</table>
With the introduction of the Apple II family of computers, the wonders of programming, communicating, and just plain geeking out became affordable for an entire generation of budding enthusiasts and their families. By the end of the 70's an entire culture had risen up around the Apple II, and the energy of thousands of hardware and software hackers went into learning every last op-code and settable switch within the machine.

It can't be discounted that Apple's successful foray into the educational market resulted in schools countrywide brimming with Apple IIs, and social groups collecting around the labs after school hours. All manner of things happened there, some documented below.

These files range from explicit memory maps of the Apple II to long tutorials on how to "crack" games, that is, remove all copy protection and make the game easier to distribute between other pirates.

Note: It appears I am missing two files from the archive I got, one of which is probably named <B>almp9709.asc</B> and the other is Volume 6, Issue 60. If you find them before me, let me know.
Since April 1, 1992, a group of Apple II Enthusiasts on the GEnie Online Network have produced a newsletter covering all aspects of the Apple II series of computers. Well-written, thoughtful articles cover hardware, software, anecdotes, company news, and the occasional off-topic rant.

The current listed run covers all the issues of GEnie Lamp A2 from April 1992 to October, 1997. The newsletter supposedly moved onto the Delphi information service, although none of those newsletters are archived here.

# MALCOM -- The TinyTIM FTP Site Index.html Generator.
#          Written by Sketch the Cow, April, 1998.
#
# Malcom creates a file named index.html, adds the contents of
# .header, goes through .descs and generates a huge-ass table, then
# appends the contents of .footer at the end. Does it get easier than
# that? Don't think so.
#
# REQUIRED FILES:
#
# .malcom (This one)
# .malcomx (The table generator)
# .header (The header of the web page)
# .footer (The footer of the web page)
# .descs (A list of files and descriptions. Filenames MUST MATCH.)

sort .descs >.descs.tmp
mv .descs.tmp .descs

cat .header

sh .malcomx <.descs

cat .footer
#!/bin/sh
#
# MALCOM X -- The heart of Malcom
#     Written by Sketch the Shell Cow, April, 1998
#
# This was just written so I wouldn't have to remember to do an input
# redirect when executing malcom. By getting called, all this thing has
# to do is just the middle part while all the redirection is done by
# malcom.sh.

>>> WHAT'S HAPPENING IN THE COMPUTER ROUNDTABLES ON GEnie? <<<

~ April 1, 1992 ~
FROM MY DESKTOP ........ [FRM] HEY MISTER POSTMAN ...... [HEY]
Notes From The Editors. Is That A Letter For Me?
HUMOR ONLINE .......... [HUM] FOCUS ON... ............ [FOC]
Taxing Fun! Shareware, Freeware or ????
ONLINE FUNNIES ........ [FUN] HARDWARE VIEWPOINT ...... [HAR]
CowTOONS! Your Apple ][ Needs a Quickie!
HARDWARE VIEWPOINT ...... [HII] TELETALK ONLINE ....... [TEL]
Don't Touch That Keyboard! Telecomm Power!
HIDDEN TREASURES ...... [HID] SOFTVIEW ][ ............. [SOF]
F.Y.I. ................... [FYI] PRINT ME! ............... [PRT]
Alliance On GEnie. GEnie Lamp Template.

LOG OFF ............... [LOG]
GEnie Lamp Information.

[IDX] """"""""""""""""""""""""""""""""""""""""""""""""""

READING GEnie Lamp GEnie Lamp has incorporated a unique indexing
system to help make reading the magazine easier.
To utilize this system, load GEnie Lamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE .......... [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO To make it easy for you to respond to messages re-printed here in GEnie Lamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

_____________|  _____|__  _|___    |____ |_____________  |
|Name of sender| CATegory  TOPic | Msg.# | Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}

There seems to be a potential problem with an Apple II stamp. The post office won't enshrine a person on a stamp until they are dead. If the same goes for machines, the Apple II can't be put on a stamp for a long, long time. :) <tongue in cheek, of course>"  

TOP OF THE PAGE   Talk about changes! GEnie Lamp has divided into four separate issues. Along with the original Atari ST GEnie Lamp, we now offer the magazine for the IBM, Macintosh and Apple ][ RoundTables as well. From now on you will be able to find GEnie Lamp as an online readable file in each of the respective RoundTable's main menu. Better yet, access to the GEnie Lamp magazines is now available as part of your GEnie*Basic package! That is, when you capture GEnie Lamp from the RoundTable's main menu, the GEnie clock will be off. Cool! (Note that this applies _only_ to the version that is found on the ST RoundTable main menu, _not_ the libraries.)

But wait, there's more! GEnie Lamp now has a new home. The GEnie Lamp RoundTable is located on page 515. Here, you will find all the latest issues and back issues of GEnie Lamp Online magazine.

By John Peters
[GENIELAMP]
Although we have split into four issues, I think you'll find that very little has changed in terms of context. There are several new people on the GENie Lamp staff and all of them are excited about bringing to you all the latest news, hot messages, latest files and information about your favorite RoundTable.

If you like to hang out in the ST, IBM, Macintosh or Apple ][ RoundTable, there's something for you in GENie Lamp!

>>> ROUNDTABLE NEWS & ANNOUNCEMENTS <<<

NEW SHRINKIT IS FINALLY HERE!  Can it be?  Yes!  Bugs in the old versions of ShrinkIt have been found and obliterated. A new version of ShrinkIt is here for EVERY machine!  Don't skip this one, the fix is an important one, so update your version right away! Download whichever of the following files is for your machine and unpack with your old version!

18064 IIPLUS21.BXY    Apple ][+ UnShrinkIt v2.1
18062 AUTO11.BXY      Auto-UnshrinkIt v1.1, big bug fix
18060 SHRINKIT34.BXY  ShrinkIt 3.4 -- Big bug fix
18058 GSHK105.BXY     New GS-ShrinkIt!  Many bug fixes!

GENie APPLE II PEOPLE'S CHOICE AWARDS  If the Apple II Achievement Awards are the Oscars for the Apple II, here's your chance to be Siskel and/or Ebert! Are you dissatisfied in any way with the 1991 Apple II Achievement Awards? Do you want to get YOUR vote in? Well, then, check out Topic 9 of Category 5 in the A2 Bulletin Board, the GENie Apple II People's Choice Awards, and make your own picks for the winners! Vote by March 30th!

THE ONLINE LIBRARY  Check out these excellent files recently uploaded to our library!

18014 ASPHYXIA.3.BXY          Great Freeware Apple II magazine!
18054 APPOINTS.BXY V1.1      Print out ProSel-16 appointments!
18011 EAMON.204.BXY          One of the best text adventures ever
17999 NOISETRACKR.BXY V1.0    v1.0 of FTA's hot music program
17998 SENSEI.DOX.BXY         English docs for Sensei in AWGS format
17976 PROSEL.BXY             ProSel-16 version 8.71
17974 DEARC2E.BXY V2.01      Original Dearc2e, for un-ARCing files
17962 THE.DRAGON.BXY         Nice shareware clone of Shanghai GS
17960 FLOORTILES.BXY         Nifty new IIgs strategy game

DESKTOP PUBLISHING  If you're into desktop publishing, on Tuesday, April 14 the DTP RoundTable will feature a question and answer session on scanning, using halftones and producing photography for print beginning at 9:30 PM EST. This is a discussion for anyone interested in going beyond type.

April 7, the DTP RoundTable will be featuring a special conference on color publishing with Macintosh and PC compatible computers beginning at 9:30 PM EST. This discussion is also open to users of other publishing platforms that allow color publishing.

The DTP RT bulletin board category 1 invites all members to tell

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 16 of 1824
NEW SYSTEM SOFTWARE/HYPERCARD RELEASED!

CUPERTINO, California--March 24, 1992--Apple Computer, Inc. today introduced new system software and an upgraded version of HyperCard IIGS for the Apple IIGS personal computer.

Apple IIGS System 6 software offers an enhanced user interface, greater speed and performance, and data exchange capabilities not available on current Apple IIGS operating systems. HyperCard IIGS version 1.1 has been upgraded to include a Media Control stack for operating CD ROMs and videodisk players, and new HyperTalk scripting capabilities.

"Apple IIGS System 6 encompasses the most robust and feature-rich system software offered since the introduction of the Apple IIGS in 1986, bringing Apple II customers much of the same ease-of-use and functionality now available on the System 7 Finder for the Macintosh," said John Santoro, Apple II product manager. "The extensive development of System 6 and HyperCard IIGS version 1.1 underline Apple's continuing support of the Apple II line."

FEATURES & BENEFITS Apple IIGS System 6 features three new File
System Translators that provide easy access to Macintosh disks, Pascal disks, Apple II DOS 3.3 disks.

In addition, Apple IIGS System 6 offers users significant feature enhancements to control panel and desk accessory functionality, providing an enhanced new "look and feel" to the Apple IIGS. Control panels can be opened directly from the desktop and Find File and Calculator desk accessories have been incorporated.

Finder Help on Apple IIGS System 6 can be accessed through pop-up menus and kept on screen while users step through procedures. Window handling and window appearance have also been enhanced, making it easier to move between and manage multiple windows on a single screen.

Apple IIGS System 6 offers two new applications--Teach and Archiver. Teach is a desktop text processor that enables the user to jot down notes, read disk files and create formatted or unformatted text documents. Teach also provides file import capability from ASCII, AppleWorks version 3.0, AppleWorks GS, MacWrite version 5.0 formats and AppleWriter. Archiver offers flexible hard disk backup functions to save and restore either individual files or entire volumes.

The Apple IIGS System 6 Media Control toolset is a new tool/driver/control panel/desk accessory combination that allows users to integrate, configure and manage highly sophisticated multimedia effects. The performance of this toolset is optimized when used in conjunction with HyperCard IIGS version 1.1.

The Universal Access suite (also available on Macintosh System 7 software) opens the Apple IIGS to disabled users via Video Keyboard, Easy Access and Closeview programs, simplifying system use for the visually or physically impaired. As with the System 5 series, Apple IIGS System 6 users can network their Apple IIGS computers with each other and with Apple IIE, Macintosh and MS-DOS computers. However, System 6 improves networking functionality via EasyMount, a new feature which allows users to mount a network server with a simple double-click command.

Apple IIGS System 6 replaces Apple IIGS System 5.0.4 for the stand-alone Apple IIGS, providing a consistent graphical interface and high performance for both the individual and networked user.

SPEED & FEATURE ENHANCEMENTS

HyperCard IIGS version 1.1 features a Media Control Stack for the control of external media devices such as Laserdisk players and CD-ROM drives from within the stack. Control is provided to the user through a common interface to two external devices by using standard "Play", "Fast Fwd", etc., buttons or floating control panels. A Tune Builder stack allows the user to create short original tunes by simply clicking the mouse on the stack's music staff. Notes can be played in variable time and with the voices of a large collection of instruments. These tunes can then be used as enhancements to other original stacks by cutting and pasting.

HyperCard IIGS version 1.1 has incorporated features from Macintosh HyperCard version 2.0 and 2.1, such as HyperTalk extensions and X Windows. As with original HyperCard IIGS, version 1.1 is also in color.

The Apple IIGS SuperDrive Controller card is also available for the enhanced Apple IIE and Apple IIGS, allowing users to utilize Apple's
Apple II Computer Info

SuperDrive which permits the use of 1.4MB floppy disks. The SuperDrive card also operates all other Apple II 3.5 disk drives.

SYSTEM REQUIREMENTS Stand-alone Apple IIIGS System 6 software requires an Apple IIIGS personal computer with at least 1MB of RAM, ROM version 01 or 03 and one 3.5-inch disk drive, although configurations of 2MB of RAM and a hard drive is recommended for optimal performance. Networked systems require Apple IIIGS computers with at least 768K RAM, ROM version 01 or 03 and appropriate LocalTalk cables.

HyperCard IIIGS version 1.1 requires an Apple IIIGS personal computer with 1.5MB RAM, one 800K disk drive and hard disk or connection to a networked environment, and system software 5.0.3 or subsequent version.

PRICE & AVAILABILITY The Apple IIIGS System 6 package includes six 3.5-inch disks containing system and set-up software and system tools, as well as the Apple IIIGS System Software User's Guide. The package will be available in early April from authorized Apple dealers, Apple Educations Sales Consultants, and Resource Central, Inc. (913) 469-6502) for a suggested retail price of $39 in the United States.

Apple is also making Apple IIIGS System 6 software available from licensed user groups and licensed on-line services.

HyperCard IIIGS version 1.1 will be available in early April from authorized Apple Dealers and Resource Central, Inc. for a suggested retail price of $69. HyperCard IIIGS 1.0 owners can purchase an upgrade to version 1.1 from Resource Central, Inc.

SYSTEM 6.0 NOW AVAILABLE FOR DOWNLOADING! The Apple II RoundTable is pleased to announce that System 6.0 is now available for downloading in the A2 libraries! To get in on this hot new operating system, which brings untold levels of power and flexibility to your IIgs, check out the following files in the A2 libraries (page 645, option #3):

18176 ABOUT.SYS6.TXT IMPORTANT info on System 6.0! Read!
18145 S6.SYSDISK.BXY Main SYSTEM DISK for IIgs System 6.0
18144 S6.SYNTHLAB.BXY SYNTHLAB disk for IIgs System 6.0
18143 S6.FONTS.BXY FONTS disk for IIgs System 6.0
18142 S6.TOOLS2.BXY SYSTEM TOOLS disk #2 for System 6.0
18141 S6.TOOLS1.BXY SYSTEM TOOLS disk #1 for System 6.0
18140 S6.INSTALL.BXY INSTALL disk for IIgs System 6.0
System 6.0 for the IIgs comes on six disks. It's a long download but well worth your time. But you don't have to download all six disks! But be sure to first check out file #18176, ABOUT.SYS6.TXT for more details on what you'll need to get this amazing new software for your IIgs.

To find out more about the new System 6.0, or for help installing it, check out Category 8, Topic 9 of the A2 bulletin board!

ENHANCED APPLE IIE AND IIC USERS ALSO BENEFIT FROM NEW SYSTEM SOFTWARE!

If you don't have a IIgs, you're still in luck. The new versions of ProDOS 8 and Basic System are also available now in the A2 library. They include a number of bug fixes and enhancements over previous versions.

Probably the most exciting feature of the new PRODOS 8 version 2.01 is the ability to access more than two drive/devices per slot, something many Apple II users have been begging for for ages!

ProDOS 8 version 2.01 requires an enhanced Apple IIe or IIC. It will not work on the un-enhanced IIe or the II+. Here are the files you'll need to access this new system software for 8-bit systems (it's included automatically with System 6.0 for the IIgs, so if you have a IIgs you don't need to download these):

18169 BASIC.1.5.BXY           BASIC.SYSTEM version 1.5.1
18168 PRODOS.2.01.BXY         ProDOS 8 version 2.01

THANKS, APPLE! Our thanks goes out to Apple Computer, Inc. for providing these fantastic enhancements to the Apple II line and for allowing GENie users to be among the first in the country to get them. -Dean Esmay

>>> APPLE ][ ODDS & ENDS <<<

GOING BUGGY! In the A2 RT, Category 9, Topic 5 an amusing off-topic discussion has arisen. I thought it would be fun to select a few of these messages and share them with you -- even though they have nothing to do with the Apple II:

>>>>> I do remember the first computer VIRUS that I saw. On the 1401, the program was kept as an object (machine language), self loading deck of punched cards. We wrote, in machine language (not assembly language), a one card program that would fill memory with "THE PHANTOM STRIKES AGAIN". That is what the programmer saw when he crashed and printed a memory dump. He would have to find the card in the object deck and remove the virus. #Ken Lessing

>>>>> Wasn't the first bug a moth that got trapped in a relay, thus killing the computer until they found the "bug", and coining #the term. #HangTime [Script-Central] B-)

>>>>> Actually, the term "bug" was in use in engineering for a long time before the first computer bug was discovered. That's why they labeled the moth they found in the relays "first actual bug found"
-- because it was the first glitch in the system that could literally be traced to an insect. #Jerry

>>>>>> I can probably out geezer most. I was at MIT when the first """""""" timesharing system was developed and Dec systems were on racks in the Research Lab as we tried to put the first one ever together.

The MIT/IBM story I remember is when they were trying to reach agreement on royalties for the development of "core" memory. At one time MIT turned down an offer from IBM of 1 cent per bit of core (I assume some people still know what core was). MIT turned it down - and took a couple of 7094's and $7 million instead. If MIT had taken it, they would now own IBM.

Later on, I actually worked on a project whose software development methodology was reviewed by Grace Hopper. I got to do a presentation to her. Talk about sweat! She was tough. But fair and very smart.

Did anyone use mylar tape? We used that for archives (before Andy Nichols).

About 5 years ago I was a consultant for a job a JPL. I studied network traffic in Europe. We discovered one Army network with strange characteristics. Further investigation showed that the network consisted of a large warehouse with many model 35 ASR teletypes with paper tape readers and punches.

When a message came in it was punched on paper tape. An army corporal would then carry it from teletype to teletype to forward the message to other nodes. (was that you Gary?) The speed of a message depended on the relative positions of the teletypes!!! There was one anomaly in the speed characteristics - the owner of the building got the message first. - #Bill Mosier

>>>>>> I don't know about the first "bug", but I can relate a "bird" story. When I was working at Continental Bank in Chicago, my analyst boss told me about when he worked for a super-secret military computer center - with IBM 1440 CPUs. The trouble was, that it didn't have air conditioning, so they made-do by leaving the windows open. This kept the machines cool, but it had an interesting side effect. It seemed that the _BIRDS_ liked the warmth, especially the pigeons. They would fly in and _roost_ on the cpu, dropping their you-know-what into the innards of the machines. (and you thought that YOU worked for a chicken-sh*t company!).

After a while, the s**t dried out, and piled up. On the power supply. Eventually, it hit combustion temperature and the cpu caught on fire!

The first thing they did was to call the fire department. Then they realized that the card decks contained super-secret data, so...they locked the door. They could not secure the cards, so they decided to destroy them. And the quickest way to destroy them was to throw them on the fire! They didn't let the fire department in until all the secret cards had been destroyed! This _is_ a true story! #Ken Lessing

>>>>>> Here's the entry on "bug" from _The New Hacker's Dictionary_, edited by Eric S. Raymond: "Historical note: Some have said
this term came from telephone company usage, in which 'bugs in a
telephone cable' were blamed for noisy lines, but this appears to be an
incorrect folk etymology. Admiral Grace Hopper (an early computing
pioneer better known for inventing COBOL) liked to tell a story in which
a technician solved a persistent glitch in the Harvard Mark II machine
by pulling an actual insect out from between the contacts of one of its
relays, and she subsequently promulgated bug in its hackish sense as a
joke about the incident (though, as she was careful to admit, she was
not there when it happened). For many years the logbook associated with
the incident and the actual bug in question (a moth) sat in a display
case at the Naval Surface Warfare Center. The entire story, with a
picture of the logbook and the moth taped into it, is recorded in the
285-286.

"The text of the log entry (from September 9, 1945), reads '1545
Relay 70 Panel F (moth) in relay. First actual case of bug being
found'. This wording seems to establish that the term was already in
use at the time in its current specific sense. Indeed, the use of bug
to mean an industrial defect was already established in Edison's time,
and bug in the sense of a disruptive event goes back to Shakespeare! In
the first edition of Samuel Johnson's dictionary one meaning of bug is
'A frightful object; a walking spectre'; this is traced to 'bugbear', a
Welsh term for a variety of mythological monster which (to complete the
circle) has recently been reintroduced into the popular lexicon through
fantasy role-playing games."

Jeff

>>> WHAT'S NEW? <<<

****************************************

IIIGS MULTITASKING?   Multitasking for the IIIGS? What once was a foolish
dream for those suffering Mac envy has become reality. While it may take some time before any real applications are
available, the operating environment is here today thanks to Procyon:

>>>>>   Procyon, Inc. announced today the release of the GNO

""""   Multitasking Environment (or GNO/ME) for the Apple IIgs
microcomputer. GNO/ME brings all the power of the Unix operating system
to the IIgs for the first time.

"GNO/ME is a programmer's dream," said Jawaid Bazyar, head of the
project. "So many things are possible now that just weren't before."

Jawaid is referring to GNO/ME's multitasking ability: many programs
may be run simultaneously, either interactively with the user or in the
background, where the program does it's processing (printing, compiling
a program, searching files, etc) while allowing the user to seamlessly
move on to other tasks.

Another GNO/ME feature is multiple terminals; more than one person
can use the same IIgs at a time. Such programs as multi-user BBS
systems are now possible.

Matt Gudermuth, President of Procyon Inc., tells about the company.
"We founded Procyon to bring high-quality products to the badly
neglected Apple IIgs market. It makes no sense that no one is
developing for this machine which is still far from it's capabilities,
and among all the PC brands in existence has the most loyal and
supportive user base."

"This is something we've all been waiting for for a long time", says Tim Meekins, the other principal programmer. "GNO gives me the ability to do things I only used to be able to do on the $10,000 workstations in the labs at school. When the IIgs was released, it was the most technologically advanced PC in the world. GNO brings the IIgs once again to the forefront of the home computer world."

GNO comes with almost 40 utilities tailored specifically for the GNO environment, and also comes with the C and assembly _source code_ for these programs, to allow budding programmers to see how it's done.

GNO also comes with a large library of Unix subroutines, to make porting Unix software to run on the IIgs easier than ever. The powerful libraries include curses and termcap flexible screen manipulation for any terminal type, and all the C library routines your IIgs C compiler forgot about!

For those of you out there who like Unix, and don't want to spend the thousands of dollars needed for a Unix computer or even for Unix for DOS machines, GNO is an unbeatable value.

The price for the GNO system (3 disks and full printed manuals) is $80 US plus shipping. Shipping is by USMail First Class ($3), or International Airmail ($5). GNO/ME can be ordered directly from the publisher:

Procyon, Inc.
1005 N. Kingshighway, Suite 309
Cape Girardeau, MO 63701
(314) 334-7078
Mastercard and Visa accepted.

February 17, 1992
(Cape Giraradeau, MO)
(press release by Mike Horwath)

See A2PRO, Category 19 (Programming Shells) for more information on GNO/ME, including a feature by feature breakdown of the software.

MONEY MATTERS For those who want to put their home finances in order or those running a small business, Software Solutions has released Your Money Matters. As you can see in their media release, this may be the single most important piece of management software ever developed for the Apple IIIGS. Normally business programs do not turn heads, but this one really shines.

>>>>> I am happy to announce a new IIgs software package called Your Money Matters. It is a complete home and small business financial package which is very fast, flexible and easy to use. Your Money Matters provides a wide range of features while at the same time keeping it as easy to use as possible by using the Apple Human Interface guidelines.

A demo version of Your Money Matters (file #17966) has been uploaded into the A2 Library and should be available in a few days. If you prefer you can get a demo disk in the mail for $5.00 (check/money
order). The demo version is complete except it will not let you save any changes you made to the file.

Some highlights of Your Money Matters are:

- The only full featured IIgs Financial Program.

- The only financial program which will print on your own personal checks. You can move the fields of the check around by just clicking on it and dragging it wherever you would like.

- Supports having as many windows open as you would like and you can move and resize almost all of the windows.

- You can paste the results of a NDA calculator into any YMM field.

- You can define up to 256 Tax Indicators, not just Yes/No.

- You can sort on up to twenty fields and specify which of the sort fields will generate subtotals (for reports).

- You can specify and unlimited number of selection criteria on any of the fields used in the report/window.

- You can search across all accounts (i.e. all transactions in all checkbooks/savings accounts/etc which meet your selection criteria.

- It has Online Help Screens for each menu item.

- You can split a transaction up to 20 times.

- You can enter recurring transactions with just a few keystrokes.

- It comes with thirteen different reports and three graphs with many containing various additional options.

- You can print to either individual checks or continuous form computer checks.

- Your Money Matters has a payee file with payee names and addresses for automatic inclusion on your checks.

- For each account you can enter account address, number, and description information.

- For any account you can put in the original value and original purchase date and Your Money Matters will tell you what the annual rate of return is on this investment.

- You can budget accounts weekly, biweekly, monthly, semi-monthly, bimonthly, annually, or semiannually and...
you can have the budget amount increase/decrease a set percentage and/or amount each budget period.

- You can balance/reconcile any account including chargecards, loans, IRA, savings accounts, checkbooks, etc.

- Your Money Matters keeps track of not only this years actual dollar amounts, but last years, and this years budget amounts.

Your Money Matters is the only Apple IIgs financial program which provides you with all of the features and ease of use of Apple's User Interface. It allows you to have multiple windows open at one time, to resize your windows, and to select multiple records with the mouse and then copy or delete them.

Your Money Matters contains many features which allow you to quickly track your finances as well as features which allow you to customize it to fit your specific situation.

Your Money Matters is the only financial program which allows you to print checks on your own personal checks instead of the relatively expensive preprinted continuous form checks.

With any NDA or CDA calculator which will paste the results into the clipboard (System 6.0 comes with a such a NDA calculator) you can even paste the results of the calculation directly into any field in Your Money Matters.

Requirements/Limitations Your Money Matters requires a IIgs with at least 1 meg of memory and one 3.5 inch disk drive. It is compatible with and runs on any GS/OS (Prodos) hard disk drive. Your Money Matters is not copy protected.

Transactions: 16,000 Accounts: 4,000
Tax Indicators: 255 Account Types: 255
Recurring Transactions: 4,000
Payee Addresses: 1,000

To Order Your Money Matters Send Check, Money Order, or VISA/MC number and expiration date to:

Software Solutions
5516 Merritt Circle
Edina, MN 55436

The list price of Your Money Matters is $99, but until April 15th 1992, Your Money Matters is just $69 plus $5 shipping and handling. If you send in the first page from another financial program or the original disk you can get Your Money Matters for just $59 plus $5 shipping and handling.

In addition, while supplies last you will also receive a 3.5 inch disk full of useful and fun shareware and public domain GS games and utilities.

Visa and MC orders will be filled and shipped by A2-Central.
Guarantee

If you are not completely satisfied with Your Money Matters return it within 60 days in good condition for a no questions asked full refund of the purchase price (does not include shipping).

(Facts, Fiction & Maybe)

HERE WE GO AGAIN

Will Apple Inc. discontinue the II line? These rumors have been with the Apple II community for many years now. There are as many good reasons for Apple Inc. to drop the line as there are to maintain it and this balance has created an atmosphere where such rumors grow like tumors. Obviously, only the top brass at Apple Inc. knows for sure:

>>>>> According to the latest 'Scarlett', Big Red Apple Club says that Apple will announce on April 1st, (no fooling) that they are stopping the production and distribution of the entire Apple II product line. This is the reason that the Apple Expo East thing due to happen the first week of April was cancelled.

I know, this is the latest in a long list of lets-kill-the-II dates, but sooner or later, it's going to be the real thing.

Any rumblings?

(P.JONES7, CAT5, TOP3, MSG:49/M645)

>>>>> Personally, I think it is nonsense. Apple is still making money off these things, and they are not going to STOP making them until they need the manufacturing capacity for something that is going to make them MORE money. No matter how much they might denigrate the II, Macs don't have a big enough profit margin that shutting down the II production lines to ship Macs out of them is cost effective. Gary R. Utter OffLine Productions (GARY.UTTER, CAT5, TOP3, MSG:68/M645)

APPLE II HORROR STORY

This is an RT member's account of his elusive search for the Apple II. It is a horror story which is taking place all over the country and which can be found on many local BBS's.

I wanted to share this one with you since it is so through and includes a response from Apple Inc:

Here is a letter I sent to Apple Computer and their reply:

[*][*][*]

December 27, 1991

RE: Sales of Apple II Line and Apple dealers

I have a question about the way your authorized Apple dealers are doing business.

I have now spoken to five different Apple salesmen about information on and the purchasing of an Apple IIGS. Here is what they have said:
EXPERIENCE #1  
Salesman #1: "May I help you?" Me: "Yes, I'm interested in buying an Apple IIGS, but I don't see one here in your store."

Salesman #1: "Is this for a school or personal use?"

Me: "Personal use."

Salesman #1: "You know, the IIGS has a very short life. After next year, Apple is no longer making it."

Me: "Is that a rumor, or a fact?"

Salesman #1: "It's a fact. APPLE HAS NOT YET INFORMED THE GENERAL PUBLIC, BUT THEY HAVE LET DEALERS KNOW THAT LATE IN 1992, THE IIGS WILL NO LONGER BE MANUFACTURED. I'm sorry to tell you this, but it is the truth."

Me: "Why is Apple discontinuing the IIGS?"

Salesman #1: "Because Apple believes the Mac can do so much more in terms of high end software."

Me: "But I'm not at all interested in a Mac - I'd have to buy all new software."

Salesman #1: "Yes, that's what all the educators are telling us too. But we do have the Mac LC, which has a //e emulation card."

Me: "I understand there are some problems with the emulation."

Salesman #1: "Yes, especially with the system 7 software. That's why we sell it bundled with system 6 software, but Apple is working on a fix for it."

At this point I walked over to the Mac LC, which had the //e card up and running, but I couldn't make it do much. It appears that it cannot use the Mac hard drive, there is no way of using //e interface cards (such as the //e scanner), it will not run IIGS software, and it is not up to the speed of my real //e which uses a ZIP chip.

EXPERIENCE #2  
Same store, a week later.

Me: "I'd like to look at an Apple IIGS, please."

Salesman #2: "I'm sorry, we don't have one anymore. Perhaps there's one in for repair you could look at."

Me: "I'd like to see a working IIGS."

Salesman #2: "Oh, no, that wouldn't work. We would have to special order one if you really wanted one. We don't normally carry it."

Me: "Why not?"

Salesman #2: "It isn't selling well enough - that's why we don't have one to show to people."
EXPERIENCE #3  A different authorized Apple reseller:

Salesman #3: "Apple II is no longer made."

Me: "Which Apple II are you talking about?"

Salesman #3: "Apple is no longer making ANY of the II line."

Me: "Who told you that?"

Salesman #3: "We know that because we are an authorized Apple dealer. We should know."

EXPERIENCE #4  Same store, a different salesman:

Salesman #4: "Apple II is no longer manufactured."

Me: "Is that a rumor, a way to sell Mac's, or what?"

Salesman #4: "It's a fact."

Me: "I don't believe it. Our school just bought a brand new Apple IIGS."

Salesman #4: "Apple is selling from their stock. But they are no longer manufacturing the IIGS."

Me: "Can you show me some documentation from Apple?"

Salesman #4: "Well no, Apple has not come right out and said it, but we know the Apple II has been discontinued because none of the II's show up on the price list."

At this point I asked to talk with the manager of the store, who told me the same thing. Asking for documentation, he phoned his manager and asked how they knew that Apple II's were no longer made.

After the call he said, "Well, well, well. The Apple IIGS and the //e are still on the price list after all. But we feel that they will probably be discontinued next year."

Is this how to sell Apple computers!!!??  I was ready to spend the money to buy a IIGS because I have used Apple for many years. I started on a II+, then purchased two //e's, which I use in my ministry, one at home, the other at the office. I'm interested in staying with the II family. I do not want a Mac.

I would have to buy all new software as well as throw away my interface cards. A IIGS at the office would allow me to continue using what I have at home, as well as my software. But I can't find a dealer who will even show me one.

And after talking with these five authorized Apple dealers who have told me that it is or soon will be no longer made, I'm not even sure if I want one anymore. Who wants to buy an orphan?

So I've begun looking at IBM compatibles. Everyone else at the office uses IBM compatibles.
I'm looking at a 16 MHz 386SX system made by BSR with a .28 dot pitch super VGA monitor, 40 MB HD, both 5 1/4" and 3 1/2" disk drives, 1 MB Ram, 101-key extended keyboard, for under $1300. (There are systems selling for a lot less, but they may be junk.)

But I'd really like to stay with Apple. But not with the sort of trash the dealers are telling me. Or are they telling the truth?

Can you tell me something to help me stay with Apple? Are you planning on discontinuing the Apple II line next year? I have heard a rumor from two people now (not Apple dealers) that you are working on a new II line computer - is this true?

I would suggest that in order to stop the rumor mill, Apple come right out and say what you plan to do. Is the Apple II dead (dying within the year), or is there something new on the horizon?

I'd appreciate an answer. Thanks.

Sincerely,
Terrell Smith

APPLE RESPONDS

January 20, 1992

Dear Mr. Smith:

Thank you for your recent questions about future plans for the Apple II product line. Apple will continue to sell, support, and service the Apple II product line as long as customer demand warrants it. We plan to continue to enhance the existing product line through updates to system software and peripheral add-ons and we fully expect Apple II computers to continue to serve our customers satisfactorily for many years to come.

We are pleased to send you the enclosed The Apple II Guide, a comprehensive resource for Apple II products. Designed to help the millions of Apple II owners identify and locate Apple II support resources, this guide includes hardware and software information, answers to commonly-asked technical questions, and more. The Apple II computer will remain a viable and productive tool for years to come. We believe The Apple II Guide, and its future editions will serve as a valuable resource for you and other Apple II users.

(The letter went on to give info on users groups, free 800 line for area support, and an invitation to use the Apple Customer Assistance Center line at 1-800-776-2333 between 6 am and 5 pm Pacific time.)

Signed,
Henry Sohn (Apple Customer Assistance)

So folks, that's the official word from Apple. It looks like their DEALERS need to hear it as well! Apple is NOT ready to close down the II line. Let's stop grousing and support the official Apple II Line
"line", give any ignorant dealers in our area the word, and maybe things will pick up again for Apple. It's up to us.

And by the way, The Apple II Guide from Apple is 231 pages. It contains a long letter from John Sculley about his support of Apple II, a history of the Apple II, and other information. -Terrell Smith

BYTEWORKS        at 12:56 EST

Actually, the Apple II is still a pretty good market for us smaller publishers. The fact that Apple has stopped supporting the machine doesn't mean you've stopped using it -- or buying software. The big companies can't make enough money from GS products to make it worth while. (I hear MicroSoft would like to dump their Mac BASIC because it _only_ sells 1000 or so copies a month! I have fantasy dreams of sales like that. :) That makes the GS a great market for new or small niche market publishers.

As for finding someone to release GS or Apple II programs that are no longer in print, that's being done. Beagle Bros. has done that with several programs, Big Red Apple has bought up a lot of stock, and I'm trying to find the current address for whoever owns Pecan's copyrights to swing a deal. All you have to do to keep a program in print -- assuming it's one that can still sell several hundred copies -- is find out who owns the copyright and which current Apple II publisher does that sort of program and make sure they know about each other.

The Apple II isn't dead, and won't be for a long time. The kind of market has just changed -- a lot! :)  

Mike Westerfield

P.S.  We made more from the II in 1991 than in 1990, and more in 1990 than in 1989, etc.  We expect to make more in 1992 than in 1991.  We'll be here for a while, guys. :)  

[*][*][*]

While on GEnie, do you spend most of your time downloading files?  If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your Apple II, the GEnie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

>>> COOK'N WITH TAXES <<<

~ Chocolate Layer Cake 1040 ~

Line 1. Butter, a minimum of half a pound <8 oz.>, but not to exceed 1 pound <see line 5>.

Line 2. Sugar, light brown or white, unless you or your spouse had a financial account in a foreign country in 1988, in which case dark brown sugar must be used. Do not substitute molasses or honey. Use 1 cup and adjust to taste.

Line 3. Eggs, six or half a dozen, whichever is greater.

Line 4. Semisweet chocolate, 6 oz. Nonfarm families may choose the optional method of using cocoa powder. If you elect the Cocoa Method, add 1/2 oz. <1 Tablespoon> of butter to each 3 tablespoons of cocoa. Multiply by .9897 per ounce of substitution. For adjustments to sugar, see p. 29. Add total to additional butter to Line 1 <above>. Sugar adjustments should be reflected in final total of Line 2. For additional details on cocoa conversion, see Form 551.

Line 6a. Flour, white. If you were a federal, state or local government employed, you may be eligible for an excess flour tax credit. Measure 2 cups, sifting is optional.

Line 6b. Flour, whole wheat, 1 2/3 cups.

Line 6c. Alternative mixture: 1 cup white flour plus 3/4 cup whole wheat flour.

Line 7. Vanilla, 1 teaspoon. See Schedule ZE for reporting use of imitation vanilla flavoring. You may be able to deduct the cost of real vanilla extract in 1991 if you itemize deductions.

Line 8. Salt, 1/3 teaspoon <optional>. If you are a head of household with dependents and were born during a leap year, you must add salt.

Line 9. Baking powder, 1 1/2 teaspoons. Use of baking soda will result in a penalty. See form W-Q.

Line 9a. Walnuts, 8 oz., chopped. You may be eligible to use pecans or almonds. See Part III of Schedule PE, Itemized Substitutions. Preheat oven to 350 degrees F <375 if altitude exceeds 5,500 feet>. Be sure that you have turned the oven on before you begin assembling the ingredients. In a bowl <2 quart capacity> cream butter and sugar for 3 minutes, or until well blended, whichever occurs first. <Note: If you are using the Nonfarm Cocoa Method R[see Line 4 R], add additional butter and sugar at this point.> Next incorporate eggs, one egg at a time, into creamed mixture. If the eggs are from a farm of which you are the sole owner, you may be eligible for a Fowl Credit. See Form 9871m "For the Birds". Add vanilla. In a double boiler, melt chocolate at low heat. If you are using the nonfarm Cocoa Method, disregard the preceding instruction and stir in flour.
Apple II Computer Info

from Line 6a, 6b, or 6c, add salt <optional, but see Line 8 for exception> and baking powder. Add nuts, which should be chopped, regardless of type <see Line 9>. Pour batter into greased and floured cake pans, which you should have prepared earlier. After removing cake pan <s>, cool for 10 minutes <12 for 9x13 pan> and turn cake out on wire racks. When cake is completely cool, frost it. <To determine time needed for cooling, complete Worksheet on p. 25.> See Form 873 for details on appropriate frostings.

Note: If you weigh 20 percent more <or higher> than your ideal weight, ignore this recipe and complete Schedule F, "Fresh Fruit Desserts."

SHAREWARE, FREeware or ???
----------------------------------

By Richard Vega
[RVega]

>>> SHAREWARE, FREEWARE OR? CONFUSED? <<<

SO WHAT IS IT? In putting together the PD_Quickview article for the first issue of the GEnie Lamp Mac I noticed that the application was shareware, not public domain. I then started to ask around to see how many people really knew the difference between them was. I even watch a news shows where the anchorman was using the wrong definitions. This article is going to attempt to address that, along with some of the other terms we use for the files found in the public libraries.

The basic terms used for files are public domain, shareware, copyrighted and freeware. The first thing to understand about these terms is that they are not mutually exclusive. That will be explained more as I explain each one. If you are going to download files from a BBS then it is important to have at least a working knowledge of these terms. Please note that when I use the word file, I am talking about an application, graphic or anything that is the result of someone's work. In fact it doesn't even have to be computer related.

PUBLIC DOMAIN The most common term used is public domain. Most people believe that if you can share the file with your friend then it is in public domain. There was a time when this was true. It is not true now. Public domain means that the author gives up any rights to what happens to the file. It can be used, copied changed or treated in any way. It can even be included in a commercial product.

This last point is important when we are talking about computer program code. The issue came to a head on the MS-DOS platform with the ARC compression format. To those who may not know, ARC on the MS-DOS machines is the standard for compressing files together for transferring over a modem. It is the equivalent to the Stuffit format on the Macintosh. What happen is that a company came out with a compatible
PKARC program for sale. The author of the ARC code, which was freely distributed claimed that the ARC format was not public domain. Therefore even though anyone could get a copy of ARC, the author of PKARC could not use the code in the commercial program.

The result of this disagreement is not as important as the basis for the disagreement. If the ARC code was in public domain the the author had no basis for his objection. The PKARC author could use the code in his commercial program. If the ARC program was not in public domain, even though it was free, then the PKARC author did not have the right to use it, or alter it, without first receiving permission from the ARC author.

SHAREWARE The most common files found on public BBS systems are "shareware. This sprang up due to the fact that many users where complaining that software was becoming to expensive and the you could not return it if it did not live up to the claims made by the publishers. People wanted to be able to "try before you buy!" With shareware you can get a copy off a BBS or from a friend, try out the program for a while, and then decide if you want to pay for it or not. Sounds simple enough, doesn't it?

Almost immediately people started to confuse shareware with public domain. It was understandable since up to that time anything found open to the public was public domain. Shareware authors have their hands full. They first have to make the public understand that the files they release as shareware may not be freely used, changed or altered. Second, they are trying to find a way to get people to pay the money asked for, if and when they decided to use the files.

The results of the "shareware wars" have been interesting. Some have chosen to just place the files in public with clear messages about what they want. Others have released crippled versions of applications, or sample files. When you pay the "THE RESULTS OF THE 'SHAREWARE fee you then receive the full WARS' HAVE BEEN INTERESTING." working copies of the files with documentation. To date I am not sure what has been the result of any of these efforts. I have been in on many discussions that often become heated. The bottom line I see is many people don't understand that the author of shareware files have retained all rights to that file. We have seen some files move from shareware to becoming commercially packaged and distributed. Some have done very well for the authors on the dealers shelf. As shareware they didn't bring in a penny. The files' rights were always owned by the author. What changed was the way the author choose to distributed it.

COPYRIGHTED Copyright for software hold the same rights, and same "muddled clarity, that it does for any other area of creative work. Simply stated, any creative work is under the control of it's author unless legally given to another.

What has caused confusion is twofold. First, in the beginning, computer programers worked mostly in a club atmosphere. Code and programing style was freely passed around. With the onset of the personal computer came the software marketplace and the need of protecting you code under the copyright laws. The concept of passing around code, ideas, programing style and even full working application has hung on, especially in schools and "hacker" user groups. The ethics of "a fair wage for fair labor" is slowly making it's way in the
computer users circles. As computers become an everyday items in peoples houses the understanding of copyrighted software should become clearer.

The other confusion lies in the fact that some software is free for the taking. This leads many to think that the author has given up the rights to the file (be it code, application or data). What needs to be made clear is that the author of any work has the right to what happens to that work. That means the right to say if, when, where and how the creative work is distributed. If some is given freely away and then sold to others, it is within the copyright owners right to do that. The only action that removes that right is a legal written release of those rights. This was clearly shown when Apple decided to give away Macwrite and MacPaint with each Macintosh. Then they decided to sell it separately. Many people disagreed with this move but it was within Apple's legal rights.

FREWARE The newest term being used is Freeware. This term was coined in an attempt to clear up the confusion mentioned above. There are many files given away freely but still not in public domain. These files often come with restrictions about how they are to be distributed. Some are very specific about how they are _not_ to be distributed, such as through "pay per disk" shareware companies. The author doesn't want any money for their work and doesn't want anyone else making money from their work. As stated above, they have the right to make that limitation, even if we do not agree with them.

When you get a copy of an application look for the copyright screen. This will tell you if the author is keeping the copyrights. If the screen _does not_ clearly place the file into the public domain then the rights are retained. Look also in any documentation files that come with the file. These often contain directions as to how the file may be shared. Be careful, for these sometime contain very restrictive directions. Many distribution rights are restricted to GEnie or other on-line BBS systems.

SUMMARY Some people believe that the copyright laws are unclear about computer software and data. In some areas that many be true. In the world that most of us work and play, the copyright laws are very clear. Our rights to use and share any creative work, be it on the computer, on canvas or in any other form are limited by the copyright holder of that work (usually the creator). The copyright owner then has the responsibility to make those limits clear to us in a manner that we can understand.

[EOA] [FUN]
CowTOONS!

By "Hawk"

This cow belonged to George Washington. Ben Franklin owned this cow. Abe Lincoln's cow.

THE QUICKIE SCANNER

The Quickie scanner by Vitesse promises to be one of the new products that can breathe new life into the Apple II. It is a hand-held half-page black & white scanner with up to 400 dpi (dots per inch) resolution. Although I have mine installed on my IIgs, the Quickie will work just as well on the IIe, the II+, or the Laser 128.

The scanner comes with a 6 foot cord, bootable GS/OS and ProDOS versions of its software on both 3.5" and 5.25" disks, and an interface card. The installation procedure is adequately documented in the 46 page manual. Basically, installation takes less than 5 minutes and boils down to plugging the card in a slot, attaching the card's socket to the backplane of the computer and plugging the scanner into it.

Although the manual claims that the card can be installed and operates "invisibly" in any slot, the short cable that goes from the socket to the card doesn't allow for placement in any other slots other than 1 or 2 on the GS. It also fails to give any alternative to the "short access hole" (next to slot 2 on the GS) into which the card's mini-DIN socket is fastened. Mine was occupied with my ProGrappler cable, and after thinking about the problem for a little while, I chose to move the ProGrappler cable and "modify" one of the removable plastic covers for the longer slots for it.

The software is equally as simple as the normal installation. The GS/OS version comes with a run-time version of "Wings", another Vitesse product, which further simplifies the process, and presents the ever-familiar desktop interface. One particularly nice touch to the GS version is the inclusion of a condensed version of the program that can be installed as an New Desk Accessory (NDA) which can be invoked from within virtually any GS application. (Another documentation failure: the
manual fails to point out that not only "Quickie.NDA" must be in the Desk.Accs folder, but the file "Quickie.Prefs" must be as well!). The choices on the pull down menus in the GS version (both stand-alone and NDA) have keyboard equivalents. However, the scanning options in the NDA version are limited as compared with those of the application itself. By contrast, the ProDOS version is simply menu driven.

The real fun begins with the actual operation of the scanner. Once you set the appropriate method of scaling the grey tones, proper use of the Letter/Photo switch and the contrast thumbwheel takes a bit of practice (A minor complaint: the infinitely-adjustable thumbwheel is positioned right where one's hand would grasp the unit for scanning, and therefore is very easy to move unintentionally). Scanning takes a steady movement of the scan head- the software constantly "clicks" as you move the head during a scan, letting you know when you're going too fast.

My own experience with the scanner has led me to a somewhat surprising solution for getting consistently straight and smooth scans- use a "Rolling Ruler" held firmly against the top edge of the scan head. The ruler's "wheelbase" is wider than that of the scan head, and the straightedge provides an ideal method of making sure the material to be scanned is lined up correctly.

Once you finish the scan, the scanned image is processed according to your settings and displayed on the screen. The processing time is dependent on your settings as well as the size of the scan itself.

The "Save As..." command gives the user the option of saving the scan in either:

- Screen Format (65 blocks long),
- Paint Format (compressed),
- Apple Preferred Format (compressed),
- Print Shop GS format (a non-standard format used only for that program),
- Hi-Res format (standard format used by Publish It!, among other programs), or
- Double Hi-Res Format.

The software is very forgiving if the scan does not turn just out the way you intended and you want to try again. Just discard the old scan, and scan again.

Uses for the Quickie are only limited by your imagination. True, the scans are in greyscale, but they can be imported into and "colorized" with any paint program. Line drawings, photographs and even paintings can become clip-art for your desktop publishing applications or "slides" for your slide show presentations or even the bases for your own unique computer art.
In summary, the Quickie scanner is simple to install in any Apple II, is nearly flawless in operation (with practice), and is a fast and easy way to add clip-art, photographs, and artwork to all of your Apple II applications.

>>> DON'T TOUCH THAT KEYBOARD! <<<

NEW LIFE FOR APPLE II   In my article about the Quickie hand-held scanner, I sang praises about how it could breathe new life into the Apple II. Well, folks, when the Quickie hand scanner is used in conjunction with Westcode's InWords OCR (optical character recognition) software, the Apple II not only gets new life breathed into it, but actually allows Apple users to tap the raw power that up until now was reserved for those, ahem, "sophisticated" machines. And it does so for a fraction of the cost!!

Using InWords, virtually any printed information can be scanned and imported into:

- a classic AppleWorks or Appleworks GS word processor document, spreadsheet, or database,
- a BeagleWrite GS (MultiScribe GS) document,
- a GraphicWriter III document, or
- a text file for inclusion into HyperStudio (and theoretically, HyperCard GS)

A user should even be able to "scan in" a program listing that has been published in a magazine, instead of typing it!

This powerful program was written by our good friend, Alan Bird. Mr. Bird was responsible for a lot of the Beagle Bros AppleWorks enhancements. In this program, he hasn't forgotten his roots. InWords has the familiar AppleWorks filecard interface, and hence is extremely simple to use. It comes on non copy-protected, bootable 5.25" and 3.5" disks.

The documentation is well-written and indexed. It even walks the user through several OCR sample sessions.

InWords presents the user with THREE different ways to scan printed material:

- Standard scan- used when the column of text is narrower than the scanner's head,
Apple II Computer Info

- Merge scan—used when the column of text is wider than the scanner's head, as in a hardback book, and

- Column scan—used when there are two or more columns of text, as in a newspaper or magazine.

InWords comes with an extensive standard font table plus specific font tables for many popular magazines (I was gratified to see A2-Central and NAUG as two of the specific fonts recognized).

Once the Letter switch on the scanner is set and a resolution of 300 dpi (dots per inch) is selected, the user is all set to scan down the page (portrait mode). Again, as when using the Quickie alone, there is the option of audio feedback to monitor the speed of your scan.

After the scan, and Return is pressed, then the magic takes over. This is called the recognition process, and, yes, InWords actually analyzes your scan, compares it to the font table that you've selected, and quickly recognizes the text which it then deposits into an AppleWorks-like editor for proof-reading and correction by the user. All unrecognized characters are denoted by a user-definable character (the manual suggests one such as " ~ " which can be easily detected by a spell-checking program).

Don't worry if InWords doesn't recognize some particular text because it's in a unique font. If the "Font training" option is selected, InWords will "step through" each of the scanned characters and ask the user to tell the program what letter or number that the character represents. As more characters are "defined", the process gets faster. The program gives the user the option of saving this information in a font table which can be saved and used again.

The user is given the choice of THREE methods of saving the recognized text:

- as a straight text or ASCII file,

- as a text file with a <RETURN> placed after each line, or

- as an AppleWorks word processor file.

What you intend to do with the recognized text afterwards should govern how you save it to disk. For instance, if you want to import the recognized text to a AppleWorks database, it is important to save it with a <RETURN> after each line, as these will define the fields and records.

Version 1.0 of the program (released in mid January, 1991) is the current version of InWords, and there are the inevitable but, in this case, relatively minor "undocumented features" or peculiarities to deal with. Four of the most egregious:

1) if you have a RAMdisk set up as part of your system's configuration, InWords doesn't like anything to be on it,

2) if the document you are trying to scan has any blank lines, such as signature lines, in it, InWords will not be able to recognize them and will crash,
3) the program tends to take all available memory (it shares this peculiarity with Classic AppleWorks pre-version 3),

4) InWords tends to confuse similar looking characters, such as "O" and "0", "1" and "1", and "S" and "5",

5) InWords doesn’t allow for landscape scanning (scanning across the page instead of straight down it), and

6) Although InWords supports Quickie and other Apple II hand-held scanners, it doesn’t support flatbed scanners.

I have it on good authority that version 1.1, which should be shipping to registered users and available for sale by the time you read this, corrects ALL of these shortcomings, except landscape scanning and the flatbed scanner support.

Despite these peculiarities, InWords allows the Apple user to become even more productive—productivity that, again, is only limited by the imagination—unleashing yet another part of the Apple II’s power at a very reasonable cost.

>>> FLAT-RATE TELECOMMUNICATION <<<

~ A Landmark Event in the History of Human Communications ~

Throughout the history of human communications, there has always been a monetary fee associated with long distance communication. From the pony express to the U.S. mail to the telegraph to the telephone to the fax, every long distance communication medium has charged a "per unit" message fee. The underlying rule has been that the more you communicate, the more you pay.

Enter flat-rate telecom.

For the first time in the history of civilization, human beings are offered the opportunity to communicate long distance at a flat-rate.

The upshot of this is that the MORE you communicate, the LESS you pay per message.

Human beings are so accustomed to being charged "per-message" fees for long distance communication that they fail to fully appreciate the revolutionary nature of flat-rate telecom. Homo sapiens are creatures of habit, and the habit to keep long distance communication to a brief minimum is one that is hard to break.

But take a minute to think about this.
The United States Postal Service charges you a communication fee by the ounce.

Your long distance phone carrier charges you by the minute.

Western Union charges you by the word, for telegrams.

But GENie charges you a flat-rate --- by the month --- for unlimited usage.

Not only that.

Unlike other national information services, GENie doesn't place a cap on how many e-mail messages you can send per month. At no time do you have to stop and consider, "AT NO TIME DO YOU HAVE TO STOP AND CONSIDER, 'GEE, I WONDER IF IT IS WORTH MY WHILE TO SEND THIS NEXT MESSAGE?'")

"Gee, I wonder if I've exceeded my 60 messages per month limit? I wonder if it is worth my while to send this next message?"

GENie also goes beyond other information services by allowing lengthy text file uploads via GE Mail. (While GENie does not explicitly state a size limit for text file uploads into the GE Mail editor, a recent test upload of a 25K text file received no complaints from the GE Mail editor.) Other information services limit text file uploads to 5K or less, per e-mail message. This effectively forces you to send larger files via other methods, rather than as e-mail.

As we enter the Information Age, anthropologists have come to appreciate that communication lies at the very core of our social structure. It’s no exaggeration to say that civilization as a whole advances in direct proportion to the quantity and quality of communication taking place.

Businesses grow through communication.

Children learn through communication.

Social fabric is formed through communication between human beings.

When the per-unit fee for long distance communication is kept to a bare bones monthly minimum, society as a whole becomes the ultimate beneficiary.

When people freely exchange ideas, society as a whole moves forward.

The full significance of flat-rate telecom becomes apparent when you consider it as a better bargain than even flat-rate local phone service. Just as nobody thinks twice about picking up the phone to call a local friend, in time nobody will think twice about making the best use of flat-rate telecom.

True, e-mail does not offer the equivalent communication experience as a real-time phone conversation. But e-mail does offer two distinct advantages over phone communication: 1) It is non-disruptive, and, 2) It
is easy to "publish" or "broadcast" a message by courtesy copying two, four, eight, or twenty-eight other persons.

Whatever advances in communication occur in the next 50 to 100 years, historians will look back on the early 1990's as being a pivotal turning point in the history of human communications. Those were the first days that the human animal communicated long distance without having to pay a per-message fee.

You don't have to be Johann Gutenberg to realize the full significance of this development.

And the doorways it opens up.

[*][*][*]

Phil Shapiro (The author is the founder of Balloons Software, a new Apple II educational software company. Phil Shapiro is a resident of Washington D.C., uses GEMail to communicate with friends and business colleagues in Honolulu, Hawaii; British Columbia, Canada; and Moscow (via Finland). He can be reached at 5201 Chevy Chase Parkway, NW, Washington, DC 20015-1747. Or via electronic mail on GEnie: P.Shapiro)

Throughout the ages, we humans have been striving to create an equal and universal language of communication. The ancient Egyptians, the Heinian, the Romans, the Orthodox, and even the ancient Chinese have all recognized the potential for a creative solution.

File Type : Freeware

[*][*][*]

>>> HIDDEN TREASURES <<<

~ The "Computer Keyboarding" Freeware Disk ~

Every once in a while a program is uploaded to the Apple II Round-
Table library that has all the polish and refinement of a commercial software program. Two months ago Charles Hartley, a middle school computer teacher from Kentucky, uploaded a disk he made called "Computer Keyboarding." If you missed seeing the freeware notice on the opening screen, you could easily mistake this program for being a commercially produced product.

Computer Keyboarding is a touch typing tutor that thoroughly and carefully drills you on touch typing skills. The program takes you right from the beginning, even giving you a short lesson in proper body posture and hand-positioning. Beyond that, the program keeps careful track of your progress, so that you can easily pick up where you last left off.

Best of all, Computer Keyboarding runs on any 64K Apple II, and does not require an 80 column card. (Presumably, therefore, it could be used on a 64K Apple II+ or an unenhanced, 64K Apple IIe.) Naturally, it should also run fine on any Apple IIc, IIGS, IIc+, and Laser 128 series computer.

Before describing this program any further, let me quote from the documentation that comes along with the disk, describing the author's motivation for making it:

"I wrote this program because I could not find a decent and affordable typing instruction program that taught typing the way I thought it should be taught. This program is unique in that it puts greater emphasis on accuracy, not speed. Other programs that I have seen or used seem to have a fixation with speed. The program is highly structured in the sense that users must attain a degree of mastery with one set of keys before they proceed with the next set. At the same time there is a degree of flexibility built into it. Users who have difficulty with a set of lines are presented with the same set again and/or are presented additional lines to type. Also, users have the opportunity to practice lessons a second time voluntarily if they wish."

When I took this program out for a test drive I was happy to see that the author included three cute little typing games. But the only way to get to these games is to progress methodically through the lessons.

Should you wish to download and use this program, here are some tips and suggestions:

The name of the shrunk file is: "Typing.Inst.BXY". You can download it to either a 5.25 or 3.5 inch disk. The program itself is quite large, and therefore needs to be unpacked to two 5.25 or one 3.5 inch disk.

Instructions for unpacking to two 5.25 inch disks is contained in the AppleWorks file titled: "Read.Me.First". First you format the two 5.25 disks using the given volume names. Then you can unpack the shrunk files to the two disks by following the given directions.
As with most downloadable programs, the final step is to copy ProDOS and BASIC.SYSTEM onto your bootup disk. But before you boot this disk, WAIT! Make a backup copy first. Put the original aside. Because after you register your name to the disk, the disk will not allow someone else to register under a different name.

The whole idea is that each person gets their own typing disk, where the program keeps careful track of your progress. Since the software is freeware, there is no reason why you can't easily make ten, twenty, or as many copies of the disk as you need. But if you register your name on the disk before making the copy, you'll have to go through the whole unshrinking procedure to produce a virgin "unregistered" disk.

One final note: the documentation in the "Read.Me.First" file is contained in an AppleWorks 3.0 word processing file. Even if you don't own AppleWorks 3.0, you can still display this file on your screen by using the "Type" command on ShrinkIt. You may want to take some written notes if you plan on unshrinking the file to two 5.25 inch floppies.

If you're an adult who is still doing the "hunt-and-peck" routine, now you have no excuse for not learning to type with ten fingers. If you know of any teenagers who have some spare time this coming summer, learning to type with Computer Keyboarding could be one of the best uses they could make of their free time.

Charles Hartley, the talented programmer who made Computer Keyboarding, invested months of work in producing this disk. The fact that he is willing to share this program as freeware is a testament to his generous and caring spirit. We are fortunate to have such a creative, sharing soul as an active members of the GEnie Apple II community.

>>> A USER'S REVIEW OF POINTLESS <<<

~ by WestCode Software ~

I'll try to hold the Pointless jokes to a minimum. TrueType for the Apple IIGS is the name of the game here, and Pointless is an excellent rendition of it.

This program begs for your abuse. You can store fonts in any online drive, load and unload available fonts from the control panel, and read Macintosh TrueType fonts directly from a Mac formatted disk. (Reading Mac disks will be allowed with the arrival of GS/OS 6.00)

Alan Bird knew what we needed, and gave it to us in spades. Pointless works invisibly, on screen and out the printer. In short, this is good stuff:

1) Smaller system size for those with a lot of font sizes -- a
TrueType font family can be a lot smaller than the bit mapped equivalent; bitmapped Courier font in 8 sizes (9,10,12,14,18,20,24,28) takes 61K and prints jagged characters in the larger point sizes. Courier bold adds another 63K for a total.

If you use a printer driver that reduces larger point sizes for higher quality (The Imagewriter II uses 2 times the screen font, Imagewriter LQ uses 3 times the screen font, Deskjet uses 4 times the screen font) you'll have used a lot of disk space for fonts.

TrueType Courier, with bold, takes 113K, and prints smoothly at all sizes. And the TrueType fonts will load from any online disk -- not just the boot volume.

2) Better print for most printers -- Pointless generates the correct size when asked by your printer driver, so you always have that larger font size to reduce for smoother print.

3) Better screen print -- I haven't noticed THAT much difference on the screen, except I can now read the font used in the AWGS communications module. The online talk is that many people do notice.

4) The manual is quite good.

5) It's from WestCode, home of Inwords digital scanning software. These guys deserve our support!

Bad Stuff!

1) Eats system RAM if you are not careful -- Generating fonts is so painless, you will not notice them piling up. At 4 megs I can play pretty hard. But with five or six fonts in three sizes on the screen, I better not try to print. Pointless will generate bit maps for each of font and point size that are 4 times the screen size when Harmonie asks it to. I will run out of memory.

I had the same problem before, with the bitmapped fonts, but Pointless is so much fun, it happens more often.

2) Time for font generation may be a factor -- With a ZipGS 10 mhz, 64K cache, font generation time is always less than 5 seconds. But I am impatient, so I load some bit mapped fonts.

3) Genie bills will go up -- As you download more fonts (the cost of improvement) or you brag about the improved output, or some obscure font. All in all, It's Pointless to use TruType fonts on the GS!

So What?

1) You need this program if you have Harmonie or Independence, and a high quality printer.
2) LaserWriters are a special problem, and this won't help. You don't need this if you have a "basic" system, unless you like to play with fonts.

Note: If you use a Mac, Metamorphisis will convert most any PostScript type1 font to TrueType, then use Stuffit (not Deluxe) and transfer to a Prodos disk with APFE, unShrinkit it with the GS, and you have a new font for your GS.

Alliance International On GEnie

""""""""""""""""""""""""""""""""""

ALLIANCE INTERNATIONAL ON GEnie New on the marketing side of the Apple II world is the Alliance International Inc. In its simplest form, the AII is a national Apple II user group, determined to bring the lonely Apple II user into the interactive Apple II community.

But AII plans on doing much more. The following two posts can be found in AII's new topic, Category 5, Topic 7. The first explains the formation of AII and the groups goals. The second tells about AII's current status.

>>> WHAT IS THE ALLIANCE INTERNATIONAL INC. (AII)? <<<

The Alliance came about as a result of discussions between a group of Apple II developers, users and Apple engineers on America Online's "Across The Boards" area. One of the developers/users involved in those discussions, John Majka, of Louisville, KY, decided to form a "support group" for the Apple II based on the premise that since Apple Computer, Inc. apparently is not going to support Apple II owners, Apple II owners should get together and support each other.

In late 1991, AII was incorporated in the state of Kentucky. It is currently a "for-profit" corporation because a "non-profit" company is somewhat more complicated to set up and there are complex state and federal laws about tracking donations, costs, reporting, etc. So it is simpler and cheaper to go "for-profit", at least for a while.

The mission of The Alliance is to promote and advance the use of the Apple II computer in home, business, education and other markets.

We intend to accomplish that mission by...

1. Notifying Apple II users through national media (newspapers, radio, TV) that they can get support for their computer from The Alliance.
2. Providing an "800" support number.

3. Offering a subscription to a quarterly publication which lists available Apple II software, hardware and services and where to purchase it or find it.

4. Encouraging existing developers of Apple II software to continue development.

5. Encouraging developers of software for other computers (Borland, Aston-Tate, Lotus, etc.) for home and small businesses to develop software for the Apple II.

6. Talking to, lobbying, pressuring Apple Computer, Inc. to devote more resources to the Apple II line.

In order to accomplish these goals we are asking individuals and Users Groups to become members of the Alliance. The dues for individuals are $20 and for Users Groups, $50.

Your membership will tell us that YOU want the Apple II to live and grow. It will tell us, and the developers that you want more software and hardware. It will tell us if we are right or if Apple Computer, Inc. is right, that Apple II users don't care, and that we are just whistling in the grave yard of the Apple II. It will let us know if we are wasting our time, efforts and money or not.

If you decide to support us in supporting the Apple II, please send your $20 or $50 check and any ideas and suggestions you may have to:

THE ALLIANCE INTERNATIONAL INCORPORATED
P.O. Box 20756
Louisville, KY 40250.

For more information about the Alliance's activities and goals, please continue to read the messages in this topic. We invite any questions, comments or discussion of the Alliance's goals and purposes.

MORE ALLIANCE   FOR IMMEDIATE RELEASE  March 16, 1992

THE ALLIANCE INTERNATIONAL INC. REACHES INITIAL MEMBERSHIP TARGET, WILL BEGIN APPLE II PROMOTIONS

The Alliance International Incorporated announced today that it has reached its initial target of 150 paid members. Alliance officials say this early success means that The AII will soon be able to begin actively promoting the Apple II computer through advertisements in national magazines or newspapers.
The ads will be aimed at current Apple II owners who do not belong to a local users' group or subscribe to Apple II publications. The advertising campaign also will target new computer buyers with the message that an Apple II computer is still an excellent buy in the current computer market.

The Alliance, incorporated in October, 1991, is an organization of Apple II users and software developers who want to promote the Apple II computer. Although such promotional activity would normally be done by the computer's manufacturer, Apple Computer Inc.'s marketing efforts have been focused almost exclusively on its Macintosh line of computers in recent years, resulting in a significant decline in consumer awareness of the Apple II. The Alliance is not affiliated in any way with Apple Computer Inc.

In January, 1992, The Alliance's board of directors had established a minimum target of acquiring 150 dues-paying members ($20 per year for individual memberships, $50 for user group membership) by April 1, 1992. The board believed that achieving this goal would show that there is sufficient user support for the goals of The Alliance. The fact that the goal was reached two weeks ahead of schedule is especially encouraging.

As support for the Alliance continues to grow, convincing software developers to stay with the Apple II and to create new products for it should become easier.

Another goal of The Alliance is to provide greater support for current Apple II owners by increasing the number of programs available for the computer. The AII intends to accomplish this goal by encouraging current Apple II software developers to write new programs and by persuading IBM PC and Macintosh software developers to "port" or re-write current applications to run on the Apple IIe and Apple IIGS.

"If Lotus 1-2-3 could run on a 40 kilobyte IBM PC, then it could easily run on a 1 megabyte Apple IIe," said John Majka, secretary of The Alliance. "And there is a great deal of similarity between the operating system and tools of the Macintosh computer and the Apple IIGS computer. If a program runs well on a Macintosh, re-writing it for the Apple IIGS would be very simple. By opening up the Apple II market, software developers could increase their sales and profits."

APPLE ALLIANCE THOUGHTS Allow me to post my own thoughts on the Alliance and its goals. I speak here as a member of the Alliance (I sent my $20 check last week), a friend of John Majka's (he's in my local Apple users' group) and a longtime and still-committed Apple II user. I opened this topic because John asked me -- and I agreed -- to serve as the unofficial GEnie representative for AII.

I support the Alliance for the same reasons that I supported an effort that began more than a year ago here on GEnie. For those of you who followed that discussion, there was an attempt to accumulate enough money to place an Apple II ad (or series of ads) in inCider or some other national publication. As I recall, nearly 100 GEnie subscribers pledged money to the cause, but in the end the person who had agreed to lead the effort abandoned it for lack of time.

It was evident then that any such effort would engender, at the
least, a fair amount of dissension. Everyone seemed to have his or her
own idea about what the ad should say and where it should be placed and
why we should adopt one strategy over another.

The Alliance undoubtedly will face the same problems. Lots of us
would like to support the Apple II in some way or another, but we want
to do it OUR way. We would all love to see Apple Inc. step up and
actually try to persuade people to BUY the computer they make (and
software developers to write programs for it), but we also all know that
that just isn't going to happen.

So what are our choices? We can gripe a lot at users group
meetings or in BBS messages; we can send poison pen letters to John
Sculley, or we can join the Alliance and try to pool our resources to
create an effective, organized voice of support for the Apple II.

The Alliance may not be the organization that YOU would have
created, or you may not agree with all of its goals or strategies, but
it is the ONLY group I know of that is actively working to create a
national (indeed, international) coalition to support and promote the
Apple II. Its long-term goals include advertising the Apple II in
national magazines and newspapers, encouraging developers to write or
port software for the Apple II and, in general, increasing consumer
awareness of the Apple II.

If you agree with these goals (and especially if you were willing
to pledge to the earlier effort here on GEnie) I hope you will support
the Alliance by sending your $20 membership fee to the address listed in
previous messages in this topic.

If you have ideas, suggestions, comments for AII, or disagreements
or whatever, please post them here (or send me e-mail) and I will pass
them on to John and the other Alliance directors. --Dan (via TCXpress)
(D.CRUTCHER, CAT5, TOP7, MSG:8/M645)

ALLIANCE Responds  (D.CRUTCHER: John Majka asked me to post the
following response to previous messages in this
topic: First, all comments and criticisms and advice are well taken.
Some of us have said many of the same things. We are NOT thin-skinned.
If you don't agree, fire away! We don't claim to know everything nor
have a corner on the good idea market.

The Stamp   Well, its worth a shot! The worse they can do is say "No"
""""""""""" and we're no worse off than before. If we get it, it's
great publicity for a great computer.

Support   One of the biggest, if not the biggest gripes I've heard from
""""""""" users is that there isn't enough software for the Apple II.
We aim to change that.

Marketing  The Apple II is a great computer but the world doesn't know
about it. It's time it did! That's why we're trying to advertise it. Then, maybe, people will stop saying that the II is technologically obsolete or a kid's toy and say nice things about it. That will encourage Apple II users and developers. It may also bring in new computer sales. Remember that Apple said that they would support the II as long as people wanted to buy it. If new users aren't buying, Apple will drop it. So new sales are as important as existing users.

We will NOT be advertising in Apple II publications. That's preaching to the choir! That's also the responsibility of companies that make and sell Apple II stuff. If we're selling anything, it's the computer and the Apple II Dream that seems to have died at Apple Computer Inc. Just a few of the mags we're putting ads in are National Review, New Woman, Sports Afield, Inc. Magazine and Nation's Business.

Our ads will start out small but as The Alliance grows, so will the ads and our effectiveness.

We probably won't be advertising in other computer mags either. That's preaching to the devil! The readers already have their computer and are not about to toss it out. (Although, an IBM PC clone user here in Louisville recently got his hands on a IIGS. His PC clone is now for sale. Any offers?)

Coming out of the closet As for pulling the Apple II out of the closet, if that's what they have, then we'll encourage them to do so. In addition to my IIGS, I still have and use a II+. It's even connected to my HP LaserJet IIP. The Alliance has also received letters with membership checks from a number of Apple II+ owners. One was a lawyer who still uses Applewriter and is very happy. If the user is happy and it meets his needs, fine and dandy. If not, maybe we can convince him to upgrade to an Apple IIGS instead of a clone.

Education We've not forgotten the educational wing even though most software and hardware sales are not to educational institutions. (A recent, non-scientific survey of a few Apple II developers showed that less than 5% of their sales went to the education market.) One of our members is writing up his experiences in helping a local school make their Apple IIs more effective. When finished, we plan on giving it to educational computing magazines and member user groups as an article or series of articles depending on the length. Another member already has written a couple of books on the subject and is writing another. We are going to see if we can sell them.

T-Shirt Thanks to A2 Sysops for putting The AII on your mailing list. We appreciate it and especially appreciate the article mentioning The Alliance.

If the topic of my article was not suitable, well, I can't be perfect all the time and can't please everybody. But if it was my writing style, let me know and I'll change or get somebody to do it better. Of course, you're free to edit it too.

The T-Shirt was done before but it might be worthwhile to do again. My idea is a picture of an Apple II on the front of the T-shirt with the words "One more time: This is your brain." On the back, a picture of an MS-DOS computer with the words, "This is your brain on drugs."
questions?" We could sell the T-shirt and use the funds for additional activities. One person wrote in and suggested jewelry like a tie tack or pin.

Good idea though, contests are always good at generating publicity. That's why radio stations use them so much.

Let's get these ads rolling first. If you're in the business of supporting the Apple II, expect to be getting a letter in the next week to 10 days. If you haven't received it by April, 15th (TAX DAY), let us know. We're going to need something to send to the people who respond to our ads. We think brochures of Apple II software & hardware are perfect to let them know that the II hasn't been abandoned!

We've been up to our eye balls with processing new memberships, getting advertising info, developing the ads, figuring out where to put them, getting developers & publishers & others involved and getting info for the National Apple II Day at the Mall and answering questions. Then there's KansasFest and Boston Applefest coming up.

Once this stuff is out of the way, we can concentrate on other things.

Joining I can understand reluctance to join on the part of Apple II "*******" users. One fellow sent in a membership check and said that he'd put an article about The AII in his user group newsletter if we were still around in 30 days. There have been a number of ad hoc campaigns that just petered out. I assure you that this one won't! We know that we have to prove it to you and we will! Besides, have I ever lied to you before? :)

We've been officially around since October 22, 1991, the incorporation date. That's more than 30 days right there! It's taken a while for word to spread and get stuff in the Apple II magazines because of publishing schedules. But we're in here for the long haul.

I'm of 100% Polish blood. There seems to be something about Poles that doesn't let them give up. Face it, any country whose national anthem begins "Poland isn't lost while we are still alive..." is going to produce fighters. As far as The AII is concerned, "The Apple II isn't lost while we are still alive."

We may still lose the fight but there will be a fight!

-John Majka (D.CRUTCHER, CAT5, TOP7, MSG:34/M645)

FROM MY DESKTOP /

Notes From The Editor
"""
By John Peters

Welcome to the second multi-platform issue of GENieLamp Online E-Magazine, (and for the ST readers, our 35th issue). All-in-all, we've had a pretty good month. Considering the scope of the task of getting four 100+K issues online, things went rather smoothly for our first issue. We did experience a couple of major glitches, however. My apologies to the ST and MAC readers for the repeating text problem. I think I have a handle on the infamous "dreaded GENie Text Editor," and I'm confident that it won't happen again. Also, the IBM, MAC and ST version ran an article on the GENie Flight/war simulator, Air Warrior. Somewhere along the line, I got the idea that AIR.WOLF was the author when it really was Robert C. Bingham. [R.BINGHAM2]. Sorry, Robert!

Soon after the premier issue went online, I received GENmail from Patrick Boyle asking if it would be possible to insert codes into the issues that would allow vision impaired people who use text-to-braille and text-to-speech devices to be able to skip over the "ascii-art." I thought that this was a great idea, so I set up a bulletin board topic in the disABILITIES RoundTable to get some feedback on it. It appears that we are breaking new ground here as there are no standards set for these readers. If you would like to get in on the conversation, you will find us in Category 9, TOPic 42 in the disABILITIES RT.

GENieLamp Is Looking For... We need help! If you think you have what it takes to be part of the GENieLamp staff, we want to hear from you! We are especially in need of help in the IBM, MacIntosh and Apple areas. Send your brief resume to GENIELAMP now. Let's talk!

GENieLamp RoundTable The GENieLamp RoundTable got off to a slow start - at least as far as content goes. The actual setting up, testing and going "live" was all done in less then 48 hours (a new GENie record!). We do have lots of plans for the RoundTable in the near future, so keep an eye on page 515.

ED-NET Comes To GENie! What is ED-NET? One of the major headaches many user group newsletter editors have is getting articles for his or her publication. ED-NET provides an answer for that. ED-NET is a place where you can trade pd or shareware articles with other editors from around the world for use in your own publication. You will find ED-NET in the GENieLamp RoundTable on page 515.

GENieLamp Keeps On Growing GENieLamp is now available in the following RoundTables:

The GEnie Faire Hits Town!  On Saturday, May 30 from 6:00 to 9:00 PM EST, GEnie will be sponsoring its first ever GEnie Faire. It will be an event that Saturday afternoon in the National Real-Time Conference during which many GEnie products will be manning a booth to introduce you to their product and to have some fun. The entire GEnie Faire will be free, so it will be a chance for you to find out what is out there on the system while having some fun.

The SFRT will man a booth during the entire Faire. They will be presenting a series of events based on the broad spectrum of subjects covered in the SFRT. You will be able to find anything from discussions about comics and Star Trek to a meeting with an published author to a writer's workshop, and much more!

The Radio RT will be sponsoring a live shortwave listening RTC at its booth. They occur every Saturday in the Radio RT, but this way people without radios or new to the hobby can stop by for pointers and to see what others are hearing. This is your chance to eavesdrop on what is happening in the world as it occurs! Stop by for a few minutes or for the entire GEnie Faire.

The Writers RT will also be manning a booth for the entire GEnie Faire. They will be sponsoring a series of meetings about the craft and industry of writing. An hour will be devoted to a discussion with the romance writers on the topic "So You Think This Is Easy? What DOES it Take to Write a Romance Novel?" Special guests will include several published romance authors along with several Romance Exchange participants.

The Games RT by Scorpia has come up with fun and games for everyone! They will be sponsoring a booth which will include the following:

6 - 6:30 : Games RT Open House (all staff online for intros etc).
6:30 - 7 : War Games with Pete Szymonik
7 - 7:30 : Ask Scorpia
7:30 - 8 : Video Games with Danny Han
8 - 8:30 : Neat Library Stuff with Capt. Cook
8:30 - 9 : Ultima Contest (win a copy of Ultima Underworlds, PC ver).

GENIEus will be sponsoring a booth which will go beyond the basic questions of how to use GEnie. They will be talking about a range of subjects including how to put together your own GEnie user group and much more!

The Genealogy RT will be hosting a time where you can learn how you
can go about the process of digging for your ancestors on GEnie. It's fun! It's clean! It's you!

The *StarShip* Amiga RT will be demonstrating one of its new features, the 5-MINUTE News Network. This feature gives you the news from the world of Amiga in a concise, fun way.

The Home and Real Estate RT will be hosting an hour's worth of popular "Parlor Games" for you. These games are geared towards subjects about the home, so anyone with a home should stop by for some fun and relaxation!

Star Fleet Battles will be hosting a booth where you will have a chance to talk directly to the developers of this game! They will be discussing Star Fleet Battles and their other games including Star Fleet Missions and Federation & Empire. They will accept proposals for new rules and debate their merits. If you want to participate in discussing important issues that will impact the games, then this will be your chance.

The Germany RT will be hosting discussion about Germany followed by thirty minutes of trivia where you will have the chance to win a German prize. Come meet people from another continent and find out about a place where many Americans can find their roots.

The Aladdin RTs will each host a booth where you can find out about a variety of subjects. Do you want to know how Aladdin can help you? Are you interested in knowing ways Aladdin can cut down on your time online? Here's your chance to ask the experts. Look for three Aladdin booths brought to you by the PC Aladdin, Ami Aladdin, and ST Aladdin RoundTables.

-Laura Staley [L.STALEY]

LAPTOPS ROUNDTABLE

Some vital files whose names never change, though their file number will change as they are updated:

- STREET.$$$   Quarterly report on street prices of popular laptops
- DEALERS.RAM  Quarterly listing of RAM module/chip dealers
- COMPANY.DIR  Quarterly listing of laptop/notebook manufacturers
- 3RDPARTY.ZIP  Listing of peripheral vendors and their products; prepared by Toshiba America, the information can be of great value to all laptop users. Current: 4/25/92
- TOSHIBA.$$$  Models & list prices of Toshiba computers. 4/92

Also, check out "RoundTable News" (Page 655:5) regularly for the latest pointers about the WordPerfect RoundTable and WPCorp announcements.

-Dave Thomas, Laptops SYSOP

GeoWorks RT Anniversary! The GeoWorks RoundTable is celebrating it's 1st anniversary. The RoundTable features support for GeoWorks Ensemble 1.0 to 1.2 to GeoWorks Pro, the GeoWorks Font Packs and a Clip Art library. They have also released the three Personal Office Series products. (They now have over 100 clip art volumes in our library and we're quickly approaching the 100 mark in the PD/Shareware font library!)

POSTSCRIPT HAPPENINGS... COMPUTER SHOPPER has unilaterally, formally, and completely discontinued the ASK THE GURU and LASERWRITER CORNER columns, citing "lack of space".
Apple II Computer Info

We do have ALL of the Guru columns available as our Book-on-Demand published ASK THE GURU I, II, and III. The full original texts, including all of the "lost" columns. Many of the later columns are (and will remain) on GEnie PSRT.

I've also just upgraded and improved our LASERWRITER SECRETS book and disk package, again picking up the latest and best (mostly unprinted) stuff. Just about all of these are (and will remain) on GEnie PSRT.

Any and all of these can be ordered through [SYNERGETICS] email, or by calling me at (602) 428-4073. I've also got a pair of free INSIDER SECRET RESOURCES brochures waiting for you, but I must have your snailmail address to send them to you. (GEnie keeps your address private, even from sysops with no-strings-attached free stuff to give away.)

I've just started a major new RESOURCE BIN column in NUTS & VOLTS (714) 632-7721. This is mostly on unusual sources of supply for electronic and computer projects. My HARDWARE HACKER columns in RADIO-ELECTRONICS (516) 293-3000 and my BLATANT OPPORTUNIST columns in MIDNIGHT ENGINEERING (303) 491-9092 are continuing as usual, with full reprints available.

And I seem to be backing into a minor column in THE FLASH, a great free Desktop publishing newsletter from Walt Jeffries and his BLACK LIGHTNING at (800) BLACK-99.

But I would very much like to find new and suitable high profile homes for a PostScript/LaserWriter column and for a Desktop-publishing-for-real-end-users column. If you can suggest anyone, have them give me a call at (602) 428-4073.

I guess I need your help on this. Thanks. -- Don Lancaster

UNIX ROUNDTABLE NEWS

It is now April 1992 and spring has arrived.

Spring cleaning is happening in the Unix bulletin board. New events are occurring, and ongoing happenings continue.

Two key items are coming up in the near future; the Unix RT hopes to be your center for information about these products.

* GEnie is implementing an Internet Gateway with X.400 mail services scheduled later on

* A Unix Help Desk is being established in both the Unix RT Conference area and the GEnie Chat Lines.

What does internet mail mean for you? GEnie responds to the widespread request of its members to have some kind of gateway for mail to the "Net." It means now you can distribute to persons outside the GEnie mail system your internet address. It means that you will be able to send mail to just about anyone on the Net. It means greater connectivity with the world. It may even mean world peace. We can
always hope.

X.400 mail is an international mail standard used for addressing mail across disparate mail systems. It has a very long method of addressing which some folks find cumbersome to type. In addition, there are current limitations in the GE Mail product limiting addresses to 35 characters. These limitations are being removed by the GE Mail programmers to allow a better integration of X.400 with the GE Mail system. GENie has elected to delay the release of X.400 connectivity until this integration is available.

(As of this writing no information about domain name or pricing is available. Stay tuned. Some information and discussion about the internet gateway status is available in the GENie Users' RoundTable on page 150;1 or 8001;1, category 5, topic 35.)

And beginning April 16, 1992 every Tuesday night in the Unix Roundtable Conference area (page 160;2 keyword UNIX) and every Thursday night in the GENie Chat Lines (page 400;4 keyword CHAT) a Unix Help Desk will be made available for anyone to ask Unix-related questions. Once you have entered the chat lines, choose channel 4 or type /CHA 4 after entering to get to the Help Desk. Hope to see you there!

In addition to help desks, Chat Lines offers many enticing features: multi-player games such as Trivia and word games, interesting conversation and socializing, role playing games with the Electronic Adventures University, and a full schedule of events every day. Check out the weekly schedule on page 400, item 3.

(Side note: your Sysop, Andy, has written several of the games used in Chat Lines.) Until next month, it is good to be alive!
- Andrew Finkenstadt/Chief Sysop

That's about it for this month....

Take care!
John Peters

News & Views

""""
By Tom Schmitz
[TOM.SCHMITZ]

Marketplace Changes and it is difficult to say who actually has the biggest news to tell. What we at GEnie Lamp are sure of is that these changes are for the good and will strengthen the Apple II community.

Readers of A2-Central can tell you Apple Inc. has licensed the Apple Programers and Developers Association catalog to Resource Central. According to the March Resource Central Catalog, "Adding Apple's tools to our already large catalog of Apple II developer books and tools from third party sources, such as Addison-Wesley and The Byte Works, makes us the world's central source for these materials."

It is well known Apple Inc. has been looking to tighten ship so they can concentrate on more recent projects. With this news from Resource Central, what had been a cause for concern to Apple II users resulted in a positive action where everybody wins -- this time.

But Resource Central is not the only mail order giant with exciting news. As Mark Munz from Beagle Bros explains, "Quality Computers has been contracted to be the exclusive distributor of our (Apple II) product and to handle all sales and support of our product." Quality Computers is not only a respected seller but also operates various development companies such as Q Labs. In a separate deal, QC recently acquired Roger Coats mail order company as well.

Munz went on to say, "I think the move to have Quality support our A2 products is a great one in which everybody wins. Beagle Bros can concentrate most of its efforts on other platforms (ie. Macintosh and the like) and Beagle Customers get a great level of support. Beagle Software Dealers will see that Beagle Bros products will be more visible, making them happier."

As for continued support Munz said, "I believe Quality Computers will be able to give the customer the same kind of support that Beagle Bros has always given its customers. This was an important consideration when we decided to do this with our Apple II line. Quality Computers has many exciting things planned for these products and as you may have heard, they planning on releasing a new TimeOut application in the very near future which is sure to be a hit."

In other news, Seven Hills took advantage of Apple Inc.'s System Software 6.0 introduction to release QuickLaunch. (File #18232) QuickLaunch, a must for your system software collection, is a finder extra that allows GS users to run applications without tunneling through endless folders. While QuickLaunch far surpasses all similar programs, Seven Hills decided to enter QuickLaunch onto the freeware market for open distribution.

Why would anyone release such a strong package without charge? As explained in the program's help file, Seven Hills wants to hear from every Apple IIGS owner so they can mail out a catalog full of products for the GS. GEnie members can e-mail their address to Seven Hills at SEVENHILLS. (Where else?)
Dave Hecker of Seven Hills recently told GEnie Lamp how he feels about Apple II users. "The Apple II community will continue to thrive because they use great computers, great software, and have formed one of the strongest user networks in the world. Seven Hills plans to support Apple II users by its continued development of software for the Apple IIGS."

Seven Hills has developed everything from utilities to games including their recent release Express. Express is a printer buffer/spooler which allows GS users to continue working while documents are being printed. Under ordinary circumstances one has to wait for printing to finish before moving on.

Hecker also told GEnie Lamp about some upcoming releases. "Of particular interest to GEnie customers will be "Spectrum," a IIGS-specific telecommunications program! Spectrum supports several screen emulations, all common file transfer protocols, and full scripting capabilities to automate frequent tasks. Spectrum should be available in June or July." Other titles include a utility package titled Kangaroo that allows the user to quickly hop from one folder to another and a major update to their popular "Disk Access" NDA.

"Did I miss something? That _could_ be right (you _can_ zap a / / chip with static, though it's also possible you won't). My / / favorite story was from my wife; one of her office cohorts / / ordered some chips and the included installation instructions / / warned about static generation from certain types of clothing./ / So he changed his chips in the nude. :)")

Heckler also told GEnie Lamp about some upcoming releases. "Of particular interest to GEnie customers will be "Spectrum," a IIGS-specific telecommunications program! Spectrum supports several screen emulations, all common file transfer protocols, and full scripting capabilities to automate frequent tasks. Spectrum should be available in June or July." Other titles include a utility package titled Kangaroo that allows the user to quickly hop from one folder to another and a major update to their popular "Disk Access" NDA.

DID YOU HAVE IT YET? In case it passed you by, the BIG news for April
was the physical release of System Software 6.0 for the Apple IIgs and Prodos 8, 2.0.1. System 6.0 started as an update for 5.0.4 and was going to be called 5.1. But with all the new items being placed in the system the folks at Apple soon decided to call it 6.0.

Now that 6.0 is out, the big question is will there be future versions of the system software or is it time to put the Apple II to rest? There has been much speculation about this, but as Lunatic found out from Finder author Andy Nicholas, Apple is committed to keeping the current system updated:

(LUNATIC, CAT9. TOP6, MSG:42/M645)

(As an aside, I was very tempted to say something very sarcastic here...)

Yes. I have already said many times that we anticipate doing System Software beyond System 6.0 for the IIgs. Don’t get your hopes up for System Software of the caliber that would require us to change the version number to 7.0. At this point we don’t foresee doing another System disk that major.

andy

>>> REGISTRATION INCENTIVES THAT DON'T WORK <<<

~ Part 1 in a Series ~

SCAREWARE After 45 days, if you haven't registered, it threatens to format your hard disk.

SNAREWARE Like SCAREWARE, but it merely threatens to hold one of your data files hostage.

GLAREWARE If you don't register, it burns the word "CHEAPSKATE" into your monitor.

SPAREWARE If you register, the author sends you another copy of the program, complete with the "Please Register Me" message.

PRAY'RWARE If you register, the author agrees to ask God to be nice to you for being so honest.

FAREWARE Every five days you have to send the author another $5.

CAREWARE If you don't register after 45 days, the program starts writing cutesy-pie poems on your output until you get sick to your stomach.

MAYERWARE When you register, you get a nice thank-you note from the President of the ASP.

STAREWARE After the 75th day, two bloodshot eyes appear in the upper right hand corner of the screen. They watch you accusingly until you feel guilty and pay up.

TEARWARE Runs your printer paper back and forth until it jams.

BLAREWARE If you don't register in time, the program still works. With the added entertainment of a loud tone coming from the speaker.

DEBONAIRWARE As long as the program is within the legal evaluation period, it enthusiastically compliments you on your appearance. Afterwards, though...

AIRWARE If you haven't registered by the 60th day, the program simply disappears off your hard disk, vanishing into thin... etc.

/ "<can I make money on it?> <I haven't a clue> /
>>> EPITAPH FOR AN OLD FRIEND <<<

There are a lot of hard things you must do throughout the course of your life; difficult decisions, hard choices, and, of course, good-byes are always a part of growing. Good byes to friends, acquaintances, and loved ones - even pets are one of the hardest things with which you will ever have to deal, but a BBS?

When I bought my first computer (lo, those many years ago), the choices were very few. I made my selection of computer based upon experience and ease of use. I had learned on an Apple II (not even a Plus) computer; had gone through both the instruction manual, and the Reference Guide (who remembers the green & white Apple II Reference Guide?) in about a month. I was hooked! After I had made my purchase (which is a whole story in itself) I closeted myself in my little "computer room" and from that day to this, my wife has seen more of the back of my head than she has the front. She was VERY surprised to learn that my hair line had receded as much as it has (but then it was about a four year period since she had last seen my face).

I started with my Apple II trying to teach myself programming: BASIC, PASCAL, and 6502 Assembler. I also learned a lot about the operating system (or DOS 3.2 and DOS 3.3, remember those?) through various publications. One such publication became the early focus of my attention. A magazine devoted solely to the Apple II family, SoftTalk. I was an avid fan of the monthly Uncle-Dos column (and still read A2-CENTRAL every month). I bought anything and everything that Beagle Brothers published, and I carried the manual for "Bag Of Tricks" around with me like a Bible ("Have you heard the Word of DOS today?"). In spite of all that, I knew that my computer was deaf, dumb, and blind to any information that I did not put into it myself. I wanted to communicate! So... I made the second biggest (best?) mistake in my life, I bought a modem. Now in those days, there weren't a lot of modems to choose from, and most were external (which required the additional purchase of an interface, or serial card). I wanted an INTERNAL modem, and that limited my choices even more. I ended up buying a Novation Apple Cat, 300 BPS modem. I had the computer... I had the modem!... I had the phone line and the manual! I even had the SOFTWARE!!!!!! But - I didn't have any phone numbers. In desperation, I called Novation, and a young tech-weenie (now a near-famous Apple tech-weenie, and good friend; Willie Collier) gave me a few numbers in my area code. I found a BBS across the San Francisco Bay from me, and spent WEEKS reading, posting, inter-acting, and chatting with the sysop. BUT! (and I hope you're all sitting down) when the phone bill came in -- $252.00 for a TWO WEEK PERIOD IN THE SAME AREA CODE! I honestly came as close to passing out as
I think I ever have been. Naturally I had to curb my calling out to BBSs. But... I was hooked! I had to get that "BBS Fix"! The only alternative open to me was to start my OWN BBS. So I called back down to Novation, spoke with my friend Willie again, and he recommended a BBS software program that worked with my computer and modem. It was called T-Net at that time, and was written by a young student in Warren, Michigan, named Dean Drako. I bought a copy, and started my own BBS. I advertised on a few other BBSs, and soon found that, because I had one of the very few Apple II systems in the area, that I attracted a lot of Apple II users. Many were from the local user group (San Francisco Apple Core) and told me that the group no longer had a BBS, so I went to the group leaders (of which I would become one in later days) and asked if they wanted a BBS. They said "How much will it cost us?". "Not a thing!", I replied, and we were in business! This all came about within about the first nine months of operation. In that time I had seen a number of other BBSs open and close quickly. Usually run by a seventeen year old, and called "The Dragon's Sphincter" or something like that. I learned two valuable lessons from those days: be consistent; and provide substantial information regularly.

As time went on I took up support for two other user groups: The Apple II Users of Northern California (ATUNC), and the Peninsula Apple Users Group. Then I got ambitious. I was aware that a number of large user groups had BBSs, but the largest, International Apple Core did not. I got on the phone, talked with the president, Karen Zinsmeister, and asked if she wanted a BBS. She said "How much will it cost us?". "Not a thing!", I replied, and we were in business! So now I was running the BBS for IAC! It was about this time that I decided to upgrade the software and changed to another system called Alpha-III (by a company called ProTree). The author, Bob Garth, later created a multi-user BBS called ELITE, and I ran that for about 2 years (it required an Apple II+ for each modem and an Apple IIe for a file server).

Then I got ambitious again... Softalk had folded shop some years ago (and I still have all those back issues), and I had become an avid reader of A+ Magazine (Maggie Canon, Fred Davis, Chip Carmen, Gary Little, and Michael Fischer)! So... I got on the phone to Maggie and asked... and she said ... and so we were in business! By this time I had two 60 Mb drives on the system, and was getting about 90 calls a day. I needed three other sysops to help with answers ('cause I don't know much myself), and a software librarian!

It was about this time I saw an ad in a magazine for a new network just about to open (you know how you get a magazine for the next month, 7-10 days before the end of the month?). The new network was called "GEnie", and there was a demo number you could call for a free "tour". Being a solid "modem junkie" by now, I dialed in and immediately went to the Apple II section. Naturally I couldn't read messages or download files, but the way the system functioned was pretty easy to understand and... WHAT'S THIS??? THEY ARE LOOKING FOR AN APPLE II SYSOP??? Quick - where is "GEnie" located... 301 area code? Where the hell is that? Maryland? Ok... [DIALING SOUNDS] "Hello, I'd like the number for GEnie in Rockville" ... "I don't know, it has something to do with General Electric!" ... "General Electric Information Services? Yeah, sounds close enough to me!". I called and spoke to a gentleman named Bill Louden. "Hey, I see you're looking for an Apple II sysop? I run a BBS system out here on the west coast, and I think we might have something of mutual interest to talk about.". And so it came about that I started
working for GEnie as the first Apple II sysop. It consumed a lot of time and energy. My wife saw even less of my face, and the users of my BBS saw even less of my messages (probably many of them were greatly relieved). I got another sysop to run the entire BBS, and I devoted most of my time to running the "American Apple RoundTable" on GEnie. What followed is history...

In all this time the BBS remained running in my office (no matter where I moved), and the regular users kept calling in. However the number was dwindling, the user groups had either folded or faded, A+ was absorbed by InCider, and I was tremendously occupied with what had now become a time and a half job! In it's last incarnation, the BBS (now called "Draco Apple Information Service") was moved over to a Macintosh computer (oh, the indignity of it all), and served no more than 50 regular callers with about 60 Mb of storage and two phone lines.

Now a brief explanation is due... in all the years I've been sysoping, and producing or doing whatever it is I do online, I've developed some operating principles that I know are true; they are simple, basic, and they work. Some of these principles involve the running, management, and ultimate success of a small BBS (others are more applicable to national information services like GEnie). One of these principles requires that who ever runs and manages the BBS must (repeat MUST) also provide an engaging personality (either pleasant or controversial, but it must cause people to want to come back for more). Since I had more or less abandoned the BBS to the care and ministrations of others, it lost something. They were there to learn. The BBS had become a training ground for sysops, and had declined in the service it was providing to the Apple II users in the community. (Note, almost ALL of the sysops who have worked on the system have gone on to become sysops on national services: Leonard Reed, (AOL, GEnie); Bob Mulligan, (GEnie, AOL); Rick Mulligan, (GEnie, AOL, GEnie); Rod Whitten, (AOL); Tom Carlton, (AOL); Kent Fillmore, (GEnie, AOL, GEnie)). It would also be unfair to mention the BBS without mentioning that these people were largely responsible for its success, with their diligence and hard work. They didn't get to where they are now, on the national systems, by mistake. On the other hand, the number of Apple II users who were calling in also declined. I tried focusing on Mac information as well to supplement the messaging, but that didn't help either (there are a number of GOOD Mac BBSs in the San Francisco Bay Area).

It becomes a very sad point when you realize that something you've started, something that has become a tradition, and a benchmark in its time, has outlived its usefulness. This was the situation I faced. Finally, on Sunday, December 22nd, 1991, after some ten years of continuous, non-stop service, I turned off the power to the computer, parked and powered down the hard drives, and let it rest. It had been a constant companion, a good friend, and a virtual help mate. It had seen many Apple II users through insoluble problems, and had lightened many dark evenings with a little chuckle ('cause I don't believe ANY information is worth spit if it doesn't have something entertaining to go with it). For me, it had been a point of pride, frustration, honor, and anger. It had helped me realize that there IS truth in Apple's promise "The power to be your best" even though they may not have seen the full potential of that promise, and had always been a refuge where I could communicate with those who knew me best. I think it may have been that to others as well. Ultimately it was fun, and really when you get right down to it, isn't that what makes it all worth doing?
Good bye, old friend - you've earned your rest. Sleep well.

-Kent Fillmore

Getting Started With 6.0

By Tom Schmitz
[TOM.SCHMITZ]

>>> SYSTEM SOFTWARE 6.0 <<<

~ Getting Started ~

WHY SYSTEM 6.0? The first thing most folks notice is that System
Software 6.0 comes on six disk. Yes, people have asked me if that is why Apple calls it System 6. Don't let this scare you though. Included in these disks is a volume called SYSTEM.DISK. If you do not have a hard drive or a large ram disk, the SYSTEM.DISK will allow you to use 6.0 to the same extent as earlier versions, but with several modifications.

The reason for so many disks is all the new technology which has been added. If you want to use more than a few of these extra options you need more than a single 800k disk drive. Dennis Doms from Resource Central said it best, "If you're using your system that hard, you probably should have extra hardware anyway." You are going to want at least two megabytes of RAM and a hard drive to use 6.0 with applications effectively.

As mentioned, there are six 800k disks in the System Software 6.0 set:

<table>
<thead>
<tr>
<th>GENie File #</th>
<th>Disk Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>18140</td>
<td>/Install</td>
<td>A bootable installation volume.</td>
</tr>
<tr>
<td>18141</td>
<td>/SystemTools1</td>
<td>Tools and other features.</td>
</tr>
<tr>
<td>18142</td>
<td>/SystemTools2</td>
<td>More tools and features.</td>
</tr>
<tr>
<td>18143</td>
<td>/Fonts</td>
<td>Fonts and the Apple Bowl game.</td>
</tr>
<tr>
<td>18144</td>
<td>/synthLAB</td>
<td>Apples MIDI music software.</td>
</tr>
</tbody>
</table>
If you are downloading 6.0 from GEnie or another service, you can skip the System.Disk should you have a hard drive or boot from a large, permanent RAM disk. It was included since the installer takes over 90 disk swaps to create an 800k System.Disk.

To install 6.0 you will first need to decide if your main booting directory requires a customized driver. If so, place it in the drivers folder of the /Install disk. Since there is only 1 byte free on this disk, delete a few scripts which you will not be using. This will make room for your driver. Do not delete drivers or other devices as the installer program will be looking for them even if they are not used.

Now all you have to do is insert the /Install disk and boot your IIGS from the 800k drive. When the option window appears, choose Easy Install. This will update your existing system software to 6.0. After Easy Install is finished working its magic, you can use the Customize option and install extra features as you see fit. It is a good idea to boot the finder and take a look at your machine to see what Easy Install has placed and what remains to be installed before customizing.

When you boot 6.0, the first change you will notice is that the version number is now clearly displayed on the thermometer screen. The second thing is the Finder. Be warned, finder icons are used in a whole new way with 6.0. If you are using customized icons rename FINDER.ICONS and FINDERRx.ICONS to xxxx.ICONS before you install 6.0. (xxxx being anything but FINDER. Try STANDARD.ICONS and STANDARDx.ICONS) If you do not rename these files the Install program will delete them and the finder will use Apple’s plain icon package.

Once you get the finder started you can take off on your own. Apple has provided two help packages to get you going. The first and most important is part of the menu bar. Just click the Apple logo and drag it down to HELP. This HELP box has a whole index of useful information. Just use your mouse to choose your subject.

The other help Apple has provided is a Teach Text file called Shortcuts. Teach is a simple word processor that Apple included with 6.0 that can read several different file formats. To read Shortcuts, just open up your boot drive and double click the Shortcuts file. Teach will come-up with Shortcuts already loaded.

Also, included in this issue of the Apple II GEnie Lamp are several message excerpts containing useful information about running 6.0, including the first 14 of Lunatic’s 6.0 hints.

Food For Thought
""""""""""""""""""""
By Phil Shapiro
[P.SHAPIRO1]

>>> FUTUREPHONES <<<
""""""""""""""""""""
REACH OUT AND... Anyone who has ever used a modem knows how fast data can be accurately transferred along a telephone line. Yet business phone calls across this country continue to exchange vital data via voice, which takes place at an effective rate of about 10 baud, using an error detection protocol that's inherently susceptible to mistakes. "Mistakes?" "That's: M for Mary, I for Igloo, S for Sam, T for Tuesday, A for Apple, K for Kangaroo, E for Elizabeth, and S for Slow, Silly, and Stupid."

Take, for example, the exchange of names and addresses by two potential business persons. If either of the two person's names is uncommon, they'll have to spell it out letter by letter to the other person. Usually the street address doesn't present too many problems, but you better double check the suite number twice.

Cities and zip codes typically aren't that difficult to exchange, except you have to pay attention to subtle differences, such as Newark, New Jersey, and New York, New York. "That's Newark: N for Nancy, E for Elizabeth, W for Window, A for Apple, R for Radio, and K for Kangaroo." You never want to make a mistake on the zip code, so better check it over at least twice.

Exchange of data by voice would simply be slow and inefficient under the best of circumstances. But throw in background noises (traffic and printers being the chief villains), regional accents, and sundry distractions, and the result can be a real headache. "Headache?" "That's H for Henry, E for Elizabeth, A for Apple, D for David, A for Apple, C for Charlie, H for Henry, E for Elizabeth."

The simple exchange of name and address can take up to two minutes for each person's name and address. For a mutual exchange of names and addresses, we're talking four to five minutes. How much time would such an exchange take using a data transfer of 2400 baud? About two seconds, maximum. The 150 times improvement in speed being only incidentally important to the improved accuracy in data transfer. "Transfer?" "That's: T as in Tom, ..."

Now, the neat thing is that the data transfer need not be on a separate phone line from the voice communication. Just last week I called a friend who runs her own little desktop publishing business. While we were chatting, her fax machine cut in, and started transmitting. I chatted with her fax machine for a while, but continued to hear her voice in the background. After she switched off her fax, I remarked, "Gee, do you think it's possible to transmit both voice and data along the same phone line, at the same time?"

Even if you couldn't transmit voice and data simultaneously, it wouldn't be too difficult for both sides to coordinate a few quick pulses of data exchange at a certain point in the conversation. Both phone systems would have to be equipped with modem capability. Low end systems could have a capture buffer, to capture the incoming data. High end systems could have a direct link to a person's desktop computer, so that incoming data could be automatically dumped into a database (or temporary clipboard, where appropriate.)

The absolute ideal set up would be to have two phone lines for every call: one for voice, and one for data. The voice line would serve to
coordinate which types of data to be sent on the data line. Data exchanges could be ASCII exchanges, using a modem, or graphics exchanges, using a fax machine.

All "routine exchange data" could be available for quick transfer. Routine exchange data would include:

1) The names, positions, and phone numbers of key employees at each company
2) Product lists and price sheets
3) Written records of standard operating procedures of each company

The process of data exchange would be further enhanced if each future phone had a mini-printer attached. The mini-printer would serve solely to print mailing labels. These labels could then be printed at the touch of a key, rather than having the information manually transferred from a slip of paper into a computer, and then out to a printer.

The process of exchanging vital data over the phone has changed very little since Alexander Graham Bell invented the phone about a hundred years ago. It's high time we used the new electronic tools to streamline the way modern business is conducted. The savings in time and energy are in the order of ten and twenty times as fast and efficient. Some procedures could speed up vital data exchange by as much as 5000 percent.

Everybody benefits by such streamlined efficiencies. And the wheels of business and industry will be able to spin that much more smoothly. Sure beats having to spell out long names over the phone. "That's: S for Sam, L for Lucy, O for October, and W for Walrus."

>> SOFTWARE 6.0 PROBLEMS <<

Since 6.0 is just getting into the hands of many users out these, I have copied several of the best answers to many of the questions being asked on GENie. I abbreviated the questions and answers to save space.

Q. Can I use the StyleWriter with 6.0?

A. U.Huth - the StyleWriter driver for 6.0 lets GS/OS apps print to the StyleWriter (landscape mode is NOT supported though). Apps that don't bother to use the Print Manager (which obviously includes all 8-bit apps) can NOT use this driver and thus can NOT print to the StyleWriter... (TIM.SWIHART, CAT9, TOP6, MSG:38/M645)

Q. Will Prodos 2.0.1 access more than two devices per slot?

A. |) \umours?? It's not a rumour, it's a fact. ProDOS 8 v2.0 can and will access more than two devices per slot (up to 14 devices total for all slots, I think). This is one reason I find it silly that a lot of people intend to reformat most of their hard drive as an HFS partition: Now that they will be able to access ALL of their hard drive ALL of the time, they want to go and make most of it inaccessible to P8 again by formatting it as HFS. The other main reason I find it silly is that HFS has been tested by several different people as noticeably slower when writing than ProDOS, under GS/OS. I'll keep my four ProDOS partitions and use HFS on floppies when necessary, thanks. (LUNATIC, CAT9, TOP6, MSG:65/M645)

Q. Do I really need to download the /System.Disk?

A. Hang - the "System.Disk" is for the folks without hard drives! In fact, it's really for the folks that don't have hard drives _AND_ only have one 3.5. For those folks, in order to create a bootable 6.0 floppy, they would literally have to swap disks over NINETY times (one of our guys did it last year and counted the number of swaps - "System.Disk" became part of the package right after that). (TIM.SWIHART, CAT9, TOP6, MSG:95/M645)

Q. What is the ultimate way to install 6.0?

A. The "ultimate" way to install 6.0 is to boot the 6.0 golden master CD and launch the Installer from it. The CD has a partition representing each of the five major disks from 6.0 (the "System.Disk" partition was left off since we just established in the prior message that it's not important in this case). Using the CD lets you install with _ZERO_ (count 'em if you want to) disk swaps! Everything you need
for the installation is on the CD ready to go – just give it a target and kick back for a while.

The next best thing is to bum some 3.5 drives from a friend so you have two platinum 3.5's and two Uni 3.5's. Then, boot the Install disk and put "SystemTools1", "SystemTools2", and "Fonts" in the other drives. You can install everything except synthLAB that way (assuming you're installing to a hard drive). If you also have /RAM5 set up as "synthLAB", then you'll have everything you need online... :-)

(TIM.SWIHART, CAT9, TOP6, MSG:96/M645)

Q. I'm having problems installing 6.0 onto my Vulcan.

A. Doesn't Vulcan require a custom driver? Seems I recall they use their own interface card and need a special driver for it. System 6.0 does NOT include any third party drivers, so you'd need to put the Vulcan driver on the Install disk and try again (you might need to nuke a couple of scripts to make room for the driver so use a COPY of the Install disk).

(don't nuke system components to make room!!!!!! nuke scripts that you're not likely to use!!!!!!)

(or, set up a Ram disk big enough to hold Install _AND_ your Vulcan driver and boot from there).

(TIM.SWIHART, CAT9, TOP6, MSG:101/M645)

Q. Can I install 6.0 onto my existing ramfast?

A. It works fine with the existing driver, but you can't do HFS volumes through the RamFast. i.e. HFS floppies work fine, but HFS partitions are invisible, I put in a Mac formatted Syquest cart, and it doesn't show.

Q. Why won't AppleWorks GS work with 6.0?

A. Re: AWGS 1.something. The very first thing that comes to mind is that if you are not using the latest version of a piece of software you should not only be prepared for problems ... you should expect them. The current version for GS system Software is 6.0. The current version for AWGS is 1.1. Software updates/upgrades may add features, but they almost _always_ fix bugs and certainly are more likely to be compatible with later System Software updates.

(HANGTIME, CAT9, TOP6, MSG:28/M645)

Q. Why does 6.0 take longer to boot than 5.0.4?

A. The reason it takes longer to boot System 6 than System 5 is that SYSTEM 6 IS BIGGER!

(QC, CAT9, TOP6, MSG:274/M645)

Q. I'm having problems unpacking the disks I downloaded.

A. Make sure you are using the latest version of ShrinkIt. That's ShrinkIt v3.4 or GSHK v1.0.5. These were uploaded in the last couple weeks. They fix bugs in the older versions that have caused problems unpacking the new system disks.

(A2PRO.TOM CAT9, TOP8, MSG:47/M645)
Q. How do I get ProSel 16 back to the way I had it before?
A. Here's what to do to make SetStart work:

1) Name the Finder FINDER
2) Name ProSel-16 PROSEL.16
3) Copy SetStart to your CDEVs folder (if you haven't already done so)
4) Copy the file named START from the System folder on the Installer
disk to the System folder on your boot disk
5) Reboot. Pull down the Control Panel, select SetStart, and set your
boot application to ProSel.16 (or whatever you want)

(C.MADSEN, CAT9, TOP8, MSG:125/M645)

Q. Why won't SoftSwitch work with 6.0?
A. There is a compatibility problem with SoftSwitch and System 6.0,
which we will soon have a fix for. I don't have an "official" message
for you yet, but feel free to ask in just a few weeks if you haven't
heard from me by then.

(ROGER.WAGNER, CAT32, TOP5, MSG:90/M645)

Q. Prodos 2.0.1 keeps crashing with my RamFast.
A. This is caused by a mapping conflict between your RamFast and Prodos.
The best way to cure this problem is to make a one byte change in Prodos
as provided by Tim Grams:

1) To turn it off the completely, perform the following patch to
file P8 in the system directory. Be sure to save a copy somewhere
before you do the patch:

   Block 5 byte $1A3, change $A5 to $00  (or anything really)

   You can also download file #18309  P8Patch.Bxy by Tim Grams which
will automatically complete the disabling.

(TGRAMS, CAT9, TOP13, MSG:16/M645)

[*/][*/][*]

ASK ME! If you are having trouble with 6.0 and cannot find the answer
"""""""" here, you can ask the experts on GEnie's A2 RT, Category 9,
Topic 8. There you will be able to meet people like Tim Swihart who
answered many of the above questions. Tim was on the 6.0 Marketing team
members who kept us so well informed while everyone waited for System
Software 6.0 to go Golden Master -- twice.

--- APPLE II ACHIEVEMENT AWARDS PRESENTED ---

The 1991 Apple II Achievement Awards, sponsored by Resource Central and A+/inCider Magazine with cooperation from Apple Computer, Inc., were presented Friday, April 3rd, in a national online conference on America Online, winner of the 1990 Achievement Award for Best Online Service.
A prestigious panel of Apple II industry watchers, including representatives from A+/inCider, A2-Central, Apple Computer, America Online, CompuServe, GEnie, GS Plus Magazine and Nibble, recently nominated awards in a number of categories designed to recognize excellence in products for the Apple II family of computers during the period from November 1, 1990 through the present. Those products recognized as the best by the panel were nominated for Awards. A panel of over 100 Apple II community members was entrusted with selecting the best of the best during balloting between March 3rd and March 27th, 1992. Those selected receive the 1991 Apple II Achievement Award, a lead crystal disk engraved with "1991 Apple II Excellence" and an Apple logo on a crystal base.

The complete list of Apple II Achievement Award categories and recipients is as follows:

Best Freeware or Shareware: ShrinkIt for the Apple IIgs (Andy Nicholas).
Best 8-bit Application: ProTERM 3.0 (InSync Software).
Best 16-bit Application: HyperCard IIgs (Apple Computer, Inc.).
Best Innovation: Pointless (Westcode Software).
Best Utility: Prosel 16 (Glen Bredon).
Outstanding Developer Aid: GSBug v1.6 (Apple Computer, Inc.).
Best Apple II Periodical: A2-Central (Resource Central, Inc.).
Best Online Service: TIE: America Online (America Online, Inc.)
Software of the Year: Apple IIgs System Software 6.0 (Apple Computer).

Apple II Individual Recognition (for service of distinction to the Apple II community): Alan Bird and Tom Weishaar.

Apple II Individual Achievement (for making the most positive impact for Apple II computer owners during the awards period): Andy Nicholas.

Apple II Group Achievement (for making the most positive impact for Apple II computer owners during the awards period): Apple II System Software team. (C.GUNN, CAT5, TOP6, MSG:92/M645)

COPYRIGHT FEVER I had no idea the article on copyrights would create such an interest. I want to thank all those who dropped me email with comments on the article and on the subject of software distribution. I decided to write this second part because of
some of your comments.

It needs to be understood that I am not a lawyer. If you need to know for sure where you stand on the copyright laws you should seek out legal help. There are some very good books on the subject. Some of them concern themselves just with the software end of the issue. My comments and ideas here are from my own background and investigations. Last, but not least, it has been brought to my attention that the HOSB RT has a growing discussion on the topic in CAT 8.

WHAT MOTIVATED ME TO THIS ISSUE? I have been in computers since 1983. """"""""""" I started with the Atari 1200XL machine. That was a 6502 8-bit processor. I quickly began writing BASIC programs, starting with magazine programs and then my own. My first useful hack was a team scheduling program for our local CYA department. I uploaded it to a local BBS and was amazed at how quickly it spread across the country. What also amazed me was the changes that were made and also how, on one BBS, someone removed my name and put in their own, without changing a line of code otherwise. That prompted me to look into what I could do to protect my work.

Computers are not my only area of concern for copyright laws. I also write music for use in church services. You would think that this would be a safe area. You would also be, I'm sad to say, wrong! Churches are a breeding ground for copying of music. I know a few other musicians like myself and we will not be quitting our day jobs soon. Go into any church, any denomination, and pick up a Sunday bulletin. Chances are you will see the words (and sometimes full scores) for a copyrighted song. Chances are that they have not asked for the right to reprint that music. I am not saying that these people mean any harm. Just like most software copiers they are just not thinking the issue through, or simply are unaware that they are doing anything wrong.

For the last three years I have been attempting to start up a DTP and computer consulting company out of my home. The Toledo, OH area is currently very weak economically, so every penny helps. Within those three years I have seen my DTP work copied, hack and recopied. I have seen these copies used where they did not even take out my copyright notice! I do not have money to go to court. It is hard to get any judgement when the loss is less than the court finds worth bothering with. I do drop off a letter telling them that they are violating copyright laws and should stop. To date I have received no response.

My personal feeling is it _is_ nice to know that they feel my work is worth copying. My phone number is on the bottom of those copies. I take it that I am on the right track with my work. When talking with anyone about copyright infringement, be it my own material or someone else's, I stay within the 'ethical' discussion. This is not always easy, people have a way of justifying what they want to do. It also means that I have to be willing to listen and think out what I do and say. I can't 'flame' anyone, even when I feel like they deserve it. Once I have done that I have lost any chance of communication and change that may come from it.

Q: Can software be PD and have restrictions on it?

A: No. This question seems to be the #1 question asked. I know why. It is because more software each day is coming out with statements like,
"This software is in the Public Domain with the exception that it may not be included in any commercial package or sold for a fee." What this person really means is that the program is 'freeware', not 'public domain'. It is being released free, but the control is staying with the author.

If you read the section about public domain in the first article then you will understand that public domain means _no restrictions_. Once you place something in public domain you give up all rights to what happens to it. In the above section I told you that I placed my BASIC program on a BBS. I also placed it in public domain. It hurt me to see my name removed from it later, but I had no recourse. I had given up any rights to that program. I could tell the person that I thought the actions were unethical, but that was all.

Q: Is a program that was sold, and the company is now out of business, in public domain or freeware?

A: No. The program's copyright is still held by the person, or persons that owned it when it was being sold. The rights may be tied up in court, but it is still protected. I have seen programs sold, then disappear with the company that sold them, then come back. Sometimes under the same name or a different name. A good example of this is the spell checker Thunder! on the Macintosh. It was originally sold by a company called Batteries Included. Then Batteries Included was bought by Electronic Arts and all but disappeared. Thunder! then appeared with an update from another company called Baseline Publishing. Now it's one of the best selling spell checkers on the Mac.

Q: Can I start asking a fee for a program that I once released as freeware?

A: Yes. What you are doing a moving your program from freeware to shareware. That is within you right as long as you made it clear in the first place that the program was _not_ public domain. I would suggest that you do this after a major upgrade, but you don't have to.

Q: What if it isn't clear if the program is PD or not?

A: Treat it like it is freeware. This is a very gray area. A program should always have clearly stated if it is PD, shareware or freeware. That is usually done in the documentation, title screen or the 'About' box. If it is not clearly stated then the author has little recourse when it is treated like PD.

This is where the ethical issues come into play. From a legal ground you could most likely get away with using the above program in your commercial package. From an ethical point of view it would be questionable, if not down right wrong. It wasn't your work so why should you get the money and glory for it.

Q: Is it okay for me to change (or hack) a program as long as I don't pass it around to anyone else?

A: I really try to stay away from questions like these! I cannot come up with an easy and safe answer. If the program is in public domain, yes. Then again if it is in public domain you could also share your changed version with someone else. Please note, that is the closest
thing to an answer you will get from me on questions like that.

[*][*][*]

THAT'S ALL FOR NOW  If there are more issues that come up, or if I
feel inspired, I'll write up another article for
future issues for the GENie Lamp. Feel free to keep the email coming
with your comments. I always enjoy getting email and reading them.

Lunatic's Finder Hints

>>> FINDER 6.0 TIPS & HINTS <<<

Finder 6.0 Tip #1, v1.1  If you have any problems with Finder 6.0
re-mapping your icons to something you don't
want, do the following:

1) Set your Preferences so that Finder will show invisible files.

2) Determine the disk that the original icon Finder re-mapped
   is on (icons taken from the resource forks of applications,
   including Finder, will be on the same disk as the application).

3) Determine the application that Finder re-mapped your icon to.

4) Delete the Desktop file in the Icons folder on the disk that
   application is on.

WARNING:  You will lose any links to applications on this specific disk
that you have made under Finder 6.0.
[Note from Tim Swihart of Apple Computer]
(TIM.SWIHART, CAT9, TOP3, MSG:68/M645)

Finder 6.0 Tip #0  Don't use a crow bar to open a box of cookies!

  i.e.:  Your tip #1 is off in the weeds!  Finder 6.0 has a BUILT-IN
way to let users "adjust" icon mapping!!!  Use it and you won't
lose all your other mapping (your method loses wayyyyyyyyy too much
info - it essentially makes crumbs from cookies, not usually a good
thing to do <grin>).

If you don't like the way an icon is mapped, just hold the OPTION
key down while you're double-clicking the icon.  That brings up the
"Locate" dialog and lets you pick a different application to have
that icon mapped to!

Finder 6.0 Tip #2  If you want to make sure that you never
accidentally add a comment to a file under "Icon
Info," simply lock that file.

ADDENDUM:  If you put in a volume name before the name of the
application in the application path, Finder will present you with the
name of the application to launch. Otherwise, it will just give you "".

Finder 6.0 Tip #3 Make sure that any icon files you have which have more generic icons in them than other, more specific icon files in that folder come AFTER the more specific icon files. Otherwise, the icons in them will override any of the more custom icons you have in other files in that folder. Be especially careful that any icons file you have which has replacement icons in it for the standard Finder icons is _LAST_ in the Icons folder. This is the reverse of previous System Software releases.

Finder 6.0 Tip #4, v1.1 If you want to have as many of your document icons as possible placed into your Desktop file(s), simply go into an icon editor and edit the application path(s) of all your icons so that they contain only the file name of the application. Now, Finder will ask you to Locate all of those applications when you double-click on those icons. As soon as you locate those applications in Finder, it will put those icons into a Desktop file.

Finder 6.0 Tip #5 Old-style document icons MUST have some data in their Application path attribute for Finder 6.0 to ask you to Locate the application that corresponds to them. If the Application Path attribute is blank, Finder 6.0 will only tell you that it cannot find an application for that document.

Finder 6.0 Tip #6 There is no Tip #6.

Finder 6.0 Tip #7 There can be more than one Desktop file. Finder 6.0 creates one in the icons folder of every disk that has applications on it which Finder has linked to document icons.

Finder 6.0 Tip #8, v1.1 For those of you who don't like yellow folders and don't want to wait for some resource editor to come out that can recognize the rRectList resource in Finder 6.0: Folders that are already set in place with an existing Finder.Data file are left white and not coloured yellow. Folders can be re-coloured white with the Colour menu and will stay white if you save a Finder.Data file for that window. (P.S. Any standard resource editor can be used to edit the menus of Finder 6.0 to correct the spelling of the "Color" menu and the "Initialize..." item. :)

Also, if you are using a custom folder icon (such as my "pop-open" folders), you can load the icon file into IconEd, go to the attribute editing dialog for that icon, and select the "Color" checkbox there. Finder will no longer re-colour your folder icons, however, YOU will also no longer be able to re-colour your folder icons with the "Color" menu, either. IconEd does not support setting the colour bit for an icon (IHMO, its greatest failing).

Finder 6.0 Tip #9 Certain file types cannot have Comments attached to them in the Icon Info window under ProDOS. The types I have identified as such, so far, are:

Folders ($0F/$xxxx), TrueType Fonts ($C8/$0001), GS/OS System files ($F9/$xxxx), and ProDOS 8 applications ($FF/$xxxx).
(…)ne more file type I've found that can't have comments attached to it is the FST ($BD/$0000).

Finder 6.0 Tip #10  To minimize icon conflicts, especially if you ever switch between System 6.0 and earlier version of the system software, I would suggest editing all of your icon files so that all icons for a specific file type are contained within one file. Then, the order of the icon files within an icons folder will be much less important. Of course, you still must have more "generic" icons located later within the files.

Finder 6.0 Tip #11  The method of renaming files has changed slightly under Finder 6.0. If you click twice too quickly on the name of an icon, Finder will try to open that file. Under Finder 6.0, after clicking on an icon, you should wait about a second before clicking in its file name to edit it. Another way to edit a file's name is to select the file with the mouse, and then simply start typing. If you only wish to edit the existing file name slightly, just use the cursor keys before typing. If an icon has ALREADY been selected after performing some action on it (Icon Info, copying, duplicating, etc.), simply press the Return key before typing or using the cursor keys to edit its file name. If you make a mistake while editing a file's name, pressing the Escape key will return it to what it was originally, as in previous versions of the Finder.

Finder 6.0 Tip #12  v1.1  Finder now checks to see if a file matches a different icon immediately after you rename a file. Unfortunately, Finder doesn't do the same thing if you change a file in some other way, such as making it active or inactive, or changing its file type or aux type with a non-Finder 6.0 aware DA or improperly written extension. If you wish to immediately see Finder update the icon of a file on the desktop or in an open window, after it's changed in some way other than by being renamed, simply select that icon and press the Return key once or twice. This tricks Finder into thinking the file's name has changed, so it checks that file's icon match again.

Finder 6.0 Tip #13  There is a bug in Finder 6.0 related to having documents on the desktop. When trying to launch a ProDOS 8 application by double-clicking on a document icon that is on the desktop, Finder will present the message "Documents which launch ProDOS 8 applications must reside on ProDOS or AppleShare volumes." However, _IF_ the position of that icon on the desktop has previously been saved by Finder in a Finder data file, the ProDOS 8 application will launch correctly. The necessary Finder data file that Finder uses to save the position of icons on the desktop is called Finder.Root. It resides in the root volume of the disk on which the file on the desktop is located (it's an "invisible" file, so you have to set your Finder preferences correctly to see it).

To save the position of a file on the desktop, first drag the file onto the desktop, and then do the following:

Set your Finder Preferences to "Save Finder information to disk," or hold down the Control key.

Then
Drag the disk with the file on it into the Trash, 

- or -

Quit Finder (either by selecting "Shutdown," or by launching an application).

The next time you insert that disk or return to Finder, the file will be on the desktop, and you will be able to use it to launch ProDOS 8 applications.

Finder 6.0 Tip #14 If you have a bunch of old custom icons for BASIC programs which point to BASIC.Launcher as their application, and for some reason you do not wish to change their application path attributes to point to BASIC.System, you can simply make a copy of BASIC.System in the root directory of your boot volume and name it BASIC.Launcher. The programs will then continue to launch correctly without any modification of their icons. (A good reason would be if you needed to switch between Sys 5.0.x and 6.0 a lot.)

(This one's thanks to Jerry Kindall who suggested this in another topic. I checked it out to make sure it works before posting it as a Finer 6.0 Tip.)

- Lunatic (:)

Modem USA Book Review

By Phil Shapiro
[P.SHAPIRO1]

>>> MODEM USA <<<

~~~~~~~~~~
~ Low Cost and Free Online Sources for Information, Databases, and Electronic Bulletin Boards via Personal Computer and Modem in 50 States ~

This newly published reference book contains a wealth of information on government-operated and privately-run electronic bulletin boards. The book itself is divided up into the following thirteen sections, based on topic:

1) Medical and Health Info
2) Library and Book Info
3) Government Info
4) Environment and Nature Info
Each section starts out with a listing of toll-free phone numbers, followed by a listing of bulletin boards organized alphabetically by state. Each entry in the book is accompanied by a short annotation, ranging in length from a brief sentence to a full paragraph.

The first section I perused was the section on government information. My curiosity was piqued into finding out whether gigabytes of governmentally compiled information could be tapped via a simple phone call.

While I was happy to find many government BBS's right in the Washington DC area (where I live), few of them beckoned me to put down the book and call right away. I was a little disappointed to find that the Library of Congress hasn't set up a public BBS yet. (Or if they have set one up already, it's not listed in this book.)

One BBS that caught my eye is the U.S. Dept. of Transportation's Federal Highway Administration BBS. (Phone: 202-366-3764.) This BBS contains downloadable text file reports on all sorts of transportation safety concerns. Ralph Nader could have the time of his life calling this board.

Another BBS that has downloadable files of civic interest is The All Night Book Store, in Newark, NJ. (Phone: 201-751-9420, 7PM to 7 AM, Eastern time.) The annotation says, "Call here for a copy of the Freedom of Information Act, with form letters for your use (go to Door 5.)" It's amazing that Lynne Motley, the author of this book, was able to track down such golden nuggets.

After paging through the section on government-oriented boards, I headed over to the Medical and Health section. With health care so much a national concern these days, it's hardly surprising to find quite a few bulletin boards organized around health care themes. One particular BBS in Kansas City even offers the advice of a family practice physician to people who call in with questions. How delightfully progressive. (For serious questions, kindly e-mail your own physician, though.)

Naturally, other health theme bulletin boards offer health and community resource information on topics such as disabilities, AIDS, nutrition, and addiction. To have so much useful information accessible with a simple dialing of your modem is a great convenience. Think of how much easier it is to call a BBS late in the evening, rather than scheduling a trip to the public library during your busy day.

Incidentally, do you need a GIF graphic of the Jarvik-7 artificial heart? A BBS in Juneau, Alaska, has exactly what you're looking for.

Moving onto the chapter on genealogy bulletin boards, it's
interesting to note that almost every state has at least one bulletin board set up for genealogy enthusiasts. Some of these boards concern themselves with genealogy in general, and some concern themselves with a particular population. An example of a particular population might be persons of European ancestry, Australian ancestry, or Texan ancestry, or Jewish ancestry.

One interesting BBS in Atchison, Kansas, provides an online database of all headstones of local cemeteries. Now that's what you call an imaginative database application.

The Job & Employment Information chapter contains bulletin boards that deal with employment in general, and employment within specific fields. Some of these boards have conferences dealing with job search strategies, too.

Several boards have been set up to announce jobs in the "emergency response" field. Presumably such jobs would include police officers, firefighters, and emergency medical technicians.

The chapter on Computer & Data Processing lists boards that include toll-free tech support for modem makers (such as Hayes and U.S. Robotics). But the chapter also lists boards whose focus is C programming, assembly language programming, and object oriented programming.

This book is clearly a labor of love. Researching all the facts in the book must have taken several months of hard work. Organizing this information into subject categories must have been no small job either.

The only small criticism I have of this book is that the sales pitch on the back cover of the book comes across a little too strong. In my mind, the sales pitch promises more than the book delivers.

All in all, Modem USA would make a useful addition to almost any library. Telecommunication enthusiasts might want to obtain a copy for their personal bookshelves, too.

With updates to the book planned, the book itself takes on a life of its own. Given proper encouragement, this 190 page large-sized paperback may well grow up to be the "Whole Earth Catalog" of the Information Age.

MODEM USA   Low Cost and Free Online Sources for Information, Databases, and Electronic Bulletin Boards via Personal Computer and Modem in 50 States

The annual Trenton Computer Fair, held near Trenton, New Jersey, is one of the largest computer fairs on the East Coast. It attracts people from as far away as North Carolina and Boston.

The crowd congregates at Mercer Community College, a grassy knolled campus with large, spacious parking lots. For a modest $35, anyone can set up a vendor table in these parking lots. About 700 to 800 persons do.

In addition to the outdoor parking lot vendors, populated by private persons and small businesses, the indoor campus buildings include large booths from the heavyweight software companies: Adobe, Aldus, Borland, Lotus, Microsoft, Symmantec, and the rest of the gang.

But the Trenton Computer Fair is more than just a colossal commercial carnival. Free tutorials are scheduled throughout the two day events. These tutorials, which take place in the regular college classrooms, offer something for everyone. On the novice side, the tutorials offered a bare-bones beginners class titled, "How to Use a Word Processor." On the other side of spectrum were classes in advanced C++ programming.

To accommodate the 6000 to 7000 people that show up, an adjacent state park is commandeered to serve as a makeshift parking lot for the 3500 vehicles that show up. About fifteen to twenty traffic attendants steer these vehicles into three parking areas. A dozen school buses shuttle people from the state park over to the community college area.
Arriving at the fair Saturday morning was an experience akin to showing up at the Woodstock folk festival. Two miles away from the campus you already began to see long lines of people walked briskly towards the campus. (Other than the vendors, no members of the public were allowed to park on the college campus proper.) Yellow school buses, packed full with computer enthusiasts, convoyed back and forth between the state park and college campus.

The lines of walkers apparently were composed of people who got tired up waiting their turn for the shuttle buses to ferry them over to the campus. At the state park, people waited in lengthy lines for the shuttle buses. The lines must have been more than 100 to 150 yards long, with two or three persons across each line. From the looks of it, people waited about half an hour to forty-five minutes to get on a shuttle bus.

Even with such large crowds, the parking lot flea market area was surprisingly orderly. The flea market area was spread out over two large parking lots, so the aisles in between the vendors were wide enough to accommodate a lot of human traffic.

Some flea market vendors were selling new, shrink-wrapped software at discount prices. Other vendors were selling boxes of electronic components: diodes, capacitors, assorted electronic doodads. Still others were selling second-hand parts and peripherals.

One vendor from Pennsylvania was selling blank Maxell 3.5 inch floppy disks at $25 per hundred. Within six hours they had sold 10000. They were planning on bringing another 10000 for the second day of the fair.

A few vendors were selling boxes and boxes of broken electronic junk. One vendor hawked his wares: "One dollar takes this whole box of broken goodies. Get your treasures here." Knowledgeable buyers knew that somewhere in that box was something worth more than one dollar.

About two or three dozen vendors had set up large tents, with all their wares set out on tables underneath the tents. (The tents served as a nice insurance in case it rained.) Many of the other vendors were selling from the back of their trucks or vans.

Walking through the flea market area was like walking through a time tunnel of electronics history. At one booth an elderly gentleman sat with boxes of dusty vacuum tubes. At his feet were boxes of electronics magazines from the 1950's, sure to be of interest to modern archaeologists.

At another booth was a bearded flower-child with a TRS-80 microcomputer, circa 1979, priced at $10. To everyone's amazement, someone bought it.

State of the art business computers, circa 1981, were selling for about $60 to $80. These huge behemoths could conceivably be useful for some small businesses, if you were able to purchase the system with a sufficient supply of 8 inch blank floppies.

With the popularity of the new low-cost laser and ink-jet printers,
it was not surprising to see a goodly number of daisy wheel and dot matrix printers at the fair. Most such printers were selling for under $100. One not so astute person was trying to sell a second-hand nine pin dot matrix printer for $180. Chances are he had to carry the printer back home with him at the end of the day.

Camaraderie and goodwill were widely evident. Vendors took time to explain to buyers what it was that they were buying. More important to vendors than getting the best price was finding a good home for older electronic equipment.

Despite the general atmosphere of goodwill, one or two vendors displayed shocking conduct. One table was set up to sell bootleg cassette music tapes. A large sign actually said, "Bootleg cassette music tapes." Such a flagrant violation of the copyright law met with more than a few cold stares.

Another vendor was selling a handful of Apple 5.25 inch disk drives at bargain basement prices. A cursory inspection of the drives showed that they had been sanded with sand paper on the front and sides of the disk drive case --- exactly where schools mark their names with indelible magic marker ink.

When asked about the origins of the drives, the young vendor gave the evasive answer: "Oh, a friend of mine asked me to sell these for him." It's a sad day indeed when schools lose precious computer equipment to juvenile thieves.

At the end of the day people filed onto the yellow school buses to head back to the parking lot. With arms full of bargains and brick-a-brack, many looked weary but happy. Once home they'd be able to separate the jewels from the junk. Finding out which is which is all the fun.

    HARDWARE VIEWPOINT /

|---------------------------------------------|

Back It Up!

Lorraine "Rainy" Wilson

[L.WILSON6]

>>> A QUICK LOOK AT GSTape - HDTape <<<

~ Tape backup for SCSI block devices ~

I am doing this review, because these products are so useful, and so under advertised. GSTape - HDTape are tape backup and restore
Apple II Computer Info

programs by Tim Grams for the Apple ][.

HARDWARE SUPPORTED

Teac SCSI (60 or 150), Archive 150, and Apple (3M) tape drives. But most SCSI tape drives work with this software, even though Tim hasn't tested each one specifically. Apple SCSI cards (either one), and soon the RamFast SCSI card.

SOFTWARE

GS/OS for GSTape, Prodos for HDTape.
HFS partition support is also coming soon

I feel uniquely qualified for this, because I have so much need for the programs, and have built a few SCSI hard drive/tape units. The need comes about from two very active children and their friends. The hard drive/tapes were made for neighbors.

All this adds up to a lot of disk space at high risk (games are not always system friendly, and new users do make mistakes). GSTape has rescued me from bad files and accidental formats more times than I care to remember. GSTape's unique single file recovery can save a lot of aggravation. Especially when the saved game they trash is mine! Then there was that term paper, and the Christmas list. If you have a hard drive, you have to back it up. Sometimes you trash just one file, why restore the whole drive? GSTape makes that backup (and restore) easy.

GOOD :)  

- works with most hardware
- runs under GS/OS (GSTape has desktop interface) or Prodos 8 (HDTape)
- supports Apple cards (HDTape with Rev C Apple card only)
- GSTape has single file restore (HDTape is an image backup)
- Tim Grams has experience and dedication, this will be supported by him personally

BAD :(  

- you don't have a tape backup (can't use this program)
- you enjoy rebuilding your hard drive files from scratch (one sick puppy here)
- RamFast support is incomplete HFS support is incomplete GSTape doesn't work with the GS/OS SCSI tape driver.

SO WHAT?

If you have an Apple SCSI card, these are the best tape programs around. Get a tape drive, send Tim Grams $35 and make your backup problems go away. If you have a RamFast, watch for an announcement about version 2.0. If you use the HFS FST in system 6.0, look for that in version 2.0 also. 2.0 is due out this spring, with the release of the 3.0 ROM RamFast.
MORE ON TAPE    I am running GS/OS 6.0 now, and still use Tim's driver
and software. It has features that Archiver (Apple's utility) can't match. The 3M tape is SSLLOOWW, but half hour backup times are the norm with floppies, on a 32 meg volume, so a slow tape is not so bad. You don't have to be there feeding it disks every minute.

    The TEAC is fast. Any SCSI tape will probably get the job done
easier than disks. I added a 3M tape drive to my drive (home made Quantum) for $100! GSTape will not do background backups, like the RamFast, but it will do single file restores, and that is worth the extra time and planning. Just do your backups at night.

GSTape - HDTape may be purchased directly from"

An Ounce of Prevention  We all depend on our Apple II's so much that should our systems break down we'd all be up a proverbial creek. Since prevention is often the best cure, it would behoove you to have a good diagnostic disk in your software library.

No need to spend a lot of money, though. An excellent Apple II diagnostic is available as shareware in the A2 Roundtable library. Whether you have an Apple II+, IIe, IIc, IIGS, or IIC+, you could benefit from the diagnostic routines on the two Yoyo Duck disks. The requested shareware fee is a modest $5.

Best in the World  One of President Bush's education goals is to make American students the best in the world in mathematics by the year 2000. Any serious attempt to accomplish that goal would involve good math software.

Commercial software is not the only solution, though. A new shareware disk, "Number Games 1," has some simple number games for elementary and middle school students. None of these games are very fancy. But kids seem to enjoy them. Number Games 1 runs on any 64K Apple II. The requested shareware fee is $10.

Gutenberg Never Had it this Good  Are you new PublishIt user? You can quickly become an expert by reading the archived bulletin board messages on PublishIt. This shrunk text file contains over 50 kilobytes of questions and answers from PublishIt enthusiasts around the country.

TrueType Fonts Galore  If you're a Pointless user, be sure to check out all the TrueType fonts that Larry Faust has uploaded in the past two months. Search under the keyword "TrueType" to see the wide selection of fonts Larry has uploaded.

CHECK IT OUT!  It's been a busy month in the GEnie Apple II library and this is just the tip of the iceberg. Check it out!

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 95 of 1824
Apple II Computer Info

Ask Doctor Franklin.  

READING GEnie Lamp  GEnie Lamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnie Lamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnie Lamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)
|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}

ABOUT GEnie  GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99368,GENIE and hit RETURN. The system will then prompt you for your information.

////////////////////////////////////////////////////////////////////////////////////////////////// GEnie_QWIK_QUOTE ///

Notes From The Editor

By John Peters
Soon after the May issue was online, a GENieLamp reader by the name of Jim Goepel wrote to me asking if I would consider starting up another version of GENieLamp for all the other RoundTables here on GENie. My first reaction was, "Oh no! _FIVE_ issues of GENieLamp?" But after thinking about it for a bit, I came to the conclusion that Jim may be onto something here. And with that, GENieLamp Elsewhere was born. Now you have an online magazine devoted to the "other" computing RoundTables. To check out the premier issue of GENieLamp Elsewhere, look for it in the GENieLamp RoundTable on page 515. Thanks, Jim!

Another reader asked if it would be possible to download GENieLamp instead of capturing it off the menu. I was kind of surprised to see this request since capturing GENieLamp from the menu is free (i.e. part of the GENie*Basic service) and downloading the magazine would be at normal online charges. However, there are some advantages to downloading the magazine such as the time it takes. Another factor would be if you have trouble with line noise. For those of you who would prefer to download GENieLamp, you will now find all the GENieLamp versions in the GENieLamp RT Library on page 515;3.

You also might want to keep in mind that with the proper script Aladdin could capture GENieLamp for you. Fred Koch has come up with an excellent script for the Atari ST. (File #23605 in the ST Aladdin RoundTable/M1000;3). We are also working on a all platform Aladdin script that will, with the push of a key, download any or all of the GENieLamp issues, do an Autopass 1 or 2 (if you like) and then log off GENie. Look for more info in the next issue of GENieLamp.

GENieLamp MAC Goes Graphics! As most of our Atari readers know, we have a special version of GENieLamp available for the ST which includes pictures, screenshots, illustrations and other graphics. Now Macintosh readers can get in on the excitement too! Our Macintosh editor, Jim Flanagan has come up with a graphics issue for the GENieLamp MAC readers. If you own a Mac, do yourself a favor and download the latest graphics issue available in the GENieLamp RoundTable library (M515;3). It'll knock your socks off!

That's about it for this month....

Take care!
John Peters

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 97 of 1824
INCIDER/A+ TO HOLD FTA CONTEST

Summer time, for many, is vacation time and a time for fun, so the next several Shareware Solutions columns will be all about fun and games. In the July issue, we'll be taking a look at some wonderful ProDOS-8 based games and in the August issue, we'll be looking at some phenomenal GS/OS games. We'll be looking at some of the unreleased treasures from our good friends The FTA, and from some other French programmers you may have never heard of before.

Also, in the August issue, timed to coincide with KansasFest, we will be announcing the first ever Shareware Solutions Contests. One contest will be for programmers and one will be for end users. Without giving away any state secrets, I'll just say that the contest is being made possible by Olivier Goguel. You know the Gog; founder of the FTA.

(As per the SOURCE COMMENTS)

As you may have heard, when the FTA disbanded last winter, they left behind a number of partially completed programs. Olivier Goguel has provided me with the source code for the FTA software, and it is that source code that will be the basis of the programming contest. That source code is going to be released as public domain (Spread it far and wide, please) and we will be conducting our contest to see who can create the most mind blowing completed product from the source code. We're currently trying to get sponsors, so we can offer prizes.

I'm very excited about the contests, as I see it as a way for the II community to get focused again on something positive. There's been entirely too much doom and gloom recently (IMHO) and I see the contest as a way out of all that negativity. I hope you'll agree, and get involved in that first contest. So does Olivier Goguel, who sends his regards to the IIGS community. —Joe Kohn

(Go one Joe, tell 'em a little more)

\[NOTE: Joe writes the SHAREWARE SOLUTIONS column and other articles for incider/A+. Be sure to check out his great work!\]

KANSASFEST TAKING SHAPE

A2-Central Summer Conference!

July 21-22: Two-day Colleges. If you come for Tuesday and Wednesday's activities, you'll have your choice of one of three two-day developer colleges. One of these will be an introduction to Pascal programming on the Apple IIgs, by Mike Westerfield, developer of the Orca series of development tools from The Byte Works. The second will be an introduction to C programming on the Apple IIgs, by Walker Archer and Gary Morrison. The third will be an intensive look at Apple IIgs Sound and Graphics programming, which will be led by Nate Trost, Chris McKinsey, and Bill Heineman.

JULY 23-24: KANSASFEST

If you come for Thursday and Friday's activities, you'll get our best summer conference ever — two days packed with sessions about the Apple II. We're planning sessions that will help developers keep their System 6 products compatible with each other. We already have registrations from a group of Australian developers and a number of interesting proposals. For example, Softdisk, which continues to actively buy Apple II software from developers, is planning
several sessions. And we're planning sessions for HyperStudio, HyperCard, and UltraMacros developers. Apple itself will once again attend this portion of our conference. In addition, we'll have a bunch of old-timers around to reminisce with you and a bunch of new-timers to tell you about their dreams for the Apple II's next 15 years.

JULY 25-26: APPLE CENTRAL EXPO  Just like last year, Events Specialists is holding its Apple Central Expo in Kansas City on the Saturday and Sunday following our conference. This is a user-oriented show that draws Apple II users from across the midwest. The Expo will be held in the same building as our conference. For tickets to the Expo or to reserve exhibit space, call Events Specialists at 800-955-6630 (617-784-4531), or write them at 17 Lilac Road, Sharon, MA 02067.

Call for proposals  If you'd like to make a presentation at this year's conference, send us a proposal by May 1. Tell us about your topic, intended audience, and equipment and time requirements. Presenters earn a discount!

Facilities  Like last year's summer conference, most of our sessions will be held at a state-of-the-art conference facility owned by the National Office Machine Dealer's Association (NOMDA) in Kansas City, Mo. This facility is within networking distance of Avila College, where our conference has been held in the past and where, once again, we'll be able to provide dormitory rooms and meals to those who want to have the best time possible meeting and learning from other developers. Make your plans to attend now. Whether you come for one day or more, we promise you'll enjoy the sessions you'll attend and the people you'll meet. You must register by June 1 to get the best prices. We have private rooms available at Avila this year, or, if you prefer, choose double-occupancy and save some money. Avila's prices include evening and morning meals surrounding the nights of your stay. College and conference prices include lunch. If you like, you can pay for the sessions only and make your own hotel and transportation arrangements. Or you can eat and stay at Avila for $30 a night ($40 for a private room). And, for $30 more, we'll arrange to have you met at the airport and brought directly to Avila and returned. This final option would cover ALL of your costs for the conference except airfare.

>>> APPLE II ODDS & ENDS <<<

WHAT IS APPLE'S TIM SWIHART DOING? Now that System 6 and HCGS are done,
I've moved into a new role at Apple. Same group, different role. Instead of managing products, I'm managing people. :-) Tim Swihart

NEW Co-PILOT VERSION 2.0 I have just uploaded Co-Pilot version 2.0 (finally!!!). It should be available as #18389, GECoPilot.BXY, as soon as the sysops get to review it.

This version of the Co-Pilot program itself is pretty much the same as the beta version that has been available, but with the bugs all fixed (hopefully) and a few details improved. The scripts have been completely revised to make them easier to understand (for those of you who care) and easier for me to modify and improve and to work better with GENie. There is a new installer to make the installation easier but, due to numerous changes in the organization of Co-Pilot, the installer can not update configuration files from previous versions -- you will have to re-configure them manually.

This version of Co-Pilot requires Point-to-Point version 4.0 or later or Talk is Cheap version 3.20 or later (please note that TIC 3.20 is now required -- the beta worked with earlier versions IC). This version will work correctly with PnP and System 6.0.

The fee for new users remains $25. I regret that I have concluded that I have to charge an upgrade fee for this new version, due to the amount of time and effort that went into it, and the severe reduction in new sales. The upgrade is $10. There is one exception to this -- in appreciation of his support of Co-Pilot when I have not been available, Gary Utter gets a free upgrade.

Besides squashing the inevitable bugs that will appear, I will be devoting my time in the next few weeks to adding support for ProTERM to Co-Pilot. (K.GLUCKMAN, CAT10M TOP11, MSG:65/M645;1)

MORE FROM GENie LAMP When we saw the good word GENie Lamp decided to give Ken a call and find out more about Co-Pilot: Co-Pilot is an off-line message processor which works with Talk is Cheap or Point-to-Point (and soon with ProTERM 3.0) to provide an easy to use IIGS desktop interface to GENie. Changes in the latest version allow you to copy text from the message you are reading and paste it into the message you are writing, or to any other program which supports the clipboard. Other changes improve the performance of the scripts used to access GENie and make the script files easier to read and therefore to customize. Many smaller refinements in the program have also been added to make use even easier.

Co-Pilot was originally written as my first programming effort. It is still the only major application that I have written. It is written entirely in ORCA/M assembly.

I only intended to create a desktop program that would allow me to read messages from (excuse me) CompuServe. However, it just kept growing and soon had many features for responding, archiving, downloading files and, eventually, fully automating an on-line session. Subsequently, I began to notice that really cool things were happening in the Apple II world on GENie. However, I just couldn’t deal with the GENie interface. Tom Hoover’s GEM helped a lot, but I am not an AppleWorks person, so I was
still not comfortable with GEnie. I approached Tom Weisharr at AppleFest in Boston and he agreed to support the creation of a version of Co-Pilot for GEnie. I got a lot of help from all of the Sysops, Tom Hoover, Don Elton, Gary Little and others.

I was really pleased when I was able to create a version of Co-Pilot for GEnie that looked to the user almost the same as the CompuServe version. I believe that one of Co-Pilot's greatest contributions has been that it provides the same interface for both GEnie and CompuServe. I know of no other set of programs that does that for any other computer. This has enabled many users of CompuServe to start using GEnie and vice-versa. In fact, it was Co-Pilot that brought the famous Gary Utter to GEnie from CompuServe! -Ken

AII ADVERTISING THIS MONTH The following is from John Majka, secretary of AII: The ads for the Apple II have been placed in the following magazines:

National Review - Mother Jones - Discover - Sports Afield - The Atlantic - Inc. - Electronic Musician - CQ (for ham radio operators)

They should begin appearing in the June issue due to publishing schedules except for NATIONAL REVIEW. Our ads are already appearing there and we have been getting responses to it.

(D.CRUTCHER, CAT5, TOP7, MSG:44/M645;1)

NO HARMONIE FOR EXPRESS From the thread here on GEnie it has become obvious that Express is not useful with the Harmonie printer drivers. This is due to the way Harmonie works (images a little then sends data out the port in little chunks). Express is most beneficial for printer drivers like the standard ImageWriter driver and the Independence printer drivers for the DeskJet and LaserJet. All of these drivers image larger chunks of data and pump more data out the port in a single shot. For these drivers Express DOES REDUCE the time waiting to regain computer control.

We apologize for making the assumption that if it saved time with our Independence printer drivers and if it saved time with the ImageWriter printer driver, that it would save time with the Harmonie drivers. (Live and learn the hard way...)

If you are using a Harmonie driver and Express isn't working well for you, please try to return the program to the place of purchase...we don't want anyone to be unhappy with us or with Express. Express is a great product; unfortunately it just doesn't benefit Harmonie users.

For those who do find Express useful, please don't return the software just to get it free...it took two years and lots of money to develop. We don't mind refunding Kirk and others who are using Harmonie because Express doesn't appear to be useful to them. Thanks, -Dave

(SEVENHILLS, CAT43, TOP10, MSG:21/24/M645;1)

>>> WHAT'S NEW WITH APPLE II? <<<

A2 RT HAS A NEW BOSS Dean Esmay (A2.DEAN) has been promoted to Head Sysop of A2 and A2Pro, the Apple II RoundTables on GEnie. Dean has been our librarian here since early 1989. Dean follows in
the footsteps of Chet Day, who resigned in late March to run the Religion and Ethics RoundTable here on GENie.

I'm renovating this room for Dean so he can have an office. Please excuse the folding table and chairs for now, we've got a computer desk and some file cabinets on order. If you have any ideas you'd like to share with Dean about how the Apple II RoundTables should be run, this is where you can catch him. —Tom Weishaar, Manager, Apple II RoundTables

UNCLE-DOS, CAT3, TOP7, MSG:1/M645;1

WHO IS DEAN? Gosh, Lloyd, tell you about myself? That might scare people away, but I'll give it a shot. :-(

I started working with computers in an independent study program back at a special education High School I attended back in the early 80's. Actually I started before that playing around with a TRS-80 Model I and Commodore 64 systems, went through a brief love affair with the IBM-PC, and finally discovered the Apple II via an Apple IIe at school. I started reading Open-Apple at that time and because I was a fanatic (perhaps too much of one, but I was young) from that point on.

When Tom Weishaar took over the Apple II RoundTables on GENie, I sent him my resume. I'd been using a modem for a while and was running my own BBS at the time. I was also President of the Apple Tree Computer Club and had developed a reputation with a lot of folks for being a problem-solver. Tom, in a momentary lapse of reason, decided to hire me. I became library and A2.HELP manager here in A2 something like three and a half years ago. I started in December '88 I think, and after a couple of weeks of training I took over from Doug Acker (library) and Dennis Doms (A2.HELP). Those were pretty scary days, especially since I'd never even used GENie before, but I guess it worked out. I'm still here.

I was divorced a while back, and now live in the south suburbs of Chicago with my girlfriend Susan, owner of Digital Data Express (a small Apple II software & used hardware dealership that also distributes the Apple II GEM CD-ROM), with her two kids and her dad. We reside in beautiful unincorporated Midlothian, just a few minutes south of the city. Heck, if anyone from around here wants to get together for coffee or beer or some such, I'd be happy to meet you.

In addition to my duties here, I've been the editor of A2-Central On Disk ever since its inception. My first job was converting all our back issues into text format for sale on a single package, and after that massive project began creating a monthly disk issue jammed full of the best PD, freeware, and shareware software I could find.

I also have that wonderful job responsibility known as "other tasks as assigned," and have at various times done things like answered mail for A2-Central or handled other tasks that Tom needed. Mostly it was just the library and A2 On Disk.

Last year I became the editor of Studio City, nee' Stack-Central. I'm particularly proud of Studio City. We made a lot of changes to it and I now think it's one of the finest disk based publications you'll find on any machine. It's a lot of work and terribly demanding, maybe even more than it's worth, but I find it incredibly rewarding.

I still do the occasional article or other task for the A2-Central newsletter, and am in the process of negotiating a deal to become a
Apple II Computer Info

columnist for inCider on top of everything else.

This stuff is about all I do for a living, though I occasionally teach computer workshops or write articles for other magazines. I also sometimes write music reviews for On-Line Digital Music Review.

I've been working more or less on my own since '88, mostly at home though I do have an office in Blue Island, Illinois. I find it all quite wonderful. Perhaps I don't make as much money as I might at a "real" job, but the compensation is that I have a much greater degree of freedom in my working hours and habits than most people ever do. It also allows me to take occasional classes at the local community college without worrying too much about scheduling conflicts. I never went to college after High School so this is nice.

Though I'm familiar with and occasionally use other machines, I've been an Apple II diehard since the early 80's and I don't see that changing any time soon.

I stand about 5'10", weigh too much, and sport quite long blonde hair and a beard to go with my somewhat piercingly blue eyes. I've been told at various times that I look like either some kind of Viking or Gregg Allman, though neither is intentional. I usually don't wear much besides t-shirts and shorts. I own exactly one tie, which I never learned how to put it on and haven't worn in at least three years.

(A2.DEAN, CAT3, TOP7, MSG:26/M645;1)

MORE NEW HIRES   I'd like to announce that Bill Dooley (BILL.DOOLEY) has recently joined the A2 staff as our bulletin board manager and Chief Topic Cop. You may not all be familiar with Bill, he's usually pretty quiet here in A2, but you may recognize him from some of the other RTs he frequents, most notably the Jerry Pournelle RT.

I hope you'll all make Bill feel welcome in his new role. I know the staff here in A2 is looking forward to working with him.

(A2.DEAN, CAT3, TOP7, MSG:36/M645;1)

TRADING ZONE REVAMPED   Categories 4 and 7 were completely reorganized last month. Category four, A2 RT's trading zone has expanded its scope and sectioned off various types of products into their own topics. GEnie's A2 RT is a unique second-hand market where great bargains are constantly found. And if nobody is offering what you are looking for, just ask. Somebody will be right along with a hot lead or maybe even with the item in hand. Here is a list of the new trade zones:

| Category Product/Service Directory (ads, addresses, phone numbers) |
|--------------------------|---|-----------------|
| Description |
| Topic # |
| [*] 1 A2's Classifieds |
| [*] 5 Full Systems/Large packages |
| [*] 7 8-bit Software |
| [*] 14 II+ specific expansion cards |
| [*] 15 Standard slot (1-7) expansion cards |
| [*] 16 IIe auxiliary slot expansion cards |
THE SEARCH IS ON FOR EARLY APPLE II AUTHORS

In recognition of all the fine support the Apple II family of computers has enjoyed from its inception, A2 and A2PRO are proud to announce a new effort dedicated to preserving as much of this older Classic software as is humanly possible. To do this we are soliciting the aid of all the visitors to A2 and A2PRO here on GEnie.

We are instituting a massive search for as many of the early Apple II programmers as possible. We have several reasons for this. By tracking down these early luminaries, we hope to get them interested in continuing their work (for those who have since left the Apple II world), or, failing that, to obtain permission for distribution of their programs and/or source code via GEnie. This would involve release of Copyright, or otherwise gaining permission for distribution. With the rumors of the loss of the original masters for much of Infocom’s early adventure games (whether true or not), the ability to acquire older programs for safekeeping has taken on a new importance.

At this point, a statement of our general goals would probably be the best way to explain what we are trying to do.

>>>>> LOST CLASSICS GOALS

1. Preserve as much Classic Apple II software as possible, including source code, if available, to prevent inadvertent loss due to accident or misplacement.

2. Provide a service to our clients by providing access to software which is otherwise unavailable due to cessation of commercial publication.

3. Provide a clearinghouse for dated software which needs update for modern Apple IIs (ProDOS vs DOS 3.3, //e vs ][+, etc.), but which may need other third or fourth party assistance to complete. (This includes both public and where necessary, private assistance with negotiations between interested parties.)

4. Try to obtain derivation rights for non-Apple II software for porting to the Apple II platform. (For example, Sim-City for the
5. In the process, make A2 and A2PRO an important hub in the continuing support of the Apple II line of computers.

These goals have been stated basically in order of importance. Our primary consideration is the preservation of existing software which may no longer be published. Because of this, we here at A2/A2PRO applaud efforts by Big Red, Triton, and others to acquire distribution rights for much of the more recent Apple II software. But they do not go far enough. In many cases they do not obtain source code, so they cannot upgrade or update much of the software they carry. If the current owner of the source code should lose their disk(s), the software is gone forever. (And we know how many people keep backups, right? :) The best that can be accomplished through Big Red, et al, is partial satisfaction of Goal #1 and Goal #2 (which is no mean feat, but it is not enough).

Detailed Approach   We will be keeping a database of as many Apple II programmers as possible. The only criterion will be that these programmers be owners of copyrights on previous commercial (copyrighted) Apple II software. We need your help. If you are an Apple II programmer (current or past), reply in the appropriate Topic in this category with your particulars: address, phone #, e-mail addresses (GEnie and elsewhere), and what software you have written. Doing so will NOT obligate you in any way. Should you know of the whereabouts of other programmers/copyright holders, then we would like that information also.

By knowing where these people are, we can start a systematic effort to track them down to ask for support of our project. Since storage on GEnie's mainframes would appear to be a very safe place for storage, this would satisfy Goal #1, even without source code. If allowed to distribute, this would satisfy Goal #2. If it needs update, we can work to organize the programmers which frequent A2PRO to get software updated (with permission, of course), assuming the original programmer is unable or unwilling to undertake the task himself. This satisfies Goal #3. Because some Apple II programmers went on to other platforms, it may be possible to convince them, or another programmer, to do a port to the Apple II of the newer, non-Apple II software which is currently unavailable on the Apple II. This satisfies Goal #4. By performing all of these, we automatically meet Goal #5.

Privacy Issues   Should you be one of the programmers we are searching for, and do NOT want your personal information stated publicly, then send private e-mail to T.TOBIN with your data and instructions to that effect. All information acquired privately will remain that way, private. If you are providing data on another individual and are unsure if they wish their addresses publicly aired, then please send their info by e-mail as well. All requests for privacy will be honored. It is also assumed that there may be programmers who do not wish their software distributed online, but would like to partake of the other services being offered here (safety from loss, programmer clearinghouse, etc.).

Although this avoids Goal #2, we realize we cannot have everything, and we will be willing to help work the problem. We are in the process of setting up an Optical Disk Cartridge (560MB Total Storage, per Cartridge) for offline storage of any and all programs and source which programmers do
not wish on GENie initially. This provides a geographically separate 'safety' storage which can be guaranteed not to be distributed without express permission, and which can be used to support whatever update/upgrade plan the author may have in mind (if any).

In Summary Remember, if you are an Apple II programmer, let us know who and where you are. If you know of an Apple II programmer, let us know where he or she is. This will only work with your support. Show your support for the best, most versatile computer ever made by becoming actively involved. Apple II Forever! (And WE really mean it!)

Disclaimer As this effort evolves, we retain the right to change or improve how we do this, as necessary. (But we will not violate any confidences, regardless)

>>> ...THROUGH THE GRAPEVINE <<<

HYPERCARD MAC DEATH? I see where Apple is now denying the rumored death of HyperCard (Mac). It seems some people are interpreting the release (pending?) of Apple script as the death knell for HyperCard. Apple says it ain't so. Isn't strange that they have to spend so much time and energy saying they aren't killing a product line?

HyperCard (and the Mac) will probably evolve to the point where current users are in the same boat as we ][ users. Tools on a RISC chip to allow it to run 680404 code? Wanna bet what kind of compatibility problems that will cause?

But hey, system 6 is great. Thanks Tom et al.

(J.L.COFFEY, CAT5, TOP3, MSG:76/M645;1)

APPLE II GF? Readers of GENie's paper magazine, LIVEWIRE, may have noticed a photo caption mentioning the Apple IIGF. As always, this started the rumor mill churning so we at GENie Lamp decided to call our friends at Livewire and get the scoop. Here is what they had to say:

The 'IIGF' is unfortunately nothing more than a typo of IIGS. Somewhere along the line someone made a mistake and it was mentioned under a screen shot of Sensei as 'IIGF', when it was supposed to be IIGS.

Being a IIGS owner myself, I wasn't exactly thrilled to see the error appear (especially since I captured the screen shot, etc).

Sincerely,
Kevin J. McCann
Asst. Editor, LW
HEATHKIT COMPUTER PASSES   Today, in the Chicago Tribune Tempo section, I
saw some very sad, though in retrospect, not
very surprising news. Heath Co. is discontinuing the production of
Heathkits. "Actuarial tables" were cited as the determining factor in
discontinuing the kits in favor of ready-made consumer electronics items.
Just another sign of the times. Too many of Heathkit's customers were old,
and passing on, and they were not being replaced. Mr. William Johnson,
president of the company asked "Do your kids have the patience to sit down
and build their own stereo set over the course of several evenings, or a
weekend? Mine don't. They want to buy one at a store so they can listen
to it the very same day".

So easy. So convenient. No curiosity for how or why it works. No, as
Johnson called it, "Eureka!" factor needed... although some people I've
seen lately probably shout that when they manage to get the batteries in
the right way.

I guess I'm just sad. Another treasure of the past fading away, as so
many others have recently, in the name of the holy bottom line. The world
is becoming a very gray place.

Bartender, got a Coke? I'm gonna dig out my Don Lancaster books and
my IC references and have some fun, in memory of Heathkit. -Rich

>>> MESSAGE SPOTLIGHT <<<

Category 19,  Topic 13
Message 3         Mon May 18, 1992
A2.DEAN [Studio City]        at 18:11 EDT

I might as well throw myself into this controversy... some of my
friends won't like that I say this, but what the heck.

BTW, I'm editor of Studio City, a HyperStudio based magazine, and am
involved on the fringes of Script-Central (some months more than others).

Using an accelerated IIgs with a hard drive and a RamFast, I have
still never seen a stack working under Hypercard IIgs that I considered
fast enough to be useful. I find it painful any time I try to do anything
with Hypercard; yes, there are neat things you can do with that language,
but anything you do with it is going to run so slow you'll probably have
time to walk down to a local restaurant for a few cups of coffee while you
wait for it to finish whatever it's doing.

I can't even imagine how horrid it would be trying to use Hypercard
on a IIgs without acceleration. If I didn't already have a Zip GS, and I
bought Hypercard IIgs, I'd want my money back.

HyperStudio is significantly faster all the way around. So much
faster that from what I've seen, a IIgs without an accelerator will be
faster with HyperStudio than a machine WITH an accelerator will be with
Hypercard.

HyperStudio excels in the tons of little things it does that other
Hypermedia programs can't do. Little things mean a lot when added up;
funky transitions, vastly better graphics and animation support, speed,
greater ease of use, flexibility, and on and on. Right now the ONLY think
Hypercard has on HyperStudio is the scripting language; if it weren't for Hypertalk's power, Hypercard would be a complete joke. HyperStudio's scripting is quite weak right now; not only weak, but also embarassingly buggy. If SimpleScript were half as good as HyperTalk, and actually WORKED right most of the time, there simply wouldn't be any question that HyperStudio was a better environment.

I'll go ahead and say that I think that HyperStudio is a vastly superior environment for most Hypermedia tasks on the IIgs. Hypercard is too bloody slow and cumbersome to do anything really useful with; it's fun to play with if you're "into" programming and want a neat and easy language that you can do lots of stuff with, but I frankly have a hard time thinking of it as anything more than an impressive and glorified toy.

Dean Esmay

BO.MONROE [ =040 ] at 21:22 EDT

Heh heh. You're fired, Dean. (Did I mention I'm Editor-In-Chief?)

The truth is, HyperCard IIGS has been getting faster while HyperStudio has been getting SLOWER. My gut feeling is they operate now at about the same speed, though HyperStudio is still probably a little snappier. This could be because this here Quadra running HyperCard makes'em both look like they're stuck in the mud. On the other hand, I don't find the pace of either of them to be painful; more like "deliberate". At any rate, seems like some benchmarks are in order.

As for HyperCard being "useful"... I use a hacked-together HyperCard IIGS stack to, believe it or not, balance my checkbook. It's eminently useful and every bit fast enough for my needs. (Like I said, I've got a Quadra sitting next to my GS. If HCGS was so "painfully slow", I'd just use the Mac. But it ain't, so I don't.) Best of all I wrote it in about 5 minutes in accordance with MY particular needs. That's the promise and the power of HyperTalk: the ability to quickly create software tailored to your own specific needs. Remember Applesoft?

Dean hints at one of the truly cool things about HyperStudio: the modular nature of NBAs, Extras, and Transitions. This means that if some enterprising programmers were to write packages of these things, you could buy them and seamlessly integrate them into HyperStudio. So far, however, these things haven't materialized. (For that matter, scripting languages themselves are modular, and new languages for HyperStudio could be added if someone were to develop them. I think this idea is a more than a little retarded, but that's another story...)

Dean rattled off some impressive HyperStudio features. On paper, it doesn't look like a contest between HyperStudio and HyperCard. However, a program is lot more than a list of features -- it's how well those features work together to make you creative and productive. My experience has been that HyperCard IIGS grows on me-- the more I work with it, the more comfortable (and transparent) it becomes. My experience with HyperStudio has been pretty much the opposite; the more I work with it, the less I enjoy it, and the more I find myself fighting the program and
Apple II Computer Info

devising work-arounds.

That sounds like a hell of a slam, I s'pose. However, I think it really only reflects the different natures of the two programs (and, admittedly, my somewhat unusual use of them). One of the primary design goals of HyperStudio has been to make it instantly accessible; this, in my opinion, comes at the cost of depth. HyperCard is a simpler tool; you have to master it before you can do anything neat with it.

If HyperStudio were a plastic model airplane kit, HyperCard would be an X-Acto knife and a block of balsa. A lot of people are going to be perfectly happy with the results of the kit. But the person with the block of balsa doesn't _have_ to build a plane; she can carve a boat or even a cuckoo clock if she feels like it. She may also cut her hand or never finish the project because it's too hard. Your preference depends on your creative inclination and whether you view mastering a tool as a challenge or a chore.

Virus Alert!
"""""""""""""""""""""""""""""""""""""""""
Compiled by Terry Quinn
[TQUINN]

!!! POLITICAL VIRUS ALERT !!!
"""""""""""""""""""""""""""""""""""""""""

* George Bush Virus: Doesn't do anything, but you can't get rid of it until November.

* Ted Kennedy Virus: Crashes your computer but denies it ever happened.

* Warren Commission Virus: Won't allow you to open your files for 75 years.

* Jerry Brown Virus: Blanks your screen and begins flashing an 800
number.

* David Duke Virus: Makes your screen go completely white.

* Congress Virus: Overdraws your disk space.

* Paul Tsongas Virus: Pops up on Dec. 25 and says "I'm NOT Santa Claus".

* Pat Buchanan Virus: Shifts all output to the extreme right of the screen.

* Dan Quayle Virus: Forces your computer to play "PGA Tour" from 10am to 4pm six days a week.

* Bill Clinton Virus: This virus mutates from region to region. We're not exactly sure what it does.

* Richard Nixon Virus: aka the "Tricky Dick Virus"...you can wipe it out, but it always makes a comeback.

* H.Ross Perot Virus: same as the Jerry Brown Virus, only nicer. Fonts are used and it appears to have had a lot more money put into its' development.

And, for those of you that absolutely *must* have the state-of-the-art in everything, is the recently released:

* L.A.P.D. Virus: This is a reincarnation of the Ted Kennedy Virus, but comes with videotape coverage of the crash and the insanity which follows.

This was contributed by Rick Bryan on another source......

[WHO]

Who's Who In Apple II

<<< GEnieLamp PROFILE OF KARL BUNKER <<<

[This is the first in a series of profiles planned by the editors of the Apple II version of GEnie Lamp. These profiles will spotlight some of the uniquely creative individuals that have contributed time and energy to making the Apple II such a wonderful computer. -ED]

[*][*][*]

1) How did you first become interested in the Apple II computer?
2) Can you share with us some anecdotes of your first forays into computer programming?

Early in 1986, I decided to buy a computer. For the life of me, I can't think why I wanted to do this. I literally had never touched a computer at this time. After looking through a Consumer Reports paperback on personal computers, I decided to get an Apple //c. I chose the //c because I liked the look of it. I don't mean the features, or the display options, or the available software; I mean the LOOK. I liked the design of the external case. Also, I could afford it.

Once I had the computer, I figured I'd better learn how to use it, so I got a book called "Understanding the Apple //c." This book just happened to contain a lot of information about Applesoft BASIC programming. I tried typing in some of the programs from the book, and before I knew it, I was hooked -- I had discovered why I had bought a computer in the first place. My first "original" program was one that continuously printed an obscenity at random locations on the screen. I thought it was hilarious; then, as now, I had a pretty juvenile sense of humor.

I bought a copy of AppleWriter (a word processor) along with my //c. After I had learned a little bit about BASIC programming, I figured I could use this knowledge to modify AppleWriter to correct some of its faults. I was quite surprised and disappointed to learn that I couldn't just "LOAD" and "LIST" AppleWriter. (AppleWriter, of course, was written in assembly language, about which I knew nothing.)

3) Over the years you've released some very high quality Apple II freeware utilities. (Such marvels as DOGPAW and Sneeze come immediately to mind.) What was your motivation in sharing these programs for free with other Apple II users? Do you have a personal philosophy about such things?

Well, first off, many programs much better than any of mine have been released as freeware. I've gotten a lot of use and benefit from things that others have donated to the Apple II community, so I feel compelled to make a contribution myself -- and that's how the tradition is perpetuated.

With Dogpaw (a text file displayer/printer) in particular, I wanted to create something that could be used to display or print out the instruction files that are distributed along with freeware and shareware programs. For this to work, I had to allow Dogpaw to be freely distributed, so I made it public domain. Sneeze is free because it started out life as "Window", a program written by someone else and released as freeware. I modified and improved this earlier program, eventually putting it through about 10 zillion iterations and increasing its capabilities enormously, but kept it as freeware. Sneeze is now probably one of the most versatile and powerful freeware utilities available for Apple II's. (Sneeze is a combination text viewer/printer, graphics viewer, program launcher, and file manager.)

Most of my "major" programs have been released as shareware. I love the institution of shareware; the voluntary, honor-system nature of it, the fact that all payments and other communication go directly from user to programmer, with no "MBA" middle-man deciding what the customer wants and what the programmer should do. I say in the documentation file to one of my programs that a shareware payment "provides inspiration and moral support that goes far beyond its monetary value", and it's quite true. I LOVE getting those little checks!
4) Who do you consider your mentors? What about them do you most admire?

There are many, many extraordinary Apple II programmers, past and present. A list of the ones I admire would go on for pages. Actually, it's easy for me to admire other programmers, because I'm not really that great of a programmer myself. I think that I get some good IDEAS for programs, and that I can design a pretty decent user interface, but when it comes to being a whiz at writing code, or inventing the killer algorithm, I'm honestly nothing special. It took me AGES to learn assembly language, and MORE ages to learn IIgs toolbox programming, and right now I'm in the process of learning C -- and it's taking me AGES!

Probably the most significant "mentor" in my life was William Ross, a woodworker who gave me my first job when I was 16. He taught me a lot about good craftsmanship, attention to detail, and that getting something RIGHT is more important than how long it takes. These principles apply very much to computer programming.

5) Where do you see the future of personal computing going?

It's not going in the direction of more and better Apple II's, that's for sure. <sigh>

But the future of computer technology is an interesting subject. There will certainly continue to be vast improvements in hardware (more, cheaper, faster, smaller), but software will continue to be something of a bottleneck. Programming is still difficult (even for smarter programmers than me), and I don't see any great breakthroughs coming that will make it significantly easier. Artificial intelligence continues to be the Great Promise for the future of computers. Apple Inc. produces promotional videos touting the hypothetical "Knowledge Navigator" of the future -- a handy-dandy personal computer that you'll be able to talk to like you'd talk to your mother, only it will understand your spoken sentences better than your mother probably does, and have more intelligent and useful responses than your mother probably does. This sort of thing has been a pipe dream since the earliest days of computers, and it's still a LONG way off, in my opinion.

6) Can you tell us a little about the types of things you like to do for fun? (Speaking of "non-computer" fun, here.)

I read a fair amount of non-fiction, and I tend to "go through" a lot of interests; reading about many different topics. My current favorite non-computer subject is military history. I've also done a lot of reading lately on the topic of failure -- great planning disasters, engineering failures, military disasters, historical embarrassments, etc. I think that spectacular failure is a fascinating subject.

7) What accomplishments are you most proud of?

I think one's best, proudest accomplishments should always be the ones you haven't done yet; the ones you're still working on.

More prosaically, I especially like my IIgs program-switcher "Quit-To". I use it constantly myself, and it makes my computing much faster and more productive. The IIgs and its system software make for a
terrific machine, and I get a real kick out of the fact that something that I've written can enhance the system so much.

Looking at my life as a whole (not just the computer side of things), I'd have to say that the accomplishment I'm most proud of is my relationship with my wife. Hokey, but true.

8) Are there any long term goals that you've set for yourself?

I'm learning Mac programming. (Boo, hiss, says the crowd.) I fully intend to continue programming on the Apple II, but I also want to move out into a market that isn't being actively buried by the company that controls it.

9) Do you have any favorite motto?

Sure, lots:

"Why the *&^% did THAT happen?"
"Oops, that doesn't look right."
"I thought I FIXED that!"
"I don't understand this at all."
"I wonder what's on TV."

10) Are you active in the local user group in your area? If so, what kinds of activities are going on involving the Apple II.

I'm too shy and antisocial to go to user group meetings. One of the many pleasures of computers for me is that I get to interact with people via screen and keyboard -- an environment that I feel more at ease with.

11) How long have you been on GEnie?

Since about 1988, I think.

12) Does your daytime job involve computers, too? If so, kindly detail trade secrets and other compromising information.

My daytime profession is mechanical technician. It's boring and doesn't involve computers, but it lets me spend lots of time thinking about whatever program I may be working on at the time. I'm constantly jotting down little programming-related notes to myself during the day.

[EOA]

By Steven Weyhrich

>>> APPLE II HISTORY <<<

Compiled and written by Steven Weyhrich
(C) Copyright 1991, Zonker Software
INTRODUCTION   This project began as a description of how the Apple II evolved into a IIGS, and some of the standards that emerged along the way. It has grown into a history of Apple Computer, with an emphasis on the place of the Apple II in that history. It has been gleaned from a variety of magazine articles and books that I have collected over the years, supplemented by information supplied by individuals who were "there" when it happened. I have tried not to spend much time on information that has been often repeated, but rather on the less known stories that led to the Apple II as we know it (and love it) today. Along the way I hope to present some interesting technical trivia, some thoughts about what the Apple II could have been, and what the Apple II still can be. The Apple II has been described as the computer that refuses to die. This story tells a little bit of why that is true.

If you are a new Apple II owner in 1992 and use any 8-bit Apple II software at all, you may feel bewildered by the seemingly nonsensical way in which certain things are laid out. AppleWorks asks which "slot" your printer is in. If you want to use the 80 column screen in Applesoft BASIC you must type an odd command, "PR#3". If you want to write PROGRAMS for Applesoft, you may have some of those ridiculous PEEKs and POKEs to contend with. The disk layout (which type is supposed to go into which slot) seems to be in some random order! And then there is the alphabet soup of disk systems: DOS 3.3, CP/M, Pascal, ProDOS, and GS/OS (if you have a IIGS). If you use 16-bit software EXCLUSIVELY, you will probably see none of this; however, even the most diehard GS user of the "latest and greatest" 16-bit programs will eventually need to use an 8-bit program. If you can tolerate a history lesson and would like to know "the rest of the story," I will try to make sense of it all.

I think one of the Apple II's greatest strengths is the attention they have paid over the years to be backward compatible. That means that a IIGS "power system" manufactured in 1991, with 8 meg of memory, a hand-held optical scanner, CD-ROM drive, and 150 meg of hard disk storage can still run an Integer BASIC program written in 1977, probably without ANY modification! In the world of microcomputers, where technology continues to advance monthly, and old programs may or may not run on the new models, that consistency is amazing to me. Consider the quantum leap in complexity and function between the original 4K Apple ][ and the ROM 03 IIGS; the amount of firmware (built-in programs) in the IIGS is larger than the entire RAM SPACE in a fully expanded original Apple ][!

This strength of the Apple II could also be considered a weakness, because it presents a major difficulty in making design improvements that keep up with the advances in computer technology between 1976 and the present, and yet maintain that compatibility with the past. Other early computer makers found it easy to design improvements that created a better machine, but they did so at the expense of their existing user base (Commodore comes to mind, with the PET, Vic 20, Commodore 64, and lastly the Amiga, all completely incompatible). However, this attention to detail is just one of the things that has made the Apple II the long-lived computer that it is. In examining the development of the Apple II, we will take a look at some pre-Apple microcomputer history, the Apple I, and the formation of Apple Computers, Inc., with some sideroads into ways in which early users overcame the limits of their systems. We will follow through
with the development of the Apple IIe, IIc, and IIGS, and lastly make some comments on the current state of affairs at Apple Inc. regarding the Apple II.

PRE-APPLE HISTORY   Let's begin our adventure in history. I've designed a special interface card that plugs into slot 7 on an Apple II. It contains an item its inventor called a "Flux Capacitor" (something about the being able to modify flux and flow of time). The card derives its power from a self-contained generator called "Mr. Fusion" (another item I dug out of the wreckage from a train/auto accident in California a couple of years ago). Connected to the card via a specially shielded line, Mr. Fusion runs on trash (and is, therefore, the ultimate computer peripheral, if you recall the old principal of "garbage in, garbage out"). Let's put a few issues of PC MAGAZINE into Mr. Fusion, and switch on the Flux Capacitor. (Incidentally, for this to work, it needs an Apple II equipped with a specially modified Zip chip running at 88 MHz). Boot the disk and set the time circuits for 1975. Ready? Set? Go! ** CRACKADOOM ** !!

Did you make it all right? (Just don't touch anything -- you don't want to disrupt the space-time continuum, you know!) Now, since the first Apple II wasn't released until 1977, what are we doing back in 1975? Well, to understand how the Apple II came about, it helps to know the environment that produced it. In 1975, the microcomputer industry was still very much in its infancy. There were few "home computers" that you can choose from, and their capabilities were very much limited. The first microprocessor chip, the 4-bit 4004, had been released by Intel back in 1971. The first video game, Pong, was created by Nolan Bushnell of Atari in 1972. Also in 1972, Intel had gone a step further in microprocessor development and released the 8-bit 8008, and then the 8080 in 1973. The year 1974 saw Scelbi Computer Consulting sell what some consider to be the first commercially built microcomputer, the Scelbi 8-H, based on Intel's 8008 chip. However, it had limited distribution and due to the designer's health problems it didn't go very far. The first home-built computer, the Mark 8, was released that same year. The Mark 8 used the Intel 8080 chip, but had no power supply, monitor, keyboard, or case, and only a few hobbyists ever finished their kits. Overall, the microchip had yet to make much of an impact on the general public beyond the introduction of the hand-held calculator.

With the start of 1975 came a significant event in microcomputer history. If you will consider the early microprocessors of the years 1971 through 1974 as a time of germination and "pregnancy" of ideas and various hardware designs, January of 1975 saw the "labor and delivery" of a special package. The birth announcement was splashed on the front cover of a hacker's magazine, Popular Electronics. The baby's parents, MITS, Inc., named it "Altair 8800"; it measured 18-inches deep by 17 inches wide by 7 inches high, and it weighed in at a massive 256 bytes (that's one fourth of a "K"). Called the "World's First Minicomputer Kit to Rival Commercial Models," the Altair 8800 used the Intel 8080 chip, and sold for $395 (or $498 fully assembled). MITS hoped that they would get about four hundred orders for clones of this baby, trickling in over the months that the two-part article was printed. This would supply the money MITS needed to buy the parts to send to people ordering the kits (one common way those days of "bootstrapping" a small electronics business). This "trickle" of orders would also give MITS time to establish a proper assembly line for packaging the kits. However, they misjudged the burning desire of Popular Electronics' readers to build and operate their own computer. MITS
received four hundred orders in ONE AFTERNOON, and in three weeks it had taken in $250,000.<1>

The Popular Electronics article was a bit exuberant in the way the Altair 8800 was described. They called it "a full-blown computer that can hold its own against sophisticated minicomputers now on the market... The Altair 8800 is not a 'demonstrator' or souped-up calculator... [it] is a complete system." The article had an insert that lists some possible applications for the computer, stating that "the Altair 8800 is so powerful, in fact, that many of these applications can be performed simultaneously." Among the possible uses listed are an automated control for a ham station, a digital clock with time zone conversion, an autopilot for planes and boats, navigation computer, a brain for a robot, a pattern-recognition device, and a printed matter-to-Braille converter for the blind.<2> Many of these things will be possible with microcomputers by 1991, but even by then few people will have the hardware add-ons to make some of these applications possible. Also, despite the power that micros will have in that year, the ability to carry out more than one of these applications "simultaneously" will not be practical or in some cases even possible. The exaggeration by the authors of the Popular Electronics article can perhaps be excused by their excitement in being able to offer a computer that ANYONE can own and use. All this was promised from a computer that came "complete" with only 256 bytes of memory (expandable if you can afford it) and no keyboard, monitor, or storage device.

The IMSAI 8080 (an Altair clone) also came out in 1975 and did fairly well in the hobbyist market. Another popular early computer, the Sol, would not be released until the following year. Other computers released in 1975 that enjoyed limited success were the Altair 680 (also from MITS, Inc., based on the Motorola 6800 processor), the Jupiter II (WaveMate), M6800 (Southwest Technical Products), and the JOLT (Microcomputer Associates), all kits.<3> The entire microcomputer market was still very much a hobbyist market, best suited for those who enjoyed assembling a computer from a kit. After you assembled your computer, you either had to write your own programs (from assembly language) or enter a program someone else wrote. If you could afford the extra memory and the cost of buying a BASIC interpreter, you might have been able to write some small programs that ran in that language instead of having to figure out 8080 assembly language. If you were lucky (or rich) you had 16K of memory, possibly more; if you were REALLY lucky you owned (or could borrow) a surplus paper tape reader to avoid typing in manually your friend's checkbook balancing program. Did I say typing? Many early computer hobbyists didn't even have the interface allowing them to TYPE from a keyboard or teletype. The "complete" Altair 8800 discussed above could only be programmed by entering data via tiny little switches on its front panel, as either octal (base 8) bytes or hexadecimal (base 16) bytes. With no television monitor available either, the results of the program were read in binary (base 2) from lights on that front panel. This may sound like the old story that begins with the statement, "I had to walk five miles to school through snow three feet deep when I was your age," but it helps to understand how things were at this time to see what a leap forward the Apple II really was (er, will be. Time travel complicates grammar!)

Apple II And The Future
"""
By Roger Wagner

>>> THE APPLE IIGS <<<
"""
~ What the Mac LC Should Have Been? ~

A REVIEW OF THE MAC LC in the December, 1990 issue of inCider magazine was subtitled "What the Apple IIGS Should Have Been?" The underlying idea was reasonable: If the Mac LC had been introduced in 1986, rather than the II GS, people would most likely have been fairly happy with this transition machine to the Mac. However, history does not accommodate "what ifs", and at this point, one can legitimately ask, "Is the Apple IIGS what the Mac LC should have been?"

The unexpected factor today is the world of multimedia, and that the Apple IIGS is arguably the ideal multimedia (or hypermedia) machine. Regardless of what term you use, this environment will be more significant in the 90's than desktop publishing was in the 80's, particularly in the classroom.

The ideal multimedia machine should have good color graphics, excellent sound, and the ability to connect to laserdiscs, CD-ROM, and VCRs. It should be easy and intuitive to use, and as affordable as possible. You should be able to present your work, and easily record and transport it to share with others. The Apple IIGS has all this and more.

Let's suppose a student creates a multimedia report, and then presents it to the class. With the Apple IIGS, a standard classroom monitor or TV can be used with no special hardware. Although a TV isn't great for displaying 80-column text screens, multimedia presentations with graphics, larger text, and video sequences from a laserdisc will look quite nice. On a Mac or PC, a projection system that can handle true color is likely to cost $2000-$3000, or more.
Laserdiscs, combined with a video overlay card, add a very attractive component, and allow anyone to create very exciting results. On the Apple IIGS, a school can buy a Video Overlay Card for about $400. On the Mac LC (if a card were available), using the slot for a video card would preclude using the IIe card. Cards similar to the Video Overlay Card on other Mac models cost around $2500. (By the way, services are now available that will convert your own videotapes to a laserdisc for $200-$300!)

On its way to that TV or monitor, the Apple IIGS video can be routed through any common VCR, recording both the audio and video portions of the presentation, so Mom and Dad can see what they did at school, and keep a permanent record of the moment. Presenters can go to conferences with just a video tape, without lugging tons of computer hardware. Macs and PCs require a special adapter (an "NTSC Converter"), and these can be an expensive addition.

You heard it here first: The VCR will be the printer of the 90's. How else to record sound, animation, graphics, video and more, and in a form that anyone can view (virtually all homes and schools now have VCRs). Once you're aware of what the GS can do, hearing that another computer can't be recorded with a VCR is like hearing it can't be attached to a printer. An article in the October 15, 1990 issue of BusinessWeek discusses Apple's generation of computers AFTER the Mac: "At least two years off, Jaguar will include extensive video technology and the ability to connect to TVs and VCRs, Apple employees say." How great for Apple IIGS owners to know that they don't have to wait for the successor to the Mac. They can have all this now!

Schools that purchase Mac LC's, hoping for a color multimedia machine, will be surprised to discover that HyperCard on the Mac is only black & white. A limited ability to display single color graphics is available, but to just draw a line or two in color, you'll need a GS with HyperCard or HyperStudio. Want to use the microphone on the LC? You'll have to leave HyperCard, run a separate program, and then go through some additional steps to incorporate the sound. On a GS with HyperStudio, adding sound is easy and perfectly integrated into the overall environment.

Last of all is the working environment itself. Stackbuilding on the GS is significantly easier. Thousands of schools are using the Apple IIGS for multimedia right now, and projects created entirely by 1st graders are by no means unusual. Home users of the Apple IIGS find it perfect for not only the kids, but fun for personal-interest uses from family trees to hobby-related projects. Through user groups, mail-order catalogs, and online services like America Online, CompuServe and GEnie, there are already almost 200 megabytes of existing hypermedia applications (stacks) of every imaginable kind - all for the Apple IIGS.

What does the future hold for the Apple IIGS? The Apple IIGS is not an outdated technology. The Apple IIGS has features that are not currently available in any machine, and offers a solution that couldn't be more relevant to the next revolution in computing. I've personally travelled extensively across the U.S. in the last year, and everywhere I've seen a tremendous amount of interest and enthusiasm for what the Apple IIGS offers. This interest is the result of recognizing a practical and immediate tool. If you haven't yet seen what multimedia and the Apple IIGS are all about, there couldn't be a better time than now to find out what the future holds, and how you can make that future a present reality.
you already have an Apple IIGS, then you'll be happy to know you own the
best machine possible to enter the 90's!

By Phil Shapiro

[P.SHAPIRO01]

>>>>> SOME THOUGHTS ON THE VALUE OF BEING A RESPONSIBLE ELECTRONIC CITIZEN

In the early days of our nation the pioneer settlers had distinct
views on the nature of civic virtue. People looked out for one another.
People volunteered a fixed number of hours each week for the public good.
And in times of crisis, people pulled together to help the most needy.

In the electronic age, a similar set of civic ideals is emerging in
the new electronic nations. The new civic responsibility includes pitching
in to help in various ways.

Contributions of time and energy can take many forms. Leaving
thoughtful answers to posted questions can be a way of carrying out one's
civic duty. Uploading new files to the roundtable library can likewise be a
civic good deed.

In terms of library uploads, you need not be a professional programmer
or software designer to upload files to a roundtable library. Less than ten
percent of all uploads are original programs or data files created entirely
from scratch. The great majority of uploads are programs and files
collected from other places. Such "other places" include local user groups,
local bulletin boards systems (BBS's), or commercial public domain disk
distributors.

Many times an individual might seize the opportunity to enhance a
particular program or file before uploading it. Typical enhancements to a
public domain program might be to set up an easy front end menu, or to
write some easy to understand instructions to be bundled as a text file within the shrunk archive.

Writing instructions, or adding helpful comments to existing instructions, requires no programming capability whatsoever. Some people who do this choose to leave full credit with the person who originally wrote the program or documentation. Others may choose to add a brief mention of their own contribution to the project.

The latter course of action is actually helpful in establishing the collaborative effort of the project. As end users come to use and enjoy such programs, seeing multiple names on the credits helps to reinforce the idea that we all have individual talents we can contribute to the electronic nation.

In terms of being an active citizen in the message roundtables, the duties of citizenship require regular reading of new messages. Someone may post a question which you are uniquely qualified to answer. Then again, someone may post an answer that solves a particularly troublesome question that you yourself have had.

The duties of citizenship further require that the public messages you post be predominantly constructive and positively phrased. It's all too easy to use a public forum to air one's gripes. In certain circumstances legitimate complaints can and should be discussed in a public electronic forum. But even in such cases, the duties of citizenship dictate that care be given to refrain from name calling and other communications that could cause emotional hurt in others.

In thinking about such ideas, recall the image of our nation's pioneer settlers. A publicly posted message with negative remarks is tantamount to standing in the middle of a village green yelling out scandalous remarks about one's neighbor. Negatively phrased electronic messages are far less noisy, but equally injurious.

One further duty rounds out the responsibility roster. When newcomers to the electronic nation require assistance, the role of experienced users, the "village elders," is to give helpful and concise advice. Such advice often involves no more effort than writing a note pointing the newcomer in the direction of written instructions. Other times a village elder may refer a newcomer to the counsel of another village elder. A virtuous electronic citizen tries to keep such referrals to a minimum, ever sensitive to burdening others with extra duties.

The value of civic virtue is that when each citizen contributes his or her part, the entire nation benefits from such acts of goodwill. Within an electronic nation, the entire nation is constructed on the good deeds of its citizens. The foundations of such a nation are built on goodwill.

As you participate in electronic communities, both local and national, take a minute to think about the time and effort being invested by others. And consider how you yourself might make a contribution. For the goodness you give to others is bound to resonate back in some way to yourself or your friends.

Perhaps John Lennon said it best on the Abbey Road LP:

"And in the end,
Apple II Computer Info

The love you take,
Is equal to the love,
You make..."

VIEWPOINT /
////////////////////////////////////////////////////////////////////////////////
Pointless Made Easy
"""""
By Udo Huth
[U.HUTH]

WHAT'S THE POINT? Well, now that you've got Pointless, what can you do """""""""""""""""" with it? Pointless allows the use of TrueType fonts (which were introduced on the Macintosh with System 7.0) on the Apple IIGS with desktop programs. It will not enhance 8-bit programs... well, not quite so. You have possibilities for using TrueType fonts with TimeOut SuperFonts or PublishIt. But more on that later.

First you need to install Pointless in the CDEVS folder on your boot disk. The installer provided on the Pointless disk will do that for you, but asks first for your name and imbeds it into Pointless. The installer forgets to copy the Courier fonts, however, but using the Finder it's only a matter of opening the appropriate folders and dragging the Courier icons to the Fonts folder of your boot disk. After a re-boot Pointless is installed and you can start configuring it and the fonts.

Choosing Pointless from the Control Panel NDA (5.0.4) or from the
Control Panels NDA (System 6.0) opens the CDEV (window). First you have to tell Pointless where it can find the TrueType fonts. You do this with the "Add" button. A Standard Get File Dialog will open and you just select the drive and folder, where the TrueType fonts are located. Once there, you select the fonts you want to add. To select all fonts, click on the first one, then scroll to the last entry and while holding the "Shift" key down, click on it. You have now selected all fonts. Click once on "Accept" and Pointless will save the locations of all fonts in it's TrueType.List file, which is located in the Fonts folder. To select just a few fonts, click once on the first one, scroll to the next you'd like, and while holding the "Apple" (or "Command") key down, click on it. Repeat this for the other fonts you'd like. Then click on "Accept". Now you'll find the fonts in the font window of the Pointless window.

There is no need for you to copy all TrueType fonts into the Fonts folder of your bootdisk. The chances are that you'll be quite quickly out of room there. It is possible to have the TrueType fonts everywhere. The "Add" button and the Get File Dialog will take care of that. It is even possible to use the TrueType fonts directly from a Mac hard disk, when the Macintosh is running System 7.0 with file sharing enabled and the IIGS connected via AppleTalk. In case you added fonts from somewhere other than the boot disk, Pointless will prompt you to insert the appropriate disk when you want to use a font which is not in your Fonts directory. "Add" will install the names of the fonts in the "Choose Font..." menu of your programs, too.

Now you have to configure the range of the font. Double clicking on "Configure" will open just another dialog. You'll see 255 different characters there (well, some are just the missing character symbol). Three rows of those characters are already selected. These are the characters Pointless will generate, when you choose a TrueType font from the Fonts menu. With System 5.0.4 configuring the range of a font was critical because you mustn't exceed the 64K limit for the size of a font. The larger a font had to be, the fewer characters could be generated. With System 6.0 this limit has been removed. You can configure those fonts in any way. For adding characters in addition to those already selected, hold the "Shift" key down and click on the characters you want to add. For removing characters from the set hold the "Shift" key down, and click on the character or characters you want removed.

In case you're done with a font, select it from the scrollable fonts window of Pointless and click on "Remove". This removes the font from the TrueType.List file and from the "Choose Font..." menu of your programs.

There is a fourth button in the Pointless window: "Save bitmap". This is where those 8-bit programs come in. Select a font from the scrollable fonts window in the Pointless window and click on "Save bitmap". A dialog box will appear where you can specify where to save the file and with which name. For the file name enter the name of the font followed by a period and the desired size of the font. (E.g. Bookman.125 will save the Bookman font in the size of 125 point.) These fonts can now be used by TimeOut SuperFonts as they are. For use with PublishIt they have to be converted. This can be done with a font editor which offers this capability. Font Factory will do very well.

Well, this was just a short expedition into the world of TrueType. With the Pointless software, TrueType fonts, and maybe a StyleWriter printer for sharp output, the Apple IIGS is really "The power to be your
HOT Files For The Asking

By Richard Vega

>>> HOT FILES! <<<

LOOK NO FURTHER FOR PRINT SHOP CLIP ART & BORDERS

Print Shop enthusiasts can find graphics galore in the Apple II Roundtable library. A search under the keywords "Print Shop" turned up over 130 files. The listed files include everything from color borders for Print Shop GS to baseball logos to scout insignia to Print Shop graphics of flags. But clip art files are not the only interesting Print Shop uploads to the Apple II GENie Roundtable. Also available for downloading is a popular utility to convert classic Print Shop graphics to Print Shop GS graphics. (File number 6541: PSGS.CONV.BNY). The fact that this file has been downloaded 317 times is an indication of its usefulness.

At 1200 baud, this 16K file should take no more than 3 or 4 minutes to download. At 2400 baud, about half that time.

FREEWARE UTILITY ON GENie HELPS EASE COLD WAR TENSIONS BETWEEN APPLE II AND MS.DOS TEXT FILES

Do you ever have a need to send a text file to MS/DOS users, to help them gain the privileged insights of Apple II users? Your MS/DOS friends may gnash their teeth if you don't do them the courtesy of adding linefeeds to your text files.

Prodigious programmer Karl Bunker has created a very useful utility, "Linefeed.IR" that will insert or remove linefeeds from any text file. You can use this same utility to remove linefeeds from captured GENie text that you've saved to disk. (Using Linefeed.IR is far more elegant than doing a search and replace with your word processor. By replacing linefeeds by spaces this way, you're actually altering your document.)

Directions for using Linefeed.IR are contained in a concise text file bundled with the program. Much to his credit, Karl fits the entire directions into a plain English paragraph:

"Linefeed.IR does not alter your text file. Instead, it creates a new text file, with linefeeds inserted or removed, depending on your initial
selection. After you select a source file to be processed, you are asked for a name for the new, "object" file. A default name, with the suffix ".I" for Inserted linefeeds, or ".R" for Removed linefeeds, is offered. You can accept this name by pressing <return>, or type in another. Once the object filename is given, Linefeed.IR goes to work, and lets you know when it's done. That's all there is to it."

Just in case you run into trouble, Karl invites you to contact him for technical support: "I hope you find this program useful. If you have any problems, I can be reached at the addresses shown below. " Karl deserves an "Apple II citizenship" award for such selfless contributions to the public good.

OTHER GOODIES IN THE APPLE II LIBRARY! Meanwhile Bill Dooley has uploaded several archived messages from the A2 Roundtable. Looking for information on Apple SCSI (small computer system interface) cards? Check out the file: "SCSI.MSG.BXY" You can easily find Bill's other uploads by searching for new files. (Choice 11 on the A2 Library's menu.)

You've Got a Good Friend in NAUG

YOU'VE GOT A GOOD FRIEND IN NAUG If you're an AppleWorks user, don't forget to check the frequent high quality uploads from the National AppleWorks Users Group (NAUG). You can search for all the NAUG uploads by specifying "NAUG" as the uploader in the "Search for a File" option on the roundtable menu.

Likewise, if you find a golden nugget file in the library, it pays to check to see if that same person uploaded other golden nuggets. Every once in a while a choice nugget points to a whole rich vein of files to be mined.

Until next month, happy mining.

GOOD AFTERNOON Good afternoon, and aren't air conditioners wonderful? Spring cleaning is well underway, and I'm glad to say that includes cleaning out my in box — which is full of interesting questions like these:

[+] [+] [+]
Dear Dr. Ken

""""

What is multi-tasking?

-- Synchronous Shirley from Sausalito

Dear Shirley

""""

Simon says rub your tummy with your left hand. Simon says pat your head with your right hand at the same time. Simon says say the Gettysburg address while continuing with both hands. Now hop on one foot. Ah-ha! I didn't say Simon says; you're out.

Now you know what multi-tasking feels like to a computer.

Most microcomputers are programmed to run one program at a time (like a word processor). But sometimes a program needs to run without your help (like sort 20,000 names and addresses, or calculate a huge spreadsheet, or download a file by modem), and you're forced to watch while it chugs away. I usually pick up a good book during these times. Wouldn't it be nice if you could play a game or run another program during these times?

Multi-tasking allows this. Each program thinks it's the only one running, but the computer's operating system switches back and forth between them several times a second. To you it looks like they are running at the same time, albeit a bit slower. The Amiga crows about its ability to do this. However, for most of us micro-munchkins, it is rarely very useful -- and for system programmers, it's a major migraine.

Limited multi-tasking, called "background tasking", is more practical. The most common example is a "print spooler". It grabs print requests from other programs (like a word processor) and tells the program they're done. Then, while you work on other things, the spooler feeds the printing job to the printer. If you have several long letters to edit, this can be a real time saver.

There are two more good examples of background tasking. One is the digitized sound hardware on the IIgs, which plays sounds without stopping or slowing the main program. The other is a screen blanker utility, which sits and watches how long since you've touched a key (and pounces on your screen if it's been too long).

Dear Solly

""""

Forget about the hard drive -- let's worry about your church group. Seventeen members? We gotta get a MAJOR revival going in Saskatoon!

Dear Dr. Ken

""""

I heard that Apple now sells a 1.44 megabyte high-density disk drive for the IIgs. For what purposes would someone buy such a drive? I use my GS about once a week, with a database application, to sort and print the 17 active people in my church group. Would a high-density drive help? Supposing I had a choice of buying a 40MB hard drive, or the high-density drive. Since the price would be about the same, when would each of these drives be recommended over the other? -- Solly Schneider from Saskatoon, Saskatchewan

I usually pick up a good book during these times. Wouldn't it be nice if you could play a game or run another program during these times?

Multi-tasking allows this. Each program thinks it's the only one running, but the computer's operating system switches back and forth between them several times a second. The other is a screen blanker utility, which sits and watches how long since you've touched a key (and pounces on your screen if it's been too long).

I heard that Apple now sells a 1.44 megabyte high-density disk drive for the IIgs. For what purposes would someone buy such a drive? I use my GS about once a week, with a database application, to sort and print the 17 active people in my church group. Would a high-density drive help? Supposing I had a choice of buying a 40MB hard drive, or the high-density drive. Since the price would be about the same, when would each of these drives be recommended over the other? -- Solly Schneider from Saskatoon, Saskatchewan

Forget about the hard drive -- let's worry about your church group. Seventeen members? We gotta get a MAJOR revival going in Saskatoon!
For you, I'd buy the hard drive. It's much faster than the high-density drive, and will allow you flexibility should your needs change in the future.

In general, the high-density drive has two advantages. First, it allows you to save more stuff on a disk for backups; and second, it allows you to read MS-DOS and Macintosh disks (if you have the software). This second advantage only applies to II users with a PC Transporter, or to IIgs users who want to convert files from Macs (like Hypercard stacks, sounds, and graphics). It is much slower than a hard drive at reading and writing information, and you must buy a special kind of 3.5" disk to be able to format for 1.44 megabytes. These special disks cost 50-80% more than standard 800K floppy disks.

I only use 1.44MB disks to make hard drive backups, because it makes a shorter stack. And by the way, the TMS Shadow 52MB hard drive is about the same price as well, so don't settle for a measly 40MB.

Dear Dr. Ken
What is Teach text and how does it differ from ASCII? -- Sharp Sven from Chicago

Dear Sven
Teach text carries imbedded rulers, which your computer uses to rap your knuckles if you daydream or throw spitballs at the monitor. It also automatically generates pop quizzes every fourth time you access the file.

Now if I were part of the "Wayne's World" fad, here's where I would say "NOT!!!!!!!" But I'm not, so I won't.

Teach text is a format created by the Macintosh folks and recently moved over to the IIgs world. It's a file with two parts: one is straight (or ASCII) text, and the other is a set of codes with font and formatting information (like boldface, italics, and so on). Straight ASCII files cannot contain formatting information (unless you want sentences like "This is *BOLD START*not*BOLD END* a pretty way to *ITALIC START*communicate*ITALIC END*!)

Teach files are most commonly used for on-disk program documentation (the "Read Me" or "Latest Release Info" files), though you can use them for any text information.

Dear Dr. Ken
When running with an accelerator board, should it be slowed to normal speed when doing supercritical things like optimizing or backing up a hard drive? -- Slinky Sparky from Silver Spring

Dear Sparky
You should only slow the accelerator down when processing school or hospital files, or when a police memorandum wants the right of way. Otherwise, floor it, bubba.

Your accelerator board, if it's working properly, should not have any problem accessing your hard drive. But if you have problems, before you toss the card, check a few things.
Apple II Computer Info

Does your SCSI card (the hard drive interface card) have a "DMA" switch? If so, turn your computer off, turn that switch off, and try again. Some accelerator boards and SCSI cards modify memory without telling each other, and that confuses your computer.

Are all the cables and sockets firmly seated? Sometimes a poor connection makes these boards intermittently flaky – and you'll hate it when that happens. Try taking each card out (with the power off, of course), wiping the contacts with a clean T-shirt, and reinserting them.

Is your Apple full of cards? You may be overtaxing your power supply, which causes the computer equivalent of low blood sugar – confusion and shakiness. Consider buying a heavy duty power supply.

Finally, do you have quality software? I would recommend a quality package, like Glen Bredon's "Prosel" or Vitesse's "Salvation" series, over a utility like "Bill and Rusty's Disk Toolkit and Bowling Simulator".

Once again, campers, I'm out of blathering room. Remember, you can send electronic mail questions to me on GENie as KEN.FRANKLIN or on America Online as Dr Ken FP.

READING GEnie Lamp  GEnie Lamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnie Lamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]  [*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnie Lamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

Notes From The Editor

By John Peters

[GENIELAMP]

TOP OF THE PAGE   Expanding the GEnieLamp concept to four different computer platforms has been a real eye-opener for me.

Reading hundreds (thousands?) of messages from the various computing bulletin boards every week here on GEnie has made me think twice about the computer choices that we have. Literally, everyday I see the good, the bad, and the ugly when it comes to the IBM, Atari ST, Apple II and Macintosh computers. This computer will do this, the other will do that, but this one does it better etc. etc. etc. Although I consider myself to be a faithful, sometimes fanatical STer, I must admit that being exposed to the other systems has altered my thinking a bit. Sometimes my mind begins to wander and I wonder if I really am getting the maximum power out of my system or if I would better better off with another computer. So, what is all this rambling leading up to? Announcing....

>>> THE ANNUAL GEnieLamp COMPUTER WAR CONTEST! <<<

Take Your Best Shot!   Here's your chance to boast about your favorite computer system, whether it is a Timex/Sinclair or a Cray Supercomputer or something inbetween. Plus, you can win GEnie online credit time! How? Simple. All you have to do is to convince me why you think I should _upgrade_ to your computer system. Or if you are an Atari STer, why you think I should stay with the Atari ST.

What's In It For YOU? Wow! Over $200.00 worth of GEnie online credit, that's what! Take a look...

1st Place............$100.00 worth of GEnie credit.
2nd Place............$50.00 worth of GEnie credit.
3rd Place............$25.00 worth of GEnie credit.
Honorary Mention.....$12.00(*)

(*) Entries selected for publishing in upcoming issues of GEnieLamp will receive $12.00 worth of GEnie time _upon_ publication.

The Details

- The contest is open to all GEnie members. (If you are not a GEnie member, maybe now is the time to join!) GEnieLamp staff writers and GEnie employees/contractors are welcomed to submit articles, but are not eligible for prizes.

- Contest entries are to be 500 words or less and in ASCII format. At the top of your article, be sure to include your name and your GEmail address.

- Deadline for submissions is no later than midnight, August 15, 1992.
Apple II Computer Info

- When you are ready, you can upload your entry to the temporary library #8 in the GENieLamp RoundTable (M515;3) or send it via GEmail to GENIELAMP. Use CONTEST for the subject.

- All entries become the property of GENieLamp Online Magazine.

- Entries will be judged by the GENieLamp Editors, Co-editors and Columnists. Judges decisions are final.

So what'cha you waiting for? This is an easy contest! You're writing about something you love, your computer system. Boot up that word processor and fire the first shot!

"GET THE LAMP" SCRIPTS NOW ONLINE  GENieLamp scripts are now available for our IBM, Atari ST and Microphone II/White Knight Macintosh readers. These script files will allow you to download all the issues, or just the issues you want. As an added plus, you can also have Aladdin grab the latest copy of GENieLamp while you sleep. Where can you Get The Lamp script? You'll find the script right here in GENieLamp ST and GENieLamp IBM. {See [GET]). Just clip it out and add it to your Aladdin script file.

The script file is also available in the GENieLamp RT, [m515], Aladdin ST RT, [m1000] and the PCAladdin RT, [m110]. The Macintosh macros for White Knight and Microphone II are available in the GENieLamp RT [m515], the Mac RT [605] and the Freesoft RT [m585].

Get The Lamp. Scripts and macros make it easy!

DEEP THOUGHTS... The following post was written by a ST RoundTable SysOp, Jeff Williams.

Atari-ST RoundTable
Category 13, Topic 7
Message 96  Tue Jun 09, 1992
JEFF.W [ST Sysop] at 00:14 EDT

While I hope to use grammar correctly and exercise correct spelling in all my writing, I make plenty of mistakes (and typos) in my online messages. I'll transpose letters, drop letters (how many times have I typed 'you' instead of 'your'? I wince at that every time I see myself doing that.), absent-mindedly use 'their' instead of 'they're', etc.

Proper grammar and spelling facilitates written communication, but it doesn't insure that one expresses his thoughts clearly. It helps, but it's not a guarantee. On the other hand, I've seen lots of posts that were clear and understandable in spite of several grammatical and spelling errors.

My point is this...if a message is to be criticized or debated, I hope it will be based on its content and meaning, not on writing skill of the author.

In business writing, education, and literature, different rules apply. For these, I definitely need tools like GramSiam!

[*][*][*]
WHAT HAPPENED? Traditionally June is a strange month for the Apple II community. Through most of the year rumors of impending doom, corporate buy-outs and new products abound, but on the sixth month one can nearly hear a pin drop. The rumors cease, the regular banter quiets and everybody sits still. Why the change in attitude? June is the month of anticipation and the month of wait.

But while June is a quiet time, July is a month of great commotion and excitement. July marks A2-Central's annual KansasFest Apple II Computer convention. This is the month when developers and programmers release their newest and greatest creations and reveal their exciting plans for the coming year.

Celebrating the developer's convention, GEnie Lamp A2 is adding coverage of the Apple II Developer's Roundtable and now becomes GEnieLamp A2/A2Pro. This month we take you on a tour of A2Pro and share with you its many exciting features. You will find it all in our A2Pro News & Features.

Stealing the show at KansasFest last year, Apple Inc. revealed they were working on new system software for the IIgs and a HyperCard GS update. What followed were several months of excitement and frustration while Apple users waited and watched as the gang from California labored and stumbled their way to golden masters.

But throughout the wait Apple Inc. kept us informed. We new it was really going to arrive. Of course GEnie was on the cutting edge as Apple Computer's Andy Nicholas, Tim Swihart and Matt Deatherage were constantly online answering inquiries. This open approach to developing rebuilt a lot of trust in Apple Inc. and has been sorely missed since HyperCard GS and System 6.0 were finished.

Now that System Six is in the consumers' hands we can look forward to more software which will take advantage of the new technologies. And since resource forks play even bigger role in programming the IIgs, developers can look forward to many new tools. Still, the big question remains. Who will take the lead in exciting announcements and releases during the 1992 KansasFest?
Apple II Computer Info

But while June was a quiet month, it did not pass without some events. The Byte Works has released their new package to program the IIgs toolbox in Pascal. This complete lesson plan even includes an abridged toolbox reference so you can delay acquiring the toolbox reference set. If you are interested in programming any Apple II, whether a seasoned professional or one who still wants to learn, you owe it to yourself to look at The Byte Work's product list.

We also began seeing references to the Avatar project and that it will be the future of the Apple II. Obviously, until Avatar is in beta testing it is still vapor ware, and even then it may not get onto the retail shelf. Any new technology which attempts to duplicate Apple's proprietary knowledge is sure to be burdened with long and costly court delays. We shall soon see -- maybe.

But what is Avatar? Bill Heineman explains in this message:

Super Apple II? Project Avatar is a machine that I am building with a friend which "Could" be called a Super Apple IIgs. It also has a lot of neat designs and concepts so the machine really is a new platform and not just an Apple II rehash. This machine is NOT a clone. It is a new design that can run most Apple IIe and IIgs software but if can do a whole lot more. I am working with people trying to get investors so that the machine can get off the ground and actually become something you can buy.

But the road is long and hard because I need several million dollars to actually go into production... If everything works out we'll all breathe easier knowing that someone will be actively selling, supporting and improving a machine that could have taken over the world but was never given the chance...

(W.HEINEMAN1, CAT5, TOP4, MSG:4/M645;1)

Next month GENieLamp A2/A2Pro will have a full story on the Avatar project, what it hopes to accomplish and why it is going to have a difficult time getting into your hands. Look for that in the August A2Pro News & Features.

But this is July, the Christmas season for the Apple II computer, and if you cannot be in Kansas with Uncle Dos and the A2-Central gang the next best place to be is online with GENie. A2-Central, the sponsors of KansasFest also sponsor the Apple II (A2) and Apple II Pro (A2Pro) roundtables on GENie which means daily updates and product announcements will be available in the A2 RT.

July Contest in A2Pro Hey, now that 6.0 is out and lots of people know about some of the programming features, we're having our first contest to take advantage of it.

This is the A2PRO contest for July 1992, and it's for Finder Extensions. If you're writing one, or if you want to, here's a great chance to win a great prize.
Here's the scoop.

- We're looking for Finder Extensions.

- We (the A2PRO staff and others we reserve the right to corral) will judge them on the following criteria:
  - How useful (or incredibly cool) they are. Some extensions may be very cool but not particularly useful (a good example of this was Jason Harper's "Meltdown NDA"). but most should be very useful.
  - How they fit into the user interface (i.e., intuitive, non-intrusive, tabbing to the next controls works and takes you where you expect, etc.).
  - We've opened a new library for the uploads -- library 22 -- and all you have to do to enter is upload your Finder Extension to that library. Don't worry about uploading elsewhere; we'll merge all entries into the main A2 and A2PRO libraries after the contest. (Only authors are eligible, by the way -- you can't upload someone else's extension and win.)
  - You get bonus points for including source code that shows useful techniques, but they can be nullified if we find compatibility risks.
  - The contest deadline is August 1st, so you have time to talk to other people at KansasFest about your entry.

  The winner will receive a FREE WEEKEND in A2 and A2PRO -- all your time in A2 and A2PRO that weekend will be on the house. The runner-up gets one free weekend day in A2 and A2PRO -- same deal.

  The library is already open and ready for your great Finder Extensions, and A2PRO is always your best resource when you have questions on how to make them work. So wrack your brains and start those assemblers and compilers!

  (People who already don't pay for time in A2 and A2PRO, like product support people, are ineligible to win prizes or be judged, but they're encouraged to upload their extensions as well. Authors retain all rights to their code just as in normal library uploads. If you have questions, just ask!) --Matt (I speak for A2PRO, not for Apple)

>>> APPLE II ODDS & ENDS <<<

A+/inCider Author Speaks! I just want to say how thrilled and
appreciative I am about the help I've received so far on my short stay here in A2.

As a person who makes my living with the Apple II, I am often called
upon to help other people with their computer related problems. Writing for
inCider and SoftDiskGS, being the Ambassador and VP of an Apple II User
Group, and having been involved with BRCC for a couple of years, I'm
constantly being asked to solve other people's computer problems.

If the truth be told, us "experts" also have computer related
problems. And, I've had a really hard time getting answers to some of my
questions. The duplicate entries AppleWorks problem has been something
I've been struggling with for over a year. I have previously sought help to
that problem, to no avail.

I'm just so happy that I posted my question here, and that Bev came up
with a solution to my problem within 36 hours. My only question now
is...how come I waited so long to get involved with A2?
(J.KOHN, CAT17, TOP33, MSG:114, M645;1)

>>> WHAT'S NEW WITH APPLE II? <<<

---------------------------------------------------------------
New Librarian   I think it's time that I announce that Tim Tobin, henceforth known as A2.TIM, has been tri... I mean, has graciously agreed to take over as A2's Chief Librarian. Tim's been with us in a couple of different capacities for about a year and we think he'll work out splendidly in this new position.

Tim will be handling the regular file checking chores and will also be in charge of general library projects, including the Best of A2 series, which we hope to get back on track in the very near future. He'll also be keeping our crack team of assistant librarians in line. I've Federal Expressed my cat'o nine tails to him so I'm sure he'll have no trouble.

I hope you'll all be kind to Tim for the first couple of weeks while he learns the ropes. -Dean Esmay

(A2.DEAN, CAT 3, TOP7, MSG:95/M645;1)

Another one bites the dust!   I just got the letter from Mike Harvey, NIBBLE is dead. From now on you will get A2-Central. Hope John's "happy".

(D.COLWELL, CAT 5, TOP2, MSG:72, M645;1)

European GS Connection

Article 36431 (68 more + 5 Marked to return) in comp.sys.apple2:
From: prisoner@CONTROL.SPIES.COM (Kent Keltner)

Contact: Kent Keltner

>>> APPLE IIIGS USERS UNITE TO FORM AN INTERNATIONAL NETWORK <<<

Santa Clara, CA. -- April 20, 1992 -- Apple IIgs users in the United States and Europe have formed a group to provide Apple IIgs software and hardware to European users at a lower cost and with faster delivery.

Current prices for Apple IIgs products are generally 400% to 700% higher in Europe than in the United States. Delivery times can run to several months. The European GS Project hopes to improve on these by buying products directly from the manufacturers in wholesale quantities. It will then ship them to the groups in the various European countries for distribution and sale hopefully within weeks of their release in the United States.

In Addition to improving prices and delivery times, The Project will be translating software and manuals into European languages for Apple IIgs users who do not have a familiarity with English.
In Europe, groups have been formed for each major language. In the United States, developers, publishers and others who wish to sell their Apple IIgs products in Europe should contact Kent Keltner, The European GS Project, 941 Di Giulio Ave., Santa Clara, CA 95050 (408) 727-8902 for more information. (LUNATIC, CAT 5, TOP2, MSG:71)

HyperStudio Bug Report

> Everyone who has HyperStudio 3.1 and System 6.0

I've been helping out Roger Wagner, lately, with some apparent problems HyperStudio 3.1 has under Finder 6.0, and I've made some interesting discoveries.

One is that while HyperStudio 3.1 has an rBundle that gets used by Finder, it doesn't have any corresponding rIcons. This is what causes your HS stack icons to stop showing up, after you've launched HS 3.1. When Finder reads the rBundle, it doesn't find any rIcons for it, so it uses the "Unknown" icon. Since there IS an rBundle and rFinderPath, though, double-clicking on an HS stack will still cause HS to be launched. Since Finder always checks the Desktop file on a disk before it checks the old style icon files, it finds the rBundle and stops looking, so it never gets to any custom HS icons you might have in icon files.

There are two solutions to getting your custom HS icons to show up. One has already been stated. That is, to move or delete the Desktop file from the disk HS is on, and then hold down Control and Option while double-clicking on an HS stack (Of course, you have to exit Finder and return to have your custom icons show up, first). The other solution is to put your HS icons on a disk earlier in Finder's search chain than the disk HS itself is on. If HS is on your boot disk, this obviously won't work. If HS is _not_ on your boot disk, then placing your HS icons onto your boot disk will cause them to show up again, without having to Control-Option double-click anything.

In the course of this investigation, I found out the full order in which Finder searches volumes for matching icons. First, it searches the last disk inserted, then the second to last, and so on under it gets to the first disk inserted. Then, it searches the boot volume. Next, it follows the order of the other disks online when Finder was started up, from first to last. So be careful of this seeming inconsistency. Just remember inserted disks are last to first, and disks already online at startup are the reverse, first to last. -Lunatic (: (LUNATIC, CAT9, TOP3, MSG:123/M645;1)

HyperBole Continues

Thanks to everyone for your comments about HyperBole. Hopefully this will make you all feel better about recent events:

It is with great pleasure that we renege on the last letter you received from us, which (for those of you with short memories) notified you of the discontinuance of HyperBole for the GS. Our most sincere apologies for the mix-up.
What happened was... our new distributor, Roger Wagner Publishing, convinced us that many of you would be very disappointed in HyperBole's untimely demise (which was reflected in your response -- many thanks to all of you for your kind words and praise). So he suggested a revamped version of Hyperbole, one aimed towards high school students, with an emphasis on education as well as literature. We agreed, but not before our last letter went out.

The main focus of the changes will be in our interface design, as well as some content alterations. We will be eliminating the rating system and the content will be consistently PG: we will no longer feature adult-oriented themes, and the language will be modified slightly (in keeping with our redefined audience). We will not, however, compromise the quality of our work, and HyperBole will continue to be a hallmark of good literature as well as an interactive pioneer. So you will still enjoy all the things HyperBole has brought you; the cutting edge of multimedia design, compelling stories and thought provoking situations.

SO... you have some options again. If we do not hear from you, we will simply keep your subscription going. Indeed, we ask that if you have any reservations about the new HyperBole, that you allow us at least one issue to convince you that the writing and the quality of our work will only be improved by the changes. If you have already changed your subscription over to another publication, you may switch back if you so choose. And if you are now a Mac subscriber, we are certain you will be completely satisfied with HyperBole on the Mac.

In regards to The Marvelous Magic Machine: it has become the new HyperBole, and therefore will not be a separate publication. We look forward to continuing HyperBole for the GS, and we feel confident that the improvements to HyperBole will allow you to enjoy it more technically and textually. Thank you once again for your patience, your understanding, and your confidence in us. --The Staff of HyperBole

Larry, I recently did some investigating into this, myself. What I found is that what Kevin said is correct: The only way to edit the image of the generic "Anything else" icon is to edit the icon in Finder's resource fork. There are pros and cons to this design. On one hand, it makes it considerably more difficult to edit this icon. While the other icons that used to be in Finder.Icons and Finder.Icons.X are now EASIER to change, without having to edit the original files (as you HAD to do to replace the trash icon and the icon for your boot volume), the generic "Anything else" icon went the other way, now requiring you to edit your original system files (in this case, the Finder itself). On the other hand, since the only generic "Anything else" icon Finder pays attention to is the one in its own resource fork, you don't have to worry as much about accidentally including an "Anything else" icon in one of your other icon files, causing Finder to "overwrite" all the icons it had loaded into memory previously. Allowing an icon in a regular icon file to act as the "Anything else" icon would also by necessity "overwrite" all of the icons in Finder's resource fork. If that one "Anything else" icon were the first file in your only Icons folder, or you didn't have any other icons there, EVERYTHING would show up blank, and nothing you double-clicked on would work, except for folders and application files.

So, I suppose that it's not THAT bad that Finder 6.0 was set up this way.
way. We just have to deal with the generic "Anything else" icon the same way in System 6 as in previous systems. That is, the original system files must be edited in order to change it. At least the OTHER icons that used to be like this (the trash can and the icon for the boot volume) can be edited much more easily, now. -= Lunatic     (:  (LUNATIC, CAT9, TOP2, MSG:136)

3.5 Inch System Disk   J Gilbert, Just in case you don't or can't follow the previous advice here is a list of the files on the Minimum System Disk from the System 6.0 package.

Editor's Note: When installing System Software 6.0 we recommend using the /INSTALLER disk. It will make a difference and save you headaches. (R.CHEVRIER, CAT9, TOP8, MSG:37)

External Power for the GS >>"I need a heavy duty power supply and I am cheap. I'll put it on the floor if I need to. Would 110W output overload the GS motherboard?"

If you want to mount the thing externally, you would probably be better off with a comparatively strong IBM supply. Supplies that are "too weak" for an IBM can be found used, REAL cheap. The problem is that the longer the power line is, the more loss you are going to experience, and the more noise you are likely to introduce. To cut down on both, you would want to use a pretty heavy gauge shielded cable. I have done this, and experienced a lot of frustration in finding proper connectors, assembling the whole thing, and getting the cable in place through the holes in the back of the GS. If I had it to do again, I would skip that step and go directly to the heavy duty AE power supply I am now using. :)

HOWEVER, if Scott is going to buy one anyway, maybe we can persuade him to open it up when he gets it and measure the actual size of the power supply inside the case. If it will fit into the stock GS power supply case, then it would be a relative piece of cake to pull it out of their case and remount it in a GS power supply case. I know at least one person who has done this (no, make that two) using the power supply from a dead Vulcan. A 110 watt power supply would not overload the GS motherboard in and of itself, however, if you get something wired wrong, or if something on the MB should short at some point, you will see smoke, and your wallet will bleed. The difference between this happening with a 110 watt supply and stock power supply (what, 40 watts?) is just a matter of how fast it will burn things up though. With a stock supply, if you SEE this happening, and hit the power switch fast enough, you MIGHT just be lucky enough not to burn anything out. With a 110 watt supply, you probably won't be able to save it. I'd say it is similar to the difference between being shot in the face with a .22 and a .38. Neither is going to make you happy.

- Gary R. Utter

Band Newsletter on Publish It! I used Publish It! 4, an 8-year-old dot matrix printer (SCM D200) and a photocopy machine to produce a newsletter for my concert band this past week. Saturday, at the annual picnic, one of the music teachers couldn't believe I hadn't used a Mac! (Several others asked me whether I was using a Mac or a "pc," but this one trumpet player couldn't be shaken in his belief.)

Another musician countered, "The Apple II is a '57 Chevy," to which I replied, "Yeah, but it gets me where I want to go."

Still another wanted to know what scanner I used for the photo of a brass quintet. No scanner; I used Publish It for the rest of the page, plopped the photo and the page onto the photocopy machine, set it for the lightest copies possible, and hit START. Of course, I couldn't use collating and stapling for this issue.
If you'd like to see a copy of the newsletter, send me a self-addressed stamped (29c) business envelope by snail mail...."while supplies last." Make sure you indicate somewhere what you're requesting....since I advertise free copies of pricelists and other stuff for stamp collector using the same method. <<<lloyd>> P.O. Box 145, Dumont, NJ 07628-0145 (L.DEVRIES, CAT8, TOP18, MSG:18/M645;1)

>>> MESSAGE SPOTLIGHT <<<

Mah Jong Vs. Shanghai Unlike Shanghai, Mah Jong also doesn't let you back up a move. Other options Shanghai has include the ability to show you all the available moves left on the board, and the ability to give up and "peek" under tiles, both of which are very useful while learning and can be nifty when you're just wanting to relax and not really challenge yourself too hard.

Mah Jong lacks these nice features. It's also slower. And, it's got this annoying feature where, every time you click on a tile that you can't remove, you get a big dialog box right in the middle of the screen and have to hit return or click "Okay" to get it to go away. This is annoying, especially when sometimes you had the right tile but you just "missed" it and hit the wrong one.

Shanghai would just not accept an incorrect tile. No dialogs or anything, it just wouldn't take it.

Another thing is that Shanghai's tiles are much more clear and crisp.

On the other hand, Mah Jong is cheaper, and it's more colorful, and it does let you change tilesets "on the fly" (you can do it with Shanghai but it's more effort). The game play is basically the same. It's a fine shareware effort.

(A2.DEAN, CAT3, TOP4, MSG:145/M645;1)

While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your APPLE II, the GENie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

/"I GOT THE JOB!!!! In 2-3 weeks, I'll be back in Illinois! / I will soon be Promotion Director for WICS!!!!! Search-ME!

By John Peters
[GENIELAMP]

SEARCH-ME! Welcome to Search-ME, our new monthly puzzle program. Each month we will have a different theme. Our first Search-ME! puzzle is about GENie. If you have some ideas of a theme for Search-ME!, send your list of keywords to GENIELAMP. Lists selected that are used in this column will get you one hour of GENie credit. Cool!

This month's keywords:

***************************************************
* ALADDIN         BOARDS          BULLETIN *
* CHAT DOWNLOAD GAMES *
* GENEMAIL GENIE GENIE*BASIC *
* GENIELAMP GENIEVALUE HOTSUMMERNIGHTS *

* MULTIPLAYER ONLINE ROLEPLAYING *
* ROUNDTABLE RTC UPLOAD *
***************************************************

GIVE UP? You will find the answers in the LOG OFF column at the end of the magazine. This column was created with a program called SEARCH ME, by David Becker.

```
//"Sir Newton, was awaken and upon noticing that an APPLE had hit him in the noggin, began contemplating why that APPLE had dropped. His conclusion was the beginning of the concept and theory of Gravity."

"Later that evening, he began to wonder why the darn thing didn't have a SCSI port built in...."
```
AUTHOR'S NOTE: This section of the Apple II history deals with the origin of the Apple Computer Company and its first product, (what else?) the Apple Computer. Predecessor to the Apple II, it was not much of a computer by today's standards, but for its time, it was incredible.

I've heard (possibly an old fable, but fun anyway) that there is still an Apple I circuit board, framed, hanging on the wall of John Sculley's office. The writing on the plate at the bottom of the frame says, "Our Founder".

-Steve Weyhrich <IX0YE>---

THE APPLE I: DEVELOPMENT

At the Homebrew Computer club in Palo Alto, California (in Silicon Valley), Steve Wozniak, a 26 year old employee of Hewlett-Packard and a long-time digital electronics hacker, had been wanting to build a computer of his own for a long time. For years he had designed many on paper, and even written FORTRAN compilers and BASIC interpreters for these theoretical machines, but a lack of money kept him from carrying out his desire. He looked at the Intel 8080 chip (the heart of the Altair), but at $179 decided he couldn't afford it. A decision to NOT use the 8080 was considered foolhardy by other members of the club. Consider this description of the microcomputer "world" as it was in the summer of 1975:

"That summer at the Homebrew Club the Intel 8080 formed the center of the universe. The Altair was built around the 8080 and its early popularity spawned a cottage industry of small companies that either made machines that would run programs written for the Altair or made attachments that would plug into the computer. The private peculiarities of microprocessors meant that a program or device designed for one would not work on another. The junction of these peripheral devices for the Altair was known as the S-100 bus because it used one hundred signal lines. Disciples of the 8080 formed religious attachments to the 8080 and S-100 even though they readily admitted that the latter was poorly designed. The people who wrote programs or built peripherals for 8080 computers thought that later, competing microprocessors were doomed. The sheer weight of the programs
and the choice of peripherals, so the argument went, would make it more useful to more users and more profitable for more companies. The 8080, they liked to say, had critical mass which was sufficient to consign anything else to oblivion."<1>

Another chip, the Motorola 6800, interested Wozniak because it resembled his favorite minicomputers (such as the Data General Nova) more than the 8080. However, cost was still a problem for him until he and his friend Allen Baum discovered a chip that was almost identical to the 6800, while considerably cheaper. MOS Technology sold their 6502 chip for $25, as opposed to the $175 Motorola 6800. Wozniak decided to change his choice of processor to the 6502 and began writing a version of BASIC that would run on it. A friend over at Hewlett-Packard programmed a computer to simulate the function of the 6502, and Wozniak used it to test some of his early routines. When his BASIC interpreter was finished, he turned his attention to designing the computer he could run it on. Except for some small timing differences, he was able to use the hardware design he had earlier done on paper for the 6800.<2>

To make the computer easier to use, Wozniak favored a keyboard over the front panel switches that came on the Altair. He also made it simple to use a television for a video terminal. (Recall that at this time the most common mechanism used for input/output was a teletype, which consisted of a keyboard, typewriter, and if you were lucky, a paper tape reader/puncher). Functionally, it was a television terminal attached to a computer, all on one printed circuit board (another enhancement over the Altair). Wozniak used two 256 x 4 PROM (programmable read-only memory) chips to create a 256 byte program (called a "monitor") that looked at the keyboard when the computer was turned on. This monitor program could not do much more than allow entry of hex bytes, examine a range of memory, and run a program at a specific address. <3> (The Altair needed these "bootstrapping" instructions to be entered by hand each time the computer was turned on).

Because there were no cheap RAMs available, Woz used shift registers to send text to the TV screen. Consequently, his video terminal was somewhat slow, displaying characters at about 60 characters per second, one character per scan of the TV screen. (This speed would be similar to watching a computer communicate via a modem at 1200 baud). It was slow by 1991 standards, but an advancement over the teletypes that could only type 10 characters per second. The computer had 8K of dynamic RAM. You could load BASIC into 4K of memory and have 4K left over for your own programs. It had a video connector, but you had to connect a monitor on your own. You also had to buy the keyboard separately and wire it into a 16-pin DIP connector. The power supply had to be connected to two transformers to get 5 volts and 12 volts for the motherboard. There was no speaker, no graphics, and no color. There was a single peripheral slot, and when it was first released there was nothing available to plug into this slot. It was entirely contained on a single printed circuit board, about six by eight inches in size (most hobby computers of that time needed at least two boards), used only 30 or 40 chips, and because it could run BASIC programs it got people's attention.<4>

THE APPLE I: MARKETING Let's adjust our time circuits for 1976, and jump forward in time. By now, Steve Wozniak had completed his 6502-based computer and would display enhancements or modifications at the bi-weekly Homebrew Computer Club meetings. Steve Jobs was a 21 year old friend of Wozniak's and also a visitor at the
Homebrew club. He had worked with Wozniak in the past (together they designed the arcade game "Breakout" for Atari) and was very interested in his computer. During the design process Jobs made suggestions that helped shape the final product, such as the use of the newer dynamic RAMs instead of older, more expensive static RAMs. He suggested to Wozniak that they get some printed circuit boards made for the computer and sell it at the club for people to assemble themselves. They pooled their financial resources together to have PC boards made, and on April 1st, 1976 they officially formed the Apple Computer Company. Jobs had recently worked at an organic apple orchard, and liked the name because "he thought of the apple as the perfect fruit—it has a high nutritional content, it comes in a nice package, it doesn't damage easily—and he wanted Apple to be the perfect company. Besides, they couldn't come up with a better name."<5>

Jobs approached the owner of a new computer store in the bay area called "The Byte Shop." This businessman, Paul Terrell, expressed an interest in the Apple Computer (to be known later as the "Apple I"), but wanted only fully assembled computers to sell. If they could provide this, Terrell told them he would order fifty Apples, and pay cash on delivery. Suddenly, the cost of making (and selling) this computer was considerably more than they expected. Jobs and Wozniak managed to get the parts on "net 30 days" (30 days credit without interest), and set themselves up in Job’s garage for assembly and testing of the Apple I. After marathon sessions of stuffing and soldering PC boards, Jobs delivered the computers to the Byte Shop. Although these "fully assembled" computers lacked a power supply, keyboard, or monitor, Terrell bought them as promised. In July of 1976 the Apple I was released and sold for $666.66, which was about twice the cost of the parts plus a 33% dealer markup. <6> Two hundred Apple I computers were manufactured, and all except twenty-five of them sold over a period of ten months.<7>

Although the Apple I was easier to begin using than the Altair (thanks to its built-in ROM code), it was still a time consuming process to set it up to do something useful. Steve Wozniak would have to type in about 3K of hexadecimal bytes before BASIC was ready to use. He could do it in about 0 to 30 minutes, but he almost knew the code by heart. The typical user was more limited in ability to use BASIC on the Apple I. To broaden the appeal of the Apple I (and at the insistence of Paul Terrell), Wozniak designed a cassette interface. It was mounted on a small two-inch-high printed circuit board and plugged into the single slot on the motherboard. The card sold for $75 and a cassette tape of Woz’s BASIC was included with it. The advertisement Apple included with the card stated,

"Our philosophy is to provide software for our machines free or at minimal cost." The interface worked, but worked well only with cassettes running on expensive tape recorders. To further try to enhance sales, the Byte Shop stores found a local cabinetmaker that made some koa-wood cases for the Apple computer (so it would no longer be just a "naked" circuit board).<8>

Interestingly, although most of the action in the micro world was going on in Silicon Valley, news of the Apple I made its way east. Stan Veit, owner of the east coast's first computer store, bought an Apple I and took it to a meeting of the Association of Computer Machinery. Those attending were quite skeptical that a REAL computer could fit into a small briefcase; they were sure that the machine was just a portable terminal, attached by a hidden phone line to a mainframe somewhere!<9>
A2 Pro News & Features

What is A2Pro? Welcome to the first installment of A2Pro News & Features. July is an exciting time for the Apple II community as it marks A2-Central's annual KansasFest where developers share ideas, exchange notes and traditionally unveil exciting new works. It seems only fitting that we use this KansasFest month to begin our coverage a great developer's tool, the GENie Apple II Developers Roundtable -- A2Pro.

In future issues A2Pro News & Features will carry exciting news from fellow developers and the companies which support them. We will share with you A2Pro's most informative and insightful messages and give you a roundup of great new files in the A2Pro Library. This month, though, we want to tell you all about A2Pro.

The Grand Tour

"You may not know it but there is a whole area dedicated to programming Apple II computers of every shape, form,
and dimension. It's the sister forum to A2, and it's called A2PRO. You can get to it by typing "M530" at the main A2 prompt (or at any GENie ">") prompt.

In A2Pro we help programmers and developers of every skill level, from the very novice to the folks who write the products you use every day. We can help you write programs in anything from Applesoft BASIC to HyperCard IIgs or 6502, 65C02 or 65816 assembly language. Why, you'll even find people from Apple Computer dropping by every now and then. :)

That was recently written by the head sysop from A2Pro and it tells A2Pro's mission quite well. The concept behind A2Pro is relatively simple and very effective, to provide a place where developers and programers can get together, pass messages, share files and talk to one another. Three areas accomplish this:

- The Message Center
- The Live Conference Room
- The Online Library

The Message center is a place where you can openly share your thoughts and ideas or respond to what other people have to say. It is divided into several categories, each category containing a number of individual topics. Should you not be able to find a topic which meets your needs, you can easily start a new topic which will be available immediately to you and everyone else. To get a complete listing of all the categories and their individual topics you can use a simple index command to list them all out.

Here is a list of the current categories:

1 A2Pro Roundtable Business
2 Programming in 6502 Assembly
3 Programming in 65816 Assembly
4 Programming in C
5 Debugging
6 Programming in Pascal
7 Programming with ProDOS 8 and other 8-bit Operating Systems
8 Programming with GS/OS and ProDOS 16
9 Programming in BASIC
10 Tools and Utilities for Programmers
11 Algorithms, Design, and Data Structures
12 Hardware and Peripherals
13 Developer Information Center
14 Other Programming Languages
15 Using the Apple IIgs Tool Box
16 Developer and User Lounge
17 Communications and Networking
18 HyperMedia Programming
19 Development Environments and Shells
20 Apple IIgs System Software

The conference room A2Pro's place for live discussions. You can arrange to meet other A2Pro members here in groups, enter into private chat or attend regularly scheduled conferences which often feature exciting guests. These roundtable conferences are fun, lively events which provide a great way to get to know other A2Pro members.

Last stop on the tour is the online library. GENie boast one of
Apple II computing's greatest collections of developer support software. Here members can find many tools to make programing easier and fun. Like the message center, the online library is separated into categories. Library navigation is a breeze with commands to browse through descriptions, display a complete directory or see what new files have been added since your last visit. Here is a list of library categories:

1. A2Pro Archives and Transcripts
2. Apple II Tech Notes
3. Apple II File Type Notes
4. Apple II Sample Code
5. System Software
6. Assembly Source Code
7. Pascal Source Code
8. C Source Code
9. BASIC Programs
10. REZ Code
11. Other Languages
12. Programming Utilities
13. HyperCard IIgs
14. HyperStudio
15. Miscellaneous Files
16. Apple II University (A2U)
17. Debugging Tools
18. Apple Human Interface Guidelines
19. Apple Interface Files
20. Cross Development Tools & Utilities
21. Library Tools
22. Compression Tools and Source

Of course you need to be a GEnie member to join A2Pro, but as you have seen, the advantages are tremendous. Remember, the best way to keep on top of things is to be in the thick of the action, and if you are a programer or developer the best place to be is on GEnie in A2Pro.

NEW BOSS IN A2Pro

Big changes have recently taken place which make A2Pro the premiere gathering place for Apple II developers. Foremost amongst these is the appointment of a new staff. Read on...

Since timing on GEnie isn't always certain, most of you will have read about this on the door of A2Pro, but some of you will read this message before the new door files get posted. To those of you who didn't find anything unusual on the door, you're about to be surprised. :)

After a long and productive reign guiding A2Pro through thick and thin, Tom Stechow and Mark Collins no longer have the time they feel A2Pro deserves, and so have reluctantly moved on to other challenges. Tom's making an important trip soon and Mark's very busy with the upcoming Foundation resource editor from Lunar Productions, so each of them has more than enough to keep them busy. Their work here has been exemplary and their presence on staff will be sorely missed.

When Tom resigned, I talked to Tom Weishaar and Dean Esmay and indicated I was interested in what happened with A2Pro. One thing led to another, and about a week ago I accepted the position of head sysop here in A2Pro, effective today.
For those of you who don't know me, I'm the lead developer technical support engineer for the Apple II family of computers at Apple Computer, Inc. -- I spend a lot of my days answering development questions from Apple Partners and working on one-to-many tools like Technical Notes, File Type Notes (which I created), Sample Code (like IR 2.0.1). I also review documentation and work with the Apple II continuing engineering group on their continuing work. I'm responsible for assigning ProDOS file types and auxiliary types, and I've written magazine articles for Call-A.P.P.L.E., GS+, _develop_ and APDAlog. I've also been active here in A2Pro for over four years.

In the past, I've had trouble with people confusing me (an individual person) with Apple Computer. I know Apple's policies inside and out. I help create some of the technical ones, like some compatibility rules and I know the people who create the system software. I know the processes that they go through and I know that decisions they took weeks to make and implement can sometimes be dismissed online by disgruntled users without thought for how the decision was made. When I tell people Apple's policies, they tend to think I'm representing Apple online. When I defend decisions painfully made by my friends and coworkers, people think I'm defending Apple even when it's unreasonable. I'm not. I'm speaking for myself and saying what I believe, and the fact that I work for Apple during the days just happens to give me more insight on some issues.

If you have a genuine development problem with something (say the Finder), those of us here in A2Pro can help you work around it and get your program working. If a bug in the Finder leads you to post something like "The Finder's a piece of crap and Apple hates us to have shipped it" -- now you're insulting my friend Andy Nicholas and my other colleagues and friends who labored long and hard over Finder 6.0 and its testing -- and I'm likely to respond to that. :)

To help keep the distinction, I'll have a "disclaimer" on my signature for the time being -- something that reminds you on every message that here in A2Pro, no matter how adamant I may be about what's compatible and what's not, I'm speaking for me and not for Apple Computer, Inc. On the bright side, Apple isn't authorized to speak for me, either. :)

Many of the names on the new door are familiar to A2Pro regulars -- Jeff Holcomb and Greg Da Costa are staying on board and lending their vast expertise (both with GEnie and with the Apple II) to A2Pro, and I'm very pleased they're here. Steve Gunn is here, also, and when he finishes the current Apple II University course he'll be promoted to assistant sysop.

The new fellow on the block isn't really new -- he's written lots and lots of NDAs and Finder Extensions, the most famous of which is probably "Big Edit Thing," a TextEdit-based desk accessory word processor. He's been here and on the Internet helping programmers for a number of years, and he's a KansasFest veteran. Lately he's been working with sysop-emeritus Mark Collins and Marc Wolfgram on "Foundation," the Apple IIGs Resource Editor. He is Jim Murphy, and we're pleased to have him aboard.

Please join me in welcoming Jim and Steve to their new responsibilities here in A2Pro (and in thanking Greg and Jeff for staying on!). Over the next few days, you'll be seeing several of the ideas we have for making this a vastly-fun summer here in A2Pro, and we hope you'll
agree that this is going to be a lot of fun.

If you have any questions or suggestions, just ask. We're here to help you out.

Thanks for stopping by.

--Matt (I speak for myself, not for Apple)
(CAT2, TOP2, MSG:7/M530;1)

SOME A2PRO REGULARS Members who frequent A2Pro can find many sources """""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
for help with a variety of problems. Not only are there fellow developers and programers but many of the companies supporting A2Pro members stop by to answer questions and offer ideas. GEnieLamp asked a few of these companies to tell us about themselves:

BYTE WORKS The Byte Works was started 10 years ago in October with the ProDOS version of ORCA/M being our first product. Since then we have concentrated on serving the developer community with programs like ORCA/M for the GS, APW (which we developed under contract for Apple Computer), ORCA/Pascal, ORCA/C, ORCA/Debugger, Design Master and ORCA/Disassembler; and with courses, like Learn to Program in Pascal, Learn to Program in C, and Toolbox Programming in Pascal.

Judging from our sales, Pascal and C are both very popular programming languages on the Apple IIGS, with the two languages virtually tied as far as the number of registered owners. Assembly language continues to be our most popular package, but a significant number of people use it to supplement C or Pascal, rather than as a sole development language.

From a technical viewpoint, Pascal and C are both great choices. It really depends what you are writing; as a general rule, Pascal is the better choice for general application development, while C is the better choice for bit manipulation, shell utilities, and hardware related programming. Frankly, the idea that C and Pascal are competitors is ridiculous -- it's like saying a hammer and saw are competing tools because both are used to work with wood. Pascal is a high-level language. C is a medium level language. People who think they are competitors simply don't know one or the other very well!

Most of my own programming is done in Pascal, frequently with assembly language subroutines. Some programs are written entirely in C or assembly.

As for your question about whether C is easier to use than Pascal, no. C is a "let the programmer beware" language that requires a strong background in writing well organized, structured programs and a detailed knowledge of the machine that usually only comes through a solid grounding in assembly language before you can really learn C well. In addition, you have to know C a lot better than you would know Pascal or assembly before you should try to use it to write programs, since C tries very hard to stay out of your way -- and in the process, makes it very easy to make subtle programming errors. I just got a note today from a very pissed off developer who has a project 6 months behind schedule, and was blaming the delay on a "bug" in ORCA/C. It wasn't a bug in the compiler at all; he had missed a subtle point about the C language that resulted in unwarranted assumptions in his program. Interestingly enough, the program would have worked on many C compilers -- the problem was due to an implementation dependent feature of the language! This is the sort of thing that happens
over and over in C. The error would not have happened in a high-level language like Pascal. (It also makes you wonder why people say C is a portable language. It isn't. C is one of the least portable languages I know. C is, however, a low-level language, and like any low-level language, a skilled and careful programmer can write programs in C that can be ported easily — programs that could not be written in a portable way in other languages. But the burden for portability is on the _programmer_, not the language.) —Mike Westerfield

Editor's Note: Check out Category 1, Topic 4, Message 6, M530;1 in A2Pro for information on Byte Works new release, Toolbox Programming in Pascal

SOFTDISK PUBLISHING Both Softdisk and Softdisk G-S are published monthly for all Apple IIs and the Apple IIgs respectively. Being on a monthly schedule can be tough, especially when you consider that the software published on both products is =NOT= shareware, freeware or public domain! Every single program is an original creation, only available to Softdisk subscribers (subscriptions by the way are $20 for three months for Softdisk and $30 for Softdisk G-S).

Because we published 4-5 programs a month on Softdisk and 3-4 on Softdisk G-S, we are =always= looking for quality submissions. We are interested in just about any category of program: game, productivity, utility, business, personal, educational — you name it!

Why sell my program to Softdisk? But, I want the widest possible audience? Can't I make more money in the shareware market? What about my rights?

These are all good questions, but the fact is Softdisk can pay more than all but the very best shareware programs (in fact, probably less than a dozen shareware programs have made more money than Softdisk pays for programs!). Considering that over 10,000 subscribers will get your program if you go with us, versus a few hundred people that actually download programs from the online services, Softdisk has a wider audience. As far as rights are concerned, drop us a note here on GEnie at SOFTDISK.INC and we'll send you a copy of our legal mumbo-jumbo so you can see for yourself what the deal is!

—Bryan Pietrzak, Softdisk Publishing

A2U, HEAD OF THE CLASS For readers who are interested in learning to program or in picking up a new language, A2 University offers courses to help you on your way. Currently Steve Gunn is teaching a class in Assembly language. And should you come into a lesson late in the session it is no problem. Each class session can be found as a file in the online library. Look for more exciting news about A2Pro in next month's issue!

GEnieLamp A2Pro Coverage In future issues of GEnieLamp A2/A2Pro our A2Pro News & Features will have all the latest happenings from the A2Pro RT and a look at new files in the online library. Also, we will be keeping in touch with many of the companies which produce development tools and with the programmers who use them.

If you like GEnieLamp A2/A2Pro, please pass copies to your local bbs's and to your friends. There are few Apple II magazines around today and
while we may not be on paper, we want everyone to share the experience.

GET ONLINE!  But remember, the best way to enjoy all the excitement is to join GEnie and become a member in A2Pro.  (See [LOG] Off for details on signing up on GEnie.) You will find yourself in the thick of the action as it happens.  And no matter how confusing things might get, you will be surrounded by experts who can get you turned in the right direction and on your way.

A2Pro membership will make your Apple II programing or development not only easier, but so much more rewarding.  You will be with folks who can appreciate your accomplishments for both what they can do and the effort behind them.

So become a part of A2Pro today! Just type M530 at any main GEnie prompt.

(From The TeleJoke RoundTable)

Fifty Ways to Hose Your Code

(Kind of by Paul Simon)

The problem's all inside your code she said to me,
Recursion is easy if you take it logically.
I'm here to help you if you're struggling to learn C,
There must be fifty ways to hose your code.

She said it's really not my habit to #include,
And I hope my files won't be lost of misconstrued,
But I'll recompile at the risk of getting screwed,
There must be fifty ways to hose your code.

Just blow up the stack Jack,
Make a bad call Paul,
Just hit the wrong key, Lee,
And set your pointers free.

Just mess up the bus, Gus,
You don't need to recurse much,
You just listen to me.

She said it grieves me to see you compile again.
I wish there were some hardware that wasn't such a pain.
I said I appreciate that and could you please explain,
About the fifty ways?

She said why don't we both just work on it tonight,
And I'm sure in the morning it'll be working just right.
Then she hosed me and I realized she probably was right,
There must be fifty ways to hose your code.

Just lose the address, Les,
Clear the wrong int, Clint,
 Traverse the wrong tree, Lee,
And set your list free.

Just mess up the bus, Gus,
You don't need to recurse much,
You just program in C.

Well, as our regular readers know GEnieLamp A2/A2Pro can never sit
still when exciting happenings are about so we decided to get to the heart
of things. Here's our chat that we had with Matt Deatherage. Next month,
GEnieLamp will introduce you to the other new sysops in A2Pro.

[*][*][*]

GL: Matt, you've been working at Apple a long time. How did you first
become involved with the Apple II? How did you come to get your job
at Apple?

MD: It's a strange story -- I'm the only person at Apple I ever knew who
this happened to, so I hesitate to mention it lest anyone else
"aspire" to it...

I was a "certified" Apple Developer back in 1987. In those days,
Apple used to try to support everyone who wanted to be a developer,
for free, as long as you could show you were working towards releasing
a for-sale product within two years. (Trying to help everyone was a
tremendous drain and burned a lot of people out, which is part of why
it was changed in 1989 to the current Partners and Associates program
-- those programs not only have fees to help with the tremendous cost
of supporting developers, they also reduce the number of developers
who get direct code-level support from Apple so the engineers can work
on more one-to-many tools like Technical Notes and Sample Code. But I
digress...)

Apple held their only "Apple IIgs College" in spring of 1987, and because I was a certified developer I was invited to attend (3 days, $500, airfare and hotel were your own responsibility). I was in college, but I figured it would be a really good way to get started programming for the IIgs, which at the time was a lot more than I understood. The documentation I had was alpha or pre-beta, and even that was hard to get -- there was nothing explaining how anything worked or what you were supposed to do, and the Apple IIgs College promised to help explain some of that. So I wheedled with my parents, and they loaned me the money for airfare, hotel and college admission.

At the college, I met a lot of people who worked at Apple in Developer Technical Support -- Jim Merritt, Rilla Reynolds, Pete McDonald -- and many Apple IIgs engineers like Steve Glass, Fern Bachman, Jay Schaffer, Dan Oliver, Cheryl Ewy and many more. It was a great college and I learned a lot, and went home to try to start applying it to programs while still going to school and keeping my GPA up enough to maintain my scholarships.

Later in 1987, I became disenchanted with college and industrial engineering (my major) -- I was taking a lot of classes that didn't really interest me, and thought I needed a break. One of my best friends was doing a "co-op study" with NASA -- he'd be at the University of Oklahoma for one semester, then he'd go to Johnson Space Center in Houston for one semester and work there for one hour of credit. He enjoyed it a lot.

When I read in "Open-Apple" (now "A2-Central", by the way) a notice from Jim Merritt that Developer Technical Support could use more engineers, I wrote him on AppleLink (I was a developer, and one of the four people in the world who could make the Apple II AppleLink software work on my machine) and asked him if I might co-op study at Apple. Jim had already left DTS for engineering, but Rilla Reynolds (who was acting manager) worked with me, took my resume and got it through Apple's College Relations department, and several weeks later I had an offer to be an Apple intern from March 14th through July 29th, 1988. I withdrew from classes, packed up about half my stuff and moved out to Silicon Valley.

While I was here, I started on revising all the Apple II Technical Notes, I wrote a few at the beginning, answered Emails (which wasn't exactly something we had planned for me to do) and generally made myself useful, and it was at a time when the Apple II portion of DTS was getting back up to strength. When I first asked about being an intern, there were only three Apple II engineers there -- Rilla, Pete McDonald and Glen Baxter, and Pete was the only one with significant desktop experience. Within about six months in 1988, Rilla brought in me, Dan Strnad, Jim Mensch, Keith Rollin and Eric Soldan. Jim Luther and Llew Roberts came in early 1989.

Anyway, Apple was pleased with the work I did and in June offered me a permanent job as a DTS engineer, which I accepted. The rest is more or less history. My parents helped me move the rest of my stuff out here and I never went back to school. Technically I'm still somewhere in the middle of my junior year. :)}
I say this is all excessively weird because I was hired for my job (as an intern) completely electronically -- I never interviewed for it at all. Rilla had met me at the IIgs College and hired me as an intern based completely on our phone and electronic conversations. I have _never_ seen this kind of thing happen at Apple except -- I've never known anyone Apple hired but never interviewed except me. :)

GL: Apple Computer was founded by two professional pranksters, Steve Wozniak and Steve Jobs. Can you share with us any of the humorous pranks that you've instigated or witnessed at Apple?

Pranks are a way of life in some groups, and in other groups they rarely happen at all. In DTS they're a way of life. Right now, Neil Day (Macintosh Technical Notes and Sample Code engineer) is on vacation after celebrating a birthday last week. To celebrate, while he's been gone, his friendly coworkers have filled his office with about two inches of sand.

I personally will not be having any more birthdays at Apple. :)

GL: Is there any achievement that you're particularly proud of?

MD: I've been lucky to achieve many things in my life so far -- academically, musically and professionally -- that it's hard to pick out one thing that I'm exceptionally proud of. I try not to start on something if I don't think I'll be proud of it when it's done -- especially things that have my name on them.

I guess professionally I'm kind of proud of the one-to-many tools I've been able to release, including a whole slew of Technical Notes, a few magazine articles and some sample code.

It's nice to be able to work on things that can help lots of people, and one-to-many tools are like that. It's also nice that Apple has a fairly-free distribution policy for Technical Notes and Sample Code (you can redistribute them, but not modify or sell them) -- that means a lot of what I've worked on is available in A2Pro's libraries where anyone can have it for the cost of the download.

GL: Who do you consider your mentors?

MD: I've learned much from a lot of people, and in a lot of cases we've learned a lot together. I've been particularly pleased at all the discoveries Dave Lyons, Andy Nicholas and I have made together and how we've been able to make use of them in the system software or in other places. It's a lot like A2Pro's bulletin board -- more often than not, everyone discovers things together.

The first person I really learned about computer programming from, though, has to be the late Dr. Richard Andree of the University of Oklahoma. Dr. Andree and his wife (also Dr. Andree) were expert cryptanalysts during World War II, and after the war they returned to mathematics and computing. They founded Mu Alpha Theta (M A Th), the national high school and junior college mathematics club. They held a summer camp for mathematically gifted students every summer for 25 years to teach them about computer programming and how common sense and logical thinking makes programming easier, and that's where I learned a lot of the programming foundation I've used for years since
Dr. Richard Andree passed away a few years ago, but Mu Alpha Theta and thousands of kids everywhere benefit every day from the work he did.

GL: Do you have any favorite mottoes or proverbs?

MD: My motto comes from my friend Robert Thurman, and remains "Eat lots of toast." Words to live by.

GL: What do you foresee as being the important developments in personal computers in the next five or ten years?

MD: The most important development will be the continuation and permeation of an idea that's already changed the way people look at computers: computers are tools, not ends in themselves. Real people are interested in using the computer to help them with their lives, not in figuring out how to make the computer do what they want.

GL: Can you describe what a typical work day for you is like?

No work day is typical. :)

We have an Email meeting at 10:00 AM every morning, where we discuss the Emails that need our attention that day. We talk about the problems and decide who will be responsible for researching and answering each one, then we go and do our stuff.

During a day, we'll answer Emails, work on Technical Notes or Sample Code, review documentation to make sure it's accurate, work on upcoming projects to make sure developers' needs are met in the product, and learning future technologies. We also throw things at each other and eat.

Sometimes it takes a lot more than 8 hours per day; sometimes I work all night because I get started on something and want to finish. I especially tend to do this on Sunday nights/Monday mornings, then come home and sleep Monday afternoon and evening and start again Tuesday morning. But sitting through Monday morning meetings after being awake for 22 hours is usually not fun. :)

MD: In the Apple II world, Steve Wozniak is a legendary figure. Was the Woz still working at Apple when you started working there? Any stories or anecdotes about working with the Woz?

"Woz" is short for "Wozniak." He's not "The Woz" anymore than you're "the Tom" or "the Phil." You're thinking of "The Wiz", which was a musical. :)

Woz is still an Apple Fellow, so he draws salary and officially works for Apple, but he doesn't have any duties that I know of. I've met him several times but I've never actively worked with him.

GL: Obviously your official presence will be a big draw in A2Pro. Do you have any changes or improvements planned for A2Pro you would like to share with us??

MD: Our revised/revamped A2Pro staff (me, Steve Gunn, Jim Murphy, Jeff
Holcombe and Greg DaCosta) are going to stir up some trouble. Right after starting we announced new programming contests and conferences, and with new Apple II university courses later this summer and more contests, people who like to program shouldn't have any trouble staying busy. :)

GL:  What advice do you have for people considering writing software for the Apple II -- new to programming and experienced.

MD:  Too much to list here -- come to A2Pro and find out!

/"No insult taken Rod. I just hoped you weren't implying that /me greatly and made me challenge you to some silly sport where /we could act like cavemen.:]"

Super Finder!

SUPER FINDER  Building a Super Finder in GS System Software 6.0 By Thomas M. Schmitz. Those who have upgraded to System Software 6.0 for the Apple IIgs are discovering a whole range of new features and abilities, but like a sports car, fresh from the factory, the Finder is even better with the addition of some well chosen, high performance parts.

For the IIgs there exist a whole inventory to choose from when souping up your computer. But before we look at individual programs you will want to know a little bit about the various classifications and their placement. We will be examining four classes of additions: Inits, Desk Accessories, Control Panels and Finder Extras. All of these are placed inside various folders within the /System folder of your boot drive or starting volume.

DESK ACCESSORIES  A Desk Accessory is a program you can run without leaving the Finder or the GSOS program your may be running. They may accomplish a number of tasks such as editing documents, manipulating files or even playing games.

There are two types of Desk Accessories, the NDA or New Desk Accessory and the CDA or Classic Desk Accessory. To install a Desk Accessory you simply copy it into the /Desk.Accs folder located inside the /System folder of your boot drive or starting volume. Then, the next time you turn your IIgs on the NDA or CDA will be automatically installed.

To access a CDA you press the Command (Open Apple), Control and Escape buttons all at the same time. Then use the arrows to highlight the needed CDA and press return. To Access an NDA simply move the cursor to the apple in the upper left hand corner, hold down the mouse button and drag the cursor until the NDA you wish to use is highlighted. Let go of the mouse and the NDA opens-up.

CONTROL PANELS  Control Panels, formerly known as CDev’s, are similar in
nature to Desk Accessories but tend to regulate a distinct function in the computer's settings and performance. Control panels are traditionally placed in the /CDev folder within the /System folder of your boot drive or starting volume.

When in the /CDev folder Control Panels are automatically installed at booting time. To access a Control Panel just open the Control Panels NDA and the menu will appear, or by simply double clicking a Control Panel's icon you can open that Control Panel directly.

INITS Inits do a number of tasks, usually having to do with system control. Simply place an Init in the /System.Setup folder within the /System folder of your boot drive or starting volume. Inits perform their functions in a number of different manners so you will need to read each Init's individual instructions to see how it works.

FINDER EXTRAS Finder Extras can be seen as a sort of marriage between Desk Accessories and Inits. To install a Finder Extra you will need to create a /FinderExtras folder in the /System folder. Copy the Finder Extra into the folder and when you boot your computer you will find a EXTRAS option on the menu bar. Click the EXTRAS on the menu and a window will open listing the installed Finder Extras.

Some Finder Extras will work like NDAs, open the EXTRAS menu, highlight and let go. Other's require you to click a file's icon or perform some other task. This can become confusing so be sure to read each Finder Extra's documentation to find out how it works.

Now that you know what Desk Accessories, Control Panels, Inits and Finder Extras are we can look at some of the great software which will make your Apple IIgs a better looking and better performing machine. Except for DeskColor, all of the following programs are performance programs. They either make the Finder more powerful or make your computer easier to use. DeskColor is like that racing stripe you always wanted to put on the side of your car. Its sole purpose is to make your computer look good.

Number: 18881
Name: FNDRVIEW3.0.BXY
Approximate # of bytes: 40192, Library: 6

Finder-View 3.0 is a Finder Extension that works with the Finder in System Software 6.0 and later. With Finder-View you can view pictures of the following formats: SHR uncompressed, SHR compressed, PaintWorks, APF, Print Shop GS, 3200 color (Brooks, French, SHR, APF), and you can also animate SC2 Paintworks animations, all right from within the Finder!

Finder-View 3.0 supports selection of multiple graphic files at once, displaying them in a slide show. Seeing a single graphic is as easy as double-clicking on its icon in the Finder!

Finder-View 3.0, by Jupiter System's Finder-View 3.0 is shareware, $10

Number: 18772
Name: MOREINFO.BXY V1.2
Approximate # of bytes: 18176, Library: 6

This Apple IIgs Finder 6.0 Extension adds more functionality to Finder's Icon Info menu item. With MoreInfo installed, shift-selecting Icon Info from the Finder 6.0 menu brings up the MoreInfo window, which shows you
the file type, aux filetype, individual access attributes, creation/mod
dates, data fork blocks, data fork size, resource fork blocks, resource
fork size, and storage type. You can also CHANGE many of these values!!
Version 1.2 looks nicer, fixes one bug, and allows/displays filetypes with
either hexadecimal numbers or 3-letter abbr. Requires System 6.0!

Shareware: Fee=$10. Copyright(c) 1992 by Bill Tudor.

Number: 18758
Name: HOTKEYS.BXY V1.1
Approximate # of bytes: 14848, Library 6

This is an Apple IIgs Finder 6.0 Extension INIT that adds "HotKeys",
which are single-keystroke function keys to the System 6.0 Finder. You can
do many Finder functions with a single keypress such as

Open folders, quit the Finder, shutdown the computer, stack windows,
set the view to "by name" and Much More! Version 1.1 adds a number of new
actions including (but not limited to) Open ANY fold and LAUNCH
Applications that you choose!! Keys on the keypad can be defined as
HotKeys. Ver 1.1 also allows Shift--<kepad key> HotKeys. Extended
Keyboard keys can also be HotKeys. Documentation Included.

Shareware: $10. Copyright(c) 1992 by Bill Tudor.

Number: 18696
Name: INITMASTER.BXY V2.1.1
Approximate # of bytes: 16640, Library: 6

This Apple IIgs Init is a Finder 6.0 extension that allows you to quickly
change the Enabled/Disabled states of all your Inits (PIF and TIF), DAs
(NDA and CDA), Drivers, FSTs, Icons (old style), and FinderExtras without
having to use Finder's "Icon Info" window on each and every one of them.
You can also have up to 3 sets of saved settings for quick recall.

This program is ShareWare (Fee=$10). Copyright(c) 1992 by Bill Tudor.

Number: 18633
Name: PIECEOSTRNG.BXY V1.0
Approximate # of bytes: 5248, Library: 6

Piece O' String is a Finder Extension that will memorize and later
restore icon selections in the Finder. Selections are remembered across
Finder sessions. It adds two items to the Extras menu: "Preserve
Selection" and "Restore Selection".

Number: 18603
Name: DTUTIL3.3.BXY
Approximate # of bytes: 81664, Library: 6

DeskTop Utilities is GyruS shareware from Australia. Goes in System.Setup
folder but gives you an NDA and CDA with incredible functions! Add/remove
fonts/DAs, create virtual DAs, instant DAs, has a screen blanker for both
P8 and GS/OS, installs a menu clock with date, frees memory, has a
stopwatch, does mouse coordinate info, creates custom hot keys and includes
some already set up to shutdown (with options) or launch another program
from within any desktop app. You can even launch a program and open a
document file at the same time (great for running HCGS or HS stacks).
Apple II Computer Doc Info

Number: 18582
Name: SYNTHINIT.BXY
Approximate # of bytes: 5504, Library: 6

SynthInit Play MidiSynth songs by double clicking on their Icons from the Finder. Accepts multiple selections, next, previous feature. Will play to either the GS speaker or both GS speakers and Midi device Docs included. FreeWare...

Number: 18533
Name: FNDRSOUNDER.BXY V1.0
Approximate # of bytes: 3840, Library: 6

Very handy finder-extension that lets you play rSound resources in files by double clicking them in Finder. Finder Sounder is less than 3K and doesn't take up much memory. Currently only supports playing first rSound resource in a particular file. Highly recommended, short download. Freeware, written by Jupiter Systems

Number: 18232
Name: QUICKLAUNCH.BXY
Approximate # of bytes: 13184, Library: 6

Here it is! QuickLaunch by Steve Stephenson. This is a Finder Extension which will launch programs from the Finder with the greatest of ease. Install the INIT in your System.Setup folder under System 6.0 (or greater) and reboot. Then select the QuickLaunch menu item under the Extras menu in the Finder to add programs to the Launch List. This file is FREEWARE and copyrighted by Seven Hills Software. Please read the Read.Me file and check out the on-line Help System for more information about QuickLaunch and Seven Hills Software! Enjoy!

Number: 17727
Name: DESKCOLOR.BXY V3.1
Approximate # of bytes: 31744, Library: 11

Deskcolor is a neat IIgs CDEV/Control Panel to change the color or pattern of your desktop, or add a background graphic. This version of DeskColor simplifies the interface for selecting patterns which is now done from the main window - you may also insert or delete patterns. It also updates immediately to the new desktop when you close the Control Panel, especially desktop graphics. Has a built-in pattern editor. Includes documentation and sample patterns.

This utility is JesusAware and is distributed the same as Freeware.

[***][***][***]

You should note that all these programs take-up memory on your computer which makes InitMaster and Desktop Utilities particularly attractive programs. Learning and using these two programs can take you to a higher level in your IIgs's ability and in memory management.

You can find many popular Desk Accessories, Control Panels, Inits and Finder Extras available in GEnie's Apple II library. There are games, word processors, clocks, calculators and other useful applications. You owe it to yourself and your machine to take a look at what your Apple IIgs
Apple II Computer Info

can achieve under System Software 6.0.

Online Food For Thought

"""""""""""

By Phil Shapiro

[P.SHAPIRO2]

>>> COLLABORATION IN THE ELECTRONIC AGE <<<

"""""""""""

Each one of us is born into this world with unique talents.

However, no two persons have exactly the same strengths.

Working alone, each one of us can make a contribution to society.

But working together, in collaboration with others, our individual talents are magnified.

Defying logic, when two or more persons collaborate on a project, the sum of the parts is often greater than the whole.

In this electronic age, electronic mail is the lifeblood of collaboration.

Within the business world, e-mail is the cement that binds companies together.

Outside the business world, e-mail facilitates social and intellectual discussions.

Whatever the nature of the collaborative project, be it software development, scientific research, or the writing of a book, electronic mail can facilitate just about every stage of the project.

Before a project even gets launched, the participants can brainstorm ideas via e-mail.

Once the project begins to take shape, the direction and timetable of the project can be worked out via e-mail.

During the middle stages of the project, progress reports can be distributed via e-mail.

And in the final stages of the project, feedback from independent observers can be sent via e-mail.
It used to be that persons who were collaborating on a project needed to live in the same city, or at least the same state.

In the electronic age, physical proximity is becoming increasingly irrelevant.

Emotional and intellectual proximity are far more relevant.

Most interesting, people can collaborate on long term projects without ever having met each other.

Their shared ideas alone can be the sole force connecting them over months of work.

Ideas themselves can be both the communication medium and the end product of collaboration in the Information Age.

In the previous Industrial Age, shared ideas could only be used as a means to an end.

The structures and inventions of the Industrial Age were all physical tangible structures.

In contrast, the structures and inventions of the Information Age are intangible, knowledge structures.

The ideas themselves are the invention.

As the world becomes more complex, no one individual has enough know-how to tackle ambitious, original projects.

Shared knowledge and shared insight are going to be the hallmark of future successful ventures.

Persons open to working in collaboration with others are going to have a distinct advantage over the "lone wolf" worker.

In the coming years rugged individualism is going to have to take a back seat to rugged cooperation.

Orville and Wilbur Wright's father once remarked that neither of his two sons, working on his own, would ever have achieved much with his life.

Working together, bouncing ideas and energy back and forth, the two were able to soar to unimaginined heights.

-Phil Shapiro

SEVEN HILLS DROPS SOUNDMITH  Earl Childers, the president of Seven Hills Software, recently announced his company was forced to abandon its plans to commercially release SoundSmith, the popular shareware music authoring program. Huibert Aalbers, SoundSmith's creator, became disenchanted with the Apple IIgs community after a beta-tester broke the nondisclosure agreement and copied the program for a friend. This "friend" in turn began passing the program to others and the SoundSmith beta has become a favorite target for the IIgs pirate community.

Seven Hills, which had planned a series of improved SoundSmith versions, could not acquire the source code and did not have the resources to take over the project independently. Following the incident, Huibert Aalbers denounced the Apple IIgs community and has turned his efforts towards the Macintosh.

The SoundSmith episode stresses the importance of honesty in the Apple II community. Too often we see people passing out copies or selling and trading software black market style. With such a small developing and programming community, making sales in ever shrinking quantities, the survival of the IIgs market depends on our honesty.

Piracy is the copying of software without proper payment. But, as SoundSmith's misadventure shows, it may not always be so simple. There are many forms of piracy and many degrees, but it all hurts the authors and it hurts the Apple IIgs community.

Software piracy is not always intentional either. Customers often commit theft by ignorance when they download a shareware file from a commercial service or they pay the copying fee at a user meeting or they purchase a disk from a mail order house. Many of these people do not realize they are still responsible for sending in their shareware fees unless the distributor specifically states the author's fee is included in cost for the program acquisition.

In many ways it is the shareware market which keeps the Apple IIgs a viable, growing computer. Prompt payment of the fees is important if users do not want more programmers to defect to more profitable platforms. Just because a program might only be used occasionally is no excuse not to pay for the author's efforts. Just because one has empty pockets can it be assumed others will make their payments. Beg, borrow but do not steal!

Another form of piracy is the selling of extra disks. Many programs come packaged with software included on both 5.25" and 3.5" disks. Do not believe that because only one disk is being used the other can be sold. Potential buyers need to be skeptical when they see programs on one sized disk being sold without a manual. This does not imply everyone who sells a single disk is dishonest. It is, however, something to be aware of and to inquire about. Never be afraid to ask what happened to the manual or the second disk when it is not included in a used software purchase.

While there are too many forms of piracy to mention here, you should ask yourself a simple question when using or buying software. "Did the author or publisher of this program get properly paid for this software?" Now comes honesty and conscious.

The Apple II community may be small, but it is filled with creative
and committed people who could easily be filling their pockets by defecting to another computer. Every Apple II user owes it to the developers and programmers to watch out for piracy in any form and to make an effort to stop it. We should not lose good programmers the way we lost Huibert Aalbers.

>>> HAVE A PROBLEM? JUST ASK! <<<
""""""""""""""""""""""""""""

Question  A friend of mine has a single 5.25 inch disk drive on his Apple II system. He tells me he's interested in learning about telecommunications, including uploading and downloading, but doesn't have the money to buy an extra disk drive. Would it be possible for him to use ShrinkIt on a single 5.25 inch system?

GENieLamp  The answer is a qualified "yes." He could use ShrinkIt in a limited way on a single 5.25 disk drive. The compressed source file and the uncompressed destination file would both have to fit on the same 140K disk. Unlike the "duplicate disk" feature on the Apple II System Utilities disk, ShrinkIt does not have a capability of keeping track of different floppy disks in the same disk drive. So you couldn't do disk swapping to unshrink a downloaded file from one 5.25 inch disk onto another.

Whether you find this limitation serious depends on the types of files you upload and download. Text files, for instance, typically are quite small, and can be compressed even further using ShrinkIt. On the other hand, some public domain and shareware programs take up an entire 5.25 inch disk. (These would be impossible to unshrink after downloading to a single 5.25 inch disk drive system.)

Assuming that ShrinkIt can be used in a limited way on a single 5.25 inch disk system, the natural follow-up question is: "How large a file can you download and unshrink onto a single 5.25 inch disk?" The answer to this question is complicated by the fact that ShrinkIt has varying compression performance depending on the type of files being compressed.

Text files, for example, are usually compressed to about 50% of their original size. So a 10K text file (about the length of an average newsletter article), compresses down to 5K after being shrunk. Using this 50% rule-of-thumb for text file compression, that means you could download a fairly large 40K text file to a single 5.25 inch system, and still have room to unshrink it onto the same 140K disk. (The arithmetic for this is: 40K + 80K = 120K.)
So while it is possible to use ShrinkIt on a single 5.25 inch disk drive system, the freeware ShrinkIt program was designed to be most useful when being used with two or more floppy drives, or a hard disk drive. At the price of new and second hand disk drives these days, it's very much worth your while to get a second disk drive for your Apple II system. You'll find an extra drive opens up new possibilities for telecommunications adventures, as well as adding great convenience to your word processing (by allowing you to leave your data disk in your second disk drive).

[The Program Clinic column provides answers to Apple II technical questions. The aim of the column is to provide simple answers to questions that novice Apple II users might have. Occasionally the column will tackle more difficult questions as well.

[AII]///WHY APPLE II ROUNDTABLE? ///
///WHY APPLE II ROUNDTABLE? ///
Here's Why!

By Phil Shapiro
[p.shapiro@]

>>> REASONS TO VISIT THE APPLE II ROUNDTABLE <<<

Ever since Tom Weishaar and A2-Central took over command of the Apple II Roundtable on GENie, back in 1988, the roundtable has served as a central gathering place for Apple II users nationwide. People turn to the roundtable to find answers to their most perplexing, difficult technical questions. But they also turn to the roundtable for camaraderie and socializing.

A recent tally of the attendees of the roundtable turned up lots of RoundTable members. Within these members is a phenomenal wealth of talent and experience. If knowledge could be quantified in gigabyte units, the collected knowledge of the Apple II users on GENie would take up several dozen laser discs.

But it's not only the programmers who possess the technical knowledge. Some ordinary Apple II users are virtuosos at using PublishIt and HyperStudio. Other "ordinary" Apple II users are using their computers in extraordinary ways.

The original spirit of the Homebrew Computer Club is alive and well
and meeting on a daily basis on page 645 of the GEnie information service. Stop by and visit sometime. If you've got a question to ask, just yell it out (in the appropriate category and topic, of course). If you've got something neat and interesting to share, by all means share it with the rest of us.

A community can be defined as a gathering of souls who look out for one another, nourish each other, and feed each other goodwill. Apple II users are ever so lucky that Tom Weishaar drove his covered-wagon into this clear pasture called GEnie, placing down stakes for his vision of a busy and bustling village. While it might seem trite to say, it's indeed true that a community has grown up where nothing but barren magnetic tape existed before.

Looking back, it has been quite some journey. (But then again, the journey is often the reward.) Come walk with us. We've only begun to find out what the Apple II can do...

----------- GEnie_QWIK_QUOTE -----------
"Ain't it a shame that "80%" of computer users aren't online, and don't realize the magnitude of expertise available here on GEnie!"

[LIB]/// THE ONLINE LIBRARY //

Yours For The Downloading
******************************************************

>>> HOT FILES! <<<
******************************************************

CHECK IT OUT Public domain and shareware programs are not the only kinds of files you can find in the Apple II Roundtable library. The Apple II library also has a goodly number of text file uploads.

These text files range from newsletter articles to press releases to software reviews to real-time conference (RTC) transcripts to archives of messages from the Apple II Roundtable. If you like to read about the Apple II and the national microcomputer scene, check the recent uploads to the Apple II library. You may be surprised at what you find.

If you're a newsletter editor, you may find text files in the A2 library worth re-printing. And if you know of a newsletter editor who's looking for new articles, you could do him or her a favor by downloading text files and passing them along.

As an example of some of these text file uploads, you may enjoy browsing through the following text files recently uploaded:

18792 News.9206.bxy (This file contains fresh Apple II news items compiled by prolific author Steve Weyhrich. User group newsletter editors could possibly use this file as a stand alone article.)

18288 EFF.Info.bxy (The Electronic Frontier Foundation in a non-profit...
Apple II Computer Info

organization that lobbies Congress on important telecommunications and personal privacy issues. Download this file to find out more about their recent testimony before Congress.)

18792 PI.Tips1.bxy (This user group article provides time-saving tips for creating newsletter using Publish It 4.0. Learn how advance planning can save you work. The article covers such topics as setting up page standards, basic column formats, page elements, resizing graphics, and the rule tool.)

18828 H.I.G.Notes.bxy (Apple Computer's phenomenal success is partially due to the consistent interface used by many different applications. This consistency is a result of software developer's following Apple's Human Interface Guidelines. These guidelines are an ongoing, book-length project at Apple.

If interface issues are of interest to you, you might enjoy reading some of the notes and updates Apple has released about the Human Interface Guidelines. While intended for programmers and software developers, many of these notes are written in plain English and make for fascinating reading.)

18765 Dave.Matt.bxy (When Apple Computer released System 6.0 for the Apple IIGS, earlier this year, GEnie hosted the leaders of the System 6.0 development team in a real time conference (RTC). If you missed the conference, you can still download the transcript as a text file. You can learn much from the probing questions put to Dave Lyons and Matt Deatherage.)

18756 Broderpr.txt (Last month Broderbund released not one, but two new Apple II programs. Download this short press release to find out about "Where in America's Past is Carmen Sandiego" and "The Treehouse.")

494 Woz.Hrtzfld.txt (Finally, if you're interested in Apple II history and folklore, this early GEnie text file tells about Steve Wozniak and Andy Hertzfeld's trip to visit the Wellington, New Zealand, Apple user group in 1985. This feature-length 20K article summarizes some of the remarks Woz and Hertzfeld made about Apple Computer, Steve Jobs, and the Apple II.)

The Squeaky Wheel...

by Lorin Evans

o APPLE DMP or IMAGEWRITER I & II TUNEUP

o APPLE DISK ][ DRIVE TUNEUP

>>> PREVENTATIVE MAINTENANCE <<<

~ For Your Apple II Equipment ~

Your dot matrix printer allows you to make a paper copy of your creative writing and graphics. Its components clank about inside the case.
along dirty rails, pushing little pins through dried out ink trying to reproduce your work faithfully. Little guidance is provided by printer manufacturers concerning preventative maintenance of your printer. This tutorial article is designed to redress that oversight.

After the discussion of printer maintenance routines is a discussion about preventative maintenance of 5.25 inch Apple II disk drives. While this article focuses on the Apple Disk drive, most of these remarks are applicable to generic disk drive brands as well.

Note If you are uncomfortable doing any portion of this preventative maintenance, it might be wise to solicit the help of someone who is more mechanically inclined. It is possible, for example, to damage the printhead card on your dot matrix printer. The usual caveats concerning your responsibility for the work you perform apply here. If you undertake any of these maintenance routines, you do so at your own risk; Washington Apple Pi is not responsible for the outcome.

--- APPLE DMP or IMAGEWRITER I & II TUNEUP ---

Tools Required:
- foam swabs
- isopropyl alcohol
- WD-40 lubrication spray (or equivalent)
- small Phillips head screwdriver
- paper towels
- LaBell lightweight oil

Historical Note before Apple made the ImageWriter I printer, it produced a dot-matrix printer by the name of the "Apple DMP" printer. For preventative maintenance purposes, the Apple DMP and ImageWriter printers are often treated the alike.

Disassemble First shut off the power. Remove any paper, the two cover panels, and the print ribbon. Now remove the print head. [ImageWriter I and Apple DMP owners: there are two metal hooks that swing out from each side of the print head.] On the ImageWriter II there is a white plastic clip that must be GENTLY pressed to the right. AT THE SAME TIME, raise the print head straight up with a side-to-side rocking motion. The part of the print head that you can see is attached to a card below it that plugs into a socket. DO NOT USE FORCE IN LIFTING UP THE PRINT HEAD.

Clean Printhead Do NOT attempt to disassemble the printhead. [ImageWriter I and Apple DMP owners: with the head out, remove the stainless steel shield by removing the screw on the bottom of the print head. Set them aside.] Take WD-40 or equivalent spray and squirt both the face of the print head and underneath in the open channel you will find there. Lay the print head face down on two or three folds of paper towels. What should begin to happen is old dried print ink will dissolve and flow off both the face and the rear of the print pins. You are lubricating the pins where they pass through the head and removing dried ink. Repeat this several times until the spray comes out clear. Use the
swab when wiping the face of the head. Gentle, gentle! Set this assembly aside while the spray works.

Clean Platen/Rollers  Take one or two towels and moisten with isopropyl alcohol. Wipe the platen (the black roller) with the paper lever in the lower position. Turn the platen so all of its is wet. A black residue should come off along with ink from where the print head printed on the platen. After several wipes, switch to a dry towel and rub until essentially dry. Now remove any lint or fuzz on the chrome rail(s) inside the printer. Take the lightweight oil and drip some on the rail(s). Then slide the ribbon carriage back and forth to provide an even coating of lubricant on the rail(s). [ImageWriter I and Apple DMP owners: place several drops of fresh oil on the felt washer in the center of the ribbon carriage.]

Now clean out the lint and fuzz in the rear of the printer where the tractor feed mechanics reside. Wipe the square rails with isopropyl so that the tractor feed wheels slide easily side to side. Some folks like to lubricate those square rails as well to ease sliding.

Now take a plain piece of paper and inset it into the printer as if you were going to print a document. You want it to absorb any residual alcohol on the bottom pinch rollers. Roll it through and discard.

Reassemble  Check the condition of the print head. Spray it again to make sure only clear fluid is running out of it. Wipe the face and reinsert into the guide card slot. [ImageWriter I and Apple DMP owners: first reinstall the shield after you have cleaned it.] On an ImageWriter II, align the guide card above its slot. Then apply a VERY GENTLE forward pressure pushing the head towards the platen and down into the slot. If in doubt, remove the head and start over again. That approach is cheaper than a new print head! [ImageWriter I and Apple DMP owners: close both locking hooks.] With the head reinstalled, replace the print ribbon, insert paper, realign the paper against the pin feed marker, set the lever to pin feed, and reinstall the two covers.

Test  To test your newly cleaned head, hold down the 'form feed' button and simultaneously turn on your printer. This will cause the 'self test' to run which will remove any remaining spray on the pins and reassure you that you have proper pin action. Shut the printer off, remove and discard the test paper.

You will have done your print head a favor and be rewarded with clearer printing after this is done.

>>> APPLE DISK ][ DRIVE TUNEUP <<<

Tools Required:

- isopropyl alcohol (90+% by volume)
- foam swabs (NOT cotton tip style)
- thin blade slot screwdriver
- Copy II+ utility software (or equivalent)
- blank disk
The items to clean inside a Disk drive are the read/write head, head load button (pressure pad), and head carriage rails. If during the drive speed test you find a large variation in speed, there are two additional items under the drive that can be cleaned as well.

Remove the Cover

With the power off to your computer, turn the Disk drive over and remove the four screws that secure the cover. Slide the case backwards off the chassis.

Remove Analog Card

Gently remove the read/write head plug from the right front of the card. Remove the motor connector from the center rear of the card. Now, note the orientation of the flat ribbon cable on the left side. If all gray, note whether the red stripe is on the left or right, or if rainbow colored, which way the cable curves as it comes off the connector. (You need to know this so as to orient the cable correctly when reinstalling it.) Now gently remove the ribbon cable plug from the left rear of the card. Remove the two screws at the front of the analog card. Slide the card forward past the retaining slots in the rear and lift the card out of the drive. Now lay the card on a foam pad or cardboard, etc and gently press the socketed chips into their sockets. Over time they sometimes creep out which can cause erratic operations.

On some machines you will see a metal shield that straddles the "collet hub frame." (The "collet hub frame" is the technical name for the cone-shaped device that you see through the disk drive door that actually presses the disk against the turntable. The collet hub frame sits above the turntable on two little arms that extend to the back of the disk drive. When you close the disk drive door, this assembly comes down and pushes the floppy disk against the turntable.) It will pop off. Note which way it came off; you want to reinstall it when you are finished.

Clean It

Take a foam swab and dip it in isopropyl alcohol. Clean the head load button [the small round pad of white felt found in the spring loaded black arm mounted above the read/write head.] Next clean the head. Finally clean all around the entire length of each guide rail. You can manually slide the guide carriage back and forth to gain access to all of each rail.

Now take a look at the head load button (pressure pad). If worn — it will look somewhat like a cylinder skewed to the right — replace it. Check with a dealer first to be sure they have the part. The button snaps in and out of its holder.

Speed Check

When all is done, reassemble, but leave the cover off. It is time for a drive speed check. KEEP IN MIND that if you change the speed significantly, disks that were recorded at the old speed may not want to boot at the new one. If the test shows the speed out of specification, adjust one of your drives to Apple specs and copy any disks made on the out-of-spec drive from that drive to the spec drive.

Be sure the isopropyl alcohol has evaporated or you will end up with a wet disk. Boot a program that has a drive speed check routine (such as Copy II Plus, Essential Data Duplicator, or Diversi-Copy). Follow its instructions. The speed control is located on the motor control board on the rear of the chassis. The speed control, which is located on the vertical circuit board, is a small wirewound resistor with a slotted screwdriver adjustment protruding from one side. DO NOT TOUCH THE TRIMPOTS.
ON THE ANALOG CARD! The speed is controlled by turning the trimpot on the motor control board. Move the screw in small increments and wait for the speed to settle down before making another change. If the plus or minus is considerable, it can sometimes be reduced by cleaning the pulley and drive belt (located under the chassis) with isopropyl.

Reassemble When you are finished, reassemble and you are ready for many more hours of successful use.

[*][*][*]

This article is the first in a series of articles on Apple II maintenance and repair. The author, Lorin Evans, serves as president of the Washington Apple Pi user group, a large Apple user group located in the Washington DC metropolitan area.

If you have suggestions, comments, or questions you'd like to see answered in future articles in this series you can contact Evans at: Washington Apple Pi, 7910 Woodmont Ave., Suite 910, Bethesda, MD 20814.

THE ONLINE LIBRARY ...... [LIB] SHAREWARE SOLUTIONS ..... [SHA]
READING GEnie Lamp  GEnie Lamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnie Lamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnie Lamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)
________________________|_______|_______|_______|_______|_______|_______
|Name of sender|CATegory|TOPic|Msg.#|Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58)

ABOUT GEnie  GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99368,GENIE and hit RETURN. The system will then prompt you for your information.

"When my Apple [gs eventually conks out, I want to invest in an equally powerful computer; Therefore, I think I'll invest in a CRAY."

PROPTOSIS

Notes From The Editor

By John Peters

The GEnieLamp Computer War contest is heating up with entries from several computer platforms. Surprisingly, we have received responses from platforms that GEnieLamp doesn't directly support (like the Amiga and NeXT computers). Even more surprising is the fact that we have received zero entries from the IBM and Macintosh crowd while the Apple II/A2Pro response has been tremendous.

The contest is simple: Tell us why you think your computer is HOT. Why and how do you use your computer in everyday life? What are its strengths. What are its weaknesses? What keeps you from switching platforms?

There are only a couple of weeks left to get in on the contest, so if you're planning on entering do it now. Just send your entry of 400 words or less to GEmail address GENIELAMP or upload it to Library #8 in the GEnieLamp RoundTable on page 515. And don't forget, there is over $200.00 worth of GEnie online credit time which will be given away!

Amigians Ask, Where Is GEnieLamp AMI? I have received several GEmail asking me why we GEnieLamp doesn't support the Commodore/Amiga line of computers. The reason is simple: You already have a great newsletter, Viewport. Viewport is edited by Jim Meyer and published by Livewire editor, Peggy Herrington. And like GEnieLamp, Viewport is distributed via the main menu and is included in your GEnie*Basic package. Check it your copy of Viewport out in the *STARSHIP* RoundTable on page 555.

GEnieLamp Elsewhere Update Our "elsewhere" issue is undergoing a complete make-over. In order to better serve you we are hiring reporters/writers to cover the Computing RoundTables that are currently not included in the GEnieLamp magazines. If you would like to become part of the GEnieLamp team, write to GENIELAMP today.

MINI_HUMOR! This small poem has been floating around GEnie lately. I reprint it here for those of you who might have missed it.

Spellbound

I have a spelling checker
It came with my PC;
It plainly marks four my revue
Mistakes I cannot sea.
I've run this poem threw it
I'm sure your pleased too no.
It's letter perfect in it's weigh.
My checker tolled me sew.

-Pennye Harper

[*][*][*]

That's about it for this month. Until next time...
Welcome! Welcome to the August GEnieLamp A2/A2Pro. Now that KansasFest is over we can catch our breath and take stock of what is happening in the Apple II world. You will find a special section devoted to the best KansasFest post so you are amongst the first to get the scoop on what went down.

GEnieLamp A2/A2Pro wants to hear from you! We start on GEnie, but it goes much farther. We encourage you to upload copies of GEnieLamp to your favorite BBS's and to share it with your local usergroup. So it only makes sense that you be able to write us and let us know what you think.

Send me a letter telling me what you think about GEnieLamp and our articles. We also want to hear what you do with your Apple II. If you are a developer or programmer, send us a letter telling us what you are doing. If you send us a program we will review it. (We accept Commercial, Freeware, Shareware & Public Domain. Make sure you indicate if we may place it in the GEnie online library.)

Do you have fresh news or a hot rumor? Send it in and we will share it with the world. (Subject to editors' discretion and/or verification.)

Send your letters and programs to:

GEnieLamp A2/A2Pro
%Thomas M. Schmitz
6750 Hawaii Kai Dr., 1005
Honolulu, Hawaii 96825

Make sure you have the correct postage since we cannot accept postage due.

Bulletin boards are hot! If you have not been in the message center lately you owe it to yourself to take a visit. Here is a rundown of current events:

To help celebrate GEnie's Hot Summer Nights Promotion, the A2
Roundtable will be the host for several Special Guests in Real Time Conferences. Scheduled so far, noted Apple IIgs programmer Bill Heineman has agreed to be a guest on Sunday August 2, to discuss his latest HOT arcade game for the Apple IIgs. Kitchen Sink Software, publishers of a wide variety wonderful 8-bit Apple II software for home, education, and small business, will be the guest on Tuesday August 11. SoftDisk Publishing, makers of Softdisk and Softdisk GS, will be our guest on Thursday, August 20, and have agreed to give away a free subscription or two to lucky attendees!

An agreement has been reached with Roger Wagner, publisher of over 100 Apple II and Apple IIgs products, to be our guest. No final date has been set, but watch for announcements within A2 very soon! Tom Zuchowski of the Eamon Adventurer's Guild has also consented to be our guest at a soon-to-be-announced date.

Right now the A2 and A2Pro sysops are at the yearly A2-Central Summer Conference speaking to many more Apple II developers and publishers, so expect even more exciting Real Time Conference announcements for August!

A2 will also be conducting an Upload Contest in the A2 Libraries. Every week the GEnie Sysops will choose their favorite new Apple II 8-bit and new Apple IIgs specific upload, and the uploaders will receive TWO FREE hours in A2 and A2Pro RoundTables. August is THE time to upload your favorite piece of software, or your neatest file, or WHATEVER you think would interest other Apple II users - don't put yourself down, you'd be surprised what others might like!

The BIG contest is already happening in A2 and A2Pro. Joe Kohn, author of ShareWare Solutions, a monthly article in A+/InCider magazine is sponsoring a contest for the best, neatest, most awesome levels for the FTA game Bouncin'Ferno. Boucninc' Ferno is an amazing arcade game for IIgs users, available from the A2 Library as:

File #18948 BOUNCNFERNO.BXY Desc: Bouncin' Ferno game from the FTA!

The game includes a level editor, which can be used to create your own levels. Those who create the best new levels may win prizes from the contest sponsored by Shareware Solutions. To help Mr. Kohn's contest, A2 has decided to allow GEnie users to "get in on the action" early. Create your own levels for Bouncin' Ferno, upload them, and maybe WIN A PRIZE! The winner will win TWO FREE WEEKEND DAYS in the A2 and A2Pro RoundTables, and the runner up will receive ONE free weekend day. Whether you win in A2 or not, you'll also be eligible to participate in the Shareware Solutions column, so check out Bouncin' Ferno and create those levels right away!

8-Bit Apple II users should not feel left out, because A2 is also sponsoring a contest for Print Shop Graphics. Create a new Print Shop Graphic (in either New Print Shop or original format) and upload it to enter our contest. Winner will receive TWO FREE WEEKEND DAYS in the A2 and A2Pro Roundtables, runner-up will receive one free weekend day.

/CHERRY.FONTS/"
RTC HUMOR   If no-one has told you, insanity abounds in the Apple II RT.

Just look at this clipping from a live RoundTable Conference:

<A2.HANGTIME> KFest?
<A2.HANGTIME> 5 days, 10 hours, 29 minutes, 18 seconds until KFest
<A2.HANGTIME> KFest?
<A2.HANGTIME> 10 hours, 29 minutes, 9 seconds until KFest ... YAY!!
<A2.HANGTIME> KFest?
<A2.HANGTIME> 10 hours, 29 minutes, 8 seconds until KFest ... YAY!!
<A2.HANGTIME> Are you enjoying yourself, Hang?
<A2.HANGTIME> Why, yes. As a matter o' fact I am. SO there.
<A2.HANGTIME> Man you're weird
<A2.HANGTIME> Define weird.
<A2.HANGTIME> YOU are the definition of weird!
<A2.HANGTIME> In who's eyes? Yours?
<A2.HANGTIME> Yes mine.
<A2.HANGTIME> Ptthhhhh. Look who's talking!
<A2.HANGTIME> --==[] Hang
<A2.HANGTIME> Oh yeah? --==[]
<A2.HANGTIME> OUCH!
<A2.HANGTIME> Yeah, serves you right.
<A2.HANGTIME> Yeah, but I just threw a pie, you threw a pie TIN!
That's not very nice.
<A2.HANGTIME> I'm not a noce person.
<A2.HANGTIME> I know you're not a "noce" person. You also can't
type worth $#!+
<A2.HANGTIME> B-P> You know I meant "nice", you dork.
<A2.HANGTIME> on
<A2.HANGTIME> your
<A2.HANGTIME> knees
<A2.HANGTIME> Oh my? Now I'm not sure who's taking? Is it you, or me?
<A2.HANGTIME> I don't know. But I'll make it easier for you ... I'll
leave. bye
<A2.HANGTIME> Okay, later.

More on SoundSmith   DISCLAIMER: These are my personal views and not that
of Seven Hills, my users' group, or any other group.
I may not disclose any proprietary information and will not willing do so. If
I do so, it is involuntary.

As a Seven Hills Partner and "kind of" beta tester (I was real late on
Express - but the final version doesn't conflict with Pointless like one of
the early ones did), I have seen SoundSmith in a "commercial form". I also
signed a non-disclosure agreement.

It was/is nice. I played with it quite a bit. I can not / will not
Apple II Computer Info

discuss the program itself.

The only BBS I ever saw it on was the Seven Hills area (closed to non-Partners) here on GEnie, but then, except for my brief monthly forays onto AOL, this is my only BBS.

If some Seven Hills Partner let it out by giving it away to a pirate BBS, then shooting is too good for that person. Hot coals, v-e-r-y s-l-o-w-l-y, maybe.

I really liked the "commercial version". As the PD librarian of a users' group, I had played with SoundSmith, but never kept it because of the way it never liked my system configuration (i.e., it wouldn't run off my hard drive and I hate booting from a floppy). So I used AOL's pre-System 6.0 version of SynthLAB and later FTA's freeware NoiseTracker (I just listen to other people's compositions).

When I was in Germany I wrote to FTA and to Huibert Aalbers. I even paid for Photonix II prior to it's release (still don't have it...). Olivier and Huibert are talented guys, but they were writing for a platform that was never even supported in Europe to a tiny fraction of it's US support — slim as that was!

Sr. Aalbers might be tempted if _every_ person who _uses_ SoundSmith: (a) paid their shareware fee; and (b) deluged Seven Hills with prepaid orders for the "commercial version" — AND cheerfully and uncomplainingly accepting the "final beta" without a manual until any bugs are worked out.

[BTW, I have suggested in the past that Apple II users could commission programmers to write programs for them. In other words, Bill Heineman gets, say $5,000 for a program, we raise $5,000 and pay him for his work. If any one of these "alliance" operations ever got off the ground, that would be one vehicle to raise programmers' commissions with. Perhaps GEnie could even be convinced to allow electronic fund raising?]

Seven Hill's is committed to the GS. People who pirate their programs in these day of faint support should be ashamed — by doing so they are actively helping to kill a fantastic platform (the GSD a very good company (Seven Hills, not Apple)). I hope they enjoy their putrid PC's when that's all that's left. Try my suggestions of getting people to pay the shareware fee and trying to preorder the finished program. Money talks, all else walks. Just remember, you'd also have to be happy with the "final beta" until Huibert Aalbers' ruffled feathers are smoothed.

Mike (On all but beta testing information, you may quote me in print if you credit me) Murley

(M.MURLEY3, CAT 6, TOP12, MSG: 4,/M645; 1)

Best of Music Studio

Just thought you would all like to know what is in A2's Best of Music Studio Songs (file 18976).

(You must have Music Studio to listen to these files.

PRE-KANSASFEST NEWS

Even Before the KansasFest convention began Zip Technologies announced new, faster accelerators for the II GS -- up to 14 megahertz! But if you already have a Zip and want to save money you can make the upgrade yourself. Lunatic found this on the Internet:

---

I was talking to Bill Heineman and he mentioned a new chip that's available from WDC. It's a fairly standard 65c816, except for two things:

- It runs at 14MHz
- It was reengineered almost from scratch by Sanyo to run at 14MHz

This is no joke; I called WDC and asked them (talk to 'Deb'). They have them, they cost $95 just like the old 'high speed' (not) chips they had. And, they have what's probably an unlimited supply of them.

You can pump your Zips up to 12.4MHz (their gate array is now the bottleneck, although there are about 100 Zips out there with faster gate arrays). Transwarps can probably go the full 14MHz, though I don't know for a fact. There is no power supply boosting necessary; these chips run straight off the regular 5V (they were reengineered, remember?). Just plug 'em in, put in a new crystal, hope you particular accelerator card doesn't have some odd fault, and GO! Ultra fast IIgs's.

WDC will require you to look at some outdated (and because of the new chip, obsolete) information on modifying TWGS's and Zips before they'll let you order the chip; but that's free, and well worth a IIgs at 12 or 14 MHz.--(81%)

Again, *THIS IS NOT A JOKE*. WDC's phone number is 602-962-4545.

Warp Six in the Works Just to keep everyone up-to-date, I'm working on the next version of Warp Six BBS, which will either be 8.9.4 or 9.0. So far, I've re-written the forum module to support hundreds of messages per forum.

Any other suggestions will be welcome. ---
Jim Ferr, Fantastic Software

New AppleNET Coming Soon AppleNET v2.0 may sport a slightly different name from current AppleNET versions! This will be to emphasize the major changes that have taken place from current AppleNET versions to the new version under production.

AppleNET 2.0 is like nothing you've ever seen. X/Y/Zmodem transfers, file enclosures, new user fields, more efficient storage of data... EVERYTHING has been revamped completely! As AppleNET's new author, I'm trying to make it the best possible software I can, and I'm going to need all the user/sysop feedback I can get.

As a small show of my gratitude, if anyone suggests an extension to the AppleNET name that I like and use, I'll give you full credit in the AppleNET v2.0 docs! So let me know what AppleNET name extensions (eg: AppleNET Pro, AppleNET Doo-Dah, etc.) you'd suggest! -Derek Fong
(M.POTTER4, CAT41, TOP 2, MSG:2/M645;1)

Spaced-out Price Increase Well, I hate to do it but I find that I must increase the price of Astronomer GS if you buy it directly from me (there is no change if you download it from GEnie. A major increase in the prices I must pay for disks and Xerox is the reason. Here's the latest breakdown:

The Works: 7 Disks, Manual w/ labels is $41
Registration and Manual Only: $28 (you get the program from GEnie)

This price increase is effective 15 July 92. and are for U.S. orders only. Orders from other countries may cost substantially more to cover the cost of postage. If you have questions, post them here or in E-Mail I'm L.Bell13 or write to: Larry Bell, 2537 Jefferson St, Long Beach, CA 90810.
(L.BELL13, Category 13, Topic 14, Message 10)

FantasyWorks ~ The Elite Fantasy Football League Management System ~ FantasyWorks version 3.0 is now available from FantasyWorks Software, Inc. for the start of the 1992 NFL season. FantasyWorks again remains the ONLY Fantasy Football software for the Apple II line.
Fantasy Football is a seasonal event that coincides directly with the National Football League's 17-week season. A commissioner runs a league where members become team owners by drafting a team of NFL players and decide who to play each week. Each NFL player scores points based upon their performance in actual NFL games.

FantasyWorks gives you everything you need to run a top-notch Fantasy Football League on your Apple (or Mac LC or LC II with Apple II emulation card) using Classic AppleWorks, Publish It and your favorite telecommunications software. Our thick 300-page manual covers everything from publishing your own league newsletter to setting up a league hotline.

The included telecommunications scripts automatically capture NFL stats from Computer Sports World (CSW) and Fantasy Point Scoring is accomplished automatically using the included UltraMacro TaskFiles within AppleWorks. Basic, Distance, Performance and our "Elite" method are included. If necessary, custom scoring TaskFiles are available separately.

FantasyWorks Version 3.0 runs with AppleWorks 3.0 and includes more than 60 templates to help manage a proficient Fantasy Football League and requires at least two 5.25" drives or a single 3.5" drive. A TaskMaster version of all TaskFiles are available free for those AppleWorks owners who don't have TimeOut UltraMacros. Version 3.0 will have many enhancements such as automatic weekly scoring sheets and automatic ranking of NFL players. Numerous customer requests were also added. Registered owners can upgrade to Version 3.0 for $14.95. A version compatible with AppleWorks 2.0 is still available for an additional $14.95. A discount coupon to join CSW is also included.

Fantasy Football is becoming more popular each year and now has 5 paperbacks and 3 magazines dedicated to it. There's lots of stuff here so if you want to start your own league, now's the time to do it. The NFL season is almost here.

FantasyWorks normally sells for $74.95 but is available to GENie members through December 1st for $59.95 plus $6 s/h (Canadian members, please add $1 s/h). Please identify yourself as a GENie member when you order. Visa and MasterCard orders are accepted.

FantasyWorks BBS ONLINE A new BBS dedicated specifically to Fantasy Football called the "Fantasy Football Information Exchange" (FFIE). Access to the FFIE is FREE through November 1st. After Novemebr 1st, our initial, first-year membership fee is $14.95 plus $4.95 per month for usage. All FantasyWorks owners who are registered by October 1st, 1992, do not have to pay the monthly fees in their first year online. The FFIE will include: NFL draft reports, rookie info, player ratings, injury status reports, various fantasy forums, NFL stats, FantasyWorks software updates, weekly scouting reports, and more. The BBS will be officially online in mid to late August and enrollment will be limited. BBS#: (214) 642-9559.

>>> APPLE HEADS WANT TO KNOW <<<

IIGS Music Thoughts \//\ell, it's kinda funny when people ask to hear "computer" music with "real" instruments in it. Sure, it can be done, but that's far from where the strengths of computers...
lie. The reason you see so much "euro-disco-industrial-pop-dance" music available for our favorite computer is because that's the kind of music that is being CREATED on computers, predominantly, in the first place. As such, it's ideal for the translation to something that we can play on our own machines.

One example I'd like to make is a song in the library called ACID.BXY. I would consider this song not just an approximation of a "real world" song in the style of acid house dance music, but actually an example of that music ITSELF. Obviously, the music style of acid house dance music is predominantly created on computers, with a lot of samples. Anyway, there are still quite a number of artists who use computers to make their music and who DON'T end up making "euro-disco-industrial-pop-dance" music.

For example, there is a CD called Bachbusters, recorded by Don Dorsey in 1985, which is a selection of Bach pieces done entirely with synthesizers (using an Apple II Plus as a synchronizer/sequencer). These synthesizers were dedicated musical instruments, though (a Fairlight was used, for example), which become increasingly difficult to duplicate with an IIGS when you're trying to make it sound like a "real instrument." Now, synthLAB can be pointed out as an example, but almost all of the people who actually MAKE music on the IIGS who I’ve seen comment do not take synthLAB very seriously, due to quite a number of shortcomings (difficulty in creating instruments is one -- even the original author did a bunch of tricks to create his instruments and used MPW IIGS to assemble them, from what I’ve heard).

It's surely possible to do forms of music other than "euro-disco-industrial-pop-dance" with NoiseTracker and SoundSmith, but I don't think you should be too upset if you don't see very much of it, since the "euro"etc. music is where their strengths lie. -= Lunatic (:

Hmm, neat trick, talking about acid house and Bach within the same message.... (CAT3, TOP4, MSG:78/M645;1)

Mac Icons on the IIGS |)ave, here's another way to do it that may be a bit easier: Use the program called Resource Spy (I know it's in A2Pro, and it may be in A2, as well) to open the original Mac Desktop file and copy the Calvin and Hobbes icons out of it. Resource Spy will save them directly as IIGS Finder icons. Now all you have to do is edit their attributes in an icon editor, and maybe colourise them if you want. Set the file type attribute of each one to $FFF1, if your hard drive is SCSI. If it's not SCSI, set it to $FFF3, or maybe even $FFFD (this is what an older Sider partition would use). Set the file names of each icon to the names of your partitions. Finally, put the new icon file in the Icons folder on your BOOT disk, to make sure that they will show up.

Whatever you do, don't put the icon for a partition in the Icons folder of that partition itself (except for the boot partition) or the icon won't show up. The reason for this is that, except for the boot partition, Finder shows the icon for the partition first, and THEN reads all of the icons on that partition. On the other hand, at the urging of myself and probably several other people, Finder 6.0 reads all the icons on the boot volume FIRST, and then shows that volume on the desktop. Having all of your volume/partition icons on your boot volume makes sure that they're always in memory before Finder starts looking at other devices.
Apple II Computer Info

BTW, once you've got 'em working, why not upload them so we can all take a look? -= Lunatic (; (CAT9, TOP2, MSG:142, M645;1)

Hyper Card Update Info I know why the upgrades for HCGS aren't available thru Apple dealers (I had a big hand in establishing that policy, so I should know... <grin>).

We wanted a single point of contact for customers upgrading and we wanted to keep the cost as low as possible. If the upgrade went through the "dealer" channel, it would have _HAD_ to be packaged like a regular product (fancy box, etc) and that would have driven the cost up quickly. Instead, we chose to go through APDA. As reality unfolded, APDA worked out a deal with Resource Central to allow RC to take over distribution of APDA's A2 packages - including the soon-to-be-released (at the time this happened, HCGS v.1.1 hadn't quite been released yet) HCGS v.1.1 upgrade package.

By putting the product through APDA, we could do away with the traditional packaging requirements and get the cost down considerably.

As for why RC wasn't sent a list of registered owners - _THEY WERE_! But that doesn't solve the problem you mentioned (avoiding having to send in your Installer & Tour disc [not "discs", "disc", only one disc and it's named "Installer and Tour"]). See, the vast majority of HCGS customers never bothered to send in their registration cards, so we had no way of telling RC who those users were. We didn't want to leave those users out, so RC established a policy that solved the problem at minimal hassle to the customer (a single floppy can be easily mailed in a normal envelope - I've done it often when sending out updates to ShareWare subscribers).

If I left something unanswered, let me know...

Tim S. (my opinions are my own) (TIM.SWIHART, CAT5, TOP3, MSG:22/M645;1)

Running Astronomer GS Boy...I don't know if a floating point engine will help or not. I'm not familiar with them on the Apple. Remember, Astronomer is a 16-Bit program. As for the speed...I know it seems slow but there's a reason for it. All calculations are done in double precision and I don't use many of the approximation equations used by other programs. Where ever possible, I use the most accurate calculation algorithms available (see Astronomical Algorithms by J. Meeus). The emphasis has always been on accuracy vs speed.

Having said that, I have found that some folks have had problems with incompatible DA's Inits etc that cause the program to slow WAY DOWN. Try booting from System 6 holding the shift key down till the thermometer appears then run Astronomer and see if it improves. You must also remember that for some routines the farther your date is from present, the longer calcs may take. For a quick test, find the Sun Rise/Set time for your area on a date in 1991 (any date). If the calc takes less than 60- sec you're probably OK. For most folks it should take less than 20 sec. (L.BELL13, CAT13, TOP14, MSG:8/M645;1)

Laser Computer Ram >R.ROEHNBER [RJ]
" " >I could use Prosel 8 to load the whole thing into >this RAM disk and then when it came time to check my spelling I would
press open-apple V as I do now, but the dictionary would already be in
memory so there would be no need to swap discs? And Nibbler, when you
say the Laser ram expansion behaves like the RamFactor from AE, what is
RamFactor and is it something that could be used with the Laser?

I haven't attended here in awhile but just noticed all of the
discussion on using the Laser 128EX's RAM disk.

For the Laser, Copy II+ is also a great utility for loading the RAM
disk, as well as ProSel 8. Like Prosel, you can copy all of the files in an
entire directory by designating it, or you can copy the files one-by-one.
Copying individual files has the advantage of allowing you to increase
desktop space by being selective about which subroutines you wish to use.
For example, you can leave out spreadsheet, database, printer routines,
dictionary or various TimeOut apps, if you want to increase desktop space.
Use only your word processor and dictionary, your database, whatever. Both
ProSel and Copy II+ version 9 can be configured to launch apps from RAM.

Since the RamFactor was mentioned, I thought I'd also add that if this
card is used with the Laser in the expansion box, I believe that you can
increase the Laser's RAM beyond 1 MB. The Laser's built-in RAM card is 1
meg only, while Ramfactor can go beyond 1 meg.

I should also comment about "Autocopy 2." If you want to get really
fancy, Applied Engineering supplies a little utility with their RAM cards
called "Autocopy 2." It is an uncompiled basic program that you can go into
and edit to suit your needs. Basically, Autocopy 2 copies everything in the
directories you designate onto your RAM disk...automatically at bootup.

The advantage to Autocopy 2 over ProSel and Copy II+ is that it
occupies very little memory if you're trying to cram a lot of apps on a
single microfloppy. With Autocopy 2 installed on your microfloppy, you can
simply boot a disk. (It takes awhile for 500K + of applications to load to
RAM, so go get a cup of coffee.) When you come back, press "return," et
voila! No muss, no fuss; everything is the re in RAM.

You only have to know a little bit of basic, i.e. "load," "list,
"save," etc., and ProDOS file structure. The docs that come with Autocopy 2
tell you the rest to let you customize it for yourself. I believe that
there are also some basic programs in the Genie library that will do the
same thing.

I've always wondered why Apple didn't encourage programmers to use
these kinds of copy routines in their programs by manufacturing and selling
their machines off-the-shelf with more RAM than the basic 64k or 128k. A
stock Apple IIe or IIc with 512K or 1 MB would have been a nice product 6
or 8 years ago. It sure would have been interesting to see what kinds of
programs developers would have come up with for an Apple with that kind of
memory. It would have kept Apple IIs more competitive (sigh!).

Not being a programmer or engineer, I've never seen much difference
between "extended" RAM, "expanded" RAM or RAM disk. Heck, if you can call a
program's subroutine from memory instantly, what's the diff??
Good Luck, J-Bird (J.CURTIS8, CAT2, TOP2, MSG:59/M645;1)

The SoftSwitch.Init file does have a problem with
System 6.0. You can disable (or just remove) the
SoftSwitch.Init file, and as Luny mentioned, the only drawback is loss of
Modem to Modem >I am wondering if two people with ordinary BB type
software - TIC for me and the MS-DOS equivalent -
can communicate in this way.

My brother and I do this all the time, now, between his PS-2 and my
IIgs (ProCOMM to ProTERM). A secretary who does private work for me uses a
rickety old XT clone and an out-of-date term program to communicate with
my IIgs over the phone. She types up my dictated notes on her machine using
WordPerfect. Calls my computer and uploads her files. I can turn them into
AppleWorks WP files effortlessly using either ProTERM or Beagle's
Textloader.

>My understanding is that if the two computers and their modems are using
>Hayes protocols and text files, it doesn't really matter what operating
.languages they're using.

Amen! It is amazing to me how stupid a lot of IBM folks are when it
comes to connecting different systems over the phone. My brother once had a
PROFESSOR in a telecommunications class tell him that it was impossible for
IBM and Apple Systems to talk to one another. It simply couldn't be done,
period, even with Hayes-style modems and ASCII. IBM folks seem to like this
techno-myth. I think it is something like the caste social system in India
where one group is perceived as beneath another and therefore unworthy of
communication.

>Sounds like ProTERM is one of the programs which does at least VT100,
>and its scripts may allow integration. Can anyone confirm this?

Yep. But there are others, too. In my experience, if there are
problems in hooking into an IBM system, the problem usually lies with some
deficiency or limitation in the IBM system's equipment or software, rather
than the Apple. -J-Bird

RAMdisk Settings From your comments I take it that you have a ROM 01
like I do. One factor to remember when setting a
RAMdisk is NEVER set a different Max and Min size - never. It causes
problems - which is the reason the capability was removed in the ROM 03
machine. Remember PT3 claims all unused memory for itself - then if the
RAMdisk has to expand to receive more data, it seems to me that it might
well be "lockup-city".

I learned about the possibility of problems very early and never had
any reason to want to make the sizes different when I wanted a RAMdisk.

Try setting up your RAMdisk with EQUAL settings to see if these
lockups occur. -Dale

Formatting Dos 3.3 To make a bootable disk under DOS 3.3, you need
to format a 5.25 inch disk with the command INIT
HELLO. INIT formats the disk and puts an image of DOS 3.3 in the first 3
(or was it 2?) tracks. When you boot this disk it will look for an
AppleSoft startup program named HELLO and run it. HELLO was the traditional name—it could be anything. A BRUNnable binary file might also work as the HELLO program—I'm not sure of that, though.

Copy the game files from the DOSless disk to the bootable one, make sure the menu or startup program, if any, is named HELLO, and you should have a self-starting game disk. If you can't fit all the files on the bootable disk, you'll have to make two bootable disks and put some games on each.—Bill Dooley (A2.BILL, MSG:63)

Why Use SuperConvert? I imagine that some folks who've been using SHR.Convert for years have never bothered to purchased SuperConvert, so I'll give you one good reason to spend the $28 that mail order vendors are charging for SuperConvert.

In an online conversation with Jason Harper, I was commenting that it seemed to me as if SuperConvert can create a GIF graphic 10 times faster than SHR.Convert did. Jason Harper, the author of both programs, admitted that when he wrote SHR.Convert he hadn't implemented GIF file creation properly. He fixed it in SuperConvert.

I'm not the type to sit in front of my computer with a stop watch, so I don't know if that "10 times faster" is accurate. But, SuperConvert is a heckuva lot faster than SHR.Convert.

That's just one good reason to buy SuperConvert. But, by no means, is it the only reason! —Joe Kohn (J.KOHN], CAT3, TOP8, MSG:4/M645;1)

Want An Extra Phone? You may be able to hook up an extra phone in your computer room and not know it. Most phones are wired with 4 wires. R/G/Y/B. Red and Green are the main lines and yellow & Black are/or can be the second lines.

At my house this is how it is. I set up one line with the modem and the other for a telephone. I also went a step further and installed a toggle switch so I can switch between lines for the modem and have a two line phone in the room. This gives me the most versatility with a teenager in the house:)

If you only have one incoming line you can use a splitter and have the phone and modem on one line. I did that before I had two lines. ( _) Bob Cherry (R.CHERRY2, CAT10, TOP2, MSG:138/M645;1)

NoiseTracker And Amiga MODs are in a totally different format from SoundSmith songs. Beyond that, one really big difference between the types of files is that MODs can (and usually do) have instruments larger than 64K in them. This requires a special program such as NoiseTracker, MODZap, or soniqTracker to dynamically swap data in and out of the limited 64K of sound RAM in the IIGS. It's a lot like displaying a 3200 colour picture: the computer is so busy doing the work of presenting the data to you that it can't really do much else. This precludes anyone from effectively writing a CDA or NDA player for MODs, because you can't be running some other program while the MODs is playing. The MOD players that are out there _do_ have other things happening while the music is playing, but it's very limited. Only a few simple graphic displays that don't take up much processor power are possible. It can be compared to the way DreamGrafix is able to edit 3200 colour pics. -=

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 194 of 1824
Best Phone Call of my Tenure at Resource Central software for an old Apple. She had put it in a garage sale last weekend for $100 and it didn't sell. She was going to lower the price to try and sell it again but she wanted to locate some software to encourage buyers.

It was an Apple _I_.

I double-clutched and explained to her that it was probably worth somewhere between $6,000-$10,000 if she could find a collector who knew the real value (especially since I assume it was _working_ if she was looking for more programs). That seemed to make her perk up. :)

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your APPLE II, the GEnie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

"The JSR $FE1F method is the only Apple-documented way to detect that your program is running on a IIGS. I'd never seen the PEEK (65055) before. I do remember that Bill Basham "documented" another IIGS ID byte -- if PEEK (-1) = 192 then the machine is a IIGS. Be warned, though; that method may not work on future IIGS models! (Hoo hahahah, I crack myself up sometimes.)

The sign upon the cafe wall said, "Oysters: 50 cents" "How quaint," the blue eyed sweetheart said, with some bewilderment.

"I didn't know they served such fare out here upon the plain."

"Oh, sure," her cowboy date replied. "We're really quite urbane."
"I guess they're Chesapeake, or Blue Point, don't you think?"
"No m'am, they're mostly Hereford cross, and usually they're pink.
But I've been cold, so cold myself, that what you say could be
true.
And if a man looked close enough, their points could sure be
blue!"

She said, "I gather them myself out on the bay alone.
I pluck them from the murky depths and smash them with a stone."
The cowboy winced, imagining a calf with her underneath.
"Me, I use a pocket knife and yank 'em with my teeth."

"Oh my," she said. "You Animal! How crude and unrefined!
Your masculine assertiveness sends shivers up my spine!
But I prefer a butcher knife too dull to really cut;
I wedge it on either side and crack it like a nut.

"I pry them out. If they resist, sometimes I use the pliers.
Or even Grandpa's pruning shears, if that's what it requires!"
The hair stood on the cowboys neck; his stomach did a whirl-
He'd never heard such grisly talk, especially from a girl!

"I like them fresh," the sweetheart said, and laid her menu down.
Then ordered oysters for them both when the waiter came around.
The cowboy smiled gamely, though her words stuck in his craw.
But he finally fainted dead away when she said, "I'll have mine
raw."

[*][*][*]

I just had to put this here - after all the talk about
"unmentionables" - I have to confess, that it took me a few minutes to
realize the kind of "oysters" that were on the menu!
(COOKIE.LADY, CAT2, TOP14, MSG:293/M1150)

Apple II And You
"""""""""""""""""""""""""""
By Darrel Raines
[D.RAINES]

>>> THE FUTURE OF APPLE II SOFTWARE <<<
""""""""""""""""""""""""""

The text before you represents the first column of a new GENieLamp
series on programming for the Apple II computer. However, this column will
not be like any other that you have seen that went by a similar title.
More on that subject later. I should introduce myself first. My name is Darrel Raines. I am also the author of the Computer Games article that appears elsewhere in this issue. You may want to refer to that column for a brief biography. For the purpose of a brief statement, I would say that I have many varied computer interests. One of those long term interests has been programming on the Apple II.

The next order of business will be to explain why I was interested in starting a regular series on Apple II programming. I have seen more columns about programming a personal computer than I can count. Most of them started with a bang and then faded away before too long. That brings me back to why this series of articles will be different than any you have ever seen before. I want to cover a broad set of topics that will interest not only the hardcore programmer and the novice programmer, but also the person who has never diddled a bit before in their life. That means that we will cover more than just how to program. We will also cover topics like how to select and use the software that you need.

If you have owned an Apple II computer for more than one year, you cannot have failed to notice the diminishing support for the computer from Apple Corp. I have been noticing it for about four and one half years now. My first reaction was one of anger and frustration. "How can Apple Corp. take my money spent on Apple II equipment and use it to shove Mac's down the throat of corporate America?" It has gotten worse over the last few years. After a while, my anger gave way to reason and I have been a happy camper for the past few years. As long as my computer does what I want it to do, I will remain content and enjoy what it CAN do. This seems to be much more productive than sitting around hating Apple for abandoning the II line.

One of the reasons to stay happy is the introduction of some new software products during the last few months: two of note are Apple System Software 6.0 and Pointless (by WestCode). Granted, Apple Computer will not be doing any more software updates for the II line. That just makes this last gasp effort at product support that much sweeter. Seven Hills has a few new releases and Q-labs has some new updates and products. All of these sources are nice, but they do not represent the future of Apple software. And THAT subject is the one I want to focus on for this first article.

"Where", you may ask, "do you expect future Apple II software to come from if it is not from these companies? Do you expect it to grow on trees?" I have been accused of being a raving optimist, but I am not quite so bad as to expect software to magically appear. The question still remains: what company will be the source of most future Apple II software? The answer lies at the other end of your modem. Have you played Solitaire, Euchre, or Gin Rummy with your computer lately? Have you ever printed a text file in multiple columns on your wide carriage printer? Have you sampled the power of a relational database with a sophisticated report generator? If you have done any of these activities or thousands more just like them, then you know where to look for future software. Shareware and Freeware are the future of Apple II software.

I need to be absolutely clear here. I do expect to continue seeing some commercial software appear during the next few years. I applaud the efforts of the remaining Apple software companies and will try to support them through the purchase of their products. However, these developers cannot hope to provide the Apple II users with the variety of software that
we have become accustomed to over the last few years. Too many of the
various software manufacturers have moved over to Mac and IBM products.
Beyond this fact, I believe that Apple II users will need more and
different applications than can be produced by what is left of the
supporting software industry. On the other hand, I have seen more powerful
shareware programs over the last two years for the Apple II computer than I
ever thought possible. The part-time and leisure-time programmers have put
together some very nice products.

One of the reasons that I believe Shareware to be our future is the
continually decreasing use of the Apple II computer in school systems. The
majority of software purchasers will soon be the home computer owner. The
home computer owner does not traditionally buy as much software as the
school or business user. Again, this points to a reduced commercial market
and an increased informal distribution system. Most home computer users
are not too excited about spending a lot of money on a product that they
have not seen in action. Shareware offers them an opportunity to try
before they buy.

Of course, the good news about this situation is that GEnie users are
in a prime position to receive new software straight from the producers.
You are already aware of the fantastic benefits available to you by simply
logging into the Apple II Library and browsing through the latest uploads
for your computer. Any of these potential gems may be yours for the price
of a download. Over 19,000 separate files have been placed in the Apple II
Library area. Most of these files are still available and offer a rich
variety of software for you to choose from.

If my analysis about software production is correct, the users of
Apple II software have an unprecedented chance to shape their future
computer use. Most of the Shareware authors that I know have a common
problem: what program do I write next? You might be surprised by how many
programmers are willing and able to write good software, but do not have a
specific goal in mind for a project. This situation lends itself well to a
productive cross-fertilization between software users and authors. I
propose that this problem can be alleviated with some simple communication
between the two groups. Like most problems, once it is understood the
solution can be achieved without too much trouble.

In my next article, I will address the issue of how to get these
groups together. We will discuss a number of different ways to develop
synergy between them. If I am correct about the future of Apple II
software, then it is in everyone’s best interest to keep the Shareware
authors busy producing software that we want to see and buy. In future
articles I will discuss how programmers can use the resources available in
the A2Pro area to develop software that people want to buy. Until we get
together again, why don’t you sit down and register your favorite piece of
Shareware. You may just help insure your computing future.

[PRO]///////////////////////////////////////// A2 PRO ROUNDTABLE /
>>> WHAT'S GOING ON IN A2PRO? <<<

A2Pro Survey We need to know more about what you want from A2Pro, so
PLEASE take a minute to complete the A2Pro Survey. It's
item 7 on the A2Pro menu, and the results will help us serve you better.
Thanks!

The June 1992 Apple II Technical Notes in text files are here! Loaded
with new file formats, 6.0 programming information and tons more useful
stuff you as an Apple II developer need to know -- sparse files,
documentation errors, resource formats, dealing with interrupts and more.
File #2373 contains all the new Notes -- file #2759 contains just the
Technical Notes and file #2762 contains just the File Type Notes. Download
them and learn all kinds of things!

Win FREE printed Apple II Technical Notes just for showing up to the
A2Pro weekly Monday Night conference. Also, program a great Finder
Extension and win a FREE WEEKEND in A2 and A2Pro. See category 1, topic 16
in the bulletin board for details.

Got some time and want to beta-test ShrinkIt for the Apple IIgs? Read
category 16, topic 14, message 2 and you might find yourself on the
ShrinkIt Beta-Testers Honor Roll!

What do you want to learn? A2 University wants your input on courses
for the summer and fall. See category 1, topic 14 for the ideas so far and
tell us what you'd like to know.

Procyon, Inc., makers of the GNO multitasking environment (GNO/ME) now
have their own category and library here in A2Pro where they answer your
questions about programming under GNO and give you the latest GNO goodies.
Check out category and library #30 for more details.

Coming soon: Company Support, KansasFest technical summaries, New A2U
categories and topics, and more.

>>> ROUNDTABLE OUT-TAKES <<<

Who Uses A2Pro? You'll get a serious argument if you contend most of
the people who _use_ A2Pro are experts. A lot of the
people who _post_ are, and one of our goals is to make sure everyone
realizes that no one got to be an expert overnight.

Lots of the people you see as "experts" learned a lot of what they
know in this very roundtable.

We just have to make sure everyone realizes there's plenty of room for
_them._ --Matt (speaking for myself, not for Apple)
(M.DEATHERAGE, CAT1, TOP14, MSG:24/M530;1)

5.25 Drive Bug Yeesh. We've been through this in detail on CompuServe,
and I'll try to summarize (and I'll leave out all the
part about the guy who was nearly ready to file a lawsuit against Apple for obsoleting his disk drives):

The new 5.25" driver tries to be clever and notice when there are actually drives connected to your 5.25" interface by turning on the motor and looking for noise on the bus. Theoretically, no drive is so quiet that it won't return noise, so the driver can only build DIBs for drives that are actually there and not give you more devices than you have drives.

In reality, there are _lots_ of drives out there this quiet, and so the new 5.25" driver doesn't think you have any drive connected at all. The two ways to get around the problem are to 1) use the 5.0.4 driver, or 2) always keep a formatted disk in the drives when booting or restarting GS/OS.

Engineering now accepts this as a bug and they intend to fix it.

(M.DEATHERAGE, CAT8, TOP5, MSG:47/M530;1)

Modula-2 Revisited  Modula-2 has been available for the Apple II series since 1984, in the form of Volition Systems' Modula-2 (later, Pecan Power System Modula-2). It features a syntax very much like Pascal's, special language elements that make low-level programming easier without sacrificing readability, maintainability or (in many cases) strong-type checking. Mostly, however, Modula-2 is centered around the concept of the module, a collection of procedures and data structures that are known to clients by a separately compilable definition section, and realized in an implementation section. Modules permit better organization of code, the implementation of opaque, abstract data types, and many more advantages that are often claimed for object-oriented languages, although Modula-2 is not itself an "object-oriented" language. Oberon, designed to succeed Modula-2, is a "minimalist" notation that retains Modula-2's module mechanism, and also adds an inheritance mechanism that can function across modules. It is much closer to a classical "object oriented" design than Modula-2, but to draw closer to "true OOP," Oberon had to eliminate many features that were deemed "superfluous" in a minimalist design, such as enumerations, subranges, direct support for coroutines and multiprocessing, and other aspects.

Modula-2 that many Pascal and Modula-2 fans liked. Oberon is still quite young, as languages go, and it will certainly be several years before a generally acceptable dialect -- perhaps reintegrating old M2 features that are now absent, while keeping Modules and cross-module inheritance -- is defined. Modula-2 is the more mature language, for which an ISO standards effort is now underway and many implementations are available, depending on your computer platform. For example, minicomputers and mainframes support Modula-3, a new language based on M2, and designed to support OOP. Macs have versions of Modula-2 that include special extensions for OOP. I believe the same is true for IBMs; there are several implementations for the IBM world, in any case. Modula-2 is available for Commodore Amiga and Atari 68000 machines, as well. Sadly, only the original (and now unsupported) Volition and Pecan M2 implementations work on the Apple II. This situation may change in the near future, however, at least for Apple IIGS owners. Stay tuned for more details. In the meantime, I hope to discuss M2 and Oberon with other Apple II programmers, especially those who used the earlier systems or those who have questions about those languages. Regards; Jim Merritt

(JIM.MERRITT, CAT14, TOP4, MSG:1)
Want C? Get ORCA  Marc - let me make this REAL SIMPLE.  I'm the Product
Manager at Apple for all Apple II Developer Tools, so
APW C falls under my responsibility.  If you want to learn C on a IIGS,
get ORCA/C! It's an ANSI C compiler (i.e.: supports function prototypes
for stronger type checking) and has some other capabilities that APW C
doesn't have and won't have in the future.  APW C is only a "K&R" C
compiler, so you don't get the stronger type checking and you're lacking a
few other things that you'll find in ORCA/C (for example, ORCA/C supports a
desktop environment for code development and debugging - APW C's interface
is closer to what you find under MS-DOS, ugh).  -Tim S.
(my opinions are my own)

(TIM.SWIHART, CAT4, TOP2, MSG:90/M530;1)

Don't Make System Tools  If memory serves, these tools are "system" tools,
and third-parties writing system tools is
strictly against Apple's compatibility guidelines.  There are user tools
for that purpose.  However, you can't use _LoadOneTool or _LoadTools on
user tools, so some people get lazy and write system tools.

(This is the bad side to having a toolbox that does so much for you
-- some programmers have no problems making things difficult for the users
or in breaking compatibility guidelines if it saves them four lines of
code, which is exactly the wrong attitude for programmers to have.)

Anyway, StartUpTools has to know the startup _parameters_ to each
tool, so it only knows about the legitimate, Apple-provided system tools.
--Matt (speaking for myself, not for Apple)

(M.DEATHERAGE, CAT16, TOP17, MSG:12/M530;1)

Contest Extended  In our A2Pro Finder Extension Contest, we neglected one
little point.  Until now, Finder Extension and 6.0
programming documentation hasn't been available except through ERSs, only
on the 6.0 GM CD.

Now that "Programmer's Reference for 6.0" is released, and _everyone_
can (and should!) get it, Finder Extensions are within the reach of every
programmer.

Therefore, to try to get it right the second time, we've extended the
deadline for the A2Pro Finder Extension Contest to _September 1st_.

You now have an extra month to read the documentation and crank out
the world's greatest Finder Extra, and win a free weekend in A2/A2Pro for
the effort.
--Matt (I speak for A2Pro, not for Apple)  --------

(M.DEATHERAGE, CAT1, TOP16, MSG:22/M530;1)

Byte Works,  A Force in A2Pro  Apple II Programmers have a great friend
at A2Pro in Mike Westerfield.  Mike is the
driving force behind the Byte Works, a software company specializing in
programming and development aides.  You can catch Mike in A2Pro answering
questions and offering his views several times a week.  One current
discussion which has been raging is what should a Pascal compiler be
capable of in conjunction with the

Toolbox.  If you are a regular visitor you know Mike has strong views
on the matter.  No matter where you fall on the issues, Mike Westerfield
certainly makes A2Pro a more exciting place.
The Byte Works recently released The Programmer's Reference for System 6.0. This book is the latest in the series of Apple IIGS reference books which include the Apple IIGS Toolbox Reference Volumes 1-3 and the Apple IIGS GS/OS Reference. Programmer's Reference for System 6.0 covers all of the changes, enhancements and additions to the Apple IIGS operating system since these books were published for System 5.0.

This complete technical reference to System 6.0 includes:

* New tool calls and tool updates
* Documentation for these new tools: MIDI Synth, Media Control Tool Set, and Video Overlay Tool Set
* Finder documentation
* GS/OS Update
* Information about the new FSTs
* Sound Control Panel documentation
* A complete toolbox concordance listing every page a tool is documented over all 4 volumes of the toolbox reference manuals.

The Toolbox Concordance The toolbox documentation stretches across four volumes, now. Between the original documentation, error corrections, clarifications, and new features, some of the tool calls are actually documented in as many as three different books!

The Toolbox Concordance lists all of the places you need to look to find information about a tool call. Every tool call in the entire suite of books is listed. You also get a comprehensive list of all of the error codes used throughout the Apple IIGS operating system, from the tools to GS/OS errors to the System errors.

Includes All the Toolbox Updates System 6.0 came with a lot of new features, including the new rectangle and thermometer controls, animated cursors, named resources, new dialog tools that handle all of the controls and the new Media Control Tool Set, Video Overlay Tool Set and MIDI Synth Tool Set. Programmer's Reference for System 6.0 tells you how to use these new features in your own programs.

Changes to GS/OS Programmer's Reference for System 6.0 is your best source for changes to GS/OS. You'll learn about the new GS/OS calls, changes to the existing calls, and the errors in the original documentation. You will get an update to Apple IIGS GS/OS Reference, which was written for System 5.0. You'll discover the latest on the new FSTs (AppleShare FST, HFS FST, DOS 3.3 FST, and the Pascal FST), the new Initialization Manager, and more.

Finder 6.0 Our documentation of the 6.0 Finder really includes two different kinds of information. First, it tells you how to use the Finder. It describes all of the cool new features for Finder 6.0, but it assumes you are a reasonably computer literate person, and don't need to be told which end of the disk to stick in the drive. You also get all of the technical details you need to make your programs work smoothly with Finder 6.0, including information about the new rBundle and rVersion resources, how to write Finder extensions, and how the Finder communicates with other programs.

New Resource Types There are a lot of new resources, and the Programmer's Reference for System 6.0 tells you all
Apple II Computer Info

about them. You also get information about the changes to the system resource file, so you know about the new resources you can use from your own programs.

While there are several new resource types, the major ones are the rBundle, rComment, rVersion and rFinderPath resources. You need to use these resources in all new programs, since they tell the Finder what kinds of data files your program can handle, what icons to use, what version number to display, and what to tell the user about your programs and data files.

Technical Appendices  Several other appendices fill in the details. You will learn about the new uses for the Battery RAM, get an update on how to write your own tools, and get a complete listing of the standard font characters for both the Apple IIGS and Macintosh computers.

What You Get  Programmer's Reference for System 6.0 comes in a 3-ring binder to make it easy to use. Because of the format, you can add your own notes, and we will be able to mail update chapters if the need arises. The binder includes attractive inserts, so you can quickly find the book on your shelf.

The documentation itself is a whopping 478 pages of detailed technical information, following the same style as the toolbox reference manuals. This is final documentation, not beta documentation. A comprehensive table of contents makes it easy to find the information you need, and the extensive index and concordance help cross-reference information by topic.

Note from the Boss  By the way, folks: "Programmer's Reference for System 6.0" is _THE_ official reference for programmers using features beyond those in 5.0.2. It supersedes the ERSs and all documentation in interim form before it.

If you're programming with 6.0 and want to release anything, you _need_ this book just as soon as you can get it. It's as vital a reference as the Toolbox and GS/OS manuals and you should _not_ be without it.

--Matt

(M.DEATHERAGE, CAT1, TOP4, MSG:10/M530;1)

>>>>>  Another recent release, which this author eagerly awaits Snail Mail delivery of, is the Toolbox Programming in Pascal set. The course is designed to guide programmers through the ins and outs of the GS toolbox using the ORCA/Pascal development environment.

The course has been broken down into 18 lessons covering all aspects of designing and writing toolbox programs:

Lesson 0 - Before We Start
Lesson 1 - Current Events
Lesson 2 - What's on the Menu?
Lesson 3 - Be Resourceful
Lesson 4 - Keep Alert!
Lesson 5 - Why, Yes. We Do Windows!
Lesson 6 - File I/O
Lesson 7 - Move Over Gutenberg
Lesson 8 - Thanks for the Memory
Lesson 9 - Drawing on the Front Side of the Screen
Geared toward intermediate and advanced programmers, "Toolbox Programming in Pascal" uses a hands on teaching approach. Along the way, the programmer will write dozens of working desktop programs, including a slide show program that views, prints (in color), and loads and saves screen dump pictures; a small text editor; a scrapbook; a music instrument sampler; and much more.

"Toolbox Programming in Pascal" comes with the largest library of Pascal toolbox source code ever assembled. Four disks filled with source code are included in the package. This includes the source code to all of the examples in the book, and working solutions to every problem. The disks also include a copy of Apple's Rez resource compiler and sample data files for programs developed in the course.

"Toolbox Programming in Pascal" also includes an abridged toolbox reference manual. This manual is so comprehensive that no other reference materials are needed for this course.

The course fully supports Apple's latest operating system, 6.0. It uses new 6.0 features throughout the course to create up to date programs.

System Requirements

Software:
  - ORCA/Pascal 1.4
  - Apple's System Disk 6.0

Hardware:
  (for programming in Pascal's text environment)
  - 1.25M of memory
  - 1 800K floppy disk drive
  - one other disk drive of any kind
  (for programming in Pascal's desktop environment)
  - 1.75M of memory
  - hard drive

Byte Works products tend to be designed conservatively, paying strict attention to industry standards and protocol. This makes it easier for programmers to use their knowledge of other systems to program the Apple II line.

If you have even thought about becoming a programmer, check out Mike
SEARCH-ME! Welcome to Search-ME, our new monthly puzzle program. Each month we will have a different theme. This month the Search-ME! puzzle contains 20 keywords taken from the Computing RoundTables here on GEnie.

GIVE UP? You will find the answers in the LOG OFF column at the end of the magazine.

This column was created with a program called SEARCH ME, by Atari ST programmer, David Becker.

/* Good news Dorothy!! I have in front of me Webster's Ninth New Collegiate Dictionary (copyright 1983) and in it, on page 653, it says "judg-ment OR judge-ment" so you can go back to making the same mistake with the rest of us peons. :-} */

[EOA]!!!@

WHO'S WHO

>>> CHATTING WITH MATT DEATHERAGE <<<

RENE LAMP: Can you tell us a little about how you first became interested in the Apple II?

ALAN BIRD: My introduction to the Apple II came from Mark Simonsen who is now the owner of Beagle Bros. He and I became acquainted while seniors at Brigham Young University and then went on to work for GTE Network Systems in Phoenix, AZ. The first time I had ever used an Apple was when Mark went on vacation for two weeks and asked me to baby-sit his Apple II Plus. I really had a lot of fun with it.

RENE LAMP: Can you recall any anecdotes from your first forays into computer programming? When did you first realize that you'd like to make a career out of programming computers?

ALAN BIRD: At BYU I had a hard time declaring a major but was leaning toward accounting. One of the required accounting courses was an introductory computer programming class. We were programming in FORTRAN on IBM 360's using punch cards. We would type in one statement per card on a huge punch-card machine, take our stack of cards to a card reader where we normally had to stand in line for our turn, submit the job and wait for a printout. Then it was back to the punch-card machine to fix bugs. My back pack was always full of stacks of cards held together by rubber bands. It's hard to believe it now, but I actually enjoyed this much more than I did my accounting classes.

RENE LAMP: Please describe your educational background and how you came to work at Beagle Bros. Was Bert Kersey still there when you joined the company?

ALAN BIRD: I finally declared Computer Science as my major when I was a junior and finished the entire program in two years. Several times I took a course and its prerequisites simultaneously in order to finish quickly.
After graduation, I went to work for GTE in Phoenix designing telephone switching systems. It was there that I got to know Mark Simonsen quite well. Mark wrote a program called Flex Text which he sent to Beagle Bros. Bert Kersey was the owner of Beagle Bros and he decided to sell it and soon after invited Mark to come to San Diego to take over tech support so Bert could get off the phone. After Mark wrote "Double Take" he was making enough off his royalties that he wanted to get off the phone, so he asked me to come take his place. I jumped at the opportunity.

Bert was still running Beagle Bros out of his house. I worked at home in our apartment where Beagle Bros would forward the calls. The business got to the point where they couldn't fit it into their house anymore, so when they got an office, I actually commuted to work.

After about two years, I was fired from Beagle Bros by Bert's wife over a policy dispute. By this time, however, I was making enough off the royalties from my programs that I didn't need the job anymore. It was actually a great opportunity because Mark Simonsen and I decided to start our own company which we called Software Touch. We did surprisingly well with that company and after about two years, Mark became interested in buying Beagle Bros. I had become a little frustrated at Software Touch because I would go months at a time without programming because we had to spend so much time running the business. This was another great opportunity, so I went home to program and have been doing that ever since.

GEnieLamp  Over the years you've independently created or contributed to some Apple II classics: the Beagle Compiler, Program Writer, the TimeOut kernel, AppleWorks 3.0, InWords, and Pointless. Which of these do you consider your most inspired work? Which required the most creative programming work?

Alan Bird  Most inspired: TimeOut. Most creative programming: Beagle Compiler. Most difficult to develop: InWords (by far). Most successful: QuickSpell. Program I wrote that I use the most: Program Writer. Program I wish I didn't have to claim writing: Fatcat.

GEnieLamp  Who do you consider your mentors? What about them do you admire most?

Alan Bird  I would have to say first and foremost, Bert Kersey. He was a lot of inspiration and helped me get started. Without him, I never would have been able to do this work which I love so much. Others that I have greatly admired are Steve Wozniak (for obvious reasons) and Bob Lissner (author of AppleWorks). AppleWorks is the best-designed, best-written program I have ever seen.

GEnieLamp  What are some of your favorite books? Favorite authors?

Alan Bird  Unfortunately, most of what I read is technical manuals and computer magazines. My wife, however, is an avid reader and is very much into Agatha Christie and Star Trek, The Next Generation books. I have greatly enjoyed some of her Star Trek books.

GEnieLamp  Are there any Apple II programming utilities you use on a daily basis?
Alan Bird  I have always used the Merlin assembler. For AppleWorks 3.0 and
Pointless I used the MPW cross assembler (on the Macintosh). I
use GSBug for debugging and have recently been using Nifty List quite a
bit. For the occasional BASIC programming I need to do, I use Program
Writer.

GENieLamp  Jean-Louis Gassee, former Apple executive, once remarked that:
"Programming in BASIC is dangerous to the mind." Granting
that this statement involves poetic exaggeration, how much underlying
validity do you think there is in the statement?

Alan Bird  BASIC has weaknesses when compared to more modern structured
languages, but I wouldn't agree with his statement at all.
BASIC is easy to learn and is great for turning out quick-and-dirty
solutions when you don't have a lot of time. It is not good, however, for
writing large applications. It's biggest strength is that it is interpreted
instead of compiled so that changes to the program are instantaneous and
you can run the program immediately after making a change.

AppleSoft BASIC's biggest weaknesses are variable names significant to
only 2 characters and no ELSE statement.

GENieLamp  Where do you see personal computers going in the next five
years? Ten years?

Alan Bird  The biggest change will be portability. Hand-held computers
will go with us where calculators now go.

GENieLamp  What accomplishments are you most proud of?

Alan Bird  I would have to say TimeOut. It gave me and several other
programmers the opportunity to let AppleWorks do almost
anything. I don't think I've seen any other program with so many add-ons as
AppleWorks has had.

TimeOut started out as a tool I was writing to make it more convenient
to use Mark Simonsen's FontWorks program. His program allowed you to print
AppleWorks documents in various fonts. The biggest complaint we received
from customers was that it was inconvenient to save the files, quit
AppleWorks, run FontWorks, print the files, and then restart AppleWorks.
From my work with AutoWorks, I knew the insides of AppleWorks quite well
and was looking for a way of temporarily interrupting AppleWorks so we
could run FontWorks (that is sort of where TimeOut got its name). What I
stumbled into was a way of seamlessly adding virtually any utility into
AppleWorks.

GENieLamp  After working at Beagle Bros for several years, you co-founded
WestCode in 1990. What lead you to decide to start this
publishing company?

Alan Bird  Actually, WestCode was started by Rob Renstrom and John
Oberrick--two good friends from Beagle Bros. Since Mark and I
dissolved Software Touch, I have always been self-employed and worked as an
independent.

GENieLamp  Can you tell us a little about the types of things you like to
do for fun? (Speaking of "non-computer" fun, here.)
Alan Bird  I enjoy running (I run 10K races during the summer), gardening, going to the San Diego Zoo and Sea World with my family, reading to our children, skiing, water-skiing, motorcycles, etc.

GEnieLamp  You've succeeded so well as a software developer, Alan, do you have any aspirations to move on to hardware design? Do think microcomputer hardware can still be designed by a solitary designer these days?

Alan Bird  No. Software is much more fun.

GEnieLamp  As a person who has produced a great deal of creative output, can you share with us any thoughts you might have on the nature of human creativity? Any insights on ways to nourish the creative spark?

Alan Bird  I think one of the most valuable parts of my career is the years I spend on the telephone as technical support at Beagle Bros and Software Touch. It gave me the opportunity to talk to customers to see what they were doing with their computers and to listen to their complaints about ours and other company's software.

The two most important things about software development are: 1) choosing a program that has a market--a program that people have a need or desire for--and, 2) to write it so that it is easy and convenient to use. Both of these require that you look at things from the customer's perspective. Creativity for me means putting myself in my customer's shoes and imagining what they would want.

For some reason, many of my creative thoughts come while I am taking a shower. Too bad I can't shower all day.

News & Views

DO'N THE SHOW!  The first shuttle busses have transported the Kfesters to the college and I (the shuttle busser) have a few minutes to fill you in on my impressions. This KFest is better attended than last years, and the new people here are very interesting. In one BearMobile shuttle there was a contingent from down under and a lovely Southern Belle. The weather here is beautiful, a little on the cool side, and the OZians are very hospitable.  -Bear

(A2.BEAR, CAT44, TOP7, MSG:5/M645;1)
Apple Publicly Announces MS-DOS FST For Apple IIGS

A2 CENTRAL SUMMER CONFERENCE 1992 ("KANSASFEST"), KANSAS CITY, MO., U.S.A., 1992 JUL 23 (A2 ON GENIE) -- Apple publicly announced today that they are working on an MS-DOS File System Translator (FST) for the Apple IIGS. Currently the FST is read-only, and writing ability is being worked on. It is not expected that the writing ability will be ready in time for its initial release. The MS-DOS FST is expected to ship with Apple IIGS System Software version 6.0.1.

Apple IIGS System Software 6.0.1 is a maintenance release made necessary by the Apple II Ethernet Card. When the Apple II Ethernet Card ships, expected by the end of the year, System 6.0.1 will be made available. Besides bug fixes to System 6.0, the only other major change announced in System 6.0.1 is the addition of keyboard navigation to the Apple IIGS Finder.

The MS-DOS FST will work on any MS-DOS volume that can be accessed by the Apple IIGS. Currently, the access of MS-DOS 3.5" disks is limited to 720K and 1.44M MS-DOS 3.5" disks read via an Apple SuperDrive or equivalent, connected to the Apple II SuperDrive Card (formerly known as the Apple II 3.5 Drive Card). Other known methods to access MS-DOS data on an Apple IIGS include MS-DOS formatted Syquest cartridges and MS-DOS 5.25" floppy disks read via an Applied Engineering Transdrive, connected to an Applied Engineering PC Transporter card.

(Lunatic E'Sex, reporting for A2, the Apple II Roundtable on GENie)

\[
\text{You read it here first! More information will be forthcoming, live from KansasFest 1992!}
\]

|= Lunatic (:)

(LUNATIC, CAT44, TOP1, MSG:2/M645;1)

This morning at 9:05 Kansas time, Resource Central Founding father, Uncle-Dos, otherwise known as Tom Weishaar, opened the Conference with a brief talk on the 15 years of the Apple II computer. Tom followed his talk with a surprise video of a telephone conversation with Steve Wozniak, taking Steve on a 30-year trip down memory lane, including discussions of 15 years of Pre-Apple II History. Steve praised many early contributors of the Apple II line. Mike Markula, Del Yocam, Mike Scott, Chris Espinosa, Randy Wigginton, and Rod Holt were all praised by Steve. The 150 Conference Attendees were suitably impressed by the video, and really enjoyed it (despite the large numbers of hangovers in evidence from the impromptu arrival parties which took place in the dorm rooms of Avila College last night).

The NOMDA Conference Center has provided excellent facilities for the Conference, including an outstanding menu for lunches this year. Many participants enthusiastically commented on the menu.

Following the break from Tom's opening and video, Tim Swihart - Manager of the Apple II Continuing Engineering Team - gave a talk on the status of the Apple II. Included was a review of the past year since the announcements made at last year's KansasFest. Three of the four product
announcements were actually brought to fruition, including Apple IIgs System Software v6.0, the Apple Superdrive Controller Card, and Hypercard IIgs.

Tim brought a few figures from Apple USA showing that there are nearly 1 million Apple IIgs' in circulation. Of these, nearly 2/3s are Rom 01s, and about 3/4s are in Education environments. Very few have been accounted as "Retired". Tim gave these figures to explain Apple's current direction with regard to the Apple II. The company has decided to reduce the level of staffing allocated to Apple II development and support. There are currently approximately a half dozen people with _some_ support staff assigned to the "Apple II Continuing Engineering Team", managed by Tim. Apple has decided to place its efforts to maintaining and supporting the established User Base, as listed above.

With this in mind, APDA products have been turned over to Resource Central for distribution. What this means, is that the Apple II products from APDA will receive more attention from the distributor, and because Resource Central is already set up for it, there will continue to be WorldWide availability. Some products have been dropped from the line, such as APW-C. The Byteworks' ORCA/C is better maintained and supported, more bug-free, and it is felt that in the best interests of the developers and users, it was better to discontinue the products.

Developers were informed that other decisions have been made which affect them in a hopefully more positive light, such as the granting of permission to the Byteworks to publish the Official System 6.0 Reference manual.

It was stressed that proper development under 6.0 _required_ this reference. It is less time consuming and expensive to do this, than for Apple to continue publishing documents such as this, itself. Additionally, extensive effort has been put into updating the Technical Notes. Steve Gunn was praised by Matt Deatherage of Apple's Developer Technical Support for taking on the thankless job of converting the Tech Notes into ASCII Text files for uploading to the major Online Services.

The Apple II activity level at Apple, as previously reported, has been reduced, but it is certainly a non-zero level. The products fall under a "Continuing Engineering" group, which handles all post-release product issues. This includes handling bug reports, manufacturing difficulties, distribution difficulties, etc. The Apple II C.E. group, as time allows, plan _some_ new work.

This has been identified to include System Software enhancements, but nothing at all in the way of a Major (i.e. System 7.0) update. What is planned, are some new features, improved compatibility with 3rd party products, some enhancements for both the 8-bit and 16-bit platforms.

Tim proceeded to provide a few "Sneak Peeks" at the future, including the one previously announced, but not-yet-released product - the Ethernet Card (announced at last year's KFest, but not mentioned since). The original design was discarded and the project was re-started. This, of course, wreaked havoc with the original schedule. As of this morning, the project was nearing Beta Testing, and plans are to begin Seeding this week (during late Alpha phase). Apple hopes to begin shipping a finished product by the end of this year.
The card uses Friendlynet connectors. There is an expected significant speedup on crowded, multiple-machine systems. There is not expected to be that significant a speedup noticed on smaller, isolated workstations. The Ethernet card will require an Enhanced Apple IIe, or an Apple IIgs. On the IIgs, System Software v6.0.1 !!!! will be required.

Apple IIgs System v6.0.1 is planned for release with the Ethernet Card. Support for the Ethernet Card is the Number 1 Priority. It will contain new drivers, updates to some Control Panels, and it is expected that there will be a few Low-Level changes, including bug fixes for compatibility problems. The focus of the release will be user-oriented, not developer-oriented (i.e. no new Toolsets).

Apple is currently investigating an MS-DOS FST. It is currently a read-only FST, but it is hoped that upon completion, it will be a read/write FST. It hasn't been fully tested yet, and may very well be deferred beyond v6.0.1 rather than hold up release for supporting the Ethernet Card.

Keyboard Navigation is being added to the Finder. What this means is you will be able to highlight a file in a window in the Finder by pressing a letter on your keyboard, as you are currently able to do inside applications when opening a file. A more in-depth peek at System Software updates will be forthcoming during the Apple Team's System 6.0 session on Friday morning.

Following Tim's presentation was a lengthy Question and Answer period. One question was about which drives do the MS-DOS FST work with? The answer, provided by Apple's Greg Branche, was "Any way you get it into the computer, the FST will recognize it". However, it should be noted that a Disk II, or Apple 5.25 drive _cannot_ physically read an MS-DOS formatted disk. The Apple drives are only capable of reading the GCR encoding for the Low Level Format. MS-DOS disks are formatted with MFM encoding. Any MS-DOS formatted 3.5 disk can be read in a 3.5 High Density drive hooked up to an Apple SuperDrive Controller Card. If you have an MS-DOS formatted Syquest Cartridge and a Syquest mechanism in your SCSI bus, the MS-DOS FST will be able to read it. An MS-DOS 5.25 disk can be read from a 5.25 drive hooked up to an Applied Engineering PCTransporter card, if the driver for it is installed.

Another question was whether the Superdrive Card supports 5.25 drives. The answer was categorically NO. Any Apple brand 3.5 drive, such as the Unidisk, 3.5 drive, or High Density 3.5 drive are supported. It was reported by a Conference Attendee that Applied Engineering's High Density drive works with the Superdrive Card.

A participant asked for more information about the Ethernet Card. Tim explained that, because it does not support TCP/IP, a networking protocol, the engineers wanted to call the card the EtherTALK card. It was decided that, to avoid Customer Confusion, it would remain the Ethernet Card. Apple hopes to support TCP/IP in the future, perhaps with a ROM revision.

There was much discussion, some of it with kind of vague direction, looking for clues about the future of the Apple II. Tim was not able to satisfactorily answer all of the concerns. Decisions concerning these questions are made at levels above Tim's area of responsibility. To be fair, Tim did the best he could. Unfortunately, many people appeared disappointed by his answers.
KansasFest is off and Running! More information will be forthcoming as it becomes available! -Donald A. Grimes
(DON.GRIMES, CAT44, TOP1, MSG:3/M645;1)

I have a pair of Roger Wagner Tie Reports:
""""""""Today, at NOMDA, Roger was wearing a mootiful Cow tie....Udderly ridiculous! This evening, during the Creative Black Tie Dinner, Roger managed to win 1st prize with his "SlideShow" tie. It was basically a tie made from some Film strip.

Donnie (The Enforcer) Grimes
(DON.GRIMES, Category 44, Topic 5, Message 25, M645;1)

Last night, while wandering around, I happened upon Lunar Productions. I managed to get a sneak preview of the long-awaited Foundation. It appears at first glance to be a well thought out application....Light-years beyond Genysis. It was, at the time, working over a netwoeve 4) files open at the same time. It seems that it is easily expandable, and will be a HOT item RSN. ~Donnie
(DON.GRIMES, CAT44, TOP9, MSG:1/M645;1)

I've been somewhat regretting trying to build excitement about our coverage of this year's KansasFest. Why? Well, I'm being quite honest when I say that there hasn't been a lot in the way of "newsworthy" items.

The first two days of the event were devoted to Apple IIgs "colleges," which were devoted to various aspects of Apple II programming. Unfortunately there's not a whole lot to say about them. People learned about programming with things like C and HyperStudio. Those who attended the colleges that we asked about them said that they enjoyed them and learned about how to program these environments, but otherwise not much can be said except that people had fun, learned things, and enjoyed meeting other Apple II users from across the country.

It's been a great deal of fun renewing old acquaintances and meeting new faces. One of the neatest things about KansasFest is meeting people from across the country, especially meeting people I've seen many times here on GEnie for the first time.

But the first two days were odd, because, well, the programming colleges were exactly that - colleges. People learned about how to do things with C, or with HyperStudio, or whatever. Not a whole lot to say about those. <wink>

Yesterday KansasFest "proper" started with the hourly sessions and new announcements, and I think Donnie Grimes covered that real well. There are a few other things to talk about besides some of the things he mentioned.

Probably the session that has the most people interested would be the one on Bill Heineman's Avater project. Avatar, for those who haven't heard, is supposed to be a "next generation" Apple IIgs computer.

Boiled down to its essence, what was revealed about the Avatar was:

A) It will use a 10 Mhz 65816 chip,
Apple II Computer Info

B) It will use an Ensoniq chip for sound, perhaps the one Apple currently uses or perhaps a more advanced one,

C) Instead of using Apple type equipment, such as ADB devices, it will rely extensively on off-the-shelf MS-DOS compatible equipment,

D) It will use a complicated bus-arbitration scheme to share processing with other computers.

Those last are probably the most interesting two. Avatar will use a great deal of IBM-style equipment, including four IBM "AT" style slots, IBM style keyboards, and IBM-style interfaces for such things as hard drives, disk drives, and CD-ROM drives.

Avatar is also designed to share processing with other, plug-and-play processing units. So, for example, you'll be able to plug in a card that uses an 80386 processor, and with software supplied by the manufacturer you'll be allowed to run MS-DOS software on it. But not just MS-DOS cards, it will be theoretically possible to design plug-in cards to run Macintosh (if the ROMs could ever be made to work), Amiga, Atari ST, Nintendo, Lynx, or other systems.

Avatar will require its own custom operating system, which Mr. Heineman is anticipating having to "clean room" design (meaning, have someone write the software from the ground up, using programmers who've never even seen Apple's code but who have seen the publically available specifications to the system software).

Bill said he is almost certain he'll get sued if he goes through with Avatar, in which case he says he hopes to either get Apple to license the toolbox to him, or to be able to weather the lawsuit if not.

He also says that he hopes to have working prototypes available for programmers by the next KansasFest, and if all goes well he hopes to have it available for sale to consumers by spring of 1994.

When asked where he was getting funding, Heineman was rather evasive, saying that he couldn't actually give full information on that.

After the presentation, it appeared that a great number of people were skeptical. Programmers and engineers who saw the project stated that they thought the idea was all very interesting, but reactions ranged from, at its most negative, "I wonder who his drug dealer is," to, at its most positive, "it's an interesting fantasy, but I won't believe any of it until I see a working prototype."

Heineman seems to think he can make his machine Apple IIGs compatible by using a whole lot of custom chips to duplicate or work around Apple's patents and copyrights without infringing on them, while at the same time offering a machine with a whole new purpose - a sort of "chameleon computer" that supports parallel processing that boasts the ability to have compatibility with many other systems, while starting with a base unit that already runs an established base of software - i.e. Apple II and Apple IIgs software. He said that he sees his main competition as being the Macintosh LC II, and that the education market appears to be his biggest potential market.

Whatever the truth of Avatar, it appears that a lot of experts are highly skeptical if not outright scoffing, and at best this machine can't possibly be available to consumers in less than two years or so.
Apple II Computer Info

Time will tell.

In the meantime, KansasFest has been an exciting even for Apple II users, serving as a meeting ground for Apple II users from all over the world, and a place where at least a few significant new announcements have been made.

More in the next few days as things progress.

By the way, be sure to check out A2Pro's bulletin board, especially Category 1, Topic 17, for some interesting programmer-related stuff on this year's KansasFest! ;-) -Dean Esmay

(A2.DEAN, Category 44, Topic 6, Message 6, M645;1)

The Down Under crew are very talented programmers. The author of Express, (his name escapes me at the moment) solved a printing problem I was having. They also had the neatest looking tie at the Black Tie dinner Thursday night but dye to sentimental reasons Roger Wagner won the contest.

Last night Resource Central threw a buffet party in the cafeteria. Steve Dizzbrooow was the MC of a "Roast" of Roger and a good time was had by all! Bill Heineman talked about his Avatar project at a well attended conference session. If you are interested in what he said, order the tape of the session from RC. Tape #AT2-09 price $3.00. I am not sure if that is a special price on the tapes to KFest attendees or not. Such a deal!

Chester Page demonstrated PageWriterGS, a very impressive inexpensive ($35) word processor based on AppleWriter. There is a demo in the library, and they are trying to solve copyright confusion right now.

The Lee Golden, Jay Jennings show on making billions was a treat. Not only is SoftDisk a great way for programmers to fine tune their skills, it should keep Jay in Shreveport for another year.

The days festivities started off with Uncle DOS selling hot dogs to the hungry programming masses in the auditorium, and then a real treat. Tom had recorded a telephone conversation with our favorite engineer the Woz. Steve wanted to be here this year and but scheduling problems prevented it. He did say he wanted to come to a future KansasFest.

-Bear

(A2.BEAR, CAT44, TOP7, MSG:10/M645;1)

I spoke with a conference attendee from the user ranks. His impression of the Avatar project is that it would be an exciting product, but he was not convinced that Heineman has the business acumen to bring the product to market and gain adequate market share to support a going business. He wasn't really negative, just uncertain.

This is no time to be throwing wet blankets on any new possibilities in the Apple II world. I hope Avatar succeeds, and I'll be up front brandishing my MasterCard when the time comes. -Bill Dooley

(A2.BILL, CAT44, TOP4, MSG:7/M645;1)

Last night, I wandered into Roger Wagner's room and wound up in front of a video camera while Roger demonstrated some really nifty video tricks using new, inexpensive video chips for picture-within-picture effects. It's too early to tell if a new product will result from these
experiments, but a few people in the room felt that a basic unit could be
made to sell at under $200 list.

I watched in amazement as Roger hauled the tools of his trade out of
his shipping cartons while setting up the demo: a crazed rat's nest of
cables and one gadget after another, including a breadboard video gadget,
video camera, an 8mm VCR/color TV in a package roughly the size and shape
of a 5 lb. sack of flour (didn't catch the maker), a Canon video still
camera that stores 50 images on a 2 inch magnetic disk, and lesser items.
He had composite and RGB monitors on the GS and a Video Overlay Card
inside. Sitting amid this jumble, Roger enthusiastically demo'd the
concepts he's working on to a crowd spilling out into the corridor. After
a couple of hours, about 11:30, I got tired and went off to bed. Roger
was still going strong.

He can generate video letters on 8 mm tapes with a HyperStudio demo
on the main screen and himself in the inset screen, or vice versa, and
mentioned many variations on this theme.

He has ideas for enhancements to HyperStudio that will enable
preschoolers to use it with a mouse or even a touch screen, a purely
audiovisual approach for non-readers.

Roger's enthusiasm is catching, and representative of the overall
mood at KansasFest this year. Few negative comments to be heard. We know
what to expect from Apple now, and we're focusing on the new and nifty.
Despite the lack of spectacular announcements thus far, there are plenty of
new things happening to keep Apple II enthusiasts pleasantly and
productively occupied. -Bill Dooley

(A2.BILL, CAT44, TOP9, MSG:3/M645;1)

>>> I thought some of you might enjoy a clip from some of our late
night follies. In this case it was a "Roger Wagner Roast". This
was so incredibly funny, I really wish I could post an entire transcript of
the event (I must admit I wasn't expecting it to be very funny at all, but
_**man_ was I surprised ... it was great!) , but not only doesn't one exist
(yet, at least), but I wouldn't want to be the one to type it all in
<grin>. What I _did_ do was write down an especially funny bit from
MoMan's routine ... so without further ado:

The Top 10 Reasons Why HyperStudio Crashes.

10) "Something you did"
9) "It must be a bug in your System"
8) "It must be a bug in the System Software"
7) "Ummmm, define 'Crash' "
6) "We can't seem to reproduce it"
5) "Next time, try exporting the scripts first"
4) "It's not a 'Crash', it's just a detour into GSBug"
3) "Real programmers don't use 'goto' "
2) "Oh yeah ... 'goto' doesn't"
1) "We've got an update coming up for that RSN"

(A2.GUEST, CAT44, TOP9, MSG:4/M645;1)
Each one of us is born into the world with different talents and skills. Most of us spend a lifetime trying to hone and develop these native born talents to maximize both our own potential and our contribution to the greater social good.

But rarely can anybody these days maximize his or her talents working cloistered and alone. In this world of increasing specialization and complexity, rare indeed is the individual who achieves great success working independently on his or her own.

Long ignored and overlooked, the wonders of collaborative creativity are just beginning to be understood and appreciated. In an important and revealing new book, Shared Minds: The New Technologies of Collaboration, syndicated columnist Michael Schrage examines both the nature of the collaborative process and methods of "fanning the collaborative flame." With frequent reference to legendary creative collaborative teams of the past (Orville and Wilbur Wright, Watson and Crick, Jobs and Wozniak, Lennon and McCartney), Schrage articulates truths that well deserve to be lifted to the forefront of our consciousness.

How This Book Came to be Written

Initially Shared Minds was to be a book about the social dynamics of business meetings, and how new technologies can help streamline these dynamics. But the author soon realized that the most interesting group work doesn't occur in large business meetings, but in small, energetic teams. So instead of writing a book about business meetings, he decided to closely examine the nature of creative "small group" collaborations. After interviewing many famous scientific and artistic "collaborative teams," Schrage spent a year as a visiting scholar at MIT's Media Lab synthesizing the ideas in this book.

The Personal Attributes of Successful Collaborative Teams

One of the probing questions examined in this book is: "What personal attributes contribute to successful collaborative joint ventures?" How is it that the family team of Orville and Wilbur Wright worked so well together, when other sibling pairs find it a struggle to order pizza together? And what role did Orville and Wilbur's parents play in fostering...
their creativity and perseverance. (Apparently Orville and Wilbur's mother played a decisive role in showing her sons the methodology of creative invention.)

Along the same lines of thought, what personal qualities allowed Watson and Crick to work together to formulate their landmark three-dimensional model of DNA? True, they had differing and complementary scientific backgrounds. But more than that, they both had a hunger to understand the physical structure of DNA. That intellectual hunger united them in a focused scientific quest.

Speaking on the subject of collaboration, Crick, in his memoirs, sheds light on the nature of his successful teaming with Watson: "Our...advantage was that we had evolved an unstated but fruitful methods of collaboration....If either of us suggested a new idea, the other, while taking it seriously, would attempt to demolish it in a candid but nonhostile manner." Good collaborative teams, therefore, have a tacit understanding that individual ego must necessarily be subsumed to the larger team goal.

Examples of How a "Sharing Ideology" Can Develop Another subject examined in the book is the similar "sharing ideology" used by great artists and great scientists. There comes a time when human beings rise above the possessive attitude of "that's an idea I thought of first" to the grander attitude of "that's an idea I had a part in creating."

One moving anecdote about collaborative artists occurred when Picasso and his close associates stopped signing their paintings for a brief period in their lives. These artists worked so closely together in producing new art that they genuinely believed that signing any of their paintings would be a misrepresentation of "authorship." In this case, keeping track of who produced which paintings became subservient to the group goal of producing excellent group paintings.

Thoughts About "Idea Development" At another point in the book Schrage examines the concept of "idea development." How is it that ideas get developed from nascent whims to full-fledged notions? Quoting a modern expert on the subject, John Cleese (the gifted comic writer of Monty Python fame): "The really good idea is always traceable back quite a long way, often to a not very good idea which sparked off another idea that was only slightly better, which somebody else misunderstood in such a way that they then said something which was really rather interesting.... [That's] actually why I have always worked with a writing partner, because I'm convinced that I get to better ideas than I'd ever do on my own."

One perceptive observation in Shared Minds is that some of the best collaborative work occurs in informal, playful settings. The proverbial doodle, hastily sketched on a cafeteria napkin, serves as a forceful reminder of how creativity can best be unleashed in informal settings. Likewise, brainstorming sessions in a formal conference room seldom yield memorable creative results.

All in all, Shared Minds is an important, thought-provoking book. If you've ever spent time thinking about the wonders of collaborative
creativity, you ought to find a rich vein of ideas to mine in this book. The very act of reading the book ought to stimulate those areas of the brain responsible for the "open-minded" reception of new and interesting ideas.

Want To Know More? If you're interested in reading further about the subjects of creativity and collaboration, you might be interest in some of the recommended readings at the end of Shared Minds. Here is a list of some of the juicier sounding titles.]

By Mel Fowler

MUSIC LOVERS TAKE NOTE I was asked to write a review of some of the programs currently in the A2 Software Library. So what I decided to do was to write an article reviewing three music programs, NoiseTracker GS 1.0, SoniqTracker 0.5, and MODzap 0.8. This is not a review in the strictest since of the word because I am not a programmer nor a musician and also SoniqTracker and MODzap are not completed programs. This article is written from the stand point of a music lover and an Apple IIGS fanatic.

First a bit of back ground concerning the Apple IIGS and music programs. Music Construction Set was one of the first, followed by Music Studio. Music Construction Set was mostly just a music player were as Music Studio was more a word processor for music. Both programs had there limitations and regardless how hard they tried they still didn't sound like violins or horns. Mostly they sounded like organs trying to sound like violins or trumpets. They did fairly well with pianos and guitars but when it came to holding long notes or adding color to the music, forget it. The music sounded like computer generated music. We were happy with these programs at the time because they sounded great when compared to previous Apple II music programs. Diversi-Tune sounded a bit better but again was mostly just a play back program, although I loved the bouncing ball.

The next great music composition program was SoundSmith. The first to incorporate a spreadsheet like front-end for the IIGS, SoundSmith made writing original and cover music relatively simple with a minimum of complexity. As its newer versions progressed, new features were added making it possible to breathe greater life into the music. And while the professional software community often ignore d the effort, SoundSmith quickly became the new standard in IIGS music. Recently, the SoundSmith fairy tale came to a bitter end when a beta tester for a commercial version broke the non-disclosure agreement and caused the author to abandon work on the application.

Then came NoiseTracker GS from the french base group the Free Tool Association or FTA. With its rich, full basses and quality,
fidelity, and full dynamic range of instruments this was indeed the next generation in music software for the Apple IIGS. This was the first music program to break the 64K size barrier for instruments and could provide full rich sounds never before heard on any Apple computer.

NoiseTracker GS is SoundSmith compatible so all the available SoundSmith songs and instruments could be used. NoiseTracker GS also includes an editor which can be used by musicians to create a full range of musical sounds only limited by their imaginations. Just about any sound can be made into an instrument including human voices.

Even a novice like myself can re-orchestrate compositions with the Instrument Add, Replace and Delete features of the program. I was able to setup the stereo effects that I wanted by setting instruments to the right or left channels or both. I was also able to set the tracks to a desired right or left channel. If the bass drum is too loud, just lower the volume on that one instrument. Does the song seem to be playing to slowly for you, change the tempo.

The main difference between NoiseTracker GS and all previous music programs was its ability to sustain long notes and the ability to import Amiga Mods. Music can be saved in two different formats, a songs file with a separate instrument wave file or as modules which include the instruments in one file.

Speaking of modules, Amiga MODs. It is somewhat limited in this capability in that NoiseTracker does not support all the special effects required by Amiga MODs. However, you can load in an Amiga MOD file and save it as a NoiseTracker module. If you then load the NoiseTracker module you can use the NoiseTracker program to change tempo, change instruments, etc., as with any other NoiseTracker song.

The music editor screen is well organized and easy to use. To play a SoundSmith or NoiseTracker song you simply "Open Musicfiles" from the Music pull down menu, then select the "Scrolly Player" which shows you a 15 channel VU meter. Like all FTA software there are "Easter Eggs" hidden inside the program. Click on the Scrolly Player and notes will come flying around the screen. Click on the song title location and the program changes colors, gray, blue, green or black.

There appears to be a running gun battle between SoniqTracker and MODzap as to who can write the best Amiga MOD player for the Apple IIGS. Both programs have jukebox features and you can load in a list of your favorite Amiga MOD songs and listen for hours on end.

I like the "Dancing Lights" in SoniqTracker and the more conventional look of the player. The Player controls are more in line with those of a standard CD player with Volume control and Mono or Full Stereo or even 25%, 50%, or 75% Stereo. In Jukebox mode the N key takes you to the next song. The Track Meter is also a nice feature. The Volume control is especially nice for those of us without external volume controls on our speakers. SoniqTracker is indeed an impressive program and plays Amiga MOD song with crisp, clear sounds and superior channel separation. The documentation is adequate but a bit preachy.

MODzap is more technically oriented and supports more features in setting up the player. For example there is a "Force 31 Inst" and "Force 15 Inst" in the "File" pull down menu. I have never had an occasion to use
these selections but they are there. Another feature is the ability to loop the music so if you like a particular song you can have it played over and over in a continues loop. Under the Option menu are options such as Ignore Tuning and Ignore Arpeggiatos, also Turbo, Normal, Enhanced and Premium. The documentation is not very clear as to what Tuning or Arpeggiatos means or when to use these options. Turbo, Normal, Enhance and Premium has to do with the quality of the playback. However again the documentation is not to clear as to what the differences are between them or when to use them.

MODzap version 0.8 added a keyboard so that you can select an instrument from the currently load Amiga MOD and play it on the keyboard. The sound quality is superior on some selected Amiga MODs but this mostly has to do with special effects such as bends up and down.

Overall the music outlook for the Apple IIGS is tremendous. SoniqTracker and MODzap are still in there development stages but already show a great future for music on the Apple IIGS. The developers of these two wonderful programs are to be congratulated and encouraged. Although both of these programs are currently freeware, your monetary considerations would help to keep things going. The dream music program would be a combination of all three of the music programs. Compatible with Sound Smith, NoiseTracker GS and play Amiga MODs with all the required special effects. Editing capabilities currently available in SoundSmith and NoiseTracker GS should be compatible with all formats. Hopefully this is what the developers of soniqTracker and MODzap are working towards. We can only hope.

[EOA]

---

If the "Gno/Me" gang is writing the system software for Avatar, will it be called "Gno/Way"?

---

A search under the keyword "BBS" in the Apple II Roundtable library turns up several dozen files relating to running your own BBS. Some of these files are actual BBS programs.

Some of the BBS options for the Apple II include the public domain "Prime BBS," the shareware "AppleNET BBS," and the shareware "Office BBS" system. Most of these BBS's use ModemWorks, a special set of modem ampersand routines develop by the Morgan Davis Group.

To help you learn what GEnie has to offer in terms of Apple II BBS's, a new AppleWorks file titled "BBS.Files.bxy" has been prepared. This file lists all the BBS files available for downloading from the A2 Roundtable library, along with file descriptions of some of the more interesting sounding files.

Why would someone want to set up and maintain his or her own BBS? Many user groups find that a BBS facilitates user group communications. But the BBS you set up need not be computer related. You could set up a BBS for your local school or PTA; you could set up a BBS for a boy scout or girl scout troop; you could set up a crime prevention BBS; you could set up a BBS to offer editing or desktop publishing services; you could set up a BBS just to learn about what it takes to run a BBS.

Learning about bulletin boards need not even require a modem. Dean Esmay, chief Apple II Roundtable system operator (sysop) recommends KidMail BBS, a bulletin board simulator. (File number 8723: KidMail.bxy). This program simulates an actual BBS allowing multiple 'users' to 'sign on,' get...
a password, and leave electronic mail for other users.

With the price of second hand Apple IIe's dropping down to the $200 to $300 range, the cost of setting up a BBS has likewise fallen dramatically. You don't even need a hard drive with some Apple II BBS systems. (Although almost all of them recommend at least two 5.25 inch, or one 3.5 inch disk drive.)

The following information about the popular public domain Prime bulletin board system (BBS) was collected from Category 10, Topic 6, in the Apple II Roundtable message area.

Prime BBS A while ago one of you asked us to step back and explain what the Prime BBS was and what it had going for it. I was so busy uploading files and getting some beginner downloaoders going that I neglected to respond to that posted message. Hopefully, I can rectify that here in a question and answer format. By doing a few of these, I hope I can answer the most frequently asked questions. Here we go....

Q: What is Prime? Is it new? Why haven't I heard of it before?
A: The Prime BBS system has been around the Apple II world for 7-8 years now. It began as Alfa III and was supported right here on GENie by Bob Garth and Vince Cooper. The program was advertised in classifieds of major magazines but most of its customers (including me) got in contact with the authors by way of the Demo/Ad called Alfa/EZ. The most recent support for the program was in the Smoke Signal Software area on America Online.

Prime is a great BBS and now that its in the Public Domain, is the potential new sysop's _best_ option possible. I've seen a lot of shareware and p.d. BBS's over the years and nothing compares to Prime. This software is PERFECT for smaller BBS systems of the 10-200 user variety...great for user group boards, local Apple II support groups etc. It can handle much larger user numbers, but I find it perfectly suited for smaller groups.

Q: What do I need to run it?
A: You need any 64K Apple ][. I've run it or helped run it on ][+'s, //e's, Franklin Ace's, and IIGS's. You need two or more disk drives. A hard drive is not necessary...but recommended. I've run this software on everything from 4 Disk II's up to 200+ megs of hard drive all chained together off a RamFast and a TransWarp GS. In addition, you need a Novation AppleCat, Hayes Micromodem, Datalink 2400, or a Super Serial Card with an auto-answer 300, 1200, or 2400 external modem. Others may work, but may take some playing around... A Prodos compatible clock is nice but not mandatory.

Q: What are the limitations of Prime and why did it go public domain?
A: The most recent owner of Prime (Danny Haynes) found that he and the others responsible for maintaining Prime simply did not have time to update the system. They concluded that Prime would have the best chance of growing in the hands of a new generation of Prime Sysops....so, they decided to offer it to potential Prime sysops for FREE! Prime is currently a full featured BBS. We'll talk about all those features a bit later, but we might as well get the limitations out in the open first because these are the things that we hope new Prime sysops will help to rectify.
Apple II Computer Info

1. Prime requires a Super Serial Card (SSC) (even in a GS). Bob Garth found that the Apple modem port didn't do things quite the same way as the SSC and never supported the port. Paul Parkhurst has this problem 'almost' fixed but we all need to call him and encourage him to finish that goodie.

2. Prime's transfer (Xfer) system is GREAT. However, support for newer protocols is lacking. It does handle normal Xmodem, Xmodem CRC, Prodos Xmodem, Standard Xmodem. (With Binary II for Apple users). Ymodem and Zmodem would be nice if someone has the ability to take it on. Andy Nicholas posted once that he had written a Zmodem driver for Prime but we've not tracked that down yet.

3. While Prime sysops across the country once had a networking scheme set up, this never became an official part of Prime. Prime's strong point are its elegance and simplicity. I'm sure future sysops will be writing schemes to network but they don't currently exist.

4. I've never heard of Prime's compatibility with newer 9600 baud modems. New drivers or empirical set-ups may need to be developed for these.

That's about it! Not really too limited is it? Frankly, I've never found any of these detrimental to my BBS.

Q: What features does Prime offer?
A: Prime is a full-featured BBS. I'll summarize only a few here....

1. Hot key menus of either the autoformatting internal type or fancy ones made from external text files of your design.

2. Multiple Boards, Email, full line editors for all posts and mail. New message scans. Autosignature capability. Private posts can be set. Autodelete old messages at sysop controllable levels to minimize sysop interaction required. Many more options.

3. Feedback commands, sysop page and chat mode.

4. User can set configuration from normal to expert turning menus on and off.

5. User search and listing built in.

6. G(iant) file reader to allow readers to read any text files the sysop chooses to put online.

7. Complete transfer system capable of tracking up to 215,622 files and 10 line description of each in up to 99 libraries of 99 files each in each of 22 prefixes! New file scans can be set up in multiple combinations for your users convenience.

8. BASIC programs and Games can easily be modified to run with the Prime BBS system. Many examples have been uploaded here to GEnie. The modifications are pretty easy and lots of fun. These include user Voting Booths, BBS databases, Adventure games, etc.
Q: What does the Sysop have to work with?
A: A lot! There is a completely menu driven maintenance system. The sysop simply keys up a Control-C from the keyboard and can then menu his/her way to anything in Prime that needs attention. Among these are:

1. Board and Menu editors.
2. Prefixes (you can put any part of Prime on any prefix on your system).
3. User time restrictions can be set by time limits (if you have clock) or number of bytes transmitted if you don't.
4. You can create and toggle on or off Pre and Post new user messages and Pre and Post login in messages.
5. You can create Theme messages at the beginning of each board to keep things going in a reasonable thread.
6. Email and transfer have their own complete set of utilities... all accessible with the Control-C when you've entered their area.
7. Remote sysoping available on ALL features so you can take care of the system from a remote location or have a co-sysop care for the system while you're on vacation.

Q: What about SECURITY? Can I closely control what users see what on my BBS?
A: Yes, more than you will ever need. There are 9 user class codes for gross set ups. In addition, each user has a 19 byte index string that determines what he can do on your BBS. Each of these bytes can be set from A to Z. You can then tie EVERY MENU KEY to one of these bytes and levels and therefore control who can execute (or even SEE) these commands. In addition, the sysop can give users ability to post private messages, make entire boards restricted, record phone numbers that the system will not accept for a user, allow or disallow login of new users, offer a side door entry with proper password.... and allow or disallow the use of alias's for users. All these things are handled with ease by way of the comprehensive menu and user data editors.

Q: Who is this Goose fellow?
A: Nobody special.. I've been using and enjoying Prime (and its predecessors) for nearly 8 years. Its been so much fun that I've learned just enough about it to be dangerous. I hate to see such a strong BBS die just because nobody knows about it. I'll help anyone who tries to use it. No guarantees, but hopefully this is a GREAT way to start small inexpensive pockets of Apple II users. My old trusty II+ sits in the corner with a castoff 30 megabyte Seagate hanging there serving as our user group communication port. How about it? Can you use your old hardware to create your own private user group? Go for it! <Grin>.... (W.GOOSEY, CAT10, TOP6, MSG:121)

These are the minimum necessary files to run the Prime BBS:

[*][*][*]

Number: 18837  Name: PRIME.DOCS.BXY
Address: W.GOOSEY                Date: 920613
Approximate # of bytes: 142720
Number of Accesses: 102  Library: 39
Description:
This file is the documentation for the Prime BBS system for the Apple ][]. This is a very mature BBS that has been around for several years. The
entire BBS comes in 7 packed files. This file is the entire documentation as published by Smoke Signal software when the BBS was commercial. The BBS has all the desirable features for the Apple ][ sysop. Boards, Games, Vote modules, Quote system, Other BBS databases, etc. Written in Basic (using included powerful amper set) so you can modify it or modify other Basic programs for use as external programs.

Keywords: BBS, Public Domain, PD, Prime, Manual, Documentation, ProTree, Smoke Signal

Number: 18894 Name: SYSTEM.BXY
Address: W.GOOSEY Date: 920617
Approximate # of bytes: 75136
Number of Accesses: 46 Library: 39
Description:
This archive contains all the needed system files for the Prime BBS package recently released to the Public Domain by Danny Haynes. Originally written by Bob Garth. Excellent BBS for any Apple ][. In addition to this file you will also need PrimeManual.shk, Install.shk, Xfer1.shk, Xfer2.shk, and the optional Source1.shk and Source2.shk. Great BBS. Best I've ever seen for simple, but powerful operation.
Keywords: Prime, BBS, modem, SmokeSignal, PD, Public Domain

Number: 18896 Name: XFER1.BXY
Address: W.GOOSEY Date: 920617
Approximate # of bytes: 48128
Number of Accesses: 42 Library: 39
Description:
This archive comprises the first of two Xfer system disks for the Prime BBS system. Other files needed for this BBS are PrimeManual.shk, System.shk, Install.shk, Xfer2.shk and the optional Source1.shk and Source2.shk. Great Apple II BBS!
Keywords: Prime, BBS, Modem, SmokeSignal, Public Domain

Number: 18897 Name: XFER2.BXY
Address: W.GOOSEY Date: 920617
Approximate # of bytes: 77696
Number of Accesses: 48 Library: 39
Description:
This archive is the second part of the Prime BBS xfer system. This is a great Apple ][ BBS. Other files you need are the Primemanual.shk, Install.shk, System.shk, Xfer1.shk, and the optional Source1.shk and Source2.shk.
Keywords: Prime, BBS, modem, SmokeSignal, Public Domain

//GENIE_QWIK_QUOTE
//
The French Free Tools Association, better known as The FTA, burst upon the IIGS scene at the 1989 San Francisco AppleFest when their freeware Nucleus demo stunned, dazzled, and astounded all who saw it during Jean Louis Gassee's mind-blowing presentation.

The FTA, a small group of French programmers, graphic artists and musicians continued to awe the IIGS community, releasing one smash hit after another. Their demos, including ACS Demo, Modulae, California Demo, Xmas Demo, Animaga, and Delta Demo pushed the IIGS to the limit with their astounding 3 dimensional animations and rock n roll soundtracks. The freeware FTA games of Easy Dead, Flobynoid, Star Wizard, and Mini Prix have provided countless GS owners with innumerable hours of super hi res fun. Their shareware disk copy program, Photonix, must be the only copy program in existence that contains animation and music and efficiently copies entire 3.5" disks in just one pass, using only a single 3.5" disk drive. NoiseTracker, released in December of 1991, must surely be the most talked about IIGS music program of 1992.

And then, as 1991 drew to a close, the FTA disbanded. According to FTA founder and president, Olivier Goguel, "We stopped programming for the IIGS for a lot of reasons, but we don't deny it and are still very proud of what we've done, or tried to do on it".

The FTA may be gone, but they will surely never be forgotten. They have left a legacy for the rest of us who remain with the IIGS. They showed us what was possible, and they inspired and stimulated us by demonstrating just how much fun it can be to own a IIGS. In our hearts and minds, the FTA will live forever.

In late Spring, 1992, a package arrived in SiliKohn Valley with a postmark of Dijon, France. The package contained a number of disks, and they were described by Olivier Goguel as "the latest gifts from the former FTA group to the IIGS community". Just as the FTA's software resulted in so much joy and fun and respect for the IIGS, we would like to use those gifts as a way to provide the IIGS community with a positive focus. We are pleased to announce the first ever "Shareware Solutions Contest". In an effort to double our pleasure and double our fun, we're actually going to institute 2 different contests; one for programmers, and one for non-programmers.

One of the programs provided by Olivier Goguel is Bouncin'Ferno. It's a Marble Madness type game, with incredible graphics, sound effects and music. 3 levels, each with 25 different play fields, are already defined, and you can play the game with either a mouse or a joystick. On each level, you'll try to roll over small objects and pick them up before advancing on
to the next level. Some objects are suspended high above the ground, and you'll need to jump up to get them, while other objects are hidden under 3 dimensional ramps. As it is, Bouncin'Ferno is a lot of fun, but, it's not quite complete; there's no scoring module. But, the complete Merlin 16+ Source Code is provided.

The programming contest rules are very straightforward: use the Bouncin'Ferno source code to create a completed game. We don't care if you make it a desktop program, or use the toolbox. We don't even care if you translate it to run under Orca/M or APW. What we do care about is game play, artistry, creativity, fun, sounds, animation, documentation, user friendliness and compatibility with both ROM 01 and 03 machines. We don't even care if you use the source code to create a totally different game; just impress the judging panel of inCider/A+ editors. Make our eyes bug out of our heads, and make our toes tap. In short, we suggest that you let the FTA guide you in spirit, and that you create a program that the FTA would be proud of.

Included with Bouncin'Ferno is a screen editor that will allow you to create your own levels. So, the second contest is focused upon new Bouncin'Ferno levels. Make them hard or make them easy, make them fun or make them frustrating. Just submit your favorite new Bouncin'Ferno levels, and you'll be eligible to win some valuable prizes.

As it is now, Bouncin'Ferno is hard drive installable; if copied to hard drive, just double click on P8.LOADER to run the game. If run from floppy disk, just boot the disk. If you have any problems booting the disk, just run P8.LOADER from either ProDOS-8 or GS/OS. Documentation in both French and English is also provided.

Bouncin'Ferno has been placed by the FTA into the public domain. Therefore, all contest submissions, being derivative works, will also be in the public domain. To enter the contests, just print out, complete and sign the contest entry form that's provided on disk as a standard text file, and send along with your disk to FTA Contest, c/o inCider/A+, 80 Elm St, Peterborough, NH 03458. All entries must be postmarked by 12/31/92.

We will be making the Bouncin'Ferno disk available, along with the contest entry form, for downloading from the large online networks (America Online, CompuServe, and GEnie). No restrictions of any kind are placed on it, so please make sure your user group, and all your friends, know about it.

After the contest winners are announced, the winning entries will also be uploaded to the online networks, and will spread from there.

Bouncin'Ferno version 1.03 by F.T.A

[*][*][*]

(Translated haltingly from la belle langue by ToH)

Board Editor

4 editing modes:

1 - Move mode :

THIS MODE IS SELECTED BY THE SPACE BAR
To move (square by square) use the 2, 4, 6, 8 keys on the numeric keypad. Move vertically with the + and - keys (pixel by pixel).

By simultaneously holding down the apple key, you can increase the movement speed of the cursor (by 4 squares and by 10 pixels).

By simultaneously holding down the option key, you can move from room to room with the 2, 4, 6 and 8 keys.

By simultaneously holding down the shift key, the cursor will follow the terrain, that is to say:

- for horizontal movement, it corrects its altitude automatically to follow the slope.
- minus key: it puts itself on the first plate down.
- plus key: it puts itself on the first plate up.

This allows rapid passage from one floor to another when there are superimposed levels.

The effects of the apple and shift keys are cumulative (rapid movement and terrain following).

Cursor Selection:

- the 0 to 9 keys on the top row of the keyboard select the 10 special plates:

0: deadly plaque
1: left projector
2: back projector
3: right projector
4: front projector
5: icy plate
6: invisible icy plate
7: invisible plate
8: spring
9: can-bearing plate

- the 0 key on the numeric keypad selects the normal horizontal plate
- the 4 arrow keys select inclined plates, rising in the direction indicated by the arrow. To obtain the 3 possible inclinations, press repeatedly on the corresponding arrow.

2 - Trace mode

THIS MODE IS SELECTED BY THE RETURN KEY

The cursor remains identical to the one in movement mode if there is a plate identical to itself at the position it occupies. You can move it like before, but now it leaves a trail behind it. The terrain-following mode is replaced here by a continuously sloped movement if you trace with an inclined plate.

DON'T FORGET TO QUIT THIS MODE WITH SPACE (RETURNING TO THE PREVIOUS) IF NEED BE.
3 - Erase mode

   THIS MODE IS SELECTED BY THE DELETE KEY.

   The cursor is then replaced by a two-tone horizontal plate (red and
   orange). This cursor erases all the plates it passes.

4 - Block mode.

   A block is a continuous collection of all the plates within a selected
   box.

   This mode allows selection of blocks, cutting them, moving them, pasting
   them, reshaping them...

   Selecting a block :

   - place the cursor on one of the 8 vertexes of the box.
   - type apple-B.
   - the display becomes monochrome (yellow) with the exception of the
     plates in the block (orange) and the shadow of the selected box on the
     floor (green rectangle).
   - move the cursor to the opposite vertex.
   - Press ESCAPE to cancel the selection.

   Otherwise :

   - apple-C copies the block into the clipboard.
   - apple-X also copies the block, but then erases it from the board.
   - apple-M selects the block in block editing mode.
   - apple-V recovers the last block copied and selects it in block editing
     mode.
   - apple-W recovers the last block copied and uses it as a brush (the
     block remains behind after each movement)

     NB : in brush mode, the shift key produces a continuous slope which
     is set up according to the shape of the cursor. This is displayed, but
     doesn't leave a trail.

   - delete erases the block from the board.

   Features of block editing mode :

   - the cursor movement keys move the selected block.
   - return accepts the editing and the block is replaced on the board at
     its actual position.
   - Escape cancels editing and the block disappears.

   - also, 8 keys allow reshaping the editing block :
     - option-L turns the block one-quarter turn on its vertical axis.
     - option-X reverses the block left-to-right.
     - option-Y reverses the block front-to-back.
     - option-Z reverses the block top-to-bottom.
     - option-arrow (right, left, up or down) changes the inclination of the
       block by one unit in the arrow direction. (Note: given the small
       numbers of inclined planes, this operation is sometimes neither
       perfect nor reversible.)
5 - The library:

   The library is for the storage of copies of blocks that you use often, or which you think you'll reuse. It allows you to recover copies at any time without having to return to the board where they were found.

   To copy a block into the library, use the usual copy commands:

   - apple-C
   - apple-M

or apple-X plus hold down the option key. The command will execute normally, but in addition a copy of the selected block will be stored in the library.

   To recover a block from the library, use the normal command to recall a block (apple-V or apple-W), plus hold down the option key. Instead of recalling the last block copied, this will connect on the selector of the library.

   The library selector:

   - the + and - keys stream through the different components in the library.

   - for housekeeping, the delete key erases the displayed block from the library.

   - the return key selects the displayed block. It then becomes the last block copied and your initial command (apple-V or apple-W) executes normally.

   - the escape key quits the selector and cancels the command.

   Library capacity:

   - the library's capacity is sufficient to store approximately the equivalent of 25 rooms of a board. It's therefore possible that you may fill it in normal usage. Nevertheless, in this case a message will inform you that copying into the library is impossible. You'll then have to do some housekeeping with the selector's delete command. - the library selector position defaults to the last selection made.

6 - Miscellaneous commands

   - / and * (keypad) : Retreat and advance the first plane seen.
   - apple-Q : Quit the editor.
   - apple-H : See the high scores (press Del to reset, any other key to close the high score window)
   - apple-U : Undo.
     Restore the previous state:
   - change mode
   or - change the cursor
   or - block layout (return after apple-V)
   or - block copy (apple-C, apple-X or apple-M)
   or - ... (you're out of luck for other cases.)
     [not _quite_ what it said B-]
   - escape : Cancel the operation in progress.
- apple-? : Help from god.
- apple-P : Play the board from the cursor position.

>>> BOUNCIN'FERNO CONTEST ENTRY BLANK <<<

("""
(Source = GEnieLamp)
""")

Please read this contest entry blank, fill it out, sign it, and mail it in, along with a 3.5" disk containing your contest entry, to:

FTA CONTEST
inCider/A+ Magazine
80 Elm Street
Peterborough, NH 03458

NAME________________________________________________________

ADDRESS_____________________________________________________

CITY_________________________________ STATE_____________

ZIP________________________________________________________

COUNTRY________________________________ I saw it on GEnieLamp!

PHONE________________________________

Remember, all contest entries must be postmarked by December 31, 1992.

The enclosed disk is submitted for the (circle one):

PROGRAMMING CONTEST           BOUNCIN'FERNO LEVEL CONTEST

Briefly describe your submission:

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________

_________________________________________________________________

I understand that the FTA's Bouncin'Ferno program, and all the source code provided on the Bouncin'Ferno disk, is in the Public Domain. I further understand that my submission, being a derivative work, is also in the Public Domain. I understand that public domain software cannot be copyrighted, and that no restrictions can be placed on its distribution.

I understand that the decision of the panel of judges is final.

SIGNATURE
Greetings. I personally feel that there's been way too much "doom and gloom" in the Apple II world recently, and conceived of the Shareware Solutions Contests as a way to turn some of that doom and gloom around. I just feel that for the next few months, the IIgs community is going to have something to look forward to, namely, some mind boggling games based on the FTA's Source Code, and some great user submitted Bouncin'Ferno levels that we can all play.

This is a time to celebrate the glories of the IIgs!!

I just wanted to make a few small comments.

In order to enter the inCider contests, we want everyone to fill out and sign the Contest Entry Blank. When I put together that entry blank, I was thinking about legal ramifications, especially knowing that contests are against the law in some states. I just want everyone that enters the contest to sign the form, agreeing that whatever work is submitted becomes the property of the Apple IIgs community. Obviously, you'll need to have a printer to print out the entry blank. Well, if you don't have a printer, then just create a facsimile of the entry blank, and send that in. Use ink.

At the time I write this, we do not have all the prizes lined up. Paul Statt and I are working on that, and don't really expect that we'll know what prizes we have to offer until after KansasFest. We will have some good ones, that I have no doubt about. As is said in every Hollywood movie: "Trust Me". We'll have some great ones.

Have fun playing Bouncin'Ferno, and have fun creating something that the FTA would be proud of.

Questions, comments, problems?

Contact me online at the following addresses:

America Online: JOKO
CompuServe: 76702,565
GENie: J.KOHN

Internet mail can be sent to either America Online or CompuServe. If you don't have a modem, you can always contact me by US Mail at:

Joe Kohn
166 Alpine Street
San Rafael, CA 94901

One last note Copy the disk and give it to everyone you know. The more people that enter the contests, the better. Have fun, and just remember: Apple II Forever!

Please feel free to re-format the entry blank before printing it out. I have a feeling that it'll be a little easier to read if some of the lines are double spaced. Either that, or write small <g>.
The other comment has to do with the FTA themselves. In a recent letter from Olivier Goguel, founder of the FTA, he says "The idea of a contest to create levels for Bouncin'Ferno is great. We tried the same thing in France when we were programming it, but it didn't work as we thought. About programming FTA programs, this is a challenge because our source code is not commented (or only in French) and we're not using academic programming ways and tools. But, I hope someone will manage to create something great from our source code".

The challenge is offered. Let the games begin! -Joe Kohn

GEnie_QWIK_QUOTE

Hey, I can't complain with that kind of service, eh?? It's called, "Next Day GEnie"... <Grin>..

[EOA]

APPLE II HISTORY

Apple II History, Part III

By Steven Weyhrich

Compiled and written by Steven Weyhrich
(C) Copyright 1991, Zonker Software

(PART 3 -- THE APPLE II)
[v1.1 :: 12 Dec 91]

This third part of the Apple II History deals with the original Apple II and the design features that went into it. What is most amusing to me is this: The decisions Wozniak made when laying out his revision to the Apple I involved not only those that would make it a good computer, but also would let him use his computer to play "Breakout". The color, the graphics, the sound, and the paddle circuits had the primary intention of making that possible.

What is also interesting is that the success of the Apple II was strongly related to the free reign given to Wozniak the hacker, rather than allowing several people decide on features the computer should have.

Also found in this part of the History is a glossary to some of the common terms used in the microcomputer world; it makes the novice more able to appreciate things discussed later in the history.

Moving our time machine on to 1977, we can now look at Steve Wozniak's next generation Apple. Even as the Apple I was completed and was slowly selling, Wozniak was already working on making enhancements that would make his computer faster and more functional. He wanted to make it display in color. He worked to combine the terminal and memory functions of the Apple I by moving the display into main memory, allowing instant screen changes. Many of his changes were not added with the end
user specifically in mind. Wozniak stated:

"A lot of features of the Apple II went in because I had designed Breakout for Atari. I had designed it in hardware. I wanted to write it in software now. So that was the reason that color was added in first--so that games could be programmed. I sat down one night and tried to put it into BASIC. Fortunately I had written the BASIC myself, so I just burned some new ROMs with line drawing commands, color changing commands, and various BASIC commands that would plot in color. I got this ball bouncing around, and I said, 'Well it needs sound,' and I had to add a speaker to the Apple II. It wasn't planned, it was just accidental... Obviously you need paddles, so I had to scratch my head and design a simple minimum-chip paddle circuit, and put on some paddles. So a lot of these features that really made the Apple II stand out in its day came from a game, and the fun features that were built in were only to do one pet project, which was to program a BASIC version of Breakout and show it off at the club."<1>

Wozniak added other features that he felt were important for a computer that was useful, one that he would want to own. Since the 6502 processor could address a total of 64K of memory, he designed the computer with the ability to use either 4K RAM chips, or the newer (and more expensive) 16K RAM chips. The first Apple II's came standard with 4K of memory, and more could be added, to a maximum of 12K (if using the 4K chips) or 48K (if using the 16K chips). Specially wired strapping blocks attached to the motherboard told the Apple II how much memory was present and where it was. According to the 1981 edition of the APPLE II REFERENCE MANUAL, the Apple could have memory in the following sizes: 4K, 8K, 12K, 16K, 20K, 24K, 32K, 36K, or a full 48K. (These sizes were determined by the different ways that three RAM chips, either 4K or 16K, could be installed). The strapping blocks were even designed with the flexibility of allowing blank spots in memory if there were no RAM chips available to fill those spots.

The first 4K of memory always had to have RAM present, since it was used by the 6502 processor, the ROM routines, and the text screen display. If, for example, you only had two other 4K RAM chips to install and you wanted to display hi-res graphics, you could strap one chip to the lower half of hi-res memory from $2000-$2FFF, and the other to the upper half of hi-res memory from $3000-$3FFF.<2> Since 16K RAM chips cost about $500 when Wozniak designed the Apple II, not many users could afford them. Whereas the Commodore PET and the Radio Shack TRS-80 could not easily be expanded beyond the 4K they came with, the Apple II from the beginning was designed with expansion in mind.<3>

The row of eight expansion slots was another feature about the Apple II that was a strong selling point. Unlike the TRS-80 or PET, you could easily expand the Apple II by simply plugging a card into one of these slots. This degree of expandability made it more expensive to build, however. Steve Jobs didn't believe that anyone would ever need more than two slots, one for a printer and one possibly for a modem. Wozniak knew from his experience with computers at Hewlett-Packard that computer users would always find SOMETHING to fill those extra slots, and insisted that they keep the number at eight.<4>

One problem Apple had to deal with was getting FCC approval for the
The RF (radio frequency) modulator that had been designed gave off too much interference, and it was probable that the FCC would not approve it. (The RF modulator allowed a user to attach the Apple to a standard television receiver, instead of requiring the purchase of an expensive computer monitor). Rather than have the release of the Apple II delayed for re-engineering of the RF modulator to get that FCC approval, Apple gave the specifications for the RF modulator to Marty Spergel. He ran a small company (called M&R Electronics) that specialized in obtaining hard-to-get parts that electronics and computer hackers wanted for their projects. Their agreement allowed M&R to make and sell the RF modulators, while Apple could concentrate on making and selling the Apple II. Dealers would sell an Apple II with a "Sup'r Mod" (costing about $30) if the buyer wanted to see the graphics on their color TV. Jobs assured Spergel that the item would sell well, maybe as many as fifty units a month. (Years later Spergel estimated that he had sold about four hundred thousand Sup'r Mods).<5>

Other features that Wozniak (and Allen Baum, who helped him with the project) included in the Apple II ROMs included the terminal software to do screen text display, expanded Monitor functionality, and cassette input/output routines. They added the ability to split the screen into different sized windows. They also wrote a disassembler, which was one of the most important features of the Apple II from the beginning and a significant part of its open design. It allowed ANYONE to view the 6502 code that ANY program used, and matched the philosophy of the Homebrew Club of making all computer knowledge available to everybody. In the Apple I days, when Apple was supplying software "free or at minimal charge", Wozniak and Baum published an early version of their 6502 disassembler in a hacker's magazine. It was designed to be loaded in memory on the Apple I from $800 to $9D8 and the routine could be executed from the monitor. This early code was quit similar to the disassembler that was later included in the Apple II ROM.<6>

Having an expanded Monitor program in ROM and color graphics were not the only features in the Apple II that attracted people to it. Having Wozniak's BASIC language in ROM, available immediately when the power was turned on, made it possible for non-hackers to write programs that used the Apple II's color graphics.

An interesting bit of trivia about Wozniak's Integer BASIC was that he never had an assembly language source file for it. He wrote it in machine language, assembling it by hand on paper:

"I wrote this BASIC processor, and I wrote a little ALGOL simulator and got it simulated. It looked like it would work, but I had forgotten to build the machine. I had no assembler, that was another thing. To use an assembler, they figured that somebody was going to buy this processor [the 6502] to use for a company, and their company can pay a few thousand dollars in time-sharing charges to use an assembler that was available in time-share. I didn't have any money like that, so a friend taught me that you just sort of look at each instruction, you write your instructions on the right side of the page, you write the addresses over on the left side, and you then look up the hex data for each instruction—you could assemble it yourself. So I would just sit there and assemble it myself. The [Integer] BASIC, which we shipped with the first Apple II's, was never assembled—ever. There was one handwritten copy, all
handwritten, all hand-assembled. So we were in an era that we could not afford tools."<7>

Even to this day there is not an official source code listing of Integer BASIC at Apple. And interestingly, the only error I am aware of in the Integer interpreter is one involving a single byte. If a line is entered that has too many parentheses, the "TOO LONG" error message is displayed instead of the "TOO MANY PARENS" message.<8>

>>> NOW A WORD FROM OUR SPONSOR: BACK TO THE BASICS... <<<  

I want to take a short break in this discussion of the Apple II firmware to look at some other items that will make further descriptions easier to understand. If you are a programmer already, you may want to skip this section, since you probably already know this stuff. First we will examine some definitions of terms that are commonly known to programmers, but possibly not to you. Next will be a brief excursion into the realm of hexadecimal, and finally a look at the memory map of the original Apple II.

First, let's look at definitions of some words that I have been loosely throwing around:

**BIT**
The smallest piece of information that a computer can deal with, it is either a "0" (off, clear) or a "1" (on, set).

**BYTE**
The most convenient piece of information (for humans) that computers use. One byte consists of eight bits, and ranges from "00000000" (0 decimal) to "11111111" (255 decimal).

**NIBBLE**
(also spelled "nybble"). One half of a byte, consisting of four bits, ranging from "0000" (0 decimal) to "1111" (15 decimal).

**WORD**
Two bytes (or four nibbles, if you prefer), consisting of sixteen bits, and ranging from "00000000 00000000" (0 decimal) to "11111111 11111111" (65535 decimal). Not used much in microcomputers.

**BINARY**
A system of counting using only two digits, "0" and "1" (base 2). Computers speak in binary at their most basic level; anything else is translated into binary, so the computer can understand it.

**DECIMAL**
A system of counting using ten digits, "0" through "9" (base 10). Most of the Western world uses this system.

**HEXADECIMAL**
A system of counting using sixteen digits, "0" through "9" and "A" through "F" (base 16). Programmers use this system as a convenient way of organizing groups of binary numbers.

**KILOBYTE**
Abbreviated "K", "KB", or "Kbyte", it refers to 1,024 bytes. A 64K computer has 64 x 1024 = 65536 bytes.

**MEGABYTE**
Abbreviated "M", "MB", or "meg", it refers to 1,024 Kbytes, or 1,024 x 1,024 = 1,048,576 bytes. A 32 MB hard disk, the largest size volume that ProDOS can handle, holds 32 x 1,024 = 32,768 Kbytes, or 32 x 1,024 x 1,024 = 33,554,432 bytes.

**GIGABYTE**
Abbreviated "G", "GB", or "gig", it refers to 1,024 MB, or 1,048,576 Kbytes, or 10,737,411,376 bytes. The Apple II Smartport (which will be mentioned later in this history) can handle disk devices up to 4 gig in size (although the software to handle that type of size has yet to be written).

**RAM**
Random Access Memory. Any data stored in this memory disappears when the computer is turned off.
Apple II Computer Info

ROM
Read Only Memory. Data cannot be stored in this type of memory, but instead it usually contains programs or other information that does not disappear when the computer is turned off.

HARDWARE
The physical electronic components and mechanical parts that make up a piece of computer equipment. Examples would be the keyboard, disk drive, or television monitor (also called CRT, or Cathode Ray Tube).

SOFTWARE
The digital instructions executed by the computer in RAM. They may act on the hardware that is attached to the computer. Examples would be a BASIC or Pascal program, an assembly language routine to read a clock, or a disk operating system. Since software is executed in RAM, it disappears from memory when the computer is turned off.

FIRMWARE
The same as software, except it is executed from ROM, and does not disappear when the computer is turned off. Almost any software could be in ROM, except programs that modify themselves as they run.

Next, let's look at hexadecimal numbers in more detail. Since computers deal in binary (base 2), the true language of computers is either in terms of "0" (off) or "1" (on). However, it quickly becomes cumbersome to refer to large numbers in binary; the base 10 number "458" is "110001010" in binary. So programmers have decided to group numbers in such a way as to make it easy to convert part or all of that number to binary if necessary, but still have numbers (almost) as easy to deal with as our standard base 10 system.

Now, in the familiar base 10 system there are ten digits, 0 through 9. When counting, after you pass 9, you add one to the digit to the left of the 9, change the 9 to a 0, and continue. So, "09" becomes "10", "19" becomes "20", and so on. However, in the base 16 system there are sixteen digits, 0 through 9, and then A through F (representing decimal 10 through 15). When counting, then, you go 7, 8, 9, then A (not 10), B, C, D, E, F, 10, 11, 12, and so on. In the Apple world we have traditionally used a preceding dollar sign to signify a hexadecimal number, so "$25$" means twenty-five, but "$25$" means thirty-seven (2 x 16, plus 5). To translate a hexadecimal number to decimal, use powers of 16:

\[
\$B65F = (11 \times 16^3) + (6 \times 16^2) + (5 \times 16^1) + (15 \times 16^0) \\
= (11 \times 4096) + (6 \times 256) + (5 \times 16) + (15 \times 1) \\
= 45056 + 1536 + 80 + 15 \\
= 46687
\]

The same thing can be done in reverse to convert base 10 to hexadecimal, starting by dividing the number by 4096, then the remainder by 256, then 16. If the number is greater than 65536, you need a bigger power of 16 (and you are probably not dealing with an 8-bit Apple II!) Or you can just get a programmer's calculator like mine that automatically does the conversion for you...

When dealing with memory addresses on an Apple II, we usually designate them as four digit hex numbers (such as the $B65F$ example above). Numbers less than $1000$ often are printed without the leading blank ($400$ instead of $0400$), and numbers less than $100$ are treated the same way ($32$ instead of $0032$).

>>> THE APPLE II: MEMORY MAP <<<
To understand the memory layout of the Apple II, consider this analogy: Imagine a cabinet with sixteen shelves, and sixteen separate slots or pigeon holes on each shelf (similar to those found in old roll-top desks). Each slot refers to a specific address in memory on the computer, and each slot can hold a number between 0 and 255. (Since a byte is eight bits wide, the largest number that can be represented by eight binary bits is 255). The bottom shelf is row "0", and the leftmost slot in that row is slot "0". The address of that slot, then, is $00. As we move to the right, the addresses increase, $01, $02, $03, and so on to $0F at the end. We then go up to the next row, (row "1"), and the addresses continue in the same fashion with $10, $11, $12, and so on as before. The sixteenth row is row "F", the rightmost slot in that row is slot "F", and the address of that slot is $FF. This cabinet has, then, 256 slots (16 x 16), and represents what is called a "page" in the Apple memory. The cabinet itself has an address (since computers need addresses for everything), and this one's address is "00". The full address of row "5", slot "A" on cabinet "00" is $005A.

Only the Altair 8800 came with just 256 bytes of memory, so we have to account for the entire 64K memory space that the 6502 chip in the Apple II can handle. There is a cabinet sitting on top of cabinet "00", and it is laid out in the same fashion with its 256 slots in sixteen rows. This is cabinet "01", and on top of that one is cabinet "02"; this continues on up until we reach cabinet "FF" way up at the top. Apple programmers refer to these cabinets as "pages" of memory. There are 256 pages of memory, each with 256 bytes on a page, making a grand total of 256 x 256 = 65536 bytes of memory (or slots that can hold a number, if you prefer the analogy).

In discussing the memory map on the Apple II, we can refer to pages of memory with a hexadecimal two-digit number for shorthand if we wish. The general layout of the Apple II memory is as follows:

- **Page $00**: used by the 6502 processor for storage of information that it can access quickly. This is prime real-estate that is seldom available for general use by programmers without special care.
- **Page $01**: used by the 6502 for internal operations as a "stack."
- **Page $02**: used by the Apple II firmware as an input buffer when using the keyboard from BASIC, or when a program uses any of the firmware input routines.
- **Page $03**: general storage area, up to the top three rows (from $3D0 through $3FF) which are used by the disk operating system and the firmware for pointers to internal routines.
- **Pages $04-$07**: used for the 40 column text screen.
- **Pages $08-$BF**: available for use by programs, operating systems, and for hi-res graphics. Within this space, Woz designated pages $20-$3F for hi-res "page" one, and pages $40-$5F for hi-res "page" two.
- **Page $C0**: internal I/O and softswitches
- **Pages $C1-$C7**: ROM assigned to each of the seven peripheral cards
- **Pages $C8-$CF**: switchable ROM available for any of the seven cards
- **Pages $D0-$D7**: empty ROM socket #1
- **Pages $D8-$DF**: empty ROM socket #2
- **Pages $E0-$F7**: Integer BASIC ROM
- **Pages $F8-$FF**: Monitor ROM
The memory space on the Apple II between $C000 and $CFFF was assigned to handle input and output. From $C000 to $C0FF the space was reserved for various soft-switches used to control the display, and various built-in I/O devices, such as the keyboard, paddles, annunciators, and the cassette port. (A soft-switch is simply a memory location that, when a number is stored there, changes something in the computer—such as switching on graphics mode). From $C100 to $CFFF the space was reserved for ROM on the plug-in peripheral cards for each of the seven slots. Slot 1 was given the space from $C100 to $C1FF, slot 2 from $C200 to $C2FF, and so on. The $C800 to $CFFF space was special slot-selectable ROM that was uniquely available for each of the seven peripheral cards. For example, a program running on the card in slot 6 to control a device could use the $C800-$CFFF space for its own purpose. When control passed to the card in slot 3, that card could use a program of its own that ran in the same $C800-$CFFF space. This was accomplished by allowing each card to have ROM code that covered pages $C8-$CF, and making that space "switchable", depending on which card wanted to use it. Having this space available made writing ROM code simpler, since it would not have to be capable of running at various memory locations (depending on which slot a card was plugged into).

The memory from $D000 to $D7FF and $D800 to $DFFF was empty on all early Apple II computers. On the motherboard were two empty sockets that were available for the user to plug in their own ROM chips. The $D000-$D7FF space was most often used by a plug-in ROM chip sold by Apple, known as "Programmer's Aid #1." It contained various utilities for Integer BASIC programmers, including machine language routines to do the following:

- Renumber BASIC programs
- Append one BASIC program to the end of another
- Verify a BASIC program that had been saved on tape (to confirm it was an accurate save)
- Verify non-program data that had been saved on tape
- Relocate assembly language routines to a different location in memory (most would only run in one place in memory)
- Test the Apple II RAM
- Generate musical tones through the built-in speaker
- Handle hi-res graphics from BASIC, including code to clear the hi-res screen, set colors, plot points and lines, draw shapes, and load shapes from tape.

All the routines on the Programmer's Aid #1 ROM were written by Wozniak between June 1977 (the RAM test routine) and April 1978 (program renumber and append), except for the music routine, which was written by Gary Shannon.

The other empty ROM socket (covering memory from $D800 to $DFFF) was never filled by Apple. Various third-party vendors sold ROMs for that socket (or for the $D000-$D7FF socket used by the Programmer's Aid #1 ROM), but none made enough of an inroad to be preserved in the INTBASIC file that would later be included on the DOS 3.3 System Master disk. In fact, the $D800-$DFFF space in the INTBASIC file on that disk contains an image of that same space taken directly from the Applesoft ROM! It is completely useless to Integer BASIC, of course, but disk files being what they are, Apple had to fill that space with SOMETHING!

The Integer BASIC interpreter lived in the ROM space between $E000 and $F7FF. However, BASIC only used the space up to $F424. Between $F425-$F4FB and $F63D-$F65D could be found a floating-point math package.
that was not used by Integer BASIC, but was available for BASIC programmers who were astute enough to figure out how it worked. (An early Apple user group, the Apple Pugetsound Program Library Exchange, or A.P.P.L.E., sold a tape and notes by Steve Wozniak they called "Wozpak", that documented some of the secrets of the Integer BASIC ROM). Between $F500-$F63C there was code that was known as the "miniassembler", which was executed starting at the ominous address $F666. The miniassembler allowed you to enter short machine language programs using the standard 6502 mnemonics (the three letter codes that referred to a specific type of operation; for example, "LDA #" represented the 6502 opcode $A9) instead of entering the program byte by byte in the monitor. The $F689-$F7FC space contained Woz's SWEET 16 interpreter. Wozniak wrote SWEET 16 to simulate a 16-bit processor; it simplified some routines he wrote for the Apple II ROMs, including the Programmer's Aid #1 renumber, append, and relocate routines. Simply put, he took a series of hex bytes, defined them as "opcodes" the way HE wanted them to function, and when executing the code used his SWEET 16 interpreter to translate the code into legal 6502 operations. It ran slower than standard 6502 code, but when memory space was at a premium it was better to have a slow program than to not have enough room for the program at all.

For those who are keeping count, there are a few unreferenced bytes in the latter part of the Integer ROM. Those bytes contained filler bytes that were not used as any program code.<9>,<10>,<11>

The last part of the Apple II memory, from $F800-$FFFF, contained Wozniak's Monitor program which has already been discussed above.

[**][**][**]

NOTES

<7> Jack Connick, p. 23.

A few words of introduction are in order. My name is Darrel Raines. I will be writing a new column for the Apple II version of GENieLamp dealing with games and gaming. Since this is our first article together, I thought you might want to know a little bit about my background. I am a long time computer user and hobbyist. I have owned an Apple II+ since 1982 and a IIgs since 1987. I have used personal computers at work and at home ever since I graduated from college. I currently work for NASA as a contractor on the Space Station Freedom (SSF) Training Simulator. I still work with computers on a daily basis, yet enjoy working/playing with my Apple II when I get home.

My Apple IIgs is used for a programming service that I run out of my home. I also spend a fair amount of time playing games on my computer. I consider computer games to be an important part of the reason to own a home PC. Along those lines, I have written my own game software and released it as freeware or shareware. When it comes to gaming, I enjoy playing all types: on a computer or otherwise. In this column, I hope to explore various games available for the Apple II series of computers. Along the way we will discuss many topics that I hope are of interest to the general computer user and/or programmer. I thought it would be fair to start with a look at what criteria we measure a game against to determine if it is "good".

Let us get started by discussing some of the skills acquired while playing games, on or off the computer. I believe that learning to play games helps to build a number of character traits that are important to a person's development. Logical thinking is a skill that can be learned and honed while playing many games. Sportsmanship and fair play can be taught through games (no one wins every game). Since games are played by a set of established rules, a person learns something about citizenship and living
under a government. Hand/eye coordination and motor skills are developed through participation in sports games (and, the couch potato says, using a joystick). Cooperation and teamwork are learned while playing games between teams.

All of the traits listed above can be acquired while playing at one game or another. Stated differently, every well designed game gives the participants the opportunity to learn one or more of these traits. Going back to the subject of this article, we have slipped into what I consider to be the prime quality that defines a "good" game. For your consideration, I will now place before you a shopping list of characteristics that I believe to be important in the development of game software. I will also indicate some games (past and present) that meet the criteria given here.

**Skill Development** How well does the game teach one or more of the various skills that we discussed in the previous paragraphs? A single game cannot hope to accomplish every expectation of a "good" game. However, ONE or more of these characteristics will be developed in a well designed game.

Chess will always be a favorite game for millions of people since it epitomizes the logical game. Nothing is hidden and all possible moves are known by both players. Therefore, it is sheer thinking ability between the players that is the deciding factor in the outcome of the game. Computer versions of this classic game have done nothing to diminish the allure of a head-to-head battle. I am always joyous at any victory that I am able to eek out over Chessmaster 2100.

Adventure games can teach a player how to cooperate with other team members. You will not make it very far in any of the Bard's Tale scenarios if you do not heal your wounded companions. I always spend the first part of any role-playing adventure game trying to determine how to best use my various characters. This helps out in the later part of the game where it is imperative that you kill off your foes with the least amount of effort.

**Playability** Does the game make you want to come back and play "just one more time"? Does it draw you back to the keyboard when you know that you should be hitting the pillow instead? Measuring a game's ability to addict the player is not always easy. But it is certainly undeniable that certain games are very addictive.

How many of you have fallen prey to the mesmerizing pleasures of that fiendish delight, Arkanoid (I or II)? Come on, be honest and raise your hands. Both my wife and I were caught up in this wonderful game. The premise is simple and the game is very easy to learn. All you have to do is hit the ball with your paddle and make sure that it does not reach the bottom of the screen. The problem is that a gamer wants to play just one more time to reach that next level. Eventually, you can't seem to stop until that evil demon has been knocked back into the far reaches of space from whence he came.

At one time, Lode Runner was the hottest game going on almost any computer system. I can remember spending hours dissolving bricks, picking up lodes, climbing stairs, hanging from the high wire, and eventually clearing the current level: only to have to do it all over again on the next screen. What fun! I once was enjoying a particularly successful game of Lode Runner, when I hit the pause button to rest my hand. I had cramps
from hitting the fire button on the joystick too many times. The fact that I was on level fifty pleased me very much until I looked at the clock. I had been playing for two hours and I still wasn't done with one game!

Stimulation Does the game make you think in new and creative ways? Are you faced with challenging situations that allow you to do things that you don't get to do in real life? Admittedly, this is something that you don't want from every game that you play. However, the joy of discovery and the excitement of the unknown make some games well worth the time spent playing.

When you play the Infocom game Sherlock Holmes and the Riddle of the Crown Jewels, you are forced to think like a detective. You begin to look for clues. You try to determine motive behind actions. You try to emulate Holmes knack for deducing so much information from so few clues. When I began to play this game I was reminded of my love of the character and the story telling ability of Arthur Conan Doyle. This stirred me to the point that I pulled out my old books and reread some Sherlock Holmes stories. I had first read these stories as a teenager. The experience was extremely enjoyable.

I have always loved to play basketball. I enjoy officiating basketball (more than six seasons of experience). I even enjoy watching basketball. Currently, I do not have the time to do any of these activities. So how do I get my basketball fix? I plug in Gamestar's Two-on-two Basketball and dunk to my heart's content. This is especially nice since I could never even come close to dunking a basketball in real life. By the time that my team has made it through the playoffs and won the world championship, I feel like I have accomplished the real thing. The Chicago Bulls had better watch out.

Random Events Does the game have some amount of random occurrences or situations? This factor makes a game less predictable and more entertaining. The random events should not be so prevalent that they alone determine the outcome of a game. No one wants to play a game where their efforts do not make any difference in the outcome. However, the addition of factors that the players cannot predict can add to the excitement of a game.

I enjoy playing war and tactical games when I have a good bit of time to spend with them. The games can tend to be somewhat on the dry side if the designers are not careful. Even the best strategists in a real world battle may be hampered by the onset of an unexpected blizzard. Therefore, I want the simulations that I play to have the same type of possibilities. The space war game Reach for the Stars has a number of random event options that may be selected. If you turn on the natural events option, you may start to wage an all-out offensive on a neighboring planet only to find that your best production planet gets hit by the plague.

Computer Player Modes -- Does the computer opponent (when available) adapt to my skill level? Can I select a level of opponent to match my playing ability? If a game is too easy to win, then you loose interest easily and do not play it for long. If a game is too hard to win, then you get frustrated by it and no longer play. This factor can do much to extend interest in a game to a wide variety of players.

One of the reasons that I prefer to play Jack Nicklaus Golf (JNG) instead of Mean 18 has to do with the computer players. JNG does not have
very many courses to choose from and it is very slow. But all of the bad things about the game are compensated for by the computer players that are available to compete against. When you get really good at the game, you can invite Jack himself to a friendly (growl) game of golf. One of my greatest thrills in computer gaming occurred the day that I finally beat Jack in a head-to-head skins match. Now if I could just do that on a real golf course...

Fun Factor Is the game fun to play? There is no way to quantify this """""" item. The only defense I have in listing it as a criteria is that it definitely exists. Perhaps a way to test for this factor would be to take ten average computer game players. Put each of them in front of a computer running the game in question. Have them play for an hour and ask them the question "did you have fun"? If at least three answer to the positive, then you may have a "good" game.

If any of you have played Infocom adventures you know that many of them can be very tough. I usually get frustrated at some point along the way in any of these games. I just cannot seem to find the right word or command to progress in the adventure. I have come to the point where I will not even start an Infocom game without a walk-through in my possession for emergency reference. With this type of frustration likely while playing a game, you might think that I would not even bother playing. An illustration should suffice to show you why I keep going back for more.

In the hilarious adventure Hitchhiker's Guide to the Galaxy, you eventually get stuck on an alien ship. You need to get a babel fish stuck into your ear so that you can understand what the aliens are saying. However, the stubborn little fish just will not seem to cooperate. I finally had to give up and get some help. The answer to the puzzle was not at all obvious. You needed some material that I had tossed away much earlier in the game. Then you had to perform two very unlikely acts in sequence. The result of your maneuvers puts that pesky little devil in your ear where he belongs. I would have NEVER figured out how to solve that problem. So why did I keep playing? Because the description of what goes on to the little babel fish on the way to my ear had me in the floor with laughter. In a word, it was fun.

If a computer game can succeed in one or more of the areas listed above, I would consider it to be "good" game. If I ever find a game that stands up well to all of the categories listed, then I may never see the light of day again. Since most of the criteria that I have put before you are subjective in nature I expect that various people will disagree as to whether or not they enjoy a particular game. That is okay. My purpose here is to establish a set of guidelines for future discussions on the subject. Now that we are done until next month, let the games begin!

You may contact me via electronic mail to register opinions, gripes, ideas, or your favorite games for future examination. My GEnie address is D.Raines . I will try to respond to each letter so long as the volume does not get too high. If you are writing a commercial or shareware game that you would like to see reviewed in an upcoming column, please contact me via GEmail.

 mê "Of course, if using GEnie is a regular habit for you, you / may want to check out Aladdin. It works great with a TT! / I've even used it to call CompuServe!! :)”

"GET_THE_LAMP" SCRIPTS NOW ONLINE

GEneral Access to NetLamp contributors are now available for
our IBM, Atari ST and Microphone
II/White Knight Macintosh readers. These script files will allow you to
download all the issues, or just the issues you want. As an added plus,
you can also have Aladdin grab the latest copy of GEneral Access to NetLamp while you
sleep. Where can you GET_The_Lamp script? You'll find the Aladdin scripts
in the GET_The_Lamp RT, [m515], Aladdin ST RT, [m1000] and the PCAladdin
RT, [m110]. The Macintosh macros for White Knight and Microphone II are
available in the GET_The_Lamp RT [m515], the Mac RT [m605] and the Freesoft RT
[m585]. Search for LAMP to find the latest version.

READING GEnie Lamp  GEnie Lamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnie Lamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ................ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO   To make it easy for you to respond to messages re-printed here in GEnie Lamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

| Name of sender | CATegory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}

ABOUT GEnie  GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99368,GENIE and hit RETURN. The system will then prompt you for your information.

/"Haven't you heard "patience is a virtue" and "all good things /to those who wait"? :^)"

/"Sure I have... But where's the update?? <Grin>..."

[EOA]

FROM MY DESKTOP /

Notes From The Editor
TOP OF THE PAGE The big news this month is the announcement of the GEnieLamp Computer Wars Contest winners. I am pleased to report that we received many entries from many different computer platforms. My thanks to everyone who participated in the contest.

I was surprised at how few entries came in from the larger platforms and even more surprised at how many entries we received from the smaller systems. If we were handing out an award based on how many entries we received, the Apple II platform would easily take the prize. Strangely enough, the IBM and Macintosh would be dead last. Perplexing.

You will find the 1st, 2nd and 3rd place winning articles elsewhere in this issue. All other entries will be published in future issues of GEnieLamp.

All-in-all, we had fun with the contest and we hope you did too.

NEW ALADDIN COLUMN I am happy to announce that master script writer, Jim Lubin has agreed to start a monthly column about Aladdin scripts. Each month in the IBM and ST Lamp there will be a "Cut & Paste" script that you can add to Aladdin. This month Jim makes it easy for you to check your GENie Usage and Billing Data. With this script getting this information is now just a click away!

ON A PERSONAL NOTE I received a somewhat frantic GE Mail message from long-time GEnieLamp ST staff writer Richard Brown [R.BROWN30] who wrote, "The hurricane is 16 hours and only 1.5 degrees off making my house the bullseye. 2 hours sleep, massive adrenaline. You might need to edit a little, sorry, but I'm bugging out. Online again ASAP." Since then I've seen horrifying news reports of destruction and chaos from Florida. From all of us here at GEnieLamp, our thoughts are with you and your family, Richard.

GOOD TO KNOW! I'm afraid I have to agree with you about working with the phone company regarding line noise. I work for Michigan Bell as a cable splicer, and before then I was a repairman.

For the past few years I've had a lot of battles with management about this topic. I got nowhere with them either. There are two problem areas. First, the vast majority of station repairman are not trained in repairing problems related with data lines. It requires some special equipment also. In our area, the only people with this knowledge and training are the Large Business Technicians. These are generally repairman/installers who do nothing but work for companies, and a lot of their work is on data lines.

What you need to do is request (demand?) that the repair department send out one of these people instead of a regular repairman. If you don't get anywhere then demand to talk to a supervisor. If that doesn't help, start calling your local public service commission. Unfortunately, in most cases you have to make a lot of noise.
Here is another fact. The phone company will tell you that there is nothing in the tariffs that say a "plain old telephone service" line will support data. This is true. But the tariffs and the FCC regulations require that the phone line come up to a certain requirements. If these requirements are met your phone line should easily handle 2400 baud service. When you run 9600 baud and higher you are at the very top of those limits and it's not reasonable for Bell to supply every customer with perfect lines. But there are ways to cure noise ratio and Db Loss problems very simply. But that gets back to my first comment...the repairmen are not properly trained to fix data lines.

I have found a simple way to cure most problems with data lines. It doesn't solve them all but it's worked for me in 13 out of 15 attempts. Ask your repair department to install an RF filter to reduce radio noise coming through the phone lines, and also place a Db Pad (Bell calls them a "97A Jack"). The pad is especially important if you live near the central office (where the dialtone comes from). It may cost you a small installation fee. If you just ask the repairman to install them he may even do it just to get you off his back.

Some day the government will ease off the phone company and we will start putting fiber optic cables directly to every home. Then you can enjoy super fast data without any noise at all.

(G.CROSS, CAT8, TOP10, MSG:140/M474)

Until next month...

[GENIELAMP]

>>> THE ANNUAL GENieLamp COMPUTER WAR CONTEST! <<<

~ FIRST PLACE - $100.00 GENie Online Credit ~
Brian McLean / [B.MCLEAN]

THE BEST COMPUTER? I once visited a grocers' distribution data processing center and was intrigued with the number of silver disks hanging on the wall, appearing like trophies representing best-selling record albums gone platinum. Only these weren't platinum record albums encased in crystal, framed in silver: these were hard drives nailed in effigy to the wall. And the head programmer described with horror the sound of a hard-drive crashing, the sound of steel fingernails...
dragging down some electronic chalkboard, a sound he knew too well.

There is no adequate answer to the question, which is the best computer. The truth is, none of us really likes computers. They perform stupid electronic tricks very quickly and with uncanny precision, as opposed to humans, who perform stupid tricks slowly and often inaccurately.

The problem with computers lies in their ability to lull us into complacency. Just as they become some dependable and predictable friend in our lives, bringing order to chaos, they burn us by failing to save an important file, or by destroying the hard drive, or by catching on fire. Et tu R2D2.

Computers conjure up unrealistic expectations. Some believe that computers are the harbinger of some 1984 Orwellian nightmare, and represent the ultimate instrument of oppression. Still others believe that computers will solve world hunger, bring world peace, or cure incurable diseases. The sad truth is that computers do only what humans tell them to do. Stupidly, quickly, and accurately.

The question of which computer platform is the best, then, is really the wrong question. Computers in a vacuum, unplugged, are nothing at all. It is the user or programmer that defines the platform. The flawed question posed is analogous to asking which is the best musical instrument, while ignoring the great instrumentalists. To make the question interesting at all, one must answer it with a twist.

Which is the best computer? My buddy Kevin thinks it's the Macintosh, which is arguably the coolest machine. Perhaps others would argue that the IBM or its "compatible" is the politically correct choice. Still others would embrace without question the innovative Cray. Or the vacuum-tubed Sperry-Univac, on nostalgic value alone. My little brother might convincingly argue Nintendo. But I think the proper answer to the question is the modem, that little cross-platform device with no moving parts and exaggerated warranties. The modem is the universal electronic medium. The modem educates, it informs, it amuses, it distinguishes not between seemingly incompatible platforms. The modem transfers and receives electronic mail and makes a large, detached, cold world, a little smaller, closer and warmer. The modem makes my IBM-compatible a universal platform. And I do not expect to be nailing my modem to the wall any time soon. At least not before the five-year warranty runs out.

Brian McLean owns and operates an IBM-compatible ZEOS 386-25 with a relatively full 120 megabyte hard drive. Waiting to crash.

~ Paul Vega / [P.VEGA1] ~

THE HP-15C ADVANCED PROGRAMMABLE SCIENTIFIC CALCULATOR

First, I want you to forget you saw that word, "calculator." It brings up all sorts of bilious preconceptions of gawky LED displays, Chiclet-style keyboards, and puny processing power. Preconceptions are dangerous in a world groaning under the weight of nuclear bombs.
So let us start anew, with fresh eyes, and examine this multi-functional device, this affable helper, my friend, the HP-15C.

This machine has features which far outpace those of other members in its class. Check out that full-width, ten digit display! In power-conserving LCD, no less. This is sufficient for spelling out many words, such as "07734," in the popularly used DUS encryption format. (To read DUS ("Down, upside") encrypted code, turn the HP-15C upside-down.)

The ergonomic keyboard boasts tactile feedback, and, in a bold move by H-P engineers, completely breaks from the QWERTY layout which has had such a stranglehold on the vast majority of typical personal computers, condemning users to a servitude of tangled fingers, endless typing lessons, and in some tragic cases, carpal tunnel syndrome. Indeed, by stripping the keyboard of all alphabetic characters, leaving only the numeric and mathematical/scientific function keys, H-P has virtually assured a new, refreshing brevity in any report or paper typed on this machine. I enthusiastically recommend that it be immediately installed in every legal office in the country!

But let us not overlook the HP-15C's most obviously appealing attribute--its gloriously tiny size. At 3 x 5", and a smattering of ounces, the 15C was a palmtop before the word "palmtop" was invented! I could carry it to the South Pole, if indeed I were going anywhere near there in the foreseeable future.

Along with its portability comes endurance. The HP-15C uses relatively ordinary alkaline batteries that make the nickel-cadmium ones, used in most laptops, seem like ponderous aircraft carriers. And what sort of life expectancy would you expect before the batteries powered down and had to be replaced? Two hours? Four hours? . . . How about _six months_?! Worries about whether one can continue working during that cross-country flight vanish, like so much blue water down a 747's toilet.

Finally, let me describe a hidden, yet very special attribute of the HP-15C. It turns out that most people are so seduced by the slim shape of the 15C that they ask to borrow it--even to do rudimentary tasks, like adding up lists of numbers. At this, I smile and sweetly ask, "Do you know RPN?" When this elicits the puzzled, blank expression that it invariably does, I know that once again my 15C will remain, shadowed in the warmth of my breast pocket, safe from the barbarian hordes who don't even know how to add numbers in Reverse Polish Notation.

The HP-15C. More than just a "calculator"--it's a great and good friend. Shouldn't you get one, too?
standard for all workstations and personnel computers of the future. Unix BSD which gives you multi-user and multi-tasking with many other advantages that a Unix system gives you. Then there's Display PostScript which makes the NeXT a truly "What you see is what you get" machine. Fax integration that will blow you away! Let's not forget the 68040 and the DSP from Motorola which also sets the standard in chip technology. The NeXT floppy disk supports DOS 720K, 1.44 and MacIntosh formatted disks, plus the new Extended Density 2.88 floppy disks.

On the software side of things, all the major players are there. Lotus treated us with their incredible Improv spreadsheet and WordPerfect is there with their industry standard word processor. We also have other interesting software like the product called Simon Says which gives your NeXT voice recognition and many many more applications. If that not enough NeXT bundles a massive amount of software with each machine. These include Interface Builder, C compilers, Digital Webster (with full word definitions and pictures!), A text editor, Digital Librarian and a Mail application that can include voice attachments and document attachments (like a spreadsheet or graphics or ...) Which other vendors namely Sun are only now emulating.

The future is bright for NeXT with it's multi-platform port of it's NeXTstep environment.. NeXTstep has already been ported to the 486 and ports to other platforms are planned for the near future. This gives the user a wider choice of hardware to choose from and at the same time the user is not at the mercy of a specific hardware or chip vendor. The NeXT also has an very large public domain software selection which is growing rapidly as each month passes, I'll also add that the pd software rivals some commercial applications found on other platforms, all of this due to the very advanced developers tools and a great programming community. All of that and more for a lot less then you think! I really love my NeXTstation, I would not trade it for any other computer and that includes a Sun workstation!

"Isn't it amazing how a $6 part can fix 100’s of $$$ worth of equipment?"

By Thomas M. Schmitz

Apple II ODDS & ENDS
  WHAT'S NEW?
  THROUGH THE GRAPEVINE
  APPLE HEADS WANT TO KNOW
  MESSAGE SPOTLIGHT
A2 UNIVERSITY PLANNED! The Apple II Roundtables (A2 and A2Pro) are pleased to announce the fall term of A2 University, the GENie classes you can take from your own home for just the cost of GENie time.

A2 University, abbreviated A2U, teaches courses of up to 12 weeks duration so that you can learn the programming you want to learn. And not just traditional programming either!

A2U's fall term features classes on two of the Apple II's hottest topics by experts in their fields. The first course is "Ultra 4.0 to the Max!", taught by world-renowned Ultra MacroWorks expert Will Nelken (read his stuff in A+/inCider!). Will's got a 12-part course to show any AppleWorks user how to get the most out of JEM Software's brand-new Ultra 4.0 package. If you like squeezing more power out of AppleWorks 3.0, this course is for you!

And starting in October, A2U presents Andy McFadden (author of NuLib and YankIt NuFX utilities) teaching a class on data compression. From the concepts of how data is compressed to the specifics of today's common compression standards, Andy's course can teach you how to make things smaller.

For more information on signing up for either of these courses, see the new category 22 in the A2Pro Bulletin Board! Classes start soon, so prepare to expand your knowledge here with A2Pro -- teaching you what you want to know! --Matt (A2Pro Head Sysop)

MORE K-FEST STUFF Well, everyone else has done a great job of summing up Kfest to date. Nobody mentioned the guys trapped in the broken elevator, or the frisbee, or the SoftDisk pizza orgy (which included a session of SoftDisk's "Word Search" game elevated to a contact sport), the midnight runs of Bear's monster truck, or several other things that occurred in the dorms, but what the heck.

The important point is that you people should come to Kansasfest even if you aren't commercial programmers. I'm just a IIe guy who programs mostly in Applesoft with the occasional small assembly extension. While I thoroughly enjoyed the conference sessions that I attended, I didn't come for the conference. I came for the chance to meet and talk with the movers and shakers of the Apple II world. They are all terrific people, and as Apple ramps down the GS program it seems to me that we are all growing closer. I hung out in Roger Wagner's dorm room while he gave demos of incredible prototypes of GS hardware (Roger has the neatest toys in the known universe). I went to dinner with a large group that included several Apple people, Roger Wagner, Uncle-DOS, and others, and spent much of the meal having a great conversation with Joe Kohn. Peter Walker, one of the Aussies, adopted some of us GENie guys and it was neat learning what it's like to live and compute in Australia. I spent one break listening to Greg Branch (of Apple) tell stories about the life of a programmer at Apple, Inc. I got to meet Silas Warner, Alan Bird, and many others. And on, and on.
My favorite conference sessions were the "Old Timers" series:

- Tom Weishaar and Paul Statt ran an unstructured session that turned into the "story hour" as Tom, Paul, and the many old-timers in the audience took turns telling anecdotes about the old days.

- Silas Warner's talk on the earliest days of Muse and the Apple II software was fascinating. It's a whole other world when you program for 4K and 16K Apples that don't have disk drives! Silas gave us some insights into the assembler that they invented that made code that was next to impossible to disassemble.

- Alan Bird and Roger Wagner ran another unstructured session that was largely about Bert Kersey and about Roger's early days. Did you know that Bert's porch had a trap door in front of the door of his house? Roger mused about how he declined to publish Print Shop because he judged it a stupid idea that no one would buy. Roger told us that he originally was either going to buy a motorcycle, a stereo, or a computer. He settled on the computer because, "Once it's paid for, there's nothing else to buy." There was lots more. Roger is a riveting, hugely amusing speaker.

Some people from my User Group here in NC came all the way to Kfest just for the Expo, and missed the conference. The Expo was swell, but it's the conference that has the real action. Don't miss it next year.

-TomZ (T.ZUCHOWSKI, Cat. 44, Top. 7, Msg. 22, M645;1)

AND MORE K-FEST! That Ozzie's name was Peter Weller, not Walker (if I'm not mistaken). ;-) Funny stories? How about Don "The Enforcer" Grimes hefting Roger Wagner likea sack of potatoes? Thought poor Roger would have a heart attack right then and there.

My favorite bit was spending all night talking to Tammy Wolfgram because she was locked out of her husband's room. Her husband (Marc Wolfgram, the brains behind Foundation, the new IIgs resource editor and a VERY hot product for programmers that I'm sure will be talked about in detail over in A2Pro) was stone asleep. At some point I got tired of it so I just walked up to the door and began pounding a very fast 4/4 in triple-time patter, like a drummer, until a very astounded and confused-looking Marc opened his door. ;-) 

Ah, but wait, there's more. Can anyone forget the Australian gentleman (whose name was Cameron, I believe) who accidentally kicked a soccer ball into Matt Deatherage right in the dorm hallway? Matt let out a yelp (he'd been hit in a rather sensitive area) and proceeded to bellow and chase this poor Australian around the entire dorm.

It may have been covered already, but it was surely amusing. One A2 sysop walked up to Matt after the fact and asked loudly if he was abusing the foreigners again. Everybody had a good laugh.

Guess you had to be there.
You people who didn't come missed a lot. I was way too busy myself during the conference to have near as much fun as I'd wanted to and I still had a blast. ;-) -Dean Esmay

(A2.DEAN, Cat. 44, Top. 7, Msg. 24, M645;1)

FAMOUS JOE AT K-FEST SPEAKS TOO! For me, the funniest thing that happened at KansasFest happened when I was sitting at the inCider booth. Someone approached and said something like "Wow. You're Joe Kohn? You look different than I thought. Your writing style is so formal, I expected someone very conservative looking and I thought you'd be wearing a suit and tie".

Another funny thing happened when I asked Steve Disbrow to do me a favor, and to sit in the inCider booth for a bit. He was most accommodating, and did as I asked. He also got Noreen to take a picture of him, wearing his GS+ t-shirt in front of the big inCider banner. If we're lucky, that picture will be on the front cover of the next GS+, with a huge banner announcing "GS+ Buys Out inCider". -Joe

(J.KOHN, Cat. 44, Top. 7, Msg. 25, M645;1)

Also a big thank you to Roger Wagner for all the good advice he provided to me (& many others) while at the Expo. Its really great to have such a cheerful person to talk for advice, always willing to share his experience with those in need. Its no wonder that this is the person who is almost single-handedly keeping a whole Apple product line alive. His helpfulness was exceeded only by his wonderful wife who actually handled my updates while answering a million questions from other attendees. Thanks, Pam! (R.CHEVRIER, Category 32, Topic 5, Message 100, M530;1)

WHAT ABOUT THOSE YOUTHFUL PROGRAMMERS? I used to despair a lot about the number of active younger programmers who seem to turn out miles of code. Then I realized that they have a rather protected environment, not having to maintain jobs to keep up house payments, support families, etc. :)

It would be interesting to track the number of these folks that continue to crank out work when they enter the work force. Some, like Andy Nicholas, are good enough to go on to jobs where they can continue to use their skills. Many might not.

Plus, sometimes it takes the discipline of a few years to come up with the insight for finishing really important programs (like Pointless, though Alan Bird isn't exactly an "old fogy"). The FTA wrote a lot of incredible demos, but very little of a productive nature, and productivity is the reason most people buy computers. Often age and cunning exceeds youthful exuberance... :)

(A2-CENTRAL, Cat. 2, Top. 4, Msg. 64, M645;1)

FEEL INTIMIDATED BY A2PRO? Our recent conversations with those of you who could benefit a lot from the services A2Pro has to offer make us frown -- you tell us you're intimidated by A2Pro, that A2Pro is for the "elite" and the "hackers", and that regular home-type programmers are out of place there.

We don't care if it's true or not -- we're going to wipe it out. One
way we're starting is with an A2Pro Beginner's Night conference EACH AND EVERY WEEK. At this real time conference, no programming question is too silly, no development question is out of line and no questions about A2Pro are out of line. Period.

We're going to hold these conferences every week on Thursday nights at 9:30 PM EDT (6:30 PM PDT, or 5:30 PM in Alaska) starting August 13th. And to put our money where our mouth is, we'll be giving out FREE GENIE TIME to random participants for the first four conferences.

(M.DEATHERAGE, Category 1, Topic 17, Message 9, M530;1)

A2PRO NEW USERS NIGHT CONTINUES ON 8/20 Our first new users/beginners/folks-who-haven't-been-in-A2Pro-but-that's-too-long-to-use-as-a-title night last Thursday was lots of fun -- people came, found out about what A2Pro has to offer, asked some programming questions they had stored up and two folks won FREE GENie time.

What could be better? Why, we're doing it again this Thursday night at 9:30 PM EDT, and folks will again win FREE GENie time!

The new users' RTC in A2Pro will happen every Thursday from now on, but only during the grand opening can you win GENie time. Don't miss out on all the fun -- more GENie users are having fun in A2Pro than ever before, and there's no reason you can't be one of them!

(M.DEATHERAGE, Category 1, Topic 17, Message 15, M530;1)

SO YOU FOUND A BUG BY APPLE? If you want to report the bug to _Apple_, no online service is the right place to do it. Apple's bug reporting center can be reached by internet Email (apple.bugs@applelink.apple.com), or you can US mail them at:

Apple Bug Reporting Center
Apple Computer, Inc.
20525 Mariani Ave., MS: 42-ES
Cupertino, CA 95014

But I'd strongly encourage you to check out A2Pro. I don't know and can't change what your past experiences with A2Pro have been, but if A2Pro can't reasonably help you out with your problem, we'll fix it.

That's all we can do.
--Matt (I speak for myself, not for Apple)

(M.DEATHERAGE, Cat. 9, Top. 6, Msg. 112, M645;1)

>>> WHAT'S NEW <<<

A2 LOST CLASSICS GETS APPLE WRITER 2.1 It's now official. Applewriter // by Paul Lutus is now available as Freeware in the A2 library (File # 19164). When I spoke with Paul, he agreed to allow distribution subject to a few restrictions.

1. Any and all people may copy Applewriter // version 2.1 ONLY. Other versions are not included in the Freeware

(M.DEATHERAGE, Category 1, Topic 17, Message 15, M530;1)
statement.

2. No one shall sell Applewriter. Nor shall anyone include it on a disk with other software which is being sold.

3. The documentation provided with the program was produced and is owned by Apple Computer Corp. The authority to distribute Applewriter does NOT include any copyrighted documentation.

4. The source code for Applewriter is still owned and retained by Paul Lutus. He is treating it as 'trade secrets' and therefore shall not disclose such source code. This situation is unlikely to change.

5. Paul is allowing Applewriter to be distributed as 'Freeware'. This means that the software is still copyrighted and still owned by him. It is within his rights to pull Applewriter out of circulation at any time he chooses. This also means that derivative works based on Applewriter code may be in a legal grey area. So tread carefully. :)

(A2.TIM, Cat. 7, Top. 6, Msg. 2, M645;1)

I talked with Paul Lutus earlier this week and got a clarification on the 'give away but do not sell' problem.

Essentially, Paul has allowed Apple Writer to go Freeware, because he has made enough money from it, but does not want anyone else to make money from it at the expense of the users. To this end, he wants it copied freely with no charge being made for the program. You may charge for the disk it is on, but this charge should be reasonable. For example, charging $10 for a disk with Apple Writer would be out of line, but charging $2 or $3 for a floppy is not. If a User's group routinely charges $3.95 for a filled floppy, including postage, then $3.95 for a disk with Apple Writer would be OK. But if they normally charge $3.95 and then charge $4.95 for Apple Writer, then it is NOT OK.

Do you all see where I am going with this? :) Following this reasoning then, having Shareware Solutions include Apple Writer on its disk would not be in violation. Likewise the A2 on Disk could add Apple Writer safely, because the disk averages less than $4, and would be the same price whether or not AW were included.

If you have any further questions, please ask. :) Hope this makes somebody happy. :)

Tim Tobin
A2 Head Librarian

(A2.TIM, Cat. 7, Top. 6, Msg. 48, M645;1)

SOUND ON YOUR II NON GS SoftDAC v2.0b1 is now available, pending release by the A2 sysops as file #19192. The new version offers improved sound quality—and it supports the RamWorks (and compatible memory expansion boards) to allow you to play really long sounds.
For those of you who have never heard of SoftDAC, let me explain...in December 1990, I released a program for the 128K Apple IIe and IIc that allows these machines to play sampled sounds. Sampled sound was previously the exclusive domain of the Apple IIGS, Macintosh, and similar machines. SoftDAC allows you to play sampled sounds on the IIe and IIc without any extra hardware...and now it's even better, with RamWorks support.

As usual, if you have questions regarding SoftDAC, you may (1) leave them in this topic or (2) send me email at S.ALFTER. Please note, however, that the Skunk Works BBS is temporarily offline, pending replacement of a dead power supply.

LISTEN UP! In recent issues, both A+/inCider and A2-Central printed subscriber letters which state the HFS FST works fine under System Software 5.0.4.

This is dangerously incorrect.

While Apple tries to keep the internals of GS/OS fairly stable from release to release to minimize the opportunity for errors, GS/OS has always required substantial internal changes when new read/write file systems are added. This was true in System Software 5.0 for AppleShare and is true in version 6.0 for HFS.

The HFS FST may appear to work in normal circumstances (as the letters indicate), but the older versions of GS/OS do not meet the demands of the newer FST. The FST will almost certainly crash if you try to initialize any disks.

Components from different system software versions do not mix and match -- do not use older system software files with newer system software versions. GS/OS drivers are an exception -- they have a stable, documented interface and will work fine with any version of GS/OS later than the one for which they were designed, although some manufacturers may require newer features of newer drivers. (For example, the System Software 6.0 Apple 3.5" driver supports SuperDrives attached to an Apple II 3.5 Disk Controller Card -- while you can use the older version of the Apple 3.5 driver safely with System Software 6.0, you won't be able to use drives connected to an Apple 3.5 Disk Controller Card.)

Mixing and matching system software in general is dangerous -- but using the HFS FST under 5.0.4 will eventually crash and it may trash your disks. Do not attempt this with any disks online that you want to keep.

Matt Deatherage
Apple Computer, Inc.

MS-DOS FST SOON TO BE A REALITY Apple publicly announces MS-DOS FST for Apple IIGS A2 CENTRAL SUMMER CONFERENCE 1992 ("KANSASFEST"), KANSAS CITY, MO., U.S.A., 1992 JUL 23 (A2 ON GENIE) -- Apple publicly announced today that they are working on an MS-DOS File
System Translator (FST) for the Apple IIGS. Currently the FST is read-only, and writing ability is being worked on. It is not expected that the writing ability will be ready in time for its initial release. The MS-DOS FST is expected to ship with Apple IIGS System Software version 6.0.1.

Apple IIGS System Software 6.0.1 is a maintenance release made necessary by the Apple II Ethernet Card. When the Apple II Ethernet Card ships, expected by the end of the year, System 6.0.1 will be made available. Besides bug fixes to System 6.0, the only other major change announced in System 6.0.1 is the addition of keyboard navigation to the Apple IIGS Finder.

The MS-DOS FST will work on any MS-DOS volume that can be accessed by the Apple IIGS. Currently, the access of MS-DOS 3.5" disks is limited to 720K and 1.44M MS-DOS 3.5" disks read via an Apple SuperDrive or equivalent, connected to the Apple II SuperDrive Card (formerly known as the Apple II 3.5 Drive Card). Other known methods to access MS-DOS data on an Apple IIGS include MS-DOS formatted Syquest cartridges and MS-DOS 5.25" floppy disks read via an Applied Engineering Transdrive, connected to an Applied Engineering PC Transporter card.

(Lunatic E'Sex, reporting for A2, the Apple II Roundtable on GEnie)

"""""""""
MORE ON MS-DOS FST  
****
| THE FOLLOWING MORNING. IT TURNS OUT THAT THE MS-DOS FST IS BASED LARGE OF THE PRODOS FST! GREG STARTED WORK ON THE MS-DOS FST AS A SIDE PROJECT, AFTER HE HAD ALREADY TRANSFERRED OUT OF THE APPLE II DIVISION. ONCE HE GOT IT TO A CERTAIN POINT, HE TURNED OVER THE CODE TO DAVE LYONS. THEY HAVEN'T EVEN REALLY STARTED ON THE WRITE PORTION, YET. THE BIG PROBLEM WITH WRITING TO MS-DOS DISKS IS FORKED FILES. THERE ARE CURRENTLY TWO OR THREE COMPLETELY DIFFERENT METHODS THAT ARE USED TO STORE MAC FORKED FILES ON MS-DOS VOLUMES, AND THEY DON'T KNOW IF THEY WANT TO CHOOSE ONE OF THOSE OR TRY SOMETHING ELSE (THERE SIMPLY IS NO STANDARD, AND IT DOESN'T LOOK LIKE THERE'S GOING TO _BE_ ONE).

SINCE THE ATARI ST USES A DISK FORMAT ALMOST IDENTICAL TO MS-DOS WITH A FEW VARIATIONS, GREG SAID IT'S LIKELY THE MS-DOS FST COULD READ ATARI ST DISKS, AS WELL, BUT HE DIDN'T HAVE ANY ST DISKS TO TRY IT OUT ON (IF I CAN SCARE UP SOME ATARI DISKS I THINK I'LL RUN OVER TO MONROE 4 AND SEE IF DAVE WANTS TO TRY 'EM OUT). I MENTIONED AMIGA DISKS, BUT NOTHING CONCLUSIVE WAS DECIDED ABOUT THEM.

RIGHT NOW, THE MS-DOS FST USES FILE NAME/FILE TYPE TRANSLATION THAT IS IDENTICAL TO (AND TAKEN FROM) THE HIGH SIERRA/ISO 9660 FST. FOR EXAMPLE, FILENAME.TXT IS TRANSLATED INTO A TEXT FILE. I SUGGESTED ASSIGNING NEW AUX TYPES IN THE $E0 FILE TYPE TO CERTAIN COMMON ARCHIVE TYPES, SUCH AS .ARC AND .ZIP, BUT THEY SAID THEY DIDN'T WANT TO DO ANYTHING WITH AUX TYPES, RIGHT NOW, JUST FILE TYPES. OF COURSE, ANYONE WITH THE GS/OS REFERENCE CAN LOOK IN THE CHAPTER ON THE HIGH SIERRA FST TO GET THE DATA ON MAP TABLES AND CREATE A NEW MAP TABLE FOR THE MS-DOS FST (LIKE ASSIGNING .DOC FILES TO TEXT FILES, AS WELL). -- Lunatic

Apple II Computer Info

GraFORTH IS A LOST CLASSIC! It's now official. GraFORTH by Paul Lutus is also now available as Freeware in the A2 library (File # 19206). When I spoke with Paul, he agreed to allow distribution subject to a few restrictions:

1. Any and all people may copy GraFORTH.

2. No one shall sell GraFORTH. Nor shall anyone include it on a disk with other software which is being sold.

3. The source code for GraFORTH is still owned and retained by Paul Lutus. He is treating it as 'trade secrets' and therefore shall not disclose such source code. This situation is unlikely to change.

4. Paul is allowing GraFORTH to be distributed as 'Freeware'. This means that the software is still copyrighted and still owned by him. It is within his rights to pull GraFORTH out of circulation at any time he chooses. This also means that derivative works based on GraFORTH code may be in a legal grey area. So tread carefully.

Tim Tobin / Lost Classics Coordinator
(A2.TIM, Cat. 7, Top. 6, Msg. 22, M645;1)

BUT WHAT DOES IT DO? GraFORTH is a DOS 3.3 based graphical version of FORTH for the Apple II. It also has music and sound routines built in. Several demos are included as samples. These samples include animation routines, and music. I particularly like 'Die Fledermaus' which has a bat, with smoothly flapping wings, flying though the moonlit night sky.

It is quite good, the only drawback being the fact that it is DOS 3.3. Anything in particular you would like to know? Tim Tobin / A2 Head Librarian
(A2.TIM, Cat. 7, Top. 12, Msg. 4, M645,1)

APPLENET ANNOUNCEMENTS Here are a couple of announcements concerning AppleNET v2.0. First, thanks to Michel Donais, a friend of mine, and a "sometime" developer for AppleNET v2.0, we'll be using the auxiliary bank of Applesoft memory to store most system variables. That means, we'll have plenty more memory space for the overall system. The auxiliary memory partition, as it is now, will contain the menu and configurable BBS variables, as well as (perhaps) data on system events, accounting information, etc.. Once we're done with all the major stuff, I'll see if I can stuff the message editor variables in there for even greater memory space. But right now, the routine works like a charm! (It uses the same syntax as MW 3.0's & STORE command.)

As well, unless any other suggestions are received for AppleNET 2.0's "new" name, most of the people up here have agreed on AppleNET Pro v2.0 as the program's "rebuilt" name. Didn't I say this was going to be a complete rewrite from the ground up, including its name? <g>

And one more thing. If you are on Fidonet, I will soon be getting
access to a Fidonet node, so you'll see me there once again. So, if you're an AppleNET sysop (or not!), feel free to drop me a line there once I do get my account. I'll be offering updates, news, and support on AppleNET Pro v2.0 and older versions of the BBS software. -Derek Fong

BYTE WORKS RELEASES ORCA/C

""PROTOTYPED HEADERS (ALPHA VERSION)  If you use ORCA/C and like the ANSI C features, you may have wished that the header files provided included function prototypes to help you with your programming. Well, wait no more!

Mike Westerfield from the Byte Works has uploaded an ALPHA version of prototyped headers for ORCA/C. You can download and start using them now, and if you find any problems or have any suggestions, it's still well within time to make suggestions to Mike for inclusion in the final product. Note that since these are ALPHA releases, no one's promising they won't change before final, so if you use any in final software, be sure to keep a copy around so you can rebuild later.

You can find the ORCA/C header files in A2Pro's library in file #2796, CHEADERS.BXY. Download them today and make ORCA/C work for _you_!

(M.DEATHERAGE, Category 1, Topic 17, Message 13, M530;1)

NEW HUMAN INTERFACE CATEGORY DEBUTS  A2Pro's bulletin board has a new category -- "The Human Interface and You." This new category (#21) has room to discuss all the issues programmers face when trying to make people understand how to use their work. If you've ever had any questions or personal peeves you wanted to discuss, Cat 21 in the A2Pro bulletin board is for you. Check it out!

(M.DEATHERAGE, Category 1, Topic 17, Message 14, M530;1)

>>> THROUGH THE GRAPEVINE <<<

IBM-GS ???  We are not sure where this started, but some reliable sources are talking about a IIGS on a card for the PC and its clones. Obviously such a development would make production of Avatar much easier and there has been some sketchy talk of a licensing deal between the developers. This has neither been confirmed nor denied by Bill Heineman, Avatar's would be creator, at the time of this writing.

It should be noted that IIe's on a card already exist for the IBM PC. This author wonders, if software can emulate the Macintosh on an Amiga, why the same cannot be done for the IIGS? And do not give the ancient Esoniq chip excuse. If the IIGS can play a Mod, the Amiga can easily play SoundSmith and other IIGS music systems. (Editor)

MORE ON IIGS EMULATOR FOR 386/486 COMPUTERS

Unfortunately, there's not a lot of info available, due (IMO) to Apple, Inc.'s propensity for spending tons of money on rabid lawyers to litigate the competition out of existence.
As for what software will run on the emulator; it uses active translation at the ML level from 65816 code to 80386 code. The GS tools are fully translated to Windows API calls, so it will run ANY GS specific software that uses standard calls. Sorry, but I think that probably rules out FTA stuff and maybe even IIe/c software. But there are already Apple II emulators available.

Speed-wise, it runs GS software on a 25 MHz 386 just a little faster than a standard (non-zipped) GS, so I'm sure an 8 MHz GS will still blow it's doors off.

Personally, I'm looking forward to seeing the full product!
(R.CLYDE4 [Niccolo], Cat. 1, Top. 4, Msg. 22, M530;1)

WHAT'S THAT? I have heard that Ken Franklin is about to release another dynamite ReliefWare program.
(A2.BEAR, Cat. 5, Top. 3, Msg. 36, M645;1)

TECH TALK I recall reading that for QuickDraw II version 3.x, the screen is guaranteed to be at E12000. I need to double check, but I read it in an article by Mike Westerfield on filling areas in Call-Apple very long ago. Depending on QDVersion, he either used QD calls or screen memory directly.

Should CloseView alter the QD version in the chance that some apps will change from directly accessing memory to using QD calls? ~Jay
(J.KRELL1 [Jay], Category 15, Topic 4, Message 51, M530;1)

SOUND TALK I\o, MODs are pretty sure to take the most processor time, and SoundSmith songs the least. To play a MOD you usually have to do a lot of swapping of instruments in the DOC RAM, since MODs can have up to 128K instruments. The processor hit to play a MOD is probably 50-80% or even more. SoundSmith music playing takes very little extra processor time -- lots of games use SoundSmith music. From what I understand, you set everything up in the DOC RAM and then let a little interrupt driven routine do all the work for you, while you go off and do your animation/etc. MIDI Synth music has also been used in games (the only one that comes to mind right now is Dragon Wars GS; I think Bill Heineman wrote another one that uses MIDI Synth, too). Since it uses a tool that's built in to the system, it should also be pretty easy to use. That's not saying anything about getting the music INTO the software, though. I'd say use MIDI Synth if you can spare the little extra processor time, or SoundSmith if not. -= Lunatic
(LUNATIC, Category 11, Topic 11, Message 10, 530;1)

JUPITER PAYMENTS >> does anybody know if it's possible to pay the shareware fee with Jupiter Systems by VISA-card?
The members of Jupiter Systems (Dan Wellman, Mike Fleming, Marco Busse, Brian Clark, Jonathan Stark, Chris Trimble, and Rob Lathan) are all high school students, and just aren't set up to take credit cards.
There are a few suggested ways for non-Americans to pay shareware fees to American shareware authors. You may be taking a risk with unscrupulous postal employees, but chances are that a carefully wrapped $10 bill would make it through. Another method would be to find a local branch of an American International Bank, and purchase an international check or money order. Of course, you may have to pay a fee on your end, but Jupiter probably wouldn't have to pay a fee on this end. The last method would be to visit your local bank, and have them issue a check drawn on US funds. Again, you may have to pay a fee on your end. -Joe Kohn
(J.KOHN, Cat. 2, Top. 4, Msg. 52, M645;1)

TRACKBALL PROBLEMS
Kensington Turbo Mouse: Old versions worked as "chording" feature (pressing both buttons at the same time to issue a macro) causes the computer to hang. The newest version tracks verrrrrrry slorrrrrrrrrrrllllly on the IIGS (there is Mac software included to adjust the tracking but the default tracking is much too slow on the GS).

CH Products RollerMouse: The extra buttons cause the computer to hang in various programs.

Trackballs that should work all right on the IIGS:

Logitech TrackMan: Their MouseMan works fine, so I assume the TrackMan would too. The two extra buttons generate left and right arrow keys on the GS.
(QC [Jerry], Category 12, Topic 28, Message 8, M530;1)

ICON INFO
There is no specific limit to the number of icons you can put in a file. There ARE several things to keep in mind, though:

1) The icon EDITORS may have a limit. Going beyond this limit may result in an error, a crash, inability to save the file, or worst of all, a corrupted file.

2) Earlier versions of Finder had problems loading in very large icon files. Finder 6.0 is much better with this, but I personally don't want to try pushing it.

3) Finder must allocate a single large block of memory for every icon file it loads. If it can't allocate a large enough block of memory, it won't load in the file.

I don't even want to guess what happens if it tries to load in a file larger than one bank (64K) of memory.

On the other hand, the fewer icon files you have, the faster Finder starts up, and the less fragmented memory becomes. My personal advice is that if you keep to around 50 icons per file, you should have absolutely no problems whatsoever. I have pushed a file up to near 80 icons, but all the icons in that file were very small, keeping the size of the file itself relatively small.

The way I, personally, organize my icons is in about five files:

- System. Icons (anything as shipped on a system disk,
Apple II Computer Info

including replacements for Finder's icons),

- Document.Icons (graphics files, sound files, word processing files, etc.),

- Applic.Icons (icons for the applications themselves),

- Develop.Icons (icons for source code, utilities, etc.),

- and a file I call Last.in.Folder, to remind myself where it should go (the most generic custom icons, like text files, binary files, disks and drives, the trash can, folders, etc.).

This way also keeps almost all icons for a specific type in a single file (except for Last.in.Folder) so that they can all go in any order within my icons folder (again, except for Last.in.Folder). -= Lunatic (: (LUNATIC, Cat. 9, Top. 2, Mesg. 15, M645;1)

STANDARD LANGUAGE PRACTICE This will be a little long. There seems to have been a lot of traffic here in the last couple of days!

1. Jay: I'm not trying to play God when I implement a language, just the opposite -- and that's why I'll never do what you suggested. That's not the contradiction it sounds like at first. I feel very strongly that if you pick up a package that says it's Pascal, it ought to be Pascal -- period. There is (or should be) a big distinction between a language designer and a language implementor.

That doesn't mean you can't add to a language, and in fact, the Pascal standard even addresses that issue. If you look in our Pascal manual, you'll find all sorts of extensions, and more will undoubtedly come in the future. When I extend the language, though, I do it with great care. I feel like any extension should be clearly labeled as an extension -- and our manual does just that. I feel you should be able to block any extension (so you can write portable programs) and my compiler has a directive to do that. I feel any extension should be compatible with the language as a whole, never breaking the original language, and all of the extensions I've added fulfill that requirement. Finally, I feel that any extension to a language should be made in the spirit of the language. Each language, after all, has a unique feel and basis. Pascal is safety. C is staying out of your way. BASIC is simplicity. Ada is industrial strength with rigid standards for portability. And so on.

Think about it from the other side: if you pick up a book that shows a program for the IBM PC, don't you want to be able to type it in on your Apple IIGS? If every compiler writer did what I do, and the program either enforced the standard using some directive or encapsulated things like graphics calls in easy to change subroutines, you could do that. Unfortunately, far to many compiler writers do exactly what you suggest, and far to few programmers have any idea what parts of a language are standard and what parts are extensions. As a result, it's hard to use a program on another computer. Even C, the "portable" language (what a laugh!) has this problem -- more so than Pascal, in fact. I've been told that Turbo C has four distinct compatibility modes: C++, ANSI C, K&R C and UNIX C -- and that doesn't even count the different memory models, each of
which can cause problems. (And, keep in mind, UNIX C was always advertised
as _being_ K&R C, yet they needed two distinct modes!)

No, standards are there for a reason. It's a good reason. Compiler
writers owe it to you, me, and every other person to implement a language
faithfully. Add if you want, but only within the constraints of the
language, and only to solve specific problems (like toolbox access) that
can't be handled without the extension.
-Mike <standards 'R Us> Westerfield
(BYTEWORKS, Category 6, Topic 8, Message 86, M530;1)

WPL On Apple Writer

WPL is the Word Processing Language built into
AppleWriter. Essentially, AppleWriter has a
built-in programming language, and a pretty darned powerful one. Randy
Brandt told me at KansasFest that part of the reason he wrote his first
macro program for Appleworks (he's the guy who wrote Timeout Ultramacros)
was because he AppleWriter had a programming language but AppleWorks did
not.

WPL is really quite remarkable. AppleWriter as a consequence is also
rather remarkable. There's stuff you can do with AppleWriter that you
still can't do with much more "advanced" word processors. Even AppleWorks
with souped-up macros can't do everything it can.

What's most interesting about it is that AppleWriter SEEMS deceptively
simple and lackluster. It doesn't look like much until you start exploring
what it can really do with WPL and a few other nifty features.
-Dean Esmay (A2.DEAN, Cat. 28, Top. 4, Msg. 47, M645;1)

IS JOE A DREAMER? The idea of setting up some type of Shareware Solutions
Buddy program was just something that came off the top
of my head. If you remember some of the first messages I posted here, I
said that my Shareware Solutions column is mainly directly at those who
don't belong to user groups or own modems. That's still the case, and I
think it's a very safe assumption that the vast majority of people who
write to me for the shareware solutions companion disks have never used a
freeware or shareware program before. I really do believe that.

In the back of my mind, I thoroughly believe that the more people that
use freeware and shareware, the longer the Apple II lives. After all,
everyone reading this note has probably downloaded zillions of programs
from the A2 library and has more than enough software to last a lifetime.
But, what about all those other folks who use one or two programs? What
about those who still use AppleWorks v1.1? What about the GS owners using
System 1.1?

I believe many of them read inCider, and have to at least be a little
intrigued by the shareware goodies I write about. How can we get them
better connected? How can we get them to buy modems, or to join user
groups? How can we make them aware of freeware and shareware?

That's what got me thinking along those lines. Here's my fantasy:
Suppose we had people all over the country who were giving away great
Apple II software? Suppose they contacted schools in their area, and
offered to visit and supply them with freeware? Through my involvement with
a non profit organization (CompuMentor), I visit non-profits that use Apple
II's and give them free software, as well as providing free consultation. A few weeks ago, I went to a homeless shelter in San Francisco that uses Apple II's to teach basic computer keyboarding skills, and gave them Charles Hartley's freeware Computer Keyboarding program. Since that program is so superior to what they had been using, that homeless shelter will now be able to get lots more mileage out of their Apple II's.

You may say I'm a dreamer, but I'm not the only one. I'd love to be involved with setting up some kind of Shareware Solutions Outreach Group of Volunteers who could provide software and who could answer questions about using it.

This is not something that will happen today or tomorrow, as I am not at all clear on how this could be set up, or how it would operate. It'll take time, it'll take some talk, and it will take some other idealists like me to get something like this going. Any thoughts? -Joe

(J.KOHN [Joe], Category 28, Topic 4, Message 49, M645;1)

UPDATE YOUR ZIP GS Someone recently asked me in e-mail how many chips were required to update the cache on a Zip GS. Since I thought other people might be interested in the information as well, I decided to post it here.

To upgrade the cache on a Zip GS to 32K, you need two SRAM chips, one for the TAG side and one for the DATA side. To upgrade the cache to 64K, you need four SRAM chips total, two for each side. Since these chips are 32K each, you might wonder why you need two of them for 32K or four for 64K. The reason is that each side of the cache needs to be upgraded to the full memory size. Since there's two sides to the cache, you need twice the chips. --= Lunatic (--=

(LUNATIC, Category 22, Topic 10, Message 164, M645;1)

MODEMWORKS $ APPLENET !!! IMPORTANT !!! A couple of people have contacted me telling me that they can't get ModemWorks 3.0 to work properly with AppleNET 1.5a and previous versions. This is quite normal, and even easier to explain. Due to the new architecture of ModemWorks 3.0, AppleNET 1.5a will not only not load MW 3.0 properly, but with the new command implementations in MW 3.0, you won't get too far even if you -do- manage to get the loading sequence in there properly (which isn't too hard, mind you).

As AppleNET 2.0 is so far into production right now (release date is -- cross your fingers! -- next summer or earlier), I just don't think it would be feasible to re-write AppleNET 1.5a to support ModemWorks 3.0, no matter how much I'd like Zmodem transfers to work.

However, AppleNET 2.0 will FULLY support all of MW 3.0's newest features, including Ymodem and Zmodem transfers, new terminal emulations, and the whole kit-and-kaboodle (and AppleNET will remain as easy-to-use as ever!).

So, to all those who are cursing me right now saying, "I bought ModemWorks 3.0 to work with AppleNET 1.5a, and now I find out it's a waste of my money!", HANG ON A SEC! Just hang onto the package, and wait for AppleNET 2.0. I guarantee that you'll agree it's worth the extra wait....

-Derek Fong
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 272 of 1824

Apple II Computer Info

(M.POTTER4 , Category 41, Topic 3, Message 63, M645;1)

>>>>>> You're right. What we have planned for AppleNET 2.0 is too long to get out in one breath. But, here's the low-down on what we currently plan on getting out in the final release version:

- Faster and more efficient than previous AppleNET versions
- Completely rewritten from the ground-up -- no more Kevin D'Haeze/Larry Edwards program code
- Complete support for X/Y/Zmodem, and their subsets
- New fields
- (You asked for it, and got it) More bells and whistles
- The editors have all been improved at least tenfold
- We're planning on either writing our own AppleNET network, or at least writing a patch to link to another major network (ie: Fidonet or the Internet)
- Full screen editors and split-screen chat for PSE/ANSI users
- A full-fledged accounting system, much like GENie and CompuServe, which will allow sysops to charge users for access to certain areas. You can also assign freeflagged areas to certain users whom you may not want to charge for entering a certain area...
- The new RAMDisk loader is GREAT! *blush*
- The new menu system will blow away previous AppleNET versions
- System events are now fully-configurable
- All this (and, as the old saying goes..) and a LOT LOT more for the low shareware price of $20-30 US (haven't decided yet), and $39.95 for ModemWorks Lite (all you'll need to run AppleNET 2.0). -Derek Fong

(M.POTTER4, Category 41, Topic 2, Message 4, M645;1)

DECISIONS, DECISIONS Speaking of which, I've heard great things about the Shadow. But, is it really so great that I should spend the extra $$$ to get a Shadow instead of the TMS Pro External? My desktop has enough space to accommodate a HD....

I'd avoid the 3.5-sized drives (such as the Shadow), if I were you. They take their power from your computer's power supply. Hard drives demand a great deal of power while starting up...probably more than you should be pulling from a stock Apple IIe or IIGS power supply. When you buy a drive in the larger (usually Mac-sized) case, the drive gets its own power supply.

According to the Apple IIe tech reference, the +12 line on the power supply is capable of supplying 1500 mA continuously. It can handle surges up to 2500 mA for up to 20 minutes if followed by at least 10 minutes at no more than 1500 mA. According to the tech manual for my hard drive (a Conner CP-340), the drive draws 1000 mA for startup and 300 mA in normal operation. That's 40% of absolute maximum for startup and 20% of operating maximum at full speed--and you still have floppy drives, peripheral cards, and the motherboard to share those 1500 mA with. With a 3.5" floppy drive, a 5.25" floppy drive, and a hard drive spinning all at once, you might overload the power supply...and when that happens, your computer will cycle power until the cling power like that to a hard drive is a Bad Thing (TM).

If you have an Apple SCSI card, the problem is even worse. Recently, one of the members of the local user group bought a drive and an Apple DMA
Apple II Computer Info

SCSI card from LRO. Apple's card only gives you up to a 3-second delay before it starts looking for a device to boot. The average hard drive takes about 10 seconds to spin up and go active. If your hard drive has its own power supply, you can turn it on first and turn the computer on a few seconds later. If the hard drive takes its power from the computer, though, you're stuck with a Catch-22—the computer won't boot from the hard drive until it's spun up completely, but the hard drive won't spin up until you turn the computer on. Open-Apple-Control-Reset doesn't fix the problem, either...if Apple's SCSI card doesn't find a drive, you'll have to cycle power...and you're back to Square One.

Save yourself a lot of potential grief. Insist on a hard drive that has its own power supply—preferably an internal power supply instead of an external "brick."

/ v \ (IIe \ Scott Alfter
\ ^/ ------------
(S.ALFTER, Category 11, Topic 10, Message 64, M645;1)

>>>>>> There is an external power supply available for the Shadow, just a little power cube that plugs into the wall. TMS recommends the purchase of this thing for any Shadow that is to be used on a II, and so do I. I think the thing is like $15–$20, but I could be way off on that (either way :). —Gary R. Utter
(GARY.UTTER, Category 11, Topic 10, Message 66, M645;1)

PROBLEMS As far as I can tell, the only way to do this is to use one of the older printer drivers that has the "custom" page setup option but if I remember right, they were REALLY slow. Does anyone have any ideas??

The Claris folks couldn't figure out how to do what they wanted in the Print Manager, so they cheated. They licensed Apple's ImageWriter code for the express purpose of creating an Epson printer driver, which they did and which Apple later purchased and included in the system software.

Unfortunately, they didn't stop there. They rebuilt the ImageWriter driver as ImageWriter.CL and added a few new private commands to it for the things they couldn't figure out how to do otherwise. Multiple horizontal items on the page is one of them.

If you want to do these, you have no choice but to use the old .CL driver because AWGS doesn't know how to use a real printer driver for these things.

(This is also why Apple doesn't license printer driver source to developers anymore--the .CL driver was a support nightmare for dealers and customer support people, especially once the newer ImageWriter drivers came out and AWGS features didn't work with them, and Apple's not anxious to repeat that mistake.)

—Matt (I speak for myself, not for Apple)
(M.DEATHERAGE, Category 17, Topic 17, Message 45, M645;1)

DISK ARCHIVES Here follows a few clarifications on doing "disk"
******** archives:

A2 normally insists on "file" archives for all ProDOS and GS/OS uploads. This is because we can't know what kind of hardware every downloader may have, and because hard disk owners get downright irate when they have to dust off their 5.25 drive and plug it into their GS just to unpack a file that they will then have to transfer to their hard disk. And I can't blame them. In fact, if the upload is a collection of related files, we really prefer that they be placed in their own folder and the entire folder be archived, though this is by no means a required step.

However, some things such as DOS 3.3 files, the TETRIS2 upload, etc. cannot be placed on a ProDOS disk. Since ShrinkIt is a ProDOS program, the only way it can handle such files is by shrinking the entire disk without worrying about the contents.

Let's consider what this means. If you are archiving a well-used DOS 3.3 disk, much of the "blank" disk space will actually contain files that have been erased from the disk catalog. Remember, deleting a file merely removes it from the catalog; it does NOT remove it from the disk. That's why "Undelete" programs are able to work.

Now, ShrinkIt cannot read this disk and has no way of telling which disk sectors are in use and which are free, and archives all 560 DOS 3.3 sectors. This means that all those previously deleted files are ALSO archived, even though they aren't in the catalog. Needless to say, this is incredibly inefficient and you can easily wind up with a disk archive that is larger than the unpacked length of the files you are uploading!

Some people have tried to get around this by transferring the DOS 3.3 files to a ProDOS disk and putting them in a "file" archive. This is an ungood idea for several reasons. First, the downloader must convert it back to DOS 3.3 to use. You'd be amazed how many people don't understand how to do that or why it's necessary. The confusion factor is just too much. Secondly, the files will have to be renamed to something that ProDOS will take. All too often, the new name will cause the program to crash. And the user will be unable to fix it because he won't know what the original names were.

We also want to remember that DOS 3.3 uploads must not contain a copy of the DOS 3.3 system software. Apple Corp. still owns it and frowns on this practice. We check all DOS 3.3 uploads for this and do not release the ones that still have DOS on them.

Here's how to fix all of these problems:

1) Format a blank DOS-less disk. I use Copy II+.

2) Copy all of the files to be uploaded to the new disk.

3) Archive the new disk.

The freshly formatted disk will have all unused sectors "zeroed out". These "zeroed" sectors compress to an extremely small space, so that the resulting "disk" archive is at most just a block or two larger than a "file" archive would have been.

I hope this makes the reasoning behind our rules clearer to you.
PRIME BBS - ROLL YOUR OWN  With the rapid spread of the Prime BBS system since its introduction onto GENie, I suspect that there are some of you who want to start modifying your own BASIC programs to run online with Prime. This is not nearly as hard as it might seem on first glance and I highly recommend it as a fun thing to do as well as an excellent way to get a handle on the Prime ampersand set.

Here is about all there is to it....

1. Look in your copy of the doc file. This is file 18837 on GENie and it is called Prime.DOCS.bxy. On pages 57 to 69 you'll find a full description of all the amper commands. Look carefully at & PRINT, & GET, & INPUT, & AT, and & VLIN. These are about the only ones you'll need for your first cut.

2. I use Program Writer to edit my BASIC files. Makes the job a whole lot easier. You old timers like me might prefer GPL:) Go through the program and carefully replace all the PRINT statements with & PRINT. This results in the program printing to BOTH your BBS screen and to the modem so the user can see it. A comma after the & PRINT will print a carriage return. Ie, & PRINT ,,"This is a test" will print two carriage returns and then "This is a test" to the screen and to your modem.

3. Replace all GET statements with & GET. This one always killed me! This & GET tells the program to get a single key input from EITHER the sysops keyboard or the modem. If you leave a GET in there without the ampersand the program will get to that point and wait for an input from the sysops keyboard! Your user will be able to do nothing and your system is hung until he hangs up! NOT GOOD! So, look carefully for the GET statements. Same thing replies to INPUT and & INPUT. Use the 'find' feature of your editor to make sure that you got 'em all.

4. If your program writes any data to disk, (ie, high scores, etc.) then use the & AT command to set the prefix to one of the BBS prefixes. You CAN hardwire the prefixes with the normal BASIC commands, but I don't recommend it since this makes the program useless to other Prime sysops until they go edit it.

5. The & VLIN command can be used to restrict the allowable input characters to any set you want to define. You probably won't want this one often.

6. Lastly, you need some way to protect your system from syntax errors you didn't catch before you put your new gem online. In addition, you need to be able to protect yourself against the rude user who drops carrier right smack nab in the middle of your add-on external or game program. Historically, this is done by a fairly
standard error trapping routine that does a few good things for you.

- It hangs up the modem and resets to LOG if carrier is lost.
- It shows the user an error number and line if he runs into a bug. The user can then report it to you so you can go squash the bugger! The user is then returned to the BBS.1 code.
- If you hit a control-C during execution of the program, this routine will tell the user to hang on while you work.

I'll upload that little EXECable file with this TIP. When you make your BASIC code, leave line 1 unused and don't use any line numbers above 60000. Drop into BASIC, load your file, and EXEC this file. It will add the error trap to your program. Save the modified program as a PRG.XX or GAM.XX file and you're ready to rock and roll! Take a few minutes to study this code. In addition, take a few minutes to look at other PRG.XX and GAM.XX that I have uploaded. It'll go a long way toward enhancing the fun you can have with PRIME!
(W.GOOSEY, Category 41, Topic 4, Message 52, M645;1)

Time for a lecture on heat.

Chips get hot. They heat the air at their surface. If that air remains at the surface of the chip, then the chip just gets hotter and hotter. If you can move the hot air away from the surface of the chip, and replace it with air that is not so hot, then the chip can heat THAT air. Heat that is transferred to the air in this fashion is heat that is not giving the chip itself a problem. Without a fan, the only way that air moves is by convection. (Hot air rises, remember that from high school science? :) Generally speaking, convection is not going to move enough air to keep the chip cooled to within its normal operating temperature range IF the ambient air temperature is much above 75 degrees, especially if you have a lid on the machine.

This is why god made fans.

A fan will move the hot air off the chip, and allow it to be replace with air that is less hot, thus allowing the chip to be cooled. So long as the air that is moving across the chip is cooler than the chip itself, this will keep the the chip within its operating temperature range. The variables here are how hot the outside air is, and how fast it moves across the chip. If you move enough air, then the chip will have no problems until the ambient air temperature is higher than the operating temperature of the chip. The operating temperature of the chip is certainly a lot higher than YOURS. Which is to say, when the outside air becomes hot enough that it cannot cool the chip with a good fan, it is so hot that you will have NO
interest in computing, or anything else except escape, if you aren't already cooked, literally.

(Wordy tonight ain't I? :)

Anyway, the answer to your problem (assuming you are correct in it being heat related) is a FAN, or SEVERAL fans. I myself have three high capacity fans sitting on top of my CPU (with the lid on). They are mounted in a board (actually a sheet of plexiglass that I happened to have on hand), and the board is cut to the size of the top of the GS and has a gasket of weatherstripping around the bottom edge, so it sits nice and airtight on the GS. This thing sucks so much air that I need both hands to lift it off the case when the fans are running.

I do NOT have heat related crashes. Period.

A Kensington System Saver or AE Conserver is the minimum level of fannage you should have on your machine, and if you have a serious problem with high temperatures in the area in which you must run your GS, you need MORE fannage. The absolute minimum I would suggest in a high temperature environment is a System Saver or Conserver in which the fan has been replaced by a higher capacity fan from Radio Shack. A lot of people here have made that particular modification with good results.

However, if you do not have to have your monitor sitting on top of the CPU, I would recommend several fans in some type of enclosure like I built. I was at a local electronics surplus house this afternoon, and saw a whole big box of these "muffin fans" at $5/each.

Gary R. Utter

While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your APPLE II, the GENie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

///
Python Fever Spreads in STRT
''''''''''''''''''''''''''''''''''''''''''''''''''''
By T.J. Girsch
[T.GIRSch]

TOPIC COP HEADACHES! Most of you who frequent the message bases in the
ST Roundtable have almost certainly experienced it. You're browsing through the messages, looking for ways to minimize your LZH difficulties, when suddenly you see a totally out of place message:

< Your mother wuz a hamster anda your father smelled of elderberries! >

The first thought that runs through your mind is "What the heck is this person talking about?!?" And the next thought, "IGN PERM," is synonymous with the next message:

< Run away! Run away!! >

These thoughts undoubtedly pass through your mind, UNLESS you've seen "Monty Python and the Holy Grail." If you've seen it, then your first reaction is not one of confusion, but of hysterical laughter. The mere quotation of a line from the film puts you in a fit.

If you're reading this, and you have already encountered these quotes and reacted with confusion, your next question is almost inevitably "What does any of this have to do with the Atari ST?" The answer: almost nothing. But once the craze was started, it proved nearly impossible to extinguish the flame.

If you're wondering how it started, it’s really quite simple. In the CAtegory __, TOPic __ there is a "M.U.L.E. for the ST" topic, in which Network 23 Software (represented by Rod Martin) would regularly give news briefs and ask for feedback regarding his ST MULE clone, "Dromedary," which is currently under development. After a while, the topic seemed to be in danger of "disappearing" due to a seeming lack of interest. In a last ditch effort to save his topic, Mr. Martin released a 2 A.M. update on the development. His post, probably due both to a strong desire to save the topic and to the simple fact that it was 2 A.M., included a quote from the film "Monty Python and the Holy Grail."

Immediately about a half-dozen GEne users replied with their favorite quotes from the film, to which there were counterreplies, and replies to the counterreplies. In short time, the fever had grown to exponential proportion, resulting in possibly the worst occurrence of topic derailment in GEne history. The difference here was that no one who frequented the topic seemed to mind one bit. What's more, about once every two weeks, Mr. Martin would still post an update, "relevant" to the topic.

The problem with all this is that any newcomers to the topic may be scared off, because they wonder what "< What is the airspeed velocity of an unladen swallow? >" has to do with M.U.L.E. Plus, these "Python posts" began to spread to other areas of the RoundTable. So, in an effort to address these problems, I submit the "Atarians Guide to Python Awareness."

I. How To Identify a Quote Identification of Python quotes, or any TV Show/Movie Quote, is fairly simple, thanks to a convention which most of the "offending" posters (myself included) have adopted. An irrelevant quote is generally enclosed by a less than sign (< ) and a greater than sign ( > ), as in:

< Stop that, stop it!! There won't be any singing while _I'm_ 'ere >

Note Be aware that the Holy Grail is not the only film that is quoted in this fashion. It has also become common to quote Star Trek: The
Next Generation in a similar manner.

II. How To Read Grail Quotes In order to get the "full effect" of a Grail quote, it must be read in the proper manner: with a thick British accent. The one notable exception to this rule is in cases where the enclosed text is a stream of insults, for example:

< You stupid English pig-dogs! Now go away, before ah taunt you a second time! >

In these cases, a pseudo-French accent should be used.

III. How To Understand a Grail Quote The best advice I can give here is to watch the movie. "Monty Python and the Holy Grail" can be found at video rental outlets everywhere, and is excellent for a lot of laughs. And you don't need to be a big Monty Python fan to appreciate it.

Two things to bear in mind before watching the movie:

1) A general knowledge of the Legend of King Arthur is helpful in understanding some of the humor.

2) If you don't like extremely off-the-wall slapstick, in the tradition of the Zucker brothers (Airplane, The Naked Gun), then this film is probably not for you.

IV. How To Reply To a Grail Quote Replying to Grail quotes requires that you have seen the movie. For example, without seeing the movie you would not know that the proper response to "< But I've cut your arm off! >" would be "< No you haven't! It's a flesh wound. I've had worse! >"

If you have seen the film, however, and you wish to reply to a Grail quote, feel free! More are always welcome. Just use the "greater than/less than" convention described above, and try not to stray too far from the topic, lest the topic police come and spank you!

Note We apologize for the abrupt end to this article. Those responsible have been sacked. The rest of this issue of GEnieLamp has been completed in a totally different style and at great expense.
I want to start this month's column by giving an example of what I consider to be a bad marketing and project development decision. We will spend some time during the course of this article discussing a way to make sure that software written for the Apple II is wanted by the user community. I saw an advertisement for a product that, in my opinion, is not going to be useful to the common software buyer. SoftPC has developed a package that works on the Macintosh series of computers. It will allow you to run any Windows compatible software product on the Mac. (Windows is an IBM/clone version of the Mac operating system. Much of the current Windows software has been ported over from the Mac.) Does this strike anybody as a case of trying to sell California wine to a French wine connoisseur? Who in their right mind would want to buy something that will make IBM/clone software run on a Mac just like native Mac software? Buy the Mac software and be done with it. I do not understand why anyone would develop a product like this.

In last month's article, we explored the future of software for the Apple II platform. I put forth the prediction that most of the software developed for Apple II's would come from Shareware sources. I explained my reasons for these ideas and encouraged readers to take heart in the fact that certain advantages are to be gained from using Shareware and Freeware programs. Chief among these advantages is the ability to guide the development of software that you want to use by paying for software that you find useful and asking for software that you want to use. This arrangement can work to the benefit of both the developer and the end user.

The next question, and the one that I want to answer this week, is how do you get a software package developed if you really need one. The flip side to that question is how does a developer find out what users want to use (and pay for) on their computers. One way that doesn't usually happen is for luck to bring together the user and the developer in the same place at the same time. "Ha", you say. "It will never happen", you say. I think that you are correct.

A much more likely circumstance is that a user seeks out a developer with a program idea and asks for software to be built to his specifications. The transaction usually requires an up-front fee and a guaranteed fee upon completion of the package. This is expensive since it requires one potential user to absorb the entire cost of the project. A much more financially reasonable plan calls for the joining of like-minded users that are willing to pool resources and contract for a program to be built. This begs the question of how you find other users who want the same software that you want. We can see that there are problems with this approach also.

A third alternative is available when we consider the online community available through a service like GENie. (Please excuse references to a nationally advertised alcoholic beverage in the rest of this paragraph.) Wouldn't it be great if you could register your software needs in a forum visited by both users and developers? And wouldn't it be great if other users could add to your ideas and produce a program specification that the group would be willing to pay for if the software was ever developed? And wouldn't it be great if the developers who were looking for their next project took these specifications and built the software that so many users were wanting to see? And wouldn't it be great if the result of all of this synergism was some of the best software that the Apple II had ever seen?
Wouldn't it be great?

Okay, I feel better now. Sometimes I get these flashes of inspiration and I just have to let them run their course. However, I hope that you saw something you liked in that last paragraph. I laid out, in brief detail, what I envision as a public clearing house for program ideas and software development. An entity can be created that will meet the needs of the software user and creator in a way that is beneficial to both. Perhaps a user can identify a software need that a developer was wanting to create anyway. Such a meeting can serve as a spark to get the developer started on the project.

I can see that some software wants will be too big for a single programmer to tackle. Such programs (that are deemed worthwhile) could be broken down into sub-projects that are handled by individual programmers. A project lead would be established to manage getting the pieces built and put together. On the other hand, many programmers like to work by themselves. This can certainly be accomplished by allowing software package ideas to be "checked out" by a programmer indicating that it is currently being worked on. Profits, for shareware packages, would be distributed according to who worked on the project and to what extent. Users would be much more likely to pay for a software package that they helped bring to life by establishing what the package would do. A promise sheet could even be created which tracks the people willing to pay a certain shareware fee if a package is finally produced.

I can hear the nay-sayers now. "This idea will never work since it requires people to pay shareware fees." "Who would write these programs?" "I only wanted to read a game review and got lost in the wrong article! (Oops)" I will grant you that this is a radical idea and certainly requires more thought before being put into action. However, the investment is small for everyone concerned. All the users have to do is register their software needs. All the developers have to do is write programs that they want to write. If the idea works, then many people may be happy. If the idea does not work, then no one loses. The argument that the developer loses his valuable programming time can be countered with a quick check to see how many people have registered shareware programs by some of the prominent Apple II authors. Putting a program without a guaranteed audience on the market will produce mixed results. Writing a program with an established audience can go a long way toward maximizing profit.

Since there is so much to gain, and so little to lose, why don't we get started right away? I will volunteer to gather program ideas that users want to see written for the Apple II. If you have such an idea, please send a brief statement about what you want to my online address (see bottom of article). I will tabulate these ideas and find a good way to distribute them to the programming community. I am not sure that GENie Lamp is the proper way to get these ideas in front of the Apple II community as a whole. Therefore, I will explore the possibility of getting something going on the A2/A2Pro Bulletin Boards.

I would like to hear from any person who has suggestions concerning the information in this article. If you have an inspiration on how to establish such an idea/program exchange, I would be glad to hear about it. If you want to tell me how ridiculous I sound, then blast away. If you want to volunteer to write some of these new programs, then step right up. If you have a catchy name that will get peoples attention and focus it on
what we are trying to do, then by all means send it to me. I do not live in a vacuum. I am connected to GEnie and hopefully you are too.

I am out of breath for this month, so let us stop for now. I have probably launched more ideas than I have distributed information. Next month I will try to swing more to the other side. We will discuss the ins and outs of the Apple Human Interface Guidelines. Until then, let me know that you are out there and reading this by sending e-mail (its free). I will attempt to respond to every letter that I receive.

Who's Who In Apple II

********************************************************************

>>> CHATTING WITH GARY UTTER <<<

********************************************************************

~ Apple II Guru ~

GEneLamp > Gary, how did you first get interested in the Apple II computer?

Gary Utter > Back in the early days, a friend of mine who was in the Navy left his black Bell and Howell II+ clone here while he was on sea duty and stationed in Japan. I played with it a bit, but after finding a bug in Wizardry that let me build up an incredible number of character points in an hour or so, I kind of lost interest. When my wife decided, back in '87 or '88 that she needed a computer for her small business, I looked at Apples first, because I was SLIGHTLY familiar with them.

I also looked at IBM (clones), Macs, and Amigas. I settled on the Apple because it seemed to have the best support, most ease of use, and because I had friends who had Apples. I did not, however, BUY an Apple, I bought a Laser 128EX. It seemed silly to spend the money for an Apple IIc when the Laser was just as good and half as expensive. (And I still feel that way. :)

GEneLamp > At what point did you realize that your casual hobby had evolved into something more than a "casual hobby"?
Gary Utter > When, in the course of 3 weeks, I had spent well over 150 hours "getting the computer set up" for my wife, and when I had gone out and purchased an additional meg of memory (just before the big price jump), a mouse, a printer, additional disk drives, literally hundreds of blank floppies, etc.

At that point, I decided that my best course was to upgrade, and I took the Laser back to the dealer and swapped it (and a bunch of cash) for a GS. I was still trying to be cheap, so I didn't get a 3.5 drive. :) Over the course of the next five months, I upgraded from 1 meg of memory to 3.75 megs on a RamKeeper, added an Apple 3.5 drive, replaced my Laser drives with Apple brand 5.25s, upgraded to a color printer, and finally, at the end of the five months, got a used ProFile 5 meg hard drive. After that, it was all over, my "enhancement curve" went vertical. :) Somewhere in there (at about the 2 month point, as I recall) I got a modem and accounts on The Source, CIS and GEnie. That REALLY pushed me over the edge. :) At that time, I was running a combined bill on those services in excess of $300 a month, and I was spending ALL of it combing through the Apple II areas for information and downloads. (No time for Chat, no time for Games, just information and more information. :)

I am now up to a 5 meg GS, with Rev D RamFast, 240 meg Quantum, 44 meg Syquest, a pair of 3.5 drives, Magnavox color monitor (larger and brighter than the Apple), Zip GS (only 8 mhz though), 9600 baud USR modem, DeskJet printer, and tons of software. Expense wise, it has been ugly, but fun.

GEnieLamp > In the past few years, Gary, you've assumed a leadership position in the national Apple II community. Please tell us a little about how this came about.

Gary Utter > Simple, I read everything I can get my hands on, (electronically speaking), and forget very little of it. I experiment with the information when it is appropriate (just because I want to KNOW) and I seem to be able to synthesize it well. I'm not afraid to ask questions, and, more importantly, in terms of the question YOU asked, I'm not afraid to answer questions.

GEnieLamp > What do you consider your most proud accomplishment?

Gary Utter > Being one of the best police dispatchers in the US. :)

GEnieLamp > Who do you look up to as your mentors?

Gary Utter > Loren Damewood, David Winograd, Marc Farnum Rendino, and a bunch of the regulars on MAUG. Due to the lack of a front end for GEnie (i.e. a 16 bit front end, specifically CoPilot), I was a lot more active on CIS than on GEnie during my "formative years" online. Now that I have CoPilot, I am a lot more active here than there. GEnies pricing has something to do with that, as GEnie is more active these days than CIS. I've been trying to persuade "the guys" from CIS to come on over here, but so far without much luck. I tend to go where the action is, which is to say (no offense to GEnie) that if CIS was busier than GEnie, I would probably spend more time there than I do here (that just applies to A2, of course). But, I wouldn't cut back on my time here, just spend more time online overall.
Gary Utter > Hmm, I can't really answer that. I don't see any
SIGNIFICANT change coming, just incremental improvements
(widespread availability of 9600 access, better front ends, etc). It is
likely that there will BE some significant change, but it is not something
that I can predict.

GENieLamp > What sorts of things do you like to do for fun (i.e. non-
computer hobbies)?

Gary Utter > For fun? I like to sleep.

GENieLamp > Are computers a part of your daytime job? Please tell us a
little about what you do between 9 and 5.

Gary Utter > I dispatch police cars for the Office of Emergency
Communications in beautiful downtown Rochester, New York.
We use computers all over the place, but we don't really get to WORK with
them, all the software is "canned", and runs off mainframes. They are just
tools.

Our center presents probably THE most intense dispatching environment
in the US, but explaining what that means is, I suspect, well beyond the
scope of this profile. (It would take a LOT of background. :) Let's just
say that it is intense, and stressful, and a whole lot of fun if you have
the right attitude, and SERIOUS work. (If I screw up, people can DIE.)

GENieLamp > How long have you been a member of GENie? What new services do
you think GENie should provide its subscribers?

Gary Utter > Jeez, memory does not serve in this case. It seems to me
that it was July of '87 when I got my first modem, and
August when I discovered GENie and CIS.

As for new services, I would like to see widespread availability of
9600 baud nodes, along with v.32 capability. I would also like to see
Prime Time eliminated, but I don't know that I would say that is something
GENie SHOULD provide. I think it would be a Good Thing, but I am not at
all sure that it would be practical. :)

GENieLamp > What one piece of advice would you pass along to a new Apple
II telecommunications enthusiast?

Gary Utter >

1. Get the fastest modem you can possibly afford, and make sure that
   it has MNP 1-5 and V.32 and v.42bis. (Of course, to be reading
   this, they will already HAVE a modem....)

2. Get a GOOD communications program. I personally would recommend
either TIC or ProTerm v3.0. I understand there are some new things
coming down the pike, so I don't want to limit myself too much
here, but I don't know anything specific that I can talk about.
3. Get a good front end program. I am not going to make any recommendation at all on that. Anyone who knows me knows that I am a heavy CoPilot user, but basically, all the front end programs currently available are good choices, so I think which one you get is up to personal preference.

Gee, that is THREE pieces of advice, isn't it? (And I didn't even mention the dedicated phone line. :)

GENieLamp > You've worked as chief assistant in the Jerry Pournelle Roundtable for a while. How did you come into getting this job? What aspects of the work do you find most interesting?

Well, originally I was a heavy poster in the Pournelle RT, and I was almost always on at 3, 4, 5 in the morning. This is a REAL good time to do maintenance tasks in a RoundTable, and Howard Rosenman, who was then the Assistant, needed someone to do maintenance, so he asked me. As the situation wound up, Howard got a new job shortly after that (with GEnie) and I moved up into his slot.

What I find most interesting about it is the ability to increase usage by making the RT more interesting to the USERS. Just how that is done is something really hard to explain, but I seem to have a knack for it. Fascinating work, overall, but it cuts into my sleep severely. :)

[FOCUS ON...]

By Phil Shapiro

>>> HOW APPLE II COMPUTERS ARE BEING USED FOR COGNITIVE THERAPY <<<

From the time when computers were introduced into schools about a dozen years ago, teachers have had an opportunity to watch closely how students interact with these wondrous machines. It's no great surprise that computers have been seen to assist intellectual growth. But what is surprising is how computers can help boost student self-esteem and self-confidence.

As students interact with computers, they are given constant feedback as to their current progress. With well-designed educational software they can almost feel their minds growing. As students develop a mastery of several educational computer programs, their sense of self-esteem and self-confidence naturally rises. Thus, the very act of interacting with computers may change the students' sense of self.
If, then, computers can help strengthen the self-image of schoolchildren, shouldn't they also be able to strengthen the self-image of other people, as well? This very question was asked and answered by occupational therapists at St. Elizabeth's Hospital, a publicly-funded psychiatric hospital in Washington, D.C.

About eight years ago the hospital bought two Apple IIc computer systems for use by staff and residents. Along with the computers they also purchased a wide selection of educational computer software.

The aim of the computer project was to bring residents to the computer lab in small groups, giving them the opportunity to interact with both the computers and with one another. Suzanne Pickering, the occupational therapist supervising the computer project, explains that the residents take a strong interest in working with the computers. The software engages their minds, providing a welcome intellectual stimulus within their daily routine.

Pickering further explains that the nature of the software program being used seems less important to the residents than the fact that they're just using the computer itself. Residents of the hospital take pride in simply sitting at the computer and using whatever software is available. Yet choosing which software to use with the residents is no easy decision. The two categories of software most often used are drill-and-practice software and creative expression software. In the drill-and-practice category are the math, spelling, geography and problem-solving games most frequently used with elementary and middle level students. In the creative expression category are programs such as Print Shop and AppleWorks.

Pickering explains that her objective is to get the residents quickly involved in a computer activity that's not overly complicated. While the residents have great enthusiasm for using computers, their attention spans are not always long. For the maximum beneficial result, residents need to be given software that allows them to achieve actual, demonstrable success within the first few minutes after booting the program. The programs need to coax them along to greater and greater challenges, all the while giving them positive and encouraging feedback. The goal is to produce small intellectual fireworks in their brains as they develop greater and greater skill at a given cognitive activity. The object is to facilitate and encourage the growth of new neural links in their minds. An interesting analogy is offered by Pickering.

Just as doing sit-ups can help strengthen lower back muscles, so too can doing cognitive drills help strengthen a person's sense of self. And once a person's sense of self is strengthened, once they have a stronger and renewed sense of their own being, a positive spillover effect results. By strengthening one group of mental muscles, the spillover effect strengthens them all.

In terms of the creative expression software, the goal of the project is to reinforce their self-concept as artistic creators. A simple Print Shop sign serves as visible proof of their creative powers.

To help celebrate the residents' creativity, the walls of the computer lab are adorned with their handiwork. What started as a small computer lab has grown to become a small art museum as well. Extra printed copies of their creative work are given the residents to show others.
Sadly, the popular Print Shop software has been missing for over two years. (The residents were using the original Print Shop software, with its easy menus and interface.) Keeping software secure in an institutional setting is always a serious challenge.

The hospital staff has been talking about new software they'd like to add to their collection. High on their wish list is the Children's Writing and Publishing Center. With limited funding for the project, software purchases are made very carefully.

When asked how other Apple II users might be able to support this interesting computer project, Pickering commented that the hospital could really use another copy of the original Print Shop disk. (The New Print Shop might present too many confusing options, and disk swapping, for the residents.) Other items on her wish list include standard computer supplies: floppy disks, ImageWriter ribbons, and disk storage cases. Donations to the hospital are all tax deductible, Pickering hastened to add.

In discussing the great potential for success in this project, Pickering mentioned that she’s interested in hearing from occupational therapists in other cities who might be doing similar work. It makes sense to share ideas and experiences in this fledgling new field of mental therapy.

The operations of the human mind remain one of the great mysteries of all time. Yet you need not be a neuroscientist to realize that computer-assisted cognitive therapy may have long-lasting positive effects for those suffering from mental illness. If the sole result of these computer interactions is to bring an interesting new focus of interest into these people's lives, that alone can make this project worthwhile.

Somehow, I suspect, this project will accomplish much more.

I drink to that, one narrow minded person to another. -- T. MCCOMB
GOOD NEWS / BAD NEWS   This month's topic is the final (sigh) program to be released by that amazing and sometimes frustrating French organization: Free Tools Association (FTA). FTA has produced some of the most beautiful graphics and sound demonstration programs that have been seen on the Apple IIgs. They have produced a number of exciting game programs. Perhaps best of all, they have released most of their software in the public domain as freeware. However, FTA has developed all of their software "free from the restrictions of Apple's toolset". This has meant that you usually have to load the software from floppy disk and that the software did not always work after updates to the system software. The claim, I believe, was that use of the toolset slowed programs down to the point that they were not useful.

For better or worse this seems to be the last of the FTA programs that we will be seeing. If a person wants to be known by their best efforts, then this game may be the lasting image people have of FTA. This game is, just like its creators, both amazing and frustrating. Perhaps I have gotten ahead of myself. First I should describe the game and then I will tell you my impressions of the software.

The Introduction   Yes, the introduction of this game deserves a separate section. Like all of the previous FTA offerings, this one has great sound and graphics. All of the music is on the first screen. The main title is displayed with an impressive graphics-as-letters image of a roaring fire. A scroll line appears in the middle of the screen with a long line of credits and other semi-useful information. A ball (or marble) appears at the top of the screen and then things really start to happen.

[**][**][**]

As the stereo music starts to play the ball drops from the top of the screen. It hits the scroll line and BOTH the ball and the scroll line bounce to reflect the collision. While reacting to the collision, the information line continues to scroll as if nothing had happened. This is some of the smoothest graphics that I have seen in quite some time. When you finally get tired of watching the pretty pictures, you can hit the mouse button to move on to the game.

[**][**][**]

The Game   The first thing to greet your eyes after the introduction screens is the main control panel for Bouncin' Ferno. You can choose all of the game options from here. A joystick can be selected and calibrated from this screen. You can also choose to use the mouse (default) as an input device. You may choose to play a new game, select the maze (labeled Level) to be played, or start the editor. The editor is discussed below. FTA has provided you with three demonstration mazes. The
first maze is a good introduction to the game. The other two are monsters that are probably well beyond your skills for quite a while. You will want to stay with maze (Level) 0 until you are much more familiar with the game.

Bouncin' Ferno has been likened by many to the old Electronic Arts program Marble Madness. I cannot compare the two since I never owned a copy of MM. The object of the game is to move a small ball (or marble) around a three dimensional maze and collect the small containers of fluid that keep you alive. You must continue to collect fluid since you are continually draining your current supply. This fill and drain activity is monitored by a crystal ball on the right/lower portion of the screen. As you collect containers, the fluid level rises in the crystal ball. As you progress in time, the fluid is slowly drained until the crystal ball will eventually crack if it ever becomes dry. When this happens, the game is over.

The maze itself is a very large chamber that is broken up into individual rooms. The rooms are arranged in a five by five matrix. Your position in the matrix and how many containers are left will be shown at the top of the screen in the upper/left area. You begin in the upper-most (on the map), left-most room in the matrix. You can only go into other rooms via a transporter. Transporters are marked as small triangles on the floor. If you start in the first room and land on a triangle on the right side wall, you end up in the upper-most room second from the left. The ball will only travel one room in the direction of the transport.

Once you are in a room you may move freely about the room and try to pick up any of the fluid containers that you can reach. A mouse or joystick may be used to accelerate your ball on the playing field. The ball will accelerate in the direction that you move the mouse/joystick and will continue to accelerate until you stop moving. I have practiced with both input devices and find the mouse offers better response. The faster you move the mouse, the more acceleration you will get. A nice, slow movement is wanted for most of the obstacles. I believe that you can progress to the next maze if you manage to get every container on the current maze. I cannot check this guess since I have never quite finished a level. I will have more to say on this subject later. You need the containers anyway since you must replenish your fluid level in the course of play. Therefore, it is a good idea to get every container, if you can.

The floor of each room is a purple slab that is marked with a grid to help the player see proper angles. On top of the purple slab can be a number of different surfaces which have varying characteristics. A red square indicates fire and will drain your fluid very rapidly. Stay away from these at all costs. A green, orange, or brown square is part of a ramp or higher surface. These are not bad for you except that any incline will be more difficult to go up than flat ground and will accelerate you on the downhill slopes. Some squares (of any color) will contain a centered straight line which represents a spring mechanism. Landing on this square will send you sky-rocketing into the air. This may be useful for reaching upper levels of the current room.

A blue colored square indicates a glide region. Once you enter a
Apple II Computer Info

glide region, you cannot control the movement of the ball until you touch another type of square. Therefore, a combination of blue and red squares can be deadly since you cannot change direction on the blue once you have started toward a red square. There are also invisible squares which act just like one of the other purple, green, orange or brown squares. I understand that there exists (but have not encountered) an invisible square that acts just like a blue surface. These could be even more dangerous.

The one maneuver that I have not mentioned so far is what I call the "marble hop". The ball that you control is capable of a very short hop whenever you press the mouse button. I have not found this to be all that useful. There are certainly a couple of rooms that require this feature. However, the marble hop is so low that I have found the major usefulness of this feature to be during a jump from a high level. Pressing the mouse button will help break your fall and keep you from bouncing so high.

Each room can play like an individual puzzle. Think of it as a real-time test of your ability to solve mazes, but with a twist. The puzzle can involve figuring out how to get to the can of fluid. It can involve determining how to get to the next room. One devious little quirk that I have failed to mention until now is that a time limit exists for each room. No timer is visible. However, if you stay in a room long enough, it begins to fill with water. This is not immediately detrimental to your ball. The effects are that the ball does not have the friction it used to have with the various surfaces. Your crystal ball will drain about twice as fast while you are in a room filling with water. I am not sure how much the room will fill. One of the interesting things that I have discovered is that the water will sometimes stop filling the room and the room will retain the water that it had received until that point. I cannot decide why the water stops flowing into the room. I also fail to understand why it stops at different levels during different games.

When you put all of this together, you get a good picture of what goes on during a game of Bouncin' Ferno. You roll, hop and slide your way through a series of traps, ramps, hidden surfaces and other obstacles trying to reach the next can of fluid or the next room. Multiple room puzzles are possible and even exist on some of the more difficult rooms in the demonstration mazes. If you get tired of trying to complete the room you are in you can always go to the next room. There is nothing to prevent you from passing through all of the rooms and not getting any of the fluid containers (although that would not do you any good). The best reason for using this capability is to skip difficult rooms until after you have captured easy containers in later rooms.

There is of course the mandatory high score name board. These exist for each maze, so you should get to type your name in quite often. There does not seem to be a way to save a game in progress. There is supposed to be a way to quit play during a game, but it does not always work for me.

The Editor I don't plan on going into much detail here on the editor. I simply wanted to say that it exists and can create any maze that you are able to conceive. The instructions are written in French so you will need to download another file that has a translated version of the instructions. The interface is mostly via the keyboard. You will see the rooms as you build them, but the construction is done from keyboard commands. You can test any level as you build it. The editor looks to be very complete.
A Review  Bouncin' Ferno is one of the best Freeware games that I have seen anywhere. It is also one of the best games that I have experienced for the Apple IIgs, period. It does have its faults, however. The game can run a bit on the long side for one sitting. I have played one maze for almost an hour. Therefore, a save game feature would be very useful. Along those lines the quit command should work at all times during the game. I would also like to see a pause feature added so that the kids can get my attention without my fluid draining slowly away. ("Not now honey, daddy's in the middle of something important.")

Other minor faults include the lack of music other than the main title screen. FTA is known for its music demonstration programs, right. It would also be nice to know how much time is left for you to finish a room. Perhaps a clock could show up in the upper/right corner to count off you last minute before the water starts filling a room.

The game play is smooth and realistic. The ball acts just like I would expect a marble to act on the surfaces and inclines that you go over. I have no complaints in this area other than to say that the marble hop seems to be of limited use. I think that a cumulative effect would be appropriate for the hop feature. What I have in mind is a second button press bounces you higher than the first. The third press would send you higher and so on. However, this is a minor gripe and merely a suggestion for improvement.

Now we come to the area where I have the biggest complaint. The game can be VERY difficult when the mazes are constructed without proper care concerning how they can be traversed. I suppose that this may have been the area that FTA was still working on when they disbanded. For whatever reason, the level 0 maze is barely playable (toward the end) and the other two mazes are ridiculously hard. I am a fairly good arcade game player. I have been unable to finish the level 0 maze in over a dozen attempts. My wife cannot even complete half of the maze. I have "solved" every one of the rooms in the maze at least once, but never within the same game. Four of the rooms are very difficult and I run out of time on at least one of them every time I play.

This concern is the source of the statement I made at the beginning of this review. Bouncin' Ferno is both amazing and frustrating. The graphics and playability are fantastic. The frustration at being unable to win even the simplest maze is enough to drive you crazy. There is hope on the horizon, however. Both A+/Incider and GEnie are conducting contests for the creators of the best mazes for this nifty game. All a person has to do is use the built-in editor to create a maze for the game and that creation can be entered in both contests. If enough people put their talents to this task, we should see enough good levels to make this game one of the all-time classics for the Apple IIgs. Until more mazes exist, I can only say that the game has the potential to be a classic.

The exciting thing about all of this is that the reader of this column can directly take part in the action. All he/she has to do is download the files listed at the end of this article. After playing a few rounds of the introduction maze, select the editor from the main menu and let your creative juices flow. There are many prizes to be won and recognition awaits the creators of any worthy mazes. There is nothing to lose and a good time to be had by any participant. Until next month: Roll carefully.

Bouncin' Ferno:
Apple II Computer Info

Review Rating: 8 out of a possible 10.

Entertainment Factors: (See August article/ALMF0892.ASC GENieLamp RT)
Skill Development: Minor mouse abilities are developed.
Playability: This game is very playable and somewhat addictive.
Stimulation: The maze editor is the only creative outlet in this game.
Random Events: None supported in this game.
Computer Player Modes: N/A.
Fun Factor: This game is a blast (and could be even better).

Files: (GENie A2 file numbers, of course)

CowTOONS? Mike took us up on our offer and sent us this month’s CowTOONS selection. Thanks, Mike!

If you have an idea for a CowTOON!, we would like to see it. If we use it here in GENieLamp, we will credit your account with 2 hours of GENie non-prime time!

"Haven’t you heard “patience is a virtue” and “all good things to those who wait”? :^)"

"Sure I have... But where’s the update?? <Grin>..."

It’s Only Money

By Kirk Hollingsworth

>>> YOUR MONEY MATTERS <<<
YOUR MONEY MATTERS

This is a home/small business accounting program for the IIGS. It is extremely flexible and fast in its operation, and, for the most part, follows the normal Apple Interface guidelines so that its operation is relatively intuitive for IIGS users. (There also are enough keyboard equivalents to make operation that way pretty simple.) It not only provides quite flexible handling and reporting of the data, but permits exporting it to Appleworks or AWGS so that it can be massaged further via spreadsheets or an additional database.

First The Bad News

it does not have many of the additional modules which, for example, Managing Your Money does. It has no modules for calculating loans, for example, and thus no way of automatically separating out equity from interest payments for mortgages: the user has to secure this data and input it himself. There is a capability included for investment management, but it is seriously compromised by the lack of any method to input new asset values/share prices to change the value of the investment. The module is therefore of little value to anyone who has securities or mutual fund investments: it will mainly be useful to keep track of savings accounts, money market funds, and the like. Additionally, YMM has no equivalents of the MYM Insurance or for the Calendar modules.

The Good News

however, is that what YMM does do it does very well indeed. Perhaps its most salient feature is its flexibility: all transactions go into a single transaction file, and this file can be very simply sorted and/or selected from in virtually any way a user could ask. The main transaction file has the following fields:

- Base account (e.g. Chase Bank, cash, Savings) *
- Transaction Type (e.g. Check, Refund, Cash exp etc.) *
- Reference number (e.g. check number)
- Date
- Paid to
- Distribution Account (e.g. Household, Medical, Groceries)*
- Tax ID (e.g. medical expenses, interest) *
- Cleared
- Amount
- Memo

* User constructed ahead of time

One can sort and/or select based on any combination of these fields: all Savings, or all Savings after August 1, or all Grocery expenditures of more than $25, or all checks to Joe Smith. The dialogue box involved in setting up multiple selects is ingenious and works well.

There are a few additional "files" within the database (there's actually only a single datafile, though - no directories full of different files):

- Accounts (base and distribution)
- Account addresses
- Recurring transactions, and
- Payee addresses.
New accounts can be easily added at any time during the span of the year (unless cramped storage facilities require "extending" the data base [probably similar to the dreaded MYM scrunch?): once the database is extended no new accounts can be added).

There are separate windows available for viewing transactions, all of the above subsidiary "files", plus other transaction fields, including

- Account budget (for setting up new budgets)
- Account monthly (shows actual vs budget [but not the net of the two] vs. history [generally last year] month by month for any account).

The windows are shown, normally, in list form. Fields are, in the case of text fields, truncated so that all the fields will always fit on the screen at one time: the user has no flexibility about changing field size or hiding fields. There is, for most of the windows, a single-record "Form" display easily available: it's nicely made, but there seems little use for it since in list mode you can, as in AWGS, read the entire contents of a truncated text field by putting the cursor on it.

Adding new transactions is very simple. One opens the transaction window, and puts the cursor on the last record of a particular transaction type (the last check, for example) and hits Apple-I, and gets a blank next line. Hitting Return for the base account, transaction type and/or date fields (instead of entering new data) dittos the previous record's entry for that field; hitting Return on the Ref Number field increments the previous check number (if any) by one. (It is not absolutely necessary to find the last record of a particular type: one can put the new record anywhere and it will be automatically sorted at the next access. However, choosing the logical place for it does give useful automatic dittos from the prior record.)

The Payee entry always checks the Recurring Payments file, so that there's no need to enter more than two or three letters of a frequently used payee: if you pay the Chintzy Mortgage Company $745.86 per month, writing "Chi" (or however many characters you need to make it unique) will fill in the name, the amount, allocate the amount to Mortgage (with some to Insurance and Taxes if you account it that way), and add your account number to the Memo field, all instantaneously.

It is also possible to copy several frequently made transactions at once from the Recurring window to the Transaction window. I keep my regular monthly transactions with a dash before each payee's name, so they're sorted together: then I just select them all with the cursor, and copy them into the Transaction window. Note that both windows must be open for this, however: despite the existence of Apple-like menus, there is no clipboard.

Split transactions are easily handled, and the splits can be routinely shown or not shown in the Transaction file as desired. (One oddity in this, though. When marking transactions as "cleared" the marking takes effect only for the Total part of the record. If you select, as I do to minimize the "current" transaction file, only uncleared transactions to be shown in the window, cleared split transactions will also continue to show unless you list the splits and clear each split individually.)

As noted above, there's also a Payee address file. If you're going to
use checks with window envelopes, the address will be searched for the
payee and printed.

There is a relatively limited number of reporting possibilities at
this point, and report formats cannot be modified by the user. However,
reports can be written easily to disk, and are written with Returns between
records and Tabs between fields - so importing them to AWGS is a breeze.
(With one caveat, however: the reports are written to disk as formal
reports, so that one must first use a text editor to delete the column
headers and subtotal lines for the import to go through properly.) I use
this feature a lot: for reasons noted later, I'm currently using AWGS to
print my checks, and I also keep a hard copy of my checkbook register done
that way. It is really very simple to use (even with the necessary editing).

The current checkwriting format (listed under Reports) is very
limited, but undergoing revision at the moment. Currently one can print
(1) a personal check, with no address and no voucher, but with the ability
to move the fields around, or (2) a continuous commercial check in a fixed
format (the same NEBS check format used for MYM) with address and voucher.
The checks are printed (at least, on my DJ 500) with uncondensed Shaston -
hardly elegant, and of limited value because of the difficulty of fitting
the result into an envelope window. However, all of this will change
within the next month or two: the author, Steve Peterson, is currently
working on a new checkwriting module which will allow a great deal more
flexibility. (I hope to be able to use, for example, 3-on-a-page
Quicken-type checks with no vouchers and with choice of fonts.)

In the meantime the exporting to AWGS is so simple and trouble-free
that (assuming you pay virtually all your checks at one time in the month,
as I do) it works very efficiently as a part of the package to print the
checks with AWGS.

Other improvements in the works include

 o allowing the user to specify fonts used in a window,
 o permitting sending of control codes to the printer for
   printing in text mode,
 o permitting the Match Record dialogue to be shown
   automatically before accessing Transactions, and
 o some improvements in the monthly account report.

There are also graphs (in color) available showing account amounts
(e.g., assets vs. liabilities, expenses vs. income - user's choice), cash
flow, and net worth. These can only be printed via a "hard-copy-of-screen"
facility, and they cannot be printed to disk.

The program seems to be very efficiently written: it's quite fast,
particularly considering that it's always drawing and re-drawing graphic
text screens. I have a RAMFast and a 8 mhz Zip: it took 8 seconds to load
the program, and only another 11 to load a complete transaction window
(with graphic lettering) with 500-plus transactions (cutting it to current
transactions brought it down to 9 seconds). Comparable figures with the
Zip off were 11 and 21 seconds respectively. Quitting the program (unlike
MYM) is virtually instantaneous. The only slowness is in the saving of the

datafile when backing up: it's a very sparse file (users of the Prosel 16 appointment calendar will know what I mean) which (for me) runs currently over 4 megabytes (but only 214 on disk). When backing up a hard disk with Prosel it takes several seconds of apparently no action to get past the datafile.

Despite its relative newness, I have found no bugs in the current version after virtually daily use for several months. Perhaps every few dozen accesses I may get a crash to monitor when leaving the program, and I have two records which mysteriously are accounted a month earlier than the month entered (and deleting and reentering doesn't solve the problem): other than that, no problems.

The manual is superb: orderly, readable, and very complete — with page by page illustrations of windows.

The Bottom Line is that this is a program which any IIGS user looking for a small accounting/checkbook management program should seriously consider. It is, as indicated, very flexible, and once you get used to the data structure it is also fast and simple to use (a lot simpler to use than Managing Your Money) — and very intuitive. There are a few things I'd like it to have that are not currently planned: I'd like to be able to enter my data into a single record form without accessing the Transaction window, (preferably with the form knowing what day it is), I'd like a bit more flexibility in report formats, and I'd like some more graphs (being able to see Actual vs. Budget for total Expenses or total Income would be nice, for example). But but these are relatively trivial needs: the program is a wonderful addition to the IIGS arsenal, and I expect to use it, happily, for a long time to come.

[*][*][*]

Note It should be recognized that the author of this review is not totally objective. Although he did not participate in the formal beta testing of YMM, he was (by his own request) an early user of the first post-beta version, and has corresponded fairly energetically about the program with the author, Steve Peterson, over the past several months. He also saw the manual in draft and provided input on that.

/ "Anyway, I'm dead tired. Gotta go. Too bad, I'm in / rare form tonight."

[EOA]

Apple II History, Part 4

By Steven Weyhrich
[S.WEYHRICH]

>>> APPLE II HISTORY <<<
INTRODUCTION  As the Apple II History moves on, this month we continue the discussion about the design of the original Apple II, concentrating on the contributions made by people other than Steve Wozniak. We will also see its introduction at the First West Coast Computer Faire in April 1977, just over fifteen years ago, and see how it was for the first Apple buyers way back then.

THE APPLE II: OTHER DESIGN FEATURES  Since Steve Wozniak was the designer of the Apple I and II, exactly what contribution did Steve Jobs make to the effort? Unlike Wozniak, who would not think much of extra wires hanging out of a computer that worked properly, Jobs had an eye for the appearance of the final product. He wanted the Apple II to be a product that people outside the Homebrew Computer Club would want to own:

"Jobs thought the cigar boxes [housing the home-made computers] that sat on the ... desk tops during Homebrew meetings were as elegant as fly traps. The angular, blue and black sheet-metal case that housed Processor Technology's Sol struck him as clumsy and industrial ... A plastic case was generally considered a needless expense compared to the cheaper and more pliable sheet metal. Hobbyists, so the arguments went, didn't care as much for appearance as they did for substance. Jobs wanted to model the case for the Apple after those Hewlett-Packard used for its calculators. He admired their sleek, fresh lines, their hardy finish, and the way they looked at home on a table or desk."<1>

The final case design made the Apple II look quite different from most of their competition. The other computers looked like they had been assembled at home (and many of them were). The Apple had no visible screws or bolts (the ten screws attached at the bottom). It had the appearance of some variation of a typewriter, but still looked futuristic enough to be a computer. The friendliness of the design even extended to the lid, which popped off easily to allow access to the expansion slots, almost inviting the user to look inside (unlike most electronic devices that held the warning "CAUTION! NO USER SERVICEABLE PARTS INSIDE").<2>

Other aesthetics to which Jobs paid attention were the color of the keyboard, vents for heat dissipation (avoiding the need for a noisy fan), and a shape and color that would blend in with other items in a home or on a desk. He also hired an engineer who was good with analog circuitry (not Wozniak's area of interest) to design a reliable, lightweight power supply that would stay cool. The engineer, Rod Holt, was working at Atari at the time, but was convinced to help Jobs and Wozniak. He developed a new approach (for microcomputers) by taking household current and switching it on and off rapidly, producing a steady current that was safe for the expensive memory chips. The final design of this switching power supply
was smaller than a quart carton of milk and was quite reliable. Holt also helped design the television interface for the Apple II.<3>

The new company was racing to have the Apple II ready for the First West Coast Computer Fair in April of 1977. Some last minute bugs had to be eliminated; because of a static electricity problem affecting a sensitive chip, the keyboards went dead every twenty minutes. Chris Espinosa and Randy Wigginton, two high school students who were early employees of Apple, had written programs to demonstrate the computer's color and sound. They were hurriedly working to duplicate these programs on cassette. People at Apple were working to fix blemishes in the computer cases that had returned from the plastics molding company. The name for this new computer was also finalized as "Apple II", following the example of Digital Equipment Company, who had given each newer version of its PDP series a higher number (PDP-1, PDP-6, etc.). They stylized the "II" in the product name by using right and left brackets, and displaying it on the case as "][". The final product bore the mark of each person at Apple:

"The computer that appeared at the West Coast Computer Faire was not one person's machine. It was the product of collaboration and blended contributions in digital logic design, analog engineering, and aesthetic appeal. The color, the slots, the way in which the memory could be expanded from 4K to 48K bytes, the control of the keyboard and hookup to the cassette recorder, and the BASIC that was stored in the ROM chip—in effect the motherboard—was Wozniak's contribution. Holt had contributed the extremely significant power supply, and Jerry Mannock the case. The engineering advances were officially recognized when, some months later, Wozniak was awarded U.S. Patent #4,136,359 for a microcomputer for use with video display, and Holt was given Patent #4,130,862 for direct current power supply. But behind all Jobs was poking, prodding, and pushing and it was he, with his seemingly inexhaustible supply of energy, who became the chief arbiter and rejecter... [Finally,] the combination of [Mike] Markkula [Apple's first president], Jobs, and the McKenna Agency turned Apple's public bow [at the West Coast Computer Faire] into a coup."<4>
"[Steve] Jobs was meticulous about the style and appearance of the logo ... When Janov suggested that the six colors be separated by thin strips to make the reproduction easier, Jobs refused."<5>

For the Faire, Markkula had ordered a smoky, backlit, illuminated plexiglas sign with the new logo. Although Apple had a smaller booth than other companies displaying their products at the Faire, and some of the other microcomputer makers (Processor Technology, IMSAI, and Cromemco) had been in business longer, Apple's booth looked far more professional, thanks to Markkula's sign. Some of the other participants, companies larger than Apple, had done no more than use card tables with signs written in black markers.

Because they had been one of the first to commit themselves to displaying at the Faire, Apple's booth was near the entrance and was visible to everybody entering the convention center. They demonstrated a kaleidoscopic video graphics program (possibly an early version of "BRIAN'S THEME") on a huge Advent display monitor, catching everybody's attention. But, after the Faire its organizer Jim Warren (Homebrew club member and editor of DR. DOBB'S JOURNAL) didn't think that Apple was a strong exhibitor. Byte magazine, in their report of the show, failed to even mention Apple. Despite these early opinions by influential people, over the next few months Apple received about three hundred orders for the Apple II, over a hundred more than the total number of Apple I's sold.<6>

THE APPLE II: COST

Prebuilt systems were also sold by Commodore (the 6502-based PET, for $595), and Radio Shack (the Z80-based TRS-80, for $600). This was quite a bit less than the Apple II's premium price of $1,298 for a 4K computer, a pair of game paddles, and an audio cassette with demo programs. This price did not include a cassette recorder or monitor (which both the PET and TRS-80 did include). The hardware limitations and lack of expandability of those machines, however, offset some of the price difference. Also, one other hardware introduction for the Apple II that happened in mid-1978 set it well ahead of its immediate competitors; we'll get to that shortly.

THE APPLE II: EXPERIENCES OF EARLY USERS

The original manual for the Apple II was sparse. It consisted of thirty photocopied pages, including some handwritten notes from Woz. The over stated, "simplicity is the ultimate sophistication: introducing Apple ][, the personal computer." In early 1978 these original photocopied manuals were replaced with the new "Apple II Technical Reference Manual" (also known as the "Red Book"), and copies were mailed to previous customers. Steve Jobs realized that people often viewed the quality of a product by the quality of its documentation, and so he took pains to get manuals that were easy to read and had a professional appearance.<7>

Setting up an early Apple II was fairly simple. The lid popped off easily, and one of the first things you would attach was the Sup'r Mod (RF modulator). This was plugged onto two pins sticking up from the back rear of the motherboard, near the video output jack (assuming that you did not also buy a REAL computer monitor). The game paddles were two small black boxes, with a knob on the top attached to a potentiometer (similar to volume controls on a radio) and a tiny black button on the side. These
boxes were attached via a narrow cable to a plug that looked (and was) fragile; this plug also went into a small socket in the motherboard. Lastly, you attached your data storage device (the cassette recorder) to the input and output jacks in the back of the computer.

After turning on the Apple II, the first thing to greet you was a screen full of random alphabetic characters and symbols, and possibly some colored blocks (lo-res graphics mode might be turned on). Here you had to press the RESET key in the upper right hand side of the keyboard, which, after releasing the key, would cause a "beep!" and an asterisk to appear in the bottom left-hand corner of the screen. (If the lo-res graphics mode had been on, it would now be off). Next to the asterisk (which was a prompt to show that you were in the Monitor) was a flashing box, the cursor. To get into BASIC, you had to press the "Ctrl" key and the "B" key simultaneously. Now you would see a different prompt, one that looked like a ">".

At this point, you could either begin entering a BASIC program, or try to load one from cassette. To load from cassette was not always easy; it took time to get the right volume and tone settings on the tape player in order to avoid getting the "ERR" or "*** SYNTAX ERR" message. (And if you didn't have much memory, you might get a "*** MEM FULL ERR" message!) When you got it properly loaded, you could type RUN and see what happened. Beyond that, it was more or less up to you to actually find something to DO with your new toy.<8>

THE APPLE II: EARLY HARDWARE ADD-ONS   Aside from the M&R "Sup'r Mod" that

allowed early Apple II users to run
their computer on their color TV's, some other enterprising hackers

designed their own versions of modulators. One used by an early member of
an Apple user group in Washington State (Apple Pugetsound Program Library
Exchange, or A.P.P.L.E.) was somewhat better shielded than the "Sup'r Mod". It had its own power supply and plugged into the video output jack on the back of the Apple. The "Sup'r Mod" was by far the biggest seller, however.<9>

At first, there were no interface cards for any of Woz's eight slots. With the limited funds that computer purchasers had then (and now) there was not much they could afford after shelling out anywhere from $1200 to $1800 just to get their own Apple II. But they were innovative, and like many other hardware hackers of the day managed to make do with old or surplus parts. Some people, for instance, had gotten their hands on used teletype printers, such as the ASR-33 (called "battleships" because they were so rugged and heavy). Since there weren't any printer interface cards to plug into the slots to allow the computer to communicate with the teletype, they used a trick they learned from Woz himself. The Apple II had four single-bit output pins on the game controller socket that could be used for various purposes. A schematic floated through the various user groups that showed how to connect the teletype to an annunciator pin; along with it was a machine language program that re-directed output from the screen to that one-bit port, and on to the printer.<10>
HOME FINANCE PACKAGE  

Commercial venders have produced a vast array of programs since the Apple IIGS was introduced. These programs covered just about every application thinkable, except for a good quality home financial program. There have been many templates for Appleworks and Appleworks GS that cover everything from checking and savings accounts to home budgets and car loans, but nothing that would do all these things and much more.

<<< FINANCIAL GENIUS >>>
Financial GeniuS (FSG) is an excellent home finance program written specifically for the Apple IIGS using the standard GS/OS interface and is completely compatible with System software 6.0. With FSG you can keep track of all you financial records including; checking and savings accounts, credit card management, home budgets, investment management, car loans, assets, liabilities, cost projections, home mortgages and much more. FSG uses standard methods to enter information into your financial records such as menus, line edits, radio buttons, check boxes, and pop-up menus.

Financial GeniuS comes complete with an 8 page tutorial that completely covers all the features included in the program. Starting a new account mainly consists of opening a checking account followed by various categories (up to 120 per account) which lists assets, liabilities, income, and expenses. Each category can be used to break down assets such as your car, home, summer cabin, fishing boat, and jet plane (don't we wish). Liabilities like credit cards and Uncle Fred, expenses like groceries, household goods, Car loan monthly payments, mortgage monthly payments and interest. Income can be included also as various categories such as Paycheck, Savings interest, and stock dividends.

The checking account acts as a base for the other categories as most transactions are done through your checking account. However, each category can also be accessed for individual transactions, for example your savings account. Automatic Transactions is a neat feature were you can create a list of transactions that take place each month, like your car loan payment, mortgage payment or any month payment where the amount does not change. Then when it comes time to enter that car loan payment all you do is call it up from the list of Automatic Transaction. You can also setup automatic transactions for your savings account for Social Security, Retirement pay that go into your savings on a monthly bases.

Another great feature is the ability to Split Transactions. This is useful when you write a check for the local market and not all that you purchased will fit into one category. Perhaps you also purchased detergent, bleach, paper towels and toilet tissue. These items would go under household expenses and not groceries. With Split Transactions you can split up a single check into two or more categories.

One draw back to the program, and it is a minor one, is that you must use the TAB key to move from input edit box to the next input edit box. Of course you can also use the mouse. The TAB key after entering information in order to go to the next entry box takes some getting use to. The RETURN key would be more traditional and easier as that is the way most programs are written. After a bit of use though you seem to get over hitting the RETURN key to go to the next input box.

Another feature I would like to see added is an Automatic monthly entry into the savings or checking accounts to handle automatic deposits from retirement or Social Security payments. I have my Navy Retirement and VA benefit check deposited automatically and my mortgage and maintenance fee withdrawn automatically from my savings account. Yes I can use Automatic Transactions to list these four transactions and enter them one at a time into my savings account, but it would be nice to have the programs do this automatically without any actions on my part.

Let's get to the bottom line. This is not only an excellent home financial program for the Apple IIGS, it also fills a rather large hole in
this somewhat forgotten applications area. We should all give a hardy congratulations to Rick Adams for taking the time and effort to write such an outstanding financial program. The $35 Shareware fee is so very small considering what this program offers. This is not just a Shareware program, it is indeed commercial quality and we should be thankful that Rick decided to go the Shareware route because an equivalent commercial Finance Genus would cost in the neighborhood of $90 to $100 dollars. I highly recommend this program for those among you that want to keep track of your home finances.

Doing It Online!

 >>> THE SUPRA-FAX MODEM <<<

SupraFAX Modem V.32bis  A month and a half ago, my modem was hit by lightning. I'm fortunate that it was the only piece of hardware affected. After wrestling with the insurance company for a few weeks, I collected, and bought a new SupraFAX Modem V.32bis.

At first glance, it's a neat little modem. It's very small, about half that of most modems. It measures 6-3/8 by 4-5/8 by 1- 1/4 inches. The case is silver, and it has a black faceplate. The faceplate has four LED indicators, Off Hook (OH), Send Data (SD), Receive Data (RD), and Terminal Ready (TR). To the right of that are a pair of 5x7 dot matrix LED displays that show the rest of modem's modes and functions. Next to that is the power switch, a rarity on today's computer equipment. Finally somebody has put the power switch in an easy to reach location!

The modem comes from the factory with two presets to get you up and running immediately. One is for IBM PC/Amiga/Atari owners (AT&F2), and the other is for Macintosh owners (AT&F1). Other settings allow you to set how the modem tells you its connect rate, and which protocols it uses. Some terminal software chokes on these extras, so it takes some time to determine just how your program will react. One very interesting command is AT%Q. When you are logged onto a BBS, return to command mode with ++++, then type AT%Q. The number it gives you is the quality of the connection, from 0 being good, to 10 being awful. Then you can return to the BBS with ATO.

The documentation is excellent. Included are a thick reference manual that explains every feature of the modem, all of its Hayes-compatible commands, a glossary of terms, and even an index; a Getting Started manual that explains how to install your terminal software (PC and Mac users only), what the different display codes are on the modem's fancy display, and a very basic guide to sending a FAX (if you have FAX software); and very handy reference card with all of the commands, the display codes, and...
Apple II Computer Info

even an RS-232 pinout.

UP & RUNNING  Okay, so how does it work? My first impressions are excellent. The character display is very interesting, and is certainly a change from the typical row of LED's found on most modems, although I would have preferred a larger display, since to a novice, a flashing sequence of 144, LP, DC, and CD don't mean much. What it does mean is a connect rate of 14,400 bps, LAP-M error correction (V.42), Data Compression (V.42bis), and Carrier Detect, respectively. After a while, I discovered a very annoying problem with this modem in particular. When first powered up, I have no problem connecting to any BBS. But after the first call, the modem will only connect using MNP error correction. Since performing a soft reset with the ATZ command didn't cure the problem, I found that powering the modem off and back on did the trick.

CUSTOMER SUPPORT  Now we get to Customer Support. It takes a while to get through to them, but once you do, they're very helpful. I tried all afternoon, and the line was busy. Finally, it rang, and I got the recording, "All operators are busy. Please stay on the line, and someone will be with you shortly." After about three minutes, someone came on. He was completely baffled with my problem, as it wasn't one they'd heard of. He was very knowledgeable and, and decided the easiest thing to do was to replace the modem. He said there were two ways to do it: I could send it back, and wait a few weeks for a new one; or I could give them a credit card number (as a deposit), and they would express-mail me a replacement, with a prepaid return envelope. The only catch is that there is a $20 charge for this. I opted for the faster way. Two days later, the UPS Red Label package arrived at 10:00 am. I sent the old modem back via Federal Express, in the included envelope.

THE BOTTOM LINE  The new modem works great! It has no problems that I have detected so far. I regularly achieve speeds in the high 1600 cps range, with V.42bis and Ymodem-G, on files compressed with Quester's LHARC. This modem really flies! I'm very pleased with it, and I recommend it to anyone looking for a good, low-cost high speed modem.

The SupraFAX V.32bis retails for $399, but I have seen it as low as $309 from some mail order houses. This makes it one of the best deal in high speed modems.

[GENIELAMP]  

TOP OF THE PAGE  GEnieLamp writers and contributors are paid for their efforts with online time here on GEnie. In order for me to credit their accounts, I ask them to send me their GEnie ID number. Recently, a new contributor sent me his password. GASP! I blinked a few times, took a deep breath and wrote a reply to his message explaining to him how to go about changing his password.

Afterwards, I got to thinking that maybe it was because of my position here on GEnie that he assumed it would be okay to give me his password. Or maybe it was just an oversight. Regardless of the reason, it brings up the point that it can happen. Don't let it happen to you. Never, I repeat, _NEVER_ let your password out into the hands of someone else! There is absolutely _no_ reason what-so-ever for anyone but yourself to know your password. Period.

Sooooo.... how long has it been since you've last changed your password? Last week? A month ago? Never? If it has been awhile, perhaps today would be a good day to change it. Odds are your account will never be the victim of some unscrupulous member, but why take chances? Changing your password takes only a few seconds to do, plus, it is part of your GEnie*Basic package.

To change your password, type SET or M900;2 at any GEnie main prompt. You can use any character from A through Z, all digits from 1 through 9, asterisks, periods and dollar signs. GEnie will ask you to enter your old password, then to enter the new password. It will then ask you to re-enter your new password for verification. Pick a password is easy for you to remember, but next to impossible for someone else to figure out. Commit it to memory or write it down and put it in a _secure_ place.

If you are using Aladdin while on GEnie, changing your password is even easier. Just choose "Change Password," follow the prompts and let Aladdin do the dirty work.

Take the time and effort to do this. Your pocketbook may thank you someday!

>>> GEnieLamp Odds & Ends <<<

Standing Ovation  Tom Schmitz, the chief editor of the Apple II/A2PRO GEnieLamp, has informed us that he's accepted a large promotion at his daytime job and will consequently have to relinquish his role as chief editor of the Apple II/A2PRO GEnieLamp. Since April, 1992, Tom coordinated the production of the first seven Apple II/A2PRO GEnieLamp's, setting high standards in every facet of his work. We will deeply miss Tom's pioneering leadership.

Taking over as chief Apple II editor is frequent GEnieLamp contributor Darrel Raines [D.RAINES]. Darrel has broad interests in the Apple II, and hopes to give the Apple II GEnieLamp his own signature leadership in the...
THOUGHT YOU SHOULD KNOW... I downloaded the new (ALADDIN) 1.62 version from a local BBS. After that I had all kinds of problems, like it would download a long time and when I went to read the messages, there was only one available to read. Another time it downloaded a few messages and gave the 'end' beep and said I've been idle too long. Another time I didn't get me mail at all even though I had 4 letters waiting.

So, last night I downloaded 1.62 again, this time from the Aladdin library and everything seems to be working the way it is suppose to now. So I want to warn people, sometimes you may get a bad download especially if it is from a local BBS, it may have had a bad upload if you know what I mean... -Leska [V.WRIGHT]

[*][*][*]

Have you ever wondered what it's like to be a SysOp?

To the tune of "White Rabbit" By Jefferson Airplane...

Some folks like the BB's,
And some folks like the Mall.
And the ones who start up flamewars,
Don't like anything at all.
Go ask Sysop, when he climbs the wall.

And if you go, chasing lurkers,
And you know you're going to fall.
Tell 'em hookah... smoking modem,
Has given you the call.
Poor Sysop, he deals with it all.

When the posts in the deadmail,
Get up and tell you where you go.
And you've just had some kind of linenoise,
And your node is moving on...

Go ask Sysop, I think he'll know.
When the pointers, and topic markings,
Are lying sloppy dead.
And the cursor is typing backwards,
And you can't read what you've just said.
Remember, what the Doormouse said,
Park your head... park your head.

(Reposted with the author's permission)

Until next month...
CALL TO ARMS!!!!!!! According to some reports I've seen Apple won't be distributing version 7.1 of the Mac operating system via bulletin boards--such as GENie-- or user groups. While it's not been stated that sounds like Apple is going to charge for system 7.1. I strongly recommend you call Apple and tell them that you don't want to have to pay both a premium for their hardware and for relatively minor updates to the System software.

I'm not suggesting that Apple should be a charitable institution. However I do feel that Mac owners should be able to get the latest version of the basic operating system for free. So it's ok in my mind for Apple to charge for new functionality such as DAL or AppleScript-- although charging for AppleScript will probably keep it from being accepted due to the high costs for developers to redo their software to support it-- but they shouldn't charge us for a .1 version upgrade.

Further I don't expect Apple to provide printed documentation, media, or support for those who get the latest system via an electronic, ie free, channel. It's perfectly reasonable for Apple to charge for tech support once you're Mac is out of its one year warranty period. In any case you'll probably get all the support you need here on GENie. The Apple support people are good but Apple can't afford the type of people who provide answers here out of the kindness of their hearts.

Finally I would be willing to pay for system 8 if it had enough new features and/or improvements to warrant the cost. So start writing now...
folks let Apple know that they can't charge more for the hardware and also charge for the basic system software. -Tom Schmitz

HELP!!!!! Denver, CO (PNS) Jawaid Bazyar of Procyon, Inc. reported today that an AWGS gone amuck caused non-trivial damage to Procyon's customer database. Since he seemed about to have a breakdown of some sort, this reported offered a suggestion—ask around and people would probably help in the reconstruction effort. At that point, he put the grenade down and wrote the following for me to publish, in this fine gazette:

"Dear Valued GNO Customers, unfortunately a certain sequence of events occurred that caused us to lose our records for customers with GNO serial number from 000160-000183, and from 000201-000220. If you're one of these good folk, please send me (via email, GEnie: Procyon.Inc) the following information to help us reconstruct our database.

Name
Address
City, State, Zip, Country
Phone
GNO Serial Number

We're going to be mailing announcements of our new products soon, and we don't want anyone to miss out!"

After Mr. Bazyar handed me this note, he proceeded to tell me all about the Unicorn collection at the Zoo, and how he loves to visit them wearing anti-radiation DEVO clothing. White-clothed men then came to assist Mr. Bazyar away for treatment.

[p.s. This really happened, and we really need your help! ]

Matt Gudermuth

>>> WHAT'S NEW <<<

IT'S BACK! A2 and A2Pro's educational arm, A2Pro, has been undergoing serious renovation during summer vacation -- and now it's back, bigger and better than ever!

Our new A2U Dean, Professor Steve Gunn, has been renovating the university all summer. You'll now find A2U in A2Pro, where the programming discussions it spawns can peacefully coexist with all the other programming discussions with programmers of all skill levels and interests. A2U lives in the A2Pro bulletin board as category #18, and also in A2Pro's library #18.

There you can find all the past A2U courses plus sign-ups and discussion for two of the most exciting courses we've been pleased to offer.
Starting September 15th, Professor Will Nelken (professor for a previous A2U course on UltraMacroWorks and author of numerous Ultra reference materials, including columns in A+/inCider) starts a brand-new 12-part course on JEM Software's latest, most powerful offering to date: Ultra 4.0. "Ultra 4.0 to the Max!" can teach _you_ how to squeeze all the power possible from this fantastic new offering.

And starting in October, Professor Andy McFadden, author of NuLib and YankIt archiving programs -- both of which deal with ShrinkIt (NuFX) archives and often do so faster than ShrinkIt -- begins a fantastic course on data compression. If you as a programmer have ever wondered how compression works, how specific compression algorithms work, how to choose the right compression for you or how the most popular Apple II compression schemes work in theory or in practice, this course is for YOU! Prof. McFadden's course starts with how compression works and continues, in English and with sample code, through some advanced topics in byte squeezing.

How much does it cost? Nothing more than the time it takes to read the messages and download the files -- it's part of A2 and A2Pro's service! No additional charges whatsoever!

Stop by new A2Pro category 22 and take a look around, and sign up for more Apple II programming knowledge from A2 and A2Pro -- _THE_ place to be!

(M.DEATHERAGE, CAT1, TOP17, MSG:29/530)

What Is A2 University? A2 University is a special area in A2PRO that provides for programmers and non-programmers alike to increase their programming skills via free classes that are taught online. A2 University (A2U) has the following goal: To increase the number and the quality of programmers in the Apple II world. For you see, that is the only way that we can prolong the life of the Apple II.

What is Involved? A2U was designed to serve the needs of all levels of programming experience. Whether you want to get started in basic, or optimize some of your assembly routines, A2U is the place for you. Four times a year, we will have a course registration for 2 weeks right before the next term starts. In this time you will need to register for any courses that you wish to study. Please note that there is no extra charge to participate, but we do need you to register.

Then when the course begins, you will be able to download the weekly lessons that are uploaded by your professor, and attend the RTCs held here in A2PRO to ask them questions live. There will also be topic available here in the Bulletin Board to ask questions if you are unable to attend the conference.

How Do I Register? When each teaching term in A2U is about to begin, all students who have sent in a general A2U registration form will receive a short Email reminder as to what courses are being taught this next term, and how to register. There will also be plenty of reminders on the front door of A2PRO when the registration period is going on. Simply fill out the registration form in the registration Topic for each course that you want to participate in, and post it as a reply in that topic. That simple.

How Do I Get Mailings? In this category, there is a topic called...
"Student Directory" which contains a form. When you fill out this form, you will receive Email announcements from A2U. These will announce new courses, new Professors, important information etc. Please note that you must fill out this form to be placed on the mailing list, but you only have to register for a course to participate.

What Happens When The Course Is Over? After each 12 week term in A2U, the messages concerning each of the courses will be archived and uploaded to the A2PRO library. Then a topic will be started for the discussion of the Old Course. These topics should be used for any discussion of A2U courses that are not currently going on, and will contain all information on what is required to take the course.

Who Teaches The Courses? A2 University Professors are volunteers that teach the classes. The classes that they teach are of their own creation. Their only compensation is a Free Flag in both A2 and A2PRO for the duration of their course. If you are interested in teaching a course, please send a letter to that effect to me (A2PRO.STEVE) and carbon copy it to A2PRO$. Then we will let you know what is involved and get you started on your course!

Is There Anything Else? Well, in addition to the time here on GEnie, some courses may require a textbook, or a special piece of software. But most of the courses will use the "standard" tools for Development. If you have a compiler for the language you will be using, the Toolbox Manuals, and the GS/OS manuals, then you are probably set to tackle most of the courses offered in A2U. But there have been courses that required only AppleWorks and TimeOut UltraMacros. Each course is unique, and its requirements are equally unique.

Closing Thank you for reading this, and your interest in A2 University. We hope to see your face in a classroom next course session.

How To Take an A2U Course Taking an A2U course here on GEnie is actually very simple. All you need to do is say that you want to take it. Then you can participate in several areas. All of which are _OPTIONAL_. I suggest that you download all of the lessons for the course you are interested in. It usually helps to have them around. Plus, the Bulletin Board (Right Here!) is another great place to ask questions. Then finally, each class will have an RTC (Conference) that you can attend to ask questions in real time! And that is about it! Take time to post a message about yourself in Topic 4, and there is nothin else that you need to do! You are a full fledged A2U Student. -Steve

Fall Term Courses I am happy to announce that we will have two new courses for the Fall Term here in A2U. They will be on Ultra 4.0 (Will Neklen) and Data Compression (Andy McFadden). Here are the topics that have been created for these courses, post anything pertinent to the course there.

22 ULTRA 4.0 - To The MAX! (Ultra 4.0 Course)
23 A pinch of Data Compression (Data Compression Course)

-Steve A2 University Dude (A2PRO.STEVE, CAT22, TOP2, MSG:1/MA2PRO)
A2PRO COMPANY SUPPORT GROWS WITH GS+ MAGAZINE AND JEM SOFTWARE

The list of companies providing direct support for programmers in A2Pro grows to five with two sterling new Apple II developer-supporting companies opening their own categories and libraries in A2Pro.

GS+ Magazine, published by EGO Systems of Tennessee, is famous for the with, technical information and no-holds-barred style of the publishers and authors, mostly Steve Disbrow and Joe Wankerl. Steve and Joe have opened a new category in A2Pro's bulletin board and a new library (both #33) to help programmers who want to use GS+ utilities, or maybe who want to write and become famous by publishing in GS+ Magazine! Check out category and library 33 to learn more about GS+ Magazine. Steve and Joe have also opened a category in the A2 bulletin board (on page 645) for non-programmer concerns, such as subscriptions and back issues.

JEM Software, Randy Brandt's AppleWorks super-charging company, has just released the most powerful AppleWorks 3.0 enhancement ever, Ultra 4.0. Not only does A2U offer a course on how to use this fantastic product -- JEM Software and Randy Brandt are now in Category #34 of A2Pro to support Ultra programmers as well as programmers who use all kinds of JEM products. Drop by and have a look -- if you want to know how to make AppleWorks do more for you than before, this is for you. A2Pro supports all kinds of programmers, from assembly language to HyperTalk to Ultra 4.0!

Please join A2Pro in welcoming these fine companies to our online family. Drop by their bulletin board categories and say hi!

(M.DEATHERAGE, CAT1, TOP17, MSG:30/M530)

MORE APPLE HISTORY If you caught (or will catch, depending on how you are reading these messages today) my post in Cat 3, Top 4 (New Uploads), I've uploaded five more pieces of the Apple II History (finally!) These:

#19320 Apple II History, Part 18 -- Software
#19339 Appendix A, Part 1 -- Software 1977-80
#19340 Appendix A, Part 2 -- Software 1981-82
#19341 Appendix A, Part 3 -- Software 1983-86
#19342 Appendix A, Part 4 -- Software 1987-92

Now, even though I've uploaded an appendix, that does not mean that I am finished with this puppy yet. Actually, I have several more segments to polish up and add to, but the appendix that dealt with software seemed appropriate to upload at this time. Also, I had another reason for uploading it right now.

The appendix, in its four parts, gives an annotated listing of popular Apple II software that was released over the years. For the years 1977-1983, this is taken directly from the Softalk Top Thirty lists published each April (and voted on by their readers). Many of the descriptions that go along with each program are also taken directly from Softalk's "Fastalk" column. In some cases I added comments of my own, or created comments where Softalk never got around to it.

The place where I find I need help is in the years after 1984. I have had to rely on posted ads for the various software packages during the
years late 1984-1992, since no magazine has taken on the task of compiling a list of top software on a yearly basis since then. Consequently, the list is rather scarce during some years.

What I would like from you, the users of A2, is this: If you have an interest in reviewing the lists in the Appendix parts and see if there are either errors (author’s name misspellings, program name, publisher, or description) or omissions, I would be most pleased to know so I can make the list better. If you know the name of an author that I have not included, please let me know. I feel that I am particularly weak on the GS side of software, not having gotten into the 16-bit world until about 2 months ago.

I don't feel that I can include EVERY piece of software that has ever been released for the Apple II, but if there is anything that was clearly a popular program, or an innovative program, that I have missed, here is your chance to make me aware of it.

What I probably cannot do is make the appendix files, in toto, shorter. Trying to find a way to present information about the gargantuan pile of programs that have come out over the years is part of what made this part of the History take SO-O-O-O long to get out. I've had information for Parts 19-22 actually completed for months, but I had this stumbling block of how to organize this stuff that slowed me down so badly.

If the info presented in Appendix A (parts 1-4) is already acceptable, I would appreciate hearing about it also. Oh, yes; the stuff for 1991 and 1992 I did more annotation on, since it is current and still available. If there are some other programs recently released that I should include, please tell me about that also. Steve Weyhrich <IX0YE>---<
(S.WEYHRICH [Historian], Cat. 2, Top. 16, Msg. 114, M645;1)

SOFTDISK PUBLISHING ONLINE IN A2PRO

Softdisk Publishing, creators of Softdisk and Softdisk G-S magazines on disk, now have their own online support category _just for programmers_ in A2Pro!

Softdisk has long been a valued contributor to A2 and A2Pro, and they continue to provide customer service and support for the subscribers in A2, as they have for a long time. But now, here in A Pro, Softdisk has support for you, the _programmers_!

Want to know how to submit to Softdisk? You should, because Softdisk pays good money for your work -- sometimes more than you can get from shareware fees. Do you subscribe and admire the produce on values? You can find submission guidelines that describe all these things in Softdisk's new A2Pro category and library, both #31.

We're pleased to welcome Softdisk to a formal level of support for programmers and potential submitters here in A2Pro. Look for even more companies supporting programmers here in A2Pro -- the development information you want all in one convenient place! Drop by category 31 and check it out!

(M.DEATHERAGE [A2Pro Leader], Cat. 3, Top. 7, Msg. 9, M645;1)

WARP SIX NOW PD

Warp Six BBS is now in the public domain, with the release of public domain version 1.0, right here on A2 as
file number 19178, filename W6BBS.BXY.

I'm not going to completely stop working with the system, but I plan on spending a lot less time with it. For this reason, I felt it would be best to place it in the public domain.

For those interested in the source code to the modem drivers, I'll be uploading those to A2Pro very soon. You will need Merlin to edit and re-assemble the SSC.Driver, and Merlin 16 or Merlin 16+ to edit and re-assemble the GS.Hski and GS.GPi drivers. The Xmodem module and Xloader can be assembled with Merlin 8. (If you have Merlin 16 or 16+ you can assemble the lot.)

Best wishes in the future and with this message I'm departing from this topic.  -Jim Ferr, creator of Warp Six BBS.

(October 41, Top 10, Message 51, M645;1)

ASTRONOMER GS V2.3.2 IS HERE!  I just complete the upload of the latest version. With luck (and the Sysops help) it should be available on-line very soon. Along with that, I uploaded two other separate files that will 'tell you about the program. First, for those who don't have the program the file "About Astronomer" in the Education library contains a text file and some screen snapshots showing what the program screens look like. The text file explains what the program's capabilities are. The second file, Astro..Changes in the same library will describe the changes since version 2.3.1. Since the new version corrects several bugs everyone should update as soon as possible.

(L.BELL13 , Cat. 13, Top. 14, Msg. 11, M645;1)

MDG PROGRAMMERS EXCHANGE The Morgan Davis Group is proud to unveil the MDG Programmers Exchange. Many of our products are geared toward software development for both 8- and 16-bit Apple II platforms. This is the place to go when you have questions about working with our tools. Use the TOPIC command to get a complete listing of c 1 is for MDG news and announcements. Here, you'll find notices about new products, upgrades, new uploads in our software library, and so on.

Topic 2 contains summary information about our entire product line, including pricing, order information, etc.

The first message in each product topic is a press release describing current features and availability.

The last topic is the MDG Hackers' Lounge. Post messages here that are not appropriate in any of the other topics.

In the MDG Software Library, you'll find files related to using Morgan Davis Group development products. Uploads consist of either binary programs and data files, or lengthy text documents describing some aspect of programming with our software.

Occasionally, we will upload "freebie" software -- utilities to help around the hard disk. We also have a few demos of some of our titles, like MD-BASIC. With ten minutes of informative and humorous running time, the MD-BASIC demo is really fun to watch.

Thank you for joining the MDG Programmers Exchange here on GEnie.
Enjoy!

FOUNDATION IS BACK Well Folks, I'm finally back here on GENie and you're going to start seeing my face (so to speak) around here to answer any Foundation related questions and keep you up to date on Lunar Productions.

To start things off, here is the current state of Foundation:

We released it! Yes, version 1.0 was released at KansasFest, but... (you knew there was a but :) ...at the last minute we decided to pull ScriptEdit from the release. We couldn't convince Uncle DOS or Event Specialists to postpone KansasFest for a month, and Jim "no sleep" Murphy gave it his best shot anyways. The bottom line is that Foundation 1.0.1 will begin shipping in a couple weeks with a VERY nice ScriptEdit module (including the dynamic ScriptBuilder!) Anyone who has already purchased Foundation will get 1.0.1 as a Free update (please keep those registration forms coming :)

Foundation 1.0.1 is $79.95 and can be ordered directly from us at:

Lunar Productions 1808 Michael Drive Waukesha, WI 53186 414/549-9261 (evenings please – central standard time)

Marc Wolfgram Lunar Productions –

>>> THROUGH THE GRAPEVINE <<<

GSP CARD  Tom, like the GSP Card for the Apple II that was rumoured to be in development by Apple, the Apple /// on a card (codenamed "Rub a dub dub") is actually in development by a ///rd party. A prototype is expected to be shown off running one of the cash registers and acting as a coin-op videogame simultaneously at PizzaFest. (: -= Lunatic (: (LUNATIC, Cat. 44, Top. 11, Msg. 33, M645;1)

ANNOUNCING: THE MACRO PROJECT (?) Several months ago I floated the idea that we macro writers consider forming some sort of association or alliance for the purpose of promoting macro-based programs, exchanging information and ideas, etc. Although some expressed a general interest in the idea, I did not find much enthusiasm for a formal association, largely because of the bad taste left in all of our mouths by the untimely demise of the AppleWorks Programmers Association.

While I agree that there may not be a need or a desire for a formal, dues-paying organization like APA, I still believe that those of us who write macros for commercial consumption could take some steps to increase the visibility of the AppleWorks/UltraMacros combination in general and to promote our own products in particular.

As independent programmers writing for a necessarily limited (and perhaps dwindling) universe (those who use AppleWorks _and_ UltraMacros), I believe we need to make special efforts to reach our entail customers.
ad in, say, inCider (aside from its cost) may not be the most effective marketing tool because many of the Apple // users who would see it would not be UltraMacros owners. Advertising in NAUG's AppleWorks Forum might be more effective in reaching the targeted audience, but only a small percentage of AppleWorks users are NAUG members, and again, many of them either do not own UltraMacros or do not have enough memory or disk storage space to use some macro programs effectively.

Most marketing experts will tell you that the best potential customers for most products are people who have previously bought a similar item or an item carrying the same brand name. That is, the people most likely to buy our macros are those who have already bought our macros -- or someone else's macros.

With that idea in mind, I would like to propose what I call The Macro Project.

The Macro Project would produce, at least as its initial offering, a comprehensive catalog of UltraMacros-based programs, task files, macro sets, useful macro tips, hints and/or instructions. The catalog would provide sufficient space for each macro programmer to list and briefly describe all the macro sets/programs/taskfiles that the programmer is selling. The catalog would have a consistent format and would include a table of contents listing offerings by programmer name and/or company name (for example, Dan's Macro City would have a section, Marin MacroWorks another, etc.). It would also contain an index of the individual macros or macro sets.

The Macro Project catalog would, at the very minimum, be mailed to everyone on the combined mailing lists of all participating macro writers. This could be handled in several ways. Either sufficient copies would be provided to each individual so that he could mail his own list (which would result in a fair amount of duplication) or our lists could be combined (and the duplicates winnowed out). The details of how the mailing would work would have to be handled through discussion and negotiation.

I would hope that eventually we could obtain other useful mailing lists from sources that have a high percentage of customers who would be likely to own both AppleWorks and UltraMacros. The names companies that might have those lists are fairly obvious. I have not contacted any of them yet, so the availability and/or cost of these lists is unknown. Of course, all Apple // publications would be notified of the catalog's availability and asked to publish an address that anyone could write to for a free catalog. I'm sure there are other distribution strategies that we could explore.

The immediate goals of this project would be:

1) To provide an appropriate and effective advertising medium for macro-based software.

2) To promote and increase the visibility of the AppleWorks/UltraMacros software combination.

3) To demonstrate the range of macro-based productivity software available.

4) To establish an ongoing publication that can be updated at regular
I know that there are a lot of issues to be worked out between stating the concept and mailing out the finished catalog; I don't intend to go into all of them here. I will state that I am willing devote my time and energy to overseeing this project if there is sufficient interest among macro writers.

If the interest is there, I would like to see the project finished before Christmas, so I need feedback on this soon. I would appreciate it if the discussion of this could be kept public and in t forum so everyone can read the responses. But if there is something you would rather express to me privately, please feel free to email me. -=* Dan *=-

(D.CRUTCHER [Dan], Cat. 17, Top. 12, Msg. 84, M645;1)

APPLE CLINIC UPDATE   I was kind of sad to see that Cecil Fretwell will no longer be writing Apple Clinic in inCider, myself. Fretwell was an Apple II pioneer, from the very earliest days. His column was always well written and accurate. It's a shame he isn't doing it anymore.

On the other hand, I expect good things from Cynthia Field, so we'll see I guess!

In other news, I got word last week that Dan Muse had left inCider to work at Byte. At the moment the editing duties are being taken care of by one Eileen Terrill, though it's not clear if that's to be permanent or not.

What with a change of hands at Apple Clinic, and my new column, and Matt Deatherage's new column, and with more columns for Joe Kohn, and a new editor, inCider is starting to look like a whole new magazine! Should be interesting to see how much it changes with all these new faces and new directions. -Dean Esmay

From our Foreign Desk

PROTOCOL

(summary by Henrik Gudat)

Pizza sponsored by: Apple dealer U. Brunner Organizer: H. Gudat

The first meeting in Reinach, Switzerland was a real success. 9 programmers (8 assembly language, 1 Pascal), the local Apple dealer and two other interested people attended the "show". Besides exchanging information and eating tons of peanuts, the most recent releases of some programs were shown.

The meeting ended in a pizzeria. Mr. Brunner, the Apple dealer, expressed his support and belief in the Apple II by generously sponsoring the complete evening. Thank you very much!

The equipment - provided by H. Gudat - consisted of two Apple IIGS, a 52MB and a 20 MB HD, two 3.5" drives, one 5.25" drive, a Revox amplifier, Bose 301 III speakers, and other stuff.

Present Urs Brunner, Joerg and Valerie Kienzle, Yann Le Tensorer, Laurence, Urs Hochstrasser, Marc Schweizer, Andre Horstmann, Michael Born, Andreas Furrer, Dominik, Henrik Gudat.

U. Brunner confirmed his faith in the Apple IIGS, donated a 6.0 CD and suggested interesting marketing strategies.

Joerg Kienzle he demonstrated SpaceFox because one person didn't know the program! (Okay, he played in the cheat mode)

Andre Horstmann showed off the brand-new ShadowDial II 2.1. It's a Videotex/Btx decoder with great capabilities. Unfortunately, there wasn't a modem connected to the GS so he could scratch the surface only. What a shame! Andre added tons of new macro commands and features supporting the new system tools. In addition you're now able to copy graphic directly out of the Vtx/Btx screen into the system clipboard.

Michael Born and Andre explained their new project. They are building a hardware/software package that will allow you to control any external device via phone (!) and much, much more. As far as I understood the whole thing, it will turn the GS into a intelligent telephone answering machine.

Andreas Furrer and Dominik they started a demo with sensational
Apple II Computer Info

70-line-scrolling (!!!) and NoiseTracker music. The quality was outstanding! Both had also some great ideas regarding new programs. They are now working on a new action adventure game with smooth animation.

Urs Hochstrasser... launched ChemiGS, a desktop application for molecular design. It's similar to an object oriented drawing program but features some functions for "simulating" 3D structures. A protocol between GSymbolix (see below) and ChemiGS is planned. (ChemiGS will be released in 1993.)

Henrik Gudat...double-clicked on GSymbolix 1.7. This nearly-running prototype has been modified so that it supports 6.0 features (especially the Sound CDev and menu icons). A short 3D animation of a cosine could be seen as well as the built-in debugger (...which was definitely better than GSBug...) The most important change is GSymbolix's new capability of working with complex formulae. The program recognized even complicated expressions (such as 4*i/3*i^3). A button bar _might_ also be part of v1.7. GSymbolix 1.7 will ship in a couple of months.

Marc Schweizer...demonstrated LinReg, a desktop program written in ORCA/Pascal for linear regression. It worked flawlessly but it is not yet finished.

New action game Bright Software will soon start with a new, funny action/strategy game for IBM (by Yann Le Tensorer), Mac (Joerg Kienzle), Atari (?) and IIGS (Andre Horstmann and Henrik Gudat). We promise you: the IIGS version will be the best!

There are also plans for an application-independent, object oriented, graphic based programming language. Let's face it when the new game hits the shelves...

To make a long story short, this afternoon was plain fun. Obviously we all spoke the same language (except for one - Urs is using APW — uuuuhhhh). Though the evening ended with a lot of confusion regarding negative fixed values, I'm about to call this meeting the Swiss KansasFest.

And next year I'll take a big pizza. — Henrik

PS for more info, please contact Bright Software, P.O. Box 18, 4153 Reinach 2, Switzerland.

(A.HORSTMANN, Cat. 13, Top. 13, Msg. 13, M645;1)

Ultra Macro Printing A while back I saw a message requesting a macro that would print all of the odd pages in a document, then pause to allow the paper to be turned over, then print the even pages. I also needed to print on both sides of the paper and, unable to find a ready made macro, I was "forced" to write my own. Actually there are two macros; one for the odd pages and one for the even.

<ba-o>:<cawp {macro to print odd pages}
oa-1: {move to beginning of file}
oa-k rtn: {calculate # of pages in doc}
oa-9: {goto last page}
up: {move to status line}
P = peek $00b4: {get last page #}
C = 1: {start page counter @ 1}
Apple II Computer Info

begin:                     {start loop}
oa-1:                     {move to top of file}
oa-P>P<rtn :            {go to printer options, select page}
print C: rtn :print C: rtn: rtn:  {print the page in C}
C = C + 2:                {increment counter by 2}
if C > P then exit        {check for last page}
else rpt!:               {end loop}

<ba-E>:<awp               {macro to print even pages}
oa-1:                     {move to beginning of file}
oa-k rtn:                 {calculate # of pages in doc}
oa-9:                     {goto last page}
up:                       {move to status line}
P = peek $00b4:           {get last page #}
C = 2:                    {start page counter @ 2}
begin:                    {start loop}
oa-1:                     {move to top of file}
oa-P>P<rtn :            {go to printer options, select page}
print C: rtn :print C: rtn: rtn:  {print the page in C}
C = C + 2:                {increment counter by 2}
if C > P then exit        {check for last page}
else rpt!:               {end loop}

I hope that someone will find these useful. Although these macros are not very long (or elegant) they took several hours of head scratching and reading the excellent Ultra Macros series by Willen. Enjoy! Karl R.

Quiet Your MDIdeas Card   re long cables on the MDIdeas card, I had the same problem basically the thing wants to oscillate, so on the MDIdeas end I put a 3 ft cable before the 20 ft cable, and inbetween a little RC net work. I _think_ I put about a 100 pf cap across the line on the MDIdeas side, and about a 100 ohm resistor in series with the line. Used a little piece of perfboard.

Worked fine then. This is my standard procedure for lines that go from a computer into the real world. Actually a .01 cap will just round the edges of a 10khz square wave, and it kills noise dead. Violates all kinds of people's sensibilities, but works. :)  

(J.IMIG [Bit Picker] , Cat. 6, Top. 7 Msg. 155, M645;1)

DRIVE TALK   Yes the Vulcan is IDE and you can replace it with any Quantum or Connor mechanism and I would expect the Maxtor drives to work as well. Current state of the art IDE drives use a block translation and are not designed to require an initialization routine to know the parameters of the drive. For example the Quantum drives will allow the interface card to setup an arbitrary number of heads/cyl inders/sectors per track. The drive simply stores these parameters at initialization time and when the interface card issues a read command the drive will convert the head/cylinder/sector number using the initialization parameters over into a logical block number. From the logical block number the drive will convert over into a head/cylinder/sector number that fits with it's drive parameters. It has to be done this way because current state of the art drives have variable number of sectors per track.

>>> Flopticals..... We are looking into it and we make no promises at this time. Further badgering on the subject will not be taken in a positive light.
AS FAST AS IT GETS  The RamFAST does DMA at 1meg/sec. This is as fast as the IO bus can handle. The RF could actually DMA at about 1.7 meg/sec but the IO bus can't handle it so the RF runs as fast as the IO bus can handle. We read the drive at 1:1 interleave which is as fast as the drive can manage. The RamFAST is as fast as it gets. It is theoretically possible to make a DMA interface that plugs into the Zip or the processor socket and is capable of DMA at 2.6 meg/sec (2.59xxx actually) but it would not be compatible with the TWGS so we haven't pursued it. -Drew  
(CV.TECH [Tri.Stated], Cat. 11, Top. 10, Msg. 77, M645;1)

TAPES  The mechanism in question is a 3M mechanism and it uses the DC-2000 tapes. I've got one here and we use it for testing. The tapes will run you about $14 ish a piece in small quantity and the performance of the drive is about 1.1 meg/sec. A couple of drawbacks to the drive include:

- The tapes only hold 40 meg (actually about 38000k)
- The tapes have to be formatted before use and that takes over half an hour per tape.
- The drive is slightly finicky about power consumption so make sure it comes with a box and power supply. If you put it together yourself you will need at least a 60 watt power supply.
- The drive takes awhile to recognize a tape. When you insert a tape the drive "goes away" for a couple of MINUTES.

Advantages of the 3M mechanism:

- It is the only tape drive I know that can do random access. This means that the RF card can tell the drive to go out into the tape and find block number xxx and read it. The tape drive copes. This is a great improvement when it comes to file based restores using the RF. -Drew  
(CV.TECH [Tri.Stated], Cat. 11, Top. 12, Msg. 82, M645;1)

SCRIPT-CENTRAL SUBSCRIBERS  A quick note to Script-Central subscribers.... I am sorry to say that I left two bugs in the Doctor Who stack. Until the Companions and Villains Stacks are provided, do _NOT_ select Slide Show from either the Companions or Villains popUp menus. If you wish to fix the 'bugs' you must add three lines to the slideShow handler of both the All Companions button and the Some Villains button. The three lines are as follows:

```on slideShow
checkIt                         -- <----- add this Line 1
global F                        -- <----- add this Line 2
if F is "NO" the exit slideShow -- <----- add this Line 3
global STK
```

If you do not wish to make these changes, the 'problem' will disappear when the auxiliary stacks are provided. -Joseph

LOOKING FOR...

"""
> Can anyone suggest or recommend software that will generate invoices and
> statements?

Sure. First, there's an add-on of some sort for AppleWorks; I'll bet someone's already posted that information.

Myself, I like DB Master Pro for its flexibility. And, with Barney's going-out-of-business sale, it's fairly inexpensive. (BusinessWorks is fairly expensive, if I recall.) I uploaded to the Library a demo of a relational inventory/invoicing system for DB Master awhile back; all you have to do is add the program itself :).

If your group went that route, Bill, I could probably modify my system to its needs, gratis, if it's not too involved. You didn't tell us anything about what the requirements are: Is this for inventory, fund-raising and contributions, or something else? Does the system have to add interest on an automatic basis (like credit cards)? What sort of a system does the group have -- hard drive, ram, platform? <<<Lloyd>>>

(L.DEVRIES [Lloyd], Cat. 2, Top. 5, Msg. 60, M645;1)

MODEM DRIVERS

TO: Everyone who uses a USR HST or one of the new SupraFAXModems with GBBS Pro or another ACOS-based system. Paul Parkhurst has recently completed work on a set of drivers which will run any variety of US Robotics HST modem and the SupraFAXModem v.32bis from either the GS serial port or the Super Serial Card. The cost for the complete set of drivers is $15.00. If you want just the Supra driver, the cost is $10.00. He is waiting for 40 orders before he will ship. He can be reached by voice at 510-837-9098, or on his BBS, the Infinity's Edge BBS, at 510-820-9401. This is the only way I know of to use the SupraFAXModem v.32bis with GBBS, but I'm open to other suggestions.

BTW, what's the story on the guy who was working on FAX software for the GS? --> Dan <via GEM v4.20>

(D.BROWN109 [Dan], Cat. 10, Top. 2, Msg. 166, M645;1)

WAIT, THERE'S MORE... Matt's right about 6.0 and CPS Follow, but there's more. I wrote the patches that Zip is distributing (actually they had a contract programmer adapt the code I gave them), and you only need the AppleTalk patch for pre-6.0 AppleTalk. Since slowing down to 81% worked, I have to ask if you are in fact running system 5, because 81% and CPS Follow disabled should not (under 6.0) make the printer disappear -- 30% or so would.

I have my own version of the init that not only fixes AppleTalk for 5.0 but also fixes the "disappearing cursor" flicker and patches the GS/OS SET_SYS_SPEED vector for Future Driver Compatibility (oooh ahh). I sent the
entire init to Zip, and it looks like their contractor didn't change anything (although they did convert the source from Orca/M to Merlin). The system 5 version of the init is called ZIPTALK, and when system 6 came out I removed the AppleTalk code and called the resulting init ZIPFIX. Both inits have been available on internet.

What Zip's documentation probably still doesn't tell you: AppleTalk delay was a last minute compatibility hack. It is really an IRQ delay that turns off the acceleration for 5 milliseconds every time an interrupt occurs. Zip did all their prototyping and beta testing with boards that ran just slow enough for AppleTalk to keep working, and when they finally got the 8 mhz parts from WDC with weeks to go before the release date, they scrambled to find a way to keep from breaking AppleTalk. Since AppleTalk Delay kicks in on any type of interrupt, enabling it really slows down the Zip -- heartbeat interrupts happen 60 times a second (16 ms), and the Zip slows down for 5 ms each time... so roughly a third of the time (or more) is spent unaccelerated. For this reason the AppleTalk delay should ALWAYS be disabled and an init (or system 6) should be used. Besides, as you've probably discovered, AppleTalk delay doesn't fix AppleTalk under system 5 unless you slow the Zip down a bit yourself. Blearg. This is because long AppleTalk packets take 14 ms to send, and the AppleTalk delay only makes things work for 5 ms -- so if you are sending data to the printer and running the Zip at full speed under system 5 the first third of the packet makes it OK and then the Zip comes back on and you're toast. You may be noticing something like this now; you can see the printer, but actually printing doesn't always work. That's because you don't need to use long packets to see the printer, but you do need them to print to it.

Likewise, CPS Follow should ALWAYS be on. Turning it off may make the Zip run a bit faster, but you won't be able to use Disk ![ 's (big loss) and system 6's AppleTalk driver requires it, as Matt said. Other things won't work, like border color animation demos, and the Normal Speed setting in the control panel won't do anything. There are probably other compatibility risks but I haven't run into them because I play it safe and leave CPS follow enabled.

I suppose I should upload these inits to the software libraries. Which category would be the best one, or it is obvious? --Todd Whitesel

RULE #1

"""
> the only thing anybody is going to use the MSDOS FST for is writing out
> files that are intended for an MSDOS system (or a unix system that can
> access MSDOS, like the one I use at work). NOBODY IN HIS RIGHT MIND IS
> GOING TO REGULARLY USE MSDOS FOR REAL IIGS FORKED FILE WORK. Get real!!

Rule #1 of designing software: NEVER assume what people are going to do with it.

90% of all the problems I've ever seen users have with developer's work come about on things where the developer says "People won't want to do that. Get real."

If the FST is writable, people will try to save files to it in Standard File, and if the file has a resource fork the file will then be immediately unusable to the application that just saved it.
This was an early problem with the HFS FST -- it treated files of type $B0 (SRC) as files of type TEXT, so they got HFS creator 'pdos' and file type 'TEXT'. The problem was that when you read them, they had GS/OS file type $04 (Text). It had the advantage of making sense, and letting Macintosh applications read the files with no tweaking. It had the disadvantage that if you copied an ORCA/C source file to an HFS partition, ORCA/C would no longer compile it (wrong language type).

Either it acts like a disk or it doesn't act like a disk. If it doesn't act like a disk, it shouldn't be an FST. Anything less is imposing even more "rules" for IIgs users to remember, and this is absolutely positively not the goal. --Matt (I speak for myself, not for Apple)

WHAT'S A COMPUTER? [t's a person who uses a slide rule, pencils, and lots of paper to make complicated calculations. At least, that's how they're referred to in the Lensman series of book by E.E. "Doc" Smith. ( :

INTERESTING TRIVIA The first manned spacecraft to include an electronic computer was the Apollo. All previous manned spacecraft (Mercury, Gemini, and the Soviet craft) were controlled merely by various combinations of simpler electronics and mechanical devices. Kinda scary, when you look around these days and practically EVERYTHING has a computer in it just to make it work the way you want it to. -= Lunatic (:

>>>>> Don't forget the pigeon bomb control system. Pigeons were conditioned to watch a small screen and peck one of four buttons when a certain shape came on the screen (circle, square, triangle, and diamond). If the rocket started to get off course, the navigation system would flash a symbol on the screen and the pigeon would peck the correct button to respond. I don't recall if this navigation system was ever used, but I saw a number of times the pigeon training program to "program the navigation computer". Skinner would probably have loved it.

APPLE II WARS   The following commentary was aired on Sound Bytes, a public radio show originating in Rochester, NY. It is copyright (c) 1990 by Nick Francesco. Permission is granted to disseminate it in any form, as long as the wording is not changed, and this copyright notice accompanies it.

DOS and Mac people have been at each other's throats since the introduction of the Mac in 1984. Which machine is better; which machine is more fun. As religious wars go, it's somewhere in the middle: worse than the Crusades, but not as bad as the Inquisition. No one on either side has been willing to take prisoners, and Silicon Valley is littered with its victims. Like the Crusades, no one was ever really persuaded to change sides, and like the Inquisition, people who did change sides did so only under extreme duress.

Up until now, of course, most of the ammunition has been on the Mac side. Lots of studies have come out about how easy it is to learn to use a Mac, and how Mac people know and use more different types of programs than DOS people. No less prestigious a company than Microsoft (all rise) has released the information that their support lines prove that the Mac is easier to learn and use. They provide less support per package sold on the Mac side, proving that a Graphical User Interface is better. Of course, they didn't release this information until they had their own Graphical User Interface on the market, but I'm sure it takes a long time to compile the results of this sort of study.

The DOS people had to content themselves with intangibles (it's slower), and appeals to the compu-macho in us all (real users don't use mice).

Now, however, from the hallowed halls of the University of Delaware, comes Dr. Marcia Peoples Halio (trumpet sound). Dr. Halio (no relation to the graphics package, I'm sure) has released the results of a five-year study that suggests that Mac people are shallower, more illiterate, and less likely to have sex than DOS users.

She did this by looking at the grades of a basic composition course. You see, as each student entered the University of Delaware, he or she was required to take a writing course in basic composition. Each student was also allowed to decide if he or she would rather use a Mac or DOS. And over five years, Dr. Halio discovered that Mac people got lower grades, picked shallower topics, and (gasp!!!) had more spelling errors than DOS people. The obvious conclusion? DOS people are fine, upstanding, moral, right-thinking people you would be proud to call your neighbor. And Mac people... well, you wouldn't want your daughter to marry one.

Of course, this begs a few questions. Do the Mac people start out stupid, or is it something to do with the user interface? Is there something about a DOS command line that builds strong minds twelve ways?

And what about a control group? If you took a few of these DOS Ubermenchen and put them in front of Macs, would they turn into drooling idiots? And if you could prop some of these Mac people up in front of DOS machines, would they suddenly start speaking in complete sentences and be able to get dates?

We clearly need more study here. We need to delve deeper into this
obviously fascinating mystery - I sense a Time-Life Books series coming on. Do DOS people eventually burn out and buy Windows? Do Mac people find themselves reduced to pointing at pictures in the menus at Denny's?

And what about their future? Do DOS people end up becoming dry academicians, arguing about Edwin Newman's latest column and living on stipends while praying for tenure? Do Mac people spend their evenings standing around fern bars in double-breasted Armani suits, talking about convertible debentures and vacationing in the Azores?

I am prepared to devote my life to this study. All I need is about five million dollars from Apple Computer, and about twenty million from Bill Gates (that's a fair assessment, based on their respective net worths). John, Bill, are you guys listening? I can be bought. Uhh... rented. Hired. You know.

This is Nick Francesco for Sound Bytes, a production of WXXI in Rochester, NY - Hub of Civilization in the Western World.

>>> B*ST*RD OPERATOR FROM HELL <<<
""""""""""""

~ PART 1 ~

It's backup day today so I'm P.O.'d. Being the BOFH, however, does have its advantages. I assign the tape device to null - it's so much more economical on my time as I don't have to keep getting up to change tapes every 5 minutes. And it speeds up backups too, so it can't be all bad.

A user rings

"Do you know why the system is slow?" they ask

"It's probably something to do with..." I look up today's excuse "..
clock speed"

"Oh" (Not knowing what I'm talking about, they're satisfied) "Do you know when it will be fixed?"

"Fixed? There's 275 users on your machine, and one of them is you. Don't be so selfish - logout now and give someone else a chance!"

"But my research results are due in tomorrow and all I need is one page of Laser Print.."

"SURE YOU DO. Well; You just keep telling yourself that buddy!" I hang up.

Sheesh, you'd really think people would learn not to call!

The phone rings. It'll be him again, I know. That annoys me. I put on a gruff voice

"HELLO, SALARIES!"

"Oh, I'm sorry, I've got the wrong number"

"YEAH? Well what's your name buddy? Do you know WASTED phone calls cost money? DO YOU? I've got a good mind to subtract your wasted time, my wasted time, and the cost of this call from your weekly wages! IN FACT I WILL! By the time I've finished with you, YOU'LL OWE US money! WHAT'S YOUR NAME - AND DON'T LIE, WE'VE GOT CALLER ID!"

I hear the phone drop and the sound of running feet - he's obviously going to try and get an alibi by being at the Dean's office. I look up his username and find his department. I ring the Dean's secretary.

"Hello?" she answers

"Hi, SIMON, B.O.F.H HERE, LISTEN, WHEN THAT GUY COMES RUNNING INTO YOUR OFFICE IN ABOUT 10 SECONDS, CAN YOU GIVE HIM A MESSAGE?"

"I think so..." she says

"TELL HIM 'HE CAN RUN, BUT HE CAN'T HIDE'"

"Um. Ok"

"AND DON'T FORGET NOW, I WOULDN'T WANT TO HAVE TO TELL ANYONE ABOUT THAT FILE IN YOUR ACCOUNT WITH YOUR ANSWERS TO THE PUURITY TEST IN IT..."

I hear her scrabbling at the terminal...

"DON'T BOTHER - I HAVE A COPY. BE A GOOD GIRL AND PASS THE MESSAGE ON"

She sobs her assent and I hang up. And the worst thing is, I was just guessing about the purity test thing. I grab a quick copy anyway, it might make for some good late-night reading.
Meantime backups have finished in record time, 2.03 seconds. Modern technology is wonderful, isn't it?

Another user rings.

"I need more space" he says

"Well, why don't you move to Texas?" I ask

"No, on my account, stupid."

Stupid?!?... Uh-Oh..

"I'm terribly sorry" I say, in a polite manner equal to that of Jimmy Stewart in a Family Matinee "I didn't quite catch that. What was it that you said?"

I smell the fear coming down the line at me, but it's too late, he's a goner and he knows it.

"Um, I said what I wanted was more space on my account, *please*"

"Sure, hang on"

I hear him gasp his relief even though he covered the mouthpiece.

"There, you've got plenty of space now"

"How much have I got"

Now this REALLY *PISSES* *ME* *OFF*! Not only do they want me to give them extra disk, they want to check it, to correct me if I don't give them enough. They should be happy with what I give them *and that's it*!!!

Back into Jimmy Stewart mode.

"Well, let's see, you have 4 Meg available"

"Wow! Eight Meg in total, thanks!" he says pleased with his bargaining power

"No" I interrupt, savouring this like a fine red, at room temperature "4 Meg in total..."

"Huh?... I'd used 4 Meg already, How could I have 4 Meg Available?"

I say nothing. It'll come to him.

"aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaagggggghhhhhH!"

I kill me; I really do!

APPLE_TALK /

Apple Vs. IBM
"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
by Stephen Kroese

As I was walking down the street the other day, I noticed a man working on his house. He seemed to be having a lot of trouble. As I came closer, I saw that he was trying to pound a nail into a board by a window with his forehead. He seemed to be in a great deal of pain. This made me feel very bad, watching him suffer so much just to fix his window pane. I thought, "Here is an opportunity to make someone very happy simply by showing him a better way to do things." Seeing him happy would make me happy too. So I said, "Excuse me sir, there is a better way to do that."

He stopped pounding his head on the nail and with blood streaming down his face said, "What?"

I said, "There is a better way to pound that nail. You can use a hammer."

He said, "What?"

I said "A hammer. It's a heavy piece of metal on a stick. You can use it to pound the nail. It's faster and it doesn't hurt when you use it."

"A hammer, huh?"

"That's right. If you get one I can show you how to use it and you'll be amazed how much easier it will make your job."

Somewhat bewildered he said, "I think I have seen hammers, but I thought they were just toys for kids."

"Well, I suppose kids could play with hammers, but I think what you
saw were brightly colored plastic hammers. They look a bit like real hammers, but they are much cheaper and don't really do anything,' I explained.

"Oh," he said. Then went on, "But hammers are more expensive than using my forehead. I don't want to spend the money for a hammer."

Now somewhat frustrated I said, "But in the long run the hammer would pay for itself because you would spend more time pounding nails and less time treating head wounds."

"Oh," he said. "But I can't do as much with a hammer as I can with my forehead," he said with conviction.

Exasperated, I went on. "Well, I'm not quite sure what else you've been using your forehead for, but hammers are marvelously useful tools. You can pound nails, pull nails, pry apart boards. In fact every day people like you seem to be finding new ways to use hammers. And I'm sure a hammer would do all these things much better than your forehead."

"But why should I start using a hammer? All my friends pound nails with their foreheads too. If there were a better way to do it I'm sure one of them would have told me," he countered.

Now he had caught me off guard. "Perhaps they are all thinking the same thing," I suggested. "You could be the first one to discover this new way to do things," I said with enthusiasm.

With a skeptical look in his bloodstained eye he said, "Look, some of my friends are professional carpenters. You can't tell me they don't know the best way to pound nails."

"Well, even professionals become set in their ways and resist change." Then in a frustrated yell I continued, "I mean, come on! You can't just sit there and try to convince me that using your forehead to pound nails is better than using a hammer!"

Now quite angry he yelled back, "Hey listen buddy, I've been pounding nails with my forehead for many years now. Sure, it was painful at first but now it's second nature to me. Besides, all my friends do it this way and the only people I've ever seen using hammers were little kids. So take your stupid little children's toys and get the hell off my property."

Stunned, I started to step back. I nearly tripped over a large box of head bandages. I noticed a very expensive price tag on the box and a blue company logo on the price tag. I had seen all I needed to see. This man had somehow been brainwashed, probably by the expensive bandage company, and was beyond help. Hell, let him bleed, I thought. People like that deserve to bleed to death. I walked along, happy that I owned not one but three hammers at home. I used them every day at school and I use them now every day at work and I love them. A sharp pain hit my stomach as I recalled the days before I used hammers, but I reconciled myself with the thought that tonight at the hammer users club meeting I could talk to all my friends about their hammers. We will make jokes about all the idiots we know that don't have hammers and discuss whether we should spend all of our money buying the fancy new hammers that just came out. Then when I get home, like every night, I will sit up and use one of my hammers until very late..."
when I finally fall asleep. In the morning I will wake up ready to go out into the world proclaiming to all non-hammer users how they too could become an expert hammer user like me.

[WHO]////////////////////////////////////
WHO'S WHO /

Who's Who in Apple II

by Phil Shapiro

[P.SHAPIRO1]

>>> WHO'S WHO? DEAN ESMAY <<<

~ Head Apple II Roundtable Sysop ~

GENieLamp> Dean, how did you first get interested in the Apple II computer? Do you have any anecdotes you can share with us about your first experiences with the Apple II?

DEAN ESMAY> The first computer I messed with was a TRS-80 Model I. A neighbor upstairs had one when I was a kid. It fascinated me and I quickly learned how to load game programs from its cassette tape - it was neat!

Though I drifted away from that, years later in high school I started working extensively with TRS-80 Color Computers. I also went through a brief love affair with the IBM-PC, but I spent most of my time with the CoCo, and later with a TRS-80 Model XII, a pretty rare CP/M based business computer that never did too well for Radio Shack.

In school I had almost unlimited time in front of the machines. The school was very small (it was a Special Education school with a student body of somewhere between 70 and 90) and I quickly gained a reputation for being great at word processing, so the people who ran the school let me spend a lot of time in front of the machine. They had me doing office correspondence for them, typing in software from computer magazines, and just basically the computer whiz kid for the school.

Anyway, to get to the point, one day the school got an Apple IIe to run some specialized vocational evaluation software. Well, it was right there in the office so I got to play with...
Apple II Computer Info

I remember starting with Apple Writer and not really being sure what to think, but the demo disk that came with the machine was very intriguing. It only had a green monochrome screen, but the graphics were still much nicer in many ways than what the Radio Shack TRS-80 Color Computer could do.

Well I didn't get too much further into it right then. But not long afterwards I started going back to hang out with some friends in my old neighborhood who I hadn't seen for a few years, and pretty quickly I found that a couple of them used Apple IIes in school. One of them in particular, a close friend named Thom Ryng, actually had one at home. And wow, they had these neat disks with software to give me; mostly Applesoft and Integer BASIC stuff under DOS 3.3, just silly demo stuff that was used back then to teach programming. But it was wonderful!

I had been messing with BASIC programs on the TRS-80 systems, but the Apple was just so neat! It had disk drives that were actually useful! Oh sure, the TRS-80 systems had disk drives, but they were a real pain to work with, especially under BASIC. I fell in love with the Apple because you could put in a disk, boot the machine, and then just type CATALOG to see what was there! And just type RUN and a file name to run a program! Amazing!

And you could just type LOAD and a file name to load a program up, and then you could LIST it, make changes to it, almost anything!

And you could make a turnkey disk by just writing a program, putting in a blank disk, and typing INIT HELLO. Your own custom Hello programs! You could even write one BASIC program that would run another program! Jeez, it was just so freaking AWESOME.

It all sounds quaint and kind of silly now, but at the time it just blew me away. I was just absolutely in love.

Soon we got a copy of AppleWorks (I'm pretty sure it was 1.0 at that point) and I started doing all sorts of things with it. I think that's when I finally stopped using the other systems completely. The IIe was just way too much more powerful, more friendly, and more FUN than any system I'd used before.

---

GENieLamp> You've been working for Resource Central for several years now, doing work in several different capacities. How did you first link up with Tom Weishaar and his merry crew?

DEAN ESMAY> I think I picked up my first copy of Open-Apple (which is what A2-Central used to be called, even before the company was named Resource Central) only a year or so after I started using the Apple IIe as my primary computer at the school. I got a copy of that first "Issue #0," the one that talked in glowing terms about what a wonderful system the Apple II was, despite the way Apple ignored it. That's pretty funny considering that this was, what, seven or eight years ago? We Apple II'ers have been complaining about Apple and worrying about the Apple II's future for at least that long, but we're still here!
Well anyway, Open-Apple hooked me immediately and I scraped up what meager funds I had to subscribe. Come to think of it, I may have actually gotten a teacher to subscribe to it for me. I can't remember anymore. (Chuckle.)

That little newsletter changed my life. I remember telling Tom Weishaar that once and he seemed to think that was a kind of weird thing to say, but when I started reading it I was still in my mid-teens, and it more than anything else was responsible for plunging me into a long-term love affair with computers. Let me tell you, the direction my life would have gone in if I hadn't developed a serious interest in computers is kind of scary for me to think about even today. I'd probably be working at McDonald's or eking out a living on food stamps or something. <grin>

That newsletter made me an expert, gave me something I could both understand and enjoy, and something I actually enjoyed working with. It made me a serious computer fanatic — and not just computers in general, but the Apple II in specific. I still like working with other computers, and we now have others around the house, but my Apple II is where I do all my real work.

Well anyway, I kept reading Open-Apple for years, and wrote in a few letters now and then that Tom actually published, which was a big thrill for me. Then one issue of Open-Apple came along where Tom talked about how he'd been talked into taking over the Apple II areas on GENie.

Well I was already a diehard modem user; I'd been calling local systems for years and eventually started running a bulletin board myself (the Apple Tree BBS, under the auspices of the Apple Tree Computer Club, south–suburban Chicago user group I've been involved with for many years). I had never used a large service like GENie, but I sure knew my way around modems, and had some amount of expertise in computers and in the Apple II. So when I saw Tom mention he was taking over GENie's Apple II areas, I thought, "What the hell." I worked up a resume and mailed it to him, saying I'd be very happy to work as a volunteer to help manage the area.

I never got a response, so a few months later I sent him another copy, slightly updated. I had learned by then that if you wanted to make sure those Open-Apple guys saw something and actually remembered it, you had to send at least two copies. <grin>

Well I still didn't hear anything for a few months. And then one day I got this hand-scrawled note from Tom saying, and I'm quoting almost exactly, "Got your resume. Can you send me some references? Why aren't you in college? Tom Weishaar." (Which is pretty classic Tom Weishaar — much of his correspondence reads that way. Short and to the point!)

So I wrote him another letter, including another resume and the requested list of references. I didn't hear anything for...
another few months, so I basically forgot about it.

Then one day sitting at my desk (I was working as a secretary at the time) a friend of mine called me up and said, "Hey, Tom Weishaar just called me and asked me about you." Then two other people called me and said the same thing within the space of maybe ten minutes. And these were all people that I'd put down as references! Well I didn't have any chance to really absorb that news, because right after I hung up with one of them, the phone rings again and this time it's Tom Weishaar himself! I was almost speechless; he was something of a hero to me and here he was calling me to talk about working for him.

It was more than that; he actually wanted to fly me out to meet the rest of the crew and we even talked about salary over the phone. Within a week he'd flown me to Kansas City for the interview.

For a guy in his early 20's with nothing but a High School diploma, working a dead-end job but who loved his Apple, well... it was just the biggest thrill I'd ever experienced. And though the salary he could afford to offer wasn't really much, it was much more than I was making at the time.

The worst part was that I had to turn down the job. I wanted it badly, but at the time I was trapped in a marriage; a very unhappy one that I had been thinking about terminating for a while, but I was still young and insecure and not sure what to do. Anyway, she couldn't/wouldn't move to Kansas City. I told Tom I might get a divorce, or maybe try to work something else out, but I just couldn't come work for him now. I hoped he'd hold the job open for me but I didn't know if or when I could take it. So I left back for Chicago very depressed and unhappy.

Well a few days later Tom calls me again and tells me that for the projects he wants me for, he doesn't see any reason I can't just stay in Chicago. He wouldn't pay me quite as much, but I could set my own hours and work from where I was!

I eventually did get out of that marriage (no one should ever marry at 19!) but somehow it's always worked out that I'd just stay here in Chicago anyway. I seem to have started a minor trend at Resource Central though; seems like more and more of the people who do stuff for Tom (such as Bo Monroe, and HangTime) live nowhere near Kansas.

I see I've left a lot of little things out, but I do have a tendency to drone on and on once I get going, so I'd better stop.

GENieLamp While just a few years old, the A2-Central Summer Developer's Conference (nicknamed "KansasFest") has become a veritable Apple II institution. As a person who has attended every KansasFest conference, can you share some thoughts about KansasFest? What would you like to see added for next year's conference?
DEAN ESMAY> Well one correction - the first KansasFest was called the
"A2-Central Developer's Conference.  I remember how we all sort
of nicknamed it KansasFest the first year.  But anyway, all
subsequent conferences have been called simply the A2-Central
Summer Conference - note that the word "Developer" was removed.

It's not a developer conference; there's lots of stuff for
programmers and developers, but plenty to interest
non-programmers.

But anyway, what can I tell you about KansasFest?

Basically, I think anyone who is an Apple II aficionado (not
just a user, but someone who really ENJOYS working with it)
really should go.  Not so much for what you'll learn (though
you'll probably learn some things) but for who you'll meet and
how much fun you'll have.

I always have a wonderful time there.  Meeting other Apple II
users from around the world is such a treat.  It's a double
treat if you're on GEnie, because you usually find at least a
few people who you've met in RTC's or on the bulletin board,
but never actually seen face to face.

One of the strongest observations I want to make about
KansasFest, though, and one which I think far too few people
realize, is that the real fun is not the conference - it's
hanging out in the rooms during the evening with other Apple II
users!

What's weird is some folks who come never catch on to that.
They actually try to find hotels, or they hole up in their
rooms, or just stick with one or two friends and don't
socialize much.  Oh, what a mistake!

The fact is that there's just nothing more fun than getting to
know the other Apple IIers in the world.  I remember that first
KansasFest four years ago; I just swallowed my many insecurities
and started walking around introducing myself.  Nobody knew who
I was, but soon I had a bunch of friends; computer enthusiasts
all share certain personality traits, and Apple II users are an
unusually friendly bunch anyway.

What would I like to see added to KansasFest?  I can't think of
a thing; it's always one of the highlights of my year now.  This
year was by far the worst KansasFest I ever attended - but only
because I was quite ill with some kind of respiratory problem,
and then some kind of stomach problem on top of it, for half the
event.  And a bunch of things we'd planned to promote the
goings-on here on GEnie fell through because I was under the
weather, and also some other things we planned didn't come
through.

But I STILL had fun!  The only thing that was not-fun was seeing
all the other people having even more fun than me.  <wink>

You will make friends at KansasFest, you will learn things about
your Apple II, and you will have fun.  That's what it's all
about.

So, the only thing I can think of that should be added to
KansasFest is more Apple II users. Those of you who don't come
just don't know what you're missing.

That's all KansasFest needs - more of you guys out there who
say, "Ah, I don't know if it's for me." Yes it is!

GENieLamp> Before ascending to the head sysop of the Apple II Roundtable
on GENie, you worked for a while as the head Apple II
Roundtable librarian. What did you find most rewarding about
the librarian job? Least rewarding?

DEAN ESMAY> I didn't just work for "a while" as librarian. It was the only
thing I ever did on GENie!  <wink>  Well actually I did that
and answered almost all A2.HELP mail at the same time. I did
both for something like four years before becoming chief sysop,
which was only just a few months ago.

I always tell people the same thing about being software
librarian on GENie.

The greatest thing about it is getting to download and play
with so many files! It really is neat to see so much stuff and
get to mess with all of it. You have to make sure it all works
and all that, right? So when the latest new shareware game
comes along, of course I have to spend some time playing it to
make sure it works... right?

But the worst thing about being file librarian is... having to
download and mess with so many files! Seriously, it's both the
greatest plus and greatest drawback. When you see EVERY file
that goes up, and when you HAVE TO look at all of it, it starts
to lose some of its attraction. Some days you just can't stand
the thought of having to deal with any more new files... but of
course you have to, because it's your job.

I kind of thought I'd miss the job after I turned it over to
Tim Tobin a few months ago, but you know what? I really
haven't. A2 gets anywhere from a few dozen K to a megabyte or
even several megabytes (and I mean megabytes AFTER being
compressed with ShrinkIt) every single day. Having to wade
through all that can be fun, but I find that after a having had
a few years of it I don't miss it near as much as I thought I
might!

GENieLamp> What do you consider your most proud accomplishment? (In terms
of your work with the Apple II.)

DEAN ESMAY> My work on Studio City.  Studio City is a bi-monthly
magazine-on-disk that I edit. It uses HyperStudio as its main
environment.

It used to be called Stack-Central, but we thought Studio City
was more catchy and would help people more clearly distinguish
it as a HyperSTUDIO product. (We also have Script-Central, for
HyperCARD, but I'm only involved peripherally with that.)
I pour a lot of my soul into Studio City, and it's a lot of work. I've been doing it for about 14 months now and, while I'm starting to feel a real strain to keep up with it, it's still the work I'm proudest of. I look at those back issues since I took over, and I think that much of what is in them represent some of the best work I've ever done in my life.

I'm also proud to say that we've attracted some people who aren't HyperStudio owners but who really like and can use the stuff we put on each issue! I really like that; you can use HyperStudio stacks without owning HyperStudio, due to the free "runtime" module we include with each issue, but most people don't seem to have caught on yet. We publish loads of good software that people can use every issue, much of it stuff you just DON'T need HyperStudio to use or enjoy.

HyperStudio is such an exciting environment. There's all sorts of opportunity it represents from the enterprising person; you don't have to be a "real" programmer to do some very exciting stuff with it. Although if you are a "real" programmer there's stuff for you in it, too. Again, since people DON'T have to own HyperStudio to use what you create with it, there's just lots of opportunities there if you want to develop products people might buy (or at least enjoy downloading from our library! <wink>).

Unfortunately, at the present time HyperStudio is in a new release stage (version 3.1) which has some significant bugs. This doesn't affect "average" users much, but those of us who push the environment to its limits keep coming across frustrating bugs that cause real problems.

Fortunately it's been getting more stable, and I hope that Roger Wagner Publishing gets them all ironed out soon.

GENieLamp> Who do you look up to as your mentors?

DEAN ESMAY> I don't really have any mentors; I never really have had them. I suppose you could say I am a self-made man. I didn't go to college, and in fact I barely squeaked through a Special Ed High School (they made me Valedictorian but considering that it was a graduating class of about a dozen, with an average GPA of maybe 2.0 that's not saying much!). I was always a loner who kept to himself and read.

I suppose you could say my mentors were books. I feasted on them; especially SF books, but other books of many types, not to mention magazines. Certainly the Open-Apple newsletter and those who wrote in it (not just Tom Weishaar but Dennis Doms and the many people who wrote letters that were published in it over the years) had a big effect.

But many others would include those authors who taught me ways of looking at life, taught me facts about the world, and even sometimes taught me how to think (especially how to think for myself). As a kid I read three to five books a week, and even
now I read at least one a month on the average (which isn't near as much as I'd like, but I'm too slow and too busy to handle much more).

There are some names that come to mind though — Mark Twain, Robert Heinlein, Isaac Asimov... and Albert Einstein (not that he wrote much that I read, but I spent so much time and energy trying to teach myself Special and General relativity, he had an effect anyway, if you see what I mean).

I guess this is a kind of weird answer but it's the only one I have. I grew up reading, and books were my mentors; not just my mentors, but my friends, allies, and partners in crime. Guess that means I was a weird kid, but so what? <grin>

GEnieLamp> Dean, speaking as someone with quite a lot of telecommunications experience, where do you see the future of telecommunications moving in the next five to ten years? Do you think the new Internet capability of GEnie will be opening up a lot of doors? (In terms of allowing GEnie subscribers to communicate with people on other information services.)

DEAN ESMAY> I think it's really hard to say where the future lies. Certainly telecommunications will get faster and more efficient and more powerful. We'll also see things that are much more advanced in terms of graphics, and even sound, being generated across modem lines. How much so is very hard to say.

Not to get all political (though I love to talk politics), much of it depends on how soon the government gets around to regulating the industry. I'm confident they'll do it sooner or later. No matter how much we fight it, they'll have their way with us eventually. And once the on-line services are hostage to government control and restriction, then the technological advances we see, and what companies are allowed to offer consumers, will be slowed down significantly.

So it really depends on how long we have until the government finally comes in and screws up a good thing. <grin> It's inevitable; I merely hope it's later rather than sooner. If we have a decade or so more without much interference, I think what we'll see will be mind-blowing. If we only have another year or two, don't expect too much more exciting than what we have now (which I'll admit is still pretty neat! :-).

The Internet links thousands of different computer systems around the world. So yes, that makes it likely that there will be a lot of new opportunities for communicating with people on-line. You won't have to require that other people you know have GEnie accounts before they can send messages to you; they'll be able to send mail to you from all kinds of other systems. That should be very nice.

I'm not really an expert on the Internet, so I can't say much else about it than the fact that it will give us access to quite a lot of information and quite a lot more people!

GEnieLamp> What sorts of things do you like to do for fun (i.e.
I'm a rabid music listener. I have a fairly nice stereo and several hundred CDs. I listen to many different kinds of music, mostly rock and blues but a smattering of everything - jazz, pop, country, classical, industrial, rap, folk, and avant-garde stuff.

I also still read quite a lot. A majority of the fiction I read is Science Fiction, but I read lots of other things. I seem to have a perverse interest in economics, as well as certain odd kinds of historical and sociological areas.

I also used to love to go to places like the Jerry Pournelle RoundTable to talk about everything from politics to physics, but since taking over A2 I haven't had enough time for that.

Along with everything else you do, Dean, you also edit A2-Central On-Disk. Since some Apple II enthusiasts may not know what A2-Central On-Disk has to offer, can you give us a brief synopsis of its contents? Does editing A2-Central On-Disk take up a lot of time each month?

A2-Central On Disk (A2 On Disk for short) is a monthly companion to the A2-Central newsletter. Now, A2-Central (formerly Open-Apple) has won many awards and much acclaim as an Apple II periodical. What doesn't get mentioned as often is the monthly disk that you can get with it as an option.

Each issue of A2 On Disk is a single 800K 3.5 disk that contains, first, a copy of the A2-Central newsletter itself in a text file. Each month I convert the newsletter into a usable text file.

That may not sound all that exciting until you realize that we provide software to let you search through that text for items of interest. One thing you can do is take all the text files from your back issues and use software such as Sneeze (which is free), or Fastdata Pro (which costs a little but is awfully nice) to search through back issues very quickly. It becomes a highly useful technical reference, much more convenient and flexible than standard indexes.

There's TONS of useful information in back issues of A2-Central, so it's neat to have it all quickly at your fingertips.

Now, the newsletter text only takes up a small fraction of the disk. So each month it is also crammed - and I do mean crammed - full of the best public domain, freeware, and shareware software I can find. Not only do I get stuff from on-line, but people send me stuff all the time. Many shareware authors send me their programs, and quite often subscribers from around the world will send me disks with neat stuff on them. It's really cool when you get a disk from a place like Australia full of new software you've never seen before.

While most of the software on A2 On Disk is IIgs-specific,
every month I try to include as much quality 8-bit stuff as I
can find. And it usually winds up being at least enough to fill
up a 5.25 disk or two.

You see, we compress all the files on each issue with
ShrinkIt, which means your 800K disk actually has well over a
megabyte worth of programs on it. So there's lots of things I
can do with it now.

As for how long it takes - you know, it takes up a lot more
time than you might think. Usually I get the raw, unformatted
text from Ellen Rosenberg (the current editor) about four days
before it has to be done. And it usually takes me about two
working days to finish the issue at that point. I spend a lot
of time fitting stuff on there, trying to develop a theme, and
trying to make sure everything on it is really interesting and
that there's a variety of all kinds of things. I put a lot of
effort into that, and making sure there's stuff for all
machines on there.

I also work really hard to fit things together well; each
issue usually has well under 10K of free space left on it by
the time I'm done, and that's not as easy to do as it sounds.
Let's say you have ten files to choose from; but if you use
these two files, you can't use this other file because you'll
be out of room, and so you dump those two for later and then
you realize you've got a bunch of space left over and have to
go find something to fill that gap, and so on. It really does
take some effort, and a sort of intuition that you develop for
it over time.

And there's work the rest of the month, mostly in collecting
materials, weeding through what I've gotten lately for things
that are appropriate, and contacting the authors of the
programs we feature.

Though the material is mostly shareware and freeware, it's
important to us that we actually contact the author whenever
possible to obtain permission to use it. So there's a lot of
chasing people down in e-mail (which not everybody answers
unfortunately), trying to find their phone numbers and getting
them on the phone, keeping track of who I've gotten permission
from and who I haven't, who I still have to call, and so on.

I've been doing it for years now and I've got most of it down
to a system. But it's not as easy as it might appear!

As a person who works out of a home office, can you share any
special insights as to the benefits and drawbacks of working
at home?

Working at home has obvious advantages. No "boss" looking
over your shoulder or riding you to work on certain things at
certain times. No need to "look busy" when you have nothing
to do. And not near as much office politics to deal with as in
a standard work environment.

No need to dress up; I wear comfortable clothes at all times
and NEVER wear a tie (heck, I don't even own one anymore). I can listen to my stereo as loud as I want. I can sleep late pretty much whenever I want.

And I like to say that I have a thirty-second commute in the morning - that being about how long it takes me to stumble out of bed and stump over to my computer to check my morning mail! :-) 

It saves money, too. You don't spend near as much on clothes, gasoline, or upkeep on your car. Then again your phone bills shoot way up, so it kind of evens out.

There are drawbacks; you don't get a lot of office socializing, chatting around the water cooler type stuff. You spend a lot of time on your own, or without adult company anyway. Sometimes there are interminable delays when you can't reach someone on the phone and have to wait 24 hours or more for e-mail to be returned on what should be a simple matter that would only normally take 30 seconds to get answered.

You also tend to get fat I'm afraid. Not only do you not even get the exercise it takes you to walk out to your car in the morning, but it's insidiously easy to run downstairs to the refrigerator to snack on stuff. No one's going to notice or care if you eat at your desk, right? Well that's nice but it's easy to do too much of it.

Another drawback is that sometimes other people have a hard time believing that you actually do work much, or work very hard. I've had people more or less tell me that they don't believe I really have a job, that I just sort of horse around a bit. When you don't have a firm schedule, and don't have to GO somewhere to work, well, to some people it doesn't seem like WORK.

This is a double problem for me because I generally keep a night schedule; many people who work at home don't do that, but I personally find that I work much better that way. Unfortunately, this leads some people to consciously or unconsciously think of you as "lazy" because you're usually asleep at 9 or 10 in the morning. They don't realize that you were still working while they were snug in their beds. (I usually don't go to sleep until around 5:00 a.m., sometimes later.)

So, sometimes I have to put up with a little snootiness and sniffing because of the hours I keep.

But overall it's great. I much prefer it to working in a regular office; I did that for several years and sure don't miss it much.

    "Wow, three new messages waiting for me when I posted my / last message!"

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 348 of 1824
They are out there. Those logjams in the bit stream; those dropped characters (there are a few characters I'd like to drop, but they seem to be more prevalent than ever); those I/Os (I/O, I/O, so CompuServe I owe), and those lows. But what _really_ bugs a modem geek (or, as someone I know chooses to refer to them, a "modemhead")? (I rustle the card, and try to screw my expression up, to the delight of the audience.)

TOP TEN THINGS THAT GIVE A MODEMHEAD A HEADACHE

10. Soap.
9. Hardware incompatibilities between modems.
8. The Danger Man from Domino's.
7. Those nasty things hooked to modems called "computers".
6. Actually paying to download a MIDI or GIF file after seeing its description, which begins, "This is my first attempt at this sort of thing . . .".
5. Rugrats belching into the family phone in the middle of a download.
4. When the 9600 bps modem gives out in the middle of the night, and the spare 2400 bps internal model is found at the bottom of a stack of dirty dishes.
3. Thinking that you bought a Hewlett Packard product, and discovering the next morning that it was manufactured by that _other_ company.
2. After you've moved, your spouse insists on unpacking inconsequential items like children's toys _before_ the computer equipment.

and (give us a digital drum roll, will you, Hal?) . . .

1. Getting "pulled into chat" by the sysop of a local BBS, and discovering that he/she is normal.

    //////////////////////////////////////////////////////////////////////////////////// GENie_QWIKQUOTE /////

Thinking Out Loud

by Phil Shapiro
[P.SHAPIRO1]

>>> THINKING ABOUT PEOPLE'S AFFECTION FOR THEIR HOME COMPUTER <<<

The other day I got to thinking about people's affection for their home computers. These thoughts were raised when I took my computer in for a motherboard upgrade. As the dealer took my computer out of my clutches, I hesitantly asked: "So how many days is this going to take?"

If the upgrade were going to take five days, that would be an eternity. Three days would be barely manageable. Two days would be difficult, but I'd get over it.

It turns out that putting in the new motherboard would take three days. Barely manageable.

But as I walked out of the store it struck me how very similar my feelings for my computer were to the feelings for my classical guitar when I took it to the store to have an electronic pickup installed. When I handed over my cherished guitar, I hesitantly asked: "So how many days is this going to take?"

If the upgrade were going to take five days, that would be an eternity. Three days would be barely manageable. Two days would be difficult, but I'd get over it. The answer: "Three days." Arrrggh. Barely manageable.

The reason people's affection towards their home computers is so similar to their affection towards their cherished musical instrument is because both computer and instrument are extensions of the human personality. Both computer and instrument provide unlimited opportunities for creative expression. Both, too, provide unlimited opportunities for creative exploration.

Computers are sandboxes for the mind. Musical instruments are sandboxes for the soul.

But the comparison doesn't stop there. The parallels grow stronger on closer investigation.

About six years ago my older brother Ian showed me a new tuning for guitars, the lovely-sounding "dropped-D" tuning. The moment I heard that tuning I knew it would open up vast new areas of musical exploration. In a sense the new tuning was a new "operating system" for the guitar. It allowed me to produce the same music I produced before, but in a whole new and interesting way.

The parallels between computers and instruments continues when you consider that both computers and musical instruments provide opportunities for a lifetime's worth of study and mastery. After mastering the basics...
you can go on to study endless intricacies. You can stand in awe at what virtuosos have accomplished in the past. You can develop a fine appreciation of the art and the craft. You may even develop enough skill to extend the boundaries of the craft yourself.

Perhaps these parallels are all centered around the "appeal to the creative temperament." Could anybody doubt that if Wolfgang Amadeus Mozart were alive today he'd be spending much of his free time sitting at a computer keyboard --- playing, learning, composing, exploring? Knowing Mozart, he'd find a way to get Salierni's computer to print musical notes backwards, from right to left, on Salierni's computer screen.

Likewise, could anyone doubt that Da Vinci, were he alive today, would be online three or four times a day with other artists/inventors in other Renaissance villages? Chances are Da Vinci would be at his computer so much he'd never have a chance to take a good look at his screen saver. (You know --- the one with sketches of parachutes, gliders, and other mechanical contrivances.)

Moving ahead five hundred years, it's intriguing to consider that Alan Kay, an awesomely creative research fellow at Apple Computer, is himself a world class pianist. And it's hardly surprising to hear that his special talent is extemporaneous composition.

Other microcomputer visionaries have had similar musical passions. Paul Allen, co-founder of Microsoft, likes to do nothing more than to jam with his rock-and-roll band. Microcomputer legend Steve Wozniak organized and sponsored two large rock concerts in the early 1980's.

People who don't use a computer regularly can sometimes have a difficult time understanding how other people could get emotionally attached to such an "inanimate object." If you need a quick explanation of your emotional attachment to your computer, drawing the comparison to musical instruments can serve as a useful analogy. If such non-computer using persons had every experienced the joy and wonder of playing a musical instrument, they'll nod their heads in understanding. Some things in life you just can't put into words.

**NOTICE!** Last month GEnieLamp printed an article about how Apple II computers are being used for "cognitive therapy" in a psychiatric hospital. GEnieLamp would like to spotlight other inspiring stories where Apple II computers are assisting and uplifting people with special needs.

If you happen to know of Apple II's in your area being used in a children's hospital, adult literacy center, special needs school, or other community organization, please contact GEnieLamp co-editor Phil Shapiro (p.shapiro1) here on GEnie.

We are also interested in putting together a story on how Apple II's are the favored computer for public access use in our nation's libraries. Anyone with anecdotes or interesting stories on this subject are invited to contact us about that article.

-Phil Shapiro

"I'm still sold on LiveMouse. It's a one-size-fits-all kinda deal. If it's too small when you buy it, you just feed it until it's the right size. Then you pull the Freeze Tab and voila...instant mouse."

-- J.EIDSVOOG1 --

--- HIDDEN TREASURE ---

~ The Public Domain Eamon Adventure Game Series ~

Introduction

"Fade in to a dimly lit tunnel that has moss hanging on the walls. The source of light is a few torches hung every 10 feet along the sides of the tunnel. On the floor of the tunnel you can see a pile of diamonds that would buy you a kingdom and ensure a happy future for the king into the foreseeable future. Now, there is only one little problem with your plans for a glorious retirement.

You swing your trusty sword, Trollsfire, at the giant orc and hit.

The giant orc is at death's door, knocking loudly!

The giant orc swings his heavy axe and hits. Your armor absorbs the blow. The lesser orc shoots an arrow at you and misses.

The orc guard stabs at you with his sword and hits. You are badly injured!

The question of the moment is whether you should flee now and return to fight another day. You have the giant orc on the floor, if you can just finish him off before you are finished yourself. Unfortunately, for the giant orc, that pile of diamonds sure does look like your destiny.

You thrust Trollsfire back at the giant orc and ...

... as you look around the tunnel that is now littered with the bodies of fallen orcs, you find that you have no more enemies at hand. With a sigh of relief, you put Trollsfire back into your belt until the next battle. Your body feels like you just tried out a new carriage by letting the horses drag it over you. With a coarse whisper you utter the words of healing. Immediately you can feel the wash of energy through your body. You are now in good shape.

With a confident stride you walk over to the pile of diamonds. This
was a rough dungeon to conquer, but it looks like the reward will make it worth the effort. As you bend down to scoop the diamonds, you meet an unexpected resistance. Something is wrong here. The diamonds don't seem to be laying loose in a pile like you first thought. Instead, they seem to be embedded in a tough hide! As you draw your head back to look for the edge of the seemingly endless stretch of hide, you see a large pair of gleaming eyes inspecting you from the dark shadows of a tunnel recess. You have managed to irritate a very large dragon.

As you draw out Trollsfire, you think to yourself that you should have stayed back in that warm, cozy tavern with the sweet tasting ale. Fade out to the sounds of metal biting into bone and the roar of fire blazing out in a hot blast."

**History**

The section of history related in the previous section could have easily come from one of the many adventures awaiting the daring game player within the varied worlds of Eamon. Eamon is a public domain, adventure gaming system for the Apple II computer that has been around for many years. As best I can tell, it was created about 1980-1981.

The original idea was brought to life by Donald Brown. I was first introduced to Eamon in 1983-1984. Even at that time, no mention was ever made of Donald Brown still being around to support his creation. But the wonderful thing about Eamon is that the software was written to be an expandable, changeable, unrestricted environment for people to create their own adventure games. Eamon provides a shell that can be adapted by the programmer to make an adventure of any variety. Indeed, many different styles of adventures already exist within the Eamon gaming system: Tolkien-type adventures, science fiction, fantasy, Dungeon and Dragons, and many more.

Eamon adventures are written in Applesoft Basic and run under the standard 40 or 80 column screen mode. Don't let this fact fool you. There are many Infocom text adventures that outshine the graphic adventures produced since then. Eamon adventures are as good or bad as the creators of the individual games themselves. Some are outstanding. Others are at best only fair. When you get tired of playing a game, you can sit down and create a game. The possibilities are endless.

Even if you do not want to write your own adventures, you can still enjoy the more than two hundred games that have already been written. All of them can be run under ProDOS and many of them make use of 80 column text screen to provide magnificent descriptions of the adventure creatures and surroundings.

It wouldn't be fair to describe the history of Eamon and not say anything about the best thing to happen to Eamon since its creation: Tom Zuchowski. Tom has been keeping Eamon alive and well now for some time. He has written a number of games himself. But more importantly, he has spear-headed many of the efforts to keep Eamon working on modern Apples with modern operating systems. Eamon was first written on 5 1/4' disks under DOS 3.3. After you play a few Eamon adventures, see if you don't think that Tom's efforts have been worthwhile.

Next Time

Eamon is too big and too exciting to do justice with a single article. Therefore, I must ask you to look back in on this column in the November issue of GEnieLamp. We will then do some critical analysis of the gaming system.
Next month I will describe how to play a typical game of Eamon. I will go through the process of setting up the game on your hard drive or 3.5 inch floppies. I will give you a rating for the Eamon system itself and a few of the better adventures. Finally I will have a few parting words about this wonderful freeware system. Some of you will be itching to try out Eamon before next month. Therefore, I have listed below some good starter files that are available on GEnie right now for your gaming pleasure. Until next time, happy exploring!

CowTOONS? Mike and Robert took us up on our offer and sent us this month's CowTOONS selection. Thanks, guys!

If you have an idea for a CowTOON, we would like to see it. If we publish it in GEnieLamp we will credit your account
Greetings Everyone   I am firmly convinced that the single most valuable peripheral device that can be connected to a computer is a modem. Once a modem is connected, it's possible for anyone to join that huge group of Apple II users who frequent America Online, CompuServe, GEnie, and the Internet. I'm so convinced of the importance of "going online" that I will be writing a new column for inCider/A+ on the subject. By now, many of you will have seen the first installment of "Grapevine", and I hope that it's piqued your interest in owning a modem. Each month, I'll be sharing interesting Apple II related tidbits found on the various online services, and I'll also be sharing money saving hints and tips for those of you who already have modems. Grapevine; coming monthly to inCider/A+.

* I'd like to mention a brand new $10 Shareware program that's one of the best brain teasing, yet enjoyable, games I've ever played on the IIGS. Kenrick Mock, the author of that fine game Columns GS, has just released BoggleGS, and it's something that all fans of word games should have. When first run, a colorful grid filled with letters appears. You have 3 minutes to find words that can be made from adjacent letters in the grid. It's a very colorful program and even has music. If you enjoy working crossword puzzles, you should really enjoy it, and if you're a teacher, you'll love BoggleGS.

* Speaking of shareware, I'd like to let you know about a fantastic new Apple IIGS shareware utility program that may change your life. Coming
all the way from New South Wales in Australia, John MacLean's $10 DOS 3.3 Launcher should be of great interest to long-time Apple II owners who have a large library of older DOS 3.3 software. In short, DOS 3.3 Launcher provides an easy-to-use way to store, and run, DOS 3.3 software on any hard drive connected to an Apple IIGS. Even if your hard drive wasn't DOS 3.3 compatible before, it is now.

DOS 3.3 Launcher is a GS/OS desktop based program that can be launched from the Finder. It has a standard GS/OS interface complete with pull down menus. Once run, it will allow you to copy DOS 3.3 Binary files, or entire DOS 3.3 disks, to your hard drive, and it will let you launch those files or disks from the Finder, and will return you to The Finder when you're finished using the DOS 3.3 software. DOS 3.3 Launcher works with single or double sided disks. It even slows down old games so that they run at 1 Mhz, and returns you to the GS'es faster speed upon exiting those programs. It does not work, of course, with copy protected software.

John MacLean, who also wrote Roger Wagner's Graphic Exchange, has written a very useful utility program that will soon have you dusting off your old DOS 3.3 software.

* Speaking of new software, I finally got around to installing the new AppleWorks Classic enhancement TimeOut Grammar. This is a grammar checker that works right from within AppleWorks, and I like it a lot. This TimeOut version is based upon the old Sensible Grammar, and works in a similar manner. It checks Appleworks word processing documents for grammar usage and punctuation. Combining that with TimeOut Thesaurus, AppleWorks V3.0 is a writer's best friend. TimeOut Grammar is available from Quality Computers.

* Quality Computers will soon be releasing Finder Helper, an incredible collection of System 6.0 Finder Extensions and Desk Accessories written by noted IIGS programmer Bill Tudor. I really like Finder Helper a lot, but before I provide any details, allow me the liberty to stray, and please be patient with me as I editorialize a little.

Many of the utilities found in Finder Helper started out life as shareware products. Bill Tudor must have been quite proud when he saw that his programs had been downloaded hundreds of times from the various online networks, and were in use on thousands of System 6 equipped GS'es; hardly a day went by when I didn't hear someone rave about how great Bill Tudor's shareware programs were. But, something was amiss. Many of the people that used Bill Tudor's shareware never bothered to send in their shareware fees, so he sought a more traditional outlet for his software. Now that it's a commercial product, he'll at least be getting some monetary reward, but, in some ways, I can't help but feel that the Apple IIGS community has lost something.

It's important to submit shareware fees for programs you use. By sending in shareware fees, you'll be helping to prolong the life of the Apple II, because you'll be encouraging those who program these computers. Think about it, and then take the pledge to submit at least one shareware payment to an author whose work you like.

Getting back to Finder Helper, it's a collection of Finder Extensions and New Desk Accessories that provide useful new tools that can be used when using GS/OS. It includes a very well behaved Alarm Clock that appears in the IIGS Menu Bar. It includes Cdev Alias that allows you to control
your Control Panel Devices from a New Desk Accessory. SuperDataPath allows you to easily instruct the Finder where it can find your data files. HotKeys allows you to launch your favorite programs directly from the IIGS'es numerical keyboard. Catalog will save a disk catalog's contents to a file on disk. File Peeker shows you the contents of Text, Teach, Pictures, Sounds, Icons and Filetype documents. Workset allows you to double click on one small icon and have AppleWorksGS, for example, launch and load multiple documents. Crypt allows you to encrypt all your sensitive personal files, and MoreInfo provides, among other things, the ability to lock and unlock files right from the Finder's Extra Menu.

Due to the fact that Apple has trademarked the word "Finder", when this set of utilities is actually released, it may have a different name. No matter what it's named, it's a great package of System 6 enhancements.

* I spent a pleasant afternoon recently with Olivier Goguel, the founder of the FTA, when he was visiting San Francisco. If you're not already familiar with the FTA, make sure you pick up some of their freeware disks from your local user group or download some from your favorite online service. The France based FTA has created a stunning collection of GS software, and it is not to be missed.

The FTA disbanded late last year, and are no longer actively programming for the IIGS, but Olivier Goguel still managed to bring me some GS news from France. And, it's from France that we might eventually see a MultiFinder. In any case, Olivier did give me a disk of his latest software. Alas, it requires an IBM or compatible. I brought it over to a friend's to see, and we were both mightily impressed.

I was able to arrange what I think of as the "Summit Meeting of the Century" between Olivier Goguel and that GS programming master, Bill Heineman. The two spent a day together, impressing each other with their programming abilities. It's just possible that we'll see a joint project coming from that meeting.

* In the rumor department, I've been hearing a lot recently about One World Software Wizards, a new group of Apple IIGS programmers whose plans include a freeware CAD program and a new version of NoiseTracker. It's even rumored that the founder of the FTA is going to be involved. Stay tuned, in future months, to see if anything comes from these great plans.

** Joe Kohn is a Contributing Editor for inCider/A+ Magazine, and writes the monthly "Shareware Solutions" and "Grapevine" columns. He also writes a monthly column for Softdisk G-S, and is the Founder and President of Shareware Solutions: The User Group. INTRODUCTION
The second most important device that Steve Wozniak invented, after the Apple II itself, was the Disk II drive. It was the availability of the floppy disk that catapulted this computer into prominence beyond its competitors of the day, and ensured that it would survive for the long haul. Certainly, something was necessary to overcome the less-than-intuitive cassette interface built-in to the Apple II. That was one place where the TRS-80 had it over the Apple II: A real cassette operating system. Of course, which computer survived the long run...hmmm?

THE DISK II
Let's put some more trash into Mr. Fusion to fuel the next leg of our trip. How about one of those KIM-1 computers over there in the corner of the Computer Faire auditorium? We might have to break it up a bit to make it fit ... Okay, now we'll just make a small jump, to December of 1977. By this time the Apple II had been generally available for about six months. Most customers used their television as an inexpensive color monitor, and used a cassette recorder to store and retrieve their programs and data. Apple's major competitors were the TRS-80 and the Commodore PET. The products made by these two companies, together with Apple, could be considered as the second generation of microcomputers; they all came fully assembled and ready to use out of the box, with a keyboard and cassette interface. The TRS-80 and the PET even came with a monitors and cassette recorders. The strength of the Apple was expandability and graphics, while the strength of the others was cost (both the TRS-80 and the PET sold for around $600, half the price of the Apple II).

By late 1977, Apple had introduced some enhancements to the II, including their first version of a floating point BASIC (called "Applesoft") on cassette, and a printer interface card to plug into one of the slots on the motherboard. But the Apple II still needed something to make it more attractive to buyers, to stand out above the TRS-80 and the PET. One area that needed improvement was its program and data storage and retrieval system on cassette; it was a continued source of frustration for many users. The cassette system used on the TRS-80 was more sophisticated than that of the Apple II, allowing named files and easier storage of files and data on the same tape. On the Apple II it took VERY careful adjustment of the volume and tone controls on the cassette recorder to get programs or data to successfully load. The Apple cassette system also needed careful attention to the location on the tape where a program was stored, and was no more accurate than the number on the recorder's mechanical tape counter (if it had one).
Apple president Mike Markkula was one Apple II user that was dissatisfied with cassette tape storage. He had a favorite checkbook program, but it took two minutes to read in the program from the tape, and another two minutes to read in the check files. Consequently, at the executive board meeting held in December 1977 he made a list of company goals. At the top of the list was "floppy disk". Although Wozniak didn't know much about how floppy disks worked, he had once looked through a manual from Shugart (a Silicon Valley disk drive manufacturer):

"As an experiment Woz had [earlier] conceived a circuit that would do much of what the Shugart manual said was needed to control a disk drive. Woz didn't know how computers actually controlled drives, but his method had seemed to him particularly simple and clever. When Markkula challenged him to put a disk drive on the Apple, he recalled that circuit and began considering its feasibility. He looked at the way other computer companies—including IBM—controlled drives. He also began to examine disk drives—particularly North Star's. After reading the North Star manual, Woz knew that his circuit would do what theirs did and more. He knew he really had a clever design."

Other issues that Wozniak had to deal with involved a way to properly time the reading and writing of information to the disk. IBM used a complex hardware-based circuit to achieve this synchronization. Wozniak, after studying how IBM's drive worked, realized that if the data was written to the disk in a different fashion, all that circuitry was unneeded. Many floppy disks sold at that time were "hard sectored", meaning that they had a hole punched in the disk near the center ring. This hole was used by the disk drive hardware to identify what section of the disk was passing under the read/write head at any particular time. Wozniak's technique would allow the drive to do self-synchronization ("soft sectoring"), not have to deal with that little timing hole, and save on hardware.

Wozniak asked Randy Wigginton for help in writing some software to control the disk drive. During their week of Christmas vacation in 1977 they worked day and night creating a rudimentary disk operating system, working hard to get the drive ready to demonstrate at the Consumer Electronics Show in the first week of 1978. Their system was to allow entry of single letter commands to read files from fixed locations on the disk. However, even this simple system was not working when Wozniak and Wigginton left for the show.

When they got to Las Vegas they helped to set up the booth, and then returned to working on the disk drive. They stayed up all night, and by six in the morning they had a functioning demonstration disk. Randy suggested making a copy of the disk, so they would have a backup if something went wrong. They copied the disk, track by track. When they were done, they found that they had copied the blank disk on top of their working demo! By 7:30 am they had recovered the lost information and went on to display the new disk drive at the show.

Following the Consumer Electronics Show, Wozniak set out to complete the design of the Disk II. For two weeks, he worked late each night to make a satisfactory design. When he was finished, he found that if he moved a connector he could cut down on feedthroughs, making the board more reliable. To make that move, however, he had to start over in his design. This time it only took twenty hours. He then saw another feedthrough that
could be eliminated, and again started over on his design. "The final
design was generally recognized by computer engineers as brilliant and was
by engineering aesthetics beautiful. Woz later said, 'It's something you
can ONLY do if you're the engineer and the PC board layout person yourself.
That was an artistic layout. The board has virtually no feedthroughs.'"<5>

THE DISK II: COST The Disk II was finally available in July 1978 with
the first full version of DOS, 3.1. It had an
introductory price of $495 (including the controller card) if you ordered
them before Apple had them in stock; otherwise, the price would be $595.
Even at that price, however, it was the least expensive floppy disk drive
ever sold by a computer company. Early production at Apple was handled by
only two people, and they produced about thirty drives a day.<6>,<7>

Apple bought the drives to sell with Woz's disk controller from
Shugart, right there in Silicon Valley. To cut costs, however, they
decided to go to Alps Electric Company of Japan and ask them to design a
less expensive clone. According to Frank Rose, in his book "West Of Eden":

"The resulting product, the Disk II, was almost obscenely
profitable: For about $140 in parts ($80 after the shift to
Alps) [not counting labor costs], Apple could package a disk
drive and a disk controller in a single box that sold at retail
for upwards of $495. Better yet was the impact the Disk II had
on computer sales, for it suddenly transformed the Apple II from
a gadget only hard-core hobbyists would want to something all
sorts of people could use. Few outsiders realized it, but in
strategic terms, Woz's invention of the disk controller was as
important to the company as his invention of the computer
itself."<8>

[EOA] [LIB]

>>> TOP 10 LIST FROM THE AUGUST UPLOADS <<<

These are among the best UPLOADs to the A2 Software Library in the past month. Please check them out. You will not be disappointed.

[*][*][*]

19253 Name: CASTLE.ARMS.BXY V1.1 Castle Arms is a two player game for the Apple IIgs. The object is to volley a cannon shot across a random terrain and strike the opponent's castle.

19246 Name: DYAINST1.BXY This is a packed disk full of instruments created by the DYA. They can be used with SoundSmith and NoiseTracker.

19244 Name: TIMELORDDEM.BXY This is a demo version of TimeLord IIGS a new adventure, role playing game from DreamWorld Software. Great game.

19224 Name: COMP.KB.BXY V4.01 This is an upgraded and fixed of the V3.0 and allows for multiple users on a 3.5" disk or hard drive only. This version is also SHAREWARE.

19215 Name: DE.DEMO.BXY Freeware demonstration of the Desktop Enhancer V2.0 from Simplexity Software. This is an excellent enhancer for the System 6.0 Finder. Check it out.

19205 Name: BOGGLED.GS.BXY Boggled GS is a GS implementation of the popular word game, Boggle (TM Parker Brothers). In Boggled, a 4 by 4 grid of randomly generated letters is displayed, and you must find words linked by connecting letters. An excellent word game.

19188 Name: UMDEMO.BXY This is a crippled version of Universe Master v1.0 from Econ Technologies, Inc. UM is a fully integrated, desktop based disk management utility written specifically for System 6.0. It includes backup/restore, volume repair, and a wide variety of other essential functions.

19183 Name: STARTREK.FC.BXY This is Star Trek: First Contact, a game based on Star Trek: The Next Generation. No two games are ever exactly the same. Planet locations and intruder intentions are
randomized before each game begins! Written using Zbasic this version of Star Trek will work on any Apple II with 128k of memory.

19177 Name: BJ TUTOR.3.0.BXY Use Blackjack Tutor to play the game of blackjack, learn playing strategies, and test those strategies over hundreds of hands. Changes for version 3.0: keep detailed statistics for each decision, and write to spreadsheet-compatible file; optionally display # cards & tens left in deck; allow user to set betting strategy.

19164 Name: APLWRTR.2.1.BXY As of 24 July 1992, Paul Lutus has allowed Applewriter 2.1 to be classified as Freeware. Applewriter 2.1 (NOT any other version!) may be freely copied and distributed. This is a 5.25 DISK archives. This is the predecessor to AppleWorks. It will work on any Apple II with 64K of memory.

="/""Actually if you mail an envelope with nothing but a disk in it, /"" it can pass for 29 cents. But as soon as you put a note (so we /"" know what you want) and a check in it, it exceeds one ounce and /"" costs 52 cents.""="/"" J.EIDSVOOG1 "/

[EOA][SOF]"

Welcome to Softdisk Publishing Online...

Softdisk and Softdisk G-S are disk-based magazines for the Apple II family of computers. Each month we deliver useful applications, unique AppleWorks(tm) templates, fun and challenging games, dazzling Print Shop(tm) graphics, and informative commentaries on one 3.5-inch disk or two 5.25-inch disks (Softdisk only).

If you are a programmer, Softdisk may have a special treat for you. We offer the serious programmer an alternative to shareware offering prices that range from 100.00 to...the skies the limit. We may not make you rich beyond your wildest dreams, but we have helped pay the bills of some of the most deserving programmers, artists, and gurus in the software world.

Please use this area provided by A2Pro for your support or programming questions, as well as a two way commentary with the gang who puts the disk together. We are looking forward to making your Apple II soar!

Lee Golden
Managing Editor,
Softdisk and Softdisk G-S

You can contact me at:

Softdisk, Inc.
Attn: Lee Golden
606 Common St.
Are you a closet Apple II programmer? Are you a closet Apple II programmer, a pixel Picasso, or an Appleworks(tm) template machine? Do you wish there were a way to gain world wide recognition for the work you do when you know it's high quality material? Do you like money?

If you answered yes to any of the above questions, please read on. If you answered no, read it all the same. If you answered no to the last question we may need to have a serious talk.

Seriously, Softdisk is in the business of providing a monthly magazine on disk to over 10,000 subscribers and we need to get our material somewhere.

That somewhere could be you. Everyday we receive disks full of programs, graphics, and Appleworks templates for publication consideration. Although the majority of programs don't make it onto the disk on the first cut, most are honed to softdisk standards with the specs that we provide after a complete review.

Program prices range from 100.00 to more money than any human should make on a 1 or 2 week fun programming project. Most fall into the 350.00 to 550.00 range with those few exceptional programmers planning a vacation to Las Vegas with gambling money! Hey shareware is great, but we GUARANTEE FULL PAYMENT on publication, so you know what you're going to make. A wish list will be provided here on GEnie and we have loads of routines that you can use. All we ask is that you sign our non-disclosure for our routines...if this stuff fell into the wrong hands it could be the end of civilization as we know it! :)

Lee Golden
Softdisk Publishing

INTERESTED? If you are interested in submitting to Softdisk or Softdisk G-S, we've uploaded some documents you may be interested in:

- 2826 Softdisk Submitter Guidelines (Teach)
- 2825 Softdisk G-S Programming Guidelines (Teach)
- 2824 Softdisk (8-bit) Programming Guidelines (Teach)
- 2823 Softdisk Submitter Guidelines (ASCII Text)
- 2822 Softdisk G-S Programming Guidelines (ASCII Text)
- 2821 Softdisk (8-bit) Programming Guidelines (ASCII Text)

The Teach documents use the Bookman and Courier font families and look _very_ sharp when printed on a LaserWriter...

Also, if you'd like, we'd be happy to mail you a copy of these documents (in case you have trouble downloading, or just want the nice Laser printed versions :) —Zak

(SOFTDISK, CAT31, TOP6, MSG:1/M530)
CHECK IT OUT... I'm not sure when you saw your sample disk, but Softdisk G-S has undergone _radical_ changes in the last 18 months. First, our rule of thumb is 10 programs per three issues (it used to be 5 :). So, here's a short listing of the last few issues (and of the next couple to come):

Issue #32 ---------
Word Search............. Just what the title indicates :)  
Home Refinancer........ I learned a lot doing this one :) 
World Tour: Australia.. Part of a series

Issue #33 ---------
Crazy 8's.............. the card game, with variations too 
Lift-A-Gon............. 30 levels of Fox-and-Geese puzzle thingy (cool:) 
Text Wizard............ convert text formats including Softdisk issue text 
The Optimizer........... er, ignore this one (see below)

Issue #34 ---------
BlockWords............. spell words on a 4x4 grid, very well-done 
Easy Eyes.............. change the gs colors to be more pleasing 
The Analyst 1.1........ just what is in your system anyway? Issue #35 -----

---
Nucleon........... arcade game that can be addicting as anything  
SeeHear............ NDA/Finder Extension to view graphics and hear sounds 
World Tour: Pacific another in the series 
The Optimizer v1.0.1 scrunch resource forks in programs and stacks

Issue #36 ---------
Sound Wizard....... convert sounds between various formats 
Canasta............. a card game 
Quizzical G-S...... an educational tool/game/program thing 
ZMaker............. Mass format/verify/copy/compare 3.5-inch disks

Issue #37 ---------
Son of Star Axe.... the legend continues! 
Mintrel w/new songs MIDI Synth song player NDA 
QuickForms........ An app for dealing with form letters

Ok, these are just the _programs_ on our issues (and don't blame me for the weak descriptions, I'm just a programmer :). Don't forget that we are a "magazine-on -disk" with all that implies: editorials, columns, reviews, reader's write, professor know-it-al, and what-not. We also publish clip-art, clip-sounds (new!), awgs templates, print shop stuff and more! (really, there is more :)

Not bad for $10 a month eh? (less if you get it by the year :)
-Zak

(btw: All of the programs on Softdisk G-S have a _very_ professional look and feel. The Human Interface is something that is very important to me, and I really nitpick on interface issues--just ask some of the submitters that have dealt with me. In the end, the subscriber is the winner though.)

(SOFTDISK CAT31, TOP3, MSG:7/M530)

/"In 1 Second the eye sends 1 billion messages to the brain (it has a 1 BIP, I/O port).:->) Your eye can sense about ten million gradations of light and seven million shades of color. Whats/
Doing It Online  Some of you have probably heard that you can now play USCF-rated postal chess on Compuserve. This makes some sense since it is the largest system, but it is also (probably) the most expensive pay BBS around. But there is an alternative here on GENie and it is part of Basic*Service to boot. Imagine playing against players throughout the country for twelve hours a day at no extra charge! (NOTE: See end of article for information on new pricing structure for the RSCARDS Multi-player games effective October 1, 1992. -ed.) To get started, simply go to page 875 to familiarize yourself with the RSCards games and how to get your graphic front-end program for your particular computer model. Then go to page 882.

So how is the competition you ask? There are over four hundred thirty GENie-rated players as I write this and the list is growing. I have found eight USCF Masters (including International Master Doug Root), eleven Experts, sixteen A-players, eleven B-players, six C-players, a sprinkling of lower-rateds and some who may not have ever played tournament chess, but are none-the-less strong players. There are online tournaments played over two weeks to minimize connect time since they cost $6/hour, with 100% of the entries returned in prizes -- 80% in cash and 20% in free connect time.

When you first enter the chess Room, the current Tables are displayed along with the player’s handles. (I use Golden Knight.) You can either challenge another player in the Room or move to a Table to sit in the Gallery and watch and kibitz. Once you sit down to play, you choose the time limit first (5-minutes up to no clocks). When both agree, the game begins automatically. If you get disconnected or have to leave, the game can be saved and finished at another time. Colors are assigned randomly when both are due the same color, otherwise you alternate.

The chess program, written by John Weaver, Jr., is surprisingly capable with many built-in automatic features: (a) makes your move if it is forced; (b) moves a piece when selected if there is only one legal move; (c) declares a game drawn when there is insufficient material to mate when the clock expires, after 50 moves, or threefold repetition (but only if in succession); (d) prevents resignation before the tenth move; and, (e) the option to squelch messages from kibitzers or other games in progress.

It has been an interesting experience playing unseen human opponents on a computer. It is exactly like playing a computer chess program if you use the graphic front-end program available. But, do not forget, it is not a chess program! It is live. It is fun. Trust me. So, come on by and play...
ATTENTION!  GENieLamp has just received the following notice in regards to the RSCARDS RoundTable.  RSCARDS will be changing their pricing structure effective October 1, 1992.  GENie subscribers will be able to access RSCARDS games (Blackjack, Backgammon, Checkers, Poker, Reversi, and Chess) via two options:

1) The standard $6.00 per connect hour non-prime time rate,

or

2) As a member of the RSCARDS Club. RSCARDS Club membership will cost $30.00 per month, and entitles the member to a discounted rate of $3.00 per hour for unlimited non-prime time play of any RSCARDS games at speeds up to 2400 baud.

The institution of the RSCARDS Club also marks the end of our seventh RSCARDS game, Basic*Chess, which will be discontinued on 10/1/92.  Full details of the RSCARDS Club, and signup information will be available on 10/1/92. Type RSCARDS at any menu page prompt or move to GENie page 875.

As a bonus, anyone who played any of the RSCARDS games (including Basic*Chess) between June 15, 1992 and September 14, 1992 will be entitled to join the RSCARDS Club and have their first month’s membership fee WAIVED if they sign up for the RSCARDS Club between 10/1/92 and 10/15/92. Hourly charges will still apply, and subsequent months' membership fees will be charged at the standard $30.00 per month.

The RSCARDS system allows you to play real-time multi-player games with GENie users from all over the world, in text or with an optional graphics driver program (available online for the Atari ST, the Commodore Amiga and 128 computers, the Apple Macintosh and //gs, and IBM compatibles).

Full details of the RSCARDS Club, and signup information will be available on 10/1/92. Type RSCARDS at any menu page prompt or move to GENie page 875.

NOTE: Rates quoted are for 300/1200/2400 baud access from the United States. A Club Plan will also be implemented for Canada, and details will be announced shortly. Non-Prime time is from 6:00 PM to 8:00 AM local time Monday through Friday, and all day on Saturday, Sunday and holidays. Communications surcharges, if applicable, still apply.

Discussion of the RSCARDS Club is taking place in the Multi-Player Games Bulletin Board, Category 29, Topic 10. (Type *MPGRT to get there, or move to GENie page 1045;1).

GENie Games and Entertainment
PLEASE REMEMBER! You are responsible for any damage or liability when you make any modifications or upgrades to your equipment. Also keep in mind that opening your computer may void your guarantee. If you are unsure of your ability to take on a hardware project, find someone who isn’t.

GIF ILLUSTRATIONS To help you with this upgrade, you can find a series of GIF illustrations by the author in the GEnieLamp RoundTable on page 515. (Keyword: GENIELAMP) Download: HST_GIF.ARC

A v32.bis SOLUTION! Times change quickly in the world of high-tech electronics and the world of telecommunications is certainly no exception. It wasn’t long ago v.32bis was conceived. Now, with the advent of modems supporting this type of modulation at very affordable prices, new high speed users are coming on-line faster than ever before. In the past, US Robotics dominated the high speed market with their HST modulation. Gradually, the tide seems to be turning and HST users are finding themselves unable to connect at high speed with the increasingly popular v32.bis modems. If you’ve found yourself in this predicament, read on and you may find an inexpensive solution to your plight.

The Upgrade The upgrade about to be described is not possible with all HST only modems. The particular upgrade pertains only to the newer model Courier HST 14.4 modems. The newest 16.8k modems are quite different from the previous 14.4 models and I have not had the opportunity to investigate the possibility of performing a similar upgrade on those nor on any older models. Refer to the graphic illustration to determine if you own an HST model suitable for this upgrade. I have personally performed this upgrade and have verified it's reliability on my own Courier HST. The largest benefit of doing this upgrade is the substantial savings involved. The value of this upgrade is somewhere around $300-$400 (based on the cost of a new v32bis unit); however, the cost of required materials is approximately $60. If you are handy with a soldering iron, the entire process should take about 8 hours.

The most difficult part of the operation was finding parts sources. I was able to obtain everything required in about 1 week. I was informed the main DSP (Digital Signal Processor) chip could take up to 12 weeks to be delivered since it is a "highly allocated" part. This did not prove to be
the case as it showed up a mere 5 days after I placed the order. Hopefully, everyone else will receive the same surprisingly fast delivery. I'll include the sources for all necessary components below for your convenience. Just to clarify USR's position on the matter of parts procurement: They will not assist you in any way. They do not sell parts. In fact, there is no upgrade kit available for the type of modem to which this procedure is applicable. USR will upgrade the unit for a fee of $350 according to Mark Eric of HST. This was the only information he was willing to offer.

How Dey Do Dat? The HST modulation is asymmetrical. Data travels at 14.4k bps in one direction while the back channel proceeds at 450 bps. In order to serve as a v.32bis modem, we must install the necessary components to provide for 14.4k bps operation in both directions. There are illustrations to accompany this text and they do aid in determining if you have an appropriate model and in finding the correct position to install the new chips. In the event you are unable to obtain the graphic portions of this article, I will attempt to give a complete and accurate enough description to facilitate the successful completion of the project without them.

The first step is to open the case by removing the rubber feet at the rear of the case and the two phillips screws beneath them. The case can now be opened. You are now looking at the guts of one the best modems in the world. What? You're not impressed? Try removing the metallic shield that isolates the digital from the analog. There, that's better. The area you've just revealed is the focal point of our work and is shown in detail in Figure 4. Immediately noticeable should be several spaces suitable for mounting the necessary circuitry. If there are no unused spaces, you don't have the proper model for upgrading. Welp, it was worth a shot, huh? Thank you for your patience in bearing with me this far. I bid you farewell. If you DO notice the aforementioned spaces, you're about to become the proud owner of a USR Dual Standard modem. As you further inspect the unit, you will notice the pc board is well marked. There will be very little doubt concerning where the parts are to be mounted. If you notice empty spaces that do not correspond to the details I'm about to present, you probably have an older model. Drop me a line on GEnie and maybe we can come up with a solution.

Some desoldering is required to clear the holes for mounting our new parts. This can best be done with a desoldering iron. Radio Shack carries one for under $10 that does a good job. I would also recommend the use of desoldering braid for the more stubborn spots. This too is available at any local electronics shop, Radio Shack included. The task of clearing the solder out of all the necessary holes is the most tedious portion of this upgrade as it involves clearing a couple hundred holes. As desoldering goes, it's a straightforward operation because there are very few paths on the bottom side of the pc board. In light of this fact, every effort should be made to clear the holes from the bottom so as to avoid damaging traces.

All of the desoldering having been completed and the pc board ready for the new parts, refer to the following parts list with associated pc board silkscreen labels. If you don't have the graphic portion of this article, refer to these pcb labels to determine the correct location for parts placement.

A Word Of Caution

Before installing an IC pay special attention to it's orientation as marked on the pc board. Unlike many
circuits which have all chips oriented in the same direction, this circuit follows no such convention. Pay particular attention to the new DSP which is rotated 90 degrees from the existing DSP.

Some Notes About Suppliers

The most important chip is the DSP. It's by far the most expensive and the hardest to find. I found a local Texas Instruments dealer who would order them for me at ten dollars each but I would have to buy 20 of them. I also found them in stock at Hamilton Avnet but there is a $100 minimum order. Arrow Electronics is a national distributor with a $25 minimum and this turned out to be the best source for a single part. Even though they did not have the part in stock and warned of a long delay, the chip arrived within a week in a 3X1X1 box. No, not 3 inch by 1 inch by 1 inch. Three feet by 1 foot by 1 foot! These guys really know how to pack a chip. The packaging included a large, military spec desiccant, a humidity indicator, static shielding barrier film (with label indicating relative humidity when opened), a three foot plastic chip carrier and lots of packing popcorn. Wow! Needless to say, when installed, the chip worked fine.

Substitutions

The pc board is designed to accept surface mount resistors and capacitors. These are sometimes hard to obtain in small quantities. The $5.99 price for the 10k resistors represents the price for 200 of them. Even so the plastic tube they came in is no bigger than my little finger. Although they're really tiny, I had little trouble handling them and mounting them with conventional equipment. It might not be a bad idea to substitute conventional resistors and capacitors of the appropriate values for the surface mount devices. Such substitutes can be
found at any local electronics shop. There is no real space restriction to prevent you from using the more common (albeit much larger) parts. If by chance you have trouble finding the 6.8 uH rf choke, you may place a jumper from L7 to provide the necessary B+ to the IC's.

Finally, The Fun Part

Reassemble the modem and type ATI7 from your favorite terminal program. The modem should respond with:

```
ATI7
```

DSP rev               10
```

OK

Did it work? Are you leaping with glee? Do I detect a tear of joy in your eye? I thought so. Congratulations. You've done a fine job. You may now be able to sell your modem for almost what you paid for it. Isn't that an enchanting thought? Thanks for coming along for the ride and have fun with your new dual standard.

Testing

There's only one command set option needed to enable the V.32bis handshaking. It's ATB0. Change this parameter and write it to NVRAM. From now on, your modem will attempt to negotiate a v.32bis connection with any modem it dials. If you call another dual standard, you will connect as a v.32bis, NOT HST. Therefore, you may want to change back to ATB1 when dialing duals. When dialing HST only modems, an HST connection will be made after a brief attempt at v32.bis. If you have trouble making a v32.bis connection, try dialing the GENie 9600 line in your area. I've experienced no trouble connecting with GENie at high speed.

WHAT? It Doesn't Work?

Here's some things to try if you didn't achieve immediate success:

If the modem is completely dead:

Check the fuse. If it's blown, there's a reason why it blew. Don't just replace it and try it again. Try and find the cause of the trouble by looking for:

1) Shorts across leads of any capacitor.
2) IC's which may have been installed with incorrect orientation.
3) Globs of solder left from desoldering which may be shorting.
4) A broken trace in a part of the modem you shouldn't be touching in the first place. Remember, we're adding a new
circuit, not tampering with the old ones.

If the modem lights up and echoes back characters but doesn't show HST,V32 in the second line of the ATI7 response:

1) Type ATI2 from your terminal program. This checks the ram. you now have two banks of ram and should subsequently receive two OK's as a response. Like this:

   ATI2
   OK
   OK

   If you receive the correct response, the trouble is not in your ram. If you do not receive two OK's, make sure you have 35ns or faster static rams.

2) Did you remember to install L8? If you don't have a 6.8uh rf choke, did you install the jumper properly? The jumper should extend from the lead of L7 that is farthest from the edge of the modem to the through hole for L8 that is likewise, farthest from the edge.

3) Did you install the DSP correctly in it's socket? Remember, it does not face the same way as the existing DSP.

4) Did you make a parts substitution other than using conventional instead of SMD resistors and capacitors? For example: Did you use 74LS541's instead of 74HCT541's?

5) Nearly all connections are made on the top side of the pcb. check the legs of the chips on the top side to verify the establishment of a good solder joint.

6) Also check for the items mentioned above in the "Completely Dead" section.

   Hopefully, any problems will be resolved using these methods. If not, have yourself a good long cry because you trashed a $600 modem and your wife will never let you buy another in a million years. She may even confiscate your tools to prevent you from destroying anything else around the house. (And we couldn't blame her one bit) Go ahead, get it out of your system. It's not good to keep that kind of emotional loss all bottled up. Okay, alright, enough of that. Get a grip on yourself. Take a couple deep breaths. Chant your mantra. Relax.....

   Just kidding. In reality, if you've exhausted every other option, leave me e-mail on GEnie and I'll try to bail you out but I can't be responsible for your actions or the quality of your work. Take your time when you do this upgrade. It's not a race. There is no prize for he who completes it the fastest. If you absolutely can't live without a modem for even one day (like me), do the desoldering one night and the soldering the next. It took me about 6-8 hours to do this, most of which was spent desoldering.

   Performance I'm a relative novice to v.32bis so I'm not sure how the modem should perform but I have noticed some shortcomings in the v.32bis type modulation. First of all, there is one bbs with which I have trouble making a connection. The problem is intermittent. Usually when I DO have the trouble the modem will hang up while negotiating error correction. As soon as the ARQ light comes on, I get a NO CARRIER. This
doesn't happen all the time and only with that one bbs. (The Woodworks. Thanks, Tim) Secondly, the modem realizes cps rates around 1300 even though the result string indicates I'm connected at 14400/V32. With HST modulation, 1650 cps is typical. Even so, 1300cps is noticeably faster than 280cps. (To say the least!) Other than that, I'm just ecstatic over the whole episode.

Acknowledgements I didn't figure this out without help from others. Those who contributed know who they are and I wish to thank them sincerely. Thanks to Atari for making a computer for those of us without patience, money or a doctorate. To those who offered nothing but disinformation and discouragement, I still think you make the best modem in the world. With that said, I have no further axe to grind and nothing nice to say either, leaving me with no alternative but to terminate our little chat....

-Bill Yung

--- The BBS Roundtable ---

What's the difference between a local bulletin board (BBS) and GEnie? Only size and accessibility of GEnie which allows real time interaction between many users at the same time. Now local BBS SysOps (as well as anyone aspiring to possibly be a SysOp) have a place to talk, leave messages or exchange files on GEnie. It's the BBS Roundtable, page 610 and although it has been around for quite a while it's being given a facelift, the cobwebs are being swept away and Real Time Conferences (RTC's) are starting up again every Thursday night at 7:00 o'clock PT.

The newly appointed, helpful SysOps in this RT are:

Leonard Reed (BIBLIA), Chief SysOp
Dave Cole (MACLAMP), Macintosh SysOp
Tony Newman (UHH.CLEM), PC/Clone and CP/M SysOp
Chris Carpenter (C.CARPENTER3), Atari SysOp

So if you are an active SysOp or an aspiring SysOp wanting to know more about what running a BBS entails...stop by and read some messages or leave a message of your own, check out the BBS related files for your particular computer (upload some if you think they'll help someone else)
Apple II Computer Info

and be sure to show up on Thursday nights for the RTC's which focus on a different computer platform each week. You can talk with the SysOp's, all of which have experience with local BBS's, or with other folks who might stop in like you and have just the answer you've been looking for or might need an answer that you can give...and after awhile every RTC turns into a simple social affair where you can just talk with other people sharing the same interests.

The BBS RT is once again growing and all of the SysOps extend an invitation to everyone to come by and discover an online community with similar interests, mainly 'Connecting the World' through BBS's. We hope to make this the most active area on GEnie but it's up to you...by using this resource that is available to you and contributing when you can. With your help we hope to establish a service on GEnie that will represent the best storehouse of BBS information and related files in the world, and one of the few places in the world where you can talk to others with similar interests without leaving the comfort of your home.

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 377 of 1824
Hang on to your hat! The first annual GEnieLampLighter Awards will be announced in the January issue of GEnieLamp magazine. The awards are designed to honor PD/Shareware/Freeware programs and their programmers for excellence and creativity in their respective fields. Categories for the awards are as follows:

>>> GEnieLampLighter Award <<<

1) PROGRAM OF THE YEAR
2) PROGRAMMER OF THE YEAR
3) Best Utility
4) Best Personal Productivity or Business Program
5) Best Desk Accessory or TSR program
6) Best Telecommunications Program
7) Best Graphics Program or Utility
8) Best Educational Program
9) Best Game
10) Best Programming Software or Utility
11) Best Sound or Music Program or Utility
12) Best Use of Graphics In a Game
13) Best Use of Graphics in a Non-Game
14) Most Used Program or Utility
15) All Time Favorite

Read A Good Bookette Lately? Electronic Publishing comes to GEnie! The GEnieLamp libraries are filling up fast with new bookettes, (A BOOK on a diskETTE), magazines, newsletters and even online comics. Everything from poetry and short-stories to How-to-do-it text files are being uploaded on a daily basis. Indeed, electronic publishing is the future - you can find it NOW in the GEnieLamp RoundTable. (M515;3)

Disktop Publishing Association Nationally known Disktop Publishing Association (DPA) has found a home in the GEnieLamp RoundTable. If you have any interest in electronic publishing you should consider joining DPA. Membership applications are now being accepted via GE Mail for the Disktop Publishing Association. Presently, there is _no_ fee for you to join, so what are you waiting for? (For your convenience, you will find a DPA application at the end of this magazine).
For more information, see GEnie Elsewhere in this issue or drop by the
GEnieLamp RoundTable and visit the DPA in CAT6, or you may leave GE Mail to
the founder and president of DOA, Ron Albright. (GE Mail=RALBRIGHT)

Until next month...

Changing of the Guard

By Darrel Raines
[D.RAINES]

EDITOR'S VIEW   This issue of GEnieLamp marks the changing of the guard at
the editor position. Tom Schmitz, who carried the Apple II version of GEnieLamp
from conception through the first six issues, has decided to step down from the helm
of this newsletter to better pursue his day time job. Tom had a few things to say
upon making his decision. I reproduce here a copy of the farewell letter he placed
in the Bulletin Board area.

[**][**][**]

A FAREWELL MESSAGE   Well, many of you may have noticed I haven't been
online much lately. And there is a good reason for this. Recently I was promoted
at the Life Foundation, the AIDS Foundation of Hawaii on Oahu, to run the Free
Legal Clinic and to be the Development Liaison between staff and volunteers.
Both are relatively full time responsibilities and have left me little time at home
with my modem. (The only thing at home seeing much of me is my bed.)

And since I do not have the free time as before, I have stepped down
as editor of GEnieLamp A2/A2Pro. I can no longer do it justice, and if it
were not for John Peters' and Phil Shapiro's excellent work, the October
issue would never have made it.

GEnieLamp is truly something extraordinary. It is the first major
online, regular newsletter of high caliber quality. Much more than a
round-up of monthly events, it brings interviews with industry luminaries,
and timely articles on interesting subjects.

I encourage all of you to keep reading GEnieLamp and to support those
who create it with your praise and with your articles. It means a lot to
the staff when you give feedback. It tells them, hey, someone cares about
what we do.

And while I may be biased, I do think the A2/A2Pro edition has the
best damn GEnieLamp staff online and that this magazine will get even
better and bigger than even I ever imagined.
And to everyone who has ever written or edited for GEnieLamp A2/A2Pro, all I can give you is my thanks, but let it be known you have made it a fun experience looking foreword to being the first to see these great articles and to viewing the final product on the first of the month.

To the A2 & A2Pro staff, I have been on GENie, CompuServe and America Online through the years. No one, but no one can even come close to the fun, comraderie and quality you maintain in A2 and A2Pro.

I'll still be online, though not as much. And I will still read GEnieLamp on the first of every month.

(TOM.SCHMITZ, CAT3, TOP3, MSG:78/M645;1)

>>> SETTING IN OUR NEW COURSE <<<

Those of you who have read previous issues of this newsletter will already be familiar with me. I have been writing the games column and the somewhat sporadic programming column. Both of these assignments will be re-evaluated during the next two months as I start to settle into my new responsibilities as editor of GEnieLamp. For this month, both columns will be on hold. The gaming column will return in December with a few more good things to say about Eamon. More information about these columns will be available in the next issue.

Despite the fact that the regular articles mentioned above will not be included in this issue of our newsletter, we still have many new and exciting articles available for the first time in this newsletter. Along those lines, Jim Couch has joined the staff of GEnieLamp to provide coverage of the A2Pro roundtable on a regular basis. Phil has written another article that will stimulate your "thinking muscle". Mel Fowler gives us a peek at a new shareware game available here on GENie for all IIgs's. Morgan Davis drops in for an interview and reveals some very interesting history of a famous Apple software development company. Any way that you slice this newsletter pie, the results should be plenty of interesting reading in your future.

Be sure and note the upcoming RTC conferences that are held regularly in both the A2 and A2Pro areas. Paul Lutus, author of AppleWriter and many other older programs for the Apple II computer, will join us on November 10 at 9:30 pm eastern time. We hope to get some interesting information out of Paul. Join us if you can.

In the next section I will present a variety of interesting posts that have appeared during the last month in the bulletin boards for A2. These messages can be identified by the footer attached to each item. (See the introductory notes on how to interpret the footer.) If you find the topic, excerpt, or just the interplay between various people to be stimulating, then please jump to that topic on a weekly basis and read what is new. Our hope is that you will find something new in this section to keep you guessing.

And now, please enjoy the first fruits of our efforts in the post-Tom days for Apple II GEnieLamp.

>>> Apple II ODDS & ENDS <<<

SPELL IT AGAIN, SAM
I thought that I'd post this little ditty that my wife brought home from work for those of you who use the AppleWorks spelling checker:

HUMAN BRAIN NOT YET OBSOLETE:

I have a spelling checker,
   It came with my PC;
   It plainly marks four my revue
      Mistakes I cannot sea.
   I've run this poem threw it,
   I'm sure your please too no,
   Its letter perfect in it's weight,
   My checker tolled me sew.

When I ran this through my AppleWorks checker (with no Custom Dictionary) it innocently caught the word "revue." I don't know if that means that the AppleWorks checker is BETTER than most PC checkers or not. According to my Websters, while "revue" (used to indicate a theatrical production) is acceptable, "review" is the preferred spelling, which is what was offered up by AppleWorks.

(J.CURTIS8, CAT17, TOP33, MSG:193/M645;1)
HOW TO BURY YOUR HARD DRIVE IN FLOPPY DISKS

Let me just make an additional comment on top of Gary Utter's. If you have a 32meg partition on your hard drive, and want to back it up to standard Apple format 5.25 disks, here's what you'd be looking at.

A 32meg ProDOS volume consists of 65536 block. Each ProDOS-formatted 5.25 disk can hold 280 blocks maximum (this is assuming that there is NOTHING else written on the disk except backup data; most backup utilities will either use a standard-appearing ProDOS disk, which takes up 7 blocks just for overhead, or use the first several blocks of the disk for information on which disk is which).

Taking 65536 / 280, we get 234.057 disks, rounding up to 235 floppy disks if the ENTIRE hard drive is full. Since I am still backing up to 3.5 disks, I still tend to keep my 32 meg partitions no more than 20-25 meg full, so I don't have TOO many disks to use when doing a full backup. I would need a maximum of 42 of the 3.5 disks to do a full backup, and even THAT is a bother that keeps me from backing up as often as I should.

I'd agree with Gary; invest in a tape drive (if you are using a IIGS, you can get a used Apple Tape drive from Sun Remarketing for about $200) and back up to that. That's what I plan to do when I've dug myself out of my current computer budget hole... :-)  

(S.WEYHRICH, CAT42, TOP13, MSG:40/M645;1)

SUPRISING NEW DEVELOPMENT   LINKING HEALTH TO COMPUTER EQUIPMENT

I just wanted to alert everyone that I have just uploaded a wonderful and fantastic IIGS utility that should be of interest to all long term Apple II users. John MacLean's $10 Shareware DOS 3.3 Launcher, file number 19469, allows you to store, and run, DOS 3.3 software on your previously non-DOS 3.3 compatible hard drive. It works for both single sides and double sided DOS 3.3 disks.

DOS 3.3 Launcher is desktop based and very very easy to use. It allows you to launch DOS 3.3 BIN files or complete disks, from the Finder. If you want, it'll let you slow down the system to 1 Mhz (necessary for old games), but when you quit from a DOS 3.3 program, it'll return you to the Finder at the GS'es faster speed.

This is one of the most useful IIGS shareware programs I've ever seen.

(S.WEYHRICH, CAT42, TOP13, MSG:40/M645;1)
Apple II Computer Info

Although it can be somewhat difficult to send shareware fees to other countries, please send John $10 if you find this utility useful. As the author of Roger Wagner's Graphics Exchange, John is an accomplished programmer, and if he receives enough shareware registration fees, that very well may serve as encouragement to him, and other Australian programmers, to release additional software as shareware.

(J.KOHN, CAT28, TOP10, MSG:/M645;1)

JUST FOR FUN...

""""""""

>>"do you know why the chicken crossed the road?"

1. (Metaphysical answer) Because it was too far to walk around.

2. (Realistic answer) To show the opossum it could be done.

(GARY.UTTER, CAT2, TOP13, MSG:47/M645;1)

UPCOMING REAL TIME CONVERENCE EVENT! Join us Tuesday, November 10, at 09:30 Eastern in the A2 RTC rooms (item #2 on the main menu!) when our conference guest will be PAUL LUTUS, legendary Apple II Pioneer and author of such recently found "Lost Classics" as Apple Writer II and GraFORTH! Don't miss this HISTORIC event right here in A2!

THE DEAN'S LIST Check out these exceptional files recently uploaded to our library!

+19448 TURBO.IDE.BXY Press release for new drive card.
19475 SHOWME.NDA.BXY V1.0B2 Latest version of NDA graphic viewer.
+19481 APPLE.HIST.BXY V1.0 It's complete! The long-awaited history of the Apple II computer.
19484 DOS3.3.LNCH.BXY Store and run DOS 3.3 programs from your IIGs hard drive!
19495 FLOP.LAUNCH.BXY V1.1 Launch floppy-based programs via Icons.
19497 GSMEMORY.BXY NDA to show GS memory use.
19517 GSHK.BSE V1.1 Self-Extracting GS-Shrinkit V1.1.
19520 FILMS.ADB.BXY Over 2000 films listed in ADB format.
19531 QUIT.TO.BXY V2.02 New version of IIGs program switcher.
19544 SHOVEIT.BXY Very colorful, thought provoking game.
+19555 HWN.TH1.NPS.BXY Halloween & Thanksgiving New Print Shop art.
19567 PLASMALAB2.BXY New version of cullular automata program.
+ - denotes Apple IIe/IIc compatible file.

A NEW HARDWARE PRODUCT FOR THE APPLE IIGS! The SoundMeister is our upcoming stereo digitizer/amplifier board. It not a software product, although it does come with some of that. :) Actually, there are going to be two models: SoundMeister JR. which is basically the equivalent of a Sonic Blaster, both in terms of price and capability. It will be a little bit cleaner however. The SoundMeister, OTH is totally awesome. It uses its own pair of A/Ds to allow one to digitize in stereo up to a hardware selectable 54khz! An
expandable buffer alleviates the software so it can perform other tasks such as update a really groovy interface or, best of all, spool samples to disk so you can digitize high quality sources for minutes at a time instead of mere seconds (limited by disk space, really). Both versions share virtually identical output stages providing 1.9w/channel or line level with a software controlled volume level.

Is that a bit more detailed than "It's a sound board!"?

(ECON, CAT35, TOP10, MSG:/M645;1)

>>> APPLE HEADS WANT TO KNOW <<<

IS THERE A LASER PRINTER IN YOUR FUTURE? If you want to go the laser printer route, I would recommend that you take a look at the Epson Action Laser II. I have been using one with my GS for about six months and I am very pleased with it. It is LaserJet IIp (and Epson LQ and FX) compatible, 6 pages per minute, has serial and parallel ports, a 100-page sheet feeder, comes with 512K (if you print complex documents from GS/OS you'll want to add at least 1 MB), and, course, gives 300 dpi output. Unless you've got lots of time on your hands I would strongly recommend using a parallel card for complex fonts-and-graphics stuff.

The EAL II works like a charm with AppleWorks and other 8-bit programs (where the Epson FX emulation comes in handy, as just about any program can handle that), and does equally well with AWGS, GraphicWriter, etc. It's a very versatile printer.

In the most recent Computer Shopper I saw it advertised for $689. I bought mine at an Office Depot for about that price. One caveat: check on the price and availability of the RAM expansion card (usually not included) before buying the printer. I had a hard time finding it (finally did at
Apple II Computer Info

Flex-USA, and they had lots of them) and it wasn't cheap. I went to 2.5 MB (probably more than I need) and it cost about $250. Another caveat: A new toner cartridge (every 5,000 pages) costs about $95, considerably more the ones for the LaserJets. I haven't yet found a source for refurbished cartridges, which are usually much cheaper and are certainly less wasteful, for the EAL II. I'm hoping that as more of them enter the market, competition will drive down the price of the cartridges.

(D.CRUTCHER, CAT12, TOP8, MSG:191/M645;1)

CABLE QUESTIONS AND ANSWERS

"will the cable that runs from a Super Serial card to the IW II work for direct connection to the GS, or do I have to purchase a different cable?"

The SS to IW II cable will not work. The SS to the IW (early model) would probably work, but if you're going to buy a cable anyway, why not get a cable that will come off the Serial Port in the IIgs?

You need a 8-pin mini-DIN to DB-25 cable, which is also known as a Mac+ to ImageWriter cable. Most dealers wouldn't know what you're talking about if you said a IIgs to ImageWriter cable. Make sure you get a cable that has a round plug on one end, and a 25 pin "D" connector on the other. Don't let them give you a ImageWriter II cable that has a round plug at each end. (R.MERLIN, CAT17, TOP17, MSG:100/M645;1)

WHAT ARE MY MONITOR INTERFACE SPEC'S

Does anyone know the video output specs for the GS? The owner's manual doesn't list horz and vert frequency. I'm looking to get a VGA monitor that I'd like to switch between my GS and a 486. But I understand that there is probably a compatibility problem due to horz sync rate.

OR - does anyone have any advice re connecting a VGA monitor and the GS? Models, video converters, etc?

(C.LYON, CAT4, TOP2, MSG:45/M645;1)

>>>>> If you have the IIgs set for 60 hz in the control panel (everybody in the USA and NTSC-speaking countries should) then the specs are: vertical: 60 hz, non-interlaced horizontal: 15.750 khz analog RGB, internal composite sync on all three channels external composite sync available (I can get the pinout if you want)

Note that most monitors that accept composite sync either require it as an external (i.e. on a wire by itself) or only need internal sync on the Green wire (internal means the sync signal is combined with the video signal).

Unfortunately, most PC monitors seem to require separate horizontal and vertical sync (at least they did a few years ago when I was shopping for a new monitor), but with the Mac market I wouldn't be surprised if most of the good ones available now have a Mac connector that you can use directly. It is possible (although a bit kludgy) to make an adapter cable that will go between a IIgs and a separate-sync-only monitor; I've seen it done and I might be able to get a schematic for you. It's really just a normal cable with a couple resistors in the works to keep the two sync lines that the monitor sees from interfering with each other.

(TODDPW, CAT4, TOP2, MSG:48/M645;1)
GOT A QUESTION? YOUR GENie FRIENDS CAN HELP IN A FLASH

Does anyone have a phone number for MECC software publishing?

(K.TAGGART, CAT2, TOP4, MSG:72/M645;1)

The phone number for MECC is: 800-685-6322 or 612-569-1500

(S.MACGREGOR2, CAT2, TOP4, MSG:79/M645;1)

I have 800-228-3504 or 612-481-3500 for MECC. Address is 3490 Lexington Avenue North / St. Paul, MN, 55216-8097

(J.YANDRASITZ, CAT2, TOP4, MSG:90/M645;1)

PRINT QUALITY -- IS IT REAL OR IS IT MEMOREX?

Is the print quality from Publish It as good as that from a GS specific program? Will a 16 bit publishing program be able to take advantage of Pointless fonts?

I haven't used PI4, but version 3 only has a "double strike" mode, which doesn't scale down oversize fonts like Apple's ImageWriter driver does. Hence, the output isn't quite as good. OTOH, it works beautifully with a LaserWriter. A 16 bit program, such as GraphicWriter III, would let you use Pointless, while you can't directly use it with an 8-bit program (you _can_ create bitmaps of any size, and save them for use with an 8-bit program). I published a newsletter for about a year using Publish It 3 and a LaserWriter; people always asked me if I used Quark Xpress or PageMaker, and which Mac I had... B-)

(D.BROWN109, CAT2, TOP4, MSG:87/M645;1)

WHICH IS BETTER: ZIP OR TRANSWARP

BTW, on average I've heard about equal opinions about the ZIP GS or the TWGS

Actually, I have owned both, and I have no real choice between them. I THOUGHT I had a problem with my TWGS (which turned out to be a bad cable), so I replaced it with a ZIP (only to find I had the SAME problem with the ZIP, drove me NUTS). In the process of determining just what the problem was (and it took me weeks), I did a lot of comparisons between the two.

Performance wise, the 7/8 mhz ZIP and the TWGS are essentially identical. The ZIP follows Apples rules better (or so I am told) and uses less power, but the TWGS seems a bit more reliable (based on word of mouth reports from the field). I suspect that the performance of the TWGS can be pushed further than the performance of the ZIP for those technoids who want to get into hardware modifications.

The REAL killer on both cards is service, or the lack of it. I don't see a lot to choose from there either. We sure could use a third manufacturer of GS accelerator cards.

(GARY.UTTER, CAT2, TOP10, MSG:/M645;1)

MESSAGE SPOTLIGHT <<<
Vic,

>>"I feel Apple Computer has forced me to turn away from the platform I truly love– the Apple [."

This is kinda the key statement here. First of all (and I don't intend to be defending Apple in saying this), computers evolve. The GS, good as it is, is not a platform with sufficient development potential to carry it into the next century. The MAC probably will not make it into the next century. While I don't think Apples treatment of the II line is the wisest course they could have taken, I am not prepared to say that it was foolish, either. The fact of the matter is that the GS does not have what it takes to be a major platform, and Apple made a serious mistake when they released it. The LC is what the GS should have been. That is, the GS SHOULD have been a Mac with color capabilities and built in IIe emulation. Instead, they released a computer that has very serious design limitations that simply cannot be overcome at a reasonable cost.

So what we have here is the bastard child of muddled thinking at Apple Computer. But despite the fact that it was a bad idea in the first place, and despite the fact that it does not have the capabilities that would make it the basis of long term development program, that does not make the GS a bad computer, or a bad choice for a computer.

When you see a 486 with a super VGA monitor and a huge hard drive for $950, it will be because it is seriously outmoded by the 686 with extra super VGA and a gigabyte drive. Don't waste your time waiting for it.

>>"it seems to me that the GS is on a dead end street with the ridiculously little continuing support for it from Apple itself"

Of course it is. So what? I live on a dead end street, as a matter of fact, and every house on the street is a very NICE house, and the neighborhood is quiet and peaceful. Being on a dead end street is not bad in and of itself.

Ask yourself THIS question...

"What do I want to do, and NEED to do, that cannot easily be done on a GS with current software?" If you answer truthfully, I strongly suspect that the answer will be "Nothing!" Especially in view of the fact that you have been getting along for so long with a Laser. :)

What you are dealing with is the popular perception of computing, "if it is not the latest, greatest, most powerful, most cutting edge, it is NOTHING". That turns out not to be the case, however. The sorts of applications that you CAN'T run on a GS are not anything you are likely to need to run your church. Do you have a real (as opposed to imagined) need for high end DeskTop Publishing? Do you have a real need for CAD/CAM? How about running a major spread sheet or database program over a network? Do you REALLY need to do that? If so, then go for a high end Mac or a 486.

Let's turn it around a bit. I'm guessing at what you would need to do with a computer for a church, so let me know if I am wrong, but I expect that your needs run to some small accounting/bookkeeping needs for the church itself, perhaps several databases of members and various projects/activities they are involved in, maybe a spreadsheet or two to
project costs for the church and determine budgeting for the coming year or
two. I would expect that you would need to be able to do the churches
correspondence on your computer, and that you would like to be able to
print letters for mass mailings, perhaps flyers to advertise church
activities, etc. Did I miss anything vital there? ALL of that stuff can be
done easily with the Laser (or was it a Iic?) that you have now. Not as
easily, or as effectively, as it can be done with a GS, but it can be done.
In fact, all of that sort of thing could be done with Appleworks and a full
suite of TimeOut addons.

Look at it realistically, and you will see that anything that you
really need to do can be done easily, and economically, on the GS. The GS
is as reliable as a stone. If you want a DOS platform that you can really
COUNT on to work, and work properly, and work for years to come, AND you
want 486 type performance, you had BETTER plan on spending at least $2500.
(Sure, clones are cheap, but there is a REASON for that. If it were ME
buying one, I would expect to spend more like $1800, but I LIKE to get into
the guts of my hardware, and as much as I might complain about it, things
that don't work properly can keep me entertained for days at a time. :) And
after you spend that money, look forward to spending a long time learning
how to USE it. And don't for get that the high powered specialty software
(the stuff that you CAN'T get for the GS) is going to cost you hundreds of
dollars per program.

Now, I'm not trying, necessarily (g) to DISCOURAGE you from buying a
PC clone, if that is what you want to do, but don't try to tell me that it is
a WISE choice because it is more economical for your assembly. That is
simply foolish. AND, chances are really quite good that the GS will still
be running smoothly when that PC clone is an outmoded clunker. Remember
that the GS has been dead for YEARS. I have a friend who dumped his GS
three years ago, bought himself a state of the art 286 clone. He has dumped
that for a 386, and now he is moaning because he is going to have to
replace THAT with a 486 because the 386 won't run the newest stuff
effectively, just not QUITE enough memory capacity or something like that.

Since he got rid of his "dead end" GS, (because there was no support,
no new products for it, and because Apple was going to discontinue the
machine and stop supporting it before the end of the quarter), we have seen
the release of the RamFast, the Quickie, System 5.0.4, HyperCard IIgs,
InWords, Pointless, System 6.... the list goes on (and someone is going to
be upset with me for leaving out something important :).

Let's go back to the first statement "the platform I truly love- the
Apple ][]." Why should you punish yourself with a DOS machine? Why should
you deal with the learning curve for a DOS machine, and all the quirky
differences between every application? I suggest that the GS, which does
everything that your Laser does, and does it the same way, lets you be up
and running from the day you get it, and lets you learn all this NEW stuff
that the GS can do at your own pace. (Not that there is too much to learn,
this system is DESIGNED to be user friendly, after all. :) It seems to me
that this benefits your assembly, since they lose a lot less of YOUR
productive time.

>>"Is $950 "reasonable" when before long ....."

SURE it is. Depending on what you get with it, it is almost certainly
"reasonable" for the work you need to do. And the GS will keep ON doing
that work for years to come. The GS (as I have said MANY times) will NEVER
Apple II Computer Info

be less competent than it is today. This lust to be on the leading edge of computing is silliness. What counts is that your computer can do what you NEED to do, do it quickly, do it well, do it without a lot of hassle, and do it at a price that you can afford. For somewhere between $900 and $1200, you should be able to get a GS with a decent sized hard drive (minimum 40 megs) a decent amount of memory (expandable to 4 megs, minimum), an accelerator, and 3.5 a dn 5.25 drives. At the higher end, you should be getting a hard drive of at least 80 megs and a DMA SCSI card, AND a printer. If it were me, I would go for a lower price, and add a DeskJet 500 printer and a hand scanner and Inwords (for what you are likely to want to do). There are LOTS of toys out there for the GS at very good prices, and software to do virtually anything you need to do. (realistically) And for the budget conscious, almost everything is available used and in real good condition. GO for it. :)  

Gary R. Utter

World's Fastest Chip
*******************************

From: I. B. Lyon <iefbr14@ibm.com>
Subject: IBM Zurich announces new chip

----- PRESS RELEASE -----------------------------------------------

The Zurich laboratory unveiled the world's fastest chip this week. The chip, code named "Timeless", is based on high temperature superconductors and is capable of transferring data signals faster than the speed of light. This makes it possible for a computer based on this chip to produce answers before questions are asked.

Using this technology, the Hursley laboratory has been able to produce a program product before the user requirements were known. Industry analysts found the Hursley announcement humorous, citing that IBM has been writing program products without user requirements for years. Products created using the Hursley method are still expected to miss their ship dates due to the excessive length of the Fall and Spring planning cycles.
The Communication Products Systems Test organization is using the same technology to test program products in zero days. Said a spokesperson in Raleigh, "It's amazing. Just preparing to test the software thoroughly causes it to be tested. It's like the system can read your mind." Oddly enough, planning experts in System Test are reporting that regardless of the productivity gains realized by the Timeless chip, the average test duration is expected to be nine months.

There have been rumors of some odd side-effects of the Timeless chip. Some customers have been receiving products before they order them. Most customers we interviewed did admit that they were planning to order the new software when it arrived. They said that they liked the speed with which the products arrived, but they disliked IBM's new policy of billing them before they ordered anything. Said an IBM billing expert, "We knew they were going to think about ordering some software, so we thought we would think about billing them."

IBM Service has made some exciting advances in hardware and software maintenance based on these side-effects. IBM Service worldwide has begun a free preventative maintenance program in which the IBM Customer Engineers think about fixing all the problems of every customer. Said an IBM Service representative, "The program is working very well. Service calls are down 99%. The only calls we are getting now are to fix hardware and software that hasn't been invented yet."

If you are thinking of ordering computer systems which uses the Timeless chip, they can be ordered from IBM.

Of course, if you have been thinking about ordering one, it is probably on its way to you right now.

---

"Obstreperous comportment? The very thought terrifies."

Take Another Look!

By Jim Couch

>>> A2PRO, IT'S NOT JUST FOR PROGRAMMERS ANYMORE <<<
Apple II Computer Info

not just for programmers!

To help keep you in touch with what is happening in A2Pro I have been engaged to write a monthly column about the RoundTable. For this month I will content myself with a brief introduction.

I have been playing with the Apple II since somewhere around 1984. Although I had used both mainframes and personal computers at various jobs prior to that point the Apple II was the first computer I purchased for myself. I purchased a IIc after looking at a number of other computers, including the (then) new IBM PC JR, Osborne, and Compaq machines. What attracted me initially to the II was its history. There was something very engaging about a machine that was initially designed in a garage! I used the IIc for a number of tasks including financial record keeping, and word processing. I found the machine to be a great help at work as well, and often took the IIc into work with me.

At the time I was running a _very_ small business with my brother selling climbing and outdoor gear. As he lived on the east coast, it made sense to purchase a pair of modems and transfer files back and forth. From this modest beginning in telecommunications my interest grew. In the winter of 86 I began running a BBS part time off of our business line during the evenings. This, like so many other things got way out of hand and eventually came to occupy its own phone line and run full time! The BBS eventually became what is now the support board for my local user's group and moved to a IIe so I could again have my IIc back full time!

About the same time as my plunge into the world of a BBS Sysop I also ran into a little publication called Open-Apple. I subscribed and bought all the back issues as well, this magazine helped me better understand my machine and may me feel like I really understood what I was doing. My first issue was October 1986. In this issue the IIgs was introduced! When my IIc died I replaced it with a IIgs which is my current computer.

After reading about GENie in Open-Apple (now A2-Central) for quite a while I finally joined to see what it was all about. I primarily lurked in the A2 area in the beginning and also checked out a few other RoundTables. The introduction of GENie's Basic Services saved me a bit of money, so I began to lurk in A2Pro as well, finding much to my surprise that there was a lot of useful information, even though I was (and am) not much of a programmer!

On the subject of programming, you will notice that there is not a lot of experience mentioned, that is because there isn't much to mention! After I got comfortable with the machine, I did decide I would like to learn to program, but found that I just never had the time. My programing experience consists of only modifications to my BBS and some Ultramacros task files. In all honesty I cannot claim to be a programmer. I think my lack of background as a programmer will help me to cover A2Pro in a unique manner. This may also make other non-programmers feel more comfortable with the RoundTable. There is much within A2Pro that is useful to ALL of us, come join in!

The following items appeared during the last few weeks in the A2Pro bulletin board area. If you find something of interest, you might want to look in on a regular basis.

[*][*][*]
TOOD WITESEL STEPS UP TO BAT

Hello! I'm Todd Whitesel, the new A2PRO library slave. I'm supposed to write a bio for everyone to snigger at, so here 'tis.

It was at Caltech that I discovered VMS, Macs, unix, the Internet, and the IIgs -- in about that order. It was the summer after my first year there that I got my own IIgs. By my third year at Caltech, I had had enough true Computer Science pumped into me that I was able to start writing serious programs. We had just had an AppleTalk network recently installed, so I started by writing small Inits and utilities (some of which are in the libraries now).

Now that I've graduated and escaped from Caltech, I work for a company owned and operated by Caltech alumni called Green Hills Software. The meat of our product line is compilers, and my main job for the foreseeable future is to take over maintenance of the 680x0 code generator. I used to avoid the 68000 like the plague, but I would rather work on it than on something for a modern RISC machine. Like the 65816, the 68000 presents all sorts of great opportunities for optimization that separates the truly sneaky programmers from the rest.

And now, I think I'd better get on with the library slave part of this...

A2PRO REAL-TIME CONFERENCE MOVES TO SUNDAYS

The recent (and ongoing) A2Pro survey showed us that lots of you wanted to see the conference earlier, and on Sunday. In fact, Sunday was by far the most popular choice of any day presented. So, after considering this and asking a few people in person, we're going for it.

Effective October 18th, the A2Pro Real-Time Conference will be each weekend on Sunday night at 8:30 PM ET (5:30 PM PT). The weekly A2Pro conferences at 9:30 PM ET on Monday and Thursday will be discontinued after Thursday, October 15th.

If you want to chat on Monday or Thursday, though, don't worry, because A2U still has conferences on both those days -- Will Nelken's great Macro conference on Monday nights and Andy McFadden's A2U Data Compression course, both at 10:00 PM ET, on Monday and Thursday respectively.

To help celebrate the move, we'll be giving away a free non-prime hour of GENie time to three lucky people at the first conference on Sunday, October 18th. So be sure to be there and help us inaugurate a new A2Pro tradition!

DON'T, UNDER NO CIRCUMSTANCES, NOT EVER, ETC

Like Matt said, NEVER use Control-Reset to simply reboot or exit a program on the GS. Especially GS/OS programs. It can be incredibly dangerous and there is the possibility that you'll lose data or corrupt files. (Some programs actually keep files open on the disk when the user is using them in order to support networking and whatnot. Control-Reset could cause these files to become at worst, corrupted, and at best they could no longer be up-to-date.)

WANTED: OLD TIME PROGRAMMERS

Now that Lost Classics is off and running,
with more classic software on the way, I figured it was a good time to come on over here and get the programmers to help us out. We brought you Apple Writer. We brought you GraFORTH. We found the WPL Expansion Kit. We have some rocking games in the pipeline on their way to you.

In order to truly succeed, we will need to locate quite a few more Old-Timers. For that I am asking your help. If you know of anyone who has written a commercial program for the Apple II, and that program is no longer being distributed, then I want to talk to them. If you wrote something, then I want to talk to you. To make Lost Classics really succeed, I will need the direct and indirect help of the larger Apple II family. How about it? :) –Tim Tobin Lost Classics Coordinator

P.S. See also A2 Category 7.

QUALITY COMPUTERS LOOKING FOR R&D PEOPLE! This is NOT a mere programming job. Think of it as a career opportunity. At Quality Computers we have a rather flexible corporate organization. For example, take my job (please). While I originally started out answering the phones in tech and migrated into taking sales calls, I now am QC’s only full-time R&D person. I write books and manuals, I do some programming, I work with outside contractors to get products finished, I work on videos.

We’re looking to expand our R&D “department” by hiring one new person immediately and another a couple months down the road.

We’re looking for someone with a good Apple II background, solid programming skills, and decent writing ability. Experience with other platforms, especially multimedia/HyperCard on the Mac, is a definite plus. If you have other talents (computer art, music, whatever) that might fit into a "creative" program like this, that may be another plus. You have to be able to work well as part of a team.

When I moved into my position full-time a few months ago, we weren’t sure whether or not we’d be able to find enough projects for me to work on. But it’s turned out to be quite the opposite -- I’m swamped and I need some help! I think having a full-time guy who works only on special projects that Joe Gleason, the president, dreams up has made him dream up even more projects than ever before!

Quality Computers offers some great benefit packages including health insurance, 401K retirement account, and profit-sharing. Plus the pay is good, and it’s exciting and fun to work here.

If you’re interested, please send a resume via Snail Mail to: Quality Computers, Attn: Jerry Kindall, 20200 Nine Mile Rd., PO Box 665, St. Clair Shores, MI 48080. (Please do not inquire about this job via e-mail or by phone.) No experience is necessary -- just ability.

MORGAN DAVIS ACCOUNT NAME CHANGE

Our old account name, M.DAVIS42, has been changed. The new name is MORGAN-DAVIS. Please make a note of it. This message will not repeat. :-)

/\/\ /_/\ Morgan Davis
(MORGAN-DAVIS, CAT32, TOP1, MSG:6/M530;1)
NOT TO LATE TO JOIN THE ULTRA 4.0 COURSE

Well, folks, here's the good news... The first four segments have been RE-uploaded as:

2939 A2U.ULTRA00.BXY -- Introduction
2940 A2U.ULTRA01.BXY -- Lesson 1 (fixed)
2941 A2U.ULTRA02.BXY -- Lesson 2
2942 A2U.ULTRA03.BXY -- Lesson 3 (fixed)

_and_ Lesson 4 is also to be released today as:

2943 A2U.ULTRA04.BXY -- Lesson 4

The fourth lesson deals with the new repeat command, the <onerr> tokens, and looping procedures, including the new for-next loops. FYI, I have also included an appendix that lists the byte size of each and every Ultra 4 command and function. I know you'll be referring to it often. :-) 

Have at 'em. And let's hear (SEE) what you're doing with it all.
(W.NELKEN1, CAT22, TOP22, MSG:91/M530;1)

Search-ME!

By Scott Garrigus
[S.GARRIGUS]

SEARCH-ME! Hi there everyone! Are you ready to have some fun?

Search-Me is taking on a new twist this month. Instead of coming up with a word list about any old thing, we're going to use GENie as our well-spring from now on. Every month I'll visit a different area on GENie. I'll tell you a little bit about it, what you can find there and then have fresh list of words for you to search for from that area. Sound good? I hope so, because here we go...

This month I visited the fabulous Germany RoundTable. There are a lot of things to do here, especially if you are interested in Germany. ;-) You can learn more about German culture, German food, the German language, you name it - if it has anything to do with Germany, it's here. You can also find out about Austria and Switzerland while your at it. So come on over and visit our German friends! To get there just type GERMANY at the system prompt. But before you do, be sure to have some fun and try to complete this month's puzzle about GERMANY! Keep on smilin'!

>>> GERMANY RoundTable PUZZLE <<<

>>> WHO'S WHO? <<<

~ A Profile of Morgan Davis ~
~ Creator of the ProLine Bulletin Board System ~
Morgan, how did you first become interested in programming the Apple II? Can you remember the specific time and place?

I was a junior in high school (1981), when I had a short one-week introductory class on computers. Fortunately, the computer was an Apple II. That started my (so far) life long interest in them.

Over the years you've created some superlative telecommunications products (including ModemWorks and ProLine). Can you tell us a little how you first became interested in telecommunications? When was the first time you saw the word CONNECT?

Actually, my communications history goes back much farther than what you suggest. While in sixth grade, after tiring of only being able to listen to a short-wave scanner, I wanted to get my amateur radio operators license, but succumbed a few years later to the easy access of CB radio. My interest in communications started out in radio.

It was in 1983 when I got my own Apple IIe and had a job writing books on BASIC programming for CompuSoft Publishing, Inc. They had an acoustic coupler modem that I was able to take home during the weekends and connect to the IIe. I would cruise the local bulletin boards for 48 hours and then take the unit back to work on Monday.

Finally, I couldn't take it anymore and decided I needed a modem I could use all the time. So, I bought the best modem you could get for the Apple II series at the time, a Novation Apple-Cat II with a blazing 300bps throughput and a $400 price tag. I must have been saving my paycheck money diligently, because it wasn't too long thereafter when I purchased the 1200bps upgrade option for about $250, as I recall.

The popular external modems at the time were Racal Vadics -- very expensive, very cutting-edge. The Hayes Smartmodem wasn't in full popularity until much later. I didn't have a real Hayes-style modem until around 1984, perhaps '85.

Before I had a Hayes-compatible external modem, I had already built an Apple-Cat-only version of ModemWorks. It was distributed as "shareware" (a new concept at the time) through a small company a friend and I founded called "Living Legends Software". I distributed ModemWorks, ProLine, and a few other programs through LLS between 1984 and 1988.

On February 14th, 1989, the Morgan Davis Group was created, and I've been selling my own products through it ever since. While the Apple II market has shrunk over the years, MDG has expanded its product line and increased revenues each year.

In the late 1980's you worked for a year or so at Beagle Bros. Did your job involve software programming work?

Yes. This is a minor point in history.

Was it more along the lines of telephone technical support?

Heck no! :-D I was hired in February, 1989 (the same month I
started MDG) when TimeOut was really enjoying its success. Bert Kersey had sold Beagle Bros to Mark Simonsen, and Simonsen decided that he'd like Beagle to become a heavyweight contender in the Macintosh market. I was hired, along with about six others initially, to work with existing Beagle programmers (who only had Apple II experience at the time) to create a product that would dethrone Microsoft Works, Microsoft's integrated package with a long, successful history.

Our product, code named Cheetah, was to be designed and developed into intercommunicating modules that included more features than Works -- all in eight months -- a ridiculous timeframe for a group of Apple II programmers, most who didn't even own a Macintosh (like myself) and had little or no experience using one, let alone programming it. From 1984, I had spent a lot of time working with Macs, but I had only developed software for the Apple II. I bought a Macintosh IIx through Beagle and paid it off through my salary over a number of months.

My responsibility in the Cheetah project was to develop the communications module. Amazingly, I had it getting me online and transferring data in about two or three months. The hard part, however, was putting a Macintosh interface on top of it all. Familiar with the serial port on the IIGS, getting the Mac to speak to a modem wasn't hard. But having to learn the other 99% of the Macintosh's toolbox, operating system, and development environments took a long time. The other programmers had similar hurdles to overcome, and many dropped out of the project early on (Rob Renstrom and Alan Bird, who went on to start WestCode). The team went from 12 down to about 4 programmers, still holding the same initial feature list and the same eight-month deadline. Not surprising, we didn't make it.

Can you tell us a little about the work environment at Beagle Bros (formal/informal)?

Beagle was a fun place to work at during the days when it was under the fatherhood of Bert Kersey. On many occasions, I would stop by at the Beagle offices to visit or drop off a Living Legends product they might have ordered. It always struck me as the greatest Apple II company to work for, second only to Apple, of course. I'd love to continue a happy story, but I'm afraid there isn't one.

Things were quite different after the TimeOut success. Beagle moved to an expensive technical park in Sorrento Valley (the Silicon Valley of San Diego). The atmosphere was casual, but not informal. When I came aboard, I think they had about 25 employees. There was "management structure", company policy manuals, legal agreements to sign, and a marketing V.P., the only person really overseeing R&D (that was us). Not at all like the small, attractive company I used to dream of working for.

The Cheetah project lacked serious direction and management. I became aware of this after long time Beagle programmers, like Randy Brandt, decided not to be involved with the project. A friend of mine who later went on to work for Aldus (Silicon Beach at the time), left because of the pressure and idiocy that went on up in the higher ranks. They had an insight that I didn't. After about a year, Cheetah's team consisted of Joe Holt (the only accomplished Mac programmer there), Tom Birchall (experienced at HyperCard, but not application development), and myself.

In the months ahead, Beagle's employee count atrophied to about 12 following layoff after layoff. There were a few who got out before their
number came up. I stuck with the initial Cheetah plan until April 13 (a Friday, no less), 1990, when Mark Simonsen called me into his office at the end of the day and expressed the company's difficult financial situation, of which I was all too aware. That was my last day. I went home that evening in a daze, disappointed that what could have been never happened after a year and a half. When my good friend Joe Holt heard what happened, he left Beagle to work for Adobe Systems. I went on to pursue MDG full time, and have been doing just that ever since.

It's a real shame. There was amazing talent at Beagle Bros in every department except the ones that count. We had excellent writers, artists, an established sales force, awesome Apple II programmers, a few promising Mac programmers, and everyone (below a certain level) got along expertly. It just seemed like we were always working against management, or more accurately, operating under the lack of real management.

To bring a long story to a quick ending, things got worse in the two years that followed my departure. For months, Beagle operated on a shoestring with just five or six employees. They sold their Apple II products to Quality. And then last Friday, they shut down for good. I'm certain the worsening economy only helped to speed up Beagle's demise.

GEneiLamp Is Sophie a real dog?

************

Davis She was (past tense). Sophie left us for Beagle Heaven a few years ago.

GEneiLamp Your ProLine bulletin board system has earned an enthusiastic following with Apple II users and user groups around the country. In what year was ProLine first released? Can you describe some of the new features of the latest ProLine version, ProLine 2.0?

Davis ProLine was first conceived and named in early 1984. It wasn't released until 1985 as a commercial product through LLS. ProLine 2.0 was a major upgrade, entailing a nearly total rewrite of the core system. At the lowest level, I had developed the Object Module Manager to make ModemWorks 3.0 a reality. This allowed me to create interchangeable modules for taking care of specific functions, like terminal emulation, transfer protocols, serial I/O, and so on. ProLine 2.0, mostly written in Applesoft using MD-BASIC, was able to take advantage of the new features in ModemWorks by just "recompiling" all the existing code with some new libraries. So, 2.0 offers additional terminal support (VT-100, 102, 220, and ANSI), a full complement of protocols (X/Y/ZMODEM), all new online documentation, and a new 350 page owners manual.

GEneiLamp You run the Morgan Davis Group publishing company with your wife Dawn. Does running the company take up all your time? Or are you able to work a separate job as well?

Other than moral support, Dawn doesn't get too involved in MDG these days. She's started her own licensed family day care facility (in our home—where I no longer keep my office for obvious reasons!). With seven kids to take care of, she's pretty busy these days, and loving it.

Running MDG does, indeed, take up ALL of my time. There are always hundreds of things to do, and it seems like I can't keep up. Since I write
and develop our products, handle phone support throughout the day, keep up with online tech support, write and typeset the manuals, handle sales and marketing, fill orders and shipping. I am PLENTY busy. We're at that uncomfortable stage of being too small to hire additional help, but too big for one person to handle. Somehow, I manage, but I feel the company's growth is being retarded due to lack of manpower. How I long for a 36 hour day, and the endurance to survive one.

**GENielamp**: After ProLine, your next most popular software product is probably MD-BASIC, a structured BASIC preprocessor. The essence of MD-BASIC is that it allows programmers to side-step the sticky "spaghetti-code" problems inherent in Applesoft BASIC's open-ended structure. It's even possible to write MD-BASIC programs from within a word processor. Can you tell us a little about your motivation for creating MD-BASIC?

**Davis**: Actually, our most popular product is ModemWorks, then ProLine, and then MD-BASIC. I think MD-BASIC has the potential of being an extremely successful product, but because of minimal advertising and practically no magazine coverage, not many people know about it.

When you market the premier Apple II bulletin board system that encompasses over 100 BASIC programs, you have a lot of motivation for improving your Applesoft development scheme! I love the C programming language, so I took the best features in a C compiler and rolled them into something that allows you to write BASIC programs in a word processing environment (that in itself is a far cry from what you have in Applesoft's "immediate" programming mode). MD-BASIC's source files look a lot like BASIC, C, and Pascal, and when they get run through the MD-BASIC compiler, extremely compact and efficient Applesoft programs come out.

So you can now write highly structured and well-commented BASIC programs using a word processor *and* get better results in the end. MD-BASIC optimizes your code and strips out the dead weight that bloats most programs written the old, painful way. Its the proverbial "win win" situation.

**GENieLamp**: Are there any shareware or commercial software products on the market that were developed using MD-BASIC?

**Davis**: I know from product registration cards we receive that a lot of companies use it. In fact, almost anyone who is doing serious development work that involves either a little or a lot of Applesoft is probably using MD-BASIC. Most can't stop saying good things about it. I love reading unsolicited endorsements like that here on GEnie.

We, of course, use it for all of our products. We don't have a single Applesoft-only product, but almost every disk we put out includes some short "Startup" program on it which we write using MD-BASIC. It's easy to crank out new, impressive programs with it in short order, because you can easily make use of work you've developed in the past by maintaining your own set of library routines, just like with real high-level languages.

**GENieLamp**: If it doesn't violate any confidentiality agreements, can you tell us if MD-BASIC is being used by any commercial software publishers?
Davis  Of those most GENie members would recognize, Tom Hoover uses it for
    developing his GENie Master program. Soft Disk programmers use it.
There are many others. I'd have to open our customer database to find
    more.

GENieLamp  Just a few months ago you released yet another BASIC
    programmer's tool, the Real-time Applesoft Debugging
    Environment (RADE). Is this tool intended to be used in
    conjunction with MD-BASIC? What are the most common
    programming bugs that RADE helps overcome?

Davis  Since RADE is invaluable for debugging any Applesoft programs, its
    not just for MD-BASIC programmers. It can be used to debug ANY
Applesoft programs. It is even a great educational tool, allowing you to
    snoop through programs other people have written. Because of its "stop
    action" ability to freeze a running program and let you analyze each
statement as it executes, it is indispensable for discovering and
    understanding the tricks accomplished programmers use in their programs.

    It's also indispensable in uncovering those elusive bugs that can't be
    hunted down easily. For example, while a program runs, you can monitor the
    flow of execution to see just which statements are being executed. At the
same time, you can watch a set of variables to see how they change in
the real-time. You can modify the values of variables while a program runs to
    see how that might affect your program. You can look at the program
listing. And you can do all this without having to stop your program or
    mess up the screen display. Plus, RADE's history feature keeps track of
your debugging operations so you can easily scroll back through them
    and find out what might have happened way back when the program first
started running.

    RADE is an awesome product that makes the BASIC development cycle a
    snap. It's unobtrusive (takes up just 768 bytes of main memory), it lets
you switch between your program's display and RADE's debugging screen to
    avoid disturbing your program's output. It's great for anyone who programs
in Applesoft.

GENieLamp  Outside of programming the Apple II, what are some of your
    hobbies and interests? What do you like to do for fun?

Davis  With a family of four and a business like MDG, I don't have much
    time for myself. However, if, by some fluke of good luck, I do get
    some free time, I'll spend it reading or listening to music -- something
    truly relaxing. I'm a pretty good racquetball player, so I keep in shape
that way. I spend most of my time on the weekends with my kids. So we do
    a lot of outings to places like San Diego's Zoo and Wild Animal Park, the
Natural History museum, Aerospace Museum, Fleet Space theater and Science
    Center, parks, swimming, etc. Lots of stuff kids and grownups both enjoy.

GENieLamp  What is the accomplishment of which you're the most proud?
    What have been the most intriguing experiences for you?

    At first, I was going to say that I'm not really proud of any
    particular thing. But, I guess I'm proud of all my work, because I'm just
amazed that my stuff works when I complete a project (or think I have
    completed one -- I don't think I have yet!). Writing a program and then
documenting it (complete with typesetting) is a long and arduous process.
It can take up to six months for one small project. When you alone work on
one project solid everyday for six months, the tendency to burn out is prevalent. I'm really happy when we finally get to the shipping stage.

The most intriguing single thing so far was writing a PostScript generator for ProLine's online help system. ProLine has always had command-formatted built in help files which were processed for display on a computer screen or dot matrix printer. But with ProLine 2.0, I wanted to be able to ship a manual that included the online documentation in nice laser printer output. Needless to say, I learned a lot about PostScript, which I had always feared as being out of my league. It's pretty cool that a BASIC program in ProLine can crank out 300 professionally typeset pages from PostScript code in a manner of minutes. I'm sure there will be something even more intriguing happening tomorrow.

GEnieLamp As someone who has spent a great deal of time creating and supporting telecommunications software products, can you comment a little about the likely future directions of telecommunications? A recent magazine article said that the U.S. Postal Service forecasts hard copy mail growing to 250 billion pieces annually before the turn of the century. Rather than spending huge amounts of money on expanding the current postal sorting and delivery system, wouldn't it make more sense for the U.S. Postal service to subsidize terminals for every home and business? (Along the lines of the French Minitel system.)

Davis I think we're coming to this. Just look at the proliferation of FAX machines. To a lesser extent, look at the people who pay their bills electronically with CheckFree. Granted, CheckFree still utilizes the postal service, but with direct bank deposits, you'd totally eliminate the paper. It's the closest thing to owning a Star Trek-like transporter we have now.

In the communications world of the future, your home address is only valid for people who need directions to get there and the occasional parcel package that a computerized shipper, such as UPS and Federal Express will use. Otherwise, our address will be in the form of computer accounts or personal access ID numbers that are used to reach us on our portables (or pen-based systems) wherever we go. The post office won't provide this technology. The phone and cable TV companies are more likely to develop this simply because of their existing roots in communications technology (fiber optic, cellular, satellite, etc.).

GEnieLamp How can Apple II software developers find out more about your products?

Simply write or call us at:

Morgan Davis Group
10079 Nuerto Lane
Rancho San Diego
CA 91977-7132 USA

+1 619 670 0563
+1 619 670 9643 (FAX)
+1 619 670 5379 (BBS)

We're putting together a newsletter, Groupnews, which we'll be
sending to all of our customers next month. Groupnews talks about our latest product line and upgrades. We'll be happy to send a copy to anyone who is not currently in our customer database by supplying us with a 29 cent postage stamp and their address.

Incidentally, our GENie address has changed from the difficult to remember "M.DAVIS42" to the much simpler "MORGAN-DAVIS".

THE MIGHTY QUINN

Milliseconds With Mark

By Mark Quinn

>>> A WHOLE BUNCHA MILLISECONDS WITH MARK <<<

~ Home Conversion ~

As Bill Dunne slowly motored into the driveway of his home, its ground floor lit up with an inviting glow. He whistled an old, bawdy tune, and was pleasantly surprised to find his favorite magazine in his mailbox.

Bill opened his front door. A synthesized voice rang throughout the house. "Intruder Alert", it chimed repeatedly. He punched a keypad with dizzying speed and the litany ended. Bill went through the living room into the kitchen, unclipped his cellular phone from his belt, then listened to his voice mail messages.

"It's time for the six o'clock news", the same voice said above the background warble of a pan flute concerto.

"Okay, Zamfir," Bill quipped. He grabbed a bottle of mineral water out of his refrigerator and descended to the family room. Dunne had just eased himself into his easy chair when the music dampened. "And now, the six o'clock news," the voice announced.

"Here's to you, Zamfie old boy," Bill said before he gulped down the liquid. The lights in the room dimmed, and a white screen and a projection unit began to extrude from the ceiling. His Ovation II front projector filled the large screen with a bright, crisp scene from an outdoor ceremony that had obviously been taped hours before. An hour passed. The news ended. Bill raised the bottle in his left hand in a salute and pinged it musically with his right forefinger. He stifled a belch, and his nasal passages tickled with the backwash. Sniffing, he unsteadily got to his feet.

"There is someone in the driveway," the voice announced.
Bill grabbed his unified remote control and fingered one of its buttons. A picture-in-picture display on his screen showed the driveway. He maximized the image to cover the whole screen, and laughed when he recognized his friend. John Lawson had heard about Bill's all-automated "home conversion" at the office and wanted to see it for himself. Bill watched Lawson and his wife emerge rosy-cheeked from their car and walk sprightly toward his front door. He switched off the projector with his remote and scurried to greet them.

He swung the front door open, and bright smiles appeared on the Lawsons' faces, almost as if the two events were automatically associated with each other. "What's that delicious smell?" Lawson's wife asked.

"Oh! That's the homemade bread my automatic bread machine is making, June. In fact, it should done. Do you guys want a slice, or even one for each of you? I usually program it to make a couple of loaves a week."

"No thanks. We just ate."

"Let me take your coats, and I'll be back after I put the loaf away," he said.

After he returned, Bill strode proudly through his house, showing them feature after feature. "If the house is broken into, the system will call the police and page me."

"I don't think I'd like that last option," John laughed.

"The system _can_ be set just to notify the police, you know. Though I can't think of much that would take precedence over an intruder."

"How about several intruders with guns?" June joked. The three of them laughed and climbed the stairs to the second floor. The upstairs hall light automatically guided their way to Bill's den.

"This is "da brains of da outfit", Bill joked, directing them toward his PC. He switched between several screens. "When I'm away from the house at night, it puts the lights in a "lived-in look" mode. I could even set the darned thing to warm up the hot tub for a small gathering, or the house itself for a large one. And look at this," Bill coaxed. He hit a couple of keys on the computer, and a view of his driveway popped into the upper left-hand corner of its screen, then filled it. He pressed more keys, and the Lawsons chortled when they saw some of their favorite cable channels flip by. "I can also capture and save animated sequences from these feeds to the hard disk on this computer."

"I keep expecting Robbie The Robot to come into the room with a drink in his hand," June said.

"He won't be showing his sensors around here for quite some time to come. But in the meantime . . .""

They both left the house, thoroughly impressed.

Bill plopped down in his easy chair. "Might as well watch a tape before I go to bed," he thought. The video setup stirred to life again, and he pressed "PLAY" on the remote just to see if there was a tape in the
Apple II Computer Info

There was. It was camcorder footage of his ex-wife and Ray, her German shepherd. Bill was saddened to see it, but he let it play on. Their twelve-year-old son was obviously having fun doing tricks with the camcorder, which followed the dog as it raced towards Bill. Bill watched himself, all 350 lbs. of himself, jiggle all over the screen. The mountain of fat clapped its hands, ran back and forth and tired itself after chasing the dog just a few feet. Its breath rasped out of its mouth; its voice echoed in the back yard, where the movie had been taken.

Bill found it hard to believe that _he_ was the grossly fat man, and that he had undoubtedly put on more weight since the images were recorded.

His health-consuming fascination with sedentary pursuits had cost him his marriage, and separated him from his child. He finally had to stop the tape before he became too drawn into his problems to extricate himself from them.

Bill sat there in the chair a while, then walked out of the room, which darkened as he huffed and puffed his way up the stairs.

"Wow, gone for a 'few days' and look what happens... Let's see what I can take care of here."  

---

"THE CURSE OF THE TELEPHONE IN TIMES OF FAMILY CRISIS" 

Two months ago a close relative of mine became seriously ill. Family members on both the East coast and West coast spent hours on the phone conversing with one another. Daily briefings as to the current health situation were interspersed with lengthy discussions as to treatment options. The natural stress of worrying about this individual's health were compounded by worries about the steep health care costs. And then as if to add insult to injury, sky high phone bills were added to the picture.

The phone at the house where my ill relative was staying was ringing off the hook seven days a week. The peace and quiet this ailing person so desperately needed was shattered ten or twenty times each day.

Which all got me thinking about the curse of the telephone. To be sure, real-time voice communications has its place. But phone communications can be so annoyingly disruptive at times. And when you factor in the added curse of call-waiting, these interruptions themselves can be further disturbed by even more interruptions.
Electronic mail would have worked so well during this family crisis. Daily briefings on the current health situation could be courtesy-copied to all family members. (Thereby cutting down on much of the redundant long distance conversations.) All family members could stay in touch with the situation, offering their ideas and input when requested.

Curiously enough, each one of my relatives had a microcomputer in their homes. But none of them subscribes to a national information service.

With the stress of the family crisis, my relatives were not about to start learning how to use a modem, send e-mail, capture messages to disk, and send replies. In times of crisis, people are just not receptive to learning to use a whole new mode of long distance communications.

But had they been comfortable using this technology, there would be no doubt that they could have made good use of it. Instead of disruptive, noisy phone calls bouncing around the continent each and every day, quiet non-disruptive e-mail could carry the same information content. My relatives wouldn't have felt tied down to sitting by the phone all evening --- making sure they would be available to take the call when the phone rang.

This is not to say that electronic mail can totally supplant phone contact in times of a family crisis. But e-mail can help minimize the stress and costs of lengthy long distance phone calls. And GENie's flat-rate, unlimited e-mail service could keep everyone in the family in contact with one another with a minimum of expense and disruption.

Having found myself wishing that my extended family had been online during these trying times, I've taken it upon myself to become a more vocal advocate of online communications. Vocally advocacy need not be pushy advocacy, mind you. The most effective social advocacy has a strong grounding in tact - - - letting others draw their own conclusions in their own good time.

Speaking on the subject of electronic mail, InfoWorld columnist Cheryl Currid summed it all up well in a recent column when she said, "Lots of people fail to understand the benefits of electronic empowerment." It takes time before people realize that new information technologies can greatly facilitate and reduce the costs of long distance communication. Currid goes on to say that: "Getting benefits from information technology is as much a cultural mission as it is a technological one." Before new information technology can be beneficial, people need to be convinced about what specific benefits the technology has to offer to them. It's simple human nature to hesitate before jumping into something new.

It's interesting to consider human nature in my own family's case. Had all family members been communicating with one another via e-mail prior to the crisis, they would have had no problem using the technology to address the new situation. But with all the worry of a very ill family member, few persons would have had the mental composure to learn the procedures for using a new communications technology.

Which all goes to say there are benefits to bringing family members online. These benefits go far beyond being able to "stay in touch" or "casually socialize." When the going gets tough you can be there for one another, day and night, via online communication.
And the phone can sit quietly off in the corner --- almost inconspicuous --- for days on end. So that healing can take place.

[*][*][*]

[The author takes a strong interest in the social dimensions of communications technology. He can be reached on GEnie at: p.shapiro; on America Online at: pshapiro; and on Internet at: pshapiro@pro-novapple.cts.com]

%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
~ From Sound Barrier ~

Over the years there have been many game programs written for home computers. But often times new games are nothing but a remake of older games. Or the new games are just another shoot-em-up arcade game of some kind. Once in a rare while, however, a software developer comes up with something new, unique, and refreshing. LetterSlide, a new shareware game for the Apple IIGS, falls into this category.

LetterSlide breaks new ground in word games. You will find the game easy to play, complex to figure out, and most addictive. Kendrick Mock has indeed come up with something unique and clever. In some ways LetterSlide is like a book you can't put down. The day that I downloaded the game I was up until 3 am before I got to sleep. And yet I was still only able to reach level 9 of the game.
The object of the game is fairly simple. You move a little funny alien-baby creature around the screen and push blocks, some with letters on them, some without letters, with the goal of forming words.

The words can be arranged from left-to-right, right-to-left, vertically-up, or vertically-down. Each word can be constructed from three to nine letters. You earn points for the words you form, with each letter being worth one point. After the word is formed, the word then magically disappears from the screen, freeing up the screen for more game play.

By forming words you gain access to either bombs or jewels. You can collect the bombs for blowing up obstacles (no points) or get the jewel (10 points) to advance to the next level. There may be more than one bomb or jewel in a level. The last jewel in the level advances you to the next level. Some of the levels are fairly easy. But others are very complex and my take two or three tries to figure out. The more words you construct, the higher your score will be. LetterSlide saves your highest scores to disk. Should you wish, the game gives you the option of resetting this "hall of fame" to zero.

There are 29 default levels ready to play when you first boot LetterSlide. Should you ever exhaust these levels, LetterSlide provides you with a level editor for you to make up your own levels (up to 99 per game). Or you may choose to edit existing levels. The LEVELEDIT program is straightforward and easy to use. You move the funny alien-baby around the screen and by pressing various keys (listed on the edit screen) you can deposit letter blocks, movable blocks, unmovable blocks, bombs, and jewels anywhere on the screen.

Here are some friendly tips that may help you enjoy your LetterSlide games. One of the main things to keep in mind when playing LetterSlide is to figure out which words you need to spell to get to the next level. Once you make this determination, you can then reserve the letters required. Try not to get letter blocks stuck against a wall. When the letters get stuck against a wall you cannot later move them away from the wall. While moving letters around the screen, try to keep from spelling words by mistake because you will use letters up that you may need to go to the next level. The game comes complete with background music which can be switched off (toggled off) with CTRL-S. Other features include saving two different levels with CTRL-A and CTRL-B. You can load the saved levels with CTRL-C and CTRL-D. Another nice feature is that you can restart the level you are on with CTRL-R. CTRL-Q (the standard quit command for most Apple IIGS and Macintosh programs) takes you back to the startup menu screen.

I only have one real problem with the game and that is the choice of control keys to move the funny alien-baby around the screen. The game makes use of the keypad keys; 4 goes left, 8 moves up, 6 moves right, and 2 moves down. Often I will miss a key and the funny alien-baby will either not move at all. Or it will move in the wrong direction. I would much prefer using the four arrow keys as they are located close together and are clearly labeled with directional markers. This is a minor problem and perhaps most of you can get used to the keypad keys.

One nifty little feature of the game is the easily accessed online help screen. If you can't remember the controls for the game, simply press the space bar for a pop up control screen. Along with the control screen is a list of the last ten words you have formed.
In the LetterSlide documentation Kenrick Mock explains how he developed the idea for LetterSlide by making up word games while corresponding with his girl friend. Unfortunately the romance didn't work out. However, we should all be grateful to his ex-girl friend because we are now reaping the rewards of his word game correspondence. Kenrick Mock is a gifted software developer who deserves to be encouraged. In the past two years alone he has produced a handful of exceptionally high quality shareware games. If you like his efforts please be sure to send him the modest shareware fee.

Incidentally, Kenrick Mock and Sound Barrier have produced several other outstanding programs such as Columns GS, Simple Animation Program (SAP) and the companion game to LetterSlide, Boggled, where you compete against the computer to make up words from a matrix of letters.

In the humble opinion of this reviewer, this is one of the best games to come out for the Apple IIGS in a long time.

INTERNET ON GENie

With GENie open beta-testing an Internet gateway, I thought it was about time to get serious about learning about the Internet. Good references on the Internet are not all that hard to find; I located a number of downloadable files on GENie that told me a lot about it. However, finding good, comprehensive information in book form was beginning to look like a challenge. Then, O'Reilly and Associates came out with The Whole Internet Users Guide and Catalog, by Ed Krol. Talk about synchronicity...

Krol is also the author of The Hitchiker's Guide To The Internet, a well-known source of Internet info. He's been involved with the Internet since 1985. In The Whole Internet User's Guide, he pulls together a wealth
of info on virtually all aspects of "the world's largest computer network". The book is written for everyone from the total beginner to the experienced Internet user. A guide on page xxiii indicates which chapters will help the reader most, depending on his or her level of expertise. Being a total beginner and a Mac user, I wanted to find out just what the Internet could do for me, and how best to access it with a Mac.

I quickly learned that the Internet is a sort of 'network of networks', consisting largely of computers and computer networks on college campuses, and in businesses, libraries and government institutions. They are spread all over the USA and a great many foreign countries, forming a gigantic spider web of computer systems. Any computer with access to the system can connect to the other networks as a remote user and make use of the resources at that end.

I was pleased to learn that a Mac (or any other computer) with a basic terminal emulation program can access the Internet through one of its 'servers', and basically log on in real-time to a host computer. Many college students and employees of some businesses can get free access through their respective organizations. The rest of us have to find a site that provides dial-up access and purchase an account. There are a number of such services popping up all over the country, and the book provides listings for a number of them.

It's difficult to describe or even imagine the breadth and scope of information and services accessible through the Internet. It includes the ability to access card catalogs and online databases at universities around the world. Also on the network are private and proprietary databases, specialized research databases maintained by schools, businesses and independent researchers, including unusual and esoteric material that only may be found at one or two locations in the world. How to find and access this enormous wealth of information is the purpose behind The Whole Internet User's Guide.

The Guide contains detailed chapters that will tell you how to log on and use the various features of the Internet. Although the Internet operates mainly on unix-based machines, almost any computer can access and use it.

Since the Internet has no central office, customer service or index, one of the most useful features of The Whole Internet Guide is the Catalog of Resources. This is a topical listing of some of the more interesting and useful resources accessible through the Internet. It is by no means comprehensive, but serves as a starting place for new user.

Also included in the book are descriptions of some of the newer software resources that make finding things on the Internet much faster and easier. Programs like 'archie', 'gopher' and 'finger', will automate searching for files and for the addresses of other users. Krol supplies descriptions and instructions on how to use these programs, and throws in some illustrations to boot.

Reading research papers isn't the only thing you can do on the Internet. There is also Internet mail, which transfers e-mail all over the world. And there is 'anonymous ftp', which is like having a world-wide library of downloadable files and software, including tons of stuff that will never be seen in stores, or even on GEnie. There are also 'newsgroups', which are the Internet equivalent of GEnie's Roundtables. The
Guide provides complete descriptions of all of these, and how to use them.

There is a lot more to the Internet than I can touch on here. Someone wanting to explore should just log on and go for it. The Whole Internet User's Guide includes a chapter on Internet protocol, what's allowed and what's offensive, legal considerations and more.

I found the Guide to be both informative and readable. Given the highly technical nature of the subject, producing an interesting guide that's useful to novices is no mean feat. I'd recommend it to anyone getting started with the Internet. Those who've already gotten their feet wet should also find it a handy reference to keep by the terminal.

The Whole Internet User's Guide And Catalog is available from the publisher, O'Reilly & Associates, Inc., and bookstores including those in the GEnie Online Shopping Mall. List price is $24.95.

NOTE   GEnie's Open Beta of Internet is available at page m207. As of November 1, 1992, the pricing for Internet will be:

$2.00 registration fee – this will be a one time charge for all new users signing up for the service. However, if a user cancels and signs up another $2.00 charge will be incurred.

$.30 for each 5000 bytes or portion thereof for incoming or outgoing messages.

APPLE II HISTORY

INTRODUCTION

This part of the Apple II History gives the lowdown on the version of the Apple II where I cut my teeth -- the II Plus. The modifications made from the original II to this version I just took for granted at the time (like using IJKM to edit, instead of the older ABCD a character at a time -- ugh!). Also in this part, for nostalgia's sake, is a reproduction of an original Apple II Plus packing list. Don't read it just before bed, or you'll probably be too excited to sleep. :-)

THE APPLE II PLUS: HARDWARE

We now go cruising ahead in time about one year, to June of 1979. Applesoft BASIC had been in heavy demand since the introduction in late 1978 of an improved version. It was needed by those wanting to write and use applications that needed the capability of floating-point math. Because of this, Apple engineers had begun working in 1978 on the Apple II Plus, a modest enhancement to the Apple II. The main attraction of this newer Apple would be Applesoft in ROM, available immediately without having to load it from cassette or disk. Also, having it in ROM would move it out of the part of memory where RAM Applesoft conflicted with hi-res graphics (after all, Applesoft had commands specifically written into it for manipulating those graphics, something that Integer BASIC could only do via special CALLs to...
the routines in the Programmer's Aid 1 chip).

With the decision made to upgrade the Apple II, other changes were made to make it more attractive to new computer buyers. The cost of RAM chips had dropped considerably, so most new II Plus systems came standard with a full 48K of RAM. Since the disk operating system consumed about 10K of memory, having the full complement of available RAM made it easier to use the Disk II with either version of BASIC. Since users would not need to add the smaller 4K memory chips, the strapping blocks that had made it possible to use either 4K or 16K RAM chips on the original Apple II were removed.

Small changes had already been made to the product since it first began distribution. Most of these changes were made primarily to simplify it and decrease costs of manufacturing. First of all, the original Apple II motherboard, designated as "Revision 0", was changed to make it possible to display two more colors in hi-res graphics. The Revision 0 board had only four colors (green, violet, black, white), but Wozniak had learned that by making a simple alteration he could get two more colors (blue and orange) and two more varieties of black and white. The Revision 1 and later boards were capable of displaying all eight colors. The means of making this modification to Revision 0 Apples was described by Wozniak in his reply to an article by Allen Watson III about hi-res graphics (in the June 1979 issue of Byte magazine). With that change, people who were not afraid of doing a little electrical work on their computers had some of the benefits of an updated Apple II.

Hardware bugs that Apple engineers fixed included one that caused text characters to be displayed with green and violet fringing, whether in graphics mode or text mode. The "color killer" circuit they added fixed things so that non-graphics text would display in black and white only. Another problem involved RAM configurations of either 20K or 24K (a 16K RAM chip plus one or two 4K RAM chips). In those systems a hardware bug caused the 8K of memory from $4000 to $5FFF to be duplicated in the next 8K of memory, from $6000 to $7FFF, whether there was RAM present at those locations or not. This made a 20K Apple appear to have 24K, and a 24K Apple appear to have 36K. The Revision 1 motherboard fixed this problem as well.<1>

Revision 1 boards also modified the cassette input circuit to respond with more accuracy to a weak input signal, making it easier to load data and programs from cassette. Also, one "feature" of the original Apple II was that any sound generated by the internal speaker also appeared as a signal on the cassette output connector; this was fixed in the new motherboards. Lastly, the RESET cycle was made part of the power-up circuitry, eliminating the requirement that the RESET key be pressed after turning on the computer.<2>,<3>

THE APPLE II PLUS: FIRMWARE More important than the minor hardware changes, however, were the changes in the ROM code. The new ROM replaced the original Monitor with one that, among other things, better supported the new Disk II drive. Since RESET was now automatically activated when the power was turned on, the new ROM code had the computer automatically do a few things. It cleared the screen (displaying "APPLE []" at the top), and began a scan down the slots, starting at slot 7 down to slot 1. It examined the first few bytes of code in each card’s ROM for a specific sequence that identified it as a Disk II controller card. If one was found, control was passed to that card,
causing the disk drive to startup and begin loading the disk operating
system into memory. If no disk controller was found, the ROM code jumped
instead to the start of BASIC (instead of leaving the user in the Monitor,
as in the old ROM). This "Autostart ROM", as it was called, made it
possible to have a system that started up a program on the disk with little
action needed by the user.

The RESET code was more intelligent in the Autostart ROM than in the
Old Monitor ROM. There was now a "Cold Start" RESET (which functioned as
described above), and a "Warm Start" RESET. A Warm Start RESET could occur
without re-booting the Disk II (if it was present); in fact, it ensured
that the disk operating system remained "connected" after RESET was
pressed. This feature was implemented by setting three bytes at the end of
page $03 in memory. Two of the bytes were the address of the place in
memory to which the Apple should jump if RESET was pressed. The third byte
was a specially coded byte created from half of the address byte. When
RESET was pressed, this special "power-up" byte was checked with the
address byte. If they didn't properly match, the Monitor assumed that the
power had just been turned on, and it executed a Cold Start RESET. This
feature was extensively used by writers of copy protected software, so
users could not modify or copy the code in memory simply by pressing the
RESET key.

The other major change, mentioned earlier, was the BASIC that was
supplied in ROM. Gone was Steve Wozniak's hand-assembled Integer BASIC, in
favor of the newer Applesoft. Since these ROM versions of BASIC used the
same memory locations, they could not be used simultaneously. With the
introduction of the II Plus, Apple also released the Applesoft Firmware
card. This card, which plugged into slot 0, made it possible for previous
Apple II owners to have some of the benefits of the II Plus without having
to buy an entirely new computer. Even with that card, however, you could
not use features of one BASIC while the other was active, and switching
from one BASIC to the other erased any program that was being used at the
time. The two BASICS could be told apart by the prompt they used; Integer
BASIC used the ">" character, but Applesoft used the "]\" character.

Another change made to the Monitor ROM made screen editing easier.
The original Apple II's procedure for editing a line typed in BASIC or in
the Monitor was tedious at best. To change a line of text in BASIC, you
had to list the line, move the cursor up to the start of the line, and then
use the right-arrow key to "copy" text from the screen into the input
buffer. If you wanted to skip part of the line, you had to move the cursor
past the text that you wanted to eliminate WITHOUT using the arrow keys.
If you wanted to INSERT something into the line, you had to move the cursor
off the line (above it or below it), type the additional text, and then
move the cursor back into the line to finish copying the original part of
the line.

For example, suppose you had typed this line in Applesoft and
displayed it on the 40-column screen:

]\LIST 100

100 FOR I = 1 TO 100: PRINT "I
LIKE MY APPLE": NEXT : END

To change that line so the PRINT statement read "I REALLY LIKE MY
APPLE" meant either retyping the entire line, or using the edit feature.
(If the line was particularly long, it was preferable to edit rather than retype the entire line). To edit this line, you would have to move the cursor up to the "1" of "100" and begin pressing the right arrow key. When you got to the "L" of "LIKE" you would have to move the cursor above or below the line, type the word "REALLY" followed by a space, then move the cursor back to the "L" of "LIKE", and continue copying with the right arrow key. After editing a line, the screen might look like this:

```
100  FOR I = 1 TO 100: PRINT "I
LIKE MY APPLE": NEXT : END
REALLY
```

(In this example, I moved the cursor down one line, typed "REALLY", and then moved it back to the start of the word "LIKE"). If you didn't make any mistakes it would read like this:

```
LIST 100
100  FOR I = 1 TO 100: PRINT "I
REALLY LIKE MY APPLE" : NEXT : END
```

However, if you didn't take care to skip over the extra spaces inserted in front of the word "LIKE" by the Applesoft LIST command, it could appear this way:

```
100  FOR I = 1 TO 100: PRINT "I
REALLY LIKE MY APPLE"
: NEXT : END
```

The big problem with these cursor moves for editing under the Old Monitor was that each move required two keypresses. To move the cursor up, you had to press "ESC" and then "D" EACH TIME you wanted to move the cursor up. "ESC A" moved right, "ESC B" moved left, and "ESC C" moved the cursor down. With a long line that needed much editing, this would get old real fast. Not only was it cumbersome, but the layout of the keyboard made it difficult to remember the correct letters used for cursor movement; although "D" (up) was above "C" (down), it seemed that "D" should stand for "Down". Also confusing was that "A" was to the left of "B", but their functions were the opposite of their position!

The new Autostart ROM improved this screen editing process just a bit. Now, pressing "ESC" turned on a special editing mode. Repeated presses of "I" (up), "J" (left), "K" (right), and "M" (down) continued to move the cursor until a key other than ESC was pressed. On the keyboard these letters were arranged in a sort of "directional keypad" or diamond, which made remembering the moves a little easier. The previous ESC editing codes were still supported, but still with their previous limitations. Unfortunately, however, you still couldn't tell whether you were in the regular text entry mode or in the ESC editing mode, and often attempts at changing a line took several tries to get it right.<4>,<5>

Other features added in the new Autostart ROM included the ability to pause a listing by pressing Ctrl-S (VERY helpful when trying to scan through a long program!) As mentioned above, pressing RESET would return control through the soft-entry vectors on memory page $03. This would allow a user to exit from a runaway BASIC program by pressing RESET, and still keep program and variables intact in memory (which could not be
Apple II Computer Info

John Arkley at Apple wrote the changes to the original Monitor ROM and created the Autostart ROM in November 1978 (he's the "John A" mentioned in the source code listing found in the 1981 edition of the APPLE II REFERENCE MANUAL). After he had done the work and the ROMs had been created, Apple wanted to publish a new version of the Reference Manual to cover the Apple II Plus. The older Reference Manual (affectionately known as the "Red Book") had included an assembly language source code listing of the Monitor ROM. They wanted to include the source for BOTH versions of the Monitor, but a problem came up. While developing the Monitor, Apple had used a local mainframe computer dial-up service known as "Call Computer." They used a cross-assembler on that computer, assembled the code, and then used the resulting object code to create the ROM. (A cross-assembler is an assembler that creates object code for a processor other than the one the cross-assembler runs on. For example, if you can write 8080 machine code with an assembler running on a 6502-based computer, you are using a cross-assembler). Unfortunately, Call Computer had accidentally done a system backup with the source and destination disks reversed, erasing all the files containing the source code for the Apple II Monitors. There were no disk or cassette copies of the source code for the Autostart ROM back at Apple. Working from the source listing in the Red Book, John recreated the source file for the original Monitor, and then disassembled his own modifications for the II Plus and re-created his Autostart ROM source file. Those reconstructed listings are what appeared in the 1981 edition of the Apple II Reference Manual.<6>

Not everyone was pleased with the modifications made in the Autostart ROMs, however. Some of the authors of the magazine CALL-A.P.P.L.E. liked to refer to the new computer as the "Apple II Minus", since Arkley had to remove some of their beloved routines from the ROMs to make room for the new features. Missing from the Apple II Plus ROMs were Integer BASIC, the mini-assembler, and Woz's SWEET 16 interpreter (that entire space now being used by Applesoft). Missing from the Monitor were the assembly language STEP and TRACE features, and a set of sixteen-bit multiply and divide routines.<5>

THE APPLE II PLUS: COST The new Apple II Plus, at $1,195, sold for over $100 less than the original Apple II, although it came with more memory and had Applesoft (previously an added expense item) in ROM.

THE APPLE II PLUS: BELL & HOWELL Apple made a deal early on with Bell & Howell to let them sell the Apple II Plus with a Bell & Howell name plate on it for use in schools. These Apples were black colored (instead of the standard beige), and had screws on the back to keep the lids on (apparently to keep students' hands out). These Apples (sometimes called "Darth Vader" Apples) also had the "shift-key mod" (see below) applied. Since Bell & Howell was a major supplier of school equipment, this was a means for Apple to get a foothold in the school environment.<7>,<8>

Bell & Howell also had electronics correspondence courses, and used the black Apple II Plus for one of their courses. They offered a one year warranty, instead of the ninety-day warranty offered by Apple.<9>,<10>,<11>

THE APPLE II PLUS: EARLY USER EXPERIENCES An Apple II veteran on GENie, Dennis Ulm, kindly provided me...
with the following reproduction of his ORIGINAL Apple II Plus packing list. It gives a little picture of what early non-disk users had to work with:

APPLE II PLUS PACKING LIST

This package should contain the following items:

<table>
<thead>
<tr>
<th>item no.</th>
<th>part number</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>600-2023</td>
<td>cassette tape: LITTLE BRICKOUT, COLOR DEMOSOFT</td>
</tr>
<tr>
<td>2</td>
<td>600-2024</td>
<td>cassette tape: RENUMBER/APPEND, ALIGNMENT TEST TONE</td>
</tr>
<tr>
<td>3</td>
<td>600-2025</td>
<td>cassette tape: FINANCE I, PENNY ARCADE</td>
</tr>
<tr>
<td>4</td>
<td>600-2026</td>
<td>cassette tape: LEMONADE, HOPALONG CASSIDY</td>
</tr>
<tr>
<td>5</td>
<td>600-2027</td>
<td>cassette tape: BRIAN'S THEME, PHONE LIST</td>
</tr>
<tr>
<td>6</td>
<td>030-2057</td>
<td>manual: Introductory Programs for the Apple II Plus</td>
</tr>
<tr>
<td>7</td>
<td>030-0044</td>
<td>manual: The Applesoft Tutorial</td>
</tr>
<tr>
<td>10</td>
<td>030-0035</td>
<td>publication: Apple Magazine</td>
</tr>
<tr>
<td>11</td>
<td>600-0033</td>
<td>1 pair of game controls</td>
</tr>
<tr>
<td>12</td>
<td>590-0002</td>
<td>cable: to hook up a cassette recorder</td>
</tr>
<tr>
<td>13</td>
<td>590-0003</td>
<td>cable: power cord for the Apple II Plus</td>
</tr>
<tr>
<td>14</td>
<td>030-0001</td>

<td>600-0832</td>
<td>Apple II Plus System 32K</td>
</tr>
<tr>
<td></td>
<td>or</td>
<td></td>
</tr>
<tr>
<td></td>
<td>600-0848</td>
<td>Apple II Plus System 48K</td>
</tr>
</tbody>
</table>

(LITTLE BRICKOUT was an abbreviated Applesoft version of Woz's Integer BASIC Breakout game (the reason he designed the Apple II in the first place). BRIAN'S THEME was a hi-res graphics program that drew lines on the screen in various patterns. HOPALONG CASSIDY was a "guess who" program that also used the hi-res screen).<12>,<13>

Also included in Dennis' II Plus box was this photocopied instruction sheet:

TAPE LOADING INSTRUCTIONS

If problems are encountered in LOADing tape programs, it may be necessary to "queue" (sic) the tape before LOADing. To queue a tape, use the following procedure:

1. Rewind the tape.
2. Disconnect the cable from the tape recorder (so you can hear what's on the tape).
3. Start the tape recorder in PLAY mode.
4. When a steady tone is heard, STOP the tape recorder.
5. Connect the cable to the tape recorder and adjust the volume and tone controls on the tape recorder to the recommended levels.
6. Make sure your computer is in BASIC.
7. Type LOAD.
8. START the tape playing.
9. Press RETURN.

The program should LOAD properly. If an error message occurs, repeat the procedure, but try readjusting the tone and volume controls on the tape recorder.

Dennis says that in his experience it took at least five to ten tries to get anything to load properly from tape!

THE APPLE II PLUS: MORE HARDWARE ADD-ONS

Lower-case was still not supported on the new Apple II Plus, though it was a popular user-modification. The thriving industry for Apple II peripherals made up for this shortcoming, with various vendors supplying small plug-in circuit boards that fit under the keyboard, allowing display of lower-case on the screen (and sometimes direct entry of lower-case from the keyboard). By 1981, when the Revision 7 motherboard was released for the Apple II Plus, a different method of character generation was used, which reduced radio-frequency interference that was generated. For Revision 7 boards, lower-case characters could be displayed with the addition of only a single chip. However, unless a user changed the keyboard encoder with a third-party product, only upper-case characters could be typed.<14>

The keyboard itself underwent some changes, both by users and by Apple. The original RESET key was in the upper right-hand corner of the keyboard. The problem with that key was that it had the same feel as the keys around it, making it possible to accidentally hit RESET and lose the entire program that was being so carefully entered. One user modification was to pop off the RESET keycap and put a rubber washer under it, making it necessary to apply more pressure than usual to do a RESET. Apple fixed this twice, once by replacing the spring under the keycap with a stiffer one, and finally by making it necessary to press the CTRL key and the RESET together to make a RESET cycle happen. The keyboards that had the CTRL-RESET feature made it user selectable via a small slide switch just inside the case (some people didn't want to have to press the CTRL key to do a RESET).

Another keyboard limitation was addressed through a modification that became known as the "shift-key mod". This was such a widely used trick that Apple ended up supporting it in hardware when they designed the Apple IIe. Since the II and II Plus keyboards could not directly generate lower-case characters, early word processing programs had to find some way to make up for that deficiency. Apple's own Apple Writer program used the ESC key as a shift and shift-lock key, displaying upper-case characters in inverse video and lower-case in regular video. Other programs suggested installing the shift-key mod to allow more natural entry of upper-case, using the SHIFT key already present on the keyboard. The user had to attach a wire to the contact under the SHIFT key, and run it to the game port where the input for push-button 2 was found. (This push-button PB2, $C063 in memory, was for one of an optional second pair of game paddles that third-party hardware companies supplied for the Apple II).
program would assume that all letters being typed were in lower-case, unless the SHIFT key (attached now to paddle button PB2) was also being pressed; in that case the letter would be entered as upper-case. Since the PB2 button was not often used for a second pair of game paddles, it was unlikely that this modification would be accidentally triggered by pressing one of the game paddle buttons. This modification did NOT use buttons PB0 or PB1, which were on the first pair of game paddles. (PB0 and PB1 now correspond to the Open-Apple and Solid-Apple/Option keys on modern Apple II computers).

<12> Dennis Ulm, GENIE A2 ROUNDTABLE, Category 2, Topic 16, Apr 1991.

GEnie QWIK QUOTE // / "Wow, talk about a rumor. Take no prisoners, Steve. :^) / / No mercy. :^)"

E.KRIMEN //
19318  Name: LETTERSLIDE.BXY   LetterSlide is a companion piece to Boggled GS. Although both programs share some of the same graphics, gameplay is radically different! In LetterSlide, you must push blocks around to form words so you may collect jewels and advance to the next level. If you have played SokoBan, then there are some similarities; except instead of pushing blocks to an area, you must push blocks to create words. Challenging yet amusing! The program comes with a Level Editor, so you can create your own levels and boards if you wish.

19378  Name: SOUNDSMITH.BXY V1.01   SoundSmith returns to shareware with the new version 1.01! SoundSmith is a music creation program that can make songs for playback on your IIGS. SoundSmith uses ASIF instrument files which can be created from digitized sounds. SoundSmith 1.01 features MIDI support as well as other minor enhancements. A must download for the SoundSmith fanatic, would-be music writer, or for anyone who likes neat IIGS sound software. $20 shareware.

19388  Name: GECOPILOT.BXY   Co-Pilot 2.0.3 is a IIGS message processor for GENie that works with Talk is Cheap (v.3.20 or later) or Point-to-Point (version 4.0 or later) to automatically download messages from RoundTables and GE Mail which you can then read, reply to or save off-line. Co-Pilot then calls GENie and uploads your replies. You can download or get descriptions of files automatically. Operation is simple and fully automated. This evaluation version of Co-Pilot has some non-essential features disabled. On payment of a $25 fee (or a $10 update fee) you will be told how to activate all features.

19444  Name: MINEFIELD.BXY   This is one of the best kinds of games: simple and addicting! Minefield is a game for the Apple IIgs that plays like the game Mine Sweeper. The object of this game is to clear a grid of squares (the minefield) of mines, without hitting any of them. Every time you click on one of the squares, it will either be a mine or a number. The number will show you how many mines are surrounding that square. From this, you decide which other squares are clear or have mines. When you're sure a square has a mine in it, you can put a flag on that square. Multiple levels of difficulty and options are available.

19445  Name: MINESGS.NDA.BXY   An NDA version of this great simple and
Addicting game! Mines GS is a game for the Apple IIgs that plays like the game Mine Sweeper. The object of the NDA version of this game is a little different from the full GS/OS application. In this NDA, all you have to do is clear a path from one corner of a grid of squares (the minefield) to the other. Every time you click on one of the squares, it will either be a mine or a number. The number will show you how many mines are surrounding that square. From this, you decide which other squares are clear or have mines. When you're sure a square has a mine in it, you can put a flag on that square.

**19471 Name: W6BBS.BXY** Warp Six BBS, public domain version 1.1. Requires a IIe Enhanced or IIGS and Hayes or compatible external modem. Docs included, in AppleWorks 3.0 format.

**19472 Name: SUPERBASIC.BXY** This utility allows anyone with knowledge of BASIC programming to create stunning IIgs programs with Super-High-Resolution graphics. An 84 page manual and many examples are included. Use Shrinkit to unpack the program files to a blank disk called /SUPER. Then copy PRODOS and BASIC.SYSTEM to the disk and boot it.

**19475 Name: SHOWME.NDA.BXY V1.0B2** Beta release 2 fixes problems with large GIF's and file selection restriction problems. This NDA works under System software 5, but has System software 6 Finder enhancements. You can view all IIgs graphics, view GIF files, view MacPaint files, save graphics in Screen or APF formats, and do some simple color conversions. Beta Release. JesusAware released the same as Freeware.

**19478 Name AW.INSTRUCT.BXY** This well-written 29K text file gives complete instructions on how to get started using Applewriter. Thanks are owed to Gareth Tucker who explains everything in the simplest and clearest possible terms.

**19484 Name: DOS3.3.LNCH.BXY** All the way from new South Wales comes this incredibly useful GS/OS utility that allows you to store, and run, older DOS 3.3 software on your previously non-DOS 3.3 compatible hard drive. Written by the author of Roger Wagner's Graphic Exchange, John MacLean, this is a $10 shareware utility. It's very easy to use, it's desktop based with pull down menus, and it even has the ability to slow down your system to 1 Mhz when running DOS 3.3 software, but returns you to the Finder at the GS's faster speed. Supports DOS 3.3 BIN files and single or double sided disks.

**19511 Name: HWEN3.DHR.BXY** Graphics guru Pat Kern offers more of her handiwork in this interesting collection of double hi-res Halloween clip art. The large jack-o-lantern and trick-or-treating scene look sharp. Useful for Publish IT! school newsletters.

**19517 Name: GSHK.BSE V1.1** This is GS-ShrinkIt v1.1. This is also a ShrinkIt self-extracting archive inside a Binary II wrapper. This means that you'll have to remove the Binary II wrapper either when downloading using your communications program (ie, turn Binary II mode ON), or remove the Binary II wrapper with a separate program once you've downloaded this archive. GSHK v1.1 is faster compressing, faster decompressing, can make self-extracting archives, and has been made easier to use. A MUST-HAVE for anyone downloading files from A2 or A2Pro! Remember, you MUST download this with Binary II turned on, or use some
other utility after the download to remove the Binary II wrapper. Then just run the program to have it extract itself. Enjoy!

**19529   Name: WSCRAM.BXY** The dynamic-duo team of Preston and Sara educational program. This cute little Applesoft program does a swell job of printing word scramble puzzles for teachers. The program sports an easy to use interface for inputting your own word lists. Share this one with your local school.

**19540   Name: GENEALOGY2.BXY** This freeware Applesoft program can print predecessor and descendant charts on any ImageWriter printer. Fully listable code for snooping programmers and other nice people.

**19544   Name: SHOVEIT.BXY** A brand-new game for the GS that comes under the 'addictive' heading. The game has 50 built in mazes that you move objects through to destination boxes. Included is an editor to make your own maps for play and up-loading. Every game has a playback feature, to enable you to see a high speed movie of your moves AND see the winning moves of other players who upload their 'won' game files. This is a challenging game for both kids (easier levels) and grownups.

FREeware.

**19573   Name: SONIQTRACKER.BXY V0.60** This is the latest version and it definitely my mod player of choice right now. This version of sonicTracker adds some nice conveniences (it saves the preference box, mainly the stereo setting) and gives you an instrument list (I forget if the last version did that or not). It's still not as feature-laden as ModZap, but the sound quality is definitely better on some instruments.

[*][*][*]

WAIT, THERE'S MORE! There are several uploads that are not listed here do to limited space but are non-the-less deserve your attention: PRIME BBS and all the PRIME BBS accessories. There are so many of them I can't even list the Numbers. History of the Apple II and Astronomer GS are another two programs that must be included here. Simply search on the key words I have listed in this paragraph to get the file numbers. You can then get a description and/or continue with a download.

[*][*][*]

**Thanks to Phil Shapiro for the inclusion of the 8-bit programs to this list.**

Electronic Publishing On GEnie
Dear Reader,

I wanted to make this special mailout to everyone I could think of to keep you posted about the exciting activities the Desktop Publishing Association has planned for the final quarter of 1992. We want to finish off 1992 with a bang and get ready to make 1993 the year that electronic publishing really takes off. Here are some of the things you should be aware of and, hopefully, take an active role in making these events notable successes:

Electronic Publishing Month   The DPA is proud to proclaim November, 1992 as "Electronic Publishing Month." The announcement and the activities planned for the month have been circulated to the media and the national communications networks (CompuServe, GENie, etc.) and are intended to call attention to wealth of materials available on disk for reading by computer.

The DPA membership, which now range across the United States, Canada, and Europe, is encouraged to work actively through their local bulletin board systems (BBSs), commercial communications systems (such as CompuServe and GENie), and computer user groups, to bolster the awareness among computer users of the quality of reading material available through electronic publications. We hope to call attention to the benefits of "paperless" publishing as both an environmentally-sound alternative to print media as well as offering benefits to readers that are not possible with traditional books and magazines (hypertext linking, animation, and sound).

As noted by Paul Saffo in his October, 1992 column in PC/Computing magazine, "We are in the age of electronic incunabula, and the inventions of media entrepreneurs are certain to surprise and delight us in the decade ahead." As a DPA member publisher and author, you are on the cusp of the exciting age of electronic media and "Electronic Publishing Month." The emphasis during the month of November is intended to bring new interest and readers into the group already enjoying the innovative works already existing in computer-readable format.

Hardware platforms (like Apple's "PowerBook" and new, DOS "palmtop" computers) now make reading of electronic documents possible anywhere. And electronic magazines, novels, and instructional materials are available through many outlets at prices which are lower than bookstore prices. The 1990s is, indeed, the decade of electronic publishing.

What can you do to work toward making the month of November a major step forward for all of us? Here are some ideas from Ted Husted, author of IRIS and DART:

- Add an Epub tagline to your offline reader.
- Adopt a local BBS, ask them to open an Epub category.
- Ask your nearest FIDO net board to carry the DPA echo.
- Ask your user group to publish (or republish) their
Apple II Computer Info

- Open a "Electronic Publishing" category on your BBS or file library.
- Register an electronic publication or program.
- Submit an article to your local users group, or the computer columnist of your local newspaper. (We can get you all the background you need).

Can you think of some ideas yourself? It's time to beat the bushes, folks! It's a perfect month to re-double our efforts to put electronic publishing "on the map" of readers and consumers everywhere. The DPA revise our "DEMO-DPA.ZIP" file with its sample publications and informational material about the DPA and its members. You can download the file by modem or, if you like, send me a disk and two stamps, and I will send you a copy. You can then distribute it - by modem or by hand - to the four winds and get the word of the electronic publishing revolution everywhere in your area.

**GENie Becomes a National Home For the DPA**

As you all know, the key to a productive group is communication. Being able to poll the membership on ideas and proposals and inform the membership of new developments is key to the growth and perceived value of any organization. We have tried to establish the DPA BBS (205-854-1660) at the nerve center of our activities and it has served us well up to this point. However, with continued growth and the membership being spread to the four winds across the country and, indeed, the world, it seems time to establish a more cost-effective hub for communications and discussion. Calling the BBS with the long-distance charges involved, has been a burden for many and our organization has suffered for that. Since we are all - shall we say "low profit margin" publishers - it is a strain on all our pocketbooks to call long-distance on a regular basis.

For these reasons, I would like to propose a new communications center. You all have probably heard of GENie, the "General Electric News and Information System." GENie is a national, modem-accessible system with access numbers a mere local call to 99% of the United States and Canada. A couple years back, GENie established a flat-rate access system that allows users to access electronic mail, news, and selected "roundtables" (Forums or "special interest groups") during evening and weekend hours for only $4.95 per month. Subscribers do not pay per-minute connect charges when using these services and you can spend as much time as you like in these areas without incurring any additional charges. Since the calls to the GENie system are local calls, there are no long-distance tolls levied either.

There are two areas on GENie where we can gather. For those of you who want to keep charges down to absolute minimum $4.95 per month, we have an area setup on one of the GENie*Basic free access roundtables - "The Writers RT" (Page 440) - already has a specific conference set up for DPA activities. CATEGORY 46, TOPIC 38 is the "Electronic Publishing" category. We can leave unlimited messages there in non-prime hours (evenings and weekends) to discuss DPA business. This RT is frequented by a number of writers and is the perfect place for DPA publishers and authors to meet other writers and recruit material for their publications. Again, all your time in the Writer's RT is not billed per-minute and will be covered under the standard $4.95/month basic charge.

I further propose that we make the "GENIELAMP RoundTable" (PAGE 515)
on GEnie as the "public" headquarters for the Desktop Publishing Association. The GENIELAMP RT, run by John Peters and Jim Flanagan, actively supports electronic publishing through their monthly "GENIELAMP" newsletter and is already recognized by the GEnie user base as the location for on-disk publications. The DPA already has special areas (CATEGORY 6 is a public message area for the DPA and CATEGORY 7 is a private area for member-only conversations) set up on the GENIELAMP RT for messages related to electronic publishing. We also have our own library set up for DPA publications (which I am actively filling up with your publications off the DPA BBS). With these areas in place, we can communicate much more cost-effectively with our members. We can upload new publications to the RT without charge (downloading is billed, though, at the usual $6.00 per hour). GENIELAMP is NOT one of the unbilled Forums, but they are the one that has given us the support we need - with our own conference and file areas - to establish a true national presence and recognition. We can leave messages with a local call into this area and, even at 10 cents per minute, the access charges are cheaper than long-distance rates to the DPA BBS. We can use the electronic mail area for private messages (at no charge over the monthly $4.95 monthly fee. Many of us are already spending much more than that calling the DPA BBS long-distance.

Signing on to the DPA is free and can be done in the following way:

1. Set your communications program to half duplex (local echo).
2. Dial 1-800-638-8369 (or 1-800-387-8330 in Canada).
3. When connected, type "hhh" (do not press ENTER).
4. When you get the "U#=" prompt, enter XTX99368,GENIE and press ENTER.
5. Have a credit card or checking account number ready, and answer the questions that follow.

To repeat, there is no sign-up fee. The monthly fee is $4.95 for unlimited, non-prime-time use of all basic services (which includes electronic mail, news services, and several RoundTables, one of which is the aforementioned Writers RT). If you don't like GEnie, you can call them within the first 30 days and get your $4.95 refunded. For more information on signing on and technical support for signing on, call 1-800-638-9636 for more information. Remember uploads are free; downloading time is billed at $6/hour. Incidentally, there is a software package, that I will be happy to send anyone who sends me a disk and two 29 cents stamps, called "Aladdin," that automates message reading and sending as well as file uploading on GEnie completely so there is really nothing you will need to learn about GEnie commands or navigating. Thus, you will be up and reading DPA bulletins and downloading the same day you sign up.

It all makes such good sense to me. I would appreciate any feedback you have about this idea. I am already on GEnie (my "User Name" is "RALBRIGHT") and, along with several other DPA members (notably Don Lokke, John Gaudreault, Robert Jordan, Thomas Easton, and others), have been beating the drums of the DPA for several months. I would be happy to talk you through accessing the system and getting to the DPA materials.

I, therefore, propose we make GEnie's "GENIELAMP" our national public home and the "Writer's Roundtable" as our users home. I look forward to
seeing you on that system. For less than $5.00 a month, we can communicate
daily and really get this organization moving toward national prominence.
What do you say? See you on GENie. Of course, the DPA BBS (205-854-1660)
will continue to operate full-time in case anyone chooses to stay with the
long-distance route of access.

DPA Scores a Coup with Associated Press' Larry Blasko

Syndicated Associated Press computer columnist Larry Blasko has teamed
with the Disktop Publishing Association (DPA) in releasing a disk-based
version of Blasko's popular "ABCs of Computing - A Plain-English Guide."

Blasko, who has written his column - called "Compubug" - on computer
technology for eight years, first released his "ABCs" in 1989. The author,
currently Director of Administrative Services for the Associated Press, has
updated the book annually and it is now in its fourth edition. Written for
the first-time computer buyers and existing owners thinking about upgrading
their computer, the "ABCs" includes chapters on "What's a Home Computer,
and why should I care?," "Do I need a home computer?," "What kind of
computer do I want?," and "What computers fill those needs?." The book
includes an extensive glossary of computer terminology. "ABCs" runs 170
pages in the printed edition.

With the release of the book on-disk, the material is presented in a
new, exciting way. Utilizing "hypertext," "ABCs" becomes interactive - with
the reader directing what they read and where they go within the book.
Blasko says "Hypertext is a way of organizing information so that you can
jump from any point to any other logical point. If, for example, you are
reading a sentence that talks about RAM and you don't understand the term,
all keyboard or mouse click will flip you into the glossary for a definition
of RAM. Then you can hop back to where you were in the sentence. Hypertext
allows a reader to go anywhere they please whenever they please.
Unsettling, but nifty when you try it."

I have been chasing after Larry since he wrote one of his "Compubug"
columns about electronic publishing several months back. He not only
published our organizations address and purpose in a subsequent column but
agreed to let me give converting his "ABCs" book into hypertext. I used
Ntergaid's "HyperWriter," put together a prototype, and fired it up to
Larry. Obviously, he liked what he saw and now we have a full-fledged
version available for sale. He is announcing the books availability (along
with another shameless plug for the DPA) in a column set for the end of
September.

CompuBug's book, "ABCs of Computing, a Plain-English Guide," is
available in print from CompuBug, PO BOX 626, Summit, NJ 07901 for $10.00
($7 for active-duty US Armed Forces). The on-disk hypertext version is
available at the same prices from the DPA, 1160 Huffman Rd., Birmingham, AL
35215. Customers should specify disk size and monitor. Questions and
comments are welcome at either address. Wish us luck!

Final Thoughts  As you can see, a lot is going on with the Disktop
Publishing Association. We wanted to keep you informed of
the latest. Of course, a lot of this material here in will also appear in
the October issue of the "News From the Disktop" newsletter. I just wanted
to make sure the news of these exciting developments made it into your
hands without fail. I need your help in getting these activities rolling
Apple II Computer Info

and in making the DPA the success it deserves to be. SPREAD THE WORD! Our work is too important to be left unattended. I beg each of you to devote some time in the last 3 months of this year to making the DPA known throughout the computer world. It's time we were heard and time we found our place as a publishing industry to be dealt with. Thanks for listening.

GEnieLamp is monthly online magazine published in the GEnieLamp RoundTable on page 515. You can also find GEnieLamp in the ST (475), the Macintosh (605), the IBM (615) Apple II (645), A2Pro (530), Unix (160), Mac Pro (480), A2 Pro (530) Geoworks (1050), BBS (610) CE Software (1005) and the Mini/Mainframe (1145) RoundTables. GEnieLamp can also be found on CrossNet, (soon) Internet America Online and many public and commercial BBS systems worldwide.

We welcome and respond to all GEmail. To leave messages, suggestions or just to say hi, you can contact us in the GEnieLamp RoundTable (515) or send GE Mail to John Peters at [GENIELAMP] on page 200.

READING GEnieLamp

GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO

To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|________________________| |______| |____| |______| |
|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GEnie

GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99368,GENIE and hit RETURN. The system will then prompt you for your information.

[FRM]FROM MY DESKTOP

FROM MY DESKTOP

Notes From The Editor
By John Peters
[GENIELAMP]

TOP OF THE PAGE   Oops, I think I was a bit premature in announcing the

"""""""""""""""""""""""""""""

GEnieLampLighter Awards in the last issue. Although we
had several "professional" people respond to our questionnaire, many of
them felt they weren't qualified to judge because they didn't have enough
experience with shareware/PD programs. (!!!) So, does this mean that
we're dropping the ball and canceling the awards? Absolutely not!
Sometime in January, the GEnieLamp RoundTable and participating Computing
RoundTables will be offering a GEnieLampLighter Awards survey on their main
menu. This option will give _you_ the chance to vote for your favorite
shareware/Pd/Freeware and commercial programs. All the details are still
being ironed out so look to the January issue of GEnieLamp for complete
details.

Bad News, Good News   If you have been following the saga of our GEnieLamp

"""""""""""""""""""""""""""""

Elsewhere Magazine, you'll know that in spite of my
continuing efforts, the magazine fell far short in the quality department
when compared to our other offerings. Sad to say, the support for the
magazine never developed like I had originally hoped. If you haven't
noticed, GEnieLamp Elsewhere is no longer available on the RoundTable
menus. That's the bad news. The good news is you'll now find a brand new
magazine taking its place, GEnieLamp MacPRO.

GEnieLamp MacPRO will focus on the Macintosh Developers RoundTable
locate on page 480. Jim Flanagan is the managing editor, Erik Thauvin, is
the supervising editor and they will be supported by GEnieLamp staff
writers', Chris Innanen and Paul Collins.

GEnieLamp MacPRO is available in the MacPRO and Macintosh RoundTables
and of course along with all the other GEnieLamps in the GEnieLamp
RoundTable on page 515.

Download GEnieLamp?   I have received several GE Mail messages asking me

"""""""""""""""""""""""""""""

where can they download their issue of GEnieLamp.
The answer is, in the GEnieLamp Library! The current issue, as well as
back issues are available for downloading in compressed or ascii format.
To get there, just type M515;3 or GENIELAMP at any prompt.

Until next month...

John Peters
GEnieLamp E-Magazine
Apple, Microsoft, Intel Bringing Video to PC's

Apple Computer Inc. says it is preparing to introduce software that enables the playing of video clips on most IBM-compatible PCs. Apple says its QuickTime for Windows will give machines equipped with Microsoft Corp.'s Windows the same capabilities that Apple Macintosh systems have had for the past year.

Apple has licensed the new technology to a number of software developers -- including Adobe Systems, Lotus Development Corp., Software Publishing Co. and WordPerfect Corp. -- which will build applications for it.

Apple's announcement came at the same time Microsoft and Intel Corp. unveiled a competing product dubbed Video for Windows, based on Intel's new Indeo video digital technology.

SPA Membership Hits 1,000

The Software Publishers Association (SPA) announced this week that the association's roster has topped 1,000 members. The SPA, which acts as the industry representative to the federal government and works to stop software piracy, was begun in 1984 with only 25 member companies.

First 66 MHZ 486 Computer For Under $2,000

Lightning Computer has announced shipment of a computer billed as the first 66 MHZ 486 PC to be priced at under $2,000.

Available by mail order for $1,995, the new Lightning Omnicache 486DX comes standard with a 170 MB hard drive, 4 MB of RAM (expandable to 32 MB), 64K of cache (expandable to 256K), an SVGA monitor, a Windows accelerator, and a 1.2 or 1.44 MB floppy drive, among other features. For additional fees, the system can be customized with options ranging from drives and monitors to accelerators and memory boards.

Other standard features consist of an eight-slot ISA bus motherboard with AMI BIOS, a full-sized chassis with six drive bays and a 250-watt UL power supply, a heat sink for cooling, an 101-key enhanced keyboard, and a combination card with IDE, FDD, two serial ports, one parallel port, and one game port.

Apple to Sell More PCs than IBM this Year

According to industry analyst Kimball Brown, Apple Computer is gaining on IBM and will probably sell more personal computers than the IBM, the industry's largest company, this year. Brown said that Apple shipped more pc's in the second quarter of this year than IBM did and widened the gap in the third quarter.
Brown says that the reason for Apple's gain is twofold. One because Apple finally announced products based on Motorola's top-of-the-line 68040 processor. Second because IBM was late launching its new low-end product line.

Brown's projections refer only to personal computers. IBM's unit shipments of all computers, including mainframes, minicomputers, and workstations, still exceed Apple's.

IBM, NBC Test 'News On Demand' IBM and NBC are developing a personal computer-based system that will allow viewers to retrieve videotaped news reports on demand.

Home personal computer users would not be able to hook up to the system. But businesses and other large subscribers would be able to call up video news, updated stock market summaries and internally produced training films or corporate announcements.

The news reports will be supplied by NBC News and CNBC, the company's business-news cable TV channel, and will be updated hourly.

Verbatim Introduces 5.25" Rewritable Optical Disks Verbatim Corp. has introduced new 5.25-inch double-sided rewritable optical disks that store 1.1 to 1.3 gigabytes of data.

A statement from the company quotes John Stevens, manager of its optical storage products marketing, as saying the disks, which meet proposed ECMA/ISO standards, now are being evaluated by a number of leading drive manufacturers.

He said the disks are compatible with existing optical disk drives, adding, "Perhaps even more important is the increased data transfer rate of 750 to 1,600K/sec. This allows even faster retrieval of files, which becomes more important as the amount of archived data increases."

IBM Hits 100mhz! Code naming it "Blue Lightning," IBM Corp. announced this week that it has hit the 100mhz speed barrier. IBM demonstrated the clock-tripling processor monday, calling it the world's fastest 486 microprocessor.

Blue Lightning works through clock-tripling, a process that allows the chip to operate internally at three times its rate clock speed.

The chip was developed by IBM under a long-standing agreement with Intel Corp.

Intel Offers New '486 Chip A new '486 chip for portable computers that is said to offer twice the performance at half the power usage of an earlier model has been introduced by Intel Corp.

Intel's '486 SL microprocessor operates on 3.3 volts of electricity, down from the 5 volts required by most chips. Intel says that provides more computing time on battery-powered portable computers. The '486 SL produces twice the computing speed and performance of Intel's earlier '386 SL microprocessor, another chip designed to conserve battery power.

--- Apple II ODDS & ENDS ---

Late Breaking News   A new Apple IIGS users group has formed recently in
England to serve the needs of Apple IIGS users in the
entire United Kingdom. This group will be publishing a "members' disk"
every two months. The disk will include articles, AppleWorks macros and
templates, and other goodies.

This new group is looking to their fellow Apple II enthusiasts in the
New World to help them assemble some lively and informative disks. If you
know of any good articles or public domain/shareware files they should
have, kindly send the material to:

Dr. B.P. (Peter) Stark
41 High Street
Great Shelford

[EOA]

[HEY]
WOW! A lot of excitement occurred earlier this month when Quality Computers announced their new Apple II specific bi-monthly magazine, II Alive. Shortly after this announcement, a new topic was started up on the subject in the Quality Computer category in the Apple II RoundTable. For the latest news about "II Alive," stop by and read the new messages topic 10 in category 42.

Apple II Gaming Update

> If anyone has any of the Sierra games for the GS, please Email me at R.HOUSTON3 so we can compare lists and perhaps trade. I've got quite a few of them, but not all of them. Can't seem to find them for purchase anywhere. Thanks!

Try Big Red Computer Club (aka Big Red) at (402) 379-4680.

They also have Sierra's "Smart Money" for $35 (members - $45 for nonmembers).

Membership is $19.95 and includes 12 issues of Scarlett (Big Red's newsletter), which also lists a very dynamic PD library whose disks cost only $3.50 a piece. —Mike Murley

OUT OF THIS WORLD Got "Out of this World" today. :) Starts off with a very nice cinematic introduction (well, the actually the game has a lot of cinematic aspects), and then throws you into the game (course you can bypass the introduction later after you've enjoyed it a few times).

Been using the keyboard (also supports a joystick), and the playability's great. As mentioned in an earlier RTC on OOTW, the game features polygon graphics which results in very nice animation (life-like movements of your character and the others he encounters), music that sets the proper atmosphere, and great sound effects.

It also has customizable settings before you play that allows for the setting of full-screen play, 3 quarters screen, half screen, or even less.
Apple II Computer Info

depending on whether you have an accelerator card or not (I have a ZipGS 9/32k, and I've been playing it at full screen with very good results). Course if you have an unaccelerated GS, you'll probably want a smaller screen mode (although I'd recommend getting an accelerator instead :). OOTW also has keywords that allow you to restore at different levels so you don't have to start from the start (ie. preset saves).

For those of you that attended the conference on OOTW, or read the transcript, you probably know all this (this is primarily for the gaming lurkers out there ;)). So those of you out there that have been longing for new IIGS games, grab this great arcade/adventure game. It's available from the Big Red Computer Club (BRCC). -Thanks, Bill. :)

(KMCCANN, CAT6, TOP3, MSG:90/M645;1)

Thoughts on computer games, hints, and solutions... When I use a walk-thru or commercial clue book, I have another person keep it. That way, I can't just read my way through the game. My wife delights in making me "die" a dozen times before giving me the clue. Some of us just need some extra help, which is why the folks who put out the games put out clue books. Otherwise, most of us would never finish anything. That's why every slash and spell game (Wizardry, BT series, Dragon Wars, Ultima series, AD&D series, etc.) winds up with a legion of hint books, solves, commercial and PD character editors, and maps. They are just plain hard. Remember just trying to get two blocks out of the Adventurers' Guild in BT I with a wimpy level 1 party without getting creamed? Some designers have never figured out that playability (i.e. you have a chance of winning...) and enjoyment are why people play games. I have never finished the last arcade sequence in Manhunter NY, nor did I ever win the last shootout in Rocket Ranger. As far as I am concerned, those are impossible and I tossed the games. For the record, my kids, with their super fast, arcade trained reflexes were unable to beat those either...

OTOH, romping and blasting your way through a game with level 256 characters, maps, and a complete walk-thru defeats the purpose of the game. Somewhere in the middle lies fun. -Mike Murley

(M.MURLEY3, CAT6, TOP3, MSG:136/M645;1)

>>> THROUGH THE GRAPEVINE <<<

THE PLAYERS IN THE PLAY Have you ever wondered about the background and interests of the other Apple II enthusiasts on GENie? Would you like to meet others with similar interests and computer set ups? The Apple II RoundTable has a special message area, "Category 2, Topic 6," set aside expressly for people to introduce themselves to one another. Stop by and find out more about your fellow Apple II enthusiasts. To give you a sample of the message postings, here are five interesting messages that were posted in the last few months.

[*][*][*]

PLAYER 1 Hi! My name is Steve Colton and I make my home in Minneapolis, MN... I've got an Apple IIgs with a 40 megabyte Vulcan hard drive, a 4 meg ram expansion and a TransWarp GS accelerator card...
I'm just starting to work with desktop programming, the toolbox and Pascal and I'll be haunting the A2Pro RT for ideas there... I pay for my computer habit by working as an accountant and I've done a lot of work with classic Appleworks (particularly the spreadsheet) and UltraMacros. Hope to get (and give if I can) Appleworks help and ideas here... I also use ProSel and Talk Is Cheap and will be interested in conversations there...

(S.COLT0N1, CAT2, TOP6, MSG:42/M645)

PLAYER 2 Hello! My name is Andre. I'm living in the small town called """" Zug in the small country called Switzerland. I joined GEnie only a few weeks ago and I like it very much! I've got an Apple IIGS at home equipped with a 40 meg Vulcan Gold, 8 meg OctoRam and a 7 Mhz TransWarp (and of course a lot of other accessories like Audio Animator, DataLink, ComputerEyes, ...).

Recently I became a member of Bright Software. I like this group. We're independent and we enjoy the work with the IIGS. Assembly language is our second mother tongue; we are exclusively working with Merlin. At the end of 1991 I finished my first commercial program called ShadowDial, that's a software decoder for the IIGS allowing to use the Swiss (German) Videotex (Bildschirmtext) service. Videotex (Bildschirmtext) is something like the French Minitel or like the American Prodigy.

If you have any questions about us or our products send email to me or use the RoundTable Category 13, Topic 13 (Hmm...fortunately I'm not superstitious!). --Andre

(A.HORSTMANN, CAT2, TOP6, MSG:45/M645)

PLAYER 3 This is Texas Red """"Deb"""" signing on. I run an Apple ][e with an """" AE Vulcan 20, an AE DataLink Express, an AE RamFactor, an AE Transwarp, and an Epson FX185 powered by a Grappler +. I use my computer for Genealogy (Family Roots) and Money Management (MYM) and newsletters (out of the game for a while, nothing really good without a mouse), plus the modem. Plus I use Appleworks with all of them. Love my Apple ][e, and I do know the """"other"""" world as I use a Zenith Lap Top 286 with Microsoft Word 5/Graph/and Spreadsheet. I also use a """"Big"""" Zenith at my church where I spend a lot of volunteer time where we have loaded on a custom Church management program and use also Wordstar Professional. --Deb

(D.KOPL3N, CAT2, TOP6, MSG:51/M645)

PLAYER 4 Hi! My name is Steve DePaul. I'm from Gig Harbor, Washington """" and I have been lurking around here for too many months. I've learned a lot but it is time to ask some specific questions so I had better figure out how to send a message.

I run a computer lab at an elementary school in Tacoma and I have a few AppleShare headaches. If this comes through, I'm heading over to the appropriate category. How did I do? --Steve

(S.DEPaul3, CAT2, TOP6, MSG:79/M645)

PLAYER 5 Hello! I've been visiting the A2 Bulletin Board on GEnie for """" over a year. My """"participation"""" has been downloading files and reading the messages posted. I did post a question about a problem I had getting logged on to America Online --- probably not a good first post! (By the way, I did get an answer that fixed my problem). Anyway, I thought it was time to introduce myself.
I've had an Apple II since 1983; first a IIc, and now a IIgs. My kids (8 & 11) use the IIgs for entertainment and some school projects (word processing, generating graphics). I use it for a little of everything—my current project is to create some HyperStudio stacks to help me keep up with what my kids are learning in school! My day job is as a manager of an engineering group responsible for process integration/new technology development at a semiconductor manufacturer. I'm over 40 and responded to the urge to buy a sports car (mid-life crisis) with the purchase of a TransWarp accelerator card. Paint job isn't much to talk about but the mileage is great!

Like to thank everyone who has posted questions and replies. The Apple II RoundTable on GEnie is the most reliable source of information about the Apple II around. Best Regards, —Don Erickson

Keeping an eye out on all of us is Tom Weishaar, the Manager of the Apple II RoundTables here on GEnie!

(A2.DEAN, CAT1, TOP24, MSG:1/M645;1)
TIPS & TRICKS  If you'd like to add your own short "bio" to Category 2, Topic 6, you need not compose the message online. You can save connect time (and money) by composing your message in AppleWorks 3.0, printing the short file to disk as a text file (do make sure to add carriage returns at the end of each line, though). Then after entering the roundtable message area, type "Set 2" to set the category. You can then proceed to read the last message, and add your own.

Instead of typing in the message online, use the GENie "#UPLOAD" command when you see the first line number. Then do an "ASCII" upload from your Apple II communications program.

When the cursor returns to the bottom left corner of your screen, type a <Control-C>. You'll then see the bottom line number of your prepared message. The final step is to type: "#SN" to save this message without having GENie reformat it.

To help the Apple II community come to know each other better, the Apple II GENieLamp will be featuring messages from the Category 2, Topic 6 in upcoming issues of the publication.

THE ONGOING APPLE II FLEA MARKET  The Apple II RoundTable on GENie is known nationwide for the interesting and helpful messages that are posted each day. But technical support and advice are only one part of the roundtable message area. The roundtable serves as host of the Apple II Free Trade Zone, an ongoing international Apple II flea market. Before you buy that new computer or peripheral, you'd do well to check the messages in Category 4, the "A2 Free Trade Zone" to see if someone is selling what you want second-hand.

What makes the A2 Free Trade Zone so particularly useful is that the "for sale" and "wanted" classifieds are neatly organized into topics. So if you're looking to buy or sell something, you can steer right over to the appropriate topic.

A recent perusal of the A2 Free Trade Zone turned up the following two exceptional bargains. After these two messages is a listing of all the topics in the A2 Free Trade Zone.

[*)[*)[*]

LOOKING?  Apple IIc System 128k, includes Panasonic color monitor, built in 5.25" disk drive, Apple Brand IIc carrying case........$200

Half Height 5.25" drive for IIGS or IIc.............. $50
Apple 3.5" Platinum Disk Drive.....................$125
Grappler C IIc Printer Interface w/cable............$20
Jeff Strichard: (305) 587-9590; GENie address: J.Strichard1 (J.STRICHARD1, CAT4, TOP10, MSG:45)

OR....  For Sale: Zip chip accelerator for Apple II+ or Apple IIe. 8mhz.....$65.00. Send e-mail if interested.

(RAM-ROD, CAT4, TOP10, MSG:71/M645)

CHECK IT OUT!

CATEGORY 4 : The A2 Free Trade Zone  (Items For Sale, Items Wanted, & Etc.)
There are a few more topics shown in a complete listing of the category, but most of the rest have been closed since the category was reorganized recently. The first twelve topics are meant to handle all possible sale items

>>> MESSAGE SPOTLIGHT <<<

UNBRIDLED ENTHUSIASM! While the popular computing press has been declaring the Apple II "old technology" for the past 8 to 10 years, Apple II users know that their computers still have great untapped potential. You can be pretty sure that almost all the strong Apple II believers have an account on GEnie, too. For a taste of unbridled Apple II enthusiasm, listen in on the following public message posted by Jay Curtis three weeks ago.

[*][*][*]

Category 5, Topic 3
Message 123 Wed Nov 11, 1992
J.CURTIS8 [Jay] at 09:10 EST

I'm still having fun with my IIGS. I've got years of experimentation and tinkering ahead of me. I've still got a couple of free slots begging for me to add some sort of peripheral to them. I need to add the PC Transporter card, a new accelerator card, boost the cache memory on my RamFactor memory card to 1 MEG. This spring I'm getting one of those Applied Engineering floptical drives to serve as backup to my 105 meg Quantum. Eventually, I'm going to have to have a Laser or Ink Jet printer.
Apple II Computer Info

I've got no reason to add more memory, but, shoot, it might be fun to have nine megs in this sucker rather than just five! Besides, memory is so cheap now, and I might need the additional if I get serious about running GNO/ME. (Wish I could find out more about it here on Genie.)

My IIGS boots and runs faster than the MAC Classic II at work and is just so much more interesting and versatile. I've got text display as well as graphic display, three different operating systems to play with, more programming languages than I'll ever be able to learn, and so many pieces of software to check out that I'll never get around to all of it. It's the best of many different worlds: expandability, near state-of-the-art technology with a slice of history, text and graphic display, entertainment and productivity, 8-bit and 16-bit. When I talk to other computerphiles, they're amazed at what an "Apple II" can do. Some have to come see for themselves, because they don't believe me.

[*][*][*]

In the following sections we present a variety of interesting posts that have appeared during the last month in the bulletin boards for A2. These messages can be identified by the footer attached to each item. (See the introductory notes on how to interpret the footer.) If you find the topic, excerpt, or just the interplay between various people to be stimulating, then please jump to that topic on a weekly basis and read about developments in the Apple II community. Our hope is that you will find something new and interesting each month in the A2 bulletin boards. If you are serious about your APPLE II, the GENie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

ZEN And The Art Of Flaming

Compiled By Terry Quinn
[TQUINN]

>>> FLAME ON! <<<

flame: 1. vi. To post an email message intended to insult and provoke. 2. vi. To speak incessantly and/or rabidly on some relatively uninteresting subject or with a patently ridiculous attitude. 3. vt. Either of senses 1 or 2, directed with hostility at a particular person or people. 4. n. An instance of flaming. When a discussion
degenerates into useless controversy, one might tell the participants "Now you're just flaming" or "Stop all that flamage!" to try to get them to cool down (so to speak).

USENETter Marc Ramsey, who was at WPI from 1972 to 1976, adds: "I am 99% certain that the use of 'flame' originated at WPI. Those who made a nuisance of themselves insisting that they needed to use a TTY for 'real work' came to be known as 'flaming a**hole lusers'. Other particularly annoying people became 'flaming a**hole ravers', which shortened to 'flaming ravers', and ultimately 'flamers'. I remember someone picking up on the Human Torch pun, but I don't think 'flame on/off' was ever much used at WPI." See also {asbestos}.

The term may have been independently invented at several different places; it is also reported that 'flaming' was in use to mean something like 'interminably drawn-out semi-serious discussions' (late-night bull sessions) at Carleton College during 1968--1971.

flame bait: n. A posting intended to trigger a {flame war}, or one that invites flames in reply.

flame on: vi., interj. 1. To begin to {flame}. The punning reference to Marvel Comics's Human Torch is no longer widely recognized. 2. To continue to flame. See {rave}, {burble}.

flame war: n. (var. 'flamewar') An acrimonious dispute, especially when conducted on a public electronic forum such as {USENET}.

flamer: n. One who habitually {flame}s. Said esp. of obnoxious {USENET} personalities.

flamer: n. One who habitually {flame}s. Said esp. of obnoxious {USENET} personalities.

flame war: n. (var. 'flamewar') An acrimonious dispute, especially when conducted on a public electronic forum such as {USENET}.
gauntlet? It's your chance to talk directly to the programmers!

A2 University has two courses currently running. In Ultra 4 to the Max, Will Nelken is focusing in on the new Randy Brandt's Ultra 4.0 macro language for Appleworks. Ultramacros has grown well beyond a macro utility into a full blown programming language. With Ultra 4.0 the power of Ultramacros has improved even more while still maintaining it's ease of use. If you do anything with Ultramacros you will want to come by for a look. Many class participants have been posting small useful macros that are definitely worth looking at. Ultra 4.0 really is amazing and Will's class demonstrates much of the new power of this improved language.

Not to be outdone 'Professor' Andy Fadden is covering data compression. If you ever wondered how one can manage to compress files and then uncompress them without scrambling all that data (I certainly do!) then this is the class for you.

Although both classes are in full swing, you can still stop by and join in on the discussions. Lessons for both of the classes are in the A2Pro library and have a wealth of great information.

There is a lot of other things going on in A2Pro as well. With the wide variety of stuff going on, there is something for everyone. C'mon by, I dare ya!

ULTRA EXTRAS RELEASE DATE DELAYED

I've had delays ranging from other obligations to sickness in the family (nothing serious, just time-consuming), so Ultra Extras is running a little behind schedule. If all things all into place, we'll still be done in October, but now it won't surprise me if we don't ship until November. Mark Munz is pretty much done his stuff, and I've only got a few more bugs to track down. Coming soon...

(BRANDT, CAT34, TOP8, MSG:16/M530)

>>>>> Due to other events chewing up time, UE likely won't ship this week as hoped. It's close, but needs more testing. If all goes well, it'll ship in three weeks or less.

(BRANDT, CAT34, TOP8, MSG:17/M530)

ULTRA 4.O TIP

Don't record over any existing macros, since following macros can get messed up. Make sure you record only macros that haven't been compiled. For example, reserve number macros for recording, or both- apple macros, or something like that.

(BRANDT, CAT34, TOP4, MSG:55/M530)

REVERSE ENGINEERING DEEMED FAIR PLAY BY U.S. COURT

Thought I would bring everyone up to date on the latest court ruling regarding reverse engineering. This information comes from the Tuesday (10/27) issue of Investors Daily.

Appeals Panel Finds Disassembly of Sega Game by a Rival To Be Legal

...Reverse engineering has received a stamp of approval in a landmark ruling by the Ninth Circuit Court of Appeals in San Francisco.

...the court ruled last week that Accolade Inc. was within legal
limits to disassemble Sega Enterprise Ltd.'s electronic game cartridges to figure out how to produce games compatible with Sega's Genesis game machines....

...Technology companies have lined up on both sides of the fence on the disassembly issue. Officials at Apple Computer Inc., Intel Corp. and IBM have stated that disassembly reduces their ability to protect their investments in hardware and software. (Now if we could only get rights to the IIGS hardware and firmware! -Ed)

...But Sun Microsystems Inc. Unisys Corp. and others have sided with Accolade, arguing that disallowing reverse engineering would stifle competition (mine: there is no IIGS clone (unfortunately)).

Sega says...

"In our opinion, the court improperly applied the doctrine of fair use and disregarded established precedents in this area of law," Riley Russell, Sega's corporate counsel, said in a prepared statement after the ruling. "We feel the court's ruling, as it stands, substantially reduces the ability of manufacturers to protect their intellectual property."

The case came down to the legal doctrine called "fair use".

The Appeals court said that under the doctrine one can dissemble a product as a means of accessing the unprotectable ideas underlying the particular expression of the product if that is the only way to get access to those ideas. The company disassembling the product cannot, however, then create a work that infringes another's copyright (mine: probably a IIGS clone!).

Ideas themselves cannot be protected by a copyright; only specific expressions of the ideas can be.

Another issue in a copyright cases is whether the copyright holder was actually harmed (would IIGS clone harm Apple ??).

...."The ruling says the monopoly power granted by patent laws will not apply to copyright law," said Stephen Hollman, a partner with Pettit & Martin in San Jose, Calif. "This case has ramifications for the computer hardware and semiconductor industries, as well as software."

Hope you found this interesting. -Chris

(CHINOOK.1, CAT13, TOP22, MSG:69/M530)

HOW WOULD YOU LIKE TO MAKE $200? $400? $800? Read on! :) As always, we're looking for submissions for both Softdisk and Softdisk G-S. In a moment, I'll list some ideas, but first let me address one misconception. You DO NOT HAVE TO BE A PROFESSIONAL PROGRAMMER TO SUBMIT. All too often people think that they must be professional programmers whose works rival those of Andy Nicholas. Well, if you were that good, you'd probably be working for Apple right now :) You might be surprised just how easy it is to get your programs published and to make some easy money. For example, we have a full staff of in-house artists that can redo your artwork. We have people that get paid to design interfaces for programs. We can work WITH you to make your
program as good as anything Andy can do.

Here are some program ideas that we are interested in. Some of these things are quick, $100 programs, others are major undertakings and thus major bucks would be paid (upwards of $1500 in some cases!)

- database shell that would allow the user to create their own templates
- anything related to astronomy (hot topic these days :)
- statistical analysis type programs (we've had requests for those)
- Zip Code/Area Code finder CDA database thingy
- Text Viewer CDA, allow preset files and file selection
- time billing database thingy
- Car maintenance scheduler database thingy
- games, games, and more games :)
- family tree programs
- weird things like those things that tell you are far your mouse has traveled, or eyes that follow your mouse, etc.

You get the idea? -Bryan

(SOFTDISK.INC, CAT31, TOP3, MSG:21/M530)

>>> I was talking with a submitter the other day and he said to me,
"Bryan, why don't you let more people know how much you pay for submissions?"

So, here I am.

A submission can fall into one of four broad categories: feature, "filler", reusable, article/artwork

Features A feature is a submission an issue of Softdisk or Softdisk G-S will be centered around (our issues are not thematic, but the issue cover art and what-not always tend to reflect the feature). Usually, features tend to be large programs, sometimes as large as 200K on Softdisk G-S. Usually no more than 100K on Softdisk (mainly due to disk space considerations), but occasionally, Softdisk features use two 5.25-inch disk sides.

We generally pay between $500 and $1200 for a feature.

"Fillers" To be more accurate, this category should probably be called "non-feature". This is the category of submissions that aren't features. On Softdisk G-S we try to publish 3-4 programs on each issue (4-5 on Softdisk 8-bit). Since only one program can be the feature, the other programs "fill" out the issue.

Fillers vary greatly in size. Some are as small as just a few K, others are as much as 150K. Again, the size varies with the product.

Small fillers bring around $100-$300. Larger fillers between $300-$800.

Reusable This is not so much as another class as it is another aspect of the other classes. Anytime we can reuse a submission repeatedly, it's worth more money to us. For example, a program that allows the user to play crossword puzzles where the puzzles are simply documents that can be opened and played will be worth more than a crossword player that only plays a specified puzzle.
Apple II Computer Info

Being reusable can add anything from $200 to $1500 to a submission.

**Article/Artwork** I'm not really sure what to call this category. Maybe "Documents" would have been better. Things like product reviews, articles (yes we accept articles even though few people submit them!), artwork, MIDI Synth songs, clip, print shop stuff, appleworks and appleworks GS templates, rSOUNDS, all this kind of stuff brings anything from $5 to $200 (or more, depending on quantity).

Now, I'm not going to sit here and tell you why selling your program to Softdisk is better than making it shareware: you are capable of the simple math involved. Softdisk simply pays better. -Bryan

(I should include this disclaimer: these prices are NOT set in stone. I don't decide what we pay for submissions, that's done by other management people. The numbers could change at any time--but since these are the numbers we've been paying for a few years now, I doubt there will be much change.)

(SOFTDISK.INC, CAT31, TOP4, MSG:1/M530)

**AND THIS FINAL LESSON FROM THE PROGRAMMERS**

> Tracking down a bug caused by an errant BRA sometimes takes HOURS. I know, just don't insert bugs into the code...

My wife found the last errant BRA I forgot about. Boy did that take a lot of explaining! -Bear

(A2.BEAR, CAT7, TOP7, MSG:47/M530)

Search-ME!

By Scott Garrigus

[S.GARRIGUS]

HEY, BOYS AND GIRLS! It's that time of the year again! Time to spend all your money on your family and friends! You _have_ done all your shopping already, haven't you? :-) You know the GENie Mall will be open 24 hours, 7 days a week. (premeditated plug :-)

This month I didn't visit a specific place on GENie. So be sure to tell your kids they can write letters to Santa on GENie. Just have them address their letters to SANTA.CLAUS and send them via GE Mail. Santa will write back to each and every one of them. He must have a terminal up there somewhere. Hmmm... I wonder what kind of computer he has? :-)

Well, this month's Search-ME theme is of course, Christmas! So get yourself a nice cup of hot chocolate, curl up on the couch and have some fun finding this month's keywords! Oh, yeah, and have a Very Merry Christmas!
Apple II Computer Info

>>> CHRISTMAS! <<<

[PRO]///PROFILE///

Who's Who In Apple II

By Phil Shapiro

[P.SHAPIRO1]
GenieLamp> Randy, how did you first become involved with the Apple II?
Brandt> I started playing around with an Apple II+ which had been donated to the Geophysics Dept at Christian Heritage College in San Diego, where I was a sophomore at the time (1981). They set it up in the library with a sign-out card, and I filled up so many cards they finally gave me my own key to the computer desk. I played a lot of Sabotage, Pac-Man, etc., and got into Basic and then 6502 assembly. My first program was a grade keeping Basic program for my girlfriend's student teaching needs. Her name was Joanna Ellen Morrison; astute readers will see the significance of those initials. Anyway, I began selling GRADE.AID to other teachers and that got me thinking there might be some money in computers. Then I sold a little hardware as well during my first year of teaching after college. As for actually thinking I could make a living at it, I'm not sure about that yet, but I have survived over 7.5 years as a full-time computer nerd.

GenieLamp> Can you tell us a bit of how you came to work at Beagle Bros?
Brandt> I quit a white collar job in 1985 and was looking for work when I decided to send applications to Roger Wagner and Beagle Bros, thinking that my English major and Apple ii experience would make a good combo for documentation writing. Joanna was pregnant with Heather, so we were rather interested in becoming employed, but when she spelled the address wrong on the letter to Beagle, I told her not to redo it since we'd never hear back from them anyway. A few weeks later I started writing docs for Pro-Byter and Extra K.

GenieLamp> At what point did you leave to form your own company, JEM Software? When did you join GEnie?
Brandt> I didn't leave Beagle to form JEM. I actually started JEM in 1984, over a year before I started at Beagle. However, it was dormant until I wrote PathFinder. I wanted a special royalty rate and a low-cost disk since the program was so simple and there was no need for a manual, but Beagle didn't want to pay any more, and suggested I sell it myself. That propelled JEM into AppleWorks enhancements, which is basically all we've ever published, other than MiniPaint and I.O. Silver. I joined GEnie around 1988 or 1989, mostly to support Rose16, my APW editor, and my other JEM products.

GenieLamp> Over the years UltraMacros has evolved through several generations, culminating with your recently released Ultra 4.0. For the benefit of those who walked in late to the party, kindly explain a bit about the early generations of UltraMacros.
Brandt> My first macro program was MacroWorks. That came about because I was beta-testing Alan Bird's Program Writer, and really liked the OA- Delete command to "gobble" the character under the cursor. It really annoyed me that AppleWorks couldn't do that. Since I'd switched from AppleWriter, I also liked having a command to jump to the end or
beginning of a line. After playing with Merlin's sample keyboard macros I
kind of figured out the theory behind macros and went to work on
AppleWorks. Beagle liked the idea, gave me an advance to pay the bills
while I worked on it, and began creating ads for PatchWorks. Then it
turned out there was a quilting program with that name, and they finally
gave in to my request for "MacroWorks" even though they thought it sounded
too techie.

Then Alan came out with AutoWorks, I wrote Super MacroWorks for
AppleWorks 2.0, TimeOut got going and I wrote TimeOut UltraMacros, and now
finally there's Ultra 4 from JEM. Somewhere in the early, days Pinpoint
came out with KeyPlayer, which copied a lot of my stuff while adding some
good ideas, but had some flaky problems and finally vanished.

GenieLamp> Can you briefly tell us what Ultra 4 has to offer?

.Brandt> Ultra 4 is a major rewrite, primarily offering external dot
commands which are added through init files. This means there
never needs to be a successor to Ultra 4, since I can simply create
additional command files as needed.

GenieLamp> The National AppleWorks Users Group (NAUG) has played a
central role in popularizing AppleWorks. What are your
thoughts about the role NAUG has played in the national Apple II scene?

.Brandt> NAUG _is_ the AppleWorks scene. Without NAUG members ordering my
products, I would've had to abandon the Apple II years ago. As
for the national Apple II scene, there's plenty of IIgs stuff out there,
but NAUG certainly dominates the 8-bit world. While I know I've
contributed to NAUG's success, they've been the indirect source of most of
my income over the last few years, for which my family is very thankful!

GenieLamp> Over the years many people must have sent you copies of nifty
macros they've created. Can you tell us a little about some
of those most creative and zany macros you've seen?

.Brandt> It's tough to pick just a few macros, but the more creative ones
include Mark de Jong's drawing program which used text
characters in a word processor file, Rod Young's Lynx Hypermedia program.
There have been hangman, blackjack and shoot'em up games that were very
creative, but the zaniest is likely the one that made AppleWorks screens
display bottom to top so the main menu had Quit at the top, the
REVIEW/ADD/CHANGE messages were at the bottom of the screen, etc.

GenieLamp> The TimeOut series of AppleWorks enhancements gives great
power for using an Apple II in a small business setting. Can
you share any juicy anecdotes about Apple II's you know of that are being
used in a business setting?

.Brandt> I know of a fine watch repairman ("any watch cheaper than $500 is
junk!") who uses a couple of IIgs's and a couple of Laser's to
run his whole business. There's a travel agent who uses II's to run a
million-dollar business, an auctioneer, and a pediatrician. I'm sure there
are others I haven't run into, but these are some that I've talked to who
are using my add-on's to AppleWorks and running good-sized operations.
The best anecdote is a Hewlett-Packard employee who had to teach a massive
class on Windows to other employees. He created the entire course outline
using my Outliner and AppleWorks 3.0.

GenieLamp> What types of things do you like to do for fun?

Brandt> I have fun at a lot of things, including playing in two ice
hockey leagues. I also enjoy playing basketball and softball,
and watching all the major sports on television. Playing with my kids is a
joy. Before starting my computers, I load up my CD carousel from my
collection of 400+ CD's, mostly Christian rock with a bit of classical
thrown in for culture's sake. I also enjoy reading techno-thrillers
(Tom Clancy, Dale Brown, etc), magazines (MacUser, National Review, The
Hockey News, National Geographic), the daily paper (sports first, then
editorials), and the Bible.

GenieLamp> What work are you most proud of?

Brandt> Other than my role in producing Heather, Erika and Michael, I'm
most proud of Ultra 4 and TotalControl. They're both major
products that add an awful lot of power to AppleWorks for any serious user.

GenieLamp> What do you think are going to be some of the more exciting
technological developments that will be realized before the
turn of the century?

Brandt> Although I'm sure I can predict the future at least as well as
the tabloid psychics, I'm not too sure what we'll see. I'd LIKE
to see affordable extremely high-powered notebook computers with stuff like
built-in cellular phones/fax, satellite-based navigational maps, voice
recognition, and battery technology that lets you work all day. A complete
office in one package, sans water cooler. Maybe a cold fusion computer
that you could dump your Big Mac wrapper into for instant recycling. The
new MacEverything- it slices, it dices... Apart from computers, who knows?
To be honest, I think short-term technological growth will be hampered with
Al Gore as Veep, at least if he gets his buddies into the EPA and the like.
Startup companies are going to have a tough time surviving all of the new
regulations that'll be here soon. When massive corporations dominate,
creativity stagnates, like with HP rejecting Woz's silly little ideas about
building a personal computer.

GenieLamp> For the benefit of those who may be unfamiliar with JEM
Software's product line, kindly tell us a little about each
of your products, along with your motivation for making them.

Brandt> My product line is getting shorter, but this is the active stuff:
PathFinder is a directory selector I wrote in a two-day period in
1986 or 1987 that lets you pick subdirectories from a list instead of
having to type in the name. I built that into AppleWorks 3.0.

DoubleData by Dan Verkade gives the AppleWorks 3.0 database 60
categories per record. It was created because 30 categories per database
record seemed like too few.

TotalControl adds spreadsheet-type formula capability to the
AppleWorks 3.0 database (Dan did the formula stuff) and gives you control
over your input, allowing you to set min/max lengths, values, case rules
and do automatic importing and lookups from other files.
DB Pix displays Print Shop graphics in the DB along with your record, so you can have a "graphic category". It also displays single and double high resolution pictures.

Ultra 4 is a major rewrite of TimeOut UltraMacros, offering a more powerful compiler, easier-to-use but more powerful commands, and the ability to add new commands via disk files.

OmniPrint is an ImageWriter II enhancement that lets you access all ImageWriter II capabilities from within the word processor, including font, downloading graphic patterns, color, change of pitch on one line, etc.

InitCity is the next JEM disk, due out sometime before the snow melts in 1993. It offers a dozen or so AppleWorks 3.0 inits to make life easier, such as letting you tab through multiple OA-Q desktops, pick a new directory from a list during the Add files process, print titles on each page of a multi-page spreadsheet printout, etc.

GenieLamp> How can people contact you?

Brandt> People may write to JEM Software at 7578 Lamar Ct, Arvada, CO, 80003, fax (303) 422-4856, or contact me on GEnie. My electronic mail address is: BRANDT, and you can leave public questions or messages for me in category 34 of the A2Pro (Apple II Programmers) Roundtable on GEnie.

"Technomare"

I suppose most of us have our own "tech nightmares". In short, equipment that just doesn't do what it's supposed to do, or what we'd like it to do, which reminds me of a story I heard about a man who was told to "take the 5.25" floppy disk out of its jacket and insert it in the disk drive" and took the instructions a wee bit too literally: he ended up ripping the black cardboard part of the disk apart and taking the media itself -- that little circle of mylar that's inside the disk -- and inserting it into the drive.
Not me. I won't turn into one of those old gents who doesn't know quite what to do with the "business" end of a remote control, who literally couldn't program a VCR via an onscreen menu if his life depended on it. Why, I am part of the "hands-on" crowd, the group that solves problems with tech, and is constantly shepherding that other (shudder) group, the ones who don't know their azimuth adjustment from a hole in the ground.

Well (deadlines will oft make fools of mortal men), there _was_ that time when I was trying to obtain a decent setup with my video equipment. Let me warn the squeamish among you "hands-on" folks: This just about tops the guy I mentioned (the one who tried to insert Disk A in Drive A) in the paragraph above. And it was done with video gear.

It began the day I stood admiring our video equipment. I had recently purchased a Pioneer "combi" laser disc player and was in the process of merging with my Significant Other and her gaggle of VCRs.

All that equipment, and a TV and a stereo system besides, sat on an industrial-strength stainless steel rack that could (literally) hold a Cessna power plant or three. My SO had been using the rack in the basement for storing heavy objects, and I was a little proud of myself for adapting it for use as a home entertainment center.

I was tired from having to schlepp all that stuff to the top of Mount Videorat, and was thinking about the task that lay before me: hooking up the mess.

My SO, sensing my fatigue, offered to help. "I'll hook it up," she said. "You just sit there and think manly thoughts."

"I've got one now," I sneered. "How are you going to dub stereo movies from our laser discs to the SuperBeta VCR? And how are you going to dub stereo tapes from the SuperBeta to the linear stereo VHS job?"

"Can't you copy tapes in stereo this way?" she asked, innocently holding a coaxial cable.

"Puh-leeze. We true videophiles would never ask such a question. Then again, if I'm a true videophile, why are we holding on to such low-end equipment? Ahh, no matter. The way is being made clear to me, even as I speak." My SO sat down and struck a match to a coffin nail.

"What do you have in mind, Swami, and how much is it going to cost us this time?"

Sheesh. What I "had in mind" seemed perfectly reasonable to me. It would be a masterpiece of engineering: I was planning on connecting the "direct video and audio" inputs/outputs of my equipment in such a fashion that dubbing from one piece of equipment to any of the other five in the series would be possible. And using the direct inputs meant -- at least to this video slug -- that I would be getting a higher quality connection than if I had used the coax, and my stereo laser discs would be dubbed to both those stereo VCRs in stereo. The keystone of my hazy 'plan' was the RCA male-to-female (one male to two female) y-cable, which was available at the local Shadio Rack.

"This shouldn't cost me more than twenty bucks," I said.
Later . . . fifty bucks later, I came home with my kill: a pile of those cellophane and cardboard packages, complete with that sprayed-on odour de plastique that we have all come to love. I ripped them apart, and arranged the cables in neat rows.

"I think I should start with the laser disc player. The direct VIDEO OUT goes to the VIDEO IN of all the VCRs. That should require two y-cables. Or is it three?" My plan involved "Y-ing" those RCA y-cables. I connected the first piece of video equipment in the series to the second, then the second to the third. Then the first to the third. About then, Murphy's Law paid me a visit, as I was already running out of y cables, and my grand "setup" was well on its way to breaking some kind of record in pure complexity/stupidity. It had long ago gotten dark outside, and I rushed again to SR before they closed.

I came home, determined to solve my wiring dilemma. I even (gasp!) drew a diagram or two. That didn't help, either. The sheer complexity of what I was trying to do was beyond the scope of my now- seemingly feeble talents. And I was -- again -- out of y-cables. I stood, drenched in sweat, behind Mount Videorat, trying to 'picture' the setup in my mind. "It won't work," I realized. And I was right. I was trying to do the job of a $1,000 piece of video switching gear with $70 worth of wires, and had forgotten that there was a reason why such devices existed: because it was just about unfeasible to do it the "hard way".

I was angry at myself, and literally felt like toppling the whole mess into a pile on the floor. I ripped out all those cables, and started again.

My new plan was to wire all six units in series with coaxial cable, and come up with a much simpler way to dub between the stereo units in stereo. I was done a few minutes later.

I explained everything to my SO. We had a good laugh over it. "So. It's all hooked up now? Let's watch something on cable!"

I turned the TV on, and watched about five seconds of the Evening News. Apparently, lots and lots of snow and herringbone patterns were "falling" in the CBS studios. It is said that a picture is worth a thousand words, but only one described this one: 'Mud'. "Noooooo!" I cried. I had used _so_ much coaxial cable to wire everything up that all that signal loss took its deadly toll on our already-poor cable signal.

"You watch TV," I snapped. I picked up a hand full of cables and handed them to her. "I'm going to bed!"

So now you've read how I shakily survived my technomare. By the way, most of the cables I bought are now in a laundry basket in the basement.

Contact me at my GEnie address (NEWSIE) and I'll tell you where to send _your_ diagrams. But please don't send any cables.

/ "...what the problem was REALLY trying to tell me was that / my 85MB Seagate was about to take a trip south. The erratic / reading was the first sign the thing was dying. The funeral / will be here in Georgia. Probably have the #@%!&* drive /
MAGICAL COMMUNICATIONS  The other day I paid a visit to the city public library to dig up some books about telecommunications. I've been an active telecommunications enthusiast for the past several years and my curiosity was getting the better of me.

As with most computer enthusiasts, I've got a passing acquaintance with most basic telecommunications concepts. But my understanding still remains at a superficial level. For a long time I've had a burning "curiosity to find out more about these magical packet switching systems" that allow people to place a local phone call to connect to a national telecommunications network. And I've always wanted to know more about how this process called "multiplexing" makes the packet switching systems work.

A computerized search of the library's holdings turned up about three dozen books dealing with telecommunications. As I wrote down the call numbers of these books, I couldn't help but think of my past experience trying to find books or magazine articles to explain the fundamental concepts of modern telecommunications.

About one third of all such books were written before 1982, strongly suggesting that their contents are at least ten years out-dated. Major changes in the telecommunications industry have happened in the past ten years. Whatever was written about telecommunications before 1982, therefore, ought to be taken with a large grain of silicon.

Another third of all books about telecommunications are written primarily for third graders. These books cover the subject in such a simplistic manner that any child who has ever dialed a telephone is likely to be yawning before the close of the first chapter.

The last third of all books about telecommunications are written for graduate electrical engineering students. Identifying such books requires no special skill. One telling characteristic is that the preface of these books contain more schematic diagrams than English language sentences.

So I was especially delighted to discover the book "Understanding Telecommunications," published by TAB Books in 1989. Written neither for
third graders, nor for graduate electrical engineering students, the book explains all the basics of telecommunications theory and practice at a level that any typical college graduate could understand.

The book starts out with a concise yet comprehensive review of telecommunications history. Starting with Morse's telegraph, moving through Bell's phone, covering early radio and television, the transistor, and the earliest electronic computers. The author even sneaks in a few words about the reasons for establishing the Federal Communications Commission (FCC) in 1934.

The second chapter of the book logically follows from the first. This second chapter, "Electricity and Electronics," gives a solid explanation of the differences between direct current and alternating current. A discussion of the development vacuum tubes is accompanied by an informative illustration. Definitions of capacitors, transistors, and other electronic doodads are presented for you to nod your head in feigned acknowledgement.

The third chapter, on "Computers," gives a good general grounding in basic computer operations and theory. Most interesting is the last section of the chapter which explains how computer technology has been incorporated into so many different facets of the national phone system. If you're already familiar with basic computer concepts, this chapter can easily be skipped over.

Chapter 4, "Telephone Systems," does a great job in explaining about telephone switching equipment, the phone company's central office, the amplification and transmission of phone signals, private branch exchanges (PBX's), and the movement towards digitalization of the entire phone system. What makes the author's explanations so compelling is that he places concepts in their historical perspective. So before explaining about the complexities of modern telephone switching systems, he first explains about the early manual switchboards. The end result is that you learn historical context as well as modern developments.

The fifth chapter, "Communication with Computers," explains such things as modems, ASCII, protocols, and error detection techniques. Good for beginners to learn about. Eminently skippable for the rest of us.

The sixth chapter, "Radio," did not hold my attention that much. Sure, the new mobile radio and cellular phone systems are interesting. But radio theory remains one of the most colossally boring subjects ever conjured up by the human mind. If radio is not your bag, it's easy enough to flip over to the next chapter of the book.

The seventh chapter gives a good overview of the technical aspects of television. Compared to radio theory, television theory is almost interesting. But the real goodies can be found in chapter 8, "Long Distance Telecommunications."

This chapter starts out discussing "transmission mediums," including copper wire, coaxial cable, fiber optic cable, and air. The fascinating historical treatment of the subject continues on in this chapter. So you can find out about how MCI gained permission from the FCC to build a microwave radio system between St. Louis and Chicago, thereby setting off a whole series of events leading to the breakup of AT&T. You can learn about WATS systems and INWATS systems. You can revisit multiplexing (packet switching) from a data communications viewpoint.
Ronald R. Thomas, who authored Understanding Telecommunications, has a natural and breezy writing style that illuminates the most complicated of subjects. In this book he achieves the unique feat of making serious telecommunications subjects intelligible for the general reading public.

Can't wait to hear about what new books Thomas may be working on. It sure would be interesting to learn more about the behind the scene action at the major national information services. A behind-the-scenes report about GEnie, America Online, and CompuServe would make for a delectable read. With the cooperation of these services, such a book would not be difficult to construct. And with hundreds of thousands of people now on the national information services, the market for such a book would be quite large.

Understanding Telecommunications

By Ronald R. Thomas, TAB Books, 1989,
243 pages, $24.95.
ISBN 0-8306-9229-0 (hardcover)
ISBN 0-8306-3229-8 (paperback)

>>> BIG TEXT MACHINE <<<

By David Hindman

Recently, InCider/A+ Magazine published a brief story about Phil Shapiro and his company Balloons Software (Sept '92). In it was mentioned one of his products called Big Text Machine. While InCider/A+ concentrated on Phil, his company and the work he did with Bernie Benson in creating Big
Text Machine, they said little about the actual program. I hope to tell you more about BTM than they did (with no disrespect for the people who put it together).

To put it simply, BTM is a text-file displayer that will run on virtually every Apple II, as well as Laser and Franklin clones, and the Mac LC II, with the IIe emulation card installed. The one difference in BTM from other text display utilities is that BTM uses letters that are almost 1/2 inch tall, hence the word "big" in the title.

The program comes on your choice of 5.25" or 3.5" disks that contain the main program, some sample text files, and an auto-display program disk. The main program starts out with a big text menu to select any of the following functions: read a file, run a demo, online help, printer on/off, other activities, and a quit option.

When BTM reads a text file on your disk, it displays it in large letters on the screen. It then awaits a keypress before showing the next page. The demo program shows how different options set in "other activities" look, to give you an idea of how you might wish to customize the program to your own tastes. Color, font style, and the "ruling" lines can be set to the user's wishes. The online help is very good, which almost makes the instruction manual unnecessary. There is also a print option that allows a hardcopy to be generated that is similar to the text display on the screen. Quit lets you exit BTM and back to your program selector or ProDOS.

The manual is well written, but anybody that's read anything Phil Shapiro has written would expect that from him. The book goes to great lengths to explain not only how to work BTM, but how to prepare text files for use on BTM with AppleWorks and FrEdWriter. There are also suggestions for uses of BTM throughout the book. Explanations on how to use BTM from a minimal one-drive system up to a system with a hard disk drive are explained in plain English and with great detail. You can mix and match 3.5 drives, 5.25 drives and hard drives all with ease.

As for uses, that is only limited by one's imagination. Teachers could use it in a classroom situation to display a story to students, or have it flash letters and word examples on the screen. These files don't have to be limited to just English, either. Four foreign character fonts are also available, so accented letters can be displayed as well. This could make some interesting "flashcard" screens for other language classes. Visually impaired people could use BTM to read text files with less difficulty. If you're imagination needs to be jump-started on other uses, Phil's got lots of ideas available in the manual.

On one of the other disks included with BTM is the Auto Display program. This does the same thing that the "regular" BTM does, but instead of pressing a key, the screen is displayed for a moment or two, then the next screen is displayed. All you have to do to run the auto program is put in the auto disk and boot it. The auto program uses a text file named "auto.display" on the auto disk. To change the text, simply save (or "print" if using AppleWorks) a text file to the Auto disk and name it "auto.display". Just as an example of a use here would be a monitor placed in a store window could run information across the screen to help sell whatever products are being peddled (I stole that one from the manual, by the way).
The third "extra" disk included in BTM is a sample file disk. This disk is crammed full of interesting, amusing, informative and well-written stories covering a wide range of subjects. There was almost as much time put into the sample files disk as there was into the code for programming the BTM program. These are also summarized briefly in an appendix in the manual. Not only do they give you a start on BTM (as well as a few files to play with), they're darn good reading as well. I don't run around looking for things to read on my computer, but they are well written and entertaining and they deserve a plug here.

When I first looked at the manual for BTM, I was a bit surprised by its thickness. Being the typical user, I'd already booted the program up and played with it for awhile before checking the manual to see what I'd missed. About half the manual deals with running BTM, and making text files with AppleWorks and FrEdWriter. One section even goes into detail about different versions of AppleWorks and the subtle differences between them when it comes to text file manipulation. The other half of the manual contains appendixes that cover a wide range of topics. There's plenty of information here to help the non-technical user out if he or she gets in a jam. There are many hints listed that don't necessarily pertain to BTM's operation, but are good guidelines for getting better use out of your II. The appendixes include a ProDOS summary, "text massaging" (or getting what you want and how you want it on the screen with BTM), transferring text files from one type computer to another, and recommended monitors. There is also an appendix appealing to unpublished writers of children's stories, promising a chance at getting their stories seen as freeware.

Balloons Software puts a lot of TLC into their products. Version 2.0's manual states that there is going to be improvements or add-on features in future versions of BTM, so this program won't grow stagnant from lack of customer support. Phil is available on several online services, and welcomes feedback and provides customer support as well. Although designed with even the old IIs in mind, BTM will run fine on a GS or Mac LC (with a IIe emulator card installed) just as easily. That's more than can be said for a lot of the software coming out now for computers in general. Putting emphasis on sound, flashy graphics, and mega programs to do little more than drill-and-practice children seem to be the big push now. But letting a child write his or her own story to a floppy and then have it displayed in big letters on the screen for all to see might be more incentive to be creative than having the computer talk to the kid. With the wide compatibility of the software to existing machines in our schools, and the simple, friendly interface of the program, Big Text Machine would be a good product to recommend to a parent-teacher organization or school board to purchase for use in your child's school.

Big Text Machine retails for $35, and lab packs are available for $75. If you act before Feb 28, 1993, your school can get a site license for just $65, and there's no restriction on the number of computers being currently used at the school. Here's where to order:

CowTOONS? Mike White took us up on our offer and sent in this month's CowTOONS selections.

If you have an idea for a CowTOON, we would like to see it. And, if we pick your CowTOON for publishing in GENieLamp we will credit your account with 2 hours of GENie non-prime time!

Walking In A Minefield

By Mel Fowler
[ M.elsoft ]
ADDICTIVE? YOU BET! MineField GS was ported from the IBM Windows format by Aaron Taurog. I have no idea what the IBM version looks like but I cannot imagine that it could look and play any better than MineField for the Apple IIGS. This game is in the addictive category and can be most challenging.

The object of this logic game is to uncover all the squares in a grid that do NOT have mines in them and to FLAG all the squares that have mines in them. You start out with a blank grid of gray boxes. A number of mines, 20 in the EASY mode, 40 in NORMAL, and 90 in WELL DONE, are randomly distributed. There is also a Custom mode where you decide the grid size and number of mines.

As you uncover a box you can have one of three results. (1) You may uncover a blank box which means there are no mines present in the adjacent boxes. This will reveal all the boxes around the blank box. (2) You may uncover a mine and the game ends, or, (3) you may uncover a box with a number inside. The number may be from 1 to 8 and tells you how many mines are located in the boxes adjacent to the box you just uncovered. The adjacent boxes are defined as pictured here.

```
I 1 I 2 I 3 I
I____I____I____I
I 4 I 5 I
I____I____I____I
I 6 I 7 I 8 I
I____I____I____I
```

By using the numbers in the boxes you can use a process of elimination to locate the mines. The example below shows how you can locate mines by using this process. In the third box in the second row there is a 1 indicating that there is one mine located in an adjacent box. Since there is only one box adjacent that has not been uncovered, it must have a mine in it (located in the fourth box in the first row). Change the cursor from pointer to FLAG by pressing the TAB key and leave a flag in the fourth box in the first row. The fourth box in the second row also has a 1 located in it and since we know that the fourth box in the first row is a mine and it is adjacent to the fourth box in the second row, the 1 is satisfied and there can not be any mines in the other adjacent boxes (indicated by No Mine).

The first box in the second row has a 3 in it which means there are three mines in the adjacent boxes. Since there are only three boxes that have not been uncovered, all three must have mines in them. This also satisfies the first box in rows one and three. This means that there can not be any mines in the other boxes adjacent to those boxes. The boxes that cannot be eliminated are marked with question marks. By using this method you can identify and FLAG all the mines and win the game. Your score is determined by the time it takes you to solve the game. The lower the score the better.
You are often faced with situations where you can not determine the exact location of the next mine and then it becomes a guessing game.

You can use the "Command" key to start a new game and it will uncover all the blank boxes around the one you select. Command-N will start a new game, so you can hold the Command key down while start a new game and if you fined a mine just press "N". What you want to start a new game is like the example above. You can then start out knowing the locations of some mines.

If you get frustrated you can choose "Safe Corner" from the Game Menu. Two of the four corners with have an area of blank boxes. Of course you do not know which of the corners is safe.

There is also a MineField NDA game. The object is a little different than MineField GS in that you try to get from the left side of the grid to the right side without hitting a mine. You use the same elimination process however. Look for "HELP" under the Game Menu for instructions.

Thank you Aaron for this great game. You show a real talent for porting programs from other platforms to the IIGS. We are looking forward to your next endeavor. Users of Minefields GS are urged to show their support by sending in the very modest shareware fee.

SO WHERE ARE THEY? With the advent of Pointless from WestCode, Apple
IIGS users have been looking high and low for collections of TrueType fonts. Well we have a great collection of TrueType fonts right here in the Apple II Library. In fact there are some 55 individual fonts that have been uploaded into individual files. In addition, the National Appleworks User's Group (NAUG) has uploaded 20 disks of TrueType fonts. The Apple II community on GENie would like to take this opportunity to thank NAUG for their time and effort in uploading such a vast collection.

You may wonder why I entitled this article "TrueType Fonts And How To Download Them"? Well with all these TrueType fonts available within the Apple II Library, how do you ensure that you do not waste time and money getting duplicate fonts? That is what this article will attempt to answer.

Fortunately NAUG included an Appleworks database listing all the files on each of their TrueType font disks. I would recommend that you download this database as a first step. Next choose menu item number 3, Search the Library. For the keyword, type in "TrueType". This will result in a library listing of all the individual TrueType font files and the NAUG disk files. (Be sure to turn on your capture buffer so you can save this list to disk.)

You now have a database of the NAUG disks and a list of the individual files. Simply compare the individual TrueType listing with the NAUG database and eliminate the individual fonts that are included in the database. This will give you a single list and you will have eliminated any duplication. The fun now begins as you download the 20 NAUG disk files and those individual TrueType font files that were not included in the NAUG collection.

Now that you have all the NAUG disk files and individual TrueType files downloaded and unpacked, you may want to get your collection into some kind of order. As the Apple IIGS disk librarian in my local user group, this was my next concern. If you have a hard drive it is not too much of a chore to get your collection into alphabetical order. I just opened temporary folders for each letter of the alphabet. Each TrueType font disk was then brought up on the Finder and all the "A" fonts were copied into the "A" folder, all the "B" fonts copied into the "B" folder and so on. When my hard drive was close to being full, I would change the "View" to "By Name" on each font folder and copy all the "A" fonts back to disk starting at the top of the directory. When all the "A" fonts were copied back to disk, the "A" folder was trashed thus making room for another folder. The "B" folder was then copied back to disk in the same way and then erased. You now have a well organized collection of TrueType fonts.

I even took it a step further by printing out a hardcopy sample of each font for each disk. Our Special Interest Group (SIG) was very impressed with the collection and with the sample printouts they could easily select which TrueType disks they wanted.

Good luck in getting your Apple IIGS TrueType Font collection and I hope this article will help. -Melsoft

>>> IMPORTANT NOTICE ABOUT GEnie's INTERNET GATEWAY PRICING <<<

The pricing for GEnie's Internet gateway changed after GEnie LiveWire
Magazine went to print. The new pricing can be found on page 207, and in
the file GENIE-INTERNET.INFO #4331. In summary, there is no longer a
monthly $9.95 fee but a one-time $2 fee for registration with the Internet
gateway, and the per-piece price has been reduced from 40 cents to 30 cents
per 5,000 characters or part thereof, and applies to messages both sent and
received via the Internet gateway.

CANADIAN INTERNET GATEWAY ANNOUNCED Today, GEnie announced the expansion
of its Public Beta Test of the GEnie
to Internet Gateway for Canadian members of GEnie. The Canadian pricing is
as follows:

$3.00   one time registration fee
$.40    cost for each 5,000 characters or portion thereof on
each inbound or outbound message.

The beta test for Canadian users will be opened on Tuesday, DECEMBER
8, 1992. The keyword remains INTERNET, and can be gotten to on that date
by typing INTERNET or moving to page 207, or by selecting the Internet
option on the Unix RT menu.

For information about the Internet, select item 5 from the Unix
RoundTable menu. As mentioned in this month's GEnie LiveWire Magazine
these files are good starter files for learning all about the Internet.
And this month's GEnie LiveWire Magazine contains a coupon good for one
free hour in the Unix RT - a good chance to start learning for almost
nothing.

PD_QUICKVIEW
Eamon, Part II

By Darrel Raines

YOURS FOR THE ASKING!   Eamon is a Freeware gaming system allowing a
single player to experience a Dungeons and Dragons (D&D)(TM) type of environment on any Apple II computer. In a previous Apple II Gaming article, I described a typical scenario that a player might encounter in the world of Eamon. This article will examine how to set up Eamon on your floppy or hard drive system. We will also run through a sample dialogue for a first-time player. You should download one of the two files listed at the end of this article to get started. Each contains a number of good scenarios and a complete set of the basic files, called the Main Hall. There are two versions of the Main Hall available: Text or Graphics. The graphics version is more enjoyable and has more options, but it is less stable. There are also a few character editing programs available that you may find useful.

The Setup  If you wish to play Eamon from a hard drive, the setup is quite simple. Create a directory somewhere that you want to store all of the various Eamon files. Place each of the basic files in this directory including the Main Hall and character files. You can then store each of the scenarios as a subdirectory under this main directory. The name of the subdirectory should indicate the name that you will use to identify the scenario. Store all of the files associated with each scenario under the appropriate subdirectory. Scenario names will automatically appear when prompted for the adventure area. This setup will avoid confusion and directory listings with hundreds of entries.

If you wish to play Eamon from a floppy drive, the setup is equally simple. Create a disk that will serve as a boot disk and Main Hall area. Place each of the basic files on this disk including the Main Hall and character files. Each of the scenarios should be stored on separate disks. The title of the disk should indicate the name that you will use to identify the scenario. Store all of the files associated with each scenario on the appropriate disk. Scenario names will automatically appear when you place the disk in the drive (when prompted for the adventure area). This setup will avoid confusion and each disk will contain a separate scenario.

If you have followed the instructions listed above, then you are ready to start up Applesoft Basic (Basic.System). Move to the directory (or disk) with the Main Hall and run Startup. You may eventually choose to start by running the Main.Hall program. The next thing that you know, you will be playing Eamon!

The Play  When a person first starts up the Eamon program, he is faced with a desk and the imposing question of "What is your name". Since our typical player has never used Eamon before, he/she is free to choose any name that they want. It is unlikely that the new name will have ever been used before. Therefore, the gatekeeper will ask if you want to create a new character. The correct answer is "yes".

The next few questions will help determine the traits of the new character. Dice will be rolled to assign values to each character trait. It is important to hold out for reasonable values in each category. A value of 10 for each trait would be a minimum with some traits reaching 17 or higher. You may find it difficult to survive with much less ability. The next order of business will be to equip yourself for battle. You should be able to purchase leather armor and a sword to begin with. If you can get a shield also, then do so. The first adventure that you pursue will help finance further wardrobe purchases. Be sure to arm yourself and put on the armor after it is paid for.
If you decide to download and play the graphical main hall, there are other shops available. I don't recommend doing business with them until after you have tried the first adventure. A note is appropriate here concerning the various scenarios. The key to Eamon is the flexibility of the gaming system. Every person who writes a game for the Eamon system is given total freedom to create whatever type of world he/she can dream up. This can also lead to chaos. Files can get mixed up, weapons may be inappropriate for certain scenarios, directories can become unmanageable, etc. All of these problems have been solved to some extent in the modern world of Eamon. Each separate scenario is given its own subdirectory under the main Eamon directory. Any files needed by that scenario must be contained in the subdirectory.

Every new character should start with the Beginner's Cave. This simple and not-to-dangerous adventure will get you started and produce reasonable gold and weapons. To choose a scenario, the new character must exit the main hall. This will bring up the prompt asking for the scenario that the character wishes to pursue. A listing of the various subdirectories can be obtained by pressing the return key when prompted.

Once the new character has selected the Beginner's Cave, the scene will be set by some introductory text and the adventure will begin! A question mark (?) will bring up a list of the commands that the current scenario understands. The inventory command (I) will list the items available to the character. The new character should attempt to explore the entire cave before returning to the Main Hall. If a character is unable to finish the Beginner's Cave in one outing, then the rest of the Eamon scenarios will be much too difficult to attempt. I will leave the budding Eamon game player with one final word of advice: Read descriptions completely and look for hints in the wording of those descriptions.

With this hint and the trusty question mark (?), the reader should be able to start discovering the wonderful world of Eamon on their own.

Apple II History, Part 7

"""
INTRODUCTION

With the advent of the Apple IIe, a significant event occurred in the life of the Apple II line. Realizing that this computer was NOT going to go away, Apple finally realized that it needed to improve its four-year-old design and bring it out of the 1970's in which it was born. The IIe's keyboard was influenced by that of the Apple III, and it is appropriate to take a brief look at that computer's development and problems to see why the Apple IIe came to exist at all.

[*][*][*]

PRELUDE: THE APPLE III PROJECT

As we continue our travels examining the history of the Apple II, let's fine tune the time-machine card on our souped-up Apple II to concentrate specifically on the next version of the II, the IIe. As before, just accelerate the microprocessor speed to 88 MHz, and watch out for the digital fire-trails!

Between the years 1979 and 1983, although no new versions of the Apple II were released, it enjoyed a broad popularity and annually increasing sales. The open architecture of the computer, with its fully described hardware and firmware function via the Reference Manual, made it appealing both to hardware and software hackers. Third-party companies designed cards to plug into the internal slots, and their function varied from making it possible to display and use 80-column text, to clocks and cards allowing the Apple II to control a variety of external devices. During this time there was also an explosion of new software written for this easily expandable machine, from the realm of business (VisiCalc and other spreadsheet clones), to utilities, to games of all types. Each month a host of new products would be available for those who wanted to find more things to do with their computer, and the Apple II was finding a place in the home, the classroom, and the office.

At Apple Computer, Inc., however, the Apple II was not viewed with the same degree of loyalty. By September 1979 the Apple II had continued to be a sales leader. However, few at Apple believed that the II could continue to be a best seller for more than another year or two. Since Apple Computer, Inc. was a business, and not just a vehicle for selling the Apple II computer, they began to enlarge the engineering department to begin designing new products.<1> These new design efforts had begun as far back as late 1978. Their first effort was an enhanced Apple II that used some custom chips, but that project was never finished. They also began work on a different, more powerful computer that would use several identical microprocessor chips sharing tasks. The main advantage would be speed, and the ability to do high precision calculations. This computer was code-named Lisa, and because it was such a revolutionary type of design,
they knew it would take many years to come to actual production. Because of the power it was to have, Apple executives felt that Lisa was the future of the company.\cite{2,14}

Because they knew that the Lisa project would take a long time to complete, and because the Apple II was perceived to have only a short remaining useful life as a product, they began a new computer project called the Apple III. Instead of building upon the Apple II as a basis for this new computer, they decided to start from scratch. Also, although Wozniak made most of the design decisions for the II, a committee at Apple decided what capabilities the Apple III should have. They decided that the Apple III was to be a business machine, and not have the home or arcade-game reputation that the II had. It was to have a full upper/lowercase keyboard and display, 80-column text, and a more comprehensive operating system. They also decided that since it would be a while before many application programs would be available for this new computer, it should be capable of running existing Apple II software. In some ways this handicapped the project, since it was then necessary to use the same microprocessor and disk drive hardware as was used in the Apple II.\cite{3}

Apple executives also decided that with the introduction of the Apple III they wanted a clear separation between it and the Apple II in regards to marketing. They did not want ANY overlap between the two. The III would be an 80-column business machine and was predicted to have ninety percent of the market, while the Apple II would be a 40-column home and school machine and would have ten percent of the market. Apple's executives were confident that after the release of the Apple III, the Apple II would quickly lose its appeal.\cite{4}

Because of their desire for a strong and distinct product separation, the Apple II emulation mode designed into the Apple III was very limited. The engineers actually ADDED hardware chips that prevented access to the III's more advanced features from Apple II emulation mode. Apple II emulation couldn't use 80 columns, and had access to only 48K memory and none of the better graphics modes. As a result, it wouldn't run some of the better Apple II business software, during a time when there wasn't much NEW business software for the Apple III.

The Apple III engineers were given a one year target date for completion. It was ready for release in the spring of 1980, but there were problems with both design and manufacturing. (It was the first time that Apple as a company tried to come out with a new product; the Apple II had been designed and built by Wozniak when he WAS the engineering department). The first Apple III computers were plagued with nearly 100% defects and had to be recalled for fixes. Although Apple took the unprecedented step of repairing all of the defective computers at no charge, they never recovered the momentum they lost with that first misstep, and the III did not become the success Apple needed it to be.\cite{3}

Although all of the bugs and limitations of the Apple III were eventually overcome, and it became the computer of choice within Apple, it did not capture the market as they had hoped. At that point, they weren't sure exactly what to do with the II. They had purposely ignored and downplayed it for the four years since the II Plus was released, although without its continued strong sales they would not have lasted as a company. In a 1985 interview in Byte magazine, Steve Wozniak stated:
"When we came out with the Apple III, the engineering staff cancelled every Apple II engineering program that was ongoing, in expectation of the Apple III's success. Every single one was cancelled. We really perceived that the Apple II would not last six months. So the company was almost all Apple III people, and we worked for years after that to try and tell the world how good the Apple III was, because we KNEW how good it was ... If you looked at our advertising and R&D dollars, everything we did here was done first on the III, if it was business related. Then maybe we'd consider doing a sub-version on the II. To make sure there was a good boundary between the two machines, anything done on the II had to be done at a lower level than on the III. Only now are we discovering that good solutions can be implemented on the II ... We made sure the Apple II was not allowed to have a hard disk or more than 128K of memory. At a time when outside companies had very usable schemes for adding up to a megabyte of memory, we came out with a method of adding 64K to an Apple IIe, which was more difficult to use and somewhat limited. We refused to acknowledge any of the good 80-column cards that were in the outside world--only ours, which had a lot of problems."<4>

Wozniak went on in that interview to say that at one time he had written some fast disk routines for the Pascal system on the Apple II, and was criticized by the Apple III engineers. They didn't think that anything on the II should be allowed to run faster than on a III. That was the mindset of the entire company at the time.

Apple has been much maligned for the attention they gave the Apple III project, while suspending all further development on the Apple II. They pegged their chances for the business market in 1980 on the Apple III. Even Steve Wozniak had stated in another interview, "We'd have sold tons of [computers in the business market] if we'd have let the II evolve ... to become a business machine called the III instead of developing a separate, incompatible computer. We could have added the accessories to make it do the business functions that the outside world is going to IBM for."<3> Part of the problem was the immaturity of the entire microcomputer industry at the time. There had NEVER been a microcomputer that had sold well for more than a couple of years before it was replaced by a more powerful model, usually from another company. The Altair 8800 and IMSAI had fallen to the more popular and easier to use Apple II and TRS-80 and Commodore PET, as well as other new machines based on the Intel 8080 and 8088 processors. It is entirely understandable that Apple's attitude between 1978 and 1980 would be of panic and fear that they wouldn't get a new computer out in time to keep their market share and survive as a company. However, during the entire time when Apple was working on the III as a computer to carry the company through until Lisa would be ready, and during the entire time that the Apple II was ignored by its own company, it continued to quietly climb in sales. It is a credit to both the ingenuity of Wozniak in his original design, and to the users of the Apple II in THEIR ingenuity at finding new uses for the II, that its value increased and stimulated yet more new sales. The Apple II "beat" the odds of survival that historically were against it.

THE APPLE IIIE: BEGINNINGS When Apple saw that the sales on the Apple II were NOT going to dwindle away, they finally decided to take another look at it. The first new look at advancing the design of the II was with a project called "Diana" in 1980. Diana was intended primarily to be an Apple II that had fewer internal components, and would be less expensive to build. The project was later known as
"LCA", which stood for "Low Cost Apple". Inside Apple this meant a lower cost of manufacturing, but outsiders who got wind of the project thought it meant a $350 Apple II. Because of that misconception, the final code name for the updated Apple II was "Super II", and lasted until its release.<5>

**THE APPLE IIE: HARDWARE**

Part of the IIe project grew out of the earlier work on custom integrated circuits for the Apple II. When they finally decided to go ahead and improve the design by adding new features, one of the original plans was to give the Apple II an 80-column text display and a full upper/lowercase keyboard. Walt Broedner at Apple did much of the original hardware planning, and was one of those at Apple who pushed for the upgrade in the first place. To help maintain compatibility with older 40-column software (which often addressed the screen directly for speed), he decided to make 80-columns work by mirroring the older 40 column text screen onto a 1K memory space parallel to it, with the even columns in main memory and the odd columns in this new "auxiliary" memory. To display 80-column text would require switching between the two memory banks. Broedner realized that with little extra effort he could do the same for the entire 64K memory space and get 128K of bank-switchable memory. They put this extra memory (the 1K "80-column card, or a 64K "extended 80-column card") in a special slot called the "auxiliary" slot that replaced slot 0 (the 16K Language Card was going to be a built-in feature). The 80-column firmware routines were mapped to slot 3, since that was a location commonly used by people who bought 80-column cards for their Apple II's, and was also the place where the Apple Pascal system expected to find an external terminal. The auxiliary slot also supplied some special video signals, and was used during manufacture for testing on the motherboard.

The engineers that worked on the IIe tried hard to make sure that cards designed for the II and II Plus would work properly in the new computer. They even had to "tune" the timing on the IIe to be slightly OFF (to act more like the II Plus) because the Microsoft CP/M Softcard refused to function properly with the new hardware. A socket was included on the motherboard for attaching a numeric keypad, a feature that many business users had been adding (with difficulty) to the II Plus for years. The full keyboard they designed was very similar to the one found on the Apple III, including two unique keys that had first appeared with the III—one with a picture of an hollow apple ("open-apple") and the other with the same apple picture filled in ("solid-apple"). These keys were electrically connected to buttons 0 and 1 on the Apple paddles or joystick. They were available to software designers as modifier keys when pressed with another key; for example, open-apple-H could be programmed to call up a "help" screen. The newer electronics of the keyboard also made it easier to manufacture foreign language versions of the Apple IIe.<6>

Overall, Broedner and Peter Quinn (the design manager for the IIe and later the IIC projects) and their team managed to decrease the number of components on the motherboard from over one hundred to thirty-one, while adding to the capabilities of the computer by the equivalent of another hundred components.

**THE APPLE IIE: Firmware**

Peter Quinn had to beg for someone to help write the firmware revisions to the Monitor and Applesoft for the IIe. He finally got Rich Auricchio, who had been a hacker on the Apple II almost from the beginning. Quinn said in a later interview, "You cannot get someone to write firmware for this machine unless he's been around for three or four years. You have to know how to
get through the mine field [of unofficial but commonly used entry points]. He [Rick] was extremely good. He added in all the 80-column and Escape-key stuff." Quinn also got Bryan Stearns to work on the new Monitor.<6>,<7>

Changes were made in the ROMs to support the new bank-switching modes made necessary by having two parallel 64K banks of RAM memory. To have enough firmware space for these extra features, the engineers increased the size of the available ROM by making it bank-switched. This space was taken from a location that had previously not been duplicated before—the memory locations used by cards in the slots on the motherboard. Ordinarily, if you use the Monitor to look at the slot 1 memory locations from $C100 through $C1FF, you get either random numbers (if the slot is empty), or the bytes that made up the controller program on that card. Any card could also have the space from $C800 through $CFFF available for extra ROM code if they needed it. If a card in a slot did a read or write to memory location $CFFF, the $C800-$CFFF ROM that belonged to that card would appear in that space in the Apple II memory. When another card was working, then its version of that space would appear. On the IIe, they made a special soft-switch that would switch out all the peripheral cards from the memory, and switch in the new expanded ROM on the motherboard. The firmware in the new bank-switched ROM space was designed to avoid being needed by any card in a slot (to avoid conflicts), and much of it was dedicated to making the 80-column display (mapped to slot 3) work properly.

Also added were enhancements to the ESC routines used to do screen editing. In addition to the original ESC A, B, C, and D, and the ESC I, J, K, and M added with the Apple II Plus, Auricchio added the ability to make the ESC cursor move work with the left and right arrow keys, and the new up and down arrow keys. The new IIe ROM also included a self-test that was activated by pressing both apple keys, the control key, and RESET simultaneously.<5>

THE APPLE IIE: SUCCESS The new Apple IIe turned out to be quite profitable for Apple. Not only was it more functional than the II Plus for a similar price, but the cost to the dealers selling it was about three times the cost of manufacture. They had gotten their "Low Cost Apple", and by May of 1983 the Apple IIe was selling sixty to seventy thousand units a month, over twice the average sales of the II Plus. Christmas of 1983 saw the IIe continue to sell extremely well, partly resulting from the delayed availability of the new IBM PCjr. Even after the Apple IIc was released in 1984, IIe sales continued beyond those of the IIc, despite the IIc's built-in features.<8>

THE APPLE IIE: MODIFICATIONS Early Apple IIe motherboard's were labelled "Revision A". Engineers determined soon after its introduction that if the same use of parallel memory was applied to the hi-res graphics display as was done with the text display, they could create higher density graphics. These graphics, which they called "double hi-res", also had the capability of displaying a wider range of colors, similar to those available with the original Apple II lo-res graphics. The IIe motherboards with the necessary modifications to display these double hi-res graphics were labelled "Revision B", and a softswitch was assigned to turning on and off the new graphics mode.

Later versions of the IIe motherboards were again called "Revision A" (for some reason), although they HAD been modified for double hi-res graphics. The difference between the two "Revision A" boards was that the latter had most of the chips soldered to the motherboard. An original
"Revision A" board that had been changed to an Enhanced IIe was not necessarily able to handle double hi-res, since the change to the Enhanced version involved only a four-chip change to the motherboard, but not the changes to make double hi-res possible.<sup>9</sup>

**THE APPLE IIIE: THE ENHANCED IIIE**  This version of the Apple IIIE was introduced in March of 1985. It involved changes to make the IIe more closely compatible with the Apple IIc and II Plus. The upgrade consisted of four chips that were swapped in the motherboard: The 65c02 processor, with more assembly language opcodes, replaced the 6502; two more chips with Applesoft and Monitor ROM changes; and the fourth a character generator ROM that included graphics characters (first introduced on the IIc) called "MouseText". The Enhanced IIe ROM changes fixed most of the known problems with the IIe 80-column firmware, and made it possible to enter Applesoft and Monitor commands in lower-case. The older 80-column routines were slower than most software developers wanted, they disabled interrupts for too long a time, and there were problems in making Applesoft work properly with the 80-column routines. These problems were solved with the newer ROMs.

Monitor changes also included a return of the mini-assembler, absent since the days of Integer BASIC. It was activated by entering a "!" command in the Monitor, instead of a jump to a memory location as in the older Apple[]. Also added were an "S" command was added to make it possible to search memory for a byte sequence, and the ability to enter ASCII characters directly into memory. However, the "I" command to disassemble 6502 code still did not handle the new 65c02 opcodes as did the IIc disassembler. Interrupt handling was also improved.

Applesoft was fixed to let commands such as GET, HTAB, TAB, SPC, and comma tabbing work properly in 80-column mode.

The new MouseText characters caused a problem for some older programs at first, until they were upgraded; characters previously displayed as inverse upper-case would sometimes display as MouseText instead.<sup>10</sup>,<sup>11</sup>

**THE APPLE IIIE: THE PLATINUM IIIE**  This version of the IIe, introduced in January 1987, had a keyboard that was the same as the IIGS keyboard, but the RESET key was moved above the ESC and "l" keys (as on the IIc), and the power light was above the "/" on the included numeric keypad (the internal numeric keypad connector was left in place). The CLEAR key on the keypad generated the same character as the ESC key, but with a hardware modification it could generate a Ctrl-X as it did on the IIGS. The motherboard had 64K RAM in only two chips (instead of the previous eight), and one ROM chip instead of two. An "extended 80-column card" with 64K extra memory was included in all units sold, and was smaller than previous versions of that memory card.

No ROM changes were made. The old shift-key modification was installed, making it possible for programs to determine if the shift-key was being pressed. However, if using a game controller that actually used the third push-button (where the shift-key mod was internally connected), pressing shift and the third push-button simultaneously causes a short circuit that shuts down the power supply.<sup>12</sup>

**THE APPLE IIIE: EMULATION CARD ON MACINTOSH LC**  In early 1991, Apple introduced a new version of the Apple IIe. This one was designed to be exactly like the 128K...
Platinum IIe, with the modification that it had a color Macintosh attached to it. This Apple IIe cost only $199, but the required Macintosh peripheral went for about $2,495, which makes the combination the most expensive Apple II ever made. Apple engineers managed to put the function of an entire IIe onto a card smaller than the old Disk II controller card. With version 2.0 of the Apple II interface software, more of the memory allocated to the Macintosh can be used by the IIe (strange way of designing an Apple II!). However, unlike all previous versions of the IIe, there are no hardware-based slots on the IIe card; instead, there are software-based slots that are allocated by moving icons that represent various peripherals into "slots" on the Mac screen. (Oh, yes; it runs some Mac software, too).

To use 5.25 disks with this Apple IIe, there is a cable that attaches to the card. The cable splits into a game connector (for paddles or joystick operation) and a connector that accepts IIc and IIGS style 5.25 drives. The IIe card runs at a "normal" (1 MHz) speed and a "fast" (2 MHz) speed.<13> It has limitations, however. For a 1991 Apple II, it is limited in being unable to be accelerated beyond 2 MHz (a Zip Chip can run a standard IIe at 8 MHz), and the screen response seems slow, since it is using a software-based Mac text display instead of the hardware-based Apple II character ROM. As a Macintosh it lacks the power and speed of the newer Macintosh II models (which also run in color). But if having a Apple II and a Mac in one machine is important, this is the best way to do it.

NEXT INSTALLMENT The Apple IIc

NOTES

<6> Williams, Gregg. "'C' Is For Crunch", Byte, Dec 1984, pp. A75-A78, A121.

This was an early version of the Lisa project. When the 68000 microprocessor became available from Motorola, it was decided to use that as a single processor for the Lisa. Also, after Steve Jobs paid a visit to the Xerox lab and saw the Xerox Star computer with its icon interface and mouse pointing device, he pushed strongly for the Lisa to work in that way.

READING GENieLamp

GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO

To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

| Name of sender | CATegory | TOPic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GENie

GENie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GENie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99368, GENIE and hit RETURN. The system will then prompt you for your information.

Notes From The Editor
TOP OF THE PAGE  The GENie RoundTables were a sure hummin' with activity
during the month of December! Thousands of messages
were posted throughout the system as well as many, many new files were
uploaded to the libraries. How does one sift through them all? You're
reading it! In this and every issue you will find the latest file
highlights from the library and juicy messages from the hottest topics in
the Computer bulletin boards. And as a bonus you get reviews, news and
computer related information too, all in one easy to get download. Best
of all, it's included in your GENie*Basic package making GENieLamp an
inexpensive means of staying in touch with what's happening in the Computer
RoundTables here on GENie.

Can I Upload GENieLamp To...  I'm still receiving GE Mail asking for
permission to post GENieLamp on other BBS's and information services. Folks, not only do we allow GENieLamp to be
uploaded elsewhere, we _encourage_ it! See LOG OFF elsewhere in this
issue for more details.

Changes Are Happening!  The GENieLamp staff is undergoing some changes.
As of the February 1st, Peter Bogert is resigning his position as editor of GENieLamp IBM. Taking his place is Robert
Connors, a.k.a. Bob, a.k.a. BobC, a.k.a. Bobsie. Bobsie is a long time SysOp of the Wildcat! Orphanage and former co-editor of our original online
magazine, TeleTalk Online.

My thanks to Peter for sticking with it as long as he did. (Peter was more or less drafted into the position. :) I am happy to say that Peter
will remain on the GENieLamp IBM staff as a library program reviewer.
Peter will also be doing the online interviews for GENieLamp.

In The Misc. Department  Two other important changes have taken place in
GENieLamp during December. Mike White took us up on our CowTOONS offer so many times, I appointed Mike to be our official
columnist. We're still accepting CowTOONS from "guest CowTOONists" so if
you would like to try your hand at ASCII art, drop us a line at GENieLamp.
Scott Garrigus has been doing the Online Fun column for so long we decided
to make it official and invite him on as a permanent staff writer.
Welcome Mike and Scott!

What? _Another_ GENieLamp?  That's correct! Last month we brought you
GENieLamp MacPRO, next month it will be
GENieLamp A2Pro. The last three issues of GENieLamp A2/Pro have easily
gone over the 200K mark so it was time to look at splitting the magazine up
into a more manageable size. The staff is now being assembled for the
Apple II Developers RT magazine so if you're interested in joining the
GENieLamp staff, now is the time to get your resume in. (GE Mail:
GENIELAMP) Starting on February 1, 1993 GENieLamp A2Pro will make it's
first appearance in the main menu in the GENieLamp (M515), the A2Pro (m530)
and the A2 (m645) RoundTables. Watch for it!

NEW GENieLamp Macintosh MACROS  The latest version of the GENieLamp
Module is smaller with a new better interface, online help and options for multiple downloads. This newest
incarnation has been incorporated into Erik Thauvin's "GEnie Navigator 1.1" for Microphone II. With GEnieLamp Module 3.0e, you can capture the new GEnieLamp MacPRO online or download its graphic version, as well as capture the online versions of any other Lamp, including the A2Pro issues starting in February.

GEnie Navigator 1.1 will be uploaded to the GE-MUG library (m605;3) the first week of January. The GEnieLamp Module will also be uploaded as a "stand-alone" module for Microphone II folks not using Navigator to GE-MUG and to the GEnieLamp Library (m515;3.). We're still working on the White Knight version of the module and should release it before the end of January. If you like to see it sooner write me and let me know. :)

Also if you're not reading the DocMaker versions of GEnieLamp Macintosh and GEnieLamp MacPRO, you're missing color graphics, an excellent index, and screen shots of the products reviewed. Plus beginning with the January issue, the "GE-MUG Gallery" returns with artwork from our members and perhaps we'll even start running brand-new cartoons. And it's all available only in the graphic versions of the Mac Lamps. —Jim Flanagan

Changes, Changes, Changes!

By Darrel Raines

[D.Raines]

>>> MORE GEnieLamp CHANGES ARE ON THE WAY! <<<

GREETINGS EVERYONE! I hope that Christmas this year was a time of joy for you and yours. I always enjoy the holidays as a chance to spend more time with my family.

More changes are in the works for the A2/A2Pro edition of GEnieLamp. You may have noticed that the size of the 'Lamp has grown over the past year to the point where it is a sizable download. With an electronic newsletter, we are not constricted on space. Our goal has always been to provide good information, interesting articles, and probing interviews in a timely manner.

The recent expanded coverage of the A2Pro area has inflated our size to the point that we feel that some changes are in order. The A2Pro area has sufficient events, bulletin topics, and other happenings to warrant separate coverage in its own GEnieLamp newsletter. Therefore, starting in February, we will have not one, but two separate issues of GEnieLamp covering the Apple II! This newsletter will continue to cover all of the A2 news fit to print. Our sister magazine for the A2Pro area will cover a more focused subject matter: topics of interest to A2Pro Roundtable.
participants.

Now you can have twice the fun on a monthly basis. GENieLamp for the A2 and GENieLamp for the A2Pro will be available separately starting in February.

Shareware Idea Exchange For those of you who were interested in the Shareware Idea Exchange that I proposed in an earlier edition of GENieLamp, read on. Four topics have been created in category 13 (Independent Developers Online) to start a dialogue on this subject. The topics are listed below. Please drop into these discussions if you are a programmer or a user with an interesting idea for a program.

Author and editor Darrel Raines (D.Raines) welcomes any feedback or comments via electronic mail to the listed user name.

Ohio Researchers Develop New LCD Researchers at Ohio's Kent State University have developed a new smaller, lighter, more energy-efficient liquid crystal display that they say could revolutionize portable computing.

Researchers at the university's Glenn H. Brown Liquid Crystal Institute say it took two years to develop a different type of liquid crystal material -- namely, polymer-stabilized cholesteric liquid crystal -- that allows a display to operate without a backlight.

J. William Doane, one of the display's inventors, said, "This is a breakthrough in reflective, front-lit displays. (It) is important because virtually all flat-panel liquid crystal displays manufactured today require
Apple II Computer Info

backlights (and it) will allow the batteries of the terminal to last much longer. Backlights are bulky and power hungry, draining most of the power from batteries of laptop computers."

The researchers as saying their invention also has full memory, meaning, says the wire service, "an image can remain displayed indefinitely without requiring an additional electronic charge and offering better contrasting images."

In addition, the new material can be used in plastic displays; existing LCDs require a glass screen.

Doane says patent applications have been filed and work is under way to develop color displays and to achieve display speeds fast enough for television.

Japan Starts Project for Human-Like Approaches to Computing
Japan has launched a 10-year project to teach computers to mimic the human brain, an effort called Real-World Computing Partnership that backers say will benefit fields as diverse as agriculture, medicine and education.

Reports from Tokyo say the project "aims to develop software that would enable computers to escape from their traditional number-crunching role and think in the kinds of ways humans do."

Hajime Irisawa, executive director of the project, told a news conference, "Our computer will have quite excellent intuitive sensory power. The scientific impact, the industrial impact and the social impact will be quite significant."

The Japanese government is putting up 90 percent of the project funds and that 14 private institutions are taking part, including Hitachi Ltd., NEC Corp. and Fujitsu Ltd.

Microsoft Faces Injunction Action
Attorneys investigating Microsoft for the Federal Trade Commission have requested the agency's permission to seek a premliminary court injuc- tion to stop alleged monopolistic practices, a Washington, D.C. news- letter has reported. The action was the latest move in a lengthy inves- tigation into Microsoft's pricing practices and, if pursued by the FCC, could force the software manufacturer to change the way it deals with thousands of computer makers who buy its MS-DOS operating systems.

Novell Denies Apple Merger Talks
Novell Inc. is denying a report in the San Jose Mercury News that said the networking giant was negotiating a merger with Apple Computer Inc.

"There is no truth to that," said a Novell spokeswoman. "We're always in industry discussions with them, but we're not having discussions with them about merging."

An Apple spokesman declined to comment on the report.

The Mercury News said talks between Apple Chairman John Sculley and
Novell Chairman Ray Noorda were a closely held secret and only known by an elite group of senior executives at the two firms.

Chip Shipping Ratio Up In November   The U.S. chip industry's book-to-bill ratio rose to 1.13 in November, up from 1.11 in October, according to the Semiconductor Industry Association trade group. A 1.13 book-to-bill ratio means that for every $100 of products shipped, or billed, manufacturers received $113 in new orders, or bookings.

Former Computer Whiz Kid Caught   Kevin Poulsen, a former Silicon Valley computer whiz kid, has been charged with stealing Air Force secrets that allegedly included a list of planned targets in a hypothetical war. The 27-year-old Los Angeles resident was named in a 14-count indictment that includes a charge of gathering defense information. If convicted, he would face 7-1/2 to 10 years in prison.

In the early 1980s, Poulsen was accused of breaking into UCLA's computer network, but he escaped prosecution because he was a juvenile. He later went to work for Sun Microsystems. It was while Poulsen was employed by Sun that he illegally obtained a computer tape containing an order concerning a military exercise code-named Caber Dragon 88, the government said in court papers.

Poulsen was also charged in 1989 along with two other men with stealing telephone access codes from a Pacific Bell office, accessing Pacific Bell computers, obtaining unpublished phone numbers for the Soviet Consulate in San Francisco; dealing in stolen telephone access codes; and eavesdropping on two telephone company investigators. Sources say he remained at large until a television show elicited a tip that led to his capture in April 1991. He is scheduled to be tried in March on these charges.

>>> HOT TOPICS <<<
APPLE IIgs?  Well friends & neighbors, I called the Apple Customer Assistance Center (1- 800-776-2333) twice today and around 4:50 p.m. I spoke to a guy named Shawn. Told me that Apple had gone and discontinued the IIgs, effective 12/14/92, apparently confirming our worse fears. I say apparently because when I called earlier today 10:00 p.m. EST, the guy I spoke to told me that he had heard that the IIgs was going to be discontinued but had no further info.

On the skeptical side, Shawn told me that a new price list had NOT been released as of close of business today. The rumor I had heard involved the IIgs being dropped from the price list on 12/15.

In the "what else is new dept.", he told me that there was no official confirmation from Apple (read "press release" or "bulletin"), as of yet. He could just offer the VERBAL confirmation.

Real Apple Information or Real Apple Misinformation?  You decide.

TTFN, Larry ;-) )

P.S.- I chose to post this here and NOT in "Confirmed News" for obvious reasons.

L.FAUST2, CAT2, TOP5, MSG:146/M645;1

[*][*][*]

!!!!!!!!!!!!!!!  Much shouting, name-calling and general anguish followed the speculation and then confirmation (of a sort) that the IIgs was going to be discontinued. One of the most discussed events involved a report by some of the Bay Area Apple User Group (BAAUG) members concerning a meeting with Apple representatives. The following posts exemplify the information you can find in this topic.

[*][*][*]

REACTIONS TO THE NEWS  Now that the cat's out of the bag, allow me to add a bit more information that I gleaned from that meeting (BAAUG and Apple), and from talking to John Santoro later that evening at a user group meeting.

- Apple wanted to do a IIgs Card for the Mac LC, and looked into it, but found that they couldn't make one for less than the cost of the Mac itself.

- Apple will not license the Apple II ROMs to a third party for three major reasons:
  
  I.  It is proprietary technology.
  II.  Apple is now a competing product to the Apple II, the Mac LC.
  III.  The Apple logo must be licensed with the ROMs. Any action that a third party takes while using the Apple logo reflects on Apple Computer, Inc., whether good or bad. This is unacceptable.

- No new Apple II hardware is expected to be developed by
Apple Computer, Inc. after the Apple II Ethernet card is released.

- System software tweaks such as printer drivers for new Apple printers are expected to continue. One large thrust will be continued network and printer compatibility.

- HyperCard GS and Apple IIgs System Software 6.0 were done partially to give Apple IIgs users "a taste of the Mac" in the hope that they would eventually migrate to that platform.

- Apple is actively investigating a PowerBook-style mail-in service plan for all Apple II users.

- The much-rumored "ROM 4" Apple IIgs was to have the following features: Built-in 40MB hard drive, built-in SuperDrive, 2 Meg RAM, System 6.0 tools in ROM, DMA SCSI port, HyperCard GS bundled with the machine. It would have retained the 2.8 Mhz processor speed of the previous versions of the IIgs.

- Part of the delay in the development and release of System 6.0 was because of the cancellation of the "ROM 4."

- A re-engineered Apple IIgs was investigated, solely to lower production costs (continued production could be justified for a longer time with lower costs) but it never even got past the idea stage.

Finally, with all this darkness, I'd like to add a little light. Regardless of the actions of Apple Computer, Inc., A2 and A2Pro, the Apple II RoundTables on GEnie, have pledged to do everything we can to support you, the Apple II user, for as long as you continue to call this system. We will be here, as strong as ever, and in fact growing in size as we continue to add direct online support from more third party Apple II companies, for many, many years to come. As long as you, the users of A2 and A2Pro, continue to support us by your presence here, we will support you in any way we can. There is no question as to where OUR loyalties lie. We all love our Apple IIs, and we will not give them up! Apple II Forever!

-= Lunatic E'Sex (A2.LUNATIC, CAT5, TOP4, MSG:18/M645;1)

I'd like to add a few comments.

First off, I attended the meeting at Apple as a representative and officer of two Apple II User Groups. I was not there to represent inCider/A+. (Of course, as soon as I left the meeting, I did call inCider/A+ and offered them "the scoop of the decade", and in a later phone conversation with an inCider staffer, John Santoro confirmed that the Apple IIIGS would be "removed from the price list" before the end of 1992.)

Second...I grappled with it, and I made the decision to not broadcast this information. With the holiday season just starting, I didn't want to be thought of as the guy who announced the death of the IIIGS. As anyone who knows me knows, I aspire to be known as the world's biggest supporter of the Apple II; I've often been heard to say that I want to be remembered as the person who saved the Apple II.
Third...To my great surprise, there was not a lot of anger at the meeting. In fact, everyone remained very civil. I personally want to say that I was not entirely surprised by Apple's decision to cancel the Apple IIGS. And, in an odd sort of way, I breathed a sigh of relief at the announcement.

I feel as if all of us, myself included, have spent entirely too much time over the past several years wondering about Apple Computer Inc, and what they were going to do. In many ways, it's been wasted energy.

As I left the meeting, I thought "now we know what Apple has planned, so to hell with them, and let's get on with, and back to, business".

IMHO, the Apple IIGS will not die. Over the past several years, I've often thought of the Apple II "as the computer that refuses to die". The fact that Apple intends to stop producing the IIGS makes no difference to me. My computer is just as powerful and fun to work with today as it was one month ago. Apple's decision will never take anything away from how I feel about the IIGS. It has, however, changed the way I feel about Apple Computer Inc.

As I have said often in the past year, it's very important for us as Apple II owners to support those who support us. That's even more important now. If we want Seven Hills and Quality and WestCode and Vitesse and Sequential Systems and TMS (and on and on...the battle lines are clear...you know who supports you) to remain with us over the years, we absolutely must support them now with our wallets!!

Now, speaking as a guy who has made 100% of my living for the past 6 years working with and for the Apple II...

I am personally obsessed with the Apple II. I do not have any intention of leaving the Apple II. I will continue to write for inCider/A+ and Softdisk G-S and anyone else that wants me. I will continue to make freeware and shareware disks available to my Shareware Solutions readers. I will continue to be involved with Apple II User Groups. I will continue to volunteer my time to assist non-profit organizations that use Apple II's. In short, I am in for the long haul.

I love the Apple II, and nothing that Apple Computer Inc does will change that! Long live the IIGS! Long live the Apple II family of computers. And, long live those who will continue to produce hardware and software for the Apple II. -Joe Kohn

(the above views are mine, and mine alone. I do not speak for any organization) (J.KOHN, CAT5, TOP4, MSG:23/M645;

>>> A2 ODDS & ENDS <<<

GOOD TIP! Sometimes one will get 3.5" disks, where the write protect tab has been permanently removed. Those disks can't be written to, because they are write protected permanently. No longer!! Just take a write protect strip from 5.25" disks, declare it to be a write enable strip and cover the hole on the 3.5" disk with it. You're now able to reformat the disk and store some information on it. If it's information that mustn't be changed in the future, just remove the strip covering the hole and the disk
will be write protected again and you don't risk losing your data. BTW, it has to be an opaque strip, see-through material won't do.
(U.HUTH, CAT2, TOP4, MSG:196/M645;1)

>>> The trick with using 5.25" write protect strips to write enable a 3.5" will also work when you have a Superdrive, and a High Density disk, but do not want it formatted High Density (HD). You just put the strip on the other side. (We've only tested this with the AE drives so far.)
(A2.SUSAN, CAT2, TOP4, MSG:197/M645;1)

PRINTING DHR GRAPHICS To print out DHR graphics, you need a program called Photomatrix. It will work on IIe & IIc, but requires an ImageWriter printer. If you have something else, you could be out of luck for the printing part.

To view DHR graphics (& other kinds, too), you need the program Sneeze. It will work with any II & does lots of other neat stuff.

Both these files are in the library.

18768 SNEEZE.BXY V2.2 X K.BUNKER
Desc: Popular file viewer/program launcher
14547 PHOTOMATRIX.BXY X T.KONCZAL
Desc: Great double hires print utility

-Pat Kern (as forwarded by Tim Tobin)
(A2.TIM, CAT3, TOP8, MSG:27/M645;1)

MORE DISK TIPS The SOS disk format is completely identical to the ProDOS disk format, except for a small difference in the boot block which is, for the most part, totally irrelevant. You can stick any SOS format disk into an Apple II and it will work just like a ProDOS disk, and vice-versa. GS/OS uses the ProDOS FST, and this will read SOS disks no problem (because ANYTHING that reads ProDOS disks can read SOS disks).

File types work exactly the same under SOS, too. Several file types are used by both machines, such as TXT and BIN. SOS has a few that are reserved for itself, but these are rare and basically not relevant.

I imagine that Apple Writer II would read Apple Writer III files automatically - in fact it probably couldn't even tell the difference (i.e. the file formats are almost certainly COMPLETELY IDENTICAL and neither version of Apple Writer would know the difference).

SOS was a really good operating system. Whole chunks of the ProDOS kernel are byte-for-byte identical with chunks of SOS in fact - since they're both 6502-based machines with a lot of shared architecture, that's not surprising. -Dean Esmay
(A2.DEAN, CAT7, TOP6, MSG:95/M645;1)

SOFTWARE LOST AND FOUND I always thought the same thing: that Police Quest II and Space Quest III were never even developed for the Apple IIgs, but a Sierra rep (who has a IIgs) at a Scorpia Roundtable Conference told me differently. According to him, those titles are not nonexistent, just very rare; I backordered them several years ago when they first appeared in advertisements (for the GS), but I got a letter saying they were discontinued. :-(
(S.STUART2, CAT2, TOP22, MSG:84/M645;1)
DOLLARS AND SENSE   The marketing and development rights to Dollars and Sense for all platforms (MS-DOS, MAC, DOS 3.3, and ProDOS) are now owned by:

   Business Sense, Inc.
   6360 Moki Circle
   West Jordan, Utah 84084

   Phone:  800-377-4954
   FAX:    800-377-5453

   They are currently offering all versions at special promotional prices. Might be of interest to the Dollars and Sense fans lurking here.

   -Hank  
   (H.WESEL3, CAT8, TOP5, MSG:102/M645;1)

SPECIAL PRICE INFORMATION   Purchase one (Mac, IBM, Apple II) for $39.95 and you can purchase any number more at "two" for $39.95. It makes no difference if you mix Mac, IBM, or Apple II. I had two people in my church that wanted IBM versions so we split the total cost three ways. The more people you get involved the better the deal. They are backlogged on the Apple II orders. The person I talked with on the phone said they were swamped with orders from Apple II users. From what I understand they plan on continual upgrades and support for the Apple II version in the future. [*] Vic B.[*] 
   (V.BENTLEY, CAT8, TOP5, MSG:119/M645;1)

LESS SOFTWARE?  NOT!   Whoever above said he was sorry to see less and less new software needs to look again - I see more new IIgs software coming out today than a year ago, or two years ago, or three, for that matter. We're in good shape, with a good computer.

   Commodore hasn't (enhanced the) Commodore-64 in a good five years, yet THEY manage to maintain a thriving community and new software STILL comes out for that machine. And a C-64 isn't nearly as nice or as powerful as a IIgs. Think about it. :-)  -Dean Esmay 
   (A2.DEAN, CAT5, TOP4, MSG:34/M645;1)

>>> F.Y.I. <<<

ALTERNATIVE NETWORKS FOR GENie   SprintNet is the new name for Telenet, one of the major public data networks. It has many local nodes throughout the country. There's a $2 per hour surcharge to use SprintNet for GENie access, though. You dial up a local node, tell SprintNet what system you want to connect to, and it connects you. You can reach systems like Dialog, Knowledge Index, and Dow Jones News/Retrieval through SprintNet. It's well worth knowing about, even if you don't want to use it for GENie.

   You can get the details from GENie for free under PHONES. 
   -Bill Dooley  (A2.BILL, CAT3, TOP13, MSG:6/M645;1)

GENie SLOWDOWN?  HERE'S WHY   Here's an explanation of the problems we've had with slow system response these last few days:

   > GENie User's RT  Category 1,  Topic 10
> There is no question that system performance has been atrocious
> the last two nights. We have been in the middle of a system
> reconfiguration that (believe it or not) is intended to improve
> GEnie performance. We were at least as surprised (and dismayed)
> as you folks by the current results. There are a number of
> things we can do to alter the new configuration to address the
> current problems, and we will be making changes again today. I
> wish I could say that all will be well tonight, but I can't. We
> went with the intuitively correct configuration Monday and were
> proven very wrong, so it may take us more than two tries (last
> night's was clearly a bummer) to get it right.

> GEnie is a distributed system, and all of the bulletin boards,
> software libraries and real time conferences are on different
> systems (which we're not messing with) so you should see good
> performance once you get there even if it's painfully slow
> getting there. I'm convinced the changes we're making will
> ultimately make for a better, more responsive, GEnie, but I
> admit I grossly underestimated the difficulty of the transition.
> My apologies to all who have been inconvenienced.
> John

-Bill Dooley      (A2.BILL, CAT3, TOP13, MSG:12/M645;1)

(Sometimes the average GEnie user is not aware of happenings that
affect them online. A2 strives to bring information of this sort the
attention of all. Well informed users = Happy users. -Ed.)

>>> WHAT'S NEW? <<<

HYPER-PAST AND FUTURE   For general information: Roger Wagner Publishing,
                        Inc. started under the name "Southwestern Data
                        Systems" in August, 1978, and is, I believe, THE oldest
                        operating company providing Apple II products other than
                        Apple Computer, Inc.

                        Our newly announced HyperStudio for the Mac has been described as "an
                        addition, not a transition", and it's as good a description as any of our
                        current position.

                        We have a number of new Apple II-related products still under
                        development, and only one Mac product: HyperStudio for the Mac. Our
                        company mission at this point is to provide the best personal multimedia
                        authoring tools available, particularly for K-12 education, but also suited
                        for home and family users. In that direction, we also intend to continue
                        our position as a valuable resource for anyone with questions about
                        multimedia.

                        Regardless of what Apple Computer does with the Apple IIGS on their
                        price list, the Apple IIGS remains the best bargain for personal
                        multimedia, and offers the most capability for the vast majority of users.
                        Sales of new Apple IIGS computers have been diminishing for some time now,
                        primarily due to the success of those who would like to sell other models
                        in convincing the public at large that the Apple IIGS is a dated and
                        insufficient machine.
For myself, I will continue to use the Apple IIGS as my primary presentation tool, and show people what the machine offers. For those with eyes to see the value there, the machine remains an exceptional value.

I deeply appreciate the support given to me and my company over the past many years by computer users the world over, and hope to continue to earn that support by our continued enthusiasm for personal creativity and expression via the personal computer.

By the way, the summer of 1993 will offer the first "HyperStudio Festival", to be held in San Diego, California. I hope to see you there!

-Roger Wagner  (ROGER.WAGNER, CAT5, TOP2, MSG:24/M645;1)

[*][*][*]

In the following sections we present a variety of interesting posts that have appeared during the last month in the bulletin boards for A2. These messages can be identified by the footer attached to each item. (See the introductory notes on how to interpret the footer.) If you find the topic, excerpt, or just the interplay between various people to be stimulating, then please jump to that topic on a weekly basis and read about developments in the Apple II community. Our hope is that you will find something new and interesting each month in the A2 bulletin boards. If you are serious about your APPLE II, the GEnie Lamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

/"Well, I have time on my hands every evening 6 'til Midnight. /

Quayle Season Is Almost Over!
""""""""""""""""""""""""""""""""""""""""""""

By Charles Johnson

[CODEHEAD]

>>> POLITICAL PONDERINGS <<<
""""""""""""""""""""""""""""""""""""""""""""

WE'RE GONNA MISS YA!  I always get a kick out of people who say, "The "media picks on Dan Quayle" and "Quayle's not so bad!"  Hey, just because everybody says he's a moron doesn't mean he isn't!

The fact that Dan Quayle could reach the second-highest office in the land says something deeply terrifying about American politics.

But in a way, his retirement from the vice presidency is also very
How can we ever forget his chihuahua-like attack-dog strategy, in the
debate with Al Gore? ("You know what you're doing? You're pulling a
Clinton!!!") His wonderful way of paraphrasing fables and aphorisms? (Like
the time he said, "Give a man a fish and he'll fish for a day; teach him to
fish and he'll fish for life.") Or his monumental gaffs -- like when he
posed for a picture in El Salvador with a grenade launcher aimed at his own
elbow?

How can we ever forget that picture in Time magazine of J. Danforth
Quayle with a fly resting between his eyebrows?

I had to stop typing for a while to laugh at that one again. He he
he.

Or the time he visited the cleanup workers at the Exxon Valdez oil
spill, and told them to "have a great day!" Or the fact that he voted for
a special tax break ... for golf pros???

One of my favorites, Quayle explaining why he favors sending humans
to Mars (this is a direct quote): "Mars is essentially in the same orbit.
Mars is somewhat the same distance from the sun, which is very important.
We have seen pictures where there are canals, we believe, and water. If
there is water, that means there is oxygen. If oxygen, that means we can
breathe."

This is funny, funny stuff, and it wasn't just every once in a while.
Compilations of his hilarious misstatements and slapstick clowning fill
books. Republican, Democrat, liberal, conservative, who cares? Danny boy,
yer a certified stalk of broccoli, but arrr, we'll miss ye!   - Charles

What's Up Doc?
""""""""""""""""
By Jim Couch
[J.COUCH]

>>> A2PRO REORGANIZES <<<
""""""""""""""""

December was a busy month in A2 Pro. Probably the biggest news was the
reorganization of the Roundtable. Most of the categories have remained
essentially the same but some have changed a bit. Some topics have been
moved to more appropriate categories. The biggest change is that Byte Works
has formalized their support in A2 Pro and they have their own category.
Here is a list of the current A2 Pro categories:

CATEGORY 1: A2Pro Roundtable Business
CATEGORY 2: Programming in 6502 Assembly
CATEGORY 3: Programming in 65816 Assembly
CATEGORY 4: Programming in C
CATEGORY 5: Debugging
CATEGORY 6: Programming in Pascal
CATEGORY 7: Programming with ProDOS 8 and other 8-bit Operating Systems
CATEGORY 8: Programming with GS/OS and ProDOS 16
CATEGORY 9: Programming in BASIC
CATEGORY 10: Tools and Utilities for Programmers
CATEGORY 11: Algorithms, Design, Data Structures and File Formats
CATEGORY 12: Hardware and Peripherals
CATEGORY 13: Developer Information Center
CATEGORY 14: Other Programming Languages
CATEGORY 15: Using the Apple IIgs Tool Box
CATEGORY 16: Developer and User Lounge
CATEGORY 17: Communications and Networking
CATEGORY 18: HyperMedia Programming
CATEGORY 19: Development Environments and Shells
CATEGORY 20: DAs, Inits, Control Panels, Modules, Parts and Friends
CATEGORY 21: The Human Interface and You
CATEGORY 22: A2 University
CATEGORY 30: Procyon, Inc. Online
CATEGORY 31: Softdisk Publishing Online
CATEGORY 32: Morgan Davis Group (MDG) Programmers' Exchange
CATEGORY 33: GS+ Magazine Online
CATEGORY 34: JEM Software Online
CATEGORY 35: Lunar Productions Online
CATEGORY 36: The Byte Works Online

Welcome to Byte Works Online. For those of you who enjoy the fine support that Byte Works provides in A2Pro, but had trouble finding them things just got easier. All of the Byte Works topics can now be found in Category 36! Mike Westerfield has provided wonderful support to Byte Works customers via A2 Pro for ages. Byte Works has formalized that support with official participation in Category 36. The many Byte Works topics, which were formerly spread throughout A2 Pro are now gathered into one category. Byte Works also now has their own A2 Pro library, #36!

As if all this weren't enough Mike Westerfield joined the A2 Pro folks in a Real-Time Conference December 13th to talk about the upcoming ORCA/C v2.0! A transcript of the RTC is available in the A2Pro library.

Category 36, The Byte Works Online currently features 29 topics dealing with the numerous Byte Works products available to Apple II programmers:

CATEGORY 36 : The Byte Works Online
====================================
1 The Byte Works, Inc.
2 Catalog
3 Rumors, Wishes and Vaporware
6 ORCA/M 8-bit Assembler
7 ORCA/M 8-bit O/S Source
8 ORCA/M 8-bit Floating Point Libraries
Apple II Computer Info

9 ORCA/M 16-bit Macro Assembler
10 ORCA/Pascal
11 ORCA/C
12 ORCA/Integer BASIC
16 The ORCA Shell
17 Linker
18 Text-Based Editor
19 Prizm Desktop Development Environment
20 Utilities
21 Learn to Program Pascal
22 Toolbox Programming in Pascal
23 Learn to Program C
24 Toolbox Programming in C
25 Programmer's Reference for System 6.0
26 ORCA/Disassembler
27 Design Master
28 Talking Tools
29 ORCA/Debugger

But Wait There's More! Byte Works is not the only company that offers online support in A2Pro. Many other companies offer formal support via the roundtable and our listed in the Categories above. Here is what is happening with some of them:

PROCYON, INC Procyon will be shipping 'Switch-It' very soon. 'Switch-It is a multiple application switcher for the GS. Also on the horizon from Procyon is an update to GNO/ME their UNIX like multi-tasking environment. Check out Category 30 for all the details.

MORGAN DAVIS GROUP Morgan's 'History Buffer' is a regular on-line newsletter you can find in Category 32. This newsletter contains information about goings-on at MDG, and other interesting tidbits. EVERYONE should check this out, even if you are not a programmer or MDG customer. Morgan's little on-line newsletter is well written and entertaining!

JEM SOFTWARE Ultra 4.1 is now shipping and INCLUDES Ultra Extras! The improvements, added features, new utilities and capabilities over UltraMacros 3.X are nothing short of amazing! To get all the information on this new Appleworks programing language (macros long ago ceased to adequately describe this product) check out Category 34.

LUNAR PRODUCTIONS If you are a registered owner of Foundation be sure to check out Category 35. The latest version of Foundation (1.0.2) is a free upgrade to previous purchasers and is currently shipping.

A2U News A2U continues to roll along. Will Nelken's fine Ultra 4.x class is finishing up with a contest for all participants. Check out Category 22, Topic 22 to see who will win the coveted Ultra 4 to the MAX T-shirt.

If you wanted to get involved with Andy McFadden's 'Hacking Data Compression' course now may be your chance. Andy is busy working on his new file compression program for Westcode (HardPressed) and the class has slowed for a bit. Now might be a good time to jump in and get caught up. Once HardPressed is finished Andy's class will be back up and rolling. Check Category 22, Topic 23 to get involved.
Ultra Extras Becomes Ultra 4.1

Roger, as I've been telling folks whenever possible, Ultra 4.1 _is_ a updated Ultra 4.0 along with Ultra Extras. There is no separate UE disk, or separate U4.1 disk w/o UE. JEM Software now offers one product only, Ultra 4.1, which is priced at the combined Ultra 4.0 and Ultra Extras price of $60, apart from any special offers. In other words, you now have no choice—if you want Ultra 4, you will get Ultra Extras, like it or not. :-) Ultra Extras is dead, long live Ultra 4.1!

(BRANDT [Randy], Category 34, Topic 8, Message 21, M530;1)

Ultra 4.0 - 4.1 Changes

> Can you list the bug fixes/new features/changes for 4.0 to 4.1?

Yes. Oh, you weren't just wondering if I could, you actually wanted me to do it? Here goes, off the top of my head:

  o updated clock init solves some early problems, displays according AW date/time settings
  o updated Debug 2.0 adds more power including breakpoint debugging
  o added oa-H init does screen shots to clipboard or printer
  o Macros2Menus lets you convert macro programs to TimeOut apps
  o macro titles allow you to pick a macro from a scrolling list without having to know the keystroke command; just press SA-Esc from the macro menu, paralleling OA-Esc for the TimeOut menu
  o 60 new dot commands add everything from handy menu stuff like boxes, scrolling lists, etc., to extended math for BIG numbers, new input commands such as .getvalue, .getstring, .getinput, commands to search and sort string vars, returns dates in various formats, draw thermometers to display macro progress, etc. You can even change the speed macros run at to create hands-off demos, and if you have a IIgs you can change screen colors, and get the time with seconds.

(BRANDT [Randy], Category 34, Topic 2, Message 7, M530;1)

Announcing GSTape version 2

County Line Technology announces a new release of its premium tape archival program. GSTape is a fully file oriented, backup and restore utility for the Apple IIGS, offering the convenience that GS owners have come to expect in a desktop program, and providing power that advanced productivity users appreciate. Among the current users of GSTape include companies, government agencies, schools, bulletin boards, and others who demand the convenience of tape backup.

The new version continues to provide the original GSTape features such as: incremental backup, image backup, multiple backups per tape, point and click selection of files/directories/volumes, numerous restoration choices, backup logging, friendly prompts and warnings, etc.

Version 2 adds RamFAST support, System 6 and HFS compatibility, backup scripting, timed backups, and a new fast backup mode for ProDOS partitions and streaming tapes (4-5 megs per minute using a Teac or Archive drive and a DMA card).

System Requirements

  o Apple IIGS with 2 megs memory
  o GS/OS System 6
  o Apple SCSI card (rev C or HSDMA) _OR_
  o C.V. Technologies RamFAST SCSI card (Rom 3.0 required)
Tape Drives

- Apple (3M) 40 meg
- Teac SCSI 60 or 150 meg
- Teac SASI (CMS/Sider, RamFAST required)
- Archive Viper 150/250

Availability

GSTape can be purchased directly from County Line Technology for $35 US, check or money order, shipping included. Rev 1 owners may upgrade for $15 (include serial number). Demonstration disk available for $5. Add $5 for shipments outside of the USA.

(TGRAMS [Tim], Category 1, Topic 4, Message 49, M530;1)

Jim Murphy to Intern at Apple

I am pleased to do another "Local Boy Makes Good" announcement with his permission, even though I had little to do with it:

Our own Jim Murphy (A2PRO.JIM) has accepted an intern position with the Apple II Continuation Engineering group beginning in January.

Jim is a junior at Drexel University in Philadelphia, PA, studying computer science. Through the normal Apple intern program, he'll be helping our friends Dave Lyons and Tim Swihart and company produce things like 6.0.1 and beyond before returning to Drexel sometime in late 1993 to continue his studies.

(At least in theory -- I started out on a five-month internship in March 1988 and I never went back. Go figure.)

Jim's been responsible for the past six months (has it been that long already?) for helping answer questions here in the bulletin board, maintaining our product support and beta-test areas and generally being helpful. He's also the author of Big Edit Thing, Big Crunch Thing and is the chief designer and author of ScriptEdit and HexEdit, the generically-useful editing parts of Foundation, Lunar Productions' resource editor for the Apple IIgs.

Jim will be continuing his work here in A2Pro before and after his move to California later this month, because he knows that since he'll be local, I'll pummel him about the upper torso if he tries to quit.

Please join me in congratulating Jim on taking on a lot of thankless work for not nearly enough credit. :)

--Matt (I speak for myself, not for Apple)
(M.DEATHERAGE, Category 1, Topic 17, Message 44, M530;1)

Softdisk Looking for Programmers

Softdisk Publishing is now accepting applications for in-house programmers. If you can program in 6502 or 65816 assembly, enjoy short-term projects and are willing to relocate to Shreveport, LA, send your resume to:
Why You NEED those Tech Notes

Believe it or not, a common mistake a lot of programmers make is thinking that they Toolbox References are Correct. In fact, the technotes are just as, if not more important than having the references. There are _tons_ of corrections, examples, clarifications in the technotes that you really need to know.

If you have trouble downloading, you can purchase (and when you consider that you are paying $6 an hour to download, the price isn't that bad) the entire set of technotes (over 200 of them) from Resource Central. You can also just get specific groups: only GS/OS or only IIGS, but I recommend getting them all just to be safe. The price for all of them is about $60 and well worth it.

(SOFTDISK.INC [Zak], Category 13, Topic 8, Message 91, M530;1)

Who's Who In Apple II

By Phil Shapiro

>>> WHO'S WHO? <<<

'""""

~ A GENieLamp Profile of Ellen Rosenberg ~

Editor-In-Chief: A2-Central Newsletter

GENieLamp> Ellen, can you tell us a little about how you first became involved with Apple II computers?

Ellen> My life as a computer-obsessed person started only about four years ago with a Laser 128 computer. My son started pestering his dad for a computer (I didn't need convincing) when he was about four and won the battle when he was ten. It took us that long to convince the major breadwinner that a computer was more than just another screen to sit in front of. Actually, I don't think that we ever did convince him but he got tired of fighting the war. We couldn't talk him into a genuine Apple and we didn't mind starting with a clone. I was hooked from day one, so
much so that a few months later I asked for a printer for Mother's Day and a modem for our anniversary one month later.

The modem opened up worlds unknown. I lost neighborhood friends but gained online ones. My phone was constantly busy, the common things that a stay-at-home mom normally did, suddenly didn't get done. I got active in my local user group and took on the editorship of the user group newsletter. I had taught school full time before I had children and very part time afterward but I must admit that doing the editing thing grabbed me in a way that I hadn't been grabbed before. I'd found myself.

Well, I'd found myself but my husband felt like he was losing me. "If you're going to fool around on the computer all day long," he said, "why don't you find a way to be paid for it?" This was getting serious. He meant it. So my brain went into gear.

GENieLamp> When and how did you come to work for Resource Central?

Ellen> A fitting second question. <grin>

""""""
When we first got that Laser 128, I started reading inCider and A+ magazines. I believe that was the time that inCider (or was it A+?) cited A2-Central as the best Apple II publication around and noted that its publisher and founder Tom Weishaar, lived in Overland Park, Kansas. Incredible, I thought. I'm living in the same town as this famous newsletter publisher! I called and asked for the two issue free trial subscription, but decided after perusing the publication that it was "too technical" for me. I passed on paying for a yearly subscription.

Well, I guess that A2-Central and I were meant to be, because a few months after my free trial ended, I won a year's subscription at our user group's summer picnic. The more I read, the more it all made sense. While I might not have understood everything in every issue, it was beginning to seem less daunting.

This was all about the time that laundry was piling up at home, home-cooked meals were becoming scarce and my family was becoming more jealous of the time I spent with my computer. We traded in the Laser 128 for a used Apple IIgs that a neighbor was selling. Had it been left up to me, we would have kept the Laser 128. But selling it was conditional to buying the IIgs.

My husband continued to complain about my hours on the computer and I knew that I'd have to find a way to make a living at this or else. It seemed more than ironic that A2-Central's office was a few miles from my house. At that time the KansasFest conference was a few months away. I was drooling to go but knew it wasn't in the budget.

There had to be a way. I knew a couple of the guys from the user group who worked at A2-Central, but had never met Tom Weishaar. I decided to write a letter to him and for months composed clever letters in my head. Finally, one day I took a deep breath, sat down and wrote (actually typed) an unsolicited plea for employment. I didn't know the guy and if he read my letter and laughed cruelly as he threw it in the trash, I'd never know it and he'd never know me.

To my surprise, a few days after I wrote that letter he called. We met for lunch and the rest is history. I started work at the end of April,
1991 as a "front end" type person doing, among other things, low-level customer support. After six or seven months Tom asked me to take over the editorship of A2-Central. Big city girl makes good in small town. I still say that the unedited version of this story would be a great article for one of those Good Housekeeping success stories.

GEnieLamp> Many admirers of A2-Central would be keen on hearing how the publication is put together each month. Can you tell us briefly about what goes into assembling the publication each month? What are the parts of the work you like best?

Ellen> I get submissions from various people or former editor Dennis Doms writes an article or two. After looking over the submissions, I decide what I'm going to use each month. Once that decision has been made, I usually edit the copy in Classic AppleWorks on my IIgs. I write the Miscellanea column and the Ask (or Tell) Uncle Dos section that way as well. When the text approaches printable form, I dump it all into QuarkExpress on the Mac and do the fine print stuff like bold-facing and other style details. I try to remember to change the page numbers and the issue dates on the templates and only have slipped twice in the year that I've been doing this. (That's a record, I think. Or I may be tied with Tom Weishaar, but he's been publishing newsletters for years and years.) Before the newsletter leaves our office, Tom always give it the final once over. Then it goes to a commercial art service to be readied for the printer.

GEnieLamp> Any amusing anecdotes about office life at Resource Central?

Ellen> Lots of amusing anecdotes really, but I wouldn't want to spoil our image! I have the pleasure of working with an exceptional bunch of people and most days don't seem like work at all.

GEnieLamp> Most unusual phone call? Most extraordinary letter? Most distant Apple II user? (i.e. Tibet? Nepal?)

Ellen> We get a variety of unusual phone calls and letters. Mostly from people who want technical help and want it now. One person who called recently was indignant because I couldn't tell her which version of the system software she was using without her reading the label on the disk which she didn't have with her. We have subscribers literally all over the world. Australia is probably the furthest away but we've got customers in lots of little countries in Europe, South America, Africa and Asia as well.

GEnieLamp> Which person do you think has had the greatest influence on your choosing to pursue a career in computers?

Ellen> I can't really say that anyone really influenced me to pursue this career, except for maybe my husband who threatened to divorce me if I didn't start getting paid for what was becoming an all-consuming hobby. Of course, if it hadn't have been for Tom Weishaar, I wouldn't be answering these questions, either. <grin>

GEnieLamp> Your role as editor of A2-Central, the leading national publication for Apple II programmers, places you with one foot in the "humanities" and one foot in the "hard sciences." Do you have any thoughts about whether these two intellectual "modes of thought" are reconcilable or not?
First of all, we don't consider A2-Central to be a publication for programmers. We feel that it's a newsletter aimed at all Apple II users who want to get the most from their computer. This includes everyone from the novice to the power user. Our slogan, so to speak, is that we're a "journal and exchange of Apple II discoveries." An international clearinghouse of ideas and innovations.

Humanities and hard sciences are indeed reconcilable. Technology has, and is, giving the arts new means of expression. It’s hard to even envision how far and how wide computers can take us into seemingly unrelated fields.

In the computer industry, both hardware and software companies are overwhelmingly populated by men. Even Apple Computer itself has just a handful of women in the company's upper echelon. What are your ideas for helping bring greater gender equity in the profession? What can schools do to help?

The role of women in the computing fields is probably changing for the better, as it is in all fields of business. I read recently that the majority of small businesses today are owned by women. We bought an expensive computer software program to run the business earlier in the year from a local company owned by a woman. Things are looking up.

Schools should reinforce positive feelings about computers and the computer field in general as well as other non-traditional areas for women. Positive role models and mentorships are essential.

Soon you'll be editing A2-Central from your new home in Texas. Do you have any comments to share about how telecommunications has had a liberating effect on the workplace? What are the down sides to working from your home, do you think?

I feel incredibly lucky that I'll be able to take my job with me when my family moves to Dallas sometime early in 1993. It’s one of the things that will make the move more bearable. Naturally, without telecommunications, I probably wouldn't be afforded this luxury.

This opportunity will probably have some good and some bad points. It will be great to work from home, to be there for the kids when they get home from school or when they're sick and have to stay home. It probably will require a good deal more discipline than comes naturally for me, though. I'll miss going into the office everyday and I'll definitely miss the interaction with my coworkers. I'll miss answering the phone and chatting with customers. I'll miss the office birthday parties too.

I will have more time to explore my computer again, the way I did before I started working. This may end up being the best of both worlds.

Favorite authors? (Any good books you've read recently?)

Read? Read? Who has time to read anymore? I used to read voraciously but now feel like I'm ahead of the game if I get to read the headlines. Maybe when I get to Dallas...

I do listen to National Public Radio almost exclusively these days, though. Unless I'm in the car with my daughter who has to listen to the
How about a few words on what GEnie has offered to A2-Central, and vice-versa?

Ellen> I think the A2 RoundTable on GEnie does an extraordinary job of supporting Apple II computers and the people who use them. The technical level of expertise here is as good and solid as it can possibly be. As the support from developers and mail order houses diminish, the online services (and user groups) become all the more important. More and more, we're recommending that our customers get hold of a modem and telecommunications software in an effort to get quick answers to their questions.

A2-Central will be around as long as we're supported by the users. We have to face the fact that many Apple II users are either moving on to, or adding another platform to their computer desks. Tom is starting a new publication, Fishhead's Children, to address the needs of our subscribers as they learn other systems. But we're not about to give up on the Apple II until our subscribers tell us that it is financially ridiculous to do so.

The Guru of My Dreams

By Mark Quinn

"A Whole Buncha Milliseconds with Mark"
by Mark Quinn, DOA
GEnie address: NEWSIE

"The Guru of My Dreams"

The time comes for all good (or bad) computer users: that fateful middle-of-the-night-on-a-Sunday hardware/software problem that rears its head(s). Perhaps your problem is that you just want to install a program/device, and are biting your nails over whether it will mesh properly with the rest of your system. Staying productive means keeping your system happily crunching bytes into bits, and it also means keeping your hardware 'current'.

Let's face it: a mere mortal such as I can't give you an answer as to how to proceed in such situations. You need a guru. No, let me amend that. You need a Guru, with a capital "G". What is the difference between a guru and a Guru?

A guru will "seem to know everything"; a Guru will have some
solutions.

A guru will find excuses; a Guru will find solutions.

A guru will always do the job "next week"; a Guru will do it ASAP.

A guru will meditate and make things worse; a Guru will fix the problem.

A guru gives out a lot of bad advice; a Guru checks other sources to make certain his advice is up to date.

A guru finds working with hardware/software 'mysterious and challenging', but hates it with a passion -- yeah, and it's going to be a minor miracle if your system survives his/her tomfoolery; a Guru loves her job _most_ of the time, and will be aware of most of the problems which she will encounter. At the very least, she will return your system to you in the same condition she found it.

A guru will plunge right ahead in tricky situations, sometimes with disastrous results; a Guru will admit that she needs help, and get on the phone/modem until she gets it.

A guru will either trash or "half-repair" your system, get it "half-working", and let it sit there for a couple of months/indefinitely; a Guru will see your problem through to an end which satisfies both of you.

A guru will sometimes tell you "There is no problem. Your system worked the last time I left it, and is working now. YOU'RE the problem"; a Guru will try to the best of his ability to explain things/get your system working to your satisfaction, and failing that, refer you to a person/source of information which can.

A guru will make appointments that he doesn't have any intention of keeping, and generally avoid you like the plague when he's confronted with problems he can't handle -- he'll never admit defeat; a Guru will tell you flat out: "Look, this is out of my field. You need the advice of another Guru." (This may seem contradictory. After all, why should a true Guru refer you to another Guru? The first expert should know everything there is to know about hardware/software. Sorry, folks, but that's patently impossible, given the amount of information that your basic Guru has to weed through.)

A guru can never be a Guru. The two are like oil and water.

(I have yet to meet a Guru, at least, in the IBM realm. If you know of one of these gallant and magical beings who just happens to live in my neck of suburbia -- GET HIM THE HE** OVER HERE!)

ELLOW:\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\}
Last summer I started thinking that I was missing out on computing in the 90's by staying with my 1979 Apple ][+. So, when a member of the local Apple user group said that he was selling his Apple IIGS, I decided it was time to move. After all, his machine had all the trimmings -- a 20 megabyte Applied Engineering (AE) Vulcan hard drive, an AE 8 MHz Transwarp accelerator card, an AE 2400 Datalink internal modem, a 1.75 Meg AE GS-Ram card, and an AE PC Transporter card. What more could I possibly need?

Well, I've had the new system for six months and I now know what I desperately need -- -- MORE STORAGE. Twenty megs of storage seemed like a lot when compared with an Apple ][+ with a 20 Meg Sider that was only 60 percent full. I knew that GS/OS programs were big but I did not truly appreciate that big data files go with big programs.

In the two operating system environment, MS-DOS and GS/OS-ProDOS, in which I operate I quickly filed up the Vulcan and faced the decision of how to add additional storage. My choices included a 105 Meg SCSI hard drive, an Apple 1.4 Meg Super Drive, or a 21 Meg floptical drive. All three options required another interface card and I was running out of slots — only 4 and 5 were still available. And, the winner was -- the 21 Meg floptical drive from Tulin connected to a RamFAST SCSI card. The Tulin won over the Applied Engineering floptical (which uses the same internal mechanism) because for about the same price, Tulin included two 21 Meg disks formatted with System 6.0, a $25 value.

One of the factors that led me to chose the Tulin floptical was the drive's ability to read and write 1.4 Meg disks, giving me more disk storage options. Backing up my 20 Meg Vulcan could be done with 14 (1.4 Meg) disks rather than 25 (.8 Meg) disks. Of course, I could use just one 21 Meg floptical disk. The other factor was the forecast that Apple would be releasing in early 1993 a new version of GS/OS System 6 (V6.01) which would include a File Structure Translator (FST) that would enable ProDOS to read (and maybe write, but that's another rumor) MS-DOS disks. However, only the Apple SuperDrive would be able to use the new FST unless one considers the floptical. Since the floptical uses the same disk format as MS-DOS drives, all that was needed to read a MS-DOS disk was the new GS/OS FST. With the FST and the floptical, I could bring home a 1.4 Meg MS-DOS disk from work, insert it into the floptical, and using AE's PC Transfer program, I could move the data to the MS-DOS partition on my Vulcan. Actually, I can do that with my current 800k disk drive but I am restricted to the 720k MS-DOS disks. Being able to do all of this remains to be proved after the new MS-DOS FST is released. Maybe that will be material for another story.

When my new drive arrived I immediately pulled out the manuals for the drive and the RamFAST SCSI card and read them cover-to-cover (that's what everyone does first, isn't it?) before installing the card. The
installation was smooth and uneventful once I had decided to use slot 4. (As a side comment, setting slot 4 to "YOUR CARD" in the Control Panel meant that I would not be able to use the mouse in any ProDOS 8 programs or with the PC Transporter. GS/OS programs, however, can see the mouse regardless of the setting of the Control Panel.)

The RamFAST card comes with its own installation program built into the card's firmware and will install the SCSI driver and RamFAST.System file on to the drive that you select. All went as advertised until I tried to startup the system. Then, everything came to a screeching halt. After a long-distance call to Tulin (they do not have an 800 number) and a long discussion with Francis, it was finally decided that I needed to turn DMA (direct memory access) off because my AE-GS Ram was not DMA compatible. Once the proper setup was established, I was off and running with another 21 Megs of storage. Now that I have broken the ice by getting a SCSI interface card, the possibilities for chaining a CD-ROM drive or replacing my Vulcan (freeing up slot 4) becomes an option.

For the RamFAST and the floptical to work together properly requires ROM V3.00k on the card. If you have already upgraded your RamFAST to ROM V3.00 but do not have a "k" then I understand that CV Technology will provide the necessary upgrade without charge. Otherwise, a full upgrade from rev C boards to rev D V3.00k is available by returning your card to CV Tech along with a check for $79.00.

Most of my experiences to date have been positive. I have divided one floptical disk into a 10 Meg volume for ProDOS and a 10 Meg volume for the PC Transporter. ProDOS recognizes the drive on the Finder as a removable hard drive allowing the disk to be ejected by dragging it to the Trash Can. Changing disk from within a program, however, requires a "straightened" paper clip inserted into the tiny hole below the disk window, like the original 128K Mac's because the Tulin drive does not have an eject button. From the pictures in the magazine ads, it appears that the AE floptical does have an eject button.

The PC Transporter is not as flexible. It sees the drive as a fixed hard drive (/:D, in my case) and goes ballistic if the disk is removed. One of these days, I am going to format a 1.4 Meg disk as a small MS-DOS (/:D) drive with the same PCT volume name as the floptical and see if I can make the switch.

I thought that two disks (42 Megs) would be plenty but disks make an easy way to sort programs and data. And, if one has a lot of data, like sound files for HyperStudio from Roger Wagner Publishing, the flopticals can put a large quantity of storage on line without committing large sections of your hard drive. In fact, depending on the level of sampling (5 to 10 K per second), one floptical disk could provide 25 to 35 minutes of digital sound.

I had one problem with one of the floptical disks. It somehow lost its configuration block so the Finder would not recognize it asking if I wanted to initialize it. If, however, I ran RamFAST.SYSTEM and reset the partitions, it would work until I removed or rebooted the machine. To solve the problem, I backed up the two partitions (ProDOS and MS-DOS) using the Finder Archiver and repartitioned the disk using RamFAST.SYSTEM. After I restored the two volumes, everything was back to normal.

As I mentioned, Tulin sells additional disks for $25 but I have been
able to find the same brand, InSite Peripherals, locally at CompUSA, which sells a SCSI floptical for the MS-DOS world. Their price was $29.95.

In closing, let me relate my experience at the new Computer City Super Store when I asked them about floptical disks. When I told the salesperson that I had put a floptical disk drive on my Apple IIGS, he asked, "Why would you want to put such new technology on such an old machine?" My answer was, "because I can!", which to me says it all. The Apple IIGS (properly equipped with a hard drive, System 6.0, and an accelerator) is a powerful machine. As long as I can do the things I want a computer to do, it will remain the computer of choice.

[S.GARRIGUS]

WELCOME BACK! Well, the holiday season has come and gone. Did everyone get what they wanted from Santa? Oh, and I hope you all made some really good New Year's resolutions! I've decided to spend more time keeping in touch with my friends. :-)

Now on to this month's puzzle. Just cause the holidays are over doesn't mean we can't have some fun, right? :-) This month I visited the GENie Livewire Chat Lines. This is the place to be if you want to find some new friends this year! Here you'll find people who are interested in all the things you could possibly be interested in and more. There's even a Chat lines library with pictures from some of the Chat lines regulars. So check out the GENie Chat lines and make a few new friends! To get there type M400 or use the keyword CHAT. But before you do, be sure and solve this months puzzle! It'll help you to remember those Chat Line commands! Happy New Year! :-)

Games People Play

By Darrel Raines

Program Name : Solarian GS
Solarian GS   This is a very likely candidate for the best shareware arcade style game to ever be created for the Apple IIgs. This game claims to be patterned after a similar game on the Macintosh. I have never seen the Mac game, but this one is a real winner. Warning, Warning: Solarian is deceptively addictive. Great quantities of time may be wasted by the unwary player who thinks, "Just one more crack at it before I go to bed." Play at your own risk.

The object of the game is to clear a level of attacking aliens. They come in different shapes, sizes and attack characteristics. Some of them will simply float around and do nothing. Some will shoot at you. Some will drop bombs at you. And some will even try to dive down and crash into your ship. What does our fearless player have to defend himself/herself with? Not much, actually.

The initial craft that the player starts with moves and shoots very slowly. The ship will only fire one gun at a time and takes a while to reload. The shields to protect the ship are not fully charged. This doesn’t sound like a picnic, for the good reason that it is not. All of these deficiencies can be cured during the course of a game by catching presents that fall from the sky. One present will fall (fully wrapped) during each level. The ship’s defensive powers are improved by catching these presents. The presents sometimes give extra points, as well. The presents aren’t all positive, though. Watch out for the dreaded "Nothing" present.

You can build up your ship’s powers until you have quite a powerful craft. However, if you manage to allow the aliens to destroy your ship, then you must start over with one of the dismally plain vanilla ships. Lose three ships and you are out — — — game over.

On the other hand, if you manage to clear a level, then another level will provide you with more of the nasty aliens to wipe out. A top ten scores list is maintained to stroke your ego. Sound and visual effects are equal to the best game software that I have ever seen on the IIgs market (including commercial software). Online instructions and a worthy cause (elementary education) for the shareware payments round out a very nice offering for the IIgs gaming crowd.

Every IIgs owner should download this file. Just be sure to remember the warning posted at the first and last of this section.
Blackjack Tutor V3.0  This is a somewhat older upload that needs to be remembered from time to time so that it is not forgotten. Blackjack Tutor is much more than a Blackjack game for the Apple IIgs. It is a Blackjack training system that will teach you how to play, assess appropriate hit/stand decisions, and even count cards. Spending a few hours with this program will get you ready for the Vegas Blackjack tables. You may even be able to play for many hours without losing your shirt.

One of the integral features of Blackjack Tutor is the ability to learn "proper" playing techniques by having the Tutor prompt the player during the game. The rules that this program uses for making its decisions are completely modifiable. Therefore, you can use a system described in a book, or even one that you create yourself. After entering all of the pertinent information in the preference lists, you can even test out your latest set of rules by turning on the automatic play option.

During automatic play you can watch as the computer keeps track of your winnings (or lost money, as the case may be). A graph can be drawn if you wish to get a visual image of your status. You can also adjust the rules used by the computer for the amount of each bet. Virtually unlimited control is available to the user of this program.

If you are planning a trip to the Blackjack tables anytime soon, then you need to download a copy of this program. If you like to play Blackjack and want to improve your play without going to Vegas, then this program is for you. If you just like to play card games, then how can you possibly go wrong by downloading this game. Be sure not to miss this all time favorite Tutor program.

/"There seem to be more off topic than on topic messages. /Therefore, don't sweat it; but don't do it again [grin]."/ BRIAN.H////

Yours For The Downloading

*****
If you like sliding piece logic puzzles and you own an Apple II Gs computer, you're bound to find the new Shove It GS freeware game absolutely captivating. In some ways Shove It is reminiscent of the popular Sokoban puzzles that are available on other computer platforms. But Shove It goes way beyond any other version of Sokoban you might have seen.

Not only does Shove It give you fifty mind-teasing puzzles to solve. You can also download complete solutions to all of the puzzles and watch the puzzles solve themselves, in a "puzzle movie," right on your computer screen. Or you can watch an "instant replay" movie of your own attempts to solve any of the puzzles.

The object of Shove It is simple: push the colorful rainbow colored apples one-by-one around the mazes to the storage areas. The difficulty is that you're only allowed to push one apple at a time. Moving all the apples over to the storage area therefore requires some circuitous pushing.

Invariably you'll find yourself getting into one kind of jam or another, with the apples getting stuck in corners or against each other. But if you persevere you'll encounter great delight in discovering the solutions to some of these fiendishly fun puzzles.

You say challenging puzzles are not your bag? No problem. You can easily design your own puzzles using Shove It's built-in puzzle editor. Designing puzzles itself can be an interesting exercise in creativity and reasoning.

My own preference is to modify existing puzzles, simplifying the difficult puzzles by replacing some of the apples and storage areas with bare floor space. Editing existing puzzles saves yourself the chore of creating your own original maze walls.

The other day I had a chance to play Shove It with an energetic third grader. We played the puzzles for almost forty-five minutes before I suggested that we try designing some of our own puzzles. The young fellow's eyes lit up on this suggestion.

We proceeded to load puzzle number 49, one of the most difficult puzzles on the Shove It disk. It took us no more than three to four minutes to simplify the puzzle by removing apples and storage areas. (Please note: You need to always remove an equivalent number of apples and storage areas. Otherwise Shove It will not allow you to save and play your edited games.)
We were somewhat disappointed to discover that the puzzle we designed did not have any possible solutions. But after loading the puzzle back up into the puzzle editor, we were able to easily modify the puzzle to make it solvable.

Having tasted the fruit of puzzle design, my young friend insisted on trying his hand at designing a puzzle from scratch. Fifteen minutes later, to my amazement, this young fellow had designed his own puzzle from scratch. The entire puzzle was created with about seventy to eighty mouse-clicks -- well within the capability of a third grade puzzle designer.

I must admit that I was a little surprised to find that my young friend's puzzle was solvable without going back to make further modifications to his original design. It appears this young fellow has an equal talent at solving puzzles as he has at designing them.

Speaking from a teacher's point of view, Shove It GS can be very beneficial in teaching younger and older students about the concept of forces in physics. One of the wonders of the microcomputer is that it can bring alive such vital scientific concepts in a game format.

The analysis skills that Shove It develops would certainly be transferable to any type of higher level mathematics, as well. But you don't need to tell your third grader this game is preparing him or her for advanced algebra and calculus. Chances are the child is having too much fun to notice, anyway.

A big thanks is owed to Peter Brinkley, the inspired programmer who created Shove It. While Peter does not explicitly request a shareware fee in his freeware notice, chances are he wouldn't refuse a monetary gift you sent his way. Programmers like Brinkley deserve both our gratitude and financial support.

One final note: The gorgeous color graphics from Shove It GS do not show up well on a composite color monitor. So if your Apple IIGS has a composite color monitor, rather than an RGB color monitor, you may find it difficult to see the shapes in the game.

[AI]
INTRODUCTION

Apple II historian Steven Weyhrich brings us yet another detailed and informative chapter in his 23 part series on the history of the Apple II. This month, the intriguing story of the Apple IIc.

[*][*][*]

PRELUDE: STEVE JOBS AND MACINTOSH

Rewind back to 1982, before the Apple IIe was introduced, and adjust the tuning on our Flux Capacitor-enhanced peripheral card. Before dealing specifically with the smallest Apple II, the IIc, it would help to take an aside and look at some other events happening at Apple Computers, Inc. at this time that affected its development.

If you recall, the Lisa project was designated as the computer that was considered to be the future of Apple. From a series of parallel processors and a "bit slicing" architecture, to a focus on the Motorola 68000 microprocessor as the controller of this advanced computer, the project had been progressing very slowly. It was begun back in 1979 with the same focus as any other Apple product: "Both [Apple III and Lisa] had been conceived of as nifty pieces of hardware rather than as products to appeal to a specific market: At Apple you designed a box and people bought it because it was neat, not because any thought had been given to what it would do for them."<1> However, a significant change occurred in 1979 when Xerox bought a large chunk of Apple stock. In return for being allowed this stock purchase, Xerox allowed some of their research ideas to be used in designing an office computer. After Steve Jobs visited the Xerox Palo Alto Research Center in 1979 and saw the user-interface on their Alto computer--icons, graphics-based text characters, overlapping windows, and a pointing device called a "mouse"--the Lisa took on a distinct personality that made it possible to become the ultra-computer Apple needed. This was important, since by 1981 Apple executives were getting sweaty palms worrying about the future. The Apple III was clearly NOT taking the business world by storm.

Unfortunately for Jobs, who was excited about using the Xerox technology in designing a new computer, he was excluded from the Lisa project. After the problems associated with the introduction of the Apple III, a reorganization in 1980 moved the Apple II and III into one division, and the Lisa into another. Lisa was put under the control of John Couch, and Jobs was not allowed to participate. Since Lisa had been taken away, Jobs in 1981 began to assemble a team to "out-Lisa the Lisa" by creating a smaller, less expensive computer that would do the same thing. Jef Raskin,
the engineer that helped design it, called it Macintosh.

While the Macintosh developed as a pirate project with a smaller team and less money than Lisa, the concept of an "appliance" computer also emerged. Instead of those messy slots and a lid that popped off (which made the Apple II so popular with the hacker community), Jobs' team was sold on the idea that all necessary features should simply be built-in and the case sealed. It would be something that you just plugged in, turned on, and started using. With the Xerox Alto mouse/icon/window interface it would not only be easy to set up and turn on, but also easy to use.

THE APPLE IIc: BEGINNINGS  What was happening with the Apple II during this time? The efforts to make it less expensive to build were progressing, and the Apple IIe was in the formative stages. In the summer of 1981 someone proposed a portable Apple II, a book-sized computer. It wasn't until Steve Jobs became interested in it as an engineering challenge, well after Macintosh was under way, that anything came of the idea:

"...one day late in '82, Paul Dali showed him [Jobs] a photograph of a Toshiba portable and they started fooling around with the idea of an Apple II that would look like the Toshiba but come with a built-in disk drive. They took out a IIe circuit board and a disk drive and a keyboard and played with them until they arrived at a promising configuration--keyboard in front, disk drive in back, circuit board in between. What got Jobs excited about this idea was the engineering difficulty of squeezing it all into a package not much bigger than a notebook. And a machine so small wouldn't have the expandability that characterized all the other II's. Like Macintosh, it could be taken out of the box, plugged in, and put to work--no extra parts to buy, no cables to figure out. It was the II reinvented as an appliance."<2>

As with all Apple projects, the IIc went by various code names during its development, for the sake of internal communications and to keep outsiders from knowing what was going on. The various names used included VLC (Very Low Cost), Yoda, ET, IIb (for "Book"), and Teddy (which stood for "Testing Every Day"). Also, following a long standing tradition at Apple, some of the code names assigned to the project at various times were names of children of people at Apple: Chels, Jason, Lolly, Sherry, and Zelda. These names persist in the source code for the firmware for the IIc as later printed in the technical reference manual; the serial port driver is called a "Lolly" driver.<3>

During the time the IIc was under development, Apple was working on a change in the look of their products. They planned a more European styling, and a color scheme called "Snow White". The IIc would be the first product with the new appearance and color.

THE APPLE IIc: HARDWARE  As mentioned earlier, the IIc had its origins while the IIe project was going on. When Steve Jobs became involved, he felt they should continue with the open IIe as they had planned, but do this other Apple II as a product "focused" to a specific group of customers, primarily new users. Originally he had planned a closed Apple II that had a built-in mouse port, one serial port, and some other features. What they ended up with at that point was just a computer and a keyboard. Walt Broedner, the engineer who pushed for the
Apple IIe to be produced, used some of their previous work with custom IC's for the disk controller and combined both projects together to make the IIc.<4>

Although he was told it was not be possible, Jobs strongly pushed for the mouse in this closed Apple II to be compatible with the Macintosh mouse--and they managed to make it work.<2> Regarding the plans for a single serial port, however, Apple's marketing people pointed out to Jobs that many people were going to want both a printer AND a modem, so they added a second port to the original design. They decided to use serial ports on the IIc instead of parallel ports for a couple of reasons. First, the socket for a serial port is smaller than a parallel port, and it would fit better onto a small box like the IIc. Also, Apple's general direction at the time was to get consistency in its hardware, and they had decided to make everything they made use a serial interface.<4>

They began work on the Apple IIc in earnest right after the IIe was finished. Because they were trying to squeeze an Apple IIe with 128K, 80 column routines, two serial cards, disk controller, and a mouse card into an 11 by 12-inch case, the design challenges were greater than with the IIe (recall that this was what appealed to Steve Jobs). The size of the case was determined by the decision to make it able to fit into a standard-sized briefcase.<4>

Apple also had the international market in mind when they designed the IIc. A special chip containing the keyboard map could easily be changed depending on the country where the computer would be sold, to make it consistent with regional keyboard differences. The external pushbutton would switch between the two different keyboards, between a UK and German layout, for example. In the U.S. version of the IIc it switched from a standard Sholes keyboard (also known as "QWERTY") to a Dvorak keyboard (which allows faster touch typing). The decision for the foreign keyboards came first; the added bonus for American versions of getting Dvorak came as an extra bonus, to save having two different cases (one for US and one for foreign versions).<4>

One problem in creating such a compact computer was dealing with heat production. Apple engineers wanted it to be able to function in environmental temperatures up to 40 degrees Celsius (about 104 degrees Fahrenheit). One article published at the time of its introduction mentioned jokingly that the designers wanted to make the IIc capable of doing a long disk sort (sorting data in a disk file) while on the beach in Florida in the summer! Their major obstacle was the heat generated by the internal 5.25 disk drive. They tried some special low power drives (which would have been much more expensive), but they didn't overcome the heat problem even with them. Eventually they tried a complicated venting scheme that was designed by drilling holes into a case and putting it into an oven to let them measure internal temperatures. The engineers were surprised when they found that the normal power disk drive worked and generated less overall heat within the case than the special low power drive did. The only explanation they could come up with was that the normal power drive generated enough heat to cause it to rise, which pulled cool air in through the vents by convection.<4>

THE APPLE IIc: FIRMWARE Since they used the newer 65c02 chip, which ran cooler and had 27 additional commands that could be used by assembly language programs, Apple's programmers had some new power to use in firmware design. Such power was needed to squeeze in all
the firmware code for the IIe, plus code for the disk controller, serial cards, mouse card, and 80 column card into 16K of ROM space.

The firmware for the IIc was written by Ernie Beernink, Rich Williams, and James Huston. They designed it to look (to a software application program) exactly like a IIe with an Apple Super Serial Card in slots 1 and 2, an 80-column card in slot 3, a mouse in slot 4, and a Disk II in slot 6 (though there were NO slots in hardware). Since these first IIc's had nothing emulated in slot 5, the firmware authors immortalized themselves by making a "ghost" peripheral appear to be present in that slot. Entering this Applesoft program:

```
100 IN#5 : INPUT AS : PRINT AS
```

...and running it would print the names of the authors. (They used a decoding scheme to extract the names, character by character, so a simple ASCII scan of the ROM would not show their little trick). This "feature" had to be removed in later revisions of the IIc ROM, because an actual disk device was added then to slot 5.<4>,<5>

What about the unassigned slot 7? Here they put a small piece of code to allow booting from the external 5.25 drive by typing "PR#7" from Applesoft.

The programmers fixed some known bugs in the IIe ROMs, and added 32 graphics characters they called MouseText. To make MouseText fit they removed the ability to use flashing characters (when in 80 column mode) and replaced those characters with MouseText. Apple veteran Bruce Tognazzini designed the MouseText characters, which included a picture of a running man (perhaps to suggest "running" a program). He later sent a letter to Call-A.P.P.L.E. magazine to warn programmers that the Running Man characters (assigned to "F" and "G") had been determined to be unnecessary and would probably be replaced eventually. (This did eventually happen, but not with the IIc).

Beernick, Williams, and Huston also made some minor changes to the Applesoft part of the ROM. They fixed things so Applesoft commands could be entered in lowercase (and translated into uppercase). They removed the Applesoft commands that were specific to the obsolete cassette interface (which was absent in the IIc) and made Applesoft more compatible with 80 columns.<4>,<6> They did NOT go so far as to make any major changes in Applesoft to use the newer 65c02 commands and therefore fix known bugs or add features to this seven year old language. Their reluctance stemmed from the fact that historically many BASIC programs had made use of undocumented assembly language entry points in Applesoft, and any changes they would make here made it more likely that older programs would crash unexpectedly.<4>

THE APPLE IIC: PRODUCT INTRODUCTION Apple's introduction of the new IIc came at an "event" at the Moscone Center in downtown San Francisco on April 24th, 1984. It was entitled "Apple II Forever", and was described as "part revival meeting, part sermon, part roundtable discussion, part pagan rite, and part county fair". Apple's objectives here were to introduce the Apple IIc, describe how it fit into the company's marketing strategy, show off new software that was made to work with the new computer, and emphasize that Apple was still firmly behind the Apple II line of computers. (Steve Jobs also took some of the time to report on the sales of the Macintosh in its first 100
One of the interesting things they did at the "Apple II Forever" event was the actual introduction of the IIc. Giant video screens were used to show previews of Apple's TV commercials for the IIc, as well as slides and images of the speakers, including Wozniak, Jobs, and Apple's new president, John Sculley. Sculley spoke of "sharing power," and then demonstrated that in a unique way: "After holding up the tiny IIc for everyone to see and eliciting a response that they'd like to see it better, Sculley ordered the house lights on. As the light burst forth, nearly every fifth person in the audience stood up, waving high a IIc. As startled dealers cheered uproariously, the Apple plants passed the IIcs to them. Within seconds of its introduction, more than a thousand Apple dealers had a production-line IIc in their hands."<7>

When Jobs gave his report on the Mac, it revealed some interesting statistics. He told them that the first industry standard was the Apple II, which sold fifty thousand machines in two and a half years. The second standard was the IBM PC, which sold the same amount in eight months. Macintosh had done sold its fifty thousand machines only 74 days after its introduction. Although sales would not be nearly as good, Apple took orders that day for fifty thousand Apple IIc's in just over seven HOURS.

At the "Apple II Forever" event, they also had a general software exhibition and a setup called the Apple II Museum. This contained Apple memorabilia, and included Woz's original Apple I, and a reproduction of Steve Jobs' garage where it was built. Although not on the schedule, "Apple II Forever" included an early-afternoon earthquake centered south of San Jose that measured 6.2 on the Richter scale.

THE APPLE IIC: SUCCESS?   Their original goal had been to sell the IIc for $995. As productions costs turned out, they found that they couldn't hit that price, so they came up with $1,295, balancing the decision with the number of people who were predicted to buy the optional Monitor IIc or an external Disk IIc drive.

The only problem was that although the IIc was a technological breakthrough in miniaturization, customers at that time didn't value smallness. They viewed something that was too small as also being cheap and lacking power. Although the Apple IIc was equivalent to a IIe loaded with extra memory, a disk drive, two serial cards, and a mouse card, most customers seemed to want the more expandable IIe. Apple marketing went to much effort to make the IIc attractive, but it didn't sell as well as the IIe. Just as IBM overestimated the market when producing its PCjr (which eventually failed and was discontinued), so did Apple when producing the IIc (and the original Macintosh).<7>

THE APPLE IIC: OVERCOMING LIMITATIONS   Although the IIc did not have any slots for plugging in peripheral cards that had traditionally been used in the Apple II, the ports that were built-in had the capability to do much of what the slots had often been used for. The serial ports were compatible with any serial device; this included common ones such as printers and modems, and uncommon ones like security controllers, clocks, and speech synthesizers. Some third party companies also supplied serial-to-parallel converters for IIc owners who wanted to use parallel printers made by Epson, Okidata, and C. Itoh that were popular elsewhere in the computer world.
There was, of course, the AppleMouse IIc sold by Apple. It plugged into the game port on the IIc. Also available were two types of touch tablets: The Power Pad (Chalkboard) and Koala Pad (Koala Technologies), though the latter sold best. The Koala pad would appear to a program to be the same as a joystick, but could not emulate the mouse.

The disk port on the original IIc was only designed to control an external 5.25 disk drive. Apple sold the Disk IIc for $329, and other companies later sold similar drives for less. Despite this firmware limitation, Quark Engineering released a 10 MB Winchester hard drive called the QC10 that would work with this disk port, and was the first hard disk available for the IIc.

The video port worked with a standard monitor, but had access to all video signals. Included with the original IIc was an RF modulator that allowed it to be connected to a standard television (for color games). An RGB adapter box attached to the video port would allow a true RGB monitor to be attached, giving color and sharp, readable 80 column text on the same monitor. Apple also sold a flat-panel liquid crystal display for the IIc that attached to this video port. It was capable of 80 columns by 24 lines, as well as double hi-res graphics. Apple's price was about $600, but it looked somewhat "squashed" vertically, and did not sell well. Another company marketed a better flat panel liquid crystal display called the C-Vue.

With a battery attached to the 12V input, and a liquid crystal display, the IIc could be made into a truly portable computer.

THE APPLE IIc: ENHANCEMENTS The earliest change made available for the IIc was a motherboard swap that fixed a hardware bug causing some non-Apple modems to fail if used at 1200 baud. This modification was made only if the owner could show they needed the change (that is, they owned a 1200 baud modem that wouldn't work).

The first significant upgrade available for Apple IIc owners was also available as a free upgrade for previous owners. Changes were made to the disk port firmware to accommodate the new 800K UniDisk 3.5. Using Apple's Protocol Converter scheme (later called "Smartport"), this new IIc could handle four 3.5 disk drives, or three 3.5 disk drives and one 5.25 drive.

With the UniDisk 3.5 upgrade, the internal 16K ROM was increased in size to a 32K ROM that was bank-switched to make space for the extra code necessary to implement the Smartport. Also added were additional serial port commands to improve compatibility with the older Super Serial Card. The Mini-Assembler, absent from the Apple II ROMs since the days of the original Integer BASIC Apple II, was added back in, with support for the extra commands provided by the newer 65c02 processor (the disassembler had always supported those new commands). The STEP and TRACE Monitor commands made a comeback, having also been a casualty of the 1979 Autostart ROM for the Apple II Plus. Lastly, the new IIc ROMs included a built-in diagnostic program to do limited testing of the computer for internal failures, and had improved handling of interrupts.

The next Apple IIc upgrade was known as the Memory Expansion Apple IIc. This came as a response to requests for the ability to add extra memory to the IIc. Applied Engineering had already produced a Z-80 coprocessor for the IIc (to allow access to CP/M software), and an expanded memory card, up to 1 MB, which would either act as a RAMdisk for ordinary
ProDOS applications, or as extra memory for the AppleWorks desktop (through a special patching program). Seeing the popularity of this, Apple released this third version of the IIc ROMs and motherboard, this time with a RAM expansion slot included. The Apple IIc Memory Expansion Card could take up to 1 MB of RAM, in 256K increments. The firmware in the new ROMs made it work as a RAMdisk automatically recognized by ProDOS and following the Smartport protocol that had been designed for the UniDisk 3.5. Apple even included code in the new ROM to patch DOS 3.3 so it could be used as a RAMdisk with that system (400K maximum size), and did the same with Pascal v1.3. Also, because this firmware was in the motherboard ROM, ANY company could make memory cards to attach to this version of the IIc.

Other changes made in this version of the IIc ROM included moving the mouse firmware from slot 4 to slot 7, and putting the RAMdisk firmware into slot 4. Also fixed was a bug that caused a write-protected 3.5 disk to be incorrectly identified with early versions of the UniDisk 3.5.<9>,<10>

Since code as complex as ROM firmware rarely makes it out the door without at least one bug, Apple had to make one final improvement to the IIc ROM. The Revised Memory Expansion Apple IIc (ROM version 4) included changes which made it easier to identify if no RAM chips had been installed on the memory card. A problem with keyboard buffering was also fixed. Lastly, this version of the ROM resolved an obscure bug in the slot 2 firmware that was supposed to allow the IIc to function as a simple terminal (with a modem attached to that port). The previous version of the IIc ROM had been assembled with a couple of wrong addresses in the code, and the terminal mode produced garbage. Few people used this feature, so it was not noticeable to most users, and the corrected ROM chip was therefore not as quickly available as the original Memory Expansion upgrade.

Computer NewsCenter On GENie

By John Peters

~ WELCOME TO ~

COMPUTER & ELECTRONICS NEWS CENTER

COMPUTER NEWS CENTER NOW AVAILABLE

So, what exactly is the Computer & Electronic NewsCenter? The Computer & Electronic NewsCenter is a database where you can quickly find the latest product announcements, software and hardware reviews, editorials and industry trends from a wide variety of computer science journals and recently released government reports. All of this is available to you by simply entering a word or phrase, and then selecting the type of source you're most interested in. Some articles have informative abstracts while others contain the full text.

Articles and abstracts you can download are from Byte Magazine Plus, Computer Database(TM), Computer ASAP, (more than 45 computer publications) Engineering/Technology Journals, Government-Sponsored Research from the NTIS database, newsletters come from the PTS Newsletters database, (contains more than 500 consumer, business and professionally-oriented newsletters,) physics journals from the INSPEC database and software reviews from Microcomputer Software Guide.

That's the good news. The bad news is that having all this power at your fingertips isn't free. If you don't plan your searches carefully, you can easily run up a large bill in a matter of minutes. Clearly, this is not a place for browsing or window shopping!

One of the disadvantages of owning an Atari ST (and I have heard the same said for other GUI systems as well) is that GUI users tend to develop the bad habit of jumping into the program head first and only resorting to the documentation when all else fails. Well, being the GUI lover that I am, I ignored the above warnings, threw caution to the wind and jumped into the Computer NewsCenter headfirst. In hindsight, I strongly recommend that you do not do the same! However, you can take advantage of my boldness, (and lack of common sense :) and learn from my mistakes.

But before we do, let's jump to the bottom line. The Computer NewsCenter is a GENie$Professional service which means that there are
additional charges over and above your normal online charges. To search through the millions of records and to provide a list of those sources will cost you $2.50. It's another $4.50 to view up to the first 10 record titles per source on your topic. For each group of up to 10 titles, sources marked 'Summaries' cost $4.50 and sources marked 'Fulltext' cost $6.00. Full records that include a summary of the article cost $4.50, and those that contain the fulltext of the article cost $6.00 for each full record. If by some chance your search request comes up with no hits, you are charged $1.25.

Fortunately, a practice area is available so that you can learn the basics of fulltext online searching at a greatly reduced cost. Note however that the Practice Area does *NOT* include all sources or all years. The charges which apply to practice searching, in addition to GENie's hourly connect rates are Groupsearch - $1.00, Title Review - $1.00, Fulltext Review - $1.00 and a No-Hit Search - $1.00.

Still with me? Let's get online! (I'll use a >>>>> prompt to indicate my comments as we go.)

[*][*][*]

>>> First off, we pick option #14 from the GENieLamp RoundTable menu located on page 515. Here is the first menu:

    Computer & Electronics NewsCenter

1. [*] About the Computer & Electronics NewsCenter
2. [*] Computer & Electronics NewsCenter Rates
3. [*] Computer & Electronics NewsCenter Instructions
4. [*] Disclaimer & Warranty Limitations
5. [$] Search in the Computer & Electronics NewsCenter >>>>> Notice the
6. [*] Send Computer & Electronics NewsCenter FEEDBACK """" [$] prompt!
7. GEnie Computing RTs and Services

Option #5 is the where the action is, so...

Computer NewsCenter keeps track of your charges as you go along.

Nice touch. We forget the practice area, damn the torpedoes, full speed ahead and we dive directly into the search area.

Computer NewsCenter (Staff)

1 Search by Subject
2 Focus by Year

Your Computer NewsCenter (Staff) charges: $0.00
Here I need to set up the search pattern so I pick option #1. I want to search for Atari articles (might as well make it difficult :) and I limit the years from 1989 to 1992.

Computer NewsCenter (Staff)

1 Search by Subject ATARI
2 Focus by Year 1989:1992
B Begin your search

Your Computer NewsCenter (Staff) charges: $0.00

I enter B and hit the return key. Here we go!

Hi, I am a Knowbot... your computerized online librarian. My job is to help you find information on your topic. While you're reading this, I'm already working -- checking all my sources to find the best places to start.

I'm searching thousands of publications to find the articles and reports to find which ones are best for your question. In fact, I'm already working on your request.

Next, I'll provide you with a menu which informs you which sources have information on your topic. Select one of these and I'll show you up to 10 titles.

You can select from the list of titles and I'll get the full record for you. You can always come back to the list of titles and select other full records...or back up a menu and see titles from another source.

I'm looking for the information...

I'm still looking...
I'm still looking...
I'm still looking...
I'm still looking... >>>>> I envision Knowbot running around a bunch of file cabinets frantically searching for the data. :)
I'm still looking... """""" After approx. 3 or 4 minutes, Knowbot appears with the following report:

<table>

Atari takes multimedia to extremes with Falcon30. (Atari Corp. introduces new multimedia microcomputer) (Product Announcement)
ATARI TAKES MULTIMEDIA TO EXTREMES WITH FALCON030

Atari Corp's new Falcon030 multimedia computer sounds like the ultimate Christmas present for anyone that can afford $800. The Sunnyvale, Press <RETURN> or <S>croll? S

>>>>> Since we are dealing with copyrighted material, I'll stop here. """" I can say that the information received is accurate and informative.

Your Computer NewsCenter (Staff) charges: $14.50

[*][*][*]

Is It For You?  So, as you can see, the total cost of our Computer NewsCenter adventure was $14.50. Too expensive? Well, that depends on how quickly you need the information the Computer Newscenter offers. In my opinion, that is the whole point of Computer NewsCenter. If I had an editor breathing down my neck looking for an article on the new Atari computer, then yes, having quick access to this data could mean the difference between making the deadline or not. However, there was nothing in this particular NewsCenter article that couldn't be found elsewhere, (like the ST RoundTable for example). But keep in mind that this was a fairly basic search. Where Computer NewsCenter would really shine is when you are looking for facts and/or information on a specific product or perhaps an obscure computer related topic.

The Computer Newscenter is available from the GEnieLamp RoundTable menu (Page 515, option #14).

READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ........ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REpIly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: (58).

ABOUT GEnie  GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99368,GENIE and hit RETURN. The system will then prompt you for your information.

Notes From The Editor

By John Peters

FROM MY DESKTOP   When chatting online or when leaving messages to other RoundTable members, sometimes problems, misunderstandings or downright angry confrontations are created simply because the other person doesn't understand what you're _really_ trying to say. If you're not careful in how you convey your thoughts via the keyboard, what you meant as a joke or wrote in jest, can sometimes be taken the wrong way or blown entirely out of context.

   The problem is it's not _what_ you say that creates this situation, but it is _how_ you say it. For instance, a sentence said with a smile can take on a whole new meaning than if it was said with a frown or angry look. Facial movements and voice inflections are difficult to interject into your writing, especially when you're writing on the fly as in an informal RoundTable Conference or when writing a message or reply online. Since the reader can't see your face or body-language, he or she may not know that you're making a joke or that you are teasing.

   There is a solution. Over the years a "modem-language" has developed to help take care of this predicament. By interjecting a smiley face, " :) " within your message or a descriptive word in brackets, such as [grin] or [laugh], you can tell the other person, "Hey, don't take this seriously, I'm just having fun." A well placed [grin] can go a long way to help stop a misunderstanding.

   Another reason this modem-language developed is to help minimize the amount of typing it takes to convey a message to someone else while online. For example, it is much quicker to type, "BTW" then to type, "By The Way" or "IMHO" instead of "In My Humble Opinion."

   Confusing? Not really. As you become more familiar with the lingo, the strange characters and funny faces will be easier to figure out. If you do come across an unusual cluster of letters and you don't understand what they mean, by all means ask the person who sent them. To help you get started, here's a partial list of some of the more popular modem-phrases being used today on GEnie. (Note: The following has been collected from online posts, unofficial dictionaries and other sources.)

>>> THE UNOFFICIAL GEnieLamp ONLINE DICTIONARY <<<

b4 - before                          BCNU - Be See 'N You
brb - be right back                  BTW - By the way
chuckle - something was kinda funny  channel hoppers - someone who
                                      jumps from one channel to another
Apple II Computer Info

CU L8TR - see you later
go pri - go into private

GR8 - that's great
grin - something was humorous

groan - I can't believe you said that
hahaha - something was funny

HAHAHAHAHAHA - something was REALLY funny
MORF - Male or Female

OIC - Oh, I see
re - about (as in re last night)

rehi - hi again
TTFN - Ta Ta For Now

turbo sta - doing a /sta * to get a list of all Chat Lines users
UR- you are

wave - to someone monitoring (like "Waving at Fuzzball on channel 15")
yawn - I've heard that before

???? - I don't understand... or What?

[] = hugs

:) - a sideways smiley face
;) - a winking smiley face

:P - a smiley face sticking tongue out
:( - a sad face

:/ - frustrated/perturbed

=::0 = surprise

:-I - Indifferent smilie. Better than a Frowning smilie but not quite as good as a happy smilie

:-> User made a really biting sarcastic remark. Worse then a :) >:-> User just made a really devilish remark. >;-> Winky and devil combined. A lewed remark was made.

[SMILE] [LAUGH]

LOL - Laughing Out Loud
ROFL - Rolling On the Floor Laughing

IMHO - In My Humble Opinion

WTG - Way To Go!

Think about what you're typing. Does what you write really say what you mean?

PARTING SHOTS

GENieLamp Script users take note! The GEnieLamp RoundTable (M515) is undergoing some major menu changes. Unfortunately, this means that your script files will no longer work. Once the changes are in place we will be uploading new scripts to the GEnieLamp Library. We're sorry for the inconvenience, but we think you'll like the new menus. (Hint: Lots of new goodies in store! :)
NEW BBS ONLINE NEWSLETTER  February 1, 1993 marks the start of a new online newsletter for members of the BBS RoundTable. How the newsletter will be distributed is still undecided. For more information, drop by the BBS RoundTable on page 610. (Keyword: BBS)

ASK DOCTOR BOB  Do you have a question about operating systems, GENie or anything concerning computers? If so, you can get your questions answered here in GENieLamp by Doctor Bob. Any question is fair game...and if the good Doctor Bob doesn't know the answer, he'll find someone who does. Stop wandering around in the dark, send your question via GE Mail to GENIE-LAMP.

Until next month...

[D.Raines]

IT'S NOT JUST A JOB!  As we begin to get settled into 1993 most people are starting to forget the New Year's resolutions that they made. These resolutions were probably made with the best of intentions, but eventually the monotony of carrying out the pact has caused us to forget our resolve. It is my job to make sure that this newsletter stays on its toes for the whole year. I want to continuously examine the product of our efforts and assess how well we are following our New Year's resolution to be the best we can be.

With this said, I now want to request your help. As a reader of this newsletter we need your feedback. I can see that hundreds of GENie subscribers are getting their free copy of A2 GENieLamp. Great! Now we need to know what you think about our efforts. Even if we think that things are going well, it is ultimately the decision of the average GENie user as to whether or not the results are readable and informative.

Therefore, take some time to write us and let us know what you think. If you like an article, then say so. If you think that we don't have enough Cowtoons (although I can't image why you would think this), then tell us. If you believe our coverage is biased and therefore unfair, then blast away. If you think that an article is especially good, then let both the author and the editor hear about it.

By Darrel Raines
[D.Raines]
Apple II Computer Info

I received more mail concerning GEnieLamp when I was writing individual columns for this newsletter than I have since becoming the editor. We need more feedback than this to better meet your needs. It only takes a few seconds to give us this type of information. The mail menu is part of GEnie*Basic services for composing online messages. You don't even have to find a stamp and get your tongue sticky to give us feedback on GEnie.

Consider this to be an "Are you out there" feeler. I really want to hear from a lot of people about this month's GEnieLamp for the Apple II. If we continue to have sufficient letters coming in, then I will consider starting a section devoted to letters. With your input we can climb on to greater heights. Let us hear from you.

Author and editor    Darrel Raines (D.Raines) welcomes any feedback or comments via electronic mail to the listed user name.

LEARNING DTP   The Robin Williams who wrote "The Mac Is Not A Typewriter"
is a woman.

Lots of folks at my local user group love that book, and feel as if it's a good intro primer to DTP. To tell the truth, I looked at it recently, and felt that it was just too elementary for my needs.

I feel that there are 2 aspects to DTP...the first, and easiest aspect, is learning how to use a DTP program. IMHO, the much harder part has to do with presentation. Anyone can learn how to use a DTP program, but not everyone is artistically inclined enough to make their DTP project look good.

I'm one of them.
But, I recently got a great book out of the library called "Looking Good in Print". It's by Roger C Parker, and it doesn't say a word in nearly 400 pages about how to use software. Instead, it's more involved in what I imagine is called "elements of design". There's lots of examples, and many "makeovers". Those show a before and after picture. The before examples look like lots of DTP projects I've seen. The makeovers show exactly what can be done to give those projects a professional look to them.

Roger C Parker has another book, but I'm not sure of the name, and it's devoted strictly to the before and after examples.

They're both published by Ventana Press. Looking Good In Print is $23.95. I highly recommend it for anyone who knows how to use DTP software but who lacks an artistic sense.

(J.KOHN, CAT2, TOP4, MSG:38/M645;1)

MY NEXT COMPUTER "My next computer" turned out to be a IIgs, purchased through this RT.

I decided to get another Apple II rather than a Mac for a number of reasons: Cost; I already have a lot of software and files for the Apple II series; learning curve; and the IIe (which I'm keeping for the kids) does practically everything I want, except feed my ego.

I get the feeling the driving force behind MS-DOS sales (and the Mac, too) is ego: "Gotta have the latest, the greatest, the biggest, the fastest."

If memory serves, it was my questions that prompted this topic, so I thought I'd do the follow-up, as we'd say in the news biz.

(L.DEVRIES, CAT2, TOP5, MSG:97/M645;1)

SHRINKWRAP LICENSE Generally speaking, a "shrinkwrap" license is illegal when it attempts to restrict YOUR rights under the copyright laws.

Those parts of the "shrinkwrap license" which are in agreement with the copyright law are enforceable, NOT because they are in the license, but because they are in the law. Those parts of the "shrinkwrap license" which restrict rights granted to YOU under the law (such as the making of archival copies) are NOT legal, or enforceable.

Those parts of the license which are not covered, in any way, under the copyright law may or may not be enforceable, but in any case, will be a civil matter, i.e. violation of any part of a "shrinkwrap license" which is not backed up by the copyright laws is NOT illegal. You cannot be arrested and prosecuted for it. You MAY be sued, but that is relatively unlikely. (Depends on how seriously, and how blatantly, you are in violation.)

Unfortunately, in the language quoted above, wherein the company refuses to transfer your "rights" in the program to a new owner, there is nothing you can do. You CAN sell the program, but the new owner cannot get support from the company, etc, and there is not a darned thing either you or the new owner can do about it.

(GARY.UTTER, CAT2, TOP8, MSG:6/M645;1)

IS MUSIC WRITER GS STLLL AROUND? Yes. I have had MW GS for a little over two years, and I love it. As to Pyware
support, it has been good. I received an offer to upgrade (either to the professional level - 32 staves, or across platforms) about two months ago. As the majority of the music I write is for small choral groups and a pep band, the 8 staves of the intermediate level is more than enough. If you want to print music, I _heartily_ recommend Music Writer GS.

(CBR2, CAT6, TOP7, MSG:69/M645;1)

CRASHES & FILE-COPYING PROBLEMS  Update on crashes, file-copying problems, etc. in GS/OS:  In our last installment I was unable to copy large batches of files across hard-drive partitions using Finder, and I was getting frequent crashes in GS/OS applications. Received many helpful suggestions, tried many things including swapping Zip cards between two systems, disabling RamFAST driver, reinstalling system 6.0, burying dead cat at midnight, etc.

My hard-won discoveries:

I can complete batch-copying operations if I:  1) Turn Zip speed down one notch, or, 2) disable the RamFAST driver in the System folder. On another, nearly-identically set up GS, neither of these steps is necessary. Go figure. Current theory is that on the one machine that needs fiddling with, there is some sort of timing incompatibility between the RamFAST and the Zip that is cured by slowing either down, even a slight bit.

Regarding other crashes, I found and deleted three (count 'em, three!) icons in my ICONS folder that were set to match type $00, auxtype $0000, which, if I understand this correctly, can cause some problems. The specific problems I was having that seem to have been cleared up by this action were: the "calculate" function in the "Get info" window was crashing; I was also occasionally getting garbage characters in Finder windows and some system sounds weren't playing when they should have. The whole system seems more reliable since deleting these icons, but that may just be the placebo effect at work.

The third change I made that seems to have improved the behavior of the system is installing the Pointless 2.01 upgrade. Now GraphicWriter and other DTP programs no longer hog huge gobs of memory.

I also tossed out a couple of DA's and inits that were of questionable integrity.

Hard to measure the effect of the cat funeral, but the windows _do_ seem to whoosh open and closed with a bit more snap since then.

Lesson I've learned from all this fooling around: If it's not one thing, it's probably another...

(D.CRUTCHER, CAT9, TOP6, MSG:1/M645;1)

MNP ISN'T A PERFECT WORLD...  As you explained your problem, it sounds line noise and invoke MNP, its not going to make the world perfect. MNP as you know is just an error checking protocol and if data is transferred that is not correct, it is resubmitted until it is correct. What that translates to is: If you are sending at 2400 BPS its working. But if you send at 9600 and noise effects the transfer and you have to use MNP to make the 9600 work, it has to keep re-sending until its correct (or it gives up). You could find 9600 w/MNP slower than 2400.
If you have a line noise problem, it can be detected by the phone company. Call the repair service and ask. If they say it may be in your house wiring and you don't have the repair service insurance, get yourself a long piece of phone wire extension (called base cord) and take it directly from your modem to the interface box on the outside of your house. Unplug the modular interface plug (this disconnects all the phones in the house) and plug your modem in directly. Try the call and see if you still have problems. If you do, its not on your end, ask the phone company to assist you. Tell them you are using the phone for data transmission - its legal. If they tell you to buy a special line, just ask them for a clean voice quality line, that is all you really need.

If the noise disappears when you plug in outside, remove all of the coverplates on your phone jacks and loosen and tighten all screws and check again. Dissimilar metals (screws and wires) sometimes interact and loose good contact.

You asked about a special line. They are pricey and are referred to as "balanced lines." Of all the Tech Support calls we have ever taken, not one person has ever said they have one of these "special" lines.

If you have line noise it often looks like -- )\{f\} - kinda stuff. You can even hear it a crackling hissing sound when the phone is quiet. Dial one digit and listen. Radio Shack sells a device for less than $10 that indicates if your wires are reversed. It seems that is a problem some of the time, but I am not sure when and why it sometimes seems to affect the modem and sometimes does not??

Re; your question about the buffer and percentage display, if you would like to try a demo version of ProTERM 3 we would be glad to send it to you or you can d/l it from the Library here on GEnie. If you would like us to send it, let me know your address and the disk size via EMail or whatever is easy for you.

SOUND FILES HELP
"""
> How can I adapt sound files for the Sound CDev in System 6? Is there a
> way to take Mac Soundmaster files and adapt them?

There is a file here in the A2 library somewhere entitled rSounder. This will take raw sound files and/or HyperStudio sounds and turn them into rSounds which will work on the Sound CDev.  
(D.MILLER132, CAT9, TOP12, MSG:68/M645;1)

PROPERLY WRITTEN?  A properly written 8-bit program will NOT copy a file """
with a resource. It will instead kick up an "unknown storage type" error. It should refuse to do anything at all with a resourced file. Only 8-bit programs specifically written in a way that ignores Apple's rules on this, such as Copy II+, will copy resourced files

"""
and leave the resource behind.

A properly written 8-bit file copier will simply refuse to copy the file. ProTerm 3.0 is such a program; you will find that it will refuse to manipulate a resourced file.

PT3 is an excellent file utility program in an 8-bit environment. IIgs users can use it with confidence whenever convenient, bearing in mind that it just won't copy certain files. It WILL copy ShrinkIt archives and text files, which are the types of file you'd most often want to copy from within your modem software. ;-)

TAKE A DEEP BREATH... 

**************************

TO: ALL
RE: Zip GS and Self-Test

Everyone take a deep breath and then repeat after me...

"My Apple IIgs will not EVER pass the self-test with a Zip GS installed."
"My Apple IIgs will not EVER pass the self-test with a Zip GS installed."
"My Apple IIgs will not EVER pass the self-test with a Zip GS installed."
"My Apple IIgs will not EVER pass the self-test with a Zip GS installed."
"My Apple IIgs will not EVER pass the self-test with a Zip GS installed."

Now that you've gotten that out of your system, you don't need to worry about it. The tests on the GS are designed to run a 2.8 MHz. Even if you turn OFF the Zip GS, most likely the tests will not pass correctly. THERE IS NOTHING WRONG WITH YOUR GS, OR WITH YOUR ZIP GS CARD IF THE TESTS FAIL! IT IS NORMAL.

The Zip GS card is pretty simple, when it comes right down to it. I used to work for Zip, I know. If the Zip GS is bad, most likely your computer won't work for longer than 3 minutes at all. If you are worried your GS itself is bad, remove the Zip, put in the normal CPU, and THEN run the self-test. Hope this alleviates the concern over bad self-testing.

(M-RYAN, CAT12, TOP5, MSG:154/M645;1)

DISCOUNT MAIL ORDERS While we're on this subject, let me offer my unsolicited feelings about the discount mail order system and how it affects a company. MDG has been doing direct mail-order to customers with excellent speed and service for over five years. At one time, we offered our products through Roger Coats, Programs Plus, and Preferred Computing. We didn't gain anything by distributing our products through vendors -- in fact we lost income because they demanded a substantial discount off the retail price so that *they* can make a profit. I could not artificially increase prices so that we recover what our products are worth.

That's why you'll only see MDG products in magazine news and reviews sections--not in mail order ads. Mail-order distribution is for suppliers that don't have the resources to do their own sales, packaging and shipping to their customers. For that service, they pay the price in the form of 40% to 70% discounts offered to their distributors.

Years ago, if you could get a one-liner in a full page ad, you were doing well. Today the distributors ask suppliers to PAY big dollars for...
large chunks of ad space within their ads! The free one-liners, now cutting into space that could be paid for by a supplier, have dropped in number (not to mention point size). So relatively small to medium sized companies, like MDG, get the squeeze and end up staying out of the mail-order vendor mess.

In the last two years, we've streamlined our ordering, production and shipping capabilities so we can cut out the middle-man approach. We're fast--we can ship within 12 hours of receiving an order--but we don't move enough volume to offer overnight shipping like big companies. However, we can get you your products in just two days or less. Plus, we've integrated a CASS certification ZIP+4 Postnet bar code system into the addressing of everything we mail, which lets the post office instantly route mail where it should go. We used this last month to quickly and accurately deliver thousands of Groupnews newsletters to our customers and friends. (See the HISTORY BUFFER topic for more details). And we use it on all of our packing lists and address labels.

>> WHAT'S NEW? <<
***********************************************

NEW PRODUCT ANOUNCEMENT! Although most of my programs have been utilities, I've also written one game for the IIgs: FloorTiles. FloorTiles has been quite successful as shareware, and has gotten good reviews in A+/InCider and elsewhere.

I have just released Ant Wars, my new game for the IIgs. According to my wife (the real game-playing expert in our household), Ant Wars is "even better than FloorTiles".

Ant Wars is a strategy/arcade game in which you maneuver red ants around a grid, attempting to kill -- and avoid being killed by -- black ants. You will need both quick reflexes and careful planning to chalk up the high scores. Watch for Ant Wars in the A2 download library, and give it a try. (K.BUNKER, CAT13, TOP10, MSG:30/M645;1)

SWITCH-IT! - A MULTI-APPLICATION SWITCHER FOR THE APPLE II GS
***********************************************

Littleton, CO, December 25, 1992 -- Procyon Enterprises, Inc. of Littleton, Colorado announced today that they have released Switch-It!, an extension to Apple Computer, Inc.'s GS/OS, that brings Macintosh MultiFinder style capabilities to the Apple II GS. Switch-It! allows the user to load any number of desktop programs (limited only by main memory) and switch between them instantly. The addition of this important new
ability makes the Apple IIGS computer one of the most versatile and cost effective personal computers on the market today.

Switch-It! is fully compatible with the most popular applications for the IIGS, including AppleWorks GS, Platinum Paint, DreamGrafix, Medley, Finder, GraphicWriter III, HyperCard and HyperStudio, and many more. Matt Gudermuth, President of Procyon, Inc., said "For anyone who finds themselves moving between a lot of different GS/OS desktop programs, you'll save an amazing amount of time. Switch-It! allowed us to produce the documentation in roughly half the time it normally takes. Switch-It! is the perfect way to increase your productivity."

Switch-It! is closely integrated with System Software 6.0 via its Inter-Application Communication features, turning the plain IIGS Finder into a MultiFinder. "When you launch a program from the Finder, the Finder remains resident. This not only greatly speeds up launching and quitting, but means the Finder is always handy in the event one needs to format a disk or do other Finder operations from another program.", Jawaid Bazyar, Vice-President and Chief Technical Officer, explained. "With Switch-It!, those long periods waiting for a program to load or for a program to quit back to the Finder are gone. This is especially beneficial to users without hard disk drives."

Switch-It! is fully compatible with and requires GS/OS System 6.0. It comes with several desk accessories that help exploit the power of switching technology. Switch-It! also comes with Apple IIGS Installer scripts, so putting Switch-It! on a hard drive is a simple operation. Product support is provided by telephone and online through InterNet, America Online, GENie, and Delphi.

Switch-It! has a list price of just $79.95 and will be available from mail order houses by the third week of January. For more detailed information, contact Procyon Enterprises, Inc. - P.O. Box 620334 - Littleton, CO 80162-0334 - (303) 933-4649. Distributors please contact Sequential Systems - 1200 Diamond Circle - Lafayette, CO 80026 - (303) 666-4549.

APPLE EXPO WEST Event Specialists, in association with the Bay Area Apple II Users Group & BMUG proudly present:

The Apple Expo West
April 23-25, 1993
@ Brooks Hall in San Francisco, CA

Three exciting days (compromising one weekend) are planned for all Apple II and Macintosh users throughout the world meeting in one prime location - San Francisco. Located near SilicOn Valley, the San Francisco expo will feature MANY events, all offered at one very low and economical price. All seminars offered through the duration of the Expo will be offered to all attendees at no extra charge. This is the best opportunity
for Apple users to see what the future holds for them, and should be considered an event NOT to be missed. Apple II users will have a few special treats in store for them as this will be an invaluable chance for them to check out all the new products which will be unveiled at the show first hand, and possibly get a chance to walk away with some of these products at one-time, show special pricing. Over 12,000 people are expected to attend this premier event.

For more information on this event, see the bulletin board item listed below. (A2.LUNATIC, CAT5, TOP2, MSG:29/M645:1)

I HAVE SEEN THE FUTURE! Last summer, a challenge was issued to the Apple IIGS community. That challenge was in the form of a contest. With the backing and support of Olivier Goguel of the FTA, we at inCider/A+ urged the IIGS community to seek greater heights, to have fun and to go where no one had gone before.

Some answered the challenge and some rose to the occasion. I personally came online and said "blow my mind and make my day". And, guess what?

Yes, indeed, the first Bouncin'Ferno entries are starting to arrive in SillyKohn Valley.

I have seen the future. I have tasted greatness. I have feasted on the next generation of IIGS superstardom. I have climbed to new peaks. I have played new Bouncin'Ferno levels. I have gotten blisters on my fingers. I have smiled at the little bouncin fernos, and I have cursed at frustratingly insane new Ferno games.

You rose to the challenge and you have succeeded. You did make my day. And my night, as well. Thank you, thank you, thank you.

Over the next several weeks, I'll be sorting through the contest entries, and choosing the winners. And, prizes will be announced.

But, will that be it? Is Bouncin'Ferno really the last of its kind? Have we seen the last works of The FTA? Is the fun and excitement that the FTA generated for us over? Are memories of the FTA all that remain?

I think not!

Coming soon to Shareware Solutions: The Lost Works of the FTA!

You ain't seen nothing yet! (J.KOHN, CAT28, TOP4, MSG:157/M645:1)

GEM IS NOW FREEWARE! Well, it's about time we announced this.

Those of us who run A2 have recently finalized a deal with Tom Hoover to license GEM.

For those of you who are interested, GEM is now available as freeware. The $20 shareware fee no longer applies. :-)

We are in the process of rewriting the GEM documentation, and are planning on adding a couple of _minor_ additional features, though they will be of no use to current GEM users.
Tom Hoover hopes to continue to update and expand GEM, but such
updates will still undoubtedly be shareware upgrades – i.e. you’ll be able
to have the current one for free, but if Tom Hoover does a major updates he
can still charge for it. ;-) 

Anyhow, if anyone out there has been hesitating to start using GEM,
now’s a good time. We'll soon be uploading an unlocked version with
revised documentation, but anyone who’d like the program now can write to
me for the unlocker program to get all GEM features functioning.

We think GEM is a great product and hope many people who’ve been
hesitant up to now will give it a try.

(A2.DEAN, CAT29, TOP5, MSG:41/M645;1)

>>> THROUGH THE GRAPEVINE... <<<

WHAT YOU WANT IS...

-----------------
> Where do I get a crystal to upgrade from 8/32 to 9 or 10 mhz? Where do
> I put the crystal or crystals? Thanks Dan, thanks for your earlier help!
> Fritz

>>>>> What you want is a crystal oscillator. These are available from
"""" companies such as Jameco, JDR Microdevices, and DigiKey. Sorry, I
don't have the numbers or prices handy, but you can call 1-800-555-1212 for
the phone numbers. For 9 MHz, you need a 36.00 MHz oscillator. For 10
MHz, you need 40.00 MHz. For any other speed, simply multiply the
processor speed by 4. You can get a CMOS oscillator, but it's not
required. I don't know about pricing; the figure of $15.00 sticks in my
head though.

Now take a look at your Zip card. With the card "fingers" at the
lower right, you should see a little silver box in the top left corner.
Among other markings, you should see "32.000 MHz". VERY CAREFULLY unsolder
this box, and solder the new one in its place. ORIENTATION IS IMPORTANT!
If you get a CMOS oscillator, it should have a notch in one end. Install
it with the notch up. If you didn’t get a CMOS oscillator, there should be
a painted dot on one end; install it with the dot toward the top.

You should also install a new CPU that's rated for the speed you want
to run at; I understand these run $95 from WDC in Mesa, AZ at 602-962-4545.
You want the 44-pin PLCC version, not the 40-pin DIP version.

WARNING: I have _not_ done this myself. The information in this post
was compiled from prior posts here, on the Internet, and other sources. I
_do_ believe it to be accurate; however, I can't guarantee that.

(D.BROWN109, CAT22, TOP10, MSG:149/M645;1)

LET US HELP YOU! AE's attention to this topic -- probably to this whole
"""" RT -- is spotty, at best. I had major problems with my
Serial Pro, too....finally got them to swap it with another that had some
different alphabet soup that the rep never bothered to explain to me.

But there are a lot of smart technically-minded people on this board,
so why not detail your problem here (even if it is with another on-line
service)?
If I buy a piece of hardware, and it doesn't work, I won't just toss it aside and buy another brand. I don't have that sort of money to waste. I eventually had to call AE's main number and ask for the president (Robert Carroll) before getting satisfaction. I wasted more than the cost of the Serial Pro on that *(*&^%! 900 number before making that much cheaper call to (214) 241-6060.

(L.DEVRIES, CAT14, TOP11, MSG:2/M645;1)

REGARDING YOUR FLAKY TWGS... A friend and myself both had problems with a flaky TWGS which were solved by replacing the short cable that goes from the board to the CPU socket. I got a plug that had gold pins and I soldered the connections on the connector so there would be better reliability of the connections. I have not been aware of any problems due to the TWGS for the several years since I made the cables. It was my assumption that non-corroding gold would be more reliable than the tin (?) plating on the original connectors.

(W.SHUFF, CAT, TOP9, MSG:6/M645;1)

OPTION KEY TIP Hold down the Option-key, while selecting "About" from the Apple menu in AppleWorks GS. You'll see a screen with some memory information and information about your GS.

(U.HUTH, CAT17, TOP17, MSG:23/M645;1)

WHY A USER GROUP? There are advantages to being an "official" Apple User Group. Among the advantages are:

- A free license to distribute Apple II System Software.
- Being listed with the 800 User Group Locator Service, so that when folks in your area call Apple to find out where the nearest group is located, they'll give your group as a contact.
- A monthly mailing from Apple.
- A subsidized account on AppleLink.
- A free hour of connect time each month on AOL.
- A yearly Christmas card from Apple.

I can't think of any disadvantages to registering with Apple, except that whoever is listed as the contact person will start getting lots of Mac oriented junk mail. And, I do mean Junk Mail.

(J.KOHN, CAT31, TOP5, MSG:25/M645;1)

>>> MESSAGE SPOTLIGHT <<<

S.WEYHRICH [ Historian ] at 21:29 EST

Here is a reproduction of part of my upcoming A2 News Digest that I thought deserved posting immediately:

[*][*][*]

--Zip Continues Zippin' Along

Out of the blue, there was a report from the National AppleWorks User Group posted in their category on the A2 RT on GEnie. It read as follows:

"Zip Technology no longer sells Zip Chips, replacement processor chips
Apple II Computer Info

that dramatically increase the speed of Apple II+, IIe, and IIc computers. According to J. P. Hayes, President of Zip, the company can no longer find a manufacturer capable of producing these 'hybrid' chip products. When NAUG contacted Ms. Hayes in early December, she reported that Zip had a single Zip Chip in stock that would be kept by the company. She indicated that the company is operating under Chapter 11 bankruptcy protection from its creditors.

"Although Zip Chips were recently sold with a one year guarantee, the company originally advertised an unlimited 'satisfaction guarantee' on the product. According to Ms. Hayes, Zip can no longer replace defective chips and, under the terms of their Chapter 11 protection, cannot refund customers' payments for these products.

"Ms. Hayes reports that Zip continues to manufacture accelerator products for the Apple IIgs. However, NAUG suggests that its members consider the company's financial condition carefully before buying a Zip product."

Naturally, this raised some concerns among Apple II and IIGS users who read the message. In my preparations for this article, I decided to contact Zip myself and see exactly where things were at this time. On January 8, 1993, I called Zip and Ms. Hayes spoke to me. In our discussion, I found a some major inaccuracies in the NAUG article. Ms. Hayes stated that she is Zip's CEO (not president), and that they have been in Chapter 11 for two years, and actually went OUT of it four months ago. That means that they are NO LONGER in Chapter 11 at this time! (For those who don't know, a Chapter 11 declaration simply provides protection from creditors, while a company reorganizes itself to change its operations to a more profitable situation. It is NOT the same as a company declaring bankruptcy and going out of business).

Secondly, and of similar importance, she said that Zip had indeed lost their previous manufacturer for the Zip 8 Chips, but they HAVE located a new company for doing this work. It is not a trivial operation to create a Zip Chip, and it will take another four to eight weeks until they will be back at full production again; however, Zip Technologies WILL still be making the 8 MHz Zip Chip for 8-bit AppleII computers, as well as the Zip GS card for the AppleIIGS.

Now, it concerns me greatly that there could be such a discrepancy between what NAUG says it learned in talking to Ms. Hayes in December, and what I learned in talking with her on January 8th. If we can assume the best, that no one was INTENTIONALLY deceiving anyone else, we DO have a serious miscommunication here. It is so serious that just the RUMOR that Zip was in Chapter 11 could easily have mutated into a rumor that they WERE out of business (perhaps the rumor has done so by now). Press coverage like that can kill a company. If we who write news articles (such as NAUG and myself) are going to be helpful to the AppleII community, we need to make things absolutely clear. The people that PROVIDE information should try to make sure that whatever they said was understood (the correct message was transmitted), and we who try to write up this information must take care to ensure that we have REALLY heard what we think we have heard (the correct message was received). It may simply require a phone call to clarify things.

The whole situation reminds me of the inCider/A+ "announcement" that indicated a major change in direction was in the works, and then their
subsequent correction that stated that, no, they were NOT decreasing
AppleII coverage. I was just as guilty as any in transmitting the
incorrect information; I assumed (erroneously) that the statements made by
Cameron Crotty were an accurate reflection of upcoming corporate policy.
As it turned out, whether minds at inCider were changed because of the
ruckus that was raised by the suggestion of such a radical change, or
whether the statements made by Crotty WERE incorrect at the time, things
did NOT change for the worse, and all that hand-wringing and name-calling
was unnecessary.

The bottom line for this situation is this: If you were interested
in a Zip accelerator for YOUR AppleII, rest assured. For the time being,
at least, Zip Technologies will stay in business and continuing producing
products for both the 8 and 16 bit platforms. And it doesn't hurt to point
out that if you want them to STAY in business, it would be a good idea to
plunk down some money and buy an accelerator from this company.

>>>>>>> THE FRIENDLY GUIDE TO SAFE FAX <<<

Dr. B. Comfortable answers some of your questions....

Q.: Doctor, I am new to fax, I have not had much fax, and I am worried.
    Is it safe to have fax?
A.: Fax is perfectly safe, providing both you and your partner maintain
your equipment in good order, keep it clean and have a regular
check-up by a qualified consultant. Do not be embarrassed at your
lack of experience. There are many excellent fax manuals available,
including my own "The Joy of Fax".

Q.: About how often should I fax?
A.: Those who are new to fax often can't get enough, and do it all the
time. We usually find, however, that as we get older and the novelty
wears off, the desire for fax decreases rapidly, particularly if we
still have the same old machine. (It is not unknown for jaded faxers
to have a brief "fling" with a new, exciting machine, but this, too,
will usually burn out quite quickly.)

Q.: Can I have fax with more than one person?
A.: By all means. This is perfectly normal, even necessary in most
circumstances. It is time we cast aside our hang-ups about fax, feel
free to "let it all hang out" and share your true self with the world.

Q.: Do I have to be married to have fax?
A.: Good Lord, no. People who hardly ever fax their wives will spend
most of their working lives faxing complete strangers.

Q.: My parents say they never had fax when they were young, and were only
allowed to write memos to each other until they were twenty-one, is
this true?
A.: Yes, but why worry about boring old twits like them?

Q.: If I fax something to myself, will I go blind?
A.: Certainly not, as far as I can see.

Q.: There is a place on our street now, where you can go and pay to fax,
is this legal?
A.: Yes. Many lonely people have no other outlet for their fax drives and
must pay a "professional" when their need for fax becomes too strong.

Q.: What are the consequences of indiscriminate fax?
A.: Very high telephone bills

//REFLECTIONS
/
Thinking Online Communications

[EOA]
[REF]

By Phil Shapiro
[P.SHAPIRO1]

>>> APPROACHING A MORE PERFECT STATE OF HUMAN COMMUNICAION <<<
Have you ever stopped to consider the many types of barriers that exist in human communication? Some barriers are barriers of cost. Some are barriers of inconvenience. And some are barriers of time delay.

It's interesting to take a closer look at these barriers to see how online communication helps eliminate or minimize them.

The Barrier of Cost The barrier of cost takes on two principal forms:

1) The cost of transmission, and,
2) The cost of production.

The cost of transmission usually involves first class or second class postage costs. And the cost of production usually involves editing costs, page-layout costs, printing costs, and paper costs.

Online communications radically minimizes both transmission costs and production costs. In some cases the transmission costs of sending ASCII text can amount to a small fraction of the cost of sending the same text via the postal service. This is especially true if people take full advantage of flat-rate electronic mail.

Of all the many barriers, the barrier of production costs is the one that most severely restricts useful information from passing between human beings. The restrictive barrier of production costs was recently brought to mind in a very personal way. Just last week a national magazine sent my software publishing company a strongly favorable, but extremely brief, review of my company's new educational software product.

Despite the positive tone of this review, I could not help but be disappointed about the brief length of review. One can only speculate that their production and transmission costs were so exceedingly high that they had to condense each of their reviews to the absolute minimum number of words. Another consideration could be that they wanted to give equal space to fifteen or twenty new software products. The only way to be fair-handed would be to give short shrift to each product.

Had this same publication been published online, the production and transmission costs would be a fraction of their current costs. The editors of the publication would then have no problem in "printing" complete and informative reviews of new educational software products. The beneficiary of such improved communication would include not only the software publishers (who might benefit from increased sales), but also the teachers and students who ended up using the software. In a very real sense, society as a whole benefits from the opening of improved communication channels.

Another example of the barrier of production costs can be seen in newspaper classified ads. Whether it be employment, for-sale, or housing classifieds, the content is almost always boiled down to twenty five or thirty words, with each word so radically abbreviated as to constitute a
Imagine if each classified fully and completely described the job available, the merchandise for sale, or the housing situation offered. People could actually browse the classified with a reasonable chance of finding something that meets their needs. Currently, newspaper classifieds can only give you an inkling of the opportunity expressed by the classified.

Online communication does not place such rigorous limits on the length of "classified" communications. On both local bulletin boards and national information services classified notices often run to several hundred words in length. Luxuriating in the available space, persons selling second-hand computers have been known to list all two hundred titles of software accompanying the computer. Buyers, likewise, can luxuriate in knowing the complete details of the computer system they are purchasing.

The Barrier of Inconvenience

The second barrier to human communication, the barrier of inconvenience, is not as obviously pernicious as the barrier of production costs. Yet this barrier remains doggedly irksome.

A prime example of such inconvenience is the game of telephone tag. Nobody but the most persistent person would continue the game of telephone tag past the first few missed connections. Even when substantial benefits could be gained on both sides, few persons have the resolve and tenacity to continue playing telephone tag for more than a few days.

A second example of inconvenience is the trip to the post office that is required each time you need more postage stamps. Next time you're standing behind ten other people at the post office, take a moment to consider the heavy burden of the "barrier of inconvenience."

A third barrier of inconvenience is the time-consuming chore of affixing an address and postage stamp to your postal correspondence. (Not to mention the chore of printing out, signing, and folding each letter you send.)

Online communications almost totally eliminates the barrier of inconvenience. E-mail makes telephone tag history (or at least more bearable.) You'll never run out of postage stamps when sending electronic mail. And you can bypass the "envelope game" entirely.

The Barrier of Time Delay

A third barrier to human communications is the barrier of time delay. If it takes too long for communications to travel back and forth, the rhythm of human communication is seriously disrupted. The example that immediately comes to mind is the interminable delays of sending and receiving mail between the United States and Canada.

It's not unusual for an air mail letter to take ten days to travel between the United States and Canada. That means that an ongoing postal correspondence between the United States and Canada would yield a maximum
of two interchanges of letters in any given month. It is amazing our two countries have remained such good trading partners given such slow-motion postal exchanges.

A second example of the time delay barrier is overseas correspondence. An air-mail letter traveling between Washington D.C. and Moscow takes about two weeks to be delivered. Interestingly enough, the letter actually travels to Moscow in less than three days. It takes the Moscow postal authorities about ten days to sort and deliver their local mail.

Such time delays degrade the natural rhythm of human communication. If you sent a letter on the first of the month, would you even remember what you wrote when you received a reply on the 31st?

Conclusion As each of the above-described communication barriers is eliminated or minimized, communication between human beings flows smoother and faster. And history has repeatedly revealed that the forward progress of civilization is directly proportional to the quantity and quality of communication taking place.

Businesses grow through communication. Children learn through communication. Social fabric is formed through communication between human beings. Improved communications yields rippled benefits that extend far out in all directions.

>>> WHO'S WHO? <<<<

~ A GENieLamp Profile of Mike Westerfield ~
~ of ByteWorks ~

ByteWorks is a long time supplier of programming software for
the Apple II line of computers. We were able to tag up with
Mike Westerfield, owner and chief software guru for ByteWorks,
and asked him a few questions. The results of that interview
are reprinted below.

How did you get started writing software for Apple II computers?

By accident, really. At my first assignment in the Air
Force, I was sent to a computer school to learn assembly
language for the IBM 360. The year was 1977, just as home computers were
starting to get fun. I bought an Apple II, and decided to write a chess
program. As a warm-up exercise, I wrote an Othello program, but none of
the assemblers could handle the job -- so, as a "brief" aside, I wrote my
own. Not knowing that it "couldn't" be done, I implemented the full
assembly language and macro language I was most familiar with, the one from
the IBM 360. I've been at it ever since.

When did you decide to start up business with the Byte Works?

The Byte Works got started as a software development
company. The original goal was to sell the ORCA/M
assembler and related products, which I did. Hayden Software published the
DOS 3.3 version of ORCA/M in January of 1982. A couple of years later,
just before the ProDOS version was ready, Hayden started to slide. A
friendly product manager at Hayden saw this, and set things up so we got the rights to ORCA/M, rather than getting stuck in the process of the company folding, and it was then that we started publishing our own products.

Like most startup companies, we began business in the house. Steve Jobs and Steve Wozniac started their business in a garage. Software is, of course, a more refined activity -- we started our business in a bedroom.

GEnieLamp> What kind of products does the Byte Works produce?
Westerfield> We've tried from time to time to publish just about everything, but most of our products are for programmers. We've published compilers, assemblers, programming utilities, and most recently, self-study courses.

GEnieLamp> When Apple started preparing for the introduction of the Apple IIgs, how was Byte Works selected to produce the software development environment that was eventually introduced at the same time as the computer?

Apple's engineers wanted a broad-based, flexible environment that could handle more than one language. ORCA/M did that. The fact that the assembler was so powerful helped in the decision, but as I understand it, the main reason for picking ORCA over the other programming products available at the time was that it was already set up to handle multiple languages.

GEnieLamp> How do you rate the ORCA development environment in comparison to what is available on other personal computer platforms?
Westerfield> These days, there are certainly better development environments on other computers, but strangely enough, I still think the ORCA environment is the best one anywhere for the audience it has to satisfy.

Let's look at that for a moment. If you are an advanced hobbyist or professional programmer, there are better environments available. The stuff that comes with the IBM compatible machines is very extensive, and MPW is a fine system; both are more capable than ORCA. I would estimate that ORCA has about 95% of the features any given professional would be likely to use, and about 60% of the features that you would find in the most advanced IBM or Mac development systems. When you consider the number of people involved in developing those other systems -- MPW took 10 man years for the _first_ release -- I feel pretty good about what we have on the GS.

For the beginner and hobbyist, though, the most advanced system is too big and complicated. Even a lot of the professionals will choose THINK Pascal or THINK C on the Mac, even though MPW is unquestionably more powerful, because the compilation speed is more important to them than all of the features. The ORCA languages have a nice, simple environment in PRIZM that gives even the least experienced programmer a quick and easy start, so they don't have to worry about spending hours of time learning the environment.

It's also pretty unusual to be able to tie these two environments
together. MPW is the only other system I know of that fully integrates a shell with a graphical environment, so you can mix window/menu based work with typing shell commands. MPW does a better job than ORCA in this area, mostly because you can script the menu commands and even add new menu commands to run scripts. The ORCA environment, though, beats MPW when it comes to debugging a program. The ORCA debugger is faster, and it's integrated with the environment. The MPW debugger has a lot more features, but for the hobbyist or student that makes up the bulk of our customers, the ORCA debugger works a lot better, simply because of the smooth integration with the environment.

On the Macintosh and IBM computers, the market is big enough to support more than one version of each language, so you have systems specialized for different needs. The specialized systems are certainly better at what they do than ORCA. I can't think of a single system that serves as diverse a market, from rank beginners through professional developers, as well as the ORCA system does, though. And, while there are better systems than ORCA, ORCA still stacks up pretty well. Outside of mainframes and the Mac and PC worlds, we have some of the best tools anywhere, and our tools are by no means outclassed.

GEnieLamp> What languages are available for the Apple II from Byte Works?

Westerfield> We currently have four languages on the Apple IIGS and one for the 8 bit Apple II family. The ORCA/M macro assembler is available for both the Apple II and the Apple IIGS. On the Apple IIGS, we also have ORCA/Pascal, ORCA/C, and ORCA/Integer BASIC.

GEnieLamp> What other products are available from your company?

Westerfield> I think the best way to answer that is with a complete list of the products and prices. (The ByteWorks product list follows this interview text.)

GEnieLamp> With all of these wonderful products that you have created for the Apple II, which is your favorite, and why?

Westerfield> A lot of people may think this is strange, but I don't have one. I also don't have a favorite language. What I have is a favorite activity -- creating programs. Each of our products is a different tool, with one begin better for one task, and some other product being better for a different task.

And, contrary to a very widely held opinion, I don't think Pascal is a better language than C. I just think Pascal is a more appropriate choice for most of the kinds of programs people actually write than C. I react very quickly when I see some guy trying to use C, and getting himself in trouble, when Pascal would do the job as well or better and not get him in trouble. C is a great language for some kinds of jobs, though, and I use it myself.

GEnieLamp> With the recent decision by Apple to finally drop the IIgs from their price lists, many Apple II users are feeling somewhat frustrated. What do you see as the future for the Apple II and its owners?

Westerfield> The Apple II is clearly not a big factor in new computer sales, due mostly to the way Apple handled the machine. I
was very frustrated at that, too. Still, removing the Apple IIGS from the price lists isn't that big of a deal. Apple stopped selling the machine two years ago, they just didn't make it official until the last price list.

Like all computers that are no longer sold, the Apple II will slowly fade away. I think that, five or six years from now, there won't be many people still using Apple II computers. The ones that are left will probably be in schools or charitable organizations, with a few people still using the computer in their home.

On the other hand, there is still a very viable market for software on the Apple IIGS. The publishers that have stuck with the machine and been flexible enough to change with the changing market have done pretty well. I expect you will see major new software packages released for the Apple IIGS for two or three years, at least.

Look at it this way: All of the big companies are experimenting with entrepreneurial units, trying to find and serve the small, profitable niche markets that they have seen make so much money when they are tapped properly. The Apple II and Apple IIGS are perfect niche markets. There are still a lot of people using the machine. In fact, our active customer list is still _growing_, not shrinking. Publishers have left the Apple IIGS a lot faster than the people who own the machine, which has helped those of us who stayed around. A few companies have even started to discover that the products they release on the Apple II do pretty well. They seem surprised, but the only thing that surprised me was that they were surprised!

I still use and enjoy my Apple IIGS, and I know a lot of other people do, too. As long as there are a lot of us around, and as long as we keep buying new hardware and software for our computers, there will be publishers and manufacturers who will give us the hardware and software we want.

GEnieLamp> Do you still have a good relationship with Apple Computer?

Westerfield> Yes. I certainly don't have as much contact with Apple anymore, but on a personal level, the ones I do have are a lot closer than they ever have been. On a business plane, I still do a lot with Apple, when you consider how much emphasis Apple puts on the Apple IIGS. Publishing "Programmer's Reference for System 6.0" is the latest in a long line of collaborations.

GEnieLamp> How long does the Byte Works plan on supporting the Apple II computer?

Westerfield> Tim Swihart, when asked when System 6.0.1 would ship, gave the only honest answer anyone could: "When it's ready." I liked that, so I'll follow his lead.

I intend to continue producing and supporting Apple IIGS programs for as long as people keep buying enough of them to pay the bills.

I can't tell you how long that will be. I can tell you that we have definite plans to release several new products this year, though. In fact, the Apple IIGS is a part of our plans for as far in the future as we make plans.
GEnieLamp> Did you ever have an urge to create software for any of the
Macintosh computers?

Westerfield> Yes. Someday I'll probably do something about that urge,
but I'm sort of busy with the Apple IIGS at the moment.

GEnieLamp> We understand that ORCA/C version 2.0 is ready for release.
Can you tell us what improvements are available over older
versions of the package?

Westerfield> Not in the space I expect you would allow me. :) I'll hit
some of the high points, though.

First, ORCA/C ships with the 2.0 environment that you've seen with
ORCA/M 2.0. This includes a new shell that takes advantage of System 6.0
and has a lot of new features; a new editor that supports editing multiple
files, editing files up to the size of available memory, and a new dialogue
based interface; and it comes bundled with Rez and DeRez.

You also get PRIZM 2.0. This is the first version of PRIZM that
works with the 2.0 shell. Besides the obligatory changes, though, PRIZM
has been reworked to take advantage of System 6.0, using all of the new
dialogues features and disk handling procedures. But the biggest change is
in the debugger: it supports structures, and does a mot better job with
pointers. You can look at some pretty complex values, like this one, for
example:

    document->points[5].theRect.h1

The major changes to the compiler are internal, but they really are
major! The code generator got a complete overhaul, with the addition of
loop invariant removal and common subexpression elimination, plus major
changes to the existing optimizers. Most programs are about 15% smaller
and faster with the new compiler, although I've seen some programs that
don't change much at all, and some that run in well under 10% of the time
it takes with any other Apple IIGS compiler.

The other major internal change is the addition of precompiled
headers. With precompiled headers, the compiler remembers some of the
things it figured out on a compile, saving the results in a special file
that is read the next time the program is compiled. The result is that
programs that use a lot if header files -- like just about any toolbox
program does -- compile about twice as fast as they did with ORCA/C 1.3.

There are several small enhancements, too. Just to name a few, there
is direct support for HyperStudio NBAs and HyperCard XCMDs, several new
pragmas to control the compilation process, new library calls, and new
command line options for those people who use shell scripts.

GEnieLamp> Do you have any new products under development with which you
can whet our appetites?

Westerfield> Sure. The obvious product for us to do next is ORCA/Pascal
2.0; stay tuned, it will be here sooner than you think.
We're also working with Peter Easdown, an Australian, who is in the final
stages of developing a Modula 2 compiler for the Apple IIGS.

GEnieLamp> The Byte Works is located in sunny Albuquerque, New Mexico.
Is New Mexico weather conducive to software development?

It's not the weather that's conducive to programming -- it's the surroundings. Looking out across the mesa, you see sand, tumbleweeds, rocks, and for variety, more sand. Heck, what else is there to do but program? :)

Seriously, it's a great place to live, and I like it a lot. People talk about cultural diversity, but we live it, here. People are friendly, curious, and neighborly -- a great example of what I hope the whole country is growing towards.

GEnieLamp> Do you have any favorite programs (other than your own) that you have spent significant time using or playing?

Westerfield> I used to, but I've been working too much lately! I still like the old classics, myself. Space Eggs, Alien Rain, Alien Invader -- they are great, timeless programs. I still think Pinball Construction Set is one of the best programs ever written, especially when you consider the state of human interfaces when it was designed. And, of course, Battle Chess is a must. I don't use my GS for desktop publishing, but I've seen some great looking software for the GS. I use ShrinkIt a lot, and I think it's a great program. SuperConvert is very nice, too, and it's been very handy for moving screen dumps to the Macintosh for manuals.

GEnieLamp> Do you spend much time using GEnie or any of the other major computer information services?

Westerfield> I spend about equal time on GEnie and America Online, and spend a little time on AppleLink. All total, I guess I spend about 10 hours a week either online or doing offline processing to support the online time. Almost all of that time is spent doing customer service, although I do occasionally prowl around the libraries.

GEnieLamp> Any words of wisdom for the hordes of people still happily sitting down to use their Apple II computers?

Westerfield> Keep with it. If you like it, and if it is doing what you want, it's still the perfect computer for you. And, of course, you're in good company!

/// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// /// //
1) Medicine. How about training interns on virtual patients instead of real ones? Or teaching someone who has recently broken a leg how to walk on crutches? Or spurring the memories of an amnesiac? Or bringing out the true personality of someone with split personalities? Listening to white noise in the background is comforting, but how about _actually being_ in a picturesque setting for as many hours as it takes the hurt to disappear? How about letting a paraplegic have the experience of climbing a virtual Mount Everest? Letting a (however base and hackneyed it sounds) neutered person have a universe-shattering orgasm? How about having people relive experiences in their lives in a _positive_ way -- actually going back to childhood and stifling that mouthy person or bully?

2) Education. It is said that experience is the best teacher, and virtual reality ought to be at least second best. Virtual reality field trips could range farther afield than any mundane one. Students could descend miles into the earth, and leap light years into space while in the comfort of a virtual reality classroom. Students flying in a VR spaceship could see relativistic physics at work, witness the birth of our galaxy, and preview its eventual demise. Or they could wing above a Jurassic landscape on the backs of pterodactyls, phone home on a re-creation of the set of _E.T._ to see how movies of our time were made, or peek over Segovia's sheet music as he sight-reads _Estudio Sin Luz_.

3) Military. Entire battles could be planned in virtual reality. It's raining brickbats, the terrain is muddy/rocky, the enemy is approaching from the east, your men are fatigued -- don't kiss your corporal goodbye, mister, DO something!

I might as well stop here. What I'd like to leave you with as you're reading this on your screen or from a printout is that the idea is the important thing. First comes the idea, then the hardware, then the applications for that hardware. (So we're leap-frogging the middle step? Who knew?) You've undoubtedly thought of other uses for virtual reality, too. Uses which are as varied as virtual reality promises to be. And I hope I've (very quickly) outlined some you haven't thought of.

What intrigues me so much about cyberspace/virtual reality is not how it will take us where we will go, but what we will do when we get there.

Calling All Beginners!

>>> A2 UNIVERSITY STARTS SPRING TERM WITH RESOURCES FOR BEGINNERS! <<<

JUST FOR BEGINNERS!  A2Pro, the Apple II Programmers and Developers forum, is pleased to announce the start of the spring term of A2 University (A2U) with a class on resources just for beginners!

A2U is the educational arm of A2 and A2Pro -- A2U presents courses of interest to those wanting to learn in-depth material about their Apple II computers. All courses are free -- no charge other than normal GENie connect charges!

A2U's fall term is winding down -- Certified Macro Whiz Will Nelken has just completed his A2U course "Ultra 4 -- to the MAX!" detailing how to squeeze every ounce of power out of AppleWorks and Ultra 4.1 that you could possibly want. If you missed the course, don't worry! The entire course and all the messages are available in the A2Pro libraries for you to download and study at your own pace, at any time. Andy McFadden's course on "Hacking Data Compression" has only one remaining lesson -- how to write modules for Westcode's upcoming HardPressed transparent disk-compression program. Since McFadden is the author of HardPressed, you can be sure to get all the details this way when HardPressed is released. The other 11 lessons takes students through explanations of data compression algorithms from the simplest to the powerful LZW and LZSS algorithms used in today's best commercial programs.

Now the spring term is starting with a course any Apple IIgs owner can find an interest in -- resources!

You've heard about them, you know they're there in some kind of "fork" thing, and you know you can edit them if you have a resource editor, whatever that is. But what are they _really_? How do they work? Who put them there? Do they ever get lonely? Why doesn't ProDOS 8 like them? What is the "Resource Manager," and who appointed it manager? Do resources have collective bargaining or is their manager a tyrant?

Wonder no more -- A2U's has a new short course on resources starting FEBRUARY 15TH that will answer all of these questions in six easy lessons!

You'll learn what a resource is, and how a resource fork makes a file different from a file without a resource fork, including why ProDOS 8 doesn't like resource forks. You'll learn why resource forks are mostly like completely separate files, and the later lessons will cap off with an explanation of the Apple IIgs Resource Manager and how programmers use it in simple ways to create and retrieve resources.

Sound educational? It is! And it's going to be followed later this spring with another course that extends this knowledge for people who have some programming skills to becoming a full-fledged resource expert -- using tools like Rez or Foundation, managing multiple resource files opened at once, how the Resource Manager works, what common resource formats are like and why they work, and more besides!

Our distinguished professor for this journey into resource land is
Marc Wolfram of Lunar Productions. Marc is the co-author of the Foundation resource editor, and in previous lives has worked on other Apple IIgs resource editing products like Genesys. There are few people out there who know more about resources than Marc, and we're pleased to welcome him to the A2U faculty for this special set of courses.

It all kicks off February 15th in A2Pro -- you can get to A2Pro by moving to page 530, or by typing "A2PRO" at any main GENie prompt, or by picking the menu option from A2's main menu. The discussion is in A2Pro's bulletin board -- you'll find all of A2U, including past courses, in category 22 of the bulletin board, and the lessons in A2Pro's Library 16.

Registering is as easy as posting a message saying "I'm here!", so drop by A2Pro and learn something useful!

..."We have to do something to be trendy. How about we all decorate our computers and hard drives with anchovies, wrap small woodland animals around our necks, and chant Mexican operas while we embroider "Censorship is for the *" on our underwear. Either that, or we can go out for pizza."...\n

You will hear the "Fat Lady Sing" when the game is over in Plunder, Jack Bennys' Maxwell, (if your old enough to remember), when you use a 50 mile card in MileStones, and "Honey are you through with the computer?" said by an anxious wife when you quit the game. All three have been updated to version 1.5 which fixed some problems and added new features like on screen help.

**PLUNDER**

Plunder gives you and your opponent(s) a room full of packages to choose from, open your selection and get a treasure or a big Ka-Boommmmm! You set the goal and who ever gets there first wins the game. The game can be set up for you and three friends to play or play against the computer. The treasure builds up as you play and you must choose when to exit the room before someone selects the bomb.

**ONE ARM BATTLE**

One Arm Battle is the ultimate in slot machines with, count'm, six windows. You can play against the computer or three of your friends. You can gain bonus points by fulfilling a task set by the game. Again there are great amusing sound affects. Start playing this game and you will never get your friends to go home. Better have a good stock of refreshments on hand.

**MILESTONES 2000**

MileStones 2000 is the gem of the three in my opinion. It's you against the computer in a mad cap car race. You are both dealt cards which may have miles on them from 50 to 400. They maybe good cards like get gas, repair a wreck, fix a flat, and GO which turns the traffic light green or bad cards you give your opponent like run out of gas, give a flat, crash the car, and stop which turns the light red. There are also bonus cards like unlimited gas, super driver, super tires, and emergency run. If the computer gives you a flat and you play the super tire card, you get a "Gotcha" and bonus points. On screen help is available under the "Apple Menu" if you need it.

**ADDICTIVE!**

All these games are easy to play and most addictive. You will be up all night saying "Well just one more game". Plunder and Milestones 2000 have a $15.00 shareware fee, One Arm Battle is $10.00. Be sure to send in your shareware fees. Wacky, inspired minds like Ken Franklins' must be encouraged to develop more Apple IIGS games. There have been rumors for months on GEnie that Ken is coming out with a new game. All we can do is hope the rumors are true.

[*][*][*]

These four games can be found in the GEnie A2 Library as follows:

- **Number**: 16464  Filename: BOUNCEIT.GS.BXY  
  **Address**: A2.DEAN  **Date**: 910826  
  **Approximate number of bytes**: 47488  
  **Number of Accesses**: 163  **Library**: 21

- **Number**: 17898  Filename: OAB.15.BXY  
  **Address**: A2.DEAN  **Date**: 920302  
  **Approximate number of bytes**: 189184  
  **Number of Accesses**: 105  **Library**: 21

- **Number**: 17899  Filename: PLUNDER.15.BXY  
  **Address**: A2.DEAN  **Date**: 920302  
  **Approximate number of bytes**: 313856
In late November I faced a major crisis. My hard drive was dying a slow and painful death. I certainly was upset that my drive was going out, but the good part about the situation was that I knew what was happening. And I knew early enough to do something about it. I even managed to work a review on removable hard drives into the process. Perhaps I should start at the beginning.

The way that this saga started was innocuous enough. I had been noticing a longer than usual delay in the boot process for my hard drive. I own a Ramfast SCSI card and an external 105 Meg hard drive with a Rodime mechanism. At times the drive would take about 10 seconds longer than usual to boot into GS/OS. In mid-November, this occasional delay took on a more ominous note. There were times that the software would stop at mid-boot and indicate that one or other of the system files was unable to load properly.

What I was soon to discover was that the media on my hard drive was slowly going bad. The intelligent controller on the drive was doing its best to read the data, but would eventually give up and indicate an error condition. The data fading process was slow enough that even after I figured out what was going wrong, I was still able to recover most of the...
data on the drive before it disappeared into the bit bucket. The first order of business was to find a new and reliable drive to replace my declining Rodime.

I searched the marketplace with great enthusiasm since the price of mass storage devices have been dropping quite a bit in the last few months. I also spent some time looking at removable media since there has been some activity by various manufacturers to draw attention to their products. The two most interesting devices that I saw were the SyQuest Removable Hard Drive and the Floptical Removable Drive. Both offer removable media and are priced about the same for the drive itself. I decided that removable media was the way to go since I wanted to avoid running out of disk space again anytime soon. (If you spend much time on GEnie, you know what kind of disk space problems you can run into.)

Having decided to go with a removable device, I went into a product comparison mode. Since the drives themselves were similar in price, I compared the price of media also. The floptical disks are a special 3 1/2 in. floppy with an optical tracking guide. They run about $30 in medium quantity from my usual sources. The Syquest is a Winchester technology, 5 1/4 in. hard disk platter. It costs about $110 in quantities of one from the same sources. A comparison of media costs for approximately 80 Meg of storage is compared below:

<table>
<thead>
<tr>
<th></th>
<th>SyQuest</th>
<th>Floptical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>88 Meg formatted</td>
<td>84 Meg formatted</td>
</tr>
<tr>
<td>No. Disks</td>
<td>1 x 88 Meg</td>
<td>4 x 21 Meg</td>
</tr>
<tr>
<td>Disk Cost</td>
<td>$110 + tax</td>
<td>$120 + tax</td>
</tr>
<tr>
<td>Drive Cost</td>
<td>$450 + tax</td>
<td>$499 + tax</td>
</tr>
<tr>
<td>Online Storage</td>
<td>88 Meg</td>
<td>21 Meg</td>
</tr>
<tr>
<td>Real</td>
<td>No</td>
<td>Yes*</td>
</tr>
</tbody>
</table>

The comparison above shows that the two choices are almost identical in every way except for the last two items. With the SyQuest, I get 4 times as much storage online at once. This turned out to be crucial factor. I thought that the standard floppy capability of the Floptical drive would be an important benefit. However, what I discovered was that the 3 1/2 in. floppy ability is limited to disks that are created with the Floptical Drive. I would not be able to read disks formatted with the Apple SuperDrive. Therefore, I would not be able to use the drive for disk-to-disk copies of standard 3 1/2 in. floppies.

With these ideas in mind, I bit the bullet and purchased the SyQuest removable drive. This decision has proven itself to be a satisfying approach that I have not regretted. The drive housing is a standard metal/plastic case that can hold a variety of different hard drives. The power switch is in the back along with two switched outlets and the standard pair of SCSI connectors. The front panel has a power indicator LED, an opening for the drive cartridge, two drive status LED's, and the ejection/lock buttons.

Installation was a breeze. Like any other external SCSI drive, all I had to do was plug and play. The initial cartridge was inserted without problem and I soon had my RAMfast interface busy formatting the virgin media. I decided to use standard names and partition sizes for all of my removable cartridges. With this thought in mind, I partitioned the drive
and named the individual partitions. Mission accomplished: The first SyQuest cartridge was ready to go. I repeated the process with the second cartridge that I had purchased. A price of $1.22 per Meg makes the addition of cartridges relatively painless.

With my new drive in place, I was able to copy all but about 10 files from my old hard drive over to the new SyQuest drive. I then did a low level format on my old hard drive to see if that would help the drive retain data. The bad news was that the low level format caused even more problems with read operations. Therefore, I concluded that the hard disk media was slowly loosing the ability to retain data. With my data safely tucked away on one of the new SyQuest cartridges, I felt comfortable enough to take apart my old hard drive and replace the drive mechanism. I put a new Seagate 180 Meg drive in the old case and now have a huge online storage capacity of about 270 Meg.

Whenever I want to change drive cartridges, all that I have to do is take the current cartridge offline by hitting the lock button and ejecting the disk after it has spun down. The partitions on the disk become unavailable just as if I had ejected each of them from a floppy drive. The new disk cartridge is then inserted into the SyQuest drive. The disk will automatically engage, lock, and spin up. After the front panel LED's show that spin up is complete, the new partitions are immediately available.

The SyQuest cartridges and drive have proven to be reliable and are slightly faster than the standard hard drive that sits under it. Along with that fact, the removable media was purchased from SyDos and has an extended warranty of 5 years. This guarantee is 3 years longer than the warranty on my standard hard drive.

I could not conclude this review without discussing the possibility of backups using the SyQuest device. "Backups with an 88 Meg drive, you may ask?" It may seem like over-kill, but the issue of backups was clearly a pertinent issue when I purchased the drive. The beauty of having such a large capacity drive is that a person can handle backups any way they want to. They can make exact copies of the Seagate partitions using standard copy and verify programs. Alternately, they can store compressed images using ShrinkIt or an equivalent utility. They can store compressed, incremental backups with a utility such as ProSel. The possibilities are endless with this much storage capacity.

Before anyone asks the question I will give the answer that yes, floppy backups are cheaper than using a SyQuest cartridge. However, the difference in price per Meg between 3 1/2 in. floppies and a removable cartridge is not all that great. With the removable hard drive, the user has the peace of mind that comes with being able to say the following: "Hmmm, my hard drive is acting up. No problem. I'll just stuff in my backup SyQuest cartridge and away we go. No further work required."

In summary, the SyQuest drive performs reliably and provides a very large amount of online storage (88 Meg) for the price. With drive and media costs in the same ball-park as a Floptical drive, I recommend that potential buyers consider the SyQuest as proven hard drive technology, with a twist (its removable). The final good news for me was the fact that I am back up and running with my two drives. Computing has never been better.

[*][*][*]
The PHOTO RT  Hi everybody!  Yep, it's February already.  Can you believe
it?  Boy, I wish I could build myself a time machine and
relish some of those great moments.  Though I'm not too sure if there were
really _that_ many great moments to relish but it would still be nice.  :-)  
We _do_ have the next best thing.  Photographs.  Yes, everyone's talking
about photographs these days, especially since Kodak's unveiling of that
new CD photo stuff.

Well, guess where I visited this month... Yes, you guessed it.  The
Photo RT!  And what a great place it is!  Some of the best photographs
you'll ever see in your life are in the libraries there.  There are
pictures in all the standard formats available for downloading and viewing
on your computer.  You can also contribute your own pictures to the library
too!  You send your pictures through the mail to the sysop and he'll scan
your photos and put them in the library for free!  Neat, huh?  And if your
into picture taking at all, the Photo BBS is a great place to talk to other
people just like you!  To get there, type PHOTO at any prompt.

So visit the Photo RT this month and have some fun with pictures!  But
before you do, be sure and solve this month's puzzle.  You want to be hip
by showing everyone you know all the latest buzzwords right?  :-)  Have fun!

INTRODUCTION
This part of the History describes the advancements in disk technology that have been available over the years for the Apple II series, and then examines the last 8-bit computer made by Apple, the IIc Plus.

[*][*][*]

ADVANCES IN APPLE II DISK STORAGE
Since Steve Wozniak's Disk II floppy drive changed the Apple II from a hobbyist toy to a serious home and business computer in the late 1970's,
the progress of disk storage has been slow for the Apple II series. In 1978, the year the Disk II was released, Mike Scott (Apple's president) and Randy Wigginton were asked at a user group meeting whether they were going to go to the larger capacity eight-inch floppy drives (which had been around before the 5.25 floppy drives). They answered that no, the Apple II was not going in that direction, but felt it might get a hard disk by 1979 or 1980, and possibly earlier than that a double sided, double density 5.25 disk with 500K per disk.<ref> Of course, this never did happen; as we saw in part 7 of this historical overview, the Apple III project began to overtake the hearts and minds of Apple executives by 1979, and anything newer, bigger, or better was reserved for that machine. As a result, DOS 3.2 and 3.3 was hard-coded to work specifically with the Disk II and its 143K of available storage, and never enhanced to easily access larger capacity drives. (Later, when we examine the evolution of Apple II DOS, we will see that it was possible from the beginning for DOS 3.2 and 3.3 to access up to 400K per disk in its catalog structure; however, the low-level disk access routines built-in to DOS were ONLY for the Disk II).

So what changes DID occur in Apple II disk storage? Between 1978, when Apple released their original Shugart 5.25 inch floppy drives, and 1984, nothing much changed. Third party company produced patches that modified DOS 3.2 (and later DOS 3.3) to work with larger drives; from eight-inch floppy drives to hard disks (a whole 10 megabytes for only $5,350 from Corvus!<ref>) to other various short-lived innovations, all made to try to end the "floppy shuffle". (One of the more interesting ones put five floppy disks into a cartridge, and through software made them appear to the computer as one large disk drive). Eventually Apple decided that the aging Disk II mechanism needed a face lift, and they introduced in the DuoDisk in May of 1984. This was essentially two Disk II drives in a single cabinet, with a special controller card. The drive mechanism was improved to better read half-tracks on disks (which some copy-protected software used), and at $795 was priced to be less expensive than buying two of the older Disk II drives with a controller card.<ref> The most important advantage of this new design was an elimination of the "fried disk drive" problem that happened constantly with the older design. The old Disk II controller had two connectors, one for each Disk II drive that could be connected. The problem was the in the design of the connector; like the game paddle plugs for the original Apple II and II Plus, the plugs for the Disk II drives were simply a series of pins that had to be properly aligned for the drive to function (similar to the delicate pins on a computer chip). If you tried to attach the plug in such a way as to accidentally shift the pins over by one, it would burn out the motor on the disk drive, requiring a trip for repairs to the local Apple dealer. The new DuoDisk design made connection of the disk mechanism to the controller fool-proof.

With the release of the Apple IIc in April 1984 came an external Disk II drive that was designed to plug into the new disk port in the back of the IIc, and was the same color and design as the IIc case. The Disk IIc was specific to the Apple IIc and could not be used with any older version Apple II, since it used a new, unique connector. However, since it was more expensive than a used Disk II drive, many users found out how to make a conversion cable to connect the older drive to the disk port; some even went the other direction and found ways to connect the new drive to the older Disk II controller cards for the II Plus and IIe.

The next small evolutionary step in disk storage technology for the Apple II was introduced in June 1985, with the release of the UniDisk 5.25. This drive was designed with the same appearance as the DuoDisk, but was a
single 5.25 drive. It was also designed to allow one drive to be "daisy-chained" to another (one disk could plug into the back of another, forming a "chain"), instead of the older method of connecting each drive separately to the disk controller card. Its beige color was designed to match the original Apple IIe.<4>,<5>

The last version of the Disk II was called the Apple 5.25 drive. It was identical to the UniDisk 5.25 drive, except for its case, which was designed in the platinum color to match the Apple IIGS and the platinum IIe. The connector it used allowed it to also be connected in a daisy-chain fashion.<5>

NOW A WORD FROM OUR SPONSOR: BASICS OF DISK STORAGE

Let's digress for a moment from discussing specific Apple disk products and turn to a description on how the data are stored on a disk. There are two important concepts that you need to understand to see why some methods of data storage are "faster" than other methods. The first concept is the physical data layout on the disk, and the second concept is the "logical" data layout.

The physical layout of data on a disk is important to the hardware of the disk drive. If the computer tells the disk drive to retrieve data from the disk, it has to be able to tell the drive exactly WHERE on the disk surface that data are stored. Most disk drives in use today (and when Steve Wozniak designed the original Disk II) store data on disks that are round, magnetically coated pieces of plastic that spin within a protective sleeve. The older 5.25 inch and 8 inch disks were "floppy" disks because they used a flexible protective sleeve (unlike the older yet but larger capacity "hard" or fixed disks, which usually could not be removed). The newer 3.5 inch disks are also made of the same magnetically coated plastic, but their protective sleeve is a hard shell. Within its sleeve the thin plastic disk spins around rapidly while the disk drive motor is on.

When a disk is formatted, certain addresses are written to the disk surface in a pattern that is known to the program (the disk operating system) used by the computer controlling the disk drive. Most computers divide the disk surface up into concentric rings (called "tracks"), and each track is divided up into segments called sectors or blocks. Each segment holds a specific number of bytes of data; for the Apple II, this has been either 256 bytes (sectors on 5.25 disks) or 512 bytes (blocks on newer disk devices). The number of sectors or blocks per track differs, depending on the device in question; what is important is that the disk operating system knows how to get to the right block when a request is made of it.

The second concept, that of the "logical" layout of the disk, has to do with the way in which the disk operating system organizes the physical blocks on each track. Imagine a phonograph record on a turntable (some of you still own those, don't you?) It physically resembles a floppy disk; it is just larger in size and is not "floppy". Mentally take a white marking pen and draw lines through the center of the record, across the entire surface from side to side, making the record resemble a pizza that has been cut up into wedges.

Now draw a series of concentric circles, from the outside of the record down to the center. Each ring will, of course, be smaller than the previous ring. The rings you have drawn represent "tracks" on our simulated floppy disk, and the lines running through the center of the
record represent the division of each track into blocks. Suppose we drew
enough lines to divide the record up into twelve "pieces" (of pizza). That
means that each "track" has twelve "blocks".

Now that you have your disk divided up (you just "formatted" it!),
let's store some data on it. Numbering each "block" from one to twelve
(like the numbers on a clock), let's put a checker into each block on the
first (outermost) "track" (yes, a checker. You know—from the game?)
Repeat the process on the second track, then the third, and so on, as far
as you can go. Eventually you won't be able to fit checkers into the
blocks, because they will get too small. (This points out one of the
limits of floppy disks; at some point the available space on the disk
becomes so small it is unusable. A standard 5.25 disk for the Apple II can
have anywhere from 35 to 40 tracks (Apple has always supported only 35
tracks), while the 3.5 disk has 80 tracks. The checkers we have put in the
"blocks" on this disk have also been labelled, but with the letters "A"
through "L" for the first track, and "M" through "X" for the second track,
and so on.

Turn on the record player. If you hold your hand over one spot on the
first track on the record, you can see the lettered checkers as they move
past. As it goes by, grab the "A" checker, then the "B" checker, and so
on. Likely, after picking up checker "A" (on block 1), you had to wait for
an entire rotation of the record before "B" comes by on block 2. The same
goes for "C", "D", and so on. In computer terms, the "interleave" on this
disk is 1 to 1 (written as 1:1). If you were EXTREMELY fast, you could
pick up "A", "B", "C", etc. as quickly as they went by, without having to
wait for the next revolution of the record. While few of us would be that
fast, many of us could pick up a checker after about four went by that we
didn't need. "Reload" your data on this disk, this time putting checker
"A" on block 1, then checker "B" on block 5, checker "C" on block 9,
checker "D" on block 2, check "E" on block 6, and so on. Now, as the
record spins, you might be able to pick up "A", "B", "C", and so on without
having to wait for the next revolution of the record. This would be
(approximately) a 4:1 interleave. With this "logical" layout, you can
pickup (load) checkers from the disk, and replace (store) checkers on the
disk more efficiently. If your hands are still not fast enough, you may
need to increase the interleave to 6:1 or even 8:1. If your hands are
faster, you could possibly use a 3:1 or 2:1 interleave.

This is roughly what happens with disk access. A disk device and
operating system that is extremely quick about processing the data it reads
off a disk can have a short interleave (1:1 or 2:1). A slower disk device
or operating system may need to use a 4:1 or higher interleave to work most
efficiently.

One last note: Because a track on a disk contains a continuous stream
of data bits, Apple drives were designed from the beginning to use
"self-synchronization" to be able to tell one byte from the next. This
continuous series of bits would be similar to having a paragraph of text
with no spaces between words. If a sentence read "GODISNOWHERE", does it
mean "GOD IS NOWHERE" or "GOD IS NOW HERE"? Some method is needed to let
the computer doing the reading know where the "spaces" between bytes
exists. I won't go into detail on exactly how this is carried out, but
suffice it to say that some bytes on the disk are reserved for this
decoding process, and so the true data bytes are specially encoded to not
be mistaken for the self-sync bytes. The process of decoding these "raw"
data bytes is called de-nibblization, and translates about 700 of the raw
bytes read directly from the disk into 512 true data bytes. This is
another part of the overhead necessary when reading from or writing to the
disk; it would be similar to having to draw something on each checker with
a marker as it was removed from the spinning record described above.

THE UNIDISK 3.5 AND APPLE 3.5 The first new disk drive that Apple
released after the original Disk II was a 400K, single-sided 3.5 inch drive for the original Macintosh. Then, in September 1985 Apple finally released a similar drive for the Apple II series, one that was not simply a cosmetic improvement of the original Disk II drive. The UniDisk 3.5 drive was a double-sided version of the Mac drive, and could hold 800K of data. The only connection that this new drive had with the original 5.25 drives was a chip used on its controller card; this IWM chip (for "Integrated Woz Machine") put the function of the original Disk II controller onto a single chip, plus the enhancements needed to operate this higher density drive. Apple's design for the UniDisk 3.5 was unique, in that it used a modification to Sony's design that varied the speed of disk rotation, depending on which concentric track was being accessed. This change made it possible for data to be packed compactly enough in the smaller inner tracks to gain an extra 80K beyond the 720K that was originally possible.

The UniDisk was directly supported by the newer Apple IIC motherboards (as mentioned in the previous part of this History), but for the older Apple II's a special controller card was required. The UniDisk 3.5 was designed as an "intelligent" drive, and had a self-contained 65c02 processor and memory to temporarily store ("buffer") data being read from or written to the disk. This was necessary because of the slow 1 MHz speed of the 6502 processors in the Apple II; they could not keep up with the faster data transfer rates possible with the 3.5 disk mechanism, plus the overhead of de-nibblization. This extra processing did cut down the speed in the UniDisk data transfer rate, but compared to the older Disk II drives it seemed MUCH faster.

With the release of the Apple IIGS in September 1986 came a new version of the 800K 3.5 drive called the Apple 3.5. This mechanism could be used on either a Mac or Apple II, fitting into the trend at Apple at making peripherals compatible between the two computers. The major difference between this drive and the original UniDisk 3.5 was that it had been lobotomized to be a "dumb" drive. Gone was the internal 65c02 processor chip used in the UniDisk 3.5 (which made it an "intelligent" drive) and the ability of the drive to buffer its own read and write operations. The newer Apple 3.5 drive did away with the extra circuitry, leaving it to the computer to handle direct control of the drive. This could be done in the IIGS because of its faster 65816 microprocessor, which could keep up with the higher rate of data transfer. Recall the above discussion of interleave? The original UniDisk 3.5 worked best with an interleave of 4:1, but the Apple 3.5 used 2:1 interleave and could do disk reads and writes faster. Disks formatted with either drive were usable with the other one, but would be slower on the "foreign" drive.

Overall, Apple released four versions of 3.5 drives between 1984 and 1986. First was the 400K drive used on the original Macintosh, then the 800K UniDisk 3.5 (which wouldn't work on the Mac), then an 800K drive for the Mac (which wouldn't work on the Apple II), and finally the Apple 3.5 drive, which worked on the Apple IIGS and the Mac, but not the IIE and original IIC.
Recalibrating our special time-travel card to focus on the final 8-bit version of the Apple II, let's travel to mid-1987. It was at this time that someone at Apple decided that the IIc needed to be upgraded. Shortly before July, three years after its original 1984 introduction, it was felt that the Apple IIc would benefit from the larger capacity Apple 3.5 drive as its internal drive. The primary intent was to make only this change, while leaving the rest of the IIc as it was. As with most other Apple projects, this went by various internal code names during its development, including Pizza, Raisin, and Adam Ant.<11>

Trying to use the Apple 3.5 drive in the Apple IIc was certainly an engineering problem. As mentioned above, the 1 MHz 65c02 was simply not fast enough to take raw data off the Apple 3.5 drive, de-nibble it into usable data, and pass it to the operating system. The "intelligent" 3.5 drive was designed in the first place for that very reason. To solve the problem, Apple contracted with an outside firm to design a special digital gate array that made it possible for the 1 MHz 65c02 to just barely keep up with the data transfer rate from the Apple 3.5 drive. In accomplishing this, it needed an extra 2K of static RAM space to de-nibble the raw data from the 3.5 drive. This extra memory had to be available OUTSIDE the standard Apple IIe/IIc 128K RAM space, since there was simply not enough free memory available to spare even that little bit of space. The code Apple engineers wrote to use the drive was SO tight that there were EXACTLY enough clock cycles to properly time things while controlling the drive. (Each assembly language instruction takes a certain number of clock cycles; these cycles have to be taken into account for timing-sensitive operations such as disk and serial port drivers).

To support older Apple II software that came only on 5.25 disks, the disk port on the back was now changed to handle not only external 3.5 drives (either UniDisk 3.5 or Apple 3.5), but also up to TWO Apple 5.25 drives which could be chained together (the same drives used with the Apple IIGS). These could be chained together as could the 3.5 drives. The IIc Plus, then, could have three additional drives attached, in any mixture of Apple 3.5, UniDisk 3.5, or Apple 5.25 drives.<6>

The IIc Plus design was not thought out completely from start to finish, however. After they did the work with the special gate array to make the original IIc architecture work properly, someone decided that it was not a good idea to release a 1 MHz computer in 1987. People want speed, they reasoned; look at the world of the IBM PC and its clones, where each year faster and faster models are released. They decided then to retrofit the new IIc with a faster 4 MHz version of the 65c02. That change, had it been done from the start, would have made engineering the internal 3.5 drive simpler; they could have just used the processor at 4 MHz for 3.5 drive access, and then used the true system speed (as selected by the user) for all other functions. The complicated gate array would not have been necessary. But, since the faster speed was added as an afterthought, and the project was under a tight schedule, the gate array design was not changed.

To accomplish the faster processor speed for the IIc Plus, Apple went to another outside firm, Zip Technologies. This company had already marketed an accelerator, the Zip Chip, that was popular as an add-on product for existing Apple II computers. Users could simply remove the 6502 or 65c02 chip in their computer, replace it with the special Zip Chip, and suddenly they had a computer that ran up to four times as fast. Apple
licensed this technology from Zip, but engineers balked at actually using
the Zip Chip itself for the IIc Plus. Part of this was because of the size
of the Zip Chip. The chip was shaped like a standard integrated circuit,
but was thicker vertically than a basic 65c02. Inside the extra space was
a fast 65c02 processor, plus some caching RAM, all squeezed into a space
that would fit even into the original Apple IIc (where space was at a
premium). (The Zip Chip "cache" is a piece of RAM memory that is used to
hold copies of system memory that the processor is frequently accessing.
For instance, if a lot of graphics manipulation is being done by a program,
the caching RAM would hold a copy of part of the graphics RAM, and could
access it much faster than the standard RAM. This is part of what makes an
after-market accelerator work).

Zip had wanted Apple to buy their Zip Chip and simply use that product
in the IIc Plus. Obviously, this would have been to Zip's advantage
financially. However, the thicker vertical size of the Chip made testing
the completed computer more difficult, and it would be a problem to isolate
product failures to the Zip Chip, instead of something else on the
motherboard. By using a 4 MHz 65c02 and two 8K static RAM chips as
separate components in the IIc Plus, Apple engineers could ensure that it
would work and be available in a large enough volume for production. When
they were designing the IIc Plus, Zip Technologies could not guarantee they
could provide reliable products in the volume Apple needed.

The IIc Plus did not have the 12 VDC input on the back panel as did
the earlier IIc's; instead, the power supply was built-in. This was not
because it was necessarily a better design, as an internal power supply was
actually less reliable ultimately than the external power supply. (It
exposes the internal components to higher levels of heat over the lifetime
of the product). But because many people had criticized Apple about the
IIc external power supply (called a "brick on a leash" at Apple), that they
had decided to make it internal on the IIc Plus as it was on all their
other products. This change apparently did not cause any significant
problems, as few people were actually trying to use the IIc as a "portable"
computer (with a battery pack).

The memory expansion slot on the IIc Plus was not compatible with the
memory cards that Apple had produced for the older IIc. This was primarily
a timing problem; it was not because the RAM chips in the memory card were
not fast enough to keep up with the 4 MHz speed of the IIc Plus. (Older
IIc users can use an Apple Memory Expansion card with an 8 MHz Zip Chip
with no problems). The IIc Plus also had an additional connector at the
opposite end of a memory card plugged into the expansion slot. Signals
from port 2 were made available at that end, so third party companies could
make a card that was a combination RAM card and internal modem. However,
this never did come about (see below).

Other changes in the IIc Plus included a slightly redesigned keyboard
and mini-DIN-8 connectors on the back panel for its serial ports (to be
more compatible with Apple's new Macintosh and IIGS keyboards).

One interesting note: John Arkley, one of the engineers working on
the project and a long-time Apple employee, campaigned long and hard to
take things a step further. He wanted them to take an Apple IIGS
motherboard, remove the slots, change the ROM to support only the internal
"slots", and release a IIGS in a IIc case. He felt it would have made a
great portable, non-expandable IIGS, but could not get anyone who could
approve the plan to get interested in the idea.
**THE APPLE IIC PLUS: FIRMWARE**

The IIc Plus ROM was called revision 5 (the previous Revised Memory Expansion IIc was labelled as revision 4). The main changes present were the ones that supported the internal Apple 3.5 drive. Firmware on the new IIc was not any larger than the 32K on the previous models, but it did use the entire space (the previous IIc didn't use the last 8K available in the ROM).

One minor bug that slipped by in the IIc Plus firmware was an inability to deal with 400K (single-sided) 3.5 disks. There were few commercial software packages that came on such disks, however.<7>,<8>

**THE APPLE IIC PLUS: INTRODUCTION**

In September 1988 the Apple IIc Plus was introduced to considerably less fanfare than the original IIc was in April 1984. There were no promises of "Apple II Forever" this time; instead, it warranted little more than a press release in various Apple II magazines of the time. Its selling price was $675 (or $1,099 with a color monitor). This was remarkable, considering that the original Apple IIc WITHOUT a monitor sold for nearly double the price ($1,295) and had far less capacity and power than this new version. Some models of the IIc Plus were even shipped with 256K of extra memory already added. It was faster than any other Apple II ever produced (including the 2.8 MHz IIGS), and was probably the finest 8-bit computer Apple ever produced.

**THE APPLE IIC PLUS: LESS THAN A SUCCESS**

Early on, the Apple IIc Plus was a big seller, and by January 1989 it was above forecasted sales levels. However, the biggest hurdle that the IIc Plus had to overcome was not the external marketplace, but rather the internal market opinions at Apple Computer, Inc. Since Macintosh-mania was still in full swing at Apple, and that younger brother of the Apple II was getting most of the attention from management, the IIc Plus (as well as the IIGS) suffered. It was not because of a lack of capability, but primarily from failure to thrive due to inadequate home nutrition, so to speak. Also, the IIc Plus had the same problem as the original Apple IIc; customers seemed to want the IIe with its slots, or the greater power of the IIGS.

There were some products that were designed by third-party developers for both the IIc and IIc Plus that never made it to the market for various reasons. Applied Ingenuity (later known as Ingenuity, Inc) had two products that would have markedly increased the portability of the IIc/IIC Plus. One was an internal hard disk they called "CDrive", which would have replaced the Apple IIc or IIc Plus internal floppy disk drive (converting it into an external floppy drive). Even more unique was "CKeeper", which was a multi-function card with many features. It could hold up to 1.25 MB of extra RAM; it had a clock/calendar chip that was ProDOS compatible; it had firmware routines to support dumping text or graphics screens to the printer; it could function as a built-in assembly language program debugger; and best of all, a feature called RAMSaver, which maintained power to the RAM chips during a power failure or if the power switch was turned off. Both of these products never saw the light of day, primarily because the company went out of business before they could be finished.<9>

Chinook Technologies actually finished design on an internal modem for the IIc Plus, but never released it. This card, 1.5 by 6 inches in size, would have mounted inside the disk drive shield. It connected to a small box attached to the outside of the IIc case, where there were cut-outs.
Apple II Computer Info

provided by Apple for connection of an "anti-theft" cable. This external box had phone jacks for the phone line and a telephone, just like most external modems. Undoubtedly it never was released because of Apple's indifference towards the IIc Plus.<10>

With inadequate support by Apple marketing, third-party hardware and software developers had little motivation in designing any new products for the IIc Plus. Therefore, no unique products ever emerged on the market to take advantage of its features. Finally, in September of 1990 the IIc Plus was discontinued by Apple, leaving the platinum Apple IIe and the Apple IIGS as the remaining bearers of Wozniak's legacy.

READING GENieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GENieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM] 
[*]GENie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO To make it easy for you to respond to messages re-printed here in GENieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475) 
|Name of sender| C AT egory | TO Pic | Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPLY in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GENie GENie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GENie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99368, GENIE and hit RETURN. The system will then prompt you for your information.
By John Peters
[GENIELAMP]

FROM MY DESKTOP A GEnieLamp Swimsuit issue? Yup! Hey, if SI can do it, why not GEnieLamp? Our resident CowToonist says, "These bovine barnyard bathing beauties are truly livestock lovelies, heavenly heifers, stockyard stunners, and Cowton Cuties. They should be udderly amoosing to anyone who never thought they'd see cows in 2-piece swimsuits." I agree! Definitely something you don't want to miss!

AMAZING! Ten years ago I thought a 30 to 50K magazine was large. Now it's unusual for T/TalkNET Online Publications to publish a magazine less then 150K. Of course, there are reasons for this situation. For one, 300 baud modems were the norm back then; 1200 baud was the top end and 2400 baud was reserved for the elite few who could afford them. Secondly, those who could afford it, had 64K of RAM. Third, floppy drives were $800.00+, and hard drives were just a fantasy to most of me. Thankfully, all of that has changed. Today 2400 baud is the low end of modems, 1, 2, 4 megs (or more) of RAM is not unusual and hard drives are as common as floppies.

Still, in spite of the speed-demon modems, the mega-memory systems and the monster hard drives, I must admit that 200K text files are probably pushing the limits of online publishing, considering the hardware and software we are dealing with today. So....

I have come up with an alternative plan. As you may or may not know within 48 hours of publishing GEnieLamp on the menus we also offer all the Lamps in compressed format (Pk-Zip for the IBM, Mac and ST, BXY for the A2) for downloading in the GEnieLamp Library. Starting with this issue you will now also find an abbreviated issue available for downloading as well. These special issues will contain only the main courses from each of the Lamps. That is, no GEnie_Qwik_Quotes, no games or puzzles, or CowTOONS (sorry, Mike :). So, if you prefer your meat without the potatoes, we have what you're looking for!

NEW CONTRIBUTOR I am pleased to announce that Al Fasoldt has agreed to submit a monthly column for GEnieLamp. Al writes about computers and consumer electronics from Syracuse, N.Y., where he is a newspaper editor and programmer. I've always enjoyed Al's columns that he occasionally posts here on GEnie, and I think you will too.

PACIFIC EDGE ON GEnie! The Pacific Edge Magazine has joined the GEnieLamp RoundTable. Watch for new issues in the library and reader support in the bulletin board.

PERSONAL INVITATION The RealTime Conference room is available...so let's give it a go! I know this is short notice, but everyone interested in visiting with the Digital Publishing Association and its members is welcome to join in some RTC chat every Wednesday night. Drop by...

...to talk about these exciting times for electronic publishing. Make a new friend, meet an old one, or just hang out. It's all informal so don't be shy -- give it a try -- and visit the inner sanctum of DPA's enlightened pioneers of electronic publishing. Hope we see you there!
Digital Publishing News "Desktop Publishing"...Yes, that was the headline in the "Trends" section of PC Magazine's March 16 issue. The two column story by Robert Kendall begins by saying Random House is putting selected titles from its Modern Library series on floppy disks in collaboration with Apple and Voyager Company.

But the rest of his story focuses on the "new breed" of on-disk publishers targeting the PC-compatible market. First mention goes to Floppyback Publishing International, Bruce Gilkin's "Angel of Death", and even a color screen shot of chapter one as it looks using Dart (a Hyper-text reader for IBM).

Floppyback's association with Rutgers University Press is also cited along with "Discovering the Mid-Atlantic: Historical Tours" by Patrick Louis Cooney.

Next, Mr. Kendall goes on to say Connected Editions "epitomizes the effect of information technology on higher education" through Connected Education's electronic graduate courses by modem. Faculty member David Hays' annually updated book on disk "Evolution of Technology" is mentioned as an example of an inexpensive way to revise without the prohibitive expense of bound paper reprints.

The story quickly summarizes most of the advantages DPA members already know and use, so it seems the author has been reading News from the Disktop and the other gems of information that Ron Albright has diligently distributed for two years.

Kendall offers his own opinion that "Desktop publishing is especially appealing for universities" for monographs and text- books using hypertext as a research tool, and for students on a low budget who want to get into 'print' quickly.

Regarding distribution, Kendall unfortunately failed to mention the DPA's home on GENie, (in the GENieLamp RoundTable) but he did call the DPA's free bulletin board system an "especially rich source of material."

Since the PC Mag story appeared, the DPA BBS is averaging about 40 calls per day. That's 1200 calls per month, and proof positive that the public wants more of what the DPA has to offer.

I once said something to the effect that this thing was going to take off suddenly, catching us all with our mouths hanging open. Brace yourselves! The tide is turning and is sure to flood the DPA beachfront as this kind of attention rolls into an electronic storm charged with new writers, publishers, and adventurers. -Mike White

/ "I just purchased a cordless electric screwdriver. There are two pages (31 items!) of "Important Safety Rules" for using the screwdriver -- including such things as "wear /
I want to thank everyone who took the time to send me GE Mail feedback after reading last month's edition of GEnieLamp. The responses were all positive. It is nice to know that we are doing some things right. On the other hand, I did not get very many replies compared to the number of times that the A2 GEnieLamp is downloaded. I will continue to solicit your opinions and ideas. We are always open to suggestion or constructive criticism. These will help make our product offering stronger as we continue to improve.

Now that there are separate issues of GEnieLamp for the A2 and A2Pro areas, we can focus on different subject matter for each of the two newsletters. I envision the A2 version having an eye toward the new user. I think that the game and entertainment fields fall into our domain. And finally, I see the education market as one of our prime areas. These are not the boundaries of our focus, but they represent some of the major areas that we intend to cover.

With this somewhat narrowed focus in mind, we have begun to put together articles that meet the needs of these groups. This issue has an article by Gina Saikin chronicling the trials and tribulations of a new Apple II user. Any of you who have "met" Gina on GEnie know that she has quickly become adept at using her computer. Next month, we will continue this trend by reviewing the most recent computer game for the Apple IIgs: Out of This World. And believe me, it is most certainly not of this world.

Our monthly content will vary, but we hope that you can see the results of our new alignment. Programming and highly technical articles will appear in A2Pro newsletters. The areas that I have outlined above will appear in A2 newsletters. Both versions of GEnieLamp will strive for well-written and informative articles. As always, let us know how we are doing.

[*][*][*]

As was noted in the last issue of A2 GEnieLamp, the latest version of GEnie Master (GEM) has been released as freeware to the Apple II community. This software package will allow you to use your terminal software and Appleworks 3.0 to automate your GEnie sessions. If you have never tried this nifty package, then there has never been a better time than the present. You can significantly reduce your online time on GEnie. At the same time, you can get more information and software than was ever possible.
while using GEnie "manually". Download the GEM software and check out what you have been missing. Do it today and start saving dollars tomorrow.

Author and editor Darrel Raines [D.Raines] welcomes any feedback or comments via electronic mail to the listed user name.

CORRECTION Last month's interview with Mike Westerfield was conducted by GEnieLamp editor Darrel Raines. Phil Shapiro usually conducts the monthly interviews. However, because of the nature of The ByteWorks products (programming tools) and his interest in software development, Darrel was the GEnieLamp spokesman for that interview.

/ "Wow Ringo, was that you? I didn't get a chance to say hello. / I was too busy jammin' with Jeff. (I can't believe I played / the drums... I don't _play_ the drums.) It's a good thing / the management made me quit, eh?"  

Is That A Letter For Me?

APPLE II ODDS & ENDS

WHAT'S NEW?

THROUGH THE GRAPEVINE...

MESSAGE SPOTLIGHT

GNO CONFUSION GNO is one of those bizarre things that constantly confuses everyone, including myself. :-) Things GNO does do:

- Turns the IIGS into a low (low) cost UNIX machine.
- Lets you run UNIX software (as long as someone has taken the time to port it to the IIgs).
- Makes serial port programming almost trivial, and very powerful.

Things GNO does not do:

- Run multiple desktop applications

Okay, there are a few other things GNO doesn't do but those relate to the UNIX compatibility stuff. You can have any number of UNIX style (text,
shell-based applications running, _with_ a desktop program of your choice if you like. The multitasking is actual preemptive multitasking, which means that programs waiting for I/O do not eat processor time (unlike MultiFinder, although System 7 took a few steps to alleviate that), and the system can automatically schedule how much CPU time a program gets based on its behavior. With GNO, you can be in a telecom program, download a .SHK file, then open a window and use the shell-based unshrinkit program to uncompress it in the background while reading messages, or whatever. GNO also works with Switch-It!, so you can have your multiple desktop applications and eat them too. GNO is fully compatible with the ORCA programming environment. GNO can do things that would be difficult in MultiFinder. Much of our current work is moving towards complete integration of the shell and GUI environments, much like expensive UNIX systems have been. I guess the best thing about GNO is that new programs don't have to be written specifically for GNO in order to multitask. The system handles it cleanly and inconspicuously (again, this does not yet count desktop programs).

Well, this message is quite long enough, I think. :-) I'll be more than happy to answer any questions or listen to suggestions.  

(PROCYON.INC, CAT8, TOP3, MSG:12/M645;1)

SYSTEM 6.0  The Finder in System 6.0 completely ignores any icon files it finds called Finder.Icons or Finder.Icons.X. It does this because these icons are now incorporated into the Finder program itself (in the resource fork). If you wish to use any custom icons you may have put in Finder.Icons or Finder.Icons.X, do the following: Go into your favorite icon editor and open those two files. Now, create a brand NEW file. Copy the icons that you want to keep from the two old files into the one new file. Save the new file in the Icons folder of your _boot_ disk, with a unique name (something like System.Icons or OldFinder.Icons, etc.). Completely remove those old files from any Icons folders.

The FType.Apple file in System 6.0 is not an icon file. It replaces the files Ftype.Main and FType.Aux from System 5.0.x. You need the FType.Apple file for Finder in System 6.0 to function properly. You do not need the other two older files. Everything from them is now contained in FType.Apple. What's in these files are lists of names for file types, such as "Binary file" and "Folder" and "Super Hi-Res Screen Image" etc. These are the names that show up when you do an "Icon Info..." on a file, or are viewing a window in a list view ("By Name," etc.). A few other programs, such as GSHK, use these files, as well.

(A2.LUNATIC, CAT9, TOP2, MSG:151/M645;1)

LOOKING FOR A DRIVE?  A larger drive will normally come out with a lower cost per meg. Economies of scale come into play.  

Ask yourself the following questions....

1. How much storage capacity do you NEED?  
2. How much can you comfortably spend?  
3. How much need do you have to be able to interchange files with someone else in large quantity?
Apple II Computer Info

The best overall bargain for increased storage is a medium capacity fixed drive, something like a Quantum in the 200 meg range. The cost per meg is somewhat higher than a gigabyte drive, but your overall cost is a lot lower. :) (If you don't NEED a gig, why pay for it?)

(GARY.UTTER, CAT11, TOP16, MSG:114/M645;1)

GEM 4.20 HELP

> When loading GEM 4.20, I sometimes get the "Msg" file loaded in automatically into the "msg.in.process" file and sometimes not. What command can I use to get this done in some sort of consistent fashion?

1) Captured bulletin board messages are saved as an ASCII text file called msg, appending (usually -- this is a telecomm program setting) new ones, if a msg file is already on the disk.

2) GEM then converts a msg file into an AWP msg.in.process file for your use, deletes the msg file and saves the msg.in.process file temporarily to your disk. However, if the msg file is too large for comfortable use in AppleWorks, GEM Chopper will be called into action to divide the msg file into bite-size chunks (I think the default is 25K), renaming them as msg.a, msg.b, msg.c, and so on.

3) When you boot GEM, it first scans your disk for a remaining msg.in.process file, which would be saved if you chose to "mark it for later" (Quit Menu, #3). If it finds one, it loads it first, leaving the msg file unchanged.

4) When you quit the msg.in.process file, GEM scans the disk for any remaining msg files. If it finds one, it converts and loads it before quitting. If your msg file has been chopped up (see paragraph #2, above), GEM will keep loading the smaller msg files in order, until all have been used.

5) If there is neither a msg nor a msg.in.process file on your disk, GEM creates an empty msg.in.process file for your use.

6) If you hold down the spacebar at bootup, you will go directly to the Library subsystem, and no msg.in.process file will be used or created.

7) When you quit GEM, items #1, #2 and #4 in the Quit Menu will delete the msg.in.process file; items #3 and #5 will set a marker in the msg.in.process file and resave it to your disk for later use (see paragraph #3, above).

GEM is consistent (after all, it's a computer program :), if only you know how it works. Does that help?

(W.NELKEN1, CAT29, TOP9, MSG:106/M645;1)

SCREEN SAVER KICKS IN TOO SOON
The blanker "kicks in" when the clock starts a new minute. That is, when the seconds rolls from :59 to :00. So if your last keypress was at :50, your screen will blank in 10 seconds. If it was at :10, then the blank occurs 50 seconds later.

Watch the Prosel clock in the lower right corner. The blanking happens on the minute.

(R.REEDY, CAT30, TOP2, MSG:41/M645;1)

RECOVERY FROM I/O ERRORS
Error $27 is an I/O error, and that means there's a problem on the diskette itself, not with something you're doing. There IS a trick that I've used to recover stacks from disks with I/O errors: Use a copy program that will let you go past a block read error (the only one I know of is Copy II+), and copy the entire disk. Then, load the stack from the copied disk. If the I/O error occurs in data that is just a background, you'll get a messed up screen somewhere in the stack that can be re-painted, or whatever. If it's in the middle of a sound segment, you can edit the button, and re-record or load the sound. If it's in the middle of a card-to-card link field, you're pretty much out of luck, but at least you tried! Because card backgrounds and sounds are so much larger than link fields, you've got a xx out of xxxx chance that this will all work. (I don't know the "real" odds, but I've been lucky on the disks I've had problems with!). P.S. If the I/O error is on one of the original HS disks, you can always send it back to RWP with a note, and we'll replace the disk for you. (If your dog or kid was at the root of the problem, it would be nice to include the $10 we usually charge for a disk re-copy, but you'll get a replacement disk no matter what you send).

(R.ROGER.WAGNER, CAT32, TOP2, MSG:149/M645;1)

PRINTER PROBLEMS
I have seen this problem as well. As best as I can figure, the printer is _NOT_ receiving the command to "shrink" the received page image for any but the initial page. I see this same thing using EGOEd NDA. AWGS does _not_ have this problem because it treats each page as the "first page", sending a full page set-up description to the printer driver with each page. TEACH, EGOEd, etc. do _not_. They simply send the page set-up info prior to the first page and then assume that the printer (and driver) will remember it. They dont. I have been awaiting a fix on this problem for more than a year.

I'm glad you brought it back up. Maybe we will see some action on this.

Lowell, you may remember me. I sent you a full package of printouts
illustrating this problem some time ago. As I recall, you forwarded this to Bill H., but I have not heard back from you for some time. I lost your last message when I changed offices last semester.

Judging by how AWGS operates, the solution to this (and to printing multipage, high resolution picture via SuperConvert or What.A.Poster) is to have the driver send the page set-up info after every form feed. But, then again, I am not a programmer. :)

(EBR2, CAT40, TOP14, MSG:219/M645;1)

WORDPERFECT AND A2 Just to add to the others, and give a little additional information, I'll add the following about WordPerfect for the Apple II:

I'm still using v2.1e for the GS, and my son is using the ]e/c version on a Laser 128. Neither has found another word processor for our respective machines that we prefer to use. I bought both shortly after WP was introduced for the Apple ]. I have upgraded the gs version four times, and considered it well worth the cost. WPGS has, IMHO, the best and most extensive spell checker, I know of on a GS. It's Macro feature is excellent, though I've never used AW 3.0 with enhancements for comparison. I do have AWGS, and except for the ability to select fonts, WPGS is way superior in ease of operation, and not subject to the occasional crashes that seem common in AWGS. Far more functions can be handled by the keyboard with WPGS, increasing speed of operation.

A friend, who owned a GS and used 5.0 at work asked to see my version. She refused to go beyond the initial screen, because "It doesn't look anything like the REAL program," and "it's still got the WRONG keyboard."

The manual gives no mention of support for the extended keyboard, so you will not be able to get away from the different fingering for the same features.

WPGS is a byproduct of an earlier, much less sophisticated version than 5.1 for the IBM. The original release ran under p16, before the release of GS/OS in any version. Notably, the extensive font changes available in 5.1 are not available, and graphics cannot be imported into the document and runarounds, etc, created. I do not have experience with the IBM version, but understand both of these are available.

About 1 year or 18 months ago I received an upgrade offer that would allow me to move "up" to WP for the IBM or Mac at a very reasonable fee. If memory serves me accurately, in that mailing it was stated that they would no longer support the ]gs or ]e/c versions of the program. Specifically, no further upgrades would be produced, and no telephone support would be available after a given date. I would be very surprised if you could find a copy new, unless it's been sitting on someone's shelf for quite a while.

Since then, GS/OS 6.0 has come along. I've found NO problems running it under that system -- but the handwriting is on the wall. WPGS is not of the future! (I.KNIGGE, CAT2, TOP4, MSG:45/M645;1)

>>> WHAT’S NEW? <<<

PLATINUM PAINT UPGRADES If you bought it from Quality Computers, you can
upgrade your Platinum Paint by calling 1-800-777-3642. The upgrade costs $30 plus shipping and handling.

If you bought it from someone else (even directly from Beagle before last summer) you will need to send in your original program disk, manual cover, or some other proof of ownership. Beagle didn't keep very good records of that stuff.

(QC, CAT42, TOP25, MSG:10/M645;1)

>Noticed an interesting offer in the February issue of A+/Incider. The Apple Clinic column says that Publish It! owners can buy Graphicwriter III for $60 plus an original program disk or manual cover. Is this accurate? Does the offer apply to the updated version of Graphicwriter III mentioned in the same article?

To trade up it's actually $60 plus $3.50 shipping and handling (just send payment along with an original program disk or manual cover from any DTP program!

You will receive the latest version of GWIII, which is version 1.1. The v1.2 update was mentioned prematurely...v1.2 is in development, but will not be out for several months (at which time all registered owners will be able to update for a reasonable fee).

(SEVENHILLS, CAT43, TOP6, MSG:71/M645;1)

ANNOUNCING THE MANAGER! IIGS users can now benefit from the same technology that Macintosh users enjoy--The Manager(tm) is the first and only TRUE MultiFinder(tm) for your Apple IIGS! Multiple applications can be open simultaneously and moving among them is as simple as clicking in a different window. This is a tremendous time saver because you don't have to quit one application to start using another, which is especially convenient when copying and pasting between applications.

Use The Manager to create your own integrated environment...just open your favorite IIGS-specific word processing, painting, DTP, telecom and other programs, then instantly move among them! It is fully compatible with AppleWorks GS, GraphicWriter III, Platinum Paint, Teach, and more. It even works with system extensions such as Express, Kangaroo, TransProg III, and others.

DON'T SETTLE FOR A LIMITED "SWITCHER"--the Macintosh started with this type of program but MultiFinder made it obsolete. Macintosh users know from experience that a MultiFinder program gives you greater control, makes you more productive, and is more enjoyable because it's easier to use. The only true MultiFinder for the IIGS is The Manager...it even supports multi-tasking for some applications without requiring additional software.

The Manager is the result of a two year collaboration between Seven Hills Software (Express, GraphicWriter III, SuperConvert, others) and BrainStorm Software (Kangaroo, TransProg III, others). It requires System 6 and as little as 2MB memory (4MB recommended for greatest efficiency; required for some program combinations). A hard drive is not required but is strongly recommended.

The Manager is the perfect way to increase your productivity!
Apple II Computer Info

The Manager's retail price is $69.95, and it will be shipping to our resellers on 2/15/93. Quality Computers and other leading mail order companies will be carrying The Manager. Quality Computers is ready to take advance orders for only $49.95 so The Manager can be delivered to you as quickly as possible.

MONSTER LAB NEWS

I am alive and well, and check in here every week or two. I have been stalled on my fourth ReliefWare game, "Monster Lab", for about 6 months now. For some reason, being a military doc in the 101st Airborne Division and the father of two seems to take a big chunk of my time...

Version 1.5 of all three games are still current. We are close to the $10,000 mark in payments received (and distributed). With the Lord's help, Monster Lab should be released in 1993. I won't make a promise when...

GUIDE TO INTERNET

I have to second Dan Brown's recommendation of Ed Krol's "The Whole Internet User's Guide". It's an excellent resource for anyone 'on the net'. Surprisingly, most of the information in that book is also available online, but it sure is nice to have it all in one spot.

I've been spending a lot of time on the Internet recently, and it amazes me that even people who have been 'on the net' for years have no concept of just how huge it is, how much information is available on it, or how to use some of the incredible tools that are available, such as Gopher.

I'm so enamored of the Internet that I'm writing a feature length article about it for the May issue of incider. It's an ambitious project, but I'm hoping to cover such topics as: what is the Internet, how to access it, and what to do once you've gained access.

I wouldn't be exaggerating to say that I am stunned at just how much
information is available online through the Internet. I thoroughly believe
that the entire accumulated knowledge of all mankind is currently stored on
the Internet.  (J.KÖHN, CAT27, TOP3, MSG:117/M645;1)

WHO'S WHO IN A2  Here's an up-to-date listing of your Apple II sysops on
GENie:

Dean Esmay  Apple II Chief Sysop  A2.DEAN
Bill Dooley  A2 Bulletin Board Manager  A2.BILL
Susan MacGregor  A2 Real Time Conference Manager  A2.SUSAN
Tim Tobin  A2 Library Manager  A2.TIM
Lunatic E'Sex  Apple II Promotions Manager  A2.LUNATIC
Matt Deatherage  A2Pro RT Leader  M.DEATHERAGE

And our able A2 library assistants:

Tyler Weisman  A2 Library Assistant  A2.TYLER
Tom Zuchowski  8-bit games & utilities  T.ZUCHOWSKI
Pat Kern  Clip Art & graphics  C.KERN1
Bill Goosey  Telecommunications & Misc.  W.GOOSEY

And our A2 Real-Time Conference (RTC) assistants:

Tara Dillinger  New Users - Monday  T.DILLINGER
Susan MacGregor  Formal Guest – Tuesday  A2.SUSAN
HangTime  Hypermedia – Wednesday  A2.HANGTIME
Mike Garvey  TBC Forum - Thursday  TBC
Jim Zajkowski  Telecommunications – Friday  JIMZ
Dave Ciotti  Saturday Night Live – Saturday  A2.BEAR
Gina Saikin  Sunday Morning Kids' RTC  G.SAIKIN
Don Arrowsmith  II Speak – Sunday  D.ARROWSMIT1

And those crazy guys that help Matt run A2Pro (page 530):

Steve Gunn  A2Pro Assistant  A2PRO.STEVE
Jim Murphy  A2Pro Assistant  A2PRO.JIM
Greg Da Costa  A2Pro Assistant  A2PRO.GREG
Todd P. Whitsel  A2Pro Assistant  A2PRO.TODDPW

Keeping an eye out on all of us is Tom Weishaar, the Manager of the
Apple II RoundTables here on GENie!

**********************************************************************
Category 7  Topic 2
Message 29  Sat Jan 30, 1993
A2.DEAN [A2 Leader]  at 20:14 EST

A program cannot be both public domain and freeware. That's not
possible, and if a program claims to be both I guess it's anybody's guess
which it is - but I'd say probably public domain.

Once something is public domain anybody can use it for any purpose,
period. You cannot place any restrictions on the distribution of public
domain stuff. If I want to charge $5,000 for a copy of a public domain
program I'm perfectly free to do so. Of course anyone who paid me that
would be making a big mistake because he could probably get a free copy by just looking around for someone who isn't trying to gouge him. ;-

Public domain means _PUBLIC_, as in all members of the public, _DOMAIN_, meaning property of, as in, property of the public at large.

Anybody can do anything they want with something that's public domain, including modify it, spin it, fold it, and mutilate it, give it away or charge for it, or anything else, and nothing anybody says, including the author, can stop it.

"Freeware" is just a catch-all for a copyrighted program on which the author has declared that people may copy it for free. If it's freeware, then the author still has rights and may place restrictions on its distribution or use.

They are very different concepts. That difference is very important.

[*][*][*]

While on GEnie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your AII, the GEnieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

"Are you stuck using a female character to get around in the temple of the snakes? I would rather bring my white wizard than the grey wizard chick."  

By Any Other Name...

"What's in a name? As I've been suggesting patiently for years, the real reason Jerry Pournelle no longer pays much attention to Atari hardware (besides the fact that the last call Mr. Pournelle got from Atari was probably from Neil Harris, back in 1985 (grin)) is because nobody has suggested piquant NAMES for his Atari machines.

As any real Pournelle fan will tell you, naming computers is absolutely fundamental to the Pournelle ethos of hardware evaluation. Early Chaos Manor scholarship ascribed Pournelle's naming habit to projective futuristic anthropomorphism: By naming his computers, he was merely anticipating such time as literally intelligent, fully-individuated computing machinery would become available.
Subsequent scholarship has pointed out, however, that instead of coming up with "computery" names for his systems (C3P0, R2D2, 21MM392, HAL, etc.), Pournelle continues to prefer organic-sounding names such as Ezekial, Lucy Van Pelt, Big Cheetah, and the like. One school of thought now suggests that Pournelle performs the act of naming as a divinatory gesture based in animism or pantheism. Before one can propitiate the capricious _anima_ or spirit of the machine (deus ex machina), one must determine its name -- the first step in determining where a particular anima stands in the greater hierarchy of spirits, which will in turn determine its area of specific influence, threat-value, and to some extent, elucidate the protocols and ceremonies required in its worship.

Extending the above thesis, a few Manorologists have suggested that the ultimate goal of naming is not worship and propitiation, but indeed _control_ of the hardware anima. In this formulation, if Pournelle knows the name of a computer's demiurge or loa, he can summon it and to some extent, control its behavior. Even if this so-called "Voodoo" hypothesis is correct, however, it should not be carelessly assumed to presuppose that Pournelle views computers as inherently dangerous or maleficent entities -- i.e., as demons. While this characterization may indeed inform Pournelle's view, it should be noted that the demonic picture of the anima is largely restricted to medieval and post-medieval Judeo/Christian traditions of sympathetic magic, whereas Pournelle's thinking may derive from older African, Mediterranean, and/or Asian traditions, that view the generic anima as being fundamentally unconcerned with human affairs. Even in the somewhat ill-reputed Voodoo tradition, per se, most loas are perceived as neutral -- the practice of Voodoo "demonology," or "dealing with the left hand" is associated only with a few specific spirits, most notably Le Baron Samedi (Baron Saturday), the loa of Death. While many of us, indeed, experience the use of IBM-compatible hardware as being somehow akin to death, this is doubtless related to the fact that IBM computers are, according to a Mambo of my acquaintance, under the especial protection of Lemonmedselma, the loa of segmented-addressing and 640K limitations, who is cousin to Samedi in the traditional Voodoo familial pantheon.

On the other hand, some have argued that Pournelle's having chosen the name Ezekial for his CP/M system -- that name figuring significantly in Revelations -- is evidence of precisely this type of demonologic turn in the author's metaphysics. We feel this argument is without merit. Instead, we suggest that while the name Ezekial certainly derives from mystic New Testament sources, Pournelle chose it because Ezekial's peculiar vision was especially meaningful to him, as a science-fiction writer. As the spiritual recounts: "Ezekial saw the wheel, way up in the middle of the air ..." This vision of a fiery flying wheel, along with subsequent descriptions of multi-headed, winged figures, have, of course, been popularly put forward as scriptural evidence of extraterrestrial visitation.

In the final analysis, we feel that Pournelle's naming of his computers is essentially Adamic. It derives in kind from the story of Genesis, wherein Adam's first task, as prototypic human, was to name the animals, asserting Man's natural dominion and expressing his essential relationship with God the Creator. The creating God, of course, has established the identification of naming with dominion "... and he called the light Day, and the darkness Night, etc.," and is identified in apostolic scripture with the primal word, or Logos.

Having reviewed this analysis, it should be obvious that if Mr. Pournelle is ever to take Atari systems seriously, appropriately evocative
and meaningful names for them must be provided. Ideally, of course, we might hope that Mr. Pournelle would invent his _own_ names -- but he may still be awaiting delivery of evaluation systems. In the interim, I suggest that it would do no harm, and may do some good, to suggest a few tony monickers:

Binky, Doogie, Semiramis, Carpaccio, Lucrezia Borgia, Lizzy Borden, Murphy Brown, Elizabeth Regina, Rosenkrantz, Despina, Count Ugolino, Blackadder, Lt. Commander Data, Spock (sigh), NOMAD, Tinkerbell, Bazooka Joe ...

Please feel free to add your own.

- John Jainschigg (EXPLORER, CAT15, TOP7, MSG:88.M475)

I have a theory on that. Nathan keeps asking Klaus & Kompany about Leader Tabs and they think he means Lederhosen...oh, all right it's not as funny as it seemed in the shower....

---

Gotta Problem? Gotta Answer!

By Bob Connors

What is the average life of a hard drive? How about floppies? Is it known how long the data will stay on them without some type of refresh, or what not?

Thanks! -Bruce

Bruce,

Gee Bruce, you sure come up with interesting questions. The answers, are subjective to say the least.

Let's take the average life of a hard drive first. I assume you are talking about the life of the physical drive as opposed to the life of the data contained on the drive but I will attempt to respond to each.

Almost all electronic components in computers have what is called an MTBF rating. MTBF stands for Mean Time Before/Between Failure. The value assigned to this is usually some amount of hours and is usually the manufacturer's best guess based on all testing done and possibly reports from end users of the equipment and repair facilities.

In the case of a hard drive, I do not personally think that many manufacturers actually wait until drives fail before coming up with that value because, if they did so, they would never get the equipment out the
The actual life of a hard drive may have no relationship at all to the rated life as it depends on so many factors. Things like whether or not the drive is used on a BBS system (where the computer is seldom shut off) or type of applications and whether or not those applications cause a lot of head thrashing (like a database program may do) play a role in the life span of a hard drive. Even whether or not children use the computer can be a determining factor. I have seen drives last a long time. I am still using drives in my computer that I used when I started up my BBS in 1987. However, I also have a dead one from the same system.

Data stored on the hard drive, on the other hand, can go bad. Data is stored magnetically on the drive and the magnetism holding that data in its 'fixed' position can weaken due to lack of use. On hard drives, this is usually not the problem though, although it can be. Normally, DOS just reports a read or write error for the data, a sector not found error, or something similar. In other words, data that was good the last time you accessed it suddenly is no longer accessible. The data can be a file of information used by a program or the program itself. There is no set time when you can expect such errors. According to Murphy, though, they will happen when you least expect them, when your backup has not been done recently enough, and when they will do the most damage!

It is my experience that such problems are usually caused by drifting head alignment. That is, the hard disk read/write head no longer aligns correctly with the track that contains the information. Often, a retry or a number of retries will succeed in reading or writing the information, sometimes not. When it happens, though, it usually results in an increase in your heart rate and a quickening of your pulse, especially when the retries fail.

There are quite a few utilities available that help in such situations. Norton’s Disk Doctor and SpinRite are a few of them that immediately come to mind. SpinRite is my favorite because of the way it 'realigns' the head by actually repositioning the hard disk tracks where the head actually is, not where the head is supposed to be.

The life span of data on floppy diskettes is another matter and again, depends on many factors. Among these are the age of the diskettes, how they are stored, how they are handled, the environmental conditions, whether or not they are generic, bulk, low cost diskettes or brand name, the type of oxides or other materials used in their manufacturer, the manufacturer itself, and on and on.

I have diskettes that I used on my old TRS-80 back in 1979 that I can still use with a fair amount of reliability on my XT clone system and, there are others I cannot. This is despite the fact that the diskettes were certified to be one-sided and my XT uses both sides.

Based on the above, I would say the bottom line answer to your question is, no, it is not known with any certainty how long data will stay on a diskette without need of refreshing. There are just too many variables to consider. That is why the DOS God created the DISKCOPY command and even that is not perfect.

I hope I have cleared this matter up for you.

-Doctor Bob
Doctor Bob,

Would appreciate your help, if possible, in buying a Service Manual for my Panasonic KX-P4420 laser printer. Printer makes nice pages but the reliability has been so-so. I'd like to learn more about the printer but Panasonic has not been helpful. Their 800 number says to call a pay number and the pay number, a couple times, just put me on hold - which I abandoned after several long distance minutes. They have not responded to a 5 Jan 93 snailmail letter.

I haven't found a "Panasonic printer help" category or topic on GEnie.

Thanks - from another Bob.

Another Bob,

You are experiencing something that a lot of people seem to be also experiencing with many firm's customer support. I am always amazed that companies always answer their 'sales' phone on the first ring and it always seems to be a 1-800 number. They are willing to spend the money and make the effort to get you as a customer.

After sales support really does not live up to the same standard though. The customer service or technical support number is invariably not toll free and, from what I have been reading in the IBM PC RoundTable, people get put on hold for what I consider unreasonable amounts of time. To make matters worse, the call backs that get promised are not always made, even after repeated calls to the company.

But, I editorialize and am not solving your problem. The only advice I can give you is to try Category 15, Topic 71 in the IBMPC RoundTable. The label for that topic is Panasonic Printers. I don't remember seeing any recent messages there but I do know that the topic is still open.

Good luck, Bob. I wish I could be more help to you.

-Doctor Bob

ASK DOCTOR BOB Do you have a question about operating systems, GEnie or anything concerning computers? If so, you can get your questions answered here in GEnieLamp by Doctor Bob. Any question is fair game...and if the good Doctor Bob doesn't know the answer, he'll find someone who does. Stop wandering around in the dark, send your question to Doctor Bob in the GEnieLamp RoundTable bulletin board, CAtegory 3, TOPic 2.

"It happens that the Clinton account is numerically very close to my account...I get very tired of replying to these messages, giving them the correct address. But, it's kind of interesting to be able to read the president's mail. Heh heh." -- J.NESS

[EOA]

[LAN] LAMPWIRE /
Cynthia Field, the newly-appointed chief Apple II editor for A+/inCider, has produced another in her series of "Apple II Software Opportunities" newsletters. Along with a handful of instructive articles, the newsletter includes a comprehensive listing of 500 Apple II software titles released between 1990 and 1992. Rounding out the newsletter is a lengthy of Apple II software publishers, giving addresses and phone numbers of companies both large and small.

This newsletter is free for the asking from Apple's toll-free customer assistance phone number: 1-800-776-2333. It's helpful to know that this phone number gets quite busy, so you may have to stay on hold for five to ten minutes before reaching an operator.

User groups who are interested in receiving bulk shipments of these newsletters are advised to contact Jill Avery, at Apple's User Group Connection office. To avoid duplicate requests from the same user group, Jill asks that just the president of each group be in contact with her. She can be reached by e-mail via Internet at: "avery@applelink.apple.com".

Thanks are owed to John Santoro, at Apple Computer, who coordinated the production of this publication.

New Letter Campaign  A Canadian Apple User's group is asking your help in a letter writing campaign to garner continued Apple II support from developers. They want you to write short, signed, POLITE and original letters stating clearly your objective. A signed, polite letter is worth a petition of a thousand names, in their opinion. The first target is Claris. The attempt will be to get Claris to continue Apple II support or release their products to a company that will support the Apple II. The suggested letter format is printed below this text. They urge you and your user group (if you have one) to write these letters as soon as possible.

Claris Corporation
Customer Support
5201 Patrick Henry Drive, Box 58168
Santa Clara, CA 95052-8168
United States of America

Dear Madam or Sir:

I would like attract your attention to the fact that Claris has not provided any updates to AppleWorks Classic v3.0 and AppleWorks GS v1.1 since 1991. I am a registered user of the very first version of AppleWorks GS and have purchased all the updates that were made available. I use the program almost every day.

I am disappointed to see that even though Apple Computer has taken
the care to provide Apple IIgs users with a new and more powerful version of the IIgs System Software (v6.0) and HyperCard GS v1.1, Claris has not provided loyal AppleWorks GS users with an improved version of this very good program.

If Claris is unwilling to provide an updated version of both AppleWorks programs, I kindly ask that the source code be sold to a company or individual willing to do the necessary work to or entered into the public domain.

I am looking forward to receiving an answer in this matter and hope that it will not be swept under the rug.

Sincerely,

Ronald A. Leroux
Resource Director
Le Groupe Apple St-Hyacinthe

Tulin Technology Pricing Update

In response to John B. Wilson's review of their Apple IIGS floptical disk drive, Tulin has sent GEnieLamp updated information on pricing. The current product price is $399, instead of the $489 listed in the article. This price is the price for direct purchases from Tulin Technology.

Also, additional floptical disks can be purchased for $20 each, rather than the $25 listed in the article. Please note that Tulin Technology does have a $50 minimum purchase price.

Additionally, Tulin commented that they also offer the floptical drive with the driver for the Apple Hi Speed SCSI card. And it is possible to request Apple IIGS floptical drives with eject buttons.

For further information, contact Tulin Technology at the following address:

Tulin Technology
2156H O'Toole Ave.
San Jose, CA  95131
(408) 432-9057 (voice)
(408) 943-0782 (Fax)

The above information was supplied by Chua Lin at Tulin Technology. Tulin accepts VISA and MasterCard payment.

20,000 Reasons GEnie supports the Apple II

A2, the Apple II RoundTable on GEnie kicked off the new year with a celebration of it's 20,000th upload, awarding thousands of dollars worth of hardware and software to the first person to upload a file to A2 in 1993. In association and cooperation with sixteen prominent Apple II supporting companies -- C.V. Technologies, Charlie's AppleSeeds, Digital Data Express, DreamWorld Software, Econ Technologies, GEnie, GS+ Magazine, inCider/A+ Magazine, InSync Software, Kitchen Sink Software, Quality Computers, Resource Central, Roger Wagner Publishing, Seven Hills Software, Softdisk Publishing, and Vitesse, Inc. -- GEnie client Tom Smith of Willowdale, Ontario won a package of prizes including some of the latest and greatest products for the Apple II.
The prizes Mr. Smith chose are: a RamFAST Rev. D caching DMA SCSI card, a DreamGrafix 3200-color paint program, Universe Master hard drive management utility software, one free weekend on GENie online in A2 and A2Pro, the Apple II Programmers and Developers RoundTable, a GS+ Magazine T-shirt, a one-year subscription to inCider/A+, Signature GS system enhancement utilities, Formulate formula calculating software, Salvation-Supreme hard drive management utility software, a one-year subscription to Studio City, and a six-month subscription to Softdisk G-S.

"People say the Apple II is dead, but that's hogwash," said Dean Esmay, Head System Operator (SysOp) of GENie's Apple II RoundTables. "There are millions of these computers still in operation. The first Apple II was introduced in 1977, so the way we see it, 1993 is the beginning of the second fifteen years of Apple II computing. This celebration shows the amount of support the Apple II still gets from users and third parties alike. We like to think of the 20,000 uploads we've received in A2 to date as 20,000 reasons why GENie wholeheartedly supports the Apple II, as well."

Remaining prizes donated by the listed companies were given away throughout the months of January and February in selected online Real-Time Conferences (RTC's) in the Apple II RoundTable on GENie. The prizes were: two copies of ProSel-16 hard drive management software, one copy of ProSel-8 hard drive management software, one Neuromancer game, one Shogun game, one Zoyon Patrol educational game, one free day on GENie online in A2 and A2Pro, four one-year subscriptions to inCider/A+, two InSync T-shirts, two ProTERM 3.0 telecommunications software packages, one AccuDraw CAD software or Amazing Window educational software, one subscription to A2-Central On Disk, one subscription to Script-Central, one subscription to Timeout Central, one Roger Wagner Publishing software product of user's choice, and three Harmonie high resolution printer driver packages.

"We didn't announce it in advance," said Esmay. "We just secretly got all these companies to help us out and sprang it at the last minute. It was a lot of fun. The guy who won was very surprised."

All of the Apple II vendors mentioned provide direct online support on GENie through individual support Categories and Topics in the Bulletin Boards of the A2 and A2Pro RoundTables.

"We're incredibly grateful for the support we got from these companies. The amount of enthusiasm they showed for this idea actually caught us by surprise," said L. Bruce E'Sex, the GENie Apple II RoundTables' Head of Promotions and Marketing. "Though these companies are only a small percentage of those which still support the Apple II, they're a big part of what makes the Apple II line continue to be interesting, fun, and as useful as ever for millions of computer users."

Before the days of online communication, connecting up with other people who shared your specific interests was not all that easy. You'd consider yourself quite lucky if you found someone in the same county who shared some of your specific areas of interest. Sometimes the only way to communicate with those of similar interest was to physically transport yourself to a statewide or national conference.

In this age of the modem, however, powerful new tools are available to help connect like-minded souls. Making full use of these tools can link you up directly with colleagues in other states and countries. Model railroading buffs, for instance, can connect up with each other online. So too can Civil War buffs, quilting buffs, dog-lover buffs, alternative health care buffs, and any of a myriad other human interests, hobbies, and pastimes.

But modem communication need not be restricted to recreational interests. People with more serious interests can likewise find fellowship online. On information services and bulletin boards across the country people with special interest in drunk driving, AIDS, violence against women, and many other "community interest" concerns are congregating, communicating, and working together to address these problems with the full force of group action.

Unlike printed communication, which is slow and expensive to distribute, or phone communication, which is one-to-one, expensive, and disruptive, online communication is cheap, fast, and inherently streamlined. The power of online communication was made real to me in a personal way two years ago. Hoping to attend the annual KansasFest summer conference in Kansas City, Missouri, I posted a short message in the A2Pro Roundtable here on GEnie. The message I left stated simply: "I'm hoping on sharing a ride out to KansasFest July. I'd be interested in hearing from anyone driving out from the East Coast."

Ten days later I received a phone call from Dave Ciotti, of Trenton, New Jersey. Dave's verbal response to my inquiry was equally brief: "Saw your message on GEnie. I'm driving out to KansasFest in my RV van. I'll stop by your house to pick you up."

Somehow Dave's phone call didn't take me by surprise. Given the power of online communications, the chances of my linking up with an Apple II user driving to the KansasFest conference from a mid-Atlantic city were
fairly good. The chances were increased even higher since Dave is a
regular user of the GENie Master offline message processor, which can be
set up to capture to hard drive all new messages posted in designated
roundtable topics.

Whenever human beings write messages, online or offline, it is always
with a sense of hope that someone may read and act upon the message. The
inherent efficiency of online communication is such that hope becomes
integral to the communication process.

Of course, the first step of any communication process is the
articulation of that hope. Without articulated hope, the desired
communication exchange can never progress past that all-important first
step.

It's interesting to think that over time, as online communication
becomes more widely used by the general population, an invisible web of
social and intellectual connections will be woven across the country. And
once that web is in place, the Wozniaks and the Jobs of this world need not
necessarily live in the same town to cross-pollinate each others' minds.

Living on opposite sides of the country Wozniak and Jobs could still
exchange messages in, say, the "Homebrew Roundtable" under the topic of:
"Making home computers a reality." A young fellow with the user name
"B.Gates" would likely stop by to catch up on the new messages every once
in a while. "Gee, sure seems energetic and focussed for his young age,
don't you think?" "Nah. Once he starts dating women he'll forget about
computers completely."

I Became A Real GENie Junkie!

By Gina Saikin

>>> TALE OF A NEOPHYTE HACKER <<<

As I sat down at my computer the other day, I began reflecting over
the last two years of my journey through "the land of computers."

I was a novice secretary when I received my first introduction to
I applied for a job in an advertising agency and was asked if I minded learning "wordprocessing." Needing the job desperately, I eagerly said "no problem," and off I went. Three days later, I was something of an expert on the old Mag Cards, and thought they were the wave of the future, (and at the time, they were).

Determination (and a continuing incentive to keep food on the table) kept me eagerly learning all I could about wordprocessors. Wang, Lanier, Xerox -- I sampled them all, and became proficient at most.

However, a three-year gap in working taught me that technology moves faster than the speed of light; by the time I re-entered the workforce, the dedicated word processors were out, and the new personal computers were in. During those three years, I didn't really do much with computers, except for typing a few papers and doing a few statistical assignments for college - on, of all things, an Apple IIe.

But, experience on dedicated word processors and typing a few papers on an Apple had ill-prepared me for the new office PC technology, and I felt like the proverbial "fish out of water." Because I desperately needed work (as always), and because I knew that I would have to "join the club" of PC users, I resorted to challenging a temporary agency to a dare: if I could, after a short review, make a passable grade on their WordPerfect test, they would in turn train me fully. (Their policy was NOT to train until a set number of hours had been worked - but with my lack of experience on PC's, those hours were almost impossible to gain). I won the dare, and was trained.

I had dreams of computer ownership, but with two kids (one with medical problems), a husband who had his own dreams of trucking, and an income that raised "pinching pennies" to new heights, I gave it little thought. In 1991, however, my dream came true in a most unexpected way. I inherited my father's Apple IIe computer.

Frustration still dogged my steps, though, as I discovered how little I knew, and how little support there was out there. It was scary, being on my own with a new computer! One of the first maxims I did learn, though, was "Nothing you do with software can hurt the hardware." I was often heard muttering this phrase to myself as I would observe odd gibberish on my screen after yet another attempt to get a program to work, and was sure I had blown a chip or something! Even though I had used PC's on my jobs - most of my work was simply turning on the machine, and running the current program. Now, I was faced with choosing programs, learning how to run them, and in many cases, figuring out why they wouldn't run! A few of my programs bit the dust, and another hard lesson was forever burned into my mind: "Always make backups".

Fortunately, I found a user group, which not only saved my sanity, but probably saved my computer from frustrated revenge. So the group met 50 miles away - incentive was a great motivator! Through this same group, I met a lady who owned a store that sold used Apple equipment (a mere 30 miles from home), and my flirtation with the computer turned into a full-blown love-affair.

I soon learned she was a barterer at heart, and we immediately struck a deal - I would work for her whenever I could, and in turn, she would
"sell" me equipment and software. Believe me, I earned it - with blood (damn those sharp pc boards and chips!), sweat and tears. The most wonderful part of this arrangement was not the hardware and software that I "earned," but rather the knowledge that was imparted to me patiently by her. Remember when I was scared to even take the cover off my computer? Well, through her careful tutelage (even as she probably gritted her teeth at times), she taught me how to exchange and test cards, check drive speeds, and other little tasks that would not only help her out, but would be destined to give me an even greater hunger for further exploration into the land of computers.

After a year of working at her shop, I soon realized that my IIe, albeit a great machine, was not enough for me. I began to bargain -- with her, my bank account, and my conscience -- to get hold of a IIGS. The IIGS opened up a whole new world, even greater than the IIe had, for I could do so much more on it. Even with all my experience as a IIe user, I felt like I was back to my earlier days of uncertainty. My poor friend, with infinite patience, once again drilled into my head "nothing you can do with your software will hurt the hardware!" Happily, I began playing around to see what I could do. Then, she introduced me to GEnie.

Suddenly, I had more than I could ask for at my fingertips! Unfortunately (for my bank account, that is), I became a real GEnie Junkie, delving into all the BB's, and haunting the RTC's, especially the A2 ones.

I soon discovered several BB that were of interest to me and jumped right in. Now, I am involved with the Family BB, trying to get a ToughLove Real Time Conference together, and the Environmental BB, uploading articles that my friend and I publish in a local recycling newsletter - which I produce on my GS.

And I'm involved, of course, in A2, where I am breaking down the A2 library index into usable database segments. A dream has come true there, too! I have become a staff member in A2, where I host a regular kid's RTC, and abstract special RTC transcripts.

I continue to make mistakes. But, the mistakes help me learn. And learn. And learn some more. All of this is okay, because the maxims "Nothing you can do with software will hurt the hardware", and "Always make backups of your programes" have become my household words, and I have discovered that the best way to learn - is to jump into whatever you want to do, and just do it!. By keeping in mind those maxims, exploration becomes fun and exciting, and not a little fascinating. I intend to keep on exploring!

[EOA]
[TEL]-----------------------------------
 TELETALK ONLINE /
-----------------------------------
I was banned in Boston the other day.
And in Chicago and Los Angeles.
I was banned in the rest of the country, too. It lasted for a week.

It was the first time I've ever been censored.

It all started when I tried to catch up on my mail. I had thousands of unread messages to look through on one of the national computer networks. Nearly all the messages were public postings in the conferences. Anybody in the United States can read them just by calling the network by computer.

Public messages on this network are supposed to be civil. After all, the notes that are posted are just like the scraps of paper that you see on supermarket bulletin boards. You don't want to embarrass anyone or make unpleasant remarks in public.

But as I started to read the public messages, I came across one directed solely at me. If it had been a private letter, I wouldn't have minded at all. But out in the open, where any caller could read it -- right out on the supermarket wall, so to speak -- was a note that said, more or less, that I had an unorthodox way of dealing with the truth.

A liar? Was that what I was being called?

So what, you say? You write for a living, you take your lumps, and that's that. I get letters now and then from regular readers who tell me I don't know what I'm talking about. One guy even sends me unprintable references to my ancestors. I'm used to it.

But these aren't public remarks. They're personal and private. You can ignore something like that and nobody else cares. Nobody else knows.

The public note I found on the computer network (NOT GEnie! -Ed :) had gone too far. I wrote a reply pointing this out. I made a couple of pointed remarks about the letter-writer's grumpiness, and then I posted my reply in the same area of the conferencing network.

Since his note about me had been public, I made sure my response was public, too.

I called back to look for any new mail the next day. I had a private note from one of the people in charge of the network. Cool it, he said. The other guy is being told the same thing, his note said. The two of you should calm yourselves down.

I didn't like being told not to defend myself. I wasn't about to keep quiet.
So I checked back into the public messages and found another one from the same caller. It slammed me even harder.

And so I slammed back. Nothing could stop me now.

Or so I thought. When I called again two days later, everything seemed normal. While I was reading a message, I pressed a couple of keys to tell the network that I wanted to write a comment. They were the same keys I'd always pressed.

But this time instead of getting the OK from the computer system, I got a note back from the network. You can't do that, it said in network language. You can't reply to that message.

I tried again. Same thing. I went to another message and tried to respond to it.

Sorry! This isn't allowed, the network told me. The actual note was "access denied," or something like that.

It was that way for all of the conferences I checked into. I had been silenced. I could read but not write.

Later, I found an electronic mail letter from the network manager. His note had been mailed to both me and my antagonist. It said we were being childish. Our angry messages had been deleted so nobody could read them.

The censorship would last a few days, he said. He also said things could get worse if we didn't behave.

This last part was a little odd. Without the ability to write public messages, we had no way to misbehave. We were like patrons of the supermarket who were locked out just outside the door. We could see the little pieces of paper on the public bulletin board, but we couldn't put up any ourselves.

I fired off a private reply to the manager. I pay for this service, I reminded him. It's not a service when I can't respond to public messages.

I told him I shouldn't have to pay for the time that I was censored. He wrote back right away and told me I wouldn't be charged for that period.

By the following week I was back to full status. I minded my manners, and I've been a good boy ever since. I haven't had an argument with anybody.

But the whole experience has been unsettling. It's clear that nobody came out ahead, but I still haven't figured out who lost more -- the other network callers, presumably embarrassed, who had to pick their way past our public spat, or the two of us, muzzled and singled out, treated like 7-year-olds.

Maybe the real loss is an almost insignificant erosion of the right of free expression. This decade will mark the beginning of true mass communication by computer. In some ways, conferencing networks will become as important as newspapers, and much of the time they'll serve as a replacement for the U.S. mail.
Apple II Computer Info

However, unlike the press and the postal service, with their long traditions of free speech, computer networks don't have history as a guide. They'll do whatever their managers want. And that means censorship just as easily as it means anything else.

When that day comes, who will decide what can be said in public? It's worth thinking about now, while networks and other information services are still young. It may be too late when they've grown up.

"A Whole Buncha Milliseconds with Mark"
by Mark Quinn, DOA

Forget Alvin Toffler: some of us are waiting for technology to catch up to _us_. I dream of the day when I can buy a MIDI synthesizer that, besides having a decent piano and electronic organ patch, also does a fair job of imitating an acoustic guitar. I'd like to have a vision recognition system good enough to handle driving my car. I'd like to see 40" active matrix TVs, after so many years of hearing that flat-screen TVs were "ten years away".

And these are not pie-in-the-sky Star Wars doo-dads -- they are extrapolations of current technologies. Granted, such advances will come with time, but when they will arrive is anyone's guess. I really don't expect to hop in the back seat of my car, speak a destination and have the car do the rest during my lifetime (I am 34, and desperately counting down 40) -- I expect to see glimmerings of the technology, perhaps see a few "gee whiz" promises on _Beyond 2000_, but that's about it.

Darn it, doesn't this child of the 60s and 70s, who saw astronauts play golf on the moon, the birth of MTV, and the death of communism, deserve the above wish list? I've been awfully good. I regularly back up my text files -- baby wants techno goodies. Baby promises not to do anything overtly obscene or outright dangerous with them.

Sanity returneth. (Good, just in time for this paragraph, too.) Our ancestors made do with far less, and some of them excelled. And a whole lot of people in _today's_ world don't have access to the gee whiz technology (synthesizers that have good piano patches, Super VGA monitors,
a reliable car with a full tank of gasoline) I take for granted, so a slice of humble pie is in order.

Can I have that slice with a hang-on-the-wall, flat-screen TV, please?

"Your probably right! But isn't mustard a plant or something / that the workers in the field used to have to cut, but / when they get to hold, they can't cut the MUSTARD any more? / hmmm! Hey! This sound like a new topic.........(HaHa) / I think we better give this serious investigation.....:D "

Who's Who In Apple II

By Phil Shapiro

>>> WHO'S WHO <<<

~ A GENieLamp Profile of Kenrick J. Mock ~

GENieLamp> Kenrick, how did you first come to start programming the Apple II? Do you have any anecdotes you can share about your early experiences with the Apple II?

Mock> I first started programming in BASIC on my Apple II+ back when I was in the 5th or 6th grade. I'd have a grand old time typing in games from books. At the time there were also a couple of magazines that would publish games in BASIC for users to type in and run. Eventually I took a class in assembly and pascal, but I learned most of my programming skills by just hacking around on my own.

Probably my favorite Apple II story comes a bit later in life. At one of the San Francisco Applefests, Activision sponsored a contest to promote their new GS game, GBA 2-on-2 Basketball. They had Joe Barry Carroll there and everything - it was a big deal! In the contest, whoever had the most points after playing the computer would win a new GS system. I made it to the final round in the playoffs. I played last - and the other two contestants actually lost their games to the computer! When it was my turn, I jumped out to an early lead and started messing around. The computer slowly caught up, and suddenly with about 10 seconds left to play, the game was tied! Fortunately, I was able to call a time-out and pass to my computer teammate, who made the basket and won the game! The slight controversy was that the other contestants didn't know about the time-out feature, but I won the GS nevertheless. (Ironically, I already owned a GS, while the other two contestants owned IIe's.

GENieLamp> Can you tell us a little about your background and education. I understand you graduated from college not long ago. Did you study computer science in college?

Mock> I graduated from high school in 1986 and attended UC Davis where I received my degree in Electrical Engineering and Computer Science.
Originally, I had intended to focus more on the hardware aspects of computers (I have always enjoyed tinkering with electronics since an early age - I once made a robot which I could control from my Apple II+), but towards the end of my sojourn at UCD I found that I enjoyed the computer programming the most. I worked at the Los Alamos Nat'l Laboratory in New Mexico for about 3/4 of a year, doing some work with virtual-reality, user-interfaces, and software maintenance. A lot of the ideas for my games actually arose when I was working out in New Mexico. After I'd finished there, I worked for the MIS department of Chevron Chemical Company for another 3/4 of a year primarily doing work with multimedia.

I left the "real world" to go back to school. Currently, I'm working on my Ph.D. at UC Davis, majoring in Artificial Intelligence. At the moment I'm being funded by NASA Ames to develop a prototype system for reasoning about failures aboard Space Station Freedom. It's kind of a predecessor to a HAL 9000, since we are communicating with the user in plain English. I have a few AI projects I've been thinking about converting to the GS...

GEnieLamp> Your shareware disks have achieved national recognition for their quality and originality. Can you comment a bit on your ideas about shareware as a publishing channel?

Mock> I think shareware is a pretty good publishing channel. However, shareware certainly doesn't reach as wide an audience as a commercial program. Moreover, as I'm sure you know, only a small fraction of those people who use shareware actually send in the fee. Nevertheless, I've been fairly pleased with the response to my programs, and would like to thank those who have paid. I'm not really in this for profit, so the money is really icing on the cake.

GEnieLamp> Continuing further on the subject of shareware, what is the furthest place on the globe from which you've received a shareware fee? Any interesting letters from shareware fans?

Mock> I've gotten letters from all over the world. Quite a few from Canada and Australia, and a handful from Japan and the Middle East. One of my favorite letters contained a computer printout of the high score screen, showing that my score had been surpassed! (BTW, if you read this, my new high score is 1420.) My favorite is a letter which described how Columns GS had interested their learning-disabled daughter enough to want to play with the computer. After playing Columns, she began to branch out to using the computer for other things. It was quite heartwarming to hear how Columns had gotten someone else started with the Apple IIGs.

GEnieLamp> Kenrick, all of your games seem to be centered around the English alphabet -- Boggle, LetterSlide and now VIAD. Is this due to a strong background in English?

Mock> I've always enjoyed reading and word games, but I don't have much of a technical background in English. VIAD was actually written first. While I was waiting for James to finish the music, I thought I'd make use of his alphabet block-set and cranked out Boggle. At that point, James was still working on the music, so I was able to finish LetterSlide as well.

GEnieLamp> Many people who use and enjoy your games must wonder what programming tools you used to create them. Which are your
Mock> I use a mixture of Orca/C and Orca/M for my programming. The nice thing about Orca is that it's possible to integrate assembly and a high-level language (like C) together. As far as tools, there's a package of text tools from 360 microsystems which I kind of like. I've also used the FTA's tool 219 to play soundsmith music, although one of these days I'll switch over to Ian Schmidt's music player. I've also got a variety of graphical and input/output tools I've developed myself — I used some of them in my SAP animation program.

GEnieLamp> The background music for your Columns GS game is quite striking. Did you compose this music yourself, or was it "inspired" from another source?

Mock> Hardly! The music and graphical genius for Columns and VIAD is all the work of James Brookes. You've probably seen his work on the IRC demos, DuoTris, DuelTris, and a couple of other programs. In fact, Columns GS 2.0 would never have existed if it weren't for James. I was ready to stop programming at version 1.0, but James sent me some music and graphic samples which he'd created. Since he had already made them, I had no choice but to use them! As a result, Columns GS 2.0 was released and it would never have become as popular as it is without his music and graphics.

GEnieLamp> Besides programming, what other hobbies and interests do you have? What do you wish you could spend more time doing?

Mock> Aside from computers, my next hobby has to be running. I used to run on the cross country and track teams in college. Lately, I've been a bit lax in my workouts, but I've been trying to get back into racing shape. I also enjoy various types of theater, concerts, anything having to do with the outdoors, and I've just started windsurfing. One of the things I'd like is to have some more free time for reading — I've got a long list of books I've been wanting to catch up on.

GEnieLamp> As someone who has exhibited a strong creative flair, can you share any ideas about ways of promoting creativity? Any general comments about the nature of human creativity?

Mock> I subscribe to the same theory of creativity as a psychologist named Mednick — creativity is just the ability to take different ideas and mush them together to make new ones. I believe one way to promote creativity is to stop worrying what others may think about your work. Don't worry about being "graded"! Just have fun.

GEnieLamp> Whose work do you admire most in the national Apple II community? What about their work do you admire? Locally, was there any one person who helped ignite your interest in computers?

Mock> The last question is the easiest to answer — my dad is the one responsible for getting me going with computers. As far as other people, that's a tough call. James Brookes is certainly a stud. I'd have to give him the artistry award. I've also enjoyed Will Harvey's and Bill Heineman's programs. Ken Franklin's relief-ware concept is also quite admirable.

GEnieLamp> Any ideas on where the future of telecommunications is taking us? What services do you think GEnie might be
offering in the year 2000? What services do you think it SHOULD be offering?

Mock> Here in Davis, we've got a project called the Davis Community Network. It will bring digital communications to every home in town. I'll essentially have 57.6 Kbps lines going straight to my room! I think the future will see high speed networks and internet availability coming to residential areas. Eventually I see GEnie communicating to its users via a variety of media; e.g., visual and auditory, rather than just text.

GEnieLamp> Are you currently working on anything that you can tell us about?

Mock> I have an artificial intelligence board game called Pente that will be out very soon. After that, I hope to finish up a dictionary editor for the word games, and I also want to make some improvements to the SAP program. After that, I've got a couple of ideas but nothing concrete.

GEnieLamp> Where can people reach you to send their ideas for the next great Kenrick Mock game?

Mock> I'd love to hear any ideas or comments. My mailing address is:

Kenrick Mock
2300 Sycamore Lane, 18
Davis, CA 95616-5511

And I can be reached via electronic mail at:

GEnie: K.MOCK
Internet: mock@toadflax.cs.ucdavis.edu
BBS: (916) 757-7856

[EOA] [LIB] Yours For The Downloading

By Mel Fowler [MELSOFT]

- Prime Bulletin Board System
- Zippety-Doo-Dah! Zippety-Day!

THINKING ABOUT STARTING A BBS? How many of you have wanted to start a local bulletin board system (BBS) but just didn't want to spend the money on the new equipment such a venture would entail? Well, you may have the equipment hidden away in a closet or
garage someplace. Dig out that Apple II+, IIc, or IIe and take a look at Prime.BBS version 2.2 which went public domain in the middle of 1992 and is available right here on GENie, in the A2 Library.

Prime.BBS is perfect for starting up a small (25 to 200 subscriber) local bulletin board. Its easy to install, simple to operate, and will run on any Apple II with 64K of RAM, including an Apple ][+ with some limitations. You will also need a modem (modulator/demodulator) that operates at 300, 1200, or 2400 baud and a Super Serial Card. A small hard drive of 5 to 10 Megs is also recommended but not mandatory if you have two disk drives, either 5.25 inch floppy or 3.5 inch. However, if you are using two 5.25 inch floppy disk drive you would be somewhat limited in your scope of operations, being able to have an E-Mail and a bulletin board area but not a software library. With two 3.5 inch drives you can handle just about everything with your software library or libraries on one drive and everything else on the other. A ProDOS compatible clock card is strongly recommended. A printer is optional.

You may already have some or all this stuff just hanging around doing nothing. Now you can put it to work and become an all powerful System Operator (SysOp) on your own BBS. Start a BBS for your local Apple II users group. Share a collection of shareware, freeware, and public domain software with the club, and the club with you. Local BBSs are popping up all over and cover all types of special interests from chess clubs to retired senior citizens.

Prime.BBS offers you complete access control so you can setup areas of your board that have limited access to users. You control everything your users see and do while they are on your board. If you don't like the look and feel of the default menus or the structure of the libraries, change them to meet your desires. You can edit almost anything about Prime.BBS. Electronic mail is an important part of every bulletin board and Prime.BBS supports a simple, elegant E-Mail system.

You can create as many special interest areas within your board as you need, with each area having its own bulletin board and library. The libraries can also be divided into categories which reflect the type of software in them, such as separate sections for graphics, utilities, games, etc. A SysOp can be assigned to monitor and control each area.

The External program section adds real power to your board and allows for the addition of external programs such as games, phrase of the day, "this day in history," or a calculator. You can even add external menus. You can control how the board answers callers, with a message for new subscribers that outlines what the board has to offer and the rules and etiquette required of all subscribers.

The 89 page (not counting appendices) manual covers every aspect of Prime.BBS and is written in Classic Appleworks for easy access. It is well organized and easy to follow, even though it covers everything you need to know down to the last detail.

Downloading Prime.BBS can be done in two ways depending on your choice of disks. If you want to use 5.25 inch floppy disks you would have to download the following:

<table>
<thead>
<tr>
<th>File number</th>
<th>Volume name</th>
</tr>
</thead>
</table>

---

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 609 of 1824
For 3.5 inch disks, or a hard drive, download the following:

- 19189 /Prime.BBS
- 18837 /Prime.BBS Doc

Other recommended downloads are:

- 19649 /BUGS AND FIXES
- 18994 /USER REPORTS
- 19206 /USER REPAIR UTILITY
- 19415 /SYSTEM DIRECTORY LISTING
- 19425 /PRIME.TIP1
- 19428 /PRIME Alternative Xfer System
- 19427 /Prime Xpress Xfer Documentation
- 19545 /Prime Xpress Patch & Fixes

For a complete listing of all Prime.BBS files just do a search of the A2 library for "Prime". They range from role playing games, sport simulations like golf and football, adventure games, board games, a lottery system, and general information like the complete history of the Apple II. Everything you need to make your BBS entertaining and fun to use.

The best feature of Prime.BBS is William T. Goosey, Jr. (W.GOOSEY) here on GENie and the Prime.BBS category. "Goose" is the resident guru for Prime.BBS and is available to answer any of your questions concerning installation and operation. So if you run into problems just go to Category 41, Topics 4: Prime BBS System goes Public, Topic 5: Prime Help and Bug reports, and Topic 6: Advertise your Prime BBS here. Goose has uploaded over 70 Prime BBS programs that can be used to enhance your bulletin board operation. He continues to upload tested modules for Prime.

So what's holding you back? Dig out that unused Apple II and get into the Bulletin Board business. It's easy if you have Prime.BBS. And how can you go wrong with a resident expert right here on GENie?

Zippety-Doo-Dah! Zippety-Day! New 8-Bit Apple II Utility Opens Up a Magical Kingdom of Zipped Text Files

Thanks to the programming wizardry of Russ Woodroofe, Apple IIe, IIc, IIGS, and IIC+ users are now able to download and decompress text files archived in IBM "zip" format. The neat thing about Russ Woodroofe's UnZIP IIe program is that it looks, feels, and operates in much the same fashion as ShrinkIt.

This opens many doors to downloadable files that were previously inaccessible to Apple II users. Federal government bulletin boards, in particular, seem to have many text files archived in "zip" format.

But you can also find "zipped" text file goodies right here on GENie. Two places to go hunting are GENieLamp's own file library, accessed from page 515 on GENie. And the Home Office/Small Business roundtable library,
accessed by typing HOSB at any standard GENie prompt.

For your modemng convenience and pleasure, a complete listing of the GENieLamp library of text files has been captured, shrunk, and uploaded to the A2 file library. Persons interested in delving further should direct their attention to A2 file number 20286, "GL.Library.BXY".

Within the GENieLamp library you'll find a smorgasbord of text files including information about the "Disktop Publishing Association," freeware fiction and non-fiction writings, and even freeware poetry.

The instant popularity of UnZip IIe is evidenced by the fact that over 120 people have downloaded the file in the past month. One small pointer, though. The current version of UnZip IIe has problems decompressing files whose file name violates Prodos's rules. So some of the IBM zipped files which use underline characters and other oddities will cause UnZip IIe to give a "Bad Pathname Syntax" error.

The good news is that although these "IBM oddities" files cannot be decompressed to disk, the program is still able to display the text in these files on your Apple II screen.

***************
Number: 20121 Name: UNZIPIIE.BXY V1.0
Address: NORBY Date: 930119
Approximate bytes: 18048
Number of Accesses: 124 Library: 40
Description:
Here's a nice UnZIPer, complete with a ShrinkIt-type interface, which will run on any //e or up. I would recommend an enhanced //e (the extensive mousetext would look pretty confusing without), but doesn't check, and doesn't use any 65c02 opcodes. Docs with more info are included. Shareware $10
Keywords: ZIP,UnZIP,Archiver,Compression,8-bit,utilities

Search-ME!

By Scott Garrigus
[S.GARRIGUS]

EXPLORING GENie Have you ever wondered what will happen to you in the future? If maybe you'll find romance or become rich? Don't say no because like any other human being in this world I know you have! :-) Yes! We'd all like to see what the future might hold for us but
unfortunately the time machine hasn't been invented yet. Here on GENie though, we've got the next best thing... the Astrology Roundtable!

That's right! This month I visited the Astrology Roundtable (page 1180) and found a lot of fascinating facts! If you're interested in astrology at all you've got to check this RT out! Exchange messages with other astrology fanatics in the BBS and you can even download your horoscopes from the library! It's great fun!

But before you go, be sure and solve this month's puzzle... Until next month... Keep on smilin'! :-)

>>> THE ASTROLOGY ROUNDTABLE <<<

This column was created with a program called SEARCH ME, an Atari ST program by David Becker.

"I would pound on the tree's until my characters needed rest / then back off. Rest up and bash the tree's some more. If / this got to boring I'd go off and chase rabbits for awhile, / great fun, especially with throwing the baseballs."
INTRODUCTION

This installment of the Apple II History series focuses on the return of Steve Wozniak to Apple Computer. The evolution of Apple II computers takes one of its biggest strides with the Apple IIgs computer. The development and design decisions made for the IIgs are also covered in this segment.

THE APPLE II EVOLVES

While the capabilities of the Apple II slowly advanced as it changed from the II up through the IIc, the one thing that remained essentially unchanged was the 6502 microprocessor that controlled it. Even though the 65c02 had more commands than the 6502, as an 8-bit processor it was inherently limited to directly addressing no more than 64K of memory at one time. (As an 8-bit processor, the 6502 could handle only 8 bits, or one byte at a time. However, its address bus was 16 bits wide, which made for a maximum address of 1111 1111 1111 1111 in binary, $FFFF in hexadecimal, or 65535 in decimal. If you divide 65536 bytes by 1024 bytes per "K", you get 64K as the largest memory size). When Wozniak designed it, 64K was considered to be a massive amount of memory, even for some mainframe computers. (For example, the old mainframe on which I learned programming during college back in 1975 was a ten-year-old IBM 1130 with 8K of memory; this was used for both the operating system AND user programs!) Most hackers of the time would not have known what to DO with four megabytes of memory, even if it had been possible (or affordable) to install that much. Consequently, programs of the day were compact, efficient, and primarily text-based.

The non-Apple II computer world had developed and advanced, and Apple grudgingly allowed the Apple II to make its small, incremental advances. Occasionally, efforts were made within Apple to make a more powerful Apple II, but the lure of "better" computers always turned the attention of management away from allowing such a project to actually make any progress. First the Apple III, then Lisa, and finally Macintosh swallowed the research and development dollars that Apple's cash cow, the Apple II, continued to produce. The latter two computers were based around the 16-bit Motorola 68000 microprocessor, which had the capability to address far more than 64K of memory. The Apple II could make use of more memory only through complicated switching schemes (switching between separate 64K banks). Although "Mac-envy" hit many Apple II enthusiasts both inside and outside of Apple, causing them to move away from the II, there were still...
many others who continued to press for more power from the II.

Eventually, a company called Western Design Center revealed plans to produce a new microprocessor called the 65816. This chip would have all of the assembly language opcodes (commands) of the 65c02 through an "emulation" mode. However, it would be a true 16-bit processor, with the ability handle 16 bits (two bytes) at a time and to address larger amounts of continuous memory. The address bus was enlarged from 16 to 24 bits, making the 65816 capable of addressing 256 times more memory, or 16 megabytes. The power to make a better Apple II was finally available.

THE RETURN OF WOZNIAK Back in early 1981, Steve Wozniak was involved with several projects at Apple. He had helped write some fast math routines for a spreadsheet product that Apple had planned to release in competition with Visicalc. Also, Steve Jobs had managed to convince Wozniak to participate with his fledgling Macintosh project. Then, in early February, Wozniak's private plane crashed. He was injured with a concussion that temporarily made it impossible to form new memories. He could not recall that he had an accident; he did not remember playing games with his computer in the hospital; he did not remember who visited him earlier in the day. When he finally did recover from the concussion, he decided it was time to take a leave of absence from Apple. Wozniak married, and returned to college at Berkley under the name "Rocky Clark" (a combination of his dog's name and his wife's maiden name). He decided he wanted to finally graduate, and get his degree in electrical engineering and computer science. When he was done with that, he formed a corporation called "UNUSON" (which stood for "Unite Us In Song") to produce educational computer materials, wanting to make computers easier for students to use. He also decided use UNUSON to sponsor a couple of rock music events, and called them the "US Festival".<1> Held on Labor Day weekend in 1982 and 1983, these music and technology extravaganzas were invigorating for Wozniak, but he lost a bundle of money on both occasions. Though nowhere near drying up the value of his Apple Computer stock, he decided that he was ready to return to work. In June of 1983, Wozniak entered the building on the Apple campus where the Apple II division was housed and asked for something to do.

THE APPLE IIX When Wozniak returned, he discovered the latest of the Apple II modernization projects, which was code(named "IIX". When he saw what the 65816 could do, he became excited about the potential of the new Apple II and immediately got involved. It was a tremendous boost in morale for the division to have their founder return to work. However, the IIX project was plagued by several problems. Western Design Center was late in delivering samples of the 65816 processor. First promised for November 1983, they finally arrived in February 1984—and didn't work. The second set that came three weeks later also failed.

Other problems came out of the engineering mindset that still existed at Apple at the time. Recall that people there liked designing boxes that would do neat things, but there was not enough of a unified focus from above to pull things together. The marketing department wanted the IIX to have a co-processor slot to allow it to run different microprocessors. The code name of the project by this time was "Brooklyn" and "Golden Gate" (referring to the ability to make it a bridge between the Apple II and Macintosh). The co-processor slot could allow the IIX to easily do what third party companies had done for the original Apple II with their Z-80 boards (which allowed them to run CP/M software). Co-processor boards considered were ones for the Motorola 68000 (the chip used in the
Macintosh), and the Intel 8088 (used in the IBM PC). The IIx project got so bogged down in trying to become other computers, they forgot it was supposed to be an advanced Apple II. Politically it also had problems at Apple, because it was being aimed as a high-end business machine, which was where they wanted the Macintosh to go.\!<2>,\!<3> Wozniak lost interest as things ran slower and slower, and eventually the project was dropped.

**THE 16-BIT APPLE II RETURNS**

When the IIx project was cancelled in March 1983, some of the Apple II engineers were assigned the task of reducing the cost of the Apple II. Engineers Dan Hillman and Jay Rickard managed to put almost the entire Apple II circuitry onto a single chip they called the Mega II. Meanwhile, after the "Apple II Forever" event that introduced the IIC, interest in the Apple II revived and sales were quite good. Management saw that sales of the open IIE were better than the sales of the closed IIC, so they were agreeable to the idea of another try at the 16-bit Apple II, possibly utilizing the Mega II chip. By late summer 1984 it was revived with the code name "Phoenix" (rising from the ashes of the IIx project).\!<3>

**THE APPLE IIGS: GOALS OF THE DEVELOPMENT TEAM**

The people involved in the Phoenix project were very knowledgeable about the Apple II, from the days of the ][ through the //c. They knew what THEY wanted in a new computer. It should primarily be an Apple II, not just something NEW that tried to be all things to all people.\!<4> Dan Hillman, who had also been involved as the engineering manager for the IIx project, stated in an interview, "Our mission was very simple. First we wanted to preserve the Apple II as it exists today. It had to work with Apple IIe software and Apple IIc software. That was goal number 1. But we recognized that the Apple II was an old computer. It had limitations. The new machine needed to address those limitations, break through those barriers—and the barriers were very obvious: We needed to increase the memory size. We had to make it run faster. We needed better graphics. And we had to have better sound. That was our mission." Since advanced graphics and sound were what would make this new Apple really shine, the name eventually assigned to the final product was "Apple IIGS".\!<3>

Having learned from their experience in building the Apple IIe and IIC, they knew what would make the new 16-bit Apple II more powerful. The Apple IIC was easy to use because the most commonly needed peripherals were already built-in. The Apple IIe, however, excelled in its ability to be easily expanded (via the slots) to do things that were NOT commonly needed or built-in. Harvey Lehtman, system software manager for the project, stated, "We ... wanted the Apple IIGS to be easy to set up, like the IIC, and easy to expand, like the IIE."\!<3>

**THE APPLE IIGS: ARCHITECTURE**

Wozniak was quite involved in designing the general layout of the IIGS. Insisting on keeping it simple, he recommended AGAINST a built-in co-processor (as they tried to do with the IIx). He also wanted to keep the 8-bit part of the machine separate from the 16-bit part. To accomplish this, he and the other engineers decided to design it so the memory in the lower 128K of the machine was "slow RAM", which made it possible for it to function just as it did on the older Apple II's. This included the memory allocation for the odd addressing schemes used in the text and graphics modes and (which made sense in 1976, but not in 1986). The rest of the available memory space would be fast, and could be expanded to as much as 16 megabytes. With a faster microprocessor, it would also be possible to run programs
more quickly than on the older Apple II's.<3>

THE APPLE IIGS: GRAPHICS One area they decided to focus on was bringing the quality of graphics on the new Apple II up to modern standards. Rob Moore, the Phoenix project hardware group manager, helped define the new graphics modes of the IIGS. Because a change that increased the vertical resolution from 200 dots to 400 dots would make the computer too expensive (it would require a special slow-phosphor monitor), they purposely decided not to go in that direction. Instead, they increased the horizontal resolution, and created two new graphics modes (called "super hi-res"); one was 320 x 200 and the other was 640 x 200. This decision also made it easier to keep compatibility with older graphics modes.<3>

As mentioned above, the text and graphics addressing on the old Apple II was odd, from a programming standpoint. When Wozniak originally designed the II, he made the memory allocation for text and graphics to be "non-linear", since this saved several hardware chips and made it less expensive to build. This meant that calculating the memory address of a specific dot on the hi-res graphics screen or a character on the text screen was not as simple as most programmers wanted. The hi-res screen began at $2000 in memory, and the first line on the hi-res screen (line 0) started at that address. Each line on the hi-res screen was made up of 40 bytes of 8 bits each, and seven bits of each byte represented a dot or pixel on the screen, giving a possible 280 dots horizontally. Since 40 bytes is $28 in hex, line 0 then ran from $2000 to $2027 in memory. However, the second line (line 1) of the hi-res screen did NOT start at $2028 as one would expect, but at $2080. The hi-res screen line represented by memory locations $2028 to $204F was line 8, and $2050 to $2077 was line 16. The last eight bytes of this 128 byte section of memory was unused. The next 128 bytes were allocated to screen lines 1, 9, and 17, and so on.

Because this complicated things considerably for programmers, the design team for the IIGS wanted linear addressing, which would allow the memory addresses of line 0 to be followed by the addresses for line 1, and so on. Because the graphics resolution and range of available colors planned was much greater than either of the older graphics modes (hi-res or double hi-res), they needed 32K of continuous memory to use. Because they planned on a minimum memory configuration of 256K for the IIGS as it would be shipped, they could not come up with that much memory in one single block. Engineer Larry Thompson designed a special Video Graphics Controller (VGC) to solve the problem. The chip combined two separate 16K blocks of memory and make it appear as a single continuous 32K block of memory, as far as the graphics programmer was concerned.<3>

The new super hi-res graphics modes also gave far more color choices than either the old hi-res mode (which had six unique colors) or even the double hi-res mode (which had sixteen colors). In the 320 x 200 super hi-res mode, each line could have sixteen colors out of a possible 4,096, and in the 640 x 200 mode, each line could have four colors out of 4,096. This gave graphics power that was not even available on a Macintosh (which was still black and white at the time).

THE APPLE IIGS: SOUND The second major area of focus for enhancements over the old Apple II was sound reproduction. The original sound chip that had been proposed for the IIGS would have given it the sound quality of a typical arcade game. However, this was no better
than what other computers in 1986 could do. Rob Moore suggested using a sound chip made by Ensoniq, one that was used in the Mirage music synthesizer. He had to push hard to get this included in the final design, but was able to convince management of its importance because he told them it would be "enabling technology" (borrowing a phrase from a Macintosh marketing book). He told them "it would enable people to do things they'd never dreamed of doing."<3>

The Ensoniq chip was capable of synthesizing FIFTEEN simultaneous musical voices. To help it in doing such complex sound reproduction, they gave the chip a separate 64K block of RAM memory dedicated specifically for that purpose.

THE APPLE IIGS: MEMORY The 65816 is designed to address up to 16 MB of memory. The IIGS, however, was designed to support only 8 MB of RAM, and up to 1 MB of ROM (in high memory). With cards specially designed by third-party companies, up to 12 MB of RAM could be added, but the memory manager in ROM was only aware of the first 8 MB. A special patch was needed to allow the system to use memory beyond that point.

Building on the traditional memory organization from 6502 days, memory in the IIGS was usually referred to in banks, from $00 through $FF. Each bank refers to a 64K chunk of memory. The lowest bank, $00, was identical to the 64K memory space in the original Apple II. The next bank, $01, was the same as the auxiliary memory bank used on the Apple IIE and IIC. (Additionally, the super hi-res graphics display was found in 32K of the memory in bank $00, from $2000 to $9FFF). The banks from $02-$7F were also for RAM storage, and covered things up to the 8 MB limit. Banks $80-$DF could be used for another 4.25 MB of RAM, but as mentioned above they were unusable (without a patch) because the memory manager didn't know how to access it.

The memory expansion slot designed for the IIGS only had two lines to decode addresses. This allowed for direct access to each of four 256K RAM chips, or four 1 MB RAM chips. In order to make use of the next 4 MB of RAM some special logic was needed to find and use it. RAM cards with more than 4 MB were never directly supported by Apple.<5>

Banks $E0 and $E1 were a special part of RAM that was used to duplicate ("shadow") banks $00 and $01. This RAM was designed as "slow" RAM, and would better be able to run some of the older 8-bit Apple II software. When shadowing was active, anything a program did to addresses in banks $00 and $01 was duplicated in banks $E0 and $E1. Although it appeared to a program that it was running in the lower two banks, it was really running in the slow RAM in banks $E0 and $E1.<6>

Banks $E2-$EF were undefined. The last one MB from $F0-$FF was allocated to ROM. The lower 512K (banks $F0-$F7) were set aside for a ROMdisk. (A ROMdisk is just like a RAMdisk, except it will not lose its contents when power is turned off). For a ROMdisk to be installed, a device driver for the disk had to be located at the beginning of bank $F0 (at address $F0/0000), and the driver had to start with the phrase "ROMDISK". The most common way this was used by third-party hardware providers was to take some of the GS memory, protect it with a battery (so its contents didn't disappear when the computer was turned off), and designate it properly to the IIGS as a ROMdisk (even though it was simply protected RAM, and not true ROM).<7>
The rest of the space from $F8-$FF was reserved for system ROM. The original IIGS had ROM code only from $FE-$FF, while later versions expanded this space to include $FC$ and $FD$.

NEXT INSTALLMENT  The Apple IIGS, cont.

READING GEnieLamp

GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index, you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO

To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)
|________________| |___|___|________| |________|
|Name of sender| CATEgory| TOPic| Msg.# | Page number |

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic. For example: {58}.

ABOUT GEnie

GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

"Leave it Sheldon to figure out how to get the necessities: / Heat and GEnie. It is amazing how used to things you become / and how much you miss them even if it is for only 3-7 days." / C.ALLEN17

[EOA]

[FRM]FROM MY DESKTOP /
FROM MY DESKTOP   When I typed in the characters ATDT and the the number of
local bulletin board for the very first time, I was completely and utterly awed. No longer was I alone in my computing
pursuits. At the touch of a key, I could call out to practically any place
in the world and make friends with people that I would have never had the
chance to do so with otherwise. The modem had broken my computing
isolation from the rest of the world.

Ten years later, I'm still awed by it all, but now, even more so. I
keep in touch with friends via GE Mail, I stay on top of what's happening
in the news with Newbytes and I can get answers to just about any question
I can think of - many times within hours of posting it. I can share my
knowledge with others and more importantly, I can learn from their
experiences as well. I can download pictures, sounds and books to read and
I can even play a friendly game of backgammon or chess with someone in
Boston, or Miami, or Japan. Amazing.

But it can be frustrating too... When you think about it, we "onliners" represent a very small segment of the overall population.
Surprisingly, there are many people who own computers are unaware of what's available to them online. They use the computer to type in an occasional school report or (more likely) play games on it. That's okay as eventually many of these people will find their way online by way of a friend, an article they read or because they are just plain curious (like I was).

The point is, we've only just begun. Think about it...we are in the infancy of telecommunications. In a way, I'm sorry I won't be around a hundred years from now to see where all of this is heading. On the other hand, I am thrilled to be among the online pioneers of this _new_ and exciting technology. Welcome aboard, friend, and I'll see you online!

Did you know that the Public Forum RoundTable (M545) is archiving all of the official White House Electronic Press Releases issued by the new White House E-Mail Communications Office? The files are available in the PF Library in the format WHPRxxx.TXT, and there are currently 177 of these files available. The files include press releases, official announcements, transcripts of press conferences & other official White House communique. Interesting stuff here - well worth checking out! For more info., contact GRAFFITI, the PF SysOp.

Some GENie access numbers incur a $2.00 per connect hour communications surcharge. This surcharge applies to all GENie usage, including GENie*Basic services. Surcharged access numbers are noted with a dollar-sign ($) and the amount of the hourly communications surcharge (i.e., $2.00/hr). To retrieve local access numbers, please type *PHONE or PHONE at any main menu prompt.

When accessing GENie via 800-Service (available only in the US), you will incur a $6.00 per connect hour communications surcharge, for 300, 1200 and 2400 baud access. This surcharge applies to all usage, including GENie*Basic services.
9600 baud access is also available via 800-Service. When using 9600 baud via the 800-Service, you will be charged $18.00 per connect hour during non-prime time and $24.50 per connect hour during prime time.

<table>

</tbody>
</table>

When accessing GEnie via SprintNet, you will incur a $2.00 per connect hour communications surcharge. This surcharge applies to all GEnie usage, including GEnie*Basic services. Surcharged access numbers are noted with a dollar-sign ($) and the amount of the hourly communications surcharge (i.e. $2.00/hr). To retrieve local access numbers, please type *PHONE or PHONE at any main menu prompt.

PLEASE NOTE If you are dialing long-distance to access GEnie, we do not recommend dialing a surcharged access number, as you will incur the $2.00 connect hour surcharge in addition to long-distance charges. Also note that interstate long-distance calls are usually less expensive than intrastate long-distance calls. Please be sure to verify the long-distance charges with your local telephone company.

GEnieLamp FUN AND GAMES This is one big issue so I'm going to keep my desktop notes short this time around. One word of caution when reading this month's issue: Don't forget, it's April!

Until next month... John Peters

APPLE_TALK /

Apple II Corner

By Darrel Raines
[D.RAINES]

April Fool's Day has always been one of my favorite holidays. It's not a holiday, you say. Well don't try and tell me that. I love good-humered pranks and practical jokes. My only rule is that they cannot be mean-spirited. No one gains by hurting others. On the other hand, this issue of GEnieLamp may not be as serious as the rest of the year's offering.

[*][*][*]
A few years ago, many of the major publications for the Apple II computer started to disappear. I was convinced that there were soon going to be no sources of information for my favorite hobby. I am happy to say that I was mistaken in a big way. We are starting to see just the opposite effect recently. "Major" Apple II publications of which I am aware: II-Alive, A+/Incider (with Mac cove rage), A2-Central (and their associated publications), GS+, Softdisk, Softdisk GS, and GENieLamp. :) 

[*][*][*]

A few years ago, I was also starting to get unhappy with the amount of computer software that was available for the Apple II. I have mumbled in this forum a number of times about the great share ware that is available for the Apple computer. This has been a banner month with no less than four major software releases as shareware or freeware: DuelTris, Pente, Bouncin' Ferno 2, and Spy Hunter. Oh, did I mention that this list just covers games. The May issue of GENieLamp may never get edited. 

[*][*][*]

On the other hand, I have discovered a way to make everything old, new again. It seems that if I put a commercial game on the shelf for about a year, I can get it back out again for a few weeks and enjoy it as if it were new. Sports simulations are my favorite for this trick. Two-on-two basketball was dusted off recently in honor of the NCAA men's basketball playoffs. Watch out Michigan, I can dunk with the best of them. 

[*][*][*]

I just have to sit down with my programming tools at hand one day soon. I have been doing a lot of thinking about a IIgs version of Eamon. Or, at least, a Eamon-like gaming system. My idea is that most people can no longer program on the IIgs. The gaming system would run on database structures that define the dungeon to be explored, the denizons in the dungeon, how the various characters can interact, and other information on this type. I need to sit down and write some of this down. Perhaps I should contact Tom Zuchowski with some of these ideas. Why put it here? Public humiliation if I don't carry through with something!

Enjoy this month's issue.

>>> A2 ODDS & ENDS <<<

--- GENieLamp PT Script ---

Anyone who wanted the PT3 GENieLamp script: This is a copy of GEM.PT.Usr to grab a copy of the A2 GENieLamp. You need to run it manually (answer Y to "execute user script after logon?") and have the file f.lamp present in your main GEM directory for it to work. It saves the file as lamp.MMM.YY (mmm is the three letter month), an AWP file.

Let me know if there are any problems with this script; I'll do what I can to fix them.
(D.BROWN109, CAT29, TOP17, MSG:47/M645;1)

--- ZIP TIPS ---

I downloaded UnZip.Ile a short time ago, and in the process of using it found that I could View a certain .ZIP file which I had downloaded, but I kept getting an "invalid pathname error" when trying to unZIP the file to disk.

To make a long story short, using Block Warden I found that the filename was embedded in ASCII in the zipped file and contained a hyphen, and I got it to unZIP to disk properly by changing the hyphen to a period in the zipped file.

Unless I'm doing something wrong, the program has no option to

--- Apple II Computer Documentation Resources (a2_docs_genielampl.msw) ---

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 627 of 1824
specify the filename of the new file - if UnZip.IIe had this option it would be much more convenient to use. It works very well, and I like the Shrinkit-type user interface, but unfortunately zipped files don't always conform to ProDOS pathname conventions.....

(STARRIDER, CAT3, TOP4, MSG:119/M645;1)

Concerning Script-Central Larry has once again brought up a very important point, BTW. If you _don't_ ask for features, you can pretty much guarantee you won't get it. On the other hand, if you do ask you may very well get it. In general if I can do "it" and it doesn't go against the way I think things should work, you can probably expect to see it ...ASK!

In this particular case I never even thought of such an option. I thought I had covered all the cool things. Please don't think that it's a waste of time to offer opinions/comments/ideas-for-features.

(A2.HANGTIME, CAT23, TOP8, MSG:178/M645;1)

WHICH SYSTEM? I strongly recommend those with less than 2MB of RAM, or no hard drive, to stick with System 5.0.4. A Hard Drive =and= at least 2MB are needed to effectively use System 6.0. (Having said that, I did get System 6.0 running with only 1.75MB of RAM when my memory card died and I had to fall back to my old GS-RAM card. But I also had a hard drive, and I couldn't do anything fancy, and it had already been installed, and it was temporary.)

We keep System 5.0.4 around just because of the myriad of underpowered systems out there.

The best solution is to get a hard drive and more memory.

(A2.TIM, CAT2, TOP4, MSG:162/M645;1)

HP DESKJET 500 HOMEBREW REFILL KIT I just put together a homebrew refill kit this afternoon, and thought I'd relate my experiences. First off, it worked fine, and it was cheap. That's the whole point, right?

Bill of Materials:

<table>
<thead>
<tr>
<th>Item</th>
<th>Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 cc Syringe</td>
<td>$0.40</td>
</tr>
<tr>
<td>20g 1.5” Needle</td>
<td>$0.18</td>
</tr>
<tr>
<td>Jet Black Sheaffer Skrip Ink (2 oz.)</td>
<td>$3.50</td>
</tr>
<tr>
<td>CA State Extortion</td>
<td>$0.31</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>------</td>
</tr>
<tr>
<td>GRAND TOTAL:</td>
<td>$4.39</td>
</tr>
</tbody>
</table>

I purchased the needle and syringe at a local veterinary supply store. When the saleslady asked what I was administering with the needle, I told her "ink." She looked a bit confused, but was quick to make the 62-cent sale. I needed to fill out a form with my name, address, size of syringe and needle, use, and signature. Apparently, the state of California expects that you'll actually write "IV Drugs" if that's what you're going to use it for...

In a post up-topic, someone suggested a 25-gauge, 1.5" long needle. This shop had a 5/8" 25g needle, or a 1 1/2" 20g needle. Figuring that
length was more important than the diameter, I purchased the 20-gauge. When I got it home, I had some trouble filling the BubbleJet 10 cartridge, so I figured that the previous poster had a reason for specifying a 25-gauge needle (for another 19 cents, including tax). I went back out, got the smaller needle, and tried again. It didn’t work-- ink seems to go _very_ slowly through such a small needle, so I tried once again with the 20g needle. This time, when I encountered resistance at the bottom of the refill hole, I pressed harder and punctured something. After that, I had no trouble injecting about 12 ml of ink into the cartridge, and the self-test printed fine.

By far, the greatest cost in this project was the ink. The bottle contains 60 ml of ink, which will run 5 refills, at a cost of just under 90 cents each. The syringe and needle are both marked "USE ONCE AND DESTROY", but I figured that sterility was not a crucial factor in this application, so I plan on using them for quite a while. (D.BROWN109, CAT12, TOP8, MSG:121/M645;1)

LIBRARY LISTINGS You can make your own AW DB listings of GEnie libraries. All you have to do is list the libraries you are interested in and capture the text to disk. There are two programs in the A2 library that can generate DB files from these text captures:

17042 GECONVRT3.2.BXY
17468 TO.GE.CONV.BXY

I don’t normally load TimeOut with Appleworks, so I use GECONVRT. It is a very easy program to use. You don’t even have to clean the list headers off the capture or anything. (T.ZUCHOWSKI, CAT17, TOP4, MSG:95/M645;1)

MOUSE TROUBLES... Schools are having problems w/students removing the balls from the mouses and using them as superballs. Apple had BETTER start selling replacement parts. (R.WAGONER4, CAT2, TOP4, MSG:84/M645;1)

MDG Extends International ProLine Support SAN DIEGO, California--March 15, 1993--To further support international ProLine BBS owners, the Morgan Davis Group has developed an enhanced AddUser module that offers flexible account registration for non-U.S. systems. The new module offers relaxed verification of input to accommodate a variety of address formats used world-wide. Found in eleven countries, including Australia, Canada, England, France, Germany, Japan, Mexico, Singapore, Spain, Sweden, and the United States, ProLine systems share information over the ProLine network, established in 1985, and the Internet.

In addition to international support, AddUser can also enforce rigorous input verification now available for U.S. systems. Such verification involves recognizing invalid street addresses, ZIP codes, and phone numbers with non-standard area codes or repeating digits.

Part of the ProLine software package, AddUser allows callers to sign up for their own accounts for immediate validation. This optional feature spares the system administrator from manual account validation. Users can begin to take full advantage of the system’s services without having to wait for their accounts to become operational.
Apple II Computer Info

The updated module is available free upon request for all international, registered ProLine owners. For more details, contact MDG International Services at +1 619 670 0563 (Monday through Friday, 9AM to 5PM Pacific Time), FAX +1 619 670 9643, BBS +1 619 670 5379, or via Internet e-mail addressed to mdavis@mdg.cts.com.

ProLine is a trademark of Morgan Davis Group.
(MORGAN-DAVIS, CAT27, TOP3, MSG:182/M645;1)

Upgrading to Twilight II from Signature GS and Desktop Enhancer

Thanks for your interest in Twilight II!

Owners of Signature GS and Desktop Enhancer can upgrade to Twilight II v1.1 for $25 ($24 plus $1 S&H). Twilight II v1.1 we hope to have shipping in about two weeks. (It includes many more features than v1.0.1, or v1.0) It is fully compatible with The Manager from Seven Hills!

If you would like to take advantage of this upgrade offer, send us your _original_ manual cover from Signature GS or Desktop Enhancer, along with a check or money order for $25 (made payable to DigiSoft Innovations). Alternatively you can also pay via MasterCard or Visa. If you choose to pay via credit card, email us your credit card number, expiration date, card type, etc. Your card will not be billed or your check cashed until Twilight II v1.1 is shipping, in approximately two weeks. We will immediately ship you a copy at that time.

If you haven't already heard, Twilight II v1.1 also runs all Phantasm effects! If you have any additional questions or complaints, let me know. Thanks again for your interest!

Jim Maricondo
DigiSoft Innovations
P.O. Box 380
Trumbull, CT 06611

(DYA, CAT13, TOP30, MSG:109/M645;1)

THEY'RE DOING IT AGAIN! By now, many of you now know of the collaboration between Sequential Systems and Procyon Enterprises in producing Switch-It!, the Apple IIGS application switcher. I'm pleased to announce another collaboration - the combination of Sequential's great Apple II hardware products with Procyon's on-line support expertise.

I (Jawaid Bazyar, email address PROCYON.INC) will be maintaining this new Sequential Systems category. If you have any questions about Sequential products, post them here! (Also, if you've heard any rumors lately, let us know too, so we can dispel them or set them straight, as the case may be).

Both Sequential and Procyon are dedicated to supporting the Apple II - and this is we hope a great example of what we mean by support.
(PROCYON.INC, CAT20, TOP1, MSG:1/M645;1)

>>> WHAT'S NEW <<<

***************
I'm looking for a copy of "The Hitcher's Guide to the Galaxy"

That was a Infocom 8 bit text interface adventure game program. It may be in the "The Lost Treasures of Infocom" package that Big Red just released as a set of _20_ 16 bit GS specific, GS/OS compatible, hard drive installable programs.

Call them at (402) 379-4680. It's product BR93 and costs $59.95 (for 20 games, that is a cost of $3.00 _per_game_!)

BTW, every Apple II owner needs to join BRCC! They have some real deals on classic software (and members save at least a third of the cost on all but the new stuff), plus lots of great PD; shareware; freeware; etc. (M.MURLEY3, CAT4, TOP5, MSG:55/M645;1)

LAWRENCE PRODUCTIONS UNLEASHES

THE LOST TRIBE FOR THE APPLE IIGS GALESBURG, Michigan -- February 23, 1993 -- Lawrence Productions announces the release of their latest software creation, The Lost Tribe, a unique strategy game set in prehistoric times.

The Lost Tribe takes you back before recorded history where the eruption of Belchfire Mountain destroys your primitive village. You survive the disaster but the villages' ruler and his elite hunting party are killed. The elders choose you to lead the homeless tribe away from danger to an ancient homeland known only from legend. Your perilous journey will require strong leadership, strategy, and sound decision making.

Recommended for use at home and in social studies classes, children may work individually or in small groups. They must interpret ancient maps to plot their course, make judgment decisions of when and what to hunt, determine how often to rest and feed the tribe, and resolve the many conflicts that arise among the people.

Researching information from an on-screen encyclopedia, children can explore everything from the personalities of individual tribe members, the qualities of a successful leader to prehistoric animals, and much more.

The Lost Tribe has six challenging scenarios loaded with random events, over 80 photographs (using the 256 color mode of the GS), digitized music, cartoon animation, and an on-screen Prehistoric Guide to Survival with 100 entries.

For ages 8 and older, The Lost Tribe is distributed by Davidson & Associates and is also available direct from Lawrence Productions.

System Requirements:
Apple IIGS w/ a minimum of 1 MB of memory, System 5.0.4 or above, one 3.5" disk drive.

One of the following is recommended for ease of use:
   Hard drive or AppleShare Network.
   2 MB's of memory.
   Additional 3.5" drive.

ERGONOMIC MOUSE & KEYBOARD

The new Ergonomic Mouse and Keyboards will work just fine on a IIgs, though the Ergonomic Keyboard has a bunch of buttons on it that have no use to a IIgs user.

I've had an Ergonomic Mouse attached to the IIgs on my desk at work for about two weeks. My reactions to it are mixed. It's very usable, but I don't care much for the way the big button comes down along the sides a little bit. It makes it a bit awkward to pick up the mouse and reposition it while holding down the button. It may be because I have large hands, though. I normally grab the mouse on either side of the button while lifting it up, but this isn't feasible with the new mouse. It does fit very well in the hand, though. When doing fine detail work (like editing icons :) with the new mouse, you have to move the whole thing since the ball is now forward of the center, instead of near the back. This makes the position of the cursor on the screen and the position of the mouse on your desk correspond better to each other. With the old mouse doing detail work you could hold down the front of the mouse and twist the back around for fine left-right movements. You'd often get a little bit of up and down movement, as well, though. So, it's a tradeoff with the new mouse vs. the old one, overall. At home, I'm just going to stick with my old mouse, since that's what I'm used to. _ /-

At the opening of the new Apple Company Store on Wednesday I got a look and feel at the new Ergonomic Keyboard. This one I'll definitely pass on. It was awkward for me to type on, since with my long nails I don't actually feel the keys, and have to depend on their positions relative to each other. With the keyboard opening up and being variable it really threw me off. It also takes up a lot of desk space, even without the snap on palm rests, because when you open it up it makes an arc. With the palm rests it can end up taking up a square of desk space about one and a half feet on a side when opened up, NOT including the detached keypad.

I've got a single LC III in the lab. I'll see if I can throw in one of the IIe Cards I've got lying around into it on Monday, to see if it's any faster in IIe mode than the LC and LC II. I really hope so, because I also have an LC II on my desk, next to the GS (I've got a Mac IIci on the other side of it), with a IIe Card in it and it is dog slow. Seeing the IIgs running next to the LC II... well.... Let's just say that if the dealers had actually had IIgs's in the same configuration (memory, hard disk, monitor, etc.) next to LC IIs with IIe Cards in them on display, they would've sold a lot fewer Mac LC/LC IIs.

P.S. Has it been mentioned in here that the new Color Classic has the same slot in it as an LC/LC II, and can use the IIe Card, as well?

5th Annual KansasFest

Apple II's Sweet Sixteen

Last year's conference was such a rousing success that it made sense to continue the celebration this year with a Sweet Sixteen party. In the past, attendees have raved over the sessions but were equally (or even more) enthused over

(A2.LUNATIC, CAT5, TOP2, MSG:46/M645;1)
the prospect of staying up all night in the dormitory, partying and hacking around with their online buddies and/or Apple II hotshots.

More details will follow next month, but right now we can tell you that KansasFest will take place on Thursday and Friday, July 22-23. In an attempt to simplify our lives, we are returning to our original two-day format. Sessions should run the gamut from general information to high tech programming stuff.

Call Resource Central [1 (913) 469-6502] to make advanced reservations. Mark your calendars now and get ready to celebrate!

(A2.HANGTIME, CAT5, TOP2, MSG:50/M645;1)

Symbolix "1.8" Interim Release Shipping An updated version (interim release) of Symbolix is now available on request. Registered v1.7 owners can order this improved version from the address above. Because this is an undocumented release, THE UPGRADE COSTS ONLY US$5.00 INCL. POSTAGE (surface mail, registered). That's almost free of charge! Users of v1.7 will be able to use v1.8 right out of the box. It offers:

- true multitasking support (symbolic commands, 2D/3D graphs, recurrence formulae) with The Manager - Floating Point Engine support (superfast, direct 68881 access) for real functions - redesigned desktop interface - new, modeless online help (more than 50kB of text) - improved 2D module (selectable resolution, true proportion graphs)

Multitasking Symbolix 1.8 supports the recently introduced program switcher/ multifinder "The Manager" from Seven Hills/BrainStorm. Symbolix is the first, fully multitasking compatible commercial product (No Henrik, that was my ShadowDial! :)). All time consuming tasks (symbolic and graphic commands) can be interrupted at virtually any time. While you're switching and work with other programs, Symbolix continues processing a command. Symbolix plays a sample when a background task is complete. Since Symbolix uses only 3kB of zero page space, it is a very Manager-friendly application and compatible with virtually all programs that run under The Manager. To save even more memory, the help function has been rewritten (now modeless) and is completely disk-based. More strictly speaking, true multitasking is possible with the following commands:

- 3D graphs - 2D graphs - Expand - Collect - Simplify - Evaluate (recurrence formulae)

Two check boxes enable you to control Symbolix's behavior in a multitasking environment. You can turn off multitasking which accelerates the above commands whether it is running under The Manager or not. You can also specify how "intensively" (slow/fast) the six commands in question will be processed when operating in the background.

Floating Point Engine Speeds up real functions by ca. 60%-90% (real functions only). You will notice that 2D graphs appear much faster than before (sine: 4 seconds instead of 15s).

Disclaimer: because Innovative Systems is out of business, a technical problem could not be further tracked down. We have modified the code so that FPE-generated synch problems will be fixed on the fly. However, we cannot guarantee for obvious reasons that our patches will work on all
Apple II Computer Info

possible configurations.

Desktop Interface  See articles in the Symbolix Newsletters volume 2 and
3. Changes involve "3D buttons", new window
positions/colors, new online help, etc. The desktop has been redesigned by
a Symbolix user who works with this program almost daily. You'll notice
that all windows are there were you need them! Symbolix even closes and
opens windows automatically in some situations.

This limited offer for registered customers underlines Bright
Software's non- profit philosophy. Ordering your own copy is one of the
best _and_ smallest investments. Please forward your original program disk
and enclose US$5.00 - that's all there is to it.

ATTENTION:  - Don't forget to make a backup copy of version 1.7 before
mailing the disk! We'll delete all v1.7 files!
- This interim release is available from Bright Software
  Switzerland ONLY.

Customers who already sent us their disk will receive v1.8
automatically.  --Your Symbolix guys

** Specifications are subject to change without notice. **

The Manager is a trademark of Seven Hills Software Corp. MultiFinder
is a trademark of Apple Computer, Inc. Finder is a registered trademark of
Apple Computer, Inc. Floating Point Engine, FPE, Innovative Systems are

>>> THROUGH THE GRAPEVINE... <<<

From Barney Stone  Yo! (As we say here in Philly.) I'm still around, and
so are DB Master Professional, and Stone Edge
Technologies. Here's what's happening:

The shareware version of DB Master is no longer available from Stone
Edge, simply because I ran out of manuals, and don't get enough requests to
justify re-printing them.

I still have about 50 copies of DB Master Professional, and I'm
selling them for $100 (+$5 shipping) while they last (a few more months at
the rate they are crawling out the door).

Stone Edge (that is, me, since I'm the only one left, and yes, that
had to be on the phone, unless my wife picked it up by accident) is
keeping the doors open by doing general computer consulting -- PC, Mac,
Filemaker, MS Acces, DB Master Pro, Advanced DB Master (the MS-DOS
version), file conversions, Lantastic networks, etc. -- whatever I can pick
up.

I can be reached at (215) 641-1825 for any of the above purposes.

Oh, yes -- I still check in here every week or so for messages.
PS - If you call and get my answering machine, please include what you are calling about (ordering, tech support, consulting, etc.) in your message, and note that I only return tech support calls if you say I can call collect - an unfortunate by-product of current business conditions.

(DBM.BARNEY, CAT8, TOP2, MSG:38/M645;1)

PROTERM V3.0 News Release from the maker of ProTerm V3.0 -- Effective Immediately:

Because of potential tradename conflicts, the name of InSync Software, Inc. has been changed to InTrec Software, Inc.

All references to "InSync Software, Inc." will now be assumed to be a reference to "InTrec Software, Inc."

Only the name is changed. The corporation, the ownership, the location and the way business has been conducted as InSync Software, Inc. remains the same.

Greg Schaefer, V President
InTrec Software, Inc.
Formerly -
InSync Software, Inc.

(INSYNC.SW, CAT24, TOP1, MSG:2/M645;1)

IIGS A MISTAKE? You people ought to see the reactions I've been getting from people at Apple by having a couple dozen Apple IIGS's on racks running PaintWorks animations while idle. They run along the lines of "I didn't know a IIGS could do that!" "The animation is so smooth! How does it do that?" "Is that QuickTime?" "I didn't think the GS' resolution was that good." "Boy, they really missed out on a big opportunity by discontinuing that." "Can you use those on a Mac?" and the old favourite "What kind of Mac is that?" (://_/_\nd then having a Mac LC II with a IIe Card in it next to a IIGS really shows you how awkward and slow the Mac's emulation of a IIe is. You can say that they should have come out with the Mac LC instead of the IIGS, but it really wasn't possible back then. Even now, at best, the LC's emulation of a IIe is awkward. Looking at it another way: the Mac LC/LC II with a IIe Card emulates about the average Apple IIe in 1986, when the IIGS came out.

\//\aybe the IIGS was a mistake. Maybe they should have just stopped the line with the IIe. But think of how much fun and use we've gotten out of our IIGS's over the years! I've had enough that my IIGS has more than paid for itself since I bought it -- $1000 for the CPU alone in October, 1986, one month after its release.

(A2.LUNATIC, CAT2, TOP5, MSG:173/M645;1)

>>> HOT TOPICS <<<

WHAT IF... If Apple had released a IIe-compatible color Mac INSTEAD of the IIGS, there would have been a true upgrade path to the Mac.
Now, instead, we have the IIGS, which looks a little bit like a Mac but isn't, and we have a Mac IIe card which does not give IIGS owners a real upgrade path.

Apple no doubt found the IIGS extremely difficult to market. Obviously, their future plans all hinged on the Macintosh, yet with the release of the IIGS they found themselves saying, no, wait, the Macintosh is NOT our sole future direction. The machine had a split personality (classic Apple II mode and a not-quite-Mac Desktop mode) -- like the Commodore 128 only mo' better and more seamlessly integrated. In demos, it LOOKED like it was a Macintosh (in fact, the case and keyboard even resembled a small Mac II), yet, for years, it thought Mac disks were blank.

I maintain that if Apple had released a Mac that could run Apple II software INSTEAD OF the IIGS, they wouldn't have the problem they have now. That problem is a commitment to support a machine that does not, and never did, have a place in their grand design. The problem is 1.5 million users who demand this support and are p*ssed off at Apple for "abandoning" the machine. The problem, in short, is a non-Mac computer that Apple started producing long after they had decided that the Mac was their future.

It's a pretty decent machine, and it's a lot of fun, but I can hardly blame Apple for their confusion about what they should do with it. (And their confusion is obvious. They never advertised the machine, yet they spent huge amounts of efforts on things like System 6. One action seems virtually "evil," the other is clearly "good." I think Apple's continuing support for the machine is astonishing, frankly.

If Apple had never made the IIGS and had instead focused on a low-cost Mac that could run IIe software, most of you IIGS users would be using Macs RIGHT NOW. And most would like the Mac as much as they like the IIGS.

Wellllll, I don't know about that. I didn't upgrade from the II+ to the IIE. I waited around until I saw something that made it worth my while to upgrade. The superior (to my existing II+) graphics and especially the sound of the IIgs turned my head. I wanted color graphics and stereo sound long before the Mac's ever offered either. Think back to the days of the IIgs introduction. There was nary a color Mac to be found. And to this day, no personal computer under $3000 offers better stereo sound out of the box. Add to this the fact that I was not too much taken with the desktop metaphor until much later, and I come to the conclusion that _I_ would not have purchased a low-end Mac instead of the IIgs.

I still enjoy a text-only interface at times (ProSel is my startup program) and I like my home computer to be as cheap as possible. This saves more money for productivity software, games and magazines. :)

I know that some of us have seen this type of argument and griping over and over again. However, many GENie subscribers have never had the chance to express themselves in this type of forum before. I fully support the right of anyone to "wail at the wall" for awhile. It sometimes helps to just get things off of your chest. Most Apple II owners have felt like the earlier posting by J.AMBURGEY at one time or other. By all means, release a little frustration in this forum if it makes you feel better.

Speaking for myself, I have given up feeling angry at Apple computer. (It never did any good anyway.) As a matter of fact, I have even managed
to generate a little good will toward them with the continued support of
Apple II system software such as GS/OS version 6.x.
(D.RAINES, CAT2, TOP5, MSG:45/M645;1)

>>> MESSAGE SPOTLIGHT <<<

Category 11,                                         Topic 16
Message 246                                  Tue Mar 16, 1993
A2.LUNATIC [Lunatic]                             at 06:13 EST

][ think we need to get a few things cleared up, here. There are
three categories of terms we are using, and it's easy to start getting them
confused. They break down like this:

A) Double Density, High Density, Floptical (Very High Density?), etc.
B) GCR, MFM, and RLL (Floptical)
C) ProDOS, HFS, MS-DOS, etc.

Each one of these categories is completely separate from the others.
A formatted 3.5" disk has one attribute from each category.

Category A is the type of diskette (media). Category B is the type
of LOW-LEVEL format. Category C is the type of HIGH-LEVEL format. Any one
of the options in each category has the ability to be mixed with any of the
options from the other categories. Some of the combinations you will
simply never see, though. Here are some of the most common combinations,
and what you get as a result:

1) Double Density + GCR + ProDOS = 800K disk
2) Double Density + GCR + HFS  = 800K disk
3) Double Density + MFM + MS-DOS = 720K disk
4) High Density + GCR + ProDOS  = 1600K disk (old AE HD drives ONLY)
5) High Density + MFM + ProDOS  = 1400K disk
6) High Density + MFM + HFS   = 1400K disk
7) High Density + MFM + MS-DOS = 1400K disk
8) Floptical + RLL + ProDOS    = 21 MB disk
9) Floptical + RLL + HFS      = 21 MB disk
10) Floptical + RLL + MS-DOS   = 21 MB disk

|\low, a regular Apple 3.5 drive can handle 1 and 2 only (unless it's
hooked up to a PCT, but that's another story...). The Apple 3.5 drive is
Double Density only, and GCR only. _\-
\nApple SuperDrive + SuperDrive
Controller Card can handle 1, 2, 3, 5, 6, and 7. The Apple SuperDrive is
Double Density _or_ High Density, and GCR _or_ MFM compatible. In High
Density mode it only supports MFM, though. _\-
\ Floptical drive is
supposed to support Double Density, High Density, and Floptical media, in
MFM and Floptical formats only. Looking at the list, this means it
supports 3, 5, 6, 7, 8, 9, and 10. In addition, a Floptical drive supports
Double Density + MFM + ProDOS or HFS, which should give you:

11) Double Density + MFM + ProDOS = 720K disk (apparently only 668K)
12) Double Density + MFM + HFS  = 720K disk (true size: ?)

I suspect that when the RamFAST was used to (low-level) format the
Double Density disks in J-Bird's tests, it put a SCSI partition map on the
disks, which ate up some K, only giving him 668K of free space. J-Bird,
what version of the RamFAST ROM do you have? Later versions (3.00j and up) are supposed to correct this.

\/
|es, from the numbers above you might guess that you could do Double Density + GCR + MS-DOS to give you an 800K MS-DOS disk. Well, technically it's possible, yes. Unless the PCT can do it, though, I don't know of any drive/software combination that will give you a disk like that. There would be little point, though, since the whole MS-DOS world uses MFM. _ (_h yeah, one more format I haven't mentioned, which isn't really relevant here since I've never seen any Apple equipment support it, is Extra High Density, or ED/EHD. These disks are capable of double the storage of High Density, which would most commonly be 2.8 MB.

\\(\)hile I'm at it, I'll mention that it is generally regarded as a mistake that Apple chose GCR for its Double Density 3.5" drives/disks, instead of MFM. While GCR stores a bit more information than standard MFM, it's also considerably less reliable, and tends to give mass disk duplicators headaches. _ (_| finally, (am I _ever_ going to stop?? :) the Amiga uses a non-standard type of MFM which gives it 880K per disk. I've heard that they have a considerable number of reliability problems with that format, though. (If someone tells you that the Amiga simply uses unformatted diskettes to get so much space, don't believe them. A totally unformatted Double Density disk should actually store as much as 1 MB.)

(a new annual event)

ANNOUNCING THE BANANA PC
"""" In a new product announcement made to an audience of PC industry pundits that were
waiting with baited breath, the Banana PC was introduced with a host of novel features and a price tag that will get some attention. The projected price of the new computer: $1.59 per pound!

This new PC has a number of unique features that will put it on the top of every Christmas shoppers list. The Banana PC is scheduled for volume production starting in October. Its leading feature is the bright yellow color of the exterior plastic. The small, infrequent black spots do a lot to make the PC resemble its namesake in the fruit world.

In addition to its sporty new color, this computer comes complete with the new and improved Banana Operating System Software (BOSS). With the BOSS installed in your new computer, you can realize some new generation commands that have never been available on a personal computer before. For example, the new command CONF will cause the PC to tie up your phone line and be unavailable for about two hours time (this feature requires an optional phone connection).

Many users will enjoy the new "Aroma feature". Scratching the plastic case of the keyboard will produce the smell of ripening bananas for the enjoyment of the happy typist.

Something completely new with this computer is the addition of robotics in the form of legs and feet. This new feature allows the computer to serve in a useful capacity as waiter when the aspiring programmer would like a beer or Mountain Dew from the refrigerator. However, the manufacturer does not warrant possible damage or loss from the computer drinking said beverage.

Another key feature for this product is the removal of annoying peripherals from the system. Never again will a user have to worry about noisy printers, clunky disk drives or space-consuming hard drives. The Banana PC eschews such nonsensical devices and any perceived benefits from them. An opening in the front of the computer, resembling an old style floppy drive, is just an esthetic feature to make users of older systems feel at home. It also serves as the exhaust vent for the new "Aroma feature" and the enhanced voice synthesis hardware.

Not to be outdone by older technology computers made by other "fruit" companies, the Banana PC has the latest advances in voice synthesis and recognition. Short training sessions with a microphone, yourself and a loved one will have the new computer ready to go. At this point, it will recognize your voice, ignore your verbal commands, and insult you in a voice that you are used to hearing every day.

BOSS OPERATING SYSTEM FEATURES With the advent of fifth generation software for your home computer, the newest system software will have many new features never found on computers before. A new filing system makes its debut with the Banana PC: Magical Envelope Storage System (MESS). With this filing system, every file created will be instantly lost in the mass storage area. You will never have to worry about where you put a file again. No longer will you have to dig through layer after layer of file folders. With MESS, you start out with lost files. Industry experts are amazed at this time-saving new feature.

Another break-through in computer power is the built-in software contained on the Banana PC. An integrated Word Processing Suite is
Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 640 of 1824

available in ROM (Read-Only Memory). 15 different Word Processors are available at the touch of a key. Each of the Word Processors is able to exchange data with the others (common clipboard). You can even load files directly into any of the 15 different programs without converting file formats. Use the Programmer's WP for those coding tasks. Then switch over to the Document WP for the instructions that go with your code. Finally, jump to the Note WP to write down those ideas that come to you while working. You may never need to buy another Word Processor again! Editor's note: We were unable to run more than one of the Word Processors at a time without expanding the 64 Meg memory of the base system. Our best recommendation is to go ahead and get about 1 Gig of memory to start with. That should last you at least a year, until lazy software manufacturers catch up with that memory standard. [other editor's note: What?]

Parent Company and Availability Banana Computer, Ink. was formed to develop and market this new computer in 1990. S. Sboj and S. Kainzow are the founders of the company. The initial stock offering for Banana Computer, amazingly enough, coincided with the announcement of the new PC. Stock prices have been soaring with the initial market acceptance and advance orders.

Most corporate buyers of computers are concerned about purchasing computers that are not at the leading edge of market technology. These same buyers can purchase the Banana PC with confidence. It is guaranteed to be old technology by the time it actually shows up at your office. Banana Computer is firmly committed to making product announcements so far in advance of delivery, that they will have announced the successor to a computer BEFORE the computer itself is ever rolled off the assembly line. One inside source at Banana Computer has been identified and asked to comment on the mighty feature list indicated earlier in this story. "Yeah, right", the engineer exclaimed. While asking for anonymity, the source went on to say that "it would be nice if we could get the darn thing to power on without burning out chips before the announced delivery date". However, this newsletter is not trying to cast a disparaging light on official company spokesmen. [Heh, heh. Oops.]

Banana PC's will be distributed through Sears stores nation-wide. You can place advance orders by sending a certified check directly to any Sears store or the computer manufacturer. When asked about Sears participation in home computer sales, a local store official remarked: "Why not, nothing else is selling in here."

REFLECTIONS /
//////////////////////////////////////////////////////////////////////////////////////
Basic Shareware Etiquette

By Phil Shapiro

[P.SHAPIRO1]
As shareware becomes an increasingly popular channel for software distribution, it seems fitting and appropriate at this time to review some of the basics of shareware etiquette. As your mother so often told you as a child, the rules of shareware etiquette apply equally to both shareware users and shareware creators. Good manners and thoughtful behavior have a uniquely wonderful reciprocality to them.

Shareware etiquette starts with the shareware creator. Creators have the obligation of politely informing shareware users that the software they are using is being distributed on a try-before-you-buy basis. Shareware notices should be concise and pleasantly phrased. It's entirely appropriate to give tactful hints that further goodies await the kind souls who send in the requested shareware fee. Please note that "starving college student" humor can be acceptable if it's truthful, sincere, and tasteful. Brevity, as always, is a must.

On the other side of the table, shareware users have the duty of pleasantly reading the pleasantly phrased shareware notice. They have the further duty of pleasantly understanding what the tactful and thoughtful shareware message is saying.

Customarily, shareware users are granted two weeks to try out shareware programs. If, after that time, they find the particular shareware program does not meet their current needs, they have the duty of pleasantly and thoughtfully formatting the floppy disk containing the shareware. In the case of hard drive users, they have the duty of removing the shareware entirely from their hard drive system.

Should they decide to keep, cherish, and foster the shareware, they have the duty of sending in the shareware fee along with a suitably brief but heartfelt expression of their gratitude and appreciation.

When sending in the requested shareware fee, shareware users are given generous opportunities to earn extra-credit etiquette points. Extra-credit etiquette points can be earned by including: 1) Suggested enhancements for possible future versions of the shareware; 2) Ideas for new shareware disks, and, 3) A self-address stamped envelope. To earn admiration far and beyond the call of standard shareware etiquette, a stamped, self-addressed floppy mailer might be included.

Kindly take note that shareware etiquette does not end with the shareware fee being sent. Far from it. Upon receipt of the shareware fee, the shareware creator has the duty of sending a timely, appropriately phrased expression of gratitude. This expression of thanks need not exceed two typed paragraphs. But at least two to three sentences must address the particular comments included in the shareware user's letters. Shareware etiquette frowns seriously upon the unchivalrous sending of mail-merged form letters.

It's appropriate for shareware creators to express in their own words how meaningful it is to them to have their faith in humanity renewed by the kind and thoughtful sending of the requested shareware fee. Please -- no gushing sentiments, though.

The sending of extra software goodies to the shareware user is entirely within the impeccable discretion of the shareware creator. But here again, extra-credit etiquette points can be earned by going above and beyond the call of duty. By sending extra software goodies, shareware creators
creators can help perpetuate a spiral of goodwill resonating out in ever widening circles of trust and charity.

Please be aware that special etiquette rules apply to educational shareware programs. If such shareware is being used primarily by children, then the rules of shareware etiquette dictate that the children themselves should write the thank-you letter accompanying the requested shareware fee. Handwritten letters carry far more meaning than typed letters in these circumstances. As usual, the expressions of gratitude needs to be both heartfelt and brief. Handwriting, as usual, should be the child's very best. Black or blue-black ink on white lined paper, thank you.

The rules of shareware etiquette have not fully developed to address the question of what happens if the shareware fee letter is returned as being undeliverable. We live in such a mobile society that such eventualities happen far too often. In such cases, the kind and considerate shareware user has an obligation to make reasonable efforts to track down the shareware creator. Polite inquiries directed to one's local users group, or on the national information services, are entirely appropriate.

If reasonable efforts are unable to reveal the current address of the shareware creator, a fitting course of action is to donate the money from the returned shareware fee to a deserving local charity. In that way the goodwill generated by the initial shareware creator continues to live on in some other form.

By following the basic rules of shareware etiquette yourself, you can feel ennobled by your own role in carrying on a tradition that has served computer users for several hundred years. How very fortunate we all are for the shareware traditions our forefathers and foremothers passed along to us in the early days of microcomputers.

-Phil Shapiro

>>> UNLOCKING THE MYSTIQUE OF THE REAL TIME CONFERENCE <<<

Ever wanted to talk to your favorite software author, or visit with gurus in your area of interest? Ever wanted to chat with your fellow Apple, IBM, or Atari users, or with people that share your interest in the environment, family matters, government interests or any other interest you can dream of?

On GEnie’s Real Time Conferences (RTC) these wishes can come true. Nearly every special interest area within GEnie has their own Real Time Conferences.

What is a RTC? Well, imagine anywhere from 2 to 102 people sitting at separate computers in cities and towns all across the country. At exactly 7:30 EST, they all logon to GEnie and go to an electronic "conference room". In this conference room, every message that they type on their computer keyboards is instantaneously transmitted to every other person in the room. Conversations turn this way and that as the various individuals add their ideas and thoughts to the discussion at hand. This free-wheeling exchange of ideas is an RTC.

There are so many advantages to online RTC's, it'll be hard to list them here. For instance you don't have to travel halfway around the world to talk to a special speaker in Tim Buk Tu: you don't even have to dress up (that is, until we get "computervision" <grin>). You won't have to buck Mother Nature or the traffic to get in touch with your favorite software guru, either.

We have lots of fun in the RTC's. Generally almost anything goes – discussions that may start about a hard drive might end up debating the pros and cons of crime and punishment. A spiel on AppleWorks might wind up ending in a discussion of governmental ills. Actually, craziness is NOT a detriment to an RTC. It is encouraged.

In our A2 RTC's, we've managed at some time or other to solve the problems of crime and punishment, ruminate the philosophy of good and evil, and extol the benefits of national health care. We've even managed to sandwich in discussions about Appleworks, recalcitrant hard drives, GEM, and other knotty technical problems.

Shy? Don't be. One of the beauties of the RTC is that no one can see you. This can also be a drawback, for no one can read your body language. However, this barrier has been overcome with an ingenious series of
expressions. Below are just a few to help you get started:

:), :-)) or variations indicate a smile
:( says you're sad or unhappy
:P is sticking out your tongue at someone
:/ is puzzled
X-) indicated "crossed eyes"

You can be as creative as you want. I've only mentioned a mere few of the expressions you can use to indicate your mood. Also, there are several shorthand expressions that we use:

IMHO = for In My Humble Opinion
BTW = By The Way
ROFL = Rolling On The Floor Laughing
LOL = Laughing Out Loud

Again, these are just a few of the shorthands that RTC'ers use to make typing easier and faster.

You've read all about RTC's, and want to participate in an RTC? It's simple. From the main menu, when you first come into GEnie, type either mXXX;2, with XXX being the page number of the areas main menu (i.e., for A2, you'd type m645;2), or type the keyword (i.e., A2) followed by selecting menu choice number 2, and you will shortly see this:

GEnie                         Page 645;2
                        Apple II Real-Time Conference
                        Version 3.12

(In this space will either be a message indicating no users in the RTC or one indicating a room number(s) with the number of users in the room(s))

Address of <G.SAIKIN> will be used.
What ROOM (1-3), or <Q>uit>

If you get the message "No users in RTC," that means that no one is here yet, or there is no conference being held. However, if you get the message indicating a room number and number of users in it, a conference is in session. Then, you choose the number of the room with people in it, by typing 1, 2 or 3 at the prompt. Afterwards, you'll see this message:

** <G.SAIKIN> is here.

Ok, now you've managed to get into the conference room. Suddenly, you not only find that you may not be able to see what you're typing, but people seem to type right over you. This is a common event in every newcomer's premier appearance in an RTC. Don't dismay. This can be simply remedied by putting your comm program in either full duplex AND chat mode or at the very least, half-duplex and chat mode. Then, you'll not only see what YOU are typing, but you'll be able to sort out your typing from the other guy's, because your typing will show up below a dotted or solid line. Easy, wasn't it? Each comm program has their on special terminology and ways of setting for split-screen chat, and if you don't know how to set your comm program, ask when you get into the RTC. Someone will likely be able to help you.
We can't forget your name. Nicknames can be as simple as your first name, or as creative as S.O.F.H. (Sysops from Hell), or my favorite, Binary Bear. To identify yourself to your fellow RTC'ers, simply type /NAME XXXX, with XXXX being your name or nickname. Many RTC'ers change their nicknames throughout the conference to echo their current mood (for instance, one night we were talking about the fate of Apple, and a disgruntled RTC'er called himself "FireScully")

Now, you're really into the flow of the conversation, and someone you know pops in. You want to talk to him, but you don't want everyone else to hear the latest gossip you want to tell him. This is simple. First of all, type /USERS to list the job numbers of every person. Now type /SEND XX, with XX being your friend's job number. At this point, only your friend will see what you're saying. If it's going to be a long and involved conversation; and your friend doesn't mind getting dragged away from the mainstream, you can meet him in private, by typing /PRI XX, with XX being his job number.

Most of the time, an RTC is a study in organized confusion and you can just pop in with your ideas, your philosophies, and of course, your jokes, for what would an RTC be without laughter? In the more formal conferences which normally have formal guest speakers, the RTC host will probably put the room into a listen only mode - that means you have to remember back to your school days, and /RAISE your hand (by typing /RAISE) to be called upon. (BTW, you don't have to raise your hand to be excused from the room – just simply type AFK for Away From Keyboard, but remember to type BAK when you return, so we know your back.)

Below is a schedule of the A2 RTC's. As mentioned below, there is a theme for each night, but don't let that sway you. Come on in anyway - even if you come in on Wednesday, where we discuss Hypermedia stuff, and have a question about GEM, you'll more than likely find someone that will be able to solve your problem. The only night where there may be some formality is on Tuesday nights. However, don't be shy to pop in anyway - if there is no special speaker, the RTC will be open to any discussions.

A2 Weekly Schedule
------------------
Sun 1200 ET   Kids RTC   Host: Gena Saikin
Sun 2130 ET   II Speak  Host: Don Arrowsmith
Mon 2130 ET   New Users  Host: Tara Dillinger
Tue 2130 ET   Formal Guest Host: Susan
Wed 2130 ET   Hypermedia Host: HangTime
Thu 2130 ET   TBC Forum  Host: Mike Garvey
Fri 2130 ET   Telecommunications Host: Jim Zajkowski
Sat 2130 ET   Games     Host: Dave Ciotti

Formal Conferences:
(Tuesdays, 2130 EDT, 1830 PDT, Room 3)
IMHO, I think I've pretty much covered the basics. Oops, I forgot to tell you how to get out of the RTC at the end (or when you decide your bill has reached it's limit - or your mom or spouse has threatened to hang you up if you don't get out). Type /EXIT to leave the room and go into other areas of GENie. There are, however, other ways of leaving the RTC area. You can type /BYE, and that will log you off GENie, just like in any other area. You can even move to another room (/ROO X, with X being the room number). You can also move to another page or area (/MOVe 200;9 or /MOV CHAT).

Remember, in the RTC, to move to another area, exit or say bye, you'll have to use the first three letters of the command (EXI, MOV, BYE) with a forward slash before it (/). This is true of most RTC commands.

Hopefully, this article has eased the nervousness that most first-time users experience with a RTC. I didn't want to be too technical in this first article, but wanted to give just a thumbnail sketch to get you started in the wonderful world of Real Time Conferencing. Don't be shy, jump in. We will be looking for you soon.

P.S. I snuck a few shorthands in the last part of this article to see if you could remember what they meant. How did you do? You must be ready for an A2 RTC.

~/QWIK_QUOTE~/

"Yep! I use to think I 'knew' a little something about 'puters, /
that was until I met some of the folks here on GENie... Wow!! :) /

Every year at this time, I report on the activities of a group that has been shamelessly ignored by the mass media. It's the International Substandards Organization, which has been setting substandards for consumer electronics in all member countries for decades.

The ISO is a powerful organization, and its decisions affect all of us. It was the ISO, for example, that ordered Sony and JVC to manufacture two competing vide-recording methods, Beta and VHS, and the ISO was also behind the unsuccessful marketing of four-channel sound on LP records in the 1970s. (A proposed ISO slogan, "Bad Sound All Around," never made it into print, however.)

This year's ISO conference was held, as usual, in secret, but I have obtained minutes of the session from an American delegate. The full conference report was to be made public on the first day of April, but the inevitable delays of translating from Sanskrit to other languages may keep
the report from public view again this year. So here is an exclusive account.

According to documents left on one of the coffee tables at the conference, chief among the concerns of ISO members from the United States and Japan is the need to secure faster computing speed in the latest generation of personal computers.

Early personal computers worked at what by current standards could be called a slow "clock rate." Computer designers worked hard to speed up the "clock" in these computers, and were quite successful.

But as computing speed increased, it became increasingly clear that computer chips could not be speeded up past a certain point -- that point being, as all school children know, the speed of light.

In their debate over this issue, delegates from ISO's member nations said design engineers had reached the limits of their know-how, and one delegate told the group "it was time nature did something to help us out for a change."

The delegate then proposed changing the speed of light to a more useful figure, and his motion was approved without dissent. The change is to take place immediately. The ISO then renamed the existing units for measuring the speed of light, and came up with these terms instead:

Present speed of light: 55 megaphotons per candlestick.

Proposed speed of light: 65 megaphotons per candlestick.

My source said many delegates had refused to approve the higher limit until they were assured that it was to be allowed only in those chips that were uncongested. Chips used in urban computers will continue to follow the older limit.

He added that the first computers designed to use the higher "natural" clock speed should appear this fall. Intel, maker of most of the chips used in IBM-compatible PCs, is expected to market the new design under the "Pent Up" trade name.

On another topic, a proposal to ban black-and-white televisions from the market was narrowly defeated after complaints from manufacturers of pocket sets, who said color models that will replace the tiny B/W sets are not yet readily available.

The ISO is expected to vote again on the ban next year. The ISO's opposition to B/W sets is based on medical evidence that deprivation of color leads to deep-seated ambivalence. ISO members have been of two minds about the issue for some time.

Another change that the ISO turned down would have allowed sales personnel at hi-fi shops to implant newly developed bone-conduction headphones on customers. ISO members said most hi-fi store employees do not have the experience needed to perform the implantation, in which a tiny loudspeaker is sutured under the skin behind each ear.

"The sales people at the store I go to can't even find a 6- by 9-inch speaker in a box full of parts," one ISO delegate reportedly said. "How am
I supposed to trust them with a surgeon's knife alongside some customer's head?"

The issue will come up again next year. Health authorities in some countries have already said they are opposed to the implants, unless they are performed by doctors who know something about hi-fi.

Otherwise, the ISO's yearly meeting was dull and routine. Members voted to ban "boom boxes" from all public streets in affiliated countries, and a measure to require copy-protection devices on the liner notes of recordings was approved unanimously; apparently, a strontium-90 insert at the edge of each record jacket and CD liner card will disable Xerox-type copiers permanently.

That's my report on the ISO's annual session. Please do not ask me for more information, as I have told you more than I know already.

"A Whole Buncha Milliseconds with Mark"
by Mark Quinn, DOA
GEnie address: NEWSIE

Ah, the life of the modern American man. We're sent out on midnight missions to Blockbuster Video for the latest 'Schwarzeneggar flambes Rambo' movie. We lie there in our robes and wife's/girlfriend's bunny slippers, the remote control territorially perched on our bellies.

I'm not sitting down at this word processor to condemn the above lifestyle. Everyone deserves time to kick back in front of the tube after a hard day's work making large piles of paper into small ones. It is all too easy to lob brickbats at the 'establishment'. Which reminds me of the time (hyuck) I stood behind a car in the parking lot of _my_ local BlockBuster Video store staring agape at a bumper sticker that read "Shoot Your TV". I heard no weapons discharging close by. Maybe the joke was on me, and the TV killers were carrying compound bows.
By now, you have probably sensed that I _like_ these toys. I do. I drooled over the Apple, the Atari 800, and the Macintosh fruitlessly; I was unable to Koff up the Kash for any of the three. I ended up with a 4K Color Computer that was soon upgraded to 32K. (Yawn. Yes, we all remember the time when we saw the potential of the PC, and that little red LED flashed above our heads and sent out its evil, MasterCard- melting rays. And from that point on, we were happily-ensnared techno drones, or we were The Liberated -- I guess your outlook determines which category you fall into.)

I've seen too many examples (in the media and in real life) of technology helping the handicapped, mentally dysfunctional, etc., etc., to join the "Shoot Your Wang" crowd. True, we're just scratching the surface of the virtual pond, but the years ahead should be exciting ones.

No, that last sentence should read "will be exciting ones". So, crank up the Sound Blaster and the surround sound, but not too high: save your ears and eyes and mind for the ride ahead.

By Darrel Raines

"Out of This World" draws its name from the extraterrestrial setting of this action/adventure game. The cinematic quality of this particular game makes it much more of a science fiction movie than any of the productions by the now defunct CinemaWare Inc. You can best describe the long introduction and even the events that follow in the game itself to be equal to about an hours worth of entertainment at the theater. However, you don't think that you will get to just sit there and enjoy the computer making pretty pictures do you? You were hoping not, right? Good, because you are up to your elbows in tough problems with this nifty game.

Life starts off pretty much as normal for you, an average, run-of-the-mill, physicist working one night with the particle accelerator. The new computer system that the boss installed a week ago makes running new experiments as easy as programming. You are about to start a new set of accelerator runs, when something bad happens. Lightning is good for more than just making Frankenstein's creature into a monster: it can also have dire effects on certain particles during extreme acceleration. You may have discovered anti-matter before there are containment fields for it! Big problem.

There's really no time to worry about anti-matter right now, though. Because you have been sent spinning "out of this world". It would be nice to just sit around and look at the new alien lands cape for a while. But the local flora and fauna have other things in mind. This game will have
you racing from one screen full of problems to the next while trying to figure out action puzzles along the way. You will not have time to sit back and enjoy the dazzling graphics, since to do so will ensure almost instant death for your character.

Time out for observations. This game, for me, was an immediate throw-back to one of its recent ancestors in the Apple IIgs software market: The Immortal. The Immortal introduced action gaming to the IIgs world in much the same fashion as the video arcade game "Dragon's Lair". For each of the games in the lineage, the main objective is for the player to make a series of correct choices with a joystick and buttons. These decisions are in the form of paths to take, jumps to make (and when to make them), sword swings, lever presses, and many other actions. The main character in the story will take these actions, at your command, and the story will illustrate the effects on the main character, his surroundings, and the other characters.

In a video game, the player loses his chance to play when we makes too many wrong decisions and loses his last "life". If a new coin is placed in the slot in the allotted time, then the player is allowed to continue from the last successful choice made in the game. The computer game equivalent of this feature is the "passcode". At certain points in the game, passcodes are given out to let you know that you have completed certain obstacles. Then, when you lose your characters "life" later in the game, you can start over at the last point indicated by your best passcode. This same feature allows you to start the next day at the same place, without having to complete everything done correctly to this point.

As I stated earlier, all of these games have very common features concerning game play and passcodes. However, there is one feature that distinguishes "Out of This World" from any other computer game that I have ever played: Graphics. The graphic's style used in this game is called polygon-fill. The idea is that the shape of an object is mapped to the screen coordinates and filled in to form visually "solid" objects. Bit-map, size-specific, graphics (like the ones used in "The Immortal") can render more detailed objects than are usually obtainable with polygon-fill graphic techniques.

And the graphics in this game are definitely less detailed than those in "The Immortal". However, the big strength of polygon-fill graphic techniques are used for some nice effects in this game. You see, the mapping process can let you vary the size of the objects that are being drawn. Therefore, you can vary the size of the "picture screen" that you are using for the "science fiction movie" to be anywhere from full monitor to quarter monitor in height and width.

This variance in screen size can be used to good effect when you have a game as complex as this one. The various sizes can be used depending on how much acceleration that your computer has. A distaste on the part of the player for slow computer response to commands would be a major reason for choosing a smaller screen size. Whatever your reason for choosing, the choice exists at all, only because of the technology behind the graphic techniques. I believe that you will enjoy the results. Above all, the graphic style probably aids in the overall effect that is maintained of an "other-worldly" experience.

Back to our story. This game sets new standards for action games in that you do not simply kill everything in sight to win. Certain characters
in the story will help you. Of course, most of the other characters are out to get your hide, but still, some of them are willing to be buddies. There are many puzzles in this game. Most of them will require some amount of joystick jockeying. Some will require a bit of cerebral exercise. Some will require a little bit of luck. A very few are ridiculously hard.

I had less trouble with this game than some of the others that I have tried in this vein. I figured out most of the puzzles without any help. However, I recommend a cheat sheet, a friend who has completed this game, or an online service to help you keep your sanity. After trying 50 different approaches to a problem and feeling certain that I have tried every angle, it is better to have some help on the problem than it would be to set the game aside unfinished. So you will want help available without having to go too far for it. I will offer one small hint. You will not get very far in this game unless you learn how to use a gun very well. Hint: The gun will perform different functions depending on how long you hold the trigger!

It is time for our assessment. I found this game very engrossing. It has a very original idea that is presented in a fresh style. The polygon-fill graphics are a leading edge technology that push your IIgs to new limits for a computer game. The storyline kept me guessing and wanting more. Even after the final credits, you will be wanting more and more from this fascinating plot. Highest ratings go for this facet of the game.

One of the drawbacks to paying a lot of money for a game like this one will be its long term playability. I finished the game in about a week. I spent probably about 30-40 hours actual play time. Once you have watched a movie, you are not likely to want to see it again anytime soon. The same holds true for this game. I will pull it out a few more times to relive the experience, but I will not get a lot more value from my investment. This is simply something to be aware of with any action/adventure game. I have not played Wizardry I since the first time I finished it, and will in all probability never get it out again. Such is the nature of the experience. This is not an unexpected detriment for a game of this genre. I simply mention it for completeness in this review.

The puzzles in this game are fairly difficult. The puzzles are actually not quite as hard as some I have seen in similar games. The joystick maneuvering is more difficult than what I have seen in similar games. Therefore, the average couch potato will have some difficulty in getting past some of the obstacles. This will be a serious impediment to a few game players. If you are a below average joystick jockey, then you may be very frustrated with this game.

The manuals (if you can call them that) are extremely minimal. However, this is not a bad thing. The minimum of instructions that are printed in the introduction material is sufficient to get you started. The rest of the information that you need will be learned along the way. Therefore, I would rate the documentation as adequate and appropriate for the type of game.

This game is also addicting. I had to keep playing the week that I purchased it, until I had finally won the game. I warn first-time players: make sure that you have some free time coming up. You may be tempted to drop everything else for a while after you start playing this game.

Nit-picking point: Some of the passcode points are far between in the
game. You may have to complete a number of perfectly timed jumps, a few well placed shots from your gun, and a few other gyrations with the joystick to reach the next checkpoint. Any slight mistake in this sequence will mean that you have to start from the last passcode point. Again. Frustration will build in a situation like this and you will still be unable to proceed in the game. The only solution is to take a break and try again at a later time.

Overall evaluation: This game is "Out of This World".

Specifications:
"Out of This World"
Produced by Interplay

System Requirements:
Apple IIgs with at least 1 Meg of memory
One 3.5" disk drive
GSOS version 5.0.4 or later

Recommended:
Hard drive (installable)
Accelerator card

Distributed by Big Red Apple Computer Club
Suggested price:
$49.95

///////////////// GEnie_QWIK_QUOTE //////
/ "A prediction: In nine months or less there will a plastic /
/ version of the popsicle stick idea, called something like /
/ "DeskAlign", selling for $14.95 or more. Just watch the /
/ back pages of MacWorld and see. It'll be somewhere near /
/ the refill kits. :-)"

Who's Who In Apple II

>>> WHO'S WHO <<<

~ Introducing the GEnieLamp A2 Staff ~

In lieu of an interview this month, we turn our microphones off and give you a little background information on the various staff members that write each month's articles for this newsletter. You probably don't know too much about us, so we thought that we would take this opportunity to introduce ourselves. Hopefully, this will provide our readers with some additional insight into the editors and writers that bring you monthly information on GEnie.

Darrel Raines
- Editor for A2 edition of GEnieLamp

I have been using Apple II personal computers for over 11 years now. It all began back in my first
job out of college. I graduated Texas A&M with an Electrical Engineering degree in 1982. We used Apples around the workplace for various tasks, including pressure chamber control and temperature measurement. I liked what I saw with the Apple II and bought one for use in the home. My wife wrote her master's thesis on the II+ using AppleWriter.

I skipped the IIe and IIc with my jump to the Apple IIgs computer in early 1987 (income tax refund). Since the company I was working for at the time did not use Apple II's, I began to write shareware, freeware, and commercial software for the Apple II line of computers. Once conflict of interest was removed as a possibility, I have run a small business on my home computers for over 4 years. I write custom software, consult for other business computer users, create and build custom hardware, and write articles for various publications. Did I mention that I gather great enjoyment from my hobby/business?

In mid-1989, I was hired by CAE-Link to work in Houston, Texas, on the Space Station Freedom (SSF) simulation project. (Actually, I spent more than a year working on F-16 simulators before I moved over to the space side of business.) I am currently a contractor working for NASA on this wonderful project. Write your congressional representative early and often to endorse the money that the United States spends on research projects like the Space Station. This is one of the few government projects that actually ends up saving taxpayer money over the long haul.

Since moving to Houston, I have been a regular GEnie user. I started writing articles for GEnieLamp early in 1992. When Tom Schmitz (my predecessor) was forced to resign his position due to job pressures, I was selected to serve as editor of the A2 edition. I have enjoyed writing articles and other text, as an alternative to writing Apple II software. I STILL enjoy my Apple II computer, and editing the A2 version of GEnieLamp helps me explore new possibilities for my talents. It also keeps me abreast of the latest Apple II news.

As I have mentioned in a recent editorial, please feel free to give us feedback on the A2 version of GEnieLamp. We are always searching for ways to better meet the needs of our readers. Let us know what you think.

Phil Shapiro
- Assistant Editor for A2 edition of GEnieLamp

I first became enchanted with the Apple II in 1987 when testing out some educational software I wrote for my fourth grade students. The kids got all excited about playing a simple geography game I made up. When a few of them asked to stay late after class to finish playing the game, I knew I wanted to get more involved in educational software development.

So then I taught computers in elementary school for about four years before quitting to start my own software publishing company, Balloons Software. I miss the interaction with kids in the class room sometimes, but stay in touch with a dozen or so kids by giving private computer lessons.

Locally, I stay active in the local Apple user group, the Washington Apple Pi, a cozy little group with about 4000 members. For the past three years I’ve served as the chairperson of the club’s education special interest group. Our meetings often run late into the night because there's so much interesting Apple II educational software to talk about. One
teacher in our group uses Apple II's with her mentally retarded middle school students, and her experiences in the classroom are always fascinating to hear about.

I signed up for GEnie the day after their flat-rate structure went into effect. I’ve grown tremendously in my Apple II knowledge since that day.

Mel Fowler
- Staff writer for the GEnieLamp A2

I was born on a small farm about 5 miles outside Vernonia, Oregon in 1939. We moved to northern California shortly after my dad returned from WWII and settled in Yurika. Oops, he did say a short biography, didn't he.

Well maybe I should tell you that I am a retired Navy Senior Chief Radioman with 30 years in the service. I served from Guantamno Bay, Cuba, to the aircraft carrier USS America, USS Oklahoma City on the Commander 7th Fleet Staff, were I was the Chief of Satellite Communications. Then my last twelve years were with the Defense Communications Agency with tours in Hawaii, Korea, and Japan. I am married to my final wife Hui Tae (Hee Tay) and live in Mililani, Hawaii. Currently I manage a 40 unit townhouse project here in Mililani.

The first computer in my experience with computers was purchased in 1982, while stationed at the DCA, Field Office Korea and was a Korean clone of the Apple ][+. We called them "Krapples." It was a 32K model with a cassette I/O, with my television set serving as a monitor. Pretty basic by today's standards. Next, came an upgraded Krapple with two slim line drives, IBM type keyboard, with programmable function keys. It was equipped with a CP/M card, Grapple+, Language Card, 1 MEG ram card, and an No-Name DP-80 printer. All this was Korean made, as this was all we could get then. WordStar v1.01P and DBase II v1.1 were the programs we used the most, typing up reports and developing data bases on all the DCS stations in Korea. We used it at the office and became one of the first DCA offices to become computerized.

Later, I again upgraded to an Apple IIc, a real Apple this time, also equipped with a CP/M card, and 1Meg RAM card so that I could use it in the office. It also had an Apple Color Monitor, with an Epson FX-80 attached.

When I saw Steve Wozniak on the front cover of InCider introducing the "It's Amazing," "The new IIGS," I just had to have one. I was stationed at Yokota, AB, Japan at the time. About six months later I was able to get one at the base exchange. It was love at first sight. I had to upgrade my IIGS to ROM 01 and get a new VGC chip which were supplied by an Apple representative that was sent to Japan for that reason. Currently it contains a 4 Meg OctaRAM card, Sound Blaster stereo card, TransWarp GS, Vulcan 40 Meg internal hard drive, with an ImageWriter II and LaserJet IIp printers.

I have been on GEnie for just over a year and was lucky enough to become a GEnieLamp staff writer. Primarily I write reviews of current uploads to the A2 Library. I am active with the local user's group, the Honolulu Apple User's Society, being the Apple IIGS Special Interest Group (SIG) chairman, a director on the Board of Directors, Staff writer for the IIGS section of "SIGNAL" our club journal, and even bulk mail the journal each month. I have even been known to sweep the floors and take out the garbage occasionally, but I do not do windows.
If you are curious about my handle "MelSoft" it came from some software that I had developed in my early days with a "MelSoftware" moniker. There was a home inventory program and a label maker that were mostly used in the Korea, and Japan user groups and bulletin boards. Anyway, the MelSoft part of the name has stuck and I have used it on BBS and articles ever since.

- HyperStudio presentations

HYPERSTUDIO, FROM ROGER WAGNER PUBLISHING has been the most popular multimedia program for the Apple IIGS since it was released. It allows the capability to merge graphics, sounds, music, and animation into a presentation of cards (screens) organized into stacks. With the rapid display of cards you can create animation. Nearly any subject can be presented using HyperStudio. Stacks are fun and easy to create. Schools throughout the U.S. have used HyperStudio as class projects creating innovative programs which cover everything from volcanos to stars.

Some talented shareware and freeware authors have uploaded a large collection of HyperStudio presentations into the A2 library on GENie. This month's article will try to highlight the best of the A2 collection.

Let us start with a tour of the Apple IIGS. Stephen L. Brown from Ontario, Canada, has created a shareware program entitled "Steve's Tour Of The Apple IIGS." It is divided into two sections:

1. Looking Inside The Apple IIGS and,
2. Looking Outside The Apple IIGS.

The inside tour shows you a graphic of the Apple IIGS mother board with various parts and components displayed in their relative locations. By clicking on a part or component you turn on a text window which explains what the part does. The outside tour displays the front and back of the AppleColor RGB monitor and the Apple IIGS computer. You can get explanations of all the major components, back panel controls, connectors, and ports. This is an excellent tour of the IIgs for beginners and is fun and easy to use. Shareware fee $15.00 U.S.

[*][*][*]
"The Middle East" by Jan K. France is another tour but this time it covers the middle eastern countries. The first card is a map of the world and the stack asks you to try and find middle east. Once you have completed this task you are presented with a map showing the countries and main seas, gulfs, and oceans of the region. When you click on a country, the country's name is spoken, then you are presented with a map of the individual country. A large text window is supplied which includes interesting information about the country. By clicking on "Flag" you are presented with a full screen graphics of the country's flag. There is also a "History" section included with presents a histogram of events from 3500 BC to 1990 AD. If you are interested in learning more about this little known region of the world, this is the program for you. Freeware.

"Meet the Orchestra" is a four (4) disk presentation created by Karl Ivers which introduces you to the instruments of the Symphonic Orchestra. There are four sections to the program reflecting the sections of the orchestra, Strings, Woodwinds, Brass, and Percussion. You choose which section to use and then which instrument to learn about. There is a short text window that gives some background information on each instrument. When you click on the instrument itself, it will play a song for you. Pop quiz: In what section of the orchestra do you believe the piano would be in, Strings or Percussion? What is the difference between a Harp and a Harpsichord? Which sounds lower, a Clarinet or an Oboe? The four disks must have specific volume names, "ORCHESTRA, ORCHESTRA1, WOODWINDS, and PERC.BRASS." Meet the Orchestra is extremely well done, easy to use, and most educational. Freeware.

One of the premier HyperStudio authors is Joel Helton who has created some of the best multimedia presentations. "Interesting and Little Known Facts About Our Presidents" is, I think, his best. You can learn about all the presidents from George Washington to Ronald Reagon. Each presentation shows you a picture of the president and a text window full of "Interesting and Little Know Facts." Version 2 of the program added voice recordings to some presidents starting with Theodore Roosevelt. You will learn for example: What James Monroe had to do with the death of George Washington; why Mary Todd Lincoln was accused by the press of being a Confederate spy; and what the "S" represents in Harry S. Truman. This is an entertaining and informative program which is essential for hypermedia fans. A companion three disk set entitled "Presidential Quiz" is also available which will quiz you on your knowledge of what the presidents look like. You will be asked to choose a president from four pictures. Both these programs are Freeware.
was in December of last year. All this maneuvering is so the spacecraft will gain enough speed to get to Jupiter which is scheduled to be in December of 1995. This excellent hypermedia program tells you about the mission, what experiments are planned, about the space craft, the orbiter, the Jupiter probe and more. Freeware.

10171 HS.SHUTTLE.BXY  Jim Hirsch and Diana Hewitt have created another excellent program entitled "HyperMoney." You can use it to teach your young children all about U.S. coins from a half dollar to a penny. You are first presented with a coin, and then asked to name it. The graphics are super and this is a well organized, easy to use program. Freeware.

10226 HYPERMONEY1.BXY 10227 HYPERMONEY2.BXY   "Hyper.AWGS.WP" is another excellent Jim Hirsch offering. This is an easy way to learn how to use the word processor module in AppleWorks GS. You are presented with a graphics of the word processor screen. Various parts of the ruler can be selected and a text window will appear to explain what each item means. You can also choose any of the pull down menu items to learn what they do and how to use them. Also, Freeware.

10285 HYPER.AWGS.BXY   There are two outstanding multimedia programs that teaches you about the states. State.Stack by Bob Vawter and HyperState by Marty Knight. HyperState is the more elaborate presentation supplying two different maps of the U.S., one showing "Political" boundaries and the other showing "Regional" boundaries. From the Regional map you can choose a region of interest and you are presented with a regional map. From either the Political U.S. map or any of the regional maps you can pick a state and are supplied with a state map with a text window with information about the state.

The text information includes the states' region, capital, nickname, chief industry, and the date when the state joined the Union. Also included is a State Quiz stack. With this stack a map of the U.S. is displayed and by clicking on a state the states' name and capital are shown. State.Stack also displays a map of the U.S. and when a state is chosen switches to a text window screen. State.Stack is simpler in nature but does provide additional information which includes the state motto, area in square miles, population since the 1986 census, ranking among the states regarding area and population, and the state flower, bird, tree, and song. Impress your friends and family by learning all the state capitals.

10099 HYPERSTATES.BXY 17370 H.STATES.BXY   "HyperBrain" by Jim November uses a main menu which is a graphics of the human brain. Numbers identify various regions of the brain. Each card also has several hidden buttons to move to other regions. The graphics are well done and make exploring the human brain a real adventure. Find out where your Hypothalamus and your Medulla Oblongata are and what they do.

8835 HYPERBRAIN.BXY V.2.0  If you want to learn more about how to animate Hyperstudio stacks then I would recommend several programs by Bill Lynn. You can learn such interesting animation as watching your flowers grow or flooding your living room with "Animation School." Shareware $5.00. Learn how to animate your buttons with "Stupid Button Tricks," "More Stupid Button Tricks," and "Button School." These three stacks give you great examples of how you can liven up your stacks.
Rotate a fan, smash a lady bug, eat the screen, or see your name in lights. These are fun and show a great sense of humor.

15560 SBT.ANIM1.BXY
15640 SBT.ANIM2.BXY
17302 BUTN.SCHOOL.BXY

There are far more HyperStudio offering within the A2 library than could be highlighted here. You will find stacks that help young people with their math and reading skills. A large collection of sound and clip art files. There is even a seven (7) disk series on Star Trek the next Generation. But, we do not have the room to include everything. I hope we have keyed your interest in exploring the vast collection of Apple II hypermedia software available.

[*][*][*]

[Note: You can quickly navigate to the A2 Library on GENie by typing M645;3 at any standard GENie prompt. The letter "m" stands for the command "move." The number 645 refers to the "page" on GENie where the A2 Roundtable is located. And the semi-colon 3 refers to the A2 file library, as opposed to the message areas of the A2 Roundtable. To navigate directly to the message areas (bulletin boards) of the A2 Roundtable, type: M645;1 at any standard GENie prompt.]

Search-ME!

By Scott Garrigus
[S.GARRIGUS]

WELL, HERE WE ARE It's April and Spring is upon us, finally. I'm really getting sick of all the snow up here in good ol' Derry, NH. Soon it'll be Easter and the Easter bunny will be bringing all you good boys and girls his Easter eggs. But before that, we have the inevitable April Fools Day.

But I'll say right now that I'm not going to stoop so low as try and fool all you good folks out there. So on to this month's RoundTable...

All you ladies out there are going to love this one... this month I visited GENie's famous Hairdressing Roundtable. Oh, you didn't know we had a special place for hairdressers here? Well, surprise, surprise! Here you can get expert advise on all the lastest styles and techniques. Learn how to do it yourself and get first hand instruction in this wonderful field. Yes, you too can have the greatest looking hair in town. Visit GENie's Hairdressing Roundtable today!

To get there just type JUSTALITTLEOFFTHETOPPLEASE or find it on page 1234567.

But before you rush over there to get the lastest haircutting advice, be sure and solve this month's puzzle. It's sure to keep you a cut above the rest! :-) Ta, Ta! And Happy Easter!

By Steven Weyhrich

[S.WEYHRICH]
INTRODUCTION  This segment of the Apple II History continues with the description of the IIGS, the 16-bit version of Steve Wozniak's legacy. It continues discussion of its hardware, firmware, and system software, enhancements, as well as the product introduction. Finally, some of the later parts of the IIGS story that have not yet appeared in previous releases of this segment of the history are included.

[*][*][*]

THE APPLE IIGS: MISCELLANEOUS HARDWARE  Other features Apple engineers added to make the Apple IIGS a next generation computer included a built-in clock, slot space for internal expansion cards, and the electronic equivalents of seven more expansion cards.<1> Taking the cue from their experience with the Apple IIc, they included as built-in features the peripherals that most users would want to use. They allocated serial ports to slots 1 and 2, the classic 80-column firmware to slot 3, the mouse controller to slot 4, a Smartport controller to slot 5, a 5.25 inch disk controller to slot 6, and AppleTalk capability to slot 7. (AppleTalk was Apple's network protocol that had been designed originally for use with the Macintosh).

Because the engineers wanted to make the IIGS capable of connecting to the AppleTalk network, the serial ports they planned were based on a different communications controller chip than was used in the older Super Serial Card and the Apple IIc serial controller. Although the new controller chips were more capable than the older ones used on the 8-bit Apple II's, telecommunications programs written for those older Apple's wouldn't work. This was because most terminal programs, for the sake of speed, were written to directly control the old Super Serial Card (rather than going through the slower, built-in firmware commands). The controlling commands necessary to manage the newer chip were very different, and so caused such software to "break".<2>

The case and motherboard used in the Apple IIGS was made smaller than that found in the IIe, both in order to make a smaller "footprint" on a desktop, and also to make it easier to make an upgrade available for IIe owners. They had wanted to make it possible even for Apple II and II Plus owners to upgrade, but in the end it turned out to be just too expensive and difficult to execute.<2>

The Macintosh engineering group was at this time designing a protocol for interfacing standard input devices, such as keyboards, mice, and graphics tablets. This protocol, called the "Apple Desktop Bus", was first implemented on the Apple IIGS. It made possible the interchangeability of hardware devices between the Macintosh and Apple II lines, allowing Apple to sell a common set of peripherals that both computers could use.<2>

THE APPLE IIGS: FIRMWARE  Firmware, you may recall, is that layer of controlling programs in ROM on a computer that sits between an application program and the hardware it is trying to
control. On the IIGS, the firmware was designed after the hardware was finalized. Unlike the older ROM that Wozniak included with the original Apple II, the IIGS software engineers tried to make it more than just a set of addresses to call to carry out a function (such as clearing the screen). Rather, they wanted to make a more comprehensive system (called a "toolbox") which could be more flexible for future enhancements of the hardware and firmware. In particular, they didn't want to have the addresses for carrying out certain functions to be fixed in a single location as on the older Apples. This toolbox would have a single address to call, and a specific command would be passed on through that address. Set up like this, it would allow Apple's firmware programmers to modify the ROM in the future without having to take trouble to make multiple addresses in the ROM "line up" properly. Additionally, they made it easy to "patch" the toolbox code in the ROM using code loaded from disk, allowing programmers to fix errors that were later found without having to replace the physical ROM chips.

At first, they were given 64K of space for the ROM, over four times as much as was available on the original Apple II. Later, they had to go back and ask for 128K of ROM, because of the many things that they needed and wanted to do. Of course, Applesoft had to be present in ROM in order to maintain compatibility with the older Apple II software. Additionally, they also put all of the mouse-handling tools into the ROM (unlike the II, II Plus, and IIe, which had to have the mouse firmware on a card in a peripheral slot).<1>

A boost to the firmware design of the IIGS came, unexpectedly, as a result of the merger between the Apple II and Macintosh divisions. This merger came as part of the reorganization that coincided with the departure of Steve Jobs from Apple. Since the Macintosh team was now working in the same place as the IIGS designers, they were available to offer help and ideas. Bill Atkinson, the programming wizard who wrote MacPaint and many of the mouse tools for the Macintosh, helped in the creation of the mouse tools and QuickDraw II for the IIGS. (This was the name given to the ROM tools used to draw on the super hi-res screen, and was borrowed from the older QuickDraw routines on the original Macintosh).<1>

To allow the user to easily configure certain features of the IIGS to their own tastes, a "control panel" was designed (another idea borrowed from the Macintosh). It was used to set the clock, the system speed (between a "normal" 1 MHz and a "fast" 2.8 MHz), change the standard text display from 40 to 80 columns, set colors for the text screen, set sensitivity of the mouse and keyboard, and make the standard settings for the printer and modem ports. These preferences were saved in a special battery-powered RAM that would survive even when the system power was turned off.<1>

THE APPLE IIGS: SYSTEM SOFTWARE  ProDOS needed to be updated to better take advantage of the additional memory on the IIGS, as well as the larger storage devices that were not very available when ProDOS was originally written. Back then, five megabytes was felt to be quite a large disk size. By the time the IIGS was designed, 40 megabytes was becoming a common standard. The new IIGS-specific version, called "ProDOS 16", would also be able to handle any number of open files at the same time (the older version of ProDOS was limited to eight files open simultaneously).<1>

The first version of ProDOS 16 was more limited than Apple's designers
wanted it to be, but they didn't want to hold up the new IIGS until a better version was ready. The version of ProDOS that would run 8-bit Apple II software (on the IIGS or older Apple II's) was renamed "ProDOS 8". That version was modified to handle system interrupts better, which was important on the IIGS because of the control panel feature and the way in which the Apple Desktop Bus worked. (An interrupt refers to a special signal that is sent to the microprocessor by a hardware device. This signal "interrupts" what the processor is doing, redirects it to do something else, and then returns the processor to what it was previously doing. The mouse on the Iic and the mouse card for the other Apple II's use interrupts to handle movements of the mouse).<2>

(Further details about ProDOS 16 and its later replacement system, GS/OS, will be found in an upcoming part of the Apple II History).

IIGS PROJECT CODE NAMES AND TEAM MEMBERS

The earliest name used internally at Apple for the IIGS project was Phoenix (as mentioned earlier). It was also known as "Rambo" (when the design team was fighting for final approval from the executive staff), "Gumby" (from an impersonation done at Apple's Halloween-day parade), and "Cortland".<1>,<3>

Some of the members of the design team not yet mentioned here include Nancy Stark (an early and energetic champion for the IIGS project); Curtis Sasaki (IIGS product manager); Ed Colby (CPU product manager); Jim Jatzcynski (Operating System group manager); Fern Bachman (who worked to ensure compatibility with existing Apple II software); Gus Andrate (who developed the sound tools and the unified drive firmware); and Peter Baum, Rich Williams, Eagle I. Berns, John Worthington, and Steven Glass, who each developed part of the IIGS system software and firmware.<4>

THE APPLE IIGS: PRODUCT INTRODUCTION

In September of 1986, Apple introduced the new Apple IIGS, bundled with an Apple 3.5 drive, for $999 (not including a monitor). Apple management, somewhat surprised by the response that occurred in their "Apple II Forever" event two years earlier, made the decision to heavily promote this new Apple II. Why they came to this change of heart was unclear. Although they showed no slowing in their plans for the Macintosh (which was making steady progress in gaining acceptability in the business world), a multi-million dollar marketing and media blitz was arranged to promote the new IIGS as the ultimate home and recreational use computer. Even employees at Apple who had worked on the IIGS project were startled (but pleased) at the marketing intensity that was begun, and the order for this came directly from the top. John Sculley himself had insisted that the Apple IIGS be given highest priority. (Apple's CEO since 1983, he had just a year earlier ousted founder Steve Jobs from day to day responsibilities at Apple). Rumors flew, but were never confirmed, about a shaken Sculley who had come to an executive staff meeting in July of 1986 with stories of strange things he had experienced. He had supposedly received a frightening nighttime visit from a yellow-garbed alien who called himself "Darth Vader" from the planet Vulcan. "He told me that he would meld my brain if I didn't put all I could into marketing the Apple IIGS! I have to do it!!", he was reported to have said, white-fisted and pale, at that meeting. Despite the obvious references to science-fiction movies and television of the 1960's and late 1970's, the executive staff bowed to his requests (which were no less firm after Sculley had taken a Valium and had a couple of Diet Pepsi's. After all, he WAS the boss).
Of course, the IIGS was received by the Apple II community with enthusiasm. After initial sales broke all previous records, including those for the Macintosh, Apple re-doubled its efforts to promote this as the computer for nearly everyone. After all, it had ties into the past (compatible with Steve Wozniak's 4K Integer BASIC Apple II at its core), and ties into the future (with the 16-bit technology and expanded memory). Within a year it was outselling the Macintosh (which had also received a boost in sales, thought to be benefitting from the wave of IIGS sales).

By 1988, a significantly enhanced Apple IIGS was released, with more advanced system software (which worked more like the easy-to-use Macintosh interface) and higher density graphics (the cost of better color monitors had come down considerably since the initial design of the IIGS back in 1985). Apple even decided to take the unprecedented move of licensing the Apple II technology to a couple of other companies, who worked on producing IIGS emulators for other computers, including IBM and its clones! Software and hardware sales hit a spiraling upward curve, which stimulated more sales of computers from Apple, which increased software and hardware sales further. Apple even produced a IIGS emulator of its own for the Macintosh and Macintosh II series of computers. Eventually...

(Hold it. Something just doesn't seem right. I don't recall things going NEARLY that well for the IIGS. Computer!

APPLE II: [ Tweedlesquirge ] State request, please.

AUTHOR: Compare time events just outlined in previous section with known events in database notes.

APPLE II: Working... [ Blinkitydinkitydinkityzeerp ] Events just described are from a parallel timeline, which diverged from our own timeline in July 1986.

AUTHOR: Hmmm. Any way of moving into that timeline?

APPLE II: Negative. Insufficient energy available in power supply to actually make changes necessary to alter the events in our timeline to allow the above scenario to actually occur.

AUTHOR: Then HOW did we come across that information in the first place?

APPLE II: Flux capacitor was affected by a momentary surge in power lines due to a nearby thunderstorm.

AUTHOR: Interesting. Well, maybe someday I'll have to beef up this power supply a bit and have a talk with Mr. Sculley if I can find my yellow radiation suit... So how do we get back to the correct information?

APPLE II: You could effect a complete shutdown and memory purge, then reload correct data from protected archives.

AUTHOR: Very well. Make it so.

APPLE II: Working... [ Blinkitydinkitydinkityzeerpity... ]
PROOFREADER: Your Apple TALKS???

AUTHOR: What? Yes, well I had a CPU conversion done in the early 24th century...

APPLE II: Data reload completed. You may proceed when ready.

AUTHOR: Now, let's see if we can get it right this time...)

THE APPLE IIGS: PRODUCT INTRODUCTION (Take 2)
In September of 1986, Apple introduced the new Apple IIGS, bundled with an Apple 3.5 drive, for $999 (not including a monitor). The Apple II community was excited about the new computer, and inCider magazine featured an exuberant Steve Wozniak on the cover of its October 1986 issue with the caption, "It's Amazing!"

Apple, for its part, did do some advertising for the new computer in the pages of current Apple II publications of the time. However, there was no major push for the new computer, and again it seemed destined to be dwarfed by Apple's preoccupation with the Macintosh.

Though announced in September, the IIGS was not widely available until November. Early production models of the IIGS had some problems; one of the new chips did not work properly, and necessary changes to fix them caused a delay. The upgrade that would turn an Apple IIe into a IIGS was also delayed until early 1987.<5>

THE APPLE IIGS: ENHANCEMENTS
In September 1987 Apple made an incremental improvement to the IIGS with the release of a new ROM. The ROM 01 revision made a few changes in the original IIGS ROMs and included an improved video controller chip. Bugs in the ROM code were fixed, and a problem with a "pink fringe" effect with certain graphics displays was fixed. The new ROMs were not compatible with any IIGS System Disks earlier than version 2.0. The new ROM was identified by a message at the bottom of the screen when booting the IIGS that said "ROM Version 01". The original IIGS had no message in this location.<6>

The next change came with the release of the ROM 03 version of the IIGS in August of 1989. This new IIGS computer came standard with 1 meg of RAM on the motherboard, and twice as much ROM (256K versus 128K on the older IIGS). This allowed more of the operating system to be in ROM, rather than having to be loaded from disk when booting. Additionally, fixes were made to known bugs in the ROM 01 firmware. (The latest version of the IIGS system software made patches to ROM 01 to fix those bugs, but these patches still had to be loaded from disk, which slowed startup time. Having the latest new tools and fixed new ones already in ROM made booting the version 03 IIGS a bit quicker). The new Apple IIGS also had the capability of using both the internal slot firmware as well as using a peripheral card plugged into a slot. The ROM 01 IIGS could, of course, use cards plugged into the slots, but only at the expense of being unable to use the internal firmware for that slot. With so much useful system firmware built-in, a ROM 01 user who wanted, for example, to add a controller card for a hard disk would have to give up either AppleTalk in slot 7 or use of 5.25 disks in slot 6. Almost everything else had to be set in the control panel to the internal firmware.

The ROM 03 IIGS also included enhancements for disabled users. A feature called "sticky keys" made it possible to do multiple keypresses.
To execute an "Option-Control-X" sequence, for example, required pressing three keys at once. This was something that a paralyzed user with a mouth-stick to press keys could not previously do. Also, more things that had required a mouse now had keyboard equivalents (using the keypad). The new IIGS also had somewhat "cleaner" sound and graphics. However, because the improvements made were minimal compared to the cost of providing upgrades to previous owners, no upgrade program was announced by Apple. In any case, many of the new features could be obtained on older IIGS's by upgrading the memory to at least one megabyte and using GS/OS System Software 5.0.2 or greater.<7>

A feature that was added to the ROM 03 firmware that was entirely fun, instead of functional, was accessed by a specific key-sequence. If the computer was booted with no disk in the drive, a message that said "Check startup device" appeared, with an apple symbol sliding back and forth. At that point, if the user pressed the keys "Ctrl", "Open Apple", "Option", and "N" simultaneously, the digitized voices of the Apple IIGS design team could be heard shouting "Apple II!" Also, the names of those people would be displayed on the screen. If running any version of GS/OS System 5.0, the user would have to hold down the "Option" and "Shift" keys, then pull down the "About" menu in the Finder. It would then say "About the System". Using the mouse to click on that title would cause the names to be displayed and the audio message to be heard.

THE APPLE IIGS: THE FAT LADY SINGS? Unfortunately for the IIGS and its loyal users, decisions were made at Apple during the late 1980's that dictated that the future of the company would be in the Macintosh computer, and in other entirely new platforms they would create after Macintosh. The view by Apple's management, and even by some of the engineers that had worked on the IIGS, was that it was simply underpowered when compared to the 68000 series Motorola processors that were used by the Macintosh. As I've mentioned before, the backward compatibility with the 8-bit Apple II was one of the greatest strengths of the Apple IIGS; however, this was also one of its greatest weaknesses, as it compromised from the start some of the decisions made in its design. It could be compared to creating a brand new type of automobile, one that had the capability of doing things that owners of earlier cars couldn't even imagine, but insisting that it MUST run on gasoline and use a 12 volt battery. If it could be allowed to run EXCLUSIVELY on a specialized new fuel and a more comprehensive power plant, the new car could perform considerably better -- but it needed to be backward compatible with previous releases of the car. In terms of the IIGS, it was given the power to be very much like a Macintosh, with its ease of use and graphic interface. But with all this power came the connections to its 8-bit past, and this complicated things for designers as well as programmers.

Another problem for the IIGS was that no one at Apple was in a position of power to champion the machine and push for full support and promotion by the company. After its product introduction, which involved a couple of television and magazine ads, Apple turned its attention to other concerns and left the Apple IIGS to sell itself. What promotion was done for the IIGS or products associated with it was done with all the fervor Apple had applied to the Apple II line since the Apple III had been designed (in other words, very little).

The IIGS still had people within the company that poured out their hearts in making changes to improve the computer, both in software and hardware. Their advances in system software managed to make the computer
faster without requiring any changes in hardware, and also made it possible to take advantage of new peripherals as they became available. On the hardware side, rumors flew for years after the release of the ROM 03 IIGS about an updated IIGS that was in the works, one with the capability of higher quality graphics, a faster processor, the capability for larger memory sizes, and even the possibility of a more advanced processor, the 65832. But no one in Apple's administration would give approval for these dreams to get off the ground. Even at the last minute, just before the first Apple User Group television satellite broadcast in October 1991, a ROM 04 IIGS that was to have been announced along with several new Macintosh models was pulled from the program and disappeared. This new IIGS would have included 2 MB of memory, a built-in hard drive (becoming almost a necessity to run the sophisticated GS/OS software that was available), and possibly a built-in SuperDrive (which would be capable of reading and writing 3.5 disks created by MS-DOS computers). But the future was Macintosh, and releasing another advancement to what Apple considered to be a dead-end platform was not considered to be good business sense.

It was the termination the ROM 04 IIGS that reportedly contributed to the delay in the introduction of GS/OS System 6.0, which finally arrived in April 1992. (The tools that were part of System 6.0 would have been in the ROM of the new IIGS, and made as patches to the ROM 01 and 03 machines; things had to be changed when it turned out that there was to BE no new IIGS).

The final blow to the IIGS was, of course, economic. The IIGS had been selling itself nearly from the beginning, and Apple had begun to push the Macintosh as a computer for schools to use. This had been traditionally the stronghouse of the Apple II, back from its earliest days. As school sales fell, and the computer public, unaware of the capabilities of the IIGS, bought Macs and IBM-compatibles, Apple dealers found it less profitable to carry the Apple IIGS. Lower sales also translated into fewer new software titles to run on the computer, which further depressed the market. The end of the production run of the Apple IIGS came in December 1993, when it was finally removed from the price lists Apple provided to dealers. The Apple IIe was still selling well enough (primarily to the education market) that it was left on the price lists for the time being, but the Apple IIGS was relegated to sales through the used or resellers market. Although Apple pledged to continue software support for the machine (with at least two enhancements to System 6.0 planned), there would clearly be no new IIGS, ever.

INTERNET GATEWAY  GEnie's Internet gateway offers access to the largest communications network in the world. GEnie users can send and receive Internet mail, subscribe to newsgroups, and even request files to be downloaded from the Internet to GEnie (see services offered by the Unix RT, below).

Following are some answers to commonly asked questions, as found in the Unix RT Bulletin Board on page 160;1. While researching this article, I found the Unix Rt to be the best place on GEnie to get information about the Internet gateway. Most of the info provided here comes from Andy Finkenstadt (ANDY), Unix RT SysOp, by way of the messages in Category 12 of the Unix RT Bulletin Board. Library file references are to files in the Unix RT Library on page 160;3.

[*][*][*]

>>>>> HOW DO I SEND MESSAGES TO PEOPLE IN INTERNET?
"""
There are two ways – one works from page 207, and one works at any place you can send a mail item – with the SEND command, or at the Mail Command Mode (200;9 or 8004;9).

On page 207, there is an option for "Send an Internet Mail" or words to that effect. It guides you through the process, and merely asks for the internet address of the person you want to send to, allows you to CC any addresses, asks for the subject, and then puts you in the 1> 2> line editor. .S at the end and you’ve sent your first piece of mail.

In mail command mode (ENTER) or with the SEND command, at the To: or Cc: prompts, or with the .TO .ATO .CC and .ACC commands you address your letter to the person plus the special string @INET#  For example:
To: andy@vistachrome.com@INET#
Cc: S.POPKES
Sub: Testing
1> Hi there! Just testing a letter to Andy's work account.
2> .

Now GEnie will respond with three messages - the item creation message, the "queued for INET#" message, and the item sent message. Now your item has been sent.

If there are problems you will receive a return mail from the gateway machine or a machine along the way that discovered the problem or error. Typically these come from MAILER-DAEMON or POSTMASTER or other addresses that don't contain real people's names.

Just like with FAX# delivery you can check on the status of an Internet mail item that you sent with the "DIS" command in mail command mode. Record the 7 digit item number referred to in the "queued for INET#" message and type at the Command? prompt:

Command? DIS 1234567

It will tell you the current status of the item.

>>>>> HOW DO I GET MESSAGES BACK?

Typically if you have sent a message, your correspondent will be able to merely use the "reply" command on their mailer. Your address is S.POPKES@GEnie.geis.com (you can use upper or lower case, it won't matter) so you can tell people to write you back at that address easily enough.

>>>>> HOW IS THE GATEWAY TO BE BILLED?

On page 207 there is a "Rates" menu item. The following prices went into effect on Nov. 1, 1992:

$2.00 registration fee - this will be a one time charge for all new users signing up for the service. However, if a user cancels and signs up another $2.00 charge will be incurred.

$.30 for each 5000 bytes or portion thereof for incoming or outgoing messages. For example:

A 10000 byte message would cost $.60  A 20000 byte message would cost $1.20  A 5000 byte message would cost $.30  A 12000 byte message would cost $.90

(If you read mail during the day, you'll be charged the standard GEnie connect rates since the Genie.*Basic pricing plan is only in effect weekends and undays during the week. Also, at 9600 baud special charges apply for all GEnie access, night or day.)

>>>>> THERE ARE SEVERAL CONFERENCES ON THE INTERNET.

HOW ARE THESE ACCESSED?

The files "MAILING-LISTS.TXT" and "INTEREST-GROUPS.TXT" (and the corresponding compressed files ending in .Z) show a list of about 300 to 400 special interest groups and mailing lists available on the Internet.

For example, to join the "Christianity Mailing List" sponsored by Liz
Allen, you send mail to

    mailjc-request@grian.cps.com

or to

    mailjc-request@grian.altadena.ca.us

and ask to be added. You might re-affirm your mail address as USER.NAME@genie.geis.com just in case something gets mangled by a piece of software between GEnie and there.

Then the moderator of the mailing list (or his/her duly authorized program <grin>) sends you back a welcome message, and explains the exact procedure for posting to the group. In the case of the foregoing example, it's sending mail to

    mailjc@grian.cps.com or
    mailjc@grian.altadena.ca.us

For an explanation of how domain names (the @somewhere.site.com) works, the file DOMAIN.INF is available that explains it in rather basic untechnical language.

Additionally there are over 3000 newsgroups (3572 in my newsgroups file at work) of which approximately 700 to 800 are active. Getting on a mail feed of that list requires a bit more patience.

Sometimes a friendly System administrator can be convinced to set up a mail-based feed of a couple newsgroups to a specific address - as part of the testing I did this to see what kinds of things would happen. Reading newsgroups via mail is quite a trip though .. a real time-sucker-downer. :)

CAVEAT: You may want to be aware that at 30 cents per item per 5000 characters, an active mailing list can easily cost a small fortune per month.

>>>>> CAN I SEND MESSAGES FROM GEnie TO FRIENDS ON COMPUSERVE AND VICE VERSA?
Yes, easily. From GEnie do this:

    To:  76334.641@compuserve.com@inet#
    {userid}  CIS     internet mailbag

You can leave off the @INET# =if= you are using the form on page 207.

Your friend can send from Compuserve to you with this:

    To:  >internet:ark.royal@genie.geis.com

>>>>> ARE THERE GATEWAYS TO OTHER NET SERVICES AS WELL? SUCH AS DELPHI AND PRODIGY?
If you mean can you connect with the Delphi or Prodigy services and use them as if you had called them directly, No.

You can send mail to subscribers on Delphi ( username@delphi.com ), and Prodigy has plans to have an Internet gateway for extra cost this year or next.

>>Can I use GEnie's special mail commands such as .*ATO, .*ACC and BLIND >>with Internet addresses?
Yes, when we were testing, the BLIND,address@site@inet# worked fine. (The only reason you use BLIND, I assume, is to avoid the potentially 60 lines of headers at the beginning of the letter, right?)

...you can optimize your ATO commands like this:
.ATO,BLIND,address1,address2,address3,address4,    <-- note trailing comma
address5,address6,address7,address8@inet#,
address9@inet#

And so on... It's actually a bit faster that way.

>>> IS THERE A WAY TO JOIN USENET GROUPS VIA GENIE'S INTERNET GATEWAY?

At present, Usenet access is not available on GENie. There are several lists posted in the Unix RT Library of newsgroups and their counterpart mailing lists. If you can't find information on the newsgroup you're looking for, post it on the Unix RT or drop a note to UNIX$ and we'll see if we can find out for you.

Several files in the Unix library are great starting places for information about the Internet and GENie's part in it. As a convenience to the Unix RT participants we have made these available in 3 different forms: Text form, Unix Compress form, and ZIP form. The file names and numbers are listed below:

<table>
<thead>
<tr>
<th>Description</th>
<th>Name</th>
<th>Text</th>
<th>ZIP</th>
<th>Unix</th>
</tr>
</thead>
<tbody>
<tr>
<td>How to find College E-Mail addresses</td>
<td>FYI3</td>
<td>3625</td>
<td>4361</td>

</tbody>
</table>

(The Unix compressed version of ZEN requires a PostScript printer.)

Other files about the Internet can be found by searching for "INTERNET" while in the Unix libraries on page 160.

Services offered by the Unix RT As mentioned above, the Unix RT is a great place to get more info on the Internet and the gateway here on Genie. Here are some of the services offered by the Unix RT sysops, and where to find more information:

.* Many Frequently Asked Questions archived from the Internet. Search on "FAQ" in the software library.
.* Up to date Usenet UUCP Maps in library #15. Start with file #2551 README.MAP for interpretations.
.* FTP Request Service. If you can't find it elsewhere on a GENie RoundTable, ask us to find it for you. See bulletin board category #1, topic #8. Library #41 for listings, #42 for files.

Real Time Conference:
Apple II Computer Info

Sunday:  8:00p-10:00p  Unix & Internet Help Desk in Chat Lines

INTERNET Support in category 12 of the bulletin board. Informational files in the software library #33 or search for "INTERNET".

GEnieLamp  GEnieLamp is monthly online magazine published in the
          GEnieLamp RoundTable on page 515. You can also find
          GEnieLamp in the ST (475), the Macintosh (605), the IBM (615) Apple II
          (645), A2Pro (530), Unix (160), Mac Pro (480), Geoworks (1050), BBS
          (610), CE Software (1005) and the Mini/Mainframe (1145) RoundTables.
          GEnieLamp can also be found on CrossNet, Internet, America Online and
          many public and commercial BBS systems worldwide.

          We welcome and respond to all GEmail. To leave messages, suggestions
          or just to say hi, you can contact us in the GEnieLamp RoundTable (515)
          or send GE Mail to John Peters at [GENIELAMP] on page 200.

>>> WHAT'S HAPPENING IN THE APPLE II ROUNDTABLE? <<<

~ May 1, 1993 ~

FROM MY DESKTOP ......... [FRM] APPLE_TALK ......... [TAL]
  Notes From The Editor.

HOT TOPICS ............ [HOT] A2 ODDS & ENDS ......... [ODD]
  Too Hot To Handle, Almost.

WHAT'S NEW ............ [WHA] THROUGH THE GRAPEVINE ... [THR]
  New and Improved.

MESSAGE SPOTLIGHT ....... [MES] Rumors, Maybe and Mayhem.
  Word To The Wise.

TELETALK ONLINE ........ [TEL] HUMOR ONLINE ............ [HUM]
  Online Communications.

PROFILES ............... [PRO] GEnie Fun & Games.
  Who's Who On GEnie.

CONNECTIONS ............ [CON] THE MIGHTY QUINN ....... [QUI]
  By Joe Kohn.

                    ASK DOCTOR BOB ........ [ASK]

                    Gotta Problem?

                    Random Access.

                    Online Communications.

                    Online Communications.
READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To use this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

<table>
<thead>
<tr>
<th>Name of sender</th>
<th>CATegory</th>
<th>TOPic</th>
<th>Msg.#</th>
<th>Page number</th>
</tr>
</thead>
</table>

In this example, to respond to Smith’s message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REReply in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic.

ABOUT GEnie  GEnie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014, DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.

/ "Bring the Pepsi and we be doin' the Aladdin thang! ;-)" / / R.MARTIN22 / /
CHANGE, CHANGE, CHANGE!  Change is good, right?  Well, I certainly hope so, 'cause there is a whole lot of changing going on here at GEnieLamp.  I suppose the best place to start is the changes that have taken place on page 515, our home, the GEnieLamp RoundTable.  (Keep in mind that many of these changes are happening as I write this - the changes outlined below are subject to change!) First off, the RoundTable is no longer a RoundTable but just a single page.  Here's the new menu you will find when on page 515:

**GEnie**
**GENIELAMP**

1: [*] GEnieLamp IBM Magazine
2: [*] GEnieLamp Atari Magazine
3: [*] GEnieLamp Mac Magazine
4: [*] GEnieLamp MacPRO Magazine
5: [*] GEnieLamp Apple II Magazine
6: [*] GEnieLamp A2Pro Magazine
7: [*] FEEDBACK to GEnieLamp
8: Digital Publishing RoundTable

As you can see the bulletin board, libraries and information files are gone and all that is available is the GEnieLamp Magazines, Feedback and a gateway to the new DigiPub RoundTable.  (More on that later.) On the negative side, this means that Aladdin no longer works on this page.  This goes for previous GET THE LAMP scripts as well.  On the positive side, our resident script writer, Jim Lubin has come up with a new Aladdin script which will be available in the DigiPub library as well as the Aladdin support RoundTables within the next couple of weeks.

But the Big News Is...  Now, instead of capturing GEnieLamp, you can DOWNLOAD the magazine.  No more waiting through a long capture session!  Just download GEnieLamp as you would any other file here on GEnie.  (We recommend Zmodem for best results.)  If you prefer the old method, just turn on your capture buffer and [L]ist the magazine to your computer.  (Again, this is in the planning stage and may not be implemented in time for the May 1st issue release.  However, the option to _download_ GEnieLamp is coming RSN!)

PLUS!  Starting with this issue GEnieLamp Online Magazine is going to a """"twice a month publishing schedule.  Now you can get your favorite version of GEnieLamp (GEnieLamp ST, Mac, IBM and A2) on the 1st and the 15th of every month.

AND BEST OF ALL...  ~ GEnieLamp IS STILL GEnie*Basic! ~

[***][***][***]

WHY A NEW ROUNDTABLE?  The GEnieLamp RoundTable was originally set up primarily for the distribution of GEnieLamp Magazine.  Our secondary purpose was to promote and distribute other online
Apple II Computer Info

newsletters. But electronic publishing goes much deeper then just magazines and newsletters. Therefore, we came to the conclusion that the time has come for electronic publishing and hence, the Digital Publishing RoundTable came online.

The Digital RoundTable (or DigiPub for short) is a GEnie*Value RT here on GEnie for people who are interested in pursuing publication of their work electronically whether here on GEnie or via disk-based media. For those looking for online publications, the DigiPub library offers online magazines, newsletters, short-stories, poetry, informational text files and other various text oriented articles for downloading to your computer. Also available are writers' tools and 'Hyper-utilties' for text presentation on most computer systems. In the DigiPub bulletin board you can converse with people in the digital publishing industry, meet editors from some of the top electronic publications and get hints and tips on how to go about publishing your own digital online book. As an added bonus, the DigiPub RoundTable is the official online service for the Digital Publishing Association.

(Whew!) Until next month...

John Peters
[GENIELAMP]

Apple II Computer Info

An example involves my hard drives. I decided some time ago to use an interface standard that works across the various platforms. Therefore, the SCSI interface was the only logical route to travel. These hard drives will work on Apple II's, Mac's, IBM's and the various clones, just to mention a few. I do not have to worry about the ability to use my mass storage devices on the new equipment I might purchase. The SCSI standard provides me that assurance.

Another example: my laser printer is an Epson product that conforms to the Printer Control Language (PCL) defined by the industry standard Hewlett Packard (HP) LaserJet IIP. This standard insures that my printer will work on a number of computer systems. It also insures that the software I purchase will support the printer. (An Epson dot matrix emulation adds to the functionality of the printer.)

At this point we can see one of two problem areas begin to arise: new standards that replace the old. HP has come out with a new printer, the LaserJet III printer and an updated PCL for that printer. If I want to stay up-to-date with the most current printer control language, I must buy a new printer that conforms to the new standard. When, and if, I make this change is dictated by my budget and the software I might purchase that needs this updated PCL. I have ignored the possibility of "buying a new toy" for the sake having the latest and greatest electronics.

The other problem area is the choice of which standard to buy into. My laser printer will work as another case study. The HP PCL standard is not the only game in town. Adobe has created a Page Scripting language that they call PostScript. This standard is radically different than the HP PCL and has been around longer. A good case could be made for purchasing a PostScript printer instead of the HP compatible. However, price of the final printer was a deciding factor for me (PostScript is fairly expense to license from Adobe).

With these goals in mind, I have purchased computer hardware that can be used on my current system, other computers systems that I might want to hook up, and future systems that I may buy. The biggest pay-back for this planning will be immediately after purchasing a new computer platform. I will not have to buy new equipment for every peripheral I need to enjoyment of my computer. If this type of thinking has not been a factor for you in the past, why don't you give it some consideration. You might save some money over the long haul.

[*][*][*]

Look for a couple of graphic demo programs (from me) during the next month. I managed to find the time to shake off my programming rust and get two projects finished. One package relates to the mention I made last month of Eamon software for the Apple IIgs. Where do you think that you will see these uploads first: GEnie, of course! See you online.
DEGAUSSING DISKS  I've had excellent results with a strong magnet I moved
over the disk cover of disks (either 3.5" or 5.25")
which the GS refused to format, 'cause the Finder detected some conflicting
data on them. This worked also at work on a MS-DOS clone and a Unix system.
A friend with an Amiga does this regularly, 'cause the Amiga seems to be
very picky about disks that are to be formatted.
(U.HUTH, CAT11, TOP16, MSG:268/M645;1)

There is also a knack to using magnets (bulk erasers included).
Start with the item right against the magnet and then move it in a circle
against the magnet. Then (and this is _important_) slowly (that's slowly!) move
the item away for the magnet while continuing to move it in a circle.
Also always do this to both sides of the item. (I used to use a magnetic
mount CB radio antenna, myself). -- HangTime [Script-Central] B~) (Oh,
how far do you move the item away?  Full arms distance, especially if
you're using a strong magnet like a bulk eraser)
(A2.HANGTIME, CAT11, TOP16, MSG:328/M645;1)

CONFUSING?  Boy, I'll bet this is confusing people. :-)
At 2400, the 800 line access costs $6 per hour, plus whatever
else you'd normally pay. For a Basic Services bulletin board, that would
be nothing, so you pay only the $6/hour that 800 use costs. For someplace
like A2, which costs $6/hour, that would be added on, so it's $12/hour.

At 9600, the 800 line is a real good deal because THERE IS NO
SURCHARGE. It's a flat $18 per hour, period.

For those who have 9600 and call long distance, or pay toll calls
anyway, this is a really good deal.
(A2.DEAN, CAT2, TOP4, MSG:165/M645;1)

TECH TALK  Uhhh...we spent some time with this years ago (it was written
up in A2- Central back in Feb. 1988, p. 4.3). The "Monochrome"
setting only affects the composite output (the "RCA phono" style
connector), not the RGB output (which is _always_ color). Selecting
"Monochrome" forces the composite output to use gray-scale sans color.
Apple II Computer Info

(This is the same effect as setting bit 7 of $C021 to "1".)

Apple IIe (and probably IIc) RGB interfaces normally support a tricky softswitch toggle to enable a "monochrome" mode. Unfortunately, the IIgs RGB interface doesn't support that protocol.

There is a different register value (bit 5 of the IIgs Video Control Register at $C029) that can be set to force (both RGB and composite) graphics to monochrome while the double high-resolution graphics mode is engaged (Annunciator 3 is set "off"); this is how the original Apple II Desktop (a modification of MouseDesk) managed to get crisp monochrome graphics on the IIgs using the DHR screen. By setting that bit to "1" and kicking the screen back to 40-columns (with AN03 still off to simulate DHR activity, but setting 80-columns off by touching $C00C or issuing a control-Q to the 80-column firmware and letting it do it) you can get something that simulates mono high-res. (This trick was even mentioned in an Apple II Technical Note.)

Two "gotchas": First, if you change $C029, when you enter the Control Panel it will change back (the Control Panel remembers what it's supposed to be). That means manually toggling from something like "Visit Monitor" is hopeless. Second, enabling the 80-column firmware to simulate the "single-wide double high-res monochrome" mode will force you to use the alternate character set, which means no flashing characters (and make sure you use the right ASCII range for "inverse" characters or you'll see text as MouseText). If you're writing your own program, you can probably work around these. If you're using someone else's program, $50-$100 for a monochrome monitor (you can leave it hooked up at the same time as the RGB monitor) is probably the quickest road to sanity.

Incidentally, the green/purple "fringe" created by single vertical lines on the standard high-res screen on a color monitor is _normal_ and perfectly proper due to the way the color circuitry was originally designed on the Apple II. Remember the Apple II was one of the first personal computers using _any_ color, and the design had to carry through for compatibility reasons. (I'm always getting letters from people insisting I'm wrong and that this is "broken". It isn't; look up the original articles by Steve Wozniak in _Byte_ and Bob Bishop in _Apple Orchard_. :)

If you have to have a vertical _white_ line, you have to plot it two pixels wide, effectively reducing the screen resolution to 140 across. This isn't usually enough to simulate high-res text, so high-res simulations of the text screen have color fringes. (Bishop's article explains this better than anything I've seen, and maybe the information needs to be paraphrased in _A2- Central_ someday. :)

See, it's really easy to figure out. (NOT! :)

(A2-CENTRAL, CAT2, TOP11, MSG:14/M645;1)

TECH TALK II Your problem with out of memory errors in your program is NOT a reflection of your 4 MB RAM IIgs (which seems massive enough). It is because when you are using Applesoft BASIC you are ACTUALLY running a 128K Apple IIe. To word it a different way: Inside your 4 MB Apple IIGS is a smaller box. In that box is an Apple IIe, 128K memory. Furthermore, inside that 128K Apple IIe is a 48K Apple II+, in a smaller box. Applesoft was designed in 1977 for that 48K computer, and it has NO IDEA that is REALLY running on a computer with 85 times the memory.
Apple II Computer Info

With 48K memory, you've got 2K being used by the system for screen display, stack, and so on, plus 10.5K being used by BASIC.SYSTEM (in the upper part of that memory). That leaves 35.5K for programs, which does NOT take into account any space that might be needed by variables, strings, etc. And don't even THINK about hi-res graphics, which takes another 8K right out of the MIDDLE of your program (not a convenient place).

What are your options? Well, you COULD go back to DOS 3.3 and do the program from there (although I doubt it could be done from DOS 3.3 either, unless you are using a utility that moves DOS onto the "Language Card", which was the name for the extra 16K memory that II+ users could add to give them a 64K machine. That memory is built into the IIe, which you recall is what you are actually running on in this example). Using the DOS 3.3 Launcher (available here in the A2 Library) you could still have the program on a 3.5 disk and launch it from the Finder.

OR, you could find the old Beagle Bros called "Extra K", which frees up the other 64K available in your 128K Apple IIe for use of your program (for variable and string storage). I am not sure, but I believe that Extra K may be here in the A2 Library as a freeware program.

OR, you will have to segment your program, so that it is in smaller parts that link to each other as needed.

OR, you could learn a IIGS-specific language, and write your program to run under that language. That kind of language would KNOW that it was running on a IIGS, and would be able to take advantage of the extra memory.

If you need further help with this, there are many smart programmers in A2Pro that would be glad to explain this further.

(S.WEYHRICH, CAT9, TOP9, MSG:64/M645;1)

DRIVES, DRIVES, DRIVES You cannot format a SyQuest yourself. The floptical is different though. The drive can actually lay down a low level format, but it may be tricky if the disk was previously formatted. Read on.

The "optical" in floptical refers to the mechanism which the drive uses to align the magnetic r/w head between the servo tracks. The hundreds of servo tracks are "etched" into the media and are themselves impervious to magnetic fields. Open the shutter on one of your 21 meg diskettes and look closely at the bottom surface.

However, magnetic tracks written are NOT impervious. By playing around with a diskette with different enclosures, cards, drivers etc, I managed to mess one up pretty well. A RamFast format would fail with an error every time. Thought I had ruined the diskette actually.

But it reminded me of Apple tape media, where if you screw it up just right, you can hopelessly confuse the drive as it tries to rely on invalid manufacturers track info. Also, without an erase head (like a streamer tape would use for example) the drive may have problems overwriting an existing format if there is not enough write current compared to the drive which originally formatted the media. Some of my GSTape users are very familiar with the problem.
The solution (as with the Apple tape) is to "bulk erase" the puppy and wipe it "completely" blank. (I recommend the video-tape eraser from Radio Shack which is more powerful and thorough than the cheaper one sold for audio cassettes.)

Then format it with the RamFAST utility program. Go into the SCSI util part and insert the disk. While the drive is spinning mindlessly, select format. It takes 25 minutes or so so be patient.

(1) The solution (as with the Apple tape) is to "bulk erase" the puppy and wipe it "completely" blank. (I recommend the video-tape eraser from Radio Shack which is more powerful and thorough than the cheaper one sold for audio cassettes.)

HEY, EASE UP A BIT! I think you're being a little hard on the good old IIe's! Bought mine in 1983, and it has yet to develop a single problem — in spite of having been dragged overseas (where it spent 5 years running on 50 Hz power) and back.

Installed a Vulcan internal HD 4-5 years ago along with an internal modem. All slots are full and it's running on an 8 MHz ZipChip. It's on 24 hours a day without a problem. When I'm away for more than a couple of days or a power outage is imminent. The only additional cooling I use is a Kensington System Saver (which has also been running for 10 years).

(B.MILYKO, CAT, TOP, MSG:/M645;1)

> I was trying to track down a minor problem I was having in AWorks 3.0 and noticed that one of the versions had Seg.00, Seg.AM. and Seg.XM, and the other version didn't.

These three segments and one other (SEG.RM) are used to tell AppleWorks what type of memory you have and how to use it. Only one of the four is actually needed for whatever machine you are using it on. Here is what you need for each type of machine.

SEG.RM -> //GS memory segment
SEG.00 -> //e or //c with 128k
SEG.AM -> //e with larger memory card in aux slot
a //c with extra memory will need one of these two, I don't know which
SEG.XM -> //e using a standard slot memory card

(B.MILYKO, CAT, TOP, MSG:/M645;1)

[WHAS] WHAT'S NEW? /

New and Improved

DOS 3.3 LAUNCHER I just got Dos 3.3 launcher which launches d3.3 files from the finder or prodos 8 on a IIe//c. It is one of the best utilities I've ever used. I can play Defender without having to reboot!

(D.HAND4, CAT9, TOP16, MSG:35/M645;1)

If there is still anybody who does not know:

When it comes to IDE drives, the Turbo IDE Card is the ultimate hard disk controller for any IDE drive, including Vulcan, InnerDrive and OverDrive systems. Why? The Turbo IDE Card uses DMA to make IDE drives RAMFAST!! It is the only IDE controller for the Apple II that uses DMA.

So if you feel your hard drive is a little bit too slow, consider
upgrading your system with a Turbo IDE Card - don't throw away your IDE hard drive equipment and buy SCSI!

More details about the Turbo IDE Card you can get in the A2 library on GEnie:

TURBO.IDE.BXY    a description of the Turbo IDE Card
TURBO.NEWS.BXY   Turbo IDE Card supports !!any!! Vulcan drive

The Turbo IDE Card is available from

[THR] THOROUGH THE GRAPEVINE... /

Rumors, Maybes and Mayhem

\/// ell, GSHK was _going_ to be commercial.... ][ think I mentioned it before, but: When the programs that pack files are commercial, changing the format is beneficial to the people that make/sell them, as people need to keep buying the updated versions to unpack the changed format. Even when they're NONcommercial the programmers have few scruples about changing the format, as they figure "well, anyone can download the latest version, so it doesn't matter." It may not matter to the computer format that the program was written for, but it does matter to all others. Also, think about this: if the programmers keep updating the formats, then people need to keep downloading the latest versions of the programs, which actually makes the online services happy. It's like selling appliances or cars. If you sell a customer one that never breaks, they're never going to need to buy a new one from you again. You'll have to rely on only the allure of having the "latest and greatest" for people to buy new models.

MESSAGE SPOTLIGHT /

Word To The Wise

A couple of tips -

On GEnie, use a line width of 78 instead of 80. You won't be able to tell the difference, but, many people use this width. Thus, if your messages are sent with a line width of 80, some lines will wind up wrapped improperly, as in the case with the following part from Jerry's message above, which looked like this on my end:

How to:
<> Log on automatically, read mail if it exists, go to favorite areas, read the posts of interest there and log off with just a couple of keystrokes.

But which he probably meant to look something like this:

How to:
<> Log on automatically, read mail if it exists, go to favorite areas, read the posts of interest there and log off with just a couple of keystrokes.

I thus strongly recommend setting to a "Send length" of 78 or less (75 if you want to be really conservative - some graphical based programs, especially those on smaller Macs, can't quite manage 80 columns readably).

Also, much as I hate to admit it, GEnie is a fairly slow system at times. Therefore, I strongly advise using a Protocol Speed setting of "Slow" instead of "Medium" or "Fast."

I recommend using everything else Jerry recommended. :-) 

[*][*][*]

Here's a tip not everyone knows for making sending stuff to GEnie easier:

Go to the GEnie setup menu (just type SETUP at any page-numbered menu prompt) and set up GEnie to use a "prompt character" of ASCII 62 instead of 63. This will substitute a greater-than for a question mark at most of
THEN, you can do something really neat. You can set up a text file to do everything for you, such as in the following way:

M645;1
SET 24
REP 11

Hi Jerry! Nice to see you giving people these handy tips for using GENie! ProTerm is awesome. Keep up the good work!

Dean Esmay
*S
SET 29
REP 5
To heck with you GEM users, I can do it all within ProTerm!

Dean Esmay
*S
BRO NOR
BYE

....and so on.

I put a space in front of everything here to prevent GENie from getting confused by the "*S" at the start of some of those lines - normally you wouldn't do that.

See, with GENie set to send a prompt character of greather-than instead of a question mark, that makes EVERY line start with a "">". So if you set ProTerm to watch for a "">" prompt, then you can set up text files with any string of commands or text you want.

So if you just know the GENie commands you want, you can set up a text file to do lots of stuff for you. In fact, programs like GEM and CoPilot use this very trick to do a lot of GENie work automatically. :-)

By the way, in case you didn't know, BRO NOR means BROWse NOReply, so if you type BRO NOR, it will get all new messages without stopping between topics or categories - it'll just go VOOM like a rocket and grab everything new. You can also do a BRO CAT NOR if you just want to do that on one category. ;-)

So the text file above, if you started to send it to GENie from anywhere on GENie, would jump to page 645 (A2) and select option #1 (enter the bulletin board), SET to category 24 and reply to Cat 11, put in that message and save it, then SET to 29 and reply to Topic 5, then would get a list of all new messages in the bulletin board, then log off.

Then you could read all the new messages in your scrollback buffer (if you have enough memory) and use the ProTerm editor to clip out, quote, and respond to anything you want, building your text file the same way.

This is just one way of doing things.

[*][*][*]
While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your AII, the GENieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

GENie Fun And Games

By Cliff Allen
[C.ALLEN17]

>>> ANNOUNCING THE "LIRPA 1" <<<

~ The ultimate platter balancer and bit bucket! ~

I am not quite sure if I am going to explain this correctly, but just for grins, here it goes. When you store information on a disk, does the disk increase in weight? Another way of looking at it, on a piece of blank paper, you write something. The substance from the pencil leaves marks, which in turn increases the weight of the piece of paper by a very small detectable amount. When you erase the writing, the paper now regains its original weight, but look at the erased substance - a combination of eraser and writing material.

Now, think about the computer disks. Initially, the disk contains nothing but 0's (not magnetized). When you store something on disks, it becomes a combination of 1's and 0's (not magnetized). Because nothing made of different or magnetized materials weighs the same, it would imply that a disk full of that the software 1's weigh different than one full of 0's. Could this explain the reason that retrieving information from a full hard disk takes longer - not only does it have to find the information but that the disk is spinning undetectably slower due to the increase increase in weight.

Is it possible that the software to make information contiguous on drives balances the platter? Software that I have can do this in two modes: [1] for reading (placing "IS IT POSSIBLE THAT SOFTWARE information closer to the center TO MAKE INFORMATION CONTIGUOUS of the disk so the head doesn't ON DRIVES BALANCES THE have to move so far to read) or PLATTER?" [2] for writing (placing the information on the outer rim of the disk so the head doesn't have to move far to write new data).

It might be possible to prove my my initial statement that 1's cause an increase in disk weight by moving all data to the outer edge, and use sensitive equipment to detect any increase in momentum in the rotating disk. I am presently building such a device that not only detects the slowing down of rotation, but will compensate by increasing platter speed if needed, because I firmly believe that a majority of hard disk crashes are caused by this uneven weighting of stored information.
Once I have completed this, I will be tracking down another much needed problem. Does magnetism just disappear? Now that I've pretty much proved that magnetized objects weight more than non magnetized, and that matter cannot be created or destroyed, where does the magnetism go when it becomes unmagnetized?

While working on a mobile radar system, I found that the twystron transmitter tube (power output of a klystron and the bandwidth of the TWT tube) had what was called a VAC ION pump. Its purpose in life was to pull electrons that for some reason have strayed from the center flow and stuck the walls of the tube. The VAC ION pump was like a vacuum cleaner that attracted these stray electrons and gave them a path to ground, so that they would not become a hindrance to the concentrated electron beam that eventually produces the RF energy needed by the radar system. I apologize for straying, but I needed to produce some substantiating evidence to prove my next point.

A 0 bit weighs nothing, and a 1 bit weighs a little more than nothing. When you replace a 1 with a 0, where does the 1 go? I think I have found out. While looking through the schematics of several computer systems, I came across a couple of ICs with obscure labeling. Looking through an IC Master book, these ICs pinned out to be compact RAM storage. In effect, these ICs are spare bit storage. When data is entered into the computer, if a 1 is needed, the MMU (memory management unit) first checks the bit storage chip, if empty it will bring one in from outside circuits. The term, computer glitch is so common that it is just accepted. My theory is that the bit storage chip is full and the unstored 1 causes these glitches.

The device that I'm building and testing at present will be modified to contain additional bit storage. Look for this much needed and revolutionary device at the BLUE RIDGE ATARIFEST in July. Y'all Come! Ask for the ********** LIRPA 1 **********

The ultimate platter balancer and bit bucket!
You see, most spelling checkers are abysmally dumb. They don't know the difference between "bear" and "bare," or "do" and "dew." All that most spelling checkers know is that "do" is spelled just as correctly as "dew" is.

And that's where the disaster comes in.

Combine a bad speller (human variety) with a bad software program that can't distinguish between the appropriate word and the one that is just plain ludicrous, and you have the seeds of the new illiteracy.

A poem posted on the Internet, a worldwide computer network, shows what I mean. Here it is:

"Spellbound"
by Pennye Harper

I have a spelling checker;
It came with my PC.
It plainly marks four my revue
Mistakes I cannot see.
I've run this poem threw it;
I'm sure your pleased too no.
It's letter-perfect in it's weigh.
My checker tolled me sew.

I've brought this problem up with other writers, and many of them say the current reliance on spelling checkers has made most of us lazy. Instead of looking up (and learning) a word we don't know how to spell, we just keep typing away, confident that the spelling checker will catch our mistakes.

This is probably true. But I look at it another way. Spelling is supposed to be taught in school long before students do much writing on PCs, so I don't think spelling checkers are to blame if we can't spell; I think these brainless software programs are simply showing how poorly we were taught at an early age.

I say "we" so that you don't get the impression that I am just talking about kids. Adults have this homonymic affliction, too.

The other day, a distinguished publisher of how-to books sent me a review copy of a book by a respected author. In the back of the book, he explained how he had done most of the work on the book himself - even producing the book's pages, ready for the publisher's press, on his own desktop-publishing software and laser printer.

I hadn't read past Page 11 when I saw his first gaffe.

"Press the brake key," the book said.

There were other mistakes just like that throughout the book.

I had better things to do than wade through that sort of illiteracy, so I put on the breaks and went back to my keybored. The book went into the trash.
"When he sits around the computer, he really sits _around_ the computer."

That sentence pretty much describes me. I'll admit it: I've tortured my culinary sensibilities with McWendy's not-so-haute cuisine with the worst of them. Richard Simmons would be aghast at the sight of my daily repast.

While I'm baring my ASCII: I'm 6'5" (not 6'5" through, by the way, but the jury is out as long as the light inside the refrigerator isn't) tall, and when I was in high school and attended family gatherings, distant male relatives would always ask me if I played football.

People have stopped asking me that. Instead they'll say something on the order of "I've got a cousin about your size. Where do you buy your clothes?". My father will take a close look at me and fade into a story about someone he vaguely knew ten years ago who died in bed after about nine heart attacks after they had quintuple- bypass surgery, the result requiring bashing a gaping hole in the roof of the poor deceased person's house, the services of a crane operator, a carpenter, and a large flatbed truck with a "Wide Load" sign fluttering in the breeze on its rear.

I really shouldn't trivialize my plight and the plight of many others who are ruled by their food. Then again, no one else should -- but does that stop every dumbarse from recycling tired fat jokes for the burning ears of overweight targets, waddling down the main aisles of KMarts across the country? I've felt their dull barbs for most of my life, and my main recourse is humor. My main course is a double cheeseburger with the works, but my main recourse is humor.

I haven't always been obese. When I was 14 years old, I starved, bicycled, and exercised my excess weight into temporary oblivion. I was amazed at the easy way I became 'popular' with the jocks. One of them asked me how I did it, and seemed quite surprised when I said, "I don't eat anymore. I'm a one-serving kinda guy."

Then summer vacation came, and my weight slowly began to return -- along with the stares and the jokes. I can remember sitting in our living room and scarfing down one peanut butter sandwich after another. Why? I've often thought that I was so afraid of living up to everyone's expectations that I took the easy way out: my old protective coloration. I doubt it. The answer was that I was on the wrong kind of diet. Starvation diets hardly ever work, as I've since been told.
So why don't I "buck up" and lose the weight again, the right way this time? Hmm . . . here's the answer: I'm waiting for R. Simmons to acknowledge my existence by selling his once-controversial "Deal-a-Meal" package, long ago adapted for use on PCs, on the QVC shopping network.

Then some rotund hacker will give in and write a "cheat program" for it, and I'll be able to eat all the chocolate cake and Haagen Daz (now in version 6.0, I believe) I want.

Can you imagine the calls he'd get on the tech support line? "Richard, this is Wanda. My husband got so desperate last night that he ate the Deal-a-Meal disk, and wouldn't give me a byte. It was a high-density disk, so he said he felt pretty full after it went down. Now we have no program. Then he said he had some of the wallpaper in our bedroom with ranch dressing, and swore it was delicious. What do I dooooo?"

"Hang on, Wanda. (Lapsing into some sort of high-pitched shriek.) 'Help me, Wanda, help-help me Wanda'. We'll send you a backup. About the wallpaper, ask your husband to send me a sample of it and if it's good enough, I'll put it in my cookbook."

Now that my TV, VCR, and cassette deck have fallen to Sir Richard, so far, only my computer remains unsoiled. There's a TV in the computer room, though. But there is also a way out.

"... I hold the fork", Simmons reads, racking up another fifty or so sales.

"And I hold the remote control," I say.

Who's Who In Apple II

\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\n

~ GEnieLamp Profile: Kitchen Sink Software ~

[Prefatory note: Kitchen Sink Software is a partnership currently owned by Guy Forsythe, Cindy Forsythe and Eric Bush. Most of the following questions have been answered by Guy, the founder of the company.]

[*)[*)[*]

GEnieLamp> Guy, can you tell us a little of how you first became interested in the Apple II?

"""""
Kitchen Sink Software> In 1983 I was (and still am) a Drafting teacher. I wanted to introduce computer-assisted design, CAD, in my classes at the local high school. I saw some computer things being done by teachers at a professional conference and decided I needed to start learning. I had just finished building my new home and was ready for
a fresh challenge. The computer teacher at the high school had just gotten a lab of Apple //e's and offered a short in-service in computer programming. I took it. We learned a few simple commands and that was about it. I checked the Applesoft manual out of the library and started reading it during my hall duty. It seemed logical and easy to do. A friend of my wife Cindy had purchased an Apple //+ with one drive and an Okidata printer. That was a $2700 system. In those days you could buy a good late model used car for that kind of money! She tried programming but it just didn't "take" with her so she loaned me the computer over the summer of 1983. I wrote a few programs. Nothing over a few hundred lines and none of them did anything of any significance.

GENieLamp> When and how did you decide to start Kitchen Sink Software?

Kitchen Sink Software> The next school year I looked into buying a CAD system. I bought an architectural design program that is still popular today. It had no scale to the printout. You could design a house, but it was a fantasy house that could not be built. So I sent it back and tried a Versawriter. It was a graphic tablet with software. It was a darned good product in its day. I found a way to measure when using the Versawriter that allowed me to get accurate scale printouts on an Epson MX-100 printer using Graphtrix software to dump the hires screen to the printer. It was workable but in the winter of 1984 I started writing a program that would teach true CAD in the classroom. In the spring I bought an unenhanced //e and really sweat over all the extra money I put out for the full 128k and duodisk (that duodisk STILL duplicates hundreds of disks each year). I called it CADDRAW.

In the late spring I called a Drafting supply company that supplies schools and has an excellent reputation. They wanted to take a look, so Cindy and I packed up the computer and drove 50 miles to the supplier. They weren't interested at first but called us back the next week and we gave another demo. This time the said they would sell it and make it their big new product in the Fall when school starts. They were doing nothing with software at that time, and were scared of venturing into the field.

They wanted me to handle the publishing because of their initial fear. I just wanted royalties but decided to publish it. CADDRAW ended up being 10% of their total sales the first year. We made good money and they expanded their customer base as CADDRAW brought them new customers for traditional supplies too. They are still out biggest dealer. CADDRAW became the number one program in the schools for teaching CAD. The major press didn't think much of it though, so we didn't get good reviews. It was a bit crude since it was my first real program. But, it was the only program of the time that gave accurate scale drawings on a dot matrix printer. As a professional designer, that was far more important to me. The other programs were slightly "slicker" in appearance but the output was worthless.

GENieLamp> At some time in the company's early history you teamed up with Jerry Kindall, who recently became editor-in-chief of "II Alive," the new bi-monthly magazine published by Quality Computers. How did Jerry come to work for Kitchen Sink Software?

Kitchen Sink Software> I saw Jerry writing letters to Open Apple (now A2-Central). He seemed to really know ProDOS. I had started AccuDraw in DOS 3.3 but wanted to go ProDOS with it. But
BASIC.SYSTEM is such a memory hog. Jerry lived in a suburb of Columbus exactly across town from Westerville where I am. So I looked up Jerry in the phone book. I found a Kindall in Grove City, but not Jerry. Turned out he was a student at the local 2 year college. He and I both had an interest in writing a compact shell to link Applesoft with ProDOS. He was selling paint at Sears part time. I offered him slightly more than Sears and he went for it. He started on a compact DOS shell. He kept saying things like "With just 28 more bytes I can add a rename command." The next thing you know, we had MicroDot. Then he started writing graphic assembler routines for AccuDraw. Then he graduated and got a real job at Quality. CADDRAW was starting to fade badly so I could not afford to pay him anymore so it all worked out the best for both of us that Quality wanted him.

GEneLamp> When did Eric Bush come on board at Kitchen Sink Software? And what programming projects has Eric worked on for the company?

Kitchen Sink Software> Eric was my student teacher in 1988. He had never worked on an Apple before, but he learned fast. I told him what I thought a good grade book program should be and a year later he showed up with Amazing Window. A year later it went into production. Eric and I became friends and he helped do a million little things for AccuDraw and other projects like "Kick Start" and "Routines Vol. I," just because he thought it was fun. This past January Eric finally got paid. He now owns 1/3 of Kitchen Sink. He still doesn't make anything, but now I can call him anytime or have him help with a mass mailing and have no guilt feelings. :)
decimal based and is constantly updated as you move the cursor. No
counting grid lines or ruler lines on two edges. The X, Y, True Length
distance and angle from horizontal are right together so you see them all
at once. Just press "m" and the 0,0 point changes to the current cursor
location. There is much more.

Amazing Window is THE best grade book program. It is a spreadsheet
with two windows. One window shows student names and the other shows the
 corresponding grades. It displays 10 names and ten grades for each name at
a time. The current student name and current grade are both highlighted so
there is no doubt which name you are on. At the top of the screen, the
current assignment name, point value and weighted area are displayed. You
can get a spreadsheet type printout or ten other printouts. The most
popular is the work sheet. It is a temporary grade book for storing a
weeks worth of grades and attendance. I use them the first few weeks of
the year while kids are changing schedules.

When Cindy Field (from A+/Incider) reviewed Amazing Window she gave me
a call. One of her comments was that she was amazed at how fast the
spreadsheet scrolled and displayed all the information too. It is a credit
to Eric's programming skill. Cindy thought her Apple IIIGS might still be
in the fast mode when it was actually in the slow mode. It is just that
Eric's code is so fast.

You never hear about Robot Assembly Lab but last year it was our
number one program. It is simple enough for 5th graders to use and
interesting enough for high schoolers to use. You design robots based on
customer specifications using the 64 components available. Cost is a
factor and you earn commissions. It is our biggest seller to dealers.

Just recently Kitchen Sink Software obtained the distribution
rights to OmniPrint, an ImageWriter II printer utility. How
did this arrangement come about? What do you think are the most useful
features of OmniPrint?

Kitchen Sink Software> When Randy Brandt (creator of TimeOut UltraMacros
and other gems) first showed me OmniPrint in the
wee hours at the Kansasfest summer conference, in 1991, I told him I could
sell a hoot load. He said he'd give me a good dealer price if we could
just come to agreement on what a hoot load is in real numbers. We
negotiated and concluded it was a whole Byte (256). I love Apple //
people! They are never to busy to waste a bunch of time having fun!
Skipping all the details of why, we are now the publishers of OmniPrint.
The changes we have made to the package are that it now runs on a 128k //e
with 5.25" drives. (OmniPrint does require AppleWorks 3.0.) It also now
includes a printed manual and two great "cheat sheets." We also put a
couple more sample files on the disk. The work we did to get it to this
point is why Randy let us take over publishing it. The features I use the
most are the borders, the double-high fonts and the ability to change
Characters Per Inch and fonts mid-line.

Also, I use OmniPrint to set the ImageWriter II to the best print mode
instead of pushing the buttons on the ImageWriter. Math teachers will love
the math symbols. Foreign language teachers will like the fact that you
get ALL the ImageWriter II foreign characters. GEnie folks will like the
ability to print Mousetext as well as all the features. And what's really
neat is that it prints out at text speed. If you have a color ribbon, you
can change colors anywhere in the document you want and as often as you
what. Note, though, that OmniPrint work only with the AppleWorks word processing module.

GEnieLamp> What is your wife Cindy's role in running Kitchen Sink Software?

Kitchen Sink Software> Cindy does the real work. She puts together the software packages, shipping, invoicing. She does all the day to day operations as well as keep me on the straight and narrow. She makes sure our programs and instructions are understandable by real people and not just us weirdos.

GEnieLamp> From what I understand your partner, Eric Bush, recently finished his masters degree. Was this a masters in education or a masters in computer science? Will Eric be staying on at Kitchen Sink?

Kitchen Sink Software> Eric has to stay. Since he is part owner he comes under the heading of "Slaves cannot quit." :) I'll let him tell you about his Master's.

GEnieLamp> Eric, can you tell us a little about the subject of your master's thesis? Are you currently teaching full-time? Doing any computer programming work outside of Kitchen Sink Software?

Kitchen Sink Software> My thesis was titled "Considerations for the Development of Educational Computer Software". In using software, I saw programs that were written by programmers that had no teaching background. I saw programs that were written by teachers with no programming background. A model was presented in my thesis to allow programmers to see what should be included from an education standpoint and to allow teachers to see what should be included from a programming standpoint.

I taught in the public schools for three years before returning to The Ohio State University to pursue my Master’s degree. I completed my Master’s in Education in December of 1992. I am currently involved with a national clearinghouse for science and mathematics related instructional materials. The clearinghouse collects, abstracts, and makes available instructional materials for the K-12 teacher. These materials will include, software, kits, videos, filmstrips, and any other kind of media you can think of. My position relates to creating relational databases that can be accessed across a network and providing the catalog records that can be searched on-line.

My position at the clearinghouse allows me to do some applications programming, but it is mostly software setup and database development. I do most of my programming (Apple II) between 6:00 pm and 12:00 am (with some nights a little later than that).

GEnieLamp> Eric, can you tell us about your hobbies and interests? What would you like to do more of if you had the time?

Kitchen Sink Software> My biggest hobby is of course computer programming. But, when I am not programming, I enjoy working on my father’s farm (which is about 4,500 acres). I am currently refurbishing two antique reel type lawn mowers which I hope to use to maintain the yard in the house that my wife (Cheryl) and I purchased...
in October, 1992. Electricity is a hobby that has come in quite handy with the new house. Adding lights, switches, phones, etc. where I want them has been an enjoyable pastime.

GEnieLamp> Many software publishing companies that started out with the Apple II are moving to cross-platform development for future software products. Is it possible that Kitchen Sink Software may be releasing any Mac or IBM products in the future?

Kitchen Sink Software> We already have a product for both. It is called Streamlined CNC. It is for writing G-Code program for CNC vertical mills. Any product we develop in the future will be across all platforms. In the education market, there simply is no choice any more. Eric is the MAC person. He has already started a total re-write of our Robot Assembly Lab for the MAC. I am doing the Apple version. And we have a third person doing the IBM version for royalties (that means he'll actually make some money!). We do have an Apple // specific program in the works and an IBM specific program in the works. Sadly, I expect the IBM program to be the best revenue generator. But if it makes money, we can afford to keep developing for the Apple. I guess I am an Apple // groupie. Note that we are 8-bit people and we still think that the //e still holds up compared to the others for the type of applications that most people need or want. I am sitting next to my MAC Centris 610 as I use AppleWorks to type this in.

GEnieLamp> Kitchen Sink Software has attended three out of the four summer KansasFest conferences organized by Resource Central. Can you share a few words about your view of Resource Central and their work? Are you planning on making a presentation again at this summer's conference?

Kitchen Sink Software> Jerry Kindall went to the first KansasFest when he was working for us. Eric and I have gone together to every conference since then. We both presented at the last two conferences, and our presentations were well attended. We seemed to be the major 8-bit presenters there. We will be submitting proposals to Resource Central to present again at this upcoming summer's conference.

Eric and I both like teaching to people who really want to learn something. Which is so refreshing compared to the public school classroom.

I think of Resource Central as the glue that is holding together what is left of the Apple // world. They carry on the old Apple // hacker atmosphere that Beagle Bros started. And Kansasfest itself... It is as good as going to the National Model Railroading Convention. Now that may not mean much to most of you, but these are the only two places I ever go overnight without my wife and I AM FAITHFUL to her.

GEnieLamp> For reference purposes, kindly list the Apple II software products that Kitchen Sink Software distributes -- along with their prices and how to reach you.

Kitchen Sink Software> Call us at 1-800-235-2205 or 614-891-2111

Kitchen Sink Software, Inc.
903 Knebworth ct.
Westerville, OH 43081 USA
We publish a newsletter 2 to 3 times a year called "Creativity Update." It is oriented toward our education market but has general computer information and, of course, all of our products. Call for a free copy. We send one out with every inquiry. But to get onto our regular mailing list for two years you have to purchase a product direct or through a dealer or send us $2.00 for two year subscription.

A note on dealers. Naturally, we make more profit on a direct sale, but frankly, dealers provide volume because of exposure in their catalogs. We have found it extremely difficult to get dealers outside of education. Call your dealer and insist they order it in for you. We will be happy to give them a good discount. We want them to find out that they can make money carrying our products. They won't know if they don't hear from customers.

Products (Apple //e except as noted):

- AccuDraw Electronics $ 99.95
- AccuDraw Floor Plan $ 99.95
- AccuDraw Floor Plan and Electronics $ 138.90
- AccuDraw Floor Plan network version $ 299.95
  (you can add the second module later for $39.95)
- Amazing Window Gradesheet $ 49.95
- Amazing Window Gradesheet building license $1.50 per teacher
- Amazing Median Gradesheet - same as Amazing Window 1/4" Scale Exterior
  1/2" Scale Kitchen Symbols for Accudraw $ 39.95
- Robot Assembly Lab $ 49.95
- Robot Assembly Lab pack for 6 computers $ 99.95
- Bridge Builder $ 58.95
- Bridge Builder Lab pack for entire building $ 118.95
- Bridge Builder IBM $ 98.95 Lab Pack/5 disks IBM $347.95
- MicroDot $ 29.95
- Kick Start $ 9.95
- Routines Vol. I $ 9.95
- CNC Trainer $ 69.95
- Bridgeport Mill Driver $ 39.95
- Dyna Mill Post Processor and Driver $ 39.95
- CNC Trainer with building license $ 149.95
- Streamlined CNC MAC or IBM $199.95
- Streamlined CNC with building license MAC or IBM $399.95
- Getting Started in G-Code book $ 5.00
- OmniPrint $ 49.95

Shipping is $3.00 anywhere in the lower 48 states.
8.00 for Canada, AK and HI
Actual Cost every place else.
$5.00 extra for COD
Overnight or 2nd day air UPS: Actual cost

We take checks, money orders, purchase orders, Visa, Mastercard, or COD.

Reflections

Online Communications

By Phil Shapiro

>>> ONLINE EDITING <<<

~ Polishing the Written Word ~

In ages past the written word served principally as a means of communication. In this information age, the written word is increasingly becoming an economic commodity in its own right. But unlike tangible economic commodities, information commodities have the capability of bearing greatly enhanced value if they have first passed through the hands of an eagle-eyed editor.

Chances are that in the not too distant future every professional, regardless of trade, will spend upwards of two to three hours each day writing. When a person's livelihood depends on the clarity of his or her written expression, you can be sure that person will give thought to making use of editing services.

Enter online editing. When it absolutely positively has to be edited before tomorrow morning, you can't beat electronic mail for speed, price, and convenience.

To be sure, the fax machine has great potential as an editing tool. Editor's comments can be scribbled in the margins, or can be penciled in right above the offending text. But faxes take time to send. For a simple editing job, fax machines could work well. But if multiple drafts need to be sent back and forth, electronic mail works out to be both faster and cheaper.

The Pricing of Editing Services

The pricing of online editing services is likely to be pegged to the time-sensitive nature of the editing job. Prose that can wait a whole week to be edited will likely be priced at a substantially lower rate than prose that needs to be edited before tomorrow morning. Premium rates will apply to prose that needs to be edited before the end of the next hour. Some editing services may even offer live, while-you-wait, online editing.

It's interesting to spend a little time thinking about the pricing of online editing services. Of what economic value would it be to a lawyer to make sure his or her legal brief is clear, concise, and free of embarrassing grammatical mistakes? Would the value be $75? $150 $350? $500?

If you're not sure how to answer this question, consider asking a defendant in a criminal trial how much he or she values his or her freedom. Ask a doctor accused of malpractice how much he or she values retaining his or her medical license. Ask a large corporation how much it values being exonerated of tort liability.

Naturally, the value of an editing service may vary depending on the
particular circumstances facing the author on that particular day. But it's quite conceivable that a professional worker may be willing to pay $200 or more to have an hour's worth of online interactive editing. When the stakes are really high, the value of an online editing service could rise to the $800 to $1000 level for two to three hours of late-night, while-you-wait editing.

Online Editing in the Academic World

Thinking along the same lines, how much would it be worth for a college student to have his or her English, history, or social studies paper looked over by an editor's eyes? How much would an Ivy League pre-med value getting an "A" over a "B" on an important term paper?

This, of course, raises some thorny ethical issues. How can a professor be sure that a student's writing has not been entirely re-written by a fee-based online editing service? The best counter-argument to this concern is that the ethical problems of "student originality" have always been a concern on campuses. The fact that a student makes use of an online editing service does not itself imply that an abuse of that editing service has taken place.

Already steps are being taken on some campuses to verify the originality of student writings. College students of the 1990's should not be surprised, then, to have professors asking them to hand in rough drafts along with their finished papers.

Online Editing Conventions

As online editing becomes a more accepted practice, online editing conventions will surely become more commonplace. Instead of re-sending an entire edited manuscript back to an author, many editors will favor sending just the suggested modifications.

For instance, text to be deleted could be enclosed in square brackets. "[To be or not to be; that is the thing I've been thinking about a lot lately."

Text to be added could be included in curly-brackets. {"To be, or not to be. That is the question."}

Numbered Paragraphs Greatly Assist Online Editors

For ease of reference, the numbering of paragraphs will be a big help to online editors. In the case of detailed technical writings, the numbering of sentences could be useful, too. Almost any word-processing macro language can take care of numbering sentences or paragraphs. Look for such a macro coming to a disk drive near you, soon.

It's a basic law of psychology that the human mind cannot simultaneously concentrate on the content of ideas and the expression of those ideas both at the same time. And even if you could do so, few writers anywhere can write prose that is so flawless as to leave an editor with no suggested changes to make. (Whether you decide to make those suggested changes, or not, will always be up to you.) To be sure, grammar checkers and spelling checkers can be helpful in correcting the superficial imperfections in writing. But to straighten out the internal logic of prose -- to tighten prose so that every word carries force and meaning, you must necessarily look to the services of a skilled human editor.
Lucky for you, a fee-based online editing service may be soon only an e-mail message away. It will be interesting to see which of the national information services takes the lead in bringing such services online.

[*][*][*]

Greetings everyone.

* I am firmly convinced that the single most valuable peripheral device that can be connected to a computer is a modem. Once a modem is connected, it's possible for anyone to join that huge group of Apple II users who frequent America Online, CompuServe, GEnie, and the Internet. I'm so convinced of the importance of "going online" that I will be writing a new column for inCider/A+ on the subject. By now, many of you will have seen the first installment of "Grapevine", and I hope that it's piqued your interest in owning a modem. Each month, I'll be sharing interesting Apple II related tidbits found on the various online services, and I'll also be sharing money saving hints and tips for those of you who already have modems. Grapevine; coming monthly to inCider/A+.

* I'd like to mention a brand new $10 Shareware program that's one of the best brain teasing, yet enjoyable, games I've ever played on the IIGS. Kenrick Mock, the author of that fine game Columns GS, has just released BoggleGS, and it's something that all fans of word games should have. When first run, a colorful grid filled with letters appears. You have 3 minutes to find words that can be made from adjacent letters in the grid. It's a very colorful program and even has music. If you enjoy working crossword puzzles, you should really enjoy it, and if you're a teacher, you'll love BoggleGS.

* Speaking of shareware, I'd like to let you know about a fantastic new Apple IIGS shareware utility program that may change your life. Coming all the way from New South Wales in Australia, John MacLean's $10 DOS 3.3 Launcher should be of great interest to long-time Apple II owners who have
a large library of older DOS 3.3 software. In short, DOS 3.3 Launcher provides an easy-to-use way to store, and run, DOS 3.3 software on any hard drive connected to an Apple IIGS. Even if your hard drive wasn't DOS 3.3 compatible before, it is now.

DOS 3.3 Launcher is a GS/OS desktop based program that can be launched from the Finder. It has a standard GS/OS interface complete with pull down menus. Once run, it will allow you to copy DOS 3.3 Binary files, or entire DOS 3.3 disks, to your hard drive, and it will let you launch those files or disks from the Finder, and will return you to The Finder when you're finished using the DOS 3.3 software. DOS 3.3 Launcher works with single or double sided disks. It even slows down old games so that they run at 1 Mhz, and returns you to the GS'es faster speed upon exiting those programs. It does not work, of course, with copy protected software.

John MacLean, who also wrote Roger Wagner's Graphic Exchange, has written a very useful utility program that will soon have you dusting off your old DOS 3.3 software.

* Speaking of new software, I finally got around to installing the new AppleWorks Classic enhancement TimeOut Grammar. This is a grammar checker that works right from within AppleWorks, and I like it a lot. This TimeOut version is based upon the old Sensible Grammar, and works in a similar manner. It checks Appleworks word processing documents for grammar usage and punctuation. Combining that with TimeOut Thesaurus, AppleWorks V3.0 is a writer's best friend. TimeOut Grammar is available from Quality Computers.

* Quality Computers will soon be releasing Finder Helper, an incredible collection of System 6.0 Finder Extensions and Desk Accessories written by noted IIGS programmer Bill Tudor. I really like Finder Helper a lot, but before I provide any details, allow me the liberty to stray, and please be patient with me as I editorialize a little.

Many of the utilities found in Finder Helper started out life as shareware products. Bill Tudor must have been quite proud when he saw that his programs had been downloaded hundreds of times from the various online networks, and were in use on thousands of System 6 equipped GS'es; hardly a day went by when I didn't hear someone rave about how great Bill Tudor's shareware programs were. But, something was amiss. Many of the people that used Bill Tudor's shareware never bothered to send in their shareware fees, so he sought a more traditional outlet for his software. Now that it's a commercial product, he'll at least be getting some monetary reward, but, in some ways, I can't help but feel that the Apple IIGS community has lost something.

It's important to submit shareware fees for programs you use. By sending in shareware fees, you'll be helping to prolong the life of the Apple II, because you'll be encouraging those who program these computers. Think about it, and then take the pledge to submit at least one shareware payment to an author whose work you like.

Getting back to Finder Helper, it's a collection of Finder Extensions and New Desk Accessories that provide useful new tools that can be used when using GS/OS. It includes a very well behaved Alarm Clock that appears in the IIGS Menu Bar. It includes Cdev Alias that allows you to control your Control Panel Devices from a New Desk Accessory. SuperDataPath allows you to easily instruct the Finder where it can find your data files.
HotKeys allows you to launch your favorite programs directly from the IIGS's numerical keyboard. Catalog will save a disk catalog's contents to a file on disk. File Peeker shows you the contents of Text, Teach, Pictures, Sounds, Icons and Filetype documents. Workset allows you to double click on one small icon and have AppleWorksGS, for example, launch and load multiple documents. Crypt allows you to encrypt all your sensitive personal files, and MoreInfo provides, among other things, the ability to lock and unlock files right from the Finder's Extra Menu.

Due to the fact that Apple has trademarked the word "Finder", when this set of utilities is actually released, it may have a different name. No matter what it's named, it's a great package of System 6 enhancements.

* I spent a pleasant afternoon recently with Olivier Goguel, the founder of the FTA, when he was visiting San Francisco. If you're not already familiar with the FTA, make sure you pick up some of their freeware disks from your local user group or download some from your favorite online service. The France based FTA has created a stunning collection of GS software, and it is not to be missed.

The FTA disbanded late last year, and are no longer actively programming for the IIGS, but Olivier Goguel still managed to bring me some GS news from France. And, it's from France that we might eventually see a MultiFinder. In any case, Olivier did give me a disk of his latest software. Alas, it requires an IBM or compatible. I brought it over to a friend's to see, and we were both mightily impressed.

I was able to arrange what I think of as the "Summit Meeting of the Century" between Olivier Goguel and that GS programming master, Bill Heineman. The two spent a day together, impressing each other with their programming abilities. It's just possible that we'll see a joint project coming from that meeting.

* In the rumor department, I've been hearing a lot recently about One World Software Wizards, a new group of Apple IIGS programmers whose plans include a freeware CAD program and a new version of NoiseTracker. It's even rumored that the founder of the FTA is going to be involved. Stay tuned, in future months, to see if anything comes from these great plans.

Gotta Problem?  Gotta Answer!

By Bob Connors

4DOS, NDOS, AND THE LOADHIGH COMMAND

IS MY BATTERY FADING AWAY?

Doctor Bob,

Is the MS-DOS 6 readme correct that 4.02 will fix the LH switch problem? Or does one of the 4.01x versions fix this? Also, how do I install over NDOS which I am using now?

Thanks,
Daniel

Hello Daniel,

My source tells me that 4DOS 4.02 fixes the LH switch problem although he hasn't used it (he uses QEMM386). He does know that it is not fixed in 4.01 though.

As to your second question, there are two ways to go about it:

1) Change the SHELL command in your CONFIG.SYS file to point to 4DOS instead of NDOS. Since NDOS is a subset of 4DOS, that should not affect things.

2) Another alternative is to rename 4DOS.COM to COMMAND.COM and use that in your SHELL statement. I haven't tried it (I don't use 4DOS myself) but my source has and, according to him, it eliminates a whole lot of configuration problems with applications.

Hope this helps but a word of caution, BACKUP!

-Doctor Bob

[*][*][*]

Doctor Bob,

I have a question about the IIGs battery. I have had my 'puter for going on 5 years now, and never changed the battery. Lately, about 4 times out of the last 50 cold boots, my computer lost all of my control panel settings and went to default, except for the sound. It goes to the max. Is this a symptom of my battery going on me or what? Any help would be appreciated. Thanks for any help,

chevy chase  (R.GELLOCK)

Hi Chevy,

What you describe does certainly sound like a weak battery to me. I would suggest that you get it changed or, if you are technically responsible (you know which end of the screwdriver has the blade) and you know the details of your computer's innards, you might be able to do it.
If you do not know how to do it, then either take it to someone who services the IIGS or check out the APPLE, A2PRO, or A2 RoundTables. There is bound to be someone in one of those RoundTables who can give you the necessary guidance.

--Doctor Bob

---

If you have a question about operating systems, GENie or anything concerning computers? If so, you can get your questions answered here in GENieLamp by Doctor Bob. Any question is fair game...and if the good Doctor Bob doesn't know the answer, he'll find someone who does. Stop wandering around in the dark, send your question to Doctor Bob in the Digital Publishing RoundTable bulletin board, CATegory 3, TOPic 3.

(PART 12 -- PERIPHERALS & THE APPLE II ABROAD)  
[v1.2 :: 12 Nov 92]

INTRODUCTION Some information about the foreign versions of the AppleII that have been released in the past are discussed in this section. It also includes an introduction to computer peripherals, and the
classic ones released for this computer over the years.

THE APPLE II ABROAD  Early on, Apple got involved in selling the AppleII in Europe and the Far East. To function in those parts of the world called for a change to handle a different voltage (240V instead of the 120V we use in the U.S.). Also, the language differences had to be overcome. It was easiest in Europe where, for the most part, the standard Roman alphabet was used. The primary differences were in symbols used together with letters for certain specific uses. Apple's Europolis][ had a modified ROM, and certain ESC key sequences could generate the German umlaut symbol to go with certain vowels.<1>

When the IIe was released there were some other differences. The German version was built with an external switch below the keyboard, allowing the user to change between a standard U.S. layout and a German layout. (American versions of the IIe lacked the switch, but had a place on the motherboard that could be modified to allow a Dvorak keyboard layout to be switched in instead of the standard keyboard). The IIe auxiliary slot, which was placed in line with the old slot 0 on American versions (but moved forward on the motherboard) was placed in front of slot 3 on German versions. This was because the European AppleIIe's also had added circuitry to follow the PAL protocol for video output used for televisions and computer monitors in Europe (in the U.S. the NTSC protocol is followed). Because of the extra space needed on the IIe motherboard for the PAL circuits, the auxiliary slot had to be moved to be in line with slot 3. Because the 80-column firmware was mapped to slot 3, if an 80-column card was installed in the auxiliary slot it was not possible to use any other card in slot 3. Versions of the IIe made for other European countries had similar modifications to account for regional differences.<1>,<2>

When the AppleIIc came along, it was designed from the start to take the foreign market into account. If you recall, the U.S. version of the IIc had a standard layout when the keyboard switch was up, and a Dvorak layout when the switch was down. European versions were similar to the American layout with the switch up, and had regional versions that could be swapped in with the switch down. The British version only substituted the British pound sign for the American pound sign on the "3" key, but the French, German, Italian, and Spanish versions had several different symbols available. A Canadian version of the IIc was the same as the American with the switch up, and had some other special symbols with the switch down. This version was unique because each keycap had the symbols for both switched versions. For example, the "3" key had the "3" and "#" symbols, plus the British pound symbol, making it a bit more crowded than a typical keycap.

The AppleIIGS continued the practice of making international versions available, but improved on the design by making the various keyboard layouts all built-in. On the IIGS it was selectable via the control panel, as was the screen display of the special characters for each type of keyboard.

APPLE II PERIPHERALS  Moving on, we will now take a look at hardware items that extend the capability of the AppleII. The ability to add an external hardware device to a computer has been there from the earliest days of the first Altair to the present. In fact, the success of a computer has inevitably led to hackers designing something to make it do things it couldn't do before. The more popular the computer,
the more variety you will find in hardware add-ons. The AppleII, designed by a hacker to be as expandable as possible, was once a leader as a platform for launching new and unique hardware gadgets. Today, in 1991, the AppleII unfortunately no longer holds the front position; it has been supplanted by the Macintosh and IBM crowd. However, the AppleII still benefits from the "trickle-down" of some of the best new devices from other computers (SCSI disk devices and hand scanners, for example). This is due partly to emerging standards that make it easier to design a single hardware device that will work on multiple computers, and in the case of the Macintosh, because of Apple's decision to make peripherals somewhat compatible between the two computer lines.

Trying to sort out all the peripheral devices ever designed for the AppleII series of computers into a sensible order is not easy. In this segment of the AppleII History I'll try to give an overview of hardware devices that were either significant in the advancement of the II, or unique, one-of-a-kind devices. Obviously, this cannot be a comprehensive list; I am limited to those peripherals about which I can find information or have had personal experience.

WHAT IS A PERIPHERAL? A basic definition of a peripheral would be, "Something attached to a computer that makes it possible to do more than it could previously do." It is called a "peripheral" because it usually is connected to the computer after it leaves the factory. An argument could be made that something built-in is not a peripheral, but as things have changed over time there are some devices still called "peripherals" from force of habit, though they are now built-in (hard disks come to mind). Quite probably, in time many devices that were once considered optional accessories will become so essential that they will always be built-in.

Recall that the earliest computers came with almost nothing built-in. They had a microprocessor, a little memory, some means of data input and display of results, the ability to access some or all of the signals from the microprocessor, and that was all. For those computers, the first things that users added were keyboards and TV monitors to make it easier to use them. Recognizing that the earliest hardware peripherals were keyboards and monitors highlights one fact: Nearly everything that is sold as a peripheral for a computer is either an input device, and output device, or an interface to make it possible to connect input and output devices. Exceptions are cards to add memory, co-processor cards to allow it to run software from another computer, and accelerators to make the computer run faster.

EARLY PERIPHERALS When we come to the release of the first AppleII, two important "peripherals" were built-in: A keyboard, and the circuitry to allow easy connection of a TV monitor. It had, of course, the slots for inserting expansion cards (none were available), a game port (for attaching the game paddles that were included), a pin that could be used to connect an RF modulator (so a standard television could be used instead of a computer monitor), and a cassette interface. Since there were no cards available to plug into the slots, you would imagine that the AppleII couldn't make use of any other hardware. However, those early users who had a need usually found a way around these limits.

To get a printed copy of a program listing, for example, was no trivial matter. First, there were very few printers available. Those who could, obtained old used teletypes salvaged from mainframe computers.
Apple II Computer Info

These noisy, massive clunkers often had no lowercase letters (not a big problem, since the Apple II didn't have it either), and printed at the blazing speed of 10 cps (characters per second). To use these printers when there were yet no printer interface cards to make it easy to connect, hackers used a teletype driver written by Wozniak and distributed in the original Apple II Reference Manual (the "red book"). This driver sent characters to the printer through a connection to the game paddle port. One part of being a hacker, you can see, is improvising with what you have.<3>

Another of the earliest devices designed for the Apple II came from Apple Puget Sound Program Library Exchange (A.P.P.L.E.). They were involved in distributing Integer BASIC programs on cassette to members of the group. To make it easier to send those programs to the person responsible for duplicating the cassette, Darrell Aldrich designed a means of sending the programs over the telephone lines. There were no modems available at the time, so his "Apple Box" was attached to the phone line with alligator clips and then plugged into the cassette port on the Apple II. To send a program, you first called up the person who was to receive it and got the computers on each end connected to the Apple II. The sender then used the SAVE command in BASIC to tell the computer to save a program to tape. In actuality, the program was being "saved" through the cassette "out" port to the Apple Box, and onto the phone line connected. At the other end of that phone line, the data went into the other Apple Box, which was connected to the cassette "in" port on the other Apple II. That computer was executing the LOAD command in BASIC to "load" the program from the Apple Box. A.P.P.L.E. sold about twenty of these Apple Boxes at $10 apiece.<3>

INTERFACE CARDS One of the first interface cards made for the Apple II was released, naturally, by Apple. The Apple II Parallel Interface Card was released in 1977 and sold for $180.<4> Wozniak wrote the firmware ROM, and managed to make it fit entirely in only 256 bytes. As a parallel device, it used eight wires to connect the computer with a printer, one line for each data bit in a byte. Various parallel devices also used one or more extra wires as control lines, including a "busy" line (so the receiving device could tell the sending device to stop until it was ready for more), and a "ready" line (so the receiving device could tell the sending device to resume transmission). Because each of the eight bits needed a separate wire, the cables for parallel devices looked like ribbons and were not very compact. Most of the early printers available required this type of interface.<5> A problem noticed with Apple's card, however, was an inability to properly handle these "busy" and "ready" signals (a process known as "handshaking"). One solution offered by a reader of Call-A.P.P.L.E. magazine in 1979 was to add a couple of chips to the card. If that was not done, however, the only way to do printouts that were very long was to either buy a 2K print buffer that could be used with some early printers, or use the "SPEED=" statement in Applesoft to slow down the speed at which data was sent to the printer.<6>,<7>

Apple released the Centronics parallel printer card in 1978. Selling for $225, it was specifically designed to work with Centronics brand printers.<4> It was similar to the Parallel Printer Interface, but had fewer control codes. The "Centronics standard" used seven data bits and three handshaking bits.<8> It would automatically send certain control codes to the printer when a program sent the proper command (such as a change in line width). As such, it was limited to properly working only with a Centronics printer, but many companies made printers that used the same control codes and would work with it.<5>
In April 1978 the AppleII Communications Card came out, selling for $225.<4> It was intended for use with a modem, and worked for speeds from 110 to 300 baud. The low speed (by today's standards) was for several reasons. One was that most modems of the time were acoustic. With an acoustic modem you dialed up the number yourself, and when you made a connection you put the handset (that's the part you talk and listen with, for you non-technical folks) into rubber sockets to seal out extraneous sound. A tiny speaker and microphone in the modem were then used to send and receive signals. This leads to a second reason for the low speeds of the time, which was that greater than 300 baud communications was not considered possible. In fact, the Phone Company was quite certain that speeds over 300 baud were not possible with any modem, although they would be glad to lease you a special data-quality phone line so you could get the best possible connection at 300 baud.

The AppleII Serial Interface Card ($195) appeared in August of 1978.<4> Serial devices required fewer data transmission lines, and so could work with more compact cables. Instead of sending each byte as eight simultaneous bits as was done in parallel devices, serial interfaces send each byte as a series of eight bits, which only took two wires; one to send and one to receive data. Like the parallel cards, there were a couple of other wires that went with the data lines to control handshaking. Also, serial cards needed a means of letting the sending and receiving devices identify when a byte began and ended, and the speed at which data was being transmitted. This meant that some additional information, such as "start" bits, "stop" bits, and "parity" bits, was needed.

The original version of the Serial Interface Card had a ROM that was called the P8 ROM. It contained the on-card program that allowed a user to print or otherwise communicate with the card without having to know much on the hardware level. The P8 ROM didn't support handshaking that used two ASCII control characters named ETX (Control-C) and ACK (Control-F), so a later revision called the P8A ROM was released. (ASCII stands for American Standard Code for Information Interchange). This worked better with some printers, but unfortunately the P8A ROM was not compatible with some serial printers that had worked with the earlier P8 ROM.

The Apple Super Serial Card firmware was finished in January 1981. It was called "super" because it replaced both the older Serial Interface Card and the Communications Card. To change from one type of mode to another, however, called for switching a block on the card from one position to another (from printer position to modem position). The Super Serial Card was also able to emulate both the P8 and P8A Serial Cards, making it compatible with most older software written specifically for those cards.<9>

**VIDEO CARDS** After getting a printer interface card (and printer), the next variety of peripheral cards popular for the AppleII and IIPlus were ones that allowed display of 80 columns of text (which was rapidly becoming a standard outside the AppleII world). An early entry into this market was the Sup'R'Terminal card made by M&R Enterprises, the same company that made the Sup'R'Mod RF modulator for the AppleII. One of the most popular of the 80-column cards was the Videx Videoterm. Videx even made a display card that would display 132 columns card for the AppleII, but it never made much headway in the computer world (being supplanted by bit-mapped graphics displays, ala Macintosh).<3>
Many other companies made 80-column cards, but for the most part they were not very compatible with each other. One problem was deciding on a method to place the characters on the 80-column screen. With the standard Apple 40-column display, you could use either the standard routines in the Monitor, or directly "poke" characters to the screen. With these 80-column cards, they often used a standard from the non-Apple world, that of using special character sequences to indicate a screen position or other functions. For example, to put a character at row 12, column 2, a program needed to send an ESC, followed by a letter, followed by 12 and 02. Similar ESC sequences were used to clear the screen, scroll it up or down, or do other things that Apple's built-in screen routines could do.

When the AppleIIe was released, with its RAM-based method of displaying 80 columns of text, nearly all the older 80-column cards disappeared from the market. As of 1991, only Applied Engineering still makes one for those remaining II and IIPlus users that don't yet have an 80-column display.

One unique video product was made by Synetix, Inc. around 1983. Their SuperSprite board plugged into slot 7 (which had access to some video signals not available on other slots), and was promoted as a graphics enhancement system. It worked by overlaying the hi-res screen with animated "sprite" graphics (programmable characters that moved independently on any screen background). Since each sprite was on its own "plane" on the screen, they didn't interfere with each other. Also, it didn't take extra effort by the 6502 microprocessor to manipulate the sprites; once the programmer placed the sprite on the screen and started it moving, it would continue until told to change. This was much easier than trying to program a hi-res game using standard Apple graphics. Unfortunately, at the price of $395 it never took off. (It was hard for developers to justify writing programs for only a few users that might have this card). Another company later made a similar card called the StarSprite, but it suffered the same fate. Even Apple's own double hi-res graphics, introduced on the IIe, had the same problem with a small supply of supporting software until the IIC and IIGS market got large enough to guarantee that enough owners had the capability of displaying double hi-res.<10>

ROM/RAM EXPANSION CARDS  All peripheral cards released for the AppleII up to the time of the AppleIIPlus were usable only in slots 1 through 7. Slot 0 was designed differently, and until the release of the Applesoft Firmware Card ($200) in 1979 nothing had been built to make use of it. The Firmware Card contained ROM that paralleled the upper 12K of AppleII memory. If you recall from the discussion in Part 3 of this History, Integer BASIC and the ROM version of Applesoft covered the same space in memory, and so could not co-exist. When it was clear that a floating-point BASIC (Applesoft) was what many people wanted, the IIPlus came out with Applesoft in ROM. To make sure that the previous AppleII owners were not left out, Apple released the Applesoft Firmware Card to plug into slot 0. It had a switch that allowed the user to select which BASIC should be active. In one position, the motherboard ROM would be selected, and in the other position the Applesoft and Autostart ROM was selected. Because there were quite a few Integer BASIC programs that AppleIIPlus users wanted to run, the Firmware Card also came out in an Integer BASIC version with the old Monitor ROM, that allowed IIPlus users to simulate owning a standard II.<4>

One of the benefits of the Integer BASIC ROM was the lack of something
known as a "RESET vector" in the Autostart ROM. The Autostart Monitor was called that because it would automatically try to boot the DiskII drive when the power was turned on, and jumped to a known memory location when the RESET key was pressed. This allowed the disk operating system to reconnect itself, but more importantly made it possible to create copy-protected software. Since the Autostart ROM made it possible for a programmer to do something on RESET that prevented a user from examining his program, it was popular with companies producing programs that they didn't want copied and freely given away. Usually, a RESET on a protected program would restart the program, erase the program from memory, or re-boot the disk. The Integer BASIC and Old Monitor ROM lacked this feature; a RESET would just drop the user into the Monitor. This, of course, was just what hackers and those who liked to break copy-protection wanted. The users with non-Plus AppleII's or with the Integer BASIC Firmware Card on a IIPlus could prevent a RESET from restarting anything, allowing them to hack a program as much as they wanted.

The next card Apple released for slot 0 was called the Language Card. It was released in 1979 with Pascal, and expanded a 48K AppleII into a full 64K memory computer. It did not remove the upper 16K of ROM, but the card contained 16K of RAM that was electronically parallel to the ROM. Using "soft switches" (recall that these are memory locations that, when read or written to, caused something internally to change) one could switch out the ROM and switch in RAM memory. This extra memory was used to load the Pascal disk system, and under DOS 3.2 and 3.3, to load into RAM the version of BASIC that was not in the ROM. This was a more flexible alternative to the Firmware Card, and opened the way to other languages beyond BASIC for AppleII users.

Since the only way to get Apple's Language Card was to buy the entire Pascal system ($495), it was too expensive for many users. Other companies eventually came out with similar cards that did not require purchasing Pascal, and some of them designed the cards with more "banks" of memory, making 256K or more of extra memory available. Saturn Systems was one early suppliers of the large RAM cards. Typically, each 16K bank on the card would be switched in to the same memory space occupied by the Language Card RAM through the use of a special softswitch.<11>

CO-PROCESSORS Although it did not go into slot 0, another significant card for the AppleII was the Microsoft Z-80 Softcard, which sold for around $300. It was a co-processor card, allowing the AppleII to run software written for the Z-80 microprocessor. The most popular operating system for the Z-80/8080 processors was the CP/M (Control Program for Microcomputers) system. Although the DiskII used a different method of recording data than was used by Z-80 computers, AppleII users managed to get programs such as the WordStar word processor transferred to the Apple CP/M system. Microsoft worked to make it compatible with the 80-column cards that were coming out at the time, since most CP/M software expected a screen of that size.<3>,<12>

After the arrival of the IBM Personal Computer and its wide acceptance by the business world, there was interest in a co-processor for the AppleII that would run IBM software. A company called Rana, which had been producing disk drives for the AppleII for several years, came out with the Rana 8086/2 sometime in 1984. This was a system that plugged into slots on a IIPlus or IIe, and would allow the user to run programs written for the IBM PC. It would also read disks formatted for that computer (which also used a completely different data recording system than the one used by the
Apple II Computer Info

One Rana owner, John Russ, wrote to A2-Central (then called Open-Apple) to tell of his experience with it: "We also have one of the Rana 8086/2 boxes, with two [Rana] Elite II compatible drives and a more-or-less (mostly less) IBM-PC compatible computer inside it. Nice idea. Terrible execution. The drives are half-high instead of the full height drives used in the normal Elite II, and are very unreliable for reading or writing in either the Apple or IBM format... And this product again shows that Rana has no knowledgeable technical folks (or they lock them up very well). We have identified several fatal incompatibilities with IBM programs, such as the system crashing totally if any attempt to generate any sound (even a beep) occurs in a program, or if inverse characters are sent to the display... The response from Rana has been no response at all, except that we can return the system if we want to. Curious attitude for a company, isn't it?" By August 1985 Rana was trying to reorganize under Chapter 11, and the product was never upgraded or fixed.

A co-processor called the ALF 8088 had limited distribution. It worked with the CPM86 operating system (a predecessor to MS-DOS) was used by some newer computers just before the release of the IBM PC.

Even the Motorola 68000 processor used in the Macintosh came as a co-processor for the Apple II. The Gnome Card worked on the IIPlus and IIe, but like other 68000 cards for the II, it didn't make a major impact, with the exception of those who wanted to do cross development (create programs for a computer using a microprocessor other than the one you are using).

The most successful device in this category was the PC Transporter, produced by Applied Engineering. It was originally designed by a company in the San Jose area called The Engineering Department (TED). The founder was Wendell Sanders, a hardware engineer who formerly had worked at Apple and was involved in the design of the Apple III and parts of the SWIM chip (Super Wozniak Integrated Machine) used in the IIc and IIGS. Around 1986 Applied Engineering began discussions with TED about buying the PC Transporter to sell and market it. At that time, the board was about four times the size it eventually became. AE's people were able to shrink a lot of the components down to just a few custom ASIC chips. The software that helped manage the board originally came from TED also. It was finally released in November 1987, and included a card that plugged into any of the motherboard slots (except slot 3) and one or more IBM-style disk drives. The PC Transporter used an 8086 processor and ran about three times as fast as the original IBM PC. It used its own RAM memory, up to a maximum of 768K, which could be used as a RAMdisk by ProDOS (when not in PC-mode). It used some of the main Apple memory for the interface code that lets the PC Transporter communicate with the hardware.

The PC Transporter has undergone some minor hardware changes and several sets of software changes (mostly bug fixes but a few new features). The major reasons for hardware changes came about because of the availability of cheaper RAM (the original RAM was quite expensive and difficult to obtain). Additionally, changes were made to make the onboard "ROM" software-based, which made it easier to distribute system upgrades that enhanced hardware performance. The major limitation for this product has been a reluctance by Applied Engineering to match the changes that have happened in the MS-DOS world and come out with a version of the Transporter that used a more advanced microprocessor (80286, 386, or 486). As of 1991 this is slowly beginning to become more of a limitation for those who wish to use both MS-DOS and AppleII software on the same
Apple II Computer Info

Apple II computer, since advanced software needing those more powerful processors is beginning to be released for MS-DOS.

ACCELERATORS  The two things that all computer users eventually need (or at least want) are more storage and faster speed. The 1 MHz speed of the 6502 and 65c02 chips is somewhat deceiving, when compared with computers that have processors running at a speed of 20 to 40 MHz. To put things into perspective: Since the 6502 does more than one thing with a single cycle of the clock on the microprocessor, a 1 MHz 6502 is equivalent to a 4 MHz 8086 chip. Therefore, an Apple II with an accelerator board or chip running at 8 MHz is equivalent to an MS-DOS computer running at 32 MHz.

One of the first accelerators for the Apple II was the SpeedDemon, made by MCT. This board used a faster 65c02 chip, with some high-speed internal memory that was used to actually execute the programs (since the internal Apple II memory chips were not fast enough). In essence, it put a second Apple II inside the one you could see, using the original one for input and output. Another speedup board was the Accelerator IIe by Titan Technologies (formerly Saturn Systems; they had to change their name because it was already in use by someone else). This board worked in a similar fashion to the SpeedDemon. Some users felt this product ran faster than the SpeedDemon, but it depended on the application being tested. Both boards were attached to the computer by plugging them into a slot other than slot 0 on the motherboard.

In 1986 Applied Engineering introduced the TransWarp accelerator board. This product has lasted in the marketplace longer than any of the other ones, possibly because AE did far more advertising than the companies producing the older boards. The TransWarp did the acceleration using a different method. Instead of trying to duplicate all of the Apple II RAM within the accelerator, they used a cache. (If you recall from the segment on hard disk drives, a cache is a piece of memory holding frequently accessed information). Because they used the cache, the TransWarp did not require any high-speed RAM on the motherboard. Instead, any memory access was also stored in the cache RAM, which was high-speed RAM. The next time a byte was requested from RAM, the accelerator looked first into the cache memory to see if it was there. If so, it took it (far more quickly) from there; if not, it got it from motherboard RAM and put it into the cache. Early TransWarp boards ran at 2.5 MHz; later versions pushed this speed to 7 MHz (this was the top speed used by the TransWarp GS, released in November 1988 for the Apple IIGS).

The next step in accelerator technology was to put all the components of an accelerator board into a single chip. This happened when two rivals, the Zip Chip and the Rocket Chip, were released. The Zip Chip was introduced at AppleFest in May 1988, and the Rocket Chip soon after. Running at 4 MHz, the Zip Chip was a direct replacement for the 6502 or 65c02 on the Apple II motherboard. It contained its caching RAM within the housing for the processor, the difference being mostly in height (or thickness) of the integrated circuit. Installing it was a bit more tricky than simply putting a board into a slot; the 6502 had to be removed from the motherboard with a chip puller, and the Zip Chip installed (in the correct orientation) in its place. Software to control the speed of the chip was included, and allowed about ten different speeds, including the standard 1 MHz speed (some games simply were too fast to play at 4 MHz, and software that depended on timing loops to produce music had to be slowed down to sound right). The controlling software also let the user determine...
which (if any) of the peripheral cards should be accelerated. Disk controller cards, since they used tight timing loops to read and write data, usually could not be accelerated, where many serial and parallel printer and modem cards would work at the faster speed. The Zip Chip even allowed the user to decide whether to run all sound at standard speed or at the fast speed.

The Rocket Chip, made by Bits And Pieces Technologies, was almost exactly the same as the Zip Chip, with a few minor exceptions. It was sold with the ability to run programs at 5 MHz, and could be slowed down below the 1 MHz speed (down to 0.05 MHz). Later, when Zip came out with an 8 MHz version of their Zip chip, a 10 MHz Rocket Chip was introduced.

The rivalry between Zip Technologies and Bits And Pieces Technologies came from a mutual blaming of theft of technical information. The Bits & Pieces people insisted that they had done the original work on a single chip accelerator with the Zip people, but had all the plans and specifications taken away without their permission. Consequently, they had to form their own company and start from scratch to design their own chip. Zip, on the other hand, insisted that Bits & Pieces had stolen the technology from them. The problem eventually came to court, and it was decided that Zip Technologies was the originator of the technique and the Rocket Chip had to stop production.

HUMOR ONLINE ............ [HUM]
[*]Genie Fun & Games.

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO To make it easy for you to respond to messages re-printed here in GenieLamp, you will find all the information you need immediately following the message. For example:

(SMITH, CAT6, TOP1, MSG:58/M475)

|Name of sender| CATegory| TOPic| Msg.#| Page number|

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REply in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic.

ABOUT Genie Genie costs only $4.95 a month for unlimited evening and weekend access to more than 100 services including electronic mail, online encyclopedia, shopping, news, entertainment, single-player games, multi-player chess and bulletin boards on leisure and professional subjects. With many other services, including the largest collection of files to download and the best online games, for only $6 per hour (non-prime-time/2400 baud). To sign up for Genie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U# prompt. Type: XTX99014,DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call Genie's customer service line (voice) at 1-800-638-9636.

About GenieLamp

Top of the page Welcome to the mid-month issue of GenieLamp!

If you haven't heard, the flagship issues of GenieLamp (GenieLamp IBM, Mac, ST and A2) has split into two issues, released on the 1st and the the 15th of every month. The issue on the 1st will concentrate on message highlights, news and general information. The second issue will
bring you the latest news and views from the libraries and real-time conferences as well as other GEnie bits & pieces of information.

GENieLamp Distribution Method Changes In the last issue, I announced that

GENieLamp you would soon be able to download your issue of GENieLamp just as you would with any other file here on GEnie. I'm happy to announce that the new system is in place and it works great! Now you can DOWNLOAD your favorite copy of GENieLamp Online Magazine, just as you would any other file found here on GEnie.

NOTE TO SCRIPT USERS For Aladdin readers we have included the new

GET_THE_LAMP script in this issue of GENieLamp IBM and ST. With this script Aladdin will log on to the GENieLamp page, capture one (or more) of the issues and then either hang up or go on and do an autopass 1 or 2. See ADD ALADDIN for elsewhere in this issue for details. For Macintosh readers a new version of GENieLamp Module v3.01e will be released that will allow you to download any and all issues of GENieLamp Mac/MacPRO and the other platforms -- up to 8 at a time -- from page 515 and the new DIGIPUB RT library at 1395. See this column in the next issue of GENieLamp for complete details.

T/TalkNET Publishing & LiveWire Online Starting with the March/April issue of Livewire, T/TalkNET has been commissioned to do the final formatting of the online version of LiveWire Magazine. The online version of LiveWire has many articles and features that are not found in its sister hardcopy publication, LiveWire. To check out the latest issue, type LIVEWIRE at any GEnie main menu prompt. (And like GENieLamp, LiveWire Online is GEnie*Basic!)

Until next time...

John Peters

ONLINE LIBRARY /

The Online Library

By Mel Fowler

[MELOFT]

FILES, FILES, FILES! This month we'll take a look at some recently
uploaded software, highlighting those files I think deserve a second look. So let's get started.

[*][*][*]

For those of us that still love Classic Appleworks the National Appleworks Users Group (NAUG) has uploaded Printer Drivers for most of the printers that were not covered in the original program. These printer drivers come in the form of SEG.ER files that contain customized pre-set codes for different printers. To use a particular driver all you do is rename the SEG.ER file on your copy of AW3 to another name, such as OLD.SEGER, then copy the driver you wish to used to your disk and rename it SEG.ER. There are some 43 drivers included and they cover most of the newer Letter Quality dot matrix, Ink Jet, and Laser Jet printers. Complete instructions are included with notes about the use of each printer driver. You can write to NAUG if you have a printer not included with the uploads and they will be added to the list. This is upload is very helpful for Appleworks version 3.0 users.

20311 PRINTDRV1.BXY
20312 PRINTDRV2.BXY Do you have a collection of your favorite DOS 3.3 programs but you hardly ever run them because you must undergo so much trouble on your Apple IIIGS to do it? Wouldn't it be great if you could just put those DOS 3.3 programs on your hard disk and run them like any other program? With the programs and files included with DOS 3.3 Launcher you can do just that. John MacClean from Australia gives us this capability with his DOS 3.3 Copier/Launcher program. ProDOS 8-bit versions are also included so you can work directly from the 8-bit level. Several options are available from DOS 3.3 Copier including switching to 1 Mhz system speed as the program is launched. I would highly recommend this great set of utilities for anyone that likes those classic DOS 3.3 programs. There is a $10 US or $15 Australian Shareware fee.

20316 DOS33.LNCHR.BXY Go. Yes, Go. No don't get up and leave just yet. This GO is in reference to the ancient oriental game. There are so many rules for this game that it is played differently depending which country you are in. So it's no wonder that nobody has come up with a true version of GO that can be played on the Apple IIIGS. Formerly, only the children's version of trying to get five pieces in a row has been available. The latest offering from Kenrick Mock called Pente GS is in this category. However, just like Kenrick's mind, this version has an interesting twist, or I should say "several" interesting twists.

Pente GS is easy to learn, and has great graphics and sound. It is recommended for 7 year olds and higher, although most 7 year olds would be hard to beat. Therefore, Kenrick included a computer opponent with three levels of smartness. In the "Trivial" level the computer will only think one move ahead and is finished within a few seconds. The computer is easy to beat at this level with a little practice. In the "Student" level the computer thinks two moves ahead and is done within a minute or two. Then there is the Master level (picture of Einstein sleeping) where the computer will think three moves ahead. As pointed out in the on-screen instructions, this is the slowest level, taking 10 minutes to make a move.

The object of the game is the same as previous games: get five pieces in a row either horizontally, vertically, or diagonally. However, there is
a second way to win, namely, capture five pairs of your opponents pieces. Pieces can be captured if you can sandwich exactly two of your opponents pieces between two of yours. This is a great touch and adds a new dimension to the game. Kenrick you have done it again. There is a $10 Shareware fee.

20318 PENTE.GS.BXY Often, I have been in the middle of a project using an Apple II GS application program and wished that I could rename a file or create a new subdirectory, or generally do file keeping without having to leave my application. The Classic Desk Accessory (CDA) File-A-Trix by Karl Bunker is the answer to this problem. File-A-Trix is a complete set of file utilities which can do the following functions:

- Catalog any online disk, showing the contents of any folder
- Copy files from one disk or folder to another
- Move files -- i.e., copy and then delete the original
- Delete files
- Lock and unlock files, or change their type or auxtype
- Rename files
- Create a new folder
- View or print text files, and the text content of other files
- Find a file on a disk, using its name or partial name
- Initialize (format) 3.5" disks

There is a $10.00 Shareware fee.

20392 FILE.A.TRIX.BXY Bouncing Ferno is one of the many games to come from the French based Free Tool Association (FTA), since defunct. Joe Kohn of Shareware Solutions fame, in association with the FTA, conducted a contest for the best levels that could be generated with the levels maker which was included with the original game. A second contest was done for programmers which challenged them to complete the game using the source code supplied by the FTA. Well to make a short story shorter, Brett Dunst of Palos Verdes, CA won for supplying the best new Bouncin'Ferno levels, and Dustin Mitchell of Scarborough, Maine, a 14 year old High School Freshman won the grand prize for creating the most fabulous new game.

The result is Bouncing Ferno II. This version of the FTA inspired game is fully II GS compatible and hard drive installable. There are two levels of 25 rooms each. Some rooms are easy, but some are really tough but the main thing is that the flavor of the game is still FTA. This was a great way to continue to FTA tradition and we hope with the help of such people as John Kohn the tradition will continue. This program is Freeware. You will need the English versions of the game documentation which is available in the A2 Library at file: 18711 BF.US.DOCS.TXT.

20394 FERNO2.BXY
20442 BONCN.FRNO2.BXY (non-bootable) For HyperStudio version 3.1, the people at DreamWorld have developed a New Button Action (NBA) entitled View32 v1.00. View32 permits the inclusion of 16/256/3200 color and 640 mode graphics into your HyperStudio stacks. This file also contains complete documentation on how to use View32. View32 NBA is Dreamware meaning if you are a registered owner of DreamGraphix it is free; otherwise there is a $5.00 Shareware fee.

20433 V32.NBA.BXY One of the best educational programs to come along in
Apple II Computer Info

The Presidents Game is a game by Richard Schecter called the Presidents Game. The game asks you to identify the presidents by which number they are, which years they were in office, information about the presidents, nicknames, by picture or by all the above. Who was the only President to serve two terms separated by four years? Which President lost the popular vote but was still elected? You will learn this and a lot more about our Presidents. This game will run on any Apple II and is Shareware $10.00.

20437 PRES.BXY

As a final note, remember to support those who support the Apple II. By sending in those shareware fees, you're sending an important, encouraging message to shareware developers.

BEGINNER'S CORNER

The System Utilities Disk

By Phil Shapiro

[This article is the first in a series of GENieLamp articles aimed at novice Apple II computer users. It's hoped that some of these "Beginner Corner" articles might be re-printed in user group publications, to help meet the needs of newcomers to the Apple II.]

The Apple II System Utilities disk is a useful disk that was bundled in with every new Apple IIe, IIc, IIGS, and IIC+ computer sold. Many persons who have bought second-hand Apple II computers might be unfamiliar with what the System Utilities disk can do. This article is being written to give an overview of the functions of the System Utilities disk, pointing out the handful of useful "file management" tasks the disk can perform for you.

In its early form, between 1983 and 1985, the System Utilities disk was named the "ProDOS Users' Disk." If you're still using the ProDOS Users' Disk with your Apple II, you may want to obtain the latest Apple II System Utilities disk from your local Apple user group. The latest version of the System Utilities disk offers some important disk copying enhancements not found on the either the ProDOS Users' disk, nor on the later Apple IIc System Utilities disk. (These earlier utility disks took upwards of 17 disk swaps to copy a single 5.25 inch disk. The newer System Utilities disk, with its Fast Copy routine, can copy any 5.25 inch disk in two passes, or fewer.)

As mentioned above, one of the most useful functions of the System Utilities disk is in making back-up copies of your data disks and your software programs. (Software programs that you buy in the store are also commonly referred to as "applications.")
Note, though, that the System Utilities disk can only copy software that is not copy-protected. Since 1990, most software publishers have removed copy-protection schemes from their commercial software.

A second important function of the System Utilities disk is to format blank data disks. Data disks are most frequently used to store writing that is created with word processors. But a data disk can equally well be used to store graphics created with a paint program, or music created with a music program.

Most Apple IIe and IIc users will be using 5.25 inch floppy disks with their systems. To format 5.25 inch disks you need to specify in which disk drive your data disk is residing. If you have a single 5.25 inch disk drive, that drive is designated as: "Slot 6, Drive 1." If you have a second 5.25 inch drive, that drive is designated as: "Slot 6, Drive 2." These slot and drive designation are purely historical. You do not need to understand why your 5.25 inch disk drive is designated as a "Slot 6" disk drive. To help you remember the slot designations of your drives, you may want to attach a piece of masking tape, showing the slot designation, to the front of the disk drive.

In rare instances Apple IIe and IIc users may have a 3.5 inch "UniDisk" disk drive attached to their computer. Such a disk drive would be designated as "Slot 5, Drive 1." The internal 3.5 inch disk drive on all Apple IIc+ computers also has the designation of "Slot 5, Drive 1."

When formatting disks with the System Utilities disk, the formatting program will first check to see if there is any existing Apple II programs or data on the disk. If there is, the program will prompt you to make sure you truly intend to overwrite the existing material on disk. If you have any doubts about what is contained on the disk, you can always press escape and then go back and "Catalog" the disk. Doing so reveals the directory, or table of contents of the disk.

It may be helpful to know that it's possible to format a "double-sided, double-density" floppy disk that was previously used on an IBM computer system. There happen to be several gazillion of these lying around now that homes and businesses are using high-density 3.5 inch floppy disks for their data and programs.

You can't, however, format a high-density IBM 5.25 inch floppy disk on an Apple II disk drive. The formatting program will likely tell you: "Disk is damaged," or, "Having problems accessing disk." High density IBM 5.25 inch disks look almost identical to the standard "double-sided, double-density" disks. The telltale difference is that the high-density disks don't have a reinforcing circular ring in the middle of the disk.

Another way to distinguish the two types of disks is the storage capacity listed on the label of the disk. Double-sided, double-density disks have a capacity of 360 kilobytes (360K) on an IBM-style computer. High-density IBM 5.25 inch disks have a capacity of 1.2 megabytes (equivalent to 1200 kilobytes).

When formatting a disk, you need to keep in mind the rules ProDOS has for naming disks and naming files. The rules for both types of names are identical. Here they are:
1) Names must be fifteen characters long, or less.

2) Names must start with a letter, but may include numbers within the name.

3) Spaces are not allowed within a name. But periods can be used within the name.

It goes without saying that you should give a little thought to how you name your files. Naming of disks is not as important. For reasons that are too complicated to explain in a short space, it's often helpful to keep your disk names short. You may even wish to name your disks with a single letter. (Commonly, your first initial.)

A third useful function of the System Utilities disk is to catalog a disk. By cataloging a disk you can view the disk's directory, or table of contents. This can be very useful when you need to refresh your memory about which files are contained on a given disk. Cataloging a disk also shows you how much free room is left on the disk.

Knowing how much free room is left on a disk can be helpful in letting you know when you need to format another data disk. If the System Utilities disk indicates that you have less than 10K on a given disk, the time is ripe to format another data disk. For those of you who may be wondering how much writing can fit in a given amount of disk space, you might recall that 2K of disk space is roughly equivalent to a single typed, double-spaced page. So a formatted ProDOS 5.25 inch disk holds (140K) holds about 70 typed pages of writing. Likewise, a formatted 3.5 inch floppy disk (800K) holds about 400 typed pages of writing.

The Apple II System Utilities disk will catalog the older DOS 3.3 disks, as well as the newer ProDOS based disks. Many of the earlier public domain and shareware programs can be found on DOS 3.3 disks. DOS 3.3 was the standard disk operating system for the Apple II, up until ProDOS was introduced in 1984. These two disk operating systems are incompatible with one another, although it's possible to transfer text files quite easily back forth between DOS 3.3 and ProDOS disks.

A fourth useful function of the System Utilities disk is in deleting files that you no longer need. It's not uncommon for someone to save some writing that they've done, expecting that at some time in the future they might possibly have a need for it. Two years later, they then discover, that this earlier writing no longer has much usefulness.

The System Utilities delete function can then be used to delete the file that no longer has much use. By doing so you can free up disk space that can be used for newer data.

Some of the functions on the System Utilities disk are very seldom used by anyone at all. You can use the System Utilities to lock and unlock files. This simple procedure helps you protect against accidentally overwriting a file that contains important information. Very few people lock their files, however, because the whole idea advantage of using computers is to update data files with newer, edited versions of the data.

Another seldom used function of the System Utilities disk is the function to create subdirectories. Subdirectories, also called folders, can be helpful in organizing your files on a disk. But using subdirectories
requires that you have a mastery of ProDOS pathnames. Beginners can safely stay away from subdirectories without missing out much.

Even if you don't use its functions very often, it's good to be aware of what the Apple II System Utilities disk can do. And if you've bought a second-hand Apple IIe, IIc, or IIc+ computer that didn't come with the System Utilities disk, you would do well to get a copy of it from your local Apple user group. The latest Apple II System Utilities disk is also available for downloading from the Apple II libraries on GEnie, America Online, and CompuServe.

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)

GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 728 of 1824

As computers go, the Apple II boasts a long and distinguished, if not unprecedented, history. The last 15 years have spawned literally thousands of software programs, widening vistas for people of every age and ability. With an Apple II and the right software you can do virtually any communications job both satisfying and easy. Virtually any word processing program can do the trick.

Needless to say, we couldn't include every noteworthy Apple II program in this booklet's limited space. In "How Do I Get Started?" we offer AI makes any communications job both satisfying and easy. Virtually any word processing program can do the trick.

Some word processors, such as Mouse Write, II Write and AppleWorks GS 1.1, have an easy-on-the-eyes screen appearance featuring menus you pull
down like window shades. Point to the File menu with a mouse. Pull down the menu and click the mouse button to choose the Print option that’s displayed. In no time at all your thank-you note or letter is ready to sign, seal, and deliver.

So you never me to admit: Writing was never this easy when you were in school.

Information Age Organizing life’s little details just got simpler, too. With a filing program like AppleWorks 3.0, AppleWorks GS 1.1, or DB Master Version Five, electronic address books and holiday card lists are a cinch to edit and update. If you’re active in sports leagues or community groups, a computerized filing program is indispensable. Not only can you track organization members, you can print the information on name badges, Rolodex. Thanks to modems and modern telecommunication’s software like Point-to-Point and ReadyLink, you can chat with other computer users (more than a few romances have started this way), learn about new software products, reserve airplane tickets, buy a microwave oven, and play a round of chess with a distant and unseen competitor...all with a single phone call.

Innumerable special interest groups (SIGs) have evolved on BBSes since personal computing’s early days. Are you a Star Trek buff? Rest assured there are computer users nationwide who share your disdain for Klingons. If you’re retired, contact SeniorNet to learn about lifestyle and legislative issues affecting you. SpecialNet’s a SIG serving the needs of special education and rehabilitation professionals. Computing may sometimes seem a solitary pursuit, but just wait ’til you go online!

Chest Top Publishing Politicians know you don’t limit yourself to paper when it comes to sharing opinions. Why should Apple II users be any different? Getting your message use buttons, badges, magnets, and key rings. Projects like these aren’t just fun to do—they’re perfect for gift giving and fund raising, as well.

Media Moguls If you think pictures are worth a thousand words, picture this: With a desktop publishing program like Publish It!4, AppleWorks GS 1.1, or GraphicWriter III, you can enhance nearly any message with geometric shapes, colors, patterns, and illustrations. Best of all, you don’t have to be a graphics artist because desktop publishing programs provideto make custom invitations or decorative banners—maybe even a personalized Pin the Tail on the Donkey game poster—for your child’s next birthday party.

Programs like The New Print Shop, The Print Shop IIIGS, and SuperPrint! handle these projects with gusto. Choose a typeface, type the message you want, then select and position illustrations. That’s all there is to it!

In short, a desktop publishing program may prove to be one of your best software investments. Every day, countless Apple II users create their II programs like On Balance, Managing Your Money 5.0, Quicken, and AlphaCheck Plus take the drudgery out of setting up a budget and balancing the checkbook. Bill paying may be no less painful when your computer prints checks for you, but at least the pain subsides more quickly.

Personal finance programs help with long term planning, too. Forecasting your tax liability during the year with a program like Swiftax
or Tax Preparer can keep April 15th from expanding into a 24-hour Maalox Moment. Purchasing software the easy way: Design templates that work with programs such as AppleWorks 3.0 or AppleWorks GS. (For more information about these special computer files, see "What's a Template Anyway?")

Both AppleWorks 3.0 and AppleWorks GS are called "integrated" programs because each includes more than a single application. With AppleWorks 3.0 you get a word processor (with spell checker), a database manager, and a spreadsheet program. Spreadsheets have math smarts built in, so they're perfect for designing instance, thanks to an electronic "Clipboard" feature. For value and performance, you can't top these integrated programs. One should appear near the top of your software shopping list.

That's Entertainment To paraphrase an old saying, all work and no play "'''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''''
Apple II Computer Info

Even oento write their own programs from scratch in computer languages such as AppleSoft BASIC, Assembly, Pascal, or C. While BASIC (an acronym that stands for Beginner’s All Purpose Symbolic Instruction Code) is by far the easiest programming language to learn and use, others require considerable study and practice—not to mention special software for your Apple II to "understand" these languages in the first place. Companies like Apple Computer, Byte Works, Morgan Davis Group, Roger Wagner Publishing, So What Soflled a "stack"; each screen display, a "card." Say you want to prepare a presentation about birds of the tropical rain forest. You would probably create a separate card, with pertinent facts and perhaps a picture, for each species.

You'd enliven your card with a variety of symbolic icons (pictures) called "buttons." Adding a button is as easy as pulling down a menu to invoke the program's "add a button" feature. When the user clicks on it, the button may turn the page, so to speak, taking the viewer from ge you face as an Apple II user is not learning how to use your computer—it's deciding what to use your computer for. If the possibilities seem mind-boggling at first, pace yourself. The Apple II has been around for a long time and will continue to provide. No one, it seems, has written a program to referee the endless tennis matches played by health care providers and Uncle Sam. And while there are dozens of grade book programs available, none may offer the special mix of features you need.

Thanks to programs like AppleWorks 3.0 and AppleWorksGS1.1 you neither have to "do without" nor "make do." With less effort than you think, you can design a custom template to tackle just about any project you can dream up—whether it's remodeling the kitchen, designi Then give your template a name and save the file on a data disk. After you write your next letter with the AppleWorks GS word processor, electronically "paste" the letter's text onto your letterhead template, which appears on screen in a separate document "window." Then print the completed letter on your printer.

The same three steps apply to any task: Create the template, store it on a data disk, and call it back to the computer screen when you wish. In time, of course, you'll discover new ways to import save any new versions on a floppy disk. Toying with unlimited template ideas is one of the many powerful things you can do with your Apple II.

It may come as no surprise, then, that among millions of Apple II users there are some entrepreneurial or altruistic types who create ready-to-use templates for those of us who have neither the time nor the inclination to design our own. Buying a template is often an inexpensive way to tackle a project. Moreover, studying templates designed by experienced Apple Ibudget templates—or grade book templates!--the public domain is a good place to start.

Templates of higher quality usually command higher prices, too. Few template disks cost more than $40, however. Most commercial disks hold ten or more template projects. For example, Witkin's Best by AppleWorks 3.0 expert Ruth Witkin offers a dozen financial templates covering topics like income taxes and investments. And each disk in the AppleWorks Productivity Pak series from inCider/A+ Special Products features teneate personalized birthday greetings. If variety's the spice of your computing life, take a subscription to SoftDisk, a "magazine on disk" featuring computer programs, games, and clip art...as well as templates.
Teachers searching for AppleWorks templates need look no further than the Teachers' Idea & Information Exchange (TI&IE). For a modest membership fee, TI&IE distributes monthly disks loaded on both sides with classroom and administrative templates. Or put David Chesebrough's AppleWorks Teacher Resoer Guide to Apple II Software

APPLE II HAPPENINGS /

Online Press Releases

"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

ProTERM 3.1 FEATURES & CHANGES

General

<> User manual was re-written and expanded to 430 pages, and over 50 illustrations. Help for the novice, casual user and expert.

<> Enter Scrollback (when offline) at the touch of an ARROW key.

<> When entering/exiting the Install menu, the terminal window is maintained.

<> Text entry fields now have the concept of a "HARD-SPACE" and it is entered using OPTION-SPACEBAR. The HARD-SPACE is displayed using the checkerboard character mouse text character and works with Find, Replace, Reply mode and Printer-Init to name a few.

<> There is now a Preference to control how much memory ProTERM will attempt to use when it runs. This is particularly useful for Slinky RAM users since it means they can partition their memory card between a RAM disk and ProTERM. Bank Switched RAM users, can partition their RAM cards in the event that ProTERM does not recognize the RAM-disk software being used.

<> The parameters associated with Quick Dial are now saved between different Quick Dial attempts (not between program runs).

<> Within the file selector:
   COMMAND-Left/Right-ARROW Changes to the previous/next online volume.
   COMMAND-Up-ARROW Moves to the Parent directory.
   COMMAND-Down-ARROW Opens a directory.
   (These commands are Macintosh conventions.)

<> Compatible with Textalker-GS vtt1.2 for sight impaired users.

<> Pathnames allow the convention of drive location (/5,1/FILE.NAME - /6,2/MY.FILE etc.) entries.
<> COMMAND-PERIOD is now equivalent to pressing the ESCAPE key.

<> A Mouse-Down on the Date, Time, or Label in the Status-Bar automatically executes a Global Macro to perform user-defined functions.

<> Editor Capture, Printer Capture and Receive ASCII now allow their status bars to be hidden.

<> The Screen Saver now accepts a time out up to 30 minutes, and does not activate during an ASCII send.

<> The File:Catalog command now displays as many files as can loaded into memory either alphabetically or as they are arranged in the file.

<> The File:Print command now accepts batch filename selection. If multiple files are printed, then the setting of Eject Final Page determines whether each document is printed separately, or if they are all appended and print immediately following one another.

<> The File:View command now displays location within text by screens and bytes and has a new Goto button for quick access to the screen number of choice.

<> New management of incoming characters prevents character loss during mouse and COMMAND key use.

<> A full 15 character volume name is allowed.

<> Dramatic improvements in disk I/O error handling.

Emulation

""""""""

<> HeathKit H19 Emulation now supports a "mode-select" to enable Auto-CR to be added to an LF.

<> Pascal Firmware emulation is now included as part of the software.

<> Default parameters for Emulate File are now saved with the other preferences.

<> Split-Screen Chat emulation now wraps the cursor after the 80th character instead of the 79th. (This is similar to the way VT-100 works.)

<> The emulation system has been changed so that a line which is cleared via a Clear-Line or Clear-to-End-of-Line from Col 0 now puts the line into Scrollback.

<> VT-100 emulation has been changed so that margins are supported correctly. In prior versions, the vertical margins controlled both scrolling and clearing data (actual VT-100 terminals only control scrolling).

<> There is now a Control Show emulation which does diagnostics similar to ProTERM 2.2 but also indicates high-bit data via reverse video.

Modem/Drivers
<> Data Formats of 7E2 and 702 are now supported. While unusual, these are occasionally requested.

<> When the ATDT dialing string is sent to the modem, it is truncated to the exact length instead of padding to 32 characters (the length of the phone number field). This assists compatibility problems with old modems.

<> The USR HST driver works with the "/" messages added.

<> A printer init string is now located in the install window. This string is sent to the printer prior to starting ANY kind of printer operation (print-screen, online printing, Editor printing, print file). This allows a clean way to send a string to the port (like to change the baud rate) or to the printer (to always enable a certain font/size/etc).

<> New modem drivers:
   - Quality Computers Q-Modem 2400.
   - Boca Research 14.4Kbps Modem.
   - Prometheus ProModem 2400 Mini.

<> The size of the PT3.CODE0 file has been reduced by about 1/3 as compared to PT3.0. This saves some disk space and allows easier downloading of updated files.

<> The baud (bps) of 57600 is now directly supported by the software. In addition, the SSC only shows rates of 110..19200 as being available.

<> The driver loader / modem drivers have been redesigned to allow the possibility of user defined drivers. The modem drivers have all been recoded into assembly language and many of the existing drivers have been consolidated.

<> It is possible to enable (via Macro pokes) a "data clicker" which can tick whenever a character is sent or received.

<> There is now just a single Apple //gs Modem Port driver which exhibits better performance under GS/OS and AppleTalk.

The ProTERM Editor

<> When data is inserted/deleted in the Editor, the Editor pans to show the change.

<> The Editor now has a label in the MenuBar.

<> There is a preference to "allow" use of the ruler. When turned off, PT3 will never save the ruler.

<> It is now possible to View Files directly from the Editor. Choosing the "Edit" button inserts data at the current Editor cursor position.

<> When exiting & re-entering the Editor (and Scrollback), the cursor position (line and column) is saved and restored.

<> Find/Replace strings in the Editor are now saved between entry/exit of
the Editor (and Scrollback).

<> Paste-to-Modem directly from the Editor is changed and improved.

<> A customized prompt string used and saved as a preference in Reply formatting.

<> When a file smaller than 13 lines is loaded into the Editor, the display correctly positions the small file on the opening screen.

Macros

<> PRint commands now work in the Editor and the Channel #6 command can be used to insert (print) data directly in the Editor at the cursor position.

<> ProTERM always executes global Macro @@1 on startup. It then checks for a Macro file called PT3.STARTUP or a system entry called PTD.STARTUP. As before, an application can also pass in the name of a Macro file or system entry via the PT3.SYSTEM program.

<> The Macro MIDstring command now supports a length parameter.

<> There is now a JSr Macro command which can be used to call assembly language code. One potential use is to allow flow control to be enabled and disabled directly from a Macro.

<> DO command parameter processing has been improved so that it is now possible to write a Macro which will work in Install.

<> The MEm Macro command now accepts a hex string of data as a compact way to specify the contents of continuous memory locations. Ex: MEm 30,"a9904c0034"

<> Larger Macro files are now supported.

<> There are new <SYstem> and <PHone> functions which return the name and phone number of the current system.

<> The SEMICOLON is now used as a comment character. It signifies comments than extend from the SEMICOLON to the end of the line. Large blocks of text can be commented out when placed between ASTERISKS.

<> The DO command now allows duplicate label names to be accessed.

<> Full 64 character filenames can be passed to dialogs via the DO command (3.0 had a 40 character limit).

Scrollback

<> The Find/Replace strings in the Scrollback are now saved between entry/exit of the Scrollback (and the Editor).

<> Scrollback now has a label in the MenuBar.

<> When you exit & re-enter Scrollback, your position (line and column) is saved and restored (this is also true in the Editor). When the contents of Scrollback are changed (via data coming into terminal
Upon entry to Scrollback .5K is no longer added to the status bar display.

The Find-Next command in Scrollback is now COMMAND-G instead of COMMAND-N to maintain consistency with the Editor and Macintosh conventions.

The search string/parms used with Find-Next are now saved between uses of Scrollback (but not between program runs).

When an old Scrollback file is opened, its contents can be appended to the end of the current Scrollback data.

Scrollback files can be appended to an existing Scrollback file.

Send & Receive

Paste-to-Modem now has better pacing. When it sends a RETURN character, it uses the line delay parameter for the current system entry.

Ymodem and Zmodem both send filenames in lower case in consideration of Unix based hosts and the like.

Protocol transfer estimated time values have been recalculated making them more accurate.

The status bar now displays the exact line rate at which the modem is connected. This includes 12000, 14400 and 16800. In addition, ASCII Send and protocol transfer timings are based on this value.

The protocol CPS calculation has been improved so that it more accurately reflects the actual transfer throughput.

There is now control over the Zmodem Send window size via a Macro variable.

Global Macros @@5/@@6 are now automatically executed after every protocol transfer to perform user-defined operations.

ProTERM 3.1 FEATURES - GENERAL

Full Dialing List with many changeable parameters for each system including: Name, Phone Number, Baud Rate, Data Format, Duplex, Flow Control, Emulation, Per Min/Hour Cost, Backspace, System Macros and many others.

General System Support -
- Baud Rate Support: 110 to 19200, (38400 and 57,600 with Apple IIGS modem port).
- Data Format Support: 7E1, 7O1, 8N1, 8N2, 7E2 & 7O2.
- Duplex: Full/Half.
- Flow Control: Software or Hardware.
Scrollback saves all incoming text as it scrolls off the screen so that it may be later read, searched, printed, saved, clipped or edited while on or offline. Save long distance costs and access charges by doing your work offline.

Auto-Start Protocols allow hands-off download operations. Simply tell the remote host system to start sending files via Zmodem or Kermit and ProTERM detects the start of the transfer and begins receiving the data without user intervention.

AutoLearn Macros allow automatic logon without user intervention. Call a host once in AutoLearn mode and with a keystroke, subsequent logons are automatic and effortless.

Full utilization of ProDOS compatible clocks to display date & time, time connected, connect costs and protocol performance. Connect costs can be displayed in real time and/or saved for later reference.

ProTERM's full word processor supports both text and AppleWorks files. Create text documents offline then: Save, Print or Send text (either all or selected text) directly to a remote host system from the Editor. Special "filters" perform case, paragraph and reply conversion. Use character oriented selection to Cut and Paste within documents. Upload documents directly from the Editor to a remote host. Paste Scrollback text directly to the ProTERM Editor and then edit, print or upload your reply to any host.

Editor Reply Feature allows included text to be prefixed by custom reference markers.

Screen "snapshots" can be sent to the printer from anywhere within ProTERM.

Sophisticated Terminal Emulations: ANSI-BBS, ADDS, ADM-3A/5, TeleVideo 910 & 910+, H19, VT-52, VT-100, ProTERM Special Emulation, Split Screen Chat, Pascal Firmware and Control Show allows easy access to small BBSystems as well as large mainframes.

Split-Screen Chat allows real-time conferencing without confusing text mix-up. Log on in normal mode and then toggle in and out of split-screen mode with a single keypress.

Control Show Emulation displays all incoming data in a visible format including control and high-bit characters.

Emulate File feature allows files containing emulation codes to be viewed while offline. Use the keyboard to adjust the display speed. View ProTERM Special Emulation files at any speed without line noise problems.

Complete formatting control using Dot Commands. Documents are impressive and easier to read when formatted with text justification, precise margin control, page numbering, headers, footers and more. ASCII uploads of documents with custom "on-the-fly" formatting is easy and enjoyable.

Print Preview allows documents formatted with Dot Commands to be viewed in their final form "What You See Is What You Get" (WYSIWYG)
before they are printed or uploaded.

<> Easy File Transfers using the latest selection of protocols available for the Apple II, including: Xmodem/Ymodem (4K option), Zmodem and Kermit. Supports both file and batch modes, "on-the-fly" Binary II encoding & decoding and Zmodem Resume/CRC-32.

<> Preference Window allows customization of many program parameters, protocol options and commonly used pathnames.

<> ProTERM's Screen Saver activates automatically and darkens the screen after one to thirty minutes of non-activity.

<> Programmable Delete key allows the Delete key to function as desired for each individual system.

<> Copies easily to any disk media. ProTERM is ProDOS based and not copy protected.

<> Full keyboard support, extended keyboards and/or mouse devices. Emulating terminals with function keys is a snap when using extended keyboards.

<> Unattended Operation allows secure remote access to your computer. Password protection keeps you in control as guests call your computer and exchange files.

<> Incoming data can be routed to the printer, Editor or saved to a file. Either "raw" data (with all the emulation codes intact) or processed lines (which look like the display) can be saved.

<> HotKeys feature can be turned on allowing single keystroke commands.

<> Easy File Selection System allows files to be selected quickly with a minimum of keystrokes. Alphabetized files in directories are easy to find. Typing the first few characters finds files automatically. Novice users can easily navigate through ProDOS directories using ProTERM.

<> Complete disk utilities include: Copy, Delete, and Rename Files or directories. Catalog, Print Files, View Files, Set File Info, Create Directories and Format Disks. Set File Info allows filetypes to be changed, making it easy to work with files from non-Apple hosts.

<> Protocol Transfer Status window shows:
- Current transfer progress - Estimated transfer time
- Percent completed - Protocol options
- Current status - Number of files remaining to send.

<> After a transfer is complete, a protocol statistics window can show:
- Number of files transferred
- Total size of the transfer
- Transfer termination status.
Systems with a clock show:
- Start & end time, and characters per second/minute.

<> ProTERM memory management utilizes all available system memory (even "Slinky" style RAM cards) to support separate Editor, Transfer,
IT'S HERE & IT'S NEW! PROTERM 3.1  Again -- ProTERM improves to meet current needs! The winner of two Awards of Excellence for "Best Apple II Software" just got better! Author Greg Schaefer released ProTERM 1.0 in the late 1980's and subsequent updates through 2.1 gave ProTERM users what they asked for. InSync Software, Inc. published an improved ProTERM 2.2 in Spring 1990, and after eighteen months of intense development, ProTERM 3.0 was born in late 1991.

ProTERM provides Apple II computer users with current and state of the art telecommunications. Completely redesigned and written "from-scratch," version 3.0 was a demonstration of extraordinary engineering combining incredible new features, while maintaining the best of all previous versions. Meeting the challenge of current technology, a new improved ProTERM 3.1 was released in Spring of '93.

NOTE: To insure a stronger tradename protection, InSync Software, Inc., changed its name to InTrec Software, Inc. in early '93.

The update package includes:

<> ProTERM 3.1 on 3.5 and a 5.25 disks.
<> "Jump Start" Quick-Help reference.
<> Quick Reference cards.
<> Registration materials.
<> Sign-up kits for CompuServe, Delphi, Genie, CRS & Dow Jones News/Retrieval.

Update Policy for Validated Owners

Who Is Validated?  ProTERM owners who have mailed their ProTERM Warranty/Registration cards for ProTERM 2.2 or 3.0 or have updated from any prior version to ProTERM 2.2 or 3.0 are on our records as a valid ProTERM owner.

Validation and Eligibility for Update  ProTERM owners who have purchased ProTERM 2.2 or 3.0 but have not registered by mailing their ProTERM Warranty Card, can send the ProTERM 2.2 or 3.0 serialized Warranty Card Registration card or the original ProTERM disks showing the serial number with their request for update.
Update by Phone

Registered ProTERM 2.2 or 3.0 owners can update using VISA or MasterCard.
Call our sales phone, the InTrec BBS or FAX this order form.
Enter: UPDATE at the Main Menu for this form.
EMail: INTREC on Delphi and GEnie, and 75300,735 on CompuServe.

- Update to ProTERM 3.1
  from any ProTERM 1.x or 2.x $40.00
-or-
- Update to ProTERM 3.1 from 3.0 $30.00

- Basic shipping and handling
  for ground shipping within the
  continental United States. $7.50

Extra Shipping -- For other than basic
ground USA shipments, add one of the
following to the Basic $7.50:

<table>
<thead>
<tr>
<th>Service</th>
<th>Add</th>
</tr>
</thead>
<tbody>
<tr>
<td>2nd day air within USA</td>
<td>$7.50</td>
</tr>
<tr>

HARDWARE SUPPORTED
- Computers:
  - Apple IIgs - Apple IIe (Enhanced, 128K)
  - Apple IIc - Apple IIc Plus - Laser 128

MEMORY BOARDS
- All Apple IIgs memory boards.
- Apple Memory Card.
- AE RamWorks, RamFactor, Z-RAM Ultra, Ram Express, GS RAM.
- Checkmate MultiRam Plus, RGB, Q-Card.
- Chinook Technology C-RAM.
- Super Expander "E" and "C."
- Laser 128 Memory Expander.

MODEMS/SERIAL PORTS
- All Hayes compatible modems.
- Apple IIgs modem port, IIc modem port,
  IIc plus modem port, Super Serial Card.
- AppleModem 300/1200, Personal Modem.
- AE Datalink 1200 & 2400, Serial Pro.
- Apricorn Super Serial Imager.
- Boca Research 14.4Kbps
- CTS Fabri-Tek 2424ADH/ADM.
- Epic Classic II, Plus, Mini.
- Hayes Smartmodem 300, 1200, 2400, V9600.
- Laser 128 modem port.
- Novation Professional 2400.
Apple II Computer Info

- OKIDATA Okitel 9600.
- Prometheus Promodem 1200, 1200A, 2400A.
- Quality Computers Q-Modem 2400
- SupraModem 2400, SupraFaxModem Plus.
- SupraFaxModem V32bis
- USR Autodial 212A, Password, Courier 2400, HST 9600, Dual Standard.
- Zoom/Modem MX 2400R.

CLOCKS:
- Apple IIgs internal clock.
- AE Serial Pro, TimeMaster II HO, RamExpress, Z-RAM Ultra.
- SMT No Slot Clock.
- ThunderWare ThunderClock Plus.
- ProDOS Compatible Clocks.

PLUS ALL -
- Hayes (AT) compatible modems.
- All Apple compatible printers, drives and mouse devices.
  (INTREC, CAT24, TOP6, MSG:2/3/4/5/M645)

GENieLamp Information

- COMMENTS: Contacting GENieLamp
- GENieLamp STAFF: Who Are We?
- SEARCH-ME! Answers

GENieLamp is published on the 1st and the 15 of every month on GENie on page 515. You can also find GENieLamp on the main menus in the ST (475), Macintosh (605), IBM (615), Apple II (645), A2Pro (530), Unix (160), Mac Pro (480), Geoworks (1050), BBS (610), CE Software (1005) and the Mini/Mainframe RoundTables. GENieLamp can is also distributed on CrossNet, Internet, America Online and many public and commercial BBS systems worldwide.

We welcome and respond to all GE Mail. To leave comments, suggestions or just to say hi, you can contact us in the DigiPub RoundTable (M1395) or send GE Mail to John Peters at [GENIELAMP] on page 200.

GENieLamp pays for articles submitted and published with online GENie credit time. Upload submissions in ASCII format to library #42 in the DigiPub RoundTable on page 1395 (M1395;3) or send it to our GE Mail address, GENIELAMP.

READING GEnieLamp  GEnieLamp has incorporated a unique indexing system to help make reading the magazine easier. To utilize this system, load GEnieLamp into any ASCII word processor or text editor. In the index you will find the following example:

```
HUMOR ONLINE ............ [HUM]
[*]GEnie Fun & Games.
```

To read this article, set your find or search command to [HUM]. If you want to scan all of the articles, search for [EOA]. [EOF] will take you to the last page, whereas [IDX] will bring you back to the index.

MESSAGE INFO  To make it easy for you to respond to messages re-printed here in GEnieLamp, you will find all the information you need immediately following the message. For example:

```
(SMITH, CAT6, TOP1, MSG:58/M475)
```

In this example, to respond to Smith's message, log on to page 475 enter the bulletin board and set CAT 6. Enter your REPly in TOPic 1.

A message number that is surrounded by brackets indicates that this message is a "target" message and is referring to a "chain" of two or more messages that are following the same topic.

ABOUT GEnie  Effective July 1, GEnie's non-prime time connect rate drops to $3.00 per hour, a reduction of 50% from the current rate. The monthly fee has been restructured, and moves from $4.95 to $8.95, for which up to four hours of non-prime time access to most GEnie services, such as software downloads, bulletin boards, GE Mail, an Internet gateway, multi-player games and chat lines, are allowed without charge. To sign up for GEnie service, call (with modem) 1-800-638-8369. Upon connection type HHH. Wait for the U#= prompt. Type: XTX99014, DIGIPUB and hit RETURN. The system will then prompt you for your information. Need more information? Call GEnie's customer service line (voice) at 1-800-638-9636.
WOW! WHAT A MONTH!!!! First off, an apology is in order from me to you for the mass confusion that was created by not releasing a mid-month GENieLamp as we promised in the last issue. No excuses here. I simply took on too much, too soon. I did not fully realize the extra manpower and time it would take to do two separate issues for all the platforms we cover. Anyway, to make a long story short, we have gone back distributing GENieLamp on a monthly basis. After we have had a chance to re-group we'll take another look at publishing a mid-month issue.

WELL, IT'S JULY 1ST and the the "new" GENie is now officially online! How does the new pricing structure affect GENieLamp readers? Well, for one thing we are now offering GENieLamp in compressed format from the menus. GENieLamp IBM and ST will be in PK-Zip format, GENieLamp Macintosh will be .SIT compressed and GENieLamp A2 and A2Pro will be compressed in .BXY format. What does this mean to you? It means much less time spent in downloading the magazine - in some cases half the time it used to take. Also, GENieLamp Macintosh and GENieLamp A2/A2Pro is now "computer friendly." That is we have removed the linefeeds which mess up the formatting on Apple computers from the magazine. Of course, this means that other computers will now have to convert the Mac/A2 issues in order to read them on their systems. To solve this problem (and for those of you who prefer to read GENieLamp online) there is a separate ASCII version of each issue available in the DigiPub Library located on page 1395.

A nice plus to the "new" GENie is everyone's account now has access to Internet with no sign-up fees or byte charges. I for one plan on exploring this new option asap. For those of you who read GENieLamp via Internet, our Internet address is: GENIELAMP@GENIE.GEIS.COM

Until next month...

John Peters

   o GENie Customers' Most-Asked Questions

    >>> A CLINTON TAX PLAN? <<<

By Tom Trinko
[T.TRINKO]

MIXED FEELINGS When I saw the new rates, I had mixed feelings. I spend a lot of time in basic services -- the astronomy and military history areas -- and now I'd have to pay for it, so I was depressed. On the other hand, downloading astronomy files and checking out the latest war-gaming news, not to mention getting stuff from the Mac
areas, would only cost half as much. If you use the computer bulletin board services your bill will go down by a factor of 2 -- a not negligible reduction.

This assumes that you currently spend at least $8.95 a month on GENie. But at current rates that's only an hour and a half a month, so I expect that most of you will see a net savings. You'll have to examine your usage habits, though, to insure that you get the most for your money. I used to download lots of info from NASA bulletin boards, most of which I just skimmed. I could do this because it was in the GENie*Basic area. Now I'll just skip that, unless I hear that something interesting has happened from other sources.

I still think GENie made a mistake in the way they changed the rates. I think a GENie*Basic area with reasonable limits, say 10 hours/month and 100 messages, would have prevented the "abuses" that have been mentioned without affecting most users. But "ONCE GENie GETS THE INTERFACE PROGRAM OUT IT'LL BE UNBEATABLE."

I understand that GENie has to stay competitive with America Online, which is dropping its rates to $3.50 an hour. Unfortunately, since AOL's main strength is not its rates but its graphical interface, I'm not sure that the GENie rate reduction will lure people from AOL or keep people from leaving GENie. GENie has got to get the GENie equivalent of the CompuServe Navigator out the door, with some of the AOL interface's point-and-click features. We know they've been working on it, and a Windows version, but now, more than ever, services are being compared based upon how easy they are to use rather than how much they cost. I find I spend more time uploading messages on CompuServe than I do here, not because it's cheaper, but because it's easier to do. Once GENie gets the interface program out it'll be unbeatable.

Why so, you say? I regularly use AOL and CompuServe, so I can give you my reasons. I use CompuServe because the main support board for Frontier is there. Unfortunately, unless you log on to CompuServe every few days (at $8 an hour -- can you say $$$?), you can miss topics. Unlike GENie, which keeps message threads around for years so you can find answers you need today which were posted months or even years ago, CompuServe purges the message bases on a very regular basis. Think of GENie as a library and CompuServe as that pile of notes you have by the telephone. AOL keeps messages for a long time, but accessing them is slow and not automated. You can't automatically list all of the messages in a topic. You have to select one, then hit one of the arrow keys to read the next, and so on. While that takes less skill than typing in REA 7, it takes tons of time (can you say $$$?). Previously, AOL had a better selection of files than the Mac area of GENie, but that has been changing thanks to the work of the new Mac area sysops. All in all, if I had to restrict myself to one service I'd pick GENie hands down.

With the new rates GENie is even better if you're mostly interested in computer - or Mac-related items. I think this offsets the extra cost associated with non-computer areas such as the Astronomy and Military BBS. But this raises a question about who the new users are. Originally, only fairly hard-core hackers used computer services, but now more computer users, as opposed to computer fans, are coming online. They came to GENie because of the low cost of the non-computer areas. It'll be interesting to see if they stay.
One final note. We should all remember that GEnie is a business and has to make a profit, just like the companies we work for. I feel that I get my money's worth here, and I think the new rates are reasonable, even though they change the relative cost of the various services. If you play your cards right, this rate change could save you big money or allow you to do a lot more for the same money. (Everything in this article is my opinion, not that of GEnie management.)

>>> FAIRWARS! <<<

By Mike White
[MWHITE]

REMEMBER WHEN? Remember the early 70's? The price of gasoline was skyrocketing -- when you could find it -- and none of us were sure we could pay the rent or buy groceries because inflation was out of control. Putting politics aside, it was pretty clear that Americans were energy hogs: abusers. (This fact hasn't really changed much. We just got a little help because OPEC was unable to enforce limits on oil production. But that's another article altogether.)

The ease with which we reached those depths of wastefulness was soon replaced by a general spirit of thrift and conservation. The economy had a stranglehold on our finances so we made and bought smaller cars. We turned back our thermostats and sacrificed some of our most favorite luxuries. Some of us made a few more dollars income while others used credit cards to continue living beyond our means.

In short, our economy is a monopoly. We can't go down the street and join another country with an economy we prefer. Let's say, though, that we can. Where will we go when that country's economic cycle goes south? Eventually, another country around the corner will look better economically. Why not give it a try? You know that sooner or later the cycle will turn down and another attractive economy will pop up. Just switch your allegiance again.

But by now you are a wayfarer, a gypsy, a nomad, and without a home to accept your allegiance. Opportunism has bought you a life without family or friends. After all, who is going to follow you all over the world while you search for the perfect country? It's not going to play well with your extended family and friends when you go bopping off to try out a new economy whenever the grass looks greener. They know your opportunistic habits quite well by now, and they just want to stay home where life is quite comfortable surrounded by familiar faces.

In fact, by now you wish you had never left. It wasn't worth it. Every time you moved you left behind another group of good friends. Now you realize that if you had just stayed put, adapted to the economy, and kept in touch with your long-time friends, you would be much happier and much less weary from the trek. You did it in the 70's, you can do it again in the 90's. Don't let the price wars between the consumer online networks get in the way of your long standing relationships with real people.

Who can put a price on that?
Apple II Computer Info

>>> GENIE CUSTOMERS' MOST-ASKED QUESTIONS <<<

~ Pricing Changes ~

Q: Exactly how are GEnie's prices changing?

A: GEnie has completely restructured its prices and services. Here's the new pricing structure:

- The monthly subscription fee is $8.95 ($C10.95)
- This includes a credit for the first four hours of standard hourly connect time in that month.
- The standard hourly connect time is now just $3.00 an hour ($C4.00) -- lowest in the online community!
- The hourly connect time rates apply to all GEnie's services, except our Premium Services which are still individually priced. (These services used to be called GEnie$Professional Services).
- There are some surcharges. If they're applicable, they'll be charged in addition to other fees and on all usage hours, including your first four hours.

The new structure goes into effect July 1, 1993.

Q: What happened to GEnie*Basic and GEnie Value Services?

A: These two tiers have been combined. All the services that were in those groups are now all treated equally and priced at $3.00 ($C4.00) an hour.

Q: What are "surcharges"?

A: Surcharges are any extra charges you might incur above and beyond the standard connect time rate of $3.00 ($C4.00) an hour. They include:

- A surcharge of $9.50 ($C12.00) an hour for prime-time usage.
- A surcharge of $6.00 ($C8.00) an hour for 9600 baud access.
- An "800" service surcharge of $6.00 an hour -- for 300, 1200 and 2400 baud. (At 9600 baud, the "800" surcharge is dropped, but the 9600 surcharge still applies.)
- And other communications surcharges. Extended Network ($2.00 an hour); SprintNet ($2.00 an hour); and Datapac ($C6. 00 an hour) are at the same rate as before.

We hope you also notice that our 9600 baud rate has been significantly reduced. It's now just a $6.00 ($C8.00) an hour surcharge, plus your $3.00 an hour connect fee. So in non-prime time, you'll be paying just $9.00 an hour for 9600 baud access -- 50% less than before! Effective rate for prime is unchanged at $18.50 ($C24.50).

Q: What exactly does "a credit of up to four hours of $3.00 an hour connect time" mean?

A: It means that each month, the standard hourly connect time charge for your first 4 hours online is credited. So -- let's say you spend 4 hours on GEnie one month. You will be credited the
standard hourly connect time charge for those hours. If you spend 5 hours on GENie the first four are credited, so you'll only pay for one hour at the standard hourly connect time charge.

Now, let's say you only spend 3 hours on GENie in a month. The charge for those hours will be credited, but you can't put the credit for the remaining hour over into next month, nor can you be reimbursed for it.

One more note on this subject. If you incur any surcharges in your first 4 hours, you'll still be billed for those. For example, if one of your first 4 hours is in prime time at 2400 baud, your charge for that hour will be the prime-time surcharge of $9.50 (US). Only the standard connect time is credited.

Q: Will my bill go up?

A: That depends on how you're accustomed to using GENie. For the majority of our active users -- about 85% -- your monthly bill will be about the same, or will go down.

If you currently use a mix of GENie*Basic and Value Services, you could see significant savings with this new pricing -- now that our hourly rate is half what you've been paying for Value Services.

If you use less than 4 hours per month, you can still keep your bill down to your monthly subscription fee -- assuming no surcharges. And customers who use 9600 baud access will also see savings from the 50% lower rates.

Under the new pricing plan, the customers who are most likely to see an increase are those who predominantly used GENie*Basic Services.

You can use the billing usage report on the *BILL page to review your pattern of usage and project your typical bill under the new pricing.

Q: Is there anything that's "free" anymore?

A: There are a few areas that are exempt from the hourly connect charge and prime-time surcharge. These "Administrative Areas" include:

- GENie Billing Information
- Listing or downloading the GENie Users Manual
- Sending and receiving GENie FEEDBACK through the FEEDBACK option
- General GENie help information
- GENie Index of Products and Services
- GENie Terminal Settings
- Phone Access Directory
- GENie Policies and Guidelines
- GENie Rate Information
- Logon Banners
- LiveWire Magazine Online

Also, remember, you get 4 hours every month without the standard hourly connect charge. And this time credit applies to almost every service on GENie. So you can still watch your budget and take advantage of more of our services than ever!
Please remember, if you incur any communications surcharges, you will be charged for them, even in these Administrative areas.

Q: Will GEnie continue to waive the hourly rate for uploading files?

A: Yes. In fact, starting July 1, 1993, we'll also waive the use of 9600 baud, "800" service and other communications surcharges during your upload. (In prime time, however, the prime-time surcharge will still apply.) We want to make it easier and even more convenient for you to share your software library files with your friends.

Q: What about GE Mail?

A: Sending and receiving GE Mail will be like the rest of our services. It will be charged at the standard hourly connect time charge of $3.00 ($C4.00), and your credit for your first four hours of standard connect time can apply to it.

Q: Are the prices changing for Internet Mail?

A: There's good news here for Internet users. Effective July 1, 1993, there are no extra charges for Internet. You will pay only the standard hourly connect time charge of $3.00 ($C4.00).

Q: Will I have to pay extra for GE Mail to FAX service?

A: Yes, GE Mail to FAX is still a Premium Service. When you use the service, you'll still pay a "per page" charge, along with standard hourly connect time charge.

Q: How will the new pricing structure affect GEnie's Dow Jones service?

A: It shouldn't have much effect at all. Dow Jones, a Premium Service on GEnie, will keep its present rate under the new pricing. And we will continue to waive the hourly connect time charges, while you are in the Dow Jones gateway. Communications surcharges may apply.

Q: What about other GEnie$Professional Services?

A: Not much will be changing. GEnie$Professional Services -- now called Premium Services -- have their own rate structures, which they'll keep under the new pricing system.

However, most of these charges are in addition to GEnie's hourly connect charges. So our new lower hourly rate should mean that you'll see some extra savings.

Q: What about GEnie's special clubs?

A: Our special clubs -- RSCARDS Club, $30 Chat Club and $100 Chat Club -- are being discontinued after July 1, 1993. We believe there's very little need for the special pricing clubs now. Our hourly connect time will be $3.00 an hour, and your purchasing power will be twice what it used to be.

Q: What's happening with LiveWire magazine?
A: After the July/August issue, we're going to discontinue mailing LiveWire to our subscribers. However, it will be available to you every month online in our "Administrative area" -- which means that you'll still be able to enjoy all the valuable information that LiveWire provides, without incurring the hourly connect charge.

Q: Will GENie look different after July 1st?
A: Yes, a few things will look different.

There will be no asterisk (*) keywords and 8000 numbers.

The menus will no longer have asterisks next to certain options to delineate them as GENie*Basic Services. (However, GENie Premium Services -- formerly GENie$Professional Services -- will still be noted with a "$" to remind you that separate rates apply.)

Finally, a new FEEDBACK option will allow you to send and receive FEEDBACK to GENie without paying the $3.00 ($C4.00) an hour standard connect time charge.

Q: There's no charge for FEEDBACK?
A: Right. When you use the FEEDBACK option, sending and receiving FEEDBACK to and from GENie will NOT incur the standard hourly connect charge.

This is so you can correspond freely with GENie Client Services and Billing on such matters as billing questions, personal account information and general questions or problems regarding GENie Services.

But remember, to avoid charges, you must use the FEEDBACK option available on the Administrative Menu, or use the keyword FEEDBACK. If you use GE Mail, you'll be charged the hourly rate.

Q: Does this include FEEDBACK to the SysOps?
A: No, we're treating that differently. Sending and receiving mail to and from the SysOps will now be called "Letters to the SysOps", and incur the standard hourly connect charge.

We're including "Letters to the SysOps" among our $3.00 an hour services because it is technical product and RoundTable support provided by our resident expert -- the SysOps.

Q: How are the keywords and page numbers changing?
A: Only those used for GENie*Basic Services are changing.

As we've noted, after July 1, 1993 there will be no asterisk (*) keywords or "8000" page numbers. If you're used to typing in keywords with an asterisk (*) preceeding them, in most cases you can just drop the asterisk. For example, instead of *PHOTO, you'll now just type PHOTO.

This will also allow you to see ALL the related services in that area, not just the portions previously included in GENie*Basic.
After July 1, 1993, if GEnie doesn't recognize your keyword (minus the asterisk), type INDEX to get a list of all the current keywords.

You might also want to check the INDEX now to find out what the non-asterisk keywords are. They'll still be in effect after July 1, 1993.

Q: What about independently-developed front ends and scripts ... Will they be affected by GEnie's new structure?

A: Some may be, if they used references to GEnie*Basic in their commands. If you have questions or problems, the best thing to do is contact the developer through the RT for your platform.

Q: Is my GEnie user manual still good?

A: Yes. Outside of a couple of sections relating to the GEnie*Basic and Value Services, the remainder of the manual still applies -- especially those parts which address general GEnie questions and commands.

If you have any other questions regarding something specific in the GEnie User Manual that might have changed, write to FEEDBACK and we'll pass the question on to the right people. Or call GEnie Client Services at 1-800-638-9636. We're also in the process of updating our online User Manual, so you'll be able to order that soon.

~ This And That, APPLE! ~

THE AMAZING A2GS! Dennis, Join the club! ;-) My dealer doesn't even know what a IIGS can do. When I took it over to there store after a computer club meeting one day, they were very amazed to see that the machine had a mouse and more the 64k. When they saw the boot screen and the finder they just about fell over.

-Apple IIGS Ozoneman - IIGS Forever!

Shareware Solutions II
166 Alpine Street
San Rafael, CA 94901
(J.KOHN, CAT28, TOP4, MSG:52/M645)

WORD TO THE WISE  The new version _is_ final. We may have one or two
 ********** ********** small updates but they won't be anything major or
really necessary for GEM to function properly (for example, we noticed
after release that the dial entry for GEM under ProTerm is still numbered
4.20 even though it's 4.21, or Steve Weyhrich's name is spelled wrong in
the docs - minor stuff like that).

The old GEM WILL break within a few weeks. Most likely by July 1 at
the latest, maybe sooner. You can stick with the old version if you want,
but the day GEM breaks, you will have to log on manually to get the new
version.

You need GEM 4.21 to make sure your GEM is working. As long as your GEM is
4.21 you'll be fine. Don't worry if you got an early version of GEM version 4.21
where some of the screens still say "GEM 4.20." Just ignore that. We're putting up a new v

Just a warning to the wise. You can do what you want about it. ;-)

GEM AND COPILOT UPDATE We certainly have been working overtime to get all bugs.

It's been very difficult for us because we're working with programs we didn't write, and there have been different problems not only with both programs, but with different versions of each program, i.e. there were changes to the ProTerm scripts that weren't the same as the changes to the TIC scripts and etc. Everything starts to blur together after a while.
Regarding the complaints about all the different GEM versions — that's a wee bit unfair since we only publicly released one GEM version before the current one, which we told everyone was a beta and that they should only download it if they wanted to help us test it. The next version to go up had some extremely minor problems that we provided small and simple updates for.

We've been working under the gun with all these upcoming GENie changes, and trying to get things out before July 1 so people who use the former Basic Services RTs can save money under the new rates. It seemed like a good idea, anyway. :-) — Dean Esmay

(A2.DEAN, CAT10, TOP11, MSG:190/M645)

>>> HOT TOPICS <<<

~ Too Hot To Handle, Almost ~

CUPERTINO, Calif. (AP) -- Apple Computer Inc. announced today that chairman John Sculley is stepping down as chief executive so he can focus on pursuing business opportunities for the computer company.

Sculley, who will remain chairman, will be succeeded as chief executive by Michael Spindler, Apple's president and chief operating officer.

"My personal interests have long been in defining the opportunities and technologies for Apple in the convergence of computing, communications and content," Sculley said in a prepared statement.

"There is so much to be done here, and now I will be able to concentrate fully on these activities while Michael runs the company," he said.

Sculley, who has headed Apple for 10 years, said he initiated the move and had been discussing the change with the board of directors for two years.

"We respect John's wishes and are very fortunate that he has agreed to continue as chairman and close adviser to Spindler," said A.C. "Mike" Markkula, Jr., Apple's co-founder and vice chairman.

Spindler joined the company in 1980 as marketing manager for European operations. Since then, he has served in several capacities, including general manager for European operations, vice president and in international sales and marketing.

(J.KOHN, CAT5, TOP2, MSG:136/M645)

POWERPC MIGRATION

A lot of people seem to be quoting the company line. I'm not sure this is realistic....

(1) Software emulations have historically been poor in performance (can you say SoftPC?). Plus, even hardware-supported emulations often lose the character of the original platform (IIe Card in an LC; try filling the "virtual slots" the way _you_ want to). Until I see the PowerPC do the emulation right, I remain skeptical.

(2) "We'll support the Mac." Uh, if _native_ products for the PowerPC...
show more potential for new sales, guess exactly how long Apple will stick with supporting the Mac emulation. They aren't bringing out new models of Macs every few months for the customer's health; they're doing it to move hardware (this month's _MacWorld_ is filled with letters from disgruntled IIvx purchasers; that machine had to be "planned obsolescence" as it was only on the market a few months, and the upgrade to the Centris is not cheap). When they are making money primarily on software, that will become their incentive. (This isn't knocking capitalism; I just hate to see people assume Apple will somehow become "noble" when their history is to seek bucks like any other company.)

Remember Apple is the home of the "reality distortion field". If you look around and the world isn't the way they describe _today_ (do _you_ feel you've been told the truth historically on how you as an Apple II customer were being supported?), don't even think about believing what they predict it will be tomorrow.

(I'm also waiting for "put-up-or-shut-up" on Windows NT, the Pentium, etc. ;)

(WIZARDS.MUSE, CAT5, TOP3, MSG:161/M645)

Agreed for most s/w emulations however, I _think_ the Mac <-> PowerPC situation is somewhat different. First of all, most Mac applications make heavy use of the Toolbox. That gives Apple a much smaller and defined target to aim at, compared to emulating DOS and BIOS and whatever-else is needed for SoftPC. As well, Apple did a study of a number of Mac applications and found that a very high percentage of time (over 50%) was spent in only a few key Toolbox calls. They are re-writing those Toolbox calls in native PowerPC code to get the most bang for the buck.

> Plus, even hardware-supported emulations often lose the character of the original platform (IIe Card in an LC; try filling the "virtual slots" the way _you_ want to).

Another good point, however, the PowerPC upgrades will still have access to the original hardware Nubus slots, just as the 680x0 did. Not quite the same situation.

> "We'll support the Mac." Uh, if _native_ products for the PowerPC show more potential for new sales, guess exactly how long Apple will stick with supporting the Mac emulation.

A compiler producing native code that runs under the Mac O/S on a PowerPC would still produce Mac O/S applications. Application-specific code would run at native-code speed and Toolbox calls would run at emulation speed or native speed depending on which Toolbox calls Apple has ported.

Now, if Pink ever sees the light of day, then yes, your Mac applications probably wouldn't run under it directly.

> this month's _MacWorld_ is filled with letters from disgruntled IIvx purchasers

As a IIGS owner, I have no sympathy for them whatsoever. As a Mac IIvi owner, I don't understand what their problem is - the IIvi and IIvx are both on the short list of machines with scheduled PowerPC upgrades. That's one of the reasons that I sold my Mac IICX and bought the IIvi.
do _you_ feel you've been told the truth historically on how you as an Apple II customer were being supported?

Well, I think that Apple has learned a lesson and will make every reasonable effort to provide Mac users with an upgrade path. And I am also quite satisfied at the current level of support that they give the Apple II, given the historical decisions that they made – not that I agree with the past decisions, just looking at it from where we are today, and the support that they continue to give today. –Allan

(A.BELYEA, CAT5, TOP3, MSG:163/M645)

Apple talks about compilers being able to compile the same code in both Mac and PowerPC specific versions. Obviously, though, the PowerPC is going to have a number of features that the Mac doesn't have. Otherwise, why not just continue using faster and faster 680x0 processors? So, as soon as some of those PowerPC specific features are used, the program will no longer be able to be compiled in a Mac version. Now, given the CHANCE at using some nifty new features, how many people do you think are still going to limit their programs to ONLY using features available to Macs, so that they can be easily compiled for both systems? It's going to be like when a new version of an operating system comes out. Sure, a FEW people will continue to make their programs compatible with the previous operating system, but the vast majority are going to JUMP at the chance to use the nifty new features available in the latest system software release. The number of people who are going to still limit themselves to the "smaller" feature set of the Mac may be a little bit higher in this case, but don't fool yourself that MOST people developing applications to run on the PowerPC are going to.

The PowerPC Mac emulation is going to be like the Apple IIe Card in the Mac LC/etc. Has this card increased the market for new 8-bit Apple II software? No. People with IIe Cards are NOT buying new Apple II software, they're only using them to run existing Apple II software that they already own. With the PowerPC Macs, the cross compiling system is going to be used in a similar way: Existing applications are going to be recompiled for the PowerPC, and from there there's no looking back. You're going to be able to use the Mac stuff you have now with the PowerPC Macs, but the original Macs themselves are going to be left in the dust, just like the Apple II.

That it's most likely to look like is the relationship between the Apple IIGs and 8-bit Apple IIs.

(A2.LUNATIC, CAT5, TOP3, MSG:166/M645)

The PowerPC Mac emulation is going to be like the Apple IIe Card in the Mac LC/etc. "

I don't think you guys have the true picture here. The PowerPC is not just a faster processor and an extended feature set. It IS, literally, the next generation.

As I said in an earlier post, the limit on software emulations in the past has been the power/speed of the processors on which the emulation was running. A friend of mine tells me that he read a report of someone who ran one of the standard Mac testing programs (Speedometer?) on a PowerPC doing it's Mac emulation. The testing gizmo thought it was running on a Quadra 850 at 400 mhz. I'm told that screen redrags are so fast that you can't see them happen, you can only see that they have changed.
Comparisons with earlier emulations are invalid, this thing is just so fast it is beyond the comparisons entirely.

"Hat it's most likely to look like is the relationship between the Apple IIgs and 8-bit Apple IIIs."

That's about right, if the GS in question is running at 10-15mhz. :) That is, Mac applications will run so much faster that it will compare to a 1mhz, read a block at a time, P8 application running 1500% faster with a multiple block read SCSI card.

However, the thing you can't ignore is that there is a HUGE installed base of Macs out there (as compared to the Apple II market, even at its peak). There IS money to be made for a developer who comes out with an app that runs on the older Macs. When you consider that that same app WILL run on the PowerPC (except it will be an order of magnitude faster), it'll be worth it. Also the technical advantages of the PowerPC are not radically different, in the way that going from a monochrome IIe to a IIgs are. The largest part of the difference is in extended capabilities like being able to multitask DOS and Mac applications at the same time, significantly better networking capabilities, etc. (And it is entirely possible to write a program for the old style Macs and then simply and quickly port it to PowerPC native mode code. This is SUPPOSED to be a trivial task. :)

-Gary R. Utter (GARY.UTTER, CAT5, TOP3, MSG:167/,645)

>>>>>, ary, I was trying to put it in easy to understand terms, and you took those quotes out of context. Twice now in Apple's history they have already come out with a faster/better machine that had a HARDWARE emulation of a previous CPU (three times, if you count the Apple ///'s emulation of the original Apple II). In both cases, this new machine's emulation capability did NOT create a significant new market for software that still ran on the old machine, once equivalent new machine specific software was available. That doesn't mean that the old market disappeared, but it was greatly overshadowed. Now with the Power PC Macs, due to developer seeding, and to the initial source code compatibility, there should already be a significant amount of native Power PC software (at least Power PC specific VERSIONS) at or soon after its release.

The 680x0 Mac market isn't going to disappear when the Power PC Macs come out, and it's not going to be an Apple II vs. Mac kind of controversy. What it will be more like is an Apple IIgs vs. 8-bit Apple II situation. You buy one machine, and you'll be able to run everything. The people with the older machines will be able to "upgrade" to the new machines and take all their software and hardware with them. But the people who don't upgrade are going to start wistfully looking at the neat new packages that won't run on their machines, and wonder why there's getting to be less and less development for their platform. -= Lunatic (:)

SYSTEM 6.0.1. & POINTLESS PROBLEMS? I got System 6.0.1 about a week ago from Resource Central, and after getting it, called Apple's Software Licensing to inquire about making it available to members of my local user group. After getting the OK, it was passed out this past weekend.

So far, I, and several other officers of the club, have been having
major problems. We all have Pointless installed, and as soon as accessing a
Choose Font menu from a GS/OS word processing program, the system freezes.

I have tried re-installing 6.0.1 several times, trying everything
from an Easy Update to a complete new "clean" install. Even with a minimum
system, with nothing extra installed, Pointless and 6.0.1 do not seem to
get along.

Three of us have the exact same problem. As soon as the Choose Font
dialog box appears, several dimmed numbers appear where point sizes should
go. Some of those are three digit numbers. As soon as anything (point
size, TT font) is clicked on with the mouse, the system freezes. That's
happened to me with AppleWorks GS. I then did install one NDA, WriteIt,
which has always been very well behaved with all versions of the GS System
Disk, and it did the same thing.

I have a ROM01 with a 4 meg Sequential Systems RAM card. I have a 100
meg Vulcan, and have a HP LJIIP Plus connected to an AE Parallel Pro and
have Harmonie 2.0p.

Is there a problem with 6.0.1, with Pointless, or...?
TIA -Joe

(J.KOHN, CAT9, TOP6, MSG:72/M645)

WESTCODE RESPONDS Here is the "official" posting on the current
"""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""

All -

I was recently made aware of a conflict between System 6.01 and
Pointless 2.0.

PROBLEM If you select a TrueType font from the Choose Font dialog, your

~ New and Improved ~

SYSTEM 6.0.1. RELEASED For those of you who still don't know it, Apple's
""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""""
Apple II Computer Info

available, as is the new System 4.0.2 for the IIe and IIc.

System 6.0.1 contains many enhancements and bug fixes, most notable probably being the (read-only) MS-DOS FST for high density drives, and aliasing & keyboard navigation in the new Finder.

System 6.0.1 comes in two packages. The first is only $24, and includes all six new disks, as well as a 20 page set of release notes that describe the differences between System 6.0 and 6.0.1.

There's a second package which includes a complete set of manuals for $39, but that package is not yet available. Plus all it includes is the same documentation that came with System 6.0, plus the 20 pages of release notes you'd get if you just bought the first package. ;-) You only need to order the second package if you don't already have the System 6.0 manuals.

The new ProDOS 8 System Disk 4.0.2 for 8-bit Apple II systems, which contains the latest PRODOS and BASIC.SYSTEM, is available for $14.00.

All prices include surface shipping anywhere in the world. Air mail is extra.

To order, contact:

Resource Central
P.O. Box 11250
Overland Park, KS  66207
913-469-6502

Or, if you'd like to order it through GENie, just send e-mail to A2-CENTRAL (that's A2-CENTRAL, not A2.CENTRAL or anything else - A2 dash Central) specifying what you want and giving your full name, address, credit card number, and expiration date. We only accept Visa and Mastercard.

Just thought everyone would like to know. ;-) 

IIgs System 6.0.1 and the 8-bit System 4.0.2 will be available for downloading on GENie at some point in the near future, but we are still waiting for clearance from Apple Licensing before we can make it available here.

Let me say here that System 6.0.1 for the IIgs is wonderful! You should get it ASAP. :-) -Dean Esmay

(A2.DEAN, CAT23, TOP4, MSG:148/M645)

>>>>>   This is the text of the "Whats.New" file from System 6.0.1.   
"""
What's new for System 6.0.1   This is a summary of the visible changes   
since System 6.0 was released. There have been many bugs fixed and many features added that are not immediately visible. They will enable developers to create better future products. Be sure to also read the Shortcuts file on the SystemTools2 disk for more information.

Finder (see also Finder Help)   You can now click in Name, Size, Kind, or   
last Modified at the top of a list-view...
To rename an icon, you must now click on its name rather than the icon.

The "File Copy Alternatives" dialog has been removed. Holding down the Option key now always forces a copy rather than a move.

Dragging certain system-related files to the System folder icon on the boot volume now does "magic routing" much like the Macintosh Finder. Note that this only works when using folder's icon; dragging into a window works as before. The kinds of files that are properly placed in their own folders within the System folder are: Control Panels, Desk Accessories, Drivers, FSTs, Tools, Fonts, Sounds, Inits, and Finder Extensions. Other files are just placed in the System folder.

The Finder now creates the "FinderExtras" folder for you.

If you open the Icon Info window on an Apple SCSI device, the SCSI ID number appears on the "Where" card.

The Finder's Clipboard window handles text, pictures, and sounds. If you copy a sound to the clipboard (using the Sound control panel, for example), you can click on the Speaker icon on the clipboard to hear the sound. Teach has the same Clipboard window.

Extensions

EasyMount is not just for servers anymore. It now handles aliases to any disk, folder, or application. In other words, you don't need to drag the icon onto the desktop anymore just keep an alias of it on the desktop. Select the icon of the item you want to alias and choose "Make Alias" from the Extras menu. EasyMount will ask you where to save the alias. Later, double-clicking the alias opens the real item disks and folders are opened, and applications (F8 or GS/OS) are launched. The Installer automatically installs EasyMount in your System.Setup folder.

Control Panels

DC Printer control panel This was a change in System 6.0 but not documented: The DC Printer will let you choose LaserWriter, which is potentially useful for "printing" to PostScript files.

Monitor control panel The new checkbox "Smother Mouse Cursor" sets a new Battery RAM location. It kills the cursor flicker that is especially noticeable with a Video Overlay card or an accelerator.

SetStart control panel The new checkbox "Show icons during startup" provides a way to set the Battery RAM location that disables the display of the startup icons. The Battery RAM location has been there since System 6.0, but there was no Apple-provided way to change it.

The new checkbox "Enable programmer CDAs" provides a way to set the Battery RAM location that allows Visit Monitor and Memory Peeker to show up in the CDA menu. Both ROM 1 and ROM 3 machines now check this location. This checkbox does not show up if the ROM 3 Control Panel disable jumper is present.

Startup

During startup, if you have a lot of icons, they no longer keep recycling the bottom row of the screen. They now "wrap up" to the row above.
If you use a Vulcan internal hard drive, you no longer need to copy the Vulcan driver onto the Install disk when installing new system software. The Vulcan driver should still be used for enhanced performance, but you can successfully install without it.

If your ROM 3 Apple IIgs has 8 Megabytes of RAM, the computer fails to create a RAM disk (RAM5) of any size. In this case, System 6.0.1 creates RAM5 and then restarts the system. When you turn on the computer, you will hear an extra beep at the "Apple IIgs ... ROM Version 3" screen.

Drivers
The RAM5 RAM disk has a new driver. The Installer automatically installs it if you have the RAM disk enabled when you do an Easy Update. The driver greatly enhances the disk's performance. It also allows you to have a RAM5 disk in GS/OS (but not in ProDOS 8) even when slot 5 is switched to "Your card". On a ROM 1, you must have the Minimum and Maximum sizes set to the same value; otherwise you will see a message during startup and the new driver will not be used.

The Apple II Memory Expansion Card has a new optional format. If you have a full megabyte of memory on the card, it lets you format it as either 1,024K or 800K. The 800K option blocks out the remaining 224K, but allows faster block copies to and from other 800K disks.

File System Translators (FSTs)
The MS-DOS FST is new. To use it, you need a drive that can read MFM disks, such as the Apple SuperDrive with an Apple II SuperDrive Controller Card.

This version is read-only - it doesn't let you make changes to MS-DOS disks.

ProDOS 8
The Thunderclock year table in P8 has been updated for the years 1993-1998. There is also a Clock.Patch file on the SystemTools2 disk that you may use to update P8 (renamed to ProDOS) to include future year groups. -= Lunatic (: (A2.LUNATIC, CAT9, TOP6, MSG:55/M645)

NEW PRODUCTS FROM APPLE

Apple has just announced three new computers and four printers.

LC 520
The LC 520 is an "all in one" unit 25 mhz 68030 processor 'box' with a built-in 1.44 Mb 3.5" floppy, a built-in 330i CD-ROM, either a 80 or 160 Mb hard drive, and a built-in 14" Macintosh Color Display (Trinitron tube). It comes with a minimum of 5 Mb RAM and 768k VRAM (32,768 colors). It also has one LC style processor direct slot and a math co-processor slot. So it's a LC III with a built-in CD-ROM, upgraded monitor, and one piece design.

PowerBook 145B
Also a 25 Mhz 68030 processor, 4 Mb RAM, supertwist display. Now "the most affordable PowerBook".

PowerBook 180c
A color version of the 180 (256 colors, 640x480, 8.4") running at 33 Mhz with a 68030 processor. Otherwise specs are as for the PB 180.

Portable StyleWriter
A portable StyleWriter! Weighs 4.5 lbs.
Apple II Computer Info

Personal LaserWriter 300  300 dpi non-AppleTalk laser printer. Comes with GreyShare to use it across AppleTalk. Touted as as inexpensive as an ink-jet printer.

LaserWriter Pro 800  _800_, 600, 400, or 300 dpi. PostScript level 2 and PCL 4+. 64 fonts. Serial, parallel, and AppleTalk. Sez's it works with MS-DOS, Windows, Unix, as well as a Mac. Also sez's it works over "many network operating systems concurrently via multiple protocols, including TCP/IP, EtherTalk, NetWare IPX, and Digital LAT. 15 pages per minute.

LaserWriter Pro 810  A mo' betta 800. Does more networking tricks. 20 ppm. Internal send/recieve PostScript fax modem option.  -Mike ("Maj") Murley

HARDPRESSED OUT!  Got HardPressed today. Nice manual as always (that's really why I bought it ;). Hehe, seriously, though, I gotta read up on it first before installing it, but from what I've read so far it looks great (and very well documented :). More when I get it installed tomorrow.

SHAREWARE SOLUTIONS II INFO  Somewhere up-topic, I posted a press release. What it said is that Shareware Solutions II will be published every other month, with the eventual goal of "going monthly". Each issue will be at least 12 pages. Planned feature length articles for the first several issues will include an over view of Apple Expo West, with a detailed description of all new products released there, a very detailed article about The Internet, including a description of what it is, a hundred ways to access it for free, step-by-step Apple II oriented instructions that will assist the net newcomer (and more than a few old-times), and a mini-guided tour to Apple II and Educational offerings on the net. There will be a 'Shareware Solutions like' article about all the software created by the France based FTA, including several surprises. Grapevine: The Next Generation will continue to provide readers with fun Apple II Easter Eggs, money saving hints, and include Apple II news. Modem Madness is a telecom oriented column, with news of interest to Apple II users.
Of course, every issue will contain lots of information about new and classic freeware, shareware and public domain, and all software written about will be made available to readers via the mail.

The North American subscription rate is $25 (US Funds ONLY) for 12 issues (that’s not a one year subscription; it's for 12 issues). Outside North America, the subscription rate is $40, and foreign readers will receive their copy by first class air mail.

I am not set up, at this time, to accept school purchase orders or credit cards.

Joe Kohn
166 Alpine Street
San Rafael, CA 94901

INTRODUCING: MEGABUFF
MegaBuff is a 1 MegaByte buffer and LocalTalk Option (LTO) board for the ImageWriter II printer. In serial mode, it supports data speeds up to 57600 baud. In network mode, up to four computers at once can be buffering data in MegaBuff. A special Macintosh printer driver is included that displays the amount of memory remaining in the buffer via a thermometer bar.

As an example of our continuing support for Apple II users, MegaBuff now ships with an _exclusive_ high-speed 57600 baud Port Driver (for Apple IIGS). These port drivers directly access the serial chip in the Apple IIGS for TRUE 57600 baud access (no overhead). As an example of the benefit of this, a sample four-page AWGS word processor file printed in 1:30 seconds on an IW2 (w/MegaBuff) with Apple's standard port driver. With the MegaPort driver, the same file spooled to the printer in only 30 seconds! Even better, the MegaPort driver allows you to put an expansion card in slot 1, because MegaPort directly accesses the IIGS serial port.

Don't wait! Get this powerful addition to your computer system today! —Jawaid @ Sequential

>>> THROUGH THE GRAPEVINE <<<
~ Rumors, Maybes and Mayhem ~

inCider/A+?? I was surprised the latest (and last?) issue of inCider/A+ makes no mention of its future, or lack thereof. The only reference whatsoever is that Joe Kohn "is moving on;" it's not mentioned that everyone else is moving OUT.

There's no editorial.

There ARE reader-service cards that invite new subscriptions.

Maybe the decision was made AFTER the issue went to bed? <<<Lloyd>>>

(L.DEVRIES, CAT28, TOP3, MSG:186/M645)
I was also surprised. For those who are not online, the sudden disappearance of inCider is going to be more of a shock than it would have been with the inclusion of a "farewell" editorial. Harumph.
Steve Weyhrich <IX0YE> <S.WEYHRICH, CAT28, TOP3, MSG:187/M645>

LLoyd/Steve at al - When I talked to Paul Statt about it many months ago, he told me that in general, when a magazine publishes its final issue, it doesn't mention that fact within the magazine itself, and that inCider wasn't going to say anything either.

It was for that very reason that my column includes my farewell.

The decision that the July issue would be the final issue was made long ago. It was only the details that were worked out in recent months.

Despite the fact that A+ Publishing will be publishing Mac Computing, I am firmly committed to remaining with the Apple II, and made my decision to publish Shareware Solutions II after I learned of the eventual demise of inCider/A+.

Believe me; the July issue of inCider is the last one you'll ever see. And, trust me also, when I say that the best of inCider/A+ will live on in Shareware Solutions II. -Joe Kohn

GOOD NEWS... The next release of the Six Pack product will include an improved MoreInfo extension that includes "preferences", you can pick All, none, or whatever of those MoreInfo items you like to show up in the Extras menu. I like leaving Lock and Unlock there, but I have the others set not to show up.

But that's not all :-) In the coming months (when its done!) you'll find that most of the existing programs have been improved and there will be a few new ones as well.

When the new release is ready, either Jerry or myself will post here on GEnie and let everyone know!

PS: Dont forget, with IR installed in your system (its on the Six Pack disk), you can put some of your less-often used extensions in a different folder and just double-click on them when you want to use them. This way, you won't have the giant Extras menu all the time. Also, you can create Worksets of groups of extensions to be installed with a single double-click (Isn't Six Pack a great pack of programs?)

For the record, I LOVE having a MONSTER Extras menu! :-)

Bill {W.TUDOR} <W.TUDOR, CAT42, TOP26, MSG:119/M645>

EXPRESS V2.1 SOON We expect Express v2.1 will be available in a month or so. It will also include the tweak to force T2 to do a friendly "background blank" so it won't keep Express from printing.
Thanks, --Dave
(SEVENHILLS, CAT43, TOP10, MSG:175/M645)

LATEST ACCUDRAW AT KANSASFEST For those of you who will be attending
KansasFest this year, you will be able to see the latest version of AccuDraw. This is the most complete graphics design program ever written for the Apple II.

With AccuDraw, you can even do complex features like Aldus Freehands tile fill. In AccuDraw, you can make any contents of the clipboard a fill pattern to be used. This is a tile fill.

Are there any features you are looking for in a CAD program? If so, ask here. They may already be in AccuDraw.

-Eric Bush, Kitchen Sink Software, Inc.

(KITCHEN.SINK, CAT25, TOP11, MSG:79/M645)

>>> MESSAGE SPOTLIGHT <<<

~ Listen Up! ~

Jawaid,

I agree! (Isn't that amazing!??!) I too don't understand why Apple decided that the $1.5 billion that the Apple II was generating wasn't good enough. I guess they felt that every Apple II sold was one less Macintosh. And since they wanted to go with the Macintosh in the long run I guess they decided to just shoot the Apple II in the head.

The shooting in the head is the part I don't get. I can understand a company deciding on long range goals (I guess 5 years is long range in the personal computer industry eh? :).

I guess I was saying two things: One, I was giving that guy an example of a company that could stop pushing a money-making product and still survive. And two, I was trying to say that while I think pushing the Macintosh over the Apple II was in the best interests of Apple Computer in the long run I think they could have handled the installed base of Apple II users better.

Bryan

[*][*][*]

Not all business decisions are made on the basis of logical course of action or financial evaluation. Looking back at the last few years I'd have to say that Apple abandoned the Apple II because a controlling group of management honestly think the Macintosh is a superior technology. Numbers can be moved around to support many different views of a given business strategy. Lost revenues due to non-pursuit of 6502 based technology aside, my impression is that most Apple employees are solidly behind the Mac and would prefer to use a Mac over any other personal
computer available. Remember trying to convince a CP/M user that the Apple II was a worthwhile machine? Same thing trying to convince a Mac aficionado that the Apple II is still relevant.

As for me... different tools for different jobs. I hope the Apple II will be around for years to come.

Walker

[*][*][*]

While on GENie, do you spend most of your time downloading files? If so, you may be missing out some excellent information in the Bulletin Board area. The messages listed above only scratch the surface of what's available and waiting for you in the bulletin board area.

If you are serious about your APPLE II, the GENieLamp staff strongly urge you to give the bulletin board area a try. There are literally thousands of messages posted from people like you from all over the world.

>>> I HAD A DREAM <<<
"""""""""""""""""""""

Monday, 10 AM -- Chicago, Illinois -- Start-up software developer Cuisine International announced CUISINENET, the first internetworking program to seamlessly integrate word and food processing. Called a breakthrough for small restaurants and snack bars, Cuisine Chairman Mark Meigs confidently predicted sales of thousands of copies with shipments soon to begin.

Monday, 4 PM -- New York -- Cuisine International shares closed sharply higher on announcement of new CUISINENET product.

Tuesday, 9 AM -- Redmond, Washington -- Microsoft Chairman William H. Gates, III announced that Microsoft Food for Windows would soon enter beta testing. Gates described the product as the first of a projected family of products to include Food for Windows, designed for small commercial dining establishments; Personal Food for Windows, designed for home kitchens; Portable Food for Windows, designed for lunchboxes; and, of course, at the high end, Food for Windows NC (Nouvelle Cuisine) designed for large institutional dining rooms. Asked by a reporter about CUISINENET, Gates said that he had never heard of the product, but was not surprised by it, because the software business is highly competitive, and Microsoft has to compete on the merits with many strong competitors, as the FTC had recently concluded.

Tuesday, 3 PM -- Chicago, Illinois -- An angry Mark Meigs showed reporters a copy of the nondisclosure agreement signed by Bill Gates, under which Cuisine International had informed Microsoft a year earlier about plans for
CUISINENET. Meigs said that in hindsight, he should never have signed the agreement, as the only thing he learned from Microsoft was that Gates was considering making changes to Windows.

Wednesday, 9 AM -- Redmond, Washington -- Microsoft Chairman Bill Gates announced that Microsoft would soon publish specifications for the Windows Open Kitchen Architecture (WOKA), a series of design specifications to permit manufacturers of toasters, ranges, and other kitchen appliances to integrate their products into the forthcoming Microsoft Food for Windows line. Asked about reports of a nondisclosure agreement with Cuisine International for a similar product, Gates said that the other product was really at most a niche product, and would probably have less functionality than the food-related features that Microsoft would be building into the new Unsaturated FAT File System which would be part of DOS 7.0. Gates said that he doubted there would be much interest in a dead-end solution that would not be able to keep up to date with advances in WOKA. Gates added that over 11,000 manufacturers of kitchen appliances were already having serious discussions with Microsoft about WOKA, and that he expected almost all important eaters of food to standardize on the WOKA environment.

Wednesday, 10 AM -- Redmond, Washington -- Microsoft Chairman Bill Gates announced that he would be giving the keynote speech at the American Bakers annual convention on "Nutrition at Your Fingertips." Gates played down speculation that he would use the Bakers convention to introduce Microsoft Food for Windows, saying only that alpha testing was proceeding ahead of schedule, and the product would be shipped when it was ready.

Wednesday, 11 AM -- Redmond, Washington -- Microsoft Corporation announced that its Chairman, William H. Gates, III, had made a donation of over $250 of personal funds to the Cordon Bleu to begin an endowment fund for the Bill Gates Professorship of Advanced Cookery. The famous French cooking school confirmed that it had agreed to be a beta site for the much discussed Food for Windows application sweet.

Thursday, 9 AM -- New York -- PCWeek Magazine reported in a copyrighted story that it had obtained a copy of correspondence from Microsoft to Cuisine International, demanding that the small developer of kitchen software cease using the Cuisine name, as it infringes on the trademark for Microsoft Food for Windows NC. Microsoft added that Chairman Mark Meigs would also have to change his own name as Mark infringed a copyright on the Windows Edit menu, Meigs infringed the trademark on Meigs Field in Microsoft Flight Simulator, and Chairman infringed the trademark on Bill Gates's title which he had acquired with personal funds from Mao's estate. Also, Microsoft advised that while the company did not actually have to move out of Chicago, use of the name on press releases infringed a trademark on Windows 4.0.

Thursday, 4 PM -- New York -- Cuisine International stock closed at 0-bid, 1/16-asked.

Friday, 9 AM -- ? -- An anonymous spokesman for an unnamed Midwestern software developer announced the discontinuation of operations. Undescribed legal problems were cited as the reason. Others speculated that a failure to appreciate the competitive nature of the software business may have led to the company's sudden collapse.

Monday, 9 AM -- Microsoft Internal Mail
From: billg   To: miking   Re: Food Program

Please see if you can reassign one of the 3,000 engineers from the OS/2 virus development project to do a feasibility study on a food-related program. Not sure what it would do. Low priority.

(J.ELKINS1, CAT21, TOP48, MSG:913/M615)

A2 Roundtable News

By Darrel Raines

TAKE A LOOK! This new section of GENieLamp will take a look at any upcoming events and other news dealing with the A2 Roundtable. Look here for information announcing changes to the A2 Roundtable on GENie.

BEWITCHED, BOTHERED, OR BEWILDERED BY GENIE?

Come by A2's Real Time Conference (RTC), every Sunday at 2 PM Eastern and we'll rub GENie's "magic lamp" to unlock the secrets of the universe! Well, ok, we'll unlock the secrets of the universe known as GENIE! No question is too simple, no klutz books are needed -- just hunt n' peck your way in and we'll take care of the rest. If you feel like you're all thumbs, or have two left feet, then you've found just the right place!

Hey! Guess what? We're keeping the RTC open ALL DAY on Sunday's. We move it to Chat from 8-9:30PM, (M400;4) then we're back here for our regular Sunday RTC, II Speak!

Real Time Conference Schedule

LONG AWAITED GEM UPDATE NOW AVAILABLE!

GENie Master (GEM) v4.21, the premiere FREE Apple II off-line message and file management system is finally here in the A2 libraries as file #20978, GEM.4.21.BXY. This is a MUST-HAVE program for all Apple II users on GENie! GEM saves you time and money by automating all of your regular online activities. It requires AppleWorks 3.0 and either Talk is Cheap, Point-to-Point, or ProTERM 3.0. This new version 4.21 includes a new easy to understand manual, automated new user sign ups, and lots of changes and fixes.

*** WARNING! ***  *** IMPORTANT! ***

I GEM v4.20 AND COPILOT v2.0.x OFFLINE NAV. USERS!!

Your copies of GEM and CoPilot will _BREAK_ between now and THIS WEDNESDAY, June 16th!! GENie is making structural changes to make it more responsive, but it will break GEM and CoPilot. Version 4.21 of GEM and version 2.1 of CoPilot are already compatible with all new changes, INCLUDING JULY 1ST CHANGES, and they are available NOW in the A2 Library. GEM v4.21 is file #20978, GEM.4.21.BXY, and CoPilot v2.1 is file #20878, COPILOT.2.1.BXY. If you don't have the latest GEM or CoPilot already, please download these TODAY! Some copies of GEM are already broken, and ALL versions prior to GEM 4.21 and CoPilot 2.1.1 will be broken by Wednesday at the latest.

Download these TODAY if you haven't already! You don't have much time left!

NEW! A2'S DISK OF THE MONTH!

Now, every month, starting this month, download the best Apple II files collected together on a single disk in A2! We've got the files that you want, available as a single download, easily selectable simply by choosing menu item 7 on the main A2 menu. This disk is great for user groups, and is specifically cleared for their use. If
Item #7) you're only going to download one file a month, make it this one!

[EOA]

[LIB]/---------------------------------/
ONLINE LIBRARY /
---------------------------------/

A2 Library -- Quick Takes

By Darrel Raines

This section of the monthly GENieLamp will be devoted to a sampling of the many diverse files that are uploaded to the A2 library each and every month. Our feature article will focus on a specific type of file that can be found in the libraries. This area will only offer the name and a short description of the files that are new to the A2 library during the last month.

The fact that a file is listed in the following lists is not necessarily a recommendation for the file. The attempt will be to show the diversity of files uploaded to Genie. Some selected files will have the long description directly after the file name for additional information. If you see a file that you are interested in, then write down the file number and go to the library area to download the file to your computer.

Have fun!

This is GENie Master (GEM), version 4.21, by Tom Hoover. This program is FREEWARE. GEM requires Appleworks 3.0, a minimum of 512K of memory, and a copy of a recent version of ProTerm, Point To Point, or Talk Is Cheap. A hard drive is strongly recommended, but it will work if you have a 3.5 drive. GENie Master will save you tons of connect time; it will log on at the speed of light, collect your mail, read new messages, check for new files... then you read and respond to the things it collects at your leisure, off-line! Next time it logs on, it will send all your replies and download files, and get back off, also at the speed of light! This is a MUST HAVE item - feel free to distribute copies to others!
This is Ken Gluckman's GE CoPilot, the amazing FREEWARE GEnie navigator for the Apple IIgs! CoPilot will make GEnie easier to use than you ever dreamed, plus save you lots of money by letting you do most of your work off-line, without the GEnie clock running! CoPilot grabs your mail and messages at the speed of light, then shows them to you and lets you read and respond off-line, then CoPilot logs back on and sends your responses instantly! Specify files to download, it downloads them for you without you having to fumble to type things with the billing clock running! This is a MUST HAVE item for any IIgs user on GEnie! Requires System 6.0 or later and at least a megabyte of memory, plus a copy of Talk Is Cheap, Point To Point, or ProTerm.

Vigor is a hires arcade game that's simple to play. You command a space craft on the left of the screen and obliterate the oncoming enemy ships. Once one of them reaches your side or you get hit by one of their bullets, you will lose a ship. Once you lose all 3 ships, game over! This was my very first arcade game that I wrote in assembly language therefore I am releasing it as Freeware! Enjoy!

Don't Fence Me In! A game of strategy for two players. The object is to build a fence across the screen before your opponent does. See the READ.ME file and the online instructions for more details. Run FENCED.IN.1 to begin the game. FREEWARE, but copyrighted.

File Passage 2.0 is a freeware file utility for the Apple IIGS. It implements file commands such as copy, backup, move, catalog, and delete, and lets you customize how each command works by the use of a great variety of options and filters. Detailed on-line descriptions of each command are...
Apple II Computer Info

provided, or you can send $10 to the author, Charles C. Bartley, 1310 Cholla Ct., Lake Havasu City, AZ 86403, for a nicely printed manual. Version 2.0 provides a cleaner interface and more functionality than previously released versions.

20794 GEMCFG.SIG.BNY 13696 Article On Configuring Genie Master
20792 EASYOPEN1.4.BXY 9728 EasyOpen alias fext NEW VERSION!
20791 INVADERS.BXY 34688 Space Invaders type game

This is a Space Invaders type game for the Apple II GS. Supports mouse control. [Note: Accelerator users should slow down the speed before running this game. If you don't, you're in for quite a challenge.]

20788 BUDS.LAUNCH.BXY 9600 ProDOS 8/16 hot-key launcher
20787 TASKCARDS.BXY 76160 AppleWorks GS Classroom Task cards
20737 GRAFORTH.BXY 63104 GraFORTH by Paul Lutus, now Freeware

This file contains GraFORTH, reference sheets for the GraFORTH commands, the Editor commands, and the Lost Classics Press Release. GraFORTH is a DOS 3.3 graphics-oriented FORTH compiler/interpreter. This should run on any Apple II with at least 48K RAM. Sample code is included. GraFORTH is a mid-level language with assembly level animation capabilities. Sound and music capabilities are built in. Paul Lutus has given permission for people to copy and distribute freely as long as no charge is levied for the program. Check out the GraFORTH.ReadMe file included for more information. ***REQUIRES DOS 3.3.*** Archived with ShrinkIt 3.4. Unpack the 'Disk' portion of the archive to a BLANK 5.25 disk.

20714 POSTALCODE.BXY 103040 PostalCoder - AppleWorks GS barcodes

The NAUG Library now includes PostalCoder GS, a set of professional-quality AppleWorks GS mail list management and postal bar code templates. PostalCoder GS maintains your mailing lists and addresses envelopes. Automatically prints the correct postal bar code for all records that contain a nine-digit Zip code. Documentation describes how to use the program with many printers. PostalCoder GS is shareware. You send the author, Ray Bailey, $10 ($5 if you are a NAUG member). Archived with ShrinkIt GS v.1.1

20711 TCX.DISK3.5.BXY 196352 TCXpress offline msg processor

TCXpress is a freeware offline message processor that uses AppleWorks 3.0, TimeOut TeleComm and UltraMacros (3.1 or 4.x). Auto-captures mail and Roundtable messages, auto-sends mail and RT replies. Includes quote-back, mark and unmark topics, auto-save message files to disk. Menu driven. Works entirely within AppleWorks/TimeOut environment. Use ShrinkIt to unpack this file to a 3.5" disk. TCXpress is a product of Dan's Macro City. [Note: This contains BOTH versions of TCXpress. One for UltraMacros 3.1, and one for 4.x. The individual versions are also available nearby in the library. This is a full disk archive, and must be unpacked to a 3.5" disk.]

20708 EL.DUET.BXY 25856 Electric Duet, Musical Lost Classic
20707 APPLWRITER3.BXY V4 76544 Apple Writer for Apple III computers

Apple II Computer Documentation Resources (a2_docs_genielamp1.msw)
GENIE LAMP FOLDER -- www.textfiles.com/apple/ -- 18 September 2000 -- 775 of 1824
As of 24 July 1992, Paul Lutus has allowed Apple Writer 2.1 to be classified as Freeware. Apple Writer 2.1 (NOT any other version!) may be freely copied and distributed. By agreement with Paul, NO ONE may sell it, or sell it on disks which contain other software. This is a file archive. This program will NOT print through the IIgs printer port as is. It requires a Super Serial Card. A patch to remedy this is included in this archive in a folder called /PATCHES. Packed with Shrinkit 3.4. If you have already downloaded Apple Writer in an earlier package, this program is the same. If you are distributing Apple Writer elsewhere, please delete all old copies and use this one. Previous versions did not include important copyright information.

ShadowWrite v1.2 is completed !!! Improvements: On-screen ruler (measurement in pts, inches, cm); MultiGet Open dialog; Insert & Append text; Fast Find/Replace; new actions in Modify Text: ROT13 En-/Decrypt, Change Case (UPPERCASE, lowercase, Title); word count; Save as Source; AppleWorks support; Inter-Process Communication support; and more... Documentation and Update Notes included. Requires System 6.0. Archived with GS-ShrinkIt v1.1.

Version 2.0, now works with 8-bit Apple IIIs! Also now allows saving to disk images, and making double-sided disk images on the Apple IIgs! This incredibly fantastic and useful utility allows you to store and run older DOS 3.3 software on your previously non-DOS 3.3 compatible ProDOS hard drive or 3.5" floppy drives. Written by the author of Roger Wagner's The Graphic Exchange, John MacLean, this is a $10 shareware utility. It's very easy to use, and it even has the ability to slow down your system to 1 Mhz when running DOS 3.3 software, but returns you to your launcher at full speed. Supports DOS 3.3 BIN files and single or double sided DOS 3.3 disks.

More great stuff from the FTA, including source code! This collection has eight great programs on it: "The-Scrolling-Bulla-Game," a Marios Bros. like game demo, "New Parametrix Animation," chaser balls in a figure eight, "New Real-Time Vector Balls," "Diagonal Scroll" (you gotta see it to believe it), "Psy Scroll," a funky text scroll, "Coke Animation," a spinning Coke(tm) can!, "Oscillo," music with four separate
oscillators/meters, and "Pang," some bouncing balls over a detailed background. To make a self-booting disk from this archive, unpack these files to a disk that contains ProDOS (P8) and Basic.System. Packed with GSHK. Running directly from GS/OS may require a Shift-Boot.

20648 PRODESK3.01.BXY 74240 Full featured 8-bit selector/utility
20638 SNDEDITV1.2.BXY 52352 New Sound Editor—all Apple II's!

You asked for it, and here it is—SOUND.EDITOR version 1.2—with a brand new software DAC that provides 5-bit accuracy for GREAT sound and a 22 kHz. "carrier" for NO ANNOYING HIGH-PITCHED WHINE! The new DAC uses a carrier frequency which is inaudible to almost everyone, unlike prior software DACs, whose 11 kHz. carrier made an ear-splitting whine to wake the dead! Packaged with a handy sound player-editor an, some sample sounds to get you started, and a history and theory of operation. Freeware.

---

I'm a "technoholic". If there were a Technoholics Anonymous twelve-step program available for folks like me, even though I wouldn't attend the meetings, they'd do me good. My life has been changed by technology, and I have every reason to believe that my afterlife will be as well. I have very specific instructions for my funeral. When I die, I want to be taken to my grave site in a UPS van and buried in a vault full of styrofoam peanuts. I know that in heaven there's no credit limit, no restocking fee, and all deliveries are overnight at no extra charge. It's a little hard to imagine, but (as usual) I can try . . .

St. Peter stands at the gate with a white UPC scanner, scanning the souls of those who enter.
"You were a little overindulgent during your life, Mark. Still, you made it. Here's your Golden Card."

"Do I get a PIN number?"

St. Peter chuckles. "There are none here; no confusing numbers to remember. Just insert your card into the slot at the check-outs. We trust you." He chuckles again.

"But what if I lose it?"

He takes it from me and flings it quite a distance. It sprouts wings and flies back to my hand.

I ask another question, but instead of answering it, he hands me a large white book with gold lettering. It almost looks like a wedding album. THE ZEN OF HEAVEN, it reads.

My ageless body is whisked off to my spacious quarters. I find that one could spend months just exploring the place -- it is a mansion. Rooms brim with gadgets and furniture that look like they came right out of THE SHARPER IMAGE catalog. I consult ZEN and bring out my Golden Card, which transforms itself into a remote control at my command.

An expansive wall on the other side of the room becomes a view-screen. They have digital HDTV in heaven! Soon, I am watching a new HIGHWAY TO HEAVEN episode (starring a white-robed Michael Landon), encoded with something called "MacroLogic Surround" (which reportedly won't be available on earth for many years), and enjoying every second of it. After the program ends, I consult the ZEN yellow pages for a local pizza joint. "Twenty seconds or your next one is on the house", the ad reads. There is a list of toppings right in the ad. I place the order, and moments later an angel appears at the door with the pizza.

I am so overwhelmed by what I have seen that I begin to weep. My tears turn to jewels and fall tinkling to the ground. The angel hands me my pizza.

"Wait," I plead.

"Of course."

"If this is heaven, then what is hell like?"

"Everyone asks that. It's a madhouse full of punch cards, bulging file cabinets, dirty, sleazy motels, obnoxious music, factories understaffed by discontented workers, industrial waste, humidity, tenements with fifteen to a room -- you name the malady, it has it.

"Just think," the angel continues, "here in heaven, you have everything a truly righteous technoholic could want, and all of eternity to experience it. Enjoy your pizza . . . pizza . . . pizza . . ."

As I plunge (with just a little turbulence) back down to earth, I think of a TALKING HEADS song I once heard:

"Heaven. Heaven is a place.
A place where nothing --"
Nothing ever happens."
Not true: they have the best pizza there.

buy a modem. After getting on GENie, I eventually came in contact with Walker Archer, who is the tech support manager at Quality Computers. You could say that Tom Weishaar (Uncle DOS) was at least indirectly responsible for both of those jobs! Without Open-Apple and, later, the A2 RoundTable, I wouldn't have made the necessary contacts. In fact, I met Ross Lambert -- who was the publisher of The Sourceror's Apprentice, Reboot, and later 8/16, all of which I was involved with in some way -- on GENie too.

GEnieLamp> What sort of work have you done for Quality Computers over the years? Can you briefly tell us about the commercial Apple II software products you've created or helped create?

Jerry> I've done quite a bit of stuff at Quality, ranging from programming (FlashBoot, Switch Hitter, the Q Drive configuration software, and the Q RAM memory test) to writing (manuals for the Q Drive, TimeOut Grammar, Signature, Six Pack, and of course the System 6 Book). I've put in a lot of time helping Joe Gleason, our president, turn his brainstorms into reality in various ways. For the first couple of years I was doing the creative stuff between phone calls, first in tech support and later in sales! But for the last year or so I've been able to concentrate on the projects without distractions.

GEnieLamp> What are your current duties at Quality?

Jerry> My main job is as the editor of II Alive, our new Apple II magazine. Between issues, I find time to squeeze in some of the other things I've been doing all along. I'm about to start working on a big project which I can't talk about yet. I've also been doing some work in our video facility, writing scripts for productions and also doing some computer graphics and animation on our Video Toaster.

GEnieLamp> I understand you're planning to attend the A2-Central Summer Conference, known as KansasFest, again this year. Do you have any amusing anecdotes to share about past conferences?

Jerry> I'm most fond of the first one. I'd just become a sysop in A2, and had been working for Kitchen Sink for several months. Ross Lambert asked me to be on his panel on 8-bit development environments to tell people about MicroDot. So there I was, sitting next to Alan Bird and Roger Wagner and a bunch of other Apple II demigods. And Alan Bird turned to me, looked at my name tag, and said, "Oh yeah, you're the guy who wrote MicroDot, right?" You can probably imagine my reaction. The guy who I've always considered to be one of the best programmers on the face of the planet recognized my program! Oh yes, I also managed to steal Randy Brandt's seat in the TimeOut session. And I got to talk to Roger Wagner and Bob Sander-Cederlof. On the van from the airport I sat next to Mike Westerfield and spend a lot of time looking at him and wondering, "Geez, am I really sitting next to THE Mike Westerfield?" It was really a lot of fun. The subsequent KansasFests have been just as good, but you can only attend your first KFest once!

GEnieLamp> One of your big interests is telecommunications. What new developments do you think might come online before the turn of the century? Do you think that people who are not online will be missing out?

Jerry> Recently I've been seeing a lot of those AT&T ads promising that
they're going to bring you the ability to send a fax from the beach, choose to watch any movie anytime you want to, and all that. Most of the country already has the "video dial tone" capabilities in place which will enable the phone company to deliver these services. The phone company and the cable TV companies are going to be pretty stiff competitors in the information services market. We're going to see affordable pocket phones which you can take anywhere -- instead of having a phone number that reaches your house, you'll have a phone number which reaches you, wherever you are, if you took your phone. These new services will be primarily entertainment-driven, not service-driven. After all, most people don't come on GEnie and other online services to get information -- they come to have fun. Which is why Chat Lines is so popular. But once the cable TV people and the telephone company get into information services, they'll reach many more people than services like GEnie do now. You won't even need a computer -- all the necessary hardware and software will be build into your TV.

Traditional text-based information services, chained as they are to personal computers and modems, will evolve or die. It's the services which will bring people online, which makes the second question almost moot. People will go online once it's affordable and offers things they're interested in. Right now, the fact that you have to have a computer throws a damper on things.

GEnieLamp> What sorts of non-computer things do you like to do for fun?

Jerry> My other big interest is music. I have over 300 CDs right now, and a room full of MIDI synthesizer equipment. Of course, that stuff is all hooked up to the computer, so maybe it doesn't count as a "non-computer" thing. I also like to read science fiction -- my current favorite writers are Orson Scott Card, Emma Bull, Isaac Asimov, and Ian McDonald.

GEnieLamp> How can people reach you? Do you prefer electronic mail?

Jerry> I can be reached in my capacity as editor of II Alive at 1-800-777-3642, extension 839 (that's the II Alive voice mailbox). I also have two electronic mail accounts on GEnie (QC and UN-JERRY), and a ProLine account that's accessible from the Internet (jerry@pro-quality.cts.com). Electronic mail (including voice mail, really) is probably the greatest invention of the 20th century. It allows me to respond to people rapidly, without having to interrupt what I'm doing to take a phone call!

A2: Educational Computing

By Adrian Vance

[A.VANCE]

>>> EDUCATIONAL COMPUTING AND THE SCHOOL MARKET <<<

To understand the school market we need a compass to tell where we have been, where we're going and how the Apple II fits into the picture. To wit:

Objectives
The next four posts will deal with these areas specifically. Please respond specifically regarding: Objectives, History, Teaching or Technology.

Objectives

"Give a man a fish and feed him today. Teach a man to fish and feed him for life." may well serve as a philosophy of education, but within that broad stroke lie all the nuances, opportunities and problems of the transmission of our culture, skills and values.

From the time of the Pilgrims until very recently it was the objective of American education to teach "readin', writin' and rithmetic", the three "R's." The real world of work, where heavy lifting was done, was outside the walls of the little red schoolhouse.

While many smile at the crude beginnings of American education, it gave us the most successful, dynamic and capable culture on the planet in the least amount of time with less government, war and strife than any society in history. But now, this culture is one in question.

(1) Can we, or should we, return to a simpler time?

(2) What is the role of the computer in this dynamic?

(3) What are the forces guiding our destiny? Do they include:

(a) More government to solve our problems?

(b) More individualism through technology?

(c) The dissolution of federalism? As in the USSR.

(d) More "Big Science" or new Edisons and Einsteins?

Teaching

The secret for success in classroom teaching is creating many ways of saying the same thing many different ways. The role of supplemental materials producers in films, filmstrips, audio tapes and computer disks has been to give the teacher additional tools for the job, not to find the "best way," but to supplement rather than supplant.
Our experience has shown teachers will not create their own materials. They may organize and use materials very well, but there appears to be a barrier within them against producing books, films, filmstrips or computer programs.

The questions for Apple II software are, "Where does it fit?" and "How can it be used?" in education. Consider that after a dozen years of the "Computer Revolution" there has yet to be one full-fledged program system to teach any subject from beginning to end. With our two million teachers, 100,000 authors and programmers, we have certainly had the facility for such development, but no product of this kind. This tells us the opportunities for software in education are many, but small, not few and large. This market has yet to be properly developed in view of its nature.

Technology

Educational technology began in 1919 when The Society For Visual Education, SVE, was formed by five University of Chicago faculty members wanting to "Bring the world to the classroom." via educational filmstrips. That same year, the Eyegate Corporation formed for much the same, but plainly commercial purpose. Both enterprises were possible because of the 35 mm filmstrip projection system. Using single pictures on motion picture film stock, this technology was a by-product of the theatrical motion picture business.
