6000 articles, with a total of 30,000 sections; about 7000 images, hundreds of digitized audio clips and other assorted goodies such as spreadsheet-style tables. There are some features that are not currently feasible on the GS, such as the 'Atlas' feature (it makes a Mac LC II crawl). Movies are not currently supported either, but I have reason to expect this to change in the future.

There are a few other misc. features I haven't had time to figure out, and depending on sales I will go back in & finish them up.

The color imaging seems to work quite a bit better than on the previous discQuest titles, for a number of reasons.

> What year Comptons is being sold?

We're going to be selling the Compton's New Century Encyclopedia,
> Is this in stock ready to go now?

It will be ready to ship shortly after July 1.

Category 5, Topic 8
Message 49 Mon Jun 06, 1994
BARNABAS [G.Templeman] at 13:57 EDT

> But every day there are less vendors, less programer, less support.

As a programmer who is STILL supporting ONLY the Apple IIGS, I get VERY tired of people who complain about lack of Apple II support. Softdisk G-S is a quality product, putting out cool new games, new productivity software, new system extensions, new patch programs, new fonts, new clip art, new templates, and new ideas every month. GS+ is another publication putting out great original software on a periodical basis. If you don't subscribe to SDGS or GS+, then you have NO RIGHT to complain about there not being enough vendors, programmers, or support... because you are not taking advantage of what IS available.

If you are starving to death, you may complain about the famine, but not if you're turning up your nose at all the food at the grocery store!

-G.T. Barnabas (my opinions are my own)

[*][*][*]

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Fun & Games On GEnie
"""""
by jmaharaj@mango:flex.com
(reproduced from the Jerry Pournelle RT)

The news is out folks (okay, it's still a rumor officially.)

FLEX will be adopting the new terminology standard suggested by Windows Sources in their latest June issue. The Bureau for Avoiding Lexically Offending Neologisms Engineered Yesterday has set down
regulations designed to make sure that any words used to describe software or hardware do not unintentionally offend anyone.

Following are some of the changes:

1) Hard disk drives will now be referred to as tumescent disk drives.
2) Floppy disk drives shall be now called relaxed disk drives.
3) Software bugs are now new features.
4) Fatal software bugs are now special features.
5) System crashes will be rephrased as upgrade opportunity.
6) The turbo/slow button on a system will now be called turbo/megahertz-challanged button.
7) A drive's FAT, formally File Allocation Table, will now be called HEFTY, How Each File Takes Yards.
8) For the computer manufacturer, the on/off switches must now be both child proof and accessible to arthritic users.
9) The BIOS, Basic Input/Output System will be replaced with the less graphic BMCES, Basic Mutually Consenting Exchange System.
10) For software developers, screen color schemes are required to include black, brown, red, yellow, and white in an accurate reflection of the racial makeup as recorded in the 1990 U.S. Census.

Please input your comments on the new standard being implemented. Thank you.

REFLECTIONS /
Thinking About Online Communications

by Phil Shapiro

>>> SOME THOUGHTS ON THE NATURE OF HUMAN FELLOWSHIP <<<

The other day I was a surfing around the Internet when I came across a really interesting USENET newsgroup. (For those who might not know, a USENET newsgroup functions in the same capacity as an international bulletin board system. People can read and post messages on any one of several hundred newsgroup topics.)

The newsgroup I encountered focused on the subject of autism. Most of the messages posted to this newsgroup were by parents and relatives of autistic persons. It was fascinating to read the questions people posed, and the answers given in response.
Even more interesting was the fact that the people posting to this
newsgroup were scattered all around the globe. So a parent in Amarillo,
Texas could be posting a message to the newsgroup one day, and hear a
response from an autism researcher in Italy the next day.

What struck me particularly about this newsgroup is the way it served
to connect persons of shared interest. Being the parent of a special needs
child can be an intensely isolating experience at times. Who can you turn
to when you have questions about your child? The child's pediatrician, of
course, can help answer some of the medical questions a parent might have.
But few doctors have the time or patience to answer the myriad questions a
parent with a special needs child might have.

Who better to help answer your questions than parents in a similar
situation? They have been where you are now and have encountered what you
are now encountering. If nothing else, they can lend a sympathetic ear and
offer the type of general nurturing advice that we all need at times in our
lives.

I was also interested to note that not all was calm and harmonious in
the autism newsgroup. Several disagreements and disputes flared from time
to time. Surprising? Not really. People have different views about
things. It's natural that they might disagree at times. Disagreements can
even be productive, for they force us to carefully re-examine the
supporting reasons for our points of view.

To be sure, a fate worse than disagreement and discord is isolation
and silence. Imagine having an autistic child and living in a country
without established online networks. Suppose you lived in rural Pakistan?
Chances are that the phone lines in rural Pakistan, where present, are not
good enough to support the use of a modem.

Suppose, further, that the closest village is a five mile walk from
yours. And that the closest town is a full day's journey. And that a trip
to the capital city would take three days to travel there and back.

Now suppose that you find out that your newborn child has special
needs. Need not be autism; it could be any special need. Your sense of
isolation would be intense, immediate, and all-encompassing. No person to
turn to. No place to go to seek friendly advice. The isolation could seem
overwhelming, even for one accustomed to living in a remote locale.

What online communications has to offer is fellowship. Fellowship is
one of the most primal of human needs. Fellowship is the glue that holds
society together. We engage in fellowship when we gather around to
celebrate a birthday, to rejoice at a wedding, to mourn at a funeral.
Fellowship is chatting with a fellow human being on the street corner.

That street corner has expanded in dimensions in recent years.
Anyone with a modem can share fellowship with several million other persons
who are online.

As I reflected upon the autism newsgroup, I noted the bittersweet
irony of a newsgroup on autism. Autism is a neurological condition that
can make a person less aware of the social dimensions of our existence.
Persons with more severe forms of autism live in an isolated world whose
boundary extends no more than a few millimeters beyond their skin.
It's not that such persons don't want to experience the joys of fellowship with other human beings. It's just that their brains are not wired for such experiences to take place.

Those of us who do have the capacity to experience fellowship should seize the chance to share ourselves with others. Whether via phone, via modem, or in person, seize those opportunities to be a human being among human beings. As social creatures, we become most human when we share our being with others.

-Phil Shapiro

The author takes a keen interest in the social dimensions of communications technology. He can be reached on GEnie at: p.shapiro1; on America Online at: pshapiro; via Internet at: pshapiro@aol.com.

And did you ever wonder why the Psychic Hotline NEEDS a 900#? If they were any good, they would call YOU. They could bill you in advance, too.

Polishing Green Apples

by Steve Weyhrich

HOOKED ON STORAGE (Part 5) <<<

After getting your hard disk installed, formatted, partitioned, and the disk management software put into place, an important consideration is how to organize your files to make them as easy to find as possible. There are as many different methods of arranging your directories as there are methods of housecleaning; I will suggest what makes sense to me, and you can adapt that to your own specifications.

First of all, remember that there is an important distinction between "memory" and disk storage. I've talked with people who told me that they had a computer with 4 megs of memory and 40 megs of memory. What they really had was a computer with 4 megs of RAM, AND a hard disk (for storage of data) that could hold up to 40 megs of data. RAM is where a program RUNS (is "executed"). Disks are used to STORE programs or data files. They are NOT the same. This is important to remember, if you want to keep the computer bullies from kicking sand all over your keyboard.

Consider this illustration. Imagine a desk, with a surface on which
to work, and drawers for storing things. You might put papers on your
desktop to work on, doing tasks such as reading, writing, sorting,
stapling, shredding, coloring with crayons, cutting out paper dolls, and so
on. When you are done with your papers, you put them into a file drawer in
the desk for safekeeping and easy retrieval. While your papers are in the
file drawer, you cannot very well work on them in the ways that were listed
above. But you also cannot keep ALL your papers out on the desktop where
you can work on them, as eventually it would get overcrowded and you would
lose things.

To connect the above example to a computer, the desktop refers to
your RAM memory. The larger your RAM memory, the more documents (or
programs) you can handle at a time. If you have a small amount of memory
(a small desktop) you may be able to handle only a single document or
program at a time.

The file drawer refers to your disk storage. If you have a small
space in a drawer for storage, you may need many different individual
drawers in which to store your papers. If you have several large drawers,
you will have more space to store your papers, but it will require more
work to organize them in a way that makes it easy to find them again.

ESTABLISHING ORDER  The analogy of a file drawer also takes us into the
realm of ORGANIZATION of a storage system. Just as
the file drawers in a desk require some sort of structure to keep track of
the papers within, so also does a hard disk demand structure to help keep
track of files efficiently.

When a file drawer is small, organization is less necessary. You can
easily see the few folders that are there, and it is not difficult to
quickly locate and retrieve an item. When the number of folders gets
beyond a certain point, however, it becomes more time-consuming to find the
particular folder you want, unless it is arranged in some order that makes
sense to YOU. (Note that the method of organization does not necessarily
have to make sense to anyone else; as long as YOU can find what you want
quickly, then it is appropriately organized for YOU.)

This organization can be in the form of dividers to separate
different types of folders (correspondence, bills, insurance, financial,
and so on), or perhaps just alphabetizing everything. You generally must
decide on a maximum number of folders within a category that are
manageable, and when they go beyond that number of folders it is time to
subdivide. Also, the size of a folder depends on how many papers can be
placed within it before it gets too heavy or fat to handle. (In my medical
office, we must occasionally divide our patient charts if they become too
large. It is not a pretty sight when a large, stuffed folder falls to the
floor and explodes.)

On a computer, there are two basic ways of keeping your files on a
disk. A "flat" structure just puts ALL the files in the same place. As
with a few folders in the file drawer, this is fine, as long as there are
only a few data files to keep track of. The older DOS 3.3 operating system
for the Apple II could ONLY work in a flat structure, and so a printed
catalog of a disk that contained many small files could run to several
pages, usually with the files in no particular order. To try to deal with
this limitation, a method was devised of creating "dividers", which were
actually dummy file entries, usually in inverse type (black letters on
white) to separate different types of files. Maintaining this required a
utility that could sort the filenames on a disk, to keep the correct files within their boundaries.

Here is an example of a flat file list:

```
/Disk1    <-- This is the name of the disk volume
    Letter.1
    Burger.Alert
    Letter.59b
    Eviction.Note
    MegaData.System
    Letter.2
    MD.Data.1
    MD.Data.2
    Space.Raiders
    Bozo.Graphics
```

There is no particular order to these files, and they don't have much in common. Of course, the user could just as easily put the games on one disk, the word processing files on another disk, and so on. In this example, the number of files is still manageable, and would not really NEED any further organization. But as the number of files becomes larger, finding the particular one that is wanted will get more difficult.

**ORDER WITH EXPANSION** With the advent of the ProDOS operating system in 1984 (which was taken directly from the older SOS system used on the Apple III when it appeared in the late 1970s), a slightly different approach was taken. Although the flat structure could still be used, there was a limit of 51 files that could exist in the main (or root) directory of a disk. To store more files, it would be necessary to make use of a "hierarchical" system. This system allows creation of subdirectories (similar to using a separate file drawer in a filing cabinet). These subdirectories were not limited to a single level; they could go as "deeply" as there was room for the name that defined that drawer. (This was limited to 63 characters, including the "/" that was used to separate subdirectory levels.) Within each subdirectory, files were handled in just the same way as in the flat system; the filenames typically appeared in a list that was specific for ONLY that subdirectory.

Here is an example of an entire hierarchical file list:

```
/Disk1
    /Data
        MegaData.System
        MD.Data.1
        MD.Data.2
        Letter.2
    /Word
        MegaWord.System
        Letter.1
        Letter.59b
        Eviction.Note
        Letter.2
    /Games
        Burger.Alert
        Space.Raiders
    /Graphics
        Bozo.Graphics
```

Notice in this example that the file "Letter.2" is present in more than one subdirectory. As long as it is in a different subdirectory, there can be more than one file on the disk with the same name, even completely different types of files. This would not be possible if the disk was using only a flat file system (as in DOS 3.3, for example).

When displaying this list of files on one level only, the top or root level of the directory looks like this:

/Disk1
Data
Word
Games
Graphics

A display of the files in the Data subdirectory would look like this:

/Disk1/Data
MegaData.System
MD.Data.1
MD.Data.2

and so on. Within any subdirectory, the files are displayed in a "flat" format; however, it is possible to change to another directory and access THOSE files also, still in the flat format.

Notice that at the top of the root directory shown above is the name of the disk, "/Disk1". In the ProDOS method of organizing disks, the start of a "path" to a file begins with a slash to indicate to the system that this is the name of a disk, rather than the name of a file or subdirectory. When the "Data" subdirectory was displayed, the name shown was "/Disk1/Data". Again, a slash is used, but here to indicate that the file "Data" (a subdirectory) is under the directory "/Disk1". This "pathname" specifies to the computer the path it must take to find a file on a disk. The full pathname for the file named "MD.Data.1" would then be "/Disk1/Data/MD.Data.1"

Under GS/OS on the Apple IIgs, the same format is used, but the colon typically is used as a separating character, just as is done on the Macintosh. Either the "/" or ":" character is acceptable in a pathname, but they cannot be mixed (i.e., :Disk1:Data:MD.Data.1 is acceptable; :Disk1:Data/MD.Data.1 is NOT).

Finally, understand that there can be as many subdirectories in a pathname as you can fit, as long as the total number of characters is less than the limit. Since there is a limit of 63 characters in a pathname under ProDOS, the deepest that subdirectories could be nested would be 29 levels, with each one having only single letter name (i.e., "A", "B", "C", etc). The top level would be the root directory, also a single letter name, and the name of the file could only be a single letter. The full pathname for such a file would be:

/A/B/C/D/E/F/G/H/I/J/K/L/M/N/O/P/Q/R/S/T/U/V/W/X/Y/Z/A/B/C/D/E

In this example, the disk volume name is "/A", which has a
subdirectory named "B" under it, which has a subdirectory named "C" under it, and so on down to a deeper subdirectory named "D". Within that subdirectory is the file, named "E". (If you REALLY need to be organized down to THAT deep a level, you need to be referred to Obsessive-Compulsive's Anonymous.)

WHAT GOOD ARE PATHNAMES? To get the most use out of the hierarchical filing system that ProDOS provides, it is best to use sensible names that are not too long, but are long enough to tell what they are for. This makes it easier to find the program or file that you want.

For example, I have the subdirectories on part of my hard disk organized in this fashion:

```
/C
  |--/MODEM
  |    : Telecommunications files
  |    |--/GEM
  |    |     : GEM (GEnie Master) files
  |    |     |--/S
  |    |     |      : GEM UltraMacros samples
  |    |     |--/T
  |    |     |      : GEM UltraMacros task files
  |    |     |--/TIC.SCRIPTS
  |    |     |      : GEM Script files for TIC
  |    |     |--/SP.Scripts
  |    |     |      : GEM Script files for Spectrum
  |    |     |--/LIB
  |    |     |      : GEM library files
  |    |--/TIC
  |    |     : Talk Is Cheap terminal program
  |    |     |--/TERM.CAPS
  |    |     |      : Terminal emulation files
  |    |     |--/SPECTRUM
  |    |     |      : Spectrum terminal program
  |   |--/MACH
  |         : Files from local BBS
  |--/WORD
  |     : Word processing files
  |     |--/AW1.2
  |     |      : AppleWorks 1.2 program files
  |     |--/AW3
  |     |      : AppleWorks 3.0 program files
  |     |--/AW.INITS
  |     |      : Inits for AppleWorks
  |     |--/TIMEOUT
  |     |      : TimeOut applications for AppleWorks
  |--/AW4
  |     |--/AW.INITS
  |     |      : Document files created by AppleWorks
  |     |--/TIMEOUT
  |--/FILES
  |     : General archives from GEnie
  |     |--/NEWS
  |     |      : A2 News Digest files
  |     |--/LAMP
  |     |      : Articles for GEnieLamp A2
  |     |--/HISTORY
  |     |      : Apple II History files
  |     |--/FINANCIAL
  |     |      : Financial spreadsheets
  |     |--/JOKES
  |     |      : Humor files
  |--/SYSTEM
  |     : GS/OS System files
  |     |--/DESK.ACCS
  |     |--/SYSTEM.SETUP
  |     |--/FONTS
  |     |--/CDEV
  |     |--/DRIVERS
  |     |--/TOOLS
```

This is not necessarily the BEST method of setting up a hard disk, but it works well for me. Notice that I have placed the various types of AppleWorks files within a subdirectory named "FILES", and beneath THAT level is another set of subdirectories that hold more files in a fashion that makes sense to me. To find the A2 News Digest for July 1993, I just use the path "/C/WORD/FILES/NEWS/NEWS.GENIE.9307". If a subdirectory gets too large (too many files to quickly find them), my personal preference is to subdivide it and make another subdirectory with files as similar as
possible grouped within it. Since I don't care to make paper copies of the contents of my subdirectories, it is both easier and faster for me to have no more than one or two screens of filenames (i.e., 20-40) to review when looking for a file.

FINALE The main thing I want you to take away from this month's article is to consider some sort of organization when planning how you will use a hard disk. It will simplify your daily use of it later, when you begin to accumulate more and more files.

In this series I have gone through the process of selecting, setting up, and using a hard disk on the Apple II and IIgs. Although there is still more to be said about OTHER aspects of using Apple II computers, my available time for writing articles has become considerably more limited in recent months, and so I will at this time have to bid you goodbye for now. This is the twelfth article in the "Polishing Green Apples" series, and I hope that they have been useful to you. Apple II Forever!

[*][*][*]

Steve Weyhrich is a family physician from Omaha, Nebraska. He has been using Apple II computers since 1981, and writing about them since 1990. He follows closely the events that continue to shape the destiny of the legendary Apple II and IIgs computers, and compiles a monthly column called the "A2 News Digest" for A2-Central disk magazine. He is also the author of the "Apple II History", available on fine BBSes everywhere, and drawing to a close in this month's issue of GENieLamp A2.

Apple II Hybrids

by Jay Curtis
[J.CURTIS8]

>>> THE MACINTOSH LC/IIe HYBRID (Continued) <<<

One can make a very good case for the statement that virtually all of Apple's success has depended upon the Apple II. The company was founded with the Apple II product line. It was the Apple II that kept Apple in business during its failed experiment with the Apple III. While the first Macs struggled to carve out their own market niche, the Apple II was there as Apple's bread and butter machine. Finally, the slim-lined, LC-style Macs -- which now have become Apple's best selling computers -- may well have failed if Apple had not initially sold three-quarters of them as hybrid systems with the Apple IIe PDS (Processor Direct Slot) card.

Considered only as a Macintosh, the LC was something of a hybrid by itself. Fitted with Motorola's 68020 microprocessor, the LC had a Mac II-level color display. However, without the Mac II's math coprocessor, the LCs ran like the slower Mac SE/30. Having one processor-direct slot, they were somewhat expandable like a Mac II, but they could also be considered plug-and-play like a Mac Classic. Today's LC-style Macs continue to use essentially the same motherboard and PDS setup as the original LCs, but all of them run much faster with Motorola's 68030 and
68LC040 microprocessors.

The newest LCs have not only increased in speed, but they have also increased their RAM and hard disk storage over the original models. The originals were sold with 2MB, expandable to 10MB, while today's 68LC040-based machines are sold with 4MB and can be expanded to a whopping 36MB! While few users may need that much memory, today's graphic-based, memory-hungry, Macintosh system software and applications benefit mightily from all the RAM that they can access. The LC's basic, internal hard drive has grown over the past three years from 40MB to 80MB, with larger drives optionally available. Finally, the original LC's basic 256K video RAM has grown to 512K, and it is optionally expandable to 1MB... enough for 32,000-color capability on 14 inch monitors.

Potential buyers should keep in mind that the amount of memory and speed will tend to vary with the LC-style model selected in the Performa, Quadra, and LC lines. Additionally, it should be kept in mind that while the LC's Macintosh side has grown in memory, storage and speed, there have been essentially NO changes in the IIe PDS card's capabilities. Maximum RAM accessible by the IIe PDS card remains 1MB and the PDS card's 65C02 microprocessor continues to run at 1 mhz in normal mode.

It seems useful to compare the IIe PDS card with the PC Transporter card. Both cards require their respective host computer's system software to manage most I/O functions, but management of video output is handled quite differently between the two. While the PCT card sidesteps ProDOS and communicates directly with the monitor with its own on-board, CGA video controller, the LC's PDS card uses the Mac's system software to provide a IIe video display. The IIe card possesses its own on-board ROM that translates IIe video output to the Mac's "Quickdraw" graphics language. The video output is subsequently handled like any other Mac video by the Mac's system software and microprocessor.

Like the PCT and Trackstar cards, the Apple IIe PDS card possesses its own external disk drive connector. This connector allows both 3.5" and/or 5.25" ProDOS devices to be directly connected to the card. The IIe PDS card requires a 3.5 UniDisk drive. However, for most LC/IIe hybrid users there is probably no advantage to connecting a UniDisk 3.5 drive to the IIe card, because the IIe card's system software also allows access to the Mac's own high density Superdrive as a ProDOS device. Also, like the PC Transporter and Trackstar, the Mac's IIe emulation allows for use of its host computers' hard disk drive for storage of programs and data.

The IIe PDS card possesses most of the important hardware components of a IIe, including the 65C02 microprocessor, 128K of on-board RAM, and a ROM chip with Applesoft BASIC installed. However, without the special IIe card software and Mac operating system, the card would be useless as a IIe. Three essential IIe card files ("IIe Startup," "IIe_prefs," and "Basic.System") must be installed on the LC's hard disk before the IIe PDS card can be booted and run. An optional fourth file, called "ProDOS File System," resides in the Mac's system folder and enables the Mac to display and manipulate ProDOS disks, directories and subdirectories on its desktop. However, many users have found in the past that this file can interfere with file translation between HFS and ProDOS on the Mac desktop, and they have chosen not to include this file in their installation.

The special IIe card software file called "IIe_prefs" is required in order to store information about how the user wishes their IIe card to be...
configured. Configuration is done through the IIe card's control panel, which is called the "IIe Option Panel". This control panel is a Macintosh menu that is separate from the Mac's own control panel. The Option Panel is accessed similarly to the IIgs and Mac control panels by simply using the mouse to point and click on desired options and features.

The "IIe Option Panel" is really the heart of the LC's IIe emulator. Virtually every functional aspect of a real IIe can be managed with the Option Panel. The user metaphorically configures slots in the Option Panel by dragging and dropping icons (which represent peripheral devices or cards) into graphic representations of IIe slots. There are icons for printers, a mouse, clock, block storage devices, network card, modem, and memory card which can be moved around in these phantom slots. The IIe emulator's slot 5 can additionally be configured for four smartport storage devices. Also, any of the IIe's 7 slots can be set for startup, or the user can select "scan".

In addition to phantom slot management, the IIe Option Panel is also used to configure serial ports, keyboard and mouse response, system speed in "normal" or "fast" mode and the startup sound setting. The IIe screen display can be set for monochrome or color, and the text display can be set for black characters on a white background or for normal white characters on a black background. All of these settings, phantom slots and devices correspond to the LC's own settings, ports and devices, with the exception of those devices which are connected to the IIe card's own disk drive connector. By making slot changes, the user basically tells the PDS card and software how they want the Mac's IIe emulation to represent itself to the IIe software.

Telecomm users have reported that the LC/IIe is simply not suitable for running 8-bit, Apple II communication programs. Even Apple's "IIe Card Owner's Guide" reports that the user may experience problems when trying to "use modems at a baud rate of 2400 or above". Apple says, "you may be able to solve the problem and still use a higher baud rate" by selecting "Monochrome" in the Option Panel. However, Apple makes no promises, and GENie users have reported no luck in their attempts to get adequate performance out of their Apple II telecommunication programs with the IIe card. One obvious solution is to use the Mac side of the hybrid for telecomm. The downside, according to many GENie A2 members, is that few Mac comm programs can match the better Apple II programs like ProTERM.

Many AppleWorks users, especially those who are used to working on an unaccelerated IIe or IIc, will find that the LC/IIe hybrid will exceed their requirements for an AppleWorks power system. Hard disk storage can be configured for up to 4 ProDOS partitions or 120MB. Improved speed in program execution can be achieved by doing three things: First, the "Fast" setting in the LC/IIe's control panel will increase the card's processing speed to double that of a standard IIe. Next, additional performance can be realized by selecting the "monochrome" rather than the "Color" setting in the Option Panel's "Display" menu. Finally, if you don't need ALL of the 1MB RAM available to the IIe card, use a RAM disk for running AppleWorks.

I use AppleWorks at home on an unaccelerated GS in "Fast" mode. At work, I run AppleWorks from a RAM disk on an LC-III with IIe card set to "Monochrome" display and "Fast" mode. I have noticed some slight degradation of AppleWorks' performance on the LC/IIe, compared to the GS, but not enough to be an irritant, and the advantages of being able to print...
AppleWorks documents effortlessly over a Mac network to a Laser printer seem to balance things out nicely. On the Macintosh side, the ability to import an AppleWorks document to MicroSoft Works and print it out using the Mac's superior fonts is also a very positive advantage.

Next month, in our final hybrid series article, we'll take a hard look at the future of Apple II computing. We'll talk about what's involved in running software emulations on the new "Power" RISC systems (potentially, the ultimate hybrid computers), and we'll solicit the opinions of some of our GENie A2 members and programmers to see what they think is the likelihood of an Apple IIe or IIgs emulation for the Power Mac. Until then, think hybrid!

NOTES

"""

(1) From this writer's own experience, the standard 4MB found in the latest machines is insufficient.

(2) Another way of saying this is: When you look at IIe software running on a Mac PDS card, you're looking at a Macintosh's INTERPRETATION of a IIe video display. However, when you look at PC software running on a IIgs' PCT card, you're looking at a REAL, digital PC display, not mediated or interpreted by ProDOS. For the most part, however, no one should be concerned about these differences. The Mac's IIe video rendering is quite faithful and is at least as fast as the original, even on the first LCs.

(3) The LC/IIe setup enjoys certain advantages over a PC Transporter running in a IIgs or IIe when it comes to disk storage. While a Mac hard drive can have both ProDOS and HFS partitions, the PCT requires a special ProDOS file to EMULATE an MS-DOS hard drive partition. Additionally, while the Mac's Superdrive can re-write CGR/ProDOS through its own system software, most standard Apple drives cannot re-write MFM/MS-DOS. Consequently, the reader may recall from past articles that when the PC Transporter accesses a standard Apple drive through the Apple II and ProDOS, MS-DOS is laid down in low-level CGR format, which can make file transfer problematical.

(4) It should be noted that the file "Basic.System" is a Mac file and is different from the "Basic.System" file found on IIe ProDOS disks.

(5) It was not possible to determine as of this writing if any current or modified version of this file has overcome these problems. However, the file is available in GENie's Macintosh software libraries.

(6) For users of the PCT card, an analogous ProDOS system file is the "AEPC.CONFIG" file.

(7) Of course, sufficient hard disk storage must exist in order to configure for this much space. However, in many cases, former IIe users can connect their old SCSI hard disk to the LC's SCSI port and use it immediately with the IIe PDS card.

(9) Some good news is that InTrec intends to release a Mac version of their ProTERM software. How well this software will maintain the Apple II
version's power, look, and feel will undoubtedly influence the purchase of many users.

July Celebrations

Golden Oldie Review: ChessMaster 2100

by Darrel Raines

[D.RAINES]
This month's column will examine the software classic ChessMaster 2100. There have been computer chess games available ever since there have been any computer games. The quality of chess programs has always been a measure of a computer's ability to simulate intelligent thought.

I still have some of the original columns from Byte magazine that discuss the possibility of computers thinking. In those columns they discuss (perhaps for the first time in a national forum) the type of logic that computer chess games could employ to simulate the strategy used by a great chess player. In fact, computer chess games have been the subject of critical review for years as a test of the power of computers to out-think their creators. The theory is that if a computer can ever master chess better than the humans who are champions at the game, then the validity of "artificial intelligence" will have been proven.

Most versions of computer chess that run on home computers will never offer a serious challenge to the world champions. However, many software packages exist that will give the average (or better) chess player a run for their money. ChessMaster 2100 falls into this category.

This game was made available to many different platforms when it was first released. Two newer versions have appeared for the IBM platform entitled ChessMaster 3000 and 4000 turbo. Besides some additional bells and whistles added to the interface, the game does not appear to have been significantly enhanced in its game-play ability.

The Apple IIgs version uses the familiar desktop interface with pull-down menus that allow easy access to the various game features. The game runs in 320x200 resolution graphics mode and offers good detail and color. The game runs from 3.5" disk or can be loaded onto a hard drive. The hard drive installation requires a third-party public domain program called "Chess.Finder" in order for the software to be run from the Apple System Finder. There is also a minor, but annoying, problem with the menu bar while using newer versions of the system software. You can still load and play the game, but the menu bar is black. The pull-down menus show up fine, but you must guess on the whereabouts of the top menu item. This minor problem aside, the game has no difficulties running under newer system software from a hard drive.

I should mention here that the game uses a form of copy protection that requires a date, person, or place to be looked up from the game manual. I don't consider this type of protection to be too onerous, but it certainly is not as convenient as no copy protection at all. In this area also there is help available. A file that I have seen on GEnie and other information systems shows how to get rid of the question all-together. I prefer this option, but warn you that only owners with a legal copy of the software should use this patch.

Okay, how does the game play? Great! I am a fairly good chess player and find that the game is difficult to beat on the higher levels. However, there is a penalty to pay in the form of processing time. The better you ask the computer to play, the longer it takes for the computer to make a move. This can mean a lot of time waiting on your part for the computer to pick out its next brilliant move. Of course, you can be using the time to your advantage by working on your next move. In any case, the game can be quite slow in the higher game play levels. An accelerator card can dramatically improve this performance. I would recommend an
accelerator anyway, so that you can see marked improvement with all your software.

One of the things that make ChessMaster 2100 better than any of its predecessors on the Apple II market is the number of features available at the click of a mouse. You can establish the strength of your computer opponent by choosing from a wide variety of options. Computer play strength can be selected from a range of 1 to 14. You can also select whether the computer will make random "less than the best" moves. You can even tell the computer to play like a dummy. If these options weren't enough, you can also choose from a number of timed-game modes. Anyone preparing for a real-world chess tournament will appreciate these modes. You can select any time constraint you want to use. The computer, and you, will be forced to make your moves in the specified time or that player will lose the game. For a really quick game you can choose the Blitz mode and the whole game must be completed in less than 10 minutes (i.e. 5 minutes per side to make all moves). There is also a feature called "Equal Time" mode where the computer is constrained to use about the same amount of time that you use to determine the next move.

The options don't end there. Many features are available for the human opponent. You can choose between three different views of the board. A 2D option will show the board from above. A 3D option will show a nice three-dimensional view of the board from one side. A "War Room" option provides a smaller 2D view with additional windows showing pieces captured, notation for moves made, and computer contemplated moves. If these features are not enough for you, you can also choose the colors that will be used for all pieces, the board colors, and you can even design and use a custom set of playing pieces.

A number of other good features of varying importance round out the package. The computer will play with no sound at all, bell sounds, music, or a human voice responding to play on both sides. A variety of informational windows can be turned on or off as a way of monitoring computer activity. There is a teaching mode where the computer will suggest your next play. There is a list of moves made so far. There is a computer thinking display that will give you insight into what plays the program is contemplating. Clock displays for the human and computer players can be turned on or off. All of these features are not strictly necessary, but add to the overall polish on the package.

I guess at this point you could say, "Nice review, but the real question is how well does it play chess?" I suppose this is a valid question. However, most people who buy computer chess programs are not all that strong at their game. I would venture to say that most people buy a chess package based on features, not on playing strength. I would rate the game strength of this program as equal to that of an experienced tournament chess player. That probably isn't enough of an answer, so I will attempt to expand upon the statement.

The program makes use of a large opening "book" that allows the computer to choose its first few moves from a time-honored collection of the best openings that the chess world has to offer. This is both a strength and a weakness for the computer. The response from the program will be instantaneous for the first few moves. However, once the opening book has been exhausted of moves, the computer must use its internal algorithm for making successive moves. The fallacy here is that the opening moves may have been geared toward an objective that the computer...
algorithm does not carry forward into subsequent moves. However, this does not show up as a weakness in too many games.

Once the internal algorithm takes over, the program is a good position player. The computer will attempt to crush you with its entire arsenal of pieces. The big advantage for the computer is this: it does not overlook any capture, fork, or discovered capture that is available in the next two or three moves. This is a tremendous advantage over the average human player. The advantage is even more obvious in timed games. I have slapped my forehead a number of times upon overlooking a simple fork. This is where one of the other attractive features of the game comes into play. You can take back any number of moves for yourself or the computer. This feature is probably important to the weekend pawn-pusher.

I have played chess on and off for the past 20 years. I have participated in many different forms of game play including postal chess and modem chess. (For those of you who want a rating to use for comparison, I have been rated anywhere from 1400 to 1900 during my chess playing career.) ChessMaster 2100 can beat me 9 times out of 10 in the tougher game modes. I can do a little better in the fast game play modes, but when the computer wins in the fast time play, it is usually because I failed to see something simple. Let me put the ratio at 5 out of 10 for the faster modes.

Bottom line on ChessMaster 2100: If you have any interest in chess, whether it is a casual spark or a deep seated love of the game, you owe it to yourself to get a copy of this program. You will find some combination of modes and timing constraints that will make the game play you on even ground. You will definitely enjoy this program and may actually improve your chess play.

Footnote: Many other features are included that I should not fail to mention. There is a save and load game feature. Over a hundred classic games have been saved on the distribution disks. There is an option to set up a game. There is also a solve for mate feature. The program will analyze a game and offer the moves that the computer would have made at any point in that game. You can print the board position at any time and the moves made so far. You can even tell the computer what your name is so that your chess clock will reflect that entry.

Darrel Raines is a computer user, programmer and sometime chess player. He is currently involved with the NASA Space Station development. With any luck, Americans will be playing chess in space by the year 2001.

Welcome back to the Treasure Hunt! This month we will take a look at some of the many uploads by Pat Kern. Pat has uploaded graphics
files including images for Classic Print Shop (DOS 3.3), The New Print Shop (ProDOS), Print Shop GS, as well as many double high resolution (DHR) graphics that may be used with a desktop publishing program such as Publish It! 4.

In this month's column we will take a look at some of Pat's personal favorites. All these files are public domain.

We will begin with the Print Shop graphics, fonts, and borders. Not surprisingly, Pat is fond of the "Southwest" files created for the AzApple User Group (Phoenix, Arizona). She was involved with this group until she returned to Chicago.

The Southwest print shop uploads were the signature graphics collection of the AzApple User Group public domain library. The full list is given below.

Since these are so similar, we will concentrate on the original Classic Print Shop stuff.

STHWEST1.PS.BXY contains 62 Print Shop graphics that have a southwestern, cowboy, or wild west theme to them. My personal favorites on this disk are Siesta (a Mexican in a large sombrero napping), Roadrunner, Wagon 01 (covered wagon), Stagecoach, and Campfire. There are also many horse graphics, cute Native American graphics, and cowboy graphics.

STHWEST2.PS.BXY contains 60 Print Shop graphics that continue the southwestern theme. There are 12 different sun graphics and 8 horse graphics. My favorites are Indian 06 which is almost a portrait of an Native American brave, and Indian 08 which portrays an attractive Native American woman.

STHWEST3.PS.BXY contains 67 more Print Shop graphics. If you are looking for Print Shop graphics of the states of the Southwest, get this one. It includes a graphic of the entire region, as well as individual graphics of Arizona, California, Nevada, New Mexico, Oklahoma, Texas, and Utah. These are well done. Probably my favorite graphic on the disk is "Gracias", which looks just like Teddy Roosevelt during his Rough Rider days.

STHWEST4.PS.BXY contains 29 borders and 33 fonts files. The border files are all in the Southwestern theme. My personal favorite is Longhorn. The fonts include the following regular fonts (upper case, numbers, punctuation): Angeles, Austin, Berkeley, Cactus, California, Carmel, Cupertino, Dallas, Hollywood, Hombre, Houston, Lamoni, San.Diego,
Santamonic, Seattle, Sierra, Slim, Texas, Tombstone, Utah, and Vegas. There are 4 font sets that include lowercase letters, numbers and punctuation marks: LCDallas, LCMonica, LCSierra, and LCTexas.

The best fonts on the disk include both upper case and lowercase letters plus a limited group of punctuation marks. They include AAngles, ABerkeley, ACupertino, ADallas, AHombre, AMonica, APalo.Alto, and ASierra.

There is also a text file on the disk titled INFO.FONTS that tells you how to access this last group of fonts. Since it may be a bit difficult for some to access that file, it is reproduced below.

[*][*][*]

"These Print Shop compatible fonts allow the user to combine Upper case with Lowercase. Letters from the keyboard produce lowercase. You will not be able to use numbers & most punctuation, since those characters are used for the upper case, so if you want to include addresses, phone numbers, dates, prices, etc. use another font. Use the following substitutions for upper case letters:

A 1        F 6        K -        P &        U ;
B 2        G 7        L =        Q *        V :
C 3        H 8        M #        R (        W "
D 4        I 9        N $        S )        X <
E 5        J 0        O %        T +        Y >

Only certain punctuation can be used as follows: . , ' ? !

With most programs, the number or punctuation will appear on the monitor. It will look strange, but will print out OK. Trust me. With LLL program, WYSIWYG.

You may want to print out the above substitutions and keep it in the disk jacket for reference. It will save you time."

[*][*][*]

As a side note, if you do a lot of Classic Print Shop (DOS 3.3) stuff, have many graphics disks for it (or plan to download all these), and you don't have "The PS Lover's Utility Set," stop what you're doing right now, rush to your phone, call the Big Red Computer Club at 402-379-4680 and beg them to sell you a copy of it. Among other things, it includes a program to print out all the graphics, borders, and fonts on a disk so that you can see at a glance which ones you want to use.

Uploads #17492-17495 contain essentially the same graphics, fonts, and borders for The New Print Shop (ProDOS) as are described above for Classic Print Shop (in uploads #17103-17106). They are not, however, in the same order. I recommend that you download all four, but if you are looking for the fonts and/or borders, they are on #17492-17493. All four of these may be found on one 3.5" upload by getting file #17491 from the library.

Colorized versions of these Southwest graphics were uploaded by N.TOULME and include the following:
### Apple II Computer Info

Moving onto double high resolution (DHR) graphics, some of Pat's favorites are the school graphics found in the following files:

<table>
<thead>
<tr>
<th>File#</th>
<th>File name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16320</td>
<td>SCHOOL.1.BXY</td>
<td>Double Hi Res school graphics.</td>
</tr>
<tr>
<td>16377</td>
<td>SCHOOL.2.BXY</td>
<td>More school Double Hi Res clipart.</td>
</tr>
<tr>
<td>16357</td>
<td>GRAD.1.BXY</td>
<td>Double Hi Res Graduation clipart.</td>
</tr>
</tbody>
</table>

**SCHOOL.1.BXY** contains 16 graphics. These are black and white line art drawings produced on the Thunderscan. You can import any of these DHR graphics, into such programs as Publish It! 4, Dazzle Draw, 8/16 Paint, Platinum Paint, GraphicWriter III, Tutor Tech, TimeOut Paint, or any other program that accesses DHR graphics.

**SCHOOL.2.BXY** contains 16 more school graphics; **SCHOOL.3.BXY** and **SCHOOL.4.BXY** each contain 24 graphics. These are all great for school newsletters, flyers, teacher parent conferences & meetings, fundraising posters, advertising, and nearly anything you can think of that is school related.

**GRAD.1.BXY** contains 16 b/w line drawings all related to school graduation.

Another side note here: Big Red Computers is offering Publish It! 4 for $25, which includes the disks and manuals. If you (or your child's school) have an enhanced Apple 128K IIe, IIc, IIc+, Laser, or Apple IIgs with a mouse (joystick also works, but not well), and you don't have this program, get it! The word is that Big Red is closing up shop at the end of this year, so don't waste time on this one.

Other favorites of Pat's include the 11 files of Jewish graphics and the 4 files of Wedding graphics. The file numbers, names and brief descriptions are listed below.

</table>
If you have a newborn, one on the way, or know an expectant mother, you will want to check out file #21177, titled BABY.1.BXY. This file contains 24 b/w line drawings of baby graphics that can be used for birth announcements, greeting cards, baby shower invitations, thank-yous, gift enclosures, photo albums, baby diaries, and anything else having to do with babies.

Pat has uploaded several files that help you to create attractive greeting cards and emboss a variety of things. Here are some files you may want to download.

<table>
<thead>
<tr>

<td>How to Emboss. Publish It doc.</td>
</tr>
<tr>
<td>20818</td>
<td>EMBOSS.HINT.TXT</td>
<td>Hints for embossing</td>
</tr>
</tbody>
</table>

PI.GREETING.BXY, which requires Publish It!, was created by Vivian Lynes for AzApple User Group Journal. It explains how to create a greeting card using the Publish It! program. Just load the document into Publish It! and print it out to one page. The upload also includes a greeting card template to use in creating your own cards.

PI.EMBOSS.BXY, which also requires Publish It!, is a tutorial by Vivian Lynes that tells how to emboss using computer printouts. The layout was prepared by Pat Kern for AzApple Journal. To see this correctly, install the fonts Florence.12 and Florence.24 (included with upload) before printing.

EMBOSS.HINT.TXT is a short text file giving some hints for embossing computer-generated greeting cards and even bank checks (for gift giving). It can be listed & captured in your copy buffer or downloaded as an ASCII text file.

Pat recommends the following files by Karl Bunker and Jon Thomason for those who use DHR graphics.

<table>
<thead>
<tr>
<th>File#</th>

<td>PHOTOMATRIX.BXY</td>
<td>Great double hires print utility</td>
</tr>
</tbody>
</table>

Sneeze in a terrific freeware file utility program. One of its features is the ability to display DHR graphics on command. I won't spend a lot of time on this except to say that if you don't have it, you should. While your at it, search the library for other Karl Bunker files. All of them are freeware and all are terrific.

According to its long description, Photomatrix will print out a collection of DHR pics about the size of a half dollar on a sheet of paper, about 5 across and 5 down. It is automatic and all you need to do is tell it where the disks are. It is shareware; the fee is $10. For your money you will receive, some 100 additional DHR pics found nowhere else. The author is Jon C. Thomason [jonct@pro-applepi.cts.com].
That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

-- Charlie Hartley

This month we spotlight Pat Kern (aka C.KERN1 and PATZ PIX), perhaps the most prolific contributor to the A2 library, particularly with files that deal with graphics. (Some of her favorite uploads are featured in the Treasure Hunt column this month.)

My entry into the computing world began about 10 years ago when Apple computers were being used in schools and that other computer brand was being used in business. The home computer choices were between the Apple IIc or IIe, or the PCjr. At the time, I was skeptical of buying a computer for home use -- after all, I could balance a checkbook, use a calculator, type reasonably well, and had Atari 2600 for games. So ten years ago I had to be convinced that we needed a computer. Now I doubt that I would want to live without one.

The IIc was my first computer and the one I still use the most today. I managed with one disk drive and 128K in the beginning.

You have uploaded many files of fonts, borders, and graphics for the classic Print Shop (DOS 3.3), as well as for the New Print Shop (ProDOS) and Print Shop GS. Which of these programs is your favorite and why?

For simplicity and speed of operation, the Classic Print Shop, DOS 3.3 version, is the best choice for producing greeting cards, calendars, banners, and signs. It also offers a wide variety of graphics, fonts and borders. For versatility and variation, New Print Shop offers many options not available in the original version. Print Shop GS and Companion offer many utilities for converting graphics and fonts from other sources.
The first Print Shop was fast and easy to use. New Print Shop offers more flexibility and is more like a desktop publishing program with many options in the style of greeting card, calendar, banner, or sign. Various fonts can be used together, graphics in various sizes can be placed anywhere, different colors can be used for different parts of the document. Print Shop GS offers colors and the Print Shop Companion offers several useful utilities.

Even though the Classic Print Shop (DOS 3.3) versions of Print Shop graphics, fonts, and borders were first uploaded several years ago, they continue to be popular for downloading for several reasons. The original DOS 3.3 graphics are more numerous than in the other formats. Clients who use New Print Shop or Print Shop GS can convert these graphics into formats compatible with whichever program they prefer. Furthermore, any of the graphics formats will import into Publish It!

There are many previously owned Apple IIs in use today, and the original Print Shop is one of the programs that is normally included with the sale of used systems.

I was pleased when some of the monochromatic graphics I uploaded in Classic Print Shop format were converted into Print Shop GS by Nels Toulme, a GENie client, and colorized by Yvonne Sanders.

GEnieLamp> Where do you get the graphics that you upload?
**********
Kern> The Print Shop graphics are all in the public domain -- many were created by users. Being of the philosophy that you can never have too many graphics, I began collecting them from various sources. What I did was to organize them according to meaningful categories.

I got interested in using DHR graphics when I started using the commercial desktop publishing program Publish It! The original program came with some graphics, but it seemed like I was always searching for more.

Eventually I purchased a scanner in order to create my own graphics. There are clip art books available that contain copyright free line drawings, and I used these as sources for most of my uploads. But there are other sources -- newspaper ads, direct mail advertising flyers, business, school and religious publications; all use clip art.

GEnieLamp> Do you have a personal style for using the Print Shop and Publish It! programs?
************
Kern> I like to use common programs in an uncommon way. One of the ways to make more professional looking output from any publishing program is by embossing the computer printout. Vivian Lynes, a member of my user group in Arizona, created a tutorial file on this technique.

GEnieLamp> What hardware and software do you use most often?
************
Kern> The hardware I use for scanning is ThunderScan, since it is the only scanner suitable for the IIc. When my friend, Cindy Adams (C.ADAMS11) bought a Quickie scanner, she offered to sell me her...
Apple II Computer Info

ThunderScan. I use this along with 8/16 Paint to clean up and edit the graphics I scan.

I use Sneez to view the graphics, and I use Photomatrix to print out reference sheets for the graphics. I use Print Shop Lover's Utility Set, a copyrighted program produced by Big Red Apple Club, to make print out samples of the graphics, fonts, and borders of Print Shop.

I use ProTERM 3.1 to call GEnie and other Bbses, and I use its editor for most offline word processing. I also use AppleWorks 3.0 for spell checking and word processing. I use Publish It! 4.0 for desktop publishing, but I wish the developers had continued updating its features. I use ImageWriter I and II for printing.

GEnieLamp> You have created all of these super files for the A2 library. Search the uploads for the name C.KERN1 and the list goes on and on. How do you use them personally?

Kern> I hope that by making available what I find useful, other users will be encouraged to upload files that they have created.

I use the files I upload in various ways in my personal life. I create Publish It! documents to use as publicity for public domain disks in my user group library. When I was elected to the board of directors, I would create illustrated reports to hand out at board meetings. Later I volunteered to conduct a desktop publishing workshop SIG (special interest group) during user group meetings and produced flyers and instruction handouts.

Although most of the user group's 28-36 page journal was produced on a Mac using PageMaker, I would produce pages using Publish It! to promote clip art and describe the new Disks of the Month or other Apple II news. There was also a recipe column in the journal, and I would create this page using Publish It! and clip art that I created, along with recipes contributed on the local BBS by Don Davidson or other members. Examples are here in the A2 Library 62 as Christmas, Easter, and Thanksgiving recipe files.

One of the most creative uses of the clip art came from brainstorming during a user group meeting. A member, Milt Mahler (M.MAHLER2), wanted to make use of all the new DHR clip art to create greeting cards, instead of using Print Shop. But Publish It! didn't contain this option. I suggested dividing the page into quadrants, and then flipping the graphic upside down, the way Print Shop does it, so that the graphic is right side up when the card is folded. Vivian Lynes improved on these ideas, and produced the tutorial.

GEnieLamp> Can you tell us a little about the types of things you like to do for fun? (Speaking of "non-computer" fun, here.)

Kern> My most recent non-computer-related activity/hobby is country line dancing. However, that activity came to an abrupt halt when I fractured my wrist in three places -- just two days after Christmas last year. I fell on the dance floor while doing the "Electric Slide" and left the dinner dance with the "Achy Breaky". If I ever hear country dance music again, remind me to put on my cowboy boots.

The recovery has been slow and painful, but I continued modeming on
Apple II Computer Info

GEnie even with my arm in a cast for nearly 2 months. I found the pointing, clicking, and dragging of the mouse and inserting and positioning the drawing into the ImageWriter carriage too difficult for scanning during the three months of physical therapy that continued after the cast was removed, so I edited some graphics scanned by Lee Reasly and uploaded 9 volumes of them as Clip.art.Lee.

Clients who put up with my one-handed typing in the Real Time Conferences will be pleased to know that my touch typing skills have returned, and so have my typos. :)

GEnieLamp> What accomplishments are you most proud of?

Kern> I am proud that any of my contributions here or in my user group have encouraged others to contribute and make use of the files.

I am grateful for the many friends, both seen and unseen, that I have made as a result of computing. For me, these contacts are one of the pleasures of being part of the modem and user group community.

Many of the things I now do came to me as a surprise ... like when Dean Esmay e-mailed me that there could be a staff opening here on GEnie and would I be interested? ... or when it was suddenly announced that I had become sysop of one of the branches of the local user group BBS ... or when I read that my name was on the nomination list of candidates for the local user group ... and finally, when I was recruited to be a Beta Tester for ProTERM 3 (one of the "novice users").

I was surprised when some of the clip art I scanned was chosen for the A2.Best.Clip art and again when some scanned art was used on the A2 On Disk of Resource Central or the Disk of the Month on GEnie. I was honored when my local user group named me as Ambassador at Large when I left Arizona and relocated to the Chicago suburbs. The final surprise was being asked to be interviewed for the GEnieLamp A2 profile.

GEnieLamp> I think you have discovered that it's the busy people who get called to do even more. :) Are you active in the local user group in your area? If so, what kinds of activities are going on involving the Apple II?

Kern> I became a member of AzApple in Phoenix, Arizona, at a time when I needed them and they needed me.

It wasn't until a year or so after coming to Phoenix that we added a modem to the system. In the beginning, it was used almost exclusively by teenagers to call local BBSes to chat. A few months after purchasing the modem, we joined the AzApple User Group and I began to call its BBS. Shortly after that, the teenagers went to a class there and learned enough about downloading and ShrinkIt to give it a try.

Encouraged by this success, I decided to give uploading a shot. I was one of those rare individuals who learned how to upload before I learned how to download. Pretty soon, there were several files on the local BBS waiting to be validated. Then, one day, much to my surprise, I got a message in E-mail that read, "You are now the librarian of the Desktop Publishing branch. Have fun!" That, before I even attended my first meeting!
At that time, Jerry Cline (INTREC) was the user group's president. I sat quietly in the audience at that first meeting until he asked, "Is Pat Kern here?"... since he had only known me through the local BBS. I responded, "I am sitting next to you, Jerry." I then handed him about 20 disks to contribute to the public domain library.

Soon after attending, I was searched out to become our User Group's Public Domain librarian for the Apple II, a job I took over. Then when the elections came up, I suddenly found my name in the list of candidates for the Board of Directors. So I threw my sombrero into the ring, and was elected.

I served one term, then ran for reelection. Sometime during the second term, we needed to relocate to Chicago. But the sale of the home in Phoenix dragged on so long that I nearly was elected to a third term.

I lived in Phoenix, AZ for nearly 5 years. It was there that my interest in computing and modemming became strong. So strong, in fact, that the computer system was the last thing loaded on the moving van when we moved back to the western suburbs of Chicago about 2 years ago.

Now I am in a suburb of Chicago, and have not found a suitable user group to join in this area.

GEnieLamp> How long have you been on GEnie? Where on GEnie are we most likely to find you?
Kern> I've been on GEnie for more than 3 years. Dean Esmay recruited me for the A2 staff in January 1992. I am a staff librarian with responsibility for 8 bit clip art and graphics.

On GEnie, you are likely to find me in the nightly Real Time Conferences, the Sunday RTC "talkathons" or cruising the bulletin boards -- when I'm not uploading, downloading, or updating and maintaining the libraries. I log on nearly every day. I log off the RTCs with the notice " <<<--- watch me disappear "(with the arrow pointing to my e-mail name), then wait and " :: P O O F :: " , then /exit.

GEnieLamp> What plans do you have for the future?
Kern> I plan to enlarge and upgrade my present system after Kfest (or ICONference as it is now called). There are many more projects I intend to pursue, and I'll need to put myself into LEARN mode once again.

GEnieLamp> Thank you, Pat, for an enjoyable interview.
Kern> It's been my pleasure. I hope to meet many of your readers online in the nightly RTC room meetings. See you there. :)

A note to our readers: If you want to know more about a particular person and want him/her to be interviewed for the GEnieLamp A2 profile column, send E-mail to C.HARTLEY3 or EDITOR.A2 and we'll see what we can do. In your E-mail message, tell why you think this person is a good candidate for the profile.
Last summer, at KansasFest in Kansas City, Missouri, an idea to create an online user group meeting was conceived. All too many Apple II owners are finding themselves short of local support, due to the waning interest in the Apple II, and it was felt that this online group would help fill the gaps. Hence, PAL (Planetary Apple League) was created.

With this group, we are striving to fill in the gaps in local support, and have a place for people to go who need help, want to learn more about their Apple II's, hear special speakers, and just have fun!

MAIN EVENT -- KansasFest (aka ICONference)  In less than a month, a few hundred people will be flying, driving and otherwise making their way to Kansas City, MO to attend an annual conference, held at a Catholic college right on the Kansas/Missouri border. There will be dorm food, very little sleep... and Kansas in July is HOT. Last year, it look doubtful that anyone east of the Missouri would make it -- floods had devastated the midwest -- but that didn't stop anyone! We midwesterners were determined to swim. Fortunately, we didn't have to. There were two bridges open... barely. A couple attendees even risked their necks getting to KansasFest last year. A long drive and a weary driver caused an accident with an 18-wheeler. Although the car was a bit worse for wear, the two folks came out relatively unscathed, and proceeded to enjoy the conference! Why would so many people struggle, bargain with their bosses, save their pennies and strive so hard to face the above "hardships"?

KansasFest, which will from now on be called ICONference, is worth every scrap of sacrifice, every iota of pennies saved, and every struggle to get there. The seminars are interesting and thoughtfully presented. Last year, Joe Kohn talked to us about shareware -- the importance of paying the fees and how to go about marketing your shareware programs and collecting the fees. AppleWorks 4 was introduced, and there were many more seminars that were equally engaging. But at least as important, is what goes on "after hours"... meeting folks you've talked with online all year is an exhilarating experience! (It can also be interesting if you have pre-conceived notions of how they look.)

A rough agenda has been penned by Tom Weishaar, and is presented below:
ICONFerence July 21-23 1994   Tentative Session Schedule, as of May 27:

Keynote speaker: Randy Brandt, Project Manager, AppleWorks 4.0

Pat Wilson, Microsoft - Special Preview of Microsoft Windows 4.0 (Chicago)
(non-disclosure required)
Pat Wilson, Microsoft - Microsoft Office for Windows Demo (2 hours)
Nick Dazio et al - Launch of the Mensch Computer
Roger Wagner - subject to be announced
Mike Westerfield - subject to be announced
Michael Lutynski - Animasia 3-D
Jim Maricondo - UNIX & the Internet; UNIX and the Apple IIgs: GNO/ME
Bill Lynn - Way Cool & Way Cheap Macintosh Utilities
Greg Nelson - Multimedia Authoring with CD-ROM
Nathaniel Sloan - The Ins and Outs of Telecom Scripting
Joe Kohn - Looking Good in Print
Joe Kohn - All About the Internet
Lane Roathe - How to get a job in the computer industry
Erick Wagner - Apple II Interfacing, How to Control and Monitor Real-World Devices
David Ciotti - Soldering for Beginners, Which End of the Iron is Hot?

The "unofficial" after-hours fun promises to continue this year, since some of our folks who were there last year and who contributed mightily to "after hours" will be here this year as well!

Last year, people spent a lot of time wandering from room to room, trading goodies from their hard drives, comparing notes on programs, and meeting new people! We had several from overseas -- Germany and Australia to name a couple of countries!

Roger Wagner last year not only "inspired" a "tie wearing contest" but he tried to scale the dorm wall -- outside. We have a "celebrity roast" and guess who got roasted last year? (Hint: His first name is Tom.) Another bit -- or possibly byte -- of fun was the "bag biting contest". What's that? It's where a grocery bag is placed on the floor, and the contestants pick up the bag with their teeth/lips without touching the ground with hands or knees. Doesn't sound too difficult, until you find out that after each successful grab, the bag is cut down, until it is merely a couple inches high!

There is so much more to tell about Kfest -- more than could ever fit in the article. You'll just have to come to find out more!

LIBRARY STACKS   As always, we have plenty of useful files in our library here in Apple II RT. Below are "what's hot" for this month:

+22874 HERA2.BXY                Hera: The Sword of Rhin. Disk 2 of 2
+22873 HERA1.BXY                Hera: The Sword of Rhin. Disk 1 of 2
+22849 A2LIBP8.ADB.BXY          A2 Library listing of non-GS/OS files
+22841 A2.DOM.0694.BXY          A2 Disk of the Month, June 1994
+22840 A2LIB.ADB.BXY            Complete A2 Library listing - AW3 format
22833 ANIM.XCMD2.BXY           HCGS XCMD - Plays Paintworks animations
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1566 of 1824
If there is interest in having this series appear someday as a printed book, I'd be pleased to hear from you. Part of the consideration in making that a reality is determining if there is REALLY a market for it. Direct your e-mail comments to s.weyhrich@genie.geis.com or to genielamp@genie.geis.com. And thanks for reading!

THE END IS NEAR   We've come a long way in this review of the events in the life of the Apple II computer and those who have helped shape and direct its course. My Flux Capacitor card has nearly exhausted its capacity for, er, fluxing, and I've run into a wall that did not stop Marty McFly in his time-travelling adventures: The future. Although I could create any future I wish to in my own fertile imagination, the events yet to come are no more clear to ME than to anyone else who wants to try their hand at prognostication. But one word does come to mind: Renaissance. Webster's Dictionary defines it as "a movement or period of vigorous artistic and intellectual activity; rebirth, revival". I believe this word accurately reflects the current level of activity in the Apple II world outside of Apple, Inc. In order to take a look at why I believe this to be true, and at what might be in store for this computer, let's start by reviewing in brief what we've already covered.

OVERVIEW OF APPLE II HISTORY (THE BIG PICTURE)   Back when Apple Computer, Inc. got its start, it was just one small part of the rapidly growing field of consumer-oriented uses of the new microprocessor technology. It was not the first computer available for home use, and some might argue that it was not the best for its time, either. But it did have an openness in design that made it possible (for those who were excited about exploring the digital unknown) to "boldly go where no one has gone before". Unbeknownst to these early Apple II enthusiasts, those who ran Apple Computer at the time did not necessarily have the same affection for the Apple II in their hearts.

The problems at Apple Computer in the two years after the release of the Apple II were not particularly unique to that company. They were suffering from the growth pains that can happen to ANY company that suddenly finds itself with a blockbuster product on its hands. There is a sudden influx of cash (which is a heady experience in itself), a demand for greater levels of production for the product, and the problems associated with trying to meet that demand. These difficulties were part of what bogged down MITS, maker of the Altair 8800, when demand for their computer far surpassed all their expectations.

It has become somewhat of an expectation in the minds of the American consumer that if a company has a product that is sold in a store, advertised in national magazines, and is professionally designed, that it must then be a "big company". When you as a consumer are dealing with this mythical large company, you expect that they have managers and employees who know exactly what is going on at all times, have a clear business plan, and are firmly in control of all aspects of the product. When the consumer becomes strongly attached to that product (develops a "brand loyalty" of sorts), sometimes that loyalty artificially inflates the abilities of the company that made it, and of its employees, to a status of expectations that no one can really meet. A business-oriented purchaser of an Apple II just might have had his confidence shaken a bit if he had known, for instance, that one of the first activities of the founders and early employees of Apple when they moved out of Jobs' garage and into a real office was to play games with the office telephones. Was this sort of
behavior an indication that the Apple II was a piece of junk? Not at all; but it does highlight one problem that could not then be quickly overcome... one of immaturity and inexperience.

Steve Wozniak was brilliant in his design of the Apple II; Steve Jobs was outstanding in his insistence on a quality appearance for the finished product; and all the others that made contributions in terms of hardware and software for this first all-in-one home computer did a top-notch job as well. But without the experienced help that Apple's founders got from Mike Markkula and Mike Scott, the company would likely have drowned in its own success. STARTING a business with a successful product is not that hard; what is difficult is MAINTAINING that business after it gets going. Not only do you have the problems of meeting growing consumer demand, but in the case of a technologically complex device like a computer, you have more mundane things to do. You must provide customer support involving items that WERE clearly spelled out in manual (which the owner likely did not read), as well as for problems that could not be anticipated in advance. As more computers are sold, there are more people that may need technical assistance. This was not something that only Apple had trouble with; every small company that began to sell microcomputers had these same problems. Although Apple might well have handled things better, the help provided by those Apple executives who WERE experienced in business helped them survive the first few years.

The next hurdle that Apple had to overcome was what they should do for an encore. Sure, the Apple II was a success, and the introduction of the Disk II drive, with solid application software such as VisiCalc, ensured that they would do well for a while. But until this time in the microcomputer industry, no other machine had survived much beyond two to three years. At that point in the typical life of a computer, it has usually been surpassed by more advanced technology that does more for the same or lower cost. If Apple were satisfied to be a single-product company, that would be fine; but the people running the company wanted it to survive and flourish. Consequently, the push was begun to establish both short term and long-term goals for future products. In the short term, the Apple III was designed to be a stop-gap machine until their long term goals could be achieved. It was unthinkable that the Apple II could possibly last much beyond six to twelve more months, and so they put considerable effort into creating something they thought would be better than an Apple II, something that would be more suitable for a business type of environment. As has been discussed before, this new computer was built with the capability of running Apple II software, so customers would have something they could do with it until an adequate supply of Apple III-specific software became available. But the problems of growth pains and inadequate quality control killed the Apple III, despite Apple's best efforts to overcome their false start. Meanwhile, the Apple II Plus continued to grow by leaps and bounds, ignoring the expectations of those within the company.

Apple's long-term goal was to get a radically new computer platform designed and into production, something that would be as much ahead of the Apple II and III as those computers were ahead of what came before them. The Lisa project (and later the Macintosh) were what executives at Apple really believed would be the future of the company. Certainly, with all the power and ease of use that these computers would promise, why would anyone want to still own an Apple II, or anything else? In actuality, it was probably the failure of the Apple III and the continued successful growth of the Apple II that made a major contribution to the slow start the
Lisa and Macintosh had. Combined with that factor was the high cost of the Lisa, and the limited capability of the first Macs (with only 128K of RAM, there wasn't much you could do before you ran out of memory).

All this time, the Apple II had developed its own perpetual motion that not even Apple's neglect could halt. More Apple II computers in the home, school, and workplace meant more available customers for the fledgling software industry that provided fuel for these machines to run. And a software company, though also liable for the technical support issues that affected hardware manufacturers, was extremely easy to start out of a living room. Just write a program, package it, put a few ads in magazines, and wait for the orders to come pouring in. Though few did as well as VisiCalc, the growth of that company is an example of the potential that software authors could achieve, given the right circumstances.

Champions of the Apple II within the company still managed to upgrade the product when they were given enough leeway. The Apple IIe and IIc, with their improved graphics and expanded memory, were products of this type of advancement. Those computers did not go far in covering new territory; in fact, the major justification in the minds of Apple executives was that miniaturization made it less expensive to produce a machine that worked only incrementally better than the original Apple II, primarily adding features that most people were adding to the II Plus (upper/lowercase display and keyboard, and extra memory). Eventually, they allowed a true advancement in the form of the Apple IIgs, which held ties to the past by being compatible with old software and some hardware, and to the future by providing an all-new level of graphics, sound, and memory expansion capability. Whereas the Apple IIe was not necessarily a better computer than the first Apple II or the original IBM PC, the Apple IIgs was clearly a considerable step forward. Unfortunately, the IIgs was hindered from the start, not necessarily by blatantly obstructive efforts within the company, but more from the lack of corporate interest that had plagued the Apple II line since the Apple III had first been conceived. By the time the IIgs was released, Apple's corporate mindset (the beliefs that many in the company held as absolute truth) was that the Macintosh and its descendants DEFINITELY were the true future of the company. Consequently, it was difficult to get anyone to commit to making a realistic effort to promote and advertise the IIgs for the purposes where it would be best suited. There appeared to be a paranoia that a successful Apple II of ANY kind would cause Mac sales to suffer. Taken out of the active upgrade-support-upgrade loop, the IIgs made most of its advancements through the less-tangible system software development that was done for it. When the IIgs was first released, it was not much more able to do modern "desktop" computing (the graphic user interface) than was the first 128K Macintosh; it was primarily a larger, fancier IIe. But with the maturing of its system software, and active work by outside developers, the IIgs eventually came into its own with a solid, mature operating system, and the ability to do many tasks for which people are buying other computers (not necessarily Macintosh).

By mid-1992 there was a further decrease in the energy allocated within Apple for enhancements to the IIgs. It was decided to change the Apple II Business Unit (the section within Apple that concentrated on that computer) into a "Continuing Engineering Unit". This group was to maintain support and make small improvements for the existing Apple II and IIgs user base, but not to undertake any other major projects for either platform. While the Apple IIe and IIgs were still being produced and sold then, the IIgs and finally the IIe were dropped from the dealers' price sheets in the
SO WHO IS TO BLAME? Let's take a look at the various major personalities at Apple that have had a major role in events there over the past fifteen years, and see how they affected the current state of affairs of the Apple II. Now, bear in mind that what I write here is NOT a result of time spent personally talking with these people; they have already had others interview them often over the years about the same topics, and what they have wanted to say has likely been said. Here I will summarize what HAS been written about them, and attempt to draw some conclusions. Obviously, once I leave the Kingdom Of Factual Reporting and enter the Land Of Commentary, there is a chance that the judgements I may make are not valid. I don't have an axe to grind with or against anyone, and it is not my intention to place blame squarely with any one person. Like any large company, Apple Computer is a collection of many different people's opinions, attitudes, and prejudices. The sentiments you could get from talking to one person may be entirely different from those heard in talking with another. With that disclaimer out of the way, let's begin.

First of all, consider Steve Jobs. In the eyes of many Apple II users, he is the quintessential villain, obstructing Apple II progress at every turn in favor of his baby, the Mac. Many things have been written about Jobs over the years, discussing his temperament and lack of love toward the Apple II. If accurate, these impressions could be summarized by saying that it appears Jobs was primarily a visionary, and was enamored of making Apple Computer a success and a Fortune 500 company (which he did, in the shortest time in business history). He was also a big fan of the newest, the best, and the most interesting technology available; the older stuff was just a yawn after it was released (this includes even the Mac, which eventually lost its shine for him as he wanted Apple to build something even better). He had an enthusiasm for the projects that looked like a good hack (this is what attracted him to Wozniak in the first place), and seemed to disdain anyone that did not wholeheartedly share his zeal. His problems tended to stem from the same things that gave him his strength: The single-mindedness of purpose was obnoxious to someone who was interested in upgrading older technology, like the Apple II -- why waste the time working with something old like THAT when you could be spending your time working with something NEW and exciting like Macintosh? His excitement about a pet project also tended to cause him to give out details about new projects when they should best be kept secret. Undoubtedly, Jobs played a strong role in the development of the mindset at Apple that the Apple II was "okay", but it was not something to waste much of your time with. In this way of thinking, it was much better to be doing the "right thing" and to work with the Apple III or Lisa or Macintosh team.

What about Steve Wozniak? Although good in the technical department of hardware and software design, he was not of a temperament to participate in office politics. Although he may have disagreed with the ways in which Jobs or others at Apple ran things, he did not have the business experience that let him feel qualified to counter their decisions with sufficient force to get things done his way. He just wanted to design and build things, and so he tended to work at that which he did best. When he had his opportunity, he left the company for a sabbatical in 1981, and later returned to work on whatever else happened to interest him. But since he was involved in of the initial work on the Apple IIgs, he has not done much at Apple to champion the cause of the Apple II.

John Sculley, the former vice-president of PepsiCo, who Jobs brought
in to run the company after the departure of Mike Markkula, has little better a reputation with the Apple II community than does Steve Jobs. This may be because of his position at the head of the company that has been practicing passive euthanasia on the Apple II for years, or perhaps because people have gotten the idea that he likes to tell them what they want to hear, but does not make any substantial efforts to carry the Apple II forward. On the plus side, Sculley appears to be practical and a good businessman. He is clearly able to take advantage of the opportunities presented to him, and to promote what he feels to be best for the company. He began at Apple with little experience in the technical areas that would be best suited for such a company, and had his rough times in trying to find his place. He was considerably influenced by Jobs during his early months at Apple, and this likely extended to the lack of enthusiasm toward the Apple II. Even after he realized the need to pull rank and to exclude Jobs from any influential role at Apple, it was not because he repented and wanted to champion the Apple II, but because Apple needed stability at the helm.

As a company, Apple has felt that its business goals needed to be in a direction that did not put a great emphasis on the Apple II or IIgs computer. As the rest of the world advanced, digitally speaking, so Apple needed to advance; it needed to make better, more capable, and more powerful computers for less money. The contention (whether true or not) was that the Apple II simply did not have the "horsepower" to handle the higher powered applications that computer users of the late 1980s and early 1990s demanded. As future advances are made in available technology, this will mean that even machines like the most advanced Macintosh II will eventually be surpassed by a newer generation platform (possibly the PowerPC project that Apple and IBM are jointly working on through their Kaleida company). But as progress continues, Apple has also learned that it cannot abandon its established user base, destroying the investment that people have made in a computer by making it obsolete. If nothing else, the vocal complaints made over the years by the Apple II community have taught them that lesson. Chris Espinosa, one of Apple's employees from the early days, was quoted in the March 9th, 1992 issue of InfoWorld as saying, "We're not going to do to the Macintosh what we did to the Apple II."<1>

The Mac has achieved a degree of acceptance in the business marketplace, and this credibility would be hurt badly if they began to ignore the Mac in favor of yet another, more exciting computer.

One factor that has contributed significantly over the years to the apparent inconsistency over the way that Apple has handled much of what it does (not just the Apple II) is the frequency of change within the company. This change leads to different people with different ideas taking over projects that were begun by others. Tom Weishaar has said on more than one occasion, "[There is] this vision of Apple as an organism with a brain... that's [not] a correct metaphor. Like any large organization, what it does is based on politics, and how many votes there are; [also,] the employees turn over every three years."<2> Apple has undergone many reorganizations since it started business, as it has had to handle its phenomenal growth. Usually those changes took place in response to things not going well (such as with the Apple III), but sometimes it was done in an attempt to streamline operations and make things run more smoothly.<3> A consequence of this change has been that as old people leave and new ones take their places, there is a natural desire to modify things that the old crew was doing. Thus we have events like:

- Apple allowing the Apple Pugetsound Program Library Exchange to form
the Apple Programmers and Developers Association (Apple allowing A.P.P.L.E. to form APDA, if you prefer the short version), and then taking it back from them several years later.

- Apple spinning off their application software division (AppleWorks and Mac products) to a separate company, Claris (to be less competitive as a computer manufacturer with third-party software developers), and later buying back Claris to bring it back under corporate control.

WHAT COULD HAVE BEEN DONE DIFFERENTLY? Second-guessing events of the past is easy; we see what was done, and can say with presumed authority, "Well, if I had been running things, I would have done it like this!" When these decisions were made (or not made, as the case may be), the correct path to the future was still as muddy as it is today. Nevertheless, if I can make some idealistic statements, these are my thoughts on "what might have been."

ACCEPTANCE Apple should have simply accepted the desire of the public for the Apple II computer, and responded by promoting it actively. This could have been done along with its promotions of the Apple III, and later the Mac. When the Apple IIe was riding the high tide of popularity in December 1984, Apple should have capitalized on that, and redoubled the advertising for that computer. Increased sales and profit would still have been good for the company, whether or not it came from Macintosh sales.

REALISM Apple should have been REALISTIC instead of religiously IDEALISTIC. Job's visionary approach to Macintosh as a product that would change the world was clearly NOT reflected in its early sales. A company lives on its sales, regardless of whether what it is selling happens to fit with its current philosophy. The attitude should not be one that insists to the customer that THIS is what you want to buy, but to provide him with available choices and see what sells. If the Macintosh was going to be as "insanely great" as Jobs and the rest of the Mac team believed, it would eventually pick up steam and start selling, without having to ignore the already-successful Apple II.

ENHANCEMENT The products sold by Apple should have been upgraded according to the success they showed. As Macintosh sales began to increase, advancing the machine to a larger memory size and more capabilities is perfectly reasonable. In the same way, the Apple II should have had opportunities given to it in proportion to the income it produced for the company. For example, at one time a notebook-sized Apple II (or IIGs) could have done extremely well, especially if it had been bundled with good general purpose software like AppleWorks. The IIC and IIC Plus were good starts, but things stopped there. The IBM clone market has shown that there IS a place for a notebook-sized computer with lots of memory, built-in hard disks, and color LCD screens. A flat screen monitor could have been available for the Apple II as far back as 1985, had Apple been interested in developing it.

OUTSIDE EXPANSION Even if Apple chose not to upgrade the Apple II themselves, the technology could have been licensed to someone else who WAS interested in pushing the machine to the limit. Even if these licensed Apple II products competed a bit with the Mac, it would also be competing with computers made by other companies. Furthermore, the larger the market share, the more people are aware of your product, which
can stimulate future sales. And after all, license fees paid for use of Apple II technology would still generate income, with little effort on Apple's part.

ACTIVE RUMOR CONTROL For years the rumors flew on a fairly regular cycle claiming that the Apple II had been or would be discontinued in short order. When a political candidate has something untrue said about him, he makes a quick and decisive effort to counter that gossip; it can be VERY damaging to his current image and future credibility if he lets it go unchallenged. Instead of making it clear that the Apple II was NOT being terminated, Apple seemed to usually ignore such statements. Since a lack of denial is often taken as confirmation, this led to many Apple II users and developers leaving this computer and going on to something else, often the IBM PC and clones. Decreased developers meant fewer new and upgraded programs, prompting then-current users to also move to a different computer, leading to smaller sales of existing software, which starts the whole cycle over. Even "authorized" Apple dealers were known to spout off that same old tired rumor, because they heard it from "someone in the company who knows". Official announcements from the company that strongly denied any discontinuation of the Apple II MIGHT have helped stop that cycle.

WHERE DOES THE APPLE II STAND TODAY: THE BAD NEWS

EDUCATION Although the Apple II continues to have a large installed user base compared to other computers in schools below the college level, it has been rapidly being overtaken by the onslaught of less expensive MS-DOS clones and Apple's own promotion of the Macintosh. Apple gave up on its strong support of the Apple II at the school level in the same way it had done so at the consumer level. They began to encourage schools to purchase Macintosh computers when they wanted to add to or replace their existing machines. This was demonstrated by Apple in their ads; one example that appeared in inCider/A+ during 1991 showed two students in a computer lab. One was sitting in front of an Apple IIe, and the other was at a Macintosh LC. The Mac LC had an attractive color screen with graphics, where the Apple IIe had a pitiful-looking black and white 40-column text menu displayed. If you were looking at which computer to buy, which one would YOU choose? (At that time, although the Macintosh LC was one of the best selling Apple computers to educational institutions, the best selling PERIPHERAL for the Mac LC up until 1992 was the Apple IIe card.)

DECLINING SUPPORT The Apple II support market, both hardware and software is not dead, but neither is it robust and thriving. Companies making products that work with the Apple II are often finding it difficult to continue in business without making unpopular decisions. With flat or falling sales, they have had to either expand their coverage to other computer platforms, or face possible failure as a company.

One example of this change was Applied Engineering. For years they were prolific producers of hardware add-ons for the Apple II and IIgs, and often they had a large percentage of the total advertising pages in Apple II magazines. Their early ads touted AE as Apple II experts, "because that's all we do". Not only did AE begin making and selling peripherals for the Macintosh line, but they also made the unpopular decision to begin providing technical for their Apple II line through a 900-number toll phone line. At the same time, Macintosh users were NOT required to pay charges
over and above long distance just to get technical support. Eventually, Applied Engineering found that they could not survive in the larger and more competitive Macintosh environment, and in the spring of 1994 they had to close their doors.

Beagle Bros, also a long time Apple II supporter in the software arena, also took flack, perhaps more unjustly than Applied Engineering. They worked hard during 1991 in developing an integrated software product (BeagleWorks) for the Macintosh, and temporarily scaled back their Apple II support during the last days before the release of that new product. The reason? Apple II products simply were not selling at a rate high enough to meet overhead. In Beagle’s defense, they did NOT just leave their Apple II user base dangling. Not only did they release many of their older software products to online services for free distribution (rather than just letting them disappear), but they also turned over further sales and development for the Apple II market to Quality Computers. Quality, already a well-established Apple II mail-order company, has begun releasing new products under the Beagle name, ensuring that they will continue to be available and upgraded.

Beagle, however, also succumbed to the pressures of the Macintosh market, and that company closed down in October 1992.

MAGAZINES ARE FALTERING Unlike the old days when there were several magazines that catered to the Apple II market, there are just two glossy publications left: GS+ Magazine and II Alive. Both are available only by subscription (you won't find them on the newsstand), and the latter is a recent start-up, in response to the failure of inCider/A+.

Newsletter-style publications like A2-Central and the National AppleWorks User Group are surviving, but they do not depend on advertising revenue to continue publication. Additionally, A2-Central has had to make the change to a disk-only format to stay in business.

APPLE DEALER APATHY Many of Apple's authorized dealers picked up on Apple's corporate indifference to any advancement of the Apple II, and themselves tended to ignore it. There had been exceptions, but the general rule was that an Apple Dealer was not knowledgeable about the Apple IIe or IIgs and was unlikely to offer the IIgs as a solution for customer seeking a computer for a particular need. Some of this also has to do with the bottom line: The markup (profit margin) for an Apple IIe or IIgs was not as high as it could once be with a Macintosh product, so there was less financial incentive to move those older products. Sometimes, there has been even a decreased technical knowledge about the Apple II by the very dealers supposed to be able to repair them.

READ MY LIPS: NO NEW CPUS A planned upgrade to the Apple IIgs that was to be announced at or soon after the 1991 KansasFest was killed at the last minute. This change, which admittedly would not have been a major upgrade, would have still provided in a bundled form many of the features that customers buying a IIgs needed to get anything useful done (beyond simple IIe emulation). The improved IIgs was to have more memory, a hard drive (built-in, as is done on many MS-DOS machines these days), and possibly a built-in SuperDrive (which is capable of reading 3.5 inch MS-DOS disks). No reason for the cancellation was ever given; since it was never officially announced, the new IIgs CPU never officially existed anyway. ("We do not comment on unannounced products" is the established party line.) The only public announcement Apple HAS made...
Apple II Computer Info

was that there would NOT be any new Apple II released beyond the IIe card for the Mac LC.

WHERE DOES THE APPLE II STAND TODAY: THE GOOD NEWS  With all this going against it, what possible good could there be to say about the current state of affairs regarding the Apple IIe and IIgs computer? Surprisingly, there are several things.

APPLE II SUPPORT CONTINUES  Although Apple has indicated that we should not expect to see any new Apple II CPUs released, they have also promised that they would continue to support the existing Apple II user base with hardware and software upgrades that will keep these computers useful. Products they have released that show they've kept this promise include:

- GS/OS System 6.0 and 6.0.1, which offer many features similar to Macintosh's System 7 package, as well as providing tighter compatibility between the ROM 01 and ROM 03 IIgs computer.

- ProDOS 8 v2.0.3, which offers Apple IIe and IIc users the capability of attaching large disk devices (such as hard drives with more than two partitions) to a card in a single slot.

- HyperCard IIgs v1.1, an upgrade that includes more of the features found in the latest Mac version of HyperCard. This program, previously available only as a commercial product, has recently been reclassified in the same category as System software, which means it is available to qualified user groups for free distribution to their members (minus a manual, however).

- SuperDrive Card, a hardware add-on that makes it possible to use the higher-density (1.44 MB) 3.5 disks on the IIe and IIgs, and access (read-only) to MS-DOS disks.

- Video Overlay Card, making possible multimedia computing on the IIgs that combines standard video signals with computer compatible video signals.

A DEDICATED CORE OF THIRD PARTY SUPPORTERS  There are still many small individual programmers and hardware hackers who are devoted to the Apple II. They enjoy using this computer platform, and want to make new technology and programming techniques available for other Apple II users. They continue to provide products that larger companies (who must have large returns on their development investment) cannot afford to produce for the Apple II. The risk is that small one- or two-man companies may not be able to grow enough to ensure long-term support for their products. Also, some smaller companies cannot afford to work full-time on the Apple II and must have a "real" job to support their part-time activities.

Companies and/or products that fit into this category include:

- Procyon, which has come out with a Unix-like multitasking environment for the IIgs called GNO/ME. (Multitasking means that the computer is doing two or more things simultaneously. "Unix" is a multitasking environment that has been in use on mainframes for years).
Apple II Computer Info

- JEM Software, Kingwood Micro Software, and Beagle Bros/Quality Computers all produce AppleWorks enhancements and add-ons. Quality has gone so far as to obtain rights to product new versions of AppleWorks and AppleWorks GS, which Apple and Claris let languish for years.

- Seven Hills Software has several high quality IIgs products for the serious user, including a desktop publishing package, a font editor, disk utilities, drivers to make use of high quality output printers, and more.

- Vitesse, Inc. offers a GS/OS-based package of hard disk management utilities, as well as a IIgs printer driver for the better printers.

- Resource Central, a publisher, provides news, products, and technical support for the Apple II family, as well as helping sponsor continued technical education events ("KansasFest") each year. The Apple II support that comes directly from Apple through APDA (the Apple Programmers and Developers Association) has now been turned over to Resource Central.

- plus many more that I don't have room to mention here.

USER GROUPS   Just as in the beginning of the Apple II era, these groups still exist to provide the support for Apple II users that Apple and their authorized dealers cannot (or will not) provide. They give a sense of community and comradery that can keep a new user (or semi-experienced user) from abandoning the II in frustration, with the oft-mistaken notion that the grass will be greener on the MS-DOS or Mac side. Apple recognizes this and does provide many resources for Apple User Groups (but still tends to give much of its attention to the Mac side of things).

A NEW ERA OF SOFTWARE QUALITY   Since there are no longer a large number of companies writing software for the Apple II series, we have come full circle. In the early days, most of the available software came from amateur authors, and the best of it was distributed by fledgling software companies through computer stores and magazine advertising. Today, much newer software, especially for the Apple IIgs, is coming from the same source: Amateur authors. Instead of being sold through stores or ads, much of this comes via online services through the Shareware method, or via mail-order houses. Some companies, like Quality Computers, are also directing sales of the best programs, becoming a blend of software publisher and distributor. Although the days of becoming a millionaire through selling a blockbuster Apple II program have probably passed forever, it is still possible to do fairly well as an author.

A LARGE LIBRARY OF AVAILABLE SOFTWARE   The Apple II has seventeen years' worth of software available, and much of the best of the old programs are available for bargain prices via private sales, or free for downloading from online services.

WHAT SHOULD WE DO NOW?   If it is true that the sun is slowly setting on the age of Apple II computing, is there any point in hanging on any longer? Yes, indeed! First, if you own an Apple II computer, you have a platform that is extremely mature and well known. Unlike the IBM clones, who are evolving so fast that software cannot keep up with them, the 6502, 65c02, and 65816 have been around in one form or
another for a long time. People who write software for the Apple II or IIgs know EXACTLY how to make it do what they want it to do, and they can do it well. The Apple IIgs, though released back in 1986, is just now coming into its full maturity, and some very high quality software is being released for it. This software can make it possible to use hardware (such as large capacity hard disks, optical scanners, tape drives, touch windows, and much more) that has been made "respectable" in the IBM or Mac world, and is now available for reasonable prices to work on an Apple II. The disadvantage faced by the IBM user is that mature 386 software will never exist; the 486 and its descendants will be the center of attention before that can happen. The 486 will likely suffer the same fate. Software on those machines simply cannot keep up with hardware when it changes so rapidly. The stale "growth" of the IIgs may actually have been to its advantage!

So then, how do you handle the feelings of envy you may get from scanning through the magazine racks, viewing all the lovely things you can buy for one of THOSE computers? How is it possible to not be angry with Apple for what "they've" done to your favorite computer? Here are some suggestions:

TAKE THINGS LESS SERIOUSLY After all, IT'S JUST A COMPUTER. People who got upset with Chevrolet for discontinuing their classic Chevelle Malibu had far too much of an emotional investment in the car. A computer, like a car, will NOT love you back, no matter how much time and devotion you put into it. If you view it as a tool, then do what a carpenter does: He continues to use his hammer, saw, and screwdrivers for as long as they remain useful to him. He does NOT go out each year and buy the next model of hammer, just because it has a few more features than the old one did.

Furthermore, make a decision to not let yourself become upset with Apple or with Apple dealers who were not interested in promoting the Apple II or IIgs. From their point of view, they were (and are) trying to make a living. As mentioned above, they didn't have much of a profit margin on the Apple II, and they had to pay the rent, their employees, and feed their kids. Apple could possibly have changed this by dropping dealer cost for the IIgs, but that would have dropped APPLE'S profit margin, and make them interested sooner in discontinuing the IIe and IIgs. RESOLVE to emotionally divorce yourself from Apple and what it did or did not do. Time showed us that we couldn't MAKE them change their attitudes, so why get ulcers over it?

ACCEPT PRESENT REALITY This sounds somewhat defeatist, but it has a positive reason. Accepting what has already occurred (Apple's discontinuation of first the IIgs, and then the IIe) can make it easier to decide what you want to DO with your computer NOW, instead of fussing over what might have been. Even if Apple NEVER releases another piece of hardware or system software for the Apple II or IIgs, they have provided us with tools that can be used for years to keep our hardware and software investment useful.

USE WHAT YOU HAVE TO ITS FULLEST If you are using your Apple II for word processing, or desktop publishing, or home finances, and it still works, is the End Of The Apple II really that big a deal? There are still many people in this country using Apple II=PLUS= computers on a daily basis, because that is all the computer they have found that they need. They are not suffering because they cannot run...
a desktop publishing program like Publish-It! or GraphicWriter, or a font
enhancer like Pointless; it is just not much of a priority with them. Dean
Esmay, former chief sysop on GENie's A2 Roundtable, put it well when he
stated the following back in 1992: "The bandits in the Apple II division
have always done their best to bring the machine to its ultimate limits and
past them, DESPITE the idiot marketing and the high corporate officials,
[whose actions] those guys couldn't do anything about. They've given us
all they could to take the machine to its furthest abilities. If the
higher ups decide to drop it now that's not going to change much of
anything for any of us. Look at the Apple III. That thing sold barely
100,000 units before being discontinued and there are STILL people using
it, STILL companies out there supporting it. Up to [1989 or so] there were
people still writing software for it, and at that time the machine had been
discontinued for at least five years. AND with only 100,000 or so ever
sold! There are at least fifteen times that many IIgs systems, and at
least thirty times that many IIe/IIc systems, not even counting the clones.
And a lot more software already available."<1> The IIe, IIc, and IIgs
should be useful for a LONG time yet.

Now, if you are a major computer game aficionado, it may bother you
that there are no longer lots of games being released for the Apple II or
IIgs. There ARE still some new games being released for the IIgs, and the
quality is better than ever. If that is not enough for you, though,
perhaps you would be happier with a Nintendo (oops! I mean the Super
Nintendo, which is incompatible with cartridges for the old Nintendo. No,
wait; the Ultra Nintendo, with 32 bit graphics and seventeen joystick modes
and...). Just remember, ANY game machine or computer will be made obsolete
someday.

FIND AND HELP NEW USERS Another area where local Apple II user groups can
meet a need is in the growing number of people
who are new owners of used Apple II equipment. Because there are many who
have jumped the Apple II ship for the MS-DOS or Mac world, there are quite
a few Apple II, II Plus, IIe, IIc, and IIgs computers that appear on the
used market at bargain prices. The prices on these used computers are
often low enough that an interested person can justify buying one just to
try it out ($200 compared to $1200 makes it as affordable as a VCR). If it
was interested in providing such a service, an Apple II user group could
place small ads (perhaps in the classified sections of a newspaper or home
shopper circular) to tell any new Apple II owners in the community that
knowledgeable people are available to help them.

If they felt so inclined, user groups could even act as buying and
selling coordinators for used Apple II hardware and software. This could
make it easier both for those trying to sell used equipment, as well as for
those looking to buy such equipment. This would require a higher level of
volunteer time in these groups, but has the potential of stimulating a
growth of membership.

CONCLUSION: ENJOY YOURSELF! The current era of Apple II computing has the
potential of being as exciting as the
original days, when every new program was a discovery in learning more
about the machine. As a community, Apple II users need to determine the
direction of their own future, since Apple Computer, Inc. is unlikely to be
putting much (if any) energy into that area. In 1977, the major sources of
hardware and software were not from computer stores or Apple itself, but
rather from the users. In a sense, that is also true today. The days of
making a million dollars writing software for this machine are probably
long past, but there are still many hackers out there who can write new and useful programs that will maintain our hardware investment. These authors can distribute their products as shareware through major online services, or possibly as a commercial program through one of the few remaining Apple II software distributors (such as Quality Computers, Seven Hills Software, Econ, and others), or through one of the other companies mentioned above that continue to actively support the II. Users of the Apple II can help maintain the flow of Apple II-related products by BUYING what they use (instead of making illegal copies), and by paying the shareware fees for what they download from online services.

We have the unique opportunity to actually direct and mold the future of the Apple II ourselves. Decide how you want to participate, and have fun with your computer! Find ways in which you can use your "antique" computer and STILL amaze your friends ("I didn't know you could do THAT on an Apple II!")

Apple II Forever?

Well, NOTHING lasts FOREVER... but it can last as long as we want it to!

[*][*][*]

NOTES

<3> The frequency of personnel shifts at Apple prompted MacWorld magazine at one time to lampoon this by saying that Apple's company cafeteria had been distributing milk cartons with pictures of "lost" employees on the back, sporting the caption, "Have you seen me?"

//GENie_QWIK_QUOTE //
// Ahhh. I have been spending alot of time on local BBS's
// lately (trying to save money) and I just can't find
// anywhere to replace my home here. You are all the
// greatest. What a great bunch of people!

GENieLamp is also distributed on CrossNet, Internet, America Online, Delphi and many public and commercial BBS systems worldwide.

- To reach GENieLamp on Internet send mail to genielamp@genie.geis.com or jpeters@sosi.com
- Our Internet anonymous FTP address is: sosi.com. All current versions of GENieLamp are available in the '~/pub/GENieLamp' directory. Due to the added expense involved, we ask that when you get GENieLamp via the anonymous ftp for GENieLamp, that it _not_ be ftp'd during the hours of 9AM and 5PM Eastern Standard Time. We appreciate your cooperation in this matter.
- Current issues of all versions of GENieLamp as well as back issues of GENieLamp IBM are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GENieLamp platform (FREQ FILES for names of back issues of GENieLamp IBM):

- Back issues of GENieLamp are available in the DigiPub RoundTable Library #2 on page 1395. M1395;3
- GENieLamp pays for articles submitted and published with online GENie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com
- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.
- If you would like to meet us "live" talk to us every Wednesday night in the Digi*Pub Real-Time Conference, 9:00 EDT. M1395;2
Apple II Computer Info

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GENie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GENie prompt.

READING GEnieLamp  

GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  

To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOPI, MSG:58/M475)

___________________________________________
| Name of sender | CATegory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GEnie  

GEnie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GEnie's non-prime time connect rate is $3.00. To sign up for GEnie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330 in Canada. Upon connection type HHH. Wait for the U#= prompt. Type: JOINGENIE and hit RETURN. When you get the prompt asking for the signup/offer code, type: DSD524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GEnieLamp READERS!  

If you sign onto GEnie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there are no excuses!

*** GET INTO THE LAMP! ***

I had some line noise yesterday between topics and GEnie told me (direct quote): 

-- RoundTable Staff.  GEnieLamp Information.
Did your parents ever sigh in exasperation when you replied "I didn't notice" to one of their questions? Mine did, and I didn't understand why... until recently.

In my youth, the reason I failed to notice whether a pot on the stove boiling was generally because I passed through the kitchen with my nose in a book. I later parlayed this indifference to my surroundings into a talent approaching genius. When setting up house for myself, it took me several months to notice that two equidistant supermarkets varied as much as 80 cents in the price they asked for a box of Hamburger Helper. The box was on the shelf, and the price was the price, so I bought it without paying any attention. Paying attention pays dividends!

When I read Leslie Halliwell's memoir _Seats in All Parts_, I marvelled that the author could so clearly recall the more than 20 cinemas in his home town. When I'm in a cinema, I concentrate on finding a seat with nobody behind me -- I'm 6'3", and hate being asked to move or slide down -- and then give myself over completely to the film. Half an hour later, you could ask me what color the wall was, or how full the cinema was, and I would stare at you, helplessly. Or at least rapidly change the subject.

I hadn't noticed that I don't notice. A cinema was a place with a reasonably uncomfortable seat, a screen, and projector. One supermarket was the same as the next. The only thing I ever noticed about my car was whether or not the gas tank needed to be refilled... until the day when the muffler fell off in the middle of the road.

Earlier today, I looked up, startled, as I realized that I have now completed one full year as editor of GEnieLamp A2. And just two days before, I made my first attempt to see how many Apple II users there are on GEnie.

On page 203, you will find user profiles, where you can search the profiles of others users, based on interest, first name, last name, GEEmail address, company name, city, state/province, country, or just about any combination of the above. (Do not under any circumstances confuse this option with the GEnie mail directory, which lists just about every GEnie subscriber. The list of user profiles is limited to those users who have...
Apple II Computer Info

taken the time to make up their own listings.)

A search on those interest in "APPLE II" found me 217 matches. A search on variant spellings (APPLE //, APPLE ], APPLE 2, and APPLE2) netted me another 35, making 252 in all. A search on "APPLE" got me 562 matches, though that presumably includes some of those interested in the Apple Macintosh, the Apple III, the Apple Newton, and those funny spheroid things you find growing in orchards.

AND THESE ARE JUST THE PEOPLE WHO TOOK THE TROUBLE TO FILL IN A USER PROFILE! I don't know what percentage of GEnie users do this -- I hadn't until two days ago -- nor do I know how many clients the A2 RoundTable has, but I'd be willing to bet that this is just the tip of the iceberg.

If you want to support the Apple II community but can't afford any more hardware or software this month, then here's a cheap way to make your voice heard. Go fill out your user profile, and mention the Apple II as being one of your interests. The more GEnie users that identify themselves as potential customers for Apple II products, the better off we'll all be.

What started me thinking about all this, of course, was KansasFest (a/k/a ICONference). It's not solely an Apple II event, of course, but there were a lot of Apple II people there. It was my first visit, and I hope there'll be a second! It was really a kick to know that there are so many others interested in producing -- and/or consuming -- new Apple II wares.

Most of the KansasFest coverage you'll find in this month's HEY MISTER POSTMAN column is provided by Steven Weyhrich, also a first-timer. I'm glad he posted such great reports on the A2 RoundTable, quoting him extensively makes me miss his presence around here a little less.

We have a Weyhrich spin-off this issue, by the way. Leon Raesly read Steven's POLISHING GREEN APPLES column in our June issue, and penned a rebuttal, reprinted from the NovApple Newsletter with the permission of the author and publisher.

-- Doug Cuff

REPRINTING GEnieLamp

If you want to reprint any part of GEnieLamp, or post it to a bulletin board, please see the very end of this file for instructions and limitations.

[EOA]
[MAI]-----------------------------
FROM MY MAILBOX /
-----------------------------

Letter to the Editor

"""
by Tim Grams
[TGRAMS]
I was pleased to see a mention of GSTape in the June GenieLamp A2, however I would like to comment on some things that Steve Weyhrich wrote.

First, GSTape does not require the RamFAST SCSI card. It will work with the Apple SCSI cards, both Rev C and High Speed DMA if the Apple SCSI manager is installed. The driver that comes with GSTape works with both the Apple and RamFAST SCSI cards.

Second, Steve's problem with the RamFAST driver not being recognized was not caused by renaming the partition names. Rather, he used ProSel to change the names the SCSI driver responds with when asked by GS/OS. This is the "device name" shown in Icon Information available from the Finder. GSTape does not care what your partition or volume name is, however it does need to tell the difference between the RamFAST hard disk driver and other SCSI drivers.

If you have used ProSel to change device names and have trouble getting the GSTape demo to recognize the RamFAST driver, you can do a couple of things. You can re-run the "modify parameters" ProSel utility and set the device names back to their original values. For a RamFAST this is normally ".CVTECH.S7.A" or something similar depending on which slot the card is in and which partition on the drive is being referenced. With GSTape, only the ".CVTECH" is required. You can also temporarily rename the PROSEL.PARMS file in the system folder to something else and reboot the system.

Tim Grams
author, GSTape
A VISIT FROM BRUTAL DELUXE

> When is/are Brutal Deluxe going to be visiting you?

Good question. They (him?) are arriving in SF on Monday morning, and they (him?) plan to call me first thing to set up a time. It has to be Monday or Tuesday, as I'm heading out to KansasFest first thing Wednesday morning.

And, surprise, surprise. I find that Opale is not the only Brutal Deluxe work in progress.

I will say that I'm a little concerned about the language problem. I've been e-mailing with Brutal Deluxe for the past year, and their English skills seem to be almost non-existant. It should be interesting, to say the least.

Joe (JOE.KOHN, CAT28, TOP4, MSG:257/M645;1)

Any day now, their (his?) Opale Demo will show up in the A2 library. It's one of the most beautiful things I've ever seen on my GS!

Did you upload a copy of it too? I sent one up last week, but forgot to turn on Binary II. :( Need to re-up it.

BTW, Olivier dropped into IRC last month and mentioned a few other projects Brutal Deluxe is working on (including a Tinies level editor).

SOFTDISK G-S EASTER EGGS Just thought I'd mention, on the topic of Easter Eggs, that every issue of Softdisk G-S is now published with at least one Easter Egg in the main Shell program (with perhaps some in the other programs on the issue...). I think some of them are pretty good, IMNSHO...

Just trying to keep the IIGS ever more interesting... :)

(I'll be announcing more AWGS Easter Eggs in the SDGS columns in
future issues, BTW).

-G.T. Barnabas (BARNABAS, CAT13, TOP13, MSG:187/M645;1)

SPECTRUM PASSWORDS ON A NETWORK
If Spectrum is on a network then (a) don't store passwords and (b) purchase a site license, unless there is _no_ possibility of two people running Spectrum at the same time.

Storing passwords is a convenience for users on standalone machines in their home; it is a good way to hide the passwords from a casual hacker. Storing passwords in any program on a machine that isn't in a reasonably secure location is a bad idea.

Thanks, --Dave (SEVENHILLS, CAT43, TOP15, MSG:125/M645;1)

ULTRAMACRO 'DIRSORT' LABEL
Someone recently asked me a question in email that I'll answer here for the benefit of all.

Question: "#dirsor doesn't work, do you know why?"

Short answer: Because it doesn't have the correct address.

Long answer: #dirsor is an UltraMacros label that is supposed to represent the address that can be poked to force AppleWorks to display the file listing in the order the files are stored on disk and not the sorted order AW usually displays. UM is substituting the address $2295 for #dirsor. After poking around in the monitor a bit, I found that the $31a2 can be poked to force AW to display the file listing in disk order when adding files to the desktop. The organizer must be in memory before the poke.

start

A:<all:

OA-q esc //MAIN MENU --organizer loaded
poke $31a2, $2c // disk order
rtn rtn >! //add files from current disk

You have a choice at this point of poking $31a2,$20 to restore the default or leaving it alone. As soon as you actually get in a file that code is overwritten. The sorted order will be displayed next time files are added to the desktop.

Although displaying the files in true disk order is faster, whether or not there is a _noticeable_ difference depends on the number of files in a directory and the speed of the computer. On a system with a RAM Fast and an accelerator there may be no noticeable difference.

(S.BEVILLE, CAT17, TOP16, MSG:133/M645;1)

BRIAN PIETRZAK LEAVES SOFTDISK
> the guy who had a lot of input into the development of Don't Forget (Bryan) is gone

I must've missed something...
I knew Jay left for greener pastures, but I _thought_ I heard that Bryan moved to the Mac version of Softdisk. If true, he could still be consulted. If he did leave, what did I miss?

Jeff Carr
(J.CARR20, CAT34, TOP2, MSG:320/M645;1)

>>>>> Bryan did move into Softdisk for Mac, but then he was offered a job in Omaha, Nebraska, and took them up on it. He left Softdisk about a week ago.

David
(SOFTDISK.INC, CAT34, TOP2, MSG:321/M645;1)

FIX FOR OCCASIONAL SPECTRUM "SLOWDOWN" Yes, it sounds like the clipboard problem. The bug isn't with "large" amounts of text, but if the clipboard contains text that references a font that no longer exists. For example, highlight even just one word that's set with Times.12, copy it, then quit to the Finder. Delete ALL your "Times" fonts and launch Teach. Edit/Paste will show garbage because the clipboard is corrupt.

This shows up a lot with Spectrum because it uses an internal "Spectrum.8" font that goes away when you quit (i.e. it does not exist in the Fonts folder). However, that bug apparently does not ever appear if the newest Pointless is installed (which makes me think the system bug is in the Font Manager and not necessarily in the Scrap Manager).

Anyway, we're doing two things to hopefully _avoid_ the bug (since we cannot actually _fix_ it): (1) We're going to provide Spectrum.8 on disk so it can exist in the Fonts folder, and (2) We're not going to make the Scrap Manager calls so often.

#1 should avoid the problem; #2 will lessen the effects if the problem does occur.

As Ken mentioned, the solution is just to copy something else (if you boot to the Finder or some launcher that gives access to NDAs, open the Calculator and press OpenApple-C, then launch Spectrum).

Thanks, --Dave
(SEVENHILLS, CAT43, TOP15, MSG:132/M645;1)

APPLE BRAND JOYSTICKS I can't believe all the positive remarks about Apple's joysticks. Apparently you all were either very fortunate, or didn't use your joysticks much. The sticks themselves were great, and lasted forever. The buttons, however, were (I believe) deliberately designed to stop functioning after only a limited amount of use. The actually circuitry would never go out; rather, the spring between the outer orange button and the electronics would always get compressed/bent/etc., and the button wouldn't make reliable contact anymore (it would if you took the orange buttons out, but that made it rather hard to play with).

I personally knew people who bought Apple joystick after Apple joystick because the buttons stopped working. I listened to computer-store personnel who always tried to play off Apple joystick problems as "kids being hard on the buttons". I even had an Apple joystick myself and experienced all these problems, and discovered that it was just the bad design with the springs that would stop working.
In short, the Apple joystick's buttons were lemons, and I am amazed that anyone can recommend the Apple joystick.

-G.T. Barnabas (BARNABAS, CAT12, TOP29, MSG:37/M645;1)

TIP FOR APPLETALK USERS I just solved a problem that's been annoying for almost six months now, and thought I'd share it with everyone. Talk about traps for young players, AND OLD ONES!

My IIGS has three boot partitions, which I select with a RamFAST, depending on what I'm doing during that session. One of these is a fast boot (ie. very few INITs/DAs etc.) which starts AppleTalk and logs on to my Macintosh automatically and uses AppleShare to gain access to one of the Mac's drives.

About six months ago, the boot process started getting slower and slower, until it got to the stage where it was taking up to 30-40 seconds longer than I thought it should have. I checked the Zip GSX, and for around 30 seconds or so, the cache light was almost hard on. Check the Zip settings! Nope, the AppleTalk switch made no difference. Either did changing any of the slot speed switches. Re-install 6.0.1? No difference. Remove EVERY INIT and DA (including the Apple ones, except for Control Panels NDA and the AppleShare related Control Panels. Same problem.

I didn't have time to look any further, so I forgot about it.

Recently it had been getting worse, so I decided to take another look. I dropped into debug during the "hard on delay" ;-) and found it madly polling the serial ports. Why?

Because my Mac had been reformatted a number of times, the server name had changed. The IIGS was trying to log on to every past server name which I'd used, and was "madly polling" waiting for them all to come online.

Even though only the current name appears in the AppleShare Control Panel, setup data STILL contains the old information! I deleted "ATInit" and "AppleShare.Prep", went in and logged on to the Mac again, and rebooted with the new parms. The IIGS booted to the desktop, with the Mac volume mounted, in under 10 seconds!

Sooo... If you think AppleShare is pretty slow, try deleting "ATInit" and "AppleShare.Prep", reboot, re-logon, and reboot again. Both of these files are in "*:System:System.Setup".

Regards,
Richard (RICHARD.B, CAT9, TOP14, MSG:14/M645;1)

KOALA PAD SOFTWARE? I recently got a hold of a Koala Pad. Unfortunately, there was no software with it. I know that the pad originally came with at least a drawing program. Does anyone know where I can get it? Also, is there any other software available for the Koala Pad?

(T.ABRAMS1, CAT4, TOP4, MSG:207/M645;1)
I think you can still buy a KoalaPad from Educational Resources, 1550 Executive Drive, Elgin, IL 60123 (1-800-624-2926); $89.95 (Fall '93 catalog). Possibly they would sell you the documentation and the Koala Illustrator disk, which accompanies the pad (or used to). When the pad dies (it will), you can still use Koala Illustrator with a joystick. As 8-bit drawing programs go, it's all right.

Since you can use a joystick with Koala Illustrator, I suspect that you can "read" the KoalaPad with the same Applesoft commands you use with joysticks.

I've got the documentation somewhere. Let me look around for it and get back to you in a day or two.

>>> HOT TOPICS <<<

APPLEWORKS 4.0, 4.0.1, 4.0.2... 4.3? > I just returned from vacation -
----------------------------------------------- > any news on the release of AW 4.1?

Sure as comets hit Jupiter, 4.1(3) will be out really soon now. There's one problem with a timeout that needs to be fixed before we release it.

Quality Computers --- Power for performance
(QUALITY, CAT42, TOP2, MSG:352/M645;1)

>>>>> Great news! But, uh, what's the (3)? :
"""
(T.SMITH59, CAT42, TOP2, MSG:353/M645;1)

<<<< The (3) is there because the next AppleWorks will be 4.3. We've all known it as 4.1, but to avoid confusion between 4.0.1 and 4.1, we decided we should skip a version number. I'm sure the version police will come down on us soon and our National Health Care plan will be revoked:) (I hope)

Quality Computers --- Power for performance
(QUALITY, CAT42, TOP2, MSG:356/M645;1)

APPLEWORKS _5_! AW4.3 (bug-fix update) has been finalized and will be released shortly (check your next issue of TimeOut-Central, if you don't see it elsewhere first). AW5.0 (an upgrade with some terrific new features) was _officially_ announced by Randy (and Quality) for expected release in October.

| -(+)-
| ...Will
| (W.NELKEN1, CAT44, TOP6, MSG:36/M645;1)

APPLEWORKS 5 -- WHAT TO EXPECT > I wish we could get some info on any new capabilities of AW 5.0
A _partial_ list:

SS

- memos (cell notes)
- dynamic @Alert (revaluates each recalc)
- new @Today function

DB

- background text in single record layout. You type in anything you want
in normal, inverse or MouseText, and the data is overlaid on that
background. You can make cool boxes and flashy screens.
- mixed mode in SRL pops up a scrolling list for the current category. As
you cursor through, the SRL stuff is updated
- DB Pix-style graphics command display single or double hires, PrintShop

WP

- resizable split screens which are "remembered" as you switch around the
desktop. In other words, you could have 10 differently sized windows and
use OA-Q to move from file to file, each retaining their window setup.
- print to screen. Handy for previewing mail merge, varying CPI, etc.
- print Odd or Even. Handy for book printing
- built-in Outliner
- wild cards allow search for T?M to find Tim or Tom.
- find text is remembered even when you switch desktop files

Desktop

- you can pick more than 12 files at a time and the desktop is
automatically switched when full (12 files each)
- improved version of WaitLess built-in

In addition there are various bug tweaks and little new features that
are actually very handy. Some will be happy that the screen blanker delays
are reset by mouse moves. Others will be thrilled that the OA-A command for
file listings now offers a "Reverse" the order option so you can go largest
to smallest, smallest to largest, youngest to oldest, oldest to youngest,
etc. Other new features haven't been finalized or written. We're even still
taking ideas, with no promises.

BTW, some will surely scream and holler that working on AW 5 has
delayed AW 4.3 in some unjust way. Actually, it has accelerated the fixes
in 4.3, since they had to be done in order to create a 5.0 foundation. AW 5
has also provided the financial justification to keep doing those free
updates we hear so much about.

As for cost, it will be cheaper than AW 3 to AW 4, but it's not final
yet. It will come on two 3.5" disks and include a delta manual (changes
since AW 4). It requires at least a 256k enhanced IIe, IIc or IIgs.

(BRANDT, CAT44, TOP6, MSG:43/M645;1)

<<<<< AW 4.0 was late for several reasons which do not apply to AW 5. It
"""""" also had some bugs due to major redesign which is not needed in AW
5, because we allowed for many of the AW 5 features while creating AW 4.
There will only be a delta manual for AW 5 (changes since AW 4), no video,
no fancy packaging, etc., so development time is slashed. Also, there's
more of an agreement between marketing and programming as to what a realistic date is. I fully expect to ship in late September or early October. Most of the tough stuff is already finished now in July.

We're attempting to design AW 5 so that _EVERY_ AW 4-compatible TimeOut app will work without change, but there may be a few minor exceptions. Again, the major structure change in AW was the redesign from AW 3 to AW 4. The changes in AW 5 involve adding new features, not massive redesign of how everything fits together.

(BRANDT, CAT44, TOP6, MSG:56/M645;1)

>>>>> Randy and I also discussed including the AfterWork "engine" and a couple of blanker modules in AW 5, and releasing a new batch of modules shortly after AW 5. Could be fun. B) I'm not sure if Randy will have time for that, though. It'll need a little tweak to the Screen Blanker preferences screen, for sure.

(II.ALVIE, CAT44, TOP6, MSG:57/M645;1)

REPORTS FROM KANSASFEST Howdy from ICONference, at Avila College in rainy Kansas City! I've had a chance to meet several A2 acquaintances in person; in fact, met Nate Sloan and Jim Z in the elevator, where Jim's Powerbook was plugged into the phone outlet, allowing him to conduct his RTC as he moved from 1st the 4th floor and back again.

More when there is more to say...

Steve Weyhrich <IX0YE>---<

(S.WEYHRICH, CAT44, TOP6, MSG:13/M645;1)

<<<<<< Here's a summary of Day 1 (long post warning, whatever good THAT does)

The talks for each of the two days are split up into two sessions, with a choice between two topics for each session. The one exception is that today and tomorrow there is one large session. Here is the schedule:

9:15-10:15

UNIX and the Internet Soldering For Beginner's:
Jim Maricondo Which End of the Iron is Hot?
Dave Ciotti

I attended the Unix/Internet session, and got a brief intro into what it offers and can do for me.

10:25-11:40

Launch Of The Mensch Computer
Bill Mensch & Nick Dazio

This was a presentation by Western Design Center, the current licensors of the 6502, 65c02, and 65816. The primary topic was an introduction of a computer that Mensch has designed to make use of a new microprocessor that he has designed (the 65265), but it began with the background of just how far reaching the lowly 6502 and 65816 have become. The 65c02 is used in some of the new implantable defibrillators (devices similar to pacemakers, but for those whose hearts go frequently into dangerous rhythms, it shocks the heart back into a normal rhythm); in
closed captioning devices on newer televisions; some of the intelligent cable TV boxes; the mouse port on the Macintosh computer; certain stereo systems; and Ricoh fax systems. The Super Ninetendo, of course, uses the 65816, but also the Franklin Digital Book system uses it.

The Mensch computer itself does not sound too exciting. It uses the new 65265 chip, which is a 16 bit chip with many opcodes similar to the 65816, plus some built-in ROM code that assists it in running quickly and efficiently. The computer has a 16 line by 40 character LCD display; the keyboard uses a low power chip built into it; so the entire computer can run easily for hours on batteries.

Mensch is trying to position this computer as a "consumer" computer, not a game computer or a business computer. He wants it to be something that is so simple that ANYONE can use it, without using the manual. It has built-in printer port, modem port, keyboard serial port, and "host" port (which allows it to be connected to a "more powerful" computer, be it Apple II, Mac, or PC, or to a dial-up host, such as an Internet or BBS node). The connectors for those serial ports are the same as those used to plug your telephone to the wall outlet. Also, if a user doesn't want to use a keyboard, it accepts a Sega-style game controller as an input device.

The software for the Mensch computer would be on PCMCIA cards, and one example would be a 10 meg card (that looks as thin as a credit card) which could hold an operating system, an application, and the files created by the user for that application.

The market he is looking at is the low-end home and consumer market; those who could use something less complex than a palmtop, but more than a pocket organizer. In the Far East, in countries like Korea and China and Japan where personal computers have made considerably less inroads than they have here, there are companies that are very interested in the Mensch computer. They don't intend it to REPLACE Macs or PCs, but rather to supliment them.

Examples of things it has been tested as include consumer applications like e-mail, digital message center (one that would bypass the Internet or operate separate from it), dictionary, directory assistant (like the Internet utilities Archie, Gopher, etc, work), organizer, programmer's hobby, games, control projects (he gave an example of fingerprint recognition associated with use of an ATM card);

Much of Mensch's reason for speaking with our group today is that he needs programmers to design and write applications for the Mensch computer. IIgs programmers would be perfect for this, since they already have familiarity with the architecture of the opcodes and microprocessor (similar as it is to the 65816).

MY OPINION: With a $900 price tag, it is not likely to attract much consumer attention, as it is not as flashy as a Mac or 486 or Pentium computer, though it could possibly be just as powerful. It would not run with off-the-shelf software, so those who ARE computer literate would likely ignore it. It does not offer anything that is significantly different from what you can do with an already existing computer, and it does not have (yet) a compelling application (that is, something that is SO GREAT that people have to buy the computer just to use that application. On the Apple IIe/IIc, it was AppleWorks. On the Mac, it was desktop publishing software. On the Super Ninetendo, it was Super Mario World. On
the Sega it was Sonic the Hedgehog. Etc, etc).

If the price was significantly decreased, and a business in a large city decided to offer a videotext service using these as access machines, it might achieve a foothold, especially with its ability to interface with an already existing computer. It really should be available in a handheld format (like a digital book) that has the option of plugging in a keyboard or transferring data between the MC and a more powerful PC (Apple II, Mac, or IBM).

The Mensch computer will be built by a plant that is under construction in Africa, and will then be the first computer to come out of that continent.

Applications where I believe the 65265 chip will likely have more success than will the Mensch computer will be portable pocket computers; countertop computers with expandible features; and multifunction telephones.

11:45-12:45

Lunch! The entertainment for lunch was our own Editor.A2, Doug Cuff leading a rousing game of Computer Jeopardy (aka, Computer Trivia). He was so generous in his prizes that he even awarded points to people in the audience when the questions could not be answered by the contestants.

1:00 pm

MACINTOSH SYSTEM 7.5 OVERVIEW DEVELOPMENT TOOLS FOR THE MENSCH COMPUTER
Mike Pruneau, Apple Computer Jihad Jaafar & Larry Hittel

Here we saw some of the features in the beta release of System 7.5, which is coming soon, with System 8 in the next year or so. It was demonstrated on a PowerMac, with 16 meg of RAM. He gave an overview of Apple's plans for the rest of the 90's. They admit that with as much power as the Macintosh offers today, it STILL is too hard for many people to figure out. There are STILL people who will NEVER read a manual that explains how to use their computer, even if the manual is written in as clear and concise fashion as possible. Furthermore, there will be a continuing revolution in communication, with Internet-->"Data Superhighway", Multimedia-->Interactive TV, etc. He made a good comparison: "If it is easy enough for my mom to use without being told how, it is easy."

System 7.5 has 70 new features, some of which were demonstrated. It is compatible with nearly everything out there now. Offers a built-in PC exchange capability, in which an MS-DOS formatted 1.4 meg disk inserted into a SuperDrive will appear directly on the desktop and be able to be opened, etc, just like a Mac disk (and as some currently available extensions allow you to do).

Mac "Easy Open" is a new extension that determines or asks which application should open a file if it can't be figured out.

Drag and Drop is an enhancement on Cut and Paste. Instead of having to select something (an object or text), Cut/Copy it to a clipboard, and then Paste into another document, you can now select it and just drag it
Many of the features of the Finder are now scriptable (in fact, this is how the advanced help feature works, which is significantly better than "balloon help" was).

You can lock up to two folders from prying eyes.

You can implement "Sticky Memos", which look like post-it notes stuck to the screen.

It will support up to four 4 Gigabyte volumes.

There will be a thread manager, for better multitasking.

There is a graphic calculator desk accessory that was impressive. It will take an X/Y/Z (three variable) equation, and display its graph in a window, even doing rotation of the shape that the equation defines. On the Power Mac it executed VERY quickly, almost immediately.

System 7.5 will also implement a better FindFile (similar to GS, in giving the locations of matching files with their pathnames, but with more capabilities than the GS version).

You can now print a document by dragging the document onto a LaserWriter icon on the desktop (just like the Lisa used to do).

The minimum recommended memory needed for System 7.5 will be 8 megs, JUST for the system (if you install EVERYTHING), and they recommend 16 megs if you want to do any serious work. It offers features that are, admittedly, available now through inits and extensions, but these will be built into the system and should work properly together.

On the PowerMac "power" demo (with a 601 PowerPC chip), he showed a PhotoShop application that had what appeared to be a ball, with tiny bumps (similar to a golf ball), with raised lettering. Using the mouse, you could move a light source anywhere around on this object, and it displayed the shadows properly. The rendering was as fast as it would be in real life, and included the ball changing smoothly from one color to another.

UNIX AND THE APPLE IIGS: GNO/ME
Jim Maricondo
2:10pm

I went to the GNO/ME discussion. Mostly informational, didn't see anything that hasn't already been talked about here on GEnie in the past.

ALL ABOUT THE POWER PC
Mike Pruneau, Apple Computer
3:20pm

I attended the interfacing talk, as I'd already seen some of the PowerMac stuff. Wagner showed how to use the Apple II Plus, IIe, IIc, or IIGs to connect the game port to read or control analog or digital devices. He pointed out that the Apple II is ideal for a dedicated application like this, since it has been around for a long time, and can be obtained relatively cheaply. He then showed some demos of devices being read or
controlled with his IIe.

MULTIMEDIA AUTHORING WITH CD-ROM       LOOKING GOOD IN PRINT
Greg Nelson                            Joe Kohn
4:30pm

I went to Joe's talk. He talked about the hardware, software, and
page layout considerations to make when doing desktop publishing with an
Apple II or IIgs.

These are getting shorter, as I am getting tired or typing (and you
are likely getting tired of reading).

More tomorrow...

Steve Weyhrich <IX0YE>---<
(S.WEYHRICH, CAT44, TOP6, MSG:19/M645;1)

>>>>< Chris Budewig, aka Kevin Flynn, reporting live from KansasFest, er,
""""  I mean ICONference '94.

The annual Bite the Bag contest was held tonight and has now
concluded. For those of you who don't know, Bite the Bag is a game of
balance and leg strength where you must pick up a paper grocery bag with
your teeth. The trick is that the only part of your body that may touch
the ground while doing this is one of your feet. Each round, everyone
takes a turn picking up the bag. Then about an inch is torn off the top
all the way around the bag and everyone who had successfully picked it up
the previous round gets to try again.

Competition was hot and heavy as, round after round, the height of
the bag slowly reached the floor. The final round consisted of seeing
which of the three remaining contestants, Roger Wagner, Paul Zaleski, and
Joe Wankerl, could pick up three-inch diameter section of the bottom of the
bag the fastest. And the winner? Roger Wagner won the crown from last
years winner Paul Zaleski.

...Chris           (K.FLYNN, CAT44, TOP6, MSG:22/M645;1)

<<<<< More from ICONference..

"""
Last night at the buffet and celebrity roast, Tom Weishaar announced
the new executive director for ICON, Sherry Wonning. She is a local
person, with some background in computer-related training, and a degree in
communications.

The roast was of Mike Westerfield, and the roasters were Bill
Heineman, Greg Templeman (Softdisk G-S), Jawaid Bayzar, Roger Wagner, Nate
Trost, and finally Tom Weishaar.

Beginning this morning...

09:30am
KEYNOTE ADDRESS: CONFESSIONS OF A PRIMORDIAL PROGRAMMER
Randy Brandt

Randy Brandt spent most of the time giving his personal computing
journey to the present, and then with the story getting a bit long toward
the end, he finished by saying that he was officially announcing the
AppleWorks _5.0_ would be released by the first of October. He didn't have
much time to demo features (that _I_ had a chance to see), but said that
details of the planned enhancements would be forthcoming. Much excitement
by all!

PREVIEW OF MICROSOFT WINDOWS 4.0 THE INS AND OUTS OF TELECOM SCRIPTING
Pat Wilson, Microsoft Nathaniel Sloan
10:40

I was curious about the new Windows, as I have used 3.1 on the
computer at my office, so I attended the Microsoft session. There was
originally supposed to be a non-disclosure agreement signed, but there were
so many details about Windows 4.0 in the Kansas City paper this morning,
the Microsoft rep didn't feel there was any point to an NDA.

Much of what is being done with Windows 4.0 will be in making it work
more like the Macintosh desktop (though that is not what they state, that
is the end result). It will now support long filenames, up to 256
characters, while somehow retaining backward compatibility with older
versions of MS-DOS; that is, a Windows 4.0 disk with a l-o-o-o-n-g
filename will still be easily read by a MS-DOS 2.0, as the file will have
two names, the original 8 and 3, and the new long one.

They are also working on Plug & Play architecture (removing the need
for complicated configuration files), again, very similar to what the Mac
allows. In face, the rep used the same "my mom should be able to do it"
analogy that the Apple rep used yesterday.

It will provide more powerful multitasking.

Minimum requirements will be: Needs VGA or SVGA display, HD floppy,
386 or better processor, 19 MB of hard disk, and 4 MB or RAM.

LUNCH
11:45am

HYPERSTUDIO AS A DEVELOPMENT ENVIRONMENT MICROSOFT OFFICE FOR WINDOWS, I
Roger Wagner Pat Wilson, Microsoft
1:00pm

Roger was entertaining as always. He gave a brief background of
HyperStudio, and pointed out that the program is very usable WITHOUT having
to read the manual. He announced that in January they plan to release a
Windows version of HyperStudio, and that stacks from the Mac version (and
presumably the GS version) will be directly usable on the PC version.

They've had a fair amount of success in getting the program into the
Macintosh community without getting eaten up by sharks, as have other
companies who have ventured out of Apple II waters. For example: McGraw-
Hill wanted a 40-unit multimedia educational series to produce. They chose
HyperStudio to do it, just because it WAS easy.

Wagner pointed out that education has been an excellent market for
HyperStudio. Even though sales in that market are slow to get started, a
product purchased by a school will usually be used for many years, because
they can't afford to change things every few years. Furthermore,
HyperStudio was doing color and sound multimedia before HyperCard Mac and
even SuperCard on the Mac could do it. Therefore, HyperStudio had the advantage of getting started before the others could get in.

Another commercial application of HyperStudio as a tool for education has been Texaco. That company has made use of HS to develop some educational presentations about use of methods of analyzing earth to look for oil. It finally gave them a way to explain this difficult concept understandable to people, even to engineers, that had problems grasping it. The animations from that stack are going to show up in a PBS program about the topic.

Wagner also demoed a stack that had someone's resume' on it, where the person had used HS to make a stack that scanned pictures of the books he had written, photos of the classes he had taught, etc. It was very much an eye-catching presentation, and would certain stand out over others that were only on paper.

Wagner has himself used an Apple QuickTake camera to take photos of people at ICONference, and plans to show his stack later today (maybe even right now).

During his presentation, Nate Trost & another crony came in and shot Wagner with nerf guns. However, undeterred, Roger continued his talk.

They do plan on getting an updated version of HyperStudio GS out, but have to find someone to help do the programming work.

QUICK CLICK CALC WITH PUBLISH AND SUBSCRIBE PROGRAMMER DETAILS
Mike Westerfield
2:10pm
MICROSOFT OFFICE FOR WINDOWS, II
Pat Wilson, Microsoft

Westerfield pointed out that a spreadsheet for the IIgs was reasonable to do now, especially since AWGS 2.0 isn't going to be appearing any time soon.

Features:

True split screen. There can be a _billion_ cells (limited by available memory). It can read AW 3.0, and will be able to read 4.0 (and 5.0) spreadsheet files. QCC cannot directly read AWGS spreadsheet files (because the format is not known, even to Claris, and has not been documented anywhere), but AWGS SS files can be exported to text or DIF, which CAN be read. QCC can do everything that AW3.0 SS can do. It can EXPORT to AW3.0 as well.

Data can be encrypted. The size of the spreadsheets can be limited to a specific size (no more than 100 rows and 10 columns, for example).

It has a neat graphing function, that does pie charts, bar charts, line charts of various types, will plot two kinds of data side by side. Line graphics can do "fits" of data to a line.

Colors can be changed on single cells, and not on the entire sheet (as with AWGS). Also, the height and width of individual cells (columns and rows, actually) can be modified to allow larger fonts, etc. to be in those cells.
The "publish and subscribe" feature automates copy and paste. The difference is that the changes from one SS will always be linked to make associated changes in the other documents that are subscribed to that original SS. It does it through the use of FILES, which means that the updates are available any time the subscribing file is opened.

Also does cell formatting by grades (A,B,C,D, etc) and let you do calculations on those letter grades (i.e., "B- + 1 = A-"). Can do date and time math.

"Cell notes" are available for any cell to remind you what a cell is for or does. (This is also a feature planned for AW 5.0).

Cells can be have lines drawn around them in varying thicknesses.

What does the future hold? It depends on the response to THIS product. There will be at least TWO other programs coming out, probably by the end of the year, that will help determine whether there will be further products. They would like to do further productivity products, but depends on whether or not there is enough response to THIS (and THESE) products.

If you buy, and don't like, it can be returned in 30 days.

ALL ABOUT THE INTERNET WAY COOL AND WAY CHEAP MACINTOSH
Joe Kohn Bill Lynn
3:20pm

Kohn has all the fervor of an evangelist in his presentations on the Internet. He concentrated on the "Internet for Dummies" approach, stating that all you REALLY need is to access the World Wide Web, through Lynx (for text-based computers, currently including the Apple II and IIGs), or Mosaic (for graphic based computers, Macs & PCs).

Because of the power of the WWW, Archie, Gopher, and Veronica (Internet search tools) are obsolete (according to Kohn).

Kohn says that you should imagine what you could do if the Internet was on your computer, accessible through a HyperStudio or HyperCard stack, with the power of 10 trillion stacks strong.

3D TECHNOLOGY FEATURING 3D-LOGO PROGRAMMING THE NEWTON
Mike Westerfield Josef Wankerl
4:30pm

Westerfield demoed what 3-D Logo does, and also discussed the use of HyperLogo on HyperStudio. HyperLogo is the default language on HyperStudio Mac and will be the default on HyperStudio PC.

Obviously, the meetings which I discussed above are the ones I attended. Now, off to see the hands-on demo of Lynx...

Steve Weyhrich <IX0YE>---<
(S.WEYHRICH, CAT44, TOP6, MSG:25/M645;1)

>>>>>> The Mensch Computer will never run Apple II (8 or 16-bit) software. Bill Mensch said that he had thought about it, but then
decided that he should "only look forward, never back," or something to that effect. In the end he intentionally decided to leave out features that would be necessary for it to be at all compatible with Apple II software.

In my opinion, the Mensch Computer itself has no market, especially if he insists on calling it a "computer." With that label, people are going to be comparing it to full desktop systems and laptops, and in all respects it will come up short. On the other hand, the CPU that it uses, the 6265, is in my opinion very well designed and lends itself to many better uses. It's a great low-power semi-RISC processor that can be manufactured much more cheaply than any other comparable microprocessors (according to the figures he provided).

During the Mac System 7.5 presentation everyone kept ribbing the Apple marketing guy giving the presentation about how some new feature he was describing looked "gee, just like the Apple IIgs...." These included a thermometer bar during boot and the improved Find File dialog, plus a couple of other minor features we've been used to using on the IIgs for years. (Remember when the Mac got a Fonts folder? :)

Mac System 7.5 also offers hierarchical menus in the Apple menu for folders and other various utilities as a standard (you no longer need to use a third party extension for it).

Today we were "treated" to a demonstration of Chicago, aka Windows 4.0. Everyone (except, I suppose, the MicroSoft employee) left the room feeling "it was just like the Macintosh operating system... of six to eight years ago." New features touted included copying/moving files by dragging them with the mouse into folders (what a breakthrough! :), no more eight character file name limititations (though the file names are still translated to eight character names and saved under MS-DOS -- as a result you're NOT going to see the same file names any time you drop down to MS-DOS), and a "task bar" at the bottom or top of the screen that contained the names of the currently running applications (kind of like the Mac's applications menu). The only vaguely interesting thing to me that was mentioned was that printers being accessed through Windows 4.0 would automatically add their drivers to the system, if they were not present. Beyond that I was very bored at that session and spent a large portion of my time there trying not to fall asleep.

Mike Westerfield gave a quite interesting overview/demonstration of his new Quick Click Calc spreadsheet program. He also gave technical details of its publish and subscribe features and handed out disks filled with documents about it and some sample source code. The technical specs and notes will be available in A2Pro shortly, but not the same code. To get that, though, all you'll need to do is ask Mike for it directly. He just wants to keep a bit better track of the distribution of the source code (especially since it was taken directly from the Quick Click Calc source itself).

Tonight a huge group of us went out to see the movie "True Lies." For a generally mindless acion flick with lots of violence and general carnage, it was great.

-= Lunatic     (:)
(A2.LUNATIC, CAT44, TOP6, MSG:26/M645;1)
KANSASFEST WRAP-UP Stay tuned to a Bulletin Board near you for information on "KansasFest 94 The CD" I took about 100 pictures at the fest and am having them copied onto a photo CD as I type. Once I get them back and have a rough estimate on how many I have to order I will post the information here. Developing the pictures and cutting the first CD will cost about $80. I hope to make CDs available in the $20 range. If the Photo Shop wants too much for the copies I will look into other means of reproduction.

Let me know if you are interested.

Bear (BINARY.BEAR, CAT44, TOP6, MSG:67/M645;1)

>>>> I'd be interested in one of those PhotoCDs from KFest, with the further request that I'd like to run one or two pictures from the CD in II Alive. (Hopefully they will all have captions so I know who to ask for individual permissions.)

(II.AlIVE, CAT44, TOP6, MSG:75/M645;1)

>>>> Well I just got home from Kfest yesterday. This is the first time I was able to attend. To tell the truth, I was a little bit apprehensive about attending when I knew no one at all in person, only some by name.

Now that I've gone, I'm very sad it took me so long to go. I can only wonder what previous years were like. Anyway to say I had a great time would be an understatement. I've made friends with many people in only a few short days. I enjoyed all the sessions that I attended. I loved all the ridiculous games though I was just a spectator. And I managed not to miss as much sleep as many!

Thanks to everyone who worked on Kansasfest. I'll never forget it.

Joyce (J.SULLIVAN27, CAT44, TOP6, MSG:69/M645;1)

GENie: Send e-mail to ByteWorks or visit us in A2, Category 45.
Internet: Send e-mail to MikeW50@AOL.COM

The Byte Works, long the dominant company for Apple II development
tools, has entered the productivity tools arena with a new Apple IIGS spreadsheet. Quick Click Calc is the perfect solution for:

* Grade books
* Balancing checkbooks
* Weekly, monthly or yearly budget plans
* Figuring car or house payments
* Savings plans for college or retirement
* A super calculator
* Charts and graphs
* Tracking coin or baseball card collections
* Statistical analysis

Look What You Can Do  
Spreadsheets are amazing tools. In fact, it was the spread sheet that really got the computer revolution going back in the late 70s. Why? Because the spreadsheet was the first tool on a personal computer that just worked better than any of the other ways of doing the same job.

Usually, when you compare spreadsheets (or any other program), you quickly get into a feature war. This spreadsheet has 53 functions, and that one 75, and so on. Who cares? Sure, Quick Click Calc has the glitzy features found on the Mac and PC, but the real story it what you can do with them.

For example, you can keep a grade book on a spreadsheet. Unlike a paper grade book, a computer grade book can do things like average your grades. Quick Click Calc knows that (A+C)/2 is B, for example. You can draw a pie chart showing how many people are getting As, Bs and Cs, or draw a graph showing how Ebenezer is doing at working and playing well with others.

Of course, with a computer grade book, there's always the possibility that Cain will hack into the computer to change Abel's grades. But not with Quick Click Calc, because you can protect your files with password encryption. Without the password, the file just can't be read.

Our Manual Tells You How, Not What  
Our manual helps you use Quick Click Calc for it's abilities, rather than features, too. Oh, we have the catalog of features that you need in any good reference book. But we also start off with a chapter that shows you how to use a spreadsheet, too.

Using our spreadsheet cookbook, you'll learn by doing, and create your own checkbook and grade book in the process. You'll see how to use a spreadsheet as a super-calculator to calculate loan payments for your dream house.

Little Things Mean a Lot  
If you've used spreadsheets, you know that little things can be very annoying. For example, scroll bars are supposed to help you get from one end of a document to another. The problem is that most spreadsheet programs have 1000 or so rows and 700 columns, but most spreadsheet documents only have a few dozen rows and columns. The scroll bar gets hard to use. Quick Click Calc lets you set the size of the spreadsheet. You tell it how big the spreadsheet actually is, and suddenly the scroll bars make sense for your spreadsheet.
Being Two Places at Once

Whether you want to keep a multi-row header in one place or compare two widely separated parts of your spreadsheet, you'll quickly get to like our true split screen controls. They literally cut the spreadsheet in half, so you can scroll two different parts of the same document in the same window.

Spreadsheets that Communicate

Quick Click Calc introduces one of the most useful new features to come out of Apple to the Apple IIGS: Publish and Subscribe. And a spreadsheet is the perfect program for it, too.

Publish and Subscribe is like copy and paste, but it works between documents. You can create separate spreadsheets for your checkbook and your spouse's, then create a third spreadsheet for family finances. With Publish and Subscribe, the family finances spreadsheet taps into all of the other spreadsheets that you use for finances. When you enter a new check in your checkbook spreadsheet, then open your family finances spreadsheet, you see the new totals—without manually copying numbers from one spreadsheet to another!

Formatting is Everything

Formatting is what makes one document easy to read, while another with the same information is hard to follow. That's why other Apple IIGS spreadsheets can show negative numbers in red. But Quick Click Calc does much more.

Of course you can change the width of a cell, but you can change the height, too. That's important, since you can set the font cell by cell, using big bold fonts for titles, and small fonts when you want to see a lot of information in a small space. You can use color, too, both for text and for the background—and you can use different colors in different cells. Heck, you can even get rid of the default grid and create your own, with custom line widths.

Of course, this makes your spreadsheets a lot easier to read, and that's what's important. Just don't tell anyone how much fun you're having when you are supposed to be working!

Say It With Pictures

Spreadsheets are wonderful tools for holding and analyzing information. Modern spreadsheets are also pretty good at displaying it. Quick Click Calc gives you more ways to display your information than any other Apple IIGS spreadsheet—and more than any spreadsheet we've seen at its price on any machine.

You can pick from pie charts, bar graphs, and line drawings. There are several styles and lots of options for each, too, so you're likely to find just the right way to express yourself.

You might be surprised at just how many ways you can display information. Lots of spreadsheets give you simple bar graphs or line drawings, but Quick Click Calc lets you plot multiple data in more than one dimension. A bar or line graph can display more than one thing, so you can compare information with a graph. Some spreadsheets limit you to a single dimension, but Quick Click Calc plots up to 3 dimensions at once. And you can even fit a line or surface to scattered data points using liner regression!

Quick Click Calc is the perfect program for all your number crunching and graphics needs. Get yours today!
The Byte Works   We're the Byte Works, famous for our programming tools for the Apple II series of computers—and now for our productivity tools for the Apple IIGS, too!

Founded in 1980, we have a long history of serving the Apple II community. We started with ORCA/M, a macro assembler that is one of two programs ever to earn a perfect rating from Peelings II magazine. We went on to write APW, Apple Computer's standard programming environment for the Apple IIGS. We've brought you dozens of other programs, too, like ORCA/C, the award winning C compiler; ORCA/Pascal, the only commercial object oriented language for the Apple II; and our Toolbox Programming courses, which have introduced thousands to the world of Apple IIGS toolbox programming. And don't forget HyperLogo and 3D Logo, our fun, easy to use programming languages that can actually show 3D pictures on any color Apple IIGS!

Look for more innovative, fun, useful programs for your Apple IIGS for us in the months to come. We're one company with a long term commitment to our Apple IIGS customers!

Ordering   We accept Visa and MasterCard orders online or by phone, and personal checks or school purchase orders by mail.

Please include $5 for shipping in the U.S. and Canada. For credit card orders, we can charge exact shipping for our overseas customers. If you need to know overseas shipping in advance, send your name, address, what you are ordering and how you want it shipped (air or surface), and we'll be happy to calculate the shipping charges.

Distribution   Please give a copy of this to everyone you know! Feel free to use it in newsletters or catalogs, or to post it on bulletin boards or online services.

For a printed product brochure with pictures and a special update offer, send us your mailing address. Ask about our product list showing other Apple IIGS programs, too! We'll also let you know about other new Apple IIGS programs and special offers in the months to come.

This may be a bit technical for some, so if it is, keep in mind that I'm discussing gritty details. _Using_ Publish & Subscribe is very easy.

There are three documents involved in the process of publishing and subscribing: The publisher, the subscriber, and the edition.

The publisher is the document that creates the information other documents subscribe to. The edition is the file created by the publisher; the edition works sort of like a clipboard file, saving information "copied" from the publisher document. The publisher document updates the edition file each time the publisher document is saved.

The subscriber "copies" information from the edition. The subscriber copies the information each time you open the subscriber document.

The effect, then, is that the information is moved between the
publisher and subscriber each time the documents are saved or loaded. You can also force the update sooner.

Internally, an edition file is basically some header information and a scrap, just like a scrap you would use for copy and paste inside any normal desktop program.

Since the edition information is placed in a separate file, you don't save disk space. The subscriber also keeps a copy inside its own document, just in case the edition isn't available for some reason. The advantage to using a separate file is that you don't have to have the entire publisher document available to update subscribers. I could, for example, publish information to an edition on a network server, and your subscriber document can subscribe to the edition even if my computer, with the original information, is turned off. My original document can be encrypted, too, yet you can still subscribe without a password.

Publish and subscribe is not hard to implement in any program that supports Copy and Paste with the Scrap Manager, but it isn't done automatically, either. You won't be able to use Publish and Subscribe with AppleWorks. I will, of course, support it with any productivity programs we create.

For even _more_ details, come to my session in KansasFest. If you won't be in Kansas, watch A2Pro, where we will probably do an RTC on Publish and Subscribe.

Mike Westerfield   (BYTEWORKS, CAT45, TOP2, MSG:35/M645;1)

<<<< The question came up in an e-mail message as to just how I planned """" to handle updates to QCCalc. The answer should interest any of you who have bought QCCalc, or who are seriously considering it.

Labarski's Rule of Cybernetic Entomology: "There's always one more bug."

My correlative: "There are more of them now than there will be when the product has been out for a few weeks."

It's inevitable that some bugs will be found, especially right after a new program is released to the public for the first time. My policy for QCCalc is simple: If you report a bug before the first update is released, I'll fix it free and fast and get the fix to you ASAP. The first update will be free through a variety of means, and won't cost you any more than a nominal postage fee in the absolute worst case. If there are still a significant number of bugs reported after the first update, I'll probably repeat this cycle as needed until things settle down.

To give you an idea how this worked in the past, this is also the policy I used with 3D Logo. In that case, with one or two exceptions, a bug fix was on the way to anyone who reported it within one business day of the report up through the first update release. Our free distribution methods for the 1.0.2 update were liberal enough that I don't think many people (if any) paid a dime for it.

This policy reflects some basic facts of life, like the fact that there will always be _some_ bugs, and especially so for a program on the Apple IIIGS, where the smaller number of users means testing can't be as
extensive. (For example, Borland C had more backorders when it shipped than the _total_ number of compilers for _all_ languages I've ever sold! I can't afford to test like they do-- or like they should.) I also don't think you should have to pay for bug fixes, but that has to be tempered by the fact that I don't charge Microsoft prices.

The message to you, then, is don't be afraid to buy early, but be sure to report any bugs you see so you get the fix right away!

Mike Westerfield (BYTEWORKS, CAT45, TOP2, MSG:52/M645;1)

>>>>>> I saw Mike Westerfield's demo of Quick Click Calc at KansasFest and was absolutely ecstatic! It does the things I really needed in a spreadsheet. There are vert. & horiz. split windows, changeable font sizes, you can change the number of rows & columns, and it has some decent charting options! I had actually thought of using another type of computer to get these features. Now I can stick with my GS for virtually everything :) 

I am happy! :) 

Mark

ps -- Get this program. You won't be disappointed! (IMHO) (M.KLINE1, CAT45, TOP2, MSG:55/M645;1)

NEW FROM BRUTAL DELUXE, NEW FROM KITCHEN SINK Usually, right after publishing an issue of SSII, I try to give myself a short break by not thinking about the next issue. But, Issue #7 is already starting to take on a life of its own.

I spent a very pleasant afternoon yesterday with 50% of the Brutal Deluxe team, and let's just say that I got an incredible eyeful. I marvelled at their upcoming releases, including Convert3200, Cogito (wow! wow! wow!) and Opale. So, I'll be writing up a piece on that visit, and I have a feeling that Cogito will be released by then, so there will probably also be a review of that incredible game.

Kitchen Sink's System II has arrived; it's a Finder-like environment for Apple IIe/IIc systems, and it is most impressive. So, I'd like to let people know about that with a review, and (maybe, possibly, hopefully) a "Such A Deal" offer.

Joe (I don't think I'm in Kansas yet) Kohn (JOE.KOHN, CAT28, TOP4, MSG:276/M645;1)

>>> THROUGH THE GRAPEVINE <<<

BYTE WORKS WON'T STOP WITH JUST QUICK CLICK CALC! > I noticed that you > our productivity packages for the GS." What else is on the way.

Well, that would be telling! :) We have very firm plans (i.e., the project has started) for one more package, and pretty firm plans (i.e., it currently occupies the top of the list for the next product to start, once the current projects are done) for another. Beyond that, about all I can say is that I don't make firm plans any further in the future than the next
product. We are carefully examining the idea of producing a _full_ line of GS productivity tools, either alone or in cooperation with other companies. Whether we really do this will depend on the sales of the first packages and what other opportunities come up.

As for specifically what the packages will be, I'll just have to say stay tuned. And after the two we're definitely planning at this point, we'll choose from a shopping list based on what people tell us they want and how long we thing it will take to produce, so at this point, I have only a vaugue idea myself.

(BitWORKS, CAT45, TOP2, MSG:26/M645;1)

<<<<< A few people have been trying to pry what our _next_ productivity package will be, after Quick Click Calc. Heck, I have to finish the initial marketting on QCCalc before I work too much on the other projects! :}

Without going into too much detail, we are looking into the possibility of doing a complete line of productivity software. If we do this, in the long term, the software would be available across multiple computer platforms, and would have a few other cute features that would make going into those tougher markets make sense.

The way we'll pick the order of packages to do is simple. We look at how many people seem to be interested in the program, how long it will take to develop, and based on past sales and survey results, how many we expect to sell. We then pick the one with the highest profit potential. Sounds calloused, but that's the way we have to work to stay in business. If there is no profit potential, then we don't do the product.

We've already done one small survey for productivity software. When you get your QC Calc packages, you'll see another. And we'll do more in the future.

Here's the programs we listed on our last survey. These are all of the productivity packages we've seriously considered doing so far. This is _not_ a commitment to do any or all of them; I'm sure, for example, that we would never do everything on this list. If you see something that you would like us to consider that is not on the list, though, or see something on the list that really excites you, be sure and let me know.

Mike Westerfield  (BYTEWORKS, CAT45, TOP3, MSG:1/M645;1)

<<<<< Wow! For a new topic, this sure has a lot of posts

"""

Basically, I'm listening. Here's a few random comments, though:

I _did_ come very close to releasing a Draw program a while back, and backed off. Why? There was a very large contengent of people who basically told me that if it wasn't AutoCAD or something similar, forget it. I listened to them, and didn't release the program (which was nearing alpha at the time).
I think I have to make it clear that no program I plan to develop on the GS is going to compete with the top of the line programs on the Mac or PC. That level of program would take years to develop. Also, file formats on other computers are generally not as available as they are on the GS, where there are still serious problems, so I probably won't be able to manage lots of import/export options, either. So, if you won't take anything less than a program that competes with the top of the line programs on the Mac or PC, be sure and say so. I'll listen to that, too.

But then, for $60, you don't get AutoCAD on the PC, either. ;)

What I _am_ planning in all of the programs I do is to create reliable, well-crafted programs that are better than the ones currently available. All will work with the Manager, and will be designed to work together in a reasonable way from that environment. All will be priced in the $40-$120 range.

The list of programs I posted was from an old survey we did. That's why the spreadsheet was still listed. :)

Since that time, I've looked into the QuickTime issue a lot. While it is _possible_ to create a QuickTime player for the GS, it would be so slow on CD ROM based movies that you would not want to use it. From a technical standpoint, the best bet is a movie player that can import QuickTime movies and convert them to a format that is optimized for the GS. _That_ I can do, and may do at some point. Such a program might conceivably offer the option of playing a movie right off of the CD ROM, but I promise the results would not be good enough for anything but previewing the movie to decide if it is worth converting to the GS format and saving on a hard disk. Is this still interesting?

Anyway, like I said, I'm listening... :)

Mike Westerfield   (BYTEWORKS, CAT45, TOP3, MSG:42/M645;1)

TWILIGHT II UPGRADE   We currently plan to release a Twilight II upgrade sometime in August or September, with more effects and features. Watch this space for more information. We will automatically send out update notices to all registered owners, so if you haven't registered, then REGISTER NOW! :-) Price is not set at this time.

<<Jim   (DIGISOFT, CAT13, TOP30, MSG:203/M645;1)

APPLEWORKS GS ADVICE:  KEEP YOUR EYES OPEN AND YOUR MOUTH SHUT!   It looks like we're going to give Seven Hills a shot at this. I probably won't be bringing the AWGS source code with me to KansasFest at this point.

(II.ALIVE, CAT42, TOP32, MSG:617/M645;1)

<<< I just heard that the deal with Seven Hills is not nearly as firm as I thought; I really should not have posted it here. PLEASE do not swamp Seven Hills with calls about AppleWorks GS. In fact, please don't call them at all. If and when this develops into anything solid, Seven Hills and Quality will probably post some form of announcement.

The only reason I really mentioned it in the first place is that some people were expecting to get a copy of the source code at KansasFest, and I
wanted to explain that the fact that I wouldn't be able to pass out that
source code did not mean that anything bad was happening -- in fact,
something rather GOOD is happening!

Again, my apologies to Seven Hills. You'd think after all this time
I'd know better. [BONK] [BONK] (sound of head hitting wall)

(II.ALIVE, CAT42, TOP32, MSG:626/M645;1)

>>>>>  Response to the last few messages

"""
I am not sure why QC posted a message about Seven Hills Software
considering taking on AWGS, but I know they did, so now I need post
something about the situation to hopefully head off a flood of email, phone
calls, and postings to our category!

First a little history: Quality Computers approached us about doing
AWGS a long time ago (even before they had signed a contract with Claris).
We were very interested, but we believed QC had unreasonable expectations
as far as what they wanted done in a given timeframe, as well as what would
be reasonable compensation, and we told them so.

Apparently they felt we didn't know what we were talking about and/or
some other reason(s) because when they finally did get the source code they
didn't come back to us.

Over the next few months they discovered for themselves that what we
had said was exactly true: You cannot get something for nearly nothing, and
especially not when you are demanding it yesterday. The sad thing is, if
they had trusted our opinion they might already have a solid v1.2 (not
v2.0) update.

Flash forward to last week. Last Friday we contacted QC to say we
were still interested in the project. They were interested, so we began
working with the AWGS project manager at QC to obtain source code, bug
lists, etc. so we can decide exactly what we can do with AWGS.

We expected end-users would NOT learn about this so either company
could drop out without disappointing anyone, but apparently someone(s) at
QC thought otherwise, perhaps wanting to give the impression that they were
"doing everything in their powers" to get an update done to AWGS.

Whatever the reason, making any kind of announcement is very
premature considering SHS has not even seen source code, let alone signed a
contract. And now, if nothing comes of it, Seven Hills could look bad. So
let me make one thing perfectly clear:

We _want_ to do the project, and at this point the only reason we
might not do it would be if QC is still unwilling (or unable) to be
reasonable in _its_ expectations of features, timeframe, and compensation.
Basically, our offer will not be unreasonable, so if QC wants the update to
happen, it will.

In the meantime, PLEASE do not write/call/email/post messages about
this. If we agree to do the update, an appropriate, official announcement
will be made.

Sincerely,
Dave Hecker, VP of R&D

P.S. I'm not upset with anyone who already commented here; it's a natural reaction! :) Also, GWIII v1.2 is now in beta testing; we'll make a big announcement when it's almost done. :

(SEVENHILLS, CAT43, TOP3, MSG:124/M645;1)

LYNX OR MOSIAC WITH GNO/ME?  > I know that the only really silly questions > have Internet access but would like to, is lynx included with GNO/ME or > do you have to get it separat?

Lynx is not currently available for GNO/ME, and considering its size, is unlikely to be in the foreseeable future (it's a 450KB executable on a PC!)

Something like Mosaic would actually be easier, since the GS toolbox would provide a good portion of the 'rendering' tasks that Lynx has to do manually.

Jawaid

(PROCYON.INC, CAT23, TOP10, MSG:164/M645;1)

APPLE II CD FROM GERMANY...  I sent the master CD off to the production firm on Friday. So I expect a parcel full of CDs waiting for me when I'll be back from holiday on August 12th.

Udo  - ... just a IIGS freak -

(U.HUTH, CAT20, TOP15, MSG:73/M645;1)

...AND AN APPLE II CD FROM DIGISOFT  The HFS FST is terrible. <deep sigh>

It is really slowing us down on the creation of this CD. It looks like we now will be having 2 HFS partitions and one ProDOS partition, in hopes that two smaller HFS partitions will be handled in a more stable and usable manner by the FST. At any rate, the CD is right about to be premastered. However, the HFS FST's bugs have caused us to lose so much time that there is a chance that the premaster might not be back until after I go on vacation for 3 weeks in August. If this is the case then the CD will not be released until mid/late September, because it takes 3-4 weeks to master and replicate the CD after the premaster is complete and tested. However, if the premaster gets back in time, the CD can be replicated while I am on vacation, and it should ship the last week in August or first week in September...

Sorry to bore you with all these details. Let me lighten it up a bit by giving a few statistics:

106MB of Applications
119MB of disks (selfbooting, non-ProDOS, etc.)
15MB of Sounds
31MB of Stacks
25MB of Text
33MB of TrueType Fonts
2MB of Finder Extensions
3MB of NDAs
35MB of Graphics
5MB of Cracks, Cheats, and Deprotects
2MB of BASIC programs
8MB of AppleWorks
Hello and Goodbye (reluctantly)

My name is Frank Andrews. I was an Apple II programmer for 14 years, and when the clock runs out on my Genie account tonight, that will break my last, formal link with the II line.

Why this message? Not to be maudlin, (I passed that point a couple years ago :-) but rather to know that I went out amongst the community I shared ties with for over a decade.

The Apple II gave a penniless newlywed in college his first professional job, and a couple years later, his first 'real computer'. I saw a horse run across the screen of an Apple /// at NCC (Chicago) in '81, read of Apple II evolution in 'Call Apple', watched windows open up a new world on the Lisa at Applefest San Francisco in '83 and saw and heard the wonder of the GS in '86, (of course I had to buy one :-)

Floundering around the dying threads of Compuserve, I found Genie in 1989. This was certainly the place for the Apple II user and I convinced my parent company to open an account (hence my Lawrence Prods. address).

While the rumors were flying about the death of the Apple IIGS, I ported "The Lost Tribe" over from the PC platform, (256 color graphics and Midi sound), an act of defiance as much as to prove that it could be done.

I still spend time on Compuserve and have visited other forums here on Genie and I have to say, the level of integrity and enthusiasm is higher no place else than in A2 and A2Pro.

Financial and mental pressures have persuaded my to sell my GS now. I HAVE to learn Windows to eat and the call of my GS was a distraction that impinged too much on my acceptance of this new task. If I had a non-programming job, I imagine my GS would serve my needs quite adequately into the next century.

With that last thought in mind I'll close my message.

Emotion and tradition seem to fuel the 'hang on to the GS' cry of the past three or four years and that has its place. But don't let these two items cloud the real issue.

Does the II still serve your needs? If so, then why move on? And if you can stay, support the many fine people who are doing spectacular work.
on the Apple II. Procyon, ByteWorks, Sequential, Shareware Solutions, Quality Computers, Resource Central, SoftDisk, and on and on. This list is longer than the meager offerings at the start of the II's history and is certainly more qualified to provide outstanding products for your needs.

And if you have to move on, remember one thing. It can be argued that we are a product of our environment. You have spent time in what was once the largest and IMHO the most open and honest user communities in the world. The first program that an Apple II ran was once call 'HELLO', and what might have started as a marketing strategy became the attitude and outlook for a generation of programmers and users. This kind of influence can not be denied and will follow you to whatever platform you choose to move.

Goodbye all,

(okay, so I was a little maudlin :-)

Frank Andrews

[*][*][*]

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

-----------------------------GLOSSARY-----------------------------

APPETIZING: Anything advertised on TV.
BOIL: The point a parent reaches upon hearing the automatic "yuk" before a food is even tasted.
CASSEROLE: Combination of favorite foods that go uneaten because
they are mixed together.

CHAIR: Spot left vacant by mid-meal bathroom visit.

COOKIE (LAST ONE): Item that must be eaten in front of a sibling.

CRUST: Part of a sandwich saved for the starving children of:
   China, India, Africa, or Europe (check one).

DESSERTS: The reason for eating a meal.

EVAPORATE: Magic trick performed by children when it comes time
to clear the table or wash dishes.

FAT: Microscopic substance detected visually by children on pieces of meat they do not wish to eat.

FLOOR: Place for all food not found on lap or chair.

FORK: Eating utensil made obsolete by the discovery of fingers.

FRIED FOODS: Gourmet cooking.

FROZEN: Condition of children's jaws when spinach is served.

FRUIT: A natural sweet not to be confused with dessert.

GERMS: The only thing kids will share freely.

KITCHEN: The only room not used when eating crumbly snacks.

LEFTOVERS: Commonly described as "gross."

LIVER: A food that affects genes, creating a hereditary dislike.

LOLLIPOP: A snack provided by people who don't have to pay
dental bills.

MACARONI: Material for a collage.

MEASURING CUP: A kitchen utensil that is stored in the sandbox.

METRIC: A system of measurements that will be accepted only after forty years of wandering in the desert.

NAPKIN: Any worn cloth object, such as shirt or pants.

NATURAL FOOD: Food eaten with unwashed hands.

NUTRITION: Secret war waged by parents using direct commands,
camouflage, and constant guard duty.

PLATE: A breakable Frisbee.

REFRIGERATOR: A very expensive and inefficient room air conditioner.

SALIVA: A medium for blowing bubbles.

SODA POP: Shake 'N Spray.

TABLE: A place for storing gum.

TABLE LEG: Percussion instrument.

THIRSTY: How your child feels after you've said your final
   "good night."

VEGETABLE: A basic food known to satisfy kid's hunger -- but only by sight.

WATER: Popular beverage in underdeveloped countries.

("Home Cookin' is a Family Affair")

Thinking About Online Communications

by Phil Shapiro

[P.SHAPIRO1]

>>> ONLINE LITERARY COLLABORATIONS <<<

*******************************************************************************
At the end of the last century, the invention of the typewriter allowed authors to produce crisp and presentable writing. The surge in book publishing in the 1890s attests to the empowering effects of the typewriter. Now, a hundred years later, creative expression is again benefiting from new developments in technology.

Online communications have revolutionized the way writers write and editors edit. Editors can respond to proposed book or magazine articles within hours of receiving them. Authors can cross-fertilize ideas with other authors worldwide. Complementary talents can produce synergized creations far greater than an individual could produce on their own.

Take the idea generation stage of writing, for instance. The individual who first thinks of an idea may not be the best person to nurture that idea to full blossom. One person may be talented at thinking up ideas but may lack the skills to develop them -- or may not have the time to devote to the entire writing project. Another person might be a great writer in search of ideas. Online technologies can bring these two people together, allowing them to collaborate in ways unthinkable in the past.

Imagine the exhilaration you might feel if one day you logged onto an information service or bulletin board and found that someone had sent you an entire play or novel they had created with your publicly shared idea. The finished play or novel may appear two weeks, two months, two years, or twenty years after your idea was first shared. Once the idea is shared, it becomes a literary "soup stock" for anyone to work with.

Literary collaborations can take place in all literary genres. However, in the coming years the most fruitful literary collaborations may well occur in the dramatic arts. After all, coming up with an interesting idea for a play is no easy feat. The person with an ear for dialogue may or may not possess the creative spark to think of gripping play scenarios.

All these ideas about online literary collaborations jelled in my mind during an incident two or three years ago. A friend from high school confided in me that he yearned to write plays. After writing several dozen short plays, each with its own special charm, he arrived at the conclusion that his calling in life was to be a playwright.

Having little inclination to write drama, myself, I was intrigued by my friend's creative bent. How wonderful that, even today, a young author can develop an abiding interest in the writing of plays. How often do you run into an aspiring playwright?

Today, having read some of my friend's witty and thoughtful dramas, I find myself conjuring fanciful dramatic scenarios in going about my daily business. "What a great idea for a play!" pops into my head at least two or three times each week.

I'm not the person to bring plays to life, though. Others feel the calling of the muse far more strongly. But I'm buoyed by the fact that I might live a vicarious life as a playwright. Perhaps one of my ideas might show up as a full length play in my electronic mailbox one day.

Plays are not the only form of literary expression. Online literary collaborations could have equal possibilities in the realm of prose.
Consider an author on the verge of finishing a brilliant novel, but who has trouble coming up with a satisfactory ending. Or an author who can't get a chapter "right" no matter how hard he or she tries. Or an author who needs a transition from one phase of a novel to the next. Or an author whose monthly computer column stops short of fully developing an intriguing idea.

All these folks might choose to submit a draft of their writing to a select group of online collaborators, and then consider the suggestions that were offered in return. The beauty of online literary collaborations is that the author still retains final say in the wording of the finished piece. He or she can select from the best of the suggested changes that are made. The creative and analytical skills of many persons can then become woven into a multi-colored tapestry of ideas.

Writers have never had it so good. Online communications open up tantalizing possibilities for creative literary collaborations. It will be exciting to watch this current drama unfold. Best of all, we all can become playwrights and actors in this emerging play.

--Phil Shapiro

Apple II Computer Documentation Resources (a2_docs_genielampl.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1617 of 1824
it, because the BASIC was, after all, developed on an 8080 emulation. Paul Allen was given the job of flying from Boston to Albuquerque and installing the BASIC on Ed Robert's Altair. As it turned out, the BASIC worked perfectly.(1)

It should be mentioned that Gates' early experience in programming for the 8080 also led him to promote the development and sales of a CP/M, co-processor card for the Apple II. Microsoft Corporation called these cards the "SoftCard," and they sold more than 100,000 of them for Apple IIs. "SoftCard" owners could not only run their Apple II software, but they could also run Digital Research's CP/M operating system and all of the desktop programs that were being written for CP/M by MicroSoft at that time. With his "SoftCard," Gates hoped to jump onto Apple's Apple II bandwagon by selling some of his software to Apple II owners.(2)

Microsoft wasn't the only company, however, to develop a CP/M card for the Apple II. The same SoftCard technology, which uses the Zilog, "Z-80" 8080 clone, is also found in Applied Engineering's Z-80 coprocessor cards. Additionally, there were other CP/M cards made for the Apple II and also made for PCs. Past and current users of CP/M must number in the hundreds of thousands. No doubt, some of those who are reading this article have a CP/M card which they still use. There were a huge number of programs written for CP/M, including earliest versions of WordStar and dBase, popular programs which never appeared for the Apple II's native operating systems.

Apple II users who are lamenting the discontinuation of the Apple II line should take heart by observing what has happened to CP/M. While it is unlikely that CP/M is still being used on many native systems, it nevertheless continues to have a life of its own on Apple and PC hybrid systems that use a CP/M card. CP/M has its own bulletin board here on GENie where CP/M users can obtain help and advice on software and hardware. A few, very capable telecommunications programs were developed for CP/M that were favored by Apple users.

In the case of the Apple II, continuation of the Apple II's operating systems, user environment and software is probably now dependent upon the development of a software emulation for the Power Macintosh computer or Power PC. Both of these systems use the Motorola RISC (Reduced Instruction Set Computing) "PowerPC" chip. This chip is arguably the fastest and most powerful CPU yet devised for personal computers.

The PowerPC is a 32-bit microprocessor with a "superscalar" design that incorporates three independent instruction pipelines or execution units. These are called the "FPU" (floating point unit), "IU" (integer unit), and "BPU" (branch processing unit). The PowerPC's ability to simultaneously process multiple instructions insures significant speed gains over other chips. Additionally, the chip supports a 64-bit wide data bus and 32-bit external address bus, capable of addressing up to 4 Gigabytes of system RAM. The basic PowerPC chip, the MPC-601, runs at a blindingly fast 60 Mhz in the base "Power Mac 7100/60."(3)

Because of its power, small size, and cool operating temperature, it seems likely to many computer watchers that the PowerPC will gain a significant market share in personal computers over the Intel x86 series processors within coming months. The chip is not only very powerful, but it is especially well-suited for multitasking and for running emulation software at acceptably fast speeds. The first Macintosh versions of this
computer are currently running a hybridized version of System 7, especially configured to make use of the PowerPC's native architecture. In the future, as more and more of the Mac operating system is translated into PowerPC code, software is guaranteed to run faster and faster.

Many programmers on GEnie have expressed their interest in the idea of writing an Apple II emulator for the Power PC or Power Mac, and at least one programmer on GEnie has announced that he is actively working upon a IIgs emulation for the PowerPC. Quality Computers has announced in its publication ENHANCE that they are looking into development of an Apple II emulator. However, as of this writing, no Apple II emulation has yet been offered for sale for the PowerPC architecture.

Software emulations of the Apple II already exist for use on other architectures, however. One emulation, designed to be run on 286 and 386-level PCs, can even be downloaded right here on GEnie (#23169; APL2EM.ZIP). The program reportedly runs DOS 3.3 and uses disk image files for 5.25 disks and drives. It is said to work acceptably with all types of Apple II software except communications software. (There is some speculation that its emulation is based on an illegal copy of the Apple II ROMs, however.) In addition to this PC-ready Apple II emulator, there are commercial versions of Apple II emulators for the Mac. For example, a company called Pegasus Technology wrote and marketed an Apple II emulator called "II In A Mac."

Pegasus sold its "II In A Mac" emulation software for $149. You can download a review of the Pegasus emulator from the GEnie Macintosh software library. "II In A Mac" offered a surprising number of features well before Apple's introduction of its IIe PDS card. These features included emulation of IIe 64K ROMs, 128K of memory with emulation of an auxiliary slot card, emulation of a printer port, a modem port, an 80 column card, and emulation of 5.25" drives. "II In A Mac" used the Mac's native 3.5" drive directly, while "disk image" files were also used to simulate disks in 5.25" Apple II drives on the Mac's hard drive. In order to get software from real 5.25" disks onto the Mac's hard drive, the user was required to use a cable transfer, modem, or 3.5" disk copy methods.

Popular 8-bit Apple II programs such as ProTERM, AppleWorks and ProSel were said to have run successfully under the Pegasus Apple II emulation, although they were reported to be painfully slow on the Mac's 68000 and 68020 Motorola processors. The 68030 processor was said to run "II In A Mac" at an acceptable speed, however.

According to information published in July's GEnieLamp A2, a similar program to "II In A Mac" will soon be available for commercial sale. Like the Pegasus software, this emulation program, called "STM," will also run on native Macintoshes. No announcement has yet been made about a (native) Power Mac version of "STM." The program reportedly emulates a 64K Apple II+ with the DOS 3.3 System Master. While the initial report seems to indicate that "STM" has somewhat less power than "II In A Mac," the emulation offers something that "II In A Mac" did not offer. It will come on a CD-ROM disk, and it will be bundled with a great deal of original Apple II software. Like "II In A Mac," "STM" will use disk image files to emulate 5.25" drives and disks, and it will apparently also use similar methods to the Pegasus software for copying files from native Apple II disks.

In this writer's opinion, STM's marketing innovations may best
illustrate how a future, enhanced Apple IIe (or even a IIgs) emulation might ultimately be packaged and sold. In order to determine how programmer's view the idea of writing and selling a full-function Apple IIe or IIgs emulation for the Power Mac, an informal survey was recently sent to 18 programmers who post messages frequently on GEne's A2 programmer's bulletin board. The programmers were guaranteed anonymity in exchange for their honest responses to the survey. Many of those who were polled are people who have written very popular IIe and IIgs shareware and commercial software, stuff that nearly all of us in the Apple II community possess and use.

The survey asked the programmers to respond to questions about the likelihood of whether Apple IIe and/or IIgs emulators will be produced and sold for the PowerPC. The respondents were asked to rate probabilities for each question from "low" to "high" by marking a Likert-type scale from "1" to "4" for each of the questions asked. The respondents gave an Apple II emulator for the PowerPC an above-average chance of being written and sold. An Apple IIe-only emulator for the Power PC was also given an above-average chance. However, an Apple IIgs emulation was given virtually no chance of being written and sold.

Some programmers felt that no COMMERCIAL version of an Apple II emulator for the PowerPC would be made available for sale, but, they said, a SHAREWARE or FREWARE version would be written and made available for the PowerPC architecture on bulletin board services. This would be done, they predicted, by hobbyists or by others as a "labor of love" and as an exercise in learning the PowerPC architecture. One programmer predicted that Apple Computer, itself, would write and sell a IIe emulation which would be based upon the Mac LC's PDS card and system software.

The survey also asked additional questions about the problems and advantages connected with writing an Apple II emulation for the Power Mac or PC. Three problems were cited most frequently by the respondents. First, most felt that the market for a IIgs emulation was too small to justify the development costs in view of the tremendous time and effort involved in writing the emulation. A IIe emulation was felt to be more likely, however, in view of the IIe's larger potential market and greater simplicity. The next problem that was frequently cited concerned access to Apple's ROM code for either a IIe or IIgs. Several felt that Apple simply would not cooperate with programmers by making the ROM code available from either system for an emulation.

As evidenced by the existence of previous 8-bit, Apple II emulators, the ROM code for an 8-bit Apple II could probably be obtained without Apple's assistance. In addition to those Apple II software emulators we've already mentioned, the Franklin, Laser, and Trackstar card were Apple II hardware knockoffs that also used emulated 8-bit, Apple II ROMs. However, no IIgs knockoff has ever been done, and many of the programmers surveyed felt that the IIgs ROM-based toolset would be very difficult, if not impossible, to duplicate from scratch.

The third and final problem, cited most frequently by the programmers, concerned management of 5.25" disk drive software. Because the best market for a IIe emulator would be public schools, it would be important to provide a means of accessing the huge amount of educational software found on 5.25" disks in the schools. If there were no way to attach and access a 5.25" disk drive to a Power Mac or Power PC system, then the disks would have to be copied. However, much of the educational
software that people would like to run under a IIe emulation is copy protected. Therefore, while disk image files might provide a potential means of accessing this software on a Power Mac system, it may simply not be possible to copy a lot of it, without assistance from the software manufacturers.

Interestingly, the ability to access 5.25" educational software, such as MECC software, was also cited as one important, potential ADVANTAGE of an Apple II emulator. Another advantage, frequently mentioned by the respondents, was that a IIe or IIgs emulation would provide a relatively painless way for some Apple IIe or IIgs users to migrate to the Power Mac or PC platform. Some mentioned that, in the unlikely event that IIgs emulation software could become available, the postscript printing capabilities of the IIgs would come in quite handy for those users whose budgets would not allow the immediate purchase of Mac or Power Mac desktop printing programs.

None of the survey's respondents mentioned the ability to run IIgs game software as an advantage of developing a IIgs emulation. While most of the programmers felt that an Apple II emulator could be sold for no more than the current price of an Apple IIe PDS card (currently about $125-$139), one programmer felt that a full IIgs emulator could bring as much as $200. It seems reasonable to ask, however, if a IIgs emulator might not bring MORE than that, if the IIgs emulator could be bundled together with excellent shareware and commercial game software. A IIgs emulator could potentially expand the selection of games that would be available to PowerPC users and could potentially help to resurrect many games that are no longer being sold. Ultimately, some of the best games might even be ported to native PowerPC code.

Having asked the experts about the likelihood of an Apple II emulator, I would now like to stick my neck out and make my own predictions. First, an Apple IIe-specific emulator will almost certainly appear within the next 12 to 18 months for the PowerPC. It will possess at least as much power, speed and capability as the LC's IIe PDS card and system software. Apple will probably produce the emulator, or they will license their IIe ROM code to another company who will produce the emulator with Apple's guidance and blessings. Apple's purpose will be to provide further incentives to public schools (still a significant part of Apple's market) to begin to purchase Power Macs. If Apple does not produce a IIe emulator, then a shareware version of the IIe will almost certainly be produced.

New software tools, which may make it relatively easy to port system software and applications, hover just over the horizon. They will become available specifically because of the tremendous increases in computing power that are promised by the new generation of RISC hardware now being introduced. One such tool, known as "FlashPort" already exists for IBM's RS/6000 workstation. Echo Logic, owner of FlashPort, is reportedly planning an MPC-601 version of the software, which is capable of translating the binary instructions from software written for one processor into equivalent binary instructions for another processor.(5)

A IIgs emulator will be a while in coming, but it may eventually make an appearance. CD-ROM is fast becoming a computer industry standard, and eventually most computers will come with a built-in CD-ROM drive. Considering that a compact disk can store such tremendous volumes of data, it seems possible that an enterprising software vendor may choose to bundle
several computer emulations (such as the Commodore series, Amiga and Apple IIGs) together with the best of their software on a single CD -- a sort of 'goldie oldies' disk for nostalgic computer users.

While all Apple II users now enjoy the benefits of a mature computer system and software, the future also continues to look bright. New, promising technologies are making their appearance. Software and hardware capabilities are steadily increasing while the relative cost of personal computing is going down with increased competition and sales volume. The Apple II still has a long life ahead, possibly in new, exciting, incarnations.

NOTES
2) Wallace, J. & Erickson, J.  p. 158.
4) It should be noted that because of its unique architecture, even the base MPC-601 probably runs native applications faster than a 60 Mhz Pentium will run its own native applications. Even more powerful PowerPC chips are planned for later this year and next year. Faster, 66 mhz and 80 mhz, versions of the MPC-601 are also currently available.

"Apple"

[EOA]

[Reprinted with permission from the NovApple Newsletter]

Last month [in NovApple] we ran an excellent article on the necessity, and how, to back up a hard drive by Steve Weyhrich [from the June 1994 GEnieLamp A2]. However, let me present an alternative view.

Boy, that title sure is a heretical statement! But before you get all bent out of shape, let's look first at the purpose of a hard drive, and then at the problems with back-up programs, and the process of backing up.

A hard drive is known as a "mass storage device". What does that mean? Simply put, that you can put a large amount of data on it, including programs and data files. But that is only one function of a hard drive.

The major advantage is fast access to either programs or data. So we find two primary purposes of a hard drive, essentially put, can be called speed and quantity. The quantity, however, also increases your vulnerability.

If the hard drive dies, you have "zero" speed, and no quantity of data or...
programs at all!

It is to protect yourself from this catastrophe that the concept of "backing up your hard drive" developed. And for this purpose, several programs have been written. These programs create an image of your hard drive's complete data on floppy disks (of some size) or tape. This has several inherent problems.

1. It wastes a considerable amount of time.

2. You are out of operation for some period of time until you can get the hard drive fixed, and then restore your backup.

3. You are still vulnerable to a "munged" backup that you can't restore.

Hard drives collapse in many forms. It can just mechanically die for a number of reasons. The surface can get bad, or deteriorate (bad blocks). Directories can get munged by whatever means they get munged -- such as cosmic rays <grin> (it does happen fairly often). In some cases you can rebuild the data, in others you have to repair the device. But in ALL cases, you are out of operation until you fix the errors or the device.

If the hard drive must be mechanically repaired, you must send it off somewhere to be fixed. And for this period of time you are down. Back-ups will not allow you to work with any files on them, they can only be used for restoring the data that was on the hard drive at the time that you made the last backup that you have! Thus, if you did a backup last week, the rest of that weeks work, and all of this weeks work, is lost, gone forever into the Great Bit Bucket in the Sky!

However a backup is a very inefficient way to provide yourself with data protection. Let's look at them in principle. All back-up programs copy the entire hard drive (at least once) to prepare a backup image. This includes programs as well as data. But this process means duplicating onto the backup information you already have. (Or at least, should have. You should have made a duplicate of your original program disk when you purchased it, and a second duplicate if updates to the program arrived. Then duplicate the updated copy, leaving the original and its' duplicate unchanged. Thus, you would now have an original and its duplicate, as well as an updated version and its' duplicate. You would continue to do this as long as you received updated versions. And each time, of course, copy the updated version to replace your working copy on the hard drive.)

An aside here. Some programs (most notably AppleWorks) will have been customized with accessory utilities, patches, and so forth that you really wouldn't want to have to do all that over again from scratch (if you can even remember what you added, OR REMOVED)! So these original programs I treat differently(although I have all of the original patches, add-ons, etc.). For a highly modified program such as AppleWorks, I make a special "backup" of that program! Using ShrinkIt, I shrink the modified, complete set from the hard drive onto a 3.5" disk. Actually, I do it twice, to two different disks. Now, if I must restore it, I can simply unshrink that file back to the repaired hard drive, without the fuss of re-patching, re-customizing, etc. I'll tell you more on the use of the program ShrinkIt for protection of you data in a bit.

If you are collecting fonts or graphics or sounds, or other specialty
type files, these would be on the hard drive for fast access. But you should also have an original source disk and a duplicate disk of each source disk on disks standing by.

So what you are really trying to do is protect data files. There are two classes of data files created by the different programs you use.

1. Archive copies of data files previously used, that you really want to keep; e.g. the data files of last year's tax returns in a spreadsheet. It seems evident to me that these should not be kept on a hard drive, where they are simply using up space but never being accessed, but rather archived on floppies (with duplicate disks, or even triplicates, if they are important enough, such as tax files). Whether these are 5.25" or 3.5" disks, these files should be off the hard drive and safely duplicated.

2. So this leaves us only the second class of data files: the data files that are currently in use. No matter what program they are generated from, they need to be on the hard drive for convenient and FAST access. However, if you are following the prudent course of duplicates for all your programs and special files (fonts, graphics, etc.) and have moved your archived files off the hard drive, then you would be doing a backup of your ENTIRE hard drive ONLY to secure safety for these relatively few data files.

There is another way to secure protection for this small group of data files. Make duplicates AS YOU WORK ON THEM onto your floppies. Certainly 3.5" disks are better, but if you only have 5.25" drives, they will also do. Everyone knows the need to save often, and a hard drive certainly makes this easier and faster. It is not much trouble to save these important files TWICE when you "save often". Once to the hard drive, once to the floppy.

If the program that you are using allows some type of macro, a simple keystroke saves your file twice. If not, a method of organizing types of files to floppies makes life much easier. All data disks can have the same name, with the same subdirectory. Just place the type of file on the external paper label for quick identification.

As an example, using 3.5" disks, I name all of these duplicate data disks /T, and under that a single subdirectory called M. This means that if I pick up the "Journal" disk (or "Checkbook" disk, etc.), I still save to the same location "/T/M". This then becomes my protection. By saving twice, first the hard drive, then the floppy (at pathname /T/M) I have secured almost absolute safety.

Actually, what I do, since these data files are critically important to me, is to save them three times -- first to the hard drive, second to a floppy disk paper labeled "Journal", and third to a floppy disk paper labeled "Journal.Dup". Both disks, of course named "/T", with a subdirectory named "/M". So the second saving location for all disks becomes "/T/M".

I have saved hours and hours per week, and many, many disks, for the cost of a few seconds and a few keystrokes! If my hard drive dies, all I need to do to continue working is use the floppies as my primary disk source. No waiting weeks or more unable to do anything until the hard drive is returned! When it does come back, I can rebuild the programs and
data on the hard drive as before (or change the organization if I want).

Most backup programs have an inherent weakness. They are dependent on the quality of the disk (or tape) you did the backup to. If there is a bad block (or even file header) on the backup, most will just die. And there goes your backup! No more! Kaput! Gone forever. Even though the ProSel-16 backup utility does have a recovery algorithm, it can still fail. And if you are not on a IIgs, the 8-bit programs do not have such a protection. Most backup programs do not allow a partial backup (or where they do, it is very awkward). And, of course, you have to purchase most of them.

But I don't want to do all this saving to floppies. I purchased the hard drive for the speed and single convenience. Is there any other alternative? Yes, at least it seems so to me. Another way is to make a duplicate of your working files to one subdirectory on your hard drive, and replicate that onto a floppy disk daily. So here you are using the hard drive alone for its speed. Save to the "organized" subdirectory where the data belongs. Then save to a hard drive subdirectory called "Today" or whatever you wish.

Now, at the end of the day, replicate this subdirectory unto a floppy. What do I mean by replicate? Shrink the entire subdirectory onto a disk at the end of each day! Yes, ShrinkIt does a nice protection job for you. And by shrinking the files -- and it shrinks data files quite a lot, that is, makes the resultant file substantially smaller -- you save time and space. You can easily unshrink to another disk if you lose your hard drive. There is even a special file recovery program if something is wrong with the shrunk file or disk. Just run UnShrink to recover the data. It works great!

So an alternative procedure is, save to the files regular subdirectory, save to the subdirectory "Today", shrink the full subdirectory at the end of the day to a floppy, then delete the files under "Today" to get ready for tomorrow!

Another advantage of the shrink approach is that the software is all freeware, and is available many places. So is the ShrinkIt recovery program, UnShrink.

Of course, if you have "forked" data files from a particular 16 bit program, you cannot use 8-bit ShrinkIt, but must use ShrinkIt GS. It too is a freeware program, and available many places.

If ShrinkIt just would shrink over the boundaries of one disk to the next, it would be an excellent backup program. When I last talked with Andy Nicholas (about two years ago) he was working on such a program. However, my guess is that since he is a Mac programer now with Apple Computer, Inc., he has dropped that project.

There is, of course, one situation where this approach won't work, and where doing a regularly scheduled back-up MUST be done (isn't there always a BUT?), and that is if you don't have control of the creation and saving of the files. A perfect example of this is a Bulletin Board System (BBS). Here, weekly (or more often) back-ups are essential.

But, for me at home or work, I NEVER do a back-up of my hard drive!
Last month I took one of the longest vacations that I have taken since graduating from college. My family and I traveled from the teeming metropolis of Houston, Texas, to the cool, mountain streams of southern Colorado. We spent a little over two weeks (including travel time) camping, hiking, horseback riding and otherwise enjoying ourselves. We are talking about real camping here: Tents, camp stoves, sleeping bags, eating outdoors with the mosquitoes, etc. We had a great time!

What has my camping trip to do with computers? About a year ago, I purchased a portable sub-notebook computer for those occasions when I travel. I had been feeling out of sorts when I went on a business or personal trip and did not have a handy word processor and spreadsheet. I have really enjoyed my "travel" computer; it does a good job of what I want it to do. I have not taken a single trip without my digital umbilical cord since the day that I purchased it. That is, until my latest camping trip.

I thought seriously about taking the sub-notebook along for the ride. However, the dirt and extreme weather conditions that I would encounter made me decide against taking the computer with me. This proved to be a drastic decision. I was not aware of how dependent I had become on my readily available computer. I went through some extreme withdrawal. The headaches and minor shakes were the most noticeable symptoms. However, my wife also claims that I was edgy and somewhat distant for the first few days of abstinence. I was even known to snap at the children. This lasted for the duration of the trip.

After my harrowing experience, I have decided to chronicle the events of my vacation as a warning to other computer junkies. You may have a similar situation come up and be faced with the following decision: take your computer, or your clothing. After this article, I am sure that you will decide that you would rather shop for a new wardrobe on your trip. As a public service, this month's column will examine the various facets of camping without a computer.

DAY 1 I knew I was in trouble the very first day on the road. We have made a good day of travel toward the northwest edge of Texas. However, I am force to purchase gasoline without the benefit of my computer's powerful calculator functions. There is just no way to determine what my mileage was and how far I could expect to travel before having to fill up again.

Another problem is the kids' questions. Our children are constantly asking about this subject or that. I am in desperate need of my handy CD-ROM encyclopedia. How am I supposed to know how much cotton there is in a bale? Of course I don't know the population of Littlefield, Texas. The mayor of Littlefield probably doesn't know the population of his town.
As we check into a motel for the night, the real gravity of the situation starts to sink in. I won't be able to play a game on my computer for another week and a half! At this point, only a threat of divorce from my wife keeps me from turning back to Houston and my 8-megabyte mistress. I sleep fitfully during the night.

DAY 2  I wake up slowly. I feel a strange sense of loss, but cannot remember what is wrong. And then suddenly it all comes back to me in a rush. On the road with no computer. Aargh!

We continue our travel into New Mexico. The excitement of being away from Houston and the anticipation of the mountains starts to raise my spirits. However, a major calamity hits just as we head into southern Colorado. I forgot to put the road maps into our pickup. I manage to make a wrong turn in Chama and end up on the wrong side of the San Juan National Forest. My wife is not happy. "But dear, if I had my computer along with us we could have verified the correct road using my travel atlas." My wife is not talking to me.

Despite my navigation talents, we arrive in our designated camping area in time to set up the tent before dark. As soon as dusk starts to settle in we know we are in trouble.

"Darrel, can our three-year-old fly?"

"Not to my knowledge, dear."

"In that case, the mosquitoes are carrying off our youngest child."
We rescued our son and took a bath in mosquito repellent.

DAY 3   This will be our first full day of camping. The fresh air and sound of the mountain stream awakens me. I am the first camper to arise. I sit in my lawn chair and read a book until the rest of the crew is up. We decide that pancakes would taste good. I tell my family that I had a great recipe in the computer cookbook back in Houston. My oldest daughter groans and hands me a box of pancake mix. The instructions on the side say to just add water.

We decide to go hiking later in the day. The trail head is up high in the mountains. The tall pine trees and colorful wildflowers make for a gorgeous walk. The children discover a series of cracks, or fissures, in the ground where the earth has opened up to swallow the unwary. At the end of our hike, I realize that I did not even think about my computer for the past two and a half hours.

DAY 4   Horseback riding is the activity of the day. We see a young stag deer along the way. He is evidently used to seeing humans looking uncomfortable atop a horse. The deer doesn't bolt until we are within 20 feet of the tasty grass that he is eating. After we get back from the ride, I hobble over to tell my wife that I need to start a journal of our activities.

"This stuff will make a great article! I wish that I had my computer and word processor with me."

"Here is a pencil and paper. Have fun."
"I haven't used this stuff in years. There isn't even a pencil sharpener out here. What happens when the lead gets dull?"

"Use your pocket knife."

I whine; I whimper; I end up with the pencil broken over my head.

**DAY 5**  Another hike is planned for this day. I have trouble figuring out how far we hike in the three-hour trip. I discover that I cannot do multiplication any more.

We are thrown out of a restaurant because I fondle the keyboard of the cash register. My two daughters are embarrassed beyond belief.

**DAY 6**  Laundry day. We spend the entire day in town buying souvenirs. I finish off the first book that I brought on the trip. I seem to have lots of time to read.

**DAY 7**  Today is July 4. We go to a beautiful fireworks demonstration. Our daughter tells my wife, "These are just like the fireworks that daddy has on his computer." I hear a heavy sigh in the dark.

**DAY 8**  We hike along the Continental Divide. There are a few patches of snow still clinging to the shade of the pines at this high elevation. The kids have a snowball fight. Our son, a life-long Houston resident, has never seen snow before. He wants to make Frosty the Snowman. In July!

**DAY 9**  A burst of deep sobbing wakes my wife up in the middle of the night. "What are you crying about?" she asks.

"I miss my computer... ouch! Don't DO that! I'll be quiet."

We go hiking one last time. I start my third book. I love to sit and read by the mountain stream that runs behind our tent. A tall pine offers shade and a good back rest. The view is lovely and the melted snow makes a constant murmur as it falls over the rocks. The watery drone reminds me of something from home. Oh yes, now I have it. The computer fan in my study serves as a similar source of white noise.

My family claims that they will through me in the river if I complain one more time about not having a handy computing device.

**DAY 10**  Today we bid the forest goodbye. The morning is spent in breaking camp and erasing all traces of our having been there. This is no small task since there were 5 children and 4 adults in our group. "I wish that I had my computer so I could take a quick look at our bank account information."

Splash.

**DAY 11**  It will not be long now. My fingers start to itch just at the thought of touching the keyboard. We eat green chiles in New Mexico. Why can't we get good chiles in Houston? When will satellite modem links be available throughout the country? I spend the day contemplating the mysteries of life.

**DAY 12**  We arrive back in Houston. Sweet rapture! I play a game, balance
my checkbook, and catch up on BBS news one right after the other. My wife finds me asleep at my computer keyboard the next morning. She claims that I was tapping my heels together and murmuring, "There's no place like home. There's no place like home."

Darrel Raines is a computer user and avid camper. He works on the space station program in Houston. He didn't really miss his computer as much as he said he did. Really. Honest.

Darrel Raines is a computer user and avid camper. He works on the space station program in Houston. He didn't really miss his computer as much as he said he did. Really. Honest.

[EOA]

Welcome back to the Treasure Hunt! This month we will examine 12 different files. There is no central theme this month, but I think there is something here for almost everyone. Let's get started.

TO.PERPCAL.BXY File #22882 9472 bytes AppleWorks Macros

Perpetual Calendar macros 1.3 [12 June 1994]
freeware -- copyright 1994 by Doug Cuff
algorithm partly based on an Applesoft BASIC program by ANTHONY DEBOER

Doug Cuff [EDITOR.A2] has produced a neat little AppleWorks macro package. In his long description, Doug says that this is a compact, memory-only perpetual calendar for AppleWorks. It contains TimeOut menu file for users and macro source code for programmers. It requires the built-in UltraMacros player or UltraMacros 4.2 or later.

The download includes 4 files. TO.CALENDAR.NOW is the Timeout file that you place in your Timeout folder. MACRO PERPCAL is the AppleWorks word processor file that contains the macros ready to compiled. NOTES contains Doug's directions about how to use these macros. VERSION HISTORY is just what is says.

Once installed, it will appear on the Timeout menu as CALENDAR NOW. You may select it from anywhere within AppleWorks. When selected, it first displays the present month in a box in the middle of the screen. Near the bottom is a request to press a key. When you press a key you are shown a menu of choices that include

Choose calendar year/month Solid Apple-C
Today's monthly calendar Solid Apple-T
Launch default macros Both Apples-L

You may choose from this menu by highlighting your choice and then pressing return. The first choice allows you to input the year you want. Then it displays a list of months to choose from. The list also includes "whole year." You are then shown the month/year that you selected. If you
selected the whole year, you are shown a month at a time, beginning with January.

The second choice displays the present month again. The third choice launches your default macros for you.

Using the escape key makes things a bit different. If you press the escape key while the calendar is on-screen, you will get a message at the bottom that says "Calendar stopped ... please press a key." Any keypress at this point will take you to the menu. If you press escape at the menu, you will leave the menu but will not return to you default macros. This means that the calendar is available to you with the Apple keypresses. However, your default macros are not available. You can easily get the default macros back by pressing both Apple keys and the L key to launch them.

Since our current calendar, the Gregorian, did not exist before circa 1582, you can't use a year earlier than that. However, Doug does let you go all the way to the year AD 9999. <grin>

I highly recommend this little jewel!

[**][**][**]

MATURE.MATH.BXY File #23018 2688 bytes Humorous Text File

Ken Wong has provided us with an amusing story of Polly Nomial. Ken says that he discovered this file over ten years ago on his first DEC VAX system. Unfortunately, he forgets the original author.

If you are into math and have at least a slightly ribald sense of humor, you will enjoy this little story. Even a non-mathematician, such as myself, can have fun figuring out the play on mathematical terminology.

[**][**][**]

TRIG.BXY File #21800 2432 bytes AppleWorks Spreadsheet

This is a simple trigonometry calculator that takes any two known values and gives you the other two. The file consists of several templates that work on the triangle with one 90 degree angle.

\[ \text{OPPOSITE} \quad \backslash \quad \backslash \quad \backslash \quad \backslash \quad \text{<--HYPOTENUSE} \]

\[ \text{ADJACENT} \quad \text{<--ANGLE} \]

If you enter the: you will get the:

opposite side and adjacent side  hypotenuse and angle
Nightfall II is a planetarium program designed to display what the night sky will look like easily and quickly. The display includes all of the stars you're likely to see even on an exceptionally dark urban night as well as the Moon and planets (Mercury through Saturn). If the selected time is in daylight, the Sun is also shown. The view can be set to show the entire sky overhead, or looking out towards the horizon at one of the major compass points (e.g., north, south, east, or west). Each display may be saved to disk so that you may edit and print them using your favorite graphics program like Dazzle Draw or TimeOut Paint/Graph.

"In addition to displaying views of the sky Nightfall II calculates the times of rising and setting of the Sun, Moon, and planets (Mercury through Saturn)."

About all you need to know to use this neat program is your approximate latitude and longitude and your time zone. Time zones may include any from 0 to 12. Zero (0) is Greenwich, England time. Five (5) is Eastern time, six (6) is Central time, seven (7) is Mountain time, eight (8) is Pacific time, nine (9) is Alaska time, and ten (10) is Hawaii time.

It appears that the program displays the sky only over the Western Hemisphere. To get a display for areas south of the equator, there is a menu item that has you switch from north to south.

Saving a view to disk is simple. There is a menu choice to save the screen. Just remember that you must follow ProDOS file-naming procedures: the name must begin with a letter, may include only letters, numbers and periods, and may be no longer than 15 keystrokes. Note that the screen are saved as a one double-hi-res file. Also, if you want to save to a different disk, you must type the entire pathname.

If you are looking for a program that will teach you the names of the stars and constellations, this is not it. What you get with Nightfall II is a display of the visible sky with the stars shown according to their magnitude. You also get the locations of planets (identified by name in a legend) and the sun and moon.

I can see how this program, with a book that identifies the major stars and constellations, could be a big help in locating them in your own
For those of you with Apple IIes and IIcs, this is a fine program, well worth the $10 shareware fee.

For those of you with GSes, John also has produced a program called Tonight's Sky GS v4.2 that is available in the library as file #18304.

Karl Bunker has provided the Apple II world with a variety of neat programs and utilities. Perhaps my personal favorite is Sneeze. I first came across this jewel several years ago before it evolved into its present form. As a programmer, I learned several things from studying Karl's work and was able to incorporate them into some of my stuff.

Sneeze does so many things, so well, that I doubt even those who have already downloaded it know what all it can do. This brief review will point out some of my favorite options available with this program.

The descriptions below are lifted for the most part from Karl's documentation file that is included with the program. Read the documentation! I know people who hate to read documentation, preferring to learn by experimenting with a program. Those people will be a long time making full use of Sneeze.

"Sneeze ("Applesoft Text-Based User Interface" -- "A.T.U.I." -- "Sneeze") is a text-and-graphics-display/menu/launcher program originally written for A2-Central On Disk. Thanks to the generosity of the people at A2-Central, I am able to release this public domain version to be used by anyone for any purpose, free of charge. (For subscription information on A2-Central magazine, write to: A2-Central, P.O. Box 11250, Overland Park, KS 66207)

"Sneeze evolved from an earlier program called 'Windows'. Windows (or 'Window') was originally written by Andy Anderson 1987, and was later extensively modified by Karl Bunker -- with help from Dean Esmay. Sneeze is the result of a complete rewrite of that version of Windows (and Sneeze version 2.0 is the result of a complete rewrite of Sneeze 1.x). As one might expect from a program with such a long and involved history, Sneeze is now quite a formidable little program. Here's a partial list of what it can do:

* Navigate through your disks and directories.
* Launch BASIC, SYS, and S16 programs.
* Print TXT or AWP (AppleWorks Word Processor) files.
* Display TXT or AWP files on-screen.
* Display all of the more popular types of graphics files.
* Copy files, with disk-swapping allowed.
* Run on any 80 column Apple II except for the ]]+.

"Sneeze can also scan through a text file for a word or phrase. If
you press <S> (to scan the highlighted file) or OpenApple-S (to scan ALL
the text files in the current folder), you will be prompted for the word or
phrase to search for. Sneeze will then start 'flipping through' the text
file(s), and will stop if it finds the string of characters you entered.
This search is not case-sensitive. If you want to abort a long scan, press
OpenApple<-esc>.

"Double-sided pages: If you like, you can have Sneeze print out a
file using both sides of each page. Answer 'Y' at this prompt in the
Printer Options screen, and begin the printing. Sneeze will first print
only the odd-numbered pages of the file; then it will prompt you to
'Remove, reverse and restart paper'. This means to remove the printed
paper, turn it over, and reinsert it into the printer. Sneeze will then
print the even-numbered pages. Thus, page 2 will be printed on the back of
page 1, page 4 on the back of page 3, and so on. This option assumes you
are using fanfold computer paper.

"Sneeze can display the following types of graphics files: Hi-res,
Double Hi-res (DazzleDraw type), unpacked Super Hi-res (shown as filetype
PIC), BINary SHR, Apple Preferred Format SHR, PaintWorks format SHR (both
shown as PNT), BINary '.3200' graphics, PIC (unpacked) 3200, and PNT
(packed) 3200. The IIgs-specific types can only be displayed on a IIgs.
With Apple Preferred Format graphics that are two screens tall, you can see
the lower half of the image by pressing the down-arrow key while the
graphic is on screen.

"Not all files listed as PIC or PNT are actually any of the types
supported by Sneeze, so you may occasionally see an 'Unsupported graphic
file format' message when you try to view SHR graphics."

If you don't have Sneeze, get it. If you have it, get it out and
read the documentation again (for the first time?). It may surprise you
what a jewel you have.

[*][*][*]

SEPIA.IZER.BXY  File #16262   6528 bytes  Gray-Scale to Sepia
........................................................................

Sepia-izer by Karl Bunker
freeware software

Here is another jewel by Karl Bunker. I'll let him tell you about it
in his own words. The following is lifted from the docs file that is
included with the download.

"Lots of IIgs graphics, especially scanned-in images, are gray scale.
With 16 shades of gray, a reasonable degree of photographic clarity can be
achieved on the GS. However, gray scale is kind of -- well -- gray. Sepia
tone is often a much more aesthetically pleasant palette, while retaining
all the clarity of gray scale. For those who may not know, sepia tone
refers to a range of brownish tones, from almost black to almost white.
Many early photographs were sepia tone, rather than black and white.
Personally, I like sepia tone a lot.

"Sepia-izer is a method of converting gray scale graphics to
sepia tone. Sepia-izer will take any PIC or Apple Preferred Format PNT
file, and convert the palette of the graphic to sepia tone. To use
Sepia-izer, simply launch it, and select a file from the list displayed.
Prompts explain how to navigate to the disk and folder your graphics are in. The file SF.GET must be in the same folder that SEPIA.IZER is in when you launch it.

"Sepia-izer is dangerous if misused. It alters your original graphic file, rather than creating a new graphic, so be sure your file isn't irreplaceable. If the original graphic was not, in fact, a gray scale graphic, the result will be a mess. Sepia-izer only works on Apple Preferred Format PNT files and SHR image PIC files."

If you remember to heed Karl's warning, and be sure you are working on a copy of your original graphic, then I think you will be pleased with the results. I tried it on several different gray-scale graphics and each one was improved by the process.

SF.GET.BXY File #19580 8704 bytes Applesoft utility
  SF.Get by Karl Bunker
  freeware Applesoft Ampersand routine

SF.Get, mentioned in the previous review, is for Applesoft programmers. If you know nothing about programming, you probably won't be interested in it. In his documentation that is included with the file, Karl describes it this way:

"SF.Get is an ampersand utility which brings a rough equivalent of the IIgs SFGetFile toolbox call to Applesoft programmers. What this means is that when an Applesoft program requires users to provide the ProDOS pathname of some file for some reason, there is now a simple Applesoft command which allows them to do so in an EXTREMELY friendly environment.

"Rather than having to remember-and-type a file's pathname, SF.Get allows users to point-and-click the file from an on-screen list. If the desired file is in another directory or on another disk, it can be navigated to with a few keystrokes.

"The potential benefits of SF.Get should be obvious. Many Applesoft programs, from the most elaborate application to the smallest "quick and dirty" utility, could be improved with SF.Get. SF.Get runs on any MouseText-capable Apple with 80 column display. SF.Get is freeware, and is hereby made freely available for all developers to use in their own programs, either commercial or freeware."

The download includes the ampersand routine itself, the documentation file, and a sample BASIC program that demonstrates how it works.

FILE.COMP.BXY File #15197 10080 bytes Utility
  File.Compare by Karl Bunker
  freeware file comparison utility

Have you ever discovered two copies of a file and wondered if one was just a backup of the other? I know I have. Karl Bunker has created this utility for us.
As Karl says in the documentation file, "File.Compare is a utility for comparing files (Wow! No kiddin'!). There are a bunch of reasons for comparing files. You might want to do this to see whether one file is simply a backup of another, or is a modified version. You might know that two files are different, but be curious as to just what and where the difference is. If you're a programmer who often writes various types of file-processing utilities (like me), you might want to compare some files to see if your program is working as it ought."

File.Compare requires an enhanced IIe or later Apple II. It will display the results in either hexadecimal or in text format. Whether you simply need to compare two text files for differences or want to take a detailed look at your own programs, this is a useful utility.

[*][*][*]

MAZE.BXY         File #23039        5120 bytes      ProDOS game

InternaMaze
public domain lo-res game

This is an enhanced version of InternaMaze which was first created by Dennis G. Ward and then converted to Applesoft by Bill Fortenberry and uploaded as file #1298 in 1987. I have taken the liberty of making some modifications in it to make it more user-friendly. This version adds the use of lowercase letters and the arrow keys to move though the maze. It also gives you a proper way to exit the program prematurely by pressing the escape key. For more information about it, see the April '94 GEnieLamp A2 in the Treasure Hunt column. This continues to be public domain. Enjoy!

[*][*][*]

GUILLOTINE.BXY     File #22959      6144 bytes      ProDOS game

The Guillotine
public domain game

This is another older file that I have tried to update and make more user-friendly. Originally titled THE GALLOWS (file #1612, reviewed in the April '94 GEnieLamp A2 Treasure Hunt column), it was written by Douglas Konitzer and uploaded on March 29, 1987. It requires an 80 column display.

This "word guess" program displays a guillotine which lowers each time that you select an incorrect letter. Like most games of this type, you are shown a list of the letters that you have selected. The program also tells you whether the word is a person, place, or thing. It comes with a supply of words, but it is fairly easy to change them or add additional ones. The words can be up to 18 letters in length.

This version fixes a few problems. It can now tell the difference between lowercase and uppercase input, which was a problem before. It also now correctly refers to the instrument of doom as a guillotine rather than a gallows. Most importantly, it is now accompanied with a utility program that allows you to input and/or change the words that are used in the game.

Try it out, I think you'll like it. :)}
Computer Terms Quiz by Charles Hartley

This is a little something that I put together to use with my computer classes several years ago. Essentially what it does is let you take quizzes on two different sets of computer terms. It is set up in a matching format, that is all of the terms are displayed on the screen and the definition to match is displayed at the bottom. You use the arrow keys to move the cursor to the correct term and then press return. The term is then marked as either correct or incorrect.

Once you finish the quiz, the program displays for you all the terms that you did not know along with their definitions. Then it returns you to the menu where you can choose to take either test or quit.

The program requires 80 column display. Hope you enjoy it.

Gillian's Bunny Game

In his long description of the upload, Dean Esmay said, "This game was written for a two-year-old. Loosely based on the story of Peter Rabbit, it helps teach keyboarding skills, but is mostly just for fun. The program uses graphics and sound as the player tries to help the rabbit get carrots and avoid the farmer. A doc file is included describing how the program works. Originally uploaded by T.DAWSON, this has been re-uploaded to conform to the .BXY standard to save space and alleviate confusion. No other changes have been made."

In his documentation file that accompanies the program, Gillian's dad said, "Toddlers constantly challenge themselves; they want to feel grown up and share adult experiences. Any parent using a computer sees a lot of this. So it is that an aspiring programmer and a two-year-old daughter are a combination that can lead to only one thing: late night sessions at the Apple as Dad tries to come up with software that will be enjoyable and challenging for his child."

I think it is safe to say that Mr. Dawson has succeeded. :) This rather simple game is the kind of stuff that we should see more of for the 8 bit Apples.

Mr. Dawson goes on to say, "I wanted to give my daughter a program that would contain the positive elements which attracted her, ... the sense of accomplishment for moving an object around on the screen, and pride in using the computer. I wanted to create a game that could challenge yet be easily mastered by a two-year-old, giving positive feedback while minimizing frustrating elements and mistakes. GILLIAN'S BUNNY GAME was the result.

"Requiring only the use of the arrow keys on a IIe or IIc, or the
Apple II Computer Info

I–J–K–M keys on a II+, it is easy for a small child to play and needs only minimal assistance from a parent to start. Once your child is familiar with the game, she or he can readily run the entire program, start to finish."

Not only has Mr. Dawson provided us with a neat game for very young children, he has also provided much information in the documentation file to assist anyone who might be interested in learning how the program works from a programming point of view.

If you have a toddler, get this program and check it out.

[*][*][*]

That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

-- Charlie Hartley

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1640 of 1824

GEnieLamp is also distributed on CrossNet and many public and commercial BBS systems worldwide.

- To reach GEnieLamp on Internet send mail to genielamp@genie.geis.com

- Current issues of all versions of GEnieLamp are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GEnieLamp platform (FREQ FILES for names of back issues of GEnieLamp IBM):

<table>
<thead>
<tr>
<th>Platform</th>
<th>Magic Name To Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>GEnieLamp IBM</td>
<td>GLIBM</td>
</tr>
<tr>
<td>GEnieLamp ST</td>

</tr>
<tr>
<td>GEnieLamp A2</td>
<td>GLA2</td>
</tr>
<tr>
<td>GEnieLamp Windows</td>
<td>GLWIN</td>
</tr>
</tbody>
</table>

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395 (M1395;3).

- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet the GEnieLamp staff "live" we meet every Wednesday night in the Digi*Pub Real-Time Conference at 9:00 EDT (M1395;2).

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

~ GEnieLamp Information.
READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE .......... [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GEnie  GEnie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GEnie's non-prime time connect rate is $3.00. To sign up for GEnie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330 in Canada. Upon connection type HHH and hit RETURN. When you get the prompt asking for the signup/offer code, type: DSD524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GEnieLamp READERS!  If you sign onto GEnie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there are no excuses! *** GET INTO THE LAMP! ***

------------------------------//GENie_QWIK_QUOTE//------------------------------
|  \[EOA\]  \[FRM\]|  \--------------------------|  \-------------------------------|
------------------------------\A2.LUNATIC//------------------------------
COME JOIN US ON GENIE  The A2 RoundTable is trying to make it very easy for those of you who don't already have a GENie account to join us here. To start with, America Online users who have been driven out into the snow can get a special deal (a $50 credit) when they sign up with GENie. They can get a special deal on ProTERM, Spectrum, or Talk is Cheap modem software. And they can get a special deal on getting Co-Pilot, the offline message processor for the IIgs—for a limited time, you can download Co-Pilot free (once you have a GENie account).

If you're reading this copy of GENieLamp A2 on the Internet, you'll be interested to know that you can telnet to GENie via SprintNet. Three caveats:

- you must already have a GENie account;
- you must pay an extra $2/hour;
- you can't transfer files (the lines won't be 8-bit clear).

If you'd like to try it out, type the following:  
telnet hermes.merit.edu

You should see the following prompt:  
Which host?
Answer:  
sprintnet-313171

Then you should see the familiar GENie prompt:  
U#=

Follow GENie's standard logon procedure.

ASCII ART BUGS THE VISUALLY IMPAIRED  A visually impaired user has lets us know that the ASCII art in the various editions of GENieLamp plays heck with his speech synthesis software. For that reason, we've flagged the ASCII art in this issue with the phrases "ASCII ART BEGINS" and "ASCII ART ENDS". These phrases are right-justified in the AppleWorks version of GENieLamp A2. (In the text version, the phrases have a bunch of spaces in front of them.)

If you're visually impaired, let us know if the changes help. If you're fully sighted and are distracted by the new phrases, please let us know that, too.

-- Doug Cuff

GENie Mail:  EDITOR.A2  Internet:  editor.a2@genie.geis.com
If you want to reprint any part of GENieLamp, or post it to a bulletin board, please see the very end of this file for instructions and limitations.

QUICKIE-C SHIPS... As the matter of fact, we began shipping Quickie-C yesterday (that's Monday, August 15). Depending on when you ordered, you'll probably get yours within 3 weeks.

Thanks,

Lowell Erbe
Vitesse, Inc., Technical Support
(VITESSE, CAT40, TOP8, MSG:334/M645;1)

...BUT EARLY BUYERS, PAY ATTENTION! After checking the master distribution disk against the files which should have been released, then reconstructing events, it was discovered that the first 35 or so Quickie-C packages were shipped with the wrong version of the QuickieC.NDA file!

It seems that the disk copier found a problem with the original master. The master disk was then rebuilt. Apparently, due to a clerical
error, a file from December of 1993 was used, and the copier faithfully
reproduced a program with debugging code still in it! In short, the
QuickieC.NDA's shipped to date cannot possibly run.

The master disk has been corrected. Anyone experiencing difficulty
running Quickie-C should contact Vitesse if they want to receive their
corrected program disk by E-mail. Otherwise, Vitesse will be mailing new
disks to everyone affected by this error.

The Quickie 3.2 application is not affected by this problem, so ONLY
the QuickieC.NDA file needs to be replaced. The NDA download will probably
take about 10 minutes at 2400 BAUD.

Our deepest apologies, and everyone will get their corrected programs
as soon as possible.

Steve (for Vitesse, Inc.)
(S.MCQUEEN1, CAT40, TOP8, MSG:352/M645;1)

IIGS DISAPPEARING SCROLL BARS BUG FIXED For any interested parties, I
have the "fix" for this bug (I tracked it down to bad behavior in the Print Manager) in the Softdisk G-S
Shell. I guess I should put it into GSLib, so that everybody can access it
without needing to know the gory details?

-Greg Templeman, Lead GS Software Engineer
Softdisk Publishing
(BARNABAS, CAT29, TOP12, MSG:160/M645;1)

APPLE II ENVY A M*C friend of mine was over Sunday evening, and was
kidding me about "get a _real_ computer." Then he said
he'd like to see the screen of my archaic machine. So I obliged. (heh
eh)

I showed him GEM running through ProTerm with AW. He kept saying
things like, "Hey, you can _append_ to the clipboard?! I wish the M*C
could do that." After several of these outbursts ("Hey, that scrolls
faster than my M*C.."), I suggested that he upgrade to a //e. Suddenly he
realized the things he'd been saying, and mumbled something about "The M*C
will probably be able to do those things in the next upgrade..." :)

Terrell Smith
tsmith@ivcfnsc.fullfeed.com   [ GEM4 4.22 & GEM COST 3a ]
(T.SMITH59, CAT28, TOP4, MSG:370/M645;1)

I went thourgh a similar thing with my brother. Right after my
wife picked up a IIc+ at a garage sale ($5, Yeah I'm proud of her!) I
went to FW to visit my brother. He was very proud of his new 486 and
some internet software (windows type). After a few frustrating hours of
getting nowhere I suggested we bootup the old garage sale Apple IIc+. We
spent the rest of the night breezing through GEnie and internet. To say he
was floored would be an understatement. :)
I'll verify this...

Randy and I were roommates at ICONference. I finally came in the second night after 1 am...ready to crash. Randy appeared shortly after. Then we started talking, and talking, and talking...til 5am. It was delightful, but I was beat. He went to shower before sleep, so I gratefully crawled into bed. When he returned (with a second wind) he continued talking till I feared I would doze off in the middle of something he was saying -- or worse, in the middle of something _I_ was saying. We finally called it quits about 6:45, so he could rest up for his keynote speech at 9 am. :)

|-(+)-(
...

(PETER WATSON ANNOUNCES THAT HE HASN'T MOVED)

Peter Watson, the author of MS-DOS Utilities, has asked me to pass along an important message.

It seems as if an Australian postal employee closed Peter's post office box by accident. Apparently, some shareware fees sent to him were returned, with a stamped notice that said, "moved, left no forwarding address."

If you mailed Peter a check for MS-DOS Utilities, and it was returned, please re-send it to the exact same address. Thanks...

On a similar matter, the AUSOM BBS in Melbourne was having some major problems for a few weeks, and email to Peter was "bouncing." It seems to be working once again.

(SPLIT SCREENS IN APPLEWORKS GS)

This may be common knowledge to everyone but me, but I just found out that you CAN do horizontal & vertical split screens in the AWGS spreadsheet. I have mentioned to many people that one of the things that I really needed in a spreadsheet was the ability to scroll around without losing my row & column labels. I just found out that you can do this by choosing "Set Titles" in the menu.

I feel really dumb for not having tried this choice, but I guess I just thought that that had to do with titles for the spreadsheet when it was printed out & didn't need that. However, no one ever told me that this choice worked to do what I wanted so maybe quite a few people don't know this. Anyway, I thought I'd expose my "duh - ness" just in case there's someone else like me reading this who has the same problem.

BTW, although this is 1 feature that I _really_ need, it does not in any way diminish my enthusiasm for the new Quick Click Calc! That spreadsheet, with better graphing, publish & subscribe, cell notes, and other features has fantastic capabilities! If you haven't gotten it yet, and have any use for GUI spreadsheets, get it right away!
Mark
Each day more amazed at the IIGS!

(Easy to be when simple things like this excite you, eh?)

(K.LINNE1, CAT17, TOP22, MSG:182/M645;1)

KANSASFEST SHENANIGANS    Well, at KansasFest we changed a Mac to say
"Welcome to the Apple IIGS" and a II infinitum
logo instead of that picture of a mac. Oh, and a QuickTime version of the
one and only television commercial for the IIGS. Oh, btw, did I mention
that this Mac belonged to Apple Computer? ;}

(T.BUCHHEIM, CAT2, TOP7, MSG:261/M645;1)

>>>>> Tim I had forgotten about that Mac. I wonder if the Apple office
'''''''''''''''''''''''''' in Kansas City complained to TomW about that.

(T.BUCHHEIM, CAT2, TOP7, MSG:270/M645;1)

<<<<< They probably never even noticed. They had a tape backup, and
'''''''''''''''''''''''''' probably just restored the backup before they even booted from the
drive. We didn't touch the backup tape. (I'm sure they would have gotten
mad at Tom had we done that. ;)

(T.BUCHHEIM, CAT2, TOP7, MSG:271/M645;1)

>>>>> That could be considered a very _smooth_ move, calculated to the
'''''''''''''''''''''''''' Nth degree to increase Apple's support of future Fests! Almost as
smart as the noise bombs of the first night, that almost got us booted off
campus :(

Now those who spent several hours of their last day at Fest putting
that computer software back to "normal" know who to thank for the waste of
their time :)

Doug P  

(B.DOG.P, CAT2, TOP7, MSG:277/M645;1)

BIG RED STILL THERE? I have been trying to call Big Red to order Out Of
'''''''''''''''''''''''''' This World but they don't answer at (402) 379-4680
anymore. Any idea how they can be reached?

-(Tim)-(  

(T.HOHS, CAT6, TOP3, MSG:355/M645;1)

>>>>> Keep trying the Big Red number. I have had problems getting
'''''''''''''''''''''''''' through also but persevered and finally contacted them.

Binary Bear the CoPilot

>>>>> HOT TOPICS <<<

'''''''''''''''''''''''''' WHERE'S APPLEWORKS 4.3?  > Randy Brandt has stated a few times already
'''''''''''''''''''''''''' > that AW 4.3 has been sent to QC. Could you
'''''''''''''''''''''''''' > please enlighten us as to the status of the release of AW 4.3?

I had planned to get the disks duplicated last Friday. Since then,
the hard drive that contained the master images had died an untimely death.
Randy is resending the masters to me and I will take a day to verify the
quality of them and finally they will go to duplication. Hopefully, they
will be out by this Friday. Meanwhile, can anyone out there use a dead
Seagate ST157N?

Quality Computers --- Power for performance
(Quality, CAT42, Top29, MSG:479/M645;1)

>>>>>  > Will all registered users automatically receive 4.0.3

"""

No, AW 4.3 will not be shipped automatically, due to the costs
involved. We'll have a free updater available online and through venues
like TimeOut-Central, NAUG, and users groups. If you can't get it any
other way, you'll be able to order it from Quality for shipping and
handling costs.

When a company is making thousands or millions of dollars on a
product, the expense of mailing out automatic free updates can be
justified. When you're struggling to make a profit, the expense can't be
justified.

(Brandt, CAT17, Top14, MSG:295/M645;1)

FREE COPIES OF APPLEWORKS 5!  Quality Computers is offering free copies of

"""

the AW 5 package to anyone who submits a
macro or TAPL program worthy of inclusion on the AW 5 disk (as judged by
Quality). The macro must be submitted in source code format along with
docs. Email your ShrinkIt archives to BRANDT or snail mail a disk to

JEM Software
7578 Lamar Ct
Arvada, CO 80003.

Macros must be received no later than September 12, 1994. Judges
decisions are correct, final, and relatively infallible.

Suggestion: If you can't think of an awe-inspiring application to
create, consider picking a few dot commands and doing a
demonstration/tutorial sort of thingie.

(Brandt, CAT17, Top18, MSG:14/M645;1)

THE FUTURE OF APPLEWORKS  I still hope to get macros working with

"""

AW 5. However, if I do get it working, it will be with AW 5.

I'll look into what an Append option would require, and I'll also
check into DB custom sorts.

(Brandt, CAT17, Top14, MSG:253/M645;1)

My macros work fine with AppleTalk active -- as long as I launch AW4
from ProSel-16 rather than Finder (and have applied the patch you provided
to allow me to run UM with AT active).

Simple question (with probably not-so-simple answer): What does
ProSel-16 do that allows AW4/ UltraMacros to work with AppleTalk? It seems
to me that the answer to that question might help solve the problem of how
to make UM work right regardless of how it was launched? Has anyone talked
to Glen Bredon about this?

(D.Crutcher, CAT17, Top14, MSG:254/M645;1)

...NO APPLEWORKS 6?  I like the spreadsheet idea, but the problem there is

"""

lack of code space. We've maxed it out, and so even
if there was ever an AW 6 (there won't be), the spreadsheet would be left alone. Remember that we're in essence writing modules that have to fit in about 35k of code space, regardless of how much desktop you have.

(BRANDT, CAT17, TOP18, MSG:15/M645;1)

The following official messages are from AOL:

Dear Member

The members of America Online Apple II edition are the foundation upon which the entire America Online service has been built. Starting with the launch of the service as AppleLink Personal Edition in 1988, you have helped us build an online community that now numbers almost 1 million members. I want to thank each of you for your contribution, your support and your feedback over the years.

The computing industry has changed dramatically since those first days of online communications. Apple Computer, Inc. has withdrawn from the Apple II business over the past few years. Many major software vendors have stopped supporting the product over this time period. We have been able to continue our support of our Apple II service so far by incorporating it into the America Online product.

Now we find, with great regret, that we simply can no longer support the Apple II service. It has become commercially impossible for us to properly maintain the product. Many of you I'm sure have noticed a diminished level of product quality in the last few months. Without technical support from the industry, we are not able to add new services, fix existing problems, or prevent new problems. Therefore we have made the sad decision to discontinue the Apple II edition of America Online as of November 1, 1994. In the weeks leading up to this date features of the service you have used in the past may become unavailable or non-functional.

We would like to thank each of you for your long and continued support and, if at all possible, keep you as part of our online community.

If you now have the ability to use America Online on another operating system (PC-DOS, Windows or Macintosh) we invite you to convert your membership to one of these other systems.

For details on the last month of service for the Apple II Edition of America Online, important dates and billing information, please read the other articles on this menu.

We have enjoyed serving you and hope to continue to do so on one of our other platforms.

Sincerely,

Steve Case

Important Dates

The following are the important dates regarding the last service period for Apple II America Online.

Your last monthly fee will be billed to you in September, 1994, based on your usual billing date. No monthly fees will be incurred after October 1, 1994.
You will continue to accrue hourly fees until October 31, 1994.

The last day of service will be October 31, 1994.

Your Apple II account will be automatically canceled as of November 1, 1994. If you wish to transfer your screen name to a new America Online account, you must do so within 6 months.

If you now have the ability to use America Online on a new computer we invite you to open a new America Online account.

When you order your America Online software kit you will receive a free trial membership which includes:

- Ten free hours to explore America Online. Free time must be used within 30 days of your first sign on.
- No monthly fee for the first month
- Unlimited use of the Member Service area

To order your free America Online software kit, please call 1-800-827-6364. We will send you everything you need to try America Online absolutely free.

America Online has the following system requirements:

For Macintosh (v2.5): System 6.05 or later 2 MB of System Ram 3 MB free Hard Drive space

For PC-DOS (v1.6): A PC/XT or higher with 512k or more of memory, a hard drive and an EGA or VGA monitor.

For Windows (v1.5): 386 PC Windows 3.1 4 meg or more memory VGA Monitor Mouse Hard Drive

All versions of America Online require a working, standard phone line and a Hayes or Hayes-compatible modem.

Your Final Bill Your last monthly fee will be billed to you in advance, as usual, during September, 1994, based on your usual billing date. No monthly fees will be incurred after October 1, 1994.

You will, however, continue to incur hourly charges based on your usage for the month of October. You should receive your final bill for any additional connect-time charges on your credit card or bank statement some time in November.

If you have any questions regarding your bill you may contact our billing department by calling our toll-free number 800-827-6364

-= Lunatic (:)

REACTION TO AMERICA ONLINE'S PERFIDY Since America Online has now announced they will be terminating support of the Apple II on November 1, 1994, I would like to state the following:
I will be keeping my America Online account at least until that date. Beyond that date, I may decide to cancel the account. If for some reason you have the urge to email me as sheppy@aol.com, keep this in mind. Fortunately, I'm here on GEnie, and you're here on GEnie.

But I AM disappointed by AOL's decision (but not surprised in the least -- just this morning, before this was announced, I predicted here on GEnie that precisely this would happen within the next few months).

This was just an announcement of my intentions. A similar notice will be posted on AOL tomorrow (they shut the system down for their Monday night maintenance before I could post it there tonight).

I very rudely cancelled my personal account. I'll keep the company account and use it from the Macintosh at work. It's a free account anyway so why not.

If I were paying for AOL, I wouldn't stay there at all.

Hail Genie keeper of all platforms big and small:

I got a letter from aol today expressing disappointment that I had canceled my membership. They gave me an 800 number and asked that I call and let them know why I canceled and what changes I might suggest.

Reckon I should call? <evil grin>

Charlie

The only reason I did not cancel my AOL account is because I want to see if Steve Case is going to answer my email to him. By the way, for those of you who already left AOL, Mr. Case indicated that it was the MAC that got AOL started. I guess he doesn't realize that when AOL started, it was the Apple II that enabled AOL to really take off.

Ron

Mr Case needs to quit reading and buying into revisionist history...

-Harold

I guess he doesn't realize that it was more than a year after AOL started before they HAD Mac support.

LiveWire now available for IIGS

Well, it's an online magazine which covers what's going on around GEnie...at one time it was published on paper and snail-mailed to GEnie users, but now it's available in electronic form only. For several months, they have been doing a multimedia version for Macs and PCs, but now they have a GS version. Currently, it's only available in the software library on page 20. (m20;3) It's the newest file in the library, (I forget the number)
Apple II Computer Info

called LW9408.IIGS.SEA or something similar to that. Eventually, it will be on the page that lists the other versions, and hopefully it will eventually be on the A2 page. Note that page 20 is free...so don't worry about how long the download is, it doesn't cost anything to download LiveWire. (as long as you're not at 9600 baud, and you aren't using the 800# or surcharged node, and not in prime-time)

I just heard about this today (Saturday) from one of the editors of LiveWire.

(T.BUCHHEIM, CAT2, TOP13, MSG: /M645;1)

Well, I've finally found my way in here and will try to be a more regular presence. The second issue is -- well -- lots better than the first, in my opinion. The first was a bit rushed (to say the least), but I had more time on the second to assemble and polish things (little things like coloring the menu fonts and so on). This extra time was thanks to Mary Trzyna for doing a great job on the graphic conversions and rushing them to me. :)

Anyhow, thanks for the positive comments. Oh, and this issue does have a quit button (thanks, Gary). It was something I never thought about until I finished the first issue and suddenly found myself wondering, "Ooops! I don't know how to do that." <grin>

The October issue will utilize the fontload NBA, which Auri let me know about, and I feel suitably dumb for wishing for something that HyperStudio DID have. ;) I apologize for any inconveniences with the fonts, and as of the October issue, these problems should disappear. Thanks, Auri.

While I've used HyperStudio quite a bit in the past, I'm still learning (while trying to make the IIGS version of LiveWire as professional-looking as possible). So any constructive criticism is welcome.

As a side note, there were two issues of the IIGS LiveWire that weren't released (may they RIP), because I wasn't satisfied with the artwork conversions for either. This was NOT Mary's fault (she did an admirable job), it was because the 640by200 resolution just didn't cut it graphically for the pictures. The dithering just looked too dithered, and I personally don't care for dithering to begin with.

June's issue proved to be more of just getting our feet wet, while I actually did manage to finish July's issue. But after a bit of debating with myself, I decided not to release the July issue and to switch to the 320by200 graphic mode predominantly. My most outstanding problem was finding a good font, which the Apple RT staff helped me find in the Studio City font.

The September issue will be available RSN. Enjoy.

(KMCCANN, CAT2, TOP13, MSG:61/M645;1)

>> WHAT'S NEW <<<

VITESSE ANNOUNCES ULTIMA FOR THE APPLE IIGS WEST COVINA, CA -- Under license from Origin(R), An Electronic Arts(R) Company, Vitesse proudly presents Ultima(R) I, The First
Age of Darkness. This original classic, previously available only for the Apple II, is now available for the Apple IIgs. In addition, this version includes several new features that exploit the capabilities of the IIgs to bring you enhanced music, sound, and graphics.

Ultima I is a fantasy roll-playing game that allows you to enter the ancient world of Sosaria, a once beautiful realm now scourged and plundered by evil, bloodthirsty beasts and creatures. At the root of all this wickedness is Mondain the Wizard, who unleashes his terror unceasingly upon the land. You must aid the inhabitants of Sosaria by slaying the evil Mondain.

You may travel as one of four professions: fighter, cleric, wizard, or thief. You may also adjust various characteristics including strength, agility, stamina, charisma, wisdom, and intelligence. You may then enter the world of Sosaria, where you can interact with others, pick up and carry or examine objects, and combat beasts and monsters.

Samples of scenes from Ultima I for the Apple IIgs are available here on GEnie in the Apple II software library. Just enter "Ultima I" as the search string.

Features

- Six new, original songs previously unavailable
- All new art and graphics
- New digitized sound effects
- Full on-line help
- Beginner level
- Fast game play
- System 6 aware
- Save game/Restore game

Ultima I requires an Apple IIgs, GS/OS 5.0.4, or later, and a minimum of 1MB RAM.

Ultima, Origin, and Electronic Arts are registered trademarks of Origin.

(VITESSE, CAT40, TOP5, MSG:1/M645;1)

Ultima is available from Vitesse, Inc. for $39.95 plus an additional $5 shipping and handling.

(VITESSE, CAT40, TOP5, MSG:3/M645;1)

IIIGS/MAC CD NOW AVAILABLE FROM GERMANY

The Apple IIIGS SIG and Mac SIG here in Germany have produced a joint CD which is available NOW. It contains about 300 MByte worth of Macintosh PD and about 200 MByte worth of Apple IIIGS PD. It's a plain HFS formatted CD you're able to access from Finder without any special programs necessary. The price of the CD will be US$ 43.00, CAN$ 60.00, resp. AUS$ 62.00 plus s/h. Shipping the CD airmail with jewel case to the US, Canada, or Australia will cost US$ 10.00, CAN$ 14.00, resp. AUS$ 14.50; shipping the CD with booklet and inlay card in a 5.25" disk mailer will cost US$ 6.25, CAN$ 8.75 resp. AUS$ 9.00. (I suggest you buy your own jewel case and get the CD in a floppy disk mailer...) I will accept cheques in US, Australian or Canadian currency, drawn on a US, Canadian or Australian bank. Please, add US$ 2.00, CAN$ 3.00, resp. AUS$ 3.00 for cashing fees. So to get the CD in a floppy mailer, send me a cheque for US$ 51.25, CAN$
Apple II Computer Info

71.75, resp. AUS$ 74.00; to get it with jewel case, send me a cheque for US$ 56.00, CAN$ 77.00, resp. AUS$ 79.50. (Other currencies and countries, please ask.) Guys living in Europe send me an Eurocheque for DM 80.00 (CD with jewel case). Within Germany the price will be DM 72.00 (for nonmembers of AUGE).

A catalog of the IIGS part of the CD is file # 22701 in the A2 Library.

Send your cheques to:

Udo Huth
Leipziger Str. 16 a
38329 Wittmar
Germany

BEV'S FREE PATCHER  TEXAS II announces the release of Bev's Free Patcher, a TimeOut application that applies 78 (count 'em) patches to AppleWorks 4.02 and 4.3 or later.

Here's how to obtain Bev's Free Patcher:

If you are a TEXAS II on Disk subscriber, do nothing, and the Patcher will be mailed to you within a week. Disk 11 also contains TO.WP.Defaults3 for AppleWorks 4.3, and Roger's Patcher, a patch you'll certainly have fun with because we sure had fun writing it.

If you are not a TEXAS II subscriber, send $10.00 for a disk containing Bev's Free Patcher alone. The $10.00 covers the disk, mailing, and license to distribute copies within your community to your friends and members of your user group.

If you are a TEXAS II subscriber, you can obtain the distribution disk for your user group members and friends for $5.00 instead of $10.00. So if you are a user group, it might be to your advantage to seek out a member who is a TEXAS II subscriber (you won't have to look far) to order the master disk for your group.

If you are a user group, tell us who you are, and how many members actually attend meetings. We will send you that many copies (up to 12; additional copies may be made by you) of the current issue of TEXAS II, "An Interview with Randy Brandt," which has been our most popular and most commented-upon issue ever.

Specify 3.5" or 5.25".

No credit cards please, but checks in any currency are accepted with an additional $5 U.S. equivalent collection fee. This will be the only announcement we make on GEnie. If necessary, please make a copy of this message for future reference.
A2PRO TO BE KEEPER OF THE CODES   ] [ think something can be done about creating a new "Incoming Fax" code. It'll certainly be a good idea once these things get off the ground.

APPLE II ROUNDTABLES RENEW SUPPORT OF THE APPLE II GENIE SERVICES, 1994  
AUGUST 12 (A2) -- The Apple II RoundTables on GENie (A2 and A2Pro) today announced the next step in their growing support for the Apple II line of computers. New announcements included: A special GENie sign up deal for former Apple II AOL customers; and special deal on modem software arranged with all the major publishers of Apple II telecommunications programs for America Online users; the release of a new version of an Apple IIgs-specific offline navigator program for GENie; and the assumption of the assignment of all official file types and all other types, codes, and IDs for the Apple II from Apple Computer, Inc. All are just the start of the Apple II RoundTables' continuing drive to carry the torch of worldwide Apple II support into the next millennium and beyond.

Starting immediately, all former America Online (AOL) Apple II users may sign up for GENie under a special deal provided by the Apple II RoundTable which grants those users $50.00 worth of online credit during their first month online. (Details below.) AOL's support for their Apple II software will be ending on November 1st, 1994.

At the same time, an improved version of CoPilot, an Apple IIgs-specific offline navigator program for GENie, is being made available for as freeware to all Apple II users. CoPilot v2.5 allows users to automate all of their online tasks on GENie, saving them time, money, and effort. When using CoPilot, all of the users' work is done offline, and the program then transfers all of their data to and from GENie in the least amount of time possible. This comes on the heals of the release of GEM 4.22 last month, a similar navigator for 8-bit Apple II systems.
Apple II Computer Info

Upon signing up for GENie, all former AOL Apple II users will be eligible for a special deal provided by the Apple II RoundTable for reduced prices on the three most popular Apple II telecommunications programs: Spectrum for $65.00 (+$3.50 s&h), Talk is Cheap for $20.00 (s&h included), and ProTerm 3.1 for $45.00 (+$5.00 s&h). In addition, purchasers of the ProTerm package on this special deal will receive a free disk containing both Co-Pilot and GEM, the two most popular Apple II-based GENie navigators. (Details below.)

Technical support of the Apple II line of computers on GENie is growing as the Apple II RoundTables take over the official assignment of all Apple II file types, resource types, font IDs, sound codes, request codes, and all other similar types, codes, and IDs from Apple Computer, Inc. All third party Apple II developers will now send their requests for assignments to the Apple II RoundTables, at the address A2PRO@genie.geis.com. The technical support provided by the Apple II RoundTables is expected to grow with the publication of Apple II technical documents and additional third party developer assistance programs.

"We are dedicated to providing worldwide online support for the Apple II line of computers for as long as Apple II computers exist," said Dean Esmay, president of Syndicomm, the company that runs all the Apple computer RoundTables on GENie. "These new offers and programs are just the start. While other online services are eliminating their Apple II support or allowing them to languish, we are continuing to increase our support. We're even hard at work on a full-blown graphical front end, which we hope to have available by the end of 1994." he added.

Established in 1985, GENie Services is one of the fastest growing online information services in the country. GENie is offered by GE Information Services (GEIS), a division of General Electric Co., USA. GENie and GEIS are headquartered in Rockville, Maryland.

For more information about GENie, call 1-800-638-9636, e-mail feedback@genie.geis.com, or write:

GENie, c/o GE Information Services, P.O. Box 6403, Rockville, MD 20850

Syndicomm, the parent company of the Apple II, Macintosh, PowerPC, and Newton RoundTables on GENie, was formed in 1993 by Tom Weishaar and Kent Fillmore. Now owned and operated by Dean Esmay, Syndicomm continues to expand its online support of a variety of computer platforms and services. It is headquartered in Shreveport, Louisiana.

For more information about the special Apple II GENie sign up and telecom program offers by the Apple II RoundTables, e-mail a2.help@genie.geis.com. For more information about the Apple II technical support provided by the Apple II RoundTables, e-mail a2pro.help@genie.geis.com. (Or, see below.)

(Lunatic E'Sex/19940812/Press Contact: Dean Esmay, 313-424-3970, President, Syndicomm)

---

To receive the special GENie "Apple II Forever" signup offer, made in the
Apple II Computer Info

In the wake of AOL's cancellation of their Apple II software support, take the following steps:

1. Set your communications software for half-duplex (local echo) at 300, 1200, or 2400 baud. Recommended communications parameters 8 data bits, no parity and 1 stop bit.

2. Dial toll-free in the U.S. at 1-800-638-8369 (or in Canada at 1-800-387-8330). Upon connection, type HHH (Please note: every time you use GENie, you need to enter the HHH upon connection)

3. At the U#= prompt, type JOINGENIE (or IAMCOOL) and press <Return>

4. At the offer code prompt enter DHG528 to get this special offer.

5. Have a major credit card ready. In the U.S., you may also use your checking account number. (There is a $2.00 monthly fee for all checking accounts.) In Canada, VISA and MasterCard only.

Users who sign up using this offer will pay the standard $8.95/month fee, which includes four hours of connect time. They will also receive an additional $50 credit, which can be used anywhere and at any time on the GENie system. This offer, made in the wake of America OnLine's cancellation of Apple II software support, expires 12/31/94.

---

If you're an Apple II user interested in receiving the special deal on Spectrum from Seven Hills, Talk Is Cheap from Don Elton, or ProTerm from Intrec, must send GE mail to the address SYNDICOMM. This mail must specify that you are interested in receiving our special deal on modem software, and which of the three packages you wish to receive. Your mail will then be forwarded to the appropriate company, which will ask you for further information.

Spectrum from Seven Hills is available for $65 + $3.50 shipping and handling through this special offer.

Talk Is Cheap from Don Elton is available for $20 through this special offer. This includes shipping & handling within the U.S.

ProTerm is available for $45 + $5.00 shipping and handling through this special offer(*).

This offer is made as a show of support for the Apple II community in the wake of AOL's Apple II software cancellation. Any of these three programs can be used in conjunction with Co-Pilot or GEM, the freeware Apple II off-line navigators for GENie.

* - Those who purchase ProTerm through this special offer will also receive a free disk containing the latest versions of both GEM and Co-Pilot.

---

Please, feel free to re-post this information anywhere that you think people would be interested. We'd like to see it distributed as widely as possible. We figure a lot of people will probably be pretty down in the
wake of AOL's announcement, and we'd like to give 'em something to cheer 'em up! :-)  

Dean Esmay  (SYNDICOMM, CAT2, TOP27, MSG:32/M645;1)  

>>> THROUGH THE GRAPEVINE <<<  

***************  
QUICK CLICK DATA? Databases seem to be a popular item, so I'm going to give you some first impressions about them and look for some opinions.  

First, the idea of doing a text database on an Apple IIGS leaves me cold. It would take a lot of convincing to get me to even consider this.  

Beyond that, there seem to be two distinct kinds of databases to fill two distinct kinds of need.  

One kind is a full programmable database. These programs, like 4th Dimension, are really specialized programming languages, not user-oriented databases. Right from the box, it would be difficult for the average user of, say, AppleWorks GS to do anything useful with such a program. Developing a useful programmable database would be a long, expensive project that would be useful to a relatively small number of people, so the price would have to reflect that. I doubt I will do one like this, but you can convince me otherwise.  

Another kind of database is the user database, like the one in AppleWorks GS. AppleWorks GS doesn't carry things as far as they can go with this sort of design. (That's not a criticism; AppleWorks GS is a useful program as it stands.) This is what I'd be most likely to do. So, start with what you see in AWGS and add the following:  

2. More extensive field search rules.  
3. Publish & Subscribe.  
4. Encryption.  
5. Better display of records, allowing free-format "cards" for the records that allow you to move, resize & color fields more or less like a CAD program.  
6. Ability to include non-text data, like digital recordings, pictures, movies.  
7. Printing rules that allow formatted records to be printed in a variety of layouts. Thing of this: Create a picture on a small card, and add name & address fields. Plop them down on a page & print. You get a page of mailing labels with a logo.  

I think something like this is reasonable to develop, can be sold for under $100, and, I hope, would have a wide appeal. I'd like to hear your opinions, though.  

Mike Westerfield  (BYTEWORKS, CAT45, TOP3, MSG:139/M645;1)  

QUICK CLICK WORD? There seems to be a lot of talk about word processing. It ranges from people who basically want EGO Ed with multiple rulers to folks who want Microsoft Word or Word Perfect for the GS—and they want it for less that $100, too. :)
My intent with the Quick Click Calc series is to produce a line of
software which is a step above the kind of software you find in integrated
applications like AWGS or Microsoft Works 3.0. All will work with each
other, and all will support The Manager. I have no current plans to create
an integrated application, nor do I particularly think that's needed as
long as The Manager works well with the applications.

With these things in mind, assuming I do a word processor, here's
some of the features you folks mentioned (and a few you didn't) that I
would be likely to include:

- Full support for the Apple desktop metaphor
- Selection of any font, color, size or style
- Insert pictures
- Insert movies
- Support speech
- Support subscribe to QCCalc
- Multiple columns
- Headers & Footers
- Index generation
- Table of contents generation
- Sections (these allow multiple formats on the same page; sort of a
  poor-man's page layout)
- Print preview
- Spell checker
- Multiple rulers
- Footnotes
- Importing a few formats (Not AWGS--they don't know what their own
  formats are!)
- Exporting through a few standard formats
- Encryption
- Print merge with a QC Database
- Justification & tabs, various kinds, via rulers
- Split screen
- Character/Word/Line/Paragraph counts

Here are some things I almost certainly would not include:

- Macro language
- Thesaurus
- Importing for every format under the sun
- Grammar checker
- Outliner
- Built-in graphics editor

So, given that list, would you:

1. I'm not interested in a word processor--write something I care
   about! (Name it.)

2. I want a word processor, but this doesn't fill my needs.

3. I'd probably buy it, but I really want Microsoft Word, and I still
   want it for under $100.

4. This is great--where do I sent the check?
Apple II Computer Info

(Street price for _all_ Quick Click programs is <$100.)

Mike Westerfield

(BYTEWORKS, CAT45, TOP3, MSG:204/M645;1)

MONITOR STYMIES LUGGABLE IIIGS

It's not that the line is _that_ long....

........................................

I can't build any more in the Otrona case unless you don't care about the monitor. I have no more 4" composite monitors. Have't been able to find anymore. That is the only size PCB that will fit in there. (the area for the monitor PCB to fit is about 3.5" x 6" or so.) That's it.

Now... if you want to use (and you have) an item such as a Kaypro or Compaq type case, I can help you. Otherwise, if you (Joe) look around up there for a 4" open frame type, +12VDC Composite input monitor assembly, I can help you get one built. (Using the Otrona case, I have one here)

The hardware needed to build one of these is as follows:

IIgs CPU with:

InnerDrive (This becomes the power supply) (A Vulcan will do, but I like the AI P/S better, no heat sinks to worry about mounting, and it's lasted me since Joe saw it so it must be suitable!)

SCSI Card, preferably a RAMFast Rev D, (Size is the main factor, although I have an Apple High Speed SCSI)

RAM Card. 4 Meg, since your not going to want to go inside there too much just go for the gusto and get it over with. It needs to be a small type card. AE GS RAM III is the best, but also most expensive in a 4 meg configuration. Also good is the Harris Labs GS Sauce & Pacemark (Q-RAM) GS RAM SIMM card. The GS Sauce is actually to long, but because it's a low profile card, it fits. The Sequential Systems RAM GS misses by 1/8th an inch in the Otrona case. I actually had the OctoRAM in there for a while, but the thing blocked slot 7 because I had to bend the card out of the way. The Sequential card did the same thing when used with the Otrona case. If a Compaq/Kaypro box is used the RAM & SCSI card size limitation isn't as bad.

Hard Disk: It will need to be an Quantum ELS or similar variety. A 2.5" drive will work even better! No full size 3.5" drives or old types should be used, as the heat generated will probably cause some trouble.

3.5" External Drive & a Mac II fSE/II Floppy mounting bracket. (I've got plenty of the brackets. A PS/2 Faceplate is optional) The drives LED and eject switch will be used in the assembly.

Misc Descrete items:

12" of ribbon cable (25 pin or more) rubber feet, a few sizes, about 20 are needed. These are the "bailing" wire for the entire operation. Spacers, DB 25 Male and Female crimp connectors, wire ties, 6/32 screws, etc. and about 10 fiberglass cutwheels for the Dremil.
If you wish a "matching" keyboard, one will have to be sacrificed to the Dremil, as the numeric keypad will have to get chopped off if it is to fit on the front.

Of course, there is more. A well stocked PC/Clone shop is a handy thing to have nearby when you attempt things like this, as they are an invaluable source for things like rubber feet and spacers/stanoffs and other Taiwanese made small parts that you just couldn't do without. :)

Using an Osborne case is out of the question. The way the thing holds itself together prohibits cutting into the frame, and without doing this you would not be able to have any cards installed.

That's about it. If you have either a 4" composite monitor. (even if the ttube is broken, the PCB is all I need, I have CRTs) or a Compaq/Kaypro case you want to use, (I can use the 9" monitor I mentioned earlier in those we can get started on making anyone who wants one their very own). Of course, Joe is first. ;)

BTW: The monitor type, to be a little more specific, they are usually a small metal frame assy, and the PCB has a 10 pin edge connector. The common variety are TTL input. Some will take a 75 ohm composite signal. Thats the kind I need. The TTL one won't work. Unless someone has a small circuit (one IC) that will convert composite to TTL. I tried a few various chips and wasn't able to get it to work with desirable results. (T.DIAZ, CAT46, TOP3, MSG:32/M645;1)

DESK ACCESSORY SPELL CHECKER? Keep the faith on an NDA spellchecker from Softdisk. The "shuffling/departure of programmers" hasn't affected this (except possibly to delay it a bit). If anything, you're more likely to get the finished product in the future than you have been for the past year and a half (because some with the departure of every programmer, you must remember that a new programmer has come in; and all I'll say is, that isn't necessarily a bad thing... :)

-G.T. Barnabas (BARNABAS, CAT28, TOP7, MSG:94/M645;1)

PARKHURST MICRO PRODUCTS' PMPFAX SOFTWARE As the name implies, this new topic will be used to talk about what you people would like to see in a send/receive fax package for the Apple IIGS. I'm currently working on a package right now, so it would be a great time to give me suggestions before I'm finished. Since I don't have a lot of experience actually using fax software on other platforms, let me know what features you liked in other software packages and what features you maybe *haven't* seen that you'd like in this package.

Since I've only been working on this for less than a week, there's no finally release date, price, or availability information, since nothing as of now actually exists. :) But I really do need your input, so let me know what you'd like.

Currently, I'm going to be including the following: send/receive, support for class 1 and 2 (and possibly 2.0 if I can find the specs), fax log and phone directory, user-created cover sheet (give me some suggestions as to how you'd like this implemented), executed as a control panel and/or NDA, will patch the Print Manager to allow you to "print" faxes from any application that uses the Print Manager...
Please continue along with the suggestions. Also, if anyone has actually programmed an application that talks to G3/Class 1 fax modems, I'm always open to advice... :)

Paul

(PMP, CAT38, TOP15, MSG:1/M645;1)

<<<<<< Well, so far, all I've gotten finished is the Class 1 driver. Class 2 isn't standard, and Class 2.0 has just come out.

Fax polling should be pretty simple, as will passwords and the like. What I thought instead of a "Fax" printer driver, would be to just patch the Print Manager directly and give you the ability to fax or print, no matter what printer driver you happen to be using. This would be easier than having to go into the control panel and change your printer to "fax" and have to redo all of your pages and such to conform to whatever paper sizes I'd have to include in the driver, etc. I've already done part of this and I can get ahold of the print record and other information so it shouldn't be that big of a deal.

One other thing... how would you like fax receive to work? Should it be a self-starting CDev when working in the desktop? That is, when it hears the phone ring, it will automatically bring up a system window and try to answer the fax. I could try to have it work entirely in the background, but timing with faxes is sometimes critical.

Any more thoughts, let me know...

Paul

(PMP, CAT38, TOP15, MSG:5/M645;1)

<<<<<< So far, I've got my GS sending class 1 faxes. I've been spending my time on the desktop interface, so the PMPFax CDev will now save print jobs to disk (so I can later send them). My next step will be to get the send program working with the new document format (I was sending PIC files just to get my routines down, so now I'll have to modify the program to send Apple Preferred files).

I was planning on having a polling option so you can call up fax depositories and the like, as well as having timed fax sends and the like. Any other ideas, just keep 'em coming.... :)

Paul

(PMP, CAT38, TOP15, MSG:35/M645;1)

FAXPLOSION SOFTWARE IN DEVELOPMENT

Okay, here's the official info, from the sheet handed out at Kfest:

FAXplosion (Development Name)

~~~~~~~~~~~~

by Richard Wifall

Planned features include:

- Class 2 faxmodem support.
- NDA for receiving faxes.
- Printer Driver for sending faxes. (Send faxes from any program that supports the print manager.)
Apple II Computer Info

- Support for silent answer. (Answering machine and faxmodem share the same line!)
- Delayed faxing.
- Batch faxing.
- Fax manipulation tools including scaling, rotating, printing, and conversion to APF.
- Custom serial drivers.

If you are a software publisher interested in publishing this product or for more information contact:

E-mail: rwifall@nmsu.edu
Snail-mail: Richard Wifall
11500 Tahiti Pl. NE
Albuquerque, NM 87111

That's the official information sheet, as distributed at Kfest. I wasn't lucky enough to get to see the program, but everyone says it works great.

(T.BUCHHEIM, CAT10, TOP9, MSG:166/M645;1)

CONTACTS GS I have some good news and some weird news to report about """"Contacts GS, and its imminent re-release. First the weird news...

As you remember, when last we spoke about Contacts GS, I'd commissioned Will Nelken to create TimeOut Modules for use with importing and exporting the Contacts GS data file back and forth between Contacts and AppleWorks Classic.

I guess you could say that I've been the beta-tester for the TimeOut Modules, and it has not been a fun summer. As soon as Will generated some new code, I could promptly "break it." It seemed as if we were making no progress, until a very weird thing happened this past Friday.

Will is developing 3 different versions of the TimeOut modules. I tried testing out the version that works with AppleWorks v3 and UltraMacros 4, and realized that I'd better install UltraMacros first. Try as I might, I couldn't. The Installer kept crashing.

Quite odd, I thought.

So, I called Quality on Friday, and a duplicate set of UM4 disks arrived today. I decided to not only install UM4 onto AW3, but to go back and re-install it on AW 4.0.2. I did.

Now, for the good news....

B-I-N-G-O !!

I discovered that TimeOut ContactsMover works just fine.

There's just one minor tweak to the AppleWorks 3.0/ UM 3.x version,
and then the Contacts GS package will be completed.

I'm breathing a whole lot easier.

And, so is my copy of AppleWorks v4.0.2. Strange error messages that I've been seeing for months have magically disappeared.

Apparently, the copy of UltraMacros that I purchased last December was the cause of all my AppleWorks v4.x problems. Unbelievable! Who would have ever imagined? Did I ever verify the UM disk? No.

Joe Kohn

...AND TIMEOUT CONTACTSMOVER   What Will Nelken has done is to create 3

""""""""""""""""""""

 totally different versions of TimeOut

ContactsMover. Depending on which version of AppleWorks you are using will determine which version of ContactsMover you'd install.

I guess that you could say that we are operating under the assumption that not everyone has upgraded AppleWorks to v4.x, and we wanted to provide support for those still using AppleWorks v3.0.

So, 2 of the versions of TimeOut ContactsMover are actually for use with AppleWorks v3.0. One version supports UltraMacros 3.x, while the second version supports UltraMacros 4.x. To use either of those with AppleWorks v3.0 does require that you own UltraMacros.

The TimeOut ContactsMover version for AppleWorks v4.x requires nothing extra, as AppleWorks v4.x already has an UltraMacros "player" built in to the system.

TimeOut ContactsMover moves data back and forth between AppleWorks and Contacts GS; it's a 2 way street. If you currently maintain an AppleWorks name & address database, you can use TimeOut ContactsMover to automatically convert that database into a format that is instantly recognizable by the Contacts NDA. It does everything for you, including saving your newly created Contacts data file in the proper sub-directory.

On the "other side of the 2 way street", TimeOut ContactsMover will convert your already existing Contacts data file into an AppleWorks database, and from there, you can easily generate mailing labels, reports, lists, etc.

TimeOut ContactsMover makes Contacts GS a much more flexible program.

What Will Nelken has created in TimeOut ContactsMover is quite impressive and quite flexible. Using it, you can not only create a brand new Contacts GS data file, but you can even append the one you already have, all from right within AppleWorks. And, it does it right before your eyes. Quickly and effortlessly.

Using Contacts GS data with other programs is not restricted to AppleWorks Classic. You can seamlessly and easily load all the Contacts GS data, for example, into Addressed For Success, DB Master, or any word processing program of your choosing.

The above should not be construed in any way to mean that you need to own AppleWorks or Addressed For Success to get great value from the
Contacts GS New Desk Accessory.  In and of itself, Contacts GS is a stand-alone product (well, as "stand-alone" as a New Desk Accessory can be).  As a name and address database in New Desk Accessory format, it's quite convenient and handy. As an example, I'm typing this off-line using Co-Pilot, and I can easily access Contacts GS right this second from the Apple Pull Down Menu, and find out if *you* are a SSII subscriber.

As I said way-back-when, Contacts GS is my first software publishing venture, and I just wanted to "do it right." I wanted to add as much value and utility and functionality as was possible. Did Contacts GS need TimeOut ContactsMover?  No. Does TimeOut ContactsMover add value and utility and functionality to Contacts GS?  Absolutely.

Joe Kohn           (JOE.KOHN, CAT28, TOP5, MSG:53/M645;1)

ONLINE GENIE FRONT END FOR IIGS  /\ctually, there is a considerable danger of a hacker breaking into the system if all the information about the underlying software is publically released. However, once you do have a proper working relationship with GENie and they know that they can trust you, they will give you the information (as we in the Apple II RoundTables have, and are using it to develop a full desktop IIgs front end for GENie -- it should be out by the end of the year).

>>> MESSAGE SPOTLIGHT <<<

Category 5, Topic 6
Message 152       Sat Aug 20, 1994
M.JAMES10 [MARJAM]           at 19:09 EDT

Greetings Dan,

In reference to your friend on AOL who is intimidated by GENie...She's right! GENie is much less user friendly than AOL or Delphi. I'm looking at a stack of papers next to my computer that explain how to get around GENie. 26 pages to learn CoPilot navigator. 23 pages from Category 1 explaining how GENie the Apple Bulletin Board is set up. 26 pages from Category 1 for new users on how to get around the Apple area of GENie. 67 pages of the GENie Manual for Apple II Users.

GENie is EXTREMELY INTIMIDATING for the average computer user that doesn't know the online language of bulletin boards, online services, etc. "User Friendly" GENie is not (in terms of ease of navigation).  I much prefer a GUI type of interface that I can point and click.

There are only 2 ways your friend will use GENie.

(1) You sit down and show them how to navigate.  Not once but several times.

(2) When AOL folds and they default to GENie.  I don't know about Compuserve but Delphi is much easier to navigate.
I've been lurking in GENie for a long time trying to get the hang of it. I've found people online in general are the high end users who feel comfortable with this medium. I (as is your friend) am not one of those people.

I left Delphi and came to GENie because I really like my GS. I'm just a beginner who didn't need access to Internet because it's big, complex, and was too much at once.

The "PEOPLE" on GENie are much more user friendly than Delphi. They love the Apple II and are quick with an answer, even if their answers are over my head.

When I was on Delphi, there was a guy named Chuck Orem who could shift down and tell me too: ...turn the knob right, OK click the mouse, yes...now pull down the file menu...and all this while we were online, don't know how he did it? He also had me call his home if I didn't understand. If your friend can find someone on GENie to do that they will be here for life.

Sorry for the long post but I can really empathize with your friend, I'm a cement head among A+ students that are very sincere about helping me but forget that I don't know their language (computer-eze).

If your friend wants some help navigating GENie, drop me an e-mail note and I'll walk them through the steps as far as a beginner can over the phone or via GENie. My e-mail address is M.JAMES10. I'd rather not post my phone #. Wish I had someone willing to do that when I started at GENie. THAT WOULD BE AN EXCELLENT THING TO POST ON PAGE 645!! Need a GENie mentor? Type # 23 and someone will contact you by voice phone, cool.

Mark James

[*][*][*]

While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GENieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Fun & Games On GENie

by Joe Kohn
[JOE.KOHN]

>>> FUTURE RULES FOR ONLINE GRAMMAR <<<

DATELINE: WASHINGTON, DC
The Federal Telecommunications Bureau has just released a new set of guidelines that establishes nationwide norms for electronic mail communications.

Effective immediately, two new governmental departments are being formed to combat abuses involving online communications: The Department of Grammar Abuse and The Department of Typographical Errors.

Beginning early next year, government agents will start monitoring all online electronic mail correspondance, and will prosecute all United States citizens who include grammatical and/or typographical errors in their "private" correspondance.

The Government of the United States will no longer stand for its citizens to commit crimes against the English language. The first infraction will be dealt with harshly. Those who commit grammar crimes will be tortured—their computer equipment will be seized and replaced with aging and obsolete PowerPC's computers from Apple Computer Inc, the Taiwanese company that currently produces computerized kitchen utensils. (Note: Prior to The Great Takeover of 1995, Apple manufactured the poorly made and highly unpopular PowerPC computers.)

A second offense will result in imprisonment at the Federal Grammar Improvement Center.

Third time offenders will be treated much more harshly. They will be imprisoned and forced to watch non-stop re-runs of "The John Sculley Comedy Hour" TV show that aired briefly in late 1997.

In a joint statement issued to the press, President Amy Carter and Vice-President Chelsea Clinton said, "The time has come for us to put aside personal and individual freedoms in the quest for better grammar!"

=30=

by Phil Shapiro
[P.SHAPIRO1]

DOING BUSINESS ON THE INTERNET:
HOW THE ELECTRONIC HIGHWAY IS TRANSFORMING AMERICAN COMPANIES

*******************************************************************************

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 1669 of 1824
Walk into any bookstore and you're bound to find a shelf with at least a dozen books covering the subject of business management and efficiency. Nearby you'll find a shelf overflowing with new books about the Internet.

Until now these two shelves of books had little in common. "Doing Business on the Internet" is the first book to link these two related topics.

The author of the book, Mary J. Cronin, works as the university librarian at Boston College, and teaches information management at Boston College School of Management. She brings to the subject the well-informed mind of a librarian, tempered with the pragmatism of someone closely familiar with real-world business practices.

The result is a book that is highly readable, yet meticulously referenced and footnoted. "Doing Business on the Internet" is must reading for information managers in companies large and small. The book also has an audience with persons who have a general interest in the socio-dynamics of online communications.

The Nature and Scope of the Book

"Doing Business on the Internet" was written to persuade as well as describe. The heart of this tome is a series of case studies describing how companies are using the Internet. To assemble these case studies, Cronin visited and communicated with information managers known for evangelizing the benefits of Internet connection within their companies. She then conducted follow-up interviews via electronic mail. The results of her investigations are assembled with an aim to persuade as well as describe.

To persuade what? To persuade businesspeople that a whole slew of unforeseeable benefits can arise by connecting their employees to the Internet.

The central thesis of this book is aptly illustrated in the section where Cronin explains how IBM was at first reluctant to offer Internet access to its employees. You would think that a behemoth computer company would be the first to comprehend the benefits of Internet access. Not so. Until a few years ago the prevailing attitude at IBM was that everything that IBM employees needed to know could be found on IBM's internal company networks.

These days IBM managers have arrived at the more enlightened point of view that there may be times where valuable information and ideas could
possibly exists outside IBM's internal company networks. In those rare instances, it could be useful for IBM employees to conduct searches on the Internet.

Information as the Fundamental Building Block of Business Cronin starts with the basic principle that, "information is the fundamental building block of any type of product or service." She then goes on to discuss how information can provide a crucial competitive advantage: "Executives have long recognized the importance of information for competitive advantage.... In order to make better decisions, chief executives and top level managers require fresh information about trends in the economy and the marketplace, about the activities of competitors, new developments in technology, and new product opportunities."

In the information age, to be informed is to be armed with knowledge. And a primary way of becoming informed these days--is to be connected to the Internet.

Improved Communications with Customers The Internet offers more than information and ideas, though. The net can help forge new ties between customers and companies. Since the cost of sending electronic mail is far less expensive than the cost of a phone call or letter, companies can use e-mail to communicate regularly with prospective customers as well as with established customers. Indeed, companies can set themselves apart from their competitors by making it a practice to respond promptly and thoughtfully to "external e-mail." In Cronin's words: "If a company decides to distinguish itself through the quality of its customer service organization, the network can be a decisive asset in achieving this goal."

Of course, communicating with customers is a two way street. Customers benefit by getting answers to their questions. But companies also benefit by getting speedy feedback about their products or services. The Internet provides a new type of "intimacy" between company and consumer. In a very real sense, the Internet can help establish bonds of cross-loyalty of a new order. While some companies may cringe at the invariable "closeness of contact" that results, Cronin astutely observes: "Getting closer to the customer is probably one of the most important benefits of using the network."

Computer-Assisted Journalism Manufacturing sector companies are not the only ones to benefit from closer customer contact. News providers are also reaching out for closer contact with customers. Cronin tells how The Boston Globe newspaper has started a regular column on electronic communications, and regularly includes the newspapers' Internet address to solicit reader feedback. Journalists can then get direct and immediate feedback to their stories. And the journalists themselves can use such feedback to become better informed about happenings in their local community.

Along similar lines, the Washington Post newspaper has initiated a regular column covering oddities on the Internet. This same newspaper has taken to including the Internet address of reporters at the end of articles. USA Today currently accepts letters to the editor via Internet electronic mail. (Internet address: usatoday@clark.net)

Cronin goes on to tell about a radio station in San Francisco, KKSF,
that has set up a gopher on the Internet. Listeners of this station can access a playlist of songs on the gopher. Should these listeners get the urge to purchase any of the music being played, they can quickly and easily obtain information about the location of record stores that carry KKSF music.

Using the Internet to Promote Science and Research  In a chapter titled "Transforming Research and Development," Cronin explains the immense benefits offered by the Internet to scientists and researchers: "For the millions of researchers connected to the Internet, the communication power of the network has transformed the nature of their work." Naturally, the benefits that accrue to researchers often yield ancillary commercial benefits as well.

Two specific types of scientific collaboration on the Internet are examined in this chapter: improving medical diagnosis through computer imaging, and using the power of supercomputers to help locate untapped oil reserves.

Cronin relates how the net helps doctors and researchers perform medical imaging from the data output of MR (magnetic resonance) and CT (computer tomography) scanners. Medical researchers can make use of remote supercomputer data crunching resources, saving the researchers the burden of having to purchase a dedicated supercomputer for their own use.

In a similar type of computer application, geologists and oceanographers are using the power of supercomputers on the Internet to help them locate possible undersea petroleum reserves. Gathering data about the possible location of such reserves is the easy part. Analyzing the data using computer models is the processor-intensive part.

Overseas Uses of the Internet  Few people realize the true international scope of the Internet. While it's true that the Internet had its origins here in the United States, today the net has extended its tentacles to almost every continent.

To help readers gain an appreciation of how the Internet is being used overseas, Cronin relates anecdotes of how businesses in Singapore are using the net:

"Singapore provides an interesting example of competing through connectivity—and the dynamic relationship between policy, commerce, and technology in the global village. Singapore promotes itself as the 'Intelligent Island,' and its National Computer Board has adopted a plan called IT2000 to transform Singapore into the information technology capital of Asia. Government agencies make every effort to smooth the way of multinational corporations wishing to use Singapore as a communication hub for the twenty-first century."

Empowering Individuals Within Companies  Connecting to the Internet can empower companies as a whole, as well as empowering individuals within companies. Cronin cites the example of Apple Computer's Steve Cisler, whose informative postings pop up regularly on many Internet discussion lists: "Steve Cisler, another active Internet participant, shares information on the Internet through detailed meeting reports and informative postings to discussion lists."

Cisler, a senior scientist at the Apple Library, Apple's corporate
For Cisler, his computer's keyboard serves as his printing press. The Internet serves as an accessible and cost-free tool for disseminating his writings instantly around the world.

Interestingly enough, Cisler's Internet postings are often imbued with a public spirit. Apple Computer may pay his paycheck, but his public spirited postings could easily give someone the impression that he is working for the public at large.

Well-Documented Thoughts Each of the book's nine chapters has about fifteen to twenty citations to further readings on related topics. Most references are to books and periodicals from 1991, 1992, and 1993. The quantity and quality of research that was done in assembling "Doing Business on the Internet" is indeed impressive. Citations are given to periodicals as diverse as the Internet Business Journal, Scientific American, Forbes, and Sloan Management Review--to name a few. Book citations range from better known books on telecommunications (i.e. Krol's "Whole Internet Guide & Catalog," and the like), to lesser known books on modern business practices. Along with all the standard and predictable references, Cronin includes references to annual reports from Motorola and Intel, information sources often overlooked by others.

Minor Quibbles and Nit-Picking "Doing Business on the Internet" succeeds in many respects, but the book does gloss over a few topics that beg for greater coverage. For instance, what effect will the snowballing freenet movement have on company/customer relations? And if online communications with customers yields substantial benefits to companies, what actions are these companies taking to help train the general population in basic telecommunications skills?

To be sure, freenets are mentioned in passing once or twice in the book. But the subject could well merit an entire chapter in future editions of the book.

Another minor quibble with this book is that it leaves the reader wishing for more. The content is indeed gripping and well-presented--but one might wish for just a few more anecdotes, a few more case studies.

Conclusion Cronin's book is as much about people as it is about technology. One of the recurring themes of the book is the slowness with which people come to understand the usefulness of new tools and technologies. Those who do comprehend the power of these tools have a one-up on their business competitors: "Companies already linked to the Internet receive the advantages of high-speed telecommunications and continuously evolving technology while learning invaluable lessons about the management of networked organizations.... We are just beginning to understand the impact of networked communications on our daily lives and way of doing business."

"Doing Business on the Internet" brings you the voices of many people who have evangelized the benefits of Internet connection within their companies. The book succeeds in the way that it lets you draw your own conclusions from these first hand sources.
It's an irony of modern life that it sometimes takes superhuman efforts to convince businesses to act in their own best interest. When it comes to convincing business managers about the benefits of connecting their employees to the Internet, this book is just the ticket.

The Apple Pickers

""""""""
by Susie Oviatt

[SUSIE]

This one looks best if you start at the bottom and scroll UP....

ASCII ART BEGINS

",""""""""
I've never told this story publicly, but I figure it's long enough ago, and Apple's interest in this Apple II stuff is behind us, so what the heck.

A few years ago we got a license to distribute the DOS 3.3 System Master on-line, which we hadn't had before. So the disks were mailed to us, straight from Apple Licensing.

So I get this really nice package from Apple with the nice white disk envelopes and labels and stuff. And just to make sure everything's kosher, I boot the System Master that they sent us.

Well, it boots into DOS 3.3... and up comes an old copy of Locksmith, the ancient Pirate's Favorite in the heady days of the DOS 3.3 Apple II...
world.

I'm really not kidding. I looked over the disk carefully and that's all it was... a copy of Locksmith. On a write-protected, Apple labelled disk that Apple Licensing sent straight to us.

What's doubly funny is the original Locksmith was copy protected, so this means that somewhere in Apple's history, someone either "cracked" this or accepted a pirate copy.

When we got it we realized these people had no idea what the heck they were doing when it came to Apple II stuff. So we quietly uploaded another copy of the DOS 3.3 System Master we had lying around, and that's what's up there in A2 today.

I wonder if I still have that disk? I'm pretty sure it's buried somewhere in my huge collection of 5.25 disks, gathering dust. :-)

(A2.DEAN, CAT13, TOP12, MSG:102/M645;1)
reprinted from the A2Pro RoundTable (8 October 1993)

>>> WELCOME TO THE TREASURE HUNT <<<

This month's column is dedicated to those of you who are newcomers to GEnie, or who have never downloaded or uploaded files, and want to become more familiar with the process. I will provide information about the processes, as well as the software you need to consider obtaining.

Much of the content of this column is duplicated from other sources, written by other folks, within the A2 area. It is being repeated here in the hope that its message will reach a larger, or at least a different audience.

We in A2 want to encourage you to become actively involved in the roundtable. Questions are encouraged. Visit the bulletin board or the Real Time Conference rooms and find out how friendly we can be. :)

And now, on with the show!

[*][*][*]

Downloading a file from the A2 library is a fairly straightforward task. After you access GEnie and find yourself at the prompt following the announcements, type m645;3 and press return. This will take you directly to the menu displayed below. (You can also type "A2" at the prompt, and then select #3 from the main menu to get here.)
Apple II RoundTable Software Library
Library: ALL Libraries

1. Description of this Library
2. Directory of Files
4. Browse through Files
5. Upload a New File
6. Download a File
7. Delete a File You Own
8. Set Software Library
9. Save Current Software Library
10. Instructions for Software Exchange
11. Directory of New Files
12. Join/Ignore Library Category

Enter # or <P>revious?

To download a file that you know the number for, select #6 from the menu. (If you don't know the file number, #3 will let you search for it by key word or uploader.) Next you will be asked the file number; type it and press return. Next you will be shown the long description of the file and given several options. The option you want is "D" to download it.

Next you must select from the following menu:

1. XMODEM
2. XMODEM (w/1k blocks)
3. YMODEM
4. ZMODEM

What you select will depend on the software you are using. For example, TIC (Talk is Cheap) does not support ZMODEM, but ProTERM and Spectrum do. Before you go online to download, read your software documentation to determine which of these to use. (YMODEM is generally considered a bad option.) Once you make your choice, you will be told:

"File is ready. Start your XMODEM [or whatever mode you chose] receive file."

At this point, what you do is determined by how your software handles things. Again, read your software manual first.

Once the download is complete, and you press a key or two in response to prompts, you will be asked if you want to download another file. If you do, you will go through the process again; if not, you will go back to the library menu screen.

The various sub-libraries in the Apple II RoundTable Software Library are listed below:

65. ALL Libraries
The following information is copied from the information available in category 1 of the A2 bulletin board. It should help you to understand the format of files in the A2 library, as well as what you must do to any file that you plan to upload or download.

What is the .BXY file format? You have probably been noticed that the files in our library end with the suffix .BXY. Pronounced "boxy," this type of file is a Binary II file containing a single NuFX archive created by ShrinkIt. In essence, these files are nothing but ShrinkIt files inside Binary II "envelopes".

This .BXY file format is the official A2 RoundTable packing standard. Older files created with BLU or other packing programs will not be accepted in our library. In addition, files created by ShrinkIt without a Binary II "wrapper" will also not be accepted on new uploads. Thus, older style .SHK and .SDK files will not be accepted into our library.

The reasons for this are manifold. This standard was established in 1989 in cooperation with GEnie, CompuServe, Apple Computer, Andy Nicholas (author of ShrinkIt), and Gary Little, creator of Binary II. This standard has been accepted because it will, in the long run, make life easier for all users. It's important that industry-wide standards be established and adhered to.

There are two ways to create a BXY file, and two ways to download and unpack them. You can use whichever you find easiest to use and remember.

To create a .BXY file, you just need to use ShrinkIt 2.1 or later (use the latest version available, which as of this writing is 3.4). With this method, you select the files you want to archive. Next ShrinkIt will ask you to type in a filename for the archive. End your filename entry by pressing Open-Apple-Return (instead of Return alone) and ShrinkIt will add Binary II formatting automatically. If your communications program has a Binary II option for UPloading--(such as ProTERM, Point-to-Point, or Spectrum)--just pack with ShrinkIt normally (i.e. without the Open-Apple-Return at the end), but turn your communication software's Binary II option ON while uploading. Don't do both!

To download a BXY file, you should turn the Binary II option of your term program ON. For ANY OTHER download, you should NOT use the Binary II option. After the download, just use ShrinkIt to unpack.

If your term program does not have a "Binary II" option for downloading, simply download the file without this option. You can then just use ShrinkIt 2.1 or later to unpack without any difficulty.

Just remember these simple rules:

A) When uploading, pack all files with ShrinkIt. Do not use any other packing program.

B) When uploading, EITHER use Open-Apple-Return when entering the filename of the archive, OR use the Binary II option of your terminal program. PLEASE DO NOT DO BOTH.
C) When downloading .BXY files, turn the Binary II option of your term program on. If your program doesn't have this option, or you prefer to download BXY files using exactly the same steps as other types of files, just download normally with Binary II off. But make sure you have ShrinkIt 2.1 or later.

D) When downloading any other type of file (XX., PP., .BNY, .BQY, .TXT, etc.) do NOT use the Binary II option of your term program.

Don’t worry if you forget to turn Binary II on when downloading, as ShrinkIt will handle the file anyway. But ultimately, most users will be better off making use of this option.

Graphics File Uploads   In the interest of making downloads and subsequent viewing as simple as possible, A2's IIgs graphics libraries will be supporting a single file type of both standard SHR graphics and 3200 color graphics.

In library 22, along with graphic programs, you will find 3200 color pictures. These are special graphics whereby each scan line may have a different palette of 16 colors, giving 200 * 16 = 3200 possible different colors. Our 3200 color pictures are (or will be converted to) type 76 block $C1, or PIC, files. This type of picture requires a special viewer. We recommend Chris McKinsey's SuperView. You can enter "SUPERVIEW.BXY" at the "download file" prompt. Additionally, it will also view normal one-screen pictures.

Library 23 contains standard SHR pictures of 320x200 or 640x200 resolution, using no more than 16 palettes, although most generally use one. These pictures will be in Apple Preferred Format, or PNT files ($C0/0002).

Rules About Disk Archives   Here follows a few clarifications on doing "disk" archives:

A2 normally insists on "file" archives for all ProDOS and GS/OS uploads. This is because we can't know what kind of hardware every downloader may have, and because hard disk owners get downright irate when they have to dust off their 5.25 drive and plug it into their GS just to unpack a file that they will then have to transfer to their hard disk. And we can't blame them. In fact, if the upload is a collection of related files, we really prefer that they be placed in their own folder and the entire folder be archived, though this is by no means a required step.

However, some things such as DOS 3.3 files, the TETRIS2 upload, etc. cannot be placed on a ProDOS disk. Since ShrinkIt is a ProDOS program, the only way it can handle such files is by shrinking the entire disk without worrying about the contents.

Let's consider what this means. If you are archiving a well-used DOS 3.3 disk, much of the "blank" disk space will actually contain files that have been erased from the disk catalog. Remember, deleting a file merely removes it from the catalog; it does NOT remove it from the disk. (That's why "Undelete" programs are able to work.)

Now, ShrinkIt has no way of telling which disk sectors are in use and which are free, and archives all 560 DOS 3.3 sectors. This means that all those previously deleted files are ALSO archived, although they aren't in
the catalog. This is incredibly inefficient and you can easily wind up
with a disk archive that is larger than the unpacked length of the files
you are uploading!

Some people have tried to get around this by transferring the DOS 3.3
files to a ProDOS disk and putting them in a "file" archive. This is an
bad idea for several reasons. First, the downloader must convert it back
to DOS 3.3 to use. You'd be amazed how many people don't understand how to
do that or why it's necessary. The confusion factor is just too much.
Secondly, the files will have to be renamed to something that ProDOS will
take. All too often, the new name will cause the program to crash. And
the user will be unable to fix it because he won't know what the original
names were.

We also want to remember that DOS 3.3 uploads must not contain a copy
of the DOS 3.3 system software. Apple Corp. still owns it and frowns on
this practice. We check all DOS 3.3 uploads for this and do not release
the ones that still have DOS on them.

Here's how to fix all these problems:

1) Format a blank DOS-less disk. I use Copy II+.
2) Copy all the files to be uploaded to the new disk.
3) Archive the new disk.

The freshly formatted disk will have all unused sectors "zeroed out".
These "zeroed" sectors compress to an extremely small space, so that the
resulting "disk" archive is at most just a block or two larger than a
"file" archive would have been.

I hope this makes the reasoning behind the A2 rules clearer to you.

[*][*][*]

UPLOAD.TIPS.BXY FILE #20171 12800 BYTES UPLOADING TIPS

Tom Zuchowski provides a variety of tips for newcomers to GEnie who
want to upload files to the A2 library. As Tom says, "Newcomers to A2's
uploading process must go through a learning curve. These tips will guide
you past the most common errors made by newcomers who are uploading for the
first time. If you follow them closely you can be confident that your
uploads will be correct and easily handled by the A2 staff and those who
will download it."

[*][*][*]

Obviously, if you plan to do any up- or downloading, you will need a
copy of ShrinkIt. If you do not have one, or if your copy is fairly old,
you can get the latest versions from the library. There is a version for
those of you with Apple IIE (enhanced with 128K of memory) or the Apple
IIc, as well as a version for the Apple IIgs. (There is also a version for
an Apple II+ with 64K.) First we will talk about the IIe version.

SHRINKIT34.EXE (file #20074 - 41856 bytes) ShrinkIt for the IIe/IIc
This is ShrinkIt for the IIe & IIc, the standard archiver/de-archiver for the Apple IIe enhanced with 128K of memory, or the IIc, and ProDOS.

This version of ShrinkIt will unpack itself with a little help from you. Read the directions below for details.

Make sure to give it a file type of TXT when you download it. This is important! You may want to double-check that your terminal package is not downloading as BIN. Also, it's important that you keep the file name as "SHRINKIT34.EXE". Make sure that you have 82 free blocks on the same disk as SHRINKIT34.EXE. Then run BASIC.SYSTEM and from the "[" prompt, type -SHRINKIT34.EXE (that's a dash, then the name of the file).

That will get you the working version of ShrinkIt for the IIe & IIc! It will fit on a 5.25 diskette. The documentation is available in another file (see below).

SHK34.DOCS.BXY (file #20145 - 18048 bytes) ShrinkIt Documentation

In order to make the file SHRINKIT34.EXE unpackable to a single 5.25 floppy disk, the documentation file was removed from it. The documentation merely details the history, and give other general info about the program. It's not necessary to have this file to operate the program. Should you feel the need for completeness, then this file is for you. The BXY version of Shrinkit 3.4 already contains this file so a download is unnecessary.

If you have a GS, the ShrinkIt for you is GS-ShrinkIt v1.1 which is described below. (You may also want to download ShrinkIt 3.4 in order to unpack 5.25" disk archives.)

GSHK.BSE V1.1 (file #19517 - 118272 bytes) GS-ShrinkIt v1.1

This is GS-ShrinkIt v1.1. This is also a ShrinkIt self-extracting archive inside a Binary II wrapper. This means that you'll have to remove the Binary II wrapper either when downloading using your communications program (that is, turn Binary II mode ON), or remove the Binary II wrapper with a separate program once you've downloaded this archive if you have a program like BLU or an older version of ShrinkIt. If your terminal program doesn't have a Binary II mode and you don't have a separate program, you should follow the instructions above and download SHRINKIT34.EXE. Once you have ShrinkIt 3.4, you can use that to remove the Binary II wrapper from GSHK.

GSHK v1.1 is faster compressing, faster decompressing, can make self-extracting archives, and has been made easier to use. A MUST-HAVE for anyone downloading files from A2 or A2Pro!

Remember, you MUST download this with Binary II turned on, or use some other utility after the download to remove the Binary II wrapper. Then just run the program to have it extract itself.
The Apple II RoundTable on GEnie (A2) offers three FREE (aside from download charges) great time-saving programs for Apple II users to navigate throughout all GEnie.

With CoPilot, GEM, or TCXpress, you perform all your work offline, that is, while not connected to the system. You can read and write E-mail or bulletin board messages, scan new uploads and select files to download, and more (downloads not supported by TCXpress). Once you're ready, the offline navigation program is instructed to go online on GEnie, at which point it sends all messages, collects all replies to previous messages, downloads all selected files, and so on, all at the fastest possible speed (much faster than a human could do it manually). Within a few minutes it finishes its task and then automatically logs off the system.

Apple IIgs Only  CoPilot is a full GS/OS desktop program that runs on the Apple IIgs only. It requires 1 meg of RAM, a hard drive, and Apple IIgs System 6.0. There are three versions of CoPilot v2.5—one each for ProTERM 3.0 (or later), Talk is Cheap 3.31 (or later), and Spectrum. There is an older version of CoPilot (v2.1) still available, for Point to Point 4.0 and Talk is Cheap 3.20.

For those of you with Apple IIgs's, the CoPilot files are

<table>
<thead>
<tr>
<th>file#</th>
<th>file name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>23130</td>
<td>COPILOT.SPC.BXY</td>
<td>CoPilot v2.5 and Spectrum scripts</td>
</tr>
<tr>
<td>23110</td>
<td>COPILOT.TIC.BXY</td>
<td>CoPilot v2.5 and TIC scripts</td>
</tr>

</tr>
<tr>
<td>20878</td>
<td>COPILOT.2.1.BXY</td>
<td>for Point to Point 4.0 and Talk is Cheap 3.20</td>
</tr>
</tbody>
</table>

For a limited time, you can download all three flavors of CoPilot v2.5 for nothing! GEnie surcharges (but not charges of connecting networks such as SprintNet and DataPac) will be waived while you download the file. Check to see if the offer is still open before downloading!

Apple IIe, IIc, IIgs  GEnie Master 4 (GEM4) 4.22 runs on any Apple IIe (enhanced), IIc, IIc+, or IIgs. It requires 512K of RAM, two 3.5" drives or a hard drive, AppleWorks 4.0.2 and one of the following: ProTERM 3.0, Talk is Cheap 3.20, Point to Point 4.0, or Spectrum. (Or later versions, of course.)

<table>
<thead>
<tr>
<th>file#</th>

TCXpress is a GEnie-specific message processor that uses the combination of AppleWorks 3.0, TimeOut TeleComm and UltraMacros (3.1 or 4.x). TCX is menu-driven and will auto-capture mail and roundtable messages and will auto-send mail and RT messages that you compose offline. Includes quote-back, mark and unmark, auto-file-save options. This file contains both TCX versions: TCX3 for use with UltraMacros 3.1, and TCX4 for use with Ultra 4. UnShrinks to a 3.5-inch disk, and REQUIRES either a hard drive and a 3.5 drive, or two 3.5 drives. It also requires that you own UltraMacros 3.1 or 4.X, and Timeout Telecomm.

<table>
<thead>

That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

--Charlie Hartley
Apple II Computer Info

deal for these refugees, including a $50 credit and great discounts on ProTERM, TIC and Spectrum, which will come with a GEM and Co-Pilot disk, our two popular offline processor programs.

THE MAIN EVENT This newsletter will combine two months worth of meetings, for our July meeting was the last Sunday in July--as a post-Kfest get-together.

Though we had no "special speaker", many folks who were at ICONference (formerly KansasFest) showed up to tell us about their experiences. And what experiences were had!

It was three days packed with learning and lots of fun! Seminars covered everything from the new Animasia to a demo on the Mensch computer; from Joe Kohn's inspired talk on the Internet to a glimpse at the PowerPc, a taste of Chicago (the new Windows) and System 7.5 for the Mac.

There was as much after Hours--as much fun as last year, if not more so! We had the usual "bite the bag" contest (won by Roger Wagner), a "Nerf gun fight", many pizza parties, and an annual roast of Mike Westerfield (excellent... poor guy, never had a chance! <grin>).

Actually, it's so hard to describe the goings on there... you have to be there to appreciate what went on! So, all of you, prepare for next year, so we can see you there!

Our August meeting was dedicated to an Open House for our new friends from AOL--giving them a quick tour of what A2 and GEnie has to offer them! We had a huge crowd--over 20 people showed up for this big event!

What do we have to offer? A library that's had over 23,000 uploads with thousands of cool files; a bulletin board chock full of information and support; and a very active Real Time Conference, manned 7 days a week, from 9 p.m. to 1 a.m. eastern on a nightly basis, Saturday afternoons and virtually all day Sundays.

THE LIBRARY STACK Here are a bunch of great files that are from our very own Dean's List. If you want to learn more about Kfest and have a IIgs, download Auri's masterpiece, file #23122. There's a lot of good stuff about what went on there. File #23102 has some great pictures of Kfester's.

+23050 KEYWORDINFO.TXT Describes how GEnie library keywords work

WHAT'S NEW IN A2? A2 is in the process of gearing up for AOL refugees and
we have increased our RTC schedule as well (to Saturday afternoons). We will soon be present in Chat, manning an "AOL Refugee Center" and will appear in GENIEus as "Help Desk for a night" on 31 August.

Come to our next meeting in September (topic to be announced) and enjoy the company of your fellow A2 users! We would like to say "Welcome Home" to our AOL friends, and let you know that you've picked the best online service for Apple II support out there!

[EOA]

I'd change the world, but I lost the source code.

[EOA]

GEnieLamp TX2 ................. GLTX2
GEnieLamp A2 .................. GLA2
GEnieLamp Windows .......... GLWIN

- Back issues of GEnieLamp are available in the DigiPub RoundTable
  Library #2 on page 1395 (M1395;3).

- GEnieLamp pays for articles submitted and published with online GEnie
  credit time. Upload submissions in ASCII format to library #42 in
  the DigiPub RoundTable on page 1395 (M1395;3) or Email it to
  GEnieLAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions
  or just to say hi, you can contact us in the DigiPub RoundTable
  (M1395) or send GE Mail to John Peters at [GEnieLAMP] on page 200.

- If you would like to meet the GEnieLamp staff "live" we meet every
  Wednesday night in the Digi*Pub Real-Time Conference at 9:00 EDT
  (M1395;2).

- The Digital Publishing RoundTable is for people who are interested in
  pursuing publication of their work electronically on GEnie or via
  disk-based media. For those looking for online publications, the
  DigiPub Software Libraries offer online magazines, newsletters,
  short-stories, poetry and other various text oriented articles for
  downloading to your computer. Also available are writers' tools and
  'Hyper-utilties' for text presentation on most computer systems. In
  the DigiPub Bulletin Board you can converse with people in the
  digital publishing industry, meet editors from some of the top
  electronic publications and get hints and tips on how to go about
  publishing your own digital book. The DigiPub RoundTable is the
  official online service for the Digital Publishing Association. To
  get there type DIGIPUB or M1395 at any GEnie prompt.

GENieLamp Information.

READING GENieLamp  GENieLamp has incorporated a unique indexing system
to help make reading the magazine easier. To
utilize this system, load GENieLamp into any ASCII word processor or
text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[+]GENie Fun & Games.

To read this article, set your find or search command to [HUM].
If you want to scan all of the articles, search for [EOA]. [EOF] will
take you to the last page, whereas [IDX] will bring you back to the
index.

MESSAGE INFO  To make it easy for you to respond to messages
re-printed here in GENieLamp, you will find all the
information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

| Name of sender | CATegory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page
475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic
1.

A message number that is surrounded by brackets indicates that
this message is a "target" message and is referring to a "chain" of two
or more messages that are following the same topic. For example: {58}.

ABOUT GENie  GENie's monthly fee is $8.95 for which gives you up to
four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an
Internet mail gateway, and chat lines, are allowed without charge.
GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330
in Canada. Upon connection type HHH. Wait for the U#= prompt. Type:
JOINGENIE and hit RETURN. When you get the prompt asking for the
signup/offer code, type: DSD524 and hit RETURN. The system will then
prompt you for your information. Need more information? Call GENie's
customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLamp READERS!  If you sign onto GENie using the
method outlined above you will receive an *additional* six (6) free hours of standard connect time
(for a total of 10) to be used in the first month. Want more? Your
first month charge of $8.95 will be waived! Now there are no excuses!

*** GET INTO THE LAMP! ***

"Politically correct" means "political," not "correct."

J.SCHONBLOM
In his book _The Dungeon Master: The Disappearance of James Dallas Egbert III_ (Boston: Houghton Mifflin, 1984), private investigator William Dear describes his hunt for a sixteen-year-old genius. One particularly gruelling stage of the investigation involved searching the service tunnels that ran underneath Michigan State University:

The maintenance engineer and I were the last team out of the tunnels. We emerged at about 11 P.M., after four and a quarter hours underground, through unlocked double doors into the basement of Case Hall, where Dallas had lived.... What we did next was curious, and I can only call it the act of a compulsive person. WE SEARCHED THE BASEMENT. If we'd been in Mother Teresa's bedroom, we probably would have searched that. We'd grown accustomed to searching.

I thought of that incident recently when a new piece of software arrived in my mailbox. I copied the program onto my hard drive, ran the program, and started trying every possible menu choice in an effort to find a bug.

You see, I've been spending the last little while beta-testing software, the final stage before the software is released for sale. I've gotten used to looking for bugs, and gotten used to trying menu options that I wouldn't normally use.

That in turn reminded me that my fellow beta testers and I have been falling on each new release, closeting ourselves with the latest version, and emerging hours later to point out new bugs, or crow that old ones haven't been fixed. Very rarely indeed did anyone rave about the features that had been added; our preoccupation was always the bugs that the new features caused.

Okay, we WERE asked to be beta testers, not reviewers or advertising and promotion execs. Even so:

What's beta-testing like for a programmer or programming team? For a programmer, beta-testing means the project is almost finished. What's it like to suddenly hear 80 fantasticajillion complaints, and no compliments?

I don't know; I don't really program. I suspect it can be demoralizing. (Writing--code, prose, or poetry--is so solitary that it's often demoralizing anyway.)

It's great (if not surprising) news that there are still companies publishing software for the Apple II. In the days ahead, we need to be
particularly vigilant that we haven't become so hypnotized that we continue as we always have just because that's the way we've always done it. There are few knowledgeable companies publishing Apple II software these days. Without becoming pushovers for any sloppy piece of software that comes down the pike, we need to realize that the Apple IIs dominance of the marketplace. This economic reality means that it's a lot riskier for a publisher to invest in Apple II software.

I'm not saying "Let's allow the remaining publishers to give us crummy support." (This hasn't exactly been a major worry of mine lately, anyway.)

I am saying that we should remember to be polite. (Saying "please" and "thank you" might not make all the difference, but they do make some difference.) We should remember to be reasonable. (No more blowing up the first time a mistake is made, not even if you're having a rotten day.) We should remember that practically every new piece of Apple II software comes at a bargain price... compared to a similar piece of software on a Macintosh or IBM. (Sure, your computer budget is shrinking, but so is the publisher's.)

To be honest, my advice is good advice even when all is smooth sailing. It's just crucial advice when things are not going so well.

-- Doug Cuff

Is That A Letter For Me?

-------------------------------------------

by Douglas Cuff

[EDITOR.A2]
"...FOR THEM, NOSTALGIA IS BREAKFAST..."  As the VP of a local user group, I'm listed with Apple as a user group Ambassador. This morning, I got a call from someone at Apple's User Group Connection who was wanting information to update their data base.

Her: Are you still using and supporting the Macintosh?

Me: Arrrggghhh. I've never used or supported the Macintosh.

Her: Have you switched to PC's.

Me: No

Her: Have you given up computers completely?

Me: No. I'm involved with another computer that Apple produced for a number of years. Does that give you an idea?

Her: No. I have absolutley no idea what computer you could be referring to.

(JOE.KOHN, CAT5, TOP2, MSG:338/M645;1)

AMERICA ONLINE KEEPS APPLE II AREAS Gayle Keresey is now AFL Gayle, and will stay there managing the A2 forums along with AFL GaryJ.

They may be discontinuing Apple II access, but they're not killing the forum.

<<<< May not sound logical, but that's the way it is.. They are paring it down somewhat (conference rooms have now been cut down to two.. Apple II General and Apple II Technical).

Andy... (A.WELLS5, CAT5, TOP6, MSGS:281&283/M645;1)

EWORLD AND THE APPLE II There's actually a very limited amount of support for the Apple II on Apple's own new service, eWorld. It consists of the Apple IIGs and IIE system software. Period.

== Lunatic (: (A2.LUNATIC, CAT5, TOP6, MSG:289/M645;1)
BIG RED PHONE PROBLEMS?  > Does anyone know (for sure) what the scoop on
           > BRCC is.

I last spoke to John Wrenholt, BRCC's owner, a week or two ago.

At that time, he said that he was finishing up a new issue of
Scarlett.  If I remember correctly, he said that he has 4 issues of
Scarlett to complete, and he has every intention of doing so before Dec
31st.

> nor have I been able to contact them.

When I dialed 402-379-4680, I got through with no problems.

Joe  (JOE.KOHN, CAT2, TOP4, MSG:197/M645;1)

QUICKPORT II CDA  I saw this on comp.sys.apple2

> QuickPort II is a CDA that lets you set your printer and modem ports to
> whatever speed you want all the way up to 57600 baud on the fly.

Anyone familiar with this CDA?  Would QuickPort II let me logon to
GENie at 2400bps and then, provided my particular modem connection
supported the faster speed, switch to 9600bps for a download?  I didn't
think this was possible.

Nez  (L.JIMINEZ, CAT10, TOP2, MSG:408/M645;1)

APPLEWORKS 4.3 MOUSETEXT DESKTOP INDEX  The other day at a meeting someone
asked me about patching AppleWorks
4.3 to use mousetext in the oa-Q menu like Companion Plus.  It's really
very simple.

Get in a block editor like Block Warden or Zap.

Follow SEG.AW on your AppleWorks disk or in your AppleWorks directory.

Change bytes +$14A through +$163 to the mousetext characters of your
choice.  These are the characters that appear on either side of "Desktop
Index 1".  To use the same characters as Companion Plus enter: D6 D7 D6
D7.... or for the solid apple symbol, enter C0 starting at +$14A through
+$163, 26 bytes.

Starting at byte +$22C4 enter DA DF CC.  These are the mousetext
characters used to draw the box.

It's also very simple to move the oa-Q Menu to another position on
the screen.  If anyone wants to, yell and I'll post the information.

Note these addresses are for AW4.3 ONLY as far as I know.  I don't
even have a copy of 4.1 or 4.2 anymore, so I have no way of checking.  As
always, don't patch original disks.  Always use a backup.

(S.BEVILLE, CAT17, TOP14, MSG:430/M645;1)

RAMFAST PARTITION ONE BLOCK TOO LONG  I have been using the RamFAST Rev D
to setup hard disk drives that will
be using a RamFAST or ship with a RamFAST, all year now.  Recently, I
noticed that DiskTimer GS won't run on the 32 meg partition (boot partition) but didn't think much of it until I innocently ran ProSel-16, Volume Repair in the Main Directory and Fix Directory mode and learned that the partition was one block too long. ProSel-16 volume repair fixed that, and DiskTimer GS worked! So, now I check and fix all RamFAST created 32 meg partitions (that is partitions that the RamFAST utility software creates in 32,768k size). I recall and checked to verify, that the Chinook Hard Disk Drive Utility program always creates 32,767.5k partitions, which econfirms that the RamFAST 32,768k is one block too big, according to conventional software.

In a future upgrade to the ROM software, would Sequential Systems please consider fixing this because I am now presently having to spend about 10 minutes resizing (correcting) the problem before shipping my Hard Disks (Disks) with RamFAST SCSI controllers.

Thanks; Chuck
Charlie's AppleSeeds

POSTSCRIPT ON AN APPLE IIGS? How would I use PostScript fonts from the GS? This is something I just don't know about.

Mark

BILL BASHAM SPOTTED strange you should ask. i just happened to meet bill basham a couple of months (and again weeks) ago. (he bought some stuff at radio shack & since we ask everyone name & address, i asked if he might be the same who wrote some apple software). didn't get into too deep a conversation (other customers waiting) but from what he said, i know he isn't doing anything on the ][ anymore. DID seem quite excited about the power pc's, though. (still, he did say that he enjoyed having done diversi-tune, so i'd assume support is still there if you need it).

. jyri

SOMETHING YOU DON'T SEE EVERY DAY One of the most UNIQUE ways to use a IIgs that I know of: As an Egg Sorting computer.

One of the fellows on GEnie wrote a program for the GS that will read sensors on a machine which determines the size and grade of chicken eggs. As far as I know, it is still being sold, although he has had trouble getting the A/D cards necessary.

Ken Lessing

SUPERDRIVE TIP Hugh Hood posted a really good tip in another CAT about
testing the Apple II Superdrive Card by entering Cn0AG from the monitor, where n = Slot number of the card.

It's a neat test, and can even detect the presence of an old 400K Mac MFS diskette. A2FX and HFS conversion programs won't touch these, but MAC.TRANS.GS, in our A2 library, does the trick. Even though it says GS, it will also work fine on an enhanced //e, though, just to complicate things, will work with a UDC but not the Superdrive Card.

David K. (D.KERWOOD, CAT8, TOP21, MSG:25/M645;1)

II ALIVE SUBSCRIPTION E-MAIL If you are having problems with II Alive, please drop Internet e-mail to

jmkomasa@qualitycomp.com

From GEnie you will need to add @inet# to the end of that.

That's Jeff Komasara, who is in charge of subscriptions for II Alive. I have been forwarding questions to him, but perhaps it will be easier for him to reply to direct Internet questions.

(R.HOSKING, CAT2, TOP20, MSG:192/M645;1)

ORDER NOW, AND GET 100 MEGS FREE? I recently ordered a 170 meg HD for my daughters MAC from LaCie. I ordered it on a Thursday late in the day and they said they couldn't get it to Airborne that day so it would arrive Monday. The following Thursday rolled around and no drive. When I called back, they told me that they had a computer crash and lost a bushel of orders. They had reconstructed the orders but by this time they were out of 170meggers. No problem, they shipped a 270 meg for Saturday delivery with no shipping or handling.

Shades of LL Bean. Good service, good price and, best of all, they care about their customers.

(SPECTRUM SLOWDOWN FIX BTW, the "big clipboard slowdown" actually is not related to the clipboard's size. I believe the clipboard slowdown occurs if you copy ANYTHING to the clipboard while inside Spectrum using the Spectrum.8 font. If the clipboard contains copied text that references the Spectrum.8 font, the clipboard gets corrupted after you quit Spectrum (when the Spectrum.8 font is no longer resident in memory). When you OA-Copy something new to the clipboard, you're replacing the old (corrupted) contents with a valid clipboard, and launching Spectrum won't show a massive slowdown (caused by the Scrap Manager eating all available memory).

The only solution we've come up with: Version 2.0 will ship with the Spectrum.8 font on disk and will install to the *:System:Fonts: folder, and the problem won't show up.

(SEVENHILLS, CAT43, TOP15, MSG:321 [extract]/M645;1)

>>> HOT TOPICS <<<

NEW TOPIC: SECOND SIGHT

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Topic 14        Tue Sep 13, 1994
PROCYON.INC [Switch-It!]     at 15:51 EDT
Sub: Second Sight VGA Card

Discussion of the new Sequential Systems 'Second Sight' VGA card for the Apple II and IIGS!

>>>>>   I saw the ad for "Second Sight" in GS+, your ad forgot two """""""" things...
How much $$$?
When can I get one???

Burger            (BURGERBILL, CAT20, TOP2, MSG:208/M645;1)

>>>>>   And I'm waiting to see what it'll do for the //e! :

Terrell Smith
 tsmith@ivcfns.com
 (T.SMITH59, CAT20, TOP14, MSG:29/M645;1)

<<<<<   It _will_ work in a //e. I see no reason why an enterprising IIE programmer couldn't write a quick-n-dirty GIF converter for the board. Even better, someone might write a GIF-convert code-module to run _on_ the board.

Jawaid            (PROCYON.INC, CAT20, TOP14, MSG:32/M645;1)

>>>>>   Well then, to add to the fun, how about a little believe or not. """" Rumour has it that besides Jawaid, one of Sequential's main VGA card designers is none other than Mr.Ramfast (AV).

ps. if this is true, you know it's going to be a helluva product.  
 (J.FENSKE2, CAT20, TOP14, MSG:34/M645;1)

>>>>>   COME ON ALREADY
"""

Yes, I realize Jawaid is a busy guy. But as we all sit here, the stock in Depends Adult Disposable Undergarments is going up because we're all p*ssing our pants waiting for a few details.

Sure, maybe there is going to be some FANTASTIC press release that is coming, but a few simple "it will support the following resolutions, and the following monitors, and the following colors" comments wouldn't have been so hard to come up with in the two weeks since this topic was created. Sheesh! Maybe they just don't want our money that quickly... :) 

[- Matthew Ryan, SysOp of Dreamscape 24-Line BBS - (818) 781-7529 -]
 (M-RYAN, CAT20, TOP14, MSG:46/M645;1)

ULTIMA I CHARACTER EDITOR?   I got Ultima I yesterday! Very cool!!!! Way to go BurgerBill! The sounds are fantastic!

I remember those character editors. I just used to keep a list of the byte offsets in the player file and a copy of Zap handy whenever I needed more food. :) I will play around with Ultima and let you know if the file is
easily modifyable.

Binary Bear the CoPilot

(BINARY.BEAR, CAT40, TOP5, MSG:30/M645;1)

The 'word' from the Burger Meister is that he uses a very different file format than the original DOS 3.3 version of Ultima, and that none of the old character editors will work on the new GS/OS version.

(JOE.KOHN, CAT40, TOP5, MSG:31/M645;1)

PMP FAX SOFTWARE REPORTS FROM THE FIELD

 Wheels do need re-inventing now and again... :)

Seriously, I want my software to work with ANY kind of fax modem. So, I'll have to get to Class 1 eventually, anyway, and since its the hardest to program for, I may as well get it over with. Also, if I can write fax software that will work with a Class 1 modem, I can write it to work with anything...

Anyway, I guess everyone is happy about this software :) To keep you up to day, I've been converting more C code into assembly to try to speed things up. Right now, it takes about 30 seconds or so (I haven't actually timed it) to "print" an AWGS page layout document to a fax file. It then takes about 2 minutes or so to send it to the receiver. The more complicated the document being printed, the longer it tends to take. To speed things up, I'm going to have 2 quality settings. When you "print" (ie save to a fax file), you'll be given 3 quality settings (Fast, Standard, Best). When you send the fax, you'll be given 3 or 4 resolution settings. The quality setting tells PMPFax how big to make the graphic image. When printing text, the bigger the better, since an enlarged graphic image will use larger font sizes if you have them, which will improve the general quality of the fax. The resolution is basically a chunkiness setting. Normally, PMPFax uses a 16x16 pattern to print in grey scale. With the best resolution, 1 bit in the pattern represents one fax pixel. With a resolution setting of 2, 1 bit represents 2 bits, etc. Its more complicated than that in real life, but the upshot is larger the setting, the chunkier the printout (and the lousier the quality) and the larger the setting, the faster it sends.

As I mentioned before, I'm saving fax files into standard Apple Preferred format (saved with a custom block for the page information). This will allow PMPFax to send any AP graphic file, as well as a receive fax file. Someone mentioned that type $C0, aux $0007 is the official Group 3 T.4 raw image file, so I guess that's what I'll use for received faxes.

So, here's the stuff that actually works: the CDev loads fine and patches the Print Manager. The patch code intercepts Print Manager calls to capture print jobs to fax files. And, a stand-alone (for now) program will take these files and send them out. In other words all the basics (except the receive) is finished. Receiving should be quite simple, since all the routines I'll need are already written for the send side. Converting received faxes will take a bit of time, but shouldn't cause too many sleepless nights (two weeks' worth tops ;-)

So, there you have it. Keep suggesting things, and I'll keep working.

Paul

(PMP, CAT38, TOP15, MSG:54/M645;1)
There is an article in the October '94 issue of MacWorld comparing Mac fax programs. In a sidebar, the author describes desirable features of such programs. It would be nice for a GS program to include as many of these as are feasible. To paraphrase the article:

Common features are: scheduling of outgoing faxes, send and receive in the background, multiple phone books, export received faxes as graphics, send one fax to multiple people, send multiple documents as one fax, log all faxes, forward a received fax to another fax machine, flip a received fax upside down, magnify and reduce faxes on screen.

More sophisticated features are: send gray-scale images (like photos), antialiased (gray-scale) viewing of received faxes, intelligently omit the local area code when dialing, turn received faxes into text (OCR), rotate a received fax 90 degrees, dial credit card dialing sequences, can switch to fax manually during a voice call, automatically print received faxes, import and export tab-delimited phone books, a program that lets you quickly whip up short typed faxes.

Well, first, I wasn't assuming everyone had AWGS :) Just that most do, which is why it would have been nice to have the graphic file specs. However, I'm writing my own cover sheet program, so the point is moot. It will be a basic draw program. You'll have all the basic shapes (ovals, rects, round rects, lines), 16 colors and 16 patterns, text, and APF importation of bitmaps for backgrounds, etc. Also, of course, you'll have the predefined fax fields, such as page #, total pages, address, company, comments, etc.

Short cover sheets won't be a problem. You could always just choose a short page size (such as envelope) and confine your sheet to that. Attaching a default cover sheet (or none at all) to a phone book entry is a good idea. I'll do something like that. Since the actual print jobs are going to be stored in APF format, you'll be able to choose from print jobs, APF, and coversheet formats for sending faxes. You'll also be able to send received faxes, or convert them over to APF format. I'll also include groups in the phone book so you can send faxes to a number of different people.

Keep the suggestions coming!

Paul

Well... I've changed how I'm going to do a few things. For the actual saved fax file, I'll be using my own format instead of APF and do all of the translation at "print" time. This will greatly improve the speed at which the fax is actually transmitted (saving on phone bills). It will still be able to import APF files, but actual send jobs will be saved as a fax send file.

Received images will be saved as raw T.4 fax data, with each page stored in a different file. When viewing these files, the raw information will be read in, translated to scanline/pixel information, and squeezed into whatever magnification level you've selected. When printing, I'll probably be stuck using whatever page size the printer driver is supporting. I bet, though, if you select Compressed and 50% or whatever with the Laserwriter, you'll actually get a nice printout.
As to informing you of un-sent faxes... What I'm planning on doing is keeping a scheduled log that contains all send jobs that haven't been sent yet. Each of these jobs (which can include print jobs, coversheets, pages from other scheduled or received faxes, or PIC/APF files) will have a status and a time that they will be sent. Normally, you will send send jobs immediate when they are created. The job gets sent, then they are normally deleted (you'll have an option to retain sent jobs). However, you'll be able to specify a particular time to send a job. As long as you keep your computer in the desktop, the fax software will look at the time (as well as seeing if any calls are coming in) and when the time comes for a scheduled fax, it will attempt to send. If something goes wrong, the job will remain in the scheduled log, the status will be "Send Failed" or something like that, and all the details will be in the main log for you to look at. At boot time next, you'll probably be able to hear nifty sounds for "Fax Waiting", "Fax Not Sent" and the like.

Paul

APPLEWORKS 4.3 AND TWILIGHT II

Why doesn't Twilight II blank the screen in AWKS 4.3? -- has there something been changed inside AWKS 4.3??

Udo - ... just a IIGS freak -

(U.HUTH, CAT17, TOP14, MSG:377/M645;1)

Jim M. gave me some code to turn off Twilight while AW is running, thereby avoiding the crashes people have complained about. T2 hooks itself up again when you exit AW so it should keep working when you're back to GSOS. While in AW, you can use AfterWork.

(BRANDT, CAT17, TOP14, MSG:378/M645;1)

Randy, please, put Twilight II support back into AW 5.0. Or make it an option the user can toggle.

I prefer to have Twilight II blank my screen, 'cause I own this and it behaves well on my system. I really don't wanna spend extra money on AfterWork.

Udo - ... just a IIGS freak -

(U.HUTH, CAT17, TOP14, MSG:403/M645;1)

Jim M. gave me some code to turn off Twilight while AW is running, thereby avoiding the crashes people have complained about. T2 hooks itself up again when you exit AW so it should keep working when you're back to GSOS. While in AW, you can use AfterWork.

WHAT'S NEW

SYSTEM II BRINGS THE DESKTOP TO THE APPLE II

Westerville, OH. Kitchen Sink Software is shipping a desktop system for the Apple II computer. The desktop brings the Apple II up to the same level as a Mac in user friendliness. IBM also has a desktop called Windows. Asked why the Apple II needs a desktop program, Kitchen
Sink Software President Guy Forsythe said, "There are a lot of Apple II computers out there. Schools want students to see the up to date methods of doing things. Individuals are tired of hearing about how the Apple II is just too out of date and being outdone by the newer systems. But the Apple II can do the job!"

The new desktop is called System II to keep in alignment with the MAC way of numbering their systems while at the same time making it evident that this is for the Apple II. The system will work on 5.25", 3.5" and hard disks. One place wanting a desktop is schools that have Mac LCs with the //e card. The system will work on any Apple II that can run ProDOS and has 128K of memory. Students will see System II and know how to use it because it is similar to the MAC system. System II brings the //e up to date.

The desktop is similar to "At Ease" so it is not cluttered in appearance, but it has the capability to copy files and other desktop functions. Teachers will appreciate the ability to turn off the file manipulation capabilities.

What makes System II different from //e desktop programs of the past is that System II is more than a desktop. It is a complete operating system. so teachers or developers who want to publish software that uses pull down menus, dialog boxes and all the other features that make the MAC and Windows interface so popular are available to everybody. The system works in both single and double hires in both color and mono- chrome modes.

The System II Developer's Kit includes all the programs, routines and information you need to write fast running, professional looking programs in System II. Even things like a disk formatter are included. The licensing fee lets the developer make a profit before paying any fees!

System II $39.95 with site licenses for $99.95 allowing you to put it on as many computers as you have in one building. This package includes:

- Easy II Desktop: a simplified desktop for use in classrooms or at home where you just want to run programs quickly from an easy to use desktop. Easy II allows you to boot from any disk including an internal hard disk or file server. You can run protected programs from a floppy disk as easily as any other program... all from a familiar desktop.

- Full II Desktop: when it is time to do some copying or desktop arranging, just switch to Full II (password protection built in) to get a fully functional desktop system.

System II Developers Kit $69.95. This package includes:

- Easy II and Full II desktops. System II Complete User Interface. You get all the instructions and commands that allow you to write Applesoft programs with a complete graphical user interface for ProDOS and single or double hires graphics. This includes pull down menus, dialog boxes buttons, check boxes, cursor control, graphic drawing tools, etc. You can publish/distribute disks using all of our interface routines. You pay a $100 publishing license after you sell $1000 worth of your product.

You can call and order either package from the continental US at: 1-800-235-5502 or International at: 614-891-2111. Or, you can order by
mail at: Kitchen Sink Software, Inc., 903 Knebworth Ct., Westerville OH 43081. We take VISA/Master Card, school POs, and checks. We still take cash (if anyone still uses it) but it is risky sending cash through the mail so we discourage it.

(KITCHEN.SINK, CAT25, TOP6, MSG:4/M645;1)

CONTACTS GS RE-RELEASED (San Rafael, CA. September 14, 1994) Shareware Solutions II, a general interest bi-monthly newsletter that celebrates the magic that is the Apple II computer, is pleased to announce the re-release of Contacts GS and the release of TimeOut ContactsMover.

Contacts GS is a convenient to use IIGS New Desk Accessory that provides a Rolodex-style name, address and telephone database program that can be accessed from within any standard GS/OS desktop application which displays the Apple Pull Down Menu, including HyperCard IIGS, AppleWorksGS, the Finder, HyperStudio, and Platinum Paint.

Contacts GS provides the ability to enter information into a name and address database from within other GS/OS desktop programs, and it also allows users to quickly locate specific information using a fast Search function which is able to search all of the major data fields.

Contacts GS, in conjunction with TimeOut ContactsMover, also provides a flexible and convenient method to enter and retrieve data from AppleWorks Classic database files. If you ever wanted to have a GS/OS based Super HiRes AppleWorks’ data entry and retrieval system, Contacts GS and TimeOut ContactsMover will provide exactly that for you.

Contacts GS data can just as easily be imported into any Apple II word processor, and the Contacts GS data file is also 100% compatible with Addressed For Success and DB Master.

The Contacts GS New Desk Accessory was written by Burger Bill Heineman. TimeOut ContactsMover was written by Will Nelken, the co-editor of TimeOut Central. The Contacts GS program manual was co-written by Joe Kohn, Publisher of Shareware Solutions II, and Will Nelken.

Contacts GS requires an Apple IIGS that is running System 5.0.2 or later, although System 6.0 or 6.0.1 is recommended. It has no special memory requirements; if you have enough RAM to run the Finder, you can use Contacts GS.

The Retail price of Contacts GS is $35, but as a special introductory offer, Contacts GS is available for $25 (with $3 s/h for US delivery; $5 s/h elsewhere).

Upgrades from the version of Contacts GS that was previously available from Simplexity Software are available for only $10 (plus s/h, as above). Owners of Simplexity’s version of Contacts GS must return their original disk to take advantage of this offer.

Contacts GS is only available from Shareware Solutions II.

To purchase Contacts GS, send a check or money order, made payable to Joe Kohn, to:

Shareware Solutions II
The announcement below was sent to the Eamon Adventurer's Guild by an Apple II enthusiast who asked me to spread the Word for him. I do not know this gentleman, nor can I vouch for his newsletter. You pays your money, and you takes your chances. However, I must say that he does seem to have scads of enthusiasm.

- TomZ

Resource Central go bye-bye.

NOTE: This does not, I repeat NOT, mean that any of the -Central publications are gone. They are now owned by ICON, which is sticking around. It's just the mail-order firm that's closing.

Doug Cuff, A2-Central
(I'm not affiliated with Resource Central)

SOUNDMEISTER CARD NOW SHIPPING They are starting to trickle out the door... the waiting list is first and by the time the backorders are out they should be in ample supply..

The major hold up right this second is the company that I ordered the 1/8" panel mount phone jacks from sent me mono instead of stereo. When we
recieve parts, they go into stock. They even looked like stereo so no one paid it any mind, but last Monday when I went to assemble a sample cable so they could build the rest, I discovered that.

That's the reason for the slowness at this point. If people want to build their own "patch board" for connections, they can get a card a bit sooner...

(T.DIAZ, CAT46, TOP7, MSG:112/M645;1)

>>> THROUGH THE GRAPEVINE <<<

PRINT SHOP IIIGS DESKJET DRIVER > Is the attempt to build a Printshop GS Deskjet printer driver still alive?

I really hate to say it, but at this point, I know as much about Burger Bill's progress as you do.

I recently wrote to Bill, and told him that I'd like a statement from him; a statement for publication. I feel a need to convey a message or a progress report to all those people whose hopes were elevated by my promise of HP Print Shop drivers. Only Bill can provide that progress report.

Unfortunately, I have not heard back from him.

Joe

(ECON ALIVE, BUT NO LONGER APPLE II)

I called ECON this morning, and received the following information:

ECON has discontinued their Apple II product line.

They are trying to, but have not yet found a 'home' for UniverseMaster. When they do, the lists of registered users will be passed to the new 'owners'.

Don

(Sent via CoPilot 2.5, ANSITerm 2.12, and ANSITerm beta scripts)

(RUMOR: TIMEWORKS HAS FOLDED)

I get a lot of User Group newsletters in the mail, and recently received one from Illinois. It mentioned that same rumor, and said that one of the club members drove by the TimeWorks office to see if the rumor was true. Apparently, the officers were closed, and a note was on the door saying that TimeWorks had gone out of business.

Joe

(BRODERBUND TO PULL THE PLUG?)

BTW, if anyone has been thinking about purchasing the New Print Shop or any of the NPS Graphics Libraries, you may want to do so soon. Otherwise, you'll have to look for them on the used market. I recently spoke with a fellow at Broderbund and he informed me that they will be pulling the plug on the Apple II version of NPS. From what he said, it will happen sometime within the next couple of months. They will, however, continue to offer NPS technical support for another year yet.

Abbey
As a way of encouragement to Randy and Dan, yesterday I was at our national headquarters looking at the proofs of a magazine article which had been laid out on a very expensive IBM-type machine running windows, with comercial top-of-the-line desk-top publishing software. The Microsoft screen saver kicked in with it's normal screen saver. I moved the mouse and CRASH! An error message "A fatal error has occured." Someone yelled at me, "You can't touch the mouse without holding down the shift key!"

I thought he was just kidding, but no, it's really true. With the screen saver on, one little bump on the mouse brings down the whole stack of cards requiring a re-startup - all work lost. (Fortunately, they had saved the magazine files earlier).

What we have in the little bugs in AW are nothing compared to what people have to face everyday who use very expensive MS software!

Thanks, Randy, Dan, Quality and many others, who give us programs which are stable!

---

Thinking About Online Communications
---------------------------------------------------------------------------------
by Phil Shapiro
[P.SHAPIRO1]

>>> A FEW THOUGHTS ABOUT ONLINE BOOK REVIEWS <<<
---------------------------------------------------------------------------------

As we walk through the portals of the information age, more and more books are being published on a variety of interesting topics. The reading public is eager to find out more about these books. Which books are mediocre? Which books are good? Which books are excellent? Online information services can provide a key role in helping readers separate the wheat from the chaff. By providing online book reviews shortly after the book has come to market, online services can promote the interests of the reading public as well as promote the interests of book publishers.

The Key Advantages of Online Publishing

Online publishing has three distinct advantages over hardcopy publishing: 1) With online publishing the lead time between when the article is written and when it is published can be very short; and, 2) Online publishing does not face the rigorous space constraints that haunt hardcopy periodical publishers. 3) Online publishing offers the best hope of breaking away from the "literary" strangle-hold of the current book reviewing establishment. A closer look at each of the advantages of online book reviews follows.

The Publishing "Lead Time" Lag

These short lead times mean that any article written for an online publication can be published literally minutes after the author has finished writing it. In comparison, hardcopy periodicals typically work on lead times of at
least three months. When you add the two or three months a book reviewer
usually takes to write a review, the published book review often appears
six months or more after the book was released.

This long "lead time" lag is detrimental to the reading public as
well as to book publishers. Book reviews serve as one of the primary ways
that people find out about new books. If the book review process is drawn
out, then publishers have a lag in the return on their investment (one
which could potentially cost them). Readers find it difficult to know
which new books are worth buying. As a result, society's interests may
suffer. By shortening the book review time cycle, online publishing can
serve the interests of readers, publishers, and society at large.

Hardcopy Periodical Space Constraints Many hardcopy book reviews are
condensed and read as if they are summaries of book reviews. Newspapers and magazines typically publish book
reviews 400 to 600 words in length. These mini-reviews try to both
describe and evaluate books in the span of three or four paragraphs. The
emphasis of many of these short reviews tends to be on the reviewer's
opinions of the book. Readers rarely get to draw their own conclusions
about the book's strengths and weaknesses. Rare indeed are the times when
readers finish reading a review with a good sense of the book's true
content.

In contrast, online book reviewers can write feature length book
reviews: the type of book review that gives you a clear sense of what the
reviewed book is all about. Reviews of non-fiction books can include a
copy of the entire table of contents (where appropriate). Reviewers can
quote from three, four, or five different passages in the book. And the
quotes need not be single sentence "sound bite" quotes.

With the book publisher's permission, an online book review could
even include quoted segments of the book that were two or three paragraphs
in length. In comparison with the current practice of annoyingly short
"sound bite" quoted passages, quoted segments in online reviews would be
more like "full sandwich" quotes -- far more fulfilling to both reader and
book review author.

Breaking the Current "Literary" Strangle-hold on Book Reviews Many
mainstream newspaper and magazine book review editors have a strong literary bent.
Often publishers of these periodicals might hire these editors straight from academia. The result is that "literary" books make up a large
proportion of books chosen for review. Many worthy, "non-literary" books
are overlooked.

Online publishing can help to break the stranglehold that the
literary elite have on the book review publishing process. Without the
space constraints of hardcopy publishing, online publishing can just as
easily publish twenty book reviews per month as ten. No worthy book need
ever be overlooked or brushed over.

Forging New Links Between Book Review Authors and Book Publisher

Online publishing of book reviews also opens up the possibility of
forging new links between book review authors and book publishers. There
is no reason why the book review process needs to start when the finished
book has reached the shelves of book stores. Once the publisher has a rough draft of the finished book, book reviewers can then be contacted to start work on their review. There is no reason why an online book review cannot be published concurrently, or even two weeks before, the release of a new book.

As online book reviews become more commonplace, hardcopy book reviews will become less important. Online book reviews will become known for being "early and detailed." hardcopy book reviews will become known for being "late and short."

Creating a New Type of Book Review

Online book reviews also open up the doorway for creating new types of book reviews. There is no reason why book publishers themselves could not be invited to write three or four paragraphs on why they are publishing a book. Such a "publisher's statement" could be appended to the end of an online book review. Thoughtful publishers will use those few paragraphs to honestly describe their motivation for bringing the reviewed book to market. (Publishers's statements that sounded too much like a "sales pitch" would be quite naturally self-defeating.) Readers could then judge the book on yet one more criterion: how skilled is the publisher in describing the book it is publishing.

It's a simple, yet radical, idea to let publishers describe why they wanted to publish a book. Yet this idea serves the interests of both readers and publishers. Online publishing makes the idea possible.

Finding Suitable Book Reviewers

Finding suitable book reviewers to write online book reviews should not be difficult. Currently there are about ten million students in our nation's colleges and universities. Out of those ten million, it would not be difficult to locate fifty to one hundred skilled writers with an interest in writing for a national online service. Students might also be able to submit their written reviews for credit in their classes.

Other than students, an additional fifty to one hundred reviewers could easily be found from the general population. These "non-student" reviewers could be pulled from the pool of freelance writers, published authors, librarians, and others with a general interest in books.

Finding Suitable Books to Review

Likewise, finding suitable books to review ought not be difficult, either. Every two months a new edition of "Forthcoming Books" is published by R. R. Bowker. Listed in this reference book are the titles of thousands of books due to be published within the next six months.

These "forthcoming books" are organized into subject categories. Book reviewers can zero in on their particular areas of interest to cover the new books coming out in that field of learning.

Book Review Bottleneck Burdens Burgeoning Bibliophiles

It is ironic that at a time when bookstores seem to be prospering, when people are rediscovering reading and writing via online services, and when the need for information is great, that the publishing industry is held at bay by this tiny bottleneck known as the hardcopy book review. Online book reviews offer the best hope for liberating publishers, authors, and readers. The future of the written word looks promising, indeed.
The author takes a keen interest in issues involving information access and dissemination. He can be reached on GENie at: p.shapiro1; on the Internet at: pshapiro@aol.com

SPECIAL NEEDS /

Autism and Apple IIs

"""""""""""""""""""
by Phil Shapiro
[P.SHAPIRO1]

The following two "sidebars" were written for inclusion in the recently published article in II ALIVE magazine, "Autism and Apple II's". Space constraints precluded them from being included with the published article. The sidebars are being included here in the GENielamp A2 for those who might be interested in further information on this subject.

Sidebar: Online Resources for Parents of Autistic Children

In doing research for this article, I uncovered some dandy online resources for parents of autism. I began my search from the discussion newsgroup by first navigating to the newsgroups area of AOL. (Hint: Use the keyword: "newsgroups".) Then double-click on the icon titled: "Expert Add." When the dialog box appears on the screen, type in the name of the newsgroup: "bit.listserv.autism".

AOL will confirm that this newsgroup has been added to your list of newsgroups on AOL. To read the messages in this newsgroup, click on the icon titled: "Read my newsgroups." In browsing this newsgroup I encountered a wide range of messages on a diverse array of topics relating to autism. Some messages were even posted by persons overseas. And quite serendipitously I found out that an international conference about autism...
and computers will be taking place in the south of France in January 1995. The Internet has wondrous powers at connecting up persons with shared interests.

Further information about America Online can be obtained by calling: 1-800-827-6364. To use America Online, you need to request a free copy of their custom telecommunications software. AOL currently has software for Macintosh, DOS, and Windows platforms.

Sidebar: Independent Apple II Special Needs Software Developers

Several independent software developers are working to produce Apple II special needs software. Perhaps the best known of the independent (read: one person company) special needs software developers is Bill Lynn, of SimTech, in Connecticut. Bill is a nationally recognized HyperStudio guru, and presents frequently at regional and national computer conferences. He has also written many articles on special needs computing subjects. In assembling information for this article, I sent Bill some questions via electronic mail on GENie. Here is a copy of the answer he sent:

From: BILL.LYNN Bill Lynn
To: P.SHAPIRO1 Phil Shapiro

> Bill, I'm looking forward to getting the info you're sending about the creative stacks you've made.

I dropped a brochure in the mail today, Phil. You should get it in a couple of days, depending on how many feet of snow fall between now and then. ;)

> I imagine there might be info in the material you send on where parents/schools might buy an Apple II Switch Interface.

No but plans for the A2 switch interface can be had pretty easily. Basically, you can adapt any joystick to be a switch interface by adding inputs to the fire buttons. The plans for the switch interface were also published in ](Alive last summer (July/August issue, pages 49-51.) in my article entitled "Switched On HyperStudio." There are several sources for buying the interface commercially such as Don Johnston, Incorporated ($42.00, call 1-800-999-4660), AbleNet ($36.00, call 1-800-322-0956) and Toys for Special Children ($41.00 & $46.00, call 1-800-832-8697).

Now that I think of it, Phil, I uploaded a HyperStudio stack to the A2 libraries here on GENie several years ago, called SIMTECH.01.BXY. It's file #15531 and it includes plans on how to make the switch interface, a simple push switch and a call signal. The plans for the interface call for using the Apple II joystick extension cord which is no longer available from Radio Shack (America's Technology Store). Instead, any straight through DB9 cable with male plugs will substitute quite nicely.

If you like, you can list my address and if people are interested in the plans I will send them a copy of the ]](Alive article (Jerry Kindall won't mind).

> (Is this interface different from the Adaptive Firmware Card?)
Very much so. It's a great deal less expensive, doesn't take up a slot and it's much easier to use. However, if people already have and use the AFC they needn't buy or make an additional switch interface since the AFC will accommodate two switches in precisely the same way the A2 switch interface does (i.e. emulating the joystick fire buttons or the <option> and <apple> keys).

Cheers... Bill

Here's a brief description of Bill Lynn's work, in his own words. (Also sent to me via electronic mail.)

"A quick thumbnail sketch of what I do: I specialize in accessible software for kids with physical disabilities who use switches to access the Apple II, IIgs and Mac. These are all HyperStudio or HyperCard stacks that are programmed to respond to switch hits. Most programs require either an inexpensive Apple II Switch Interface or the more expensive Macintosh Switch Interface (or an adapted mouse will work on both platforms). Although these programs are not made specifically for kids who have autism I do believe it may be useful to some, particularly for those who perhaps could bang on a big panel switch but who might not be able to relate to the keyboard."

Bill Lynn can be reached at:

Bill Lynn
SimTech Publications
134 East St.
Litchfield, CT  06759
(203) 567-1173
GEenie: Bill.Lynn
America Online: StudioBill
Internet: Bill.Lynn@genie.geis.com

Computer Options for the Exceptional: Barbara Couse Adams  Another independent Apple II software developer doing interesting work in the special needs field is Barbara Couse Adams. Along with developing HyperStudio stacks for persons with developmental disabilities, Ms. Adams also is an adjunct professor at the State University of New York.

Further information about her software can be obtained at:

Computer Options for the Exceptional
49 Overlook Rd.
Poughkeepsie, NY  12603
(914) 452-1850
America Online: barbCOE
Internet: barbCOE@aol.com

Here is a brief description of the Independent Living Activities (ILA) HyperStudio stacks she has created: "Independent Living Activities (ILA) is a series of programs designed to provide developmentally disabled children and adults the opportunity to learn real-life practical skills. These programs were designed by special educators who were looking for activities which address everyday needs." The stacks require an Apple IIgs with 1 megabyte of RAM, and can work with either a mouse or TouchWindow.
The titles in the ILA series include: Community Signs, Functional Sight Words, Grocery Shopping, Hygiene Routines, Laundry, MacDonald's Menu, Identifying Money, Dialing the Phone, Telling Time, What's That Sound. Each title sells for $20 per disk. Demo disks for this series are available. The entire series sells of disks sells for $175. Note: You do not need to own HyperStudio to use this software. A HyperStudio run-time disk is available from this company for an extra $10.

A Few Suggestions for Contacting Smaller Software Publishing Companies

If you're interested in contacting Bill Lynn or Barbara Couse Adams (or any other smaller educational software publisher), you might keep in mind a few things to make communications easier. When requesting information from smaller publishing companies, it's always thoughtful to send five or six postage stamps to help defray their postage expenses. Also, when leaving a phone message on their answering machines, leave your home or weekend phone number, so they don't have to incur the cost of calling you during peak phone-rate periods. Even better, send electronic mail whenever possible.

One interesting facet about smaller publishing companies is that they're usually amenable to working on "custom-built" software. If you have a particular software program that you'd like made, you might try contacting some independent software developers to see how feasible it would be to make the software.

I HATE shopping for computers in a computer store. I don't mean that I dislike purchasing computers. Don't get me wrong. I just HATE having to deal with the salespeople in these types of stores. I would rather spend a day at the local car dealership instead of at the computer store. I would rather go shopping with my wife for dresses in Macy's. I would rather wear the dresses that my wife had bought at Macy's. I would rather have a root canal. Well, maybe I crossed the line with those last two. But you catch my drift. Could you tell that I was clenching my teeth while I was typing?

I have been involved with home computers since 1983 when I purchased my first computer: the Apple II+. My family has never been without a computer since the day of that acquisition. I have added printers, hard drives, monitors, modems, and various other equipment through the years. I have even managed to acquire about five more computers. However, almost without exception, my purchases after the original Apple II have been from somewhere besides a computer store.

I am not saying that I have never gone into a computer store since my
original purchase. Quite the opposite is true. I have actually spent a considerable amount of time in this type of store. But when it comes down to making a major purchase, forget it. Here is the typical conversation between myself and a computer salesman:

SALESPERSON: How may I help you today, sir?

ME: Well, I was interested in this computer. Can you tell me if the motherboard has an 128K cache or 256K?

SALESPERSON: Well, I am not sure... but are you really asking the right question? Shouldn't you be asking yourself whether or not that computer will last for the next 10 years? That is really the question. Now if you would take a look at this computer over here. The Super Deluxe Mega Mainframe-in-a-box X686 computer will serve your needs for years to come. This baby comes fully loaded and ready to go. You can even mow your lawn with the optional mulching accessories.

ME: Wait a minute! This computer is thousands more than I wanted to spend. I just wanted to...

SALESPERSON: Oh sure! Go ahead and limit yourself. But I ask you, do you really want to keep your kids from going to college?

ME: What?

SALESPERSON: Your kids! Think, man. What about all of the great multimedia educational software that your kids will not be able to run? But I guess you just don't care that the Smith kids are getting scholarships to all of the best universities. No child can get into the best schools without getting the advantage you can get with this computer. But I don't suppose that this subject is important to you...

ME: Well, I want my kids to have the best.

SALESPERSON: Good! Now you are thinking. What does your wife do for a living?

ME: She is a teacher.

SALESPERSON: Excellent. I am sure that your wife will appreciate the fact that this computer comes with a subscription to the national teacher's hot line. The subscription gives your wife 10 free minutes of access. Of course, you will need to purchase the optional 4,000,000 baud modem.

ME: How much does that cost?

SALESPERSON: Darrel, you are not focusing on the key issues here. What is more important, your kids success in life or your checkbook? Your wife's ability to do her job, or a few measly bucks at the computer store?
ME: Goodness.

SALESPERSON: Now that you are thinking the right way, can I pack you one of these to take home. I would, of course, add in a laser printer, 17" monitor, and decorative fish bowl to round out the system.

ME: What would be the total system price on the computer you just described?

SALESPERSON: If you have to ask, then your heart is not in the right place. Money is not the key factor here. The success of you, your wife, and your kids IS at stake. I think that you will want to act upon those factors instead of allowing yourself to be limited by current fiscal shortsightedness. Besides, we have a loan officer in the back who will be glad to set you up with a convenient monthly payment that will be well within your budget.

Admit it. The scene I just described above has happened to you on at least one occasion. Right? I been subjected many times to the hard sale from a computer neophyte (i.e. salesman) who didn't really know how to edit a simple text file.

Here's another typical scenario:

ME: Excuse me, could you tell me the impedance of these speakers?

SALESPERSON: Well, I could, but I would be ashamed of myself for doing so.

ME: Why is that? These are the speakers that are on sale, right?

SALESPERSON: Yes, these speakers are on sale, but I don't recommend them. They are not shielded and there is no amplification system to bring out the subtle nuances of the music. Now over here we have our Bose Super Amplified 500 W Speaker System and Coffee Maker. This product will give you superior sound and will not have a bit of interference from those traffic helicopters that fly over 3 times a day.

ME: Holy mark-up, Batman! I didn't want to spend that kind of money.

SALESPERSON: Well, of course, you can purchase those speakers if you have a tin ear and don't care about true sound reproduction.

ME: I just want to play games and stuff. I don't need a home stereo system...

SALESPERSON: You are limiting yourself on this one. Why not go for the home stereo approach. With the Bose system and a few additional components, you can have a better sound system on your computer than you do in your living room. What a concept. There is special this month on the Sony Mini-Home Studio with 5000 W Amplifier and CD-ROM player. In addition, I can throw in the Virtual Reality Game Playing helmet and you will be ready for some real game playing.
ME: Aargh!

(This cry is ripped from my mouth as I go flying out the front door of the store.)

One final example should round out the explanation of my fear and loathing of computer stores:

ME: Excuse me. Could you tell me if this disk drive is compatible with a Macintosh IIx?

SALESPERSON: What is a Macintosh IIx?

ME (incredulously): It is a computer made by Apple. It was sold maybe three years ago in most stores.

SALESPERSON: Oh, well this drive is not compatible with that computer.

ME: Are you sure?

SALESPERSON: Yes!

ME: Well, do you have a disk drive that will work with a IIx?

SALESPERSON: No.

ME: Okay, let's try a different route. Can you order a disk drive that will work with my IIx?

SALESPERSON: I will have to check with my manager. This will only take 20 minutes. I will be right back.

ME: Hold on. How long does it take to get in a special order?

SALESPERSON: I don't know.

ME: Can you give me a rough estimate? Does it take two weeks? Does it take a month?

SALESPERSON: Oh, okay. It will take two weeks to get in a drive. However, since it will be a special order there will be no return possible.

ME (in frustration): Don't you guys do anything to support the Mac IIx?

SALESPERSON: No, but that computer is ancient technology. I can sell you a new computer that will work with all of our drives. In the process, you can move up to the newest technology. Besides that, the system plays great games. Let me take you over here and show you the Super
Deluxe Mega Mainframe-in-a-box X686 computer...

And you thought it was just the Apple II world that had to endure this sort of abandonment!

[HUN]////////////////////////////////////////////////
THE TREASURE HUNT /
////////////////////////////////////////////////
Yours For the Downloading

by Charlie Hartley
[C.HARTLEY3]

Welcome back to the Treasure Hunt! This month we will examine several different files. There is no central theme this month, but I think there is something here for just about everyone. Let's get started. :)

[*][*][*]

COGITO.BXY File #23321 285696 bytes GS PUZZLE GAME

This is Cogito, the latest FREEWARE release from Brutal Deluxe. This nifty puzzle game for the GS is loosely based on the Rubik's Cube. [But it's a lot more fun!--Ed.] The object is to restore a shuffled puzzle to its original condition. It starts off fairly simple and gets progressively harder. You can play any of the 100+ levels at any time, but of course you'll have more fun if you start at level 1 and work your way up. The game itself is in greyscale, but it's very well done and has some nice background music that you can turn on and off as you wish. Once the game starts, press any key on the keyboard to get to the "setup" screen. Be sure to read the README file first. Included is Tool 220 which must be placed in the Tools folder located in the System folder of your boot disk.

If you haven't discovered this game yet, rush over to the library and get it. It is well worth the long download time.

[*][*][*]

Are you tired of the generic trash can on your GS Finder screen? Would you like something different, unusual, perhaps a little weird? Check out the two files listed below that were uploaded by Lunatic.

NUKE.NY.2.I.BXY File #18231 1408 bytes Finder Trash Icon

This is the latest version of Luny's popular "nuclear trash" icons. This version has been shrunk slightly so that Finder 6.0 won't have to move the fourth volume online up to the next row of disks. NOTE: Finder 6.0 doesn't need these icons to be in any special file! Simply throw this icon file into the Icons folder on your boot disk and it'll show up!
EXPLOSIONHT.BXY  File #18268   12672 byte   rSound for trash icon

This is a Sound Resource file for use with System 6.0 and/or HyperCard v1.1. HangTime converted this sound from EXPLOSION2.BXY into a rSound for use with HyperCard. Lunatic then pulled the sound out of the HyperCard stack and put it into its own file. To use this sound, simply copy the file into your System Sounds folder on your system disk. Then it will show up in the Sound CDev (without a reboot) and you can use it for whatever system sounds you want. It'll be available to all HCGS v1.1 stacks on your machine. This is a GREAT sound for use with his updated Nuclear Trash icons. You'll be able to HEAR the explosion as well as SEE the explosion.

I might add that these icons and this sound can also be used within HyperStudio as well as HyperCard.

[*][*][*]

SHOWME1.1.BXY  File #23179   73728 byte   GS GRAPHICS VIEWER +

Dave Leffler has provided us with an exceptionally good NDA/Finder Extra to view IIgs and other graphics including MacPaint, GIF, 3200 color, Print Shop IIgs, and now Paintworks animations too! Not only that but it also allows some simple changes in the graphics as well as the ability to save in several formats. Best of all, the price is right -- FREE. Dave releases this as JesusAware, the same as Freeware.

The following comments are quoted from Dave's documentation file that is included with the download.

"ShowMe! is a combination New Desk Accessory (NDA) and Finder 6.0 Extension (FX) that will allow you to see an unobstructed full screen views of any type of IIgs Super HiRes Graphic, plus some other non-IIgs formats. You can also save the displayed graphic in a couple of different formats, and do some simple color conversions.

"You may view:
- Unpacked graphics (Screen) files
- Eagle/Packbytes format packed graphics files
- Apple Preferred Format packed graphics files
- PaintWorks packed graphics files
- PaintWorks Gold 640 mode packed graphics format
- PrintShop GS Color Graphics
- Unpacked 3200 Color pictures
- Packed 3200 Color pictures, "3201"-APP and APF.
- Graphics Interchange Format, GIF graphics versions 87a AND 89a
- MacPaint graphics, Full or Half height

"You may save graphics: (does not apply to 3200 color pictures)
- Unpacked graphics (Screen) files
- Apple Preferred Format packed graphics files, Full or Screen Size
- Double Height Apple Preferred Format files, Full or Screen Size
"You may convert: (does not apply to 3200 color pictures)
- 320 mode pictures into 640 mode color pictures
- 320 mode pictures into 640 mode gray scale pictures
- 320 mode to 640 mode
- 640 mode to 320 mode
- 640 mode to 320 mode with default palette
- 320 mode to 640 mode with default palette

"You may also:
- Display more that one graphic at a time in a slide show fashion.
- Use it as a graphics previewer before launching a graphics application.

"You must have a IIgs running System software version 5.04 or later. Also a little extra memory might be nice for those large graphics files. Even though ShowMe! will work fine under 5.04, you'll have many more features when running it under the System 6.0 since it takes advantage of the new Finder features."

Previous versions were called ShowPic NDA. If you have a previous version, you know how good Dave's work is. This one is the best yet. Rush right over to the library and get it. Read the documentation file to be sure you are setting it up correctly, and then enjoy the graphics!

SCARABAЕIDA.BXY File #18579 4608 bytes Finder Extra

Scarabaeidae v1.0 - by Richard Bennett
Copyright 1992 by Oz Data

Scarabaeidae is a Finder extension for System 6.0 and above. It doesn't do much, but what it does, it does with a vengeance. Scarabaeidae will delete any Finder data files which it finds amongst the currently selected files on the desktop. If any folders are selected, Scarabaeidae will dive into them and delete all the Finder data files it finds inside them.

If you want to remove the Finder files from any disk or folder, this is a quick and easy way to do it. If you could not possible care less that the Finder is dropping root and data files on your disks, then you don't need this program.

Install Scarabaeidae in your System/System.Setup folder, and reboot your IIgs. The Extras menu should now contain Scarabaeidae. It can be invoked by selecting it from the menu, or by pressing OA-Z.

According to the dictionary, the scarab is one of a family (Scarabaeidae) of stout-bodied beetles (as a dung beetle) with lamellate antennae. If you remember that these Finder files are often called "droppings" by those who dislike them, you'll understand why Richard selected this name.

MINIMIZER.BXY File #23193 7424 bytes Finder CDev
Minimizer Ver. 1.0  
Copyright 1994 by Bill Tudor

According to Bill's documentation file, "Minimizer is an Apple IIgs Control Panel (CDev) that adds a minimize feature to the IIgs window manager. This feature allows you to minimize a window to reduce the space required to display the window on the physical screen. In general, you would minimize a window temporarily while you work in another window, and restore the window when you want to again work with it. This process moves the window out of the way without having to close and re-open it."

To install Minimizer, copy it to the System/CDevs folder on your boot disk and re-boot. To minimize a window, hold down the Option key while clicking on the zoom box. This causes the window to minimize (rather then Zoom). Clicking in the title area allows you to drag the minimized window around the screen. Clicking the window icon restores the minimized window to its original size and position.

I've tried Minimizer several times, and it works just fine. It's actually kind of neat, and useful for keeping your Finder screen uncluttered. You should read the documentation file to get the most benefit from the program.

Bill Tudor describes this as shareware, and requires a $10 shareware payment, with a catch. If you pay him $10, you can consider it payment for any (or all) of his shareware programs in the A2 library.

[*][*][*]

Desktop Doctor Ver. 1.0  
Copyright 1994 by Bill Tudor

The following description is taken from the documentation that comes with the program.

"Desktop Doctor is an Apple IIgs Finder Extension that checks and fixes the Finder's desktop files and icon files. This includes removing duplicate entries, keeping desktop databases up to date, and checking and fixing icon application pathnames in both icons and desktop files.

"After installation, choose 'Desktop Doctor' item from the Finder's Extras menu. This is bring up the desktop doctor dialogue box. Check each option you wish to perform:

"[x] Delete desktop files  -  This option deletes all existing desktop files in the Icons folder of all of your disks. Note that this option is normally not performed. Any document/application links created with the Finder's Option-Control-Open feature will be lost.

"[x] Rebuild desktop  -  Rebuilds your desktop databases by scanning your disks for applications and checking for rBundles.

"[x] Remove duplicates  -  This options removes wasteful duplicate
Apple II Computer Info

entries and unused entries (orphans) from your desktop databases.

"[x] Check icon pathnames   -   Checks the 'Application to launch'
 pathname for BOTH old-style and new-
 style icons. You are given the
 opportunity to correct pathnames."

Desktop Doctor may be installed in the FinderExtras folder on the
boot disk, or in the System.Setup folder there. It requires System 6.0 or
later.

I confess that I don't know enough about this sort of thing to know
how valuable this program can be. However, when I ran it on my system, it
removed 13 duplicate entries and freed up 29,154 bytes.

Bill Tudor describes this as shareware, and requires a $10 shareware
payment, with a catch. If you pay him $10, you can consider it payment for
any (or all) of his shareware programs in the A2 library.

[*][*][*]

FILEFINDER.BXY   File #23252   22784 bytes   Finder Extension
........................................................................

File Finder Ver. 1.0b2
Copyright 1994 by Bill Tudor

According to Bill's documentation file that accompanies this file,
"File Finder is an Apple IIgs Finder Extension INIT program that allows you
to search for files on disks or in folders. You can search for files by
name, partial name, created date, modified date, file type, file size,
embedded text, or any combination of the above. Once a set of files is
found, you can delete, open, peek at, or locate (open the Finder window
containing the file) the file."

You may install File Finder by copying it into either the
System.Setup folder or the FinderExtras folder on your boot disk. If you
do the former, you must reboot for it to be active; in the latter case,
just run the Finder again for it to be active.

The following information is taken from the documentation file.

"To search file files, select 'File Finder' from under the 'Extras'
menu in the Finder. If you want to search a particular disk or folder
(including folders within the selected folder), select that folder before
choosing the File Finder item.

"Type in the name (or partial name) of the file you wish to search
for, select the search location and name matching criteria and then click
the Search button to begin the search. The location popup allows you to
search any disk, all disks, the current folder or the current list (if you
already have files selected). You can change the current folder by
clicking the change folder button.

"Once the search is complete, you can highlight any of the found
files and perform the following:

Open   -   Opens the file as if you had double-clicked it in Finder
Delete - Deletes the file from disk
Peek - Peeks at the file's contents (NOTE: Requires FilePeeker)
Locate - Opens the Finder window that contains this file and selects this file

"To use some of the advanced features of FileFinder, click the Options button. You can search based on created date, modification date, file size, file type, or search only for files which contains a given text string. There is also an option that allows you to add the files found in the search to the current list of files rather than replacing the old list. This allows you to perform more complicated searches such as finder all files that begin with the letter 'A' and end with the letter 'Z'."

This is a nice program, and it does some things that others like it don't do. One possible shortcoming is that it only works from the Finder Extra menu.

Bill Tudor describes this as shareware, and requires a $10 shareware payment, with a catch. If you pay him $10, you can consider it payment for any (or all) of his shareware programs in the A2 library.

[*][*][*]

FINDFILE.BXY File #10567  8820 bytes File Finder NDA

While we're talking about file finders, I must mention Steve Chick's excellent NDA. Find File NDA, version 1.2, is not quite as fancy as Bill Tutor's program mentioned above; but, it has some pretty nifty features of its own.

First of all, since it's a NDA, it can be accessed from within any desktop program that gives you access to the apple menu. Second, it searches for filenames in the background while you work. It has a priority level option that let's you do high speed searches as well.

As a test, I opened ShadowWrite, then selected Find File, put it to work hunting through my 240 meg hard drive, and then went back to ShadowWrite and began typing. As I typed, I could hear the hard drive as Find File worked. When it finished, it beeped and all I had to do was reselect it from the Apple menu to see what it had found.

Find File is freeware. It works with System 4.0 and above. For you programmer types, the source code is supposed to be available in A2Pro.

[*][*][*]

WW.PSINST.BXY File #23312 179072 bytes Physical Science files

George Heatherly has provided science teachers with a collection of files created by teachers at the 1990 Woodrow Wilson National Fellowship Foundation Physical Science Institute. The files include a number of activities created by the 1990 Physical Science Master Teachers to help improve the teaching of physical science.

This information was published by the Woodrow Wilson National Fellowship Foundation and is in the public domain. A printed copy of the
final curriculum module _might_ be available from the Foundation. The files contained in this archive are all AppleWorks word processor files.

While these files are aimed at the middle school level, they should be useful to high school teachers as well. If you teach science, or know someone who does, this is a good download for you to get.

CHASING.CAR.BXY File #18041 49152 bytes Cooperative Learning

While we're talking about school-related files, here is one that I uploaded in 1992.

The files in this upload are all connected to a middle school unit based on the computer program "Where in the World is Carmen Sandiego?" called "Chasing Carmen."

Most of the word processor files are worksheets that can be used by individuals or teams to investigate and discover the facts needed to be successful at this game. They are ready to print now.

Two of the word processor files are lists of facts that the students will discover as they complete the worksheets. They are presented to assist busy teachers. However, I encourage the teachers to discover these facts first by playing the game and using the almanac.

The AppleWorks data base template is designed to allow student teams to collect and organize Carmen facts and then use the data base to quickly find the info needed to play the game. The master data base contains most of the information that I have collected.

I have also included a similar set of data base files for use with FrEdBase for those who need or want to use this data base manager.

This material has been used successfully with seventh graders. It should be effective with anyone who finds the Carmen World game exciting.

FENCED.IN.BXY File #20817 13696 bytes ProDOS Strategy Game

"Don't Fence Me In!" is a game for two players. It is a game of strategy with skill in planning ahead a real plus.

Players take turns claiming plots on a chart. If those plots are located in correct proximity to other plots already claimed by the player, then a fence is built between the plots. Once built, these fences act as a barrier to the other player.

The object of the game for player #1 is to build a fence that connects the top to the bottom of the chart. For player #2, it is to connect the sides. If a player tries to claim a plot that is already claimed, he loses his turn.

The game is not sophisticated enough to know when one or the other
player has won. Like chess, you must decide that for yourself. There are no bells and whistles here, just the satisfaction of out-maneuvering your opponent.

The program is copyrighted, but is offered as freeware. Let me know what you think of it.

[*][*][*]

That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

-- Charlie Hartley

[PRO]/////////////////////////////////////////////////////////
PROFILES /
/////////////////////////////////////////////////////////
Who's Who In Apple II
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
by Charlie Hartley
[C.HARTLEY3]

>>> WHO'S WHO? <<<
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
~ GENieLamp Profile: Eric Shepherd ~

This month we will profile a rising star in the Apple II world. Eric Shepherd (a/k/a Sheppy) is a student at the University of California in Santa Barbara. When he isn't doing school work (and often when he is) or watching movies, Sheppy is busy online or at his computer writing nifty programs.

GENieLamp> Tell us a little bit about yourself.
```````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````
I didn't become a die-hard Apple II user until I first got online, though, and realized that there really were a lot of people out there using the II. That was the spring of 1991. Until then, I really, really liked the II, but it wasn't the kind of strong addiction I feel now.

**GENieLamp**> Do you have any anecdotes you can share with us about your first experiences with the Apple II?

**Sheppy**> Most of my anecdotes involve the fragile nature of floppy disks and how easy it is for a program gone horribly wrong to wipe them out. I used to do that a lot (and I lost a lot of really nifty programs that way). When I first got my IIgs, for instance, I only had 5.25" drives and 256K of memory, but I was determined to write a nifty paint program for the IIgs. I nuked a couple of disks trying to write that program. Eventually I did get a simple (but usable) paint program up and running, but by then I'd gotten a 3.5" drive, color monitor, and some RAM and was able to run some commercial stuff.

Probably my best Apple II anecdote is a tidbit on the durability of these machines. It was 8th grade computer class, and there were Apple //es on cheapo folding tables all over the classroom (you know the kind of table -- the ones they use in school lunchrooms). A friend of mine sat down on one of those tables and it broke. One of the //e's slid of the table, yanking the monitor and disk drives along with it, bouncing across the floor. The cases were scuffed, but the machine, monitor, and drives all worked fine. I don't think most computers could take that kind of beating.

**GENieLamp**> Where do you see the future of telecommunications moving in the next five to ten years?

**Sheppy**> "Yow!" That's the best word to describe it. It's impossible to imagine the future of telecommunications. Five years ago, telecommunications was an infant field of tiny little companies and one or two giants. Most of it was experimental. The fastest modems readily available today are 28,800 bits per second. Five years ago, everyone was just starting to make the move from 1200 to 2400 bits per second. We're looking at a speed increase of immense proportions, and vastly increased interconnectivity of networks. Today's networks will look puny and toylike compared to the networks at the beginning of the next millennium. The Internet is big and growing fast, but we haven't yet reached the point where being online is _necessary_. In five years we'll be there, and there will be nothing you can do in person that you can't do online. Or, at least, not much (let's face it, a nice dinner out just isn't the same if you're not face-to-face :).

**GENieLamp**> How did you get started writing software?

**Sheppy**> I actually got started because my school required that we learn how to program in BASIC, and I learned that I really enjoyed it and was even pretty good at it (a unique pairing of positive attributes... Not long after that, the school got some //e's and hired a new math and computer programming teacher... who didn't know how to program the II. I wound up teaching BASIC to my classmates for a while. Anyway, I used Apple IIIs more or less exclusively (although I was admittedly an MS-DOS freak for about six months... then I went into rehab and am just fine now).
that just says "do it!"). I programmed entirely in BASIC for a few years, then learned assembly, Pascal, C, and a few other languages. I guess it just sort of happened.

GEnieLamp> Tell us about some of the software you have written for the Apple IIgs.

Sheppy> Well, I've written mostly little utilities and such. The first program I put out on the online services was ProBOOT in 1991. The first version I uploaded was version 3.0, and it's at version 5.2.1 now. ProBOOT lets you hold down the Apple key to bring up a menu that you can use to choose a disk to boot from. It automatically activates the slot for that disk if it's switched out, and it sets the system speed up for you, too.

I've written some stuff for Softdisk, such as Shifty List, which allows you to choose some of your favorite INITs, DAs, and control panels to be loaded when you shift-boot. I like it not because it's useful (which it is) but because it's the kind of program you can find lots of clever uses for. For instance, you can set up your system so that booting normally loads only a few extensions, but shift-booting loads lots of extra stuff. That's kind of convenient.

I've written a LOT of stuff, some I don't even remember writing. :)

GEnieLamp> Shifty List is an impressive program. Folks who don't subscribe to Softdisk G-S may get it by calling Softdisk at 1-800-831-2694 and requesting the issue containing it.

What other platforms have you created software for?

Sheppy> I released a couple of shareware programs for MS-DOS a few years back, but nothing major. I also wrote some rather large professional database systems for MS-DOS in dBase and Clipper. I've been futzing with writing some Mac software, but programming the Mac is depressing and I tend to suffer IIgs withdrawal when I do it.

GEnieLamp> You've assumed a leadership position in the PowerPC Programmer's Roundtable here on GEnie. Please tell us a little about how this came about.

Sheppy> To be honest, I don't really know how it came about. There was a bunch of shuffling around of staff earlier in the year, and a few openings came up, and I had happened to post a couple of messages in the PowerPC RoundTables and had recently become very active in A2 and A2Pro, so I guess Dean just figured he didn't have much to lose.

The interesting thing is that I was actually picked up as an assistant sysop, but there was no Chief Sysop in PPCPro at the time, so I was kind of performing those duties... and after a couple of months, it was made official.

GEnieLamp> What do you consider your proudest accomplishment?

Sheppy> Waking up before noon today. :)

No, seriously, I'd have to say that my proudest accomplishment is the
three months I spent at Apple on the Apple IIgs operating system quality assurance team in 1990. It was fantastic work, and it was an honor to work with the folks that brought System 5.0 and 6.0 to us. Helping to squash bugs in the system software was a tremendous thrill.

GEnieLamp> Who do you look up to as your mentors?

Sheppy> As hard as it is to believe, probably the person I most admire and look up to is my younger brother. He's the kind of person that isn't afraid to do new things, and usually succeeds at them. He's more dedicated to getting things finished than I am, and usually puts more work into it than I would. When he finds something he has trouble doing, he just works at it harder until everything works itself out. I wish I could get myself to do that sort of thing.

GEnieLamp> Is your brother going to follow in your footsteps?

Sheppy> My brother is a mechanical engineering major at the University of Texas in Austin. He's just started his second year. He's going to be twenty on October 1. Holy cow... I never realized that until now. Twenty...

Anyway, he's going to be a ME [Mechanical Engineer], like my dad, so he's not following in my footsteps, which is for the best. :) But I remember helping him with his math when he was in the first grade and I was in the fourth. He finished the first, second, third, and fourth grade math courses all while he was in the first grade. He's probably the only person in the world that can impress me without trying. :)

GEnieLamp> What sorts of things do you like to do for fun (i.e. non-computer hobbies)?

Sheppy> I like movies. Even movies that sound really bad, once I start watching them, I can't stop. I also like to read. Science fiction, mostly. And music... it's a wonderful thing.

GEnieLamp> What new services do you think GEnie should provide its subscribers?

Sheppy> Lower-cost 9600 access. That's really important. But even more important than that, in my book (but less likely to actually happen) is a faster protocol for uploading. Regardless of whatever reasons GEnie might have for not supporting ZModem uploads, I can't stand XModem.

GEnieLamp> What one piece of advice would you pass along to a new Apple II telecommunications enthusiast?

Sheppy> Don't bother trying to join America Online. :)

GEnieLamp> With the decision by Apple to finally drop the IIgs from their price lists, many Apple II users are feeling frustrated. What do you see as the future for the Apple II and its owners?

Sheppy> I see the Apple II community slowly shrinking until it reaches a new stable point at which the number of users and the number of
programmers equalizes itself again. There will be fewer of each, but there
will always be an Apple II community, and I hope to remain a part of it.

GENieLamp> Of all the freeware/shareware programs that you have released
here on GEnie, which are your favorites?

Sheppy> Here's a list of my favorite programs, what they are, and why I
like them.

ProBOOT 5.2.1 (A2 Library file #21525)

This is my favorite freeware/shareware release. Of all my programs,
ProBOOT has accumulated the most time and effort, and I never seem to run
out of new ideas for what was originally a very simple concept. And it's
the first program I ever released for the Apple II. This program also
taught me the importance of beta-testing, because twice, ProBOOT went
through three new versions in less than a week because of bugs.

ProBOOT lets you pop up a list of disk drives that you can boot from
just by holding down the Apple key when you boot your computer. Selecting
one of the drives will automatically enable that drive in the control
panel, set up your system speed, and boot it. You can do the same thing
using a Finder extension that's included with ProBOOT. It's a big
time-saver when you have to boot from floppy disks a lot, especially when
you have to boot older 8-bit Apple II programs, because the system will
automatically slow down for you.

SysFail Plus 2.3 (A2 Library file #23350)

SysFail is a useful tool for finding out why your system does weird
things in the dark of night. When your system goes really nuts and boinks
into the system death manager, instead of the old "Fatal System Error
$D0D0" type screen you used to get, you'll get a nice, long, descriptive
set of information about what went wrong and why. The information can be
useful when complaining about bugs in programs. :)

FixBoot 2.0 (A2 Library file #23268)

This is one of those programs I wrote because I really needed to have
it. The first versions of FixBoot were a 13K application you'd launch to
put a boot block onto RAM disks. Version 2.0 is an INIT that automatically
puts boot blocks on all empty ProDOS RAM disks. This is really convenient,
because until FixBoot, you had to format any RAM disk you wanted to boot
from. And I used to set up lots of files on my RAM disk, then remember I'd
forgotten to format it first. With FixBoot installed, I don't have to
think about it anymore.

Cleaner Clean Up 1.0.4 (A2 Library file #21531)

Actually, I don't remember what the latest version of this is,
because I'm working on a new program that will do lots of nice changes to
the Finder, and the features in Cleaner Clean Up are in there. But Cleaner
Clean Up is the program that gave me the idea of writing Finder extensions
that added features to the Finder without actually looking like they're
additions to the Finder. Seamliness. Cleaner Clean Up, for instance, adds a warning message before letting you clean up the icons on your desktop, giving you the opportunity to avoid messing up the desktop icons.

This idea of seamless Finder extension design is carried even further in SmartRestart, which was published on Softdisk G-S #52. It actually adds a new menu item into the Finder's Special menu (a Restart item), to add to the IIgs Finder one of the few features of the Mac Finder that are better than the IIgs Finder. This kind of thing, I think, makes computer easier to use, and that's important.

That's an impressive list Sheppy! For those of our readers who want to find your other uploads, they should search in the library under either the name POWERPC.PRO or under E.SHEPHERD.

Thank you, Sheppy, for an enjoyable interview.

It's been my pleasure. Your readers are also welcome to visit with us in the PowerPC Programmer's Roundtable (PFCPRO).

A note to our readers: If you want to know more about a particular person and want him/her to be interviewed for the GENieLamp A2 profile column, send E-mail to C.HARTLEY3 or EDITOR.A2 and we'll see what we can do. In your E-mail message, tell why you think this person is a good candidate for the profile.

---

With the size of this bulletin board, finding the right topic to read or to post in can be a challenge. An index of categories and topics can help, but it lists topic titles only (see Category 2 Topic 4).

The GENie SEArch command allows you to search both topic titles and topic descriptions for a character string. Here is GENie's online help:

1 >help sea

SEArch

允许 you to search for a particular subject within the system. Each topic subject is searched for a match of the input string and a list of topics with that string is displayed. There are 2 parameters:

/STRing/ : is a string enclosed with ANY delimiter. The '/'s are used here for demonstration. The search STRing must be at least 3
Apple II Computer Info

characters long.

ALL : is an optional parameter that forces searching throughout ALL categories. If it is not specified, ONLY the current category is searched.

Here is a sample search for the word "appleworks" in all categories and topics:

1 >sea /appleworks/ all

Does anyone find this search useful?

Now, have you done a search that may be of interest to others? Post the results here. Caution: edit the search results to put a space at the beginning of every line, or post using the "*SN" command instead of "*S" or GEnie will word-wrap the list and make it very hard to read.

A search will turn up a topic only if its title or description includes the desired word. Do you have any suggestions about editing topic titles or descriptions to add appropriate search terms? Do you have any other ideas for making this topic useful? The floor is open.

Bill Dooley (A2.BILL, CAT2, TOP14, MSG:1/M645;1)
I don't agree with anybody here so I'm going to blow up the Eiffel Tower.

o Back issues of GENieLamp are available in the DigiPub RoundTable Library #2 on page 1395 (M1395;3).
Apple II Computer Info

- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet the GEnieLamp staff "live" we meet every Wednesday night in the Digi*Pub Real-Time Conference at 9:00 EDT (M1395;2).

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.

[IDX]**********************************************************************************************

READING GENieLamp  GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM] [*] GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|__________| ______|____ |____ |_____________|
|Name of sender| CATegory| TOPic |Msg.# |Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GENie  GENie's monthly fee is $8.95 for which gives you up to four hours of non-prime time access to most GENie services, such as software downloads, bulletin boards, GE Mail, an Internet mail gateway, and chat lines, are allowed without charge. GENie's non-prime time connect rate is $3.00. To sign up for GENie service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330 in Canada. Upon connection type HHH. Wait for the U#= prompt. Type: JOINGENIE and hit RETURN. When you get the prompt asking for the signup/offer code, type: DSD524 and hit RETURN. The system will then prompt you for your information. Need more information? Call GENie's customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLamp READERS!  If you sign onto GENie using the method outlined above you will receive an *additional* six (6) free hours of standard connect time (for a total of 10) to be used in the first month. Want more? Your first month charge of $8.95 will be waived! Now there are no excuses! *** GET INTO THE LAMP! ***

///////////////////////////////////////////////////////////////////////////////// GENie_QWIK_QUOTE //
/ "What would have happened if I just turned on the drive?"
/ "Have you ever heard of Chernyobl...?" 
/
As I write this, it's almost exactly halfway between the Canadian and American Thanksgiving Days. Up north, we celebrated Thanksgiving about three weeks ago; readers in the States still have three weeks to go.

This Thanksgiving, I'm thankful for a lot of things I took for granted five years ago. I'm thankful that my wife and I have a clean, warm apartment to live in, and that we've never had to go a day without food. I'm thankful that my wife's sister and her husband has moved to within an hour's drive of us instead of three days'; it makes us feel a little less like strangers in a strange land.

I'm also thankful for my GEnieLamp boss, John Peters. His wise and kind words have helped me through many a tough time over the last year and a half.

When I was at KansasFest this July, I met John and Mike "Cowboy" White for the first time. Mike and John were pressed-ganged into giving Steve "Apple II History" Weyhrich and me a ride back from a party, and the talk turned to highway driving.

"I like cruise control," Mike said, "but sometimes I feel a little silly with everybody else whooshing past me."

"But they aren't," J. P. pointed out. "You're just registering the people who are speeding. You never get to see all the other people travelling at the same speed you are, obeying the speed limit. They stay just as far ahead of you or behind you as you they ever were."

Maybe it isn't pithy and maybe it isn't profound, but I appreciated the insight. Have you ever been intimated by the illusion that you're in the minority if you toe the line? I sure have. When I was younger, I occasionally followed the crowd even though I knew it was wrong.

I don't pirate software, but I've had gentle and otherwise intelligent people ask me to provide copies of programs I own legitimate copies of. The implication is clear: they consider that they would be gullible to follow a law that is almost impossible to enforce.

My wife is taking her computer science degree at the local university, and just last week, a classmate who was proselytizing on behalf of a group offered to "tape off" one of their CDs so that she could truly appreciate their magnificence. She declined politely. When asked why, she pointed out that it was illegal.
Recently, one of my oldest friends asked me to make a copy of a videotape he had purchased on my behalf many years before. It wasn't easy to refuse an old friend, particularly one who had done me the favor of obtaining the video, but I did it, and explained why.

Sometimes one gets met with a disbelieving stare. Sometimes the response is a tolerant smile usually reserved for those who believe that the potatoes for the Sabbath meal must be peeled the night before, since it's sinful to work on the Sabbath; a sort of wordless "Oh really? I don't believe in that myself, but of course this is a free country."

When it seems that everybody is doing it, there is a pressure to conform, a concern about looking foolish in the eyes of your peers. It's no easier for me than it is for anyone else to speak up and risk being seen as a holier-than-thou zealot or a hopeless naif. It doesn't seem to be getting any easier, either; it's a struggle each time. I do it, though; even though I am not bathed in a Disneyesque glow--akin to smugness--of knowing I've done the right thing.

This year, I'm thankful that I finally got to go to KansasFest, and happy about the many online acquaintances that I finally got to meet--John Peters, Mike White, and Steve Weyhrich are just three of them. I'm also thankful that I have a boss with a good deal of common sense (and a certain talent for Charades even after a long day).

Actually, these days, I'm the servant of many masters, so I have a lot of bosses, and all of them are good folk... but let them get their own editorial, this one is for John.

-- Doug Cuff

GENie Mail: EDITOR.A2 Internet: editor.a2@genie.geis.com

[Doug Cuff is also the editor of A2-Central, a managing editor for II Alive, and occasionally does contract work for Quality Computers, publishers of AppleWorks. He would like to point out that, the foregoing editorial notwithstanding, he does not owe his boss John Peters any money, nor is he trying to stave off his inevitable dismissal as editor of GENieLamp A2, nor is there any truth to the rumor that he is in need of character witnesses in the patently ludicrous paternity suit that Bigfoot and Elvis have filed jointly. He would also like to assure all his bosses that he will return to his serious and grumpy old self the minute Thanksgiving is over.]
OLD ROGER WAGNER TITLES STILL THERE I spoke with Pam Wagner yesterday and she assures me (us) that nothing has been deleted from the RWP catalog. Even the oldest of the old titles for the ++ are still available if you call.

Cheers... Bill Lynn

(BILL.LYNN, CAT32, TOP8, MSG:97/M545;1)

TRUETYPE FROM MS-DOS Assuming one can get them onto a GS compatible disk, what has to be done to make MessyDos TrueType fonts compatible?

Curtis in /\Tana! B----< Delivered by Co-Pilot >----- (C.BARROW, CAT37, TOP4, MSG:385/M645;1)

>>>> You have to run the fonts through a converter program on a Macintosh. Then you have to spend a few hours getting things like style bits, font names, and font ID numbers right. Then just put them on an HFS disk and pop it in a GS. :)

(T.BUCHHEIM, CAT37, TOP4, MSG:386/M645;1)

>>>> It's not for the faint of heart...or those lacking in computers.

>>>> You can make the conversion if you have an MS-DOS computer (possibly optional), a Macintosh, and your IIgs.

1) Make sure the TT fonts on the MS-DOS disk are "NAME.TTF", and not "NAME.TT_". The latter fonts have some compression that has to be de-
compressed before they are usable. This would be the only situation where you would NEED an MS-DOS computer. Just use the Utility included with the fonts to install them into Windows.

2) Transfer the MS-DOS "TTF" font files to a Macintosh using Apple File Exchange (AFE) on the Mac.

3) Download the shareware program TT Converter from the Mac RT. Run each TTF file through TT Converter, and it will make it usable by the Mac. Note that the filename given by TT Converter to some fonts with similar names may be close enough that you will get an error when trying to do it. (For example, Bozo Bold and Bozo Bold-Italic might both be given the name Bozo BO by TT Converter; attempting to convert the second one will cause an error and the program will quit).

4) Put the converted files on an HFS 3.5 disk, and put it into the IIgs.

5) Move the files from the HFS 3.5 disk to wherever you want them on the IIgs hard drive.

6) Use the Pointless control panel to load each of the converted Mac fonts. Pointless will change them from typeless files ($00/0000) to proper TT fonts ($C8/0001).

There's more if you want to be fancy, but that's the quick and dirty.

Steve Weyhrich <IX0YE>---<
(S.WEYHRICH, CAT37, TOP4, MSG:387/M645;1)

II ALIVE = THE INCREDIBLE SHRINKING MAGAZINE?

I hope this is not a sigh of things to come. (Typo intended)

The heavy cover keeps it in one piece through the mail, thank you. Your printer, however, leaves something to be desired: pages 17-24 were partially uncut, but that's probably because it was stapled so crooked (pages 17-32 section).

Still love the magazine - keep up _your_ good work, and talk to your printer. :)

COGITO EASTER EGGS FOUND ON 'NET

This little tidbit scammed from comp.sys.apple2:

From: "Theo Schneider" <tooly@zelator.de>
Subject: Cogito : Easter eggs
To: "info-apple" <info-apple@apple.com>

Hi there,

i found 4 eastereggs in Cogito.
In every Ground i found one:

1. Ground: Lundy
   Click on the i-point in the Name 'Cogito'

2. Ground: Happy Land
   Click on the big white point in the right eye from the happy figure

3. Ground: Planet
   Click on the Moon from the big Planet top of the watch

4. Ground: Xeno
   In the figure right on the screen you see an row of white points. Click on the 3th from top.

mfg

(D.KERWOOD, CAT6, TOP11, MSG:11/M645;1)

PATCH FOR APPLEWORKS GS DEFAULT FONT

from a few years back:

1) Page Layout module:

Look for block $49B, byte $9C (version 1.0v2: block $24F, byte $EC).
You should find the following sequence there:

A9 03 00      LDA #3         (family #)  
8D 73 1B      STA            store family  
A9 00 00      LDA #0         (style word)  
8D 75 1B      STA            store style  
A9 0C 00      LDA #$C        (size word)  
8D 77 1B      STA            store size  
A9 19 99      LDA #$10       justification  
8D 71 1B      STA            store justification  
A9 01 00      LDA #1         (spacing)  
8D 6F 1B      STA            store spacing

2) Word processor:

This patch is divided into two steps: a) block $609, by $93 (version 1.0v2: block $4EE, byte $02)

A9 03 00      LDA #3         (family #)  
87 0B         STA [$B]  
A9 00 0C      LDA #$0C00     (size(high) and style(low) )  
A0 02 00      LDY #2  
97 0B         STA [$B],Y

b) and again on block $64F, byte 141 (version 1.0v2: block $533, byte $18)

A9 03 00 87 08 A9 00 0C A0 02 00 97 07

So what do you have to patch in here? These are the descriptions (we're looking at 1) for reference):

- font family number ($03=Geneva, $14 would be Times)  
- style (0=plain, 1=bold, 2=italic, 4=underline, 8=outline,  
  $10=shadow, $40=superscript, $80=subscript)  
- size ($0C=12 point)  
- justification ($10=left, $20=center, $40=right, $80=full)  
- spacing (1=single, 2=double, 4=quadruple (right word???) :-))

end of original post

I've used it to change the WP default to Shaston 8. For v1.1, I found the above string of bytes to look like this:

A9 03 00 87 0B A9 00 0C A0 02 00 97 0B

and I changed it to this:

A9 FE FF 87 0B A9 00 08 A0 02 00 97 0B

<table>

This may be more than a little cryptic to a lot of folks. If anyone problems finding what and where to patch, give me shout and I'll try to explain in more detail.
Udo - ... just a IIGS freak -  
(U.HUTH, CAT17, TOP22, MSG:242/M645;1)

VGC CHIP NUMBERS  Hot diggity! I can answer a hardware question that
                          ***************  Harold can't! That's not apt to happen again this
century ...which ends Dec. 31, 2000. :) 

When I was upgrading my IIgs's for computer camp, the Apple 
serviceman copied the pertinent page from Apple's manual (rev. May '91). 
According to this, the VGC is in location H2 on the motherboard, and...

Defective VGC's are numbered 344S0046-1 or 344S0046-A (Vendor: AMI) 
and should be replaced.

The following VGC versions are considered good and do not need to be 
replaced: 344S0046-2 or 344s0046-B (Vendor: AMI).

Any of the following may be used as VGC replacements: 344S0046-2, -3, 
-4, - B, -C, or -D (Vendor: AMI); 344S0056-A or 3440056-1 (Vendor: IMP).

I suspect Harold could have looked these up. He just didn't have 
the numbers memorized (tch, tch! :) 

Eric (o= =o === =ooo oo oo= == ) ------------
(J.SCHONBLOM, CAT2, TOP4, MSG:570/M645;1)

DESKJET INTERNAL FONTS TIP  Someone asked recently about the mapping of GS 
********** fonts to DeskJet internal fonts in Harmonie. 
I set up the examples from the DeskJet 500 Translation table in my Harmonie 
manual (Came with V2.0M), and tried a few other examples, printing out from 
ShadowWrite in External Rendering mode. The following translations worked:

<table>
<thead>
<tr>
<th>GS Font</th>
<th>DJ Internal Font</th>
</tr>
</thead>
<tbody>
<tr>
<td>Courier 12</td>
<td>Courier 10</td>
</tr>
<tr>
<td>Courier 8</td>
<td>Courier 16.67</td>
</tr>
<tr>
<td>Courier 6</td>
<td>Courier 20 - 6 point (half height)</td>
</tr>
<tr>
<td>Times 12</td>
<td>CG Times 12 point (Proportional font)</td>
</tr>
<tr>
<td>Times 6</td>
<td>CG Times 6 point (Half height &amp; width)</td>
</tr>
<tr>
<td>Geneva 12</td>
<td>Letter Gothic 12</td>
</tr>
<tr>
<td>Geneva 6</td>
<td>Letter Gothic 24 - 6 point (half height)</td>
</tr>
</tbody>
</table>

Anybody know how to get Courier 20 and Letter Gothic 24 without the 
half-height?

Don  (Sent via CoPilot 2.5, ANSITerm 2.12, and ANSITerm beta scripts)  
(D.ZAHNISER, CAT12, TOP8, MSG:332/M645;1)

WHY DOES TIC.KEY.Z HAVE A SHRINKIT ICON?  The problem is with your 
*********** SHRINKIT icons file. It has a 
"generic" icon in it that is supposed to show up for ZIP files, and it is 
hitting on the .Z

You need to modify that Icon file, or delete it, or just ignore it. 
The ONLY problem that you will have here is if you try to launch that 
TIC.KEY.Z script from Finder, in which case, GSHK will be launched instead.
Aside from that, the script will work just as it is supposed to regardless of the fact that it shows the wrong icon.

Gary R. Utter     (GARY.UTTER, CAT13, TOP3, MSG:316/M645;1)

MS-DOS EMULATES IIE   Here's the description (FILE_ID.DIZ) of Sim IIe, a shareware program I found on CompuServe.

~~~
Run Apple software on your PC! SimSystem IIe emulates a 128K Apple IIe with a printer adaptor, 80-col card, two floppy and two hard drives. Supports all Apple graphics modes, joystick, and sound! Runs Apple DOS, ProDOS, AppleWorks, games, utilities, even many protected programs! 65C02 monitor and 'ICE' debugger! Requires 100% IBM compatible w/286 or better CPU and graphics (CGA, EGA, VGA). Another terrific shareware product from American Research Inc.

~~~

Apparently, it will only run the included programs unless registered. If you'd like it, I'll check to see if one of the IBM RTs doesn't already have it, then upload it.

>>> HOT TOPICS <<<

SECOND SIGHT VGA CARD   In defense of Sequential, there's a finite supply of Apple IIGS RGB monitors out there. Nobody is making them, so this card will be instrumental in the preservation of Apple II computers out there. For those with an Apple IIe, it's basically the only choice for an improved display. We constantly get questions from people about the clarity of Apple II displays and this is a good solution.

So, without reservation, I'll gladly say, nice job Sequential.

Quality Computers --- Power for Performance
(QUALITY, CAT20, TOP14, MSG:59/M645;1)

>>>>>  There shouldn't be any hardware conflicts between the Second Sight and PCT, but the PCT won't be able to take advantage of the Second Sight.

Jawaid      (PROCYON.INC, CAT20, TOP14, MSG:76/M645;1)

>>>>>  > Oh, forgot my other question. Why does the card have to go in slot 3 on a ROM 01?

  > There is a signal, M2B0, that's available only on slot 3 in a ROM 01 that the card needs.

  > As I already have a Zip in slot 3 and moving it would not be possible.

  > Adding a longer cable would cause the Zip fits.

Actually, you can put the Zip in slot 1 by just reversing the orientation of the CPU cable on the Zip. The cable isn't any longer, and we've been running the 10/64 Zip in a ROM 01 (noisy) like this for over a
month without problems.

> Is the card compatible with the Zip for that matter? That ended up being 
> two questions.

  Works fine with a 10MHz/64K Zip we've got in that machine, and we've 
  no reason to believe faster ones won't work just as well.

> Say, nobody asked if it worked fine with the 3200 color viewing scheme.

  Yeesh, now that's _three_ questions. :-) I'm not 100% sure, but 
  probably not.

(PROCYON.INC, CAT20, TOP14, MSG:77/M645;1)

> Even better would be an LCD flat panel display that directly accepted 
> VGA/SVGA signals.

  Excellent idea, Luny! I've been browsing some Educational catalogs 
  going (ooh, look at _this_ screen projection system that people with II's 
  in schools can use now! :-)

PMPFAX SOFTWARE STILL IN PROGRESS

Well, the phone book routines are finished :) I'll be working on the send batches next.

This is how it'll work: You'll be able to set up multiple phone books. Each of these phone books can have a combination of book entries (which have the person's name, an organization, and their fax number) and groups. Groups are a collection of book entries and other groups. When you send a fax, you'll be able to pick an entry or a group to send the fax to from any of the phone books you have configured. Sending to groups will be handy when you have a particular fax job that you want to send to multiple people.

The send batches will consist of a variety of different page types. You'll be able to include print pages (that is, pages that are captured from any application that you can print from), an optional cover page (you'll be able to include various fax variables in them, including the name and organization, date and time, total pages, and a comment or memo field), pages from another saved send batch, pages from a received batch, or APF and PIC files. Send batches will automatically be created from the Print dialog so it will be simple to just send a fax when you go to print. You'll have the option of sending immediately, scheduling a send, or just saving a send batch and sending at a future time.

The package will also include an NDA that will have maintenance for the phone books, send and receive batches, and cover sheets. The NDA will allow you to create your own send batches outside of an application print job, will let you view/print/export received faxes, and do other sundry functions.

I am also thinking of releasing a developer's package that will allow fourth-party applications related to PMPFax. Because of the modular way I'm creating the system, other applications and NDAs will be able to access just about all of the features of PMPFax, including the phone books, the send and receive batches, cover sheets, and the view/print module. Some examples of possible fourth-party apps would be advanced phone book maintenance, manipulation of send/receive batches, specialized printing or cataloging of faxes, etc. The actual send/receive modules will also be available for use in this fashion.

Is this something any of you developers out there would be interested in? If so, let me know.

>>> WHAT'S NEW <<<

GENie ANNOUNCES REDUCED RATES FOR 9600 BPS ACCESS

Fire up that high-speed modem and head for your favorite GENie Software Library! Effective October 3, 1994, you'll be able to access GENie Services at 9600 bps for as little as $5.00 per hour. This is a limited beta test, and will be opened to all users on October 10, 1994.

As a result of an arrangement with Sprint, GENie will be offering 9600 bps access from almost 300 SprintNet locations. Best of all, this high-speed access will not be subject to high-priced surcharges. The normal $2.00 per hour SprintNet surcharge will apply...even at 9600 bps! This open beta test is expected to run through the end of the year.

To find the number of the SprintNet access number nearest you, simply type PHONES at any GENie menu prompt (or use the "Move To Keyword" option in GENie for Windows and type PHONES). Remember, this rate applies only to 9600 bps access via SprintNet. So be sure to choose the access number showing "9600" in the "Baud Rate" column AND "SprintNet" in the "Network" column.

From the "Fine Print" department, please note that the $2.00 per hour surcharge for SprintNet access is applicable even during your initial four hours of monthly usage.

So, whether you're into downloading software, reading bulletin boards, or accessing databases, it's about to become cheaper to do it faster! Join the beta test today, and get a headstart on the savings!

GENie TO PROVIDE FULL INTERNET ACCESS BY YEAR END

ROCKVILLE, MD, October 17, 1994 -- GENie announced today its plan to release Phase I of its Internet Access Service by year-end 1994. The GENie Internet Access Service will enable subscribers...
to access the wealth of information and numerous discussion groups available on the Internet from GENie.

Phase I will provide GENie subscribers with access to:

* The FTP Service which provides users with interactive access to any of the millions of files available for public access on the Internet.

* Usenet Newsgroups Service which allow users to participate in the global discussion areas collectively known as USENET.

* Outbound Telnet Service which enables users to connect to other host computers through the Internet.

* Gopher Service which is a set of menus designed to help users access files, discussion groups and other host computers in a more orderly and logical fashion.

* Wide Area Information Server (WAIS) Database Service which provides users with access to "no cost databases" across the Internet.

GENie will also establish a GENie Information Server, accessible to Internet users interested in learning more about GENie Services. Pricing information, access numbers, a list of services, and details of special offers will be available, as well as a signup module.

GENie Services, which became operational in 1985, is one of the leading online information services with subscribers throughout the United States, Canada and around the world. GE Information Services, Inc., a division of General Electric Company, is headquartered in Rockville, Maryland.

#    #    #

* RoundTables are GENie's special interest areas. Each RoundTable includes a bulletin board, software library and Real Time Conference.

Note to the Editor:

GENie Services hourly non-prime time connect rate is $3.00 U.S. ($4.00 CAN$). The monthly fee of $8.95 ($10.95 CAN$) includes up to four hours of non-prime time access to most GENie services such as software downloads, bulletin boards, email, an Internet mail capability, multiplayer games and chat lines.

(GOOSE, CAT10, TOP10, MSG:140/M645:1)

SYMBOLIX SPECIAL OFFER FOR SHAREWARE SOLUTIONS II SUBSCRIBERS (Basle, Switzerland /San Rafael, California. October 26, 1994) The European offices of Bright Software has recently taken over the worldwide distribution of Symbolix, the most sophisticated math program ever written for the Apple II GS.

Bright Software would like to take this opportunity to also inform you that an amazing new 2 disk interactive demo of Symbolix is now available exclusively from the US-based offices of Shareware Solutions II.
Symbolix is a full-featured GS/OS desktop application for complex numeric and symbolic math. Written in fast assembly language, Symbolix calculates object-oriented 2-D and 3-D graphs with hidden surfaces. It offers commands for symbolic derivatives of any complex expression and frees you from expanding, collecting, simplifying and rewriting real or complex expressions. Symbolix fully supports The Manager and the Floating Point Engine, although it requires neither.

Symbolix differentiates any mathematical expression in the twinkling of an eye. It also supports nested line integrals with any number of independent variables. Symbolix's unique 3-D module is the most impressive graphing tool ever seen on a IIGS. You can rotate graphs, choose from among different color sets, and export them in various formats. There is a complete online help system, and a complete collection of mathematical formulas and summary of all chemical elements. Plus, there are Easter Eggs galore!

Symbolix requires 2 megabytes of RAM, two 3.5" disk drives or a hard disk, and System 6. It is now available only from Bright Software's European offices for $70 plus $5 for shipping and handling. Bright Software can accept payment by EuroCheck and by check or money order in US currency.

Bright Software is also pleased to announce that a special discounted offer for Symbolix is now available exclusively to subscribers of Shareware Solutions II. Details may be found in Shareware Solutions II, Issue #7.

The 2 disk interactive Symbolix demo is reminiscent of FTA demos, with stunning and informative animations and a toe-tapping musical soundtrack. That demo is now available from Shareware Solutions II for only $5. The Symbolix demo requires a hard disk drive, but the actual Symbolix program does not.

To order the Symbolix demo, send checks/money orders, made payable to Joe Kohn, in US Funds only, to the Shareware Solutions II Worldwide Headquarters.

San Rafael, CA 94901
USA

Bright Software is the producer of a number of Apple IIIGS commercial and freeware software titles. Commercially available software includes The Gate and Space Fox. Freeware from Bright Software includes ShadowWrite and MultiView.

Shareware Solutions II is a bi-monthly 20 page newsletter that celebrates the magic that is the Apple II computer. Shareware Solutions II also publishes Bill Heineman's Contacts GS name and address IIGS New Desk Accessory database program.

Please contact Bright Software and/or Shareware Solutions II for additional information on their respective products. E-mail inquiries may be directed to:

Bright Software at:
Just a note about the Bright Software/Shareware Solutions II Press Release...

Henrik Gudat and I had a slight disagreement over the wording of the press release. I wanted to use the joint press release as a way to help promote Bright Software, and he wanted to use it as a way to help promote Shareware Solutions II.

Since readers of Shareware Solutions II already know about both the special "Such A Deal" offer and the availability of the new 2 disk Symbolix demo, it just didn't seem necessary to me to include all that info. Henrik disagreed.

But, since Henrik isn't on GEnie and won't see these remarks, I'd like to point out the significance of first paragraph. Namely, Bright Software no longer has a US distributor for Symbolix! The European office of Bright Software is now handling all correspondance, tech support and sales for Symbolix.

Although Bright Software is located in Basle, Switzerland, they do have a bank account set up so that they can accept checks in US currency. They also can accept EuroChecks.

Please note that the other commercially available software titles from Bright Software (Gate and Space Fox) continue to be published by Seven Hills Software.

Joe Kohn

Appleworks 5 Ship Date Slips

Marie, the manuals will be delayed slightly by printing, so although the software will be ready to go Monday, AW5 probably won't ship until November 4th or so.

Products that don't slip will ship with bugs.

Products that slip only once will ship with bugs, but not as many as a product that never slips.

Products that slip several times will ship with bugs, but not very many.

Products that never ship won't have any bugs, but what's the fun in that?

TIMEOUT STATISTICS MAYBE? OPS needs 2 or 3 testers for AppleWorks
(TimeOut) Application. Statistics functions performed, but only a minimal knowledge of Statistics required to be a tester. Respond via e-mail to: D.GUM@GENie.GEIS.COM

(D.GUM, CAT13, TOP26, MSG:75/M645;1)

TURBO REZ GRAPHICS CARD DEAD? Fortunately, you are incorrect. The Turbo Rez is doing better than RezTek wants to publicize due to its new competitor (Second Sight); in fact, the new TurboRez is incredible. Maybe if you dropped some e-mail to Reztek, Bill St. Pierre might give a public status report.

Michael

(M.LUTYNISKI, CAT6, TOP16, MSG:10/M645;1)

>>> I don't get the logic in this statement

How about Animasia 3-D, Mike? How do animations look on the new TurboRez? Are you ready to start selling this (A3D) yet?

David K.

(D.KERWOOD, CAT6, TOP16, MSG:11/M645;1)

RezTek has been in a position where it does not want to reveal information which the Second Sight team could use to their competitive advantage. As for features of the third incarnation of the TurboRez, I am not authorized to say; you'll have to e-mail RezTek directly. All I can say is that the TurboRez has significant features which the Second Sight lacks.

Animasia 3-D supported the second version of the TurboRez (seen at Apple Expo East '92), but does not (yet) do so for the third version. The reasons are more related to a lack of time than anything else. As for a release date, an ad was just placed in GS+ for their upcoming issue. The ad states that A3D will be available beginning December 10th.

Michael

(M.LUTYNISKI, CAT6, TOP16, MSG:14/M645;1)

KOHN WON'T BUY BIG RED COMPUTER CLUB Although I haven't yet received my copy of the latest II Alive, I infer that there's a rumor printed in it that says something along the lines of SSII taking over BRCC.

Let me just suggest that if there's something you want to purchase from Big Red Computer Club, you better purchase it soon. There is
absolutely no truth to the rumor.

On the other hand, Shareware Solutions II and Big Red Computer Club _are_ teaming up once again. In the next several weeks, all Scarlett subscribers will be receiving a sampler issue of SSII. The sampler is a 12 page abridged version of SSII #7 that will contain 60% of the articles that appeared in SSII #7.

>>> MESSAGE SPOTLIGHT <<<

Category 2, Topic 7
Message 330 Fri Oct 21, 1994
D.ROGERS2 [DAVE] at 22:45 EDT

Not to change the subject or anything, but I was just up in Joe Kohn's SSII CAT when I read his reply concerning a Honolulu user group and how they had 1000 people attending meetings at first, and they're down to 10 now.

Brought back memories. I remember how excited I was when I found out there was such a thing as a user group. I bought my ][+ back in Dec '81 and went for months relying on Nibble, Creative Computing and Byte. Then I found out about the Tidewater Apple Worms (hated the name even then). What a discovery! There were easily over 100 people at those meetings. We used to meet twice a month. Once was a "meeting" where we actually conducted "business" and the other was an informal, officially unsanctioned gathering which was much more energetic though I'm sad to say the principle activity was copying software.

But the excitement came from the fact that the whole idea of personal computing was in its infancy. None of us knew what these machines were really capable of and how we could access it. Every meeting brought new wonders to behold. Broderbund actually sent a rep to demonstrate a prerelease version of Lode Runner and showed how they took the programmers original program and refined it into a finished product.

It was heady stuff for a guy who had been raised on Robert Heinlein, Isaac Asimov and Arthur C. Clarke. It was really weird meeting so many people you didn't know and having an instant rapport with them. I haven't experienced anything remotely like it since.

My wife was asking me yesterday (pleading, really) why I didn't get rid of this thing and get an MS-DOS machine "something that's compatible." I can't explain to her that this machine has the greatest compatibility of all, it's compatible with me.

Although I'm much older and wiser in the ways of bits and bytes, I can instantly recall the wonder I felt when I turned on my ][+ for the first time. I suppose the people who owned the first televisions or first radios and perhaps the first folks to master fire, felt much the same way. It is a rich experience. I wonder if people who have come into computing in the last few years have felt any of that. The kids who have grown up since 1981 certainly take it for granted, much as I did color TV.

In the last years of my stay in Virginia TAW continued to shrink and
become somewhat mired in endless bickering about this and that. It was very sad for me. Now I'm in Jax and I don't belong to a user group anymore. I visit here and I help out at my son's school and that's about the extent of my Apple activities outside my den. But I'm sticking with the old hunk of silicon. I tell my wife it's my sandbox. All these things really are, after all, are boxes of sand. We make of them what we will. Somehow I don't think the guy walking out of CompUSA with the latest Compaq or Power PC in his hands has any inkling of that.

Sorry for the long post. But something struck a chord and I just had to let it reverberate for a while. Back to our regular programming...

Dave Rogers

[*][*][*]

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

Cartoon Laws
*****************************************

by Trevor Paquette and Lt. Justin D. Baldwin

>>> THE TEN LAWS OF CARTOON PHYSICS <<<
*****************************************

Cartoon Law I.

Any body suspended in space will remain in space until made aware of its situation.

Daffy Duck steps off a cliff, expecting further pastureland. He loiters in midair, soliloquizing flippantly, until he chances to look down. At this point, the familiar principle of 32 feet per second per second takes over.

Cartoon Law II.

Any body in motion will tend to remain in motion until solid matter intervenes suddenly.

Whether shot from a cannon or in hot pursuit on foot, cartoon characters are so absolute in their momentum that only a telephone pole or an outsize boulder retards their forward motion absolutely. Sir Isaac Newton called this sudden termination of motion the stooge's surcease.
Cartoon Law III.

Any body passing through solid matter will leave a perforation conforming to its perimeter.

Also called the silhouette of passage, this phenomenon is the speciality of victims of directed-pressure explosions and of reckless cowards who are so eager to escape that they exit directly through the wall of a house, leaving a cookie-cutout-perfect hole. The threat of skunks or matrimony often catalyzes this reaction.

Cartoon Law IV.

The time required for an object to fall twenty stories is greater than or equal to the time it takes for whoever knocked it off the ledge to spiral down twenty flights to attempt to capture it unbroken.

Such an object is inevitably priceless, the attempt to capture it inevitably unsuccessful.

Cartoon Law V.

All principles of gravity are negated by fear.

Psychic forces are sufficient in most bodies for a shock to propel them directly away from the earth's surface. A spooky noise or an adversary's signature sound will induce motion upward, usually to the cradle of a chandelier, a treetop, or the crest of a flagpole. The feet of a character who is running or the wheels of a speeding auto need never touch the ground, especially when in flight.

Cartoon Law VI.

As speed increases, objects can be in several places at once.

This is particularly true of tooth-and-claw fights, in which a character's head may be glimpsed emerging from the cloud of altercation at several places simultaneously. This effect is common as well among bodies that are spinning or being throttled. A 'wacky' character has the option of self-replication only at manic high speeds and may ricochet off walls to achieve the velocity required.

Cartoon Law VII.

Certain bodies can pass through solid walls painted to resemble tunnel entrances; others cannot.

This trompe l'oeil inconsistency has baffled generation, but at least it is known that whoever paints an entrance on a wall's surface to trick an opponent will be unable to pursue him into this theoretical space. The painter is flattened against the wall when he attempts to follow into the painting. This is ultimately a problem of art, not of science.
Cartoon Law VIII.

Any violent rearrangement of feline matter is impermanent.

Cartoon cats possess even more deaths than the traditional nine lives might comfortably afford. They can be decimated, spliced, splayed, accordion-pleated, spindled, or disassembled, but they cannot be destroyed. After a few moments of blinking self pity, they reinflate, elongate, snap back, or solidify.

Corollary: A cat will assume the shape of its container.

Cartoon Law IX.

For every vengeance there is an equal and opposite revengeance.

This is the one law of animated cartoon motion that also applies to the physical world at large. For that reason, we need the relief of watching it happen to a duck instead.

Cartoon Law X.

Everything falls faster than an anvil.

Examples too numerous to mention from the Roadrunner cartoons.

[EOA]

REFLECTIONS /
Thinking About Online Communications

by Phil Shapiro

>>> SOME THOUGHTS ON THE PSYCHOLOGICAL ASPECTS OF ELECTRONIC MAIL <<<

Last week a friend of mine sent me an E-mail message explaining the progress being made in her treatment for depression. She is taking medication, which seems to help, and visits regularly with a therapist, which she also finds beneficial. At the end of her message she inquired whether a mutual friend of ours could be reached online.

As it happens, this mutual friend does have an electronic mail address, but he hardly ever uses it. I explained to my first friend that despite my best efforts to wheedle and cajole him, our mutual friend seems reluctant to make use of online communications. At the end of my message, I added, "Well, this just reinforces the age-old Confucian adage: 'You can lead a horse to a modem, but you can't make him dial.'"

Apparently my silly little remark brought a brief chuckle to my friend. Which got me thinking about the psychological effects that E-mail can have on the human mind.

All communications has the power to lift the human spirit. But even more so when the human spirit is flagging. When you hear a friend has suffered an unexpected misfortune, your first inclination is to reach for
the phone to offer soothing words of commiseration and reassurance.

Human beings are intensely social creatures. To a large extent we derive our emotional strength from our interactions with one another. Self-esteem is largely a by-product of how others have treated us.

Thinking back to my friend undergoing treatment, it would be presumptuous of me to think that a single E-mail message could have a salutary effect on her depression. Clinical depression is a disease with a profound impact on the human mind. But if an E-mail message I sent brightened her day for a moment, that in itself is a positive result.

I came to learn recently that my friend stays in touch via E-mail with several other of her friends and colleagues. Who knows what the collective influence of ten, twenty, or thirty E-mail messages per day might have in her life?

Imagine if you yourself were stuck in a hospital bed for two weeks. Your closest friend stops by with a laptop computer and arranges for an extra phone line to be installed in your room. Within minutes you could be online savoring the waiting E-mail messages in your mailbox.

And if the doctor ordered quiet bed rest, you could still have your E-mail read aloud to you -- with each message being whispered quietly into your ear. Then you could quietly whisper a reply like: "Tell Jackson that as soon as I'm able to get out of this bed I'm going to walk over to his desk and whack him over the head with a foam rubber baseball bat."

It's the emotional warmth of these types of messages that can bolster one's spirits.

Forget the flowers and the phone calls. E-mail neither wilts nor wakes up a person who is napping. And if you choose the right words, you can transmit almost any emotion from your heart to someone else's heart.

And who knows what healing powers your messages might have.

-Phil Shapiro

Welcome back to the Treasure Hunt! This month we will examine several different files. There is no central theme this month, but I think there is something here for just about everyone. Let's get started. :)

[*][*][*]

PIXMIX.BXY  File #12726  99540 bytes  GS JIGSAW PUZZLE GAME

PIXMIX
Copyright 1989 Doug Happel, All Rights Reserved
Freeware

PIXMIX is a jigsaw puzzle game for the Apple IIgs. It can read most kinds of IIgs graphic imaged from diskette, fracture them into 6-80 pieces, and let you reassemble them as a pleasurable exercise. In my opinion, this is one of the true gems of the GS world. Even though it was created about
five years ago, under ProDOS 16, it works just fine using the latest GS System software.

PIXMIX works with most image files of types $C0 and $C1. It cannot handle image files of partial screens (these wouldn’t be of much use as a puzzle, anyway).

You may wish to select "Help..." from the Apple menu after you’ve launched PIXMIX. This will allow you to select any menu item and see a description of its use.

Start by selecting "New Image..." from the "Files" menu. This will bring up a dialogue box allowing you to choose the graphic image file you want to work with. After you have selected a file by "Open"ing it, another dialogue box will appear asking you into how many rows and columns you’d like the image to be fractured. You must make a choice here (although you can always rescramble the image later at a different level of complexity).

There are two windows available for your use. The window called "Boxtop" is the unscrambled image—use it as a model. The window called "Puzzle" is the scrambled image—this is where you reconstruct the image. You can switch from viewing one window to the other via the "Options" menu.

To reassemble the image, click on a piece you’d like to move. Its colors will invert to indicate that it has been selected. Now click on another piece—the two pieces will exchange places. This is known as "Single Swap" mode.

Another mode called "Block Swap" will let you move a block of pieces at a time. This mode can be selected via the "Options" menu. To select the block you wish to move, depress the mouse button with the cursor in one of your block's corners. Drag the cursor to the diagonally opposite corner, and release the button. The selected rectangle will invert its colors. Now click the mouse button with the cursor in the upper-left corner of the destination block (of the same size). If the blocks do not overlap, they will swap positions. If the blocks overlap, and the destination is in the same row or column as the selected block, the latter will "slide" into its new location. Illegal moves will exhibit a beep or an alert box.

Hint: In "Block Swap" mode, after you’ve selected a block, you can press the mouse button with the cursor within your selection and drag it to its new location.

Nested within the "Puzzle" menu is a selection called "Choose Timer..." When you select this item, you will see a dialogue box which allows you to choose one of four timer options.

PIXMIX is Freeware. Please refer to the "About PIXMIX" item of the Apple menu for restrictions regarding its distribution.

[*][*][*]

COLLOCATION.BXY File #22026 84224 bytes GS STRATEGY GAME

Collocation v1.1
Copyright 1993 by Benjamin Winnick
Shareware - $7.00
Benjamin Winnick has created a neat strategy game for the GS. The rules are fairly simple; the objective is to form simple pattern by pushing gray blocks into the proper sequence. As Ben says in his introduction, "There are no worlds on the verge of destruction or princesses in need of rescuing. Just play the game and have fun." The best way to describe this game to you is to quote Ben's instructions.

"MOVING .. You are represented by a blue arrow. If you are using the keyboard you can turn to face different directions by pressing the J and L keys. To move forward you can press I, K, or the space bar, whichever you prefer. If you are using the mouse, moving it left or right will rotate the arrow. Pressing the mouse button moves forward.

"The blocks for you to use come from a position in the upper-left corner of the playing area. A few moments after pushing a block off this location, a new one will grow in to replace it. You can push only one block at a time. If there are two in front of you when you try to move, nothing will happen.

"BAD GUYS .. Your opponents are red C-shaped monsters. These monsters wander randomly around the playing area. If one of them comes in contact with a block, it will eat the block. When this happens, the monster will disappear, and two more will appear to take its place. If too many blocks get eaten, the game ends.

"DEFENSE .. To assist you, there are indestructible gold blocks in the lower-left corner. These blocks can be moved the same way the gray blocks are moved, but cannot be eaten by the monsters. In addition they take slightly longer to regrow. You can use them to try to keep the monsters from reaching your gray blocks.

"PLAYING .. The pattern you must form is displayed in the upper-right corner of the screen. It starts out as a 3x3 grid, but it will get larger as you get to higher levels. The number of monsters will also increase as you progress. To complete a level you must correctly reproduce the pattern on the playing field.

"The first few levels may seem easy, but don't let that fool you. Once the pattern size starts increasing, you'll have to do your best to survive.

"SCORING .. The 'Level Score' shown on the right side of the screen is the number of points you will receive for completing the current level. When a monster eats a gray block, this number will decrease by one. If it reaches zero, the game ends.

"The 'Total Score' is the total number of points you have accumulated. The top ten high scores are listed on the left side of the screen."

A couple of things you should know: Open-Apple-Q quits the game. Also, I think you will find that it is easier to use one hand on the keyboard, rotating the arrow with the J or L key, and the other hand on your mouse button, clicking to move the arrow forward.

I didn't care for the fact that you could not save your level and return to it the next time. Apparently, you begin as a rank amateur each
time you run the game. Other than that, it seems like a neat game.

[*][*][*]

HANOI.GS.BXY File #13587 16380 bytes TOWER OF HANOI PUZZLE

by David Hallwas
Freeware

David Hallwas created this Apple IIgs version of the classic Towers of Hanoi game. For those of you who have never played this game, the object is to move seven rings from one peg to another. The rings are in descending size with the smallest on top. There are three pegs available and the trick is to move the top ring from a peg to another peg so that you can get to the next larger ring and move it. You may not place a larger ring on top of a smaller ring. It sounds simple, but it is not as easy as you might think.

This version uses the SHR screen and allows the use of the mouse to move rings. Other than that, there is really little difference between this version and earlier versions that I have seen for 8 bit Apples.

Still it is a neat game, and since it is a fairly smaller download, I recommend that you get it and try it out. Even the price is right!

[*][*][*]

POWERPLAY.BXY File #11573 51660 bytes APPLE IIGS GAMES

by Peter Brinkley
Public Domain

This collection of four games for the Apple IIgs has been around for a while and a lot of people have already downloaded it. If you are not one of them, you should take a look at it.

The first game, called Four Play, is a "columns" type game where you manipulate falling squares to match all adjacent colors of their neighbors when they land. This version allows you to control the speed at which the squares drop, so you can pick your own challenge level.

The second game, called Tron, is a two player game where each player controls a 'light cycle' with the keyboard and attempts to box in the other player. If a 'light cycle' can't move the game is over.

PignBull, the third game, is a guessing game. You have 16 chances to discover a four-digit number. In each turn, you select four 1-digit numbers, none alike. Then the game displays pig icons for each correct digit that is not in the correct location, or bull icons for each correct digit in the correct location. The pig and bull icons are not displayed in the same order as the numbers. For example if you select the numbers 1, 2, 3, 4 and you are shown one pig icon and 1 bull icon, that means that one of your numbers is correct, but in the wrong location, and another one is both correct and in the correct location.

The final game is called Gridlock. Initially you will see four 4-color icons in the game window. The object of the game is to turn and rearrange them so that all of the adjacent sides match. Once you succeed,
the level of the games increases and more icons appear.

[*][*][*]

MIND.GAMES.BXY  File #16696  30592 bytes APPLE II GAMES

MIND.TWO.BXY  File #16920  23296 bytes APPLE II GAMES

So, you've just bought an Apple IIe or IIc from someone, and you'd like to try out a few games to see what it can do. Let me recommend that you download these two collections of public domain games.

In the first collection you will find games from Joe Kohn's selections of the "Best of Big Red". This set is "mind games"—puzzles and other mental exercises. It includes: ANAGRAM -- unscramble mixed-up words; CODEBREAKER -- Lo-res color logic game; FRUSTRATION -- Lo-res color logic game; GALLOWS -- slick version of Hangman; LOGIC -- an educational tutorial game of logic; MARQUEE -- a text logic game; and TAKE.OFF -- play against computer removing numbers from a list.

The second collection of 6 "mind" games include two different flavors of "Mastermind", the old "Peg Jump" game done VERY nicely in hi-res, a utility to assist you in breaking cryptoquizzes, "Goal", and "Black Box". "Black Box" is a very nifty game in which you must deduce the positions of "atoms" based on the behavior of particle paths.

Tom Zuchowski has kindly collected these games and uploaded them for your gaming pleasure.

[*][*][*]

B.TUDOR.RTC.BXY  File #23511  13056 bytes RTC TRANSCRIPT

Last month we featured several of Bill Tudor's Apple IIgs utilities in this column. On Friday, October 21, Bill was the guest speaker at a special Real-Time Conference where he discussed his programs. This is an edited transcript of that conference.

If you missed the conference, you should download this transcript. Among other things discussed, Bill revealed the secret behind his program Minimizer which allows you to display a minimized icon for any zoomable window on the Finder screen.

[*][*][*]

XM_MANAGER.BXY  File #23128  10368 bytes EXTRAS MANAGER

Copyright 1994 by
Bill Tudor
$10 Shareware

XManager is an Apple IIgs Finder Extension init file that allows you to manage all your other Finder Extensions. You can check on the current memory usage of installed extensions, and you can install and remove them "on the fly" while the Finder is running. The following information is
Apple II Computer Info

taken from the documentation file included with the program.

To install XManager, copy the file XManager to your System.Setup folder on the boot disk and reboot, or copy the file XManager to a folder named FinderExtras located in the System folder on the boot disk, then re-run the Finder. XManager REQUIRES the program IR to install extensions. It requires System 6.0.1 or greater.

After XManager is installed, run the Finder and choose the XManager menu item from under the Extras menu. You will be presented with the XManager dialogue window. This window contains two lists. The list on the left shows all of your installed Finder Extensions, their current memory requirements, and the total memory used by all of them. The list on the right displays all of your inactive (not loaded) Finder Extensions.

Note: An "inactive" Finder Extension is a Finder Extension in your FinderExtras folder that has been marked as inactive, i.e., the inactive check box in the Finder's "Icon Info" dialogue has been checked. An inactive Finder Extension remains on disk when the Finder is running and is not loaded into memory.

To install an inactive Finder Extension, select the file and click the "<<Install" button. The file will move over to the "Installed" list. To remove an installed Finder Extension, select the file and click the "Remove>>" button. The file will move over to the inactive list and be removed from memory. This extension will not be loaded the next time you run the Finder as it will be marked "inactive". To activate it again, either use XManager to activate it on the fly or un-check the inactive box in the Finder's "Icon Info" dialogue for the file. Then it will become active the next time you use the Finder.

When you are finished, click the "Done" button.

Please note that after XManager installs a Finder Extension, you will not be able to remove that extension until you exit the XManager dialogue (click done). This is because the extension must be given a chance to initialize itself before it can be removed again. Finder Extensions installed by XManager are not "fully" installed until you click the "Done" button.

If you make a mistake and install a Finder Extension that you want to remain inactive, just click the done button, then select "XManager..." from the "Extras" menu again and you will be able to remove it.

Important: There are some Finder Extensions that cannot be removed from memory. These will appear in italics in the installed list and you will not be able to select them. An example is XManager itself. You cannot use XManager to remove XManager as an extension cannot remove itself.

Bill indicated in the RTC that there is a bug with this program that should be fixed in the next version. Read the transcript mentioned above for details.

[*][*][*]

SHOWCLIPNDA.BXY   File #23118      1152 bytes      APPLE IIGS NDA
This little Apple IIgs NDA adds a show clipboard item to the Apple menu and provides that function for programs that allow access to the Apple menu but not the Edit menu.

I recommend adding this little gem to your collection. Who knows when you might find a need for this, and the price is right.

[*][*][*]

James Davis has created this graphics puzzle game. The object of the puzzle is to exchange the colors in the two diamonds. You can move into the empty square from an adjacent square or jump over a square of any color to the empty square.

A selection is made with the game paddles, a joystick, the I, J, K, and M, or arrow keys. Put the cursor on the square you want to move to the empty one and press a game paddle or joystick button, either apple key, or return.

This program has the potential of being a neat game. Unfortunately there are some problems. The biggest problem lies in the fact that the program cannot be played on a monochrome monitor. Mr. Davis made the mistake of using two low resolution colors that look exactly the same on the monochrome monitor, so it is impossible to know which color is which.

Mr. Davis has been contacted about this problem by a staff member and his response was that the staff member could fix the problem if he wished. The indication seems to be that Mr. Davis does not plan to fix the program so that it will display properly on a monochrome monitor.

Since this is a shareware program (he wants $10 for it) I cannot recommend that you download it. It is being included in this month's column because I felt those who use monochrome monitors should be aware of its shortcomings. Perhaps Mr. Davis will change his mind about fixing it. Until then, this is a program to avoid.

[*][*][*]

That’s it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

-- Charlie Hartley
My latest purchase are these speakers, which are now located beside my Apple IIgs. While I'm writing this, I'm listening to a CD with old-time rock'n'roll music--awesome.

The speakers were about $110 here in Germany, but in my opinion they are worth every cent of that price. Like everything else from Apple they are of outstanding quality. For your money you get two speakers in platinum color (fits the IIgs extraordinarily well, as well in color as design), power supply, speaker-to-speaker cable, computer connection cable, CD stereo cable, and a manual with explanations in five languages.

The power supply isn't a simple wall wart, it comes with about 6' of cord for connecting to 110V and with about 6' of cord for connection to the speakers. The speaker for the left channel (main speaker) contains all the sockets for making the connections: power, CD in, computer in, speaker out, headphones out. A knob for adjusting the volume is also present. The speaker for the right channel (satellite speaker) is fed power and sound by the speaker-to-speaker cable connected to it.

The cable for connecting the IIgs to the speakers has 3.5-millimeter stereo plugs on both ends, the cable for connecting the CD-ROM has two cinch plugs on one end and an 3.5mm stereo plug on the other end. (This may be different in the US.) The cable for connecting the CD-ROM is designed to connect a CD-ROM by Apple in its external case, as this, too, has two cinch sockets for the sound output.

If you've put your CD in another case, you have to connect the CD via the headphone socket to the speakers. For that you have to buy your own cable.

The size of the speakers is about 4.1 by 6.7 by 4.7 inches (width x height x depth). A good deal of the depth may be attributed to the rear stand, which adjusts the tilt of the speakers, too. You shouldn't remove the rear stand, as this affects the quality of the sound adversely according to Apple.

The quality of the sound is very good. After adjusting the volume from the CD-ROM drive and selecting an appropriate volume for the IIgs via the Control Panel, I was all set. Now both signals are almost identical in volume, although I chose the IIgs to be a bit fainter. This way the messages of the IIgs are well to hear, but don't dominate the music.

You select the basic level of the volume at the CD-ROM drive and the IIgs. How loud you want to hear sound/music is ultimately selected with the volume control at the main speaker. If you don't want to disturb anybody, you can attach a headphone system to the headphone jack of the main speaker.

The Apple speakers provide a healthy bass. I notice this now more now, as my previous speakers I connected by a self-made cord to IIgs and CD-ROM drive (with capacitors in it) lacked in the bass range. The sounds of the IIgs contain lots of bass, I didn't know the standard "bonk" could be so deep.
The manual describes connecting the speaker to a Macintosh and to a MS-DOS PC. The IIgs isn't mentioned, but we're used to this from Apple by now, aren't we?

Udo — ... just a IIGS freak —

Who's Who In Apple II
/////////////////////////////////
by Charlie Hartley
[C.HARTLEY3]

>>> WHO'S WHO? <<<
/////////////////////////////////
~ GENieLamp Profile: Tony Ward ~

This month we will profile the man who knows where all the files are hidden! Tony Ward [A2.TONY] is the Chief Librarian for the Apple II RoundTable Library. His job is to make sure that the files that are uploaded to the library are okay for the rest of us.

GENieLamp> How did you first get interested in the Apple II computer?

Tony> In high school, I guess it was 1982 or so, we had a computer lab filled with various Apple II computers. I don't know what made me decide to take the "Intro to computers" class, but I did. Can you believe they actually taught Cobol on the Apple II? By the time I graduated in 1984, I was completely hooked. My mom helped pay for my first Apple, a IIe. It was stolen from my apartment at college a few years later and I used the insurance money to buy a IIgs. I guess that was a blessing in disguise because I still have that same IIgs and I use it every day.

GENieLamp> Do you have any anecdotes you can share with us about your first experiences with the Apple II?

Tony> Hmmm.... Well, I can tell you that I often stayed late after school playing games in the computer lab. As an "advanced" student I was allowed to play during class, but after school was when all the "computer geeks" got together to share solving techniques for classics like Wizardy, Ultima and Akalabeth.

GENieLamp> Exactly how do you decide which files get put in the library and which don't?

Tony> Yeah, I guess I do spend quite a bit of time online. Does that qualify for understatement of the year? My "job" (I hesitate to call it that because I really enjoy doing it) is to download and check out all the files that get uploaded to the A2 Library. I've often been asked, "Do you have to download every single file?" The answer is yes, I really do download everything. My hard drive is a mess, but I don't mind.

GENieLamp> Exactly how do you decide which files get put in the library and which don't?
Tony>  We really don't do much "screening" here in A2, we'll release just about anything. However, that hasn't stopped me from being tagged a "tyrant" by people who get rejection letters from me. GENie has a pretty strict policy concerning copyright infringements. We have to watch out for files that might violate someone else's interests. This policy hits especially hard when it comes to graphics and music. For example, we can't accept a digitized picture of Mickey Mouse or a Van Halen song, things like that.

GENieLamp>  What is the process that you go through to decide if a file is acceptable for the library? You've already mentioned copyright problems, what about viruses? How do you check for them?

Tony>  You want all the gory details? Okay. :) 

I download the file without using Binary II so I can then use BLU (Binary Library Utility) to make sure the file has a Binary II wrapper with a proper filename (i.e. MYFILE.BXY should have a file named MYFILE.SHK inside.) If it's a program, I run it through a virus checker (Salvation Exorciser) to make sure it doesn't have any viruses and it doesn't make any nasty system tool calls (erase, format, etc.) If it passes these tests, I run the program to make sure it works. I usually don't spend too much time with the program, I just want to make sure it actually runs. To date, I have found only one file that contained a virus. This file was never released to the public.

If it's a picture, I look at it to make sure it's not a copyrighted picture. I also look for nudity which would cause the file to be placed in our adult library. If it's an unpacked text file, I make sure it was uploaded without Binary II so anyone can download it or view it online.

GENieLamp>  Tony, would you explain to our readers who lack experience in uploading how it is all done?

Tony>  Uploading a file is really quite simple. You pack the file(s) with ShrinkIt first and call the archive something like MYFILE.SHK. MYFILE can be anything you want, but you need the .SHK suffix. When you are ready to upload the file, make sure you turn on your telecom program’s Binary II option. This adds a "wrapper" to the file that preserves the important filetype info so when someone downloads it they get the correct type of file. Tell GENie that the filename is MYFILE.BXY (.BXY is the Binary II suffix.)

If your telecom program doesn't have a Binary II option, you can tell ShrinkIt to add it for you when you create the archive. When you type in the name of the archive, MYFILE.SHK, just hit OA-Return instead of Return.

It really doesn't matter which method you use, but pick one and stick with it. And whatever you do, don't use both methods on the same file or you'll end up with a "double wrapped" file and you'll have to do it over again. If you want more detailed information, check out this file in the A2 Library:

20171 UPLOAD.TIPS.BXY

It's an excellent tutorial written by Tom Zuchowski on how to perform the perfect upload.
How does the keyword search work?

Searching the library is really quite simple, but I know many people are confused or intimidated by it. I try to add enough keywords to each file so anyone can find it later on. Let's say you're looking for an AppleWorks template to help with your taxes. First, set the proper library (in this case, it's #46 -- AppleWorks Templates.) Start the search (library menu item #3) and when you are asked for a keyword, try "tax" or "taxes" and you will get a list of all tax templates. That's really all there is to it.

If you are looking for a game called "pyramid" you don't want to search for keyword "games" because you'll get a few hundred files. Instead, search on "pyramid" and you'll narrow the search. You can search without first setting a particular library, but be prepared for a long list of files. If you would like more detailed information about keywords, check out this file:

23050 KEYWORDINFO.TXT

It contains a good explanation of how the GEnie library keywords work.

In the year and a half that you have been the Chief Librarian, what files have come across your screen that you think are truly outstanding?

There have been many outstanding files uploaded to A2 since I've been here. I hesitate to make a list because I don't want to leave anything out, but here are a few off the top of my head:

CoPilot and GEM -- Incredibly useful programs for managing your online time.

Cogito and Tinies -- Two very nice freeware games for the IIgs from the folks at Brutal Deluxe.

The A2 Disk of the Month -- The best A2 has to offer, on a single disk, every month. A great way for the occasional A2 browser to pick up the latest and greatest software with a single download.

I make up a Dean's List every other week or so that contains the current "hot" files. The list is displayed on the A2 banner so everyone can see what's new in the library. Dean Esmay started the list when he was the Librarian and I've kept it going because I like it.

Where do you see the future of telecommunications moving in the next five to ten years?

Internet. Actually, something resembling the Internet but a whole lot bigger and better organized. Everything will be interconnected. You'll be able to do just about everything with your TV's remote control: shop an online mall, buy groceries, send and receive mail, play games and of course watch television and movies. Your telephone will also be connected to (or replaced by) your television.

Tell us a bit about your family.

GEnieLamp> How does the keyword search work?

Tony> Searching the library is really quite simple, but I know many people are confused or intimidated by it. I try to add enough keywords to each file so anyone can find it later on. Let's say you're looking for an AppleWorks template to help with your taxes. First, set the proper library (in this case, it's #46 -- AppleWorks Templates.) Start the search (library menu item #3) and when you are asked for a keyword, try "tax" or "taxes" and you will get a list of all tax templates. That's really all there is to it.

GEnieLamp> Where do you see the future of telecommunications moving in the next five to ten years?

Tony> Internet. Actually, something resembling the Internet but a whole lot bigger and better organized. Everything will be interconnected. You'll be able to do just about everything with your TV's remote control: shop an online mall, buy groceries, send and receive mail, play games and of course watch television and movies. Your telephone will also be connected to (or replaced by) your television.

GEnieLamp> Tell us a bit about your family.

""""""""""""""""
Tony> I was born and raised in the northern suburbs of Chicago. My parents got divorced when I was very young. My mom is remarried and still lives in the Chicago area. My dad lives in Texas and has been married (and divorced) twice. My brother lives in Colorado with his girlfriend. All four of my grandparents are still around, and I've got cousins scattered all over the country.

GENieLamp> What do you consider your proudest accomplishment?

Tony> Getting my bachelor's degree in Computer Science. It took me 6 years, but I did it and I'm very glad I did.

GENieLamp> Who do you look up to as your mentors?

Tony> My dad and my grandfather. How's that for a standard answer? I really do look up to both of them and I'm trying to follow in their footsteps by choosing a career I enjoy and sticking with it.

GENieLamp> I'm curious about what your dad and grandfather do. It sounds like they found their niche.

Tony> My dad is Plant Manager for a company in Texas that makes metal frames for computers and televisions. They make other metal parts, but the frames are the big business. Lots of PCs have frames that were made at my dad's plant. I don't think I'm supposed to reveal the brand names, but they are biggies.

My grandfather tried retirement a few years ago but he wound up driving my grandmother nuts because he can't stand not being active. He went back to work as a consultant to help companies in trouble. He basically goes in and completely takes over the day to day operations of the company until it's back on its feet.

GENieLamp> What sorts of things do you like to do for fun (i.e. non-computer hobbies)?

Tony> Football. I spend every Saturday watching the college games and every Sunday watching the Pros. I'm also a book freak. I've got a pretty extensive collection of Stephen King novels and I'll read just about any science fiction, horror or spy story that catches my eye.

GENieLamp> Are computers a part of your daytime job? Please tell us a little about what you do between 9 and 5.

Tony> Computers are my life. I work on one all day and I come home to one every night. I'm a programmer/analyst for a large insurance company here in the Chicago area.

GENieLamp> What exactly do you do?

Tony> I do Cobol and Assembler programming on an IBM-370 mainframe. Most of the time is spent on database retrieval and sorting programs to keep the phone operators happy. They're always asking, "can you add this function?" and "I don't like the way the screen looks, how about doing it
like this?" We try to keep everybody happy. Then management comes along and asks us to change it to make it work the way they want it to work. It's a vicious circle, but I really enjoy doing it.

**GENieLamp**> How long have you been a member of **GENie**?

---

**Tony**> I've had accounts on **GENie** for about 5 years or so. When I first signed up, I thought it was too confusing so I gave it up and tried America Online. After about a year on AOL, I decided to try **GENie** again and I've been here ever since. **GENie** was my first experience with a commercial online service and like many newcomers, I guess I was a bit overwhelmed. I'm glad I decided to stick with it. I've been an A2 Sysop since April 1993.

**GENieLamp**> What new services do you think **GENie** should provide its subscribers?

---

**Tony**> The things most people want: High speed access at a reasonable cost, full Internet access and a more robust transfer protocol than Xmodem CRC for uploading files.

**GENieLamp**> What one piece of advice would you pass along to a new Apple II telecommunications enthusiast?

---

**Tony**> If you aren't already on **GENie**, do it now. A2 and A2Pro are the absolute best sources of information and software for the Apple II.

**GENieLamp**> What do you see as the future for the Apple II and its owners?

---

**Tony**> The Apple II has lived an amazingly long life. The basic architecture of the computer is almost two decades old, yet thousands of people are still using the darned things. I love mine and I wouldn't give it up for anything. There are still quite a few companies supporting the Apple II (Byteworks, Seven Hills, Quality Computers, Vitesse, InTrec, Procyon, etc.) because there are still lots of people buying the products.

Sure there are better computers on the market, and have been for quite some time, but the Apple II is still a great machine that performs most of the tasks people want in a home computer.

**GENieLamp**> Can you offer some advice about software and hardware that a new Apple II user might want to invest in? What do you have and use?

---

**Tony**> It's hard to make a recommendation without knowing the user's needs. Many people get along just fine with a 128K Apple IIe. Others like to cram as much hardware as possible into their IIgs. I guess I'm somewhere in between. I have a IIgs with a 4MB GS-RAM+ memory card, a 125MB hard drive connected to an Apple High Speed SCSI card, an 8MHz ZipGS, an MDIdeas stereo/digitizer card connected to a pair of Labtec amplified speakers, an Imagewriter II and an Intel 14,400 baud external modem. I have a System Saver to keep it all cool and an APC UPS back-up power supply to keep me sane (the power goes out from time to time around here).

The main thing is to buy only what you need and upgrade your system as your
needs increase. If you only want to run AppleWorks and a telecom program, go with an Apple IIe and a 1MB RAM card. Add an accelerator if you feel the need for speed and unless you enjoy disk swapping, I strongly suggest a hard drive. I know I couldn't live without mine.

GENieLamp> When you're not acting as Chief Librarian on GENie, what else do you do while you're here? What do you enjoy most about being here?

Tony> I spend quite a bit of time in the A2 RTC. I enjoy helping the new folks and just shooting the breeze with the old timers. I also play a few of the GENie multi-player games. I'm a regular player in Federation II (a space trading game, the object is to become Emperor and rule the galaxy) and Dragon's Gate (a role-playing Dungeons & Dragons type of game).

GENieLamp> Thank you, Tony, for an enjoyable interview.

Tony> I've enjoyed it! I think we have the best online Apple II library available, and I want to take this opportunity to encourage folks to continue to upload files to our library and to keep downloading them too.

[*][*][*]

A note to our readers: If you want to know more about a particular person and want him/her to be interviewed for the GENieLamp A2 profile column, send E-mail to C.HARTLEY3 or EDITOR.A2 and we'll see what we can do. In your E-mail message, tell why you think this person is a good candidate for the profile.

SPECIAL NEEDS /
/////////////////////////////////////////////////
Playing Tetris Can Help Soothe Asthma Attacks

by Phil Shapiro
[P.SHAPIRO1]

The Washington Post newspaper recently reported that playing Tetris can have a soothing effect on persons undergoing asthma attacks. In a first-person, anecdotal article by Larry Fox, in the Fast Forward magazine section, the therapeutic uses of Tetris are vividly described.

During one recent asthma attack the author casually started a game of Tetris on his Nintendo system. After playing the game for about 30 minutes he found his breathing troubles to be noticeably diminished.

Curious to see whether there might be some cause-effect relationship, Fox tried playing Tetris again during his next asthma attack. In his own words:

"Coincidence, I first thought. But I put that conclusion to test a few weeks later, when another seizure left me gasping. Again I turned to Tetris. Once again the rhythm and colors worked their magic: I could breathe!"

Fox attributes the therapeutic effect of Tetris on the way the game
mesmerizes players who are playing it. Since the game so successfully engages the cognitive processes of the mind, the brain gets "distracted" from the asthma seizure that was otherwise occupying its attention.

To find out more about how and why Tetris might help asthma sufferers, Fox talked with Dr. Joel Taubin, the Washington DC pulmonary specialist who treats him. Taubin declared, "Sure, it can work. Anything that can get your mind off breathing difficulties can help give you relief. I have recommended biofeedback to patients, told them to relax by going to a movie or resting in a dark room. Anything that can change your focus away from breathing difficulties will help."

If Tetris is so helpful, might other video arcade games have similar therapeutic value? Fox feels that Tetris is unique in this respect. Other games he has tried have had the opposite effect, "raising my blood pressure and wracking my nerves."

The Larry Fox article is bound to create a re-surging interest in Tetris. Apple II enthusiasts might be interested to know that there are more than a few public domain and shareware versions of Tetris in the GEnie Apple II Roundtable library.

A brief search of the library turned up the following Tetris games available for downloading. Following the list of Tetris games are descriptions of some Tetris variations, such as Columns and VIAD (Vocabulary in Any Direction).

Given that Columns is an easier game than Tetris, with the same general game play, it might work even better as a therapeutic resource for asthma sufferers. In my mind, Columns engages the mind in a most interesting way, while giving players a "fighting chance." Luck operates more in players favor in Columns, making the game more fun than Tetris, in this player's mind.

This Washington Post article about the therapeutic effects of Tetris has got me thinking about the general therapeutic effects that computers can have on the mind. Could not computer use be therapeutic to someone who suffered a stroke, someone getting treatment for depression, someone whose memory isn't what it used to be?

I would be interested in compiling a list of anecdotes about the therapeutic use of computers to share in a future issue of GEnieLamp. Kindly send any anecdotal stories to my address on GEnie: p.shapiro1@genie.geis.com. (The more details, the better.)

Incidentally, anyone interested in looking up the Washington Post article about Tetris and asthma might find a copy on microfiche at their local library. The citation is: Washington Post, 10/27/94, Fast Forward magazine section, page 36. Article title: "Press Command-B to Breathe." Considering its interesting subject matter, the article is rather short: about seven paragraphs.

Number: 12615  Name: TETRIS2.BXY
Address: S.SNYDERMAN                Date: 900705
Approximate number of bytes: 60480
Library: 42
Description: This is the best tetris clone I have ever seen. It should work.
Apple II Computer Info

on any 128K Apple II. You might even mistake it for the real thing. I'm not kidding. Plays just like the real thing, has different music though. And new shapes. And rounds. Joystick recommended. Open-Apple-1 will give you the preview mode. Apple buttons will show other screens. Escape pauses. Archived with Shrinkit 3.0.2 in "disk" mode. You must unpack it to a TOTALLY BLANK 5.25 inch disk, then boot the disk (it doesn't work under ProDOS so you must boot it). Note that this game does not work on some systems, apparently it doesn't like the Laser 128 for example. Enjoy this great game.

Number: 10841 Name: TETROTRIX.BXY
Address: A2.DEAN Date: 900404
Approximate number of bytes: 79380
Library: 21

Description: This is a very interesting variation on the Russian computer game Tetris called 'Tetrotrix'. It's a shareware program from a French author. The sound effects here are crude but the game play is actually better (and more complicated) in some respects. Use the numeric keypad for moving. Uploaded by permission. This program works only on a IIgs. Unpack with ShrinkIt 3.0 or better.

Number: 13801 Name: DROP.IT.BXY
Address: C.MADSEN Date: 901026
Approximate number of bytes: 10080
Library: 33

Description: This is version 1.6 of Drop It, a Lo-Res Tetris clone for the II+ (with 64K), IIe, IIc, or IIgs. It's a very fun, challenging game that people of all ages should be able to enjoy. It doesn't have any sound effects, but it's free. Archived with ShrinkIt 3.0.3.

Number: 20298 Name: DUELTRIS.BXY V1.0S
Address: S.CHIANG4 Date: 930220
Approximate number of bytes: 278528
Library: 21

Description: This is DuelTris a 2 player head-to-head tetris like game. It has incredible graphics and sound. The game is similar to tetris, but it combines extra pieces, gun, fill gun, bomb, anvil. The game also has the DuelLINK, a mechanism which you allows you to pass 2-4 lines to your opponent's puzzle DuelTris is from DreamWorld, and is shareware. For more information, please check the DreamWorld online area, category 18 in the GENie Apple II Roundtable. Steve Chiang, DreamWorld.

Number: 14261 Name: ANTETRIS.BXY
Address: J.RADU Date: 901229
Approximate number of bytes: 76860
Library: 21

Description: This is a game for the IIgs where you shoot the dropping blocks. In the theme of Tetris. Shareware and a request is included. Not real easy but hard drive installable and the kids like it. Archived with GS ShrinkIt 1.0.3.

Number: 15034 Name: QUADOMINO.BXY
Address: E.MERRILL Date: 910309
Approximate number of bytes: 16380
Library: 8

Description: This is an NDA (Apple IIGS New Desk Accessory) game analogous to Tetris. Archived with GS ShrinkIt 1.0.4.

Number: 20449 Name: GAMES.NDA.BXY
Address: S.CHIANG4 Date: 930324
Approximate number of bytes: 35200

Library: 8

Description: Here are three NDA games v1.2 by Nathan Mates. Included are Minesweeper, a game similar to the HP48sx version of mines; Multitris, a version of Tetris with weirdly shaped pieces; and Power Grid, a game like circuits on the Mac. Enjoy. Packed with GS ShrinkIt 1.1.

Number: 17677 Name: DR.MARIO3.BXY
Address: L.BOTEZ Date: 920209
Approximate number of bytes: 44928

Library: 21

Description: This is the latest release of Dr. Mario for the IIgs. Lots of bug fixes. Works great. This is a takeoff on a game called Tetris. This is an excellent, challenging game, no sound but nice graphics and excellent game play. Documentation included. Warning, there's a little foul language in the credits. Good game.

Number: 17192 Name: COLUMNS.IIE.BXY
Address: M.FOEGELLE2 Date: 911205
Approximate number of bytes: 32768

Library: 33

Description: This is a new release of the shareware version of Columns IIe. It uses double hires graphics and will operate on Apple IIe, IIc, and IIgs. It has detection capabilities for the GS, 8-bit Zip Chip, 8-bit Transwarp, IIc+, and Ramworks III RGB option, so no external adjustments are necessary. The new release includes a monochrome gem set and more. I think the game is a lot of fun and I hope you do too. Please distribute freely, try it for 15 days, and if you like it, please send in the registration fee. Otherwise, give the program to a friend or delete it. Now all the 8-bit Apple users can see what the people with GS's have been able to play. Packed with ShrinkIt 3.3.

Number: 17092 Name: COLUMNS.2PL.BXY
Address: M.FOEGELLE2 Date: 911123
Approximate number of bytes: 26624

Library: 33

Description: This is a new hires version of the shareware arcade game Columns II+. It uses standard hires graphics and will operate on all 64k Apple II+, IIe, IIc, IIgs, and compatibles which support ProDOS. It has detection capabilities for the GS, 8-bit Zip Chip, 8-bit Transwarp, IIc+, and Ramworks III RGB option, so no external speed adjustments are necessary. The new release includes a monochrome gem set and more. I think the game is a lot of fun and I hope you do too. Please distribute freely, try it for 15 days, and if you like it, please send in the registration fee. Otherwise, give the program to a friend or delete it. Now even 64k Apple users can see what the people with GS's have been able to play.
Number: 14803  Name: COLUMNS.GS.BXY  V2.0
Address: K.MOCK                Date: 910219
Approximate number of bytes: 332640
Library: 21

Description: Vastly improved Columns GS: Includes seven original stereo
SoundSmith songs, greatly improved graphics, and numerous additional
gameplay additions. Much better than Columns 1.0. The game itself is
similar to Tetris. Different blocks must be matched in groups of three or
more, vertically, horizontally, or diagonally, to make them disappear. If
you liked Columns 1.0 or Tetris, you will love this one. Packed with
ShrinkIt 3.2.

Number: 21658  Name: FCOLUMNS.BXY
Address: KEN.GAGNE                Date: 931117
Approximate number of bytes: 25984
Library: 21

Description: From the FTA (Free Tools Association). This is a Columns game,
in which straight pieces of block with multiple colors fall from the
screen, and they have to be lined up by color horizontally, vertically, or
diagonally to disappear. This is similar to file number 17143, which
contains Fun Columns in GS/OS format; this archive contains the GS/OS,
ProDOS 8, and CDA formats of the same. All appear to be identical in
appearance and operation. Packed with ShrinkIt GS v1.1.

Number: 19460  Name: VIAD.D1.BXY
Address: K.MOCK                Date: 920927
Approximate number of bytes: 445312
Library: 21

Description: VIAD = Vocabulary In Any Direction, a sequel game to Columns
GS. This time letters fall, and you must form words in english. Original
music, graphics, rendered title animation, new game options, and many more
features. REQUIRES a IIgs with System 6.0 and a minimum of 1.25 Megs of
memory. Users with 1.25 megs must shift-boot to run the game. If you are
unpacking to floppies, both disk 1 and disk 2 need to be unpacked to a disk
named /VIAD . That's right, both disk 1 and disk 2 should be unpacked to a
disk with the SAME name. See the README file for more details. Unpack with
Shrinkit. This has been a shareware Sound Barrier Systems production, and
is dedicated to Columns IIgs shareware supporters.

Number: 19461  Name: VIAD.D2.BXY
Address: K.MOCK                Date: 920927
Approximate number of bytes: 385280
Library: 21

Description: VIAD = Vocabulary In Any Direction, a sequel game to Columns
GS. This time letters fall, and you must form words in english. Original
music, graphics, rendered title animation, new game options, and many more

named /VIAD . Thats right, both disk 1 and disk 2 should be unpacked to a
disk with the SAME name. See the README file for more details. This is
The Planetary Apple User's Group has now been active for over a year. Our goals, when we started the group in the summer of 1993, was to create a stronger bond within the Apple II community, and to have a place for folks to go who don't have access to a local user group.

We feel that we're well on the way to reaching these two goals. In the future, our plans include developing a liaison between user groups in the "real world" and PAUG. Last month we invited folks from "real world" user groups to come in and tell us a little about their groups, and it was a success! We want to do more of this, since it's valuable to have user groups keep us informed on what they are doing, and bring new and fresh ideas to PAUG.

We had one report from Florida by Ev Carroll, on a group that has several different chapters scattered around the state. We had two reports from Minnesota. One user from Minneapolis made everyone very envious when he said that they have about 500 members. Other members from around the country, and even one that recently moved from Guam, shared meeting ideas, library set ups, and BBS information.

If you are a member of a users' group, or would like information about one, be sure to post questions and information the the A2 Bulletin Board Category 31.

WHAT'S NEW IN THE APPLE WORLD? Many programs are in the "cooker" as they say. Paul Parkhurst of ANSITerm fame is working feverishly on his Fax software, as are others (Rich Wifall also has put his hands in the Fax pie.)

ContactsGS is finally finished, and can be ordered from Shareware Solutions II. Just email JOE.KOHN for details. Note that subscribers to SSII have a special pricing structure!

MAIN EVENT This month, we centered on the online navigators available to Apple II users here on GENie -- GEM and CoPilot. With these tools, time online is dramatically diminished, allowing you to explore more areas of GENie and not have to worry so much about the clock ticking.

Both navigators will do pretty much the same thing -- that is, they'll gather your mail and messages, upload and download library files, and even fetch your bill (if you're courageous) automatically. The time saving factor lies in the fact that you can reply to email and messages, request uploading and downloading of files and other functions all offline (without the clock ticking).

Below is a short description of both programs.
Apple II Computer Info

GEM (GEnieMaster)  GEM will work on most Apple II systems, and requires at
bare minimum of 1 3.5" drive and 1 5.25" drive; or 2
3.5" drives. It does it's best work on a Hard Drive. You'll need
AppleWorks 3.0 or greater, and either ProTERM 3.0 or greater, Talk is
Cheap, Point to Point or Spectrum (see documents for version numbers).

Setting up GEM is quite easy, and it has a delayed logon feature,
which allows ou to set it for, say 4 a.m. (while you're sleeping).

CoPilot  CoPilot is GS specific, and needs only a communication program
(ProTERM 3.0 or greater, Talk Is Cheap or Spectrum) to work.
It's a desktop program, and is also quite powerful.

THE LIBRARY STACKS  Below is a list of this week's "Hot Files". As you
can see, we had a great Halloween with the graphics
that Pat Kern has so graciously put together for us! There are also a
couple great little games on this list as well.

Remember to visit our library for MANY, MANY more files that are
available!

+23452 NPS.HWEEN.BXY  New Print Shop Halloween graphics; 3.5"
+23451 NPS.HWEEN1.BXY  New Print Shop Halloween graphics; 5.25"
+23450 NPS.HWEEN2.BXY  New Print Shop Halloween graphics; 5.25"
+23449 NPS.HWEEN3.BXY  New Print Shop Halloween graphics; 5.25"
+23448 SSII.INDEX.BXY  Shareware Solutions II Index, volume 1
+23444 SECONDSIGHT.BXY  Info about Second Sight SVGA video board
23435 SHOWME1.1.1.BXY  New version of NDA/FX graphics viewer
23432 SPECTRUM.8.BXY  Spectrum's font; fixes clipboard bug
+23430 MATHFACTSGS.BXY  Flash card type math program
23428 SPACEINV.GS.BXY  GS version of the 1978 arcade hit
+23422 GLAMPA29410.BXY  GEnieLamp A2, October 1994 (AppleWorks)
+23420 A2.SEP.ADB.BXY  ADB update of A2 Library Index - Sept.
+23418 A2.SEP.TXT.BXY  TXT update of A2 Library Index - Sept.
+23407 CC.LESSONS.BXY  Applesoft BASIC lessons
23380 Q2.BXY  Treasures From Heaven, a IIGS game

Note: the ones marked with a + sign will also work on 8 bit systems.

WHAT'S NEW IN A2  The Apple II RoundTable is coming into the "final
countdown" on gathering AOL refugees into the fold. The
last day that Apple II users can access AOL with their IIs was November 1.
Let's give them a hearty and rousing welcome as they come stumbling and
bewildered into our midst. We could always paraphrase the statement on our
Statue of Liberty -- "Give me your tired, your hungry and your poor,
yearning to find a home" <grin>

We have added several new staffmembers -- including Bill Moore,
Charlie Hartley, and Chuck Stites as Real Time Conference hosts, and added
more staff to other areas of the Apple II RT.

We continue to have Real Time Conferences every night of the week, as
well as most of the day Sunday, and now have them on Saturday afternoons as
well. However, popping into the RTC at almost ANY time is guaranteed to
bring a bunch of folks out of the woodwork!

Our next PAUG meeting will be on November 23rd, at 4 p.m. eastern
At Microsoft, as they say, Quality is Job 1.1.

GEnieLamp is also distributed on CrossNet and many public and commercial BBS systems worldwide.

- To reach GEnieLamp on Internet send mail to genielamp@genie.geis.com
- Current issues of all versions of GEnieLamp are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GEnieLamp platform (FREQ FILES for names of back issues of GEnieLamp IBM):

<table>

</tbody>
</table>

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395 (M1395;3).
- GEnieLamp pays for articles submitted and published with online GEnie
credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

- If you would like to meet the GENieLamp staff "live" we meet every Wednesday night in the Digi*Pub Real-Time Conference at 9:00 EDT (M1395;2).

- The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GENie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GENie prompt.

READING GENieLamp GENieLamp has incorporated a unique indexing system
........................................................................................................... to help make reading the magazine easier. To
utilize this system, load GENieLamp into any ASCII word processor or
text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[+]GENie Fun & Games.

To read this article, set your find or search command to [HUM].
If you want to scan all of the articles, search for [EOA]. [EOF] will
take you to the last page, whereas [IDX] will bring you back to the
index.

MESSAGE INFO To make it easy for you to respond to messages
........................................................................................................... re-printed here in GENieLamp, you will find all the
information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|___________________|____|___|___|___|
| Name of sender | CATEgory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page
475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic
1.

A message number that is surrounded by brackets indicates that
this message is a "target" message and is referring to a "chain" of two
or more messages that are following the same topic. For example: {58}.

ABOUT GENie GENie's monthly fee is $8.95 for which gives you up to
........................................................................................................... four hours of non-prime time access to most GENie
services, such as software downloads, bulletin boards, GE Mail, an
Internet mail gateway, and chat lines, are allowed without charge.
GENie's non-prime time connect rate is $3.00. To sign up for GENie
service, call (with modem) 1-800-638-8369 in the USA or 1-800-387-8330
in Canada. Upon connection type HHH. Wait for the U#= prompt. Type:
JOINGENIE and hit RETURN. When you get the prompt asking for the
signup/offer code, type: DSD524 and hit RETURN. The system will then
prompt you for your information. Need more information? Call GENie's
customer service line (voice) at 1-800-638-9636.

SPECIAL OFFER FOR GENieLamp READERS! If you sign onto GENie using the
........................................................................................................... method outlined above you will
receive an *additional* six (6) free hours of standard connect time
(for a total of 10) to be used in the first month. Want more? Your
first month charge of $8.95 will be waived! Now there are no excuses!

In Which We Continue the Cruise Control Metaphor of Last Month, and Shift Smoothly into a Holiday Mood

Not so many months ago, I was hurrying home in my car, knowing that I would disappoint my wife and myself if I were late. We both work long, hard hours, my wife and I, and it's rare that we have time to do something frivolous together, like watch television or go to a movie. We had made a date for that night. Minutes were precious.

Naturally, that night of all nights, the monthly meeting of our annual Apple II user group ran late. I kept edging toward the door, trying to get away. Finally, I simply bolted.

I leapt into the driver's seat and started the engine. Not even taking a moment to check my watch, I nudged the speedometer needle past the posted limit and headed for home. Only when I reached a stop light did I look at my watch. My heart sank. To be on time, I needed five more minutes than I had.

The fables I had read in my childhood joined hands and danced in a circle around my head. Never give up before you try. Have confidence in yourself, and the impossible can be possible. Our fates are in ourselves. When the light turned green, I trod on the accelerator...

...until I reached the speed limit. Then I turned on the cruise control. Those childhood fables make great servants, but poor masters.

I wanted badly to be home on time. But it was no longer possible, and I refused to kill myself trying. The more nervous I get about time pressures, the worse my driving gets, and that's a vicious circle. Clearly it was time to restrain my haste, using the cruise control to enforce that restraint.

Don't I make myself sound mature? Don't I make myself sound wise? Well, the truth is, at the age of 33, this was probably the first time I had enough sense to see the bigger picture in a crisis situation. Arriving home late is bad, but having an accident is worse. (Even if you don't kill someone else, even if you don't kill yourself, even if no one is hospitalized, even if no one even has to go to the emergency department for a quick examination to be sure they're all right... do you have any idea how much hassle is created by the aftermath of putting a dent in your own car's fender?) I got home five minutes late. We had to scrap our plans.
and make new ones on the spot, but my wife and I both survived with our
good moods intact.

It's sad how often we confuse the urgent and the important. If on
Monday morning, one client says he'll pay me $1000 for a project due in two
weeks and on Monday afternoon, another client says he'll pay me $25 for a
project due in one week, I'm liable to start work on the $25 job because
it's more urgent. If my wife has a midterm worth 30% on Friday, and has a
1% assignment given her that's due on Thursday, chances are she'll start
work on the assignment. We keep ourselves so busy that we don't even
realize there is a difference between important deadlines and urgent ones,
much less try to discern it.

The holiday season does a particularly good job of underlining the
difference between the important and the urgent. Several years ago, the
city in which I lived had a power blackout on Christmas day. I had
computer games and plenty of other impressive toys--nothing succeeds like
excess--none of which counted for anything with no electricity. All of a
sudden, the gift that meant most to me was a simple hand-knit sweater from
my girlfriend. Meanwhile, what about Christmas dinner? The turkey had
already been in the oven for an hour when the power died. A phone call
from an aunt just a few blocks away revealed that she had power. Could she
possibly make room in her oven for our turkey as well? Of course she
could, and did. (Don't ask me how.)

A lot of the things we intended to do that Christmas day--urgent but
not important--never got done. We were honorably relieved from many of the
self-imposed, false responsibilities and competition of the holiday season.
We were warm, we had a hot meal, we had friends and relatives willing to
help us out, and we were together. Gifts beyond price.

I still have the sweater that meant so much to me that Christmas.
It's too small for me now, but of course I can't get rid of it.

Because my wife is wearing it.

--Doug Cuff

REPRINTING GENieLamp
If you want to reprint any part of GENieLamp, or
post it to a bulletin board, please see the very end
of this file for instructions and limitations.

ASCII ART BEGINS

GENieLamp A2
DIVERSI-FOUND! New Address for Ordering "DiversiTune", "DiversiCopy", "DivesiCache" and "DiversiKey" and Song Disks:

William W. Basham, M.D.
10400 Connecticut Ave., #407
Kensington, MD
20895-3910

He still has Disks for the IIgs and still marketing them. You can request order forms from him and they are discounted from the original price.

(H.TRUMP, CAT2, TOP21, MSG:26/M645;1)

TWILIGHT II AND APPLEWORKS 4.3 Dan, Bev is correct in that AW 4.3 does call _ClrHeartBeat on a IIgs at startup, thereby disconnecting Twilight II and any other similar software. In fact, the current issue of NAUG’s Forum has a patch to defeat that patch if you're someone who doesn't have problems with Twilight II. The disabling of Ultra if AppleTalk is connected is separate, and has been around with 4.0 or 4.01.

(BRANDT, CAT17, TOP14, MSG:99/M645;1)

"The Heartbeat Interrupt Task queue does NOT belong to the application. Different portions of System Software can, and will, install Heartbeat Tasks. If these tasks are removed, anything from a system crash to media corruption may result. NOTHING but System Software should make this call.

Eric Shepherd (Sheppy)
[Team PPCPro]
PC TRANSPORTER SOURCE CODE FOUND

It seems that I found some AE source code for the PCTransporter, but the file is partly corrupted (how do I fix it, or would someone be willing to fix it). Also, included is other AE source code for their other products. The source code, it seems is to be fairly old, that is it's not source code from the latest software. If anyone is interested let me know so that I can dig it up.... Now don't quote me on this since I'm not a programmer, but to me it looks like source code. Would this be helpful to anyone?

Sam Latella [A2World]
"Apple ][ Forever, IBM Never!!!"

MACINTOSH SOUNDS ON THE IIGS

Well, Steve is right, but that ain't why some of those files won't convert or play. Dave. MacSoundGrabber (MSG) has (IMHO) a _very_ annoying limitation—it can only load & convert Mac sound resources that are 64K in size or smaller. (Notice I did not say sound files—like the rSoundsample format on the IIGS, a file can contain more than one sample.) As long as the _samples_ you wanna convert are 64K or smaller, MSG will do a dandy job of converting them into rSoundsample format on the IIGS. If the sounds you want are bigger than 64K, other things will have to be done. If you're a GS+ subscriber, the program FileDump (in GS+ V5.N1) is a great help in converting sounds that MSG can't do. For more info, refer to my article "Catch the .WAV" in GS+ V4.N6.

FWIW, I have converted several of the AudioClips packages into rSound format for use with the IIGS. Two of these packages (Star Trek: The Logical Collection and Terminator 2: Judgement Day) are sold directly thru Sound Source Interactive and can be ordered from them directly at (800) 877-4778. If you have any of the following packages bought in Mac or Windows format, _and can supply me with proof of purchase_, I can send you the package already converted for use on an Apple IIGS. The packages I have available are:

- 2001: A Space Odyssey
- Star Trek Bonus AudioClips
- Star Trek: The Next Generation "Encounter at Farpoint"
- Star Trek: The Next Generation "The Best of Both Worlds"
- Star Trek: The Next Generation Bonus AudioClips

If interested, please contact me via E-mail.

(under disguise)

(SEQUENTIAL, CAT4, TOP2, MSG:272/M645;1)

ORIGINAL CASTLE WOLFENSTEIN TRULY LOST > Is Castle Wolfenstein acceptable material for the Lost Classics?

If I am remembering the program correctly, I spoke to the author about 18 months ago about making Castle Wolfenstein a Lost Classic. At the time, we could not come to a consensus on where to go with it. He may be willing to decide something now. I will put him on my list of calls to make and see where it leads.

In the meantime, the program is still copyrighted and cannot be legally copied or uploaded (released) here in A2. In case anyone is interested, I do know that the source code is on a hard drive in a landfill somewhere. Has been for some years. :

--Joat--

(A2.TIM, CAT7, TOP13, MSG:35/M645;1)

JOB POSTING? Attention, background MOD-player authors!

Softdisk Publishing is interested in acquiring background MOD-playing capabilities for use in our software. We'll pay good money (and, as the MOD standard seems to evolve quite regularly, it could turn into an ongoing thing for you).

Interested? Let us know!

-Greg Templeman, GS Product Manager/Lead GS Programmer
Softdisk Publishing

(BARNABAS, CAT6, TOP18, MSG:107/M645;1)

IMAGEWRITER II ON AN IBM PC? I have a question for a friend who owns an Imagewriter II Printer. She wants to run it on an IBM PC. She tells me that she has a driver for an Imagewriter II in some sort of IBM word processing program. She teaches and uses IIE's and an IBM. Her goal is to connect the Imagewriter II with a switch box to use with both machines.

Does anyone have any experience with this type of set up? I have hooked up many IBM or Parallel Printers, Including a Quietwriter to a IIE, I have no experience with anyone hooking up an Imagewriter II to an IBM rig.

(C.GERHARDT2, CAT4, TOP9, MSG:364/M645;1)

>>>>>> I have no experience with connecting an Imagewriter II to a PC, but I do have a book in front of me now that explains how to do it. On page 212 of _Macintosh Printer Secrets_ (1990) by Larry Pina, it claims
that despite some people saying this connection can't be made, "it _can_ be
done, very easily." On the next 4 pages, Pina describes how to build the
cable, how to set the Imagewriter II dip switches, and how to put in the
needed MS-DOS MODE command (no, the driver does not take care of that,
according to Pina). To tell you the truth, it doesn't sound easy to me, but
Pina's explanation should be understandable to anyone who is conversant
with terms like CONFIG.SYS, XT, and AT.

Pina's explanation is too long to reproduce here. If your friend
can't find the book in your public library (I think it is out of print),
email me your or her address and I'll send a copy of the relevant pages.

By the way, I bought Pina's book a few months ago on remainder because
it has lots of good Apple-II-relevant information on the printer I use, the
Imagewriter II.

Steve Eisenberg
Wynnewood, PA
(S.EISENBERG, CAT4, TOP9, MSG:365/M645;1)

>>>>> Here is a little something I picked up from Compuserve regarding

""""
the use of an Imagewriter printer on an PC compatible:

""""

"Yes...ladies and gentleman at long last the pinouts for a "WORKING"
cable that will connect an IBM machine to an Apple Imagewriter 2 printer.
Amaaazing!!!!

I have made and tested several of these cables all with no problems.
In no time you'll be printing from Wordperfect, Lotus, PrintShop and other
DOS programs.

I don't run windows so I have no clue if it will work from any
windows based programs.

For more interesting Apple// Goodies call:

The WAC BBS

-----------------------------------------------
Pin 1 ------------------------------- Ground shield
Pin 2 ------------------------------- Pin 5
Pin 3 ------------------------------- Pin 3
Pin 5 ----- \                        Pin 5
Pin 6 ----- ------------------------ Pin 1
Pin 8 ----- |                        \----- Pin 4
Pin 7 -------------------------------------\----- Pin 8
Pin 20 ------------------------------------- Pin 2

The only thing you need to do now is attach your cable to the COM1
port of your MS-DOS machine and add these lines to your autoexec.bat program.

mode lpt1:=com1
mode com1:96,n,8,1

If your using COM2:

mode lpt1:=com2
mode com2:96,n,8,1 "

--/--

Hope this helps... (I hope it formats OK, too. I 'Appletalked' this directly off my Mac HD to CoPilot)

Tim K

(KELLERS, CAT4, TOP9, MSG:366/M645;1)

>>> HOT TOPICS <<<

APPLEWORKS 5 SHIP DATE SLIPS AGAIN It now appears that the printers will have the AppleWorks 5 manuals ready to go by the end of next week. I expect Quality will ship November 21. (The software is ready to go as soon as the manuals are ready.)

(BRANDT, CAT17, TOP18, MSG:209/M645;1)

BIG RED COMPUTER CLUB AFTERMATH? As everyone knows by now, Big Red Computer Club will be closing their doors by the end of the year.

The owner of Big Red, John Wrenholt, has been actively supporting the Apple II computer for more than a dozen years, and he does not want BRCC members to feel abandoned or to feel that BRCC's closure will leave Apple II owners without any avenues for support.

For that reason, BRCC has included a 12 page sampler issue of Shareware Solutions II inside their November, 1994 mailing. That mailing has been sent out via bulk mail, so it may take anywhere from 1 to 3 weeks to reach its destination.

The Shareware Solutions II sampler is an abridged version of the Volume 2, Issue 1 edition.

If you are a BRCC member who is seeing Shareware Solutions II for the very first time, feel free to post questions here about Shareware Solutions II, or feel free to direct questions to the publisher in e-mail directed towards JOE.KOHN

Joe Kohn
Publisher, Shareware Solutions II

(JOE.KOHN, CAT28, TOP4, MSG:233/M645;1)

>>> BUT, where will the residual inventory ultimately reside? Joe, """"since you seem to know more than the average about BRCC, can you provide any guesstimates about this?
BRCC's inventory falls into a couple of different categories

Some of the software currently being sold by BRCC is licensed from other companies, such as The Nibble Software Collection. With software like that, the copyright holder _may_ continue to offer it for sale.

Other products are owned outright by BRCC, such as Print Shop Lover's Utility Set. I've tried to make overtures to BRCC concerning the outright purchase of the rights for PLUS and Labels, Labels, Labels, but to no avail.

Other products are merely distributed by BRCC, such as software from Triad Ventures and Seven Hills. If someone else wanted to distribute those, they'd need to contact the owners and make an offer.

In talking to John Wrenholt just the other day, he doesn't anticipate having a whole lot of inventory left. After all, his "going out of business sale" is just too good to pass up - BRCC is selling games like Pac Man for $3.50. I think that BRCC expects to sell off just about all their inventory with pricing like that. And, if they don't, I can't imagine that any other software distributor would really be interested in "picking them up."

To sum it up, if there's something you'd like to purchase from BRCC, you really ought to do it now. The software may not be available from anyone else after 1/1/95.

Concerning BRCC's library of freeware and shareware..

Since I was employed as BRCC's public domain/freeware/shareware librarian from 1989-1992 and literally added hundreds of disks to the BRCC library during that time, I do plan to make some (many?) of those disks available via the SSII Library.

Out of respect for BRCC and for John Wrenholt, I will wait until after BRCC closes their doors before making those disk collections available via the SSII Library.

Joe

I do that every day. There's a one-byte patch that will allow UM to be active while AppleTalk is active. With AW4.3 I have had no crashes regardless of how it is launched. With earlier versions I had to launch AW from ProSel-16 to keep from crashing.

I have an article in the current NAUG AppleWorks Forum that describes the patch and how to apply it. If you don't have that, let me know and I'll e-mail it.

(D.CRUICHER, CAT17, TOP14, MSG:126/M645;1)
I don't know why Dan Crutcher can use macros with AppleTalk, but I've never seen it succeed.

I don't know either, since I don't do anything special (other than apply the patch that Randy provided that allows UM to be active at the same time as AppleTalk). I boot into ProSel-8, then, if I want to use GS/OS, I launch GS/OS which is set to run ProSel-16. From there I can go straight to AW4.3, with AppleTalk active, and use macros to my heart's content.

Just a few minutes ago, I went through that process, and even launched Finder first and opened a Macintosh volume (via AppleTalk) in the Finder and then launched AW4.3. I ran about five complex macros (CheckWorks, a phone dialer, etc.) with no problems.

I do the same at work. Each of my machines is a ROM 01 GS.

I can't believe I'm the only one who can do this. If my being able to do it is unusual, I would suspect that my route through ProSel may have something to do with it.

For anyone who has a block editor, here's the patch to allow UltraMacros to be active at the same time as AppleTalk:

PATCH APLWORKS.SYSTEM TO ALLOW MACROS WITH APPLETALK ACTIVE:

The current APLWORKS.SYSTEM disallows macros with AT active. Patch it with a disk editor by changing offset +142B from EE to 2C. If +142B is_not_ EE in your version, search for EE 96 0A in that approximate area.

Try it. If it doesn't work, you can always reverse it by changing the byte back to EE.

(D.CRUTCHER, CAT17, TOP14, MSG:137/M645;1)

I would suspect that my route through ProSel has something to do with it.

Bingo.

(BRANDT, CAT17, TOP14, MSG:141/M645;1)

WHAT'S NEW

Vitesse, Inc. announces "FAXination," FAX/Modem software for the Apple IIgs.

- Allows printing to an external fax modem from any standard GS/OS-based application!
- FAXes graphics and text with ease!
- Support for Pointless Truetype fonts!
- Use the Deferred Send feature to send one or more documents to the same fax station with a single call!
- Use the Deferred Send feature to create a fax document when RAM is low, and then send it later when more RAM is available!
- Phone Book feature addresses faxes and fills in cover sheets automatically!
- Answers and receives FAX calls automatically, or only by manual command!
- Maintains a log of FAXes sent or received!
- Use Send or Receive Logs to view cover information, the actual document,
print the document, or change the address and forward it to another person!

-> Automatically supports Class-1, Class-2, and Class-2.0 FAX/Modems!
-> No knowledge of modems needed! Automatically senses which port and which modem is attached! Simply plug in the modem, install the software, and reboot!
-> Optional Call Progress window allows you to see what is happening while sending or receiving a FAX!
-> FAXination is a CDEV with an NDA interface, providing quick access to FAXination controls.
-> PrintPicker NDA allows switching between the FAXination printer and your printer with ease (GS/OS System 6.0, or higher only)!
-> Special desktop application allows even users with less than 2MB RAM to send Deferred FAXes!

FAXination requires GS/OS v5.0.4, or higher, 1-1/2MB RAM, and a hard disk drive. System 6.0, or later, and 2MB RAM is highly recommended! FAXination -ONLY- supports external FAX/Modems. FAXination is scheduled to ship the first week of December 1994. Vitesse is taking advanced orders NOW!

FAXination ................. $49.95
FAXination with 14,400 external FAX/Modem. $149.95
Tracer Sanction and Mind Shadow (combo) ... $29.95
Ultima I .................... $29.95
Quickie 3.2 Hand Scanner .............. $89.95
Quickie 3.2 Hand Scanner/Inwords OCR ... $99.95
Quickie-C (Adaptor) ....... $99.95
Quickie/Quickie-C (combo) ......... $189.95
Quickie 3.2 (update from 3.1) ....... $24.95

Prices listed are effective prior to December 15, 1994.

$$$ Order direct from Vitesse, Inc. and save! $$$

To order, contact Vitesse, Inc. sales at 1-800-777-7344.

Vitesse, Inc.
P.O. Box 929
La Puente, CA 91747-0929

This is a limited time offer. Prices are subject to change without notice.

(VITESSE, CAT40, TOP2, MSG:1/M645;1)

<<<<<< The FAX/Modem in the FAXination w/ FAX/Modem Combo is manufactured by Aspen and uses the Rockwell chipset to provide v.42 bis and Class 2 modem support.

Lowell Erbe
Vitesse, Inc., Technical Support
(VITESSE, CAT40, TOP2, MSG:23/M645;1)

>>>>>> The v.14, v.17 and v.29 specifications are communications protocols used to encode data for transmission on the telephone line. Since these numbers indicate hardware features, the modem handles all that. In short, all fax modems will work with Faxination, unless somebody can find a _real_ oddball out there that just won't respond to the standard Class 1 or...
2 modem commands.

Faxination will handle Group III encoding (a software function) and will work with all of the modem brands mentioned so far in this topic. Please note that the "print to fax" feature will only work in GS/OS desktop applications which do their printing through the Print Manager. It will NOT work with AW4, the Orca shell and other 8-bit or text-based applications.

Da Programmer

(S.MCQUEEN1, CAT40, TOP2, MSG:34/M645;1)

>>>>>>> Yes, Faxination will transmit graphics files from any desktop """" graphics or page layout application, such as Quickie or AWGS. ANYTHING which can be printed using the Print Manager can be faxed via Faxination. Since facsimile only provides black and white support, the pictures transmitted will be rendered as half-tone dithered grey-scale images.

The effect will be similar to printing a picture on a black-and-white printer.

Da Programmer

(S.MCQUEEN1, CAT40, TOP2, MSG:43/M645;1)

<<<<<< The best estimation that I have right now is that FAxination will """" begin shipping on December 5, 1994. It might end up a couple (and I really mean only 2 or 3 days) later than that.

Lowell Erbe
Vitesse, Inc., Technical Support

(VITESSE, CAT40, TOP2, MSG:75/M645;1)

SALE--HALF OFF SEVEN HILLS SOFTWARE We're having a "Super Holiday """"Special" through 12/22/94 where you can get our products at 50% off:

<table>
<thead>
<tr>
<th>PRODUCT</th>
<th>REGULAR</th>

>>> THROUGH THE GRAPEVINE <<<
---------------------------------------------

WOLFENSTEIN 3-D FOR IIGS? On the FutureNet there is a rumor that Wolf3D is about to be released for the IIgs, the rumor say that it's Vitesse that will distribute it? what else do we know.....:)  
Jonte

(JONTE.R, CAT6, TOP3, MSG:52/M645;1)

>>>> Well, the Wolfenstein 3D that is in the Mac library looks like it was done for Interplay by BurgerBill. In fact, one of the "cheat" code words included in the game happens to be "APPLEIIGS" (this is a command that you type while the game is running, to activate a cheat).

Have to say, however, that having seen Wolf 3D on a PC, and Wolf on the Mac, that the original version on the PC is better. The sound effects on the Mac are not bad, however, but the graphics are just not as good.

Steve Weyhrich <IX0YE>---<
(S.WEYHRICH, CAT6, TOP3, MSG:59/M645;1)

>>>> For what it's worth, I received a flyer from Vitesse today advertising a number of things, one of which is Wolfenstein 3-D. complete with 90 levels. They had it priced at $39.95, and recommended an accelerator. So I guess Wolfenstein 3-D has indeed made it to the IIGS. Cool. :) 
(KMCCANN, CAT6, TOP3, MSG:70/M645;1)

>>>> Yes. $39.95 through December 31, then $49.95

(K.LUCKE, CAT40, TOP7, MSG:232/M645;1)

ANIMASIA 3-D ANIMATION > I haven't gotten my issue of GS+ yet, but I assume that this means that you're ready to release Animasia3D. Great! (If I'm assuming right) :) 

You're assuming right, but not right now :) December 10th is THE date.

Michael

(ANIMASIA, CAT33, TOP2, MSG:349/M645;1)

SOUNDMEISTER STATUS I never in _any_ dream, not just my wildest ones, ever imagined it would take this long to get this card 'done'.

Yes, the connector problem has been solved, cables are being built and cards are shipping, some people who ordered very recently got cards because they ordered other things as well, and we don't like to ship partial orders unless we really need to. For the most part, back orders are being filled on a date taken basis, those that had checks/money orders
(payment attached) have been processed first due to time limits on some checks/money orders and then those that have payment info on the order sheet already, (credit card info or school PO present).

Overall, I'm very pleased with the outcome, I strongly recommend using a good pair of non-amplified bookshelf speakers or other type cabinet speakers and letting the onboard amp do the work. The output is much nicer. If your going to hook the card into an audio system, it has a true line level out signal.

Due to noise present in some GS systems, particularly ROM 01 boards, it gets amplified by the speakers if you use powered speakers.

The SoundMeister comes with Digital Session 1.0, which is a 'release' version of the last version that Econ shipped with the card, no new features have been added, all known (reported) bugs have been fixed, with one exception: Neither Econ or I was able to recreate a bug reported by a user when editing large files on the disk instead of using available RAM only. We believe it was related to that users particular system setup with reference to installed inits, etc.

The price of the card is $69.00 and $84.95 with a small set of speakers. Allthough the speakers we supply are the powered type, I recommend connecting them to the amplified output and using them that way. They have been tested that way, and work 100%. In addition, there are volume controls located on the speakers and they are functional in this configuration.

An additional note: SonicTracker v.63 has a built in volume control from the player. It supports the SoundMeister card. You can digitize with software other than Digital Session, such as AudioZap or the SuperSonic digitizer application program as well. SoundShop (shipped w/HyperStudio) should work as well, although I have not tried it. The SoundMeister will work in conjunction with the HyperStudio slotless digitizer card.

Tony

(T.DIAZ, CAT46, TOP7, MSG:135/M645;1)

TIMEWORKS SOFTWARE LOST I had to call NEBS today and while I had him on the phone I asked about the Apple II software they used to sell. Idea being to see if they would release it as copyrighted freeware. Pretty good simple accounting software that supports their forms. Seems that that division of the company was sold and took the software with them. No idea where they are now. So, it may not have been exactly a classic, but it is for sure lost.

No Joy....

VACC Dave

(VACC.DAVE, CAT7, TOP6, MSG:173/M645;1)

YOUR MONEY MATTERS UPDATE LIST I decided if I was going to wait to get all the changes I wanted into the beta test version before releasing it, it might never get done. So I have put together an almost complete beta version for testing. If you are a registered user send me email with your address and I will send you out a copy. The following is a list of things included and in progress with this version.

Steve
YMM Beta Change List

Known Bugs

Fields on the Continuous Checks without Voucher need to be moved.

There are no 'Window Options' at this point (and may not be).

Selecting Records Thermometer for Transaction Report and possible other windows/reports is not showing up? Makes it appear that the program is locked up.

Account window form layouts and maybe other form (verses normal list format) have shifted down and shading is overlaying some of the lines.

Change font and cancel change font selects a bogus tiny/tiny font.

Other Planned changes for this release

Change the accumulation in the liability type base account will show up as a decrease and via-versa. The down side of this change is if you are reporting by base account, subtotals for liability type base accounts will show a subtotal for charges as decreases and for credits as increases (which is what they do to your networth but not to the base account). Plus it is not what Credit and Charge say they do in the Transaction Type window.

Add ability to set beginning and ending month for Account Report.

Add Annual Total to the Account Monthly report (it currently prints only Jan to Dec).

Change Report Margins.

Add logic to support Epson printers better with text output.

Changes

Allow you to double click on a datafile name and have it automatically start up YMM.

Recognize and act on repeat mouse hold down actions.

Allow you to change the font for reports and windows

Changed the Acct List to include Beginning Balance

Fix Bug with New File and Start with No Accounts

Fix Bug with OA-Valid and extended file

Fix Bug with non-Calander Fiscal Year

Made sure that ValidFileTotals corrects problems with non-January Fiscal starting month.

Automatically update data file to next version and automatically invoke the Validate logic the first time the file is opened and updated to this version.

Changed the keys for doing YMM Valid from Option-OpenApple-C to
Apple II Computer Info

OpenApple-Shift-Control-C. Same goes for 'O' (toggle output), 'G' toggle super hires graphics, 'T' toggle trace, and ' ' (toggle pause).

Ask whether a transaction is to be added at the end of a split or to start a new transaction.

Changed the account monthly window so you can change the Cleared Balance but not the Actual Balance

No longer Able to Select All if Split Unbalanced

Add Menu Dialog to Allow input of Dollar Sign or other monetary symbol.

Also, change the size of report headers to be based upon the size of the large fontid size.

Changed program to allow you to toggle split transactions on and off in the reports, just like the transaction window.

Note: If you want to print a list of transaction by distribution account and you want split transactions to be included you can sort and subtotal on distribution account and then select distribution account not equal Split. This will cause all of the split transaction to sort and be displayed along with the other non split transactions by distribution account.

Fixed automatic input of remaining split amount. Before if you blanked out an existing amount it often times didn't split the amount correctly.

Fixed quit insert with unbalanced split amount. Before, it was possible for the program to miscalculate the split amount and if so you could quit inserting a split transaction with an unbalanced split amount.

Now, I allow them to paste calculator results when entering a split transaction.

Changed ValidFileTotals so that it is executed when a new version of the YMM datafile is created and the changes are automatically saved.

Changed ValidFileTotals so that it displays messages as it is checking the file.

Fixed problem with quitting insert with just one record causing the record to not get deleted.

Fixed problem with a deleted account (number 3) getting used even after it was deleted as the default base account.

Fixed Invest text report, seems to be printing the account name twice?

Fixed bug which could cause two different memo and/or payee fields to overlay each other. Was due to SaveAs compressing out and deleteing a memo/payee that was still in use.

Save As will lose investment information unless that file has been accessed by opening an investment window. Fixed SaveAs losing Investment.
Fixed so that you can change account type for the third account.

Changed the logic for checking the number of split transactions to hopefully stop the occasional but not reproducible loop when adding the first transaction.

(S.PETERSON2, CAT8, TOP11, MSG:230/M645;1)

SOUNDMEISTER _PRO_  At this point, it's still up in the air, but there are two parts to it that alarm me: 1) The cost of the blank PCB itself, to get it down to a livable level, I would have to make 250 + boards. The additional parts, it uses all the parts that the original card uses plus 8 additional IC's, which alone cost $30 more. We would have to buy in lots of 300 to get that additional price down to $20 or so.

I have not to date, built a SMP board. I have the remains of the last working prototype. In this form, it requires a standard SM board to be present and connected to it. (Which in itself, is NOT a bad idea, IMHO) but not everything functions the way it should that way, and it would still require almost 2/3rds of what the original one does, so there is no sense in building them as an addon. I have the 'finished' board schematic/flow chart/theory of operation. So, at this point, technically this is an unfinished product, it exists in 'test proving/theory' form hardware only and paper only. As a company, we can not invest any more time into it, however, on my own time, it's something I'm going to try to get finished. The schematic needs to verified and entered into a capture program so that a netlist can be made and a PCB layed out. That is no simple task, infact, it takes many many many hours, and other such time spent staring at a monitor. I really shouldn't even be saying too much, but...

It is my goal to get one built, to determine feasability, at best and see how well it really can work. I have NO software for it other than what DigitalSession supports, (no direct to disk digitizing) so I can not promise anything in that dept. What I can say for the most part of it now is, _IF_ any type of SMP board ever sees the light of 'market', it will be a limited production, more than likely, in a kit form where you would be on your own as to getting some of the IC's. One reason for this is 'freedom of choice' (Sorry, 7-11), as I see the current design, it appears to be very flexible in what size buffered FiFo you can use, as well as the A/D converter chips. It requires two of each, one for left/right channels.

I must also state at this time, the SMP was not part of the deal with the standard SM board. My dealings with the SMP have nothing what so ever to do with AEC and I can not spend company time dealing with it as such. Like I said, I have every bit of an intention of somehow trying to make something happen, and only then, when something is 100% ready to go, can I deal with it as AEC. As it currently stands, I have been spending some time going over the materials I have, I am very excited about what I have seen, yes, it's too bad ECON didn't bring it to market, but I too, have realized, it's still too far from being done to even think about it. There is atleast a month of fulltime days worth of work to be done. Something I don't have, and can't even begin to see time being available during the day to do, with all that goes on during a normal day (abnormal for most others) here. We are still working on some other Apple II products, and I'm still building SoundMeister cards every day, as I have been for the past month.
Apple II Computer Info

...and I've also got this BBS program to work on at home. :) Not
that I am complaining... the Apple II is fun! ...and I want a SMP board to
add to my collection of other stuff that 'doesn't exist' in my collection
that could be called _the_ Smithsonian of Apple II, and ///!

BTW: Anyone want to give a shot at an AAtari 2600 emulator for the
GS?? Just think of all the classic gaming fun that could be had!!!
(T.DIAZ, CAT46, TOP7, MSG:148/M645;1)

TOOLBOX REFERENCES TO BE REPRINTED? I'll check with Apple. I'm trying to
get permission to reprint TBR at the
moment, too.

Mike Westerfield

>>> MESSAGE SPOTLIGHT <<<

Category 2, Topic 5
Message 379 Fri Nov 25, 1994
M.HACKETT [Michael] at 04:23 EST

Mark and Ron echo my feelings pretty closely. I am not pleased with
Apple's practices or their support (up here in Canada, anyway) these days
and I had decided that I would not buy any more Apple products new; only
used, if at all. So when I started to feel the desire for a portable
machine, I got stuck in a bit of an ethical delimma. I would not buy an
Intel-based system, and there is no portable Apple II solution. I started
looking for used PowerBooks, but eventually ended up getting a new PB Duo
from a shop in Toronto, because it was a closeout and the price was better
than any of the used prices I had seen.

My philosophy now is that I hope to get into programming on the Mac
and work with a friend of mine who likes PCs, and hopefully broaden my
market for my future software products, thereby allowing me to continue to
develop for the machine I prefer, even though it is not the most profitable
thing to do. In effect, I'll be _using_ the Mac and Windows users to
finance my Apple II projects! :-)

[*][*][*]

While on GEnie, do you spend most of your time downloading files?
If so, you may be missing out some excellent information in the Bulletin
Board area. The messages listed above only scratch the surface of
what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnieLamp staff strongly
urge you to give the bulletin board area a try. There are literally
thousands of messages posted from people like you from all over the
world.

OUR FAVORITE TEN LIGHT BULB JOKES

Q: How many folk singers does it take to change a light bulb?
   A: Two. One to change the bulb, and one to write a song about how good the old bulb was.

Q: How many surrealists does it take to change a light bulb?
   A: Two. One to hold the giraffe, and the other to fill the bathtub with brightly colored power tools.

Q: How many lawyers does it take to change a light bulb?
   A: How many can you afford?

Q: How many Christians does it take to change a light bulb?
   A: Three, but they're really one.

Q: How many "Jewish mothers" does it take to change a light bulb?
   A: None. ("That's all right...I'll just sit here in the dark..."")

Q: How many brewers does it take to change a light bulb?
   A: One-third less than for a regular bulb.

Q: How many accountants does it take to change a light bulb?
   A: What kind of answer did you have in mind?

Q: How many mystery writers does it take to change a light bulb?
   A: Two. One to screw it in almost all the way, and the other to give it a surprising twist at the end.

Q: How many Zen masters does it take to change a light bulb?
   A: A tree in a golden forest.

Q: How many junkies does it take to change a light bulb?
   A: Who says it's dark?

[EOA]

Thinking About Online Communications

by Phil Shapiro

SOME THOUGHTS ABOUT ONLINE MENTORING

Last month a high school student casually asked me a question dealing with genetics. I'm no genetics expert, but I can pass myself off well to someone who is just beginning to learn genetics. (If you mumble things about DNA, RNA, and recessive genes you can pretty much answer any introductory question in genetics.)

Having answered this person's question, I mentally patted myself on the back. As I was leaving the room I yelled back to the student, "If you have any other genetics questions, send them on to me via E-mail. If I
can't answer them myself, I'll forward them to my colleague Watson."

While this last remark was made flippantly, on the spur of the moment, later I came to reflect upon what I said. It is indeed possible to send E-mail to James Watson, one of the co-discoverers of DNA. Watson is the current director of the Human Genome Project, working at the National Institutes of Heath. (You can probably reach him at jwatson@nih.gov, or somesuch, if your kid needs a little help before his next biology quiz.)

Imagine if Watson, in a moment of gleeful exuberance, decided to invite high school students with interesting genetics questions to send him e-mail.

Watson, himself, wouldn't have to answer all the questions. He'd get some first-year lab assistant to churn out pleasant sounding answers to the majority of incoming questions. But that same lab assistant could flag down the most interesting sounding questions, which could then be forwarded directly to Watson's mailbox.

The result? A humble high school biology student could have the possibility of having his or her genetics question answered by the co-discoverer of DNA.

Here's another scenario. How about if there were some junior high school student who had a passionate interest in astrophysics? In this day of electronic communication the possibility remains open that a junior high school student could test his or her ideas against the best of them. If his or her question were indeed probing, an E-mail response might arrive from Sir Stephen Hawking.

Just as exhilarating as it is for youngsters to be able to easily ask questions of professionals in a particular field, so to is the satisfaction that results when professionals are able to provide answers to young inquiring minds. The E-mail dialogue doesn't have to occur with a famous scientist for the exchange to be meaningful.

Truth is, many professionals would welcome the opportunity to converse online with youngsters interested in their field. If you're an adult working long hours at your desk, it can be a welcome relief to spend a minute or two answering the question posed by an 8th grader in Woodbridge, Virginia—or the query from a high school student in Parker, Colorado.

Every working adult in this country has the newfound capability of being an online mentor. As a volunteer activity, the mentor can devote as much or as little time as he or she pleases. Given the emotional rewards of being able to interact with a growing mind, chances are that mentors would allocate just a bit more time than they really should to online mentoring activities.

The above examples all cited mentoring possibilities in the sciences, but the possibilities for online mentoring in the arts are equally tantalizing. Imagine the thrill of an aspiring violist in receiving e-mail from one of the world's virtuoso violin players. Or an aspiring fine artist receiving feedback on his or her art from someone known internationally for their creative work. Or an aspiring writer receiving writing pointers from someone who spent a few months on the New York Times bestseller's list.
When two minds communicate, the result can be magic. After all, the most fertile field for any mind to grow in is a field of other minds.

--Phil Shapiro

[*][*][*]

The author takes a keen interest in the social and psychological dimensions of online communications. He can be reached on the information superhighway at: p.shapiro1@genie.geis.com; and pshapiro@aol.com.

The Internet Business Guide: Riding the Information Superhighway to Profit

by Rosalind Resnick and Dave Taylor

review by Phil Shapiro
[P.SHAPIRO1]

Publication Info

SAMS Publishing
201 W. 103rd. St.
Indianapolis, IN 46290
1-800-428-5331

418 pages, softcover
Price: $25

The Authors
This book is a winner. It sets out to accomplish ambitious goals and hits its target in chapter after chapter.

Co-authored by two veteran technology reporters, The Internet Business Guide reads like a Michelin travel guidebook. It takes you by the hand to enchanted lands and shows you that the local customs are not that bewildering after all.

Who are the authors of the book? Rosalind Resnick is a former Miami Herald business reporter, who has written for The New York Times, Forbes, Nation's Business, and Internet World. She currently writes a syndicated newspaper column, CyberBiz, addressing the very subject of this book: doing business in cyberspace.

Providing a counterpoint to Resnick's "business suit" point of view is counter-culture journalist Dave Taylor, who enjoys cooking gourmet vegetarian food and has a child named "Karma." Taylor himself is no slouch when it comes to writing, having published 500 articles and two other computer books in the past few years.

The Contents of the Book
What does this book exactly cover? Here is a listing of the chapter titles:
Restrained Hype

When covering a subject such as business possibilities on the Internet, there is a temptation for books to hype the possibilities of everything and anything. While you'll find the occasional hyped comment in this book, for the most part the authors exercise commendable restraint. (And Resnick and Taylor keep exclamation marks to a merciful minimum. Perhaps they had advance notice of the Congressional bill proposing to place heavy taxes on the use of exclamation marks in books about the Internet.)

After all, people do not read a business guide to the Internet to help them make up their minds about whether business possibilities exist on the Internet. They read such books to unearth practical information about how such business possibilities can be developed and implemented.

The Blessings of Electronic Mail

You hear so much hype about the multimedia possibilities for the Internet that you might well forget how gosh-darn useful regular old E-mail can be. E-mail is sure to remain one of the most useful of all business tools. The authors of this guidebook reiterate this point when they say: "Much of the traffic on the Internet is electronic mail. Indeed, it's been estimated that well over 4000 messages are sent each second of the day on the Internet. Being able to send messages in seconds to a user anywhere in the world is probably the single most important reason so many companies find the Internet so appealing." (p. xxv)

And bucking the trend to wax poetic about the capabilities of Mosaic, Resnick and Taylor tell it like it is: "Graphical browsers such as Mosaic can be difficult to install, and as Rosalind knows from her experience in accessing Mosaic through a 486 PC and a 14,400 bps modem, the program can be as slow as molasses when retrieving large amounts of graphics." (p. 115)

Bravo. Score one for candor and honesty. Mosaic has great potential down the line, to be sure. But 1994 will not be the year it becomes widely used.

E-mail Technical Support

Computer manufacturers and software publishers
have frequently been the first businesses to put the Internet to use. In the chapter titled "Customer Support," the authors cite the example of Sun Microsystems' overwhelmingly successful online support project: "In August, 1993, Sun Microsystems, a Mountain View, California, workstation manufacturer, launched a program called SunSolve to answer its customers' technical questions through Internet e-mail.... In the year since SunSolve was introduced, use of the toll-free telephone support line has dropped by 90 percent, and the company has cut support costs by $1,000,000 a year." (p. 234)

Don't you love it? The Internet has helped Sun slice toll-free phone costs by 90 percent. That's a sizable savings by any measure. And the saved money can go directly into providing improved online technical support (or to otherwise provide better value/dollar to customers).

There's a small company in Cupertino that would do well to take note of such facts. Apple Computer apparently receives an average of 11,000 phone toll-free phone calls per day to their 1-800-SOS-APPLE phone line. Apple refuses to disclose how many persons it employs to answer these phone calls, but you can make an educated estimate that at least 100 persons are employed at Apple's Austin, Texas facility.

(Here are my rough calculations: 11,000 calls times 5 minutes per call is 55,000 minutes. 55,000 minutes is the same as 916 hours. Divide 916 hours by an 8 hour work day and you get 115 technical support workers.)

If Apple were to set up a free Internet e-mail tech support service, they might be able to slice their toll-free bills in a major way as well. Apple is hoping that their new online service, eWorld, will serve this function. But with fewer than 30,000 subscribers, eWorld might be more accurately described as eGhosttown (or eEerie).

Marketing Do's and Don'ts

When you breach the rules of business etiquette in the real world, you risk temporarily losing a few customers. On the other hand, when you breach the rules of business etiquette on the Internet, you risk alienating 20 million persons. In the chapter titled "Marketing Do's and Don'ts," Resnick and Taylor explain how to not put your foot in your mouth at 14,400 bps: "On the Internet, the traditional rules of sales and marketing are turned upside down. Not only does junk mail fall on deaf ears on the global network, but it often drives away customers it was meant to attract. Slick ad copy with little or no informational content just doesn't fly..." Actually, in this day and age slick ad copy can alienate in hardcopy form as well as in electronic form. The rules of business etiquette are changing for the better -- both online and offline.

FAQs: The Answers to Most of Your Questions

The concept of the frequently asked question had its birth in the technical fields of the computer world. But the concept has grabbed hold in areas far astray from hardware and software. The whole idea behind FAQs is to anticipate commonly asked questions so as to provide quick and useful responses. The nifty thing about FAQs is that they save work for everyone, allowing a company's technical support staff to concentrate their time on answering the most difficult, uncommon questions.

The authors of this book suggest that one of the best ways of making use of FAQ's in a business setting is to set up a "mail reflector" that
automatically sends out your company's FAQ text file to anyone who
requests it via e-mail. The person inquiring about your company's
products or services can obtain detailed information about your company's
products or services for the slight effort of sending an empty e-mail
message. (How much effort is required to send an empty Internet e-mail
message? About five seconds of your time. If you're a slower typist,
maybe ten.)

From the consumer's point of view, mail reflectors are like instant
karma.

The book then goes on to describe the benefits for companies
specifically in the computer hardware or software business to set up a
company FTP site. Doing so provides an easy way to distribute upgrades for
application and system software. Larger companies also benefit from the
USENET newsgroups that are set up for people to share ideas about the
company's products.

Tread Softly and Carry a Fast Modem  A recurring theme in this guidebook
is that businesses who seek to create a presence on the Internet would be well advised to tread softly: "The
Internet is no different from any other community, and those companies that
'go native' by brushing up on the network's culture and mores will gain a
competitive advantage in the electronic marketplace. Taking time to learn
about the Internet now can pay big dividends in the future. If the current
growth rate is sustained, more than 50,000,000 people will be accessible
through the Internet by the turn of the century."

It's refreshing to see this enlightened point of view expressed so
well. Sensible businesses on the Internet would do well to heed this
advice.

Conclusion  All in all, The Internet Business Guide delivers commendably
on its promise. Businesses interested in galloping onto the
Internet might do well to lay down their reins briefly to read this book.
A comprehensive guide of this sort ought to appeal to the general reading
population, as well.

--Phil Shapiro

[REZTEK]

>>> THE TURBOREZ PROJECT STILL ALIVE! <<<

---------------------------------------------------------------
It would be an understatement to say it's been awhile since there's been news from us about the status of the "fabled" TurboRez product. As some of you may know, since the previewing of a prototype at the last two Apple Expos, we elected to do an entirely new design based on the use of custom gate array technology. Even though underestimating project completion time seems to be a tradition with computer hardware/software development, let's just say that even we've been amazed at the degree of difficulty involved here. This project has had an appetite for resources (like TIME) that has to be experienced to be appreciated.

The current status is that, after more than a year of design and simulation of the virtual chips, we've got actual hardware up and running. This happened just in the last 5-6 weeks and the debugging process is proceeding steadily. So far, the video is looking good and the circuits seem stable.

Our apologies for not being online with some news sooner. With the pre-announcement situations we've created in the past, it seemed prudent to wait until there was new hardware actually in operation before making any public statement. Normally though, given the incomplete state of the project at this point, we probably would have waited awhile longer. The announcement of the Second Sight card (by Sequential Systems) has altered the marketplace however, hence some earlier information from us.

On this note, we'll briefly discuss the two products. Operation in a GS with the stock RGB monitor reveals similarities such as 256-color pixels, in both 320 and 640 resolution and 400-line interlaced modes. The TurboRez card has a Display List CoProcessor and a high-speed blitter, while Second Sight has a microprocessor that does blitter emulation. Now, what about the particular strengths of the two cards?

Comparing The Two

The Second Sight card's strongest suite is when it's coupled to an external SVGA monitor. Here it offers some pretty high resolution, up to 1076 by 768 pixels. Of course, to effectively take advantage of this, you'll really need a 17 or 19 inch monitor to avoid eyestrain (price a monitor this size next time you're at a computer store). Second Sight does not offer overscanning.

The TurboRez card will accept an adaptor that allows attaching a VGA monitor and sending out a 640 by 480 image, so it appears we come in second in the resolution department. TurboRez is capable of doing overscan, however (vertical and horizontal, together or separately).

Pictures That Move

Where TurboRez does shine is in the area of multimedia animation. It's nice to be able to show pictures on the GS that have enhanced color and resolution, but what about bringing them to life? In other words, making them move and flow. Well, the TurboRez card enhances animation on the GS with a host of features. First, of course, the high-speed Blitter for drawing shapes and objects to the display very quickly. Add to that its Multi-Plane Overlay capability and Line Drawing (w/Scaling). Let's talk about those last two.

Multi-Plane Overlay Technology

The Multi-Plane hardware on the TurboRez card is similar in concept to the multi-plane techniques used by commercial film animators. Basically, it means having the various elements of the picture, both moving and still, on
separate "layers". In TurboRez, this means that moving shapes can be placed in separate image layers (or planes) and pass over or under each other (or in front of or behind foreground/background objects) without "interfering" with the other picture elements. In a single-plane video card (like Second Sight), an animated scene consisting of stacked shapes and objects is very slow and messy to update fast enough to present a smoothly flowing image. To alter a shape in the "middle", means not only erasing and redrawing that particular shape, but also anything that appears above or below it onscreen. To change that one shape requires massive amounts of erasing and redrawing even though the neighboring shapes and objects are not due to change yet. All of this activity translates to SLOW screen updating.

TurboRez, with hardware Multi-Plane technology, doesn't suffer from these limitations. With separate image planes, the update process is confined to just those shapes and objects that need it at the time. This means no wasted time redrawing things that don't need it! The result: Efficient and FAST animation on your GS (even without a Zip accelerator).

Texture Mapping via Line Drawing w/Scaling   The other major animation enhancer is the Line Drawing w/Scaling hardware. Here we take a common operation like plotting a line of pixels and couple it with Scaling logic. Scaling allows magnifying or shrinking a bitmapped shape or object as it's being drawn. The scaling operation can be done by the plotting software but that approach is never as fast doing it thru hardware. By using Scaling along with Line Drawing, it's easy to not only alter the drawn size of a source shape but to rotate it as well. Similarly, a drawing technique known as Texture Mapping is enhanced using the TurboRez hardware.

Texture Mapping lets us manipulate a source texture map, which is a rectangular, bitmapped image of something, say a picture of woodgrain or red brick siding or whatever. The effect is that it's being stretched across the face of some 3D object that's in the onscreen image. The woodgrain might be applied to the floor of the scene and the bricks to a fireplace. Where before there might have been a collection of 3D objects with solid-color shaded faces, we would now have objects with realistic textures "pasted" onto them.

To get a good idea of how effective this technique is, find somebody with a 486 PC (50 or 66 mhz) that has the popular program "Doom" and have them run it for you. Now, we at RezTek aren't advocating that all games should imitate the shoot-em up premise of Doom, but our purpose here is to examine the implementation of a realtime, 3D texture mapped universe in which the user can move about freely and interact with. The effect is quite impressive and realistic. Now imagine something similar running on your GS, running at fullscreen size and animating smoothly. How's that going to happen? Only with a TurboRez GS card, using its hardware enhanced Line Drawing w/Scaling.

While we're talking about features, we'll also mention that page-flipping is no problem and there's also support for the GS's NTSC video port and planned GenLocking support (for instance; the Apple VOC card).

What, Where, When   OK, by now the questions are when and how much. Well, we've still got quite a bit of work to do to get this ready for production, so don't worry about ordering a TurboRez card just
yet. There will be more news posted at the first of the new year (here, on Genie for sure, and possibly in one or more publications). At that time we should have a better handle on release time and pricing, etc.

Please understand that we're a dedicated but small company (i.e. understaffed and overworked) and that we'll be needing to apply all of our energy to completing the TurboRez product. Therefore, for the near future, answering the phone will probably have to take a backseat to the production effort. If we're slow in replying to E-mail and stuff, just take comfort in the thought that it was time diverted to a good cause. Also, thanks in advance to folks volunteering for beta test duty but we're doing just fine in that regard presently.

Thanks for your interest in this product. And stay tuned for more news about TurboRez GS, the video card that'll bring powerful and dynamic animation to your IIGS! (..and the company bringing it to you, RezTek, of course.)

Welcome back to the Treasure Hunt! This month we will take a look at Sonobox, a nifty New Desk Accessory (NDA) MOD player created by Tony Morales, and several nice MODules for it. Let's get started. :)

SONOBOX.BXY File #23533 22272 bytes GS NDA Amiga MOD player

Sonobox 1.0
Copyright 1994 by Tony Morales, All Rights Reserved
Freeware

Sonobox is an Apple IIgs New Desk Accessory that allows the playing of Amiga Music MODules (MODs) from within any desktop application. Sonobox features adjustable tempo and volume controls, a play list which can contain songs from any number of on-line disk volumes, and the ability to play songs in the background while you work. Sonobox primarily recognizes songs that comply with the Amiga Protracker MOD standard, though support is also provided for Noisetracker/Soundtracker MODs and for 4-track Startrekker MODs.
Sonobox requires an Apple IIgs running GS/OS 6.0 or later. A hard drive and at least 2MB of memory are highly recommended, though are not necessary to use the program. To install Sonobox, copy the file "Sonobox" from this archive into the Desk.Accs folder inside your System folder and restart your computer.

To use Sonobox, select it from the Apple menu. When you first install Sonobox, its play list will be empty. You may add songs to the play list. Doing this makes it easy to play songs regardless of where they are stored. Sonobox keeps track of your play list between uses of the program by storing a small file in your Desk.Accs folder named "Sonobox.Data". Each time you open Sonobox, it tries to load this file.

To add a song to the play list, click the "Add" button. You will then be presented with a dialog box, asking you to select a song. If the "Play Only" checkbox in this dialog is checked when you open a song, rather than adding the selected song to the play list, Sonobox will attempt to load and play that song.

If you do not want a particular song to remain in the play list, you may remove it by highlighting it and clicking the "Delete" button.

To play a song, double-click on an entry in the play list. Alternatively, you may highlight the song and click the "Play" button. Note that if you want to play a song from disk without adding it to the play list, click the Add button and check the Play Only checkbox. See the section on adding songs for more information. To stop the currently playing song, click the "Stop" button.

When you click on the "Options" button, a dialog box will appear with all of the player options Sonobox allows you to modify.

Normally, Sonobox uses a default timing rate of 50Hz while it is playing MODs. This is due to the fact that most MODs ever created were written using trackers which ran at a 50Hz clock rate. However, some MODs have been written to run at 60Hz. With older MODs, there was no easy way, short of listening to the song, to tell which clock rate the song should be played at. Sonobox allows you to select from a default playing speed of 50Hz, or an increased speed of 60Hz. You may toggle these settings by clicking on the appropriate radio button, either "50Hz" or "60Hz".

Sonobox normally plays all songs in stereo. You may listen to Sonobox's output in mono, if you wish. When the "Stereo" checkbox is checked, output is in stereo, otherwise, it is mono.

You may select from one of four different volume settings while listening to songs with Sonobox. The settings you may select from are expressed in percentages of the maximum possible output Sonobox produces. The available options are 25%, 50%, 75%, and 100%. Simply click the appropriate radio button. The default is 100%.

One of Sonobox's most exciting features is its ability to continue to play songs, even after you have closed the Sonobox window. This is known as background playing. You may turn on background playing by clicking the "Yes" radio button next to the "Background playing:" heading. Turn off background playing by clicking the "No" radio button.
Apple II Computer Info

When background playing is on, Sonobox will shut off the player when you quit the current application, rather than when you quit Sonobox.

I highly recommend that all Apple GS owners get this NDA, especially if you enjoy the sound qualities available with the GS.

The following MODules are recommended by Tony Morales. I've downloaded each of them and listened to them. I like what I hear, but then I'm probably not the best judge of good music.

[*][*][*]

DRAGONSFUNK.BXY File # 19506 140800 bytes Amiga Music Module File

This is an Amiga Music Module (MOD) file entitled Dragons Funk. It is one of the favorite 12 recommended by Ian Schmidt. According to Tony Morales, it has lots of good effects.

[*][*][*]

UNDERSTANDG.BXY File #21860 37504 bytes Amiga Music Module File

Tony Morales uploaded this file. It is a remix of "Understand This Groove" by Sound Factory. According to Tony, "this is probably the first Amiga MOD created on the IIgs. Very good samples. If you like house, download this MOD. For its size, it can't be beat."

[*][*][*]

BEYOND MUSIC.BXY File #23587 351104 bytes Amiga Music Module File

According to Tony Morales who uploaded this file, "This is a really nice sounding MOD file, which you can play with Sonobox or any other MOD player. Give it a listen. Very nice effects!"

[*][*][*]

ENJOYSILENCE.BXY File #20974 144000 bytes Amiga Music Module File

This MOD, titled "Enjoy the Silence," was uploaded by SNIPER who described it this way: "This is the most real sounding MOD I have ever heard! If you don't believe me, just listen to it. You'll be amazed!" Tony Morales describes it as "a bit overly synthesized, but is still good."

[*][*][*]

PUMPTHEJAM.BXY File #17190 132992 bytes Amiga Music Module File

According to P.BENSON1, who uploaded this MOD, "This song is the rap song Pump Up The Jam, and even has spoken lyrics! Pretty neat."

Tony Morales describes this dance MOD as "not that great, but worth listening to a few times."
Apple II Computer Info

[**][**][**]

**TECHNOCON.BXY** File #20504 252928 bytes Amiga Music Module File

According to A.TAN who uploaded it, TechnoConcerto by SideWinder was written for but never made it to the Euro song-writing competition. Tony Morales says "Creative sequence, but some samples sound bad."

This is archived from an HFS disk, so if you unpack it to a ProDOS disk you will have to rename it. This can be done easily with GS ShrinkIt.

[**][**][**]

**INSPECT.MOD.BXY** File #21569 31744 bytes Amiga Music Module File

Ken Gagne uploaded this MOD which is a slightly modified version of the theme song to the classic cartoon, INSPECTOR GADGET. Tony Morales says it has a few effects, not much else. For what it's worth, I like it.

[**][**][**]

**LETSPARTY.BXY** File #20917 65536 bytes Amiga Music Module File

According to A.TAN, who uploaded it, "Let's Party! is a very well done MOD tune. Easy to listen to." Tony likes it too.

[**][**][**]

**ESMEMOD.BXY** File #23591 190976 bytes Amiga Music Module File

According to Tim Kellers, who uploaded it, "Blue-Esmeralda, scent of Spanish Pleasure, is a MOD file that has been tested with SonoBox the MODplayer NDA by Tony Morales. It sounds great on my internal speakered GS. It is probably awesome in Stereo on a GS with a sound card installed."

Tony Morales also recommends the following MODs located in other Roundtables:

<table>
<thead>
<tr>
<th>RT</th>
<th>#</th>
<th>Name</th>
<th>Size</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMIGA</td>
<td>17268</td>
<td>MODHOUSEOUT.LZH</td>
<td>224000</td>
<td>&quot;Eat Your House Out&quot;, very good samples, nice arrangement.</td>
</tr>
<tr>
<td>AMIGA</td>
<td>21916</td>
<td>A-T-S-W.LHA</td>
<td>284672</td>
<td>&quot;All That She Wants&quot;, timing's a bit off, but still OK.</td>
</tr>
<tr>
<td>AMIGA</td>
<td>21873</td>
<td>12DAZE.LHA</td>
<td>292992</td>
<td>&quot;Twelve Days of Christmas&quot;, very good song.</td>
</tr>
<tr>
<td>MIDI</td>
<td>4436</td>
<td>ECHOING.LZH</td>
<td>30336</td>
<td>&quot;Echoing&quot;, very European, nice.</td>
</tr>
</tbody>
</table>
ST  23995 DEADJIM.LZH     138112 "He's Dead Jim", set to the tune of "You Can't Touch This". A definite winner.

MIDI 4744 DIEAGAIN.LZH     307328 "Die Again", evil sounding song, lots of interesting samples.

AMIGA 22115 SPEEDRACER.LHA 367488 Very upbeat techno MOD.

MIDI 3677 ALFTHEME.LZH     55296 Nicely done, bad "laugh" sample though.

MIDI 6568 HOUSE.LZH        86144 An OK house MOD.

ST  29398 AXELF.ZIP        76416 Pretty cool MOD.

ST  22795 BLUEMOND.LZH     35584

ST  20642 CHICAGO.LZH       71168

MIDI 3706 AMEGAS.LZH       46080

[NOTE: These files are packed with utilities not commonly found in the Apple II world. Instead of using ShrinkIt to unpack .LHA and .ZIP files, try Tony Marques’s freeware program Angel, available in the A2 library: file #20501.--Ed.]

[*][*][*]

That's it for this month. I hope you have found something here to whet your interest. Drop me a line and let me know what you think of this column and offer any suggestions you might have about what should be in it.

Until next time, happy downloading!

-- Charlie Hartley

[EOA]

SPECIAL NEEDS /

Computers in Hospital

by Phil Shapiro

[PHAPIRO1]

>>> APPLE II IN CHILDREN'S HOSPITALS <<<

It makes a lot of sense to provide hospitalized kids with microcomputers. Kids in hospital have loads of free time on their hands. They desperately need activities to occupy their minds as the hours tick by. What better way of engaging their minds than by giving them access to educational and recreational software?

A few months ago, I sent out letters to about 70 children's hospitals
around the country to find out how they might be using computers for educational and recreational purposes. Among the several replies that came back, two hospitals described computer projects glistening with excitement. The Children's Hospital of Oakland, California, has a lab of six computers that get intensive use. And Boston Children's Hospital has set up a highly unique computer project.

What's Happening at the Children's Hospital of Oakland

The computer lab at the Children's Hospital of Oakland has two Apple IIc's, two Mac Classics, a 386 IBM-compatible, and a Socrates video game system. Children at the hospital use these computers each and every day for instructional and recreational purposes. Since the computers are part of the "school program" at the hospital, educational software is emphasized more strongly than recreational software.

As you might expect some of the most popular programs are The Print Shop and The Children's Writing and Publishing Center. School program coordinator Patricia (Patty) Coffin explains that getting kids involved with creative expression helps them keep their minds focused away from the other routines of hospital life. Computers are also essential writing tools for the many children who's arms are connected to intravenous (IV) boards. These children are unable to hold a pen in their hand, but can manage to peck out words on a keyboard.

Older children in the hospital are excited about writing for the hospital's bi-monthly Teen Newsletter. They use AppleWorks and other word processors to compose the text. Originally this newsletter was planned as a quarterly publication. But the response to the first few issues was so positive that the publishing schedule was accelerated to a bi-monthly.

An interesting facet of this hospital's computer use is that the computers reside on carts and are frequently moved around to the children's bedsides. The computers are even shared with children in the intensive care unit. Children who are too sick to even speak often perk up when a computer is wheeled to their bedside, commented Patty Coffin.

"People consider the Apple IIc's real old, but they serve our purposes real well," she went on to say. "They don't have a lot of fancy features, but they run so many different types of educational programs. I particularly like the volume control knob on the Apple IIc's, which allows me to turn down the volume when the programs get too noisy. Have you ever been in a small room with excited children and noisy computers each playing a different tune?"

The most popular software programs used on the hospital's Apple II's include Reader Rabbit, Writer Rabbit, Print Shop, Children's Writing and Publishing Center, and the Carmen Sandiego series. The most popular programs on the Mac's are Number Maze, Outnumbered, and Math Blaster. And the favorites on the IBM compatible include Express Publisher, Mavis Beacon Teaches Typing, and the Isaac Asimov science series.

Most of the computers used in the hospital have been donated or have been acquired from the Apples for the Students shopping receipts project, sponsored by Safeway. Next year Coffin plans to obtain a color Mac with her shopping market receipts. She says she'd love to get a CD-ROM disc drive sometime in the near future, too.
One other item high on Coffin's wish list is a phone line for telecommunicating with the outside world. Many of the older children visiting the hospital have asked if they could telecommunicate with their peers back in school.

Apparently the primary financial hurdle to making this happen is not the price of modems or communications software, but rather the price of installing and maintaining an extra phone line. Coffin has been lobbying for this phone line for quite a while, and is hoping that a combination of individual and corporate benefactors can help make it happen.

Since the Children's Hospital of Oakland is located so near to Apple Computer's corporate headquarters in Cupertino, California, I was naturally curious to find out whether Apple Computer itself has lent any formal support to this project. Coffin relates that Apple has indeed given encouragement to the project, but has offered little in the way of hardware or other contributions. "Apple Computer must get thousands of requests for computer donations each year," Coffin declared, "so it's understandable that they cannot support everyone's pet project. However, considering the immense positive effect computers can bring to the children here in our hospital, we just hope that in the future Apple might consider our requests with that in mind."

What's Happening at Boston Children's Hospital: The "KidBits" Project

Every successful project starts out with a single individual deciding to get involved and make a difference. Back in 1986, George Boggs, an employee at GTE Laboratories, decided the time was ripe to help bring computers to the children at Boston Children's Hospital. His action was prompted by hearing the plight of a friend's child, who was spending several weeks isolated in the hospital's bone-marrow transplant unit.

Boggs, who has since moved on to work for another company, is a specialist in "human factors" engineering. His special expertise is in understanding how human beings can most efficiently and naturally interact with computer technology. His professional training in this field helped lend insight into the immense usefulness of microcomputers in a pediatric hospital setting.

Using GTE's internal electronic mail network, Boggs was able to solicit support for his ideas from 50 to 60 other GTE employees. The group quickly formed a steering committee to approach the hospital with their proposal.

The original idea was that GTE employees could donate their time and expertise to help train both the hospital's "child life specialists" and the children themselves. During the planning stages of the project children in the hospital were consulted as to how they felt the project should be run. Later on, Boggs recalled that moment: "It was very moving. We sat there listening to these children, who were dealing with a fatal illness, tell us how they wanted computers to help them with their future. I was overwhelmed with their courage."

GTE Laboratories helped the hospital acquire some Apple IIe's and some Mac SE's. The volunteer employees spent time during evenings and weekends showing how the computers could be used. GTE Laboratories has even allowed some of these employees to take off daytime hours to volunteer.
at the hospital.

To help build enthusiasm for the project, several "computer fairs" were organized. The fairs involved setting up a collection of computer stations with different activities set up at each station. Children were given "computer whiz certificates" for each station they visited. So well-received were these computer fairs that the hospital has planned them as a regularly quarterly event.

When word of the KidBits project got out, other people stepped forward to offer support. The Boston Computer Society, the local user group in the Boston metro area, generously donated copies of their entire public domain and shareware collection. These software programs can be copied and used on the current computers at the hospital, as well as on future computers the hospital may acquire.

A year or two ago the GTE Laboratories employees finished work on a network of Macintoshes in the bone-marrow transplant unit. Making use of their technical expertise, the employees set up a PhoneNet network. PhoneNet is a network which uses standard telephone wires to connect computers. While considered "slow" for use in a business setting, PhoneNet networks are often the network of choice in schools, libraries, and non-profit organizations.

With their PhoneNet network in place, the children in the bone-marrow unit can now send electronic mail back and forth between rooms. They're also able to play interactive games especially designed for use on networks.

One of the most active GTE volunteers in KidBits project, David Fay, says that he'd really like to see a modem and phone line placed on the networked computers. Connecting the kids to the outside world would introduce yet another dimension to the KidBits project.

Since George Boggs's departure from GTE, David Fay has stepped in to help preserve the momentum of the KidBits project. Myra Fox, the director of Child Life Services at the hospital, says that Fay and the other GTE volunteers have shown extraordinary commitment to the KidBits project. "Working on their own time, they have poured their hearts and souls into KidBits. They're a fabulous group of people."

Fox goes on to explain that the "gift of time" is one of the most meaningful gifts the children (and adolescents) in the hospital receive. "Knowing that the GTE employees will be visiting regularly to help with the KidBits project can go far to buoy a patient's spirits."

Myra Fox sums it up all well when she said: "Computers [in hospitals] can help encourage socialization, provide patient entertainment, counteract isolation, promote choices, and offer academic education." All that, and more.

-Phil Shapiro

[Note: The above people are happy to talk on the phone with anyone wishing to donate computer hardware, software, or financial support to these projects. All three of them have rather busy schedules and have asked that people not call just to wish them well with their projects.

Also, it's always thoughtful to include a stamped, self-addressed envelope if you send written correspondence. How can readers of this article help support these projects? Blank floppy disks and printer ribbons are always much appreciated. Both projects use ImageWriter printers.]
Paul Parkhurst (PMP) of ANSITerm fame is still working away at his fax software, and we'll pass on more information as it's available.

AppleWorks 5.0 will be shipping very, very soon. It's a major upgrade of the old "workhorse" AppleWorks, and information about it can be found in the Apple II RoundTable library, file #23470.

The Main Event Imagine connecting to thousands of computers! Picture traveling from New York to California, on to Australia, making a stop in Germany and Austria en route...all from the comfort of your home. It is indeed well-named when it is called the Super Information Highway. True, there are some potholes in the system, and one can take wrong turns. But, if you have time, a local connection, and the pioneer spirit, you can explore to your hearts content!

This is the Internet...a conglomeration of millions of computers, linked together by miles of phone wire and fibre optic technology. There are thousands of bytes of information to be gleaned on the Internet. Interested in Star Trek? Visit a plethora of newsgroups with that as the subject. Want to see the latest pics from Jupiter? Take a journey to the NASA computer system, burrowing through the internet's gopher system to get there, or millions of other locations. Need to get facts on the latest in medicine? There are dozens, if not hundreds of places to telnet or gopher to where you will get everything from information about AIDS to the latest research in cancer. Need a book? Well, you can gopher to the Library of Congress, or hundreds of other library systems, including university libraries and public libraries to find out just WHERE the book you want is! There's even a bookstore online that you can order from -- armed with a credit card and some patience...for there are thousands of books to search through!

Files...let there be files! What you cannot find anymore in computer stores for the Apple II systems can be found in abundance on the Internet through FTP and/or .binaries sites that have thousands of Apple II files...from programs to utilities, graphics to music.

How does one go about linking to this Super Information Highway? The three major online services -- Compuserve, Prodigy and Delphi already have access to the internet for their subscribers, and GEnie is not far behind, with planned full internet access by the end of 1994. There are also local Internet Providers, one of the most major ones being NetCom. Some are free to residents of the state they reside in; but most have a minimal service charge to the user. Most run $17 to $25 per month, unlimited access -- a real bargain considering how much information you can glean from this humongous system -- who can buy a ticket to the nearest town, never mind overseas for that amount? By downloading a file called PDAccesslist from the Internet RoundTable here on GEnie, you can get a list of these internet providers. There are also freenets around -- one of the more famous being the Cleveland Freenet. However, most of the freenets allow limited access to the internet, with many allowing only email access.

There are more features to the Internet, too innumerable to mention here. However, one of the best roadmaps to use is the World Wide Web (WWW), which can link you to a great percentage of the services on the internet. It's a HyperText program -- this means that you'll see highlighted phrases and words, and if you hit return when your cursor is on...
one of these words or phrases, you'll be magically transported to the area that the word or phrase denotes. The best way to learn the internet is gather speed on the onramp, and plunge in! Nothing you can do will "break" the net. You may get cornered, but you can always back out by pulling the plug! Just like someone once told me about how to find yourself around in a strange town -- if you've got a full tank of gas and time... you can do no harm. Same with the Internet. Get ready, set and go!

What's New In A2? September and October saw the Apple II RoundTable gearing up for the influx of AOL Refugees, and we weren't disappointed! Many Apple II users who were no longer able to access AOL via their systems came over to GEnie, where they found a home and a warm welcome.

You'll see some new RTC Hosts here. Paul Parkhurst (PMP) will be hosting the 9 pm to 11 pm segment of the Friday Night RTC, and Dave "Binary Bear" Ciotti, will return and host our Saturday night 11-1 segment.

There are thousands of files available in our library! These are just a few of the best files for the week! Check it out!

Our next meeting will be the second Sunday of December, due to the Christmas holidays. It will feature some of our graphics and music gurus here, to tell us all about our Christmas goodies of songs and pictures!

GEnieLamp is also distributed on CrossNet and many public and commercial BBS systems worldwide.

- To reach GEnieLamp on Internet send mail to genielamp@genie.geis.com
- Current issues of all versions of GEnieLamp are File Requestable (FREQable) via FidoNet (Zones 1 through 6) from 1:128/51 and via OURNet (Zone 65) from 65:8130/3. SysOps should use the following "magic names" to request the current issue of the indicated GEnieLamp platform (FREQ FILES for names of back issues of GEnieLamp IBM):

<table>
<thead>
<tr>
<th>Platform</th>
<th>Magic Name To Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>GEnieLamp IBM</td>
<td>GLIBM</td>
</tr>
<tr>
<td>GEnieLamp ST</td>
<td>GLST</td>

</tr>
</tbody>
</table>

- Back issues of GEnieLamp are available in the DigiPub RoundTable Library #2 on page 1395 (M1395;3).
- GEnieLamp pays for articles submitted and published with online GEnie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or Email it to GENIELAMP. On Internet send it to: genielamp@genie.geis.com

- We welcome and respond to all E-Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.
If you would like to meet the GEnieLamp staff "live" we meet every Wednesday night in the Digi*Pub Real-Time Conference at 9:00 EDT (M1395;2).

The Digital Publishing RoundTable is for people who are interested in pursuing publication of their work electronically on GEnie or via disk-based media. For those looking for online publications, the DigiPub Software Libraries offer online magazines, newsletters, short-stories, poetry and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilities' for text presentation on most computer systems. In the DigiPub Bulletin Board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital book. The DigiPub RoundTable is the official online service for the Digital Publishing Association. To get there type DIGIPUB or M1395 at any GEnie prompt.
